nine months of government control, by continuing practices devised by the carriers and by supplementing them with others which the carriers long had desired to use but were restrained by law from so doing.

If, under these conditions, no greater traffic was handled in 1918 than in 1917, greater ability and efficiency for government administration can hardly be claimed.

The volume of freight traffic measured by tons of freight carried one mile in the nine-month periods was:

1917 .....	330,486,760,286	1.3 per cent greater
1918 .....	326,306,832,131	

and the maximum volume of freight traffic handled in any one month was:

May, 1917 .....	39,273,449,624	1.3 per cent greater
July, 1918 .....	38,761,290,750	

The sole items in which 1918 shows improvement over 1917 are in average tons of freight per car of 29 against

regions alone, which is only two-tenths of 1 per cent of the total freight car miles run in these regions.

In recommending the elimination of circuitous routes the interests and convenience of the public served by them do not seem to have been considered. The great preponderance of traffic in our country is long-distance through traffic, competitive with other rail, or water, or part rail and part water routes. If, at its inception, any line projected to develop traffic, following a policy under which our country has been built up, had been prohibited from engaging in through traffic because it was longer than an existing line, it would never have been built, as it could not possibly have existed on the revenue solely derived from local traffic. In other words, it was able to develop and serve local communities by reason of supplementing local with through freight revenue.

If the circuitous route can make satisfactory earnings from the carriage of freight at regulated rates, why should it be denied the right of doing so? The ability to control such traffic evidences a public necessity, for obviously if such a route did not give better facilities and service than the direct route no one would use it, no matter how earnestly persuaded by agents of interested railroads.

The use of circuitous routes in emergencies is often imperative.

#### 5. The unification of terminals.

Under private operation it is not clear that this could be done without infraction of law, but a great deal was done during the life of the Railroads' War Board in the way of extending the common use of terminals.

#### 6. The maintenance of the "sailing day plan."

The general adoption of this plan by the Railroads' War Board followed a publication of its benefits by the Pennsylvania Railroad Company, in the autumn of 1917, the first large system to put it into general use. It is unquestionably beneficial and, as a war measure, the inconvenience of less frequent service was tolerated with great good-temper by the public.

#### 7. The consolidation of ticket offices.

Unquestionably of benefit in places and should be continued with discrimination, if permissive statutory authority can be obtained. In the government suit for unmerging the Union and Southern Pacific Systems, a point to which the prosecuting officers of the government attached much importance as proving infractions of the anti-trust law, was consolidation of ticket offices. As a result of the litigation all consolidations of this character were broken up.

#### 8. The utilization of universal mileage tickets.

Unquestionably a good thing and should be continued under private control and protective restrictions. Apparently no legal obstacles.

#### 9. The standardization of equipment.

Standardization of locomotives is unwise and unnecessary. To obtain maximum efficiency of a locomotive and corresponding minimum of cost of transportation demands close study of the alignment and grade systems, the nature of fuel, strength of bridges, weight of rail, length of turntables, depth of roundhouses and lengths of freight passing sidings on the line on which they are to be operated. As these features are different for each line, no locomotive can be designed to serve all lines with maximum efficiency; hence, if a standard locomotive is to be prescribed for use on all lines a compromise is the only possible solution of the problem, and a jack-of-all-trades-master-of-none locomotive is the result. The owning line must put up with indifferent service in order that some other line may be able in emergencies to borrow a locomotive similar to its own in all respects. The owner must be satisfied with 80 or 90 per cent efficiency for substantially all the time in order that a borrower may enjoy similarly lowered efficiency for a very short time. The director general credits standardization with prompter deliveries of locomotives. May it not be due to priority given to material for federal locomotives?

Some Southern Pacific locomotives are now 12 months overdue because of preference accorded federal locomotives, and the company itself is very much in arrears in completing locomotives which it is building in its shops because of delays in getting material.

The standardization of passenger equipment is not necessary, as it seldom leaves the rails of the owner.

Standardization of certain classes of freight cars is desirable, but should not be obtained at a sacrifice of transportation efficiency of the owning line by forcing it to use a car unsuitable for its traffic because of excessive deadweight, restricted cubic capacity, etc., etc. Most of the important details of cars have been standardized as a result of the studies of the Master Car Builders' and Master Mechanics' Associations.

Standardization, unless intrusted to officers immediately responsible for net revenue, will lead to the sacrifice of the substance of *certain* economy in operation to the shadow of *uncertain* economy in manufacturing costs.

10. The maintenance of the uniform freight classification introduced by the United States Railroad Administration.

Unquestionably of benefit and can and should be continued under private operation. This monumental work, on which the carriers had been engaged for several years, was completed just before federal control, and the government deserves credit for putting it in use immediately.

11. The maintenance of common timetables between important points.

The railroads have desired for many years to bring this about, but have been prevented by fear of violation of statutes.

12. The maintenance of high demurrage rates and uniform rules.

Desired for many years by the railroads and urgently recommended by the Railroads' War Board during its existence. The permission of the commission to increase demurrage rates was obtained, but its order was modified in a short time to such an extent as to deprive the carriers of its expected benefits.

13 and 14. The establishment of through waybilling freight from point of origin to destination, and rendering unnecessary the rebilling by connecting or intermediate routes.

Unquestionably of great benefit. If the practice means what the language implies it should break up to a large extent, if not entirely, the practice of reconsignment, which has been a most fruitful source of delay and congestion.

15. The elimination of the old practice of paying in mileage or per diem rental for the use of freight or passenger cars of one carrier by another.

This would be possible to a considerable extent by pooling certain classes of cars in general use, but not all of the freight cars of the country, a plan for which could no doubt be worked out with the authority of the Interstate Commerce Commission, which under the Esch bill is vested with control of the carriers' equipment. Carriers should be allowed to enjoy the exclusive use of special equipment designed to suit special conditions and produce minimum costs of transportation.

The necessity for pooling passenger cars does not exist, as in general their use is confined to the owning lines, without inconvenience to the public. When it is necessary they can and should be freely exchanged.

16. The simplification of the old practice of apportioning interline passenger revenue.

As we understand this language, the practice can be followed as well under private as under federal operation; however, it is a matter in which the public is not interested.

17. The utilization of water routes for the relief of crowded rail lines.

This should unquestionably be done, but past experience has shown that there is no equipment on the water routes to accommodate freight; therefore it is impossible for them to afford relief. Representatives of water-route interests were

met in conference by the Railroads' War Board on several occasions and assured of the co-operation of the carriers, but nothing ever resulted from these conferences because of lack of water-route equipment.

**Economies**

The director general asserts that reports from five of the seven regions show that on a group of selected principal items, savings totaling \$85,576,424 have been effected in 1918. Estimating a pro rata saving for the other two regions would total \$119,806,000.

For the first seven months of federal control 47,420,000

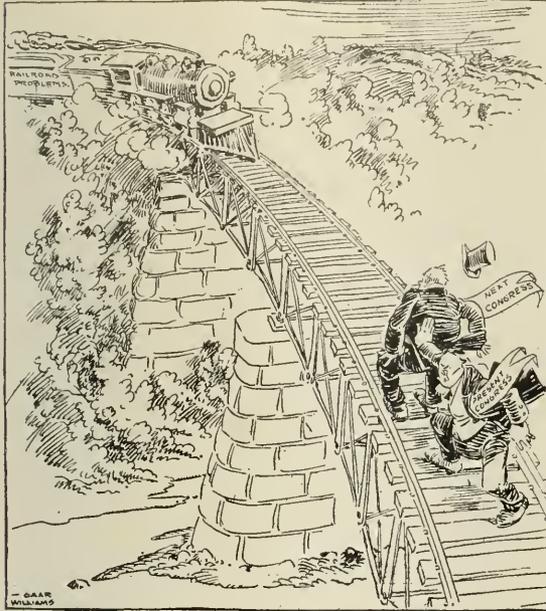

which leaves \$9,274,000 to represent economies from all sources other than those specified.

The secretary of the interior evidently does not consider the suppression of advertisements and the consolidation of ticket offices unalloyed benefits, because in his last annual report, after mentioning various drawbacks to tourist travel, he says:

"The consolidation of ticket offices in the large cities also adversely affected national park travel. *With opportunity gone to obtain accurate information* concerning the more or less complicated routes from the east to the western parks, many preferred to spend their vacations in their customary resorts, with whose ways and means they were well acquainted.

"It is earnestly hoped that, with the close of war, these discouragements to travel will be fully removed before the next season. Tourist travel should be heartily encouraged. Furthermore, *the important work accomplished by the railroads* and this department in close co-operation during the last four years in the direction of informing the people of the country concerning the greatness of their scenic possession and recreational areas *should not be lost*. The national park system is one of America's greatest assets and it must not be overlooked in planning the development of American industry after the war."

Compelling the railroads to pay their corporate officers out

From the Indianapolis News.

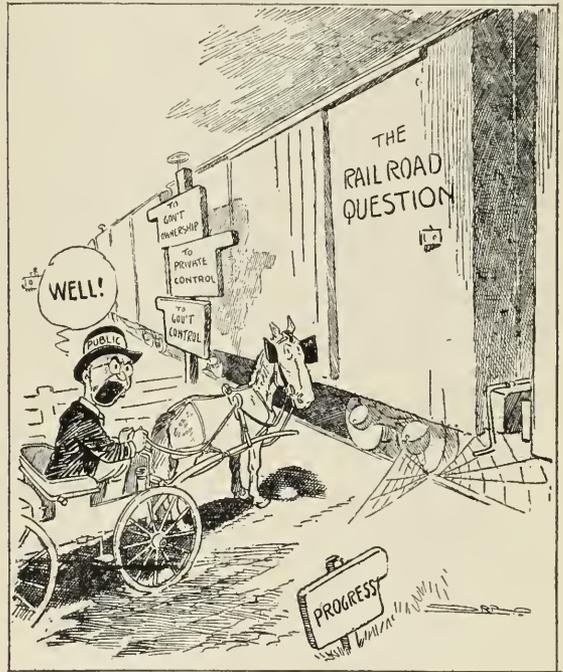

**You Do It**

passenger miles were cancelled. Inasmuch as the director general says that the elimination of many passenger trains could hardly be expected to persist after the declaration of peace, we estimate the reduction for the entire year at 40 per cent more than that for seven months, making a total of 66,388,000.

The expense per train mile for 1917 was \$2.30. The estimated increase in operating expenses of 1918 over 1917 is 34 per cent, which will raise the cost of a train mile to \$3.08. From computations made on Southern Pacific in 1916 of the cost of a passenger train mile according to a rule prescribed by the Interstate Commerce Commission it is shown to be 38.55 per cent of the total train mile cost; whence the cost of a passenger train mile in 1918 would be \$1.20 and the cost of the reduction in passenger mileage would be \$79,665,000, leaving the economies from all other sources \$40,141,000. The saving from suppressed passenger service represents comforts and accommodations of which the public has been deprived.

In his report to the President dated September 3, 1918, the director general claims to have saved:

Per cent of operating expenses	
0.16	\$6,115,000 in the salaries paid to officials and to counsel;
0.18	7,000,000 in advertising;
0.11	4,424,000 in consolidated ticket offices;
0.03	1,186,000 in insurance; and
0.32	12,142,000 in the abolition of outside agencies.
0.80	

From the Chicago Tribune

**Blocking Traffic**

of corporate funds instead of charging these expenditures to operating expenses, as was done during the test period, diminishes the fixed return of the railroads and to that extent subjects them to the loss of double the amount. Yet the saving from all of these specified sources totals considerably less than 1 per cent or 0.80 per cent.

Nearly all of this insignificant amount accrues from withholding comforts and conveniences from the public that they have long enjoyed and which causes numerous complaints and unfavorable criticism, and inspire resolutions of trade bodies favoring the return of the railroads to their owners,

with legislation to enable them to meet existing conditions.

The 16,803,633 car miles saved by re-routing freight amounts to but two-tenths of one per cent of the total freight car mileage of the regions in which the economy was effected.

While much stress has been laid on the small economies which we have enumerated, they have been sources of irritation and friction out of all proportion to their amounts, and their perpetuation under private or government operation seems unwise. Rearrangement of local passenger service without over-much consideration of the public's views; indifference to promoting traffic or settling up vacant lands; and neglect of small matters affecting the personal comfort of the traveler that have grown out of competitive conditions and been created by local managements directly responsive to the needs of the community, are some of the reasons given by the patrons of the roads for desiring their return to private management, with such legislation as will enable the owners to receive them back from the government.

### The Railroads' Plan

The plan evolved by our committee, after arduous study extending over a period of about six years, that has been presented to you by our chairman, Mr. Cuyler, and expounded by our counsel, Mr. Thom, has been adopted by the Association of Railway Executives, representing about 92 per cent of the railway earnings of the country. In it we ask Congress to make it possible for the carriers to give the public the advantages of conservation of capital by requiring unification of lines and terminals, when required in the public interest, by promoting useful consolidations, and permitting agreements as to rates and practices, the benefits of which have been proven during federal operation, but which the carriers by law have been prevented from supplying.

Its fundamental features, to which details of organization and operating machinery are subordinate, are:

(1) The creation of a department of transportation, headed by a secretary, who would sit at the President's council table, who would relieve the Interstate Commerce Commission of its executive duties; and in whose jurisdiction would be centered rate regulation subject to revision by the Interstate Commerce Commission, and the fixing of wages, and who would use the power of the administration to maintain proper service, to create the necessary credit for the carriers, and to maintain harmonious relations between employers and employees.

(2) The adoption of a fixed policy as to the revenues of the carriers by requiring that the influence of the President, through his secretary of transportation, shall be put behind movements for increased rates which he finds proper, and the establishment of a statutory rule for rate-making, which shall require that rates be not only reasonable but adequate and sufficient to protect existing investment and to attract capital necessary to maintain existing properties up to the standard of the public need, and for the construction of extensions and branches.

(3) To provide for compulsory federal incorporation and for the elimination of the conflict of regulating power between the states and the federal government as to all essential matters, including rates, state and interstate, with as little interference as possible with the state commissions in carrying out the intended purposes.

I wish to record the hearty approval and recommendation of the plan by substantially all of our constituents; as well as my own, and to express the belief that if transmuted into law it will mark an epoch in the transportation history of the United States. Competent critics, both home and foreign, have heretofore characterized the service of the railways of the United States as the best in the world, notwithstanding they have the lowest capitalization, pay the highest wages and collect the lowest tolls from the public. We believe that the character of service that has merited this high praise

can be greatly improved by profiting from the experience gained in private and government operations. Our plan is not presented in the shape of a hard and fast bill, but is offered as a suggestion, by no means inflexible, of a way to attain desired ends.

The question of a guarantee was freely discussed in our deliberations, but we do not ask for a guarantee. We recognize that the establishment of a definite guarantee would stifle all incentive to efficient management and would destroy competition as to service and facilities, for if necessary revenue could be obtained without effort what inducement would exist to make an effort?

To obtain the most efficient and economical management those charged with the conduct of the business must be personally interested.

Under our plan, if a rate system be put in effect in a given region that will produce revenue adequate to yield a fair return on roads operated under average conditions and with reasonable efficiency, and to enable them to maintain their credit and pay satisfactory returns to their security holders, some roads below the average which should never have been built, or which were poorly located and are indifferently managed, may be forced to reorganize or sell their properties, while those above the average will prosper; but all without exception will be stimulated by self-interest to create new and increase existing traffic by competition in service and facilities, because by so doing the returns to the owners are increased and at the same time the public is better served.

The carriers desire to be permitted to use all legitimate means to earn sufficient to provide safe, adequate and sufficient service, to protect their existing investments, to attract new capital, and to reflect the cost of wages and all other expenses incident to furnishing transportation.

Under our plan the measure of success of their operation depends on the efficiency and economy of their management, the extent to which their traffic is fostered and industrial development on their lines is encouraged, and recognizing this they accept full responsibility for results.

Mr. Kruttschnitt was asked several questions regarding the matter of equipment purchases. In reply to a question by Senator Smith as to whether the railroad companies had not themselves submitted the budgets to the Railroad Administration, Mr. Kruttschnitt said that the Southern Pacific in sending in its budget had made the statement that it needed no new equipment. It had recently ordered 100 locomotives, some of which were later held back to allow the standard locomotives to be built first, and it was building 5,300 freight cars at its own shops. It was allotted no engines but was allotted 2,000 freight cars at a cost of \$3,000 each, which it considered less efficient than the cars it was building for \$2,000 each. The difference in cost was largely due, he said, to the fact that less steel was used than in the government cars. The allotment of standard cars was made, he said, in spite of the showing made by the company that for five years it had had a per diem balance in its favor averaging \$1,250,000 a year, showing that it had more cars than were needed for its own traffic, and in spite of the fact that it had increased the efficiency of its cars by 84 per cent in two years. After the armistice was signed the railroads had asked the Railroad Administration to cancel the outstanding car order and others involving charges against the corporations but had been told that it was too late to cancel the cars.

### Requisites of a Proper System of Regulation

Alfred P. Thom, counsel for the executives, continued until Monday his argument on the legal aspects of the problem, the first part of which was reported in last week's issue. After outlining the opposition to the five-year plan, declaring that an extension during times of peace of the present war control of the railroads would be unconstitutional be-

cause it would give the President power to set aside all laws affecting state and interstate commerce, Mr. Thom took up the requisites of a proper system of regulation. He stated that the free flow of investment capital into railroad development had been checked since 1910 by the declining tendency of net earnings, the rigid state and national regulation of both revenues and expenses, and the lack of any assurance to the investing public that new funds invested in the business would earn a fair return. To a considerable extent Mr. Thom's argument was that which he had formerly presented before the Newlands committee. Mr. Thom took up a table introduced by Commissioner Clark, from which the latter had argued that the railroads had fared well financially in the past ten years, and pointed out that these figures show the following:

1. Every year but one after 1910 up to 1916 showed much lower operating income than in 1910.
2. In every year there was a large increase in the property investment, so that the investment was expanding, while earnings were shrinking.
3. In but one year between 1910 and 1916 were earnings sufficient to pay interest and dividends.
4. The total operating income from 1910 to 1916 was not enough to pay the total interest and dividends.
5. From 1910 to 1916 the funded debt increased \$2,200,000,000, while the stock increased only \$733,000,000; this three-fold increase in indebtedness resulting from insufficient credit to raise new capital from the sale of shares.
6. In no year from 1910 to 1916 did the carriers earn on their investment as much as 5.35 per cent, a figure which the Commerce Commission had held was less than was necessary in the public interest.
7. The average earnings for the whole period were only 4.94 per cent, or considerably below the danger level marked by the commerce commission.

Discussing state regulation, Mr. Thom said that in every state south of the Potomac and east of the Mississippi rivers the scale of state rates is different, showing an unfair and unequal distribution created by the states themselves, not only as against interstate commerce but as between the states. No question of the violation of state rights is involved, he said. The question is whether or not, in a matter of common interest to all, one state shall determine for itself the proportion of the common burden which it will bear. Of course, he said, if government ownership comes, the entire question will be removed because the national government would control the whole field. He said that state traffic produces 23 per cent of the freight revenues and 15 per cent of the volume, while state passenger traffic represents about 50 per cent of the revenues.

As to the decline of railroad credit, Mr. Thom pointed out that there is no longer any field for speculative investment in railroad securities. He also declared that the prices of outstanding stocks and bonds are not a proper index of railroad credit because the outstanding bonds represent preferred liens and that the credit of a company is determined by its ability to market new securities, particularly stock. The railroads have already passed the danger line as to the proportion of stock and bonds, because more than 60 per cent of their securities are bonds. The Pennsylvania Railroad has not been able to sell a share of stock for five and one-half years, although 75 per cent of its capitalization is in stock and only 25 per cent is indebtedness. The New York Central has about 75 per cent of bonds and 25 per cent of stock and was recently unable to sell its stock after it had been at par for some time, because the proposed offering brought the price below par.

"How can we by any legislation improve that situation?" asked Senator Watson.

Mr. Thom, after emphasizing the fact that he was criticiz-

ing systems and not men, declared that the credit of the carriers would be improved if the factors which had made it so uncertain in the past were removed and if it was made possible for the regulating body to act with something like the promptness of a business man in dealing with his own affairs in passing on important questions affecting the carriers, and if political considerations which made it unpopular for a state or the interstate commission to allow an increase in rates could be removed. After reaching the conclusion that the present regulating machinery does not possess the quality of business judgment which the situation calls for, the railway executives have proposed a new plan, feeling that the higher position a man occupies in the government, the more courageous his action and the greater his sense of responsibility is likely to be.

"We recognize," said Mr. Thom, "that we cannot get away from politics when our government is based on politics, but we ask to be regulated by the strongest and most responsible of political agencies. We believe we will find more strength at the President's table than in a bureau, and that his policies will be those of the administration. In our opinion, when a man reaches the dignity and responsibility of a cabinet officer he is less subject to petty political influences and more likely to decide questions of public policy with an eye solely to the public interest. His realization of the public needs and his proposals to meet these needs would have behind them the force of the administration and the successful supervision of transportation would be necessary to the success of the administration. Questions relating to railroad revenues, for example, ought not to be determined by the selfish interests of the railroads or the selfish interests of the shippers, but by the public interest. We believe that transportation is of such vital importance in our national life that it is entitled to its representation in the cabinet, along with a representative of agriculture, a representative of commerce and the representatives of the army and navy."

Mr. Thom added that it was not proposed that the secretary of transportation shall have any direct relation with the great army of employees. Their relations will be with the railroad companies. He did not believe it would be possible for one man to control the votes of the employees, because labor has its own politics. He thought this was demonstrated by the results of the last election because, although a cabinet officer had the most direct relations with all the railroad employees in the country, the other party won. He said he had heard no suggestion that Mr. McAdoo had attempted to use his power to influence the votes of the employees in the election, but he believed that if the secretary of transportation should attempt to do so, the effort would defeat its own purpose.

"We do not believe the American people would accept the idea of a single uncontrolled head of the American transportation system. It would demand a check and under the plan we have offered the Interstate Commerce Commission would be relieved of some of its burdens and would be raised in dignity as a judicial body. It would act as a check both on the railroads and on the department of transportation, while with the suggested regional commissions assisting it in various parts of the country it would be brought much closer to the individual communities, and local questions would be heard by the local commissions before coming up to the central body for review."

Mr. Thom said a great deal can be said in favor of the initiation of rates directly by the Interstate Commerce Commission, but that this plan entailed difficulties because of the inability of a commission to respond readily enough to business needs. Interstate Commerce Commission decisions are now controlled by considerations which do not make for promptness. The railroads urge that Congress shall establish a statutory rule of rate-making, that rates shall not only

be reasonable from the standpoint of the shipper, but adequate to insure proper service by insuring a reasonable return on the investment to attract new capital. While the law now theoretically provides this, in practice the question of adequacy has become minimized and is given less consideration than the desire for low rates. The commission has held in the past, he said, that it is not responsible for providing sufficient income for the railroads, but that it is limited to fixing reasonable rates. Since that decision the commission has advanced some, but it has been hampered by the same idea and while it has always taken wages into consideration it has held in at least one decision that it could not be expected to raise rates sufficiently to pay extravagant wages.

Mr. Thom filed with the committee a discussion of state railroad laws prepared by S. T. Bledsoe, general counsel for the Atchison, Topeka & Santa Fe, showing the numerous conflicts. Mr. Thom developed the point that many states either prohibit the consolidation of railroads or require them to obtain the approval of the state and he declared that it would not be sufficient to repeal the federal laws against such consolidations. Therefore, federal incorporation was necessary to remove the obstacle of state prohibition of a consolidation permitted by the federal government. He said he thought the people had about reached the conclusion that there are too many railroad companies.

After Mr. Thom had concluded his argument, Senator Kellogg asked why a secretary of transportation was necessary and why a railroad administrator not a cabinet member and with a long term of office would not be better.

"Don't you fear," he asked, "that in the face of an election the cabinet officer would hesitate to do anything which might be unpopular?"

"We think the most popular thing he could do would be to furnish good service. We want him to be responsible to the people for adequate service," replied Mr. Thom.

Senator Cummins asked whether the responsibility for net income did not logically go with the control of revenues and expenses and whether the government should not guarantee the return on capital. Mr. Thom replied that there were enormous practical difficulties attendant upon such a plan and that it might be wise to seek something short of a government guarantee. Senator Cummins also remarked that the power which it is proposed to give to the secretary of transportation is essentially different from and much greater than that possessed by the cabinet officers. For instance, the secretary of agriculture does not fix the price of agricultural products.

Mr. Thom replied that the government is exercising a much greater power in the case of transportation than in the case of other branches of activity and that this fact makes it necessary to give the cabinet officer in charge of transportation a different relation. His authority, however, would be reviewable by another body.

As to the principles which should govern the fixing of rates, Mr. Thom said that the duty of the government should not only be to make each rate reasonable, but the rates as a whole adequate, considering the condition of the average roads in each territory. This would leave some of the weaker roads subject to the usual loss of commercial failure, while it would allow the more prosperous roads to earn more than might otherwise be considered necessary. Senator Cummins asked if it was proposed that these roads should make some contribution to the treasury.

"We have deliberately left that subject open," replied Mr. Thom.

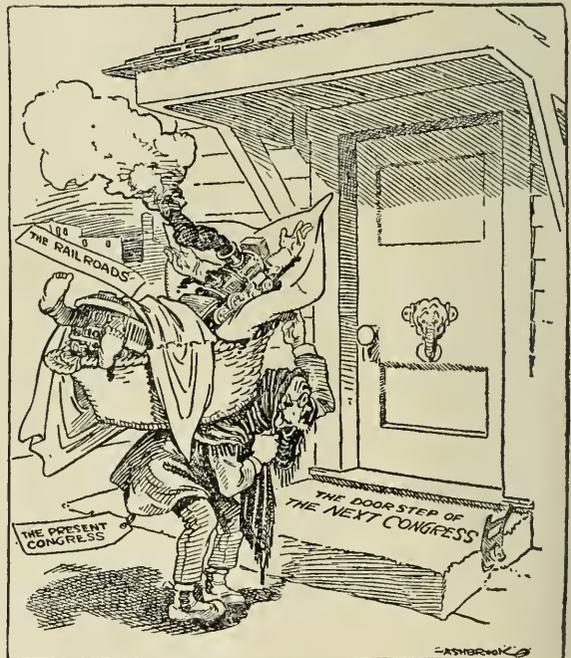

Senator Pomerene suggested the possibility of allowing state commissions to make rates, but subject to review by the Interstate Commerce Commission. Mr. Thom thought this plan impracticable, not only because of the delays which

would ensue, but because of the reluctance of a federal body to disagree with a state authority.

Director General Hines has filed with the committee a statement promised by Mr. McAdoo while he was on the stand, the purpose of which was to show that during the first four months ending April 30, 1918, during which the railroad corporations were operating the railroads as agents of the government and through their own officers, because the federal managers had not yet been appointed, the operating expenses had increased by \$215,000,000 as compared with the corresponding period of 1917, while the revenues had increased only \$108,000,000, and the net operating income had decreased \$109,000,000. This was before either rates or wages had been advanced and represented the period of some of the worst winter weather. Mr. McAdoo had suggested this for the purpose of showing that government operation was not responsible for the enormous increase in expenses during 1918.

### Federal Railway Companies Proposed

Victor Morawetz, formerly chairman of the Atchison, Topeka & Santa Fe, has filed with the committee an outline of a plan for a federal railway board to organize 10 or 15 federal railway companies with power, with the approval of the federal railway board, to acquire all or any existing lines of railway. Under his plan the federal railway board would have plenary and exclusive power of regulation of the federal corporations and to appoint regional boards of regulation and one central board of regulation. The plan also proposes a government guarantee not to exceed 65 per cent of the estimated operating income, and that interest on debentures should not exceed 40 per cent of this operating income, and for a division of operating income above a certain figure between the stockholders of the railroads and the government.

From the Dayton Journal

Another Case of Intended Abandonment

# General News Department

The Pittsburg, Shawmut & Northern had 108 employees and two officers in government service during the war. Of these men 65 were in the infantry, 14 were in the New York state guard, and 11 were with railroad engineers' regiments.

Senator Pomerene (Democrat) and Representative Esch (Republican) have introduced in Congress bills providing for the future regulation of the railroads by greatly amplifying the powers of the Interstate Commerce Commission. The provisions of those bills include regulation of security issues, construction of railroad extensions, train service and operation; and they authorize the Commission to require pooling of traffic and the common use of cars, terminals and other facilities; also to fix minimum rates for transportation.

Track Elevation in Chicago, was the subject of a conference this week, at which representatives of the city and officers of the Railroad Administration exchanged views. R. H. Aishton, regional director, Northwestern region, said that the Railroad Administration would offer no objections to the inauguration or resumption of such work provided the expenditures were kept within reasonable limits. The details of the work to be undertaken, and the financing and matters which, said he, must be disposed of by the individual corporations involved.

## Fire Protection for Railroad Properties

This is the title of a manual of 98 pages which has been issued by the United States Railroad Administration, Division of Finance and Purchases, for the use and information of fire protection inspectors. It is bulletin No. 8. This manual has been compiled by Charles N. Rambo, manager of the Fire Loss and Protection Section, of the Division of Finance and Purchases, and includes detailed instructions and advice on every conceivable branch of this subject which is of interest to railroad men.

## Condition of Locomotives and Cars

### in Northwestern Region

In the week ending January 4, locomotives in service on lines in the Northwestern region, numbered 8,004, making the efficiency 85.2 per cent, or about the same as in the preceding week, reported in our issue of January 17. The number of freight cars on the Northwestern lines during the week totaled 370,052, compared with an ownership of 334,615. Bad order cars numbered 20,886 (or 5.6 per cent), as compared with 18,916 (6.5 per cent) for the same week in 1918. Freight cars in outside shops totaled 208. The number of employees in service in car repair shops totaled 21,275 (working 47 hours (average) in the week), as compared with 17,537 in the same week of 1918.

## Medals Awarded to Atterbury and Felton

Upon the recommendation of General Pershing, a distinguished service medal has been awarded to Brig. Gen. William W. Atterbury, formerly vice-president of the Pennsylvania Railroad, "for exceptionally meritorious and distinguished services." As director general of transportation in the face of almost insurmountable obstacles he organized and brought to a high state of efficiency the transportation service of American Expeditionary Forces. The successful operation of this most important service, upon which the movements and supply of the combat forces were dependent, was largely due to his energy, foresight, and ability.

S. M. Felton, president of the Chicago Great Western, and until December 31 director general of military railways, was awarded the distinguished service medal by the Secretary of War on January 18, on the recommendations of Gen. Peyton C. March, chief of staff, for "especially meritorious

and conspicuous service in supervising the supply of railway material and the organization of railway operation and construction troops."

## Revision of M. C. B. Loading Rules

The loading rules of the Master Car Builders' Association as revised for 1918 have been approved by the Railroad Administration and are now ready for distribution. Numerous changes have been made in the present volume. The size of the pages has been increased to 5¼ in. by 7½ in. in order to permit the use of larger and clearer cuts. The general rules for loading material have been grouped in the first section and following these are the complete instructions regarding the handling of various commodities. All the rules governing the loading of each commodity are grouped together so that it is not necessary to refer to various portions of the book. In case railroads desire to provide copies of the rules for shippers, any of the sections will be printed in pamphlet form by the association. The Car Service Section has issued a circular instructing the railroads to refer any questions regarding loading that may arise to the secretary of the M. C. B. Association.

## Employees to Be Paid by Check

The Pennsylvania Railroad, and other railroads that had not heretofore adopted the plan, will pay their employees by checks instead of by cash beginning with the month of February, except at some points where difficulty would be experienced by the employees in cashing checks. This plan has been adopted at the instance of the Railroad Administration in the interest of uniformity because most of the railroads have heretofore paid their employees by checks and because the employees favor the change as it will enable them to avoid the inconvenience of waiting for the pay car. The announcement of the change on the Pennsylvania caused a protest on the part of business interests of Altoona because it was proposed to pay in checks drawn on Philadelphia banks. When this was brought to the attention of the Railroad Administration, instructions were issued to have the employees at Altoona paid in checks on Altoona banks.

## Railway Supply Companies in War Work

Information concerning war activities has been received from the United States Light & Heat Corporation, Niagara Falls, N. Y., and the Commonwealth Steel Company, St. Louis, which was received too late to be included in the article on that subject published in the annual review number of the *Railway Age*. The United States Light & Heat Corporation devoted 75 per cent of its total plant capacity to war work and utilized 900 employees, representing 75 per cent of its forces, on that work. Parts for armored tanks constituted 60 per cent of the output of the company, parts for gas shells 8 per cent, parts for army trucks 1 per cent, parts for aeroplanes 1 per cent and parts for batteries 10 per cent. The buildings devoted to war work numbered 15. One new plant containing 17,000 sq. ft. of floor space and two additions to existing plants, representing 27,960 sq. ft. were built to provide facilities for war production. The output of peace time products was approximately 50 per cent of the average before the war.

The Commonwealth Steel Company, St. Louis, Mo., constructed tractor frames for tractors of various sizes, special trucks for gun cars and main castings for Pershing locomotives. Various additions to the company's plant facilities, such as the enlargement of foundry and core rooms and the installation of new machinery were necessitated by war demands.

War Contract Legislation

Proposed legislation to validate the so-called informal war contracts amounting to approximately \$1,750,000 is still in a shape unsatisfactory to the various committees of business men representing the manufacturers of war work material who have been in Washington in the effort to have Congress approve a measure which would at an early date supply a remedy for the uncertain conditions now existing. The Senate committee on military affairs has reported, as a substitute for the Dent bill passed by the House, the War Industries Board bill, but with a section giving the right of appeal from the decisions of the War Department to both the contractor interested and to the Department of Justice to a claims appeals commission. This, according to statements issued by Joseph H. DeFrees, chairman of the War Service Executive Committee, and by H. H. Dinneen, secretary of the Association of Manufacturers of War Materials, would open the way not only to delay in payment on informal contracts, but on formal contracts as well, of which the War Department now has full jurisdiction and which are being settled.

"Our interest," said Mr. Dinneen, "is in having a reasonably clear and adequate bill passed and passed quickly. The business of this country has no fear of any kind of an investigation, but it is unwilling that relief which is now imperative should be fettered with cumbersome provisions. Labor is going out by the thousand in all of the cities which rallied to the support of the government in the four Liberty Loans and within the next ten days thousands more will go out in these centers. Millions upon millions of dollars are tied up in war work. The government does not want war products, and in the present state of affairs the government cannot in many instances settle with contractors, hence the contractors cannot get out of war work for which the government has no use and cannot return to peace work. The consequence will be that labor will necessarily be unemployed until government adjustment is possible."

Revenues and Expenses for November

Railway operating expenses for the 11 months ending November 30, 1918, were over a billion dollars greater than for the corresponding period of 1917, according to the monthly bulletin of the Interstate Commerce Commission.

Railway operating income in November again fell short of the so-called standard return guaranteed to the railroads by the gov-

ernment, amounting to \$60,012,222, or \$258 per mile, as compared with \$78,914,790, or \$339 per mile in November, 1917, and \$378 per mile, the average for the month of November in the test years ending with June of 1915, 1916 and 1917. Operating revenues increased \$82,000,000, while expenses increased \$102,000,000, partly on account of back payments of increased wages.

For the 11 months ending November 30, the operating income was \$688,442,509, or \$253,000,000 less than for the corresponding period of 1917, and the net operating income was \$662,407,625, or \$248,000,000 less than for 1917. While the operating revenues for the period increased \$760,000,000, the operating expenses increased \$1,005,000,000, while taxes increased \$8,000,000. The commission's compilations, covering 180 Class I roads and 15 switching and terminal companies, are as shown in the table.

Central Railway Club

At the January 10 meeting of the Central Railway Club, V. C. Randolph, fuel supervisor, United States Railroad Administration, presented a paper on fuel conservation, showing moving pictures of good practices in firing and methods to be avoided, which were taken on the Minneapolis, St. Paul & Sault Ste. Marie.

Frank C. Pickard, master mechanic of the Delaware, Lackawanna & Western, was elected president of the club, and in commenting on the railroad situation he called attention to the work done by the government controlled railroads during the past year. There were 8,700,000 troops moved, with a maximum of 1,147,013 during the month of July. Throughout the year 20,897 troop trains, averaging 12 cars per train, were handled. In speaking of finding positions for the discharged military men he said: "There are a lot of people who have been pessimistic about finding employment for the returning soldiers, but personally I do not feel that way. Prior to the war 1,200,000 emigrants from European countries were brought into this country and our great industrial system absorbed them with hardly a ripple on the surface. We have got to do what we can in our local communities to start building. But little has been done during the past four years because of the material and the men which were needed elsewhere. We have not had time to repair the machines in our shops and our buildings have been neglected—all that will tend to create employment. Think of what the establishment of the eight-hour day will mean. That alone will

take thousands of men. One large system recently advertised for 8,500 men."

In addition to an Interchange Rules Committee of the club he suggested the formulation of a Locomotive Operation Committee, to be composed of road foremen of engines, or supervisors of locomotive operation as they are sometimes called; a Locomotive Shop Committee, to be composed of shop superintendents, general foremen, erecting shop foremen, machine foremen and gang foremen; a Car Shop Committee, composed of similar men, and a Transportation Committee, to be composed of superintendents, assistants, trainmasters, etc.

The report of the secretary-treasurer showed a balance of \$1,360.58, of which \$500 is invested in Liberty Bonds. The total number of members January 1 was 702, which with 74 new members added at the January meeting, makes a total of 776.

The following officers were elected for the ensuing year: President, Frank C. Pickard, master mechanic, D. L. & W.; vice-presidents, H. T. Malcolmson, superintendent, T. H. & B.; L. C. Fitzgerald, shop superintendent, Erie, and M. W. Hassett, master mechanic, New York Central. H. E. Myers, master mechanic, Lehigh Valley, was elected to the executive committee. The retiring president, W. H. Sitterly, general car inspector, Pennsylvania, was added to the list of past presidents, who are also members of the executive committee.

### Western Society of Engineers Elects Officers

The annual dinner of the Western Society of Engineers was held in the Hotel Sherman, Chicago, on January 22. At this meeting the announcement was made of the election of A. S. Baldwin, vice-president of the Illinois Central, as president of the society; Kempster B. Miller, consulting engineer, first vice-president; William M. Kinney, general manager of the Portland Cement Association, second vice-president; J. L. Hecht, mechanical engineer of the Public Service Company of Northern Illinois, third vice-president, and C. R. Dart, chief bridge engineer of the Sanitary District of Chicago, treasurer, and E. T. Howson, western editor of the *Railway Age*, trustee. The election of the following chairmen of sections was also announced: Electrical Engineering Section, J. R. Cravath, consulting engineer; Bridge and Structural Engineering Section, G. A. Haggander, bridge engineer, Chicago, Burlington & Quincy; Hydraulic, Sanitary and Municipal Engineering Section, Linn White, chief engineer of the South Park board, Chicago; Mechanical Engineering Section, Fred J. Postel, supervising engineer of the Department of Public Works and Buildings of the state of Illinois, and Gas Engineering Section, H. H. Clark, engineer of the Public Service Company of Northern Illinois.

### Railway Business Association

President Alba B. Johnson of the Railway Business Association has announced the completion of the general executive committee for the current year. The committee consists of the president and vice-presidents, who were elected at the annual meeting and have already been announced, and 27 executive members, a third of whose terms expire annually. The nine appointments for three years ending January, 1922, are as follows:

W. E. Clow, president, James B. Clow & Sons, Chicago.

W. H. Cottingham, president, Sherwin-Williams Co. Cleveland.

Howard A. Gray, manager, railroad sales department, Joseph T. Ryerson & Son, Chicago.

E. J. Kearney, secretary and treasurer, Kearney & Trecker Co., Milwaukee.

E. B. Leigh, president, Chicago Railway Equipment Co., Chicago.

Herbert I. Lord, Detroit Lubricator Co., Detroit.

Burton W. Mudge, president, Mudge & Co., Chicago.

W. G. Pearce, president, American Brake Shoe & Foundry Co., New York.

W. E. Sharp, president, Grip Nut Co., Chicago.

The appointments of the standing committees will be announced later.

## Traffic News

The Southern Pine Association will hold its annual meeting at the Hotel Grunewald, New Orleans, La., on February 25 and 26.

The Panama Railroad Company has issued Freight Tariff No. 30 which gives class and commodity rates from New York to Central American and Mexican ports.

The Traffic Club of Chicago held a smoker and vaudeville in its club rooms at the La Salle Hotel on January 23. Samuel O. Dunn, editor of the *Railway Age*, who recently returned from Europe, delivered an address concerning his trip abroad, which dealt largely with European railroad conditions.

### More Sleeping-Car Lines to the South

Seven more of the sleeping car lines to the South are to be at once restored; these are in addition to the 15 through lines restored on January 1. The new lines are: Pennsylvania Railroad, leaving New York at 8:08 a. m., a car to Key West via the Atlantic Coast Line. Pennsylvania Railroad, leaving New York at 2:04 p. m., a car between New York and Pinehurst via the Seaboard Air Line. Additional cars between New York and Palm Beach via the Seaboard Air Line, as well as cars between New York and Augusta, Aiken and Asheville via the Southern Railroad, will leave New York at 1:12 p. m. An additional car will also be run between New York and Atlanta via the Southern Railroad, leaving New York at 3:38 p. m. Corresponding additional sleeping car lines will be run northward.

The cars from White Sulphur Springs and Hot Springs over the Chesapeake & Ohio, and the New Orleans car via the Southern and Norfolk & Western which now run north of Washington over the Baltimore & Ohio are to be transferred to the Pennsylvania Railroad train leaving Washington at 9:05 a. m.

### Entraining and Detraining (With Abbreviated Trains) in New Jersey

Tight skirts on women passengers have upset schedules on the railroads only slightly less than a blizzard. The Pennsylvania, which reduces all that has to do with the operation of trains to a scientific accuracy, has found that since the women have begun wearing tight skirts the average train stop is seventeen seconds longer than when skirts were short and loose.

Taking or leaving a train anywhere is no easy task for the tight-skirted woman, but in New Jersey it is serious business, for trains are equipped largely with old Pullmans converted into day coaches. Formerly a porter put a stool under the bottom step, but there is no stool or porter now and the women have to fairly throw themselves into the arms of the brakemen in detraining. In entraining the situation is even worse.—*Philadelphia North American*.

### City Drays Only 10 Per Cent Efficient

Ten trucks are needed to do the work of one in lower Manhattan, thereby overcrowding the streets tenfold. This is shown by a "time study" made by the engineering staff of the New York-New Jersey Port and Harbor Development Commission. A two-horse truck operating from a lower West Side dry goods store, delivering both from and to the store, was taken as typical. An engineer for the commission stayed with this truck six days, recording routes and distances covered, loading on each trip, time consumed in transit, loading, unloading and waiting in line at piers and other points.

During the week the truck often carried light loads or traveled empty; waited at the store for orders at piers for the

chance to load or unload; made repeated trips to the same point without carrying full loads; and on the streets was constantly held up by other trucks similarly underworked. Its loads while it was loaded averaged 60 per cent of capacity, but half the time it moved empty. It traveled 28 miles in all, making only one mile the fourth day. Of 46½ hours it was out it was idle 22½ hours, loading or unloading 11½ hours and moving only 12½ hours.

This means, says the report, that three trucks fully loaded all the time could with the same delay have done as much as ten were doing. With the idle time eliminated and loading and unloading time reduced to the lowest terms, one truck could do the work of the three. If there are 1,000 trucks of this type and 900 are unnecessary, the commission estimates that the annual waste is about \$2,000,000.—*New York Journal of Commerce*.

### New Body To Promote Foreign Trade

The Mississippi Valley Foreign Trade Convention, held at New Orleans, La., on the 13th and 14th, as announced in the *Railway Age* of January 10, resulted in the organization of the Mississippi Valley Association, the first annual meeting of which is scheduled to take place at Chicago in April in conjunction with the convention of the National Foreign Trade Council. The new association, which represents manufacturing, trade and banking interests in 20 states which constitute the heart of this country, proposes to advance the welfare of the Mississippi Valley in all matters pertaining to commerce, industry and finance, with an aggressive program for the development of foreign trade as a primary objective. It also has as one of its main purposes the development of domestic trade along north and south lines, both water and rail, to relieve the congestion of east-and-west avenues of traffic.

The officers of the association, elected to serve until the first annual meeting in Chicago, are: President, John M. Parker, Federal Food Administrator, New Orleans; treasurer, R. S. Hecht, president of the Hibernian Bank of New Orleans, and secretary, A. E. Pradillo, foreign trade manager of the New Orleans Association of Commerce. Eleven committees were appointed to carry out the purposes of the organization.

In its declaration of principles, the Mississippi Valley Association recommended the adjustment of freight relationships, parities, differentials and divisions to permit nature's economics to assist in the development of the north-and-south channels of trade and the use of the Gulf ports wherever they can best serve the needs of the Valley. To this end the Federal Government was petitioned to assign vessels to give adequate and regular service between Gulf ports and markets of the Valley and to adjust ocean freight rates to and from Mexico, the West Indies and other Latin American countries so as to give shippers through gulf ports the relative rates to which their geographical position naturally entitles them. The merchant marine, Mississippi Valley waterways development, the establishment of free ports, and the extension of the Federal reserve banking system in foreign countries in the interests of foreign trade were also endorsed.

**ARMOUR REFRIGERATOR CARS IN BRAZIL.**—The Armour plant at Santa Anna, Brazil, for which Montevideo is to serve as a shipping point, is already in operation, and will, when completed, have a capacity of from 1,000 to 1,500 head of cattle per day. For the transportation of its products to Montevideo a contract has been signed with the Central Uruguay Railway, which fixes rates for 10 years. Meat will be carried in 75 refrigerator cars, which are to be built at the expense of Armour & Co. in the railway shops at Peñarol, near Montevideo. Standardized parts for these cars will be imported from the United States. The cars are to be the property of the railway, which will gradually amortize their cost to the Armour company during a period of 10 years. The run from the Santa Anna plant to the cold storage plant at Montevideo will require about 17 hours. Tracks will be laid to the Montevideo plant and meat will be unloaded directly from railway cars to the plant. The latter is, in turn, situated at the dock, so that meat can be loaded directly on ocean steamers.—*Commerce Reports*.

## Commission and Court News

### Interstate Commerce Commission

The Commission held a hearing last week on the question as to whether the net operating income of the Pullman Company to be certified by the Interstate Commerce Commission as a basis for its income during the period of federal control should include an item of \$333,807, representing the average income of the Northern Pacific from sleeping cars operated under a partnership agreement by the railroad and the Pullman Company. The cars were sold to the Pullman Company on April 1, 1917. The Pullman Company claims extra compensation because of its ownership of property whose earnings were not included in its income during the test period. This also involved a question whether there should be a corresponding reduction in the compensation of the Northern Pacific, which has already been fixed and the contract signed. The Northern Pacific argued that whatever the decision on the Pullman Company's claim, its own compensation should not be reduced because, while its compensation represents the earnings of property not now held by the road, the commission cannot make a correction in its net income which was properly accounted for, and because it had not been allowed its claim for extra compensation amounting to seven million dollars for property acquired since the expiration of the test period.

### Court News

The Supreme Court of South Dakota has issued a temporary injunction prohibiting the American Railway Express Company from putting into effect new express rates ordered by the Director General of Railroads.

### Application of General Orders Limited

In an opinion delivered recently by Judge D. J. Munger, in the United States district court at Lincoln, Neb., it was held that the application of General Orders 18 and 18-A of the director general of railroads was limited by Section 10 of the Federal Control Act, which provides that the laws then existing governing the relationship of the railways as common carriers would remain in effect except when they were inconsistent with the terms of that act or of other acts applicable to federal control or with an order of the president.

The plaintiff, in the case decided by Judge Munger, was injured on the Chicago, Rock Island & Pacific in the state of Kansas and brought suit for damages against the railway company in the state of Nebraska. General Orders 18 and 18-A provide that all suits against carriers while under federal control must be brought in the county or district where the plaintiff resided at the time of the accrual of the cause of action or in the county or district where the cause of action arose. Inasmuch as the plaintiff resided in Kansas at the time of the accident and his injuries were received in that state, the defendant argued that his suit should have been brought there. The opinion of the court, however, was that orders of the president relating to the carriers' duties and liabilities other than as common carriers, were not authorized by Section 10 of the Federal Control Act. The cause of action in the case at hand was not one arising against the railroad company as a common carrier but involved laws relating to it merely as a corporation.

The opinion of Judge Munger is contrary to that of United States Judge Jacob Trieber, of the Eastern District of Arkansas, sitting in the Eastern Division of the Eastern District of Missouri, and delivered some months ago. In this case, the facts of which are similar to those of the one argued before Judge Munger, it was held that there is nothing in the general orders of the director general which deprives the plaintiff of his right to maintain an action against the defendant, but for reasons of public necessity in a time of war, restrictions on the manner of bringing suit were made which, in the opinion of the president and the director general, were necessary to prevent seri-

ous interference with the physical operation of the railroads in the prosecution of the war. He stated that the act and the general orders may well be sustained upon the ground that the welfare of the people is the paramount law.—*Friesen v. Chicago, Rock Island & Pacific Railway Company.*

### Crossing Accidents—Contributory Negligence

The South Carolina Supreme Court holds that where it appeared that an automobilist would have run into the side of a train through his own fault regardless of whether there were gates or a watchman at a crossing, he cannot recover, even though the railroad was negligent in not having a watchman or gates.—*Gilson v. Atlantic Coast Line (S. Car.)* 96 S. E. 519. Decided July 20, 1918.

### Claim for Damages to Shipments

The Illinois Appellate Division holds that the receipt and investigation of a claim for damages by a railroad after the expiration of the four months after delivery limited in the bill of lading for presenting it does not constitute a waiver of the defense afforded by the provision, especially where the claim does not give the date when the shipment was received.—*Pennsylvania v. Piorwaty*, 207 Ill. App. 176.

## United States Supreme Court

The Supreme Court of the United States on January 20, in a decision in a suit begun by the Baltimore & Ohio, held that the Interstate Commerce law, as amended in 1910, does not prohibit the free exchange of utility service between telegraph and telephone companies and railroad companies, even where service from one line to points on another is involved.

The decision sustains the lower court in setting aside Interstate Commerce Commission rulings of March 28, 1916, which held that such service must be paid for by each party on the basis of the published tariff rates.

The proceedings originally were instituted by the Baltimore & Ohio against the Western Union Telegraph Company; the Chicago, Great Western against the Postal Telegraph and Cable Company, and the Postal Company against the Tonopah & Tidewater Railroad, to compel compliance with the provisions of certain contracts which involved exchange of service which the commission had prohibited.

### Application of Carmack Amendment Act

In June, 1900, the Missouri, Kansas & Texas issued bills of lading to shipper's order covering 27 carloads of grain to be shipped from Kansas City, Missouri, to Galveston. No grain was in fact delivered to it for shipment; but before the fraud was discovered, the alleged shipper transferred the bills of lading to Hutchings, Sealy & Co., who made advances on them. The advances were not fully repaid, and in 1905 they brought suit against the railroad in a state district court of Kansas. The railroad defended on the ground that since the bills of lading had been delivered in Missouri, the transaction was governed by the Missouri law and that under that law the railroad was not liable. For more than eight years the record in the case contained no suggestion of a federal question, the case having meanwhile been passed upon twice by the Supreme Court of Kansas (*M., K. & T. v. Hutchings*, 78 Kan. 758; *Hutchings v. M., K. & T.*, 84 Kan. 479). Thereafter, in 1913, the railroad presented the claim that the transaction was governed by the federal law; and that, by it, the defendant was not liable. The Supreme Court of Kansas, apparently as a matter of state practice, declared that the contention came too late to be considered; and entered judgment for the plaintiff (98 Kan. 225).

The Supreme Court of the United States holds that the federal question was not seasonably raised; and that it is also unsubstantial. Prior to the Carmack Amendment the rights of the parties were governed by state law; and the Carmack Amendment does not apply, as the cause of action, if any, arose six years before the passage of that act.—*M., K. & T. v. Sealy*. Decided January 7, 1919.

## Foreign Railway News

The Jamaica legislature is reported to have voted \$250,000 for the purchase of railway and other material in France and elsewhere, which may be available as a result of the cessation of the war.

The Chilean Congress has voted \$60,000 for the preparation of plans for the construction of an extension of the Transandine Railway from its terminus at Los Andes to Santiago, which will greatly shorten the distance between these two places.

Figures recently compiled by the British Department of Labor show that there were in Great Britain at the end of 1917 seven unions in the railway transport field. These had a total membership at that time of 498,263, showing an increase of 17.2 per cent over the figure of 424,960 at the end of 1916.

Japanese iron and steel manufacturing stimulated by the war (says a Japanese contemporary) made recently a tremendous progress and development. The necessity of self-support in iron and steel is now completely realized by both the government and the people, and the government giving material assistance encourages the rise of steel industry in Japan. According to the report of the Department of Agriculture and Commerce the private organizations engaged in iron and steel manufacturing at the end of June, 1918, is figured at 247, and the capital invested is estimated to be about \$175,000,000. This means that since the outbreak of war capital investment in the Japanese steel industry is more than tripled.

Railway-owned freight cars in the United Kingdom were, before they were put into common user, as it is called, returned to their owners in due course; records being taken by the Railway Clearing House as they went off and returned to the owning line. Under common user this became unnecessary, as the freight cars are somewhere or other in the country. With the introduction of the English Channel train ferry, freight cars go to France, whence they may not return. So that there may be no loss, the number of every such car is taken by the Clearing House, also particulars of the consignment and to whom addressed. No effort is, however, made to follow its journeys in France; it suffices to record its return when it comes back.

Railway matters in what was once Austria-Hungary and is now no one precisely knows what may be most simply described as confusion worse confounded, says a correspondent writing from Berne, Switzerland, to the Railway Gazette (London). A record of accidents, robberies, more and more restricted time-tables, and a rolling stock and officials obviously incapable of performing the tasks devolving upon them. In Hungary matters seem no better than in Austria, and owing to the crowds of returning soldiers, repatriating themselves apparently without any sort of order being maintained or anyone being present to say when a train is carrying its full complement of travelers and no more persons must go on board it, an already very bad state of things has become of late still worse.

The State Railways of Siam are suffering from a severe shortage of rolling stock and railway construction material on both the Northern and Southern lines, says a recent American consular report from Bangkok. On each of these lines passenger fares were raised 20 per cent, due to the advance in prices of railway material received from abroad and to increased maintenance expenses. Imports of this material in Siam have almost ceased during the last two years. The official customs returns for the fiscal year ended March 31, 1918, quoted by the consul show that Siam imported "railway material" during the year to the value of only \$11,411, as compared with \$137,183 in the year ended March 31, 1917, and \$590,464 in 1913-14. "Railway cars, trucks, etc.,"

were imported to the value of \$24,964 in 1917-18; \$92,487 in 1916-17, and \$84,873 in 1913-14. Locomotives were not separately shown.

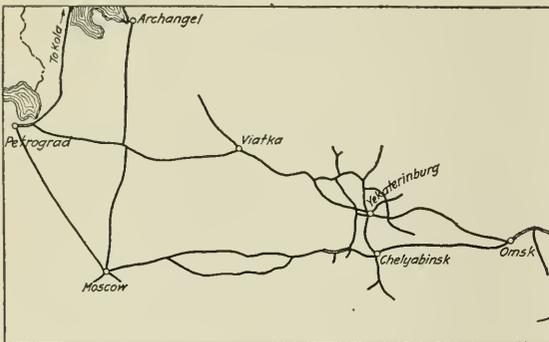

**Railway Strike in Cuba**

Telegraphers, conductors, agents and brakemen of the United Railways of Havana, Cuba, struck on January 16 to enforce demands for increased wages and betterment of working conditions, but returned to work Wednesday of this week, following intervention of President Menocal. News despatches say that the men received an increase in wages and recognition of their union.

**Allied Control of the Trans-Siberian**

The agreement for Allied control of the Trans-Siberian Railway, says a despatch from Vladivostok, dated Monday, gives the Americans control of the line from Porgranichana to Omsk, a distance of 3,000 miles; the British will have charge of the line from Omsk to the fighting front; the French will control the Khabarovsk line and the Japanese the line from Blagovistchensk to Chita.

The administrative positions are to be filled by Russians and Americans in equal numbers. There are to be Russians only on the working staff. John F. Stevens, head of the American Railway Commission to Russia, is to be chief administrator of the railway, with the Russian General Horvath as co-director. Americans are to guard the line. Cars and

**The Trans-Siberian and Its Connections**

The Trans-Siberian is operated in normal times in a number of sections as follows: The Omsk Railway, from Yekaterinburg (which is in Russia) to Omsk, Yekaterinburg to Chelyabinsk, Chelyabinsk to Novonikolaievsk (the second junction point shown on the map east of Omsk); the Tomsk Railway, from Novonikolaievsk to a point near Irkutsk, and the Trans-Baikal eastward to the Manchurian frontier. The line across Manchuria to Vladivostok is known as the Chinese Eastern. The Amur Railway is the more northern line from a point east of Chita to Khabarovka or Khabarovsk, which was built to furnish a route entirely in Russian territory. The line from Khabarovsk to the junction with the Chinese Eastern north of Vladivostok is known as the Ussuri Railway. The Altai Railway runs from Novonikolaievsk south to Semipalatinsk.

engines are being supplied from the United States, the despatch continues. Great workshops are being opened in Vladivostok, and every effort is to be made to speed up operations.

An Associated Press despatch from Vladivostok, Tuesday, said that satisfaction with the arrangement for operating the Trans-Siberian had been officially expressed by the Omsk government, which has emphasized its readiness to assist Mr. Stevens to its utmost.

Associated Press despatches from Tokio on Tuesday, also, indicate a degree of dissatisfaction with the arrangement on the part of the Japanese. In the lower house of the Japanese parliament today, the despatch said, the opposition interpellated the government concerning control of the railways in Siberia. The interpellation asserted that Japan was the leading power in the Orient and that joint control of the Chinese Eastern and Trans-Siberian Railways disregards Japan's special position, and that practical control of the railways by Americans affronted the dignity of Japan, considering Japan's greater military effort in Siberia.

Viscount Uchida, the foreign minister, in reply, said the ques-

tion of control of the railways was yet undecided and it was impossible to publish details. He added that the attitude of the United States throughout the negotiations was most friendly toward Japan.

**The Locomotive Problem in South Africa**

JOHANNESBURG.

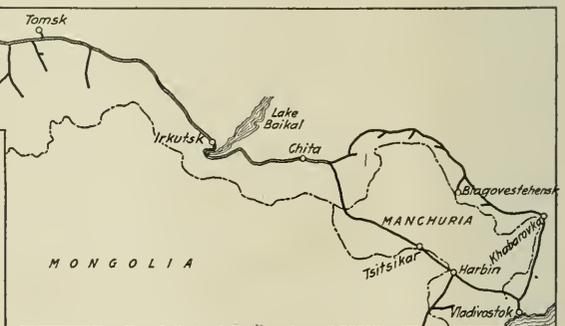

One of the outstanding difficulties the Administration of the South African Railways has had to meet as a result of the war has been that of motive power. The difficulty, under war conditions, of keeping locomotives in order has been especially acute in a country like South Africa, which has been accustomed to depend largely on oversea sources for its rolling stock and locomotives. However, by improving water supplies, and by resorting to various expedients, the Administration has succeeded in keeping about 75 per cent of its locomotives in commission.

The following figures showing the number of new engines, freight and passenger cars which have been placed in service on the South African railways from January 1, 1914, to October 31, 1917, will indicate what steps the Administration took to keep up its supply of equipment.

	Locomotives	Passenger train cars	Freight train cars
1914 .....	95	155	1,193
1915 .....	94	85	1,628
1916 .....	15	67	1,132
1917 .....	19	18	194

The following engines and cars were still on order or authorized on October 31, 1917: Locomotives, 143; tenders, 24; passenger cars, 238; freight cars, 2,471.

Unfortunately since the outbreak of the European war it has been practically impossible to obtain new engines and rolling stock from Great Britain, and orders which were accepted prior to and shortly after the commencement of hostilities are either proceeding very slowly or have been postponed indefinitely, and there appears very little prospect of delivery being obtained of a large proportion of the engines and stock until after peace is proclaimed. In view of these difficulties and the necessity for meeting the requirements in new rolling stock orders for 38 large locomotives were placed in America, delivery of which was due

about June, 1918. Everything possible, however, is being done to meet the requirements of traffic.

**Italian Railroads Carried 1,500,000 Men a Month.**

A review of the work accomplished by the railroads in Italy during the war, shows that during the period of mobilization about 90,000 cars were used monthly, and on the Venetian lines at times there were as many as 380 trains a day in use. In 39 months of warfare there were transported 27,000,000 men and 6,000,000 cars of merchandise for military use. In a record month there were transported 1,500,000 men and 220,000 cars of freight. These figures are exclusive of the regular train services which were maintained. On certain lines, by skilful operation, it was possible to move 150 trains a day, to receive as many as 400 trains a day in certain stations, and on the lines in the Venetian district at times there were 500 trains a day running.

The service done by the railroads in Italy is all the more remarkable, says the Italian News Bureau, when the serious handicap, because of the many men who left to join the mili-

tary forces, is considered. In all, 13,000 railroad employees left for military service; 507 of them have been killed in combat and 116 either are unaccounted for at sea or died in prison camps.

### Motive Power Shortage of the Malay States

The report of the operations of the railways of the Federated Malay States for 1917, recently issued by the general secretary shows that that system is another of those which has suffered severely from a shortage of locomotives and repair parts during the year in question.

The total train mileage was 3,491,741, an increase of 65,809. The number of passengers carried was 12,037,941, a decrease of 2,703,125. Freight traffic increased by 26,373 tons, the total carried being 1,293,404 tons. Live stock increased by 22,382 head, the number carried being 144,809. The falling off in passenger traffic was due to the increase of fares, which had effect from March 1, 1917. Passenger traffic had been increasing to such an extent that the department was unable to cope with it. The number of trains could not be increased owing to the impossibility of obtaining more locomotives. Some of the engines ordered from England, which it is understood were completed to the extent of 80 per cent., could not be delivered, and attempts to secure them from foreign countries were unsuccessful. The engine difficulty was not entirely due to the shortage of engines. There was also a great difficulty in obtaining materials for repairs to locomotives. Freight traffic, however, was fully maintained by the restriction of passenger traffic.

During the year the railway system of the Federated Malay States was linked up with the Siamese system, so that it is now possible to make the journey overland from Penang or Singapore to Bangkok, the capital of Siam.

### Railway Notes from China

Special Correspondence from Peking (delayed)

Considerable satisfaction is felt with the mandate appointing Hsuing Shi Ling, former premier and latterly special commissioner in charge of flood conservancy, as director-general of the Grand Canal reconstruction project. This is a joint undertaking of the American firm of Siems, Carey & Company with Japanese investors. Of the \$12,000,000 loan some \$500,000 was advanced several days ago, and the work of culling from the voluminous reports which have been accumulated on this subject during the past 200 years the essential data applicable to present conditions will be commenced shortly. Although the Grand Canal parallels the Tientsin Pukow line at places, it is believed that the improved canal will act as a feeder to the railroad rather than as a competitor. That is the direction which the traffic on other waterways is beginning to take.

\* \* \*

On July 15 were held the closing ceremonies of the First General Traffic Conference of the Chinese Government railways. The conference had been in session for three weeks. It was composed of two members from each of the fifteen lines now in the government system, together with representatives from the ministry of communications. This conference was held in furtherance of the idea of unifying operating and traffic rules much after the same fashion as the accounting classifications had been unified. While each of the lines built with foreign capital originally represented interests essentially competitive, if not hostile to each of the others, there is a disposition now even on the part of the foreign influence represented on these lines to co-operate with the Chinese Government conservatively in the welding of the separate lines into an actual government system. While a great many subjects of interest more academic than practical took up considerable time at the conference, two important decisions were reached. One of these is for a bureau to be created in the ministry of communications for the supervision of inter-line traffic. The other is regarding a scheme which looks toward the ultimate pooling of rolling stock. In the effort to relieve in part the present car shortage the ministry proposed to poll all of the present stock. This aroused strong opposition from the lines with relatively adequate supplies of cars. Since inter-line business at present comprises well under 10 per cent of the total business, these lines

were able to make out a very persuasive case against the loss of their equipment to lines which had not been so forehanded. Hence the compromise was hit upon of permitting the ministry to purchase future orders as far as it might wish and be able to do so, these new cars to be held in a central pool and be used by the individual lines for through business and locally, as deemed expedient. The rental to be paid the ministry and the regulations for interchange, inspection and repair are yet to be formulated. Acting upon this plan, the present mortgage securities remain untouched, the control of each individual management over cars in strictly local service remains unimpaired, but with the increase of business the ministry is in a position to assume control of this important function which bears so heavily on the subject of regaining Chinese control over enterprises within what have been looked upon as foreign spheres of influence.

### The Damage to Belgian Railways

A special correspondent of the Times (London) gave recently some interesting details of the damage done by the Germans to the Belgian railways. He also said, however, that things were so far restored when he wrote that three trains were running daily each way between Ostend and Bruges.

"The most extraordinary triumph, however, of Belgian grit and the resourceful skill of the army railway engineers," he said, "is the establishment of a single-track connection with Bruges and Brussels via Eecloo, Ghent, Termonde and Malines. Throughout the greater part of this route, especially the Eecloo-Termonde section, the permanent way, sidings, culverts, bridges, signals, station buildings, and other railway works have been wrecked out of all recognition by the retreating Germans. A clue to the method by which this devastation was wrought may be seen in the large unexploded land mines lying singly or in pairs in the ditches and hedges every 50 or 100 yards along the easternmost sections of the track. Some are rusty and mud-covered; others still preserve their grey war paint, with green and black lettering. As these lie most thickly just before Termonde, many were probably dug up again by the Germans themselves after the conclusion of the armistice.

"But from Eecloo through Ghent, especially the important suburbs of Ghentbrugge and Ledeburg, to Schellebelle, where the lines to Termonde and Alost diverge, the mines have done their work with an effective, in many cases with a malevolent destructiveness which is hard to parallel anywhere in the war area. The whole permanent way is rent and pitted, the rails are broken and splintered like rotten wood, or twisted like wire into every imaginable contortion, in some places sticking upright, in others sprawling apart, and in others again flung into the adjoining fields. The tall iron lattice-work signal masts have fallen on the tracks all bent and broken, and the equally tall iron electric light standards have also been brought down everywhere, while for long sections the double telegraph poles have been felled with some instrument of precision. The whole track is littered with shattered fishplates, tieplates, nuts, bolts, screws, insulators, and seemingly inextricable festoons of wire. Signal-boxes, engine-houses and goods depots are either reduced to heaps of powdered brick or mere sieves. The bridges over the Scheldt and other rivers and canals for the most part lie in broken sections in the water, whence they emerge endwise, while the overhead road bridges have subsided bodily across the track, and in some cases the macadam roadway dips down at an angle of about 45 deg.

"Through this pathless waste, working day and night, the Belgian Engineers have carried their single track to Bruges and Brussels. . . . The success of this plucky experiment, coupled with the equally successful reopening of the connection with Paris, deserves every commendation. It is satisfactory to learn that German prisoners are being sent to the Yser district to work on the railway, and it is hoped that their labor will be largely employed wherever else the German genius for destruction has been active. In view of the well-known German propensities, the strictest inquiry should be made into the plea of 'military necessity' behind which German destruction of the Belgian railways is cloaked."

## Equipment and Supplies

In the *Railway Age* of December 27, page 1175, there was a statement to the effect that part of the firedoors for the latest order for 600 locomotives for the Railroad Administration would be ordered from the National Railway Devices Company. More recent advices are to the effect that all of the firedoors for this order will be obtained from that company instead of only a part. The National Railway Devices Company also furnished a part of the firedoors for the U. S. standard heavy Mikado type locomotives ordered by the government in its first orders of 1,430 standard locomotives. This will correct the table showing the list of Specialties for Standard Cars and Locomotives in the Annual Statistical Number of the *Railway Age*, page 91.

### Locomotive Deliveries

The following locomotives were shipped to railroads under federal control during the week ending January 11:

Works	Road	Number	Type
American	Oregon Short Line.....	10	USRA Mikado
	Belt Ry. of Chicago.....	5	USRA Santa Fe
	Seaboard Air Line.....	2	USRA 6-w. Sw.
	Union Pacific.....	4	USRA 6-w. Sw.
	Boston & Albany.....	5	USRA Santa Fe
	Chicago & N. W.....	3	Mikado
	Mobile & Ohio.....	2	USRA 6-w. Sw.
Total.....		31	
Lima	New York Central.....	3	USRA Mikado
Baldwin	Great Northern.....	2	Mikado
	A. T. & S. F.....	1	Mikado
	Baltimore & Ohio.....	4	USRA Mikado
	Atlantic Coast Line.....	1	Mikado
	Philadelphia & R.....	1	Mallet
	Lehigh Valley.....	1	Consol. Pacific
Total.....		11	
Grand total.....		45	

\*Five U. S. R. A. Mikados, constructed for the Oregon Short Line, were shipped to Cleveland, Ohio, to be stored as part of an emergency pool.

### Freight Cars

THE AMERICAN RAILWAY EQUIPMENT COMPANY, Pittsburgh, Pa., is inquiring for 25 steel 50-ton gondola cars.

THE NATIONAL ANILINE & CHEMICAL COMPANY, INC., Marcus Hook, Pa., is inquiring for one 50-ton hopper car and for one 40-ton gondola car.

RURAL RAILWAYS PLANNED FOR ENGLAND.—The Ministry of Reconstruction, according to the London Daily Mail, is embarking upon a great scheme of rural development by the construction of a large number of light railways to connect the country districts with the main railways. The cost will be borne in part by the county authorities and in part by the government. Upon completion the lines will be leased to the operating companies under adequate guarantees. Enormous quantities of material used by the British army in France will be utilized, reducing the cost of construction to about \$12,000 a mile. The first rural railway has been begun at Giggleswick, Yorkshire.

PARIS-PIRAEUS TRAIN SERVICE.—Plans are taking shape for the inauguration in May, 1919, of a through train from Paris to Athens, and on to Piraeus, the port of Athens, about seven miles away. This train will leave Paris at noon on Saturdays and will proceed via Milan, Venice, Trieste, Agram, Belgrade, Nish, Skopja, Platy, and Larissa, arriving in Athens Tuesday morning. It will carry Anglo-Indian and other far eastern mails and passengers, and will in this way vastly increase the importance of the port of Piraeus, which in future will be the starting place of steamers for the Far East, in place of Brindisi and other Italian ports. It will be difficult to overestimate the salutary political and commercial results of this train, which will from one viewpoint have the effect of bringing Greece hundreds of miles nearer Western Europe in distance and several days nearer in time.—*Commerce Reports.*

## Supply Trade News

The Aspromet Company, Pittsburgh, Pa., announces the opening of a sales office in the Schmulbach building, Wheeling, W. Va. The new office is under the direction of E. A. Short.

Harry F. Worden, sales manager of the Bryant Zinc Company, with headquarters at Chicago, died in that city on January 14, after a short illness brought on by an attack of acute indigestion.

E. Logan Hill, secretary of the United States Shipping Board Commission on Port and Harbor Facilities, has resigned and become associated with Heyl & Patterson, Incorporated, contracting engineers, Pittsburgh, Pa. Previous to his appointment as an officer of the Shipping Board, Mr. Hill was assistant general manager of the Erie Railroad. He will be located at the Heyl & Patterson, Incorporated, New York sales office, 90 West street, which is particularly interested in the application of the company's cranes to wharves, cargo handling and other special purposes.

Ten million dollars' worth of equipment owned by the United States Spruce Production Corporation, with headquarters in Portland, Ore., is to be sold, and sealed bids for it will be received up to and including February 15. The equipment, which consists of everything from picks and shovels to complete railroads and mills, is in excellent condition and much of it was never used because of the abrupt ending of the war. The equipment has been stored at Vancouver, Wash., where it may be inspected on application to the Sales Board, which has its offices in the Yeon Building, Portland, Ore.

E. D. Jackson, formerly assistant to the chief engineer of the Baltimore and Ohio, has been appointed general manager of the Chipman Chemical Engineering Company, Inc.,

E. D. Jackson

New York. Mr. Jackson entered the service of the Baltimore and Ohio in January, 1903, as a rodman on the Pittsburgh division and remained in the employ of that company until December 15, 1918, when he resigned to accept his new position. Mr. Jackson was born in Front Royal, Va., July 1, 1882, and was educated in the public schools of that town and at the Virginia Military Institute at Lexington, Va., from which he graduated in the course of civil engineering in 1902. With the Baltimore & Ohio he filled the various positions on the engineering corps to that of assistant division engineer while at Pittsburgh, from which he was transferred to Baltimore to the office of the assistant engineer. In 1909 he was appointed division engineer of the Chicago division, with headquarters at Garrett, Ind., remaining there until early in 1910, when he was again transferred to Baltimore in the capacity of assistant engineer in the office of the general manager, having charge of the development of the standard track work system. In 1913 he was transferred to the Philadelphia division as division engineer, and in 1914 returned to Baltimore as assistant to the engineer maintenance of way and later as assistant to the general superintendent of maintenance of way and structures.

### Automatic Straight Air Brake Company

Automatic straight air brake equipment, developed by the Automatic Straight Air Brake Company, New York, is now being manufactured by the American Car & Foundry Company, for both passenger and freight cars. It is reported that within 60 days the installation of these brakes will begin on freight and passenger cars in regular service.

In the annual report of the Bureau of Safety of the Interstate Commerce Commission, the following reference is made to the Bureau's tests of the A. S. A. equipment, a part of which were described in the *Railway Age* of July 26, 1918, page 173:

"The automatic straight air-brake system mentioned in last year's report, which was submitted by the Automatic Straight Air Brake Company, New York, N. Y., has been subjected to thorough tests during the year. The brake apparatus was first installed on a 100-car test rack in New York City and an elaborate series of tests was made. These tests demonstrated that the apparatus was sufficiently developed to warrant its trial under service conditions on a road having heavy traffic and mountain grades, and after the rack tests had been completed the brake apparatus was installed on 100 steel hopper cars on the Virginian Railway. These cars were loaded with coal. Standing and running tests were made with trains of 50 cars and 100 cars each, various arrangements of cars equipped with the present types of brakes and the new brake apparatus being used in these trains.

"The purpose of these tests was twofold; namely, to determine whether the automatic straight air-brake apparatus would operate synchronously with brake apparatus in common use and to determine whether the new brake could be depended upon properly to control long trains on heavy grades as well as in general service. In these tests synchronous action with brake apparatus now in common use was obtained under a number of varied conditions and circumstances, and the flexibility of the system in controlling long trains, as well as smooth operation and the absence of severe shocks, were amply demonstrated. Many of the intended functions of the brake were substantially accomplished. The more important of these are (1) providing uniform brake cylinder pressure, irrespective of piston travel; (2) compensating for brake cylinder and brake pipe leaks; (3) greater availability of the emergency feature; (4) a graduated release feature, permitting flexibility of control; and (5) prompt serial action both upon application and in release."

### Trade Publications

**SMALL TOOLS.**—Catalogue No. 40, listing taps, dies, screw plates and reamers manufactured by the Greenfield Tap & Die Corporation, Greenfield, Mass., has been issued by this company. It contains 288 pages in which sizes, prices, dimensions and illustrations are given in convenient form.

**STEAM MINE HOISTS.**—The Lidgerwood Manufacturing Company, New York, has issued Bulletin No. 19 containing 32 pages descriptive of the line of steam mine hoists manufactured by that company. Two pages are devoted to general specifications and all of the others to illustrations, descriptions and tables of sizes, weights and dimensions of individual types of this equipment.

**TOOL STEELS.**—The Carnegie Steel Company, Pittsburgh, Pa., is now offering to the trade a new line of carbon tool steels made in five grades containing different proportions of carbon, which are intended for utilization in the manufacture of tools where heretofore alloy steels have been used. A catalogue has been issued describing these steels and presenting practical information for the steel user without going into an extended discussion of the theories of heat treatment. It contains a chart in colors of heat and temper colors which is a direct reproduction by color photography from test pieces heat treated to the temperatures shown. It affords a direct comparison by the blacksmith in the shop whereby it is possible to eliminate the effect of different lighting conditions. Pages devoted to reproduction of labels of the fine grades also specify the various uses for each grade of steel and facilitate the selection of the proper grade for any particular use.

## Financial and Construction

### Railway Financial News

**ALABAMA GREAT SOUTHERN.**—A dividend of 4 per cent has been declared on the preferred stock, payable February 21 to holders of record January 21, and also a dividend of 4 per cent on the common stock, payable January 31 to holders of record January 20. The previous declaration was 3 per cent on both classes of stock on June 14 last year.

**BOSTON & MAINE.**—The stockholders have voted by a large majority in favor of the reorganization plan previously endorsed by the company directors and by Director General McAdoo.

**BROOKLYN RAPID TRANSIT.**—Judge Julius M. Mayer, of the United States District Court, has formally appointed former Secretary of War, Lindley M. Garrison, permanent receiver of this company.

**NEW YORK CENTRAL.**—At the annual meeting of the stockholders, the following directors were elected: William K. Vanderbilt, Chauncey M. Depew, Frederick W. Vanderbilt, George F. Baker, William Rockefeller, William K. Vanderbilt, Jr., Harold S. Vanderbilt, Ogden Mills, Edward S. Harkness, Charles B. Seger, Samuel Mather, and Frank J. Jerome.

**PENNSYLVANIA.**—The New Jersey Public Utilities Commission has approved the application of this company to issue its general mortgage bonds to the amount of \$50,000,000.

**TOLEDO, ST. LOUIS & WESTERN.**—The January 1 interest payment on an issue of \$9,575,000 prior lien 3½ per cent bonds of this company due in 1925, has not yet been paid, apparently because the receiver's controversy with the Railroad Administration over the allocation of freight cars on the company's lines had not yet been settled. In a communication sent to the holders of the bonds the Farmers' Loan and Trust Company, as trustee of the mortgage, says that the receiver, finding himself without funds at the date of maturity of the interest, sought to raise the necessary funds through an issue of receiver's certificates. This step was vigorously opposed by the trust company, which in its circular said: "The result of the whole complicated situation was that the court authorized the receiver to endeavor to settle his controversy with the government by accepting a very much smaller number of cars, and pending the negotiation in that direction the court adjourned the receiver's application for receiver's certificates. We are expecting any day to hear from the receiver that he has settled his controversy with the government, as he was very hopeful about it, and in case the controversy is settled he is also hopeful of obtaining necessary financial assistance from the government pending the negotiation of a just compensation contract to cure this default in interest and to finance the receivership in the immediate future."

### Railway Construction

**CENTRAL OF GEORGIA.**—This road has authorized the construction of a rectangular timber engine house and four concrete cinder pits at Birmingham, Ala. The building will be constructed to house four large Mallet locomotives. The work will be done by Illinois Central forces.

**ILLINOIS CENTRAL.**—This road has awarded a contract to the William Graver Tank Works, Chicago, for filtering and sterilizing equipment for a filtration plant to be constructed at Baton Rouge, La. The contract for the construction of the building has not yet been let and possibly this work will be done by the railroad's own forces. (December 20, 1918, page 1139.)

**SOUTHERN PACIFIC.**—This road has been authorized to construct shop buildings at Sacramento, Cal., to cost about \$79,500. The largest structure to be erected will be a steel foundry which will cost \$45,000. A steel and concrete repair shop will be constructed at a cost of \$29,900. The projected work also includes a parcel post building to cost \$4,600.

## Railway Officers

### Railroad Administration

#### Regional

**H. N. Rodenbaugh**, staff officer, engineering, in the office of the Southern regional director, has been appointed engineering assistant to the regional director, with office at Atlanta, Ga.

**T. W. Proctor**, whose appointment as supervisor of merchandise service in the Northwestern region, with headquarters at Chicago, was announced in the *Railway Age* of January 10, was born in Loudon, Eng., in 1870. He attended Ardingly College, England, the University of Brussels, Belgium, and the Hanson School, Brussels. He entered railway service as a bill clerk in 1884. Later he was employed by the Burlington, Cedar Rapids & Northern, now a part of the Chicago, Rock Island & Pacific, as bill clerk at Cedar Rapids, Iowa. Subsequently he became chief clerk, yard switchman and rate clerk. In 1901, he went with the Chicago, Milwaukee & St. Paul, with which road he has held the following positions: Clerk and traveling claim agent in the freight claim department; soliciting freight agent in the traffic department at Minneapolis, Minn.; traveling freight agent at Kansas City, Mo.; assistant general agent at Chicago; general agent at Chicago; assistant general freight agent at Minneapolis, and assistant general freight agent at Chicago. The latter position he held at the time of his appointment as supervisor of merchandise service in the Northwestern region.

#### Central

**Joseph H. Young**, formerly president of the Norfolk Southern and later federal manager of the Virginian and the Norfolk Southern, has been appointed senior assistant director of the Division of Operation, succeeding **W. T. Tyler**, who has been appointed director of the division, following the resignation of **Carl R. Gray**. Mr. Young was born on January 17, 1864, at Salt Lake City, Utah, and was educated at the University of Utah. He began railway work in 1882 with the Utah Central as office boy and warehouseman, and after having been agent, operator, bill clerk, ticket clerk, train agent, traveling passenger agent and general agent on various roads, was appointed general superintendent of the Utah Central in 1889. He was later superintendent of the Utah division of the Oregon Short Line, in 1902 general superintendent of the Rio Grande Western, in 1904 general superintendent, and later general manager of the Colorado & Southern, at Denver. On May 1, 1907, he became general superintendent of the St. Louis & San Francisco, was later general superintendent of the Southern Pacific, president of the Alaska Steamship Company and vice-president of the Copper River & Northwestern. In 1912 he was elected president of the Spokane, Portland & Seattle and other Hill lines in the northwest and later became president of the Norfolk Southern, from which position he was appointed federal manager of the Virginian and the Norfolk Southern.

J. H. Young

### Federal and General Managers

**A. W. Thompson**, federal manager of the Baltimore & Ohio eastern lines and formerly vice-president of the Baltimore & Ohio Company, has resigned, effective on February 1, and is leaving the railroad service to become president of the Philadelphia Company, which operates a large number of public utility companies in Pennsylvania, including natural and artificial gas, electric light and power, and street and interurban railway companies, having a property investment of nearly \$150,000,000.

A. W. Thompson

Mr. Thompson was born on May 8, 1875, at Erie, Pa., and graduated from Allegheny College in 1897 with the degree of civil engineer. He had spent portions of each year during his college training in a drafting room of the Erie Railroad and on location work for the Pittsburgh, Bessemer & Lake Erie as rodman. From June, 1897, to February, 1898, he worked as a draftsman, and in 1898 entered the service of the Pittsburgh & Lake Erie as a transitman on location and construction. He became connected with the Baltimore & Ohio in 1899 as chief of party on surveys and was later assistant division engineer, division engineer, division superintendent and chief engineer maintenance of way, of the same road. In 1910 he became chief engineer of the Baltimore & Ohio and Baltimore & Ohio Southwestern, and later in the same year he was appointed general manager. In 1912 he was elected third vice-president in charge of operation. Later, although his experience had been in the engineering and operating departments, he was elected to the new office of vice-president in charge of traffic and commercial development. On January 1, 1918, his jurisdiction was extended over the operating and engineering department, and in May he was appointed federal manager of the Baltimore & Ohio eastern lines having charge of the operation of the property for the United States Railroad Administration during the time when the Baltimore & Ohio was called upon to handle a very large share of the heavy traffic in war materials and supplies, including the traffic originating in the Pittsburgh district, in a section of the country where the volume of war traffic was the greatest and the difficulties of operation correspondingly increased. Mr. Thompson has also taken a prominent part in the affairs of the American Railway Engineering Association and of the American Railway Association, of which he was first vice-president and later acting president.

Mr. Thompson is leaving the railroad field in which he had demonstrated such marked ability to take up a new line of work which presents large possibilities. The Philadelphia Company operates under a very broad charter which enables it to engage in a varied line of activities. The electric division furnishes light and power for practically all of the city of Pittsburgh and its suburbs having 4,000 miles of high tension power lines covering a radius of 50 miles. One of its subsidiaries owns one of the largest power plants in the United States. The natural and artificial gas properties include 3,500 miles of pipe lines and distribute in the Pittsburgh district 48,000,000,000 cubic feet of gas per year. The traction and interurban division operates over 800 miles of traction lines in Pittsburgh and vicinity.

Effective January 11, the jurisdiction of the following Texas & Pacific officers is extended over the Gulf, Texas & Western: **Phil Carroll**, general manager; **J. B. Payne**, traffic manager; **George Thompson**, general solicitor; **A. J. Biard**, federal auditor; **E. F. Mitchell**, chief engineer; **R. L. Irwin**,

purchasing agent, and **W. L. Holder**, land and tax commissioner; headquarters at Dallas, Texas.

**R. N. Begien**, assistant to Federal manager of the Baltimore & Ohio Eastern lines, with headquarters at Baltimore, Md., has been appointed Federal manager of the Baltimore

& Ohio Western lines, with headquarters at Cincinnati, Ohio, succeeding **Charles W. Galloway**. Mr. Begien was born on March 15, 1875, at Boston, Mass., and was educated in the engineering department of Harvard University. For three years he served as a member of the Nicaraguan Canal Commission in Central America, following which he went to Ecuador, South America, where he spent a year in railway engineering work. Then he returned to the United States to enter the engineering department of the

R. N. Begien

District of Columbia. Mr. Begien began his career with the Baltimore & Ohio on August 1, 1902, as an assistant engineer at Somerset, Pa., and in June, 1908, he became division engineer at Philadelphia. He was promoted to assistant to chief engineer of the Baltimore & Ohio under **A. W. Thompson** on May 1, 1910, and when Mr. Thompson became general manager Mr. Begien continued as his assistant, becoming assistant to the third vice-president on May 1, 1912. In December of the same year he was promoted to assistant general superintendent, with headquarters at Baltimore, and in July, 1913, was appointed general superintendent of the Baltimore & Ohio Southwestern. In July, 1916, he was appointed chief engineer of the Baltimore & Ohio system, with headquarters at Baltimore. On April 1, the following year, he was appointed general manager of the Eastern lines, and in July, 1918, he became assistant to Federal manager (operating) of the Baltimore & Ohio Eastern lines and New York Terminals, the Western Maryland, the Cumberland Valley, the Cumberland & Pennsylvania and the Coal & Coke, with headquarters at Baltimore, which position he held at the time of his appointment as mentioned above.

**Charles W. Galloway**, federal manager of the Baltimore & Ohio, western lines, with office at Cincinnati, Ohio, has been appointed federal manager of the B. & O., eastern

lines and associated lines, with headquarters at Baltimore, Md., to succeed **A. W. Thompson**, resigned. Mr. Galloway was born on December 11, 1868, and began railway work in 1883, as a messenger in the telegraph department of the Baltimore & Ohio. He subsequently served as clerk, stenographer, and secretary to different officers on that road, and from September, 1897, to July, 1899, as trainmaster on the Baltimore division. He was then consecutively assistant superintendent, superintendent of the

C. W. Galloway

Cumberland division, superintendent of the Baltimore division, and superintendent of transportation. He served as general superintendent of transportation of the Baltimore &

Ohio and the Baltimore & Ohio Southwestern at Baltimore from July to September, 1910, and then was transferred to Cincinnati, Ohio, as general superintendent of the Baltimore & Ohio Southwestern. From April, 1912, to July, 1916, he was general manager of the Baltimore & Ohio, with headquarters at Baltimore, and then was elected vice-president of the Baltimore & Ohio Southwestern, general manager of the Western lines of the Baltimore & Ohio system, and general manager for the receivers of the Cincinnati, Hamilton & Dayton. He subsequently was appointed federal manager of the Baltimore & Ohio, western lines, and now becomes federal manager of the B. & O. eastern lines. The associated lines are the Cumberland Valley, the Western Maryland, the Coal & Coke, the Cumberland & Pennsylvania, the Wheeling Terminal, the Gettysburg & Harrisburg, and the Philadelphia & Reading, between Shippensburg, Pa., and Harrisburg, Pa.

**Operating**

**R. A. Mason** has been appointed terminal trainmaster of the Baltimore & Ohio, Western Lines, with office at New Castle Junction, Pa., vice **L. M. Bowser**, resigned.

**B. M. Edwards** has resigned as manager of the Bennettsville & Cheraw and the office of manager has been abolished. **C. G. Rogers** has been appointed superintendent, with office at Bennettsville, S. C.

**Charles Wesley Shaw**, whose promotion to superintendent of the Springfield division on the Illinois Central, with headquarters at Clinton, Ill., was announced in the *Railway Age*

of January 10, was born on April 12, 1868. He began his railway career on February 3, 1886, as a brakeman on the St. Louis Southwestern. The following year he entered the service of the Illinois Central as a switchman at Cairo, Ill., and subsequently served as yardmaster at Mounds, Ill., and freight conductor on the Chicago division. On April 15, 1894, he was transferred to the bridge and building department at Cairo, where he remained until April 1, 1900, when he became a brakeman on the St.

C. W. Shaw

Louis division. In the fall of that year he was promoted to freight conductor on the same division. Four years later he was appointed assistant trainmaster, and on April 10, 1907, became acting trainmaster on the Champaign division. In August of the same year he was promoted to trainmaster on the St. Louis division, and on July 15, 1911, he resigned to become trainmaster on the Illinois Southern. The following year he returned to his former position as trainmaster on the St. Louis division of the Illinois Central, which position he held until January 1, 1919, when he was appointed superintendent of the Springfield division at Clinton, Ill.

**W. D. Pearce**, supervisor of bridges and buildings of the Yellowstone division of the Northern Pacific, at Glendive, Mont., has been appointed trainmaster, with office at Forsyth, succeeding **T. J. Regan**, transferred in the same capacity to Dickinson, N. Dak., vice **John Wynn**, promoted.

**H. A. Culp**, trainmaster of the Southern Pacific lines south of Ashland, with headquarters at Yuma, Ariz., has been appointed assistant superintendent of the Shasta division, with office at Dunsuir, Cal., vice **W. B. Kirkland**, resigned, and **W. T. Small** succeeds Mr. Culp as trainmaster of the Tucson division, with office at Yuma.

**C. A. Plumly** has been appointed superintendent of telegraph of the Baltimore & Ohio, Eastern Lines; the Coal and Coke; the Wheeling Terminal Railroad; the Western Maryland; the Cumberland Valley and the Cumberland &

Pennsylvania, with headquarters at Baltimore, Md., vice Charles Selden, retired. Mr. Selden will still retain the duties and title of general inspector of transportation.

### Financial, Legal and Accounting

Edward Becroft has been appointed assistant federal treasurer of the Elgin, Joliet & Eastern, with headquarters at Chicago, Ill.

E. Marvin Underwood, general solicitor of the Seaboard Air Line and Macon, Dublin & Savannah, has been appointed general solicitor also of the Georgia, Florida & Alabama, with office at Norfolk, Va.

C. S. Stebbins, assistant to auditor of the Union Pacific, with headquarters at Omaha, Neb., has retired from railroad service after having spent 42 years with that road, which he joined in 1870, as secretary to the chief engineer and general superintendent. With the exception of a few years following 1887, Mr. Stebbins was employed continuously by the Union Pacific in various capacities in the passenger and accounting departments. In 1911 he was made assistant to the auditor of that road, which position he held until his recent retirement at the age of 70 years.

### Traffic

P. W. Talbot has been appointed acting division freight and passenger agent of the Midland Valley Railroad, with headquarters at Muskogee, Okla., vice Eugene Mock, who has been temporarily assigned to serve with the St. Louis District Freight Traffic Committee.

### Purchasing

Charles W. Yeamans, who was appointed purchasing agent of the Chicago & Western Indiana and the Belt Railroad of Chicago, with headquarters at Chicago, as announced in the *Railway Age*, of January 10, was born at Akron, Colo., on August 12, 1886. He began railway work on May 1, 1905, as a clerk in the engineering department of the Chicago, Burlington & Quincy, with headquarters at Chicago. Two years later he was promoted to chief clerk to the engineer of track elevation. On May 1, 1910, he resigned to go with the Chicago & Western Indiana in charge of the field construction office, with headquarters at Chicago. During the construction of Clearing yard between 1913 and 1915 he was material agent, having full charge of the ordering of materials; their inspection and distribution. Later he became chief clerk in the engineering department, and on May 1, 1918, was appointed assistant engineer in the construction department, which position he held until December 1, when he received his appointment as purchasing agent as mentioned above.

G. W. Alexander, whose appointment as general storekeeper of the Central of Georgia, with headquarters at Macon, Ga., has already been announced in these columns, was born on February 21, 1886, at Senoia, Ga., and was educated in the high schools. He began railway work in 1905, as a receiving clerk in the freight agent's office of the Central of Georgia, at Atlanta. In 1907 he was appointed ticket agent at Bremen, and then to 1909 was mechanical clerk to the general foreman at Cedartown. From 1909 to 1912 he held different clerical positions in the division storekeeper's office at Macon, and later was appointed division storekeeper at Cedartown. He subsequently served as division storekeeper at Savannah, and from 1914 to April, 1918, as division store-

keeper at Macon, in charge of Macon, Southwest and Chattanooga divisions on the same road. In April, 1918, he became assistant to the Southern Regional Purchasing Committee of the United States Railroad Administration, with headquarters at Atlanta, Ga., and now returns to the Central of Georgia as general storekeeper as above noted.

## Corporate

### Traffic

George H. Shaw, having resigned as general traffic manager of the Canadian Northern Railway System and D. A. Story having retired as freight traffic manager of the Canadian Government Railways; George Stephen, freight traffic manager of the Canadian Northern, at Winnipeg, Man., has been appointed freight traffic manager, with office at Toronto, Ont., of the Canadian National Railways, under which name all of the above roads are now being operated. The following appointments have been made on the Canadian National Railways:—H. H. Melanson, passenger traffic manager of the Canadian Government Railways at Moncton, N. B., is now passenger traffic manager with jurisdiction over all lines, with office at Toronto; A. T. Weldon, general freight agent at Moncton, is now assistant freight traffic manager with jurisdiction over all lines from Matapedia, Que., and Edmundston, N. B., and east thereof, with office at Moncton, N. B.; Guy Tombs, assistant freight traffic manager at Montreal, is now assistant freight traffic manager with jurisdiction over all lines west of Matapedia and Edmundston, to but not including Port Arthur and Armstrong, Ont., with headquarters at Montreal; W. G. Manders, general freight agent at Winnipeg, Man., is now assistant freight traffic manager, and S. Osborne Scott, assistant general passenger agent at Winnipeg, is now general passenger agent, both with jurisdiction over lines Port Arthur, Armstrong, Ont., Duluth, Minn., and west thereof, and with offices at Winnipeg; A. Brostedt, district freight and passenger agent at Vancouver, B. C., has been appointed assistant general freight and passenger agent with jurisdiction Lucerne, B. C., and west, and office at Vancouver; J. M. Horn, assistant general freight agent at Winnipeg, has been appointed general freight agent, J. M. Macrae has been appointed assistant general freight agent, and R. Creelman, general passenger agent at Winnipeg, has been appointed assistant passenger traffic manager, all thru, with jurisdiction over lines Port Arthur, Armstrong, Duluth and west, with offices at Winnipeg, Man.; R. L. Fairbairn, general passenger agent, has been appointed general passenger agent, with jurisdiction over lines Quebec, and west to Port Arthur and Armstrong, with office at Toronto; R. E. Perry, assistant general freight agent at Moncton, has been appointed assistant general freight agent in charge of publication of tariffs and divisions for lines east of Fort William and Armstrong, with office at Montreal, and W. Hatley has been appointed assistant general freight agent in charge of publication of tariffs and divisions for lines west of Port Arthur, Armstrong and Duluth, with headquarters at Winnipeg, Man.

### Engineering and Rolling Stock

W. Walker, acting division engineer on the eastern lines of the Grand Trunk, with office at Montreal, Que., has been appointed division engineer, eastern lines, succeeding Major F. L. C. Bond, promoted.

### Railway Officers in Government Service

C. V. Gallagher, formerly assistant general freight agent of the Minneapolis, St. Paul & Sault Ste. Marie at Chicago, who was given a leave of absence last spring to enter the transportation department of the Food Administration Grain Corporation, Chicago, has been promoted to assistant general freight manager of the Grain Corporation.

Col. F. G. Robbins, assistant general manager, Service of Supply, of the Transportation Corps, A. E. F., with headquarters at Tours, France, has been transferred to the office of the chief of engineers of the army, with headquarters at Washington, D. C. Before entering military service, Col. Robbins was general superintendent of the Erie at Chicago.

### Copies Delayed in Mails

We are receiving many complaints from subscribers that the *Railway Age* is not being delivered to them promptly. In many cases, requests are received for additional copies to replace those which have not been delivered at the time of writing, but which are later delivered by the post office after an unreasonable delay. The paper is being printed and mailed on its regular schedule, and if you do not receive your copy promptly or regularly, take the matter up with the postmaster at the same time that you write to us.

A director of a division of the Railroad Administration has registered a complaint against our circulation department

**Government** because of the repeated delays in receiving his copies of the *Railway Age*.  
**Operation of the** Writing on January 25, he said that his paper for January 17 had not yet arrived, although another copy of the  
**Mail Service**

same issue for another officer of his division had just been received. Another office in Washington received its copy of the January 17 issue on January 25 and our own Washington office received its copies on January 22, although a copy sent by special delivery arrived on January 18. As all of the copies for Washington are mailed from New York at the same time each Friday, while their delivery in Washington frequently straggles through the succeeding week, we are strongly of the opinion that the difficulty lies in the postoffice department rather than in our circulation department, and this impression is confirmed by the much greater length of time that is now required to get letters delivered. Yet we have not heard of any suggestion that the government take over the operation of the postoffice for a five-year test.

The chapter of the director general's annual report on public service and accounting closes with the statement that "it can be affirmed with certainty that, were the railroads of this country actually unified under one control, there would be an enormous saving in accounting expenses." Under the heading "General Expenses," the Interstate Commerce Commission includes the salaries of general officers and the salaries and wages of officers and employees in the accounting and legal departments. Until the complete reports are filed with the Interstate Commerce Commission, it is not possible to separate general expenses into the primary accounts, but those who argue that unified control is desirable claim very large savings in almost all these primary accounts. As a matter of fact, salaries of executive officers during the past year of government operation have, in a great number of cases, been charged against the company and are not, therefore, included in general expenses. Furthermore, the salaries and the expenses of the regional directors and of the central administration are not charged to the general expenses, pro rata or otherwise, of individual railroads. While therefore there may not be any less actual expenses under this heading, it

**More Enormous**  
**Theoretical**  
**Savings**

would seem probable that there would be a very considerable reduction in the amounts charged to individual roads under this class of primary accounts in general expenses. The same ought to be true of the primary accounts covering legal expenses charged to general expenses. There are left, then, the accounting and miscellaneous expenses. Presumably, the word "enormous" is not used in a relative sense in the director general's report, for accounting expenses have averaged but from 3 to 5 per cent of total railroad operating expenses. A saving of a few million dollars for the country as a whole is apparently what is meant here by enormous. But what are the facts for the first eleven months of the calendar year? The general expenses of the larger railroads total \$101,994,264, as compared with \$88,058,679 for the same roads for the first eleven months of 1917. If there actually have been large reductions in the amounts charged to general expenses, then there has been an "enormous increase" in accounting expenses. The accounting department report gives six reasons why the saving in 1918 was "nothing like it might be and would be under permanent unified operation." Three of these reasons amount to the fact that the separate entities of the roads had to be maintained, and the other three are explanations of extraordinary expenses entailed in the installation of federal operation. It's the same old story—theoretical "enormous" savings with actual increased expenses.

The new director general, Walker D. Hines, in his letter to Carter Glass, Secretary of the Treasury, reprinted elsewhere in this issue, sets forth, lucidly and convincingly, the need for an addition of \$750,000,000 to the present revolving fund of \$500,000,000. As Mr. Hines shows, this billion and a quarter is in the nature of working capital, and to date the actual loss to the government from the operation of the railroads has been only about \$200,000,000. Assuming no loss in 1919, the books of the Railroad Administration when closed at the end of 1919 would show cash on hand or debits against the railroad companies of something over one billion dollars. The additional \$750,000,000 asked for now appears to be a minimum of what will be required. Even this amount has to be supplemented by the financing on the part of the railroads through their own credit of approximately \$291,000,000. If there is a loss in net operating income in 1919, as compared with the aggregate of rentals due the companies, it will not necessarily mean that the administration will need a larger revolving fund, but only that a greater part of the fund will have to be written off as loss and a smaller part will represent debts of the railroads to the government. It is significant that in stating the administration's needs for working capital, Mr. Hines prefaces his figures with the statement that "when the government shall have settled its accounts," etc. At present, in the absence of adequate working capital, the Railroad Administration is holding off its creditors. Without action from Congress this is the only course open for the administration, but it is a course which no soundly run business would voluntarily adopt, and Congress should act immediately to provide the Railroad Admin-

istration where in this issue, sets forth, lucidly and convincingly, the need for an addition of \$750,000,000 to the present revolving fund of \$500,000,000. As Mr. Hines shows, this billion and a quarter is in the nature of working capital, and to date the actual loss to the government from the operation of the railroads has been only about \$200,000,000. Assuming no loss in 1919, the books of the Railroad Administration when closed at the end of 1919 would show cash on hand or debits against the railroad companies of something over one billion dollars. The additional \$750,000,000 asked for now appears to be a minimum of what will be required. Even this amount has to be supplemented by the financing on the part of the railroads through their own credit of approximately \$291,000,000. If there is a loss in net operating income in 1919, as compared with the aggregate of rentals due the companies, it will not necessarily mean that the administration will need a larger revolving fund, but only that a greater part of the fund will have to be written off as loss and a smaller part will represent debts of the railroads to the government. It is significant that in stating the administration's needs for working capital, Mr. Hines prefaces his figures with the statement that "when the government shall have settled its accounts," etc. At present, in the absence of adequate working capital, the Railroad Administration is holding off its creditors. Without action from Congress this is the only course open for the administration, but it is a course which no soundly run business would voluntarily adopt, and Congress should act immediately to provide the Railroad Admin-

istration with adequate working capital so that a sounder business attitude can be adopted toward the administration's creditors.

## Why Hang It on the Railroads?

ONE OF THE DEVELOPMENTS of the war was the United States Employment Service. Established in the early part of 1918 as a branch of the Department of Labor and fostered to meet the needs of the war industries, its organization spread rapidly over the country so that there are now about 750 branch employment agencies covering practically all parts of the United States. As it was realized that open competition by the various war industries for the inadequate supply of labor would lead to no good, it was proposed to institute a form of control whereby labor could be allocated to the various industries much as was done with materials, although not to the same degree. Certain serious difficulties interfered with the success of this plan, the chief being that the laborer himself must be given some choice in the matter. In the actual prosecution of the work all industries, including the railroads, were requested to place their orders for labor with the Federal Employment Service and certain restrictions were placed upon the solicitation of labor by individuals, but under stress of war necessity individual initiative emphatically asserted itself. The great war industries did not depend upon the Federal Employment Service, but instituted their own means of solicitation and advertising, and the federal service also carried on a program of special recruiting for some of the more urgent demands, which resulted in some open competition between various divisions of the service itself. The railroads also were compelled to look out for themselves and opened up employment offices of their own in the large cities.

With the market reduction of industrial and commercial activities following the signing of the armistice, the enormous burden placed upon the United States Employment Service has been largely removed and the officers of this organization who had always felt that the railroads did not make sufficient use of the federal agencies turned their attention to a plan whereby all solicitation of labor for the railroads would be done by the federal service. This resulted in the labor conference, recently held in Chicago, where railroad officers were told of the advantages of the centralized control of labor solicitation and recruiting.

That there is considerable question as to the practicability of centralizing the solicitation of men for employment on the railroads to the degree proposed by the United States Employment Service is clear from the discussion brought forth at this conference. The position of the employment service is obvious. The removal of the enormous war demand for labor has left it with a big organization, the present demands upon which are not sufficient to justify its perpetuation on the present scale. Obviously, if it be given responsibility for the supply of labor to the railroads this will go a long way toward justifying its continued existence. Through a resolution passed by the conference, the question of co-operation between the United States Railroad Administration and the United States Employment Service has been put up to the director general and the regional directors of the railroads. Whatever action is taken in pursuance of this resolution, the matter should be considered solely with reference to the welfare of the railroads and their employees. The effect of the policy adopted upon the future of the United States Employment Service in its present form should receive no consideration. Why give the employment service a monopoly of the furnishing of labor to the railways, mainly in order that the employment service may continue to exist? In other words, why hang it on the railroads? Haven't they troubles enough, already?

## Re-Establishing Railway Credit

THE FACT CANNOT be too strongly emphasized that the pending railroad problem is essentially that of devising means of re-establishing and maintaining railroad credit. The problem of credit, in turn, is fundamentally that of adopting some plan under which the railroads can be returned to the permanent management of their owners with a reasonable certainty that they will be able to raise the large amounts of new capital which will be required for the adequate development and increase of their facilities. The problem of devising means of securing the most economical operation consistent with good service is interlocked with that of re-establishing credit, but to some extent the two can and ought to be considered separately.

The railroads can be enabled to raise adequate new capital only by insuring that, under good management, they will be given opportunity to secure sufficient net income to pay a reasonable return both upon their old and their new capital.

It is contended by some persons, including members of the Interstate Commerce Commission, that before government operation was adopted the railroads were allowed to charge rates that yielded reasonable profits. Elaborate statistics are cited to prove this. The incontrovertible facts are, however, first, that for several years before government operation was adopted the expansion of railway facilities was rapidly declining; and, second, that the facilities became inadequate to the demands of the country's business. Some take the view that the companies became unable to raise sufficient new capital because of abuses in their financial management. But the abuses, so far as they were real, were confined to a comparatively few companies, while the decline in the expansion of facilities was general. The growing inability of the railroads as a whole to raise adequate capital was due mainly to a faulty policy of regulation; and the legislation under which they are restored to private management must, if adequate expansion of their facilities is to be renewed, establish principles and methods which will insure that they will be able to pay a more certain, and many of them a larger, return.

Various plans for accomplishing this have been suggested. One is that the government shall guarantee a fixed percentage of return for all roads on some basis of valuation. The conclusive argument against this is that it would destroy all incentive to enterprise and efficiency. No plan under which the owners of each individual property will not lose by inefficiency in its management and gain by efficiency will foster good management.

Another proposal is that the government, on some basis of valuation shall guarantee each company a minimum and a maximum percentage of net return. If the minimum is not earned the deficit shall be paid from the public treasury, and any excess earned over the maximum shall be paid into the public treasury. This plan would not destroy the incentive to efficiency, and might not seriously impair it if the maximum allowed was fixed reasonably high. Its most objectionable feature is that some roads almost certainly would not earn the minimum, that the government would have to make up their deficits, and that this would create financial relations between the government and these railways which would foster agitation for government ownership of them. Governments have made guarantees of net earnings to railways in many countries. Wherever the railways have failed to earn the guaranteed amounts there has been agitation for the governments to acquire them, and in most cases this agitation has been successful.

The plan proposed by the Association of Railway Executives sets forth that "the statute itself should provide the rule of rate-making, and should require that rates be not only what is called reasonable, but adequate and sufficient to

enable the carriers to provide safe, adequate and sufficient service." That this ought to be the rule, and that it is desirable to have it established by law, seems clear. But serious differences of opinion might arise regarding the way in which it should be interpreted and applied. In spite of the decline in the development of the railways which has been constantly and rapidly going on for almost ten years, the bodies that have regulated them are still contending, in effect, as already noted, that they have been so regulated that they could have adequately expanded if they had been disposed to. Just how these bodies think they can rationally argue that people with capital carefully refrained from putting it into an industry the returns earned in which made it an attractive industry in which to invest we do not understand.

The principle by which most of the rate regulating bodies actually have been guided has been that of reducing and keeping rates as low as could be done without having them declared confiscatory by the courts. The Association of Railway Executives suggests that a large part of the control of rate-making be transferred to a Secretary of Transportation, with the thought that a purely administrative official would act, not on the principle of near-confiscation, which has guided most of the regulating commissions, but on the principle of public expediency. We believe it is sound doctrine that the administrative and judicial functions now performed by the Interstate Commerce Commission should not be delegated to the same body, but many persons fear that a Secretary of Transportation would be influenced by considerations of politics as well as considerations of public expediency.

Another plan which is being advocated is about as follows: Divide the railways of the country into, say, ten geographical groups, the boundaries to be determined by operating and traffic conditions. Provide by law that the rates in each territory shall be so fixed as to enable the railways of that territory as a whole to earn an average net operating income on the aggregate book cost of their road and equipment of, say,  $5\frac{1}{2}$  per cent. Some roads in the group would earn less than this average; some more. When a railway earned in excess of, say,  $6\frac{3}{4}$  per cent, the excess, under this plan, would be divided, part being retained by the company, part being paid as a bonus to its employees, and part being paid into the public treasury.

The book cost of road and equipment is not an entirely satisfactory basis on which to compute the total net operating income allowed to be earned, but it is the best at present available, and has been used in important rate advance cases. This plan would have several advantages. First, it would not establish entangling financial relations between the government and the railway companies. Second, since it would not arbitrarily limit the net return which any individual company could earn it would not destroy the incentive to efficient management. Third, it would nullify the old argument that rates must not be fixed high enough to enable the average road to earn an adequate return for fear the stronger roads would earn an excessive return.

From the standpoint of roads which long have been earning a high percentage of return, however, this plan would be objectionable and perhaps unjust. Furthermore, the fixing by law of specific average and maximum rates of return which the companies would be allowed to earn might in the long run prove to be unwise. Nobody knows exactly what average return is needed by the companies now; and the return required might diminish, or might substantially increase, because of national or international financial developments for which they were not responsible. But, after all, human action, including legislation, should be based on probable and not merely possible developments. People do buy bonds which run 20 years or more and pay a fixed rate of interest, in spite of the fact that the general rate of interest may decline or advance: and it ought to be possible to estimate

fairly accurately the average and maximum returns the roads as a whole should have.

It seems to us that the best solution of the pending problem of railway credit consistent with leaving unimpaired the incentives to efficient management would be found in legislation embodying the following principles: First, the railways should be encouraged, under proper government supervision, to so co-ordinate their operations as to limit the obvious wastes of competition while preserving as much competition as is necessary to promote emulation in operation and in improvement of service. Second, "the statute itself should," as the Railway Executives' plan says, "provide the rule of rate-making, and should require that rates be . . . adequate and sufficient to enable the carriers to provide safe, adequate and efficient service." Third, the statute, as an auxiliary guide in rate regulation, should specify a minimum average rate of return on property investment—not less, surely, than  $5\frac{1}{2}$  per cent—which the railways as a whole, or groups of railways, must be allowed by regulating authorities to earn, and perhaps fix a maximum return, any earnings in excess of which must be divided on some basis between the company earning them and the government. Fourth, some federal regulating authority should be given power to supervise the issuance of securities and the making of expenditures chargeable to capital account. Provisions such as these are, we believe, required to re-establish railway credit on the basis on which the public welfare demands that it shall be placed.

## Fancies and Facts Regarding Government Operation

PUBLIC OPINION seems to be running strongly against government ownership and operation of the railways and public utilities now in the hands of the government, but the question cannot be considered settled until these properties shall have been returned to the management of their owners. The former director general of railroads, Mr. McAdoo, continues to advocate a five years' extension of the present system and to make predictions regarding the results that would be gained. Many of the railway employees who under government operation have received advances in wages exceeding their fondest dreams are bombarding members of Congress with propaganda for a continuance of government operation. The doctrinaire proponents of public ownership are still arguing for it, and making as glowing predictions as ever about what it would accomplish. Some of them admit that the country's first year's experience with government operation has been rather disconcerting, but they attribute the disappointing results to war conditions and say there would be a great improvement under peace conditions.

In these circumstances, it is desirable to recall some of the predictions which emanated from exactly the same persons just before and just after government operation was adopted. On December 9, and again on December 14, 1917, just two weeks before government operation was adopted, S. W. Brookhart of Iowa, a protege of Clifford Thorne, advocated government ownership of railways at a hearing of the Newlands Joint Congressional Committee in Washington. He estimated the savings in operating expenses that would be effected at \$400,000,000 a year. Clifford Thorne had previously made a similar estimate in an address before the National Association of Railroad Commissioners. After government operation was adopted a newspaper of wide circulation estimated in an editorial that the savings effected under government operation would be at least \$1,000,000,000 a year.

On January 19, 1918, and again on January 21, three

weeks after government operation was adopted, Director General McAdoo gave his views to the Senate Committee on Interstate Commerce in Washington. He did not express such boundless optimism regarding the results of government operation as Mr. Brookhart, Mr. Thorne and others had expressed. He did, however, make the following statements:

*"So I hope that very large economies may be practiced. How far they will be offset by increased cost of material and increased cost of labor, I do not know, but perhaps one hand will wash the other. If it does, and you maintain the present status, perhaps the government would not have to meet any deficiency against guarantees it may give. In any case, I hope that the deficiency will be inconsiderable, and I hope as well that we may have a surplus."* (Senate Committee Hearings, page 823.) \* \* \* *"I hope there will be no deficiency. I hope that such economies can be effected as will prevent deficiencies, and I even hope that a surplus may result from government operation. Of course, that is a hope; I do not know."* (Senate Committee Hearings, page 840.) \* \* \* *"We are taking the railroads over under a guarantee of about \$100,000,000 less than they earned in the last fiscal year of the period (on the net operating income of which the compensation of the railways was based), and, in addition to that, excess profits taxes are to be paid out of that guaranteed income. If the government, with its powers of coordination and common use of facilities, with the unquestioned economies that may be practiced under its control of the situation, and with an advantage of \$100,000,000 over the proposed guaranty, as shown by the last fiscal year's earnings, has not made a fair trade upon the merits of the proposition for a temporary use of these properties, then I am frank to say I do not know what would be fair."* (Senate Committee Hearings, page 849. All the italics are our own.)

Mr. McAdoo made these statements knowing he was going to operate the railways under war conditions. It will be seen that he did not refer to any possible advance of rates, either freight or passenger.

Now, what was the actual outcome? There was only a small increase in the amount of traffic handled during the year. Nevertheless, the advance in operating costs in the eleven months ending with November, 1918, so "offset," and, indeed so utterly overwhelmed and annihilated the "economies" effected, that operating expenses in these eleven months on the Class 1 roads were \$1,004,924,864 greater than in the same months of 1917. When the December figures are available they will show that the increase in expenses on the Class 1 roads during the year was at least \$1,100,000,000, and when the figures for all roads are available they probably will show a total increase in operating expenses of at least \$1,250,000,000.

The increases in expenses came so fast that, contrary to his obvious expectations, Mr. McAdoo was obliged to make large advances in both freight and passenger rates. These advances in rates yielded increased earnings of about \$600,000,000 in the six months July-December, inclusive, during which they were in effect. The increases in expenses wiped out the \$100,000,000 margin with which, as Mr. McAdoo told the Senate committee, he began; wiped out the \$600,000,000 increase in earnings due to advances in rates; and left the government with a deficit of \$200,000,000 from the year's operations. Taking into account the increased earnings derived from the advances in rates and the deficit incurred, it will be seen that Mr. McAdoo missed his guess as to the final outcome of the year by at least \$800,000,000. As to the sage Mr. Brookhart from Iowa, when we add the reduction in operating expenses which he anticipated to the advance in operating expenses which actually occurred, we find that he missed his guess by over \$1,600,000,000. And as to the newspaper of wide circulation, which estimated that reductions in operating expenses of \$1,000,000,000 would be effected—it missed its guess by more than \$2,000,000,000!

In view of the disparity between the predictions of the advocates of government operation of railways and the actual results of the country's first year of government operation, we should think that the public might be disposed in future to pay less attention than it has in the past to the views and prophecies of the advocates of government operation, and to give more heed to the information furnished to it and the opinions expressed to it by persons who know something about the railroad business.

## New Books

*American Society for Testing Materials Standards; 908 pages, illustrated, 6 in. by 9 in. Bound in cloth and half leather. Published by the Society, office of secretary, University of Pennsylvania, Philadelphia, Pa. Cloth \$9, half leather \$10.*

This volume contains, in their latest revised form, the 128 standards which this Society has adopted. These standards will be published triennially, the 1918 edition being the first. The specifications are divided into the following primary groups: Ferrous metals (including specifications for rails, splice bars, track bolts, track spikes, structural steel for locomotives and for cars, spring steel, staybolt wrought iron, foundry pig iron, etc.). Non-ferrous metals, including cement, lime, gypsum and clay products. Miscellaneous materials, including paints, methods of analyzing broken stone and sand, sampling and analysis of creosote oil, etc. By combining all of the specifications of this important association in one volume they are placed in convenient form for the testing engineer and others having to do with the preparation and enforcement of specifications for materials.

*Concrete Engineers' Handbook. By George A. Hool, associate professor structural engineering, University of Wisconsin, and Nathan C. Johnson, consulting concrete engineer, New York. 885 pages, 6 in. by 9 in. Bound in flexible leather. Published by McGraw-Hill Book Co., Inc., 239 W. Thirty-ninth street, New York. Price, \$5.*

The title page of this book names six others as being collaborators in its preparation. The book is naturally divided into two sections—that for the use of the builder and that for the designer. The first portion includes a section on materials, covering cement, aggregates, water and reinforcement; a section on general methods of construction covering the proportioning of the concrete, field tests, waterproofing, mixing, finishing, forms, etc. One section covers the construction of concrete floors, walks and roadways. Another discusses the properties of cement mortar and concrete. In the second portion of the volume will be found a section on the properties of reinforced concrete, one on beams and slabs, another on columns, another on bending and direct stresses, while, with reference to the designing of specific structures there are sections on moments of building frames, buildings, girder bridges, hydraulic structures, miscellaneous structures, etc. Separate sections are also devoted to foundations, retaining walls, concrete floors and abutments for steel bridges. The subject of estimating is also treated under a separate head. Much of the information given has appeared in earlier text books written by Mr. Hool, but the manner of presenting the information in this volume is clearly that of the handbook. In the portion devoted to the constructor are illustrations of various proprietary reinforcements with tables of their properties, illustrations of construction equipment, etc. The designing section contains some very complete designing tables and charts. One section which will be found especially valuable for certain purposes is that on the moments of rigid building frames.

# Storekeepers Meet for the First Time Since 1916

## Papers and Reports on Stock Books, Scrap Handling, Use and Inspection of Lumber, and Accounting

THE FOURTEENTH CONVENTION of the Railways Storekeepers' Association was held at Hotel Sherman, Chicago, on January 27, 28, and 29. Because of the war, the organization did not convene in 1917 or 1918 and consequently the meeting this week is the first since the thirteenth annual convention which was held at Detroit, Mich., on May 15, 16 and 17, 1916.

President W. A. Summerhays, assistant purchasing agent of the Illinois Central, delivered the opening address. He stated that while the association had not met for 32 months it had not remained idle. The executive committee held frequent meetings to establish the policy of the association as conditions changed. In order that interest in the organization might not lapse, each member of the executive committee and the third vice-president held informal district conferences of members of the organization from all parts of this country and Canada. During the period elapsing since the last convention the executive committee made a thorough canvas of the membership of the association with the result that 278 non-paying members were dropped. This loss, balanced against an addition of 95 new members, left the association 573 active, paid-up members on January 1, 1919. While this is the first time in the history of the Storekeepers' Association that its membership has decreased, the present enrollment includes only those sufficiently interested in the purposes of the organization to pay their dues.

Mr. Summerhays also briefly outlined the war activities of the association. He stated that each member of the executive committee and former Presidents J. H. Waterman (Chicago, Burlington & Quincy), J. G. Stuart (C. B. & Q.), and W. F. Jones (New York Central Lines), as well as Secretary J. P. Murphy (New York Central), offered their services in connection with the instruction of prospective officers in the quartermaster and ordnance departments of the army at the schools established at the leading universities of the country. A committee headed by D. C. Curtis (C. B. & Q.) was appointed by the executive committee of the association to work with the quartermaster general of the army in his campaign for the reclamation of material and supplies at the army cantonments and supply depots, as well as at the front overseas.

Mr. Summerhays called attention to the fact that the Railroad Administration had approved the purposes and activities of the Storekeepers' Association and had issued instructions to include in its membership representatives of the store organizations on all railroads under federal control. It also commended the association for establishing standards of store department practices.

The work of the association, officers and committees in preparing for the 1919 meeting was unusually difficult. The tremendous upheaval in manufacturing and commercial lines caused by the shortage of labor and the heavy demand for munitions for shipment overseas made the maintenance of a reasonably regular supply of materials for railroad needs a serious problem.

W. H. Clifton, lumber agent of the Baltimore & Ohio, Baltimore, Md., submitted a circular of instructions issued by the Baltimore & Ohio System for the selection of the site and the design of lumber yards, for the handling of lumber in the yards, precautions to avoid decay, and fire protection.

### Fundamental Principles That Should Govern the Supply Department

H. C. Pearce, general purchasing agent of the Seaboard Air Line, read a paper outlining fundamental principles that should govern the organization and operation of a railroad supply department. He said in part:

The real purpose of the supply department is to provide materials and supplies suitable for the service for which they are required, when and where needed, at the lowest net cost. . . .

Our railroads generally have four sources of supply: (1) material on hand and on order, (2) material which can be reclaimed, (3) material made in its own manufacturing plants, and (4) material which must be purchased from outside manufacturers.

The supply officer should not make a purchase requisition until he has exhausted all other sources of supply, and the chief supply officer must have behind him an organization that will be a guarantee that when a requisition for the purchase of material is placed, it accurately describes what is most suitable for the purpose needed, and all other resources have been exhausted, or, if it is for the purpose of taking advantage of the market, that it will be used in a certain length of time and will not become obsolete. The purpose of the supply department of our railroads must not be compared or considered the same as mercantile establishments. A mercantile establishment is for the purpose of disposing of its goods at a profit. A railroad supply department is for the purpose of supplying the needs of the railroad at the lowest net cost, conserving its assets as represented by materials and supplies in every way possible.

I think it will be apparent that if the purposes outlined are sound, there should be no divided responsibility between the officer that is responsible for the expenditure, and the officer that requests the requirement and does the accounting.

### PERSONNEL

Personnel is reflected in an organization from the top to bottom. Character, energy, and loyalty are absolutely essential to the up-building or maintaining of any organization. But, this is not alone sufficient. There must be developed a broadness of conception and action that will enable them to overcome obstacles in formulating and carrying out their plans, so essential for final results.

### FACILITIES

Adequate facilities for properly housing and economically handling materials must be provided and maintained. Expensive buildings are not so much needed as ample space, platforms, tracks, cranes, and other labor saving devices for handling.

### TRANSPORTATION

One of the greatest needs for the proper operation of the supply department is adequate transportation facilities, and this has generally been neglected. Supply trains (not supply cars) should be used to connect up the storehouse with the users on the line. This is the only way supply officers have of knowing that materials and tools are giving proper service, and what is actually needed to do the work, and the only way that users of the material can be assured of receiving what they need, and come in personal contact with the sup-

ply department. For this reason, the supply train is fundamental to any supply department organization.

#### STORE DELIVERY

Delivering material to the users is the connecting link between the storehouse and the men that use the material in the shops. It is the only way that storekeepers can know that proper materials and tools are being provided, and only in such quantities as are actually required. It places the storehouse employees in personal contact with the work, eliminates friction between employees of different departments, foremen, etc., and makes the continuous chain, and is, therefore, fundamental.

#### SECTIONAL ARRANGEMENT OF MATERIAL

The sectional arrangement of material is based on grouping material of the same general class in sections, and placing it in charge of one man, who will be responsible for ordering, checking, inspecting and putting it away, as well as packing and delivering for shipment; or, in other words, handling it from the time it is ordered until it is issued. The section storekeeper is the one man that should know more about the quantity, quality and use of material in his section than any single individual on the railroad. He unconsciously identifies all material in his section and its location with the description and quantity as shown in his stock-book, and vice versa. Materials should be grouped for economical handling and not for accounting purposes.

#### STOCK BOOKS

The stock book is the catalog and bible of the storekeeper combined. It must accurately and technically describe each and every item. It must show the average monthly consumption of the previous year, the amount on hand the first of each month by actual count, the amount used and received by months, and is the basis of all estimates of advance requirements for materials.

#### RECLAMATION

I have often been asked the difference between reclamation and repairs. Theoretically, there is little. Repairs is putting a thing in shape to perform further service. Reclamation is the reclaiming of something that has been discarded as unfit for further service. In theory, nothing should be removed until it has performed its full service, and everything so removed should be repaired and put back into service where it is. In practice, however, this is not done. Enormous quantities of materials are removed before they have performed their full service; large quantities of materials are not repaired that could be repaired and made to give better service; so that reclamation must necessarily include the recovery of all useful materials, no matter for what reason it was discarded. Both reclamation and repairs are fundamental to the supply department for the reason that they furnish a source of supply and reduce the net cost for materials.

#### ACCOUNTING

The accounting for all material should be done by the supply department for the reason that they must know at all times what their receipts and expenditures are in order to control their business. The only way material can be accounted for accurately and economically is on the ground, and the fact that the supply department is responsible for all materials and supplies from the time the requirements are made until used or disposed of as salvage, makes the matter of accounting not only fundamental, but absolutely necessary.

#### The Stock Book and Store Department Efficiency

U. K. Hall, general storekeeper of the Union Pacific, read a paper on the stock book and its importance in stores work, an abstract of which follows:

The store departments on our railroads were created for the purpose of furnishing material when and where needed, with a due regard to the amount of capital invested, to conserve material, and to utilize to the best possible advantage, all material once secured. In order to carry out these functions, we must above everything else have an organization and such records that will give us at all times a complete knowledge of all the items on hand and on order and such a record that will quickly determine any article, surplus or not moving.

The stock book is the one form or operation above all others that will tend to achieve this end. By its use the storekeeper will have at all times such a knowledge of every item on hand and on order, and a perfect control of them. This condition is brought about by a count once each month of all items in stock (and by all items is meant not only material and supplies for the maintenance of equipment, but maintenance of way and all other departments). The total of these supplies and the quantity already on order as well, are recorded in appropriate columns, thereby showing at a glance the exact condition of stocks.

The benefits of this stock book in its relation to store department efficiency are so numerous that it is difficult to enumerate them all. Some of the fundamental purposes, however, other than this complete record and knowledge of all material on hand and on order, are as follows: It brings quickly to light, at least once a month, all articles in stock that are not moving. On checking items monthly, any storekeeper noting any article that is not being disposed of naturally starts an investigation, with the result that, providing the material is not held for some specific purpose, it is transferred to some point where it can be put into actual use.

It gives a complete record of every article in stock, so that the storekeeper is in a position at any time to follow the movement and consumption of any article or group of articles, month after month, and therefore is enabled to maintain his stock intelligently. All items of material received from sources other than purchases should be entered, such as material reclaimed, picked up from scrap, received from the shops, etc. The stock book will then give a complete debit list of all items received throughout the year.

By having the stock book written up in the general storekeeper's office according to a sectional arrangement—on the basis of storing together items used for the same general purpose and storing material as far as practicable in the order of the items thus entered—the same general scheme of storing material in all branches of the department is insured. Accordingly, when it is found necessary or desirable, as it always is, to transfer employees from one store or location to another, they are thoroughly familiar, immediately upon their arrival, with the new conditions. This tends to bring about what might be called a standardized system of stores.

By writing these books in the general storekeeper's office from a master copy it does not mean that the same sized book must be used at all points, but the items as selected for the smaller stores should be taken from the first or master copy used in the larger stores, thus insuring also a uniform description of all articles from all stores.

Well kept stock books allow the general storekeeper, traveling storekeeper, or store inspector, scientifically and accurately to check the material situation at any point visited.

When section storekeepers, helpers and attendants know that material has to be counted once a month they are far more careful as to how the material is sorted, stored or piled, as actual monthly counts cannot be made unless material is kept in such a condition as to allow a prompt and correct count and such care therefore brings about far more desirable working conditions.

To obtain the very best results from the use of stock books, all entries of material on hand, on order, and quantities required, should be made by the section storekeepers or stock men (subject to such check by the local or general storekeeper as desired), as they are in constant touch with the entire situation affecting the material in their respective sections and they are also thrown in daily contact with the users of the material as well.

Some roads use a stock card or ledger on which is entered all of the receipts and issues. Such a system is objectionable, however, because its accuracy depends upon the issuance of material by numerous parties, helpers, as well as office clerks, and it merely shows the condition that is supposed to exist. The only system that can be absolutely depended on is one where the material is actually counted and the results found at once entered, thus showing the conditions as they actually are and not as they are supposed to be.

As the use of the stock book develops, greater benefits can be obtained by installing in the general storekeepers' office a consolidated stock book, in which copies showing the result of the stock taking at all stores are entered. Thus by checking the purchase requisitions against this record the general storekeeper is at all times in possession of knowledge that material ordered is not on hand anywhere on the line in sufficient quantities to make the purchase unnecessary. Such a system is without question warranted on any road having a large number of district, division or even large local stores. Without its use such roads are constantly making purchase requisitions for articles already on hand.

Some roads at the present time realize the needs of a better system for the control of their stocks but hesitate to install the stock book system because they fear the cost of operating it. We all know, however, that first expenditures often result in ultimate large economies and in no operation of the stores department organization does this so aptly apply as to such stock records.

The use of the stock books is so practicable that when a road has put them into use no inducement can be brought to bear to have the practice discontinued. Without them the general storekeeper or any supply department official is merely groping in the dark in depending upon the skill of any individual in the upkeep of his stock, whereas, by the scientific use of stock books a system is built up that is not dependent upon any one or any number of individuals, but prepares a record that is on hand at all times and which will always reveal the true conditions existing.

### Inspection, Use and Handling of Lumber and Crossies

M. E. Towner, manager, Forest Products Section, United States Railroad Administration, gave a review of the organization of the Forest Products Section, Central Advisory Purchasing Committee of the United States Railroad Administration, in its relation to the War Industries Board and the lumber manufacturers. The development of the new standard specifications for crossies which reduced tie requirements to five sizes was dwelt upon in some detail, as were also the principles evolved by the Central Purchasing Committee for the purchase of ties by the railroads. This subject was also considered from the standpoint of its relation to the conservation of lumber, prices and payments and particularly to the relation of the tie contractor to the Central Purchasing Committee, a matter which has been a subject of no little contention for some time. Considerable space was also devoted to the matter of tie treatment and the economies which have been secured through the proper application of preservative processes.

The subject of lumber and lumber purchases was also treated in some detail and the following is abstracted from

the portion of the paper devoted to lumber specifications and grades:

### Lumber Specifications and Grades

The stores department will be much interested in the ordering of lumber properly specified for the use intended, and the widest possible variance is now the practice, as comparing what one road obtains as against what another finds proper for a given service. The quite general practice of ordering "special cutting" or special sizes as at present employed, results in relative high first cost and manufacturers in considering the bids of one road we know of in yellow pine, add \$5 per 1,000 ft. to their railroad schedule. Another road is referring to grades which have not been published nor even manufactured for seven years. What this road gets is known, and they pay for it. One road on hardwoods has cut its items down over 150.

Much lumber, purchased particularly through some sources, is placed at mills at from one to three grades below original order, and it is known to what destination this lumber can be safely shipped. Lumber shipped to one point on a road is often different in grade than that shipped to another point on the same road. Accepting lumber below grade at an arbitrated price, only results in accumulating off stocks, and results in using and handling expense. The shipper of standing also very soon knows what road is trying to "put it over" by improperly degrading at destination, and such road loses rather than gains by such a practice.

The "keeping the lumber coming plan" is less apt to bull the market, nor does it tie up as much money in lumber stock. During the war period, the Railroad Administration declined to purchase all of its yellow pine and fir lumber through the War Industries Board, only placing through that Board—Director of Lumber and Pine Bureaus—such orders as would come from the mills commandeered as to output, the other requirements being purchased on bids by railroad purchasing forces, at not above government fixed prices.

Under present conditions, purchasing forces place their business through competitive bid, copies of orders for yellow pine being sent to J. H. Lauderdale, special representative at New Orleans, and for fir to O. H. Wood, special representative, Seattle, Washington. Through this practice the representatives as stated, can get behind the deliveries, assist in better distribution of orders, prevent overloading of some mills, and overlooking of others, and keep the purchasing agents advised as to market conditions.

### Accounting

The report of the accounting committee was read by J. H. Waterman (C., B. & Q.), chairman. It follows in part:

The committee has considered the accounting in values only which is all that is involved in obtaining the values of such material both in stock and as used and in compiling reports for the general accounts. In order to properly account for material, the following general rules should be observed.

#### GENERAL SUPERVISION AND ACCOUNTING

1. All material stocks wherever located should be carried in the accounts of the store department which will have supervision over all and will handle the accounting.
2. All material purchased for or returned to stock will be held in the store department accounts until issued for immediate or current use or reported as used.
3. Detailed accounting should be performed at the local, division or district store or in the general storekeeper's office, under the general supervision of the auditor.
4. The departments making requisitions on which material is to be furnished by the store will show correct accounts chargeable. Store department accountants should be thoroughly famil-

far with I. C. C. instructions and see that they are observed.

5. The compilation of primary operating, construction and all other accounting reports will be handled by the store department as a matter not only of convenience but of economy and efficiency.

6. To make proper comparisons, all railroads should use the same material classification. The Railway Storekeepers' Association has approved a standard classification which, with a few modifications, we recommend be put into effect as soon as practicable.

7. We recommend that a standard loose-leaf price book be used. Actual prices should be used as far as practicable, but where they are not practicable, the average or last price should govern.

#### ACCOUNTING FOR MATERIAL RECEIVED

8. All bills payable should be checked against the receiving records and certified as to the receipt of the goods in proper condition.

9. Make all proper deductions from bills payable on account of transportation charges paid by the railroad and chargeable to the shippers to equalize the F. O. B. points or terms of delivery.

10. Check all deductions on account of cash discounts.

11. Make all proper deductions on account of credit memoranda received from dealers for the return of empty containers, etc. If necessary, such credit memoranda may be covered by regular bills collectible instead of deducting the amounts from original bills payable.

12. Make all necessary and proper deductions on account of shortages, erroneous shipments, loss and damage, non-compliance with specifications, inspection and test failures, etc., chargeable to the shippers and agreed upon by the departments' concerned.

13. Make all proper additions on account of over-shipments, errors in weight, etc., which may be agreed upon between the purchasing and store departments.

14. Verify all computations and make any necessary corrections on account of errors.

15. Classify the items and amounts on bills according to the Railway Storekeepers' Association classification and take into the material accounts. Bills payable will then be forwarded for voucher.

16. All freight bills, express due bills and other documents representing transportation charges paid by the railroad should be classified and taken into the material accounts. If to be paid by the shippers, they should be deducted from the bills, or credit taken by rendering bills collectible in accordance with terms of purchase. If to be borne by the railroad they should be included in the cost of the material based on F. O. B. points.

17. Transfer requisitions from other divisions or stores for material and supplies transferred from one stock account to another, should be taken into account as classified; after which they should be passed to the storekeeper for check against the receiving records and certification as to the receipt of the goods.

18. Transfer requisitions should be verified as to computations.

19. All overages, shortages, errors in computation and other differences should be taken up after transfer requisitions have been taken into account, adjusted by counter or additional transfer requisitions, if necessary, in the succeeding months' account.

20. Material issued from stock to the shops in connection with shop orders for the manufacture of other material or articles, should be transferred from the original classes to the class "Material in course of manufacture."

21. All released new, second-hand, and scrap material should be turned over to the store department and material accounts charged currently on basis of agreed prices, resulting in corresponding credits to operating expenses and other accounts.

#### ACCOUNTING FOR MATERIAL ISSUED

22. Values of material and supplies issued for immediate use will be compiled by the store department by primary operating and other accounts, segregated and designated as required by the I. C. C. and auditing department instructions.

23. Transfers of material and supplies to other store stocks will be accomplished through the medium of transfer requisitions, values to be based on current stock prices.

24. Such transfer requisitions against other stores will be classified and credited to the accounts of the shipping store.

25. Charges from shops to the material accounts for labor expended on "Material in course of manufacture" on shop orders, should be taken into store accounts under the class "Material in course of manufacture," and accounted for the same as other debits to material accounts. Upon the completion of the order the total cost of the manufactured article should be in turn transferred from class "Material in course of manufacture" to the proper class.

26. Material and supplies sold to individuals and companies on the basis of sale orders from the purchasing department should be accounted for by the rendition to the auditing department of bills collectible based upon the prices and terms of delivery quoted on the sale orders.

#### CLASSIFIED STATEMENT OF MATERIAL RECEIVED, ISSUED AND ON HAND

27. All debits and credits being classified in accordance with Railway Storekeepers' Association classification of material, a monthly statement should be compiled by the storekeeper showing amount on hand first of month, the receipts, the issues, and the balance on hand at end of month, by material classes.

28. This statement will show values only, except where the management desires to have the quantity shown.

29. The balance on hand in the accounts of an accounting store should represent the balance on hand first of month, plus the values of the purchases, including freight charges, and receipts from other sources, less the issues and transfers to other stores and material sold.

30. The material accounts should be held open after the end of each month a sufficient length of time to permit entering in that month's accounts, all bills payable for material and supplies received, and all requisitions covering material and supplies issued during the same month, in order that the accounts may reflect, as near as possible, the actual value of stock on hand.

#### GENERAL

31. Loss and damage to material in transit between stores should be accounted for by the consignee store taking into account the transfer requisitions and disposing of the value by obtaining relief in accordance with existing rules of freight claim and auditing departments.

32. Loss and damage by fire or other causes to stock at stores, unless covered by insurance claim, should be taken up by the accounting store in accordance with auditing department instructions.

33. When material becomes obsolete, the account that would have been affected by the use of such material should be charged with the difference between the stock values and the amounts received from its sale.

34. Store department prices should consist of cost prices less any discounts, plus any proper transportation charges and cost of inspection.

#### INVENTORIES

35. Inventories of all material and supplies, including scrap should be taken periodically, at such times as prescribed by the auditing department.

36. The method of arranging and taking inventories should be in accordance with the instructions given in Part X, Sectional Book of Standard Rules, of Railway Storekeepers' Association.

37. The prices applied to inventories should be current prices.

38. Material and supplies in transit between stores at the time inventory is taken, should be listed on separate sheets of the inventory, as an exhibit to be added to the amount of material and supplies on hand.

39. Material and supplies on hand when inventory is taken and included therein, or which may have been issued prior to taking of inventory and charged out, but for which purchase bills payable have not been rendered and taken into account, should be listed on a separate sheet of the inventory from the open items on the record of material ordered and received, to be deducted from the gross amount of material on hand.

40. Transportation charges that may have been included in the cost of material and charged out prior to completing the inventory, or included in the cost prices on the inventory, but

not taken into account prior to closing the inventory, should be listed on a separate sheet to be deducted from the gross amount of the inventory.

41. These statements should be prepared by classes of material and added and deducted from the appropriate classes on the summary of the inventory.

42. The net amount of the inventory, after necessary additions and deductions are made, should be the basis for adjustment of the material and supply accounts, which will be handled in accordance with auditing department instructions.

The report was signed by J. H. Waterman, chairman, (C., B. & Q.), U. K. Hall (U. P.), H. E. Ray (A. T. & S. F.)

### Good Work of Association Recognized

George G. Yeomans, member of the Central Advisory Purchasing Committee of the Railroad Administration, delivered an address in which he commended the association for its excellent work, and urged close co-operation with the central administration at Washington to the end that further efficiency may be effected in the conduct of railroad stores departments generally. He stated that the Railroad Administration had seen fit to recognize and adopt the standards for tinware which were originated by the Railway Storekeepers' Association. Likewise, the association's classification of scrap materials, revised in conjunction with a committee of the American Iron and Steel Institute, has been approved and adopted as standard by the Railroad Administration. The classification of material and the book of rules setting forth the best elementary methods of railway storekeeping, which are the work of the association also, have been made standard practice, and, finally, the advantages of relieving the users of material from the responsibility attendant upon its procurement, care and distribution, have been recognized and the purchasing and stores departments on the railroads under federal control are being organized to that end under the direction of the Division of Finance and Purchases.

One of the most astonishing features of the present situation, he said, is the lack of definite information concerning the material which is in the possession of a large majority of the railroads.

Three elements enter into all information upon which any successful business must be founded. It must be recent, it must be reliable, and it must be readily available. If any of these three elements are lacking the information is valueless. In this connection Mr. Yeomans strongly urged the conscientious and intelligent use of the stock book, which is now being introduced by regional stores supervisors on those roads on which it was not in effect. He pointed out that the stock book has been recommended in rules laid down the Storekeepers' Association, and that there is, therefore, no excuse for an indifferent or unsympathetic attitude by members. He asserted that the railways of this country spend more than one billion dollars every year for the material that they use, and of this amount it is safe to say that at least 5 per cent is spent because of the lack of proper information.

### Unapplied Material

The committee on unapplied material presented recommendations on the systematic upkeep and control of materials and supplies not now under the immediate supervision of a representative of the stores department. The report brought out the fact that of the entire material stock on our railroads which is now about six hundred million dollars, approximately forty per cent is distributed or scattered along the line of roads and that in many instances no complete stock record is being kept of such unapplied or unused line stock. Following the introduction to the report which was read by W. D. Stokes, assistant general storekeeper, Illinois Central, a number of pictures were reproduced on a screen to illustrate how a large part of the line stock is scattered on some of our railroads. These illustrations indicated the obvious need of some systematic upkeep and control of such material.

The discussion of the report by several members of the association finally resulted in its being referred back to the committee with instructions to eliminate from the report all recommendations which might conflict in any way with the association's standard book of rules or its recommendations on accounting.

### The Operation of a Large Army Supply Depot

The management and operation of a huge supply depot was outlined to the members of the association by Brig. Gen. A. D. Kniskern of the United States Army. He traced the rapid development of the United States supply depot at Chicago from one of very small size, which was used largely for the storage of canned and cured meat, to a depot of exceedingly large size handling all manner of supplies which had to do with the personal needs, comfort and care of our soldiers as well as the payment of the men. His work not only had to do with the handling of stores but also the purchasing of supplies.

General Kniskern asserted that the tonnage handled under his supervision in November was 71,250,000 tons inbound and 104,729,000 outbound, involving the use of 200 cars per day. His organization consisted of 169 officers, 1,200 clerks, 9,000 civilian employees and 250 enlisted men. An invitation was extended to the members of the Railway Storekeepers' Association to visit the large new supply depot on Wednesday afternoon and arrangements were made to transport the party to and from the depot by army automobile trucks.

### Other Papers

J. G. Stuart, general storekeeper of the Chicago, Burlington & Quincy, read a paper on the Conservation and Reclamation of Materials which included many excellent recommendations based on actual experience. Discussion brought out the fact that it was quite essential to know whether the cost of reclaiming material was less than the cost of the same material new. In mending broken and worn parts of material by means of the acetylene or electric arc welding apparatus the discussion brought out the fact that it was essential that those employed in making the weld should be thoroughly trained in the art in order to accomplish the best results.

W. F. Jones, general storekeeper of the New York Central, read a paper on Scrap and Scrap Handling which covered much the same field as Mr. Stuart's discussion.

H. E. Ray, general storekeeper of the Atchison, Topeka & Santa Fe read a paper on The Conservation of Freight Cars which was an amplification of a report by the Committee on Conservation of Equipment of the association which was published in the *Railway Age Gazette* of March 23, 1917.

A paper on Labor and Labor Saving devices, Trucks and Tractors was presented by D. C. Curtis, Chicago, Burlington & Quincy. The discussion developed information as to the savings made in using power trucks for the transportation of material in storehouses and between points varying from a distance of 200 feet to several miles. In one instance \$100 a day was saved in transporting store supplies from one storehouse to another one four miles distant; two trucks were used. The fact was emphasized that good roads are essential in order to obtain maximum economy.

### Other Business

The attendance at the meeting was about 700, including 462 registered members. The following officers were elected: President, H. S. Burr, superintendent of stores, Erie; first vice-president, E. J. Roth, manager stores section, U. S. Railroad Administration; second vice-president, H. E. Ray, general storekeeper, Santa Fe; third vice-president, E. J. McVeigh, general storekeeper, Grand Trunk; secretary-treasurer, J. P. Murphy, general storekeeper, New York Central.

# The U. S. Standard Light Mallet Type Locomotive

2-6-6-2 Wheel Arrangement with Weight on Drivers of 358,000 lb.  
and Tractive Effort, Compound, of 80,000 lb.

THE FIRST OF THE standard Mallet type locomotives designed by the United States Railroad Administration has recently been turned out by the Schenectady works of the American Locomotive Company, for delivery to the Chesapeake & Ohio. The locomotive is of the 2-6-6-2 type and is the lighter of the two standard Mallet types, of which orders for 50 were placed in 1918, 30 of these being of the lighter type and 20 of the heavier type.

The locomotive has a weight on drivers of 358,000 lb., 2,000 lb. less than the maximum permissible within the axle load limit of 60,000 lb. The cylinders are 23 in. and 35 in. in diameter by 32 in. stroke and the locomotive is designed to deliver a tractive effort of 96,000 lb. simple and 80,000 lb. compound. In the table will be found a comparison of the principal dimensions and data for a number of Mallet locomotives of the 2-6-6-2 wheel arrangement, of which the standard locomotive is the heaviest both on drivers and in total weight.

COMPARISON OF RECENT MALLET LOCOMOTIVES OF THE 2-6-6-2 TYPE

Name of road.....	U.S. Std. 1919	B.R. & P. 1914	N. & W. 1912	C. & O. 1911

Firebox heating surface ÷ equivalent heating surface,* per cent .....	5.6	6.0	5.3	6.1

\*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

The boiler has an outside diameter at the first ring of 90 in., increasing to 95 9/16 in. at the fourth ring just forward

into the barrel of the boiler 84 in. from the throat sheet, making the tubes 24 ft. long. It is fitted with a Security brick arch carried on five arch tubes and is fired by a Standard stoker. The fire door is of the Shoemaker power operated type and the grates are operated by Franklin power grate shakers. The boiler is fitted with the Locomotive Superheater Company's Type A superheater with 45 units.

In general the detail design of the frames follows that of all the other standard type locomotives which have been built. The top rails for both high and low pressure units are 6 in. wide, with a maximum thickness of 5 in. over the pedestals and a minimum thickness of 4 1/2 in. The lower rails have a maximum and minimum thickness of 3 1/2 in. and 3 in. respectively. The high pressure frames are designed with splice joints at the rear for attachment to a Commonwealth frame cradle which includes in one casting the frames, rear deck plate and trailer equalizer fulcrums. The high pressure cylinders are supported on a single front rail which is cast integral with the main frames.

The low pressure frames are designed to receive the articulation joint, which is of the Baldwin universal type, hinged for movement about a horizontal axis transverse to the center line of the locomotive and provided with a ball joint pin connection at the high pressure unit end. The low pressure cylinders are supported by double rails, both of which are bolted to the main frame. The frames of both units are spaced 41 in. from center to center, while the cylinders have a spread of 85 in. Owing to the size of the low pressure cylinders the face of the lower rail bolting flange is only 20 1/2 in. from the center line of the locomotive, thus requiring an offset in the front frame rail. This is provided by bolting the front rail to the inside face of the lower rail extension of the main frame and reducing the lateral thickness of this section to 3 in. where it is joined under the cylinder to the front rail. The section of the extension under the cylinders is 11 in. deep, while that of the front rail has a verti-

Railroad Administration Standard 2-6-6-2 Type Locomotive

of the firebox. The dome is located on the second ring from the front, 110 15/16 in. from the combustion chamber tube sheet. It is placed over an opening in the boiler shell 31 in. in diameter, is 9 in. high and has an opening 25 in. in diameter. The dome cap used on this boiler is interchangeable with those used on all other types of standard locomotives. The shell seams are located on the top center line of the first course, on the right side 11 9/32 in. above the center line of the boiler for the second course, on the left side 11 1/2 in. above the center line for the third course, and on the right side 37 1/8 in. above the center line for the fourth course.

The firebox has a combustion chamber extending forward

cal thickness of 7 in. The upper front rail is bolted and keyed to the top of the main frame over the front pedestal. The section of the main frame here is 13 in. deep with horizontal slots cored for the splice bolt nuts which come directly over the pedestal. The front rail has a section 6 in. wide by 5 1/2 in. in thickness.

The cylinders and valve chambers throughout are bushed with Hunt-Spiller gun iron. In the design of the high pressure cylinders is incorporated the Mellin intercepting valve which completely controls the admission of steam, either exhaust from the high pressure cylinders or steam direct from the boiler, to the low pressure receiver pipe. Piston valves are employed with both the high and low pressure cylinders.

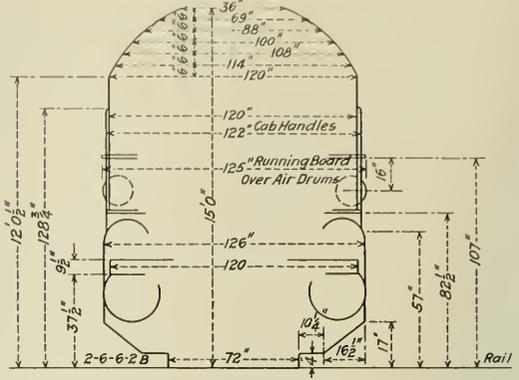

These valves are 12 in. in diameter and have a maximum travel of 6 in. The valves for the low pressure cylinders are double ported while those for the high pressure cylinders are the same as are used on the 0-6-0 type switchers. The front valve chamber heads on the 2-6-6-2 type locomotive interchange with those on all other standard types and the back heads are interchangeable with those in use on the 0-6-0 type switching locomotive.

The high pressure piston specifications call for either rolled or cast steel of dished section, while for the low pressure pistons the center of which has a diameter of 30 3/4 in., exclusive of the bull ring, cast steel only is specified. Hunt-Spiller gun iron bull rings and packing rings are used on both high and low pressure pistons. The design of the crossheads is the same in detail as that employed on all previously built standard locomotives, and is interchangeable with that on the 0-6-0 switchers. Paxton-Mitchell packing is fitted both on the valve stems and piston rods. Steam distribution is controlled by the Baker valve gear and the Chambers back head type throttle. The locomotive is fitted with a Lewis power reverse gear.

The driving journals throughout have a diameter of 11 in. and are 13 in. long. The driving boxes are interchangeable on all journals, except that the crown brass for the main journals is finished with a clearance of 1/100 in. instead of 1/32 in. The same driving box is also used on the heavy Mountain type locomotive, with the exception of the main journals, and on the main journals of the light Mikado type locomotive. The axles of the 2-6-6-2 locomotive are the same as those having the same journal sizes on the heavy Mountain type. The engine truck is of the constant resistance type and the trailer truck is of the Cole-Scoville type.

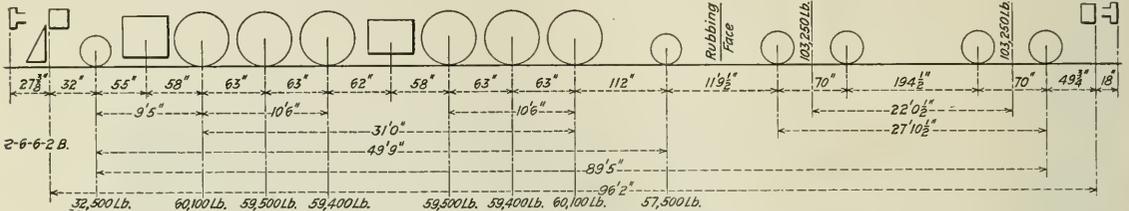

The tender tank has a water capacity of 12,000 gallons and a coal capacity of 16 tons. It is carried on a Common-wealth cast steel frame, and is one of the three standard types which have been designed to meet the requirements of all of the standard locomotives. The trucks have cast steel side frames and are of a design which is used on all the standard freight locomotives. The Unit Safety drawbar and Radial buffers are used between the engine and tender.

Wheel base, total	49 ft. 9 in.
Wheel base, engine and tender	89 ft. 5 in.

# Business Association Addresses Mr. Hines

Emphasizes Importance of Keeping at Work Industry Having 3,000 Concerns with 1,750,000 Employees

**P**RESIDENT ALBA B. JOHNSON of the Railway Business Association on Monday of this week addressed to Director-General Hines an extended communication in which he has requested the director-general to acquaint Congress with the extent to which the proposed capital outlays for 1919 would keep at work employees now or recently on the payrolls of railway supply industries and to recommend to the appropriation committees of the Senate and House an enlargement of the budget for improvements. In his letter Mr. Johnson has shown that the railway supply industry of the country includes from 2,000 to 3,000 firms, having in normal times about 1,750,000 employees and has emphasized that the withdrawing from the market at present price scales with the maintenance of wage scales as requested by the Secretary of Labor will mean but one thing—unemployment and resulting ill-effect on the industry itself as well as its extensive related industries. The Railway Business Association in presenting the letter to its members has suggested further, that the members and others interested can aid in the accomplishing of the recommended policy by Congress if they will propose embodiment of reference to it in resolutions of business organizations urging an extra session and prompt action relating to transportation.

The communication to Director-General Hines follows:

Pursuant to action taken by the Railway Business Association, a national organization of manufacturing, mercantile and engineering concerns which deal in railway accessories, at its annual meeting in Chicago, January 9, it devolves upon me as president of the association to address you upon the subject of additions and betterments during government control.

We have noted with gratification and hope the following paragraph contained in your letter of January 24, addressed to the secretary of the treasury:

## To Stabilize Industry

*"It is highly important that adequate funds for these purposes should be provided so as to give the Railroad Administration a reasonable margin for encouraging the making of such railroad improvements as may seem justifiable from the railroad standpoint, especially since such improvements will aid in stabilizing the general industrial situation."*

You indicate a purpose of effecting additions and betterments during government control with assent of the railroad corporations.

## An Intermediate Step

Events have shown that an intermediate step by the government is essential if general industrial conditions are to be stabilized through railway additions and betterments subject to corporate assent. That step is an adjustment of the cost so that the corporations having income based upon that of 1915-17 will not be charged with equipment or other construction acquired at war price levels. Railroad purchases have been cut to the bone. Cancellation of railroad orders has been general. Unemployment in the railway supply industries has already become serious and is spreading. Shops have begun to close down. Soldiers are coming home in quest of positions, and in the midst of a universal desire to re-employ them they are confronted with diminishing instead of enlarging opportunities for work.

On the other hand manufacturers are faced with a demand by organized labor and by a large part of the public, includ-

ing the Secretary of Labor, to maintain our organizations and wage-scales. Obviously with the Railroad Administration withdrawing from the market at the current price level and the Secretary of Labor appealing to us to maintain the wage-scale which determines that price level something must give way; and what is now giving way is employment.

The Railway Business Association at its annual meeting in Chicago, January 9, adopted the following resolution:

## Additions and Betterments

*"During the period of government control additions and betterments should proceed with vigor and foresightedness. Discretion should be permitted the railway corporations in determining the design and amount of facilities which they will acquire. The government should provide for corporate co-operation in projects for terminals, way and structures, so as to promote joint use and an avoidance of needless duplication. The government should make such allowance in terms of purchase that the corporations will not carry the whole burden of war prices while their income is based upon that of 1915-17. Government loans should be funded for such periods and at such rates of interest as will give each carrier reasonable opportunity to discharge all financial obligations to the government."*

While properly ordering your course from the administrative point of view, may you not appropriately lay before Congress the dilemma in which the equipment industry is placed and suggest that Congress recognize the wage and price situation as an outgrowth of the war which requires a part of the cost of railway additions and betterments to be absorbed not by the corporations, whose income has stood still, but by the federal treasury?

## Government and Unemployment

General business depressions in the past have been accentuated and prolonged by the cessation of railway purchases, while general business prosperity has been enlarged and protracted by resumption and continuance of railway buying. One of the advantages claimed for government ownership and operation of railroads has been that in time of unemployment the public credit would permit the prosecution of projects giving employment to men otherwise idle. If there ever was a time when the use of public credit was justified for maintenance of employment, it is now when an army of young men is being demobilized in the midst of industrial depression. Yet the government itself through the Railroad Administration is postponing every expenditure that can be postponed.

## Returning Soldiers

It is announced that soldiers not yet re-employed in civil life will be retained in army service until they find work. This will involve continuance of soldiers' pay and families' allowances as well as maintenance of the soldiers in camp. The government thus commits itself to expenditures for the object of relieving or mitigating the privations incident to readjustment. Would not there be even complete justification for government expenditure to employ men in the production of railway facilities? Even though the high industrial wage scale compels a higher range of prices than the railway corporations ought to be asked to pay, and though the government therefore must defray the excess over normal costs, the man placed or kept upon the payroll would

be engaged, unlike soldiers at camp, in producing instrumentalities of industry and commerce. The country will live to deplore any present neglect of provision for future traffic needs. Losses due to restricted transportation facilities in a period of great activity might easily be greater than the cost of stabilizing employment now by carrying through a budget of additions and betterments approaching in extent the provision made in some years of the past.

### A Million and Three-Quarters

We speak for a group of industries estimated to have employed when times were good about one and three-quarters enlargements of plant. They have been employing greatly increased numbers of men and women. They are now equipped with plant and people in substantially larger numbers than the estimate given above ready to work upon the production of railway supplies if ordered.

Railway purchases ramify into almost every conceivable commodity. The group of industries which our association serves is believed to number between 2,000 and 3,000 concerns whose product wholly or to an important extent is consumed by railways or by other concerns making goods for railways. These companies maintain principal or branch plants in practically every state in the union, in some cases several in a state.

This is not all. The influence of railway purchases extends far beyond those engaged in a whole or in part in the railway supply industry. A cessation of railway additions and betterments puts a blight upon a great many other people. It cuts off the greatest single market for iron and steel, lumber and practically every basic staple. It puts a brake upon the great building and construction industry, which suffers when our people cease to build factories, and hence there is no building of homes for employees. It stops the consumption of machinery and other equipment and supplies for mills. By playing havoc with the industrial payroll in many communities where these railway supply plants are located, it knocks the bottom out of retail trade and hence reacts unfavorably upon the whole community and upon industries everywhere which furnish goods for domestic consumption.

### Many Millions Affected

We have already remarked that concerns, the whole or a large part of whose product was for railways, including everything from raw material to finished products, have employed about as many men as the railways employ—or upwards of one million and three-quarters. We have seen that those looking to these industries for livelihood largely increased in number since that estimate was computed. With those dependent upon them the number directly affected aggregates many millions. Add to these the people of the manufacturing communities who are engaged in trade and in making articles which are bought for consumption by those on the industrial payroll, not to mention the stockholders in all these industrial and commercial institutions, and it is evident that the rise and fall of activity in railway supplies is a barometer of the whole national prosperity.

### What Production Is Proposed

As trustees for the stockholders and employees we, the managers of these industries, invite your consideration of certain details of fact.

Stating the conclusion first and the fact afterwards, that conclusion is that the proposed provision for additions and betterments in 1919 expressed in dollars is substantially less than the new capital put into railway improvements even in the years immediately preceding the war, not to speak of years when net earnings were more favorable; and that upon the level of labor and material cost now prevailing the proposed estimate of money would produce very greatly smaller

numbers of equipment and construction units and hence employ proportionately fewer people in the industries than would have been the case in past years.

From the annual statistical numbers of the *Railway Age*, we take the following tables, in each year going back to the date in which that periodical began to tabulate the figures:

MILES OF NEW TRACK BUILT (LINEAR AND MULTIPLE)			
Year	Miles	Year	Miles
1912.....	4,211	1916.....	1,444
1913.....	4,466	1917.....	1,655
1914.....	3,127	1918.....	1,533
1915.....	1,354		

FREIGHT CARS BUILT				(From 1902 to 1907, Inclusive, including Passenger Cars)			
Year	Domestic	Foreign	Total	Year	Domestic	Foreign	Total
1899.....	117,982	1,904	119,886	1909*	91,077	2,493	93,570

\*Includes Canadian output.

†Includes Canadian output and equipment built in company shops.

Terminal construction and improvement seems not to be recorded statistically but the tendency through a period of years would be suggested by the figures for miles of track built.

### A Significant Comparison

Would you not think it advisable to acquaint the appropriation committees of Congress with the extent of proposed additions and betterments in 1919 expressed not in dollars but in units of equipment and plant? A comparison of what is projected with actual additions and betterments in past years would enable Congress to measure the extent to which a \$750,000,000 addition to the revolving fund would in your judgment "aid in stabilizing the general industrial situation." By such a comparison, taking into consideration the current altitude of industrial wages and of prices for material depending upon the wage-scale, Congress would be placed in position to authorize if this is its purpose such railway improvements during government control as would meet future traffic needs on the one hand and employ labor on the other.

### A Question of Legislative Policy

Undoubtedly you will regard this as a legislative question; a policy which Congress should decide and which if authorized it would be your function to administer. Nevertheless the proposal of a five-year extension of government control must necessarily have contemplated some arrangement by which the corporations could acquire title to new property upon terms equitable to them. May we not suggest that you recommend such adjustment for adoption forthwith?

**The Canadian National Railways** on Prince Edward Island, which are narrow gage, are having a third rail laid on about sixty miles of the more important sections of the lines on the island with a view to running freight cars from the continent through to the principal places on the island. Standard gage freight cars are taken to the island by a car ferry between Cape Tormentine, N. B., and Borden, P. E. I.; but freight for inland points on the island has to be transferred at Borden into narrow gage cars.

# Use of Treated Timber in Car Construction\*

## Influence of Decay on Life of Wooden Car Parts; Methods of Treating and Results Secured

OVER TWO BILLION feet of lumber and timber are used annually for the maintenance of railway freight equipment and for the construction of new cars. This represents an annual outlay for material alone of approximately \$60,000,000. To this must be added, of course, an even greater expenditure for labor, steel and other material. With a view of ascertaining the service which untreated wood has given in this character of construction and with the desire also to learn to what extent it has given added service in specific cases through wood preservation, and to what extent economy would be developed by the general adoption of the practice of wood preservation, and further, as the subject is of very pertinent interest at this time, the committee felt it advisable to make this study a subject of special investigation, both through the medium of a questionnaire to all car builders and by means of personal study.

The preliminary investigation developed that there was very little information available on this subject. As it was felt that it was a matter of great importance, and that it should be gone into thoroughly and fully, a questionnaire was prepared and sent to the members of the Master Car Builders' Association.

The questionnaire covered the following information, which, it was felt by the committee and collaborators, was necessary to a thorough fundamental study of the subject:

For Car Construction—(a) Availability, cost and quality

conditions are that conditions favorable to decay vary with the type of car, it being most predominant in refrigerator and stock cars, less in gondola and flat cars, and least in box cars.

Question 2. What portions of these various types of cars are most affected by decay? (i. e., where is decay the direct cause for replacements and repairs, or indirectly the cause of mechanical failure due to the weakening of certain parts re-

TABLE 2.—SUMMARY OF REPLIES TO QUESTION NO. 2 (a)

a—Underframe—Parts repaired or replaced due to decay previous to the expiration of the mechanical life. Number of replies referring to each part are given.

Type of Cars	Points of contact are chiefly referred to, i. e., mortises, tenons and enclosed areas

Box.....	2	3	10	..	..	..	..	..	..	..	..

Note—Sixty questionnaires analyzed. Two gave no reply to Q. 2-A.

TABLE 1 SUMMARY OF REPLIES TO QUESTION NO. 1

Type of cars	Percentage of Maintenance Due to Decay Grouped According to Expirations of Respondents (Number of Replies Given)					Total Questionnaires tab.
	75 per cent and over	50 to 75 per cent	25 to 50 per cent	Less than 25 per cent	Indicating Considerable loss due to decay	
Ref. ....	11	7	8	3	18	5
Stock ....	4	11	9	9	14	2
Gond. ....	2	9	12	12	13	3
Flat. ....	1	14	7	17	8	4
Box ....	0	7	7	25	9	3

Note—Approximately 77½ per cent of those replying indicate that decay is decidedly an important contributing factor.

(b) Suitability and economy of wood. (c) Factors affecting the physical and mechanical fitness of wood. (d) Importance of the assistance it may be possible to render the nation and railroads by augmenting the car building program by the extensive use of wood.

Eighty-eight questionnaires were returned representing about 75 per cent of the most important railroad systems of the country. Of these, 61 were analyzed and the replies summarized in tables published in the appendix, 21 were discarded for lack of information, and six were too late to be included in this report.

### Results of Investigation

Question 1. To what extent, in general, does decay influence maintenance of all-wood and composite freight cars? (i. e., general observations from practical experience derived.) (a) Refrigerator cars? (b) Stock cars? (c) Gondolas? (d) Flat cars? (e) Box cars?

Over 75 per cent of the replies indicate that decay influences the maintenance of wooden freight equipment to a considerable extent, and only 9 per cent have given it as their opinion that decay is not a contributing factor. The indica-

sulting from attack by decay?) (a) Underframe (name parts)? (b) Superstructure (name parts)?

(a) Over 95 per cent of the replies specify sills and about 90 per cent state that floors or decking of refrigerator, stock and open cars are replaced because of decay. The predominant opinion is that the points of contact are chiefly affected and weakened to such an extent as to cause mechanical failure of the entire parts. (b) Posts and braces, roof boards and siding at the points of contact, appear to be most affected. Other parts mentioned which are subject to failure due to decay are: Running boards, saddles, side and end plates, ridge poles and purlines.

Question 3. What species of wood do you employ for the following parts of refrigerator, stock, flat, gondola and box cars? (a) Draft timbers? (b) End sills? (c) Side sills? (d) Intermediate sills? (e) Flooring? (f) Posts? (g) Siding? (h) Lining? (i) Ridge poles? (j) Purlines? (k) Carlines? (l) Side and end plates? (m) Roof deck?

The prevailing practice is to require oak for draft timbers,

TABLE 3.—SUMMARY OF REPLIES TO QUESTION 2 (b)

b—Superstructure—Parts repaired or replaced due to decay. Number of replies mentioning each part given.

Note—Sixty questionnaires analyzed. Three gave no reply.

end sills, posts and braces. Douglas fir and Southern yellow pine are generally used for all other purposes. The pine predominates owing to the nearness of the plants to the source of supply. In new construction, steel is very largely used

\* From a report presented at the convention of the American Wood Preservers Association held in St. Louis on January 28 and 29.

in center sills, and to some extent for side sills and for draft rigging.

**Question 4.** What service records have you which are available for the study of this subject? (a) Natural life of untreated car materials (name parts).

Ninety-three per cent of the answers stated "No record." The remainder report as follows: Sills, five to eight years; roofs, four to six years; flooring (stock cars), four to six years; posts and braces, six to eight years.

**Question 5.** Have you used treated timber in car construction? If so, state kind and character, species and treatment.

Eighty-five per cent answer "No." Fifteen per cent reply "Yes," representing 10 railroads which have used coal tar preservatives, creosote oil, paint and other proprietary products.

**Question 6.** What has been the experience with treated car material, if any? Please state this in detail, by reference to part and character of service.

Eighty-five per cent of the answers stated "No experience." The balance report varying experience referred to in later questions.

**Question 6-A.** Does the handling of creosoted material in the shops present any labor problem?

Replies from the few firms having experience indicate that labor objects to handling freshly creosoted timber. (The

Over 95 per cent agree that it is both practical and economical.

**Question 11.** Would it be satisfactory practice to use creosoted sills, sub-flooring and roofing for refrigerator cars? If not, why?

Opinion appears to be evenly divided as to whether creosoted material may be expected to contaminate lading, but one firm with several years' experience states that such practice is satisfactory.

**Question 12.** What is the mechanical life of the various types of cars, as follows: (1) Wood? (2) Composite (steel underframe)? (3) Composite (steel center sills only)? (a) Box? (b) Refrigerator? (c) Stock? (d) Flat? (e) Gondola?

It is evident from the character of replies to this question that the respondents had in mind the mechanical life of the car as meaning the full period of its usefulness, from the time of construction to the time the car is "wrecked" or dismantled, as being unprofitable, disregarding the outlay of repairs expended on it or the extent to which reconstruction was necessary at any time. In this case the committee feels a more reasonable definition of "mechanical life" would be the period required in which the expenditure for repairs, with interest, equaled the original cost of the car.

**Question 13.** Would the use of creosoted timber in under-

TABLE 4—SUMMARY OF REPLIES TO QUESTION NO. 3

committee feels that this is not a serious objection as it can be overcome by proper practices.)

**Question 7.** What service records can you give of treated car material?

Ninety-five per cent of the replies give no information, but 5 per cent of the replies give the following records: Reply No. 48. Treated refrigerator car sills in service from three to seven years. Reply No. 30. Treated log car sills in service eight years. Reply No. 26. Treated stock car sills and flooring in service six years. All of the above treated material is still in good condition.

**Question 8.** If creosoted sills are employed for refrigerator, box, stock and gondola cars, can all stenciling be applied to the body of the car?

Fifty per cent of the replies state "Yes" and 15 per cent state "No." The remainder do not reply.

**Question 9.** If creosoted sills are employed for flat cars would it be practical and economical to use metal numerals and signs to replace stenciling?

Over 60 per cent state it is practical. Opinion is evenly divided as to whether it is economical.

**Question 10.** If stock cars are built of creosoted lumber throughout, would it be practical and economical to use sign boards on both sides for all stenciling?

frame and superstructure materially increase the period of mechanical usefulness of all types of cars, or any particular type?

Eighty per cent of replies say "Yes," and 20 per cent say "No."

**Question 14.** To what extent would the use of creosoted sills, flooring, posts, roofing, etc., reduce repairs?

Over 80 per cent of the replies indicate that treatment would reduce repairs. The percentage of saving varies from less than 25 per cent to more than 50 per cent.

**Question 15.** Have you had experience with brush treatment of sills (mortises, tenons, ends, etc.) with coal tar or creosote?

About 65 per cent report having experience with brush treatment. Ten different products were used.

**Question 16.** Have you had experience with treating car material by the open tank system (hot and cold treatment) or by dipping (short immersion) using creosote oil? (a) If so, what procedure was followed in the treatment and what preservative was used? (b) What were the results obtained, and what is your opinion of the value of such treatment?

Less than 10 per cent report experience. Only one employs the standard open tank process and states that "Such

treatment very greatly increases the life of the materials treated."

**Question 17.** Have you employed car lumber creosoted by standard pressure processes? (a) If so, what species? (b) What specifications for treatment and preservative were followed? (c) What have been the results, and what is your opinion of the value of such treatments? (d) Have you used any other method of treating for the purpose of retarding decay? (If so, mention material used with results.)

But one firm reports experience with pressure treatment, having used with satisfactory results, both straight creosote and the Card process.

**Question 18.** To what extent would your shop practice be affected by the introduction of treating processes and what method of preservative treatment would be the most practical, efficiency thereof considered?

The majority feel that shop practice would be affected to a greater or less degree by the adoption of wood preservation, indicating that the introduction of preservative treatment would necessitate at least some changes.

**Miscellaneous Data**

**Question 1.** What experience have you had with the use of "new" species of wood in car building? (e. g., have you used Sitka spruce, noble fir, Western white fir, or other species which are not common?)

The replies showed the new species used for various parts of cars were as follows: Roofing—Western hemlock, redwood, cypress, Sitka spruce, noble fir. Siding—cypress, Sitka spruce, noble fir. End sills—gum. Lining—noble

days' stock whereas those which consume over 40,000,000 ft. per year carry a 12 months' supply of soft woods and an even longer supply of hardwoods. The practice of carrying a year's supply in order that the wood may become properly seasoned before use is to be commended very highly. It is essential that wood be thoroughly seasoned where it is to be given preservative treatment. (a) Replies indicate that the general practice is to store dressed lumber, kiln-dried stock and high-grade hardwoods in sheds. (b) Three-quarters of

TABLE 17—SUMMARY OF REPLIES TO QUESTION 15

Note.—Where the reply stated a term of years, i. e., "from 6 to 8 years," an average of the two figures was used in summary, i. e., 7 years.

fir. Decking—noble fir. Sheathing—Port O cedar. Posts and braces—Sitka spruce.

**Question 2.** To what extent have you used hardwoods such as oak, maple or birch, for flooring in cars subject to excessive mechanical wear? (a) Do you consider the extra life of hardwood parts justifies the expense?

Oak and maple are generally used in ore cars and to some extent in flat and gondola cars. A few firms report use of birch, hickory and beech for such purposes, and a few use pine or fir in these types of equipment. (a) More than 70 per cent of replies indicate that extra cost of hardwood parts is justified by greater life.

**Question 3.** What is the average amount of car stock kept on hand at your shops or yards? (a) Is this stock stored in sheds? (b) What is the percentage of loss from warping, weathering and decay? (c) What difficulties do you have in getting car stock true to grade and properly seasoned? With what species have you had this trouble?

Reports indicate that smaller shops carry from 60 to 90

salvage all material that can be worked over at a profit. The following instances of use for salvaged lumber are given: Old siding and lining cut into roof repairs, grain doors, coal doors, yard and snow fences. Old car sills cut into sill splices, cross-ties, engine wood, shims, car stakes, narrow gage ties, cripple posts, running board saddles, blocking, framing posts. Old roofing cut into yard fencing.

**Question 5.** What is the comparative life of single sheathed and double sheathed box cars of similar weight and capacity?

Three firms report the double sheathed box car has up to 25 per cent longer life than single sheathed. Four firms report single sheathed up to 50 per cent longer life than double sheathed. Four report that the life of the two classes of car is practically identical. The remainder report no figures available.

The report was signed by H. S. Sackett (C., M. & St. P.), chairman; K. C. Barth (Barrett Manufacturing Company), chairman sub-committee on Car Construction; Lowry Smith (N. P.), F. V. Dunham (Southern Pine Association), W. W.

Lawson (T. & N. O.), V. R. Hawthorne, acting secretary Master Car Builders' Association, and S. W. Allen, United States Forest Products Laboratory.

### Discussion

J. H. Waterman, superintendent of timber construction, Chicago, Burlington & Quincy, reported that large quantities of timber had been treated and used in the construction of stock cars during the period from 1911 to 1914, inclusive. Recent investigation at all car repair yards on the system indicated that there was no record of any of these cars having been repaired to date, because of the decay of the treated timber. This treated timber was used for floorings and sills; the average life of untreated timber for these purposes is three or four years.

L. K. Silcox, master car builder, Chicago, Milwaukee & St. Paul, at Milwaukee, urged the treatment of car roofing timbers and the material in stock cars.

J. H. Milton, superintendent of the car department, Rock Island Lines, favored the treating of longitudinal sills, posts and decking for gondola and stock cars, but opposed the creosoting of timber for box and refrigerator cars, because of danger of injury to the lading.

## American Association of Passenger Traffic Officers

THE SIXTY-THIRD ANNUAL CONVENTION of the American Association of Passenger Traffic Officers was held at Baltimore on January 22, following a short session at Washington at which Walker D. Hines director general of railroads, delivered the address which was published in last week's issue. Little business was transacted at the meeting, as most of the subjects which have usually been included in the association's docket are now being handled by the Railroad Administration. Many of the changes in the handling of passenger traffic which have been adopted during the past year, such as the standardizing of ticket forms, baggage rules and other practices, the rule against making Pullman reservations in advance of purchase of ticket and the surcharge for Pullman passengers, which was later withdrawn, originated with the association, which was not, however, able to put them into effect generally because its decisions were only recommendatory. The principal purpose of the meeting was to get the passenger officers together to meet the director general and to give them a better understanding of some of the purposes and policies of the United States Railroad Administration.

O. P. McCarty, president of the association, delivered a brief opening address in part as follows:

"On account of the participation of the United States in the world war and the taking over of the railroads by the federal government the question of abandoning the sixty-third annual convention of this association was seriously considered, but your officers, after conference with the United States Railroad Administration, decided in favor of holding it.

"It is very gratifying to me, and I am quite sure equally so to all of you, that we are able to hold our annual meeting, and to have such a representative attendance.

"This is the oldest railroad organization in the United States, and during its 63 years' existence not a single annual meeting has been missed.

"In its early history it was a legislative body, holding two sessions per annum, at which interline passenger fares were compiled, and rules and regulations concerning the conduct of passenger traffic and allied subjects were considered and adopted. The joint rate sheets of those times were about the size of pages of the present tariffs, and but four to eight

pages covered all the leading points and destinations required for the entire rate fabric of all the railroads.

"In those days the general ticket agents disposed of the miscellaneous subjects on the convention docket, and then adjourned for five or more days until the rate committees' report was completed and ready for submission. Upon the growth of the passenger traffic, the machinery of the association, with two meetings a year, was found too slow, and territorial associations were formed, with more frequent sessions, and the rate making divided into groups covering important districts or cities. Following these changes but one session a year of the general association has been held.

"Under these changed conditions our association is not, strictly speaking, a legislative body with authority to take final action, but through its committees has initiated many reforms, which when referred to the territorial organizations with the endorsement of this association, have been favorably acted upon.

"The interchange of views between members brought together at these annual meetings is educational, and through its committees the association has been of valuable assistance to the territorial committees, and we believe will be to the regional passenger traffic committees as now organized, aside from the social and fraternal benefits. We believe the association has a wide field of usefulness in the future as in the past, and the subjects listed in the dockets should be carefully selected and seriously considered.

"The activities of this association have been exercised through great epochs in the history of our country—notably: the Civil War, the Spanish-American War, and the world war, recently brought to a close. In all of these crises the United States responded nobly to the call, in blood, in money and sacrifices, to maintain the honor and glory of the flag.

"The railroads performed their share with patriotic zeal, and by furnishing the transportation needed contributed largely to the winning of these wars; furthermore, the prompt assembling of troops at the border no doubt prevented a Mexican invasion.

"To meet necessities growing out of the war the railroads were taken over December 28, 1917, and have been operated by the government from that date. Changes in operating and traffic methods were inaugurated for the better movement of troops, war materials, etc.; economies were effected in the consolidation of ticket offices, elimination of outside agencies, reduction in train service, curtailment of advertising, etc. A material advance in passenger fares was also made.

"Some of these changes would have been made by the carriers if they had not been prohibited by federal or state laws. The public have been benefited and service improved in some instances, but when the contrary was the case they have submitted graciously and loyally to a war necessity.

"The officials and employees of the railroads, including those in the passenger departments, have patriotically and faithfully performed the tasks assigned them under the new regime, and whether the railroads are to be operated in the future by the government or by the owners they can be relied upon to loyally do their part. In conclusion let us hope that permanent world peace will come out of the horrors of the past four years."

Officers for the ensuing year were elected as follows: President, W. J. Black, passenger traffic manager, Atchison, Topeka & Santa Fe; Vice-president, W. A. Russell, passenger traffic manager, Louisville & Nashville; secretary, W. C. Hope, passenger traffic manager, Central of New Jersey, New York City; chairman of executive committee, L. F. Vosburgh, passenger traffic manager, New York Central. The other members of the executive committee are T. C. White, G. D. Hunter, Cal E. Stone, Gerrit Fort, Alexander Hilton, J. J. Brown, and W. G. Black.

# Head of State Lines Opposes Government Operation

Sir William Hoy, South African Official, Says It Causes  
Political Meddling and Costly Transportation

GOVERNMENT OPERATION of railways is generally a failure; state ownership with private operation combines the advantages of railway nationalization and private enterprise in the field of transportation. Such is the substance of the opinions of Sir William Wilson Hoy, general manager of Railways and Harbors of the Union of South Africa, as presented in a hearing before the State Mining Commission of that country.

While the subject of the investigation was the proposed nationalization of mines, Sir William Hoy's testimony was presented for the purpose of outlining the experience of South Africa and other countries under government and private operation of railroads. His testimony was especially interesting because of his long experience as a manager of government operated railroads. Although he admitted that differences in conditions—political, geographical and economic—produce varying results under like schemes of management, experience in practically all countries shows that politics persist in creeping into state railway organizations regardless of the statutory or other safeguards applied; that the morale of officers and employees is lowered and discipline seriously disturbed; that exorbitant wage demands are encouraged, over-centralization stimulated and rigidity of policy fostered. While initiative and efficiency are generally found in private enterprises, they are rarely evident in government organizations.

Sir William Hoy's remarks before the commission were in part as follows:

## South African Experience with State Rail Service

The efficiency of officers and men on the South African railways is of a high standard. In capacity, experience, ability and resource they compare favorably with any similar body of men in any railway service or in any private organization. The Union possesses a staff of railwaymen of which any may be proud.

Nevertheless, South African experience indicates that certain disadvantages attach to state services, and that much of the time and energy of the staff are taken up with matters with which no private management would be required to deal. Staff control and discipline in a state concern are so bound up by regulations as to create greater difficulties in handling the staff than are experienced under private management—*vide* the experience of Belgium, where it is said that political considerations have so entered into discipline matters that heads of departments prefer to shut their eyes to many faults rather than risk having punishments they inflict cancelled by the intervention of politicians.

It is difficult under a semi-judicial system efficiently to control a large body of men of different grades, such as employed in a railway service. The service and discipline regulations on the South African railways are elaborate and cumbersome. While there are excellent motives behind these regulations in the direction of preventing injustice and insuring impartial consideration of discipline cases, I am satisfied that fair treatment can be secured to the staff without such elaboration.

In large private railways there is practically the same stability of employment as on a state railway, except that anything in the nature of "slacking" is liable to result in dismissal. In state concerns, however, it is not easy to deal with the man who while not doing an honest day's work carefully steers a course which just keeps him within the regulations. This class of man is fortunately small, and will be found in

any concern, but he is better able to indulge his bent in a state than in a private organization. In short, there is not in state concerns the same elasticity in the control of staff as in private organizations.

On the other hand, with regard to promotion and reward for good work, considerations of seniority play a greater part in a state than in a private concern in governing promotion. A private manager can promote a capable man without regard to seniority, but a state concern has to step guardedly in such matters. It is extremely difficult to demonstrate in concrete fashion that one particular man is more efficient than another, however superior he may be. If seniority be made the sole factor in determining promotion one of the main incentives to efficiency disappears, and the service suffers accordingly. Fortunately, the statutory provisions governing promotion on the South African railways prescribe that preference shall be given to the efficient. On private railways some appointments and promotions are the result of patronage, and even favoritism, and I consider that in the Union railway service an able man has opportunities quite as good as, if not better, than he would have in private employ.

There is a regrettable tendency for individuals in state employ to bring parliamentary influence to bear in regard to alleged grievances; and in this they are frequently encouraged by legislators anxious to make political capital out of such cases. Minor complaints are, therefore, frequently debated in Parliament purely on political grounds. It is obviously impracticable and undesirable for the machinery of Parliament to be utilized to perform the functions of appeal boards already in existence. Parliament has not the time, even if it did have the complete evidence, to do justice either to the men or to the administration.

The same applies to many other details which, on a private railway, would not be considered sufficiently important to place before the general manager.

Matters in themselves trifling assume unwarranted importance by reason of their entry into the arena of politics, and thus occupy much of the time of the principal executive officers, which should be devoted to constructive work. Moreover, undue influence on the executive authority is attended with a broader disability, in that it operates against adequate decentralization—the essence of efficient organization.

## Efficiency of Government Lines and Private Roads

*What Constitutes Efficiency in Railway Management?*—Considerable vagueness frequently exists as to what actually constitutes efficiency in railway management. It is misleading to judge a railway's efficiency by particular details, and I conceive that such must be determined by the following broad consideration, viz.:

(a) The maximum possible development of agricultural, industrial and commercial activity by means of cheap and well designed tariffs, and by efficient and expeditious service;

(b) The full development of passenger traffic by means of cheap fares, comfort and speed of traveling.

The principal means of insuring relatively cheap railway transportation is by economical construction, maintenance and general working. Waste or extravagance in capital or current costs ultimately results in higher tariffs. Increased railway tariffs diminish traffic and retard industrial development.

Much also depends on the general efficiency of the service provided, and on the manner in which the tariffs are designed with relation to different classes of traffic. Increased

traffic decreases the expenditure per unit. Badly designed tariffs diminish the volume of traffic, which involves increasing tariffs on the remaining traffic, for the reason that a decrease in traffic increases the expenditure per unit. Operating expenses do not diminish in the same ratio as traffic, owing to the large proportion of fixed charges included in railway costs.

*Conflict of Opinion on Advantages of State Versus Private Railways.*—There is much room for diversity of opinion as to the relative advantages of state versus private railways. So much depends on the peculiar conditions of the country concerned. Prior to 1885, Italy alternated between state and private management. In 1885 she definitely changed from state to private management, and in 1905 reverted to state management. In 1844 the British Parliament passed an act dealing with the state purchase of the railways sanctioned subsequent to 1843, and in 1865 the British Royal Commission reported in favor of the continuance of private management. Japan, after experience of private and state railways, side by side, decided to nationalize the whole of her railways.

*Experience in India.*—The Indian Government, after elaborate research, has today found it difficult to arrive at a satisfactory solution of the problem. The Railway Board of India, in a memorandum summing up the main arguments put forward on the general question, says (in part):

As regards efficiency, it is said that this necessarily varies, and good and bad examples of working can be quoted under both systems, but a general survey affords no ground for holding that a state system has the advantage. It is added as a definite disadvantage of a state system that its working is liable to be affected in many ways by political influence, and experience shows that the consequence may be very serious.

Doubts are expressed further whether in the working of rates for the development of its country, state would be as efficient as private companies, and experience is said to show that state control invariably produces a rigidity in the rate system which interferes with the attainment of the maximum economic advantage to be derived from the interchange of commodities, and prevents the full development of trade which is secured by the freer and more elastic treatment of rates by independent railway administrations.

In addition upholders of the existing system claim that it has positive advantages. They say that the present allocation of different parts of Indian system of railways to semi-independent administrations produces a healthy competition and spirit of emulation, which would be lost if all were brought under state management. They claim that the financial burden of maintaining and extending the whole railway system to India is clearly too great for the government to bear alone.

A policy of state-management for all the railways in India would inevitably tend to centralization; in this respect again the government would be overburdened, and it would be well advised, according to this view, to be content, as at present, with a general control, and, for the direct management of railway affairs, to retain the services of the companies.

The railway system in India is a composite one; the majority of the railways are owned by the state, but all except three state lines are managed by companies who have a small share in the properties they administer. Other railways are privately owned, some of them having been built by government aid under subsidy or guarantee. Others again are owned by district boards and native states.

*Statistical Comparison of State and Private Operation.*—It is extremely difficult, if at all practicable, to secure reliable concrete comparisons of the actual results of working state versus private railways. Large profits are possible under wasteful management if favorable conditions exist, e. g., dense traffic and satisfactory grades and curves. On the other hand, small profits, or even no profits, may be earned by a highly efficient railway unfavorably situated with regard to traffic, grades and curves, and costs of labor and materials. No railway unit of expenditure or revenue gives a reliable comparison between one railway and another, as so much depends upon:

- (a) Costs of fuel, material and labor;
- (b) Physical character of country, which determines train loads;
- (c) Density and nature of traffic;
- (d) Average length of haul;
- (e) Industrial and railway policy;
- (f) Competition with alternative means of transportation; particularly water ways; and
- (g) Different values of money in different countries.

### The Main Disadvantages of State Control

The practical experience of state ownership in different countries demonstrates that it is attended with powerful disadvantages. As to how far the disappointing results have been due to the peculiar local conditions of the countries concerned, to what extent they were preventable, whether equally powerful evils in other directions would have occurred under private ownership, I am not prepared to say. The results plainly indicate that, unless adequate safeguards are devised, grave abuses and disadvantages attach to state ownership.

*Undue Political Influence on Staff Conditions, Tariffs and General Facilities.*—Where a large body of men, such as a railway staff, is employed directly by the state, there is a danger of their enlisting the efforts of legislators to secure better wages, shorter hours, improved conditions, etc. . . . The enforcement on the management, by parliamentary influences, of changes in staff conditions, demoralizes the entire railway service, impairs discipline, prevents good relations between the staff and the management, destroys economical operation, and in every way is to be gravely deplored.

*Employees Resort to Political Influences.*—There is a tendency on state railways for individual employees who feel aggrieved to resort to political influence. The results are harmful alike to employees and management. Efficiency and economy are in the interest of the employees, as waste, extravagance, and inefficiency diminish railway profits, and this ultimately reacts on the staff. Economical and efficient operation soon disappears if the authority and discipline of the management are undermined by undue external influences.

*Situation in Australia.*—These evils were so pronounced in the early days of the Australian railways that the state found itself compelled to appoint railway commissioners with statutory powers, securing them as far as possible from the exercise of political influences. Conditions on the Australian railways are still unsatisfactory. The Commissioner of Railways for Western Australia in his 1910, 1912 and 1913 reports shows that as a result of undue political influence matters are drifting to an *impasse*. Labor is piling up unreasonable demands, which have been granted by the government directly to the labor societies without consultation with the commissioner. Traders and particular interests employ similar methods to secure unwarranted facilities. The net revenue of all the Australian railways decreased heavily before the war. Since the war there have been heavy deficits, notwithstanding increased rates.

*Difficult to Resist Unreasonable Demands.*—There is also a danger under state ownership of the management being forced to provide facilities to particular sections in such matters as train service, accommodations, etc., which are not warranted. Similarly, alterations in tariffs in favor of particular localities or interests are often clamored for, which are not in the general interest. Unless the management is vested with reasonable independence it is difficult to resist such demands.

*Over-Centralization and Rigid Uniformity on State Lines.*—There is undoubtedly a tendency toward over-centralization and rigid uniformity on state railways, and also of excessive rigidity in matters of audit-supervision of expenditures, contracts and revenue. These elements result from the necessity for great scrupulousness on the part of a government to avoid the possibility of suspicion of partiality or abuse. My own view is that these restrictions are carried too far. Over-centralization destroys initiative and resource, and if carried to excess, tends to cripple a large organization.

There is nothing inherent in state organization to prevent adequate decentralization, but the tendency certainly is toward over-centralization.

### General Conclusions

The wide conflict of practical evidence renders it extremely difficult to decide as to the relative advantages and disadvantages of state and private railways. On the whole, it would seem that the problem is one to be determined according to the geographical position and the industrial, economic, political and social conditions of the particular country concerned, rather than according to the merits claimed for either system in other countries.

The success or otherwise of state railways is influenced largely by the extent to which the management is freed from political influence. It is thus manifest that the problem is governed by many elements other than the purely economic.

After mature consideration of the problem in all its aspects, I am inclined to the view that railways should be laid out, constructed and owned by the state and that with regard to the working, they should either be leased to a private concern, subject to adequate control as to the general tariff policy, etc., as in Holland and India, or matters of policy should be so divorced from executive control that state management would be freed from interference, political or otherwise, and afforded the same facilities for efficient working as a private company.

Experience shows that politics do creep into all state managements—irrespective of the statutory or other safeguards applied, as in the case of Australia and Italy—and that the only managements immune from interference are the autocracies of Germany and Hungary.

A leading French economist, dealing with the Western Railway taken over by the French Government in 1909, says:

"They have increased enormously the office staff; doubled, indeed trebled, the number of employes; . . . an increase of effective force of 5,280 units; when the traffic does not warrant more than a quarter or a third at the most of that increase. . . . They have raised the larger part of the salaries, *but there is still only a dissatisfied personnel.*

"The democratic government, having a varying personnel, practicing favoritism, *favoring want of discipline* and habituated to prodigality and want of unanimity, is incapable of conducting with method, surety and economy, a complicated industrial task. We are having it fully demonstrated. . . . *The same men in the service of the state cannot be as valuable as in the service of independent companies, because they are subjected to many more hindrances, much more suspicion, much more red tape and are especially restrained in their initiative.*"

## Doings of the United States Railroad Administration

### Director General Hines Asks for an Additional Appropriation of \$750,000,000

WASHINGTON, D. C.

THE "REVOLVING FUND" of the Railroad Administration needs an additional appropriation of \$750,000,000, according to an estimate sent by Director General Hines to the secretary of the treasury on January 24 for submission to Congress. Of this amount, \$381,806,904 is required to settle the accounts of the Railroad Administration for 1918, including the operating deficit estimated at \$196,000,000, and the balance of \$368,193,096 represents the portion of the capital expenditures for the year 1919 which it is estimated will have to be financed temporarily by the government, including \$20,000,000 for the Boston & Maine reorganization and \$12,840,000 for inland waterways.

The estimate was transmitted by the secretary of the treasury to the speaker of the House of Representatives with a statement that over \$550,000,000 of the amount is to be returned to the government eventually. The \$200,000,000 not to be returned represents the operating deficit of the railways for 1918, together with that of the inland waterways, amounting to \$500,000, which are to be charged off as a loss to the government as a part of the cost of the war, thereby relieving the shippers of anxiety lest they should be called upon to meet it with higher rates.

The item of \$491,000,000 for capital expenditures plus the \$286,000,000 for equipment ordered last year makes a total of \$777,000,000, which is less than \$100,000,000 greater than the \$689,000,000 "carry-over" for last year, but the latter item may be considerably reduced, as it is now the policy not to undertake this kind of work except after having secured the consent of the corporations, and whatever amount of this work is to be undertaken this year will be added to any new authorizations for 1919 to make what amounts to a new budget for 1919. The \$491,000,000, Mr. Hines has explained, is made up of an estimate of \$200,000,000 for new equipment, including possibly some passenger cars and special types of cars not ordered last year, such as stock, refrigerator, general service and caboose cars,

for which designs have been prepared, and \$291,000,000 for additions and betterments, although it is likely that more than these estimates will be expended for additions and betterments and less for equipment. Mr. Hines' estimate submitted to Congress gives a figure of \$290,000,000 invested by the government in additions and betterments in 1918. This represents an estimate of the amount which the railroads will not have taken care of when a settlement between them and the administration is made as of December 31 of the \$588,000,000 expended for capital improvements in 1918, and indicates that the companies will have paid for \$278,000,000 of the total. Mr. Hines expects to explain the financial situation of the Railroad Administration more in detail when he appears before the Senate Committee on Monday and he may also appear before the appropriation committees.

#### The Director General's Estimate

Mr. Hines' letter to the secretary of the treasury is as follows:

I have the honor to submit herewith a supplementary estimate in the sum of \$750,000,000, to be immediately available and to remain available until expended, and to be added to and considered a part of the "revolving fund" provided for in Section 6 of the act approved March 21, 1918.

The necessity for this appropriation grows out of the following facts:

When the Railroad Administration shall have settled its accounts for the year 1918, the result will be substantially as follows:

1. The Railroad Administration had cash on hand at the end of the calendar year 1918..... \$247,100,000

This represents approximately the working cash capital partly in the central treasury at Washington, but principally in the hands of the federal treasurers of the Railroad Administration throughout the country. This represents much less than one month's operating expenses, and approximately this amount is necessary to enable the Railroad Administration and the various railroads under its control to meet without delay their payrolls, vouchers and other cash requirements.

2. The Railroad Administration had on hand as of December 31, 1918, approximately the following additional current assets:

Agents' and conductors' balances	\$154,000,600
Advances temporarily made to railroad corporations on open account for which in effect materials and supplies are held collateral	100,000,000
Total	\$254,000,600
Less outstanding current liabilities	162,047,865

Balance 91,952,135

This net balance of these current assets will become again available in cash at the end of federal control, but pending federal control is inevitably tied up as a part of the working cash capital of the Railroad Administration.

3. Loaned New York, New Haven & Hartford Railroad Company 51,475,000

This amount will be eventually paid with interest, but the greater part of it, and perhaps all of it, will not be paid until after the end of the calendar year 1919.

4. Invested in necessary additions and betterments actually made during the year 1918 over and above the amount which the companies can immediately pay out of their rental at a out of the balances due them on open account for the calendar year 1918. 290,918,283

This amount will eventually be paid with interest to the Railroad Administration. The rapidity with which it can be paid is dependent upon financial conditions and the ability of the railroad corporations to borrow this money in the open market without undue disturbance of financial conditions, and without undue interference with the financing of the government.

Total 681,445,418

It will be observed that while all this amount of cash is temporarily tied up in the government's conduct of the railroad business, it is expected that the entire amount will be eventually repaid, but temporarily it cannot be repaid as above indicated, and therefore provision has to be made for carrying it.

5. In addition, the Railroad Administration will have paid the operating loss for 1918, i. e., the difference between the standard return due the railroads and the net operating income derived by the government from railroad operations, this difference amounting to 196,000,000

This loss was due largely to the fact that increased rates were effective for only six months approximately, while increased expenses were effective to a very large extent for the entire twelve months, due partly to the unprecedented weather last winter (the railroads having shown an operating loss of over \$100,000,000, for the first four months of 1918 as compared with 1917, although no increased wages were included in those months, and while the corporations themselves were still operating the railroads as agents of the director general) and partly to conducting business at whatever cost was necessary to meet the needs of war. This represents the only item in the entire expenditure for the calendar year 1918 (except a portion of the next succeeding item), which is a loss to the government, and ought frankly to be charged as part of the cost of the war, and should be regarded as an exceedingly low cost for the result accomplished.

6. In addition, the Railroad Administration has expended during the year 1918 in connection with inland waterways 4,361,486

Of this amount \$500,000 represents operating deficit during the year 1918. It must be remembered that this operating deficit was incurred in the early and formative stages of governmental operation upon the inland waterways, and cannot be regarded as indicating in any way that similar losses are to be expected when the operation shall be fully developed. The balance, or \$3,861,486, represents boats and other property acquired by the government for operation of inland waterways, and of course can and will continue to be so employed.

Grand total	\$881,806,904
Amount of revolving fund	500,000,000
Amount to be provided to settle all accounts for 1918	\$381,806,904

In order, therefore, to settle in full the accounts of the Railroad Administration for the calendar year 1918, it will be necessary to provide the additional sum of \$381,806,904 which together with the revolving fund of \$500,000,000 appropriated in the act of March 21, 1918, will meet the transactions of the Railroad Administration for the year 1918, all of which have been outlined above. It must of course be understood that the figures used are necessarily only approximate at this time, because the accounts of the year 1918 have not been completely stated and cannot be prior to March 1 at the earliest.

For the calendar year 1919, financial provision must be made for the following:

1. To finance expenditures contemplated on inland waterways	\$12,840,000
2. To financing Boston & Maine reorganization	20,000,000
3. To financing equipment ordered in 1918 and to be delivered in 1919	286,000,000
4. To financing other necessary capital expenditures for additions and betterments, including equipment	491,000,000
Total	\$809,840,000

Less portion of companies' rental which can be devoted to capital expenditures	150,000,000
Balance to be provided	\$659,840,000

The last item above mentioned of \$491,000,000 represents a forecast of capital expenditures which will need to be made during the calendar year 1919 including these which were authorized and not entered upon or not completed during the calendar year 1918. Under existing conditions it is the purpose generally speaking to avoid the making of new capital expenditures without the assent of the corporations, but with such a vast transportation system it is believed that the expenditure of \$491,000,000 will be required during the year and will be substantially assented to by the corporations themselves.

A very large part of these expenditures must be provided for in the first few months of 1919, and we are compelled to allow for the situation that during the period prior to the next Liberty Loan campaign and during that campaign it would not be desirable or practicable for railroad corporations to do a large part of their own financing.

Under these circumstances I am of opinion that \$750,000,000 is the minimum appropriation which will enable the Railroad Administration to carry as above explained the money that is necessarily tied up in the government's conduct of the railroad business and to provide for financing by the Railroad Administration of the portion of the necessary capital expenditures which it must be assumed it will be necessary for the government to carry temporarily for the protection of the general financial situation as well as for the protection of its own financing. Such appropriation will meet the requirement of \$381,806,904 to settle the accounts for 1918 and in addition will provide \$368,193,096 toward meeting the above mentioned capital expenditures for 1919.

This matter has been very carefully considered with my associates in the Railroad Administration and we are satisfied that at least this much provision ought to be made for temporary assistance for these important purposes. It must be emphasized again that the money so provided will eventually be returned to the government with interest.

It is highly important that adequate funds for these purposes should be provided so as to give the Railroad Administration reasonable margin for encouraging the making of such railroad improvements as may seem justifiable from the railroad standpoint, especially since such improvements will aid in stabilizing the general industrial situation.

Whether government control shall continue until the end of the 21 months' period or shall be terminated in the next few months, it is equally necessary that the appropriation above recommended be made. If the control continues for the 21 months' period, it is my belief and the belief of my associates in the Railroad Administration that we cannot count upon the railroad companies financing during the calendar year 1919, any greater portion of their capital expenditures than it is above assumed they will finance. On the other hand, if control should be terminated in the next few months, it will still be true that a very large part of the capital expenditures for 1919 will have been made, and besides, the possession of an adequate fund to facilitate the transfer back to private control and to give temporary aid in financing will be highly desirable. Of course I must deal with the matter exclusively upon the basis of the law as it now stands, and without reference to conditions which might be brought about in the event of a further extension of federal control.

The reason for the submission of the supplementary estimate at this time is that the accounts of the Railroad Administration are kept upon the basis of the calendar year, and therefore it was not practicable to make any reasonable estimate until after the end of the calendar year.

### Co-operation with Corporate Officers Desired

T. C. Powell, director of the division of capital expenditures, has issued D. C. E. Circular No. 16, giving the following instructions to the regional directors:

There appears to be some apprehension in the minds of a few corporate officers of the railroad companies that certain proposed capital expenditures may not be justified by present conditions. As you are aware, it has been the policy of the director general to confer freely through the regional directors with the railroad companies with respect to expenditures involving a charge to capital account in order to secure, if possible, their consent to the work.

Supplement 1 to D. C. E. Circular 1, issued January 22, 1918, provides, in section 7, that copies of all D. C. E. Forms 3, 4, and 6 should be sent to the president of the railroad company, in order to comply with the terms of the standard contract between the director general and the railroad companies, and upon receipt of such notice that it was proposed to proceed with the work, an opportunity was afforded the railroad companies to express their approval or otherwise.

Supplement 1 to D. C. E. Circular 10, issued October 7, 1918, provides:

"The federal manager (or general manager) and regional director should invite and carefully consider suggestions from, and should confer with officers of the company owning the property to be improved respecting any work contemplated in advance of or during the preparation of the budget, or at any time, but are to be governed by their own judgment as to the work to be recommended, definite notice to the company of the work actually to be undertaken being provided for in connection with D. C. E. Forms 3, 4, and 6. The suggestions and conference herein contemplated are not to comply with any legal requirement but to get the benefit of the judgment of the company officers and to provide additional opportunity for meeting the wishes of the company wherever reasonably practicable."

It is now the desire that this close co-operation with the officers of the railroad companies be carried to the point of securing the definite approval of the railroad companies with respect to any new work before such work is commenced, and that in submitting D. C. E. forms to this office each form shall bear notation to the effect that the work has the approval of the railroad company.

In all cases where the federal manager believes the work should be done and the railroad company withholds its approval, a full report should be promptly made of the objections or disagreements that cannot be overcome.

D. C. E. Circular No. 17 gives additional instructions. The federal managers are now engaged in preparing a statement of all work authorized or commenced prior to January 1, 1918, designated as the "Carry-over," which statement is to be prepared and distributed as outlined in D. C. E. Circular No. 14, and this statement should show in detail each job or project involving a charge to capital account in excess of \$1,000.

A copy of this statement is to be sent to the president of the company for whose line the work is being done, and it is now the wish of the director general that the railroad companies be consulted and that their approval be obtained for each item of uncompleted work as contained in the "Carry-over." This, irrespective of the fact that the railroad companies may have already approved some items of the work or protested others.

In order to accomplish this the regional directors are asked to arrange for a conference with the corporate officers for the purpose of going over these "Carry-over" items before any further important obligation is entered into, so that unexpended balances in connection with work which is not approved by the railroad companies, will be reported in column 13 and an appropriate explanation made in column 15, "Remarks."

These instructions do not apply to equipment purchased by the United States Railroad Administration and allocated

to the several roads, cost of which should be entered in column 14.

"Carry-overs" should bear the approval of the regional director, and when concurred in shall bear also the approval of the proper corporate officer of the railroad company.

Items of the "Carry-over" statement recommended by the regional director but not approved by the corporate officers shall be submitted promptly after forwarding the "Carry-over" for further consideration by the division and be considered as new items not yet approved for 1919, except that no item of work involving safety of operation shall be delayed.

### State Commissions to Be Conciliated

Now that the war is over and it is feasible to give more detailed consideration to the rights, prerogatives and feelings of various interests affected by transportation policies, and less to the necessity of taking prompt action, the Railroad Administration hopes to be able to establish more harmonious relations with the state railroad commissions, which have been somewhat ignored during the past year, and many of which have resented it. Director General Hines on January 25 issued a statement on the subject which indicates that the appointment as director of the Division of Public Service of Max Thelen, formerly chairman of the California Railroad Commission and president of the National Association of Railway Commissioners, is a step in that direction. Mr. Hines said:

"Since I have become director general I have been giving careful consideration to the development of the policies of the Railroad Administration along lines adapted to peace conditions. One of these questions which I began to consider at once was the question of relationship with the various state commissions, fully believing, now that the nation's transportation functions are no longer primarily war functions, that it is of great importance to invoke to an increasing extent the aid of the state commission. C. A. Prouty, director of the Division of Public Service and Accounting, is in entire accord with this view. When it became necessary to comply with his request and relieve him of the public service part of his work Max Thelen was selected as director of the newly created Division of Public Service because he, too, was known to be a strong believer in this policy. Mr. Thelen expects to assume his duties February 1, and immediately thereafter, I hope, with his assistance, to be able to get a clear and helpful understanding with the state commissions on this highly important subject."

The circular announcing the creation of the Division of Public Service states that its "scope will primarily be to deal with the relationship between the public, including shippers, and the Railroad Administration, and the railroads under federal control."

### Chicago Suburban Fares Increased

The Railroad Administration has announced that the 10 and 25-ride commutation tickets heretofore sold in the Chicago suburban service, will be withdrawn on February 1 and a 26-trip family ticket good for the purchaser or any member of his family, limited to six months, will be sold at the rate of 2 cents a mile. Unused rides of tickets of the old form purchased after this announcement has been made will not be honored after January 31, but will be redeemed. Any tickets sold at an earlier date will be honored throughout the month of February, after which the unused rides will be redeemed. The rates for monthly commutation tickets will not be changed. The reason officially assigned for the increase is that it is necessary for the protection of the Aurora, Elgin & Chicago and that the former rates were below the

present cost of service. This was outlined in an official statement as follows:

"Some time ago the Public Utilities Commission of Illinois gave the Aurora, Elgin & Chicago Railroad, an electric line not under federal control, authority to advance its commutation fares to the statutory maximum rate of 2 cents per mile. As this road competes with roads under federal control, it found itself unable to take advantage of this permission, as such action would merely result in turning its traffic over to its competitors, whose rates would continue to be lower than 2 cents per mile. By reason of the sharp increase in its operating costs, the electric road was in financial straits. It appealed to the War Finance Corporation and the Railroad Administration in Washington. An investigation ensued in which it developed that the multiple trip ticket rates charged by the steam roads were below the present cost of the service and were also much lower than those charged for like service elsewhere—the rates in New York City, for example, being substantially higher than those in Chicago. Following this investigation, the Railroad Administration authorized the Chicago roads under federal control to advance their fares as stated above."

#### Railroad Administration Takes New Building

The Railroad Administration, in order to obtain additional office space to relieve the crowded condition under which it has been working ever since its organization, has leased a new building at Eighteenth street and Pennsylvania avenue, Washington, across the street from the Interstate Commerce Building, in which its principal offices are located.

The administration now occupies space in four outside buildings. The offices of the new Division of Public Service will be located in the new building.

#### Consolidated Classification Committee Appointed

The Division of Traffic has appointed a consolidated classification committee consisting of R. C. Fyfe, chairman, Western Classification Committee, chairman; R. N. Collyer,

chairman, Official Classification Committee, and J. E. Crossland, chairman, Southern Classification Committee. The headquarters of the committee will be at Mr. Fyfe's office in Chicago.

All requests for changes in or additions to the classifications should continue to be made either through the traffic officers of the railroads or direct to the chairmen of the classification committees, who will make investigations as heretofore and submit their recommendations to the consolidated classification committee for docket and hearings.

#### Wage Increases Estimated at \$810,000,000

Additions to the payroll of the railroads in 1918, largely as the result of wage increases ordered by the director general, are now estimated at approximately \$642,000,000, or about 37 per cent. This, however, is the total increase in the payroll and is affected to some extent by the change in the number of employees. All of the increases, however, were not in effect for the full year and the total on a yearly basis is estimated at \$810,000,000, not including the prospective large increase for the railroad train service employees.

#### Capital Expenditures to November 30

A total of \$516,515,394 had been expended in connection with work chargeable to capital account to November 30, 1918, according to the monthly report of the Division of Capital Expenditures. This represents 40.4 per cent of the total authorization for the calendar year, which amounted to \$1,278,814,998. Of the expenditures, \$242,260,135 was for additions and betterments, \$254,060,941 for equipment and \$20,194,318 for extensions.

#### Boats for New York Canal Authorized

The Railroad Administration has authorized the construction of 20 steel power boats for the New York Barge canal. These will be combined power and cargo boats with a capacity of 500 tons.

♦ ♦ ♦ ♦

A Dining Car with a Place in History

In this dining car on the morning of November 8, 1918, Marshal Foch received the German delegates and read to them the terms upon which he would grant an armistice to the beaten armies of the Kaiser. The car was at the railway station of Rethondes, 45 miles northeast of Paris, at the northern edge of the Forest of Compiègne. In this same car at 5 a. m., November 11, the armistice was signed. The photograph was taken a few hours later when the Marshal's train arrived at the railway station in the city of Compiègne. Photo copyright by Press Illustrating Service.

# The Influence of Zinc Ties on Track Circuits

## Signal Engineers on Various Railroads Relate Their Experience with This Problem

THE LAST CONVENTION of the Railway Signal Association developed an interesting discussion on the influence of the presence of ties treated with zinc chloride on the operation of track circuits. Attention was called to the tendency for the more extended use of zinc chloride at the present time owing to the decreased supply of creosote available. It was also pointed out that difficulty has arisen occasionally in the operation of signals through the fact that zinc-treated ties have a lower electrical resistance than untreated or creosoted ties.

The discussion was started by F. W. Bender, assistant signal engineer on the Central Railroad of New Jersey, who stated that for 16 years that road had operated a certain track section, 6,522 ft. long, for the operation of a block signal, using four cells of battery connected in multiple series. A derailment occurred recently on this track section which destroyed 2,580 ties. These were replaced with ties freshly treated with zinc chloride after which a relay could not be made to pick up with the usual number of cells. In order to operate it 16 cells in multiple-series were required. It was found that the leakage due to these ties increased the current flow at the battery end to 4.2 amperes in dry weather and that after a rain this reached a maximum of 9 amperes.

Ten of the zinc-treated ties were tested by placing them on insulators and it was found that their resistances were 2,200, 1,700, 401, 400, 388, 329, 326, 260, 220 and 125 ohms, respectively. The readings from which these resistances were calculated were made between two points 4 ft. 8½ in. apart. It was also found that the zinc-treated ties were generating currents of their own; a difference of potential of 20 millivolts being recorded between two points on the ties 4 ft. 8½ in. apart. Further tests showed that the track circuit section would have to be cut into 930-ft. lengths to insure satisfactory operation. Before the zinc-treated ties were installed in this particular section, the cost of the battery material averaged \$3.75 a month, whereas the cost of battery material after the zinc-treated ties were installed varied between \$75 and \$100 a month.

J. A. Peabody, signal engineer of the Chicago & North Western said that many zinc-treated ties had been put in the track on that road years ago, and that little or no effect was noted during cold or wet weather, but that difficulty occurred on hot, dry days. After studying conditions for some time it was discovered that this effect had practically disappeared within one year's time and that if not over 12½ per cent of the ties were renewed in any one track circuit in one year, little trouble would be experienced in track circuit operation. Accordingly such a rule was put into effect.

With a view to gathering additional specific data on this subject letters were addressed to the signal engineers of practically all railroads in the United States using zinc chloride ties to any extent, asking for reports on their experiences in maintaining signals operated in tracks containing an appreciable number of ties treated with this preservative. The replies received served to confirm some of the points previously mentioned as well as to bring forth a number of new ones.

E. E. Worthing, signal engineer of the Southern Pacific, Louisiana lines, related an experience with track circuits on a stretch of 10 miles of second track in Texas laid with new zinc chloride ties, which confirms the view presented above—that a track section laid out of face with new ties of this kind will invariably cause trouble, but that this

difficulty becomes less as time goes on, particularly after rains have washed away some of the preservatives near the surface of the timber. He is quoted in part below:

"We have two track circuits in service between mile posts 212 and 214, each approximately ½ mile long. This is new track and new Burnettized ties are used throughout, 18 to the rail with 9½-in. by 10-in. flat bottom tie plates, single spiked with 5⅞-in. by 6-in. standard spikes. The ties had been in the track about six months when the track circuits were put in service, the ballast was clean and well clear of the rails. Shortly after the track circuits were put in we had a light, slow rain one night for about 10 hr. It was hot and clear the following morning but both track circuits failed and did not pick up until late that evening. I took a series of readings at the batteries and at the relays at noon. One battery was discharging 800 milli-amperes to the track. A series of readings at the relay gave 30 milli-amperes. The other track circuit was discharging 900 milli-amperes to the track; the reading at the relay was 40 milli-amperes. Four-ohm relays were used.

"We have recently had a much harder rain on these two track circuits, lasting for about the same number of hours throughout most of the night. Both track circuits held up and caused no trouble. I am inclined to think that the latter rain, which started off with a very heavy down-pour, washed off the zinc sulphate.

"Several years ago I made some tests of ties treated with a solution containing about 1.3 per cent chloride of zinc. After the ties had been soaked a test was made between sections of rail spiked in the usual manner and the ties were found to offer as low as 300 ohms resistance. All the trouble that I have had on this account has been on track where a great number of ties had been changed at one time."

In corroboration of this view the following statement is given by J. C. Mill, signal engineer of the Chicago, Milwaukee & St. Paul:

"There is no doubt that zinc chloride is a first class conductor of electricity and the use of ties so treated causes an excessive leakage of track currents, which can only be offset by shortening the track circuit limits. The extent of this shortening also depends upon other general track conditions, drainage, etc., therefore we have not established an arbitrary length of track circuit for our A. C. signaling. When our A. C. signaling was first installed some four years ago, we had circuits as long as three miles, which, of course, were immediately effected by the insertion of zinc treated ties. This also applied to shorter circuits. We have followed the policy of cutting our track circuits wherever trouble was experienced with the result that we have shortened and cut many track circuits since their first installation.

"From our experience and observation we are of the opinion that the effect of the zinc treated ties is very marked when ties are first installed, but that after the ties have been in service for a year or so the bad effect gradually wears off. This is probably due to the zinc chloride leaching out of the ties and being washed away by the weather."

That the experience is less severe in some quarters than in others, probably through the influence of relative humidity or precipitation, is indicated by the following statement by W. E. Boland, signal engineer of the Southern Pacific, Pacific system.

"We have been using zinc treated ties almost exclusively for some years and our experience is that they do not seri-

ously affect track circuit operation. Unquestionably they have some slight adverse effect but it is not sufficient to cause trouble when other track conditions are good.

"We have tried several times to determine just how much effect the Brunettized ties have on track circuits, but there are so many other conditions affecting the current value at the relay that it is practically impossible to make any such determination."

Further information with particular regard to measures taken by the signal engineers to overcome difficulties with the operation of signals is contained in the following statement by C. A. Dunham, signal engineer of the Great Northern, covering experiences on that line and also in territory south of the Ohio river.

"During 1902 and 1903 we installed signals (on the Illinois Central) on about 120 miles of new second main track south of the Ohio river. The old track had non-treated ties and the new track was laid on zinc-treated ties. All ties were white oak and both tracks were ballasted with crushed rock. The longest track circuits were 5,200 ft., with most of them

about 4,000 to 4,500 ft. in length. We had no trouble on the old track with the non-treated ties, but we had trouble, and lots of it, on the new track. The remedy was to cut two track sections into three, which gave us track circuits which then approximated 3,000 ft. in length. After this had been done the service was satisfactory. During 1913, on 120 miles of track in North Dakota, the trouble was greater, largely because the ballast was gravel, and consequently the drainage was not so good as with the crushed rock. The remedy was again to cut the track sections down to about 3,000 ft. After this was done the service was greatly improved; in fact, we have been able to get along all right, and we shall, no doubt, continue to do so permanently.

"My advice would be to limit track circuits to not to exceed 3,000 ft., and preferably to about one-half mile, where the tracks are laid on zinc-treated ties. I think you will find that zinc-treated ties as ordinarily placed in the yearly renewals will not make any serious trouble, and even when all of the ties are finally treated you will not have trouble, provided you do not install long track circuits."

## Railroad Hearings Before Senate Committee

### Shippers Want Commission's Power of Rate Suspension Restored—Opposed to Government Operation

THE SENATE COMMITTEE on Interstate Commerce is still hearing various plans for the disposition of the railroads at the termination of the period of federal control, which indicate an overwhelming opposition to any extension of the present system beyond the time required to pass the remedial legislation regarded as necessary. The principal concern of the shippers who have been heard during the past week is the almost unlimited power over rate-making possessed by the director general, and they are making a strong effort to have Congress at least repeal Section 10 of the federal control law, which takes away from the Interstate Commerce Commission the power of suspension of rates initiated by the director general.

The committee at one time had decided to limit the number of witnesses to be heard, but apparently has changed this policy and intends to hold protracted hearings. When counsel for the railroads offered to file statements by Daniel Willard, president of the Baltimore & Ohio; Howard Elliott, chairman, Northern Pacific, and Samuel Rea, president, Pennsylvania, the committee decided it would prefer to have these executives testify at a later date. Representatives of the brotherhoods of train service employees were expected to follow Mr. Kruttschnitt, but they asked that their appearance be postponed. Walker D. Hines, director general of railroads, has arranged to appear before the committee on Monday, February 3. S. Davies Warfield, president of the National Association of Owners of Railroad Securities, had expected to introduce his plan on Thursday of this week, but his appearance was postponed. A number of additional shippers are to be heard and numerous members of state railroad commissions have been in Washington during the week prepared to testify.

#### Standard Equipment

Julius Kruttschnitt, chairman of the Southern Pacific, whose statement was published in last week's issue, testified again on January 23 and was questioned regarding the standardization of equipment. Replying to inquiries by Senator Kellogg, Mr. Kruttschnitt said he understood that each of the members of the committee appointed by Mr.

McAdoo to prepare plans for standard engines had given his opinion that the idea was impracticable, but that the committee had gone ahead as directed and in reporting stated that they had done the best they could with the idea. At one time E. H. Harriman had proposed to standardize locomotives on the Union Pacific-Southern Pacific system, but the plan had been found impracticable. Had the corporate officers been left in charge, he said, they would not have undertaken standardization. Every locomotive builder had plans for the kinds of engines needed by nearly every company and locomotives could have been built from those plans much more expeditiously than from new ones of the standard designs.

Asked whether the Southern Pacific needed the 2,000 cars allotted to it by the Railroad Administration, Mr. Kruttschnitt said that the judgment of the officers of the road was that it did not, but it was told that in the opinion of the director of the division of operation it did need the cars, although in 1917 the Southern Pacific had handled a larger traffic than it handled in 1918 and with less cars and engines. Traffic was diverted from the Southern Pacific in 1918 by the Railroad Administration. Senator Gore recalled that Mr. Kruttschnitt had testified a year ago that he feared the disruption of his organization and asked what had been the experience.

Mr. Kruttschnitt said it was too early to state just what the effect had been, but that the Southern Pacific system under the Railroad Administration has been operated under the direction of three regional directors' organizations and that some of its lines had been turned over to the management of the Missouri, Kansas & Texas.

Clifford Thorne, representing the American Petroleum League, National Live Stock Shippers' League, National Council of Farmers' Elevator Association, Grain Belt Meat Producers' Association, and the Western Refiners' Association, took the stand on January 24 and brought out a number of facts which he said have created intense hostility against the Railroad Administration on the part of shippers, but against which open protest has been generally withheld until the war was over.

### Clifford Thorne's Statement

Mr. Thorne's statement follows:

Government operation is so distasteful among the shippers of the United States, that, were a popular vote taken today, it would be defeated overwhelmingly.

If the members of Mr. McAdoo's staff had deliberately planned to double-cross the director general, and thereby to make government operation so unpopular that it would tend to kill any possible movement toward government ownership, they could not have adopted any more effective methods than those which actually have been adopted. I do not think for an instant that these railway officials have attempted to double-cross Mr. McAdoo, for they are honorable men. Unquestionably the emergency demands of the war were largely responsible for the existing situation.

There are some good things which Mr. McAdoo and his associates have accomplished, that must be saved out of the wreckage. To do this intelligently and efficiently will require several months of discussion, and the careful drafting of laws that will make some very important changes in our present statutes. During this interval the shipper wants protection against a business organization having powers that are autocratic and despotic in character.

In the midst of the intensely interesting and instructive discussion which you have listened to during previous days, about the forty or more reforms that have been proposed by the Interstate Commerce Commission and by the railway companies, I desire to challenge your attention if possible, to a single proposition: It is of paramount importance to the stability and progress of American industry that you shall immediately restore the full powers of our courts and commissions over the railroads of the United States.

This can be accomplished in a very simple manner, by striking out a few lines and inserting one or two sentences in section 10 of the railroad control law. Our proposition can be settled now. And unless this is done, the shippers of the country will suffer incalculable injury.

We believe that all other discussion might well be temporarily suspended for a few days so as to make possible the immediate consideration of this issue. Unless you decide to do this, nothing will be accomplished by the present Congress. For shippers, railway representatives, state commissioners, labor spokesmen, and reformers generally, can talk for the next six months continuously about the many propositions which have been suggested to you already by the railroad executives and by the Interstate Commerce Commission, to say nothing of those yet to come. You, yourselves, can reach no conclusion on this fundamental question inside of six months. The transportation problem forced upon us at this time will inevitably become one of the leading issues, if not the greatest before the American people during the coming 12 months. This subject will be discussed from every conceivable angle, on the platform, in the newspapers and magazines, and in the halls of Congress.

It is essential that this amendment shall be in effect during this interval, for, otherwise, during the next few months many sweeping, wholesale changes in rates, rules, and regulations now pending will be consummated; and these changes have no connection whatsoever with the war against the kaiser.

In the light of past experience, we earnestly beg of you to accept the word of no man as to the manner or the extent that these powers will be exercised in the future. When this law was before you, Congress was told that the power to control rates during the time of federal possession ought not to be exercised and would not be exercised except in such cases as might be necessary "in the public interest." You were told that, "It would be very unwise for the federal government to undertake through the director general of railroads—who merely represents the President in this control—to pass upon all the rates in the country, either *de novo*, or as questions

may arise concerning them." And yet the fact remains that one of the first acts of the director general was to pass upon all the rates in the country, and at the present time the director general is passing upon rates from one end of the nation to the other, and making orders that will not affect to the slightest degree, the successful prosecution of the war against autocracy in Europe.

The temptation was too great for a staff composed almost wholly of railroad men.

The director general of railroads has exercised, and is now proposing to exercise arbitrary, despotic powers, in defiance of the common law and the statutory law of the country. The director general has decided, and is now proposing to decide, controverted issues between the shippers and the railroads involving millions of dollars, without any semblance of a hearing before a disinterested body. The director general is now considering wholesale disturbances of rate relationships upon which business has been built up and established during the past generation, without any hearing before a disinterested tribunal before the new rates become effective. All this has created uncertainty and confusion amongst the shippers of the country, which is intolerable.

We most earnestly petition the present Congress to amend section 10 of the railroad control law as follows: First, restore the suspension powers of the Interstate Commerce Commission, which will insure us a decision by a disinterested tribunal before any more sweeping revisions shall become effective; second, strike out the clause which attempts to make the orders of the President superior to state and federal law and the common law; and, third, insert a clause requiring the director general to pay final judgments against common carriers under his control, and charge the same to operating expenses, where so chargeable prior to government operation.

The present law which attempts to authorize the former chairman of the board of directors of the Atchison, Topeka & Santa Fe Railway Company, speaking for the President, to repeal statutes which have been solemnly enacted by Congress and by the several states, and to reverse the decisions of courts of last resort, is an abortion. This is supposed to be a republic, and not a monarchy.

While we feel very keenly the injustice of some of the propositions now pending, fairness to Mr. McAdoo and to the railroad men and to the shippers constituting his official family demands that we state in unqualified language that prompt relief on many matters has been granted in a most estimable and praiseworthy manner. This entitles them to very great credit, and I would be the last one to question their integrity, or their motives, or their ability. They are gentlemen of the very highest type.

Before beginning his prepared statement, Mr. Thorne replied to the statement that freight rates are lower in this country than in other countries, declaring that he had analyzed the rates on 50 commodities for representative hauls in Great Britain which had been selected by W. M. Acworth and that on four-fifths of them the rates were lower than the rates in Official Classification Territory in this country. He declared that the fact that per ton mile earnings are lower in this country is not a correct measure of the rates because in this country the terminal expense is spread over longer hauls.

As an illustration of his statement that the director general and his staff have attempted to disregard or repeal laws, he cited the circular issued regarding methods of settlement of claims for loss and damage in grain shipments. He said that a joint committee of railroad men and shippers is now preparing a set of recommended rules on this subject, but meanwhile millions of dollars of claims are tied up and the Railroad Administration will not recognize them unless the shipper can show negligence on the

part of the carrier. This, Mr. Thorne said, is contrary to law.

Senator Kellogg said he had received many complaints that the Railroad Administration has not paid many loss and damage claims and Senator Cummins said he had also received many complaints. Mr. Thorne said he had no reliable information, but that scores of shippers had written to him that they were unable to obtain settlements of their claims and that more unpaid claims were awaiting adjustment than ever before in the history of the railroads.

Mr. Thorne also cited the general order which provides that suits should not be brought against the railroads except in the jurisdiction in which the cause of action arose or where the plaintiff resided. This, Mr. Thorne said, repeals the Carmack amendment, which made it possible for shippers to bring suit for loss and damage against the originating carrier and that this is particularly true whenever the claimant does not reside within the jurisdiction of the court where the shipment originated. He also referred to the order that suits shall be brought against the director general. Senator Kellogg interrupted by reading a provision in the federal control law that actions at law or suits in equity may be brought by and against carriers as heretofore provided by law and that no defense shall be made thereto upon the ground that the carrier is an instrumentality or agency of the federal government.

"That part of the law has been repealed by the President," remarked Senator Cummins. "The President doesn't know he has repealed it, but Judge Payne has repealed it for him."

Mr. Thorne read instructions issued by General Counsel Payne regarding the settlement of claims on livestock, which provided that carriers should not pay claims for failure to get cattle to market on time provided they arrived on the day scheduled. Another instruction by Judge Payne to the regional directors said the carriers need not pay on account of verdicts "based on prejudice or passion." These and other orders and instructions Mr. Thorne cited as evidence that the director general has assumed authority to decide the rules of evidence and the jurisdiction of courts. He declared that whether or not legislative power can be delegated to the President, it is certain that an administrative tribunal cannot be given power to reverse laws. Other orders to which he objected were General Order No. 15 requiring industries to pay for and maintain industry tracks, but that they shall be owned by the carriers, and General Order No. 34 providing that perishable freight shall be sold whenever in the judgment of the agent it may be necessary to do so. Mr. Thorne declared that while the exercise of arbitrary powers might have been necessary during the war they are certainly not justified during the period while we are technically at war before peace is officially proclaimed.

Mr. Thorne said he had been told that the Interstate Commerce Commission records show the number of claims filed in November to have been 59 per cent greater than in November, 1917, and that the increase for 11 months was 54 per cent. He asked Commissioner Clark, who was present, whether this was correct and Mr. Clark said the increase is in the amount of claims paid.

Turning to the question of revision of rates, Mr. Thorne said that the so-called 25 per cent increase resulted in increases of from 100 to 275 per cent in some instances and practically effected an increase of several hundred per cent in some cases where the state classification was superseded by the interstate classification with a higher minimum weight and that between 2,000 and 3,000 complaints against General Order No. 28 had been filed with the Railroad Administration on the day it became effective. Regarding local traffic committees established by the Railroad Administration, Mr. Thorne said they had done admirable work in a great many cases in effecting readjustments of rates, but

that frequently it was necessary to travel to three or four committees to secure an adjustment in a rate covering a wide territory. His principal objection, however, was that the same men that had been fighting the shippers for years in rate cases before the commissions were now the judges before whom they must appear to try rate cases, and that a majority of the committee members are railroad men. He said they will not always furnish dockets to shippers and that while theoretically there is an appeal to Washington, practically most of their decisions stand. He thought the committees ought to be continued, with perhaps an equal membership of shippers, but that the commission's power of suspension ought to be restored.

He said that while the Railroad Administration asked the advice of the Interstate Commerce Commission on the proposed standard scales of mileage class rates and the commission has recommended that consideration be postponed, there is nothing to prevent the Railroad Administration from putting it into effect at any time and the power should be taken away before something like that is done as the shippers want a hearing before the commission before any such scale goes into effect. The scale does not disturb the long distance interstate rates, he said, but interterritorially it revises, and in a large number of cases upward, all state scales in the South and West. It is a safe assumption, Mr. Thorne said, that there will be no more need of the emergency power to make large increases in rates and that the further changes in rates to be expected are those which are of far greater importance to the railroads than to the shippers. He thought the rate increase would considerably exceed \$900,000,000 because the average in the case of freight rates greatly exceeds 25 per cent. As to the proposal of the railroads that the suspension period be reduced to 60 days, he said this would be no more fair than to require a reduction asked by the shippers to go into effect within 60 days if the case were not decided in that time.

#### Texas Shippers Urge Return of Roads

R. C. Fulbright, Houston, Texas, appearing on behalf of the Texas Association of Commerce, the Southwestern Industrial Traffic League and the Texas Industrial League, rather surprised the committee by presenting an entirely different line of argument from what has usually been made in Washington by the representatives of Texas. He not only urged the return of the railroads to their owners but advocated a unified system of railroad regulation and curtailing the powers of the state commissions to a point where they could not discriminate against interstate commerce. He advocated the plan of regional commissions as branch offices of the Interstate Commerce Commission and declared that the fight in Texas between state and federal authority was at an end. He presented copies of resolutions adopted by the Southwestern Industrial Traffic League similar to those passed by the other two organizations, except that the Texas Association of Commerce resolution contained no recommendation for the establishment of regional commissions. The resolutions declared that the shippers were opposed to the principle of government ownership and operation as being destructive of American initiative and against the interests of the American people and that they believe it is for the best interest of the people that the railways and express companies now operated by the federal government be returned to their owners and competitive conditions restored as soon as adequate reconstructive legislation can be accomplished. They advocated the enactment of such laws as will secure a unified system of control of railroad and express rates, fares, regulations and practices, both interstate and intrastate, under the authority of non-partisan commissions so far removed from political control as possible and the establishment of regional regulative bodies to be composed of non-partisan members familiar

with traffic and transportation conditions in the regions for which they act.

Disapproval was expressed of the plan for the appointment of a secretary of transportation, because, Mr. Fulbright said, of the desire for non-partisan and non-political regulation and because of the belief that such a plan would keep the railroads in politics. The idea was also opposed because it would give one man too great power and the shippers have not been pleased by the exercise of great power over rates by the director general. The resolutions also favor the regulation of the issuance of securities by state and national laws and legislation providing for assistance by the national treasury for railway improvements and extensions, such assistance to be granted by a regulative body. While favoring the maintenance of healthy competition, the resolutions declared that the interstate commission should have power to prevent competitive waste by eliminating circuitous routes and controlling service and to compel diversion of traffic and control routing to prevent or eliminate congestion at ports or terminals. Pooling of equipment and unification of terminals under federal control were also favored. The resolutions also advocated giving power to the Interstate Commerce Commission to make minimum rates, the adjudication of wage disputes before a non-partisan body, with legislation guaranteeing an uninterrupted functioning of transportation facilities, the preservation of the police powers of the several states and such other powers as are not inconsistent with the program outlined in the resolutions.

Finally, pending the accomplishment of a program of reconstructive legislation, it was earnestly recommended that Congress immediately restore to the Interstate Commerce Commission the power of suspension of rates promulgated by the Railroad Administration, and the Railroad Administration was called upon to take such steps as can be appropriately taken towards restoring the organizations of the various systems and lines of railway so that upon the return of the properties to the owners the lines can proceed at once with the performance of all of their functions as adequately and efficiently as under private competitive conditions and upon a fair earning basis.

If the commission's power is not restored, Mr. Fulbright declared, it would be in the power of the Railroad Administration to change every rate in the country without a hearing and Congress should settle this important question before taking up the more complicated problems. He thought a definite date should be fixed for the return of the roads. He said he was not attempting to criticise all of the acts of the Railroad Administration because it had done many good things, but he thought it had taken advantage of its power to try to put into effect without hearing many advances in rates formerly denied by the commissions, and such hearings as were held by the various rate committees, he said, were one-sided. It is true, he said, that government operation has not had a fair test due to the war conditions, but certainly the shipping public has ascertained that it does not desire either government ownership or government operation. The incentive to perform many important services for the shipping public, such as the tracing of freight, the assistance given in furnishing rate quotations, the eagerness on the part of the carrier to make a good showing in its transportation service and the recognition of such economic necessities as transit privileges, are almost, if not wholly, removed when competitive conditions disappear. Furthermore, he thought, railway competition tends to preserve commercial competition more equally and thereby assures the more uniform development of the country. In this connection, he gave it as his opinion that the morale of the men having responsibilities in the railroad organization has been at the lowest ebb during the past year that he has ever known.

He did not think the state commissions should disappear, because there should be a certain amount of regulation con-

ducted by a body which is close at hand to which the public can go and get prompt action. If the regulatory power is centralized at Washington it becomes encumbered with such a tremendous volume of questions and cases that it is impossible to give prompt action. If the unified system could be worked out by co-ordination of the state and interstate commissions it would be preferable, but he failed to see how this can be effectively accomplished without some changes in the basic law. The principle which was decided in the Shreveport case, he said, is now generally recognized by the shipping public in his territory as a just principle. The authority of the state commissions can be preserved to do all things they are now authorized to do so long as they do not constitute a discrimination or burden against interstate commerce. He thought the time of fighting between state and federal rate-making powers has passed and that the state commissions are almost without exception ready to co-operate with and co-ordinate their activities with the federal body. The commerce act should be amended to clearly authorize the Interstate Commerce Commission to hold joint sessions with and to co-operate with the state commissions as fully as in its judgment is right and proper, and it is far more important that such a plan should be tested than to experiment with government operation for the next few years. He was in accord with the suggestion that some of the administrative functions of the Interstate Commerce Commission be turned over to some other body.

The shippers feel, Mr. Fulbright said, that the general increase of 25 per cent in rates has come to stay, with proper readjustments, at least for several years, and they also believe that the general level of wages brought about by the increases of the past year should be maintained while the cost of living is so high and only adjusted through such boards as may be constituted to handle such questions. He thought that a large part of the sentiment among employees in favor of a continuation of federal control is due primarily to the fear that the return of the railroads to private control would mean the sudden taking away of the increase in wages. He did not think that was the intention of the railways.

#### Plan for Financing Weak Railroads

E. J. Rich, formerly general counsel for the Boston & Maine, appearing for the Associated Industries of Massachusetts, presented a plan designed to establish credit for the weak roads in some other way than through increase in rates, in part, as follows:

If a weak railroad desires to raise money for improvements it should apply to the government for a guarantee of the principal and interest of the loans which it seeks to float. This would enable it to raise money perhaps on a 4½ per cent basis. In consideration of this guarantee there should be appointed by the President upon the board of directors two public directors, who should be ex officio members of all important committees. They should have no greater voting power than the other directors, *except* that all appropriations for improvements, the financing of which called for government guarantee, should be approved by them.

Under such a system, he said, little loss would fall upon the government. The railroad which has been earning only perhaps enough to pay its fixed charges and operating expenses would have no credit and could raise no money, but nevertheless would earn enough money to pay the interest charges on the new money raised. It could so improve its facilities as perhaps to reduce its operating charges and thus increase its financial solvency, with the result perhaps that eventually it might be able to finance itself without government guarantee.

Nevertheless, there might be loss, and the general treasury of the government ought not to be called upon to make up the loss. The plan would therefore provide that any railroad might earn, under an adjustment of rates permitted by

the Interstate Commerce Commission, and retain for its shareholders or put into the property, say, 9 per cent of the capital stock; that any surplus above this amount should be divided perhaps equally with the government. The railroads whose financial condition is such that they can readily raise money ought to be compelled to do so without government guarantee.

The Interstate Commerce Commission should receive a mandate from Congress to permit the establishment of a basis of rates which would prevent loss by the government on the interest charges. This should be the minimum basis, and to the extent of establishing a minimum basis the Interstate Commerce Commission should have as full powers as it now has in establishing a maximum basis.

Bonds guaranteed by the government would probably run for a long term of years and could easily be renewed indefinitely so long as the interest is paid. Therefore, no burden would eventually fall upon the government on account of its guarantee of principal. If for any reason it might be called upon to meet this guarantee on the principal of short term securities the fund accumulated from surplus earnings would undoubtedly be sufficient to take care of such payments.

The Interstate Commerce Commission, Mr. Rich said, has been very much criticised in certain quarters, and perhaps justly so. It has not always been alive to the nature of the transportation problem, which, after all, is a problem of adequate service. But it has established itself in the confidence of the public. Neither the integrity of the commission nor of a single member since its organization in 1887 has ever been impugned in the slightest degree; there never has been a charge made that it has been influenced by partisan political considerations. These are tremendous assets for any public body to have, and it would be a misfortune if the country were deprived of the services of a tribunal whose traditions for integrity and freedom from politics are so high.

The Interstate Commerce Commission, therefore, should be the supreme regulatory body. The burdens of regulation, however, are so great that they cannot be borne by the nine members of the commission. Many matters of great moment are necessarily entrusted to subordinates of limited experience and ability. Furthermore, the commission should be brought nearer to the people in their localities. Therefore, regional commissions, whose members should be appointed by the President, should exercise large powers and should have practically final jurisdiction in purely local matters, with an appeal to the commission in matters whose influence extend beyond the region, and in other matters of large moment.

**Additional Data From Mr. McAdoo**

Mr. McAdoo has filed with the committee some additional statements asked of him at the time he testified. One of these compares the earnings and expenses of the railroads for the four months, July to October, after the increased rates were made effective, with the corresponding period of 1917, excluding back pay and including the expenses of the Railroad Administration. The amount of back pay in these four months was \$116,000,000 and the expenses of the Railroad Administration, which are not included in the returns of the railroads to the Interstate Commerce Commission, amounted to \$1,939,220 for the four months. With these adjustments the operating revenues show an increase of \$493,388,566, the expenses, an increase of \$326,851,321 and the net operating income an increase of \$174,361,696. The operating ratio was 67.52, as compared with 67.94 in the corresponding period of 1917.

Another statement showed that the back pay charged to the June account was \$133,043,201 and that \$116,272,076 additional was charged in the period July to October. The

total increase caused by General Order No. 27 and Supplement No. 4, both of which were retroactive to January 1, is given as \$230,731,277 for the months January to May, inclusive, and \$18,584,000 back pay on Supplement No. 4 for the month of June is included in the \$116,000,000 back pay charged in the period July to October.

Mr. McAdoo also submitted a statement of the number of officers and employees of the Railroad Administration with the payroll for December, as follows:

Central Administration	
Number of officers and employees at Washington.....	1,193
Number of officers and employees outside of Washington (including 106 central administration traveling representatives, supervisors and inspectors) .....	227
Total officers and employees .....	1,420
Total pay roll for December, 1918.....	\$280,600
Regional Administration.	
Number of officers and employees.....	1,079
Total pay roll for December, 1918.....	\$252,500

Note.—All figures are based on pay roll for second half of December, 1918.

**Bill to Prevent Early Return of Roads**

Senator Cummins on January 27 introduced in the Senate a resolution to prevent the President from relinquishing control of the railroads to their owners before the expiration of the 21 months period provided by the federal control law unless Congress otherwise directs. The purpose is to compel the government to retain its present control until time has been afforded for the enactment of legislation to improve the system of regulation and to prevent the disastrous consequences which many believe would ensue if the railroads were returned suddenly, with a high scale of wages and other expenses. It is not considered, however, that the passage of such a resolution could affect the situation materially if the President is disposed to relinquish the railroads because he could issue a proclamation setting a future date for the termination of federal control before the resolution could be passed or he could wait until it is passed and veto it.

In discussing the bill in the Senate, Senator Cummins said that as Mr. Hines has stated that his policies will be those of Mr. McAdoo, it may be assumed that it is the purpose of the director general to return the roads at the end or very soon after the end of the present session of Congress unless Congress extends the period for five years. It was his opinion that Congress would not extend the period, but that all the members of the Senate committee believe they can work out a permanent policy for the readjustment or reorganization of the relationship between the railroads and the government within a few months and that within a year Congress will be able to agree upon some enduring, general, permanent system for the control of the railways. He thought there should be a special session of Congress, but even if there is not, if the commerce committees of the House and Senate are permitted to continue their work during the interim and are ready to report at the next regular session Congress could begin the year with all the differences composed.

"If we do not pass this bill," he said, "or something of the nature, and the President is guided by the advice of his director general and returns these properties in their present condition and under existing circumstances, the United States will see a cataclysm in finance as well as in railroad operations such as it has never witnessed before."

# Chapters from Railroad Administration Report

## Activities of Divisions of Public Service, Accounting and Law and Bureau for Complaints and Suggestions

**A**DDITIONAL CHAPTERS from Mr. McAdoo's report to the President for the year 1918, which is being issued in installments, have been given out by the Railroad Administration, covering the activities of the Division of Public Service and Accounting, the Division of Law, and the Bureau for Suggestions and Complaints.

### Public Service and Accounting

The activities of the Division of Public Service and Accounting, conducted under the supervision of C. A. Prouty, director of valuation of the Interstate Commerce Commission, include those which relate to the service rendered the public and the accounts of the director-general and of the individual railroads. The report says that as railroads must necessarily be operated by railroad men, who bring to their work the views which they had formed in the past, and as railroad operations under government control are relieved to a considerable extent from regulatory restraints, Mr. McAdoo felt that there should be in the federal administration itself some department which should stand charged with the public interest. The report then outlines the work and organization of the various traffic committees, composed of railroad men and shippers, which have been formed to consider rate questions, either locally or by reference in important cases to Washington. Every authority for a change in rates issues from the Division of Traffic in Washington and no change can be made until that change has been submitted to the Division of Public Service. If not approved, it is suspended until it can be discussed and, if necessary, taken to the director general for final determination. The report says that in the past thousands of rate changes have been made each month which were worse than unnecessary, because they produced confusion, and when no rate is changed except for some substantial reason the number of such changes will be enormously reduced and it will become possible to publish tariffs in a much more satisfactory way than at present.

The report also explains the necessity for impairment of service during the time of war, but states that this condition has been changed by the cessation of hostilities and that every effort will be made to ascertain what service the public properly requires and to render that service when possible.

An attempt is being made to work out a plan of co-operation between the state commissions and the Railroad Administration to give information as to defects in service, accompanied by suggestions as to how they should be corrected.

The accounting section of the report states that if all railroads were owned and operated by a single corporation or by the government a large part of the accounting work would disappear. Under the Railroad Administration some of these costs have been eliminated and others to a very great extent curtailed. Car hire has been eliminated. The accounting for car repairs has been much simplified. Joint facility expenses have been distributed upon an arbitrary basis and many millions of dollars have been saved, but the saving has been nothing like what it might be under permanent unified operation. The contracts with the carriers also require an accounting as to the expenditures in the upkeep of the properties because of the requirement that they shall be returned in the same condition as when received. A very considerable amount of accounting work is involved in comparing the expenditures and the prices with

those of the test period. A considerable amount of expense has been involved by the opening of a new set of books at the beginning of federal control and by the accounting necessary in connection with the orders for equipment which contain a proviso that if anything can be saved as compared with the maximum price fixed in the contracts either on materials, labor or overhead, the government shall have the benefit of the whole or a part of the saving and in the case of cars, the material is paid for by the government. A large amount of extra accounting has been made necessary in order to determine revenue from proposed rates and the effect upon revenues of various changes which will be unnecessary when conditions become stabilized. The report also says that the greatly increased wages which accountants are to-day receiving, as well as the inferior quality and reduced efficiency of some of those who are employed, has increased the cost, but that were the railroads of the country actually unified under one control there would be an enormous saving in accounting expenses.

### Law

The Division of Law, with John Barton Payne as general counsel, has had general supervision over all legal activities of railroads under federal control, and over the preparation of contracts and other work relating to claims and property protection. A list is given of 30 railroads with which contracts have been executed, many of them including a considerable number of subsidiaries, parties to the main contract. The report also gives the classification of the 2,161 short line railroads relinquished from federal control on June 29, as follows:

637 plant facilities.

726 circular roads (roads which do not file reports with Interstate Commerce Commission, but submit information in circular form.)

264 electric lines.

15 switching and terminal roads.

519 class I, II, and III roads.

Since that date 15 additional roads have been relinquished by agreement. Total, 2,176 roads relinquished.

Sixty-six roads have since been restored to federal control, leaving 2,110 relinquished. (Jan. 2, 1919.)

At the time of relinquishment it was announced that a policy of co-operation with relinquished roads would be maintained, assuring fair divisions of joint rates, adequate car supply, and the preservation of routings so far as consistent with the national needs. This policy finally, after hearings afforded the interested lines, ripened into a co-operative contract, which was announced on October 30.

Applications for this contract have been received from 90 of the relinquished roads, although a large number of the lines are satisfied with the policy voluntarily put into effect at the time of relinquishment. Seven co-operative contracts have been executed. Meanwhile joint rates and divisions are being adjusted on a fair and equitable basis with all the short lines preparatory to the execution of co-operative contracts if desired.

A committee on compensation and contracts, consisting of two representatives of the Division of Law, one of the Division of Operation, and one of the Division of Public Service and Accounting, was appointed on July 15 to hear petitions of relinquished short lines to be restored to federal control on a co-operative or compensation basis and

to hear petitions of federal controlled roads for special compensation.

There have been petitions from 79 relinquished short lines and reports on 74 rendered.

The following is an analysis:

Co-operative contract recommended.....	30
Standard return recommended.....	26
Special basis recommended.....	6
No contract recommended.....	6
Contract without compensation recommended.....	3
Contract on basis scrap value recommended.....	1
Electric lines that did not come under the proclamation.....	2
Unreported.....	5

With the exception of nine cases, all of the committee's recommendations were approved, five contracts having been executed, one on basis of standard return, three co-operative, and one on special basis. Of the nine recommendations disapproved, eight were for contracts on basis of standard return in lieu of which the co-operative contract was suggested for five, three no contract, and one road for which the committee recommended a contract whereby the government would operate the road without payment of compensation, payment of "fixed charges" was suggested. Contracts are being prepared for all of these roads except three, which have declined on basis tendered.

Petitions for special compensation have been presented by 38 roads. Recommendations have been made in 17 cases, 10 for complete rejection and 7 for partial allowances. In 3 of the rejected cases the roads desire a rehearing which will be granted. One road has withdrawn its claim, one is a matter for the Interstate Commerce Commission to dispose of, leaving 19 to be reported on as soon as heard and necessary information is received. In addition to the above, 25 new claims have been filed.

The Division of Law has also passed upon all legal matters connected with advances to railroad companies on account of the standard return or by way of loan.

The policy has been to make full use of the existing organizations, avoiding unnecessary disruption—and at the same time reduce the amount of legal expense to a minimum consistent with efficiency of service. The general plan adopted was—

(a) To separate, and assign to the appropriate accounts, expenses relating to corporate matters—and therefore chargeable to the corporations—and those incident to the ordinary operation of the properties.

(b) Appoint, as to each road, a head of the federal legal staff, with the title of general solicitor, who, under the general counsel at Washington, acts as adviser to the federal manager and is charged with supervision of the legal department.

(c) Dispense with the services of lawyers not actually engaged in the performance of necessary legal work.

(d) Eliminate duplication of employment, in view of unity of operation, and readjust salaries to conform with anticipated changes in the amount of litigation under federal control.

The separation of corporate and operating expenses has been accomplished, usually, by the assignment to the corporations of one or more members of the general office force, New York counsel, and others employed primarily in corporate matters.

Where several roads are grouped under the same federal manager, the practice has been to appoint one general solicitor, with jurisdiction co-extensive with that of the federal manager; and in determining appointments and salaries the recommendations of managers and regional directors have first been obtained and considered.

The eliminations include legislative counsel, special agents, counsel employed at Washington in departmental matters, statutory agents of individual roads for service of notices of the commerce commission, counsel located at points remote from the line of road, etc.—as to all of whom it was felt that

their employment is unnecessary under government operation.

With unity of operation, it has been possible in some cases to consolidate the legal work, and thus accomplish more effective results at a lower cost. Reductions in salaries were confined largely to trial counsel who engage in general practice, the belief being that the restrictions of the federal control act and orders of the director general relating to suits would cause some diminution of actual litigation. The "fee basis" of employment has been discouraged and definite annual salaries substituted as a rule.

The total expenditures on account of salaries in the legal departments of the various carriers approximated \$7,150,000 when federal control was assumed. Present expenditures approximate \$4,935,000, a saving of approximately \$2,215,000.

Under date of March 26, 1918, a section for the protection of railroad property and property of shippers in transit was established in the Division of Law to enforce rigorously the federal law against theft and to take all necessary measures in co-operation with carriers to prevent loss from this cause.

A Freight Car Claim Section was established August 1, 1918, with jurisdiction over all matters pertaining to loss and damage freight claims and their prevention, for the purpose of having administrative jurisdiction over all such matters on railroads under federal control, to study the causes and to take such remedial steps as appeared necessary to prevent such claims and conserve the food products and materials heretofore lost and wasted by reason of improper packing and loading and negligence in the handling of the various commodities.

Prior to this there had been no uniformity in the jurisdiction over the claims departments, and because of the varying practices governing them it was decided to place the jurisdiction under the legal department; therefore, coincident with the establishment of the Freight Claim Section, the loss and damage freight claims and the prevention of causes of such claims were placed in charge of freight claim agents reporting to the general solicitors of the respective railroads.

Another source of large expenditures, running into the millions of dollars, are personal injury, right of way, stock and fire claims. Therefore it was deemed advisable to create in the Division of Law a section co-ordinating these three branches of the railroad service.

Effective September 1, 1918, there was created a section entitled "Claims and Property Protection Section," to have jurisdiction over freight claims and prevention, property protection, and personal injury claims. It is not intended this section should be more than an administrative section to study causes, establish policies and co-ordinate with the forces of the carriers as existing when the roads were taken under control. Later the secret service was transferred to the Division of Operation.

The following statistics reflect the activities, as far as reported to the Washington office, of the police agencies of the carriers:

PERIOD FROM APRIL 1 TO NOVEMBER 30, 1918	
Arrests for thefts.....	10,530
Convicted.....	6,069
Pending.....	2,075
Employees arrested.....	3,241
Value goods recovered.....	\$667,578.54
Sentences one year or over.....	1,095
Fines imposed.....	\$150,509.63

Under corporate control each individual railroad had its own method of investigating and disposing of loss and damage freight claims. Therefore, in order to bring about uniformity and simplicity in the presentation, investigation, and disposition of loss and damage claims, General Order No. 41, "Regulations Governing Disposition of Interroad Freight Claims for Loss and Damage," was issued.

Consideration having been given to the vast amount of

freight refused and unclaimed by the consignee after its arrival at the billed destination, it was deemed advisable, for the purpose of clearing the congestion and keeping the channels of commerce open, also of conserving food products and materials by preventing waste and deterioration, to provide a uniform method of disposing of this class of freight promptly.

The method of claim handling having been simplified and General Order No. 34-A issued to clear the railroads of congestion due to the freight remaining on hand, refused or unclaimed, attention was next given to the subject of claim prevention. This, perhaps, is now the most important duty of the Freight Claim Section. The enormous amount of money (running well into millions) expended annually for loss and damage freight, which in the end has no economic value, is a situation that must be corrected by taking such remedial steps as are necessary toward the prevention as well as the settlement of claims. Therefore a careful study has been given to a method of prevention, and a nation-wide campaign is now being arranged in an effort to prevent this waste.

Promptly after the establishment of this section, numerous complaints began to arrive regarding the nonsettlement of loss and damage claims. Therefore attention was drawn to the provisions of General Order No. 41, which eliminated unnecessary interline investigation, bringing forward each month claims of greater age than four months. An inventory was made of all such claims with a view to giving them special attention.

One of the most important classes of claims to be met with in the claim departments is that of loss and damage to fruits and vegetables. There is a large amount of money expended annually in loss and damage claims on this commodity, besides the loss of millions of dollars' worth of food products. Therefore it is hoped to establish uniform practices in shipping and protecting these commodities and simplifying the adjustment of damages where negligence exists.

Because of conditions existing under corporate control, it was customary at most of the interchange points for each line to have inspectors for the examination of freight, making an inspection and record as to ventilation, refrigeration, etc., and many commodities were inspected as to loading, bracing, stability of packages, and general condition of the freight. This necessitated the employing of a number of men doing the same work. In order to bring about co-ordination of the various inspections by the different railroads at such interchange points, such duplication of inspections has been discontinued.

The greatest amount paid out by railroads for losses and damages growing out of any one individual class of claims was that of grain, and there being no uniformity of practices in the preparing of cars, recording of loss, or disposition of claims for loss and damage, General Order No. 57 was issued, setting forth "Rules governing the inspection, selection, and co-operating or rejection of cars for bulk grain loading, the recording of the loss of grain from car by leakage (if any) during transit, and the disposition of claims for loss and damage of grain." Because of the varying practices in the loading, shipping, recording leakage, if any, and the disposition of claims, there have been numerous controversies on this class of claims, and this order should have the effect of establishing uniform practices as to the cooperating and loading of cars, as well as the disposition of claims, and should result in a substantial saving to the shipping public as well as the railroads.

In the payment of personal-injury claims the amounts paid have been influenced in the past to a large extent by the decisions of the courts and juries in the respective states where the injury occurs, and therefore the steps toward prevention must be taken by the individual railroads in preventing the accidents or the causes of such injury in so far as possible.

In order to bring about uniform practices and economy in

this regard a committee, known as the Executive Committee of the General Claim Agents' Association, has been appointed for the purpose of studying the general situation throughout the country and to make recommendations to unify the practices on the various railroads.

This division is served with all "notices and processes" issued by the commission which may affect the director general and any of the roads under federal control. The information thus received is at once communicated to the general solicitors of the roads immediately involved.

As of July 1, there were on the docket of the commission approximately 1,000 formal complaints against carriers operating roads now under federal control, of which 481 had theretofore been heard and submitted but could not be decided because of the change of status. There were also pending 29 general investigations instituted by the commission.

The commission amended its rules of practice so as to allow rate complaints that had been filed prior to the initiation of rates in June to be supplemented, instead of compelling the parties to file original complaints. Two hundred and sixty-seven supplemental complaints have been filed and answered, and the new complaints are being answered as filed. The data for answer is ordinarily obtained from the general freight traffic committees appointed by the Division of Traffic.

Since July 1 counsel for the Railroad Administration have participated in the hearing of 180 cases before examiners in various parts of the country, and in the oral argument of 40 cases before the commission. The commission has disposed of 130 complaints, but none of its decisions have in any material way affected the initiated rates.

There are upon the commission's docket at this time about 1,000 complaints, old and new, of which about 350 have been submitted for decision. Many of these cases cover large demands for reparation growing out of transactions that occurred prior to federal control. Many others are important in their relation to supposed discriminations and to regulations and practices. Through the committees appointed by the Division of Traffic, counsel endeavored to bring about a settlement by conference of the controversies and differences which have led to the formal complaints, and a number of cases have been disposed of in this way.

Of the 29 general investigations above mentioned, 11 have been disposed of by the commission without any detriment whatever to the Railroad Administration, and some of the others are now under hearing, the director of the Division of Traffic having informed the commission that he will, by presenting the pertinent facts, assist it in reaching conclusions, and that he will consider any recommendations it may make.

### Suggestions and Complaints

In June Theodore H. Price was appointed actuary to the Railroad Administration, serving without salary. His duties, in addition to the analysis and study of the statistical records and the preparation of reports thereon, have included the organization and conduct of the Bureau for Suggestions and Complaints established on September 3, under the immediate direction of Ballard Dunn, assistant actuary.

Up to December 24 this bureau had been in operation some 16 weeks, during which time it had received in all 10,424 "initiatory letters" containing 11,666 suggestions, complaints, and commendations. As each of these letters has been answered, and as a thorough investigation of the things complained of and a thorough consideration of the suggestions made has involved much additional correspondence, a total of over 40,000 letters has been handled by the bureau. The aggregate of the salaries paid to the force of correspondents and employees conducting this work averages less than 4 cents a letter.

A careful classification of all the "initiatory letters" has been kept, and those commending employees for courtesy and

loyalty exceed the complaints of discourtesy by nearly two to one.

In all some 1,328 communications have been received as against only 714 letters complaining of individual discourtesy or incompetence. This is a record, the report says, of which the army of railroad men as well as the women who have recently been mustered into the service may well be proud. The commendations received have in every case been noted upon the records of the employees mentioned and will be given due consideration at the appropriate time. In addition to the 1,328 letters commending individual employees that have been received, 128 communications commending the railway service rendered by particular lines have been addressed to the bureau.

The other letters received by the Bureau for Suggestions and Complaints relate chiefly to what may be described as the organic defects of the service which were correctible under existing conditions are being remedied as rapidly as possible.

The classification that has been made of all the initiatory letters received and the number falling into each class follows:

CLASSIFICATION OF INITIATORY COMMUNICATIONS RECEIVED BY BUREAU FOR SUGGESTIONS AND COMPLAINTS FROM SEPTEMBER 3 TO DECEMBER 24, 1918 (INCLUSIVE)

THINGS COMPLAINED OF AND SUBJECTS DISCUSSED	
Train service .....	417
Pullman service .....	141
Diner service .....	329
Treatment of negroes .....	137
Boat and ferry service.....	6
Sanitary conditions .....	98
Freight service .....	92
Car supply .....	62
Cash payment of freight charges .....	16
Freight classification .....	23
Embargoes .....	34
Waybills .....	18
Express service .....	72
Baggage service .....	23
Delays to freight .....	350
Delays to express .....	76
Delays to baggage .....	91
Delays to live stock.....	41
Ignorance of rules.....	115
Clerical mistakes .....	20
Freight rate discrimination.....	99
Unfair passenger rates .....	45
Unfair baggage rates .....	6
Unfair Pullman rates.....	10
Special rates .....	79
Criticism of operation.....	1,092
Wages, hours, etc. ....	93
Safety .....	74
Garnishment .....	63
Boat lines, operation and schedules .....	6
Insufficient help .....	2
Train schedules .....	644
Station facilities and service.....	320
Station mail handling.....	6
Consolidation of stations.....	73
Consolidation of offices.....	14
Consolidation of lines.....	9
Retrouting .....	36
Improvements suggested:	
Equipment .....	150
Physical .....	62
Industrial .....	119
Service .....	81
Claims:	
Freight .....	595
Express .....	60
Passenger .....	36
Baggage .....	87
Damage to property.....	195
Claims, Pullman .....	34
Ticket arrangements:	
Railroad .....	287
Pullman .....	103
Parlor car .....	4
Baggage .....	44
Refund .....	279
Congestion at ticket offices.....	52
Overcharge:	
For tickets .....	217
For freight .....	49
For express .....	8
For baggage .....	55
On dining cars.....	10
Bills of lading.....	39
Demurrage .....	28
Protest against store-door delivery .....	1
Commendation of service.....	128
Newspaper criticism .....	2
Commendations for courtesy and loyalty .....	1,328
Discourtesy and incompetence.....	714
Dis honesty of employees.....	161
Time-tables, folders and guides .....	57
Economy suggestions .....	140
Tipping .....	8
Inventions .....	19
Passes for employees.....	101
Abuse of official authority.....	47
Discharge of employees.....	80
Reinstatement of employees.....	16
Refusal to honor United States transportation .....	9
United States soldiers.....	15
Injuries .....	50
Jobs .....	22
Politics by employees.....	6
Pension system .....	101
Miscellaneous .....	384
Draft exemptions .....	13
Total .....	11,666

Since the signing of the armistice and the gradual reversion to or toward the normal that has followed, the number of complaints received shows a sharp decline averaging now hardly more than 100 a day as against a daily average of from 300 to 400 when the bureau was first established.

A Forest Products Section has been organized in the southwestern railroad region, under the Regional Purchasing Committee. C. O. Deabler, lumber buyer of the Missouri Pacific, and recently assistant to the manager of the Forest Products Section at Washington, is chairman of the Section. Dr. Hermann Von Schrenk is a member of the committee. It will supervise the tie and lumber purchases in the southwestern region.

## Orders of Regional Directors

**C**ONTINUATION OF MEMBERSHIPS, ASSESSMENTS, DUES, ETC.—Circular 136 of the Southwestern regional director, similar to file No. 102-A-444 of Eastern regional director, abstract of which appeared in *Railway Age*, January 24 (page 257).

**Standard Form for Stationery.**—Circular 164 of Southwestern regional director, similar to Supplement 5 to Circular 6 of Northwestern regional director, abstract of which appeared in *Railway Age* of January 24 (page 257).

**Writing Material on Club Cars.**—Circular of Northwestern regional director, dated January 21, similar to File No. 1600-83A433 of Eastern regional director, abstract of which was published in the *Railway Age* of January 24 (page 256).

**Relations with Relinquished Short Lines.**—In Supplement 1 to Circular 49 the Northwestern regional director states that short line railroads complain that they are not receiving a fair share of the business which is competitive with federal controlled roads. In order to get at the bottom of these criticisms the Northwestern lines are requested to prepare statistics on the business interchanged with connecting short lines in 1918, as compared with 1917, and also with 1916 if the figures are available, explaining in connection therewith any change in the character or volume of traffic, or the amount of short line earnings. The regional director states that the Railroad Administration is under obligations to treat the relinquished roads fairly; to this end it may be necessary in some cases to divert traffic arbitrarily in order to give them such a proportion of the competitive business as they would have received had there been no change in the control of connecting trunk lines. Northwestern lines are expected to suggest such changes in rates, divisions and routing as will best accomplish this purpose.

The Southwestern regional director issued similar instructions in Order 152.

**Leave of Absence and Transportation for Representatives of Unions.**—In Supplement 1 to Circular 69 the Northwestern regional director announces that leave of absence will be granted, when requested, to employees serving on committees of employees' organizations when it can be shown they actually represent the class of men for whom representation is claimed. In Supplement 40 to Circular 20 he adds that annual railroad transportation will be issued to general chairmen and members of committees of employees' organizations. When transportation is desired on other than home lines application should be made to the director of the Division of Operation. Annual Pullman transportation should also be requested from the Division of Operation.

**Transportation for Express Company Employees.**—In Supplement 1 to Order 132, the Southwestern regional director announces that upon the request of the respective vice-presidents of the American Railway Express Company, federal managers are authorized to furnish trip transportation to the families of employees when traveling at the request of or in the interest of the express company.

**Handling Railroad Administration Mail.**—In Supplement 1 to Circular 8 the Northwestern regional director announces that mail which relates to the business of railroads under federal control and which is sent by or addressed to officers or employees of lines of that class or to representatives of the Railroad Administration, may be handled as railroad mail on all railroads under government control.

**Medical Attention for Sick and Wounded Soldiers.**—In a circular dated January 22 the Northwestern regional director announces that the surgeon general of the War Department has assigned medical officers to the various transportation centers as liaison officers in connection with the transfer of sick and wounded soldiers. In connection with this movement there will be a medical officer of the United States Army in charge who has the instructions to report to the:

proper medical officers of the army at Chicago full information respecting the party in his charge. These messages will be filed ordinarily six hours prior to the arrival time at Chicago. Railroads will co-operate in the prompt handling of this advance information and will give the army representatives all the information desired respecting the expected time of arrival of trains or cars, access thereto, information relative to breaking up trains at diverting points and other information regarding arrangements for the satisfactory and comfortable handling of the sick and wounded.

*Director General's Name on Stationery.*—Eastern regional director, file 1500-1-3-8A449, quotes a message from Edward Chambers, director, Division of Traffic, as follows

The director general's name is to be used on time-tables for public distribution without unnecessary repetition on same time-table. It should be shown in the heading and affixed to such notices as require his name to give them effect. The style to be used in such cases is "United States Railroad Administration, Walker D. Hines, Director General of Railroads." The reading for tariffs will be "United States Railroad Administration, Director General of Railroads," followed by name of railroad. In new stocks of ticket forms and baggage checks contained in circular P-10, show only "United States Railroad Administration," followed by the name of the railroad in the same manner as shown throughout in the circular. Existing stocks of tickets bearing name of Mr. McAdoo as director general may be used. Please notify interested departments and tariff bureaus.

*Services Performed by Counsel.*—The Eastern regional director, file 1500-103A448, states that the following advice has been received from the general counsel of the Division of Law: "Counsel who are regularly retained and paid by the Railroad Administration may be called upon to handle matters arising in connection with any other road under federal control without additional compensation. If a large amount of additional work is imposed, application for additional compensation will be considered." Applications for authority to allow additional compensation, in accordance with the ruling quoted above, should be submitted to the regional director in cases where federal and general managers consider it equitable that the same be paid.

*Leave of Absence to Employees to Attend Legislative Sessions.*—The Eastern regional director, file 1203-13A446, states that, "I am advised that some railroad officers have declined to grant leave of absence to employees to enable them to attend legislative sessions for the purpose of handling legislative matters, the claim being made that this course is required by orders of the director general. The director general's orders do not require such course, and such leave should be granted in the usual way as heretofore."

*Pilot for Trains Making Detour Movements.*—The Eastern regional director, file 1200-272A461, states that it is reported that in a recent case of a detour movement a 14-car passenger train was detoured over a mountain railroad with a yardmaster who did not know the road as a pilot for the engineer. In all cases of detour movement a pilot who does know the road shall be furnished to the engineer, and when possibly available for such service an engineer shall be provided.

*Cleaning and Disinfecting Stock Cars.*—The Eastern regional director, file 500-81A459, quotes from a letter from W. T. Tyler, director, Division of Operation, as follows:

"The Department of Agriculture calls attention to the fact that considerable difficulty is being experienced at many points in the enforcement of that part of Bureau of Animal Industry Order No. 245, governing the movement of live stock, which reads as follows:

Cars \* \* \* which have been used in the interstate transportation of cattle, sheep, swine or other animals affected with any contagious, infectious, or communicable disease shall be cleaned and disinfected under bureau supervision, in accordance with these regulations, and the final carrier shall be responsible for such cleaning and disinfection.

"The number of violations which have been reported to the Department of Agriculture indicates that some vigorous measures are necessary in order to insure a more strict compliance with these regulations."

*Ventilation of Coaches.*—The Eastern regional director,

file 2000-4-99A457, quotes from a report from the Committee on Health and Medical Relief of the Division of Operation, with reference to the ventilation of coaches, as follows:

The Committee on Health and Medical Relief has received a great many complaints with reference to the ventilation of coaches. A large number of these complaints are made in connection with the temperature of the cars while standing in passenger stations, and from my own personal experience the complaint is, in a large number of instances, justifiable. The cars are either so hot that they are unbearable, or they are unnecessarily cold, due to the probable fact that they have been placed in the station only a short time before it is time for the train to leave the terminal. It would appear to me that some effort at regulation should be made, so that the temperature of these cars would be comfortable. I appreciate that the general subject of the ventilation of cars is a difficult one, and the committee is now gathering information with a view of seeing whether it cannot establish a more satisfactory plan than has yet been devised. In the meantime, I believe conditions could be very much improved by using a proper standard of temperature for the cars, and that as a guide, the cars be equipped with thermometers for control. Further, that instructions be given that the temperature of the cars be kept as near to 68 as possible. The committee will advise you fully of its final conclusion with reference to the subject of ventilation after it has completed its survey.

*Special Car and Special Train Movements.*—The Southern regional director has issued the following Supplement No. 1, to Circular Letter No. 77: "Former practice of securing specific authority from the director general for movement of private cars in trunk line territory has been discontinued. Please act accordingly in connection with all revenue movements of private cars on regular tariff basis."

*Car Inspectors Needed.*—The Eastern regional director, file 1200-271A453, states that C. B. Young, manager, Inspection and Test Section, 610 Southern Railroad building, Washington, D. C., is in need of car inspectors at plants building cars for the United States Railroad Administration and asks that railroads forward him the names of men at present in their employ who would make good inspectors on car construction, and who could be spared temporarily for the work.

## Hearings Before Senate Committee

At Thursday's hearing before the Senate Committee on Interstate Commerce (see the article on page 306), C. E. Elmquist, president of the National Association of Railway and Utilities Commissioners, opposed an extension of federal control of railroads beyond the end of this year, but urged that Congress at the present session should adopt remedial legislation for the protection of the public by repealing the section of the control act which allows the director general to initiate rates without suspension, and to disregard other laws regulating carriers. He objected to the continuance during time of peace of the powers granted for war purposes. L. B. Finn, chairman of the Kentucky commission, appearing as a self-constituted unpaid representative of the unorganized public, declared private ownership cannot meet the transportation demands of the public, but condemned the Railroad Administration as dominated by men who had predicted failure of government control and declared against extension of the present plan.

The Railroad Administration has approved the continuation of work on the Chicago Union Station, amounting to \$5,000,000, for this year, to be financed by the railroad companies, who are also expected to expend about \$2,000,000 additional for incidental work on their own properties.

## Railway Passenger Service During Federal Control\*

By Gerrit Fort

Assistant Director, Division of Traffic, U. S. Railroad Administration.

WE MAY PROFITABLY engage in a little retrospective discussion about the past year and about the relations of the passenger men to what we have done that may help us to decide what ought to be done in the future. The necessary work of standardizing passenger practice under federal control has been unavoidably carried out largely by territorial traffic committees. It has not been the intention, however, of anyone who has been responsible for passenger affairs to ignore or minimize the importance or the value of the work of the passenger traffic manager or the general passenger agent. Your responsibilities have been increased. Today you are in the truest sense public servants and have a high duty to perform in seeing that the public receives adequate and comfortable passenger service.

I want to indulge here in one or two "don'ts." Don't minimize the importance of your position by saying you are obliged to do this or that thing because you are ordered to do so "by Washington." Don't get the idea that you are to be hampered by rules and regulations that will prevent your taking care of the public just as well under government control as you did under private operation. I am not referring to the reductions in passenger train service or lessened conveniences which were inevitable concomitants of the war and which the American public took very cheerfully, but to those little personal attentions which the passenger men gave so well in the past. Anything that could be done lawfully in the past can be done in the future. You ought to be just as solicitous for the comfort and welfare of the public under government control as under private management.

At the outset of federal administration there were those who seemed to regard the traffic men, freight as well as passenger, as more or less necessary evils and I must confess that there were times when I thought dark days had fallen upon the passenger fraternity, but it is remarkable how quickly the public gave voice to the sentiment that it would miss direct contact with traffic representatives and that sentiment is very thoroughly understood by the Railroad Administration. The consolidated ticket offices have been successful to a large extent in meeting the public needs, and, while they may still have some shortcomings, I have a rather definite conviction that these offices represent an added public convenience and that if and when the railroads are returned to private control the consolidated ticket office will remain as a permanent institution.

The present table d'hote meal in dining cars was put into effect primarily as a war measure. The suggestion was first made by the food administrator, Hoover, that the standardization of meals on the dining cars would be a desirable means of conserving food. The question was reviewed by the director general and his staff and it was decided, as quick action was necessary, to constitute an Inter-Regional Dining Car committee, chosen by the regional directors, which would be thoroughly representative of the dining car department of the railroads, and call for their recommendations. Jointly with a representative of the Food Administration these gentlemen produced a report in which they recommended the adoption of the present table d'hote luncheon and dinner and a simple a la carte menu for breakfast. That is the genesis of the present table d'hote dining car meal. There has been considerable complaint about it, but

we believe that this has resulted from faults of administration rather than from faults of the system itself for the reason that there has been quite as much written praise of the service as complaint.

The criticism seems to come from two extremes of travel. First, from those gentlemen who regard a meal on a dining car as a sort of gustatory function and to whom the cost of the meal is a secondary consideration. Now, while the railroads ought to give their patrons well prepared, substantial food at reasonable prices, they should not undertake to rival the Ritz-Carlton or the Blackstone. The other complaints come from people to whom the payment of \$1 for a meal may be a real hardship. To this class some relief should be afforded by furnishing supplementary service in the way of sandwiches, coffee, etc. There are already a number of railroads which are providing that sort of service in the coaches and the amplification of this service is something you ought to consider. I believe that between the classes I have mentioned is a vast army of travelers to whom a substantial meal at a reasonable fixed price appeals. It is not the intention to discard the present system until it has had a fair trial, which we believe it has not received up to the present time. Therefore, I want to bespeak your co-operation and support in seeing that the table d'hote plan does receive a fair trial.

Another thing that has been the subject of more or less criticism is the present regulations in regard to the making of Pullman reservations and the redemption of unused Pullman tickets. I want to remind you that some time before the railroads passed under federal control the rules substantially as they exist today were considered at a mass meeting held in Chicago and received at that time but one or two negative votes out of a very complete representation. Of course, at that time the refusal of one important line to join in the regulations was sufficient to defeat their adoption. The present rules assure everyone a fair deal, conserve the use of Pullman space, prevent speculation and, while there may be occasional cases causing inconvenience, perhaps hardship to individual passengers, in the main the rules are a public benefit. Modifications of the rules with a view to liberalizing them may be, I think are, necessary, but surely the passenger men who came so near to adopting these rules on their own initiative ought not to try to defeat them, but on the contrary ought to give them their full support and see to it that they are carried out in good faith.

Practically nothing has been adopted by the Railroad Administration in the way of reforms and changes in passenger practice that has not originated with the practical men who are serving on the territorial passenger committees and who were carefully selected by the regional directors as representative men, representative of you as well as of the public. If you sum up all the good and evil resulting to passenger traffic under federal operation, I think you will find the balance is overwhelmingly on the credit side and you should strive to retain that big balance. I hope these reforms are going to be permanent if the railroads return to private ownership. And remember that if we want to retain them we must not irritate the public by enacting petty rules which will stamp all of us as bureaucrats. Let us maintain the big things we have done and not give the public the idea that we are taking advantage of a temporary condition to establish rules that are inconvenient to the public and to take away from it privileges that it has enjoyed for a great many years.

Sir John A. F. Aspinall, general manager of the Lancashire & Yorkshire Railway, of England, since 1899, has resigned that office, and he at once takes a place on the board of directors, having been elected to the board in December. He is succeeded as general manager by Arthur Watson, C. B. E.

\*Address at annual convention, American Association of Passenger Traffic Officers, Baltimore, Md., January 22, 1919.

## Annual Report of the Exports Control Committee

THE EXPORTS CONTROL COMMITTEE has issued a review of its activities since its creation by order dated June 11, 1918, of which the following is a summary:

With the opening of headquarters in Washington, D. C., July 1, 1918, meetings have been held regularly each Wednesday for the purpose of determining—

(a) The probable amount of freight which must be exported for the prosecution of the war.

(b) How this war freight can best be routed through the various ports.

(c) How much of other essential export traffic has to be handled.

(d) The amount of local traffic necessary for each port. The committee has also been charged with responsibility for—

(a) Selection of the port to which specified freight shall be transported for transshipment overseas for the use of the War and Navy departments, the Allied governments, and others.

(b) The distribution of the combined amount of all exports, as between the various ports, so as to facilitate its handling at and avoid congestion in any one port.

With a view to co-operating with the several interests, an office and working force were established at New York (headquarters of the Shipping Control Committee), which has afforded opportunity to keep in close touch with the heavy volume of war supplies moving through North Atlantic ports. This arrangement has also provided the means for obtaining necessary information, as well as prompt unified action upon matters involving the Shipping Control committee, Freight Traffic committee-North Atlantic ports, United States Food Administration New York Office, Traffic Executive and individual Allied government organizations.

So far as rail transportation is concerned, in order to facilitate and control the movement of war and food supplies to the seaboard to connect with vessels, handled under convoy system during the period of war, it has been necessary and desirable to continue the railroad shipping permit system which was inaugurated through the Freight Traffic committee-North Atlantic ports for northern range ports, and the Southern Export committee, Atlanta, Ga., for South Atlantic and Gulf ports, and much credit is due these committees for the efficient handling of the detail work involved.

Threatened congestion at Pacific coast ports necessitated the organization of similar committee at San Francisco, known as the California Export committee, controlling movement through California ports, and the North Pacific Export committee at Portland, Ore., controlling movement through Puget Sound ports.

In order to ascertain the amount of freight which must be exported for prosecution of the war and also distribute the combined amount between the several ports, arrangements were perfected for securing necessary data as to the cargo and ocean program of the United States government, Allied governments, and commercial interests. This data has been compiled weekly in detail, thus presenting the committee a graphic picture of the overseas situation and enabling it to quickly note the high spots in need of attention. A compilation was also made of facilities at all ports available for the prompt and efficient handling of exports.

For the purpose of routing freight from interior to the seaboard via most direct line and to eliminate so-called cross-hauls, the Exports Control Committee Zone Routing Chart No. 1, showing groups of origin, together with natural seaboard assignments, was issued and placed in the hands of officials responsible for the routing of freight, with request

for observance, except in cases of extreme emergency. This chart had the effect of conserving rail transportation and distributing the total export among the several ports, diverting considerable tonnage to South Atlantic and Gulf ports which was formerly routed through northern range ports.

The primary object of the permit system is to establish intimate contact with the individual or agency at the seaboard responsible for prompt acceptance of the property upon arrival at destination. In the case of export, it was found necessary to recognize only the steamship line (not the shipper) in filing application for railroad shipping permit, and in conjunction with the Delinquent Bureau meritorious performance is assured, otherwise favorable consideration of future applications, when presented by delinquents, necessarily must be held in abeyance, pending clarification of the record.

At the ports of New York, Philadelphia and Baltimore it was found necessary to apply the permit system to domestic carload traffic for twofold purpose: First, to prevent forwarding to the seaboard export traffic under the disguise of domestic; secondly, in conjunction with the Delinquent Bureau, to insure expeditious unloading upon the part of consignees, thus keeping the terminals, necessarily used jointly for export and domestic, free from congestion.

Another requirement of the domestic permit system is that it provides for initial shipment to a particular station delivery, which has effectually stopped former practice of consigning cars to the Metropolitan district, to be held upon arrival at the Jersey shore awaiting orders for a specific delivery, frequently involving expensive switching and an average loss of 48 hours transportation. To a considerable extent the same situation obtains at Philadelphia and Baltimore by reason of having the permits specify delivery desired, thus insuring continuous movement upon arrival at the outer yards of the terminals.

Intensive loading is also made a requirement of the domestic applications in order to reduce the car units on the terminals to a minimum, and as indicative of the efficacy, during December, current year, as compared with corresponding period previous year, the average tons per car for all roads serving the Metropolitan district increased 19.3 per cent.

Record movement of wheat developed early in July, due to large crop and fixed price by the government, which, together with a heavy movement of Australian and Argentine wheat to Atlantic ports for transfer to Allied vessels, threatened to congest seaboard elevator facilities. At the request of this committee the Food Administration established a branch office in New York to handle applications for permits on grain in connection with the Freight Traffic committee-North Atlantic ports, thus regulating the flow to all ports so as not to exceed elevator storage capacity, but in sufficient volume to meet vessel requirements. It was also arranged to divert the Australian wheat to Gulf ports and transfer the Argentine wheat to Allied vessels in original sacks without burdening elevator facilities. The efficacy of the plan has been demonstrated by the fact that at no time has there been any material congestion at the seaboard due to grain movement, although the volume has been exceedingly heavy.

The constantly increasing volume of war supplies through northern range ports suggested that relief should be accorded by moving commodities originating in the South and Southwest, such as cotton and tobacco, through South Atlantic and Gulf ports. This program was followed to the extent of diverting considerable tonnage, principally account of the Allies, to the latter ports, although naturally the amount of cotton and tobacco so handled was limited to the measurement space thus available. For the purpose of fully utilizing measurement space at the more northerly ports arrangements were perfected for movement via coastwise steamers,

which in the case of cotton would have approximated 3,000,000 bales during the current season had the restrictions against all-rail movement to North Atlantic ports not been removed following the signing of the armistice.

The Traffic Executive was created by the several Allied governments to co-ordinate the work of shipping abroad all the freight necessary for war and commercial purposes. With the constantly increasing movement of overseas traffic essential for prosecution of the war, including the heavy volume of food requirements, it became imperatively necessary that all interested agencies, both inland and ocean, should keep in close touch, the one with the other, to insure maximum efficiency and consequent beneficial results.

At the recommendation of this committee the manager of inland traffic, United States Food Administration, was made a member of the Traffic Executive, Allies, and representative of the Traffic Executive became associated with the Food Administration, New York office, thus helping to make the rail and ocean movement as nearly continuous as possible. The benefit of this arrangement has been far-reaching, particularly during later months when the question of food supplies has been paramount.

Co-ordination of the several governmental agencies interested in inland and ocean transportation has been developed through weekly conferences with the Food Administration, inland traffic service of War and Navy departments, and the several departments of the Railroad Administration at Washington; also weekly conferences with Traffic Executive, Allies, United States Grain Corporation, Shipping Control Committee, Freight Traffic committee-North Atlantic Ports, and American Iron & Steel Institute at New York, all of which has served to accomplish many objects otherwise perhaps unattainable.

In view of the abnormal traffic burden imposed upon the rail lines to, and terminal facilities at Hampton Roads, it was felt desirable to relieve the situation by diversion of freight, particularly coal, to other ports. Accordingly, the ports of Norfolk and Newport News, including grain elevator at the latter point, were assigned exclusively for the handling of United States Army freight. The Navy department provided storage facilities at Charleston, S. C., for 150,000 tons of bunker coal, to be moved from Pocahontas and New River districts, and the Allied governments also arranged for handling of Clinchfield and New River coal to Charleston, S. C., account return cargo for grain vessels from the Argentine.

The prospects of a Siberian campaign, with consequent heavy overseas movement through Pacific coast ports, already more or less congested account shortage of ocean tonnage, necessitated the adoption of permit system of control to insure maximum transportation without confusion. The two committees organized, North Pacific Export committee for Puget Sound ports and California Export committee for California ports, began operating under general embargo effective September 13, 1918, since which time the situation with respect to San Francisco has been practically normal. The conditions at Seattle and Tacoma have required close attention, due to violations of the embargo and lack of ocean space through diversion of Japanese vessels to other ports account inability to secure return cargoes from the Orient under import restrictions. Efforts are now being made to relieve the situation by more liberal policy upon the part of the War Trade Board in the issuance of import licenses and the assignment of vessels by the Shipping Board to lift any undue accumulations.

Movement of Russian freight account of the newly organized War Trade Board of the United States Russian Bureau (Inc.) is being handled satisfactorily under an arrangement whereby emergency permits are issued at Washington in the office of the Exports Control Committee upon application of the bureau.

It has been the policy of the committee to divert all the tonnage possible to South Atlantic and Gulf ports in order to relieve the already overburdened Northern range ports, the longer ocean voyage to be equalized by the quick turnaround. The results accomplished have been very gratifying, particularly willingness of the Allied governments to utilize southern ports, thus permitting the War department to concentrate on northern ports in connection with troop movement.

Changed conditions, brought about by signing of the armistice, necessitated prompt action to avoid congestion at the seaboard, War department freight in transit on November 11 alone approximating 20,000 cars. Instructions were issued to hold eastbound overseas freight (except subsistence, forage and clothing) at interior junction points, to be diverted to interior storage or moved to ports as needed. Current production was also taken care of at interior government storage located at New Cumberland, Middletown, Pa., Columbus, Ohio, and South Schenectady, N. Y. Storage has also been arranged for some 50,000 tons of sundry materials to be returned from abroad account of the Navy department.

In the case of Allied government freight, production of munitions, barbed wire, etc., was immediately stopped and arrangements perfected to store cars en route or at the ports in private storage, also storage furnished by the United States government. Other freight, including airplane lumber, has been promptly cleared upon arrival at the seaboard.

Owing to the absence of suitable storage facilities for high explosives en route to or on cars in vicinity of ports account of the United States and Allied governments, and the serious menace through holding on cars, it was recommended that this material should be taken out to sea and thrown overboard, which disposition is now being arranged.

With the cessation of hostilities, it soon became apparent the overseas movement would be as great, if not greater, than preceding months, as indicative of which the British program for December aggregated 2,540,776 tons, or almost 1,000,000 tons in excess of any previous month during the war. The character of tonnage also changed, flour, grain and other food supplies comprising the major portion of the program. The necessity for prompt movement of this large volume of freight will continue so long as a substantial army force is maintained on the other side, and with the advent of winter weather, it is the opinion of this committee that transportation conditions will require continuance of the present permit system of control to insure proper distribution and avoid congestion.

The allocation of 10 per cent of all space on liners by the British government for commercial shipments, with prospects for early release of additional space, together with removal of restrictions on export and import traffic by the War Trade Board, will have the effect of greatly stimulating export trade and every effort is being put forth to foster this program without interfering with the essential food movement, although it is apparent that some supervision must be maintained over commercial traffic until such time as normal conditions may be resumed.

To continue the construction of the government railroad in Alaska for the fiscal year beginning next July, the sum of \$4,000,000 will be asked of Congress by the Alaskan Engineering Commission, according to a statement in the Alaska Railroad Record. The principal items in the estimates of the commission are \$1,286,526 for construction in the Anchorage division; \$718,340 for the Seward division; \$880,304 for the Fairbanks division; \$712,220 for operation in the Anchorage and Seward divisions, and \$329,890 for operation in the Fairbanks division. Provision is made in the estimates for the continuation of the construction of a dock at Anchorage and the purchase of 4,000 tons of rail at \$70 a ton.

General View of the Cinder Handling Plant

## A New Type of Locomotive Cinder Handling Plant

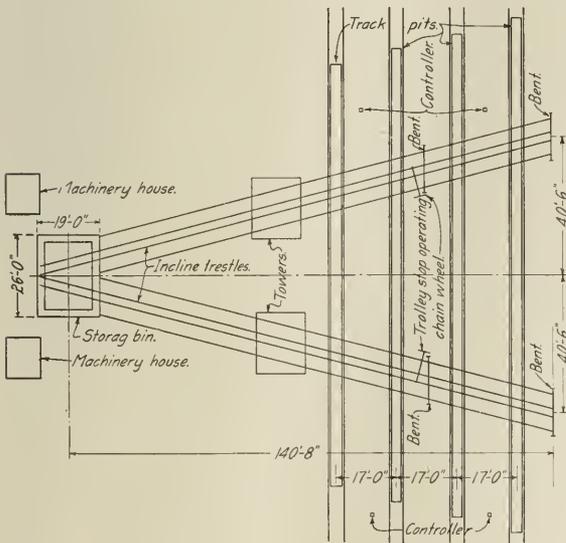

Pittsburgh & Lake Erie Facilities at Youngstown Include  
Incline Hoistway to a Storage Bin

A UNIQUE CINDER HANDLING PLANT was recently completed for the Pittsburgh & Lake Erie at Hasleton Yard, Youngstown, O. It is a development of a type of cinder handling equipment applied to earlier plants of smaller capacity by the builders, the Roberts & Schaefer

in steel buckets resting in concrete pits between the rails. The buckets are hoisted out of the pits and up an incline and are dumped into the top of a concrete storage tank. The plant serves four tracks, each of which is equipped with a concrete pit 125 ft. or more in length. These pits are of a sufficient width and depth to accommodate buckets of 55 cu. ft. capacity, 3 ft. 8 in. wide and resting on four-wheel trucks so as to give an over-all height of about 3 ft. 10 in. These trucks run on a 3-ft. 1 $\frac{1}{4}$ -in. gage track, so that the buckets are spotted readily under the locomotive ash pans to receive the cinders and are then rolled to the points of hoisting. Each bucket is provided at each end with a cast steel lug or trunnion to engage hook-shaped sockets on a steel bail attached to the hoisting equipment so that the bucket may be picked up out of the pits readily when loaded and set down in the pits and released when empty.

The hoisting arrangement, which is in duplicate, consists of two inclined trestles extending over the four cinder pit tracks. These trestles cross the tracks on a skew and converge toward the storage bin as they ascend to the dumping equipment at its top. Each of these trestles is fitted with a 2-ft. 2 $\frac{5}{8}$ -in. gage track to carry a trolley operated by a hoisting line passing over an idler pulley at the upper end of the incline and down to a hoist in a house at the foot of the storage tank. The trolley, hoisting line and bail are arranged in such a way that the trolley remains in a fixed position over the pit as the bail with the bucket attached is being hoisted, until the bail comes in contact with the trolley, after which the latter moves up the incline to the top, where the bucket is tripped over in its trunnions and empties into the bin. On the return trip to the track pits, the trolley may be stopped over any one of the four tracks by pivoted wheel blocks, any pair of which may be interposed at the will of the operator, with the aid of an operating bar controlled by a hand chain.

The movement of the trollies in hoisting is controlled by

Layout of the Track Pits, Trestles and Storage Bins

Company, Chicago, for the Pittsburgh & Lake Erie at College, Aliquippa, Monessen and Newell, Pa.

The character of the plant is shown in the photograph. Cinders are received from the ash pans of the locomotives

controllers located convenient to the track pits, but Cutler-Hammer automatic controllers and Palmer limit switches prevent overwind of the hoisting cables when the trolley reaches the upper end of the trestles.

The plant is located only 250 ft. from a 900-ton capacity coaling station, also built by Roberts & Schaefer Company, which serves the same four tracks that are equipped with the track pits for the cinder plant. The cinder storage tank is served by the track that leads over the track hopper of the coaling station so that coal cars dumped at the track hopper may be dropped back to the cinder bin to be loaded with cinders. Since the completion of this plant contracts have been awarded for similar facilities on the New York Central at Youngstown, Ohio, and Minerva.

## Valuation Progress

A STATEMENT of recent developments in connection with federal valuation work has been issued by Frederick H. Lee, secretary of the Presidents' Conference Committee on Federal Valuation, under date of January 2. Among recent developments referred to in this statement are the fact that the Kansas City Southern has filed a petition and order for a writ of mandamus with the Supreme Court of the District of Columbia to compel the Interstate Commerce Commission to receive testimony as to the cost of reproduction of its lands, the commission having overruled a similar motion made by the railroad on November 15, 1918.

The rule before the Supreme Court was made returnable on December 10, but postponement of the argument was granted until January 4.

A plan is being developed whereby the completion reports required by the Division of Valuation under Order No. 3 are to be retained in the files of the carriers and only quarterly and annual returns made to the division. It is not the intention of the Bureau of Valuation at the present time to request any reports under this order, but the carriers will be required to keep the data in their files.

Notice has been given of a hearing before Commissioner Meyer, of Chicago, beginning January 20, on the valuations of the Elgin, Joliet & Eastern, the Chicago, Lake Shore & Eastern and the Joliet & Blue Island properties.

### I. C. C. Rulings

Certain tentative interpretations have been made by Division 1 of the commission of the decisions in the Texas Midland and the Winston-Salem Southbound as follows: Where carriers agree as to the ownership of railroad crossings, the property should be inventoried to the owner or owners. Where no agreement is reached the conclusion of the commission as announced in its decision in Valuation Docket No. 5, Winston-Salem Southbound case, should be followed. This we also understand to be in conformity with the present practice of the bureau. The rule announced in the Winston-Salem Southbound case is as follows:

"It has been the practice of the bureau of valuation to apportion the estimated costs of reproduction in accordance with any agreement as to the ownership of property of this character which the interested carriers may make. Failing such agreement, the cost of reproduction estimates of the junior carrier omit, in the case of under-crossings, anything for the assumed reproduction of structures used entirely for the passage of the trains of the senior companies; but the cost of reproduction estimates of every junior carrier includes the estimated cost of reproducing the property exclusively used by it. One-half of the estimated cost of reproducing property commonly used by both carriers, such as crossing frogs, is carried into the tentative valuation of the south-

bound company. Such practice has been followed in the tentative report in this case."

Time tables, tariffs, etc., should not be embraced in the reproduction inventories nor shown in the statement of property of carriers.

Abandoned property should not be included in the reproduction inventories.

If the ownership of interlocking plants is known, they should be inventoried to the owner or owners. In the absence of such knowledge they should be apportioned among the using carriers according to use.

Where property off the right-of-way is a necessary part of the property of the carrier devoted to the public use it should be inventoried to the carrier; otherwise it should be included in non-carrier property owned. This rule would probably mean that the viaducts and rip-rap on the Kansas City Southern should be included in the reproduction inventories for that carrier.

The appraiser in the field shall determine whether the particular street, alley or highway is in fact a street, alley or highway, dependent upon the facts in connection with each individual piece of land and without regard to the number of inhabitants of the settlement in which they are found. In the case of exclusively used streets they shall be included in the land report as land owned and used for common-carrier purposes in instances where the carrier can show title or produces an order of vacation or satisfactory proof that such an order was entered; otherwise they shall be excluded. In the case of partially used streets or alleys nothing shall be included in the land report on account of such areas unless it affirmatively appears that the carrier owns it. In those instances where it is included the value to be stated will be determined in view of the conditions of its use. Highways which are used by carriers shall be included in the land report as land owned and used for common-carrier purposes unless it affirmatively appears that the carrier does not own the land, but the land section shall make no extended investigations to determine ownership.

### Progress

During the year the valuation work and inventory of the Bureau of Valuation has progressed quite steadily. No tentative valuations have been served by the commission during this period, but now that many elemental questions which have been in controversy have been decided by the commission in the valuations of the Texas Midland and the Winston-Salem Southbound it is thought that other carriers will be served in the near future. A considerable number of carriers have, however, been furnished with copies of inventories in preliminary form and conferences are being held between the representatives of the carriers and the Bureau of Valuation in order to adjust so far as possible any errors or omissions and other differences so that such items may be corrected in advance of the service of a tentative valuation and thus reduce the number of issues to be raised by protest.

The expenditures of the Bureau of Valuation for the year ending June 30, 1918, were \$3,384,444.31; leaving an unexpended balance of \$115,913.73. According to the terms of the bill carrying the last appropriation for valuation, this unexpended balance was to be carried forward and used in connection with the \$3,500,000 made available for the year ending June 30, 1919. The total expenditures on behalf of the Bureau of Valuation from the beginning of valuation work to June 30, 1918, have been \$12,251,517.43. A total of \$4,111,373.06 was expended in connection with valuation work by the carriers reporting to the Presidents' Conference Committee during the year ending June 30, 1918 (four companies not reporting), making a total amount for the five years ending June 30, 1918 (with the above omissions), of \$24,578,521.93.

# General News Department

The proposed dismantling of the Colorado Midland has been stayed by the Railroad Administration as the result of agitation by shippers and state officers of Colorado, who ask the government to take over and operate the road. Representatives of the shippers and of the Colorado Public Service Commission have been assured by the Railroad Administration that practicable recommendations will receive earnest consideration.

The American Association of Engineers, which has a railroad committee studying the railroad wage problem as affecting civil, mechanical and electrical engineers employed by the railways, will set aside for the use of this committee one half of all receipts from new railroad members during the month of January. This money will be used to make a study of the wages paid to technical engineers in railway employ and to make representation of the results to the Board of Railroad Wages and Working Conditions, the regional railroad directors and others. The railroad committee is composed of W. H. Finley, president of the Chicago & North Western; E. H. Lee, president of the Chicago & Western Indiana, and W. W. K. Sparrow, corporate chief engineer of the Chicago, Milwaukee & St. Paul.

Roy U. Conger, of New York City, a manufacturer of airplane parts, has bought from the British Government 350 airplanes and a large quantity of engines and accessories, heretofore used in Canada for training aviators for the military service, and proposes to use the machines in the operation of commercial routes in Canada. This statement, taken from the New York Sun, is based on transactions closed at Toronto, Ont., on January 29. Mr. Conger is said to be perfectly confident that the use of airplanes for transporting passengers, mail and parcels can be made profitable in Canada; and presumably also in the United States. This air equipment is said to have cost ten million dollars; and an offer of \$400,000 had previously been refused because of a probability that the airplanes would be sold subsequently at auction and would fall into the hands of irresponsible persons.

The Engineering Societies' Employment Bureau, New York City, desires that state and municipal authorities, corporations and individuals who need the services of professional engineers communicate their wants to the Bureau, 33 West Thirty-ninth street. This bureau is maintained by the four national Societies of Civil, Mining, Mechanical and Electrical Engineers. In behalf of engineers who have been serving in the army or in government capacities during the war, it is the desire of the Engineering Societies to get in touch with contemplated engineering projects as early as practicable. By resolutions adopted unanimously (by the 650 members present at its annual meeting) the American Society of Civil Engineers has recorded "its profound conviction that public works should be carried forward to the fullest extent consistent with sound judgment, not only for fundamental economic reasons, but for humanitarian reasons."

Arthur H. Johnson, signal and telegraph engineer of the London & South Western, has resigned from that office on account of failing health; and the directors of the company have granted him a pension. Mr. Johnson began his career in England, but he is well-known in America, having been for several years connected with the Union Switch & Signal Company, and later with the Johnson Railroad Signal Company. He was also for about three years signal engineer of the Erie Railroad. When he left that road he returned to England and was engaged in manufacturing with W. R. Sykes, the well-known inventor of the Sykes controlled

manual block signaling apparatus. While there he entered into a contract with the New Zealand Railways and spent several years in New Zealand in establishing the signal and telegraph department of the railways of the islands. He had been with the London & South Western nineteen years. Mr. Johnson is the author of numerous valuable writings on signaling subjects, notably a review of the history of signaling on English railways, presented before Harvard University in 1894, and reported in the Railroad Gazette in August, September and October of that year.

## Railway Honor Men

J. A. Edson, federal manager on the Kansas City Southern and other lines, reports that 1,067 officers and employees of the roads under his managership served in the army and navy during the war. The distribution of these men is as follows: Kansas City Southern, 594 men; Midland Valley, 80; Houston East & West Texas, 64; Vicksburg, Shreveport & Pacific, 88; Missouri & North Arkansas, 108; Kansas City, Mexico & Orient, 133.

## Fatal Troop-Train Collision in France

A press despatch from Paris, January 25, reports 18 American soldiers killed and 30 injured in a collision between a troop train and a freight at Nanoirs.

## Probably Sent at Government Rate

No wonder Mr. McAdoo couldn't live on \$12,000 a year. Here he is without a job, and he sends a thousand-word telegram to the waterways convention about 5-year government control of railroads.—*F. P. A. in New York Tribune.*

## Want Railroads Returned to Owners

The Lumbermen's Association of Chicago, at its annual meeting, on January 20, adopted a resolution calling for the return of the railroads to private operation as promptly as possible, with suitable remedial legislation. The association also endorsed the resolutions of the Railway Business Association, and favored an extra session of Congress to secure prompt action.

Disapproval both of government ownership and government operation has been voiced also by numerous organizations all over the country, among which are the National Live Stock Association, which took action at Denver on January 24, and the San Francisco Chamber of Commerce.

A large meeting of Texas shippers, held at Dallas on January 25, took similar action. The New York Evening Post during the past week has published letters from careful correspondents reporting similar views in St. Paul, St. Louis, Memphis, Philadelphia and Boston; and a letter from Kansas City reports business and farming interests as in a critical mood, having found railroad service unsatisfactory.

## "Safe Practices"

The sixteenth number of the Safe Practices Bulletin of the National Safety Council is a ten-page illustrated monograph on safe clothing for men and women in industry. These excellent brochures contain a large amount of useful information, gathered from varied sources and clothed in lucid and vigorous language. Some members of the Council, to encourage the wearing of suitable clothes, provide women employees with the first suit free of charge.

Pamphlet No. 17 is entitled "Yards" and deals with all kinds of outdoor operations in the yards of industries.

No. 18 is on Power Presses. The ingenious recent devices for preventing workmen from injuring their hands or feet in these ponderous machines are innumerable. One picture shows a large press, in a shop of the Ford Motor Company, where each of two men must press an electric push button with each hand before the machine can be operated.

These pamphlets are provided, at a cost of ten cents each, by the National Safety Council, 208 South LaSalle street, Chicago.

### Simplification Run Mad

In Mr. McAdoo's list of "advantages" of unified operation of the railways is mentioned the "elimination of the old practice of paying mileage or per diem rental for the use of freight or passenger cars of one carrier by another." Thus the roads which have let their cars go to other lines have no way to get them back, no matter how badly they need them. Government ownership would not obviate the necessity for some sort of distribution of cars and some way of maintaining such distribution. There is a fundamental weakness in the entire theory of running the railways "for the good of the whole country." It would mean reducing railway service in general to the minimum. It would mean only occasional freight trains on the smaller lines. It would mean the denial of proper passenger train facilities for hundreds of interior towns not located on the lines chosen for through passenger traffic. The general tendency would be to retard development of the rural sections. Merchants might as well talk of running their stores only during the rush seasons. We might as well plan street car service only during the rush hours. It would be as feasible to have telegraph offices only in the large centers of population, or to keep hotels open only during conventions. No business can live exclusively on cream. There are long periods when nearly every business runs at a loss, but it must take care of its regular patrons' needs.—*St. Louis Globe-Democrat*.

### A Message from the Ex-Director-General

Although retired to private life, W. G. McAdoo, former director-general of railroads, is still actively pushing his plan for a five-year extension of Government control of the railroads. In a telegram to an inland waterways meeting at Defiance, Ohio, last Monday, he said:

"The confusion of counsel about the railroad problem, made daily more evident by the great variety of conflicting views and opinions now being presented at Washington, makes it more and more clear that the course of wisdom, sagacity and prudence is to extend Government control of the railroads for five years, that our inland waterways be developed to the largest possible extent during that period, and that these inland waterways and rail facilities be co-ordinated with our great merchant marine in an endeavor to get for American business enterprise a fair participation in the benefits of world commerce.

"The powerful and sleepless forces of reaction are solidly arrayed against this plan. They will defeat it unless the American people are aroused to the situation. The time is short. The matter is vital. My earnest suggestion to you and your associates is that you press upon the attention of the Congress the importance of the five-year control in order that the things you want to accomplish may be brought about."

### National Rivers and Harbors Congress

The railroad problem has an important part in the tentative program which has been issued for the fourteenth convention of the National Rivers and Harbors Congress to be held at Washington on February 5, 6 and 7. The subject for discussion on Thursday, February 6, is "What Shall Be Done With Our Railroads?" Charles F. Nesbit, of Washington, D. C., will discuss this question on the side of government ownership; Samuel O. Dunn, editor of the *Railway Age*, will discuss the return to private ownership, and William Jennings Bryan will discuss a dual plan of ownership. Other topics for discussion are: "Shall waterways as well as rail-

ways be placed under control of the Interstate Commerce Commission, which shall have power not only to establish through rail and water routes, but to fix both maximum and minimum rates?" "Shall railways be allowed to continue to make extremely low rates to points on waterways, while maintaining much higher rates to inland points?" "Should railway rates be the same for equal distances to both inland and waterway points?" "Should railway rates be lower to waterway points than to inland points, providing the difference in rates for equal distances is not more than 20 or 25 per cent?"

The program also includes addresses on "What the Government Is Doing for Water Transportation," by G. A. Tomlinson, director of the Division of Inland Waterways of the United States Railroad Administration; on "Transportation," by Major Gen. William M. Black, chief of engineers, U. S. Army, and on "The Essential Unity of Transportation by Water, by Rail, by Road, on Land and on Sea," by William C. Redfield, Secretary of Commerce. Walker D. Hines, director general of railroads, is also expected to address the Congress.

### The June Mechanical Convention

J. D. Conway, secretary of the Railway Supply Manufacturers' Association, on January 23, sent out circular No. 1 extending an invitation to manufacturers of and dealers in railway supplies to exhibit at Atlantic City in June, and giving full details as to the exhibit arrangements.

In his circular, Mr. Conway says:

"This is the first exhibition that has been held for three years. The railroad associations have expressed their earnest desire that our association should make a full exhibit, and the United States Railroad Administration gives its unqualified approval of it. Invitations are being extended in the name of the three associations to all foreign trade bodies in this country, and, through the embassies at Washington, to all foreign governments (except the Central Powers), inviting them to send delegates or representatives to attend the conventions and examine the exhibits. The opportunity presented by an exhibition at this time for both the domestic and foreign demand is exceptional."

### Wood Preservers' Meeting

The fourteenth annual meeting of the American Wood Preservers' Association was held in St. Louis on Tuesday and Wednesday of this week with a registration of over 250, the largest attendance on record. An unusually large percentage of railway men were present.

On Wednesday afternoon the tie problem was discussed, with John Foley, of the Forest Products Section at Washington, and others speaking. Chicago was selected as the meeting place for the next convention.

J. B. Card, president of the Central Creosoting Company, Chicago, was elected president of the association; A. R. Joyce, Joyce-Watkins Tie Company, Chicago, first vice-president, and C. M. Taylor, superintendent of the Port Reading Creosoting Plant, Port Reading, N. J., second vice-president. F. J. Angier, superintendent of timber preservation, Baltimore & Ohio, was re-elected secretary-treasurer.

On Thursday and Friday following the meetings, the tie producers of the country held conferences looking to the organization of a national association. There were long discussions on the centralization of purchases by the government.

### American Society of Civil Engineers

Fayette Samuel Curtis, of Boston, Mass., president of the Old Colony Railroad, has been elected president, for the year 1919, of the American Society of Civil Engineers. Other officers named were H. S. Crocker, Denver, Col., and Leonard Metcalf, Boston, Mass., vice-presidents; A. S. Tuttle, New York, treasurer; G. H. Clark and Jacob S. Langthorn, New York; Charles C. Elwell, New Haven, Conn.; Willard Beahan, Cleveland, Ohio; John W. Alvord, Chicago, Ill., and Carl E. Grunsky, San Francisco, Cal., directors.

REVENUES AND EXPENSES OF RAILWAYS

ELEVEN MONTHS OF CALENDAR YEAR 1918

Table with columns: Name of road, Average mileage operated during period, Operating revenues (Freight, Passenger, Inc. misc.), Total revenue, Maintenance of way and equipment, Traffic, Trans-shipment, General, Total, Operating ratio, Net from railway operation, Railway tax accruals, Operating comp. with last year, Increase (or decr.) comp. with last year.

Traffic News

Receipts of live stock at Kansas City in the calendar year 1918 amounted to 161,812 cars, as compared with 138,186 cars in 1917, an increase of 15 per cent. The total shipments from Kansas City in 1918 were 55,123 cars, as compared with 48,772 cars in 1917, an increase of 12 per cent.

Traffic Hearings on Sand and Gravel Rates

The central district freight traffic committee opened a hearing at the Hotel La Salle, Chicago, Thursday, on the proposed mileage scale rates for sand, gravel, stone and slag in territory east of the Illinois-Indiana state line, west of Pittsburgh and Buffalo and north of the Ohio river. There was an exceptionally large attendance, the feeling running high among shippers, who claim that the new scale will mean a heavy increase over the present rates and will thereby retard road building and other construction work, which is highly essential to prevent a serious unemployment problem. In the morning session the chairman of the meeting stated that the purpose of the scale was to replace the present hodge-podge of sand and gravel rates, with a scheme which will exact the same charge for the same service throughout the territory. In reply to an allegation that the scale meant a large increase in rates, he stated that the committee had applied the proposed scale and present rates to business on Pittsburgh, Chicago, Cincinnati and St. Louis for one month in 1916, when the sand and gravel movement was normal, and found that the application of the new scale meant a reduction in revenues rather than an increase.

Fibre Container Makers Organize New Body

At a meeting of manufacturers of corrugated and solid fibre containers, held in Chicago on January 16 and 17, an association, to be known as The Container Club, was formed. It will take over the activities of the Corrugated-Fibre Association and the Fibre Shipping Container Association, both of which have been disbanded.

At a meeting of the War Service Committee of the War Service Board, of the container industry, held in Atlantic City, N. J., on December 17, it was voted to disband the board on January 1 because it was organized only for the purpose of serving the government and the industry in its relations with the government for the period of the war. The discussion that ensued resulted in the organization of the Container Club. Among the purposes of the club, as outlined in its by-laws, are the development and maintenance of a proper standard of quality of fibre shipping cases and of the raw materials entering into their manufacture, co-operation with the carriers by a strict system of inspection with the object of eliminating the use of unsafe containers and those not complying with the railroad classification rules; co-operation with shippers in devising the most suitable containers for various commodities and the best means of packing and sealing them; the prosecution of research work to secure the standardization of fibre shipping cases and the materials from which they are made, and the further development of the uses of fibre containers with special attention to promoting their sale in foreign countries.

The main office of the club will be in the Transportation building, Chicago.

The following is a list of the officers: Geo. W. Gair, vice-president, the Robert Gair Company, Brooklyn, N. Y., president; Sidney Frohman, president the Hinde & Dauch Paper Company, Sandusky, Ohio, vice-president; J. P. Hummel, president the Hummel & Downing Company, Milwaukee, Wis., vice-president; G. H. Wood, president the River Raisin Paper Company, Monroe, Mich., vice-president; Frederick A. Norris, vice-president, the Thompson & Norris Company, Brooklyn, N. Y., vice-president.

The charter membership of the association includes 25 companies located in all parts of the country.

## Commission and Court News

### Court News

#### Jurisdiction of Actions for Freight Charges

Where a bill of lading for an interstate shipment required the owner or consignee to pay the freight, the Circuit Court of Appeals, Ninth Circuit, holds that an action by a connecting carrier to recover freight due is governed by the Carmack Amendment, and under the Judicial Code is within the jurisdiction of the federal District Court, regardless of the amount involved.—New York Central v. Mutual Orange Distributors, 251 Fed. 230. Decided May 6, 1918.

#### Void Contracts to Establish Stations

The Kansas Supreme Court holds that a contract made in consideration of the giving of subscription notes whereby a railroad company agrees permanently to establish and maintain on the subscriber's land a passenger and freight station, stockyards, side tracks, and other shipping facilities, and to refrain from ever establishing or maintaining similar structures or facilities within competing distance of the subscriber's land, is void as against public policy, even if the provision not to establish other stations were omitted.—Baird v. Salina Northern (Kan.) 173 Pac. 1069. Decided July 6, 1918.

#### Interpretation of Tariffs

In an action by a railroad company to recover balances due as freight for shipments of cattle, the Circuit Court of Appeals, Ninth Circuit, holds that in a case where no through rate or through route is authorized by the tariff between the two points of a shipment the rate which would be applicable would have to be made up by a combination of the rates published in the tariff sheets. In determining the rate to be charged, all parts of the tariff filed should be considered, and if a plain meaning can be gathered therefrom, effect should be given to it.—Portland Cattle Loan Co. v. Oregon Short Line, 251 Fed. 33. Decided May 6, 1918.

#### Delivery at Private Siding

The Supreme Court of the State of Washington holds that the fact that a railroad may put goods on a siding does not make it other than private within a bill of lading provision that the carrier shall incur no liability for goods received from or delivered on private sidings, except when attached to train, where such place of delivery was fixed by the bill, with the making of which the terminal carrier had nothing to do. Such a provision is reasonable and valid. Where, under a nonnegotiable bill of lading, property was delivered on a private siding, the terminal carrier had a right to act upon the basis that the shipper, who was also consignee, still held the bill of lading, and the property could be placed on the siding without receipt of the bill of lading and without notifying the consignee.—Branchi & Sons v. Montpelier & Wells River, 104 Atl. 144. Decided May 6, 1918.

#### Right to Bridge Road—Government War Work

A railroad sued two county boards to restrain interference with the construction of a bridge over a plank road, the bridge being a necessary link in a railroad duly laid out on both sides thereof. The county boards were in possession of the plank road. The right of the railroad to lay its track and to carry it across the plank road by an overhead bridge was absolute; and it was apparent that it would suffer an irreparable injury if the use of its road were delayed for want of a bridge. Even if it did not, the New Jersey Court of Chancery holds that the public necessity at the present time is paramount and should outweigh questions of private consideration; and the court should see to it that public work for the government, in its aid, is not hampered or impeded.

Injunction was granted.—United New Jersey R. & C. Co. v. Freeholders of Hudson & Essex (N. J.) 104 Atl. 98. Decided May 23, 1918.

#### Excessive Damages

Where a plaintiff's husband was killed instantly, was 29 years old, and left no children, and was earning about \$125 a month, with prospects of increased earnings, the Arkansas Supreme Court held a judgment for \$22,500 excessive, and to be reversed unless remitted to \$15,000.—St. Louis S. W. v. Owings (Ark.) 204 S. W. 1146.

A lineman 32 years old was riding on a gasoline car weighing about 400 lb. and carrying tools which weighed about 100 lb. The car was derailed and rolled over him. He received a Pott's fracture of the fibula, and sustained a breaking or tearing away of the ankle ligaments, injury to the soft structures, etc., subjecting him to pain. The Iowa Supreme Court holds that a verdict for him of \$5,900 was excessive by \$900.—Brier v. Rock Island (Iowa) 168 N. W. 339. Decided June 27, 1918.

#### Employers' Liability Act Decisions

The Kentucky Court of Appeals holds that an employee injured while on the tracks on his way to repair the dwelling house of the general manager was not at the time employed in interstate commerce within the act.—Walden v. Cumberland (Ky.), 203 S. W., 854. Decided June 11, 1918.

The Kentucky Court of Appeals holds that a signal maintainer, who was furnished by his employer, an interstate carrier, with a tricycle to make his rounds, was engaged in interstate commerce when returning to his home after leaving the last signal.—L. & N. v. Mullins' Admr. (Ky.), 203 S. W., 1058. Decided June 14, 1918.

Where the employee of an interstate common carrier was injured while engaged in lifting rails from the ground and placing them on a car to be taken to another point on the line, and there used in maintaining or repairing the track, the Kentucky Court of Appeals holds that the question of whether he was engaged in interstate commerce when injured should have been submitted to the jury.—Probus v. Illinois Central (Ky.), 203 S. W., 862. Decided June 7, 1918.

#### Use of Waste Materials from Manufacturing Plants

The federal District Court for the Western District of Pennsylvania holds that it is not a defense to a suit by a railroad company to recover its established rates for transportation of slag, ashes and other refuse delivered on private sidings "for wasting for the plant," that some of the material may have been used by the company for ballast. The court said: "The service for which the plaintiff was entitled to recover the rates charged was the transportation of the materials away from the several plants of the defendants, so that they would be rid of them. What use the plaintiff would make of the materials after it had rid the plants of the defendant of them is, under the tariff, wholly immaterial. \* \* \* Even if there should be a disposition on the part of the court to hold that the plaintiff is not entitled to the full rate per car for refuse used by it for ballast or fill along its line, the court could not do so, because it would then be assuming a control over the rates which is not within our jurisdiction." Rates of a railroad company which conform to its published tariffs cannot be contested in the courts as unreasonable.—Baltimore & Ohio v. Carnegie Steel Co., 251 Fed. 682. Decided January 31, 1918.

#### Keeping a Look-Out When Making Yard Movements

Whether it is negligence or not for the servants of a railroad company to run an engine backwards or push cars ahead of an engine without stationing some one on the tender or foremost car to signal its approach to a person who may be on the track, is a question which is controlled by the circumstances under which the engine or train is operated. Sometimes it has been held negligence per se, but in most cases it has been held a question of fact for the jury. When, as in the present case, a train is being moved over a bridge

where it is manifestly dangerous for people to walk, and proper signs are placed so as to warn people of the danger of trespassing thereon, and only active persons who court danger attempt to cross the bridge, it would not be expected that a lookout would be stationed to prevent accidents. A night watchman was found dead on the track on a bridge, having evidently been run over by a train. If he stopped on the bridge for any purpose, there was no evidence that he could be observed by an outlook on the car immediately in front of the engine, and there was positive evidence that he was not on the track where he could be seen from the approaching train. The Iowa Supreme Court held the evidence would not support a finding that any negligence of the railroad was the proximate cause of his injury, and judgment for the plaintiff was reversed.—*Sippel v. Missouri Pacific (Neb.)* 168 N. W. 356. Decided June 15, 1918.

### Interstate Commerce—Tariffs

As a joint rate cannot be made between an interstate railroad company and a carrier by water transporting property between the United States and a nonadjacent foreign country; the Circuit Court of Appeals, Ninth Circuit, holds that, in view of rule 71 of the Interstate Commerce Commission, provisions in the tariffs of a railroad company filed in accordance with the Act to Regulate Commerce, §6, for absorption of switching charges and state tolls on traffic destined to or originating in foreign countries, apply only to state tolls on land carriage, and not to tolls and charges imposed by the water carrier.

It is also held that while an interstate railroad company is subject to the act to regulate commerce, and the provisions of the tariffs filed pursuant to that section must be strictly observed, yet the Interstate Commerce Commission is without jurisdiction over ocean carriage of export and import traffic destined to or coming from nonadjacent foreign countries. *Pacific Mail S. S. Co. v. Western Pacific*, 251 Fed. 218. Decided May 6, 1918.

## United States Supreme Court

### Validity of Provision of Notice of Claim

In an action for damages in transit to cattle carried from California to Phoenix, Arizona, one ground of defense was non-compliance with a provision in the contract for notice of loss or damage within ten days after the unloading of the animals. The shipper alleged actual knowledge at the time of unloading by the railroad of injuries sustained by the cattle in transit, and subsequent continuous negotiations between the shipper and the railroad's agents for more than three months relative to damages sustained. The trial court refused to direct a verdict for the defendant and charged the jury that if they believed the defendant or its agents or employees did know that five or more of the cattle died while in transit, and that the defendant was negotiating with the plaintiff for a settlement of his claims, and that the defendant knew the cattle had been injured as alleged in the plaintiff's complaint, the plaintiff was released from giving notice within ten days as required by the contract. The Circuit Court of Appeals, Ninth Circuit, affirmed a judgment entered upon verdict for the shipper, 233 Fed. 956.

The Supreme Court of the United States, considering the principles and conclusions approved by its opinions in *St. Louis, I. M. & So. v. Starbird*, 243 U. S. 592 and *Erie v. Stone*, 244 U. S. 332 (announced since the judgment below), is of opinion that upon the facts disclosed the stipulation between the parties as to notice in writing within ten days of any claim for damages was valid. The court also thinks those opinions make it clear that the circumstances relied upon by the shipper were inadequate to show a waiver by the carrier of written notice as required by the contract. It holds that the trial court's instruction was erroneous, and that the railroad's request for a directed verdict should have been granted. Judgment for the plaintiff is, therefore, reversed.—Opinion by U. S. Justice McReynolds, U. S. Justice McKenna and U. S. Justice Clarke dissent.—*Southern Pacific v. Stewart*. Decided January 13, 1919.

## Foreign Railway News

### Coal Shortage in Germany Is Acute

The coal shortage throughout Germany is so threatening, says an Associated Press despatch, that for the moment all other questions are overshadowed.

At present, according to the despatch, the daily production in the Ruhr district is fewer than 10,000 tons, against 24,000 during the war and 33,000 in peace times. Upper Silesia is producing 2,000 carloads, as against 11,000 in war times and 14,000 under peace conditions. The reserves are virtually exhausted.

The situation is aggravated further by lack of enough railway rolling stock to transport even the small quantities mined. Of 2,100 cars required in the Ruhr district on Saturday only 1,000 could be obtained. The Minister of Railways has had the greatest difficulty in securing locomotives for the transport of coal from Silesia to Berlin, getting only a fraction of the total needed. In addition to the depletion of the supply of rolling stock through deliveries to the Allies the situation has been further complicated by labor conditions.

### Siberian Railroad Loses \$40,000,000 a Month

The Trans-Siberian Railroad is losing \$40,000,000 a month, according to Ivan Mikhailoff, Minister of Finance of the All-Russian Government at Omsk, in discussing the Government's program for financial rehabilitation with the Associated Press recently.

M. Mikhailoff strongly supported the government's decision to accept the allied proposal for the management of the Trans-Siberian Railway, saying that if sufficient power is put into the work results will be sure to follow.

He pointed out that the reorganization of the railway would be immediately beneficial by increasing custom receipts. He said that Russia would furnish money to meet the running expenses of the work, but the plans of John F. Stevens, head of the Railroad Commission, will entail the purchase abroad of a large amount of material. To make payments on such purchases, Russia, he said, would request a loan from allied nations.

He said that the monthly expenditures jumped from \$78,500,000 in August to \$200,000,000 in December. The receipts in December were \$39,500,000, against \$10,000,000 in August. Deficiencies are being met, he said, by the issuance of treasury bonds. The budget for 1919 calls for \$300,000,000 monthly to meet the expenses attendant upon enlarging the territory under control. He said that \$50,000,000 would be appropriated for railroad work.

In the opinion of people at Omsk, the Associated Press despatch says, the hand of the government has been strengthened by the acceptance of the Foreign Ministry by Sergius Sazonov and the final conclusion of the agreement between the United States and Japan by which Mr. Stevens became chairman of the technical commission in charge of the rehabilitation of the Trans-Siberian Railway.

### French Railroad Expansion in Africa

A French committee for the development of African railroads has recently approved a program for the construction of 18,000 miles of track during the next 15 years, says an item in the Wall Street Journal, quoted from *l'Economiste Européen*.

It is proposed first to extend a certain number of existing lines in Algiers and Tunis toward the highland and build rail communications in Morocco, as proposed by General Lyautéy. This latter project has been under consideration by a committee of the French Chamber for the last 18 months.

The next step proposed is to connect northern Africa with the southwest coast on the one hand and with equatorial Africa on the other hand. This will be accomplished by a

trans-Saharan road reaching the Niger at Bourem and Lake Chad via Nguigni-Massenya.

The important projects, however, comprise a rail route between Marrakech and Dakar on the African west coast which will facilitate communication with South America, one between Abecher and El Obéid which will connect with the Egyptian Sudan system, one between Zemie and Fort Florence which will touch the Cape to Cairo railway and one between Zemie and Stanleyville in the Belgian Congo. These lines will be connected with branch lines, particularly in the French territory of the African west coast and in Central Africa. The mileage projected for the former is 7,000 and for the latter 6,000 miles. It will tap the rich regions of the Niger and of Lake Chad and provision Europe and especially France with cereals, wool, cotton, oil products, skins, meat, minerals, sugar, coffee, wood, etc., of which France had to import about \$1,200,000,000 in 1914. The cost of this rail program has been estimated at \$800,000,000.

### Railway Notes from China

Special Correspondence from Peking (Delayed)

Considerable uneasiness has been caused by persistent rumors that the net earnings of the Peking-Mukden line had been mortgaged to Japanese interests as security for a political loan. The rumor also had it that the loan would probably be large enough to redeem the present British loan and hence would out the British management. The net earnings of this line are annually about \$8,000,000, hence the property is worth acquiring.

Three Japanese railway projects indicate further development recently. The most important is the line from Tsinan to Shunteh. This is the old German concession in connection with the line from Tsinan to Tsingtao. The Japanese having taken over the latter, now elect to exercise the former. It appears, however, that this line is not fully satisfactory to Japanese interests. While it would divert a very considerable agricultural traffic to the port of Tsingtao, some time would be required to develop the route. The promoters now demand permission to swing the line further south to a connection with the Takou line. The latter line already has a coal traffic sufficient to pay all charges upon its own line, and if most of this could be captured by the line from Tsinan—as it probably could—the new line would pay from the start. All the business picked up locally would be “velvet” and a tremendous tonnage would be turned over at Tsinan to the Tsingtao line, which now is in need of something of the sort. However, the British have the right to build all extensions to the Takou line, and, hence, no decision has been reached, so far as is known.

From Kirin (in Manchuria) to the coast is another line for which an agreement has been signed, so it is reported. The Kirin Chanchun line is already under Japanese operation. Its extension is merely a solidifying of Japanese control over Manchuria. The Ta Hsing company which owns silver mines in the vicinity has petitioned for permission to build a light railway to be known as the Chientao-Tientu Railway from its mines to a junction with the new line.

Japanese interests are attempting to secure an agreement to build a line from Nanchang to Foochow on the Fukien coast, opposite Formosa. The Nanchang Kiukiang line, a private railway is in financial difficulties, and the proposal is to take over this line and its difficulties and make a through line from the Yang Tse river to the coast via this route. Chinese officials who grant this concession will do so reluctantly for the aggressions of Japanese in Fukien have already been the subject of violent protest. The British also are bound to oppose, for it would constitute an invasion of the British sphere of influence in the Yang Tse valley.

### Railway Notes From South Africa

JOHANNESBURG.

Sir William Hoy's latest report on the working of the South African Railways covers the period of fifteen months ended on March 31, last, and constitutes a sort of economic survey of South Africa. As usual it is a valuable and interesting document for the general manager not only deals with

railway and harbor activities, but follows the custom of surveying the industrial and agricultural situation generally. In his introductory remarks the general manager points out that in future the report of his department will be published for the financial year (ending March 31) instead of for the calendar year as has been the case hitherto.

The figures of primary importance for the twelve months ended March 31, 1918, the report goes on, are as follows:

Total capital expenditures on March 31, 1918, £93,431,626; total earnings, £14,315,860; gross working expenditure, including depreciation, relaying and strengthening, £10,817,639; surplus of earnings over gross working expenditure, £3,216,525; net loss (after including miscellaneous receipts and charges) carried to revenue distribution account, £181,752; passengers carried, 51,178,883; goods, minerals and coal, 13,936,502 tons; total open mileage of South African Railway lines, 9,514 miles; total mileage, 11,450.

The magnitude of the enterprise which the general manager controls is shown by the fact that the combined staff numbered on March 31, last, 72,477 individuals, of whom 35,259 were whites.

The period covered by this report has been remarkable for heavy crops and unprecedented prices for agricultural products. Local industries and manufactures have grown in number and variety and developed in production. The steady advance in prices, the continued shortage of freight, and the increasing difficulty of obtaining commodities hitherto imported have stimulated local production and led to a gratifying expansion in every direction. Considerable interest has also been created in, and in a small way steps have been taken to exploit the immense field for enterprise in the working up of raw materials and the manufacture of by-products hitherto almost entirely neglected in South Africa. Referring to the influence of the war on South African conditions, Sir William Hoy says: "In every way the appalling effects and ever widening influences of the war are becoming intimately borne in upon the people of South Africa. Neither agriculturally, commercially, nor industrially has South Africa had reason to complain, and though minor and temporary inconveniences have inevitably resulted from war conditions, the union has not only enjoyed complete freedom from anxiety with respect to the prime necessities of life, but may be said to have participated in a term of unexampled prosperity. Prices have been high, but on the whole, money has been plentiful, and trade brisk. War expenditures on a considerable scale still augment the purchasing power of the community and while it is perhaps adventurous to speculate as to the future, in view of the many accepted theories already overthrown, guard should be taken against being lulled into a false security."

#### RECORD FIGURES.

A steady and gratifying progress is reflected by the revenue and traffic returns, which show record figures under all traffic, in which there has been a phenomenal increase, notwithstanding the withdrawal of excursion and concession tickets as from October 2, 1917; the number of passenger journeys increased by four and a quarter millions, and revenue from passengers by £318,210. Revenues from goods and mineral traffic increased by £217,283, a highly gratifying result when it is remembered that during the past fifteen months restrictions on imports have been imposed with increasing severity, that a larger proportion of the available shipping has been required in the war zone and that in consequence there has been a decrease of 67,535 tons, or 21 per cent in the volume of high-rated commercial seaborne traffic carried to the competitive area. Increased local traffic has not only compensated for this loss, but has expanded to such an extent as to reflect an increase of 248,977 tons in the gross tonnage of goods traffic handled as compared with the previous twelve months. The total revenue increased by £729,382 compared with the corresponding twelve months of the previous year, an increase of 5.37 per cent. In comparison with 1909—the year prior to union—railway earnings have increased by £3,860,041, or 37 per cent, passenger traffic by 22,987,748 passenger journeys or 81.6 per cent; goods and mineral traffic by 2,719,742 tons, or 52 per cent; and the volume of revenue earning goods, mineral and coal traffic by 5,001,036 tons, or 56 per cent.

\*Four U. S. R. A. Mikados, constructed for the Oregon Short Line were shipped to Cleveland, Ohio, and seven U. S. R. A. Santa Fe constructed for the Duluth, Massabe & Northern were shipped to Columbus, Ohio, to be stored as parts of emergency pools.

### Freight Cars

THE CANADIAN NATIONAL RAILWAYS have ordered 750 box cars, 300 general service cars, and 250 ballast cars from the National Steel Car Company; 500 stock cars and 150 refrigerator cars from the Canadian Car & Foundry Company; and 500 flat and 550 general service cars from the Eastern Car Company, and 50 colonist cars from the Pullman Company, and 100 colonist and 30 baggage cars from the Canadian Car & Foundry Company.

### The Disposition of Surplus Government Material

Announcement was made in Washington Wednesday giving the details of the plan of organization of the Office of Director of Sales of the War Department as follows:

Under the director of sales, C. W. Hare, is an assistant, E. C. Morse, who serves as chairman of the Board of Sales Review comprising the following members besides Mr. Morse: Lt. Col. A. LeMar, Maj. W. M. Crunden, Col. Fred Glover, L. H. Hartman, G. F. Woods, Capt. A. L. Mercer, Capt. T. S. Schultz. Each of these members of the board is a division sales manager with the exception of Capt. Schultz, who is legal member on the board.

The announcement gives the names of seven divisions, the first of which, headed by Colonel LaMar, will handle machine tools, including all metal and woodworking tools, railway equipment, steam shovels, locomotive cranes, gantry cranes, hand tools, forging equipment, iron and structural workers' power tools and machinery.

A meeting was held in Cleveland, Ohio, on January 22 to discuss with the crane manufacturers the surplus crane situation. The meeting was attended by Lt. Col. LaMar, head of the machine tool division, by Maj. W. W. Houston, representing the director general Military Railways, and by representatives of the crane manufacturers. Colonel LaMar suggested to the latter the adoption of the same agreement as had been made recently with the machine tool builders.

The crane manufacturers expressed the belief that an effort should be made to induce the railroad administration, the navy and other government departments to take over as many of the government-owned surplus cranes as can be used before any effort is made to induce the manufacturers to take the cranes back.

After considerable discussion, they decided not to approve or disapprove, at this time, the government proposition as adopted by the machine tool builders.

manufacturers for consideration, is as follows:

The list of the cranes, which was placed before the crane

- 24 9-ton cranes, type "29," 8-wheel, 40-ft. boom (9 equipped with French draft rigging and 16 M. C. B.), manufactured by The Osgood Company; price paid \$12,400.
- 47 15-ton cranes, type "H," 8-wheel, 48-ft. boom, M. C. B. standard appliances, price paid \$18,250; 14 of above to be equipped with magnet and generator and single sheave block, price paid \$19,900; manufactured by Brown Hoist Company.
- 10 15-ton cranes, 8-wheel, 45-ft. boom, M. C. B. standard appliances, manufactured by Bucyrus Company; price paid \$20,680.
- 2 15-ton cranes, 8-wheel, 50-ft. boom, French draft rigging, manufactured by Link Belt Company; price paid \$18,566.
- 1 15-ton crane, 8-wheel, 48-ft. boom, French draft rigging, manufactured by Brown Hoist Company; price paid \$17,075.
- 3 15-ton cranes, 8-wheel, 45-ft. boom, M. C. B. standard appliances, manufactured by Ohio Locomotive Crane Company; price paid \$19,800.
- 5 15-ton cranes, 8-wheel, 40-ft. boom, French draft rigging, manufactured by Orton & Steinbrunner; price paid \$15,566.
- 10 15-ton cranes, type "E," 40-ft. boom, M. C. B. standard appliances, 7½-kw. generator sets, manufactured by Industrial; price paid \$21,453.
- 34 15-ton cranes, type "E," 40-ft. boom (12 to have M. C. B. standard appliances and 22 to have French draft rigging), manufactured by Industrial; price paid \$19,870.
- 2 20-ton cranes, type "G," 8-wheel, 40-ft. boom, French draft rigging, manufactured by Industrial; price paid \$22,402.
- 4 20-ton cranes, type "G," 8-wheel, 50-ft. boom, French draft rigging, manufactured by Industrial; price paid \$21,730.
- 3 15-ton cranes, No. 8, 8-wheel, 50-ft. boom, French draft rigging, manufactured by Browning; price paid \$19,415.
- 1 20-ton crane, No. 8, 8-wheel, 46-ft. boom, French draft rigging, magnet and generator; price paid \$22,135.
- 1 20-ton crane, No. 8, 8-wheel, 50-ft. boom, French draft rigging; price paid \$18,985.
- 5 20-ton cranes, 8-wheel, 50-ft. boom, M. C. B. standard appliances, manufactured by Joliet Bridge & Iron Company; price paid \$21,000.
- 2 20-ton cranes, 8-wheel, 50-ft. boom, French draft rigging, manufactured by Browning; price paid \$19,080 and \$19,420.
- 7 25-ton cranes, type "H," 8-wheel, 50-ft. boom, French draft rigging, manufactured by Industrial; price paid \$24,718.
- 8 25-ton cranes, type "H," 8-wheel, 45-ft. boom, pile driver attachment (4 equipped French draft rigging and 4 with M. C. B. standard appliances), manufactured by Industrial; price \$28,012.
- 3 30-ton cranes, model "E," 8-wheel, 50-ft. boom, M. C. B. standard appliances, sister hocks, manufactured by Ohio Locomotive Crane Company; price paid \$25,700.
- 2 35-ton cranes, type "L," 8-wheel, 40-ft. boom, French draft rigging, wrecking tools with spare parts, manufactured by Industrial; price paid \$27,240.
- 9 35-ton cranes, type "L," 8-wheel, 45-ft. boom, magnets and generators, outriggers (2 equipped with French draft rigging and 7 with M. C. B. standard appliances), manufactured by Industrial; price paid \$34,132.
- 3 15-ton cranes, type model "C," M. C. B. standard 15-ton capacity, 8-wheel, 45-ft. boom, manufactured by Ohio Locomotive Crane Company; price paid \$19,800.
- 18 50-ton wrecking cranes, type "P," M. C. B. coupler and trucks, pump and fire hose lighting equipment (17 are without booms and can be equipped with long booms for erecting purposes, 3 equipped with curved boom), manufactured by Industrial; price paid \$32,865.
- 9 15-ton cranes, 2.4 M. (7 ft. 10½ in.) gage, hinge of boom 17 ft. above track, 48-ft. 3½-in. boom, self-propelling, double drum, manufactured by Variety Iron; price paid \$20,300.
- 15 10-ton cranes 2.4 M. (7 ft. 10½ in.) gage, hinge of boom 17 ft. above track, 48-ft. boom, self-propelling, double drums, manufactured by Brown Hoist Company; price paid \$16,884.
- 6 5-ton cranes, 2-boom, electric cargo unloaders, 65-ft. booms, span of gantry 44 ft. center to center of rails, operated by 3-drum electric hoist, manufactured by Clyde Iron Works; price paid \$30,100.

The tentative agreement between the government and the machine tool builders, which the crane manufacturers were asked to consider, is as follows:

"1st. The inventory of all machine tools and equipment which is being made will be expedited to the greatest possible extent.

"2nd. As soon as it is known that a quantity of machine tools is available for disposal, the manufacturers of these tools will be given an opportunity to purchase them at a price and on terms of settlement which will be satisfactory to all parties concerned.

"3d. In case it is impossible for the manufacturer to purchase his product outright, an effort will be made to arrange for the marketing of the product in an equitable manner, securing for the government and the manufacturer alike the best possible terms.

"4th. In case both these methods of disposition fail, the material will be offered for sale to the general public in a manner prescribed by law.

"In the settlement of plant contracts which involve the sale of large groups of various kinds of tools and equipment, an effort will be made to prevent the sale for resale of any equipment, as it is realized that great injury could be done by indiscriminate sales of this character."

## Supply Trade News

Major O. C. F. Randolph, who was discharged from the United States Army Engineering Corps December 13, of last year, has taken charge of sale of buildings to railroads for the H. K. Ferguson Company, of Cleveland. Major Randolph is a graduate of the University of Illinois, and since leaving college has been in the bridge department of the Michigan Central and with the Timken Detroit Axle Company as construction engineer. He was also for a while the construction superintendent for the Austin Company, and left them to join the army in July, 1917, as second lieutenant in the 16th Railway Engineers. In France he was in charge of important building work on railroad and hospital construction, and was in this country organizing a sapper regiment at the time the armistice was signed.

### High Honor Conferred Upon Dr. J. A. L. Waddell

The highest honor in the entire world that can fall to the lot of any scientific man has just been conferred upon an American engineer, when on December 17 at Paris *L'Institut de France* elected Dr.

J. A. L. Waddell, consulting engineer of New York and Kansas City, a Corresponding Member in the *Academie des Sciences*. Such membership is the most highly coveted distinction among the scientists of Europe, for the organization is both old and exceedingly select.

*L'Institut de France* is composed of five academies, the principal one of which is the *Academie des Sciences*. That organization is restricted to a full membership of 66, all of whom must be citizens of France; and in addition there

are 116 corresponding members scattered all over the world.

The *Academie* is divided into two groups—Mathematical Sciences and Physical Sciences. The former is subdivided into five sections, viz., those of Geometry, Mechanics, Astronomy, Geography and Navigation, and General Physics; and the latter into six sections, viz., those of Chemistry, Mineralogy, Botany, Rural Economy, Anatomy and Zoology, and Medicine and Surgery. Each of these eleven sections, excepting that of Astronomy which has sixteen, is allowed ten corresponding members, who may be residents of France or of any foreign country, so that a scientific specialist, however great his renown, must await not merely a vacancy in the *Academie*, but one in the particular section to which he belongs. The full membership of 66 is equally divided between the eleven sections. By this means an equal balance is always maintained, and there can be no undue preponderance of any single scientific branch, or of any group of such branches.

For a year past there has been a vacancy in the list of corresponding members in the Mechanical Section, owing to the death of General Zaboudski of Russia, who was assassinated during an uprising of the populace at Petrograd. After considering the matter for several months, the *Academie* finally chose Dr. Waddell to fill the vacancy, basing their selection upon the value to practical science of his numerous books, papers, and addresses on both the theory and the practice of engineering, as well as upon his contributions to the development of technical education. One of his books was translated into French, and was published some three years ago by the French Government.

The *Academie des Sciences* was inaugurated in 1795; and during the succeeding 123 years there have been only 18 corresponding members chosen from the United States, Dr. Waddell making the nineteenth. Of these 18, three are still living, viz., the astronomers Dr. Edward Charles Pickering of Harvard University and Dr. George Ellery Hale of Washington, D. C., and the geographer, Dr. William Morris Davis of Cambridge, Mass.

### Duntley-Dayton Company Organized

On January 1 the Duntley-Dayton Company took over the entire output of the Dayton Pneumatic Tool Company, of Dayton, Ohio, and announced its entry into the pneumatic tool field. W. O. Duntley, former president of the Chicago Pneumatic Tool Company, is president of the new concern and his son, Capt. C. A. Duntley, is vice-president. Capt. Duntley has not yet been relieved of his command in the 27th U. S. Field Artillery. The Dayton line of pneumatic tools has been on the market for many years. A new plant, equipped with modern machinery, has just been completed to take care of the business of the company. In addition to handling the output of the Dayton Pneumatic Tool

Company, the Duntley organization is putting out a complete line of portable electric drills and grinders, as well as a full line of accessories, such as hose and hose couplings, rivet sets and chisel blanks. W. O. Duntley is one of the pioneers in the pneumatic tool business and has been closely connected with the industry for the past 25 years. He has a number of pneumatic and electric tool inventions to his credit, the Duntley electric drill being, perhaps, the most widely known. The offices of the Duntley-Dayton Company are located in the Westminster building, Chicago; the eastern offices are at 295 Fifth avenue, New York, and the Philadelphia branch in the Commercial Trust building.

W. O. Duntley

### Trade Publications

MALLET ARTICULATED LOCOMOTIVES.—Record No. 91, published by the Baldwin Locomotive Works, Philadelphia, Pa., is devoted to a non-technical description of Mallet articulated locomotives, illustrated with two sectional drawings. Instructions are given for the proper handling of these locomotives, as well as formulas for calculating their tractive effort. The booklet also contains a number of illustrations of various locomotives of this type, both for foreign and domestic roads, with their dimensions and general data.

THE ROAD TO PEACE.—The book which the Lakewood Engineering Company, Cleveland, Ohio, has issued under this title is one of the most attractive and striking trade publications which has been issued by any company in the railway supply field for some time. The booklet, which is 13 in. by 11 in. in size, is a story of the use of light railway equipment behind the battle fronts in France. Its left hand pages are devoted to photographs showing the light railway sections in manufacture and transit, the actual laying of the track and its use by light railway equipment. The right hand pages tell the same story in words. Special attention is given to an important shipment in the St. Regis from Cleveland via the lakes and the Welland Canal, etc., to the other side. Tribute is paid to the engineer regiments which carried on the work. One of the most interesting pictures shows a group of the French "Blue Devils" who were invited to see the Lakewood plant where the light rail was made.

Dr. J. A. L. Waddell

## Financial and Construction

### Railway Financial News

**BALTIMORE & OHIO.**—This company has arranged with Kuhn, Loeb & Co., Speyer & Co., and the War Finance Corporation for the extension until July 1, next, of \$22,500,000 note obligations, which mature February 1. The bankers, it is understood, either hold or represent the bulk of the notes, while the War Finance Corporation will supply the funds necessary to pay off the unextended portion. When the notes matured on October 1, last, they were extended to February 1 by the road's bankers and the Railroad Administration, which drew upon the \$500,000,000 revolving fund. This source of assistance has been practically exhausted for the time being, and as a result the War Finance Corporation was called upon to lend its aid. The maturing notes were originally divided into \$10,500,000 three months' notes, \$8,000,000 discount notes and \$4,000,000 of bank loans. The present is the third renewal arrangement, the first having been made July 1, 1918.

**CHICAGO, ROCK ISLAND & PACIFIC.**—A settlement of this company's litigation with the Colorado & Southern growing out of contracts entered into in 1906 and 1914, whereby it agreed to purchase from the Colorado & Southern a half interest in the Trinity & Brazos Valley Railway, has been effected. The statement issued at the offices of the Rock Island Company says: "A settlement has been agreed upon whereby the Colorado & Southern will accept in cash 60 per cent of the amount due on the contract, which under the final decree in the Rock Island receivership would be payable in full in 6 per cent preferred stock at par, such as was paid to all other general creditors of the Rock Island. This will involve the payment of some \$4,000,000, and the Rock Island will own outright a half interest in the Trinity & Brazos Valley Railway and will have a permanent outlet to the Gulf ports, which will be of great value in the event of the return of the roads to private operation. The total cost of the Trinity & Brazos Valley road is now in excess of \$11,000,000."

In 1915 the receiver for the Rock Island disaffirmed the contracts and the Colorado & Southern brought suit for their enforcement.

**COLORADO & SOUTHERN.**—See Chicago, Rock Island & Pacific.

**CUMBERLAND VALLEY.**—See Pennsylvania Railroad.

**PENNSYLVANIA RAILROAD.**—The directors of this company and the Cumberland Valley Railroad took preliminary action on January 22 toward the complete absorption of the Cumberland Valley by the parent company. Stockholders of the Pennsylvania Railroad will be asked to ratify the merger at the annual meeting March 4.

**TRINITY & BRAZOS VALLEY.**—See Chicago, Rock Island & Pacific.

**WAYCROSS & WESTERN.**—Press despatches state that Judge Evans in the United States District Court at Macon, Ga., has confirmed an order under which that part of the Waycross & Western extending 16 miles from Cogdell to Milltown is to be junked. The stretch of railroad from Cogdell to Waycross is to be continued in operation for a period of five years under the terms of the order. The purchasers, the Empire Construction Company, paid \$73,000 for the rail and ties when delivered at Waycross. The Waycross to Cogdell portion of the railroad is sold as a going concern for \$120,000 and the purchasers agree to operate this part of the road for five years under a contract with the Knox Lumber Company.

### Railway Construction

**PENNSYLVANIA RAILROAD.**—A contract has been given to E. H. Vare, Philadelphia, Pa., for building a new machine shop, and new stalls in the roundhouse at Todd's Cut, Wilmington, Del.

## Railway Officers

### Railroad Administration

#### Central

**J. C. Turner** has been appointed representative of the Division of Labor. Mr. Turner will be assigned to conduct investigations and to represent the Division of Labor of the Railroad Administration in other specific matters to which he may be assigned, affecting employees of the railroads under federal control.

**G. H. Atkins** and **C. B. Heinemann**, traffic assistants to the director of the Division of Public Service and Accounting, have been appointed assistants to the director of the new Division of Public Service, with office at Washington. The Short Line Section, of which **E. C. Niles** is manager, has also been transferred to the new Division of Public Service.

**Brice Clagett**, heretofore private secretary to the director general, has been appointed assistant to the director general. **H. A. Taylor**, heretofore assistant to the assistant director general, has been appointed general assistant to the director general. **G. H. Parker**, heretofore assistant to the assistant director general, has been appointed financial assistant to the director general.

**E. H. DeGroot, Jr.**, assistant manager of the Car Service Section, has been appointed assistant director of the Division of Operation in charge of office matters, succeeding **J. H. Keefe**, who has resigned to return to the Atchison, Topeka & Santa Fe. **J. A. Somerville**, assistant manager of the Car Service Section, has resigned to return to his former position as general superintendent of transportation of the Missouri Pacific.

#### Regional

**J. P. Walker** has been appointed terminal manager of the Charleston Terminal Company and the North Charleston Terminal Company, at Charleston, S. C. In addition to his other duties the terminal manager will have jurisdiction over all departments on his terminals, reporting to the regional director.

### Federal and General Managers

The jurisdiction of **Elisha Lee**, federal manager of the Pennsylvania Railroad, Eastern Lines, and associated lines, with headquarters at Philadelphia, Pa., has been extended over the Barnegat Railroad and the Philadelphia & Beach Haven Railroad.

**J. E. Gorman**, federal manager of the Rock Island Lines, Chicago, has had his authority extended over the Des Moines Terminal Railroad. **J. A. Wagner**, general manager of the Des Moines Union, the Des Moines Western and the Iowa Transfer, Des Moines, Iowa, has also had his jurisdiction extended over the Des Moines Terminal.

#### Operating

**E. B. Russell** has been appointed assistant to federal manager of the Baltimore & Ohio, Western Lines; the Dayton & Union Railroad, and the Dayton Union Railroad, with headquarters at Cincinnati, Ohio, vice **F. A. Deverell**, promoted.

**W. B. Kilgore**, road foreman of engines of the Baltimore & Ohio, Western Lines; the Dayton & Union Railroad, and the Dayton Union Railroad, with office at Dayton, Ohio, will also assume the duties of trainmaster, Wellston subdivision, vice **W. E. Duffey**, transferred.

**F. P. Pelter**, superintendent of the Memphis division of the Southern Railroad, with office at Memphis, Tenn., has been appointed general superintendent of the Georgia Southern & Florida; the Hawkinsville & Florida Southern, and the St.

Johns River Terminal, with office at Macon, Ga., vice **W. F. Kaderly**, promoted.

**O. K. Cameron**, superintendent of the Mobile division of the Southern Railroad, with office at Selma, Ala., has been appointed superintendent of the Memphis division, with office at Memphis, Tenn., vice **F. P. Pelter**, promoted, and **M. E. Madden**, trainmaster, with office at Macon, Ga., has been appointed superintendent of the Mobile division, with headquarters at Selma, Ala., vice Mr. Cameron.

**John Madden Egan**, whose promotion to general superintendent, Southern lines, of the Illinois Central and the Chicago, Memphis & Gulf, with headquarters at New Orleans,

La., was announced in the *Railway Age* of January 10, was born at Amboy, Ill., on September 1, 1880. Mr. Egan has been in the service of the Illinois Central for the past 25 years. He entered railway service in August, 1893, as a messenger on that road at Chicago. In 1894, and for the three years following, he was agent at One Hundred and Fourth street, Chicago. From 1898 to 1901, he was employed as rodman in the maintenance of way department, following which he became assistant engineer in the

maintenance of way and construction departments. In 1903 he was appointed road supervisor; from 1904 to 1911 he was roadmaster on the Freeport and the Nashville and Tennessee divisions. On June 6, 1911, he was appointed superintendent of the Mississippi division at Water Valley, Miss., and five years later he was transferred to the Tennessee division at Fulton, Ky., which position he held until his promotion to general superintendent at New Orleans.

**Financial, Legal and Accounting**

**L. W. McCoy** has been appointed assistant federal auditor of the Bessemer & Lake Erie, with headquarters at Pittsburgh, Pa.

**L. S. Smith**, local treasurer, at Dallas, Texas, for the Texas & Pacific, has been appointed acting federal treasurer of the Gulf, Texas & Western and the Weatherford, Mineral Wells & Northwestern, succeeding **W. M. Edgar** in the latter position. Mr. Smith's headquarters will be in Dallas, Texas.

**William C. Fitch** has been appointed freight claim agent of the Southern Pacific (lines south of Ashland, Ore.), the Western Pacific, the Tidewater Southern and the Deep Creek, having general charge of loss and damage freight claims and the prevention of causes of such claims, succeeding **M. E. McKirahan**, assigned to other duties.

**F. E. Sawyer** has been appointed assistant federal auditor of the Terminal Railroad Association of St. Louis; the St. Louis Merchants Bridge Terminal Railroad; the Wiggins Ferry; the St. Louis Transfer Railroad; the East St. Louis Connecting Railroad; the Interstate Car Transfer; the Alton & Southern Railroad; the St. Louis National Stock Yards Railroad; the East St. Louis National Stock Yards Railroad, and the St. Louis, Troy & Eastern, with headquarters at St. Louis, Mo., vice **F. M. McDonnell**, resigned to engage in other business.

**Engineering and Rolling Stock**

**Andrew Hanson** has been appointed supervisor of bridges and buildings of the Yellowstone division of the Northern Pacific, with office at Glendive, Mont., succeeding **W. D. Pearce**, promoted.

**P. T. O'Neill** has been appointed division master mechanic of the Chicago, Milwaukee & St. Paul, with headquarters at Spokane, Wash., succeeding **Fred Lowert**, who has been transferred to the St. Paul shops at Tacoma, Wash. Mr. O'Neill was formerly superintendent of motive power of the Idaho & Washington Northern at Spirit Lake, Idaho, and after that line was purchased by the St. Paul he was appointed general foreman at the Spirit Lake shops and later general foreman at the Tacoma (Wash.) shops.

**William Gemlo**, whose promotion to superintendent of motive power and rolling stock on the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., was announced in the *Railway Age* of January 10, was

born at Glasgow, Canada, on September 28, 1868. Mr. Gemlo began railway work with the Minneapolis & St. Louis as a locomotive fireman in September, 1888, and served in that capacity until October, 1896, when he was promoted to locomotive engineer. In June, 1907, he was appointed roundhouse foreman, and two years later traveling engineer. In October, 1913, he was promoted to master mechanic at Marshalltown, Iowa, which position he held until

his recent appointment as superintendent of motive power and rolling stock, with headquarters at Minneapolis, as mentioned above.

**T. E. Kirkpatrick**, signal supervisor on the western division of the New York Central, with headquarters at Elkhart, Ind., has been appointed supervisor of the signal repair shop at Elkhart. **T. G. Inwood**, assistant signal supervisor on the western division, with headquarters at Elkhart, succeeds Mr. Kirkpatrick, effective January 15.

**George W. Ditmore**, whose appointment as master car builder of the Delaware & Hudson, with headquarters at Colonie, N. Y., has already been announced in these columns,

was born on February 17, 1878, at Jermyn, Pa., and was educated in the high school of his native town. He began railway work on June 1, 1897, as a journal packer at Carbondale, Pa., on the Delaware & Hudson, and later served as car repairer. One year later he was promoted to car inspector and served in various other capacities in the car department. In March, 1902, he was appointed an interchange car inspector at Green Ridge yard, Scranton, Pa., and then served as foreman of car inspectors and repairers at the same place and at Buttonwood, Wilkes-Barre, Pa. On December 1, 1913, he was transferred to Carbondale as shop foreman, and about four years later he was promoted to division car foreman of the Pennsylvania division. Since November, 1918, he served as assistant master car builder until his recent appointment as master car builder of the same road, as above noted.

J. M. Egan

W. Gemlo

G. W. Ditmore

W. F. Kaderly, general superintendent of the Georgia Southern & Florida, the Hawkinsville & Florida Southern and the St. Johns River Terminal, has been appointed superintendent of motive power of the Southern Railroad lines east, with headquarters at Charlotte, N. C., succeeding E. C. Sasser, headquarter.

E. E. Ramey has been appointed superintendent of fuel and locomotive performance of the Baltimore & Ohio, Eastern lines; the Coal & Coke; the Wheeling Terminal Railroad; the Western Maryland; the Cumberland Valley, and the Cumberland & Pennsylvania Railroad. The position of supervisor of fuel consumption has been abolished.

F. G. Jonah, formerly chief engineer of the St. Louis-San Francisco System and recently colonel in the railroad engineers, engaged in service on light railways with the American Expeditionary Forces in France, has returned, and is now chief engineer of the Missouri, Kansas & Texas and the Frisco Lines north of the Red river, with headquarters at St. Louis, Mo. V. K. Hendricks, now chief engineer of these lines, becomes assistant chief engineer.

Junius Beverley Lamb, whose appointment as signal and electrical engineer of the Southern Railroad, Lines East, with headquarters at Charlotte, N. C., has already been announced in these columns, was born on December 1, 1885, in James City county, Va., and was educated at William and Mary College, and at the Virginia Polytechnic Institute. He began railway work on July 1, 1906, with the Southern Railway as an electrician engaged on construction work and has been in the continuous service of that road ever since. From January, 1907, to November, 1909, he was electrical and signal foreman on construction work and then served as signal and electrical supervisor on construction and maintenance work. In November, 1914, he was appointed assistant signal and electrical engineer, which position he held until his appointment as signal and electrical engineer of the Southern Railroad, Lines East, as above noted.

## Corporate

### Executive, Financial, Legal and Accounting

F. E. Connors, assistant to the vice-president of the Atchison, Topeka & Santa Fe, Chicago, resigned on January 21, and has been appointed receiver for the Spokane & Inland Empire, with headquarters at Spokane, Wash.

J. C. Williams, general manager of the Akron, Canton & Youngstown, has been elected vice-president and general manager, and A. L. Graner, auditor and assistant treasurer, has been elected auditor and treasurer; both with offices at Akron, Ohio.

### Operating

Walter Pratt has been appointed manager of sleeping, dining, parlor cars and hotels of the Canadian National Railways, with jurisdiction over all lines, and with office at Toronto, Ont.

### Traffic

J. H. Mahan has been appointed traffic manager of the Nevada-California-Oregon, with headquarters at Alturas, Cal.

Major W. M. Kirkpatrick has been appointed assistant freight traffic manager of the Canadian Pacific, in charge of the western lines, with office at Winnipeg, Man. He was assistant freight traffic manager of the eastern lines at the time he entered military service in September, 1915.

The following appointments have been made on the Canadian National Railways, effective January 24: P. Mooney, assistant general freight agent of the Canadian Northern, at Toronto, Ont., has been appointed assistant general freight agent and J. E. LePage, division freight agent of the Canadian Government Railways, at Quebec, has been appointed division freight agent, both with offices at Quebec, and with jurisdiction over Quebec City, Levis, East of O'Brien and Garneau to Chicoutimi and Quebec, and the Quebec & Saguenay Railway; Mr. Mooney has been appointed also assist-

ant general passenger agent; S. G. Tiffin, assistant general freight agent of the Canadian Government Railways, has been appointed assistant general freight agent, with office at Montreal, Que., and with jurisdiction over Kingston and East of North Bay, Ont., to Garneau, Matapedia, Que., and Edmuntston, N. B.; James Orr, general freight agent of the Canadian Northern, lines east of Port Arthur, at Montreal, has been appointed assistant general freight agent, and G. R. Fairhead, district freight agent of the Canadian Northern at Hamilton, Ont., has been appointed division freight agent, both with offices at Toronto, Ont., and with jurisdiction from west of Kingston to Windsor, Ont., Toronto to Port Arthur, Armstrong, Ont., and O'Brien, Que., and G. M. Thomas has been appointed district freight agent, with office at Hamilton, Ont.

## Obituary

J. V. Young, signal engineer of the Boston & Maine, with office at Boston, Mass., died at his home in Reading, Mass., on January 10, at the age of 56. Mr. Young had been in charge of the signal department of the Boston & Maine since July, 1895, and was a prominent member of the Railway Signal Association.

Waldo B. Cronk, vice-president and general manager of the Caracquet & Gulf Shore, with headquarters at Bathurst, N. B., and vice-president of the Kent Northern, died on January 27, in Toronto, Ont., at the age of 56. He began railway work in 1878, on the Chicago & North Western and subsequently held various positions on different roads including the Chicago, St. Paul, Minneapolis & Omaha, the Baltimore & Ohio, the Chicago, Rock Island & Pacific, the Canadian Pacific, and the Grand Trunk Pacific.

George Sherwood Hodgins, of the editorial staff of Railway and Locomotive Engineering, died at his home in New York on January 18, at the age of 59 years.

G. S. Hodgins

A graduate of the Upper Canada College and the School of Applied Science, affiliated with the University of Toronto, he afterwards served an apprenticeship in the Kingston Locomotive Works. After some experience in a division master mechanic's office on the Canadian Pacific, he was advanced to various positions on the road, and latterly was locomotive inspector on the entire system. He was recalled to the Kingston Locomotive Works as mechanical engineer. Later he entered the service of the Pressed Steel Car Company as general inspector of the output of that plant, and was also for some years inspector for the Richmond Locomotive Works. During these earlier years he had contributed to a number of railroad publications. In 1900 he entered the field of practical journalism as editor of the Railroad Digest. In 1902 he joined the staff of "Railway and Locomotive Engineering" as associate editor, and in 1908 became managing editor, which position he held till 1911, when he was called by the Canadian Government to make a comprehensive report on the shops, appliances, tools and equipment necessary for the Trans-Continental Railway. On the completion of that work in 1915, Mr. Hodgins joined the staff of the Railway Periodicals Company as managing editor of the Railway Master Mechanic and Railway Engineering and Maintenance of Way. In 1916 he returned to Railway and Locomotive Engineering and remained on the staff as editor until his death, besides contributing to popular science magazines.

## Railway Age

# EDITORIAL

It is an old saying, but none-the-less true, that it takes money to make money. The railways can with comparatively small expenditures make improvements which will save coal and there should be no hesitancy in doing this. It is a very grave error not to make improvements which it is known will more than pay for themselves in the savings they make. At a certain railroad terminal up to two years ago, two stationary boilers, each of 175 h.p. capacity, were employed for steam heating purposes—heating stations and other buildings as well as coaches and sleeping cars standing on cleaning and repair tracks. During extreme winter weather two and sometimes three locomotives were coupled to the steam line and used as an auxiliary to the boiler plant. A careful investigation of the condensation losses occasioned by carrying the steam pipes underground without proper insulation and drainage was made, with the result that the pipes were taken out of the ground and placed outside and proper insulation applied. The reduction in condensation losses accruing from this change was so marked that even under the extraordinarily adverse weather conditions that obtained last winter it was found that ordinarily one of the two stationary boilers would carry the load, the second boiler being cut in only under the most extreme weather conditions. Here is a case where a little horse sense saved the use of two and sometimes three locomotives in the cold weather months when they are badly needed by the operating department. Consider how much fuel costs today and then examine closely for similar "leaks." The results will be surprising.

### A Worth While Investment

The placing of orders for 104 locomotives for export to the South African Railways, the Railroad of the Province of Santa Fe in Argentina, the Federated Malay States Railways and to Portuguese East Africa, as detailed in the Equipment and Supplies column of this week's issue, will be received in the supply field with no small degree of satisfaction. These orders come at a time when there is practically no domestic business in sight. What is equally as important, the orders serve to bear out what the *Railway Age* and others have been saying about the world-wide shortage of equipment and about the favorable position of the United States to supply it. It is rather a co-incidence that in the new Foreign Railway News column of the *Railway Age* in the issue of January 24, statements were given concerning the shortage of locomotives on the railroads of South Africa and those of the Federated Malay States. These lines have now come to the United States to help them out of their difficulties, and it would be surprising if many others do not follow. The supply field, if the indications are correct, is now ready to make practical use of its outstanding position as a possible exporter of railway supplies and to carry on the work that will enable it to help make up for the shortage of railway supplies and material in those countries that have been unable to import them from the warring countries of Europe. It is to be expected that it will make the most of its opportunities and will strive to make permanent the large trade in railway supplies that is sure to come to us from these countries. The fact that the United States Railroad Administration is not

### Locomotive Orders for Export

in a position to place orders for equipment for domestic uses at the present time does not make for optimism, but inasmuch as every cloud has a silver lining, it in some ways may be a blessing in disguise by way of putting the supply field in a better position to build up a permanent foreign trade and to readjust itself to the changed after-the-war conditions.

The testimony of Director General Hines before the Senate Committee on Interstate Commerce on Wednesday throws

### Just Debts Should Be Paid

some light on one reason why the railways have fallen so far behind in their payments to the railway supply companies for materials and equipment. In reply to questions from Senator Kellogg the director general stated that the war department owes the roads \$81,888,000. This is quite a tidy sum and if paid to the railway companies would enable them to discharge some of the indebtedness which is of long standing and has proved most embarrassing to their creditors among the railway supply companies. Railway men and railway supply companies have tried to do their full part in the trying period through which the nation has passed. They surely want to take their full share in the Victory loan next spring. This they can not do properly unless their financial condition, or rather their cash situation, is very greatly improved before that time.

There is no question but what the railway supply companies have been a most important factor in helping to develop efficient and economical railway operation. Now, at a time when it is exceedingly important that the United States enjoy industrial prosperity, these companies are being threatened with disaster. They probably employ almost as many workers as the railways themselves, and on the basis of four dependents to each worker, a very considerable percentage of the entire population of the country will be affected directly and indirectly. E. B. Leigh, of the Chicago Railway Equipment Company, has insisted that the industrial prosperity of the country follows the prosperity of the railway supply interests. The present situation is being caused by the policy of the Railroad Administration in cutting down purchases to a minimum. The heads of the Railroad Administration are carrying a tremendous responsibility and doubtless they are fully aware of this situation, but how can they buy materials and equipment if they have no money for this purpose? It would seem that the Railroad Administration is financially embarrassed and that the only solution is for Congress to come to its rescue and provide sufficient funds to at least put the roads in as good physical condition as they were when they were taken over by the government. It has been intimated that the purchasing department of the administration is holding off to secure the benefit of lower prices. If this is true, then this policy is at variance with that of other departments of the federal government and is open to severe censure, particularly at this time when it is so important that work be furnished to soldiers and sailors returning to civilian life and to workers who have, until recently, been engaged in war work. Some

### Railway Supply Companies Suffer

Some

idea of the conditions now existing in the railway supply field may be obtained from the expressions from different supply companies which will be found in another part of this issue.

## The Tie Situation

**A**N ADEQUATE SUPPLY of cross-ties is essential to the proper maintenance of tracks. Renewals can be curtailed only to a limited extent before the track is weakened. The deterioration of ties is continuous and in large measure independent of traffic. Therefore, any curtailment of the tie supply strikes at the very vitals of roadway maintenance, and is cause for alarm on the part of track men.

There has been a shortage of ties on many railways during the past year, although this has been overcome in a considerable measure by increased production along others. The tie industry has suffered from the shortage of labor and other disturbing factors common to all industries during the last two or three years. Federal control of the railroads and the concentration of purchases in one committee have also brought about many changes, including the promulgation of standard specifications for ties and for treatment, the elimination of competition between roads in the purchase of ties, their distribution to meet the greatest needs, etc. These measures have been more or less revolutionary in character and have naturally aroused considerable opposition, particularly where they have disturbed long existing practices and relationships. This opposition has also contributed to the decreased production of ties.

Because of the unsettled state of affairs in the industry two meetings which were held last week at St. Louis were of more than usual importance. On Tuesday and Wednesday the American Wood Preservers' Association, an organization of railway and commercial timber treating men interested in the preservation and use of ties, met to discuss the situation. On the two following days over 100 representative tie producers met to consider their problems. A large part of the men of each organization availed themselves of the opportunity to attend the sessions of the other association and to gain the viewpoint of its members. With representatives of the railways, the Railroad Administration and the manufacturers meeting together, much progress was made in the elimination of the misunderstandings which have prevailed and which have retarded accomplishment of their common objective, the production of an adequate number of cross-ties.

The Forest Products Section of the United States Railroad Administration has adopted certain policies which have been ill-advised, but it has adopted others which have been highly constructive and which should be retained permanently, regardless of the ultimate form of control of the railroads. The preparation of standard specifications for ties is of benefit alike to the user and the producer, for it describes the different grades of ties in a definite manner. Uniformity of inspection is also of common benefit, as will also be a standard form of contract which it is understood the Railroad Administration now has in preparation. It is significant that one of the large tie producers, in a paper presented before his associates, urged that these and other constructive measures which have been adopted by the Central Purchasing Committee should be retained permanently. It is to be hoped that other producers will take an equally broad view of the matter, and that they will co-operate with the Railroad Administration in the development of a broad, permanent policy of production and purchase, which will insure the production of an adequate number of ties of the proper quality and at a price fair to the manufacturers and the roads.

## Mr. Hines' Statement on Government Control

**T**HE DIRECTOR GENERAL of railroads, Walker D. Hines, presented to the Senate Committee on Interstate Commerce on Monday his reasons for favoring either an early abandonment of government control or a continuance of it for five years more. He believes it would be better for the railways and the public for the roads to be returned to private control within a short time than for them to be returned, as now required by law, 21 months after peace is signed. He also believes, however, that an extension of government control to January 1, 1924, would be preferable to an early restoration of private control.

It is impossible not to admire the force and ability of Mr. Hines' argument. It shows the mastery of facts and conditions, and the power of logical presentation, which are so characteristic of him. Furthermore, unlike Mr. McAdoo, he is frank in stating his position on the ultimate disposition of the roads. He is opposed to reviving the system of regulation and of competitive operation which formerly prevailed. He does not advocate a five-year extension to give opportunity for an experiment but to give time and opportunity for a sound solution of the whole problem. He is opposed to government ownership, and says so.

Mr. Hines bases his argument against continuing government control merely for 21 months largely on the ground that, with economic and political conditions so unsettled, and with the prospect of so early a restoration of private control, it would be impracticable during this period to secure efficient operation. Strong as his presentation is in the main, we think that at this point it is weak. He does not mention the distinction between *operation* and *control*. He assumes the former must be continued as long as the latter. Unless it is decided to continue the present system indefinitely the railways undoubtedly should speedily be returned to the *operation* of the companies. We do not believe the present system of *operation* could be made a success under any conditions; and as long as uncertainty exists as to this system's tenure of life it will become increasingly inefficient. But there is nothing in the law to forbid the director general, acting for the President, to restore the actual *operation* of the railways to the companies now, while continuing government *control* throughout the 21 months' period.

Withdrawal of control would involve withdrawal of the guaranties of net operating income. Mr. Hines contends the financial dangers of immediate withdrawal of the guaranties are greatly exaggerated. But the official statistics show that with present rates and expenses the net operating income of many railways is not sufficient to pay their fixed charges and normal dividends. Mr. Hines takes the view that if an early return were decided on it would not be made precipitately, and that it is not to be assumed that the Interstate Commerce Commission and other regulating bodies would not adopt such measures as were necessary to protect the solvency of the companies. If his premises are correct, his conclusion that an early abandonment of control would be better than postponement of its abandonment for 21 months is sound. It is the financial problems presented that cause opposition to an early withdrawal of control. If the Railroad Administration, the regulating commissions and the officers of the companies would get together and solve these financial problems at once, it would be far better entirely to return the railways to the companies within a short time than to defer doing so for practically two years.

However, Mr. Hines favors the five-year extension. He does not believe a satisfactory solution of the railroad problem can be reached until after at least two more years of government operation, and until after the presidential election in 1920, and, apparently, until after the inauguration

of the next president in 1921. He contends it is not fair to advocates of government ownership to use the results of 1918 as a test of government operation, and that before a final decision on our future railway policy is reached they are entitled to see the results of government operation under normal conditions of peace. But if the advocates of government ownership are entitled to have the results of government operation under ideal conditions as a basis for argument, the advocates of private ownership are entitled to have the results of private operation under ideal conditions for the same purpose. Now, for many years the advocates of private ownership have been trying to get a system of regulation under which private operation could be conducted with maximum efficiency and economy, but they have never been able to get it. Not only were they not able to get it in time of peace, but they were not even able to get it in time of war. The conditions under which the railways were operated by the companies in 1917 were fully as abnormal as those under which the government operated them in 1918. The United States was at war nine months in 1917 and there were only 10 months of war in 1918. There was no substantial reason why the results gained in 1918 should not have been at least as good as those of 1917, except that wages were much higher in 1918 than in 1917; and Mr. Hines himself points out that the increase in expenses was due only partly to advances in wages. As a matter of fact, the Railroad Administration had the benefit in 1918 of the work of reorganization and co-ordination that was done under the Railroads' War Board in 1917. In addition, it was freed from all the governmental restrictions by which the railways were embarrassed in 1917, and exercised practically unlimited governmental power. We do not agree, therefore, that the results gained in 1918 afford no satisfactory test of government operation. If, allowing for the advances in wages, they are not strictly comparable with those gained in 1917, this is really because the Railroad Administration had many advantages in 1918 that the Railroads' War Board and the railway companies did not have in 1917.

Now, which should be regarded as more conclusive—comparative results gained under normal conditions, or comparative results gained under conditions which rendered it imperative that the roads should be operated with maximum efficiency for the protection of the very life of the nation? We believe that a test of the latter kind should prove more instructive than a test of the former kind, and, we did have in 1917 opportunity to see private operation, and in 1918 government operation, put to the supreme test. Mr. Hines believes that if the five-year extension were adopted there would be, at least after the present unsettled industrial conditions have passed, an increase of efficiency under government operation. There are very strong reasons for doubting this. In time of peace the influence of politics would almost certainly be more strongly applied to government management; and this probably would neutralize any improvements in methods that might be made.

Mr. Hines presents with great force the conditions which demand the adoption of a very comprehensive and constructive policy for the solution of the railway problem and the reasons why it should not be attempted to solve the problem within the next two years. It seems to us, however, that his whole argument makes a much stronger case for the early calling of an extra session of Congress to pass the needed legislation this year than for a five-year extension of control. During this five years, either the government, or the companies, or both, would—or should—finance additions and betterments requiring the raising of four or five billion dollars of new capital. It is very doubtful if the companies would or could do all this financing, since they would not be allowed to control the outlay. The govern-

ment surely would have to raise a large part of the capital, and might have to raise most of it. At the end of the time the railway companies would owe it a very large debt. Furthermore, after five years more of government operation the present organizations of the individual railways would be so changed as to be unrecognizable. Obviously, the difficulties to the return of the railways to private operation would then be very great, if not insuperable. We probably should have government ownership forced upon us, whether the nation wanted it or not.

Mr. Hines' argument must be admitted to be a very strong one. We believe, however, it makes a much better case for an early return of the railways to private operation, and for constructive legislation at an early special session of Congress which will enable government control to be withdrawn by the end of the present year, than for five years more of government control and operation.

## The Need of a National Reconstruction Program

TWO MONTHS HAVE PASSED since the armistice was signed and American industries are as much in the dark today regarding the future and what it will bring forth in a business way as they were on that date. As a nation we blindly refused to benefit by the experiences of our Allies during the three years of conflict before we entered the arena of hostilities. Are we going to delay similarly in preparing for the problems of peace—in many ways more difficult than those of the war itself?

With the termination of the struggle the demand for war materials ceased and those railway supply concerns and others who have been engaged in their manufacture are necessarily laying off thousands of employees. At the same time other thousands of men are being released from the army and navy. The combination of industrial retrenchment and increased labor supply can only result in unemployment and this, unless met by prompt and energetic measures, will lead quickly to business stagnation, depreciation of commodity values and serious labor troubles.

What is our national policy in this situation? Obviously the problem calls for governmental attention and solution. Private individuals or corporations cannot be expected to inaugurate large projects in order to provide employment in this period of high labor and material costs. It remains for the national, state and local governments to undertake improvement work until such time as the industries can be restored to a peace basis. Much work of a public nature must necessarily be done during the next few years. As much as possible of this should be undertaken now as a reconstruction measure and as a source of employment until the industries can build up their business. It will cost more to complete this public work now but the added cost will be borne by the public which will receive the benefits through added activity. Great Britain has already inaugurated a number of different reconstruction methods, including the payment of weekly wages to the unemployed until work can be secured for them. What are we going to do?

Let us look at the manner in which the Railroad Administration is meeting this problem as a possible indication of the attitude of the government. Until now it has been directed by a cabinet officer, an advisor of the President in the framing of national policy. It is the largest employing branch of the government with nearly 2,000,000 persons on its payroll directly and probably an equal number dependent on the railway supply companies from whom it purchases its equipment.

Has the Railway Administration work to be done? Oh-

viously it has. It is under contract to return the roads to their owners at the expiration of the period of federal control in as good condition as when they were taken over. They should be fully maintained, both to keep them in good condition to render service, and to give as much employment as reasonably can be provided during the present period of unsettled business, whether they are to be returned to private control or not. Now, it is obvious that they have not been fully maintained during the past year, when only slightly more than half of the normal quantities of rails and other track materials have been used in renewals. The purchase and installation of materials of this character necessary to make good the deferred maintenance of 1918 and to supply the normal requirements of 1919 would give employment to the normal number of men on the railways and to large numbers of men in railway supply plants. Since the Railroad Administration must take up this deferred maintenance why should it not start this program now by placing orders for the necessary materials so that they will be available when spring work opens up?

There is also a large amount of deferred maintenance in the equipment department. Information gathered by the *Railway Age* indicates that there is a very large number of freight cars which are in such a condition that they ought to be scrapped, and still a larger number that must have heavy repairs before they can be efficiently and economically used in service. The fact that there is now a large nominal surplus of cars is no good reason why needed repairs to cars should not be made, and why new cars to replace those that should be retired should not be bought. Proceeding with the work now will give employment to labor at a time when the welfare of the nation demands it shall be given, and probably it will not be long until all equipment in good order that can be used will be required in service.

Past experience has demonstrated the necessity for the roads to continue programs of improvement during periods of declining traffic if they are to be prepared to handle successfully the business of the busy years that follow. No better indication of the present inadequacy of railway facilities is to be had than the experience of a year ago. A large part of the improvement work is chargeable to capital account and thereby to the corporations. Like other business concerns, they are inclined at present to defer much of this work, regardless of its necessity, because of its present high cost, although without doubt they would co-operate willingly in the inauguration of many of these improvements if they could be carried on at normal cost to them. Furthermore, the fact that the corporations are not now in control of the management of the properties, and that how long government control will be continued, and the terms upon which the roads will be returned to private operation, are unsettled, makes the corporations extremely reluctant to co-operate with the Railroad Administration in inaugurating an extensive programme of additions and betterments. But there is no good reason apparent why the Railroad Administration should not adopt a policy of making up deferred maintenance, or why the government and the companies should not agree to make every outlay for additions and betterments which would be valuable to the individual railways if government control were abandoned and to the government if it were continued; and a large majority of needed expenditures for additions and betterments would be of this character.

It is true material as well as labor costs are at present very high; but if needed expenditures are postponed until costs come down, many of them will be made too late to be of value when an increase of business comes. The Railroad Administration as well as the railroad corporations is showing an unwillingness to carry on maintenance and improvement work at present prices of materials. The Administration's present tendency seems to be to curtail expenditures generally. Federal purchasing agents are showing a disposi-

tion to reduce purchases to the minimum. Only a few days ago the purchasing agents in one region were instructed by the chairman of the regional purchasing committee to exchange materials as far as possible in order to avoid the necessity of going into the market for any supplies other than those branches of government service are appealing to the patriotism of manufacturers and employers of labor to assist in providing work for our munition workers and returning soldiers, another government department, the Railroad Administration, is promoting unemployment.

It has been said that while attempting to settle the problems of other countries, we may be neglecting some of our problems at home. One of our most important national problems today is the development of a unified reconstruction program which will place our industries on their feet and in a position to utilize the large merchant marine which is now being built to enable us to compete for foreign trade in the markets of the world.

## New Books

*Proceedings of the American Railway Master Mechanics' Association.* Edited by V. R. Hawthorne, secretary. 528 pages, 33 plates, 6 in. by 9 in., bound in cloth. Published by the association, 746 Transportation building, Chicago. Price, \$5.

The fiftieth volume of the Master Mechanics' Association Proceedings, which has just been issued, covers the activities of the organization during the years 1917 and 1918. A large part of the book is devoted to an account of the convention of 1918, which includes several valuable committee reports. The report on the shop manufacture and repair of semi-elliptical springs covers the subject very thoroughly. The report on the design and maintenance of locomotive boilers is devoted principally to a discussion of the field for autogenous welding in boiler work. The committee on fuel economy and smoke prevention outlined briefly the problem of fuel economy on railroads and made specific recommendations concerning the methods of handling storage coal. The committee on train resistance and tonnage rating submitted data secured from train resistance tests and engine tests. Several important changes were made in the specifications, standards and recommended practices of the association. The development of feedwater heaters is covered very thoroughly in an individual paper by J. Snowden Bell.

*Structural Engineers' Handbook, Second Edition.* By Milo S. Ketchum, dean of the College of Engineering, University of Colorado. 6 in. by 9 in. 928 pages, illustrated, bound in flexible leather. Published by McGraw-Hill Book Company, Inc., 239 W. Thirty-ninth street, New York. Price, \$5.

The first thousand of this second edition brings the total issue of this book to 13,000 copies since the first edition appeared in 1914. This is probably a better testimony to its value than can be given in any other form. It is essentially a manual for the structural designer and detailer combined with a handbook on structural steel sections, 531 pages being devoted to the first portion and 397 to the latter. The crowning achievement of this book is the attractiveness of its illustrations and typography. The drawings represent an enormous amount of work and painstaking care. The scope of the volume is indicated by the subjects of the several chapters which cover such matters as roof trusses and mill buildings, office buildings, highway bridges, railway bridges, retaining walls, abutments and piers, timber bridges and trestles, steel bins, steel grain elevators, steel head frames and coal tipples, erection, engineering materials, structural mechanics, and design of steel details. In the new edition details of steel windows and doors, data on cement and gypsum tile roofs and moments in stiff frames constitute the principal new material.

# The Railway Supply Industry Is Hard Hit

## Representative Concerns Tell of Difficulties Caused by Administration Purchasing Policy

THE RAILROADS, for several years, have gotten along with a minimum amount of material and new equipment. When the exceptionally heavy traffic developed a few years ago and additional equipment was necessary, it was impossible to obtain it, first, because so much equipment was being sent to France and Russia and later, after this country entered the war, because of this reason and also because of priority orders which diverted material to ships and munitions. It has been impossible to keep the facilities and equipment in good condition and a very large amount of deferred maintenance has accumulated.

When the armistice was signed it was felt in many quarters that the transition from war to peace conditions could be very greatly helped by placing large orders for railway material to take up this deferred maintenance and to put the roads back into the condition in which they were prior to the war. For various reasons the Railroad Administration has cut down on purchases to the very minimum and this is working a great hardship on the railway supply companies, many of which had assisted the government by the manufacture of munitions and other war materials. Now, instead of being able to take care of the boys who are coming back to them from the army and navy they are finding it necessary to cut down their forces and many of them face an entire shutting down of their plants if railroad purchases are deferred much longer.

With a view to securing exact information as to the present situation the *Railway Age* sent a night letter to a number of representative companies on Monday evening, February 3, asking for a statement concerning what the policy of deferring maintenance and renewals, not to speak of betterments, means "to your organization and labor, now and in the future." It was not intended to make a canvass exhaustive, and only comparatively few names were selected at random from the large number of supply companies. A number of representative replies follow:

### American Castings Company Birmingham, Alabama

After sixteen years of hard work against considerable odds, we have built up a railroad supply commodity known throughout the railroad maintenance and construction field as National Lock Joint cast iron culvert pipe. About 95 per cent of our business is obtained from railroad construction and railroad maintenance. In 1917, our business had reached a state of development and steady production that was very satisfactory. When the United States government declared war, followed immediately by taking over of the railroads under federal control, the result in our business was almost instantaneous. The reason for this was plain; under government control, the railroads were ordered to discontinue new construction except in cases of military necessity; maintenance budgets were cut accordingly.

Fortunately for us, at the outset we received an order from the director general of military railways for a large amount of our product, to be used in the construction of military railways in France; this kept us going full tilt for about 8 or 10 months. When this order was completed we were thrown back on our regular source of supply for business, and we found that that source had vanished, and it still remains at the vanishing point.

The railroad problem still continues unsettled; no pro-

vision has been made as to who shall pay for new construction. Now that the necessity of conserving material and labor has been removed, the question of railroad construction and railroad betterments, or maintenance, still continues throttled and absolutely dead. We understand the situation or reason of this is largely attributory to the fact that no provision has been made by the government as yet to determine who shall pay for new construction and railroad betterments—whether such an expenditure shall be borne by the United States government, or private owners of the different lines.

Regardless of whether the railroads are to remain under government control for five years or for 21 months, the policy of the government in regard to railroad construction and improvements should be settled; otherwise we can expect no railroad construction and very little railroad betterments. That being the fact, manufacturing plants which are depending on that source of supply must necessarily go out of business.

Owing to the above-mentioned facts, taken in connection with the high cost of material and labor, we have found it impossible to operate, and have closed down, discharged our employees, and are now waiting and hoping for relief. That relief can only come through a revival of railroad construction and betterments, and a continuance of the maintenance program as it existed prior to 1917, or, in other words, before the roads were taken over by the government.

Railroad purchases have a vital influence on general business; they are a big factor in determining the question of good or bad times in general business. For this reason, it is hoped that a speedy solution can be reached, and that some relief for this unbearable situation may be had.—*B. D. Dimick, President.*

### American Flexible Bolt Company Chicago

I believe publicity is desirable regarding the extreme difficulty of holding the working organizations of manufacturers of railway materials together with the present purchasing policy of the Railroad Administration. Cessation of war work leaves patriotic concerns who have used their means in expanding facilities holding back and unable to now run as eleemosynary institutions. Patriotic labor does not want charity. Railroad materials orders are not charity, but will solve manufacturers' and workers' difficulties in the present crisis.—*C. A. Seley, President.*

### American Steam Gage & Valve Manufacturing Co. Boston, Mass.

The present government policies as regards purchasing new equipment, as well as for maintenance and renewals, mean to us no return on a very considerable investment, as well as unemployment for workmen skilled in this work. During the war period we were fortunately able to handle other work to partially offset the loss of orders due to government purchasing policies, but now that the substitute work is ceasing the real situation looms more clearly and causes us much concern. We cannot believe that those in authority realize the serious situation that has been created, and we feel that only quick action on their part will avert serious embarrassment to our industry.—*H. B. Nickerson, Secretary.*

### American Steel Foundries

Chicago

On account of lack of orders, it has been necessary to close down our plants at Sharon, Pa., and East St. Louis, Ill., involving directly 2,240 men and indirectly many more, as on account of the uncertain outlook we have been obliged to cancel or suspend orders for raw materials, etc. These plants normally run exclusively on railroad work. Unless there is a resumption of railroad buying for maintenance, renewals and betterments within the next 60 days, it will be necessary to close down and curtail operations at other plants involving 5,000 more men. Many of the 1,112 of our men in the army and navy now returning are expecting their old jobs, and it is our intention to take them back, but the policy of the roads of deferring maintenance and renewals is making this difficult, if not impossible, in many cases. Pending the settlement of the general plan as to how the railroads are finally to be operated, some fair arrangement should be made to enable them to continue necessary purchases at least for repairs and maintenance, proper provision being made for amortizing the amount by which present costs exceed normal average costs. A wise settlement of the railroad question would do more to help the industrial situation during this period of readjustment, necessarily involving a great deal of unemployment, than any other single action that could be taken by Congress at the present time.—*R. P. Lamont, President.*

### American Tool Works Company

Cincinnati, Ohio.

The government's policy of deferring purchases at this time is most deplorable. It sets an example which, if followed by various industries, will demoralize business, shatter organizations and throw thousands of men and women out of employment. During the industries' transition from a war to a peace basis, a period of readjustment with very light extensions or replacements of equipment is inevitable. Instead of aggravating this condition, which its present policy is unquestionably doing, the government should endeavor to assist industries over this period by encouraging sorely needed renewals, maintenance and betterments. This is the time to help, not to hinder, industries. The task of reverting to a peace basis involves much more difficult problems than the preparation for war activity. The unqualified response of our industry to the government's call for war production surely entitles it to some consideration now that conditions are reversed.—*J. C. Hussey, Western Sales Manager.*

### Ashton Valve Company, The

Boston, Mass.

In my judgment the greatest menace to the United States of America at this time and the immediate future is the lack of employment, fast assuming alarming proportions. Our gallant boys left good positions to fight the battle of freedom, and unstintingly we placed the combined resources of the nation behind them. If we were justified in spending approximately twenty billion dollars to wage this war, are we not equally justified in expending such further sums as are warranted and necessary for constructive peaceful purposes and to provide positions for our soldiers returning with the expectation of immediately assuming their former occupations?

Under government control of the railroads, the railway supply manufacturers have not received the average business obtainable heretofore under private management, and were forced in many cases to divert their plants to production of other war necessities. The need for such having passed,

unless such manufacturing plants are enabled immediately to resume their ordinary production, stagnation of business and unemployment will necessarily follow. I, therefore, believe Congress should immediately take cognizance of the situation, authorize and direct resumption at once of all suspended improvements on the railroads. If prompt action is taken I believe that this will greatly relieve the trying situation confronting the business and labor interests of our country.

Any unnecessary retrenchments or action on part of the government officials hastily to readjust prices will cause business confusion and force wage reductions, leading to strikes and unemployment, and will not only rock but swamp the boat.—*J. W. Motherwell, Vice-President, Chicago.*

### Chicago Railway Equipment Company

Chicago

The policy of deferring betterments, maintenance and renewals cannot but be paralyzing to the railway supply industry and to the employment of labor. Its baneful effect, however, is much broader and far-reaching. For years, as you know, I have claimed and graphically demonstrated beyond question that railway purchases measure general business prosperity, and that we have not had and could not have general business prosperity without this essential factor excepting when some other great element could or did take its place. This did occur during the war when munitions and other war work were the substitutes. With these withdrawals, we are again back to our normal dependency upon railroad purchases. The great problem of industrial conditions and labor employment can be solved more quickly and effectively by resumption of railway purchases than in any other manner. Thus it is not a question of the railway supply industry alone, but the welfare of the whole country—manufacturer, merchant, laborer, farmer, or of whatever occupation.—*E. B. Leigh, President.*

### Columbia Nut and Bolt Company

Bridgeport, Conn.

Our railroad business during the past three years has been about 25 per cent of what it ought to be during normal times. Our shop equipment being particularly adapted for the manufacture of nuts for railroad use, you can readily see that a curtailment of purchases by the railroads affects us vitally and does not permit us to maintain our full organization from a labor standpoint. We believe that if the railroads were turned back to private ownership, they would see the necessity of making much needed repairs as well as purchasing new equipment which seems to have been lost sight of under government management. A change of policy would certainly be beneficial to the railroad supply interests.—*Fred Atwater, Treasurer.*

### Crane Company

Chicago

We can only say that our sales to the railroads for January, 1919, were 50 per cent less than January, 1918.

### Dearborn Chemical Company

Chicago

A great opportunity for continued employment of labor at the present high but fair rate of wages is now offered Congress by so concentrating its energies on the railroad problem so as to determine an early solution of it. Pending the adoption of a permanent plan, Congress should insist on the Railroad Administration proceeding at once with a broad program for maintenance improvements and betterments, Congress providing adequate financial provision for it.

Even though government operation continues but a short time these improvements, so necessary to satisfactory public service, should go rapidly forward, as provision will be made for completion or continuance of such work on the adoption of any permanent plan of control or operation. It is most important that the thousands of workmen employed in industries making railway equipment material and supplies be kept engaged. A proper program of expenditure to improve public service will not only keep these men employed but will in addition provide in the railway manufacturing industries employment for thousands of our returning soldiers.—*Robert F. Carr, President.*

#### Detroit Lubricator Company

Detroit, Mich.

We feel that because of the effort most manufacturers are making (which cannot be kept up indefinitely) to keep their employees occupied by making stock, which later may depreciate in value, the Railroad Administration should do its part to bridge over the present low spot through a liberal policy of maintenance and betterment. If, on account of all doing their share, business can be accelerated, the railroads as the country's second largest industry will get a proportionate return. It is a good business to be fair to the railroad owners, and we believe that betterments should be charged against them only at what would represent the cost under normal conditions.—*H. I. Lord, Vice-President.*

#### General Railway Signal Company

Rochester, N. Y.

The total railway sales made by this company in the months of November and December, 1918, and January, 1919, amount to 34.3 per cent of such sales for the corresponding three months of 1917-1918 and 34.5 per cent of such sales for the corresponding months of 1916-1917. In order to retain in our employ as many of our men as possible we have been and are manufacturing stock in excess of normal requirements, but despite this artificial and necessarily temporary expedient, and though we have made no reduction in wage rates, our railway department pay rolls have decreased approximately 20 per cent in the last month. Obviously, each month's prolongation of present purchasing policies will necessitate farther and greater reductions of forces in our railway departments and will inevitably result in greatly increased cost of production.—*W. W. Salmon, President.*

#### Glazier Manufacturing Co., The

Rochester, N. Y.

No matter how optimistic we may be, there is no use in fooling ourselves; we must acknowledge the truth; times are not good, and a great many are idle who might be working if conditions would allow. There is certainly need for a great deal of railroad material, but conditions must be righted. The question is, therefore, how best to bring this about.

When we got into the war, committees of representative men were appointed to guide various industries and formulate plans for increasing production, etc., with the big idea in mind of winning the war. Now that the war is won, isn't it just as important to formulate definite plans for winning peace and prosperity in the United States? We hear much about a League of Nations, and protection for races of people all over the world. Let's have a League of Business Interests at home, whose duty it shall be to look after the rights of labor and business here in the U. S. A. By the rights of labor, I mean the *opportunity* to work at fair wages, not merely raising the wage scale and then removing the opportunity to work. There can be no prosperity in the United

States unless the railroads are prosperous. There has been much talk, but no action. The time has come for action.—*Oscar F. Ostby, Vice-President.*

#### H. G. Hammett

Troy, N. Y.

I view with great apprehension the present and immediate future outlook concerning business conditions facing the manufacturers of materials used by railroad companies. My entire output is used by the railroads and largely in the construction of new locomotives. The delay of the U. S. Railroad Administration in placing orders for new locomotives has resulted in my being compelled to reduce the number of employees by about 20 per cent; and if large orders are not forthcoming within a very short time a complete shutdown of my plant will inevitably follow.—*H. G. Hammett.*

#### International Pulverized Fuel Corporation

New York

Since 1908 the annual additions of new locomotives and cars and of terminal and equipment repair and power facilities have been entirely insufficient during each year. The equipment has also depreciated from obsolescence and inadequacy, due to the lack of additions, of reinforcements and refinements for the purpose of providing the proper safety, efficiency and economy in operation and maintenance. For the next ten years, the United States railways will require annually an average of 5,000 locomotives, 3,500 passenger cars, and 200,000 freight cars to replace obsolete and dismantled equipment, and to provide additional equipment, if the service is to be properly maintained. In addition, about 25,000 locomotives, 20,000 passenger cars, and 500,000 freight cars now in existence should be reinforced and improved.

Nothing will do more to stabilize and be of greater avail in the present period of uncertainty and unrest than immediate provision for the definite, diversified, distributed and productive employment of labor and material in the rehabilitation and reconstruction of the steam roads.—*J. E. Muhlfeld, President.*

#### Kerite Insulated Wire & Cable Company, Inc.

New York

The works of this company are located in the Naugatuck Valley in Connecticut, which has been not only during the war but is normally a large industrial center. Owing to the fact that a waiting policy is being pursued in regard to the placing of business, which, under normal conditions, would keep the greater part of these plants in operation, the question of unemployment is becoming serious. It will, of course, unless some other policy is adopted, become rapidly worse, with the result that large numbers of men will be without work and without proper means of support. It seems to us that if a way can be found which does not conflict with other broad and important phases of the situation, it would be most advisable to carry forward at this time any work for which there is legitimate need in the way of maintenance and betterment. It seems to us that in the bigger sense it is to be urged both from an economic and social point of view.—*R. D. Brixey, President.*

#### Mudge & Co.

Chicago

We have not laid off any of our men, feeling it our patriotic duty as employers to keep our labor actively employed at this time if at all possible to do so. It has been necessary for us to place a large amount of goods in stock anticipating renewed buying. We may have been able to justify our-

selves in this where other companies could not because our business is seasonal and we have had more than we could handle in the spring of the year for several years past. Also, we have felt an optimistic confidence that Congress and the Railroad Administration would soon realize that their present policy means the shutting down of many railway equipment plants and unemployment of a large number of men and would take some active steps to alleviate this very serious condition. Unless some new policy is soon pursued it will be necessary for us to close our shop because we will not be able to bear the financial burden which has been made doubly hard because the railroads are backward in paying their accounts due, as we understand it, to the inability or failure of the Railroad Administration to settle their accounts.—*Burton W. Mudge, President.*

#### National Railway Appliance Company New York

I have viewed with growing concern the apparent introduction of the policy of retrenchment in the matter of purchases by the railroads of the country which cannot help but bring disaster upon one of the most important branches of industry—the railroad supply trade. If this policy is continued, it will simply mean that we will be forced to lay off salesmen; cut down our office force, and a decided retrenchment will have to be inaugurated in the factories controlled by the companies we represent, which will mean the laying off of well-paid workmen with all the unfortunate results that a condition of this kind brings in its trail.

Something has got to be done, possibly by Congress, possibly by a change in the policy of the director general of railroads. Whatever is done or whatever change is made, *must come soon, unless the unfortunate results which I have touched upon are brought about.* There is no question that extensive repairs to equipment should be made as it is fast becoming in a deplorable condition. Large expenditures for betterments and extensions are decidedly needed, all of which, if attended to, would create business for a line of industry which is now sadly in need of work and which must have speedy relief.—*B. A. Hegeman, Jr.*

#### The P. & M. Company New York

A delay in placing orders for material needed by the railways during the coming year is undoubtedly disturbing the labor situation greatly. We appreciate that possibly the railways do not wish to make large contracts at this time in the expectation of a price reduction, but a policy of purchasing a month to month supply would help the situation greatly. In the case of our company there are less than 20 per cent of the men employed in the manufacture of our material compared with a year ago.—*F. A. Poor, President.*

#### Parkesburg Iron Company Parkesburg, Pa.

Prior to 1918, or before the United States Railroad Administration controlled the policy of the railroads in this country, the percentage of our output, which consists exclusively of charcoal iron boiler tubes, ran, for a number of years, from 70 to 80 per cent of railroad orders. During 1918 the percentage of our output shipped to railroads in this country was under 20 per cent, and at the present time we have practically no orders on our books from them.

Fortunately, during the past year we have been able to run to capacity, largely on tubes for marine boilers, but as this demand is necessarily slackening, we anticipate depression and the necessary laying off, in the near future, of men in our plant, as well as in others, whose primary purpose is to furnish railroad supplies, unless the United States Railroad Administration very promptly authorizes the transpor-

ation systems of this country to repair and replace their motive power as in the past. We believe that by so doing the government will prevent a serious business depression, with its attendant distress and hardship to labor.—*George Thomas, 3rd, Treasurer.*

#### Pettibone Mulliken Company Chicago

Stop the present deferment of railway purchases! If continued a few weeks longer it will cause us to shut down, throwing all of our men out of employment. In view of the necessities of the railways, especially as to track and terminals, we believe every effort should be made to place such orders at once in order that labor may be employed and the transportation facilities of the country maintained. This is especially important at this time when returning soldiers are looking for work. Every effort should be made to give them occupation and to maintain present labor in employment.—*A. H. Mulliken, President.*

#### Rail Joint Company New York

If the Railroad Administration has decided to defer maintenance and renewals and betterments, I feel that it is against the judgment of their practical men who certainly realize the seriousness of such a stand not only to the country at large but to the roads themselves. There is considerable idle capacity in mills and shops which furnish material now required by the roads. Unless orders are placed at once for at least their next three to six months' requirements, additional capacity will be idle with a resultant number of men.

No one can look for any considerable reduction in prices with the present scale of wages, and it is apparent the Administration has no desire to disturb them. Buying immediately will permit the manufacturers to retain the men now employed; will allow taking on a certain number of present unemployed; and permit the roads to perform on a more economical basis the necessary work already scheduled over a period of months than if later an attempt is made to crowd matters and catch up with their schedule.—*V. C. Armstrong, President.*

#### Railway Car Manufacturers' Association

Representing:

American Car & Foundry Company.	Magor Car Corporation.
Bethlehem Shipbuilding Corp. (Harriman Plant).	McGuire-Cummings Mfg. Company.
Bettendorf Company.	Mt. Vernon Car Mfg. Company.
J. G. Brill Company.	Osgood Bradley Car Company.
Cambria Steel Company.	Pacific Car & Foundry Company.
Haskell & Barker Car Company.	Pressed Steel Car Company.
Keith Car & Mfg. Company.	Pullman Company.
Laconia Car Company.	Ralston Steel Car Company.
Liberty Car & Equipment Company.	Standard Steel Car Company.
	St. Louis Car Company.

At the annual meeting of the Railway Car Manufacturers' Association, your telegram to its various members, inquiring as to the effect of the present policy of the Railway Administration in deferring maintenance, renewals and betterments was discussed, and it is the opinion that this policy, if continued, will prove disastrous to the car building, railway supply and kindred interests, and to the workmen employed by them.

When the armistice became effective, all car builders and suppliers of railway materials were engaged to a very considerable extent in producing war materials, and more particularly railway equipment for overseas shipment to the American Military Railways. These orders for the military railways have been curtailed and suspended to such an extent that the industry has been compelled to materially curtail production, necessitating the laying off of a very considerable portion of its working forces.

Under average conditions car builders and suppliers of

railway materials have always received a fair amount of orders from domestic railways, not only for new railway cars to replace those worn out and destroyed and increased equipment required to meet the country's growing needs, but also very considerable orders for maintenance materials. The industry now finds itself without orders of this class on its books, and can only look to the Railway Administration for relief, which of course will not be forthcoming if the present policy continues. This affects not only the car builders and suppliers of railway material themselves, but also kindred interests engaged in supplying materials to them and will have a far-reaching effect and result in serious non-employment in all lines in any way associated with the railroad supply business.

Some of our members report that they have now been compelled to completely close down some of their departments and materially curtail production in all others, and consequently lay off a considerable number of men through the lack of orders for miscellaneous repair and replace parts.

In our judgment, during the transition from war to peace conditions, the welfare of our industry and of every community in which any part of it is located is dependent on full maintenance of purchases by the railways, not only for present needs, but also to supply the deficiency which deferment during the period of the war has caused.

#### Roberts and Schaefer Company

Chicago

We felt for some time, and are now more impressed with the importance of the fact that our national Congress is not, as a unit, appreciative of the hardships that the railroads, in all their several branches, are undergoing. Owing to lack of funds, because the government is failing to supply funds, and because the railroads are exceeding their appropriations, it has become almost impossible for contractors to continue their construction work. We have large contracts for one of the wealthiest and best operated railroads in this country, and yesterday we received word to discontinue work or postpone construction until such time as an appropriation could be made for one of the largest contracts we have with them. Furthermore, the writer was advised last week that they might find it necessary to hold up construction work on several more contracts.

We hear from several sources that railway employees are being laid off in every department of railroad organizations; this, because of the very great decrease in income since shortly after the signing of the armistice. Furthermore, there is absolutely no business being given out by the railroads, nor has there been any for three months. If we are to enjoy the prosperity that everyone has been talking of, there must certainly be improvements and betterments in the railway system of this country.—*J. J. Roberts, Treasurer.*

#### Sherwin-Williams Company, The

Cleveland, Ohio.

Business is now suffering from a lack of confidence on the part of buyers. The longer buyers hold off, the greater this lack of confidence will be. We believe that if the large business interests would show sufficient confidence in the future and authorize needed expenditures, there would soon be a decided improvement in business. There is a great deal of unfinished work to be done, and by postponing it we are only delaying the return of prosperity. It seems to us it would be good policy on the part of the government to authorize the expenditure of money in every legitimate way, and thus set an example to others.

It is common knowledge that there is great need for a generous expenditure of money on all railway equipment and railway property of all kinds. The manufacturers of

railway supplies are suffering from the policy of the Railroad Administration in deferring maintenance and renewals, which results in a large number of plants running on part time, and in some places plants have been closed. The Railroad Administration, by proper and generous expenditures of money, will not only preserve the great railway properties, but will do a great deal to help keep business going and labor well employed. We sincerely hope we will soon see the policy of retrenchment changed to one of expansion.—*W. H. Cottingham, President.*

#### Vapor Car Heating Company, Inc.

Chicago

With the rapid return of men looking for jobs on the one hand, and the necessity of laying off men and reducing forces, both labor and clerical, on the other hand, it seems to me that we are "working both ends against the middle." Most railway supply concerns have maintained the large forces—labor, clerical and technical—required to meet the railroad wants during war activities, until its maintenance now represents an actual loss.

It has been hoped that high class labor forces and the general clerical and technical organizations required to conduct a railway supply business could be kept intact to prevent the falling away of the organization, because it is perfectly well understood by those familiar with the physical condition of the railroads that large and immediate purchases are necessary to put the railroads into a normal condition again.

It is a fact that the roads are not taking steps toward rehabilitation or even normal maintenance—railway supply companies are laying off labor instead of hiring it, and at the very time when the general good of the country most demands the quick and profitable employment of every man possible.

The present condition of affairs is serious and as I see it there is nothing but trouble immediately ahead unless the present policy of restricting the railroads' purchasing activities is changed by some action on the part of Congress that will relieve the present uncertainty as to what the railroads can do in the way of taking care of themselves.

The present wage schedules of labor as employed by the railway supply companies should be very satisfactory to the employees, but if no jobs are available what does it profit the man who wants to work?—*E. H. Gold, President.*

#### Westinghouse Air Brake Company

New York

As our industry is wholly dependent upon orders for material connected with the maintenance and extension of railway facilities, it will be injured to the extent that a policy of deferring purchases for railway maintenance, renewals and betterments results in a less than normal expenditure by the railroads for such purposes. Necessarily, the pursuit of such a course will greatly accentuate the difficulties of unemployment, at a time when it would seem as if every incentive should be afforded to existing enterprises to increase, rather than to reduce, production—particularly those contributing to the maintenance and building up of our transportation system, which is a vital element of our national existence that cannot live upon a starvation diet at any time and is especially in need of a constructive and strengthening policy, rather than the reverse, at this time. There is, no doubt, merit in the proposal to start new governmental enterprises for the purpose of giving employment to those who are seeking it, but no greater assistance in that direction can be rendered than to enable established industries to completely utilize their productive facilities.—*H. H. Westinghouse, Chairman.*

## Shall We Lay Off More Men?

By a Supplyman

**R**AILWAY SUPPLY LABOR is being discharged by the thousands, at a time when their work was never so greatly needed.

Who developed the air brake?

Who made the safe brake beam and brake shoe?

Who brought the locomotive superheater to its present status?

Who made the safe vestibule for cars?

Who developed the life-saving car coupler?

Who developed car-heating and car-lighting?

Who made boilers safe with flexible staybolts?

Who has made our railroads safe by signalling?

Who made good the steel freight car and steel car wheel?

Who dug up, perfected and developed the fire brick arch for locomotives?

Who brought to the present degree of perfection the locomotive stoker, the improved truck, safety valves, power reverse gear, bell ringers, sanders, automatic fire doors, headlights, safety devices and factors for improving economy and increasing efficiency of the locomotive?

Is there one of the major or any of the minor developments in this incomplete list that has been brought to usable shape by anyone but supply men?

These developments usually owe their success to an inspiration on the part of someone who is devoting his life to the interests of the public in connection with improvements which are made for better, cheaper, more comfortable and safer transportation.

These supply interests who have done such monumental constructive work for the locomotive, the car, the track, and for signalling are entitled to the closest, warmest and most thorough co-operation from the railroads and from the government, particularly in these times when transportation is personally vital to every soul in the country and because but for transportation we would be like China today.

The Railroad Administration appreciates what would happen to vast numbers of miners in case coal should be purchased for the railroads without reference to the wages of the miners. The Administration has ruled for protection of the miners' wages. This is done with one hand while the

other hand rules that the roads shall include nothing in their budgets in the way of supplies or for locomotive or car improvements, or safety devices—the purchase of which can possibly be avoided.

Why is this? Why is the Railway Administration putting so many men out of work, throttling an industry to which the country owes so much? Why do not the authorities examine the number of men in the country who are affected by this policy? They bulk about as large as the number of railroad men themselves. Why is the immense railroad supply industry not used for the benefit of the people? Why are their plants laying off men? They should be kept at work because the cost comes back in savings in so short a time. This costs nothing because of the savings to be made by the railroads.

It is time that those who have the power to fix this situation should take a look at what they are doing and fix it quickly.

I was told today that an important railroad committee is not announcing the dates of its meetings for fear the supply men will be in the city at the time. Of course they will. That committee, however, can not afford to overlook those supply men in working out the railroad problem of today. They are among the most valuable assets the railroads have or ever had. They are the best asset the traveling and shipping public ever had for they make travel safe and economical. Here again let us ask what the locomotive would be today and how much coal would it burn but for these very supply men, or where the car would be as to safety and efficiency but for them?

Is it possible, that knowing these facts, railroad officials and government officials do not appreciate what inspiration, what courage, what strength of purpose and persistence against obstacles are required to develop a locomotive, car, or track improvement for American railroad service?

The improvements have only just begun—a new era has opened—an era which should mean the doom of wastefulness. The public can not afford for one minute to forget what the supply men can do for them in this emergency.

Railway supply labor is being laid off by the thousands when their work was never so greatly needed.

Shall we be able to put them back to work or shall we lay off more men?

This Locomotive Made in America for the French Government Was Captured by the Germans, Used by Them, Recaptured, and Has Since Been Used by the Americans

# Tie Producers Discuss Conditions in Industry

Consider New Specifications and Methods of Purchase  
Brought About by Centralized Control of Railroads

OVER 100 PRODUCERS of railroad crossties from all parts of the country met at the Hotel Statler, St. Louis, Mo., on January 30 and 31 to discuss the conditions now existing in that industry and to perfect a national organization. This meeting was called by the Tie and Timber Division of the St. Louis Chamber of Commerce to consider the problems resulting from the centralization of purchase of railroad crossties in the hands of the United States Railroad Administration. Representatives of the Forest Products Section of the United States Railroad Administration were present and participated in the discussion of several of the papers.

The meeting was called to order by A. R. Fathman (Western Tie and Timber Company, St. Louis), temporary chairman, and E. E. Pershall (assistant to the president of the T. J. Moss Tie Company, St. Louis), temporary secretary. A permanent organization was formed under the name of the National Association of Railroad Tie Producers with permanent headquarters at St. Louis, Mo. The officers elected were: President, John W. Fristoe, president T. J. Moss Tie Company, St. Louis; vice-president, C. C. Gresham, vice-president Ayer & Lord Tie Company, Chicago; secretary, Robert Hussey, vice-president Hussey Tie Company, St. Louis; treasurer, Robert E. Lee, Hobart-Lee Tie Company, Springfield, Mo. Eleven regional vice-presidents were also elected.

## The Tie Situation

During the convention reports were called for from representative manufacturers in the different tie producing regions. One manufacturer stated that the production in Ohio and Michigan was now only 20 per cent of that of one year ago. Production in the Pocahontas region for 1918 was reported to have been 50 per cent of normal. In the Southern area the production ranged 25 per cent to 50 per cent of normal, although deliveries were in excess of this amount because of the large number of ties in stock early in 1918, 75 per cent of the 1918 deliveries coming from this stock. In the Southwestern region a shortage of crops has resulted in the maintenance of production to approximately a normal figure, but with the improvement in crop conditions the output will be reduced greatly. In the oak and cypress regions of Louisiana and Texas the production was reported to be approximately 75 per cent of normal. In the Central Western region the 1918 production was estimated at 20 per cent of normal, but the outlook is now more favorable for a normal production during this year. In Wisconsin the production is now approximately 100 per cent of normal owing to the fact that many saw mills have begun to make ties for the first time. In Minnesota, where ties are hewn, the production is approximately 40 per cent of normal. In the Pacific Northwest the excessive demand for labor in the ship building yards contributed to a heavy curtailment in tie production, but conditions are now approaching normal.

## Specifications and Centralized Purchases

M. E. Towner, manager of the Forest Products Section of the Central Advisory Purchasing Committee, United States Railroad Administration, spoke before the convention on Thursday afternoon. The following is an abstract of his remarks.

One of the first considerations in railroad construction or maintenance is the crosstie. Necessarily it must be and has

been described in the form of a specification, which advises the producer what the railroads must have and is supplemented by instructions which guide the inspection forces in their interpretation of the specifications.

The specification and its application are the result of study on the part of the railroad engineering and purchasing forces to determine (1) the crosstie which will furnish the best bearing surface in meeting the varied conditions of the roadbed, and, (2) which will best subscribe to the possibilities of production. Not until unified operation of the railroads became effective could unified specifications be adopted and such adoption only took place after a most thorough canvass of the standards necessary to meet traffic conditions effectively, with consideration given to possibilities of production. That simplification was accomplished is shown by the fact that the 30 odd sizes and shapes have been reduced to 5 with the inclusion of every kind of wood generally used for crossties and provision for such others as may suit local conditions.

## PRINCIPLES OF PURCHASE

1. No railroad under control of the director general may purchase ties on any railroad under his control with which such road connects. The elimination of competition between railroads is generally agreed to be sound in purpose and practice.

2. Any railroad under control of the director general may purchase ties on any railroad not under his control with which such railroad connects. Such purchase is made with full consideration of the interests of the producing roads.

3. The price shall be fixed on the various lines by the individual railroad companies, subject to approval by the regional purchasing committee, and at such figures as will cause the production of a sufficient number of ties to meet the requirements of all the railroads. The question requires close study, accurate action and fairness to the producer as well as the user, or to all factors involved in the actual production of crossties. The general lumber market itself as represented in the use of woods which go into crossties must of necessity be considered although the lumber market does not in all cases affect tie prices. Labor, materials, conditions of supply and demand, etc., must and have entered into consideration. In the main, crosstie prices as offered by the Railroad Administration at the present time are fully in accord with the factors above mentioned. There are two producing factors: (a) Those who own, manufacture and market their product direct to the user; and (b) Those who not only buy stumpage but through financing encourage the production of and make possible the marketing of the product.

4. Every railroad should endeavor to secure the maximum output of ties on its lines, so that its own requirements can be met with the minimum amount of transportation. This question is one of organized effort and all roads should be guided by the same principles in the application of specifications, grading rules, office organization, and with field forces obtaining an accurate knowledge of the yearly line productivity, and conservation of resources. Owners or contractors, particularly those who have built up a considerable investment in stumpages and equipment which can be used advantageously, must be carefully and fully considered.

5. Ties made on railroads which produce more than are needed for their own use, should be transferred under the supervision of the regional committees to railroads on which

a shortage exists. This injunction is being carried out and as the possibilities of productivity are better described and known, the demands involved in the proper allocation of tie requirements for importing roads will be better met.

#### CONSERVATION

The conservation of growing timber must be given the closest consideration. This not only means reforestry in the planting of trees but also the conserving of growing trees by not cutting to the point of extermination in productive fields, which practice, unfortunately, has been followed in certain territories to a very large extent, particularly in the production of ties which are known to be too small. It is the intent of the specifications to discourage the cutting of trees which should not be cut but allowed to grow. It is a fact that on many railroads, particularly in the east, the tie productivity has fallen to a low point due to the cutting of timber and any production might be quickly eliminated by the non-importation of crossties and the continued cutting of the smaller trees. Another element of conservation results from the use of all that comes out of a tree for it will unquestionably be found that either the steam railroads, the electric roads, or the industrials can find ready use for all crossties legitimately produced along the lines as above indicated. Further, the steam railroads can probably assist all concerned by taking up all ties offered.

It has been stated that the Administration aims to eliminate the contractor, but such a statement did not originate in the mind of the Railroad Administration.

If the plan eliminates anyone it can only be said that such elimination is on account of the practice followed which should not have been fostered, even if the railroads had been a party to any particular development. It is not being found that contractors with actual property investments are being eliminated, and as the problem is worked out it is shown that possibilities of crosstie production are being bettered, and better contact is being established between the user and the producer, using this term in its broadest sense.

This is not an elimination of individuals and companies from a business of years' standing, but rather a co-ordination and harmonizing of the necessary organizations in such a manner as shall produce and market a product with the least expense and the best return to all concerned. The railroads, whether under administration or individual control, must prepare themselves to be a greater factor in the production and handling of crossties.

#### The Railroad Tie Contractor

The Necessity For and The Functions of The Railroad Tie Contractor was the subject of a paper presented by Walter Poleman, president of the Western Tie and Timber Company, St. Louis, of which the following is an abstract:

The Interstate Commerce Commission reports that in 1914 there were 256,547 miles of main tracks, and 98,285 miles of yards and sidings in operation in this country, a total of 354,832 miles, to say nothing of the many miles of industrial tracks. Approximately 3,000 ties are required for each mile, giving the stupendous total of 1,063,496,000 crossties required for the main tracks, yards and sidings of the railroads of this country.

The average life of the untreated white oak tie, I think it is safe to say, is about eight years, which means that one-eighth of the present number of ties now in the roadbeds are replaced annually. In other words, there are required for replacement alone 132,937,000 ties per year, and we have not taken into account the ties necessary for new construction or for industrial tracks.

The financial figures are equally as appalling as are the quantity figures. At the present price fixed by the Railroad Administration of 90 cents per tie for a No. 3 white oak

tie at the point of production in Missouri, it means about \$120,000,000 worth of ties annually for replacement alone. This figure alone would be amazing, but when you add to this a sum of money equally as large, if not larger, representing invested capital in timber, equipment, labor organizations and working capital to finance small producers, you are beginning to have some conception of the industry we are engaged in.

Since government control, there has been a decided tendency on the part of those in charge of the administration of railroads, to deem it unnecessary (or unlawful) for the government to contract for its supply of railroad ties, but to take the view that they should leave the matter of producing and furnishing the necessary ties to the voluntary efforts of any Tom, Dick and Harry. In fact, there seems to be a very strong tendency to discourage the production of ties on a large scale; to antagonize the tie organizations in every manner possible, with a view of decentralizing the industry to the greatest extent possible, upon the apparent theory that the best results can be obtained by breaking up the business into the greatest possible number of small and unreliable units.

Up to the present time, the general public, the government and the railroads have not felt the effect of this attitude, because the contractors had large quantities of ties in their yards, along the railroads and in the forests, already manufactured, when the government assumed control of the roads. This supply has now been practically exhausted. If the present prevailing conditions continue it will be impossible to obtain even a small percentage of the demand.

The cancellation by the railroads and Railroad Administration of all contracts and the complete revolutionizing of the industry has brought production almost to the point of stagnation. When the forces and organizations which have heretofore been depended upon to produce the ties have been completely disintegrated, it will be not only a long and expensive process to reorganize them, but in the meantime the lives of the traveling public may be endangered because of insufficient ties properly to maintain safe and sound roadbeds.

In order to supply the great demand for railroad ties, there must be some kind of a financial organization to keep the wheels of production moving. This is the function of the tie contractor. He must have and maintain his organization of expert timber cruisers and buyers. He must locate the small scattered and cut over land and timber tracts where most available to railroad and water transportation. He must find labor and locate it in camps, which he must provide for, to work the timber, haul the ties to the railroad right-of-way or float them down the streams. He must provide finances to the small timber owners to take care of the mortgage indebtedness, and must finance the farmer and small producer while he is manufacturing the ties. If production is left to voluntary efforts, promiscuously, of course there will be some small production, but it will be impossible to secure the necessary large production.

It is only through the organized efforts and financial assistance of the tie contractor, that the production of ties can be increased among those men, because there are many owners of small and scattered tracts of timber who are not tie makers themselves, and who are not financially able to employ and pay the makers of ties. The contractor is obliged to send his men into the timber, inspect the ties so produced, brand them and advance sufficient money so that the tie makers may be paid, in addition to paying the owner of the timber for the value of the stumpage.

Then, too, without the organization and finances of the contractor, it would be impossible to manufacture the principal portion of the yearly supply of ties during the winter season, when labor is more plentiful, especially farm labor, and when large quantities of ties must be kept in the woods

because of impossible hauling conditions. This, of course, means that some one is obliged to keep his money tied up in finished ties for several months.

In addition to this, when tie makers cannot be found in sufficient number to keep up the necessary production, saw mills must be erected and installed, which means a heavy outlay of capital besides the attending hazards of losses not only of profits but of capital invested, and also the assumption of losses due to fire and flood.

There is an old saying that "what is everybody's business, is nobody's business." I believe this saying is still true, and I am convinced that if the production of ties is left to the voluntary efforts of the individual, the railroads, within a few months, will find themselves in very desperate straits.

### Comparison of Methods for Purchasing Ties

J. W. Fristoe, president of the T. J. Moss Tie Company, St. Louis, Mo., presented a paper on the "Comparison of Methods for Purchasing Railroad Ties," of which the following is an abstract.

The methods and practices obtaining in the production, purchase, and sale of crossties, prior to government control of railroads, is now a portion of our industrial history, of value to us at present largely as a standard of comparison, and as a fund of experience from which we may develop certain deductions for possible future guidance. These former fundamental considerations between the tie producers and the railroads were as follows:

(1) Negotiations and contracts were made between individual corporations or firms and the railroad companies for specific numbers of ties for delivery in a specified period, and at some agreed price.

(2) The production of ties was pursued by a large number of concerns, of varying degrees of financial standing, with no definite trade customs, and without any industrial organization.

(3) The larger, more efficient, financially stronger, and responsible tie producers became known as "contractors," as the better purchasing agents of our large railroad corporations recognized that first principle of a sound contract, that of entering into an agreement with a co-contractor who was entirely responsible for his obligations.

(4) These so called tie contractors, collectively, shouldered the responsibility of supplying the railroads with crossties, switch ties, and similar railroad material. Their producing operations could be roughly divided into three methods, all, or any one of which were being used by any individual operator:

(a) The contractor would purchase timber lands or timber and under the supervision of experienced foremen, and with his own payroll, would manufacture, haul, load and ship the crossties to his customer, or,

(b) He would purchase the timber, or assist in purchasing the timber for a sub-contractor, who would have the ties manufactured and hauled to a transportation line. In practically every instance the contractor would be compelled to carry the larger part of the financial burden by advancing, as above, the cost of the timber, the cost of manufacturing the ties, and waiting for his pay until such time as the ties would be hauled to a transportation line, or,

(c) The contractor's investments in timber, in saw mills, in mules, and in labor, generally stimulated the production of cross ties in the territory where he was operating, but in addition, through personal solicitation and financial help, a large number of small farmers and settlers were induced to convert their surplus timber into ties, the contractor inspecting the ties in the woods, advancing the cost of making, and waiting for his pay until such time as those ties could be hauled to a transportation line.

### EFFECT OF THE PRESENT SYSTEM

One of the first acts of the Administration affecting the industry was the order prohibiting the purchasing of ties at prices in excess of those paid on December 31, 1917. The effect of this order, while temporary to be sure, could not have been intended to inspire confidence in the minds of the contractors, in view of the rapidly rising cost of tie production. The tie contractors were told at this time by the Central Advisory Purchasing Committee, the Forest Products Section of that committee, and the Regional Purchasing Committees, that they should continue in the production of ties, as no legitimate tie producer would have any reason to expect anything but fair treatment at the hands of the United States Railroad Administration, and that all operations should continue as heretofore; that the railroads were in dire need of ties, and that the contractor had nothing to fear.

However, this order was followed by the publication of new specifications and methods of purchase, and when these were announced the tie industry became most thoroughly alarmed, doubtful, and hesitant. The action taken by the Administration of establishing arbitrary prices, specifications, and method of purchase, was only justifiable as a war measure and has worked an injury and serious damage to those very concerns that the railroads had seen fit to develop.

The effect of this attitude was to create radical changes in the very fundamentals of operation that had been in effect for a considerable period in the past, and some small measure of these drastic changes can be determined by the realization that if the railroads prior to the war had attempted to decide, by common agreement, with power invested exclusively in themselves, that they would agree nationally on the prices and methods of purchase, there would have been grounds for legal recovery of damages to such concerns as the tie contractors, and possibly federal prosecution of those very railroad officials connected with such an agreement, under the Sherman Anti-Trust law.

One of the fundamental considerations of our national commerce has been the cost of transportation, and when the prices of ties are established without regard to freight rates, they are established without regard to the intrinsic value of the material in question; without consideration to established and preeminently correct methods of valuation of all standing timber; and without cognizance of the fact that the producer is constantly competing in the purchase of stumpage with the lumber men and other wood using industries.

The answer to establishing a proper price, neither too high or too low, on all of the various kinds and grades of ties, in the numerous and extensive tie producing territories, is not a matter that can be decided upon by any arbitrary power, no matter in what man or group of men this power might be invested. The real truth, as to the proper price to pay for a commodity, has been taught us nationally, in the foundation of our American business relationships, and has been strictly guarded in times of peace by federal legislation, and that truth is the law of supply and demand.

### VALUABLE EXPERIENCES FOR FUTURE GUIDANCE

The winning of the war now brings us together to face the problem of a period of reconstruction. We would be dull indeed were we not to profit by many experiences to which we have been subjected. We have the opportunity of eliminating detrimental practices of the past and retaining constructive policies. We should weld these good parts into a symmetrical plan of general operation. A selection of these good points of both systems used in the purchase of crossties is herewith presented:

In the past we obtained (1) quantity production, (2) low prices, (3) direct contact between the individual railroad and its direct source of supply, and (4) a stimulation of

the industry due to individual initiative, contract obligations, and business reputations.

At present we are obtaining (1) standard specifications, (2) a standardization of inspection and (3) a material improvement in the grade of ties, under a system where a premium is paid for quality.

On the foregoing principles there may not be entirely unanimous agreement, but it is safe to assume that a substantial majority of all the interests affected would readily subscribe to an arrangement that would embody these various points of merit. Therefore, it is asked that the following plan be considered:

#### SPECIFIC SUGGESTION

Let us assume:

(1) That all railroads register their annual cross-tie requirements with a central purchasing committee, and that all railroad ties be purchased and inspected in accordance with nationally standardized specifications.

(2) That all railroad ties shall be inspected by regional inspectors, in accordance with standard rules for the application of the specifications.

(3) That the individual roads shall enter into contracts directly with the tie producers for such portions of their requirements as the railroad administration may consider justified from time to time.

(4) That all contracts shall be awarded only after fair and open competition has developed the lowest price per tie obtainable from responsible bidders.

(5) In the event of a contractor being delinquent in the specified deliveries for certain kinds of ties, the United States Railroad Administration may prohibit his acceptance of any additional business for the same kind of ties.

(6) That the purchase of all railroad ties by the United States Railroad Administration shall be effected through a nationally standard form of contract.

(7) Reports from regional inspectors, purchasing agents of individual roads, and the regional purchasing committee, shall necessarily be forwarded to the central purchasing committee. These reports shall provide a fund of information regarding conditions surrounding production in the various regions, and in regard to the various kinds of timber, shipments, and prices, so that the central purchasing committee can, through the regional purchasing committees, intelligently and effectively instruct the individual railroads relative to the kinds of timber, number of cross-ties being produced, and as to the opportune time and manner to purchase future increments of their requirements.

The *basic reasons and advantages* of a method of purchase of this character may be outlined as follows:

(1) The system is founded upon the proper business relationships according to our American standards.

(2) The proper price for cross-ties would be established and changed from time to time by business conditions.

(3) The purchasing departments of the entire United States Railroad Administration would be provided with first hand and all proper knowledge in regard to production, shipments, and prices of railroad cross-ties.

(4) The production would again have the stimulant of a contract obligation, individual initiative, a premium on foresight, reward for efficiency, and a desire for volume of business.

(5) The suggested arrangements are susceptible of practical application either under governmental ownership or governmental control.

(6) In cases of emergency, the regional purchasing committees could draw upon any road's contracted supply of ties; with despatch, and without any negotiation with the seller.

(7) The regional purchasing committee would be permitted to perform the highest functions in the field of pur-

chasing, leaving their minds free for the consideration of the exceptional conditions.

(8) The economies in transportation, as far as the length and cost of haul are concerned, would automatically adjust themselves in the majority of instances.

(9) The method of purchases, as above outlined, is in substantial accordance with arrangements now effective relative to numerous railway supplies.

(10) The people of the country would positively, definitely, and beyond any doubt know that expenditures for railroad cross-ties were being made in accordance with the best American business standards.

(11) The business would be conducted on the basis of absolute fairness and business equality between buyer and seller, without dictation by any arbitrary or artificial power, and in specific and direct relationship to the law of supply and demand, upon which the entire structure of our American commerce is predicated.

#### DISCUSSION

In the discussion of this paper Mr. Poleman asked Mr. Towner how over-production can be controlled with the present purchasing methods involving the elimination of contracts and the centralization of purchases. Mr. Towner replied that many roads have always secured their ties from small producers along their lines, working without contracts. There is now an over-production in one area of more than 8,000,000 ties beyond the requirements of the roads in that vicinity. The Purchasing committee has told the producers in that region to curtail their production beyond a certain date but if a surplus still exists at that time, the committee will endeavor to take the ties off the producers' hands. The central purchasing committee already knows the requirements of every road for 1919 and has estimates of the production in each area. Every producer will be notified in ample time to avoid any overproduction which may be threatened.

#### Cost of Producing Railroad Ties

The factors entering into the increased cost of producing ties under the new specifications were brought out in a paper by John H. Johnson of B. Johnson & Son, Richmond, Ind., which is abstracted below:

You are, of course, familiar with the present plan of posting circulars in conspicuous places in all railway stations, offering to purchase ties of anybody, naming the prices to be paid and giving the specifications—the man who hauls in a wagon load of ties to receive the same price for his ties as the man, firm or corporation who has an expensive organization built up after years of experience, who has large investments in saw mills, teams, timber, etc., and who devote their entire time and attention to the business of producing ties. In our experience, we have known of railroads deciding to buy their ties by the method named above, in spite of the fact that we had a good organization on the line and were getting ties in sufficient quantities to meet the needs. In fact, we procured more ties in some years than were needed, enabling us to ship the surplus off the producing line. The result of trying to buy by circular was a complete demoralization of the business, and it did not take a year's time to demonstrate that this plan was a mistake. The only reason for making a change in the manner of buying the ties, was the hope of buying them cheaper. We could not buy the necessary timber, as the owner knew the established price for the ties and he figured he must have a certain price for his timber accordingly. In a great many cases he would not make it into ties himself nor would he sell at a price which would permit the contractor to buy and manufacture, the result being that ties were not produced. Nor could we get the amount of labor usually produced, for the price of ties was published to the public at

large and the tie maker figured he should have a good share and he demanded more than we could afford to pay. As a result of this idea of "direct from the producer to the consumer" the production was practically eliminated.

We have found that it is a very difficult matter to try to change the methods of the tie maker or saw mill man. He has always been educated to make two grades of ties. Specifications handed him were simple and he could easily understand and apply them. Also it was not difficult for the man who had to ride the woods and make an inspection of the ties to apply the same simple specifications as to grades. This also applied to the railroad inspector who finally inspected the ties. But along came the new specifications with five grades and prices—and we must confess it has been very difficult to get the man away back in the country to understand them. He is not the only man either who does not, for one inspector for the railroads inspects one way and one another, interpreting the specifications differently. It seems to us that, of all times to make a change in specifications (if it had been necessary to have made any change at all) the time chosen was inopportune, as the demands for all forest product was unusually great and it has been very difficult to put into satisfactory use the new specifications.

One serious problem is the buying of timber at prices that will justify our making it into cross-ties. It has always been our policy to make our timber into ties and not take the best for some other product of a higher grade and price and then cut the cull timber into ties. We have preferred to adhere strictly to the tie business and have found it more to our advantage. The price of timber stumpage has been increasing as the demands of the country developed. We find the publication of the new government prices has greatly stimulated the price of standing timber and we cannot blame the owner of the timber for raising his price when he sees the published price of ties. On account of the way the new specifications are being applied in a great many instances, it would pay the owner of timber to let his timber stand or cut it into something other than ties.

One of our timber men estimates that 40 percent could not be made into ties to stand the technical application of the new specifications at the present prices. The price of the low grades of ties is too low to justify bringing out the 40 percent left in the woods. I am sure we will all agree that everything should be done to prevent any waste of timber and we believe a better price paid by the railroads for what are called "serviceable rejects" will make it worth while to make into ties such timber as is suitable therefore. It is our judgment that there should not be such a wide difference in prices between the Grade 1, 6 in. by 6 in. tie which is practically our old second class tie, and Grades 2 and 3. If the price of the lower grades could be increased it would be a great help in the production of ties. The prices of all ties have been too low to compete with the prices of lumber. The class of timber that is necessary to make the kind of tie desired must be high grade which is now worth more when manufactured into lumber.

We believe all of these conditions have a bearing on the cost of producing railroad ties under the new specifications. They have caused us to pay as much as ten cents per tie more to get it made with the axe and the cost has been even greater when sawed, ranging from 15 to 20 cents more per tie. It is costing from 50 to 60 cents for the labor alone to get 6 in. by 8 in. by 8 ft. ties from the tree to the railroad now, whereas formerly we could get the work done for from 35 to 45 cents. Some of our very best tie makers have left good jobs where the timber was good because it was difficult for them to make a tie to comply with the new specifications. The fact is, that the old-time tie maker is getting to be a thing of the past and it is becoming necessary more and more to produce ties at saw mills.

There are three other things which I would like to mention as having much to do with the cost of producing ties: (1) prompt inspection after they are delivered to the railroad; (2) the prompt placing of cars in sufficient numbers to avoid carrying such a large quantity on hand as has been necessary so many times, involving the investment of a great deal of money, and (3) the payments made by the railroad companies to the contractor or producer of ties.

### Disposition of Small Timber

The disposition of small timber under the new specifications was discussed by Howard Andrews, of the Nashville Tie Company, Nashville, Tenn., in a paper presented on Friday afternoon. Mr. Andrews prefaced his paper with the remark that the new specifications have eliminated the use of much small timber formerly converted into ties. He did not question the advisability of this practice from the standpoint of the railways, but did question its advisability from the standpoint of timber conservation and its effect on the ultimate source of supply of tie timber. He referred to time within his memory when roads such as the Erie were able to secure all of the ties they needed along their right-of-way, but that the country is now depleted of tie timber as far south as the Ohio River. Mr. Andrews' paper is abstracted as follows:

An examination of the Administration specifications shows that the smallest tie accepted must be one that if hewed or sawed to squared edges would measure 6 in. by 6 in. Such a tie, however, generally is one such as was formerly known as a 6 in. by 8 in. tie, being 6 in. thick, 8 in. through the body, and with a 6 in. face or surface under the rail. I know from experience that under former conditions many railroads in the country would have accepted such a tie as No. 1, 6 in. by 8 in., or at least as No. 2, 6 in. by 8 in. Under the present conditions the production of this 6 in. by 6 in. or "grade 1" tie is being discouraged by the Railroad Administration, both in price and in other ways, whereas under former conditions this was one of the standard sizes of ties in use.

What is now called a 6 in. by 8 in. tie by the Railroad Administration, being a tie that will show squared edges of these dimensions, would formerly have readily made what was the standard 7 in. by 8 in. tie, being a tie 7 in. thick, 8 in. through the body, and with a 7 in. face, or surface under the rail. Either the new specification "grade 3" 6 in. by 8 in. tie, or the old time standard 7 in. by 8 in. tie would come from the same stick of timber. I believe the advantage is all with the old tie, which has more bulk and weight, and therefore is more desirable under the rail. It is also more economical in manufacture, as so much is wasted in chips by the axeman in cutting the square edge 6 in. by 8 in. tie, and these chips would be of value if left on the tie and used in the track under the rail. It may be argued by the Railroad Administration that the tie man may have the option of leaving these chips on the tie, and that he does not have to cut them off, but no extra pay is given for these chips. Inasmuch as most ties are hauled by wagon a considerable distance before reaching the railroad, it is to the tie man's advantage to cut off and waste these chips, rather than overload his wagon on a long haul with something he does not get pay for. It is my contention that any effort to secure a square-edged tie is an economic waste, as the value of the tie is governed more largely by the thickness and width through the body than by the width of face under the rail, although the width of face, of course, is some consideration. I think there is no question that a tie, say 6 in. thick, 8 in. through the body, and with a 7 in. face is of more value than one that is hewn or sawn to strict 6 in. thickness and 7 in. wide, square edges, etc., yet the Railroad Administration pays the same for both ties.

The Grade 1 tie means a stick of timber that will cut

the equivalent of a square tie, 6 in. by 6 in., and this means a stick 9 in. in diameter at the smallest end. I understand that it is one of the theories of the Railroad Administration that by commanding a larger tie they will conserve the timber of the country by preventing the cutting of smaller trees.

The timber that it is necessary to conserve, and which should be utilized into ties and accepted and used by the railroads in such proportions as are practical, is the upper part of every tree that is cut down. The Railroad Administration specifications now admit of the acceptance only of ties made from sticks of timber at least 9 in. in diameter, although previously it was possible to market ties made from sticks 8 in. in diameter at the small end, which made a tie perhaps a little less than 6 in. thick, but 8 in. through the body, and with 5 in. or more of face under the rail. While I do not know that it is advisable to use a small tie for heavy service, I am sure that such a tie made from an 8 in. stick of timber, could be used in large quantities and with satisfactory results in spur tracks, branch lines, etc. I have been told that it is common for the largest railroads in the country to use the best 7 in. by 8 in. ties in unimportant spur tracks and sidings, where a smaller tie would not wear out or rot any sooner than a large one.

Eliminating the possible conservation of the small trees which might be effected by the use of large ties only, I am convinced that the production of ties to meet the Administration specifications means a waste of from 20 per cent to 50 per cent in timber. Every tree that is cut down will produce one or more ties from sticks 8 in. in diameter, and under 9 in., which are not accepted when the minimum tie must come from a 9 in. stick. When these smaller ties are not made, there is nothing to do with the upper parts of the trees but to let them lay in the woods and rot. I know of no other disposition to be made of the timber, except such as may be cut into cord wood for the farmer's fire. Cord wood cannot be cut and shipped to the larger cities in competition with coal as fuel. A loss of 20 per cent to 50 per cent in timber means a corresponding reduction in the number of ties coming from a certain acre, and makes necessary a higher price for such ties as are marketed, unless the timber owner is willing to accept 20 per cent to 50 per cent less for his timber.

We must remember that specifications, no matter how satisfactory they may be from the railroad viewpoint, will not affect the size of the trees that the ties are to be made from, nor will they affect the growth of timber for future use. We must cut according to our cloth.

#### DISCUSSION

In the discussion of this paper, Mr. Towner stated that the Forest Products Section has given careful consideration to the utilization of the small ties, and has taken the matter up with trolley lines and industries where small ties can be used equally well. The government has accepted over 500,000 ties too small to come within the standard specifications within the last seven months, and is trying to secure disposition for them. It will try to use all small ties coming from the tops of trees, but will not willingly accept ties cut from small trees, as this practice is in conflict with conservation.

Mr. Andrews urged that conservation must include measures looking toward (1) timber preservation, (2) the discovery of use for small ties by the steam roads, as the traction lines cannot absorb all of them, (3) the finding of use for ties with small defects. He stated that the timber he is now working on will produce from 25 per cent to 40 per cent more ties if smaller ties are accepted.

Walter Poleman asked what, if any, discretionary powers are given to inspectors to consider the larger end of the tie, or to average its diameter to reduce the minimum diameter accepted. Mr. Towner replied that the value of the tie is limited by the diameter at the point of rail bearing at the

smaller end and that no allowance is now made for excess size in the remainder of the tie.

Mr. Poleman also called attention to the fact that large quantities of timber are now being made exclusively into mine props. Mr. Towner stated that the Forest Products Section now has this question up with several state forestry departments, and is endeavoring to encourage the use of other timbers for this purpose to conserve the tie supplies.

The price paid for usable rejects (ties not complying with the specifications) has been a source of contention. Mr. Towner stated that the price for such ties has been left entirely in the hands of the regional purchasing committees and largely to the disposition of the individual roads. Attention was called to instances where purchasing agents had refused to accept ties complying with the specifications unless the usable rejects were also turned over to them. Mr. Towner stated that it was not the policy of the purchasing committee to force a producer to turn the usable rejects over to the railroads if he could dispose of them to better advantage elsewhere.

### Orders of Regional Directors

**P**ILOT FOR TRAINS MAKING DETOUR MOVEMENTS.—Order 154 of Southwestern regional director, similar to File 1200-272A461 of Eastern regional director, abstract of which appeared in *Railway Age* January 31, (page 315).

**Freight Car Distribution.**—In Supplement 1 to Circular 70 the Northwestern regional director announces that for the purpose of relieving the present surplus of box cars in eastern territory and to get cars into western territory that are suitable, or can quickly be made suitable, for loading, orders are now being placed by the Car Service Section for inter-regional movement which provide for the delivery of: (a) box cars in good order and cars that can be made fit for grain by light running repairs or cooping; (b) bad order or rough freight box cars belonging to the receiving road or belonging to other roads in the same region (bad order cars belonging to other than the receiving roads may be either repaired by them or delivered to the owning lines). Cars received on these orders which, in the opinion of the receiving line, should not have been delivered will not be rejected or returned except by authority of the terminal manager at the junction point or the chief interchange inspector if the terminal manager delegates this authority to him. When cars are accepted through gateways where no terminal manager is in charge the receiving road will accept all cars offered and will report promptly to the regional director's office all improper deliveries.

**Deadheading Household Goods for Railroad Employees.**—In Circular 166 the Southwestern regional director announces that the household goods of employees may be moved deadhead, and this may be done over two or more federal-controlled lines if that is necessary.

**Transportation over Short Line Railroads.**—In Supplement 10 to Order 109 the Southwestern regional director states that federal managers should make requests direct on non-federal controlled "short line" railroads for such annual transportation as they consider necessary for their officers and employees.

**Insurance on Construction Work.**—In Supplement 2 to Circular 68 the Northwestern regional director states that fire and casualty insurance should be secured on construction work when the cost is chargeable to capital account, the premiums to be included in the cost of the work.

**Inspection of Coal.**—In Supplement 14 to Circular R.P.C. 3 the Northwestern Regional Purchasing Committee announces that on account of the discontinuance on January

31 of inspection by the Fuel Administration of coal loaded at mines it will be necessary for the railroads themselves to undertake the inspection of fuel. As pointed out by the Fuel Conservation Section of the Railroad Administration, the decrease in commercial and railroad demands for fuel makes it no longer necessary to purchase coal of marked inferior quality. At the present higher initial mine costs for coal, increased fuel transportation and labor costs, the difference in heat values of coal having varying thermal efficiency represents, in dollars and cents, a wider margin of loss when inferior coal is accepted than during past periods when prices and handling costs were considerably lower.

The Eastern regional director has issued similar instructions, file 1500-3-28A464.

**Fire Inspection Service.**—The Eastern regional director, file 1800-34-6A472, states that a meeting of superintendents or supervisors of fire protection will be held in the New York Central Board Room, Grand Central Terminal, New York, at 10:00 a. m. Friday, February 21, to discuss the various problems in connection with fire prevention, and to analyze fire losses that have been sustained.

**Shop Supervision.**—The Eastern regional director, file 1200-2-30A474, quotes from a letter received from W. T. Tyler, director, Division of Operation, dated January 27, as follows:

It is stated that in some of the shops where a change has been made from piecework to hourly or daily basis, the piecework checkers, usually clerks or office men, have been put in the position of foremen at foremen mechanics' rates. I suggest the advisability of cautioning federal managers against leaving any opportunity for criticism in connection with this matter.

**Extension of Railroad Mail Service.**—The Allegheny regional director, in Circular 125, states that it has been decided that it is permissible for railroads under federal control to carry as railroad business, without payment of postage, mail which relates to the business of other railroads under federal control and which is sent by and addressed to officers or employees of railroads under federal control.

**Filing Time on Railroad Messages.**—The Eastern regional director, file 2001-5A475, quotes from a letter received from Martin H. Clapp, manager, Telegraph Section, Washington, D. C., as follows:

I do not think that it is desirable that the filing time be transmitted and shown on received copy of all the messages sent by the different railroads. It is, however, desirable to have the filing time sent and shown in connection with all messages sent to and from the telegraph office of the Railroad Administration at Washington.

**Meetings of O. S. and D. Representatives.**—In Supplement 2 to Circular 66, the Northwestern regional director states that a considerable saving has been effected in claims for lost and damaged freight at an important terminal in the region through periodical meetings of railroad representatives for the purpose of matching up shipments of freight found over without billing. He directs that similar weekly meetings be inaugurated at all other common points. Where terminal managers are employed, these meetings will be held under their direction. A brief report showing the number of shipments of freight "over and short" on each railroad, and the number eliminated should be sent from each station involved to the regional supervisor of freight, loss and damage.

**Consignments to Shippers' Order.**—Under date of January 27, the Northwestern regional director calls attention to Rule 38 of the Western Classification, which provides that the issuance of bills of lading for shipments consigned "to order" will not be permitted unless the name of the person, firm or corporation to whose order the shipment is consigned is plainly shown after the words "to order." Likewise the issuance of bills of lading for freight consigned to shippers' order at one point involving the notification of a consignee at another point is not permitted, except when consignees are located at prepay stations or interior points, in which case the freight must be consigned to an

open station to be designated by the shipper. The regional director states that this rule shall apply to all shipments regardless of whether the tariffs governing are subject to Western Classification rules.

**Attitude Toward Bills Introduced in State Legislatures.**—The Eastern regional director, file 1201-12A473, states that the following instructions have been received from the director general relative to the attitude that should be assumed by railroads under federal control toward bills affecting railroads and the Administration:

With respect to legislation in any way affecting the interests of labor, it is to be understood that the Administration has no such legislation to propose, nor will it lend its assistance in any form to measures affecting a repeal of existing laws affecting the interests of labor. Following out the policy which has been suggested by the director general to representatives of labor, it is understood that such representatives will bring such operating proposals affecting the interests of employees, as they consider to require action, to his attention for administrative action rather than advocate the passage of state legislation to accomplish their purpose. Should legislation of this character be proposed, however, it should be brought at once to the attention of the director general. (Of course any legislation of a "social" character proposed by representatives of labor and having no relation to railroad operation will not be dealt with at all by or on behalf of the director general, through regional directors, federal managers, or otherwise.)

With respect to other proposed state legislation affecting railroads under federal control, you are authorized to take such action as may, in your judgment, be advisable in the way of bringing to the attention of the legislatures, or of legislative committees, the facts relating to the subject of the proposed legislation, the effect thereof on railroads under federal control, if enacted, and such reasons in connection with the enactment thereof as you believe should be presented. Questions so handled before legislatures or legislative committees should be dealt with by representatives of the Railroad Administration authorized to talk for the Railroad Administration and the Railroad Administration only. Whenever any steps are taken in that direction or in the way of committing the Railroad Administration to any attitude with respect to proposed state legislation, the director general should be immediately notified.

**Duties Assigned to Board of Railroad Wages and Working Conditions.**—The Eastern regional director, file 1200-274A477, advises of special provisions which are to be made for conferences between representatives of the regional directors and representatives of the employees involved in the matter of rules and working conditions for various classes of employees upon roads where such employees do not have agreements or schedules: "Instead of holding extensive hearings and themselves sifting out the testimony and framing rules, it is considered highly desirable both for the sake of conserving the board's time and securing a more mutually acceptable set of rules and working conditions, to have representatives of the regional directors and representatives of the employees involved meet and, so far as they may be able to do so, agree upon such rules, referring to the board for consideration the rules, if any, upon which they are not able to agree (as well as, of course, those upon which they are able to agree) and from this report the board will make its recommendations to the director general."

**Agreement Between Director General and Express Company.**—In Circular 165 the Southwestern regional director refers to the agreement between the director general and the American Railway Express Company which provides that the express company will transport without charge over lines under federal control all packages of money, valuables, papers and shipments of materials and supplies ordinarily forwarded by express, which are used in the operation of any of the controlled roads. In this connection the question recently arose whether it was the intention, under this law, that business should be handled dead-head for one line moving over another. The answer is in the affirmative. The express company will also transport without charge shipments of tickets and supplies to agents of the Pullman Car Lines.

**Rerouting Carload Freight.**—In Order 153 the Southwestern regional director outlines the practices which are to be observed by railroads in rerouting carload freight. Instructions provide for notation on waybills by the agent changing the routing and the sending of a postal card to the consignee advising him of the diversion. The order also

gives detailed advice as to the method of handling charges when freight is rerouted.

*Distribution of Empty Freight Cars.*—Circular 172 of the Southwestern regional director, similar to Circular 70 of the Northwestern regional director, abstract of which appeared in *Railway Age* of January 17 (page 206).

*Cleaning and Disinfection of Stock Cars.*—In Order 155 the Southwestern regional director states that the Department of Agriculture has called attention to the fact that considerable difficulty is being experienced at many points in the enforcement of that part of the Bureau of Animal Industry order No. 245 concerning the cleaning and disinfection of cars which have been used in the interstate trans-

portation of live stock affected with contagious, infectious or communicable disease and asks that steps be taken to bring this matter to the attention of all concerned.

*Clauses to Be Incorporated in Contracts.*—In Supplement 10 to Circular 11 the regional purchasing committee states that the following clause included in Supplement 9 to Circular 11 of the regional purchasing committee should hereafter be eliminated from contracts and orders: "(A) If during the life of this agreement any competent government authority shall for the first time establish a price on the articles hereby contracted for, the price so fixed shall be paid for all material delivered under this agreement after the date when such price becomes effective."

## Plan of Security Owners for Return of Roads

### Minimum Rate of Return, Corporation to Finance Readjustment, Co-ordination of State and Interstate Regulation

A COMPREHENSIVE PLAN for the return of the railroads to private operation and for their future regulation was presented before the Senate Committee on Interstate Commerce on January 31 by S. Davies Warfield, president of the National Association of Owners of Railroad Securities. The principal feature of the plan, which has been adopted by committees of the association, proposes an act of Congress providing that such rates for freight and passenger service shall be established as will produce a minimum return (6 per cent suggested upon the combined property investment of the roads in each of the three classification territories), excess earnings above this amount to be distributed under the control of the Interstate Commerce Commission, part of it for the benefit of the employees and part of it for improvements. It is also proposed to create a National Railways Association, directed by trustees composed of the nine members of the Interstate Commerce Commission and eight railroad men, to assist in financing the return of the roads and to continue or adopt co-operative methods of operation. The plan also provides a system of regulation by the Interstate Commerce Commission and six regional commissions with a co-ordination of federal and state authority.

In outlining the association's plan before the committee, Mr. Warfield took issue with the suggestions previously made for federal incorporation of railroads and for the creation of a secretary of transportation and vigorously opposed both government ownership or government operation for the five-year period proposed by Mr. McAdoo. In support of the plan Mr. Warfield left with the committee letters of approval from Elihu Root, Hugh L. Bond, Jr., John G. Milburn, John S. Miller, Luther M. Walter, Forney Johnson, and B. H. Inness Brown, counsel for the association. The constitutionality of some of the suggestions from others previously appearing at the hearings, notably federal incorporation of railroads, was denied by these same legal authorities. Some of the important organizations of ship-owners of the country, Mr. Warfield said, support many of the ideas he advanced and for the first time the committee could find itself confronted with a plan approved by spokesmen for the security owners and the shipping interests.

An abstract of Mr. Warfield's statement follows:

#### Methods Open to Congress

We understand that three methods are open to Congress in respect to the railroads:

1. To carry out the provisions of the federal control act

under which their control and operation was taken over by the government for the sole purpose of war.

2. To extend the period of federal control and operation for five (5) years for purposes clearly not those for which they were taken.

3. Government ownership—a question embodying a complete reversal of national policy, of vital moment to every interest in the country.

The third proposition we assume is not at this time being seriously considered by your committee, no matter what may be the opinion of some in respect thereto. Certainly the results of federal control and operation thus far obtained cannot give comfort to advocates of government ownership. The exigencies of the present situation require immediate action in respect to property that was taken for war under agreement with the owners for its return as outlined in the federal control act.

The second proposition is disposed of in the settlement of the first. Extension of the time of federal control and operation beyond the time specified in the act for the return of the railroads would take them to a point where they *cannot be returned at all*. Congress placed the federal control act on the statute books. Your committee knows the purpose the Congress had in mind when this was done. And Congress will decide whether it is defensible to seize property for war purposes and when those purposes have been served to use the vast investment therein to carry out individual theories of railroad operation and for experimental purposes. The financial structure of all credit is involved in the decision of your committee, apart from the question of common honesty involved, for Congress did not authorize the investment of fifty million people in these properties to be seized for one purpose, and then put to another. Your act not only specifically names the time within which the railroads shall be gotten ready for return to their owners and for such return, but it also provides for the physical condition in which you expect and require them to be returned.

We believe that the railroads of the country should be returned to their owners under private operation as early as practicable, but not before legislation can be enacted that will assure adequate facilities and service at reasonable rates under proper control and regulation by governmental bodies and protection to the investment in the properties.

We urge that this legislation be enacted early in the 21 months allowed by the federal control act to prepare for their return, since each month of continued so-called uni-

fication and diversion of traffic takes the railroads further away from normal methods of meeting the business requirements of reconstruction. They are fast losing their individuality and we ask during the present session of Congress such temporary legislation, at least, as shall cause the immediate restoration of the normal requirements of the railroads, such as their traffic and other departments. The longer this is delayed the more difficult does it become to carry out the intention and provisions of the federal control act.

We ask that you will provide for a gradual liquidation of the indebtedness of the railroads to the government. The government's loans to the railroads, outside of advances of annual compensation or rental, largely represent expenditures made at the sole discretion of the director general for war and other purposes over which the railroad corporate managements have had no control, and often made without their approval. You may recall that the contract executed between the government and the telephone company gives 20 years during which repayment of obligations, similarly created, may be made. A large part of the loans made to the railroads by the government represents the compensation the railroads are entitled to receive under the federal control act, as rental. In many cases this rental has been called an advance, notes given therefor and collateral required therewith.

As the first step in the return of the railroads, the one plan contemplates that the present freight and passenger rates, state and interstate, and the present scale of wages shall remain in full force and effect until and unless changed in the operation of the plan.

The plan, stripped of operating details, is based upon the following fundamentals, and they are embodied therein:

#### Fundamentals of Plan

1. A minimum rate of return on the property investment in the railroads, *fixed* by act of Congress, through rates adjusted as occasion may demand, in order that the securities of the railroads may be stabilized and their credit established on a basis necessary to secure the money to provide to the shippers and travelling public adequate facilities and service;

2. Recognition that a fixed return through rates that will enable the average railroad to receive an adequate return on its invested capital is not possible without giving to the more favorably situated railroads more revenue than the public will sanction, or more than would represent a fair return on its property. The earnings of railroads in excess of a fixed reasonable rate of return to be applied as provided in the following section.

3. A distribution, under the control and jurisdiction of the Interstate Commerce Commission, of a percentage of the fund above provided, that railroad employees shall receive the benefit of profit sharing, by insurance, or by such other legal methods as may be determined upon; likewise a distribution of a percentage thereof among the railroads earning it, and under the plan, and in furtherance of incentive and initiative by establishing operating efficiency standards; for certain improvements to railroad property, under restrictions, not to be capitalized in rate making; and for other purposes defined in the plan;

4. A corporation, created by act of Congress, operated without profit to the railroads, and under federal control, directed by trustees composed of the nine Interstate Commerce Commissioners and eight railroad men, to finance in the present emergency, such equipment as may be purchased by it from the Railroad Administration and allocated to the railroads, and to furnish an immediate means for assisting in financing the return of the roads; continued as a permanent means for mobilizing and purchasing equipment to be leased to the railroads; to provide a management or

agency to continue or put into effect the joint use of terminals, unification of facilities, re-routing of freight by pooling or otherwise, and to continue or adopt such methods of operation as may have been found to be successful and expedient during federal control; to furnish a standing, trained and efficient means for immediate mobilization of the railroads for war purposes without additional legislation.

5. Federal regulation extended through the Interstate Commerce Commission as at present established, co-ordinating therewith subsidiary commissions as regional commissions, the members thereof selected equally from the two leading political parties appointed from and sitting in the six traffic territories as at present defined, giving to such bodies the determination of rates and regulations. The right of appeal is given to the Interstate Commerce Commission, which may be designated Commission of Appeal.

6. Continuation of rate committees composed of representatives of both railroads and shippers in defined territories, to primarily consider and pass upon all changes in rates requested by either railroads or shippers and before being filed with the regional commissions or Interstate Commerce Commission.

7. Co-ordination by the Interstate Commerce Commission, of the work of the state commissions, as far as the limitations of law, and the legislation provided under the plan will permit, with that of the regional commissions. The adjustment of intrastate rates to the requirements of interstate commerce as prescribed through interstate rates is vested in the federal commissions.

8. Regional commissions act as boards of conciliation for the settlement of wage differences between the railroads and their employees. In default of settlement such commissions shall appoint two arbitrators, the employees naming two, the four so selected naming the fifth, if required. Appeal may be taken to the Interstate Commerce Commission; the findings not to be compulsory unless mutually agreed beforehand. A fixed return being provided under the plan, expenditures for wages or other elements entering into expenditures are supervised by the commissions.

9. Future issues of railroad securities supervised by the regional commissions and the Interstate Commerce Commission.

#### Other Plans That Have Been Proposed

Having stated the fundamentals of our plan, it becomes necessary, before entering into the details thereof, to discuss some of the propositions that have been submitted to your committee from other sources. Their fundamentals are:

1. Compulsory federal incorporation of railroads;
2. Provision for a new cabinet officer, to be known as the secretary of transportation;
3. Regional railroad companies;
4. Withholding from the government the initiation and determination of rates, at the same time asking that such rates shall provide sufficient revenues.

#### 1. Compulsory Federal Incorporation

Compulsory federal incorporation necessitates, in the opinion of many able lawyers, the sale of existing railroad companies now organized under state charters to companies to be organized under federal charters. Such federal charters would be authorized by act of Congress, always subject to amendment at any time, and would likely contain a recapture clause under which the government could acquire the railroads on its own terms by probably taking from them the right of appeal to the courts for an adjustment of their affairs. No railroad is justified in surrendering legal rights its present status gives it for advantages alleged to be attained by federal incorporation, and thereby leave open any such avenue of menace to property rights.

The power of Congress to make federal incorporation com-

pulsory is doubtful on constitutional grounds. Endless litigation would ensue in which the states would participate to contest the abrogation of their right to exact the performance on the part of railroads of certain obligations assumed by them as conditions imposed in return for franchise rights that had been granted to them by the states. Furthermore some of the states own stock of railroads and would likely join with other stockholders in resisting any such proposal.

## 2. Cabinet Officer—Secretary of Transportation

In addition to federal incorporation it has been proposed to create an additional cabinet member who shall be secretary of transportation. The powers proposed to be conferred upon this official are autocratic to an extent beyond those given by the Congress, even in times of war, to the cabinet officer who became director general of railroads. For Congress did fix a standard return as rental for railroad properties, whereas it is now suggested that the "unifying" and other powers now possessed by the present director general, be conferred upon this new official almost without limit. The return the owners of the securities shall receive on their investment is left entirely unprovided for, excepting to express in generalities that sufficient revenues shall be provided. The powers proposed to be given to the secretary of transportation, who largely supersedes the Interstate Commerce Commission in many respects, are sufficient to practically disable the railroad structure if the office should be filled by a man untrained in the technical necessities of the case. The provision that this official shall have under him a board to decide labor disputes, no matter from what interests such board is selected, is to confer an opportunity for political favors and control dangerous in the extreme. Furthermore, this board would not be responsible for the control of rates, from the proceeds of which the employees of the railroads are paid. It is highly necessary that the governmental agency charged with the responsibility of finding the money to operate the railroads, through rates, should supervise the questions of labor in respect to its fair compensation, and to provide the money wherewith, as a part of the railroad structure, it is to be paid. We live under a partisan form of government. A proposal to turn these properties over to a newly appointed cabinet officer with the political power possible under such proposal would seem to substitute a political form of control for a non-political regulatory body, like the Interstate Commerce Commission.

It would be unfortunate to create a situation under which these great properties might be carried into politics by placing them under a cabinet officer, subject to change every four years, and in the present case in two years. It would make the railroads the political center of the presidential campaign soon to open.

The railroad problem is altogether too extended, not to require that the responsibilities of working it out shall be lodged with a body of trained men, such as the government now has in the Interstate Commerce Commission, and the railroads now have among them.

## 3. Regional Railroad Companies

It has been proposed to organize five regional railroad companies and cause the railroads operating in the respective regional districts to exchange their stocks for the stock of the district or regional company. Then it is thought a rate can be made that will work out a fair return on the regional company's stock, or on the investment in the property of the regional company. The objections to the regional plan may be stated:

(a) The area of each of the five regional districts suggested would be more than the area of England and France combined. England and France are densely populated and

their railroads serve most of the area required to be served, whereas in this country a large portion of the area of many of the regional districts suggested will be found not to be fully served by railroad facilities; the concentration incident to this plan must necessarily check agricultural and industrial development to be had chiefly through individual initiative and incentive in railroad construction, operation and management.

(b) Negotiations leading to the exchange of stocks of all of the railroads into the stock of the regional companies would be endless. It would result in a court settlement before it could be accomplished—long drawn out litigation and years of turmoil during which the railroad shippers, the traveling public and the security owners would all suffer.

(c) It draws the railroads closer to the general principles involved in government ownership. It saps initiative and incentive by combining into five areas, several of them largely undeveloped, all railroads under five managements which the plan proposed provides shall be largely governmental; why not, therefore, follow the plan devised by many advocates of government ownership, by forming one large company and take over the railroads? Practically the difficulty of bringing about one complete consolidation of all the railroads is no greater than that of five regional consolidations; the latter having all the disadvantages of limitation of service and facilities incident to concentration and reaches the point where further contraction would make little difference. It would result really in five government ownerships instead of one, with the money supplied by private means.

## 4. Withholding from the Government the Initiation and Determination of Rates

It seems hardly necessary to point out that when the government is asked to provide *sufficient revenues* to the railroads, the initiation of rates necessary to produce such return, if really given, should rest with the regulatory body responsible to the Congress and to the public for such revenues. The general proposition that rates must be "reasonable" and "fair" and "provide sufficient revenue," etc., has been discussed and protested before the Interstate Commerce Commission and elsewhere, ever since there has been a commission,—nobody has contested it, so far as known. But to *measure it in terms* is altogether a different matter. It is difficult to measure it, yet necessary, for results have not been satisfactory where it has been left for uninstructed men to decide the limitations of the words "reasonable," "sufficient" and "fair." The plan that suggests that the railroads initiate rates, to remain in effect unless and until suspended, does not define any method to produce the "sufficient revenues" which it asks for. Even under these conditions, if such return is to be expected, the body to *produce the return* should have full control over rates. But our plan goes further and provides for a *fixed* return and the method to produce it. To expect the Congress to define, by act, the *measure* of such rate of return and *instruct* the Interstate Commerce Commission to put the same in effect and see that it is continued, and then ask that the railroads shall *initiate and establish the rates* through which such defined return is secured, would certainly not be a reasonable proposition under such circumstances.

The security owners are more concerned in a method of fixing the "sufficient revenue," "reasonable" or "fair" percentage of return, than in seeing given to the railroads the *initiation* of rates, the control of which properly belongs to the regulatory body that would be charged with the adjustment of rates necessary to produce such a return. We feel that the feature of initiation can properly be exchanged for the suggested definite return.

# Railroad Hearings Before Senate Committee

Hines Says Roads Must Be Returned Unless Time Is Extended

—Security Owners and Brotherhoods Present Plans

WASHINGTON, D. C.

TWO NEW PLANS for the disposition of the railroads have been presented before the Senate Committee in Interstate Commerce during the past week. The most comprehensive one was that submitted by S. Davies Warfield, president of the National Association of Owners of Railroad Securities, which is published elsewhere in this issue, proposing a law to provide that rates shall be sufficient to produce a minimum return of 6 per cent upon the combined property investment of the roads in each of the three classification territories. The most novel one was that proposed by Glenn E. Plumb on behalf of the four brotherhoods of train service employees, providing for government ownership of the railroads and operation by a single corporation, one-third by the directors to be chosen by the employees, one-third by the officers and one-third by the President of the United States; earnings above fixed charges to constitute a trust fund to be declared as a dividend to the employees in proportion to their wages. The plan also has the support of other labor organizations. The brotherhoods also opposed the McAdoo five-year plan.

Walker D. Hines, director general of railroads, in addition to advocating the five-year extension of federal control and declaring that the railroads must soon be returned to their owners unless the extension is adopted, also outlined briefly a permanent plan which he thought might be worked out during the five years, for grouping the railroads into 6 to 12 corporations with a minimum guaranteed return and a profit-sharing plan for earnings above the guarantee.

Mr. Hines took up one at a time the various orders which have been objected to by Clifford Thorne and others as examples of the exercise of arbitrary power. He said that while it was necessary to put the 25 per cent increase in rates into effect without consulting the interests affected, the various revisions in rates since that time have been conducted in such a way as to give the shippers ample opportunity to present their case. The Division of Public Service and Accounting had been appointed to represent the interests of the public and all changes in rates were referred to it before being put in effect by the traffic department. In important cases, such as the increase in express rates, the consolidated classification and the proposed scale of mileage rates, the advice of the Interstate Commerce Commission had been sought and increases in intrastate rates had been submitted to state commissions. General Order No. 57, regarding the handling of grain claims, he said was intended to bring about a uniformity in practice pending the adoption of more permanent rules and represented the settled practice of a large part of the railroad mileage. He thought most of the criticisms of this order were unfair and misleading.

With reference to charges that the administration has been slow in paying freight claims, he said that under war conditions there naturally had been a large increase in claims, yet all the information he could get showed that claims had been handled better than they had been handled by railroads in the past. He presented a report from 16 representative roads showing an increase of 151,000 in the number of claims presented in 1918 and an increase of 206,000 paid.

Mr. Hines also referred to the criticism against General Order No. 18, requiring that suits be brought at the place of residence of the plaintiff or where the cause of action accrued, saying that this was intended to deal with a phase of the damage suit industry which had reached the proportions of a great evil and as a war measure to eliminate the

necessity of taking large numbers of railway employees away from their work to travel long distances to appear as witnesses. He mentioned the particularly large number of damage suits filed in Minnesota where conditions are so favorable to securing large verdicts against railroads that damage suit lawyers send agents all over the country to induce the filing of suits in that state. He mentioned a statement furnished by the Illinois Central of suits filed against it in Minnesota for claims aggregating \$1,360,000 on causes of action arising in other states where 13 of the plaintiffs resided in Kentucky, 18 in Illinois, 6 in Tennessee, 9 in Iowa and 1 in Mississippi. He also had a statement furnished by the Chicago, Milwaukee & St. Paul of 38 suits filed against it in Minnesota by non-resident plaintiffs for causes of action arising in other states and one of 52 personal injury suits against the Southern Pacific filed in El Paso for injuries sustained by non-residents of Texas in various states.

Mr. Hines said that while this order was a war measure it represented a fair exercise of the President's power under peace conditions, although perhaps the order ought to be revised in the light of new conditions. The general order against garnishment of wages of railroad employees, he said, represented the practice of all government departments. Regarding judgments against railroads, he said it was the policy of the administration to pay final judgments for causes accruing since the government took possession of the railroads, but that the administration has no authority to compel corporations to pay judgments for liabilities arising prior to government control and some corporations may have taken advantage of the situation.

An abstract of Mr. Hines' statement follows:

The purely executive function of operating the railroads to render the public transportation service is the primary responsibility which confronts the President. His operation of the railroads may incidentally be a protection to railroad owners or a convenience in reaching a legislative solution; but it is primarily and directly and daily and hourly the rendition of the public transportation service. From this standpoint, there are very grave difficulties in the way of successful operation throughout the 21 months' period, and unless these can be obviated through a reasonable extension, I believe Congress will decide that there is every reason in favor of the earliest discontinuance which can be effected in a reasonable and orderly way.

The emergency which necessitated the taking of the railroads has ended, or certainly will have ended when peace shall be formally declared. Certainly there will no longer be the need for unified governmental control for the transportation of troops and war supplies. The only remaining public need will be the ordinary need of rendering an adequate transportation service in time of peace. This does not in itself call for governmental intervention except to the extent that there may be temporary peculiar circumstances involved in the aftermath of the war.

If we assume that the proclamation of peace shall be made between now and July 1 next, it results that under the present federal control act government control cannot continue after April 1, 1921, and may end earlier than that date. With such a nearby limit there will be increasing uncertainty on the part of officers and employees every month that passes, growing out of their inevitable thought as to what can and will be their relations with the new manage-

ments. The results cannot be otherwise than a cumulative influence unfavorable to the most successful operation. It is obvious that when a transfer of management must take place in the near future, the sooner it takes place the better for the certainty and efficiency of the management.

Under any circumstances administration of the railroads in face of such a near approach to a change in management would be difficult. But the difficulty promises to be greatly accentuated by several different factors. One is the natural relaxation of virtually our whole population from the patriotic tension. The very fact that virtually the entire population responded so magnificently to the sacrifices demanded by the war and to the inconveniences which came from unusual war control of the ordinary industrial activities makes all the greater the insistent desire to be relieved from any sort of inconvenience and to complain against the continuance of anything that can be connected with inconvenience during the war period. Of course, the Railroad Administration gets the full benefit of this changed attitude.

Again, we are involved in an effort on the part of Congress to find a permanent solution of the railroad question. This, of course, results in every advocate seeking to find in the present government control a reason to support the solution which he advocates. Since nobody advocates perpetual continuance of the present form of control the result is that every advocate of any sort of solution is tempted to point out that the present control is unsuccessful, even as a temporary condition, because any such argument helps in his estimation to support his contentions. In the aggregate the momentum of criticism in this direction constitutes a distinct additional psychological factor which makes for difficulty of successful operation under the present form of control.

Again, the country will be entering within the next 12 months upon a presidential campaign which will culminate in November, 1920. I do not see how it will be possible, despite the firm purpose of the Railroad Administration to afford an absolutely non-partisan administration, to avoid the Railroad Administration becoming the subject of a great deal of political discussion and criticism. I do not complain of this condition. But, nevertheless, it promises to make for unsatisfactory railroad service under the present form of government control.

Now it happens that all these unpromising factors are so related in point of time that if the railroads remain under federal control throughout the 21 months' period and that be not extended, these factors will converge in such a way as to produce a cumulative effect which will be very definitely adverse to the successful rendition of the public service.

#### Additions and Betterments

Another highly important practical reason is the situation as to additions and betterments. It is highly important that a railroad shall continually be improved and developed through the making of additional capital expenditures. Not only is this important in order to improve the public service, but it is doubly important now that a large railroad additions and betterment program should be carried out in order to stabilize industrial conditions while we are passing through the period of readjustment. But with a change of control so near, the opportunity for carrying out an adequate program is largely lacking. Of course, the Railroad Administration will be glad to go forward with the betterment work to whatever extent it can get the assent of the corporations, but with control to end so soon it will not feel justified except in urgent matters in proceeding where that consent is not obtainable, and that consent will not be forthcoming in many important matters when the corporations feel that they will so soon be back in charge of their properties and that they can then proceed to develop them exclusively according to their own ideas. Indeed the corporations may well feel that they would rather wait in the hope of getting lower

prices even though in the meantime business suffers severely by the cessation of industry.

#### Temporary Continuance Not Necessary

The next phase of the matter is the argument that the President must retain possession of the railroads for the protection of the companies pending permanent legislation. The argument seems to be that an early return of the railroads before the adoption of legislation would result in a chaotic condition which would involve disaster to the credit of the railroad companies. If we admit that the re-establishment of private operation under the laws as they already exist would be an evil, it is hardly a wise and prudent remedy to insist upon continuing a form of railroad operation which is not calculated to give satisfactory service to the public and which promises to become increasingly difficult with every month. To avoid confusion I wish to make it clear that there is no such basis whatever for the assumption that I have proposed to recommend the relinquishment of the railroads under circumstances which would create widespread bankruptcy. Indeed, I think the argument that has been made that an early relinquishment will create such widespread bankruptcy and consequent chaotic financial conditions defeats itself, because it is evident that no department of the government wishes to produce any such condition. My belief, however, is that unless there should be a very serious falling off in business the situation will readjust itself in a comparatively few months so that a return of the railroads on a basis of the rates established by the Railroad Administration will be entirely admissible so far as the general financial situation is concerned.

#### Relinquishment Will Not Be Precipitate

My own thought is that whenever an appropriate time shall approach, due notice of the step will be given and the relinquishment will be made in an orderly way, so as to afford a reasonable opportunity for the transition. The further question remains as to whether there is anything in the legal situation as to the rates or anything in the arrangement of the indebtedness of the railroad companies to the government which would make it unjust to the railroad companies to make a relinquishment prior to the end of the 21 months' period without new legislation. To illustrate this let us look at the carefully thought-out proposals of the Interstate Commerce Commission. I should think it would be fair to assume that those proposals would come nearer to receiving congressional approval than any other definite plan for a permanent solution that has been offered. Let us assume that in six months the plan as outlined by the commission should become a law and that immediately the railroads should be turned back to their respective companies. I cannot see that the transition would be any less difficult or any more free from uncertainty than if the transition were made without additional legislation. There is nothing in that plan which will *per se* and instantaneously make conditions different from what they would be under the existing laws. For example, that plan does not propose to deprive state commissions of the power to deal with intrastate rates. It merely contemplates harmonious action with state commissions and that is entirely feasible under existing laws. Indeed, the commission now has a tremendous and far-reaching power over intrastate rates by reason of Section 3 of the interstate commerce act as construed and applied in the Shreveport case, and as a result of which the commission has actually prescribed the intrastate rates in a large portion of Texas. Of course, the provisions of the plan about merger of railroads, the limitations of railroad construction or any other feature will have no instantaneous effect upon the operating expenses or upon the operating revenues. With respect to those immediately pressing problems the commission can do under existing law whatever it could do under

the proposed law and it is perfectly safe to assume that the commission will be actuated by a desire to protect the situation.

My own deliberate prediction is that if the commission's plan shall be adopted, we will then find the companies exploring the government to continue to operate the railroads for a while in order to provide an entirely adequate period of readjustment. I believe that any legislation adopted prior to the end of the 21 months' control will leave the railroads just as much disturbed over an instantaneous transfer back to private management as they will be disturbed over such a transfer without any additional legislation.

#### Rate Structure Would Not Fall

It is not true that immediately upon relinquishment of the railroads there must be a return to the old rates. The Interstate Commerce Commission is on record that so far as interstate rates are concerned this could not possibly occur, and the existing interstate rates would continue in operation. The assumption has been suggested that such termination would result *ipso facto* in the re-establishment at least of those intrastate rates which have been created by statutes or constitutional provisions. There seems to be no reason for making such differentiation. If intrastate rates established by statute should *ipso facto* come immediately into application, the same condition would seem to be true of rates established under statutory authority. Indeed, the same result would seem logically to follow as to the interstate rates which had been filed by the railroads while under federal control in accordance with the interstate commerce act. It would seem that the rate structure initiated by the President would either fall as a whole or would remain in operation as a whole until some orderly modification should be made in pursuance of law.

It is not to be assumed that Congress intended that instantly upon the termination of federal control the railroads, in addition to being deprived of any compensation from the government, should also be deprived of any reasonable opportunity to sustain themselves through charging the only rates which have been fixed and reviewed in the light of existing conditions and the only rates which can possibly carry out the policy of Congress for certainty and publicity and for reasonable equality of basis as between interstate and intrastate rates.

Even if the courts would construe the congressional legislation as being so fragmentary in character as to admit of this extraordinary consequence, it would still be true that the Interstate Commerce Commission under its general powers could preserve the existing interstate rate structure and could set aside on the ground of discrimination the far lower intrastate rates which were in effect prior to the war. Therefore, we can only assume a chaotic condition by assuming the Interstate Commerce Commission would omit to perform its functions. I believe that unless the companies through a mistaken policy themselves create a needless state of alarm, a reasonable and orderly transition back to private management could be made in the next few months without additional legislation as well as under any that is likely to be obtained. It is true that companies could not at once begin mergers and pooling, etc., but those steps are not indispensable to immediate protection. What is indispensable is the preservation of a rate structure adequate to meet expenses and pay a fair return, and I firmly believe this could and would be successfully accomplished without additional legislation.

Another feature which appears to be urged in this connection by the railroad companies is that they will be enormously embarrassed in their financing by an early return of the railroads. Here again it seems to me that the railroads are creating an unnecessary alarm. It would be entirely feasible to make such reasonable terms as to the repayment

of their indebtedness to the government as to save them from financial embarrassment. If the commission's plan should be adopted they would have substantially the same financial problem that they would have if they were turned back without legislation. I can see that the adoption of the commission's plan would probably give some slight additional encouragement to railroad investment, but still they would have exactly the same problem of paying the indebtedness which they owe the government. As a matter of fact I anticipate that as conditions improve the companies will be able to finance to a greater and greater extent, and to diminish rather than increase their indebtedness to the government.

#### Advantages of Five-Year Extension

As to the actual rendition of the public service, the adoption of a five-year limitation instead of a two-year limitation will, in my opinion, make all the difference between satisfactory service and unsatisfactory service to the public. The five-year provision will postpone for at least three years the state of uncertainty and ferment which is already beginning. It will give the President for the next two or three years a stability of control which will go far toward fortifying the rendition of the public service against the state of the public mind that has inevitably developed at the end of the war. Likewise it will remove the necessity for pressing the permanent solution of the railroad question into the crowded period which will precede the next presidential election. There will be more time to get our bearings, more time to get the sober thought of the people as to what ought to be the permanent solution.

The discussions have assumed very largely that a five-year extension contemplates that no action toward a permanent solution will be taken until the end of five years; that everybody interested in legislation will sit down and do nothing and calmly await the expiration of the five years before undertaking to shape legislation. I do not think this ought to be the case or will be the case. I believe the study of the permanent solution will proceed in an orderly way, and I shall be very much surprised if at the beginning of the next presidential term the question shall not be taken up and promptly disposed of. It seems to me the natural development will be that during the first year of the next presidential term this great question will be settled and then a transfer can be made from the present federal control to the permanent form of management which may be adopted.

I think a three-year extension would accomplish a great deal to remove the difficulties, because even three years would segregate and spread out and in part dissipate the unfavorable psychological factors which under the 21 months' plan promise all to converge so as to do the maximum damage to the public service; and also the three-year extension would give opportunity for legislation immediately following instead of immediately preceding the presidential election. But I believe the five-year extension would be much better because it would give added stability.

#### Extension Does Not Mean Government Ownership

Viewed in this practical way I do not believe there is anything substantial in the argument that an extension of the time would necessarily mean government ownership. If a period of 21 months after the war will not mean government ownership, I do not see how a period of not exceeding five years would mean government ownership. The operating organization of every important railroad is preserved intact and the railroad could be turned back tomorrow or in five years from now and still its operating organization would be available to carry on the business without interruption under private management. Of course, in terminals there have been some consolidations of management, but undoubtedly they ought to continue under private control, and I do

not see any practical difficulty on this score unless the particular companies shall wish to put their separate interests above the general public interest, and in that event it will be an advantage to the public that the established terminal organization is a consolidated organization so as to make it more difficult for a separate and selfish development of the terminals. The only thing that will make against the resumption of private management at the end of five years or any intervening period between the 21 months and five years will be that as a result of unified control viewed under normal conditions, the public will reach the conclusion that a greater degree of unified control is in the public interest than can be accomplished through the medium of the large number of railroad corporations which in the past have controlled the railroads of the country. If the public does reach this conclusion undoubtedly we ought not to return to the old system and the public will have profited by having been given an opportunity to study the advantages of unified control. On the other hand, if the public feels that the advantages are less than the advantages of the multifarious railroad managements it will be entirely practicable to go back to the old forms of control.

We know that a large body of the people have a settled conviction that this question cannot be successfully disposed of except through government ownership. The arguments of the government ownership advocates are temporarily at a discount by reason of a reaction from all forms of government control. Now, is it the part of statesmanship to recommend a hasty settlement of this question in a period when the permanent convictions of a large part of the public are for the time being suffering a partial eclipse by reason of a purely temporary state of mind? A feeling prevails already that this question is being pushed now by the railroad executives because they feel that the "going" is especially good and that they had better make private management hay while the anti-government ownership sun continues to shine. I think it is a fair prediction that before any legislation can actually be shaped there will be a reassertion of the permanent views of that part of the public which insists on a greater degree of social control of the railroads and that this is going to defeat the adoption of any permanent program in the next two years. If this shall be the case there will be an outcry for an extension and in all probability the time will then have to be extended.

#### Government Operation Should Be Tested Under Normal Condition

I further believe that those who advocate government ownership and operation are entitled to have their case considered on its merits and not embarrassed by a necessarily misleading showing of the conditions of the present federal control. At this time, the only year of federal control has been a year of war; a year of heavy costs and of serious public inconvenience. There is a strong disposition to assume, therefore, that government operation under any circumstances means correspondingly heavy costs and serious inconvenience. Since government operation has been entered upon and since it is desired that it be continued to facilitate a satisfactory legislative solution, then my recommendation is that it be continued long enough to furnish a fair example of what can and what cannot be accomplished under government ownership in time of peace. So far we are not in a position to analyze fully even the results of the war year—the year 1918.

The year 1919 will be a period of readjustment. When the armistice was signed the railroads had been geared up as a war machine. Many things which were done to obtain the quickest and most effective results at whatever cost might be necessary can in peace time be done on a more economical basis. These things, however, cannot be changed overnight. For example, it was indispensable to place cars where they

were most needed and to repair them wherever they happened to be when they needed repairs. Cars can be repaired more economically in their home shops than in shops of other railroads because the home shops are especially adapted to repair the cars belonging to the home road. In the course of a few months it is believed this condition will make a material showing in the reduction of the cost of car repairs. But this is one of the processes of readjustment which cannot be done instantly and which will help to make the year 1919 a year of transition and, therefore, even its results will not be a normal showing of what can be accomplished under federal control.

Moreover, the year 1919 is a critical year from the general industrial standpoint. It is a year when the problem of unemployment will be exceedingly grave. Every government agency should deal with that problem in a comprehensive way so as to promote the general welfare and not exclusively with reference to making immediately the very greatest reduction in its own costs. This factor ought to govern largely the methods of the Railroad Administration, and in order to aid in stabilizing general industrial conditions the Railroad Administration ought not to enter upon processes of retrenchment so radical as to accentuate the general industrial difficulties.

I think this more deliberate policy is due to labor. On every hand there is a disposition to charge existing high costs to the increased wages. Practically all these arguments carry in some form the thought that these rates of pay are too high and ought to be reduced at the earliest possible opportunity. I believe these conclusions are unfair and that a method of dealing with this subject ought to be adopted which will give an opportunity to demonstrate their unfairness. A very large part of the heavy operating costs of the past year was not due at all to the high rates of pay, but to other factors brought about by the war. One was the abnormal cost of repairing cars to which I have referred. Another was the extraordinary turnover of labor due to labor being withdrawn for military purposes and labor being tempted into other lines of industry where much higher wages were paid. This led to less efficiency than could be expected of men who remain with reasonable permanency in the railroad work. The scarcity of railroad labor also made it necessary at times to employ labor which was far below reasonable standards of efficiency. It was also necessary in the times of war pressure to require a great deal of overtime work which called for time-and-a-half pay. All these various factors are being piled up together and charged to the present rates of wages. There is every evidence that the most cordial co-operation will be afforded by labor in rendering value received for the wages paid, but these conditions cannot be translated into reports of operation except by the lapse of time.

Another factor deserving serious consideration is that of the inland waterways. Under government control of the railroads the first beginnings have been made in developing what is actually practicable in the way of the economical utilization of some of the principal inland waterways. I believe it highly important that there should be a fair test of this subject and I do not look for a sympathetic test if the railroads are turned back to private control in advance of an adequate test. Undoubtedly this will be brought about if there is a reasonable extension of government control. I do not see how it can be successfully brought about otherwise, because I think mere legal provisions for co-operation will not accomplish the purpose unless the railroads wish to co-operate, and frankly I do not believe that under private management the railroads will wish to co-operate with the waterways in developing any traffic which the railroads themselves can handle without loss.

The extension of federal control would have a beneficial effect in stabilizing industrial conditions at the very time such stabilization is most badly needed. Railroad improve-

ments can be carried forward on an extensive scale and they not only afford indirect employment for a great many additional railroad employees, but they afford indirect employment for thousands of other employees. Here, then, we have the factor of rapidly increasing unemployment and we also have the potential factor of the great stabilizing influence of railroad improvement activity. If the period of government control be limited to the 21 months, the amount of railroad improvement will be minimized because of the shortness of the time within which to plan and do the work, the uncertainty of railroad credit, and the disposition of the railroad companies to defer improvements until the comparatively near date when they will again be in control. If the period be extended to five years steps can at once be taken to enter upon a much more comprehensive program, and I believe that the greatly increased credit of the railroad companies which will result from this additional certainty will enable us to get their active co-operation in financing an extensive program.

### Views as to a Permanent Solution

On account of my responsibilities as director general of railroads I believe it will be excusable in me to lay before you my personal views as to the permanent solution of the railroad problem. I have been driven to the conviction that there must be a radical reconstruction of the whole scheme of private ownership and management if we are to avoid government ownership. While I think the advocates of government ownership ought to have a fair opportunity to have their case decided on its merits and in a normal piecemeal atmosphere, I have said this because of my belief in fair play and because I do not think any solution which fails to give the fullest opportunity for the consideration on its merits of every phase of the subject can be conclusive or permanent. But I do not personally believe in government ownership. I believe there can be a form of radically reconstructed private ownership with such close government supervision, including government representation on the boards of directors, as will give the public and labor all the benefits of government ownership and at the same time will preserve the benefits of private and self-interested initiative and will avoid the political difficulties which perhaps are inseparable from government ownership.

I do not believe the plans now before the committee will meet the fundamental difficulties. I believe that a far more radical treatment will be needed and that this treatment cannot be accorded in the crowded period of the next two years.

There can be no solution through the operation of the railroads by the numerous existing corporations with their widely varying financial structures. The deep-seated suspicion of the public and of labor that there is serious overcapitalization largely negatives all representations as to the propriety of any given level of railroad operating income. To perpetuate existing capitalizations means to perpetuate suspicion and unrest and will defeat any plan despite the other good qualities the plan may have.

No plan can be permanently successful which leaves railroad operations with a large number of different corporations, some strong and some weak. So long as this condition continues it will result that on any given basis of rates and wages some railroads will prosper to a great degree and others will fail. Whatever level of rates is adopted the public will be at a disadvantage either through impaired service on the poor roads or through being charged more than is necessary on the strong roads. The contrast will lead to continual discontent and dispute as to what basis of rates is correct and will largely tend to defeat any scheme of regulation.

The plan of private management proposed necessarily involves the idea that if one or many railroad companies happen to be exceptionally prosperous the entire exceptional profits remain with the company. This condition will make

the public always fear or suspect that it is being exploited for the benefit of private capital and will lead to continual insistence upon the railroads being operated exclusively for the public benefit. Also, similar suspicions will always encourage unrest on the part of labor. If any plan of private management is to be successful it ought to provide for the participation of the government and perhaps of labor in the profits in excess of some comparatively moderate return.

This country has settled down to the definite conception that railroads ought not to receive more than a reasonable return and also that they ought not to receive less. Practically, the standard is impossible of application under the proposed plan of private management. No matter how carefully rates may be fixed they are more likely to vary either above or below a fair return than to produce the fair return and no more and no less. A prosperous year may produce too much and before the rates can be changed the exceptional prosperity may have disappeared. Of course, one company may get more than a fair return and another less. If the government adopts the proposed plan it will be doing a vain thing. It will be proceeding on the idea that it is insuring the performance of an adequate transportation service for a fair return, but it will be providing machinery that never will and never can provide the desired fair return. The logical thing to do is for the government itself to ascertain what the fair return ought to be and to guarantee that to the railroads, and then if it wishes the benefit of the increased efficiency which may probably be expected from private initiative it can permit a moderate participation in any profits in excess of that return.

### Government Should Guarantee Fair Return

It is recognized that it is indispensable that capital invested in railroads shall yield a sufficient return to attract additional capital. But the proposed plan involves the whole subject in so much confusion and uncertainty as to make the prospect of obtaining additional needed capital highly unfavorable. If the fair return principle be adopted in theory but fail in practice, the result will be either that the public will suffer serious inconvenience through railroad credit being impaired so that the necessary new capital cannot be raised, or the public will suffer serious loss through being compelled to pay a great deal more for transportation than is necessary. The real object can be obtained by the government itself assuring once and for all a fair return. Of course, a definite assurance of this character will necessitate a much lower total compensation than would have to be provided through the haphazard plan of a theoretical fair return administered through impossible machinery. Therefore, there would be a large saving to the public in a definite government guaranty and an enormous benefit in the way of creating a real and reliable credit instead of one involved in the greatest uncertainty.

The proposed plan of private management does not meet any of these fundamental needs. If adopted all these needs will remain unsatisfied and will operate with cumulative effect to produce a failure of the entire regulatory scheme and in a short while the whole railroad subject will have to be dealt with again. Indeed, the very fact that the proposed plans still leave the public suspecting that unjustified capitalization is enjoying a return, and still admit of instances of some corporations deriving apparently excessive returns even on their existing capitalization, will go a long way towards defeating the concessions which it is proposed to make in favor of the railroad corporations, and the conception will probably become increasingly clear that the desired certainty of sufficient return will not be assured. Again, the proposals of the present plans for pooling of traffic under certain conditions and for unification of terminals and facilities and for combined control of cars and traffic in time of emergencies are going to prove largely illusory. It is ex-

ceedingly difficult to see how any compulsory plan along these lines can be worked out and in practice it will mean there will be no unification except when rival companies can decide that it is distinctly to their own interest to unify or except in very extreme emergencies. It will be difficult to induce a strong enterprise to dilute itself by merging with the weak one.

It may be said that my observations necessarily lead to government ownership and operation. I do not think so. I believe that all the objects which I think must be achieved can be accomplished through the creation of a comparatively few railroad companies which will have capitalization equal only to the real value of the property, and which will have a moderate guaranteed return with the right to participate moderately in any additional profits. In this way I believe it would be entirely practicable to preserve whatever advantages there may be in private management and at the same time meet the difficulties which I have already pointed out.

I do not believe that the radical changes which in my judgment are indispensable can be made without prolonged study and debate. I am, therefore, forced to the conclusion either that there will be no comprehensive legislation in the next two years or that any legislation adopted will be so much like the present system as to offer no hope for a permanent solution.

A great deal has been said about the claims of the railroad security holders to a reasonable degree of protection. I know of nothing which would more satisfactorily protect their situation than a five-year extension because that will be ample to cover not only the period of industrial readjustment but also the period of legislative readjustment. I think any plan which still leaves the question whether the railroads will or will not get a fair return subject to all the fundamental difficulties which I have pointed out would leave the position of the security holders in doubt and uncertainty. Indeed, there will be serious question whether any legislation will be adopted in the 21-months period. I cannot imagine how this can be otherwise than prejudicial to the legitimate interests of railroad security holders.

There has been much criticism of the Railroad Administration by the representatives of the railroad executives. I do not believe that any issue now before this committee can be helpfully illuminated by any discussion of the details of these matters, although, of course, I am prepared to deal with any of them which the committee thinks important. There was no purpose whatever on the part of the Railroad Administration to take any action other than that reasonable and appropriate to meet the necessities of the war situation. In the staff of the Railroad Administration there were assembled men whose life-long experience had been with the railroad corporations as well as others whose life-long experience had been in the representation of the public or of labor. The conclusions reached were not based on hostility to the owners of the properties or on a desire to treat them otherwise than fairly or on any desire whatever except to do what was regarded as reasonably necessary and appropriate to meet the war purposes.

Senator Kellogg disagreed with Mr. Hines' statement that the rate structure would continue after the termination of federal control and pointed out that a state in the northwest had as recently as January 30 passed a law establishing scales of intrastate rates lower even than those in effect before the increase ordered by the Railroad Administration. Mr. Hines said that such a statute was clearly invalid during the period of federal control and that the rate structure established during that period would apply until organized action was taken to change it. Senator Kellogg said the railroads would have to go into the courts to prevent the states from asserting their own rates, but Mr. Hines thought the Interstate Commerce Commission could protect the situation.

The senators expressed much more interest in Mr. Hines' suggested plan for a permanent solution than in his argument for the five-year plan. Senator Townsend asked why such a plan could not be adopted in less than five years. Mr. Hines said that it involves such fundamental changes that it is extremely improbable it could be adopted within the 21-months period and he thought that an interim control by the government was necessary while the plan was being worked out. Senator Townsend asked if the five-year plan would in any way test the suggested permanent plan or demonstrate anything except the plan under which the administration is now working. Mr. Hines said that the present plan would test to some extent the regional idea because the roads are now operated in seven regions, but that it was necessary primarily to improve the service and stabilize conditions while permanent legislation was being considered. He said he had thought of six or twelve regional corporations for the permanent plan and that this would be better than a single corporation because it could give the benefit of different ideas and methods. Senator Robinson asked whether Congress should not proceed to work out the permanent plan now. Senator Pomerene asked Mr. Hines if Congress could continue a war measure into times of peace for the purpose of working out a policy. Mr. Hines said that he thought this would be a perfectly valid exercise of the power to regulate commerce and promised to submit a brief on the subject.

Senator Pomerene asked why Congress should not legislate at once on a permanent plan compelling the railroad companies to carry out the desired requirements. Mr. Hines said that it was necessary first to meet the fundamentals of the case and provide for a complete reorganization of the railroad companies. While he admitted that a start could be made on such a plan within a year or two, he thought it would be better to take a little more time and work it out on a permanent basis than to attempt to do it too quickly. He said the public sentiment toward the railroads is made up, not by the results for the railroad system as a whole, but by looking at particular railroads. One man looks at a railroad that has not enough money to enable it to give good service, and another looks at a railroad that is making large profits and both men are dissatisfied.

Senator Underwood asked if a plan under which the Interstate Commerce Commission should make up each year a budget of the expenses for each group of railroads and make rates sufficient to provide the expenses and produce a fair return would not stabilize railroad securities. Mr. Hines thought such a plan would receive less support unless it were preceded by a reorganization of the railroads into fewer companies with government representatives on the boards of directors. Senator McLean said that most of the advocates of the five-year plan are advocates of government ownership who believe that it would be impossible to return the roads to their owners after five years. Mr. Hines said that the difficulties incident to a return of the roads were exaggerated.

In reply to questions by Senator Kellogg, Mr. Hines gave some additional information about the financial relations of the Railroad Administration and the railroad companies. Senator Kellogg said that in order to understand the present situation it was important to know these relations, and asked how much the government had loaned to the railroads from the revolving fund. Mr. Hines said that the accounts had not yet been settled in full, but that when the railroads received their rental, and a portion of it is applied on payments for capital expenditures, it was estimated that the railroads would owe the government \$290,000,000 on account of additions and betterments. Senator Kellogg persisted in getting a division of the advances made by the Railroad Administration as between actual loans and payments on account of rental. Mr. Hines said the rental for the Class I roads was estimated at \$890,000,000, and up to December

31, the administration had specifically paid on account of rental or compensation to the companies \$253,277,000, and had loaned out of the revolving fund \$125,817,750 in addition to about \$69,000,000 loaned out of operating receipts, and that after making some other deductions and adjustments the government owed the railroads \$381,000,000.

Senator Kellogg asked how much the War Department owed the Railroad Administration for transportation. Mr. Hines said that up to December 31 this amounted to \$53,202,000 on bills rendered and approximately \$28,000,000 not definitely stated, making a total of \$81,889,000. He said it takes approximately five or six months and sometimes longer to get these bills through the War Department. Senator Kellogg also asked for a complete statement of the loans from the revolving fund, the loans from operating revenues, the amounts the government owes the railroads, and the amounts actually paid to the railroads in 1918, which Mr. Hines promised to furnish.

In reply to another question of Senator Kellogg's Mr. Hines said that maintenance of way and structures during the past year fell short of the government's contract obligation but that complete adjustment between prices and wages for the year and for the test period had not yet been made. The indications are that maintenance of equipment will show ahead of the government's obligation.

### The Brotherhood Plan

In presenting the brotherhood plan, on February 7, Mr. Plumb first outlined objections to the proposal for the creation of a secretary of transportation. To create such an office, he said, authorized to enforce a governmental policy that shall secure adequate returns on the capital invested in the railroad industry, would be subverting the entire purpose of the government. It would be regulating the people in the interest of capital. If it be done for the railroads we would soon be asked to have a regulating department to secure adequate returns for capital invested in the steel business or the packing business.

Mr. Plumb based the objection to an extension of the five-year period solely on the order issued by the director general prohibiting political activity on the part of railroad employees. "We earnestly protest," he said, "that this demanded deprivation of the political rights guaranteed to us by the Constitution is a sufficient reason in itself why the five-year extension asked for by the director general should not be granted. We most vehemently object to being in any way barred from the full participation in the affairs of this nation in which we are so vitally interested. We must have the same opportunity to organize for the accomplishment of a legitimate political end that our adversary enjoys. We must have the same freedom to contribute all our resources to procure legitimate political action and we must have the same right to select as our representatives in the United States Senate or any other legislative body those who share in our convictions and whom we deem best able to give expression to our political beliefs."

Advocating government ownership of the railroads, Mr. Plumb said the demands of the investor are fully met when he obtains complete security with adequate returns. The security offered by a government bond is the best possible security and the government can finance its undertakings on a rate of return from 25 to 50 per cent below the rate demanded when the same undertaking is financed by private corporations. Consequently, the difference between the cost of the capital invested in properties under government ownership and a like amount of capital invested under private ownership is an unnecessary expense, other things being equal, and unless fully compensated for by other economies made possible under private ownership which are not possible under government ownership, should determine this question in the interests of the public as well as in the interests of

the investors. Government ownership with a fixed rate of return, he said, would remove the security owners from politics and if all the railroads were owned by the government as one single system all the difficulties now arising by reason of diverse ownership and of conflicts between state and federal authority would be eliminated.

As for operation, Mr. Plumb said: "It seems to be the consensus of opinion that private operation is to be preferred to government operation for almost every reason. First, to take the roads out of politics; second, to promote efficiency, and, third, to prevent carelessness in regard to expenditures which frequently, almost habitually, accompany government operation." If the government owned the properties and financed their acquisition, construction, equipment and working capital, then the operating corporation would not be required to furnish any capital whatsoever. Its operating ability would constitute its sole capital. It should be organized under a federal law. It should be required to operate the properties under the full regulatory power of the government, to which it should account for all of its operations and expenditures. It should be required to meet all costs of operation and fixed charges upon capital employed which had been guaranteed by the government. A certain agreed percentage of the net results of operation should belong to this corporation. The stock of this corporation should be held in trust for the benefit of the employees. The earnings of the corporation should constitute a trust fund to be declared as a dividend upon the amounts paid to the labor which it employs, every employee receiving that proportion which his annual wage bore to the total annual compensation of all employees. The affairs of the corporation should be administered by a board of directors, of which, possibly, one-third should be elected by the employees, one-third by the appointed officers and one-third by the President.

Under the old system of private ownership and operation, Mr. Plumb said, the hope of increased returns actuated only those individuals who might reasonably be expected to share in those returns. All other employees were merely actuated by fear that they might lose their jobs or might face a decrease in wages. Hope of a share in the profits would promote a morale among employees that has never been approached in any industrial enterprise. A wage board and boards of adjustment similar to those organized by the Railroad Administration should be organized to investigate disputes regarding wages or conditions of employment, and their decision should be binding and final. This would provide a means for settling all wage questions in such a manner that the occasion for strikes or lockouts would be effectually removed.

Mr. Plumb also suggested a method for providing for an automatic reduction in rates. Assuming that the capital invested amounted to \$18,000,000,000, the fixed charges at 4 per cent would be \$720,000,000. Assuming the gross operating revenue as \$4,000,000,000 and an operating ratio of 70 per cent, the net operating revenue would be \$1,200,000,000, which would pay the fixed charges and leave \$500,000,000 which should be divided equally between the government and the corporation, labor receiving \$250,000,000 for a dividend on the payroll. Provision could be made that whenever the share received by the government exceeded 5 per cent of the gross operating revenue, the Interstate Commerce Commission should adjust the scale of rates in such manner as to absorb the 5 per cent. This system, he said, would soon reduce the level of rates to a point where the net revenue would not exceed the requirements of the service and where the surplus net revenue not absorbed by rate reduction should be available either for extensions or improvements without increase in fixed charges or with a reduction in the outstanding capital so that the ultimate effect would be complete retirement of all capital and the reduction of rates to the lowest point essential to paying the cost of operation.

Mr. Plumb devoted a large part of his argument to the question as to the amount of capital upon which the railroads are entitled to compensation. He declared that the investment actually, honestly and prudently made measures the full extent of the property interests which railway corporations may possess and that all values in excess of this amount are retained for the public and which the public could not be compelled to buy. He proposed that the government acquire the stocks of the companies at their present market value, which he estimated at \$5,000,000,000, by exchanging government bonds for them.

### State Commissions Ask Legislation at Special Session

Charles E. Elmquist, president of the National Association of Railway and Utilities Commissioners, appeared on behalf of the state commissions on January 30, declaring that remedial legislation for the protection of the public should be enacted before March 4, but that a final solution of the railroad problem cannot, and in justice to all interests should not, be adopted by this Congress. He said that centralization of all power over the railroads in the hands of one individual during actual warfare is dangerous, but in times of peace it becomes a positive menace which should be removed at once and he, therefore, recommended the repeal of section 10 of the control law to take from the President "the alleged right" to set aside state or federal laws or the orders of commissions applicable to common carriers and to restore the suspension powers of the interstate Commerce Commission. While the state commissions are of the opinion that the federal control act did not deprive them of jurisdiction over state rates, he said not one of them made any attempt to exercise their authority during the war, but for the purpose of avoiding litigation now they want the law made specific.

As to the five-year plan Mr. Elmquist said the railroads were taken over for war purposes only. They have performed that function well. The real purpose of government control having been accomplished, good faith and square dealing demand the return of the roads to their owners at a time when it will not embarrass the country or seriously cripple the transportation machine and under such legislative safeguards as the people may approve. December 31, 1919, would afford ample time for this purpose if a special session of Congress is called to consider the railroad problem. Congress should either amend the federal control act or adopt a joint resolution fixing the date for the return of the properties. The state commissioners oppose the five year plan, Mr. Elmquist said, for the following reasons, among others:

1. It continues the present guaranteed compensation of practically a billion dollars per annum for five years, as well as the prospect of the present high operating cost.
2. It continues in time of peace an alleged war power to set aside state and federal laws, to initiate rates, to fix wages, route traffic, and consolidate properties and terminals.
3. It continues the uncertain and chaotic condition of rates and practices whereby shippers are denied the right to be heard before rates go into effect and it purports to suspend laws for the regulation of common carriers.
4. It thrusts prominently into the public forum a discussion of government ownership before the valuation of the railroads has been completed by the government and before it is possible to know what they are worth.

Mr. Elmquist argued at length as to why the states should continue to regulate local rates and service and opposed the establishment of a central bureau at Washington to handle such matters, but he thought a satisfactory plan of co-operation could be worked out between the state commissions and the interstate commission. He also declared that the railroads need not fear that the commissions will fail to recognize the changes in conditions which have required higher rates in case they are again brought under the jurisdiction of state regulation.

As to the various plans for changes in regulating methods for the future, Mr. Elmquist favored the prompt merger of the railroads into a unified system, in times of stress or emergency under provisions to be established by Congress, and the merger within proper limits of carriers' lines and facilities to such extent as may be necessary in the public interest to meet the reasonable demands of commerce with the approval of the Interstate Commerce Commission. He also favored the consolidation of terminal facilities whenever the public interest will be promoted thereby, but believed that this question could very properly be passed upon by state authorities. He favored the limitation of railroad construction to the necessities and convenience of the public under regulation of the federal authorities in addition to that of local authorities. He favored the control of securities by the federal government, but under a plan which would require copies of applications to be filed with state authorities, thus enabling them to submit evidence and recommendations. The state commissions also, he said, would favor any proper plan which may be devised for bringing the regulation of interstate carriers closer to the people. If Congress considers it advisable to do so, they then believe it could best be done by increasing the membership of the Interstate Commerce Commission and by requiring one or more members of that body to hear and try all cases in the affected localities. In the absence of such a plan, it might be advisable to make of each state commission a regional commission to act for the federal commission in all proper matters.

The proposal for a secretary of transportation was opposed on the ground that it would make the railroads the football of politics and would make the administration responsible for rate and wage increases and decreases, the quality of service and anything else that might affect the public or the railroad interests. Federal incorporation was opposed because of its legal complications and because it would force the sovereign states to go to Congress for the preservation of the right of taxation and the exercise of police powers. Consolidations of railroad systems and terminals, he said, would place a higher power in the hands of a few men and would be inimical to the public interest unless the federal and state control is made commensurate with the danger involved. If the public policy is to be reversed, the authority of public officers over rates, service, capitalization and expenditures should be enlarged.

### Views of Other State Commissioners

Mr. Elmquist was followed by L. B. Finn, chairman of the Kentucky Railroad Commission, who had views widely at variance with those of the state commissioners generally. Mr. Finn favored government ownership of the railroads, but severely criticized many of the actions of the Railroad Administration during the past year. The Railroad Administration, he said, had proved nothing except that it should not be continued, but he placed the blame on the railroad men who had played so prominent a part in its organization. He admitted that he thought a large share of the public was now opposed to government ownership because of the things done by railroad men during the past year, which he ascribed to an effort on their part to discredit public ownership.

R. Hudson Burr of the Florida Railroad Commission also presented an individual statement. He said he concurred with the statements made by Mr. Elmquist, but had some additional criticisms of his own to make of the acts of the Railroad Administration, which he said reflected what might be expected if government control were continued. He said that General Order No. 28, if the provision requiring state rates to be raised to the level of the interstate rates before the percentage increase was completed had not been withdrawn, would have caused increases ranging up to 650 per cent because the interstate rates which it was proposed to take as a basis were mainly paper rates. He also objected

to many other features of the rate situation, which he said had been handled by officials in Washington not familiar with state conditions. Thousands of shipments, he said, have moved under rates which represent overcharges because the traffic officials of the Railroad Administration did not know what the rates were and the administration failed to make reparation. He said that government operation has brought about a great increase in the efficiency of employees and has greatly lessened the morale of the whole railroad organization by removing the incentive to efficiency and the friendly rivalry between railroads, and by removing the actual power too far from the scene of operations. "Division superintendents have become clerks to regional directors who receive their

instructions from Washington," he said. "The individuality of the railroads has gone, engulfed in a questionable experiment which Mr. McAdoo admitted would require five years more to prove its success while the public suffers poor service, inattention and increased rates." He did not criticize the railroad men, he said; they were merely human when they were willing to let the other fellow take the responsibility for the success or failure of new theories instead of standing up for what they believed to be right. He opposed the proposed scales of standard class rates, which he said would release the transportation charges on the bulk of the traffic in his state more than 100 per cent over the rates provided by General Order No. 28.

## Annual Reports of the Regional Directors

### Estimates of the Economies Effected and Examples of Co-Operative Action Under Unified Control

THE RAILROAD ADMINISTRATION is making public one at a time reports covering the operations during the past year submitted to Mr. McAdoo by the regional directors. Following is an abstract of the reports of A. H. Smith for the Eastern region, N. D. Maher for the Pocahontas region, and B. F. Bush for the southwestern region.

#### Eastern Region

The economies effected in the Eastern region during the year ended December 31, 1918, so far as they can be stated in figures, aggregate \$23,248,000, as follows:

	Estimated saving per annum
(a) Unification of terminals and stations.....	\$4,172,000
(b) Elimination of passenger service.....	12,190,000
(c) Reductions in organization, as contrasted with the same under corporate control.....	3,677,000
(d) Miscellaneous economies, the result of causes other than above .....	3,209,000

There has been a marked increase in eastbound freight traffic with a corresponding decrease in westbound, increasing the empty car mileage, and this, with adverse weather and other well-known conditions has resulted in a high percentage of expenses. The saving in passenger train expenses above noted was made by eliminating 16,253,914 passenger train miles. The decrease in the mileage of Pullman cars amounted to 41,229,702 car miles. Passengers carried one mile increased 4.7 per cent. Troops carried in special trains numbered 3,308,496, and the miles run by these trains aggregated about 2,000,000. The troops carried across New York harbor by the railroad boats numbered nearly 2,000,000.

The Eastern Regional Purchasing Committee is standardizing materials and blanks and making a uniform organization of the stores departments. Since the ending of hostilities, stocks of material have been reduced. Rerouting of freight has saved approximately 7,800,000 car miles, an estimated money saving of \$470,000. This saving, however, has been partly offset by rerouting of freight to avoid congestions which lengthened the haul of such traffic. Shipping days have been generally introduced, and 1,232 additional through cars have been scheduled weekly. It is estimated that freight transfer houses will be relieved annually of 1,780,000 tons of freight by this greater economy in loading. The average load per car, in the Eastern region, for the first ten months of the year, shows an increase of 2.8 tons. Telegrams are now sent by the Morse system on 3,200 miles

of telephone circuits, thus avoiding the expenditure of \$160,000 for the construction of new wire lines.

The Freight Traffic Committee is revising freight tariffs wherever possible, so as to secure the loading of freight cars to their full capacity, and is saving \$1,000,000 a year by consolidation of tariffs and other economies in that line. The Passenger Traffic Committee is saving \$351,344 annually by curtailment of advertising and economy in timetables. Consolidation of freight service, the combining of single track roads into double track operation, and reductions in local train service will show a saving of \$664,000 yearly.

The number of cars of freight diverted to avoid congested routes and terminals during the year was 75,000. From the Pittsburgh gateway freight was sent East over the Buffalo, Rochester & Pittsburgh, the New York Central and the Reading. Freight for New England has been sent by the Boston & Maine so as to relieve Maybrook and Harlem River, and freight from Pennsylvania for New England has been sent over the Delaware & Hudson.

Carload freight from the West has been diverted from the Michigan Central and the Grand Trunk to the Pere Marquette. Westbound freight has been diverted to boats at Buffalo to relieve the rail lines.

The movement of the great volume of export traffic at New York City has been facilitated by unified operation of all the railroad-owned boats, the discontinuance of free lighterage and the direct loading of a large number of steamers at railroad piers. Reconsigning and diversion bureaus have been established to meet the demands of shippers for current information concerning the movement of their shipments.

The locomotives received during the year aggregate 896, and the total number in service on November 1, was 10,346, or 297 more than at the same date in 1917. Stored locomotives in serviceable condition, 654. On November 30, the roads in the Eastern region had in service 748,304 freight cars, or 28,304 more than they owned; percentage of bad order cars, 6.1 per cent.

The general situation at present is normal on all the railroads in the Eastern region. A decrease in traffic is expected, together with a reduction in gross earnings, notwithstanding the increased rates. The regional-director commends the officers and employees of the road for their "tireless efforts and extreme loyalty."

#### Pocahontas Region

The annual saving by economies in the Pocahontas re-

gion, as shown by the results of 1918, amounts to \$2,336,946, as follows:

(a) Unification of terminals and stations.....	\$1,495,603
(b) Elimination of passenger service.....	23,400
(c) Reductions in organizations, as contrasted with the same under corporate control (including abolishment of fast freight lines and closing other off-line offices).....	791,615
(d) Miscellaneous economies, the result of causes other than the above.....	26,328
Total visible savings in money (annually).....	\$2,336,946

The movement of troops and war supplies through Hampton Roads was in great volume and of the utmost importance. The development of the port by the government involved a vast volume of traffic, and much new railroad track had to be laid. There was effective co-operation between the government and the railroads, and in general all demands were satisfactorily met, although there was some delay due to congestion. The extra burden on the railroads was unprecedented, and the different lines had to assist each other alternately. From June 1, to December 20, the coal loaded into vessels at the Hampton Roads piers amounted to 16,500,000 tons, an increase of 1,500,000 tons over the same period of 1917. The three principal roads in the Pocahontas region loaded, between June 1 and December 20, and moved, 727,194 carloads of revenue coal and coke, as compared with 701,410 cars during the same period of 1917. There was a similar increase in ordinary freight, the total being 1,741,793 carloads. One road, being relieved by diversions of general traffic, was enabled to open new coal mines and move 46,000 more cars of coal than in the same period of last year. Eastbound freight has been diverted from the Norfolk & Western to the Virginian to avoid heavy mountain grades east of Roanoke; and it is expected that 8 or more freight trains daily will be sent eastbound between Roanoke and Crewe over the Virginian, with a corresponding movement of 4 westbound empty trains of the Virginian over the Norfolk & Western. Passenger train service was curtailed early in the year, but it has now been put back into normal condition, and the train mileage is slightly in excess of that operated prior to the period of federal control.

The pooling of coal and of coal cars made practicable a uniformly sufficient supply of cars at the coal mines, resulting in increased production. The report describes at considerable length the arrangement for redistribution of the coal traffic to economize mileage and time. Where the Chesapeake & Ohio and the Virginian both served a single mine, one service was discontinued. The locomotives assigned to this region from roads elsewhere made possible the movement of a largely increased volume of business. The tremendous activities at Hampton Roads made it necessary to send freight for the north shore over the Chesapeake & Ohio, and for the south shore over the Norfolk & Western, so as to economize floating equipment. The heavy passenger traffic on the Chesapeake & Ohio incident to the establishment of camps and ammunition plants necessitated assigning to that road many passenger cars and locomotives from other roads.

### Southwestern Region

Unification of terminals has been accomplished at 168 places, making an annual saving of \$1,434,000; and further economies may yet be made. Enginehouse and car-repair facilities have been consolidated at 54 other places, promoting efficiency. Joint operation of switching facilities, both for interchange and for serving industries, has been introduced at 47 places, at a saving of \$228,000 yearly and releasing numerous locomotives for other service.

Military camps in the Southwestern region were numerous, and passenger traffic was exacting. A number of light traffic passenger trains were taken off, but a reasonable reg-

ular service was maintained. These economies made 57 engines and 203 passenger cars available for military or other traffic, and the total annual estimated saving was \$3,661,333. Some passenger schedules which had been too fast, because of competition, were made slower. Marked economies were effected by sending freight by the most direct routes. In the pay of officers having salaries of \$3,000 or more, about \$1,155,000 was saved, 758 officers doing the work formerly done by 907 officers. Consolidation of offices saved \$2,600,000 in the year. Consolidated ticket offices were established at seven prominent cities, saving \$71,000. About \$500,000 was saved by economy in advertising and timetables.

Shortage of labor was acute, the forces being depleted in October, mainly by influenza, about 7 per cent. Of the 12,000 men off, 900 were skilled mechanics and 150 were trainmen. However, business was kept going fairly well. On October 31, no fewer than 18,000 employees, or 10½ per cent of the entire forces were absent from duty on account of the epidemic.

The supply of freight cars has been maintained to a quite satisfactory degree. Rerouting of lumber in Texas saved 2,660,000 car miles per annum. The sailing day plan is satisfactory to consignees, especially at small places, but some of the larger shippers are yet to be convinced. Shipments of sulphur from points in Louisiana and Texas in the month of October, averaged 135 cars a day. The general condition of locomotives is good; 84 per cent available for service, and most of the balance need only light repairs. The number of freight cars awaiting repairs, 5,800, is 2.8 per cent of the total. Of the passenger train cars, 92 per cent are available for service. The number of new locomotives received in the year was 97, and 26 others have been built but are in use on eastern roads. New cars put into service numbered 51 passenger and 1,225 freight; 800 of the freight cars having been built in the railroads' shops. Traveling firemen and fuel supervisors, by careful attention to their duties, have saved a large quantity of fuel. The stores department has been uniformly organized. Stocks of supplies have been kept in satisfactory condition. Hardwood ties have been difficult to secure, and soft woods, with more tie-plates than formerly, had to be resorted to. The tie situation is now improving. The telegraph departments have been uniformly reorganized.

Tracks, bridges and other structures have been safely and adequately maintained, although, due to shortage of material and labor, some of the branch lines have not been maintained to the full standard which is desirable. The main lines of railroad, however, are in condition equal to that prevailing at close of calendar year 1917. Buildings generally on all of the roads have been maintained to proper standard, and the usual program of repairs and painting has been to a large extent carried out. Practically all of the right-of-way on main lines, and for the most part on branch lines, has been trimmed, and fences and cattle guards maintained to a proper state of efficiency.

Unprecedented drouth prevailed throughout the summer, but the weather since September has been ideal. The harvests have been good, and the amount of wheat sown is probably 20 per cent greater than ever before.

**The New Circumlocution Office**—"Dickens wrote about a place he called 'The Circumlocution Office,'" said a railroad lawyer returning to his hotel in Washington from a visit to the law division of the Railroad Administration, where he had been trying to get action on a compensation contract. "If he were alive today he would change the name of the place he wrote about and call it 'The Expedition office' and write a new story to fit the old title. And I know where he would lay the scene of his new story, but I'd better not say."—Wall St. Journal.

# Doings of the United States Railroad Administration

## Total Receipts Less Than One-Fourth Total Disbursements on the Railroads for Month of January

WASHINGTON, D. C.

THE RAILROAD ADMINISTRATION made advances in the month of January to and for the account of various transportation systems to an aggregate of \$98,269,-808, according to a statement issued by Director General Hines. This amount includes both loans and advances on account of compensation to railroad corporations, and advances made to the federal managers to meet operating needs. These payments aggregated \$67,250,696. Payments made during the month on account of the new standardized cars and engines amounted to \$30,071,471. Payments to inland waterways and canals amounted to \$947,641.

The director general received from the operating managements during the month, a total of \$13,996,455, and from the express companies he received in January \$10,327,183, making the total receipts from all transportation lines for the period, \$24,323,638.

As the total disbursements for the month of January, as shown above, were \$98,269,808, the excess of disbursements over receipts for January, 1919, was \$73,946,170.

The aggregate payments and advances by the director general to the railroad corporations and federal managers, including payments on standard equipment ordered for the one year and one month ending January 31, 1919, were \$787,304,567. Of this amount the director general has gotten back various loans made to different railroad companies for amounts aggregating \$57,030,000, leaving the net advances by the director general to January 31, \$730,274,567.

The Railroad Administration also received up to January 31, surplus operating receipts of various railroads amounting to \$237,605,000, and from the express companies a total of \$57,243,599.

The excess of all disbursements to and for account of transportation systems for the period of one year and one month to January 31, 1919, over receipts, including \$57,-030,000 received from collection of loans, was therefore \$435,425,968.

The aggregate of loans made by the director general to railroad and other transportation companies, and still outstanding is, \$151,254,767. This is exclusive of the amount advanced for the benefit of various roads on account of standardized equipment. There is also still due to the director general by various roads on account of the amounts advanced to the builders of the standardized cars and engines, the further sum of \$144,585,871.

The total balance remaining in the revolving fund on January 31, plus the sum total of balances remaining on hand with the director general from the surplus receipts turned over by certain roads, aggregates \$61,332,738.

The only railroads from which the United States Railroad Administration has received, in the period of one year and one month to January 31, as much as \$1,000,000 or more in excess of the amounts paid to the railroad properties are:

Duluth, Missabe & Northern.....	\$10,400,000
Atchison, Topeka & Santa Fe.....	9,200,000
Elgin, Joliet & Eastern.....	7,500,000
Atlantic Coast Line—Louisville & Nashville.....	7,360,000
Northern Pacific.....	5,030,000
Bessemer & Lake Erie.....	4,000,000
Duluth & Iron Range.....	3,400,000
Pullman Lines.....	2,800,000
Union Pacific.....	2,200,000
Richmond, Fredericksburg & Potomac.....	1,900,000
El Paso & South Western.....	1,000,000

In a table the statement also shows in separate columns the amounts advanced by the director general to all transportation lines in the period of one year and one month to

January 31, including advances made on account of compensation and loans direct to the corporations, also advances to the federal managers to meet operating needs, but not including amounts received by the corporations before the appointment of the federal managers, on account of compensation, or expended, for construction and additions, from operating receipts.

The table includes 31 roads receiving in each case less than \$100,000, a total of \$1,336,600; advances to inland waterways and canals, \$5,309,127, and payments on account of standardized engines and cars, \$144,585,871.

Of the total amount advanced to various railroad companies since January 1, 1918, the following loans to the companies named have been paid or reimbursed:

New York Central Railroad Co.....	\$13,500,000
Illinois Central Railroad Co.....	10,000,000
Chicago, Milwaukee & St. Paul Ry. Co.....	8,000,000
Chicago, Rock Island & Pacific Ry. Co.....	6,000,000
Baltimore & Ohio Railroad Co.....	5,450,000
Michigan Central Railroad Co.....	4,000,000
Clev., Cin., Chicago & St. Louis Ry. Co.....	3,000,000
Southern Railway Co.....	2,170,000
Chesapeake & Ohio Railway Co.....	2,000,000
St. Louis-San Francisco Railway Co.....	1,710,000
Buffalo, Rochester & Pittsburgh Ry. Co.....	1,200,000
Total.....	\$57,030,000

### Overtime Not Considered as Salary

Interpretation No. 9, relating to general order No. 27, gives a decision on the following question: If an employee covered by the provisions of general order No. 27 and subsequent wage orders issued by the director general in connection therewith, whose salary is \$250 or less per month, is required to work overtime, and in a given month his total wage, including overtime, amounts to more than \$250, is it the intention to restrict his earnings per month to \$250?

The decision is that overtime is not to be considered as salary.

### Earnings and Expenses for December

A partial summary of railroad earnings and expenses for December, given out by the Interstate Commerce Commission this week, indicates that the operating deficit of the railroads for 1918 will exceed the estimate of \$196,000,000 made by the Railroad Administration and that the net operating income for the year will probably fall short of \$700,-000,000. Reports of 175 roads, operating 214,013 miles, for December show operating revenues of \$414,537,000, operating expenses of \$375,282,000 and operating income, modified by equipment and joint facility rents, of \$23,085,847. This is a decrease for these roads of \$34,604,000 as compared with December, 1917, or nearly 60 per cent, and as the same roads earned practically all of the operating income in December, 1917, the returns for the 19 additional roads are not expected to change the result materially. The net operating income of 180 Class I roads and 15 switching and terminal companies for the 11 months ending November 30 was \$662,-407,000. Adding to this the \$23,000,000 for December gives a total of \$685,000,000. The standard return guaranteed by the government amounts to \$890,000,000 for the Class I roads and about \$905,000,000 including the switching and terminal companies. The operating revenues of the 175 roads for December were \$98,000,000, or 31 per cent, greater than for December, 1917, an amount which approximates the advance in rates, so that traffic apparently fell off nearly as badly as in December, 1917. Operating expenses were \$136,000,000 greater, or 57 per cent. This includes a con-

siderable amount of back pay, as instructions were issued to clean up as much as possible of the back pay for 1918 in the December accounts.

### Requisites for Automatic Train Control Devices

The Railroad Administration Committee on Automatic Control at a meeting in Washington on February 4 adopted the following definition and requisites for the design and construction of automatic train control devices:

Definition: Automatic Train Control: An installation so arranged that its operation will automatically result in either one or the other or both of the following conditions:

First: The application of the brakes until the train has been brought to a stop.

Second: The application of the brakes when the speed of the train exceeds a prescribed rate and continued until the speed has been reduced to a predetermined rate.

#### REQUISITES FOR THE DESIGN AND CONSTRUCTION OF AUTOMATIC TRAIN CONTROL DEVICES

1. The apparatus so constructed as to operate in connection with a system of fixed block or inter-locking signals, and so inter-connected with the fixed signal system as to perform its intended functions:

- (a) in the event of failure of the engineman to obey the fixed signal indications, and,
- (b) so far as possible, when the fixed signal fails to indicate a condition requiring an application of the brakes.

2. The apparatus so constructed that it will perform its intended function if an essential part fails or is removed; or a break, cross, ground or failure of energy occurs in electric circuits, when used.

3. The apparatus so constructed as to make indications of the fixed signal depend upon the operation of the track element of the train control device.

4. The apparatus so constructed that proper operative relation between those parts along the roadway and those on the train will be assured under all conditions of speed, weather, wear, oscillation and shock.

5. The apparatus so constructed as to prevent the release of the brakes after automatic application, until the train has been brought to a stop, or its speed has been reduced to a predetermined rate or the obstruction or other condition that caused the brake application has been removed.

6. The train apparatus so constructed that, when operated, it will make an application of the brakes sufficient to stop the train or control its speed.

7. The apparatus so constructed as not to interfere with the application of the brakes by the engineman's brake valve or to impair the efficiency of the airbrake.

8. The apparatus so constructed that it may be applied so as to be operative when the engine is running forward or backward.

9. The apparatus so constructed that when two or more engines are coupled together or a pusher is used it can be made operative only on the engine from which the brakes are controlled.

10. The apparatus so constructed that it will operate under all weather conditions which permit train movements.

11. The apparatus so constructed as to conform to established clearances for equipment and structures.

12. The apparatus so constructed and installed that it will not constitute a source of danger to trainmen, other employees, or passengers.

The committee was guided to some extent in its work by a review of a list of requisites for automatic train stops adopted by the American Railway Association in May, 1914, and a list of desirable characteristics for automatic train control systems proposed by the Block Signal and Train Control Board of the Interstate Commerce Commission. G. E. Ellis, who has been signal engineer in the Bureau of Safety of the Interstate Commerce Commission since 1915, and who had previously been in charge of the installation of signals on the Kansas City Terminal, has been appointed

executive secretary of the committee, which has established an office at 607 Southern Railway Building, Washington. The committee will hold its next meeting in Washington on February 14, and intends to press as rapidly as possible its investigation of the various automatic train control devices. It will probably include in its investigation some 40 or 50 devices which were passed on by the Block Signal and Train Control Board of the Interstate Commerce Commission which were not condemned by that board.

### Homeseekers' Bureau

As was recently noted in these columns the Railroad Administration has established a Homeseekers' Bureau whose function is to furnish information to returning soldiers and war workers generally regarding available land in all parts of the country which can be used for farming, stock-raising, dairying and kindred pursuits. The railroads are preparing to distribute a folder setting forth facts with references to climate, production, markets, schools, churches and other data needed by homeseekers in their quest for available land upon which they propose to settle.

The information thus obtained is being distributed at ticket offices in the demobilization camps, at the booths of the War Camp Community Service and at the various Y. M. C. A. headquarters.

The railroad agricultural agents, as members of the Homeseekers' Bureau, have been organized into state groups and they are now assembling reliable information on soil production, markets, transportation facilities and approximate size of the farms that can be procured. In this work, the Railroad Administration is co-operating with the state agricultural colleges and the state boards of agriculture. Hundreds of inquiries have already come to those in charge of the Homeseekers' Bureau seeking information about farm opportunities, and they are being answered as promptly as they can be assembled.

### To Keep Tabs on Back Pay

For the purpose of keeping a closer check on the amount of back pay, Director Prouty of the Division of Public Service and Accounting has instructed that, effective with the closing of the accounts for the month of January, federal auditors shall monthly prepare and forward to him a statement on letter sized sheets showing the amount of back pay applicable to prior months' expenses included in operating expenses for the month for which the report is made. In reporting such back pay, there are to be shown the name of the month, or months, in which the amount was properly includible and the amount applicable to each such month. Class 1 Roads are to forward these reports not later than the 26th of the month following that for which the report is made; other lines under federal control are to submit their reports not later than the last day of such month.

### Credit for Payment of Freight Charges

The Division of Public Service and Accounting has issued P. S. & A. Circular No. 64, as follows: In order that conclusion with respect to the extension of credit for the payment of freight charges may be promptly reached, the following arrangement will immediately become effective at points where more than one railroad is involved: Application for forty-eight-hour credit under bond may be made to agent of any carrier. The agent will secure the approval or disapproval of the agent of each other carrier named in the application, and submit the papers to the federal treasurer of his line. The federal treasurer shall grant the credit or decline to do so in accordance with general instructions and the exercise of his best judgment. He may ask for the advice of the federal treasurers of other carriers, but must himself assume responsibility for the final decision, which will be binding upon all interested lines.

### Piece Work Being Abolished

In accordance with instructions issued by Director General McAdoo just before he left Washington the shop employes on the various roads are voting on the question of the abolition of the piece-work system. As a result of the vote piece work has been discontinued on the Pennsylvania lines, east and west, Philadelphia & Reading, Baltimore & Ohio, Delaware, Lackawanna & Western, Cumberland Valley, Long Island and other roads, and the men on the New York

Central, Norfolk & Western and Chicago, Burlington & Quincy have voted similarly. A large proportion of the men had demanded the discontinuance of piece work and it is said that a strike would have been threatened if Mr. McAdoo had not issued the instructions.

### C. & O. of Indiana Transferred

Effective February 1 the Chesapeake & Ohio Railroad of Indiana was transferred from the Eastern region to the Pocahontas region.

## Wood Preservers Hold Successful Convention

### Annual Meeting Brought Out Much Practical Information About Present Problems of Timber Treatment

THE MATERIAL SITUATION with respect to ties and preservatives occupied a prominent place in the program of the fifteenth annual meeting of the American Wood Preservers' Association, which was held at the Hotel Statler, St. Louis, Mo., January 28 and 29. Because of the present acute shortage of ties the meeting was restricted to two days to enable the members to attend a meeting of tie contractors which was called by the Tie and Timber division of the St. Louis Chamber of Commerce for Thursday and Friday of the same week, at which a permanent national organization of tie producers was effected. The members of each organization were invited to attend the sessions of the other, thus enabling all to become conversant with the problems of both industries. The two organizations were the guests of the Tie and Timber division of the Chamber of Commerce on Wednesday evening, at which Ralph B. Dennis, recently vice consul for the United States in Russia, spoke of the Bolshevik movement and its relation to American industrial problems.

The attendance at the sessions of the American Wood Preservers' Association was the largest in the history of the organization, over 150 railway and timber-treating men being present at the opening meeting, and over 250 registering during the convention. This large attendance was brought out by the practical nature of the program presented and the variety and acuteness of the problems which have arisen during the last year. It was also due, in large measure, to the encouragement which the Railroad Administration extended to railway men desiring to attend. Owing to the absence of President J. B. Card (president Central Creosoting Company, Chicago), who is in active service in the army of occupation in Germany, the meeting was presided over by A. R. Joyce (Joyce-Watkins Company, Chicago), vice-president.

The report of the secretary-treasurer showed a cash balance on hand of \$951.96, the largest for six years. The membership on December 31, 1918, was 282, a decrease of seven during the year. Thirty-two members of the association were reported in military service.

### The Material Situation

The session on Tuesday evening was devoted to the consideration of the present preservative material situation and the outlook for the near future.

Galen Wood, chemist, Port Reading Creosoting Plant, Port Reading, N. J., spoke on sodium fluoride and its possibilities as a preservative. This material has only recently been brought to the attention of American timber treating engineers, although it has been used successfully in Europe for some time. It is about twice as toxic as creosote or zinc chloride. It has been proven non-corrosive after three years'

use in the mines of the Philadelphia & Reading Coal & Iron Company, where it has displaced zinc chloride because of its freedom from electrolysis troubles. A disadvantage of sodium fluoride up to the present time has been the difficulty of determining a method of chemical control and of ascertaining the depth of penetration into the timber, but recent experiments indicate that this problem is being solved. The present cost of sodium fluoride is one and one-half times that of zinc chloride, although its greater toxicity places it about on a parity as far as preservative cost is concerned. Manufacturers are now ready to make the expenditure necessary to increase the output and thereby reduce the unit cost when satisfied that there is a sufficient demand.

The zinc chloride situation was described by J. H. Jordan of the Grasselli Chemical Company, Cleveland, Ohio, who traced the development in the production of this material in this country since its manufacture was first started in 1893. After pointing out the difficulties in securing the necessary materials during the past year he stated that these difficulties have now largely disappeared and that the industry is prepared to meet all demands.

The outlook for an increased supply of domestic creosote was discussed by M. C. McIlreavy, vice-president of the Barrett Manufacturing Company, New York, E. B. Fulks, vice-president of the American Tar Products Company, Chicago, and W. H. Lewis, vice-president of the F. J. Lewis Manufacturing Company, Chicago, who brought out the fact that there is an annual tar production of approximately 500,000,000 gal. available in the United States. Between 50 and 60 per cent of that made last year was burned as fuel, while about 60,000,000 gal. of creosote oil was distilled. While the production of tar has been greatly increased recently, the greater demand for this material for fuel has offset this increase so that there has been no greater amount available for distillation. Even though the fuel demands should decrease and enable the output of creosote to be increased, this is now dependent on the ability to dispose of the pitch for roofing materials, etc. Little hope was held out for an increased supply of creosote or lower prices during the next year.

The possibilities of increasing the importation of creosote from foreign countries was discussed by G. A. Lembcke, of Bernuth, Lembcke & Company, Inc., New York, who stated that although the importation of oil from Europe had been almost entirely arrested during the war, England had raised the ban on the exportation of creosote shortly after the signing of the armistice. The greatest difficulty at the present time is that of ocean transportation. Mr. Lembcke estimated that approximately 25,000,000 gal. of foreign oils will be available for use in the United States during 1919.

The transition from creosote oil to zinc chloride in the treatment of crossties during the last two years was described by Dr. Hermann von Schrenk, consulting timber engineer, St. Louis. This change was made necessary by the shutting off of the importation of oil from Europe. Dr. von Schrenk traced the early development of timber preservation with zinc chloride and its gradual displacement with creosote, beginning about 15 years ago. The conditions of the last three years made it necessary to revert to zinc chloride. He expressed no fear of unsatisfactory results following this transition where proper precautions have been taken in the selection and seasoning of timber for treatment, in the injection of the preservative to insure thorough penetration and in the drying and seasoning of the timber after treatment. He indicated his preference for creosote under most conditions when available but stated that zinc chloride had its proper place as a timber preservative, even under normal conditions, and that the results now being obtained will warrant its continued use on a more extensive scale than prevailed before the war.

### Service Tests

A report on service tests of ties was presented by J. H. Waterman, superintendent of timber preservation, Chicago, Burlington & Quincy, Galesburg, Ill., and was confined to a description of the results which the Burlington has obtained from 26,000 ties in lots of 1,000 and 10,000 ties in smaller groups in experimental sections on 20 operating divisions in 8 states. Mr. Waterman placed special emphasis on the necessity of large ties free from decay before treatment and properly treated as fundamental to proper service. The test sections were established under general instructions from the vice-president and are inspected annually in September or October by the superintendent of timber preservation, together with the division superintendent, the section foreman and a representative from the office of the engineer maintenance of way. While the local officers have entire authority to determine when a tie shall come out, the cause for this removal is determined by the superintendent of timber preservation. The results which are being obtained are indicated by the following data:

Process	Total placed	Total removed to date	Per cent removed account decay	Per cent removed account other causes
Straight creosote.....	3,264	98	0.7	2.3
Card.....	15,817	1,119	1.6	5.4
Burntreated.....	2,488	297	6.5	5.3
Untreated.....	3,270	2,945	85.7	4.3

### Development of Uniform Practices

The development of uniform practices in procuring and preserving crossties was described by John Foley, associate manager of the Forest Products section of the United States Railroad Administration. He stated that the preparation of a standard specification for crossties was the first step in attempting to secure uniform quality at equitable prices as prices could not be discussed until uniform standards had been prepared.

Previous to the preparation of these specifications each region was asked to formulate a specification which it could recommend. These specifications were then combined into one composite specification by the central office at Washington. It is necessarily a compromise, leaving out many disputed points. These specifications were prepared to govern purchases rather than maintenance practices. Individual roads have the authority to buy as usable rejects all ties not grading up to No. 1 ties in the specifications. It was assumed in the preparation of the specifications that the railroads knew what their requirements demanded and that it was the problem of the tie manufacturers to meet this demand. The specifications were prepared to cover a wide variety of sizes and of timber while the purchasing com-

mittees in the different regions have further authority to accept other timbers suitable locally.

The Railroad Administration has advocated the treatment of ties and has necessarily limited the commercial plants to the sale of treatment rather than of ties. The handling of the treatment by one road for another has made necessary the standardization of treating methods which has led to the preparation of specifications for treatment by the different processes commonly employed which are now being put into effect. The Forest Products Section has also assumed charge of the distribution of creosote to insure its equitable use and has distributed approximately 12,000,000 gal. to date.

### Report on Terminology

The committee on Terminology presented a number of definitions of laboratory equipment and other apparatus commonly used about a timber treating plant. It also defined the various types of marine borers that are destructive to untreated timber as follows:

*Xylotrya*.—Wood-boring mollusks which lay their eggs free in the water. These hatch to form small free-swimming bivalve larvae, which attach themselves to timber by a foot and then bore into the wood and form calcareous-lined galleries, averaging  $\frac{3}{8}$  in. in diameter and 3 in. to 6 in. long, although they may reach 1 in. in diameter and over 12 in. long. The entrance to the wood is no larger than a pin-hole, enlarging within the timber to keep pace with the growing animal. The galleries are closely intertwined and very numerous.

*Teredo*.—This genus of wood-destroying mollusks is very similar to *Xylotrya* and cannot readily be distinguished from it by the layman. Its habits and effect on the wood are quite similar.

*Limnoria*.—Wood-boring crustaceans of small size, with mouth parts arranged for gnawing or biting. The bodies are flattened and provided with numerous legs. They bore holes about  $\frac{1}{32}$  in. to  $\frac{1}{16}$  in. in diameter and  $\frac{1}{2}$  in. deep perpendicularly into the surface of the wood, leaving very thin partitions between adjoining galleries. They work in salt water, and are common and destructive.

*Chelura*.—Crustaceans of small size, resembling fleas, which attack wood much the same as *limnoria*, the galleries being about the same size, but running in all directions. They were first called "sea fleas" or "red wood lice." They work in salt water and are much less common than *limnoria*.

*Sphaeroma*.—Also small crustaceans, quite similar to *limnoria*, but somewhat larger, being about  $\frac{1}{8}$  in. to  $\frac{1}{4}$  in. long, and excavating a gallery  $\frac{1}{8}$  in. to  $\frac{3}{16}$  in. in diameter. The body is somewhat rounded instead of flattened as in *limnoria*. They work in either fresh or salt water and are much less common than *limnoria*.

### Protection Against Marine Borers

L. F. Shackell of the University of Utah, Salt Lake City, presented the results of a detailed study of the efficiency of various grades of oils in protecting timber against the attacks of marine borers. He reviewed numerous experiments to determine the resistance of the borers commonly encountered to the various grades of creosote oils. As a result of his studies he presented the following conclusions:

(1) When a highly poisonous substance (such as quinine or acridine) is dissolved in a high-boiling neutral coal-tar distillate in which it is very soluble, the apparent toxicity of such a solution as measured by the killing time for marine borers will be very much less than that of an equivalent concentration of the poison when dissolved in water, in which it is only very slightly soluble. But this point is of the utmost importance for it means that the high-boiling tar bases, which are very slightly soluble in water, but highly soluble in high-boiling coal-tar creosotes will take an exceedingly long time to leach out of treated wood. Such high boiling bases are probably the most important factors in preventing attacks by borers. (2) The aim in a marine treatment, then, should be to make it in practice a toxicity test with the longest possible killing time (i.e. the oil should show the *lowest* possible *apparent* toxicity) consistent with

maintaining the dislike of the borers for the flavor of the treated wood. (3) Compounds boiling up to 210 deg. C., should be eliminated from oils destined for marine treatments. (4) The tar acids (above 210 deg. C.) though highly toxic, by lowering the surface tension of the oil in which they are dissolved, tend to accumulate at the surface of control between oil and water, and, though but slightly soluble in the water, become dissipated in a comparatively short time. A very low maximum, if not complete elimination of tar acids, should be specified. (5) Wood distillation products and preparations using petroleum oils or products therefrom as bases, are entirely unsuitable for marine wood preservation.

### Other Papers and Reports

The Apparent Relation Between Rainfall and the Durability of Zinc-Treated Ties was the subject of a paper presented by C. H. Teesdale and S. W. Allen of the Forest Products Laboratory, Madison, Wis. The record of 48 test tracks were plotted on a rainfall map of the United States. The test tracks were divided into two groups, (1) those where less than 25 per cent of the ties have been removed after a service of eight years or longer and (2) those where 50 to 100 per cent have been removed. Similar maps were prepared for minimum service periods of ten and twelve years.

A line dividing that portion of the United States receiving more than 40 in. average rainfall from that receiving less than this amount was found to extend through Galveston, St. Louis, Pittsburgh, Albany, and Eastern Maine. The data indicated that in a general way in those areas north of this line crossties treated with zinc chloride may be expected to give over 8 to 10 years' service. The authors ventured the further conclusion that this line of demarcation might safely be moved southward to include all of the region north and west of the Ohio river drainage area, although sufficient data were not available to support this.

Nelson C. Brown, foreign trade commissioner, spoke on the field for the exportation of lumber to the European countries. He emphasized that the native forests in the warring countries have largely been destroyed by the lumbering operations necessary to meet wartime requirements as well as the devastation of the conflict itself. The United States forces alone were operating over 60 portable saw mills in France at the time the armistice was signed, engaged primarily in the manufacture of crossties, while our government had contracted for over 400,000 ties from Spain alone up to last September. Even before the war the countries of Central Europe had derived a large part of their requirements from Russia and this source of supply has now been cut off because of the chaos existing in that country. Based upon 15 months' study of European conditions, Mr. Brown predicted a wide opportunity for the sale of American timber products in Europe.

C. M. Taylor, superintendent of the Port Reading Creosoting Plant, Port Reading, N. J., presented a discussion on the need for a chemist at each treating plant to establish proper control of the treatment. Present day conditions are making it necessary for the plant superintendent to devote so much attention to executive problems incident to the handling of labor, fuel and shipping that he is unable to give sufficient personal attention to the details of the treatment itself. Mr. Taylor stated that a chemist concentrating on the technical supervision of the treatment itself can reduce the waste of preservatives, insure compliance with specifications and conduct the experimental work necessary to meet changing conditions. By studying power plant operations he can also effect economies in the use of fuel, boiler waters, etc.

The work of the car service section of the United States

Railroad Administration in increasing the efficiency of freight car movements was described in a paper prepared by E. H. DeGroot, Jr., assistant manager, Car Service Section, Division of Operation, United States Railroad Administration, and presented by J. A. Somerville, general superintendent, Missouri Pacific, and formerly assistant manager of the Car Service section.

On Tuesday afternoon Joseph W. Hays, combustion engineer, addressed the convention on the subject of fuel economies and pointed out numerous defects in stationary power plants which contribute to the average waste of 25 per cent of the fuel consumed. Mr. Hays analyzed conditions ordinarily leading to these losses and indicated methods for their detection and elimination.

The committee on Plant Operation presented several forms for the recording of data relative to plant performance. It also submitted information concerning the yard arrangement and methods of stacking ties to secure the economical use of storage tracks.

A report on the use of treated timber in car construction was presented by the committee on the purchase and preservation of treatable timber. An abstract of this report and of the discussion on it was published in the *Railway Age* of January 31, page 295.

The committee on Non-Pressure Treatments, submitted as information specifications which have been prepared and are now in use by a number of companies using timbers treated in this manner.

### Other Business

The election of officers resulted as follows: President, J. B. Card, president, Central Creosoting Company, Chicago; vice-president, A. R. Joyce, Joyce-Watkins Company, Chicago; second vice-president, C. M. Taylor, superintendent, Port Reading Creosoting Company, Port Reading, N. J.; secretary-treasurer, F. J. Angier, superintendent timber preservation, Baltimore & Ohio, Baltimore, Md. Chicago was selected as the location for the next convention of the association.

Resolutions were adopted by the Association expressing its approval of the work of the Forest Products Section of the United States Railroad Administration in distributing creosote and also urging the resumption of work on the investigation of timber preservation problems by the Forest Products Laboratory, Madison, Wis.

The Committee on Publications recommended the discontinuance of Wood Preserving, the quarterly publication of the Association, until such time as the members could give it better editorial support. The Committee on Promotion and Education submitted a report recommending the appointment of a committee to canvass the commercial treating companies, the manufacturers of preservatives, the lumber producers and other concerns interested in the promotion of timber preservative, with the purpose of raising a fund sufficient to undertake promotion and educational work, tending to increase the use of treated timber. The Association concurred in this recommendation and a committee consisting of Carl G. Crawford, general manager, American Creosoting Company, Louisville, Ky.; C. M. Taylor, superintendent, Port Reading Creosoting Plant, Port Reading, N. J.; and E. T. Howson, western editor of the *Railway Age*, Chicago, were appointed.

W. B. Scott, federal manager, reports that 1,416 officers and employees served in the military or naval service of the United States during the war, as follows: Southern Pacific Lines in Texas and Louisiana, 964 men; Gulf Coast Lines, 98; San Antonio & Aransas Pass, 263; San Antonio, Uvalde & Gulf, 41, and Galveston Terminals, 50.

## Train Accidents in December<sup>1</sup>

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of December, 1918:

Collisions						
Date	Road	Place	Kind of accident	Kind of train	Killed	Inj'd
12.	Pennsylvania	Redkey	xc	P. & F.	0	1
†25.	St. Louis-S. F.	Norge, Okla.	rc	F. & P.	5	23
†29.	A. C. L.	Bainbridge	bc	P. & F.	2	3
30.	.....	Peoria, Ill.	bc	P. & F.	1	20

Derailments						
Date	Road	Place	Cause of derailment	Kind of train	Killed	Inj'd
*3.	N. Y. C.	Frankfort	d. coupl'g	F.	2	1
4.	C. C. & St. L.	Farmland	boiler	F.	..	4
†6.	Atl. Coast L.	Elrod	unx	P.	3	82
9.	Penn.	Emporium	b. rail	P.	0	1
23.	Wabash	Attica	acc. obst.	P.	..	27
23.	Balt. & Ohio	W. Newton	.....	F.	3	..
23.	West'n Md.	Cumberland	.....	P.	1	..
28.	N. Y., Chi. & St. L.	Edgerton	b. rail	P.	..	4

The trains in collision at Redkey, Ind., on the 12th, were a westbound passenger of the Pennsylvania Lines, and an eastbound freight of the Lake Erie & Western, the passenger train running into the side of the freight at the crossing of the two roads. One of the two passenger engines was overturned. The engineman of this engine was injured. The collision was due to an error of judgment on the part of the passenger engineman in making the stop for the crossing.

The trains in collision at Norge, Okla., on the 25th, were westbound passenger No. 407 and a following freight, the freight running into the rear of the passenger and crushing three coaches. Five passengers were killed and 23 injured. The passenger train had been brought to a stop because of trouble with freezing pipes. The collision was due to insufficient flagging. The negligent brakeman, having been found guilty by a coroner's jury, was placed under arrest in Grady County.

The trains in collision near Bainbridge, Ga., on the 29th, were eastbound passenger No. 182, and a westbound freight. One passenger and the engineman of the passenger train were killed, and three trainmen were injured.

The trains in the collision at Peoria, Ill., on the evening of the 30th, were a westbound passenger of the Lake Erie & Western, and an eastbound freight of the Toledo, Peoria & Western. Both locomotives were badly damaged. The engineman of the passenger train was killed and eleven passengers and three employees were injured. The collision appears to have been due to negligence on the part of the passenger train, at the meeting point, in not making sure that the freight had cleared the main track.

The derailment near Frankfort, N. Y., on the evening of the third, involved two freight trains, one eastbound and one westbound. A car in the eastbound train was derailed by the failure of a drawbar and fouled the westbound track. The westbound freight was thrown off the rails by this obstruction, and the engine fell into the Mohawk River. The engineman and fireman were killed, and one other trainman was injured. Fourteen loaded cars were wrecked and were destroyed by fire.

The train involved in the accident near Farmland, Ind., on the night of the 4th, was eastbound freight No. 92, second section. The locomotive, a new one, United States Standard, was wrecked by the explosion of its boiler and a number of cars were thrown off the track. The fireman and one brakeman were seriously scalded, and the engineman and the conductor less severely injured.

The train derailed near Elrod, N. C., on the night of the

6th, was a southbound passenger. Three passengers were killed and 73 passengers, 3 employees and six other persons were injured, of whom 67 were only slightly injured. Cause of derailment undetermined.

The train derailed near Emporium, Pa., on the ninth, was a northbound express. The train, drawn by two locomotives, was running at full speed, and all of the passenger cars (all of the train behind the baggage cars, except one sleeping car), were thrown off the track by a broken rail. Only one person—a passenger—was reported seriously injured.

The train derailed near Attica, Ind., on the 23rd, was westbound passenger No. 53. The locomotive fell down a bank and one coach was wrecked. Twenty-four passengers and three trainmen were injured. The engine was thrown off the track by some obstruction, believed to be a brake rod.

The train derailed near West Newton, Pa., on the 23rd, was eastbound passenger No. 66. The locomotive and first three cars were overturned; the engineman and two express messengers were killed and the fireman and four other persons were injured.

The train derailed near Cumberland, Md., on the 23rd, was an eastbound freight. Twelve cars were wrecked and the line blocked ten hours. One trainman was killed.

The train derailed near Edgerton, Ind., on the 28th, was a westbound special passenger carrying troops. Four passengers were injured. The cause was a broken rail.

Canada.—In a train of the Canadian Pacific at Bonheur, Ont., on the 17th, 14 passengers were killed by a fire which broke out in a tourist sleeping car and spread so rapidly that it was impossible for the passengers to escape, although the train was not in motion.

On the Canadian Government Railway, December 31, near Edmundston, N. B., a westbound special train, loaded with troops, ran off the track and one car fell down a bank and lodged in a lake. Six or more soldiers were killed and a large number injured. After the derailment a heavy snow-storm arose, making rescue work very difficult.

Electric Car Accidents.—Of the electric car accidents reported in the United States in the month of December, only two appear to have resulted fatally. At Norristown, Pa., on the 13th, a trolley car was struck by a locomotive at a crossing and two persons were killed and 11 injured. It is said that the trolley pole jumped off the wire when the street car was on the railroad tracks. At 142nd street, New York City, on the 8th, a two-car train of the Interborough Rapid Transit Company was derailed and ran against the iron pillars at the side of the track. The motorman was killed and four other employees were injured. Apparently the train contained few or no passengers.

Arrival of the German Delegates to the Peace Conference

<sup>1</sup>Abbreviations and marks used in Accident List: rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc. obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of boiler on road—fire, Cars burned while running—P. or Pass., Passenger train—F. or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

## Lining and Floor Racks for Cars Handling Perishable Freight

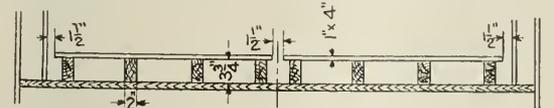

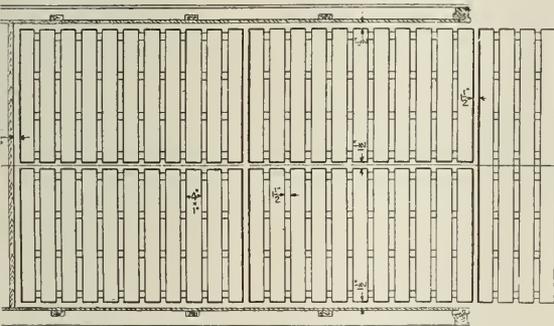

THE CAR SERVICE SECTION of the Railroad Administration issued Circular CS-43 (revised), dated January 30, covering the use of refrigerator and box cars to be used in the transportation of perishable freight.

**Refrigerator Cars.**—(1) Railroads will supply refrigerator cars for shipment of fruits and vegetables to the extent of their ability. A certain percentage of this class of cars belonging to the various railroads is already equipped with false floors or floor racks. It is contemplated eventually to equip in this manner all such cars owned by roads under federal control, and also cars of the following refrigerator lines: Pacific Fruit Express Company, Santa Fe Refrigerator Despatch, American Refrigerator Transit Company and the Frisco Refrigerator Line.

2. It will not be practicable for the railroads to equip a sufficient number of cars to fully meet the requirements of the present season. Therefore if refrigerator cars owned by federal-controlled roads, or cars belonging to any of the above-named refrigerator lines, not equipped with floor racks, are offered for loading fruit and vegetables, shippers, if they so desire, will be privileged to construct and place in cars suitable racks of standard type, in accordance with specifications shown on accompanying print. Racks when so placed will become a permanent part of the car.

3. Railroads will reimburse shippers for the value of floor racks placed as above described at the rate of fifty cents per linear foot of rack. This reimbursement will be made by the road on which load is first placed in car following installation of floor racks.

4. Any lining desired by shippers in refrigerators in

Arrangement of Floor Racks for Cars Handling Perishable Freight

In addition to floor racks must be placed by them at their own expense, and in such manner as not to damage the car or insulation.

**Box Cars.**—(5) When railroads are unable to meet the demand for refrigerator cars for above-named shipments, if shippers elect to make use of box cars, and if in their opinion such cars require lining, they (the shippers) will be given the privilege of equipping the cars with such lining entirely at their own expense.

6. In the interest of promoting shipments and conserving food supply, it is suggested that the lining of box cars, when done, conform to the following standard furnished by the Bureau of Markets, United States Department of Agriculture, which, it is believed, will give the best results:

“False floors, side and end walls shall be installed providing an unobstructed space for air circulation down between the car and walls and false end walls, and from there under the false floors to the doorways. This ventilating space must be kept clear of hay, straw, manure, shavings, and everything except the necessary false-floor supports. There shall be a space between the car side walls and the false side walls of not less than four inches at the top and six inches at the bottom.

“Each doorway shall be tightly boarded not less than 24 in. from the floor upward, the boards being nailed to the inside of the door frame to keep out cold winds.”

7. For the same reason it is further requested that shippers make it a practice to use box cars for the shorter hauls, reserving refrigerator cars for loading to the more distant points. Railroads will supply refrigerator cars preferentially as compared with box cars, for the longer runs.

8. Box cars that may be lined by shippers will be furnished with a board on either side, of uniform dimensions (24 in. by 30 in.), with lettering of suitable size, reading as shown in the illustration.

**RETURN TO**

.....

(Insert name of shipper.)

**AT**

.....

(Name of station.)

..... **RAILROAD**

(Name.)

**UNITED STATES RAILROAD ADMINISTRATION**

Instruction Card for Return of Cars

9. These boards will be furnished by the railroads. Lined box cars so boarded will be returned free, with lining, to point of origin of load, and should be waybilled to such point, consigned to party or firm whose name the board bears. They may be loaded all or a part of the way on return trip with any suitable freight. They must not be loaded out of direct line, and care should be exercised to avoid damage to lining in loading or unloading.

10. It must be understood that cars thus lined and boarded are subject to demurrage, either while awaiting loading or unloading.

11. The privilege of equipping box cars as above will extend from November 15, 1918, to April 1, 1919. In the event of failure to return lining to shippers within three months from the last-named date, roads on which it was originally placed in cars will refund to party furnishing same the sum of twenty-five dollars per car in full payment for the value of the lining, but only when installed in conformity with the specifications named in paragraph 6. In the case of box cars the term “lining” will be understood as including false floor as well as lining of side and end walls.

12. Roads on which cars are equipped should keep an accurate account, showing date, number and initial of car and name of shipper to avoid any misunderstanding in making settlement in case of loss.

13. After April 1, shippers will be required to promptly remove from cars any lining which belongs to them. Failing to remove such equipment, the work of removal will be performed by the railroads, but the latter will not be responsible to owners for the material or its value after removal.

14. Provisions herein contained which relate to reimbursements to be made to shippers become effective coincidently with the effective date of tariff provisions of the various railroads authorizing such reimbursement.

# General News Department

A second collision, resulting in fatalities to American soldiers, is reported from France. At Montieramey, near Troyes, on February 3, a troop train collided with standing locomotives. Eight United States soldiers were killed and 30 were injured.

A collision, in Mexico, on Tuesday, January 28, is reported as having resulted in the death of 25 persons, including five women and three children. It occurred at Laguna, 160 miles from the Texas border, a passenger train running into the rear of a freight.

Scrip books, containing \$90 worth of coupons, are to be sold at \$97.20, including war tax, at all Railroad Administration ticket offices in the larger cities. These books will be good on all government railroads, for passage and for extra baggage, the same as the books sold for \$30 and \$15.

The Louisiana & Northwest Railroad, 121 miles long, extending from Natchitoches, La., northward to McNeill, Ark., and the only route to Homer, La., the center of new oil fields, is to be sold. This is in accordance with an order issued in the federal court at Shreveport, La., by Judge George W. Jack.

Engineers, in Chicago, representing railroad corporations, held a meeting on January 28, at the club rooms of the Western Society of Engineers to formulate plans for a series of meetings at which they will discuss problems which have developed in their relations with the Railroad Administration. The present program includes a meeting on the first Thursday of each month, also an informal luncheon once a week. An executive committee was elected with G. W. Hand, chief engineer of the Chicago & North Western, as permanent chairman, and D. J. Brumley, chief engineer of the Illinois Central, and A. W. Newton, chief engineer of the Chicago, Burlington & Quincy, as members.

Anchorage, Alaska, through its chamber of commerce, asks Congress to appropriate funds to be expended by the Alaskan Engineering Commission for the construction of wagon roads as feeders for the Government Railroad. It is pointed out that there are more than 300 homesteads in the territory through which the railroad passes and on which large crops of potatoes, cabbages, oats, barley and other foodstuffs have been raised during the last two years, but which crops had no means of getting to the railroad and to market. It is declared that sufficient potatoes were raised in the valley of the Matanuska river alone to supply all of the towns along the Alaskan Coast if roads and ships had been available.

The Daylight Saving Law is not liked by the farmers—or at least not by a large majority of those, in various parts of the country, who have been questioned by the Literary Digest. In the summer the farmer has to begin work at daylight whatever may be the time by the clock, and the principal difference in the situation under the new law, in most cases, seems to be that hired men, beginning their work the same as before, wish to lay down their tools, at night, as soon as the whistle blows in neighboring factories. If this factory signal comes an hour earlier than under normal conditions, it tends to cheat the farmer out of an hour's work. Some farm work cannot be profitably begun in the morning until after the dew has dried off; and by long custom the farmers' habits have been adjusted to the situation as guided by the sun; and the false clock is a hindrance rather than a help.

The directors of the Canadian National Railways expect to ask the government for about sixty million dollars for betterments this year including roadway, cars and engines and considerable construction work in the west. The proposed extensions are branch lines, most of which have been graded but not finished. The Great Waterways Railway, of Alberta, which is now a provincial undertaking, about half built, is

in the market. It is understood that the government of Alberta would be glad if the federal authorities could take over the line and nationalize it. The government of British Columbia, likewise, has a railway to sell and few bidders. It is the Pacific Great Eastern, heavily financed by the province. The government of New Brunswick has the St. John Valley Railway. This is now operated as a part of the national system, but the provincial government is said to be quite willing that in place of operation the Dominion government should buy out the line entirely.

## New Railroad Y. M. C. A. Buildings

Two new Railroad Y. M. C. A. buildings were opened during January. One of these was at Maybrook, N. Y., on the New York, New Haven & Hartford; the other one was at Coxtown, Pa., on the Lehigh Valley, this being the first Railroad Y. M. C. A. building on that line. Special exercises were also held at Elsdon, Illinois, on the Grand Trunk, in connection with the completion of the second addition to that building, made necessary by the constantly increasing growth of the association.

## Proposed Salaries for Engineers

The American Association of Engineers has submitted to the United States Railroad Administration a schedule of proposed salaries for technical engineers employed by the roads. This schedule is a result of the work of a railroad committee of this association appointed to study this problem when it became evident that the complications involved were delaying its definite solution by the Railroad Administration. In the case of chief engineers, assistant chief engineers, chief draftsman, superintendents of motive power and assistant general superintendents of motive power the schedule makes no specific recommendation; the salaries should be "commensurate with the duties performed." With each position this list contains a note indicating the duties, responsibilities and scope of authority of the position.

Position	Railroads having	
	over 5,000 miles of track	less than 5,000 miles of track
District engineer	\$425	\$375
Assistant district engineer	350	300
Division engineer	375	350
Resident engineer	275	275
Assistant engineer	275	275
Engineer of bridges	400	350
Valuation engineer	400	350
Assistant valuation engineer	350	275
Mechanical engineer	400	325
Electrical engineer	325	275
Assistant electrical engineer	275	250
Signal engineer	400	350
Assistant signal engineer	300	275
	Permanent work, one year or more	Temporary work, less than one year
Instrumentman	200	225
Rodman	125	150
Tapman	100	120
Designer	250	275
Draftsman	160	200
Junior draftsman	115	160
Tracer	110	130

## American Electric Railway Association

The first mid-year meeting and dinner of the association since the entry of the United States into the war will be held in New York City, March 14. The meeting will be held in the morning and afternoon, in the Engineering Societies building, 29 West 39th street. The dinner will be held in the evening in the grand ball room of the Waldorf-Astoria. The program of the meeting will include: (1) a report from the Committee on Readjustment; (2) "The state of the Industry (a symposium), (a) Modern Regulatory Plans and

Theories—paper by an electric railway executive; (b) Capital and Electric Railways—paper by a banker; (c) From the Regulator's Viewpoint—addresses by three public service commissioners. The program for the dinner is yet to be announced.

### Some Small Percentages

Freight traffic in the United States in the year 1918, as measured by net ton miles, increased 1.8 per cent over 1917, according to the monthly report of the Operating Statistics Section of the Railroad Administration. This freight was handled with 2.5 per cent less train miles and 2.1 per cent less car miles. There was an increase of 2.9 per cent in the average number of freight cars on line. Net ton miles per car per day increased 0.1 per cent.

### Five Business Cars for Sale by Interstate Commission

The Interstate Commerce Commission has for sale five business cars with their contents. These cars were purchased from the Pullman Company in 1914 and 1915, and were standard Pullman cars of wooden construction, overhauled and refitted to serve the purpose of office or business cars for use of field parties in the Bureau of Valuation. Sealed proposals for the purchase of these cars will be received at the office of the chief clerk and purchasing agent of the Interstate Commerce Commission, Washington, and there opened at 10 a. m. on Tuesday, February 25, 1919.

### Thieves Punished

Dishonest express messengers, to the number of 11, were sentenced in court at Boston on January 30 to imprisonment from three months to eight months, according to the magnitude of their crimes. These men had been messengers for the American Railway Express between New York and Boston, on trains 48 and 49, and some of them had been stealing merchandise for several months. One man was charged with stealing \$1,216 worth of merchandise, and others smaller amounts; but the attorney for the prosecution said that a total of \$53,000 had been paid out in claims for losses which, it is believed, were due to the pilfering of these men.

At Elmira, N. Y., on January 18, in the United States Court, a conductor and a baggage master were sentenced to the Maryland State Penitentiary for six years and five years, respectively, for stealing goods from a freight car of the Lehigh Valley.

Six railroad employees, including two railroad police officers, one conductor and three brakemen, were found guilty of stealing freight in a trial before the Court of General Sessions at Wilmington, Del., on January 31. The men were charged with conspiracy, and the stealing was carried on in the early part of 1919. Goods in great variety, stolen from freight cars, were found in the culprits' homes.

### Public Sentiment on the Railroad Question

The New York Evening Post, which has investigated conditions in many cities, prints, this week, letters from its correspondent, dated Seattle, Pittsburgh and Cincinnati, all reporting a strong sentiment in business circles unfavorable to government control or operation of railroads. At Cincinnati, labor leaders who were consulted favored Mr. McAdoo's proposal to extend government operation for five years.

The Merchants' Association of New York city, adopting the report of a committee, calls for the restoration of railroads, telegraphs and telephones to private ownership, but not until such time as Congress has made suitable investigation and has passed such laws as will permit and promote maximum utilization of facilities and maximum efficiency in service; and provide for a fair return upon the capital employed.

The lower House of the Iowa Legislature has adopted resolutions of a similar tenor. The discussion on the resolution brought out severe criticism of the management by the government of the railroads and the telegraph and telephone systems.

The American Fruit & Vegetable Shippers' Association, in a four-day convention at Chicago, has adopted resolutions favoring the return of the railroads to private ownership and the adoption of laws to protect the interests of the carriers and the shippers.

## Traffic News

All of the observation cars on passenger trains of lines west of Chicago, which were taken off during the war, have now been restored.

Total coal loading for the week ending January 18 amounted to 206,835 cars, as compared with 185,883 for the corresponding week of 1918. Loading for the following week is estimated at 194,378 cars, as compared with 215,329 in 1918.

The Akron Traffic Association held its annual meeting on January 20, and Alvin Hill, traffic manager of the Robinson Clay Product Company, was elected president. The secretary is H. L. Sovacool. The annual dinner was held in the B. F. Goodrich Company's banquet hall.

The Oklahoma Corporation Commission, in a decision rendered on January 30, has ordered railroads to refund one cent a mile in all cases where a cash fare of four cents a mile is collected. The roads have been collecting four cents a mile whenever passengers were not provided with tickets.

The Rate Men's Club, an organization of rate men on railroads in this country and Canada, held its annual meeting and banquet at the City Club, Chicago, on Wednesday evening, February 5. S. J. Duncan-Clark, war correspondent of the Chicago Evening Post, was the speaker of the evening.

Coal loading for the week ending January 11 was 213,715 cars, as compared with 225,642 for the corresponding week of 1918, according to a Railroad Administration report. Grain loading for the week ending January 18 was 29,613 cars, as compared with 16,911 for the corresponding week of 1918. The total for the three weeks ending January 18 was 75,086, as compared with 57,070.

A suit questioning the right of the Hocking Valley to charge three cents a mile in Ohio in violation of the state law fixing passenger rates at two cents was instituted in the Franklin county court at Columbus, Ohio, by the prosecuting attorney of the state. The petition asks that trustees be appointed to take charge of and distribute the money which has been paid to the railroad in excess of two cents a mile.

Recent press reports state that the Agricultural Committee of the Chamber of Commerce at Spokane, Wash., has appointed a special committee to investigate order No. 57 of the Railroad Administration, which deals with claims for loss on grain shipments. A member is quoted as saying "that the order is meeting with a general protest from shippers and traffic organizations because it prevents shippers from substantiating claims for grain losses."

The American Railway Express Company is appealing to its employees and, through the newspapers, to the public, for aid in raising the standards of packing, wrapping and marking goods, so as to check the waste that results from lost and damaged shipments. "Four minute" speeches are to be delivered by local express officers, and "better-service campaign committees" will be formed in the express organizations in every city. Meetings of the different classes of express employees are to be held on every Tuesday during the "drive."

The North and West Committee and the South Committee of Railroad Agricultural Agents appointed by the Agricultural Section of the Railroad Administration have subdivided their respective territories and appointed sub-committees in each state. These sub-committees have completed the assembling of information on soil production, market transportation facilities and the approximate size of available farms in their territories, and this information is now being distributed to returning soldiers and home-seekers. Folders setting forth facts with reference to climate, production, markets, schools and churches in 19 states have been prepared, and will be distributed at ticket offices, demobilization

camp and at the booths of the war camp community service; also at Y. M. C. A. headquarters.

The Special Committee on Relations, of the American Railway Association, and the Committee on Car Demurrage and Storage, of the National Industrial Traffic League, held a meeting in New York on February 5 to further consider a proposed recodification of the national car demurrage rules. The National Industrial Traffic League for two years has complained that in their present form the rules cause confusion and loss of time because of the necessity of referring to the numerous qualifications and exceptions which modify their application.

### Need of Relief from Drought

Representatives of 17 counties in southwestern Kansas met at Dodge City, Kan., on January 22 to petition the director general of railways to grant to that territory preferential freight rates, such as have been granted the drought-stricken areas of Texas, Oklahoma and Montana, and to issue orders expediting the shipment of foodstuffs into that territory. The petition states that grain and feed crops have been practically a total failure during the past two years because of the lack of rain and that the commercial credit of the farmers and stockmen is practically exhausted. The petition also states that the present feed supply is sufficient for about two weeks only, making necessary the immediate shipment to that section of large quantities of feed.

### Rates on Sand and Gravel

The hearing of the Central District Freight Traffic Committee at Chicago on a proposed mileage scale of rates for sand, gravel, stone and slag in Central Freight Association territory was concluded January 30. Considerable testimony was offered by individual shippers purporting to show that the application of the mileage scale will mean an increase in rates which will seriously impede construction work, and it was urged further that the present rates, which were increased last summer under General Order No. 28, be reduced. Resolutions passed by the Ohio and Indiana legislatures opposing the new scale were also read. H. C. Barlow, traffic manager of the Chicago Association of Commerce, opposed the principle of the mileage scale as applied to sand and gravel, believing that zone rates such as exist in northern Illinois and southern Wisconsin are better adapted to those commodities. It was pointed out repeatedly in the hearing that a prompt settlement of sand and gravel rates is essential to enable contractors to make intelligent bids on work contemplated for the coming spring and summer.

### Chicago Commutation Fares Not Increased

The proposed increase in commutation fares to and from Chicago which was to become effective February 10, has been indefinitely postponed by the Railroad Administration. The advance was authorized to enable the Aurora, Elgin & Chicago, an electric line, to take advantage of authority recently granted to charge two cents a mile for its service. That road has been in serious financial difficulty and the Public Utilities Commission of Illinois recognized its need for additional revenues.

According to a statement given out by the railroads the Utilities Commission was consulted before any action was taken regarding the proposed advance for the steam lines, and went on record as preferring action by the Railroad Administration in the matter. In spite of this, however, the attorney general of Illinois filed a petition in the federal court at Chicago for an injunction to restrain the railroads from making the increase. Various suburban organizations have been assisting him in this fight. In view of the postponement of the advance, the attorneys for the Railroad Administration have asked the attorney general to agree to a continuance of any action on his part pending a full review of the matter by an appropriate tribunal. The Chicago & North Western, the Chicago, Burlington & Quincy and the Illinois Central, which are the largest suburban carriers, have spent 40 years in building up business on their lines. Their activities have not been confined to the operation of trains, but have included the development of many of the suburban communities. The proposed advance in rates might

drive considerable numbers of suburban passengers to competing electric roads.

The petition for an injunction to restrain the director general from advancing the fares was not granted. When the case came up before Judge Landis, in the Federal Court at Chicago, the attorney for the Illinois Public Utilities Commission requested indefinite postponement, and this request was granted.

### Maximum Anthracite Prices and Other Restrictions Suspended

Maximum prices on anthracite coal, together with all other coal and coke regulations except three, have been suspended by the Fuel Administration. The only restrictions not suspended, as to coke and all coal, are: Those requiring that contracts be made subject to maximum prices if reinstated, subject to cancellation by the Fuel Administration and subject to requisition or diversion of coal by the Fuel Administration. Those prohibiting reconsignments of coal. Those requiring shipments of coal to tidewater to go through the Tidewater Coal Exchange. The order includes the suspension of price and zone regulations on coke and bituminous coal which went into effect February 1. The administration's control of the oil industry already has been mostly suspended, so that the Fuel Administration's controls are now relaxed to the present limit of safety.

### Western Roads Resume Resort Advertising

A comprehensive advertising campaign to stimulate tourist travel in the West was launched at a meeting of advertising agents of federal-controlled lines at Chicago on February 4. The plans prepared at this meeting will be put into effect under the direction of the Western Lines Advertising Committee in collaboration with the Bureau of Service, National Parks and Monuments and R. S. Yard, chief of the Educational Division of the National Park Service, United States Department of the Interior. The advertising committee which has jurisdiction in the territory served by the Western Passenger Traffic Committee is composed of W. H. Simpson (chairman), assistant general passenger agent of the Atchison, Topeka & Santa Fe; C. R. Custer, advertising agent of the Chicago & North Western, and W. D. Braddock, advertising agent of the Rock Island. This supervisory body will be assisted by 18 subordinate committees made up of railroad advertising representatives who are familiar with the parks and resorts.

This is the first unified effort of railroads in this country to increase passenger travel. The work undertaken falls under two general heads, the attractions of western summer tourist regions and those of the national parks and monuments. Five separate publications will be issued to cover the first class of resorts, and will be entitled "Colorado and Utah Rockies," "California for the Tourist," "Pacific Northwest and Alaska," "Wisconsin, Minnesota and Iowa Lakes," "Arizona and New Mexico Rockies." Each booklet will be profusely illustrated.

The national parks and monument series will consist of 13 booklets, namely: "Yellowstone National Park," "Glacier National Park," "Yosemite National Park," "Grand Canyon of the Colorado in Arizona," "Rocky Mountain National Park," "Mount Rainier National Park," "Hot Springs National Park," "Crater Lake National Park," "Mesa Verde National Park," "Sequoia National Park," "Hawaii National Park," "Zion Canyon National Monument" and "Petrified Forest National Monument." The Bureau of Service of National Parks and Monuments will assist the railroad committees in preparing this literature.

Unlike the folders published heretofore by individual lines, these booklets will make no mention of the railroads serving the various resorts and parks except on the maps. As the pamphlets are intended primarily to serve the needs of the tourist they will include no agricultural or industrial data or detailed population statistics.

The Western Passenger Traffic Committee is preparing tourist rates to these points which will be approximately on the same basis as those of last year. It is believed that the long distance rates, such as from Chicago to San Francisco, will be about 1 1/3 times the regular one way fare, whereas the rate to nearby resorts will be in the neighborhood of 90 per cent of the regular round-trip charge.

## Foreign Railway News

New Zealand, in the first nine months of 1918 imported "railway and tramway plant" to the value of \$215,017, as compared with \$136,277 in the same period of 1917, and \$404,007 in the first nine months of 1916.

The Peruvian Congress has authorized the construction of a railway from Paita to the Maranon River, with a couple of branch lines. As a guarantee to the capital invested there is to be a subsidy of 7 per cent per annum for 39 years, the maximum amount of capital being fixed at £6,000,000.

The Spanish Government, in a royal decree, dated December 26, has authorized the railways of the country, all of which are privately owned, to advance their tariffs 15 per cent. The increase is allowed under a lengthy set of conditions, and is intended to cover increased costs of fuel, etc., but primarily increases in wages.

Railways in Siam have apparently suffered severely during the war, because of their inability to procure steel equipment necessary to maintain their efficiency. Advices are that they are in the market for iron framework, wheels and other parts. Eight Siamese students connected with the State Railways are about to visit the United States to study railway methods here.

The government of Holland is expected to place orders in the United States in the next few months for some 30,000 to 40,000 tons of steel for the Dutch East Indies. Railway supplies are greatly needed in the Dutch East Indies, the chief demand being for rails, bars, shapes and reinforcing products. Holland's own needs, which are great, will probably be supplied almost entirely from European sources.

Two Chilean engineers are expected to arrive in this country in about three weeks to continue here their investigations concerning the electrification of the first section of the line of the Chilean State Railways between Valparaiso and Santiago. The government plans to submit the project to an international competition to secure the best system, following somewhat the same plan as was used in connection with the new shops at San Bernardo, near Santiago.

The first Paris-Brussels train for 50 months started at 7 o'clock on the evening of December 27. There were 1,014 passengers, mostly officers and employees on the Belgian railways going to take up their pre-war jobs. The journey was scheduled for 27 hours, and the train traveled by way of Calais, Bruges and Ghent. The first train from Paris to Brussels by the more direct route through Maubeuge arrived at Brussels February 4. It is reported that direct train service is expected to be opened in about three weeks.

"The railways of this country are at present much in the public mind," says the London Daily News. "Traveling during the war has been expensive and uncomfortable. It is expensive and uncomfortable still, and no indication has been given as to when passenger fares are to be reduced or satisfactory services instituted or the normal conveniences of travel restored. But these, closely though they touch the welfare of the individual passenger, are no part of the vital railway problem. That problem consists in the attitude and intentions of the state towards the railways."

The great scarcity of coal in Italy has made it necessary to use wood and lignites for fuel in locomotives. The boilers and fire boxes of the locomotives have had to be changed to suit the new fuel, and employees re-educated to a considerable extent. The use of substitutes for coal as fuel has been urged on all manufacturers, and prizes have been offered for noteworthy economies. In addition to that, two companies, with an initial capital of \$1,200,000 each, have been formed for the development of lignite or brown-coal mines in Italy. One will operate mines in northern, the other in southern Italy.

The Federated Malay States legislative council has ap-

proved the construction by the government of a causeway, carrying two lines of railway and a roadway 20 feet wide, across the Johore Straits. The Admiralty has given its consent to the scheme. It has also been decided to build a dock on the Johore side of the straits capable of taking the largest craft using those waters. These decisions are of first-class importance because they mean the linking up of Singapore with the mainland of the Malay Peninsula, greatly facilitating transport to and from the Malay States through Singapore.

Three officers of the Victorian railway department have left Melbourne on a visit to America and Canada "for the purpose mainly of making inquiries and securing all the information necessary to enable an electric furnace to be installed at the Newport workshops for the production of high-grade steel castings." A statement to this effect was made by the Premier, who said that the proposed furnace will enable high-grade steel castings to be manufactured at Newport at less than one-half their present cost to the department, and render practicable the use of steel castings in substitution for iron forgings. The installation of the furnace would necessitate the erection of a new foundry to form part of the general scheme of rearrangement of Newport workshops, which was proposed prior to the outbreak of the war.

The exports of railway material from the United Kingdom for the eleven months ending November 30, according to the Board of Trade returns, were as follows, the corresponding figures for 1917 being given in parenthesis: Locomotives, \$5,225,125 (\$7,700,125); rails, \$2,351,965 (\$3,392,505); carriages, \$2,734,025 (\$825,085); wagons, \$1,521,530 (\$2,036,800); wheels and axles, \$1,639,220 (\$695,945); tires and axles, \$2,802,000 (\$2,561,440); chairs and metal sleepers, \$696,620 (\$346,450); miscellaneous permanent way material, \$2,652,395 (\$2,312,610); total permanent way material, \$5,762,195 (\$6,086,535). The weight of the rails exported was 25,475 tons (38,390 tons), and of the chairs and sleepers, 8,711 tons (5,396 tons).

### Greek Railway Development

The Athens newspaper Hestia stated recently that negotiations are being conducted in Paris by an important group of French capitalists with a view to the construction of new railway lines in Greece. Representatives of those interested will shortly go to Greece to undertake preliminary investigations. The first line to engage their attention will be that from Drama to Kavalla.

### Troops Live in Box Cars

When operating through the thinly populated forest and tundra region along the railway leading from Archangel to Vologda, the American troops fighting the Bolsheviks on the north Russian front are living, when free from trench and blockhouse duty, in tiny Russian freight cars, says the Associated Press. In this they are imitating the Russian soldiers, who, since the revolution, have commandeered freight cars wherever they found them and remodelled them for dwellings.

When the box cars are fitted up with stoves they are known as "topluchkas." They are not particularly warm in zero weather, but a welcome change from the cold trenches in the snow.

### Agricultural Light Railways in the United Kingdom

A first step seems to have been taken in the government plans outlined by the British Premier, and referred to freely during the election campaign, for the construction of light railways serving the agricultural districts. Proposals have, it is reported, been drawn up by the Ministry of Reconstruction and approved by Dr. Addison, indicating some of the localities where such railways are needed. Legislative sanction will, of course, be required, but it is understood that the cost is to be borne partly by the local county authority and partly by the government, the lines being leased to operating companies with guarantee as to wages and fares. The operation of the Belgian system of light railways is to be

taken as a model. So far as new construction is concerned a large quantity of material has been released from transport requirements on the French and Belgian fronts, and should be available within a short period, materially reducing the cost. The lines, it is stated, will be run by the side of country roads, linking up the neighboring towns.

### Train Ferries for the Irish Channel

Some important developments in the traffic between Ireland, England, South Wales and the French ports may be expected to take place during the current year, in which use will be made of train ferries for the sea passage. Last November a syndicate was formed under the title of the Irish Packing Company, Limited, for the purpose of developing the Irish dead meat export trade on lines which have been so successful in the United States, Australia, New Zealand and Argentina. The plans of the company include in part a service from Dublin and Waterford by train ferries in order to save the double transshipment of the meat and to facilitate its passage to the English market. Berths for the accommodation of train ferries are to be provided at the Alexandra Basin, Dublin, and at Fleetwood, by arrangement with the Lancashire & Yorkshire Railway, and subsequently at Waterford, from which place a train ferry service will be maintained to and from Southampton, and to a port in South Wales to be subsequently decided upon. The project is receiving the support of the Irish-office, and already negotiations have been started with the War Department for the purchase of three of the train ferries which have been so successfully used by the army between England and France.

### To Improve Mexican Railroads

A despatch from Monterey, Mexico, says that in order to bring about a betterment of the railroad service of the country the Department of Communications and public Works of the National Government has appointed a commission to take charge of the improvement and maintenance of the several lines. This commission also is charged with the function of exercising similar jurisdiction over the highways and telegraph systems of the country. Its first work will be to make a complete survey of all of the railroads to determine the exact needs in the way of physical betterment, particularly that of new rails, lowering of grades, and the adding of rolling stock. This work will be done by a corps of engineers.

The shortage of equipment is becoming so acute on some of the divisions of the National Railways of Mexico that freight and passenger traffic has been almost entirely suspended. All trains on the Monterey-Tampico division have been taken off except a mixed freight and passenger train that is to make a trip between the two important terminals three times a week.

### New Line, Rome-Constantinople Direct, Planned

A plan for the building of a trans-Balkan railroad which would connect Italy directly with the East by a system of ferries across the Strait of Otranto, which is at the heel of Italy and forms the outlet of the Adriatic into the Mediterranean Sea, has been submitted by G. Buonomo, an Italian engineer, and published by the Italian Institute for Commercial and Colonial Expansion.

Italy has always advocated the building of a railroad direct from Constantinople, through Salonica to Avalona, for her own commercial expansion and for the unity of the Balkans, but the governing nations have always opposed it.

Such a railroad would shorten the distance between the principal commercial and industrial centers in Italy and Balkan cities by several hundred miles. From Avalona on the Balkan side to Otranto on the Italian side, a ferry would have to be established to make the line from the Balkans to Italy complete. Over this route the distance from Rome to Constantinople could be traversed in 48 hours, and it would be decreased from 1,905 miles, the present length of the trip via Cevignano, to 1,260 miles, the length over the new proposed line via Avalona.

### Allied Guard Planned for Trans-Siberian Railroad

More definite information concerning the agreement between the powers concerning the operation of the Trans-Siberian Railroad is still lacking. An Associated Press despatch from Vladivostok, February 2, however, says that the feature of the plan for operating the Trans-Siberian Railway, which is in process of elaboration at conferences between John F. Stevens, the American Ambassador (to Japan), Roland S. Morris and representatives of the Allies, is that the line shall be guarded by American and Allied troops.

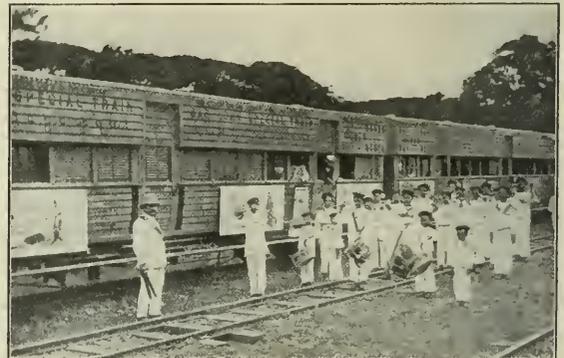

Mr. Stevens is reported to have said that only under that condition will he undertake the task of rehabilitating the railroad. Ambassador Morris is said to support him. The ambassador is clothed with plenary powers to conclude the plan of operation, which, it is expected, will be perfected within a month.

The necessity for an Allied guard has been accentuated by the project of the early repatriation of the Czecho-Slovak troops, preparations for which already are completed. The removal of invalids and wounded is now going on.

The corps of railroad operatives organized by Mr. Stevens, which has been waiting for a year to begin work, is under orders to be ready at an hour's notice to proceed to points already assigned in the scheme of operation.

### A War Loan Special in Burma

The United States is not the only place that has made use of War Loan Specials in bond campaigns. During the second India War Loan last August and September, the Burma railways ran such a train over their lines with marked success. The train was made up of highly decorated cars, had *bandé* and *pwé* (theatrical) parties on board and bands and *pwé* parties at every station. The Burmese are not great investors, but the striking appeal made by the train attracted

The Burma War Loan Special Is Assisted by a Chinese Boys' School Fife and Drum Corps

them and brought out a very large sum of money, some of which had been hoarded, and showed signs of not having been in circulation for many years. The arrival of the train at a station was the sign of a holiday, people coming with their families to take part in the festivities from every point within 20 miles distance. The train traveled during daylight only, stopping at every station. It was on the road 28 days, stopped at 202 stations and, in addition, spent three days at Rangoon. In all it covered 1,058 miles.

### New International Routes

There seems to be every prospect of quite a number of the new international railway routes proposed during the war materializing at a very early date, says the Railway Gazette of London. According to the most recent information the first of these is likely to be a through service between Paris and Bucharest, operated by the Entente, and in a measure succeeding the notorious and short-lived "Balkan Zug." This service has been the subject of study by a Franco-

Roumanian mission in Vienna, and is expected to be inaugurated during the current month. The route will be Paris, Berne, Zurich, Arlberg, Innsbruck, Vienna, Budapest and Bucharest, and is, therefore, mainly through territory which for over four years has been enemy country. During the war there have been a number of proposals for the provision of new international services entirely avoiding German and Austrian territory, and one of these will be the revived Orient Express from Paris to Constantinople. Prior to the war this ran via Strasbourg, Munich, Vienna, Budapest and Sofia. On the outbreak of war the Germans seized a good deal of the rolling stock belonging to the International Sleeping Car Company, and the "Balkan Zug" was really nothing but the Orient Express in a German disguise. The new Orient Express, which will not touch German territory, will use either the Simplon or Mont Cenis route to Milan, and run thence to Constantinople via Venice, Trieste, Agram, Nish and Sofia, with a Nish-Athens portion via Uskub and Salonica. The International Sleeping Car Company also plans to extend the service to Bagdad and Jerusalem and to link up with its existing services in Egypt, via Kantara.

### Labor Difficulties in Great Britain

London despatches of Tuesday last indicate that labor matters on the railways of England and Scotland are in a very unsettled state. The London tubes are not running owing to a strike of motormen on some lines and of power house employees on these lines and others; and the secretary of the Associated Society of Locomotive Engineers and Firemen has announced that all drivers on railways having electric divisions are being called out. The despatches say, however, that a strike of stationmasters, ticket clerks, etc., has been averted by the recognition of the Railway Clerks' Union. Representatives of the union had an interview Tuesday with Sir Robert S. Horne, Minister of Labor, and Sir Albert H. Stanley, president of the Board of Trade. The matter of the grievances of the men was also discussed by a special cabinet meeting. The president of the Board of Trade, speaking of the trouble in the tube railways, said:

"Under the arrangement made in December last the government granted railway men an eight-hour working day, excluding meal times. This was accepted by the unions concerned. The unions then submitted further demands, including increased wages and improved conditions of service apart from the eight-hour day. These matters are to be considered at the meeting next week between the members of the railway executive committee and the men's unions. Meanwhile, existing conditions of service apart from the eight-hour day are to remain unaltered. Despite this agreement with responsible unions, certain employees of the Underground and the London and Brighton railways have taken it upon themselves to strike and demand that meal times shall now be included in the eight-hour day. This demand, if granted, would mean that these men would work only seven or seven and a half hours daily. If this arrangement was extended to other railways it would reduce the working day to as low as six and a half hours in some cases. It is quite clear that what is now demanded by the small section of the men who are on strike is contrary to what has been agreed with the unions."

The present labor trouble on the railways seems to be part of the strike fever now prevalent in the United Kingdom, but it also goes as far back as the threatened strike of drivers and firemen in August, 1917. At that time, Sir Albert Stanley wrote to the Associated Society of Locomotive Engineers and Firemen as follows: "I pledge the government, the War Cabinet, and myself personally, to continue the present control of the railways for a time after the cessation of hostilities, \* \* \* and that any reasonable request for a shorter working day will have the immediate and sympathetic consideration of the government."

The signing of the armistice, being construed as the "cessation of hostilities," the society promptly demanded the redemption of the pledge and was joined by the National Union of Railwaymen. Both threatened trouble if prompt action were not taken. The Board of Trade, working without association with the railways themselves, thereupon entered into the following agreement in the early part of De-

ember, this being the agreement mentioned by Sir Albert in his statement above:

(1) The principle of an eight-hour day for all members of the wages' staff has been conceded, and is to come into operation February 1.

(2) All existing conditions of service to remain unaltered pending the decision of a committee, to be set up as soon as possible, to review wages and other conditions of service of railwaymen in Great Britain.

J. H. Thomas, who was a party in the negotiations, has stated that the eight-hour principle is not established for the purpose of enabling overtime to be worked.

The National Union of Railwaymen, promptly following the announcement of the agreement, brought out these further extreme demands:

*Hours.*—That eight hours constitute a working day and 48 hours a working week.

*Wages.*—That all advances given as war increases be converted into permanent wages.

*Guaranteed day and guaranteed week.*—That a guaranteed day and a guaranteed week be established on all railways.

*Overtime.*—That double time be paid for all overtime.

*Sunday duty.*—Between 12 o'clock midnight Saturday and 12 o'clock midnight Sunday to be paid for at rate of double time. Sunday duty to be independent of the guaranteed week.

*Night duty.*—6 p. m. to 6 a. m. That night duty be paid for at the rate of time and a half.

*Piecework, tonnage and bonus systems.*—That all piecework, tonnage and bonus systems be abolished.

*Mileage system.*—That on those systems where locomotivemen at present work under a mileage clause 120 miles to constitute a day's work on passenger trains and 96 miles on goods trains; all mileage over and above this to be paid for at an equivalent rate.

*Rest.*—That the period of rest between turns of duty be not less than 12 hours.

*Hybrid grades.*—That hybrid grades be abolished.

*Standard rates of pay.*—That conditions of service for railwaymen be standardized upon all railways in the United Kingdom.

*Management of railways.*—That there be equal representation, both national and local, for this union upon the management of all railways in the United Kingdom.

*Fourteen days' holiday with pay.*—That 14 days' holiday with pay be allowed.

These demands are apparently being pushed with a degree of force befitting their drastic character. At a conference held in London on January 26, a strong feeling was expressed regarding the government's "continued neglect to deal adequately" with the men's grievances and threats were made of a strike unless matters were settled by February 9.

The trouble on the electric lines is additional to the negotiations with the National Union of Railwaymen, and in general, the situation, to an American reader at least, seems as complicated as it is fruitful of trouble.

There is also trouble with the shopmen. These were not included in the eight-hour day agreement, but were covered by another, made between them and the railways, following a similar agreement in the engineering trades in general, which gave the shop workers a reduction of their working week "to 47 hours on the 'one-break' system to come into effect on January 1, 1919, it being further agreed that other working conditions should be meantime maintained and present weekly time rates shall apply to the reduced working hours," etc.

This agreement has also caused trouble just as that with the drivers and enginemen. Trouble was experienced during January, on the Lancashire & Yorkshire and the London, Brighton & South Coast, over the introduction of the 47-hour week on those roads. On the former, the men at the Formby power-house on the Liverpool and Southport electrified line wanted to be treated as engineers and not as shopmen; as shopmen they did not get the 47 hours until February 1. The trouble on the Brighton road is caused by the men at Lancing shops, who live at Brighton, desiring to be paid for their traveling time.

Later despatches on Thursday say that the strike of the enginemen and firemen on the electric lines has been extended to the steam suburban and to a lesser degree to other services on the London, Brighton & South Coast and the London & South-western, and that members of the National Union of Railwaymen were out on the Great Western at Plymouth. Traffic into and out of London is being handled in so far as possible by the tramways and busses and by motor trucks driven by militiamen. The large numbers who have had to walk have been much inconvenienced by snow and slush.

## Equipment and Supplies

### Locomotive Deliveries

Forty new locomotives were shipped to railroads under federal control during the week ended January 25, as follows:

Works	Road	Number	Type
American	C. & O.	7	USRA Mallet
	Mobile & Ohio	4	USRA 6-w. Sw.
	Duluth, Missabe & Northern	3	USRA Santa Fe
	Oregon Short Line	1	USRA Mikado
	Chic., R. I. & Pac.	4	USRA 6-w. Sw.
	C. & O.	3	10-w. Switch.
	C. & N. W.	1	Mikado
	Total	23	
Baldwin	Lehigh Valley	3	Pacific
	B. & O.	6	USRA Mikado
	A. T. & S. Fe.	3	Mikado
	Illinois C. R. R.	2	Mikado
	Atlantic Coast Line	1	Mikado
	Phil. & Reading	1	Consol.
	Penna. R. R.	1	Mikado
	Total	17	
	Grand total	40	

\* Three U. S. R. A. Santa Fe constructed for the Duluth, Missabe & Northern, were shipped to Columbus, Ohio; and one U. S. R. A. Mikado constructed for the Oregon Short Line was shipped to Cleveland, Ohio, to be stored as parts of emergency pools.

### Locomotives

ROBERT HUDSON, LTD., Leeds, England, have ordered two Mogul type locomotives, weighing 37,000 lb., and with 11 by 16 in. cylinders, from the American Locomotive Company, for service in Portuguese East Africa.

THE FEDERATED MALAY STATES RAILWAYS have ordered 12 locomotives from the Baldwin Locomotive Works.

[A reference to the shortage of rolling stock on these railways appeared in the Foreign Railway News Section of the *Railway Age*, issue of January 24, page 275.]

CHINESE ORDERS.—The report, given in some of the newspapers and other places, to the effect that the Baldwin Locomotive Works has recently received orders for 34 locomotives from railways in China, is not true, as the orders were placed some time ago, and in one case at least were put on the books nearly two years ago. The report in question outlined the orders as follows: South Manchuria Railway, 12; Pekin-Mukden, 14; Lunghai-Peinlo, 4, and the Shantung Railway, 4.

THE SOUTH AFRICAN GOVERNMENT RAILWAYS have ordered 40 Mountain type locomotives from the American Locomotive Company, and 30 of the same type from the Baldwin Locomotive Works. Of the 40 ordered from the American Locomotive Company, 20 will have a total weight in working order of 200,000 lb., and 22 by 28 in. cylinders, and 20 will have a total weight in working order of 195,000 lb., and 22 by 26 in. cylinders.

THE PROVINCE OF SANTA FE RAILROAD of Argentina (Cie Francaise des chemins de fer de la Province de Santa Fé) has ordered 20 Pacific type locomotives from the American Locomotive Company. These locomotives will have a total weight in working order of 105,000 lb and 16 by 20 in. cylinders.

[The Province of Santa Fé Railroad is controlled by French capital, its head offices being in Paris, and its South American headquarters being at Santa Fé. It operates about 1,200 miles of meter-gage lines and owns about 160 locomotives and 5,643 freight cars.]

### Freight Cars

THE HOLLAND-ST. LOUIS SUGAR COMPANY, Decatur, Ind., is inquiring for two small side dump cars.

THE FERRO CONSTRUCTION COMPANY, Chicago, is inquiring for one 48-ft., 110,000-lb.-capacity steel flat car.

THE PUSSEY-JONES COMPANY, Gloucester City, N. J., is inquiring for one 25-ton drop-bottom coal car.

## Supply Trade News

J. H. Regan, assistant secretary of the Pressed Steel Car Company, has been transferred from the New York to the Chicago office of that company.

W. R. Colklesser has been appointed purchasing agent of the Gadsden Car Works, Richmond, Va., vice W. F. H. Finkle, resigned to accept service with the United States Railroad Administration.

J. D. Corby has resigned as St. Louis district manager of sales for the Chicago Pneumatic Tool Company and has assumed the active management of the Corby Supply Company, of St. Louis.

Alden R. Ludlow, formerly vice-president of the Liquid Carbonic Company of Chicago, assumed his new duties as second vice-president and sales manager of the Air Reduction Sales Company, Inc., New York, January 1.

Huntly H. Gilbert, who left the service of the Pressed Steel Car Company and Western Steel Car & Foundry Company at the start of the war, to enter the army as captain in the Ordnance Department at Washington, and later was commissioned major and transferred to the Rock Island Arsenal, has re-entered the service of the above named companies, as assistant manager of sales, western district, located at 425 Peoples Gas building, Chicago.

Arthur F. Braid has been appointed sales manager of the metal and alloy department of the Metal & Thermit Corporation. Mr. Braid went to the company seven years ago as a traveling salesman, and after a few years of service in this capacity was appointed assistant superintendent of the Jersey City plant, in charge of the manufacture of carbonfree metals and alloys. When the United States entered the war, he assumed active charge of the metal sales at the New York office of the company.

Randolph S. Reynolds, secretary of the Curtain Supply Co., Chicago, died of pneumonia on January 20. Mr. Reynolds was with the Curtain Supply Co. since 1912. Prior to that time he was with the Western Steel Car & Foundry Co., at Anniston, Ala., and the Pressed Steel Car Co. at Pittsburgh, Pa., having been connected with their purchasing departments from 1905 to 1912. He left the Pressed Steel Car Co. in 1912 to accept a position with the Curtain Supply Co. and later was made assistant to general manager, and on April 30, 1918, was elected secretary to succeed Holmes Forsyth, who on that date became president.

### Railway Supply Dinner

The Chicago Railway Equipment Company gave its twenty-sixth annual dinner at the Union League Club, Chicago, on the evening of February 4. There were present the officers and directors of the company and also a large number of leading men in the railway supply and other industries. The president of the company, E. B. Leigh, was toastmaster, and the speakers were Samuel O. Dunn, editor of the *Railway Age*; William C. Cornwell, editor of the *Bache Review*; A. H. Mulliken, president of Pettibone, Mulliken Company, and James A. Emery, general counsel of the National Council of Industrial Defense.

Mr. Dunn's subject was "The Railway Problem." He pointed out several measures which should be adopted in order to make it feasible to return the railways to private operation and make private operation a success. He especially emphasized the need for legislation to re-establish railway credit, and upon this point said:

I wish to call attention particularly to the relatively small difference in railway earnings which is required to make all the difference between adversity and prosperity, stagnation and expansion, in the railroad industry. On December 31, 1917, the

property investment of our railways, as reported by the Interstate Commerce Commission, was \$19,000,000,000. Let us call it twenty billions in order to make simple the calculations I shall base upon it. If the railways earn 4½ per cent net operating income on this amount, \$900,000,000 a year, we know from past experience that the industry will be extremely unprosperous and stagnant. This is approximately the average that was earned in the five years 1911 to 1915, inclusive, when railway expansion almost came to a stop. One billion net operating income would produce 5 per cent. The industry would still be stagnant with this rate of return. On the other hand, if the net operating income amounted to \$1,200,000,000, or an average of 6 per cent for the railways as a whole, I believe the result would be reasonable prosperity in the industry and a revival of the expansion.

Since no intelligent person would contend that the railways should be restricted to less than 5 per cent, we are justified in saying that the settlement of the problem of railway credit hinges mainly upon the determination of the question whether they shall be allowed to earn more than 5 per cent, and, if so, how much more. If they were allowed to earn 6 per cent, their net operating income would be only two hundred millions a year more than if they were allowed to earn only 5 per cent.

Now, relatively, how much difference in the burden of rates to be borne by the public would this difference of \$200,000,000 a year make? A year ago, the railways were paying about \$2,000,000,000 a year in wages. Now they are paying about \$2,800,000,000, and when the pending advances to the train service employees are granted, this will be increased to \$2,900,000,000. Therefore, the difference in net operating income required to make the difference between railway stagnation and expansion would be but 7 per cent as great as the total wages now being paid, and only one-fifth as great as the advances in wages which have been made within the past year. A year ago the total earnings of the railways were running at the rate of \$4,300,000,000. Today they are running at the rate of \$5,400,000,000. Therefore, the difference in net operating income required to make the difference between railway stagnation and expansion would be less than 2 per cent as great as the current earnings, and only one-fifth as great as the increase in earnings which has occurred in the last year.

If the public is willing to pay in increased freight and passenger rates an advance of almost a billion dollars in wages in order to satisfy railway labor, surely it ought to be willing to pay one-fifth that much in order to make the difference between adversity and prosperity, stagnation and expansion in the railway industry. As a matter of fact, it would not cost the public a dollar to re-establish the credit of the railway companies by assuring them a reasonable net return, and then returning the roads to private operation. In my opinion, if this were done, the managements would soon effect economies by making needed improvements and by adopting better operating methods, which would save the country vastly more than \$200,000,000 a year in operating expenses.

Mr. Cornwell discussed the subject of "Industrial Readjustment." He laid special stress upon the menace to industry, and especially to American labor, that is presented by the prevalent unrest and increasing unemployment. The situation is aggravated by the necessity for transferring industries from a war to a peace basis. The government has available, he pointed out, a means of reducing the dangers of the transition period to a minimum. The railways directly and indirectly give employment to a large part of the people, and there is no doubt as to the need for a large expansion of railway facilities. The adoption by the government of an extensive program of rehabilitation of railroads and enlargement of their facilities would do more to tide industry over the transition period and reduce unemployment to a minimum than any other policy that could be adopted.

Mr. Mulliken, in a brief talk, emphasized the necessity for an educational campaign to show labor the dangers of socialism and bolshevism, and referred to a movement which is being inaugurated by business men in Chicago and New York to carry on an educational campaign upon this subject.

Mr. Emery, in his talk, pointed out that every exertion of the human body or mind for industrial purpose is properly comprehended within the term "labor," and that all industrial progress has been due, not merely to the physical exercise of labor, but to improvements in industrial organizations, machinery and methods which have increased efficiency of production. Whatever tends unduly to impair the rewards of management and of capital will interfere with industrial progress and ultimately destroy every industrial progress from which labor benefits far more relatively than do employers and capitalists.

## Financial and Construction

### Railway Financial News

**CHICAGO, ROCK ISLAND & PACIFIC.**—Speyer & Co. and Hayden, Stone & Co. are offering \$4,500,000 three-year 6 per cent collateral trust gold notes, due February 1, 1922. The notes are secured by \$7,500,000 of the company's first and refunding mortgage 4 per cent bonds, the bonds being pledged at 60. The trust agreement will provide that the collateral security shall, at all times, be equal at market price to not less than 120 per cent of the face amount of the notes outstanding. The proceeds of the notes will be used for the settlement of the claims, long in litigation, of the Colorado & Southern Railway growing out of contracts relating to the securities of the Trinity & Brazos Valley Railway and the Galveston Terminal Railway Company, and the use of their properties.

**FORT SMITH, SUBIACO & EASTERN.**—Judge F. A. Youmans of the United States District Court at Fort Smith, Ark., has confirmed the sale of this road to the Commonwealth Trust Company of St. Louis, Mo., for \$50,000. Protests against the sale were filed on behalf of stockholders who contended that the bid was inadequate as the company had \$200,000 worth of property. Claims aggregating \$460,000 have been filed and hearing on these claims will be held on March 3.

**INDIANAPOLIS & FRANKFORT.**—See Pittsburgh, Cincinnati & Chicago & St. Louis.

**NEW YORK CENTRAL.**—John Skelton Williams, director of the division of finance of the Railroad Administration, is asking bids from bankers on an issue of between \$8,000,000 and \$10,000,000 New York Central equipment trust certificates.

**PENNSYLVANIA.**—An official announcement states that the stockholders at the annual meeting, on March 11, will be asked to authorize an increase of \$75,000,000 in the company's indebtedness, to be made at such times as may be prescribed by the directors. The purpose is to provide for present and future requirements, including obligations maturing during the year, and reimbursing the government for additions, improvements and equipment expenditures made in connection with government control and chargeable to the company. Through unissued balances remaining from previous authorization, the directors at present are empowered to increase the indebtedness by approximately \$46,000,000. The additional \$75,000,000 will bring the total authorization to \$121,000,000.

**PITTSBURGH, CINCINNATI, CHICAGO & ST. LOUIS.**—The stockholders at a meeting in Pittsburgh on February 3 authorized an increase in the indebtedness of the company by the issuance of \$35,000,000 of debenture gold bonds. They also authorized the purchase of the Indianapolis & Frankfort Railroad for \$6,000,000, which gives the company a direct line of its own between Louisville and Chicago. The contract with the government for the operation of the company's railroad during the period of federal control was not ready for action, and the stockholders adjourned to meet on February 17, 1919, to take up that question.

**SOUTHERN RAILWAY.**—Halsey, Stuart & Co. and the Continental and Commercial Trust and Savings Bank of Chicago, are offering at 99¼, yielding over 6¼ per cent, \$25,000,000 three-year 6 per cent notes, due March 1, 1922.

### Railway Construction

**THE PENNSYLVANIA RAILROAD, WESTERN LINES.**—Work is now being undertaken on a number of new buildings and other facilities incident thereto in connection with a large car repair plant in the east yards at Terre Haute, Ind. The following buildings are under construction or contemplated: Office building, women's locker room, men's locker room, paint shop, freight car repair shop, storeroom building, planing mill, extension to power house and material and scrap bins.

## Railway Officers

### Railroad Administration

#### Central

**Charles F. Patterson**, heretofore counsel for claims in the Division of Law, has been appointed assistant general counsel, with office at Washington.

**Ballard Dunn** has resigned as assistant actuary of the Railroad Administration in charge of the Bureau for Suggestions and Complaints to become connected with the United States War Risk Bureau. Mr. Dunn was formerly special representative of the Union Pacific.

#### Regional

**J. C. Roth**, representative of the Car Service Section at Seattle, Wash., has been appointed car service assistant to **L. C. Gilman**, district director at Seattle. Mr. Roth's duties will be to supervise all car supply and car distribution matters on the roads in the Puget Sound district, to secure reports from the roads concerning car service and transportation matters, to issue orders covering the local distribution of cars of all classes between railroads in the territory, to supervise the terminal situation at all principal points, to keep in touch with the operating conditions in the district and to secure reports indicating the movement of cars in and out of the district, to gather information as to probable requirements for cars of all classes for loading and to continue, as at present, to act as zone embargo chairman.

**George J. Ray**, chief engineer of the Delaware, Lackawanna & Western, with office at Hoboken, N. J., has been granted leave of absence, and has been appointed engineering assistant to the regional director of the Eastern Region, with headquarters at New York. He will also perform such other special duties as may be assigned to him. Mr. Ray was born on March 24, 1876, at Metamora, Woodford county, Ill., and was graduated from the University of Illinois in 1898 with the degree of bachelor of science, and in 1910 received the degree of civil engineer from the same university. In 1916, Lafayette University gave him the honorary degree of doctor of science. In May, 1898, he began railway work as a chainman on the Illinois Central and subsequently served consecutively as rodman, inspector, instrumentman and assistant engineer. From March, 1901, to March of the following year he was supervisor of track, and then for one year was roadmaster on the same road. On March 15, 1903, he went to the Delaware, Lackawanna & Western as division engineer, at Scranton, Pa. From September, 1908, to January 1, 1909, he was with T. Burke, railroad contractor, at Scranton, and in January, 1909, he returned to the service of the D. L. & W., as chief engineer. His appointment as engineering assistant to the regional director of the Eastern Region became effective on February 1.

#### Federal and General Managers

The jurisdiction of **C. W. Galloway**, federal manager of the Baltimore & Ohio, Eastern lines, and associated lines,

with headquarters at Baltimore, Md., has been extended over the Morgantown & Kingwood.

The jurisdiction of **Charles H. Hix**, federal manager of the Norfolk & Portsmouth Belt-Line Railroad and the Hampton Roads Railroad Terminals, with headquarters at Norfolk, Va., has been extended over the Virginian Railroad.

**W. A. Winburn**, Federal manager of the Central of Georgia, the Louisville & Wadley, the Sylvania Central, the Wadley Southern and the Wrightsville & Tennille, has been appointed Federal manager also of the Augusta Southern and the Georgia & Florida, with office at Savannah, Ga.

**H. C. May** has been appointed federal manager of the Chicago, Indianapolis & Louisville and the Cincinnati Indianapolis & Western, with headquarters at Chicago, both roads having been released from the jurisdiction of **E. M. Costin**, federal manager. Mr. May's photograph appeared in the *Railway Age* July 18, 1918, on page 125. Previous to his appointment as federal manager, Mr. May was general superintendent of the Chicago, Indianapolis & Louisville.

**Leroy Kramer**, federal manager of the St. Louis-San Francisco, the Missouri, Kansas & Texas and the Missouri, Oklahoma & Gulf, has extended the authority of the following officers of the Katy & Frisco over the last named line: **C. N. Whitehead**, general manager; **C. Haile**, traffic manager; **W. F. Evans**, general solicitor; **J. G. Livengood**, general auditor; **G. E. Scott**, purchasing agent, and **S. G. Hoag**, industrial commissioner. The headquarters of these officers will be at St. Louis, Mo.

#### Operating

**J. W. Rector** has been appointed chief dispatcher of the Southern Railroad Lines, Richmond division, vice **Joseph Byrd**, granted leave of absence on account of sickness.

**F. A. Stine** has been appointed superintendent of dining car and restaurant service of the Delaware, Lackawanna & Western, with office at Hoboken, N. J., vice **J. L. Smith**.

#### Financial, Legal and Accounting

**W. P. Dewar** has been appointed acting Federal treasurer of the Missouri, Oklahoma & Gulf, with headquarters at Muskogee, Okla.

**Henry M. Piper**, paymaster of the Boston & Maine; the Montpelier & Wells River; the Barre & Chelsea; the St. Johnsbury & Lake Champlain, and the York Harbor & Beach, with office at Boston, Mass., was at his own request relieved of his duties on February 1, after 38 years' service with the Boston & Maine; **Nathaniel G. Hill** has been appointed paymaster to succeed Mr. Piper.

**B. Newhouse**, assistant federal auditor of the Minneapolis, St. Paul & Sault Sainte Marie, has been appointed federal auditor, vice **C. W. Gardner**, resigned to accept service with the corporation; **J. F. Heberle** has been appointed assistant federal auditor to succeed Mr. Newhouse, and **B. E. McCune**, auditor of disbursements, has been appointed assistant auditor; all with headquarters at Minneapolis, Minn.

#### Traffic

The title of **Nat Duke**, general freight agent of the Delaware, Lackawanna & Western, has been changed to freight traffic manager, and the title of **G. A. Cullen** has been changed from general passenger agent to passenger traffic manager, both with headquarters at New York. **J. L. Smith**, superintendent of dining car and restaurant service, with office at New York, has been appointed division passenger agent, with headquarters at Newark, N. J.

**W. G. Crush**, general passenger agent of the Missouri, Kansas & Texas of Texas (excluding the Trinity branch and the Beaumont & Great Northern), Houston & Texas Central and the Union Terminal of Dallas, has been appointed passenger traffic manager of all roads under the jurisdiction of **J. S. Pyeatt**, to succeed **J. L. West**, who has resigned to engage in other business. **J. S. Hershey**, general freight agent of the Gulf, Colorado & Santa Fe, the Texas Midland and the Houston Belt & Terminal, has been appointed freight traffic manager of all roads under the authority of Mr. Pyeatt.

G. J. Ray

Messrs. Hershey and Crush will have their headquarters at Dallas, Tex.

### Engineering and Rolling Stock

**J. L. Carver** has been appointed engineer of tests of the Illinois Central and the Yazoo & Mississippi Valley, with headquarters at the Burnside shops, Chicago, to succeed **M. W. Kramer**, deceased.

**J. H. Knowles** has been appointed chief engineer in charge of construction and maintenance of way and structures of the Western Pacific, the Tidewater Southern, and the Deep Creek, to succeed **T. J. Wyche**, who has resigned.

**C. J. Kelloway**, signal engineer of the Atlantic Coast Line, with office at Wilmington, N. C., has been appointed superintendent of signals, in charge of construction and maintenance of signals and interlocking plants on the Atlantic Coast Line, the Winston-Salem Southbound and the Tampa Southern.

**J. M. Kinkead**, supervisor of the Pennsylvania Railroad, at Altoona, Pa., has been appointed division engineer of the Trenton division, with headquarters at Trenton, N. J., succeeding **H. H. Garrigues**, who has been transferred as division engineer to the Philadelphia Terminal division, at West Philadelphia, Pa., succeeding **John Atlee**, deceased.

**G. M. O'Rourke**, track supervisor on the Illinois Central, at Carbondale, Ill., has been promoted to roadmaster on the Indiana division, with headquarters at Mattoon, Ill., to succeed **F. B. Oren**, who has been transferred to the Illinois division, with headquarters at Champaign, Ill. Mr. Oren succeeds **W. C. Costigan**, who has been assigned to other duties.

**Louis L. Tallyn**, division engineer of the Delaware, Lackawanna & Western, at Scranton, Pa., has assumed the duties of chief engineer with the title of acting chief engineer during the absence of **G. J. Ray**, chief engineer, who is serving as engineering assistant to the regional director of the Eastern Region. Mr. Tallyn was born at Benson, Ill., and was educated in the University of Illinois, where he received the degree of B. S. in C. E. He began railway work on June 1, 1901, as instrumentman on the Chicago, Burlington & Quincy, and the following year he became transitman on the Illinois Central. From 1903 to 1904 he served as division engineer on the Chicago, Cincinnati & Louisville, now the Chesapeake & Ohio of Indiana, and then entered the service of the Delaware, Lackawanna & Western as assistant engineer. He remained in that position until 1910 and then became superintendent of water service. Since 1911 he served as division engineer until his recent appointment as acting chief engineer of the same road, as above noted.

### Purchasing

The jurisdiction of **W. J. Diehl**, general storekeeper of the Mobile & Ohio, with headquarters at Mobile, Ala., has been extended over the Gulf, Mobile & Northern.

**C. L. Nash** has been appointed division storekeeper of the Mobile & Ohio, with headquarters at Tuscaloosa, Ala., succeeding **T. S. Edgell**, who has been transferred to other duties.

## Corporate

### Executive, Financial, Legal and Accounting

**W. W. Collin, Jr.**, assistant general counsel of the Pennsylvania Lines West, representing the corporation, has resigned to become a member of the law firm of Borders, Walter & Burchmore.

**Cecil Edward Friend**, who has been appointed controller of the Canadian National Railways, with headquarters at Toronto, Ont., as has already been announced in these columns, was born on October 12, 1871, at Brighton, England, and was educated in private schools. He began railway work on December 1, 1893, with the Canadian Pacific as private secretary to the traffic manager, at Winnipeg, Man. In Oc-

tober, 1896, he became stenographer and the following June was appointed chief clerk and accountant in the office of the superintendent of the Canadian Northern, at Winnipeg. He later served as auditor, and from July 1, 1910, as general auditor at Winnipeg, on the same road, until his appointment as controller of the Canadian National Railways, with office at Toronto, Ont., as above noted.

### Operating

The jurisdiction of **T. J. Lowe**, fuel agent, of the Canadian National Railways, with headquarters at Winnipeg, Man., has been extended to include all Western lines.

**W. E. Leith** has been appointed superintendent and general freight and passenger agent of the Sewell Valley Railroad Company, with headquarters at Rainelle, W. Va., vice **R. E. Shinn**, deceased.

**F. S. Elliott**, chief operating officer of the Spokane & Inland Empire, with headquarters at Spokane, Wash., resigned on February 1, and the position of chief operating officer has been abolished. **J. F. Gannaway**, assistant superintendent, with office at Spokane, has been appointed superintendent.

### Traffic

**J. O. Apps**, general baggage agent of the Canadian Pacific, with office at Montreal, Que., has been appointed general agent, mail, baggage and milk traffic, with office at the same place.

The general manager for the receiver of the Manistee & North-Eastern announces that **F. A. Mitchell** has resigned the office of general traffic manager, and that office has been abolished. **D. Riely**, general freight and passenger agent, with office at Manistee, Mich., will in future handle all matters pertaining to traffic.

**S. Osborne Scott**, whose appointment as general passenger agent of the Canadian National Railways, with jurisdiction over lines west of Port Arthur, Ont., Armstrong and Duluth, Minn., was announced in the *Railway Age* of January 24, was born at St. Andrews, Man., in 1881. He graduated from the University of Manitoba in 1901, and immediately entered the service of the Canadian Northern as a junior clerk in the audit department. In 1903 he became a clerk in the traffic manager's office at Winnipeg, Man., which position he held in 1907, when he took charge of the ticket stock, baggage and advertising. In 1910 he was appointed traveling passenger agent, with headquarters at Toronto, Ont., but later was removed to Winnipeg as chief clerk in the passenger department. From 1911 to the date of his recent appointment as general passenger agent he has been assistant general passenger agent. His new headquarters will be at Winnipeg.

S. O. Scott

The following appointments have been made on the Canadian National Railways, effective January 25: **James Morrison**, assistant general passenger agent of the Canadian Northern, lines east of Port Arthur, has been appointed assistant general passenger agent, and **J. E. LeBlanc**, district passenger agent of the Canadian Government Railways, has been appointed district passenger agent, both with offices at Montreal, Que., and with jurisdiction over Garneau, Levis and west to North Bay, Smiths Falls and Brockville; **H. C. Bourlier** has been appointed assistant general passenger

agent, with office at Toronto, Ont., and with jurisdiction over Brockville, Smiths Falls and west to Port Arthur.

James Edward, division freight agent of the Grand Trunk, with office at Ottawa, Ont., has been appointed division freight agent, with headquarters at Montreal, Que., vice G. T. Pettigrew, resigned to go into other business. R. J. S. Weatherston, division freight agent at Stratford, succeeds Mr. Edward and Vivian G. Snell, commercial agent at Moncton, N. B., has been promoted to division freight agent, at Stratford, to succeed Mr. Weatherston.

J. M. Macrae, whose appointment as assistant general freight agent of the Canadian National Railways, lines west of Port Arthur and Armstrong, Ont., and Duluth, Minn., was announced in the *Railway Age* of January 24, was born at Stornoway, Scotland, in 1884. He entered the service of the Canadian Northern at Winnipeg, Man., in 1906, in the accounting department. In 1907 he went with the Canadian Pacific as a stenographer in the office of the assistant freight traffic manager, remaining with that company as tariff clerk, assistant chief clerk and chief clerk in the freight traffic department until 1911, when he entered the service of the Imperial Oil, Ltd. (Canadian subsidiary of the Standard Oil Company), in charge of traffic matters in western Canada. In 1912 he re-entered the service of the Canadian Northern as district freight agent at Saskatoon, Sask., remaining in that capacity until the date of his promotion to assistant general freight agent.

R. Creelman, assistant passenger traffic manager of the Canadian National Railways, lines west of Port Arthur, Armstrong, Ont., and Duluth, Minn., with headquarters at Winnipeg, Man., whose appointment was announced in the *Railway Age* of January 24, began railway work with the Grand Trunk in 1890. He was consecutively junior clerk, ticket clerk (Toronto, Ont., office), ticket clerk (depot office) and chief clerk to the district passenger agent until 1900, when he went to the Canadian Pacific as rate clerk in the passenger department at Winnipeg. He became chief rate clerk for the Canadian Northern in 1901, and in 1902 became city ticket agent for the Northern Pacific at Winnipeg. Re-entering the employ of the Canadian Northern in 1906, as traveling passenger agent with headquarters at St. Paul, Minn., he was subsequently commercial agent, with headquarters at St. Paul, assistant general passenger agent at Winnipeg, and in 1911 was appointed general passenger agent, which position he held until his recent appointment as assistant passenger traffic manager of the Canadian National Railways.

Walter Hately, whose appointment as assistant general freight agent of the Canadian National Railways, with headquarters at Winnipeg, Man., has already been announced in these columns, was born on March 5, 1887, at Brantford, Ont., and was educated in the public schools of his native town and at Collegiate Institute. He began railway work in March, 1904, with the Grand Trunk as a clerk in the local freight office at Hamilton, Ont., and in August, 1908, he became an accountant in the superintendent's office at Toronto. From September of the following year to October, 1913, he was a clerk in the freight tariff bureau of the same road at Montreal, and then served for two years as a clerk in the freight tariff bureau of the Canadian Northern, at Winnipeg. From October, 1915, he was chief of the tariff bureau of the Canadian Northern, until his recent appointment as assistant general freight agent of the Canadian National Railways, in

charge of publication of tariffs and subdivisions for lines west of Port Arthur, Ont., Armstrong and Duluth.

### Engineering and Rolling Stock

A. L. Graburn, assistant superintendent of rolling stock of the Canadian Northern, with office at Toronto, Ont., has been appointed general fuel agent of the Canadian National Railways, with office at Toronto.

### Purchasing

E. H. O'Neil, general superintendent and purchasing agent of the Manistee & Northeastern, with office at Manistee, Mich., has resigned and the office of general superintendent has been abolished. W. D. Manchester has been appointed purchasing agent to succeed Mr. O'Neil.

### Obituary

John B. Frost, superintendent of transportation for the Oliver & Snyder Steel Company, Union Town, Pa., died January 30, age 67. Mr. Frost served for 25 years with the Baltimore & Ohio in various capacities and has been head of the Oliver & Snyder transportation department for the past 18 years.

David B. Keeler, vice-president of the Fort Worth & Denver City, the Fort Worth & Denver Terminal, the Wichita Valley, the Wichita Falls & Oklahoma, the Stanford & Northwestern and the Abilene & Northern, died on February 1, at Fort Worth, Tex., after an operation. He was 70 years old. Mr. Keeler began railroad service in 1871 with the Denver Pacific, remaining with that road until 1875, when he became agent for the Colorado Central at Golden, Colo. Subsequently he held various positions with the Colorado Central and St. Louis Pacific and in 1890 he became assistant general freight agent of the Union Pacific at Denver, Colo. In 1899 he entered the employ of the Fort Worth & Denver City as general freight and passenger agent, being elected vice-president and traffic manager in 1899, and vice-president in 1906. In 1907, he was also elected vice-president of the Wichita Valley.

Francis La Bau, traffic assistant to the regional director, Eastern Region, died on February 1, at his home in Tarrytown, N. Y. He was born on December 13, 1859, at Rahway, N. J., and was educated at the Moravian Institute, Nazareth, Pa. He began railway work in 1879, as local waybill clerk on the Pennsylvania Railroad at Philadelphia, Pa., and subsequently served in various positions in the same office until 1882, when he became a clerk in the division freight office of the United Railroads of New Jersey division. He then served consecutively as secretary to the freight traffic manager of the New York, West Shore & Buffalo, and as chief clerk to the traffic manager of the West Shore. From 1891 to January, 1893, he was assistant general freight agent of the same road and was then promoted to general freight agent. In July, 1904, he became assistant freight traffic manager of the New York Central & Hudson River and the West Shore. In May, 1907, he was promoted to freight traffic manager of the New York Central. From December, 1914, to August 1, 1917, he was freight traffic manager of the lines east of Buffalo. He was then appointed traffic manager of the same lines, and since June, 1918, served as traffic assistant to the regional director, Eastern Region, with office at New York.

## Railway Age

Since incorporation, the Southern Railway has been financed under the auspices of J. P. Morgan & Company. The company's stock had been held in a voting trust until June 30, 1914, and Morgan & Company were the dominant factors in this voting trust. Last week, however, when the Southern Railway sold \$25,000,000 notes to refund notes which fall due March 1, the underwriting was done by a Chicago syndicate, headed by Halsey, Stuart & Company. Morgan & Company gave out a short statement to the effect that the Chicago syndicate did it with their (Morgan's) blessing. The notes were offered to the public at 99 $\frac{1}{4}$ , and run three years at 6 per cent, making the interest yield slightly over 6 $\frac{1}{4}$  per cent to the investor. Everybody knows that there is no love lost between John Skelton Williams, controller of the currency, and the National City Bank, the National City Company and Morgan & Company. Probably Mr. Williams was only too glad to see someone go in and underbid Morgan & Company for Southern Railway financing. Now comes the test, however, as to whether or not these notes can be sold at the price at which Halsey, Stuart & Company have to offer them to make any profit on the bid which they made to the railway company. If any set of bankers, either in New York or in the west, are misjudging the bond market and are unduly pessimistic as to the price at which railroad securities can be sold, it is for the public good that someone else should have the courage of his convictions and prove the more pessimistic bankers wrong. The sale, sometime ago, of \$50,000,000 bonds by the Pennsylvania, through Kuhn, Loeb & Company, was eminently successful. If this sale of Southern Railway notes should prove anything like the same sort of success, it would be a most encouraging sign for the railway situation in general.

As pointed out in an article on the activities of our railway forces in France, published elsewhere in this issue, the military organization of our transportation corps has necessitated the maintenance of a personnel bureau the duty of which is to keep a careful record of the education, experience and performance of every enlisted man and officer in the service. Those who have had experience under this plan are convinced of its value in helping discover weaknesses in the organization and in making possible the ready application of remedial measures. The question has arisen in the minds of some of our railway officers in France whether the personnel bureau scheme could not be profitably adopted by the railroads of this country. Under existing conditions here it is too often the case that, while weaknesses become evident, they are not traced to their sources. Under the method used in France the discovery of inefficiency in any department has led to a careful examination of the individual records of officers and employees in that branch to see if the source of the trouble could not be found. In this connection it is pointed out that the work of the personnel bureau might be vitiated if it were subordinated to any one railroad department. The independence of its activities is essential to its success, and accordingly it is proposed that the bureau be

directly under the authority of the chief executive—federal manager, general manager or president, as the case may be. The objection may be raised, and perhaps not without reason, that it will be difficult to establish successfully any fair method of rating the work of railroad men. Many of their activities are not sufficiently tangible to render unnecessary the exercise of a wide range of discretion on the part of supervisory officers. Certainly, however, the desirability of the establishment of personnel bureaus is well worth considering.

While several of the monthly reports of freight traffic movement and car performance issued by the Operating Statistics Section of the Railroad Administration have shown gains in efficiency, the report covering the full calendar year 1918 does not make an especially strong showing for government control as compared with that of the year before. While the volume of traffic as measured by net ton miles of freight handled shows an increase of 1.8 per cent and the net ton miles per mile of road per day increased from 5121 to 5210, the report also shows that this was done with an average increase of 2.9 per cent in freight cars on line. While car efficiency has been increased by heavier loading, credit for which must be shared with the shippers and the Food Administration, the full gain in this item is not reflected in the train loading figures and the average mileage per car per day fell below the record for 1917. While the tonnage per car was increased from 27 to 29.1 or 7.8 per cent, the increase in the average tonnage per train was increased only from 653 to 682, or 4.4 per cent. The miles per car per day fell off from 26.1 to 24.9, or 4.6 per cent, and the net ton miles per car day decreased from 495 to 490, a reduction of 1 per cent. The increase of 1.8 per cent in net ton miles was handled with a reduction of 2.5 per cent in train miles and of 2.1 per cent in car miles, but the decrease of 5.6 per cent in loaded car miles was to a considerable extent offset by an increase in the empty car mileage of 6.1 per cent, the percentage of loaded to total car miles having been reduced from 70.2 to 67.7. The percentage of unserviceable cars also shows a slight increase, from 5.6 per cent in 1917 to 5.7 in 1918. While the railroad system under federal control has handled a slightly larger traffic in 1918 than was handled in 1917, at an increase in expenses of \$1,200,000,000, the report of the Operating Statistics Section shows that the principal aspect of increased efficiency was in heavier car loading and to a lesser extent in the train leading.

By paragraph five of General Order No. 8, issued February 21, 1918, which reads: "No discrimination will be made in the employment, retention or conditions of employment of employees because of membership or nonmembership in labor organizations." Director General McAdoo opened the door for labor unions to enter the railway field on all sides and to thoroughly develop and perfect their organizations. This has been done. By supplement No. 4 to General Order No. 27, issued in midsummer, he tended to discourage the railway

employees from working piecework by granting a material increase in the hourly wage, with no adjustments in the piecework rate. The difference between the piecework rate and the hourly wage was so great that only those of exceptional ability and agility could, with the unadjusted piecework rate, earn more than was paid under the hourly rate. Those who could not compete with the increased hourly rate naturally saw the futility of exerting themselves for no monetary gain and their output accordingly declined. There were, however, quite a few who still were able by their diligence and skilfulness to earn sufficiently more than the increased hourly rate to make piecework attractive to them. To make the victory for the hourly rate complete Director General McAdoo on December 31 issued instructions that the question of whether or not the piecework system should be abolished entirely be put to a vote of the employees themselves and that the railroads under government control be governed by the will of "a substantial majority." The returns are nearly complete. With the men now so thoroughly organized and with such a small number of employees able to make piecework pay under the discriminatory rates, there is but one answer. Efficiency and output have been sacrificed to further what organized labor believes to be to its interest, whereas, the truth is, the complete abolition of piecework will result in a decline of efficiency which will be harmful to all concerned and most of all to labor itself.

## Don't Lose Your Punch

“WHAT'S THE USE; what's the use.” This is the drone-like murmur that can be heard on approaching any government-run institution. This attitude is a slow poison and an ambitious man might as well acquire a drug habit as to surrender himself to its deadening embrace. Since the signing of the armistice railroad men have been exposed to this poisonous influence in a doubly dangerous way. Added to the dulling influence that accompanies all bureaucratic regimes, there is the added uncertainty, for the railroad man, in regard to his future employer. There is only one way to overcome this, and that is to fight, and fight hard against it. Fall back on your self-respect, refuse to let petty injustices weigh on your mind, stand out for what you know to be right!

This applies all down the line; to the mechanical and engineering departments as well as to the operating department. If the mechanical department is being supplied with "standardized material" which is uneconomical and does not give satisfactory service, the foreman and the master mechanic should bring this fact forcibly to the attention of superior officers. The same is true in the engineering department as regards supervisors and division engineers. In the operating department if materials or conditions are unsatisfactory and uneconomical, complaint must be made to higher officers. The true state of affairs can only become known to federal managers, regional directors and the central administration by each officer down the line vigorously and fearlessly protesting against conditions which, in his judgment, are wrong.

Surely, the American railroad man is not going to lose his punch because of a touch of government operation and a temporary combination of adverse circumstances. The master mechanic, the division engineer, the trainmaster and superintendent are having a hard row to hoe, but it is no harder and not as deep and broad as that which the federal manager has to hoe; and it is the falsest sort of philosophy to give up to a feeling of "What's the use." If conditions are wrong, each man has got to put his shoulder to the wheel to right them, and it is helping neither the federal manager nor the central administration to refrain from protesting against materials or conditions which are uneconomical and unsatisfactory.

## Early Action Regarding the Railways Needed

TWO RAILWAY PROBLEMS confront the country. One is the problem of the ultimate disposition of the railroads. This cannot be solved during the present session of Congress. The other is the problem presented by the policy of drastic retrenchment which is now being followed, and which if persisted in will have a very bad effect upon the industry and workers of the nation during the period of transition from a war to a peace basis. This problem can and should be solved almost immediately. The policy of retrenchment being carried out applies not only to additions and betterments, which would require capital expenditures, but also to maintenance and renewals, which would be chargeable mainly to operation.

With the reduction of traffic and earnings which has occurred and is still continuing, the Railroad Administration is justified in effecting every economy which will not unduly impair the service rendered or cause deterioration of the physical properties or prevent making up deferred maintenance.

It is plain that the railroads are overmanned in many departments. The public should not be compelled to pay in the form of rates or taxes the wages of men or the cost of materials which are not needed. But both the present and the future welfare of the public demands that all the men shall be employed, and all the materials shall be bought and used that are needed to offset deferred maintenance and to put the properties in condition to handle not only present, but future business.

The Railroad Administration is not following a policy of rigorous retrenchment because it really desires to. It is following it mainly because the government, as an operator of railroads, is practically bankrupt. The revolving fund of \$500,000,000 which was provided by Congress last year is almost exhausted, and the railroads are not earning enough and operating income to pay the guarantees of standard return to the companies. In consequence, the Railroad Administration is getting into sore need of funds. With its deficit rapidly growing, it cannot carry out an adequate program of maintenance, much less an adequate program of additions and betterments, unless and until Congress provides it more money. Director General Hines has asked for a new revolving fund of \$750,000,000. This will be needed whether government operation is continued or the railroads are returned to private operation. The legislation necessary to provide it should be passed at the present session of Congress. It is difficult to see how, unless this is done, the policy of retrenchment in maintenance can be discontinued until Congress meets again.

If the policy of retrenchment is continued unabated it will have serious effects, not only upon the railroads, but upon other industries. The *Railway Age* in its issue of February 7, page 337, published letters from twenty-seven railway supply concerns clearly indicating what will be the effects upon the railway supply industry unless the Railroad Administration soon begins to place larger orders. A continuance of the present policy means calamity to the railway supply industry and its employees. Furthermore, the railway supply industry is so large and extends so widely over the country that if it is compelled to close its plants and discharge its men, the effects will be felt by concerns and their employees in almost every other line of industry. Congress should not adjourn without providing a new revolving fund for the Railroad Administration, and the sooner this is done, the better it will be for the entire nation.

With respect to additions and betterments, which require capital expenditures these cannot be made without concerted action by the Railroad Administration and the companies that own the railroads. While the future of the rail-

ways is so completely undetermined, neither the Railroad Administration nor the companies will be disposed to enter upon large projects for extensions and permanent improvements. Congress cannot at its present session pass legislation finally to settle the railroad question. The time is too short. It will soon have before it, however, enough data, arguments and plans to reach as complete and constructive a solution as it would have if it continued to consider the subject for five years, or even for ten years. This being the case, the legislation needed for a permanent solution could and should be passed during the present year. That is, it could be if an early special session of the next Congress should be called soon after the adjournment of the present Congress. Therefore, the course which should be taken by the government in dealing with the present railway situation is clear.

First, the present Congress should promptly pass legislation providing the Railroad Administration with a new and adequate revolving fund.

Second, the new Congress should be called together in extra sessions soon after March 4, and should as speedily as practicable draft and adopt the legislation which is clearly needed and which the nation obviously wants, providing for the early return of the railways to the management of their owners under conditions which will render it practicable for the companies to operate their properties efficiently and economically, and to enter immediately upon a program of additions and betterments which will tend to equip the railways satisfactorily to handle the commerce of the country when business again becomes normal.

Every citizen, every business concern, every commercial organization, that is anxious to promote the public welfare, both during the present period of transition and during the period of great opportunity for American business which will follow it, should urge upon the Administration and Congress the need for action along these lines.

## Enormous Increase in Expenses

THE STATISTICS of railway earnings and expenses for December 1918, as reported by the Interstate Commerce Commission, show that the downward trend of railway net operating income continued through that month. As pointed out by the *Railway Age* in an editorial in its issue for January 24, page 236, net operating per month income steadily declined from \$128,000,000 in August to \$57,000,000 in November. In December, for 175 large roads, it was only \$23,000,000.

The bad showing in December was due almost entirely to an increase of operating expenses. In December, 1917, the weather and other operating conditions were as bad as were ever known, and yet the operating expenses of the railways included in the Commission's report were only \$238,582,000. In December, 1918, the weather conditions were as favorable to economical operation as were ever known, and yet the expenses were over \$375,282,000, making an increase over December, 1917, of \$136,700,000.

Undoubtedly this enormous increase in expenses was partly due to the fact that large retroactive advances in wages were charged into the December accounts. On the other hand, there are still large wage advances to be made to the train service employees and the Railroad Administration is not making adequate expenditures for maintenance which would be chargeable to operating expenses. The December figures alone would indicate that operating expenses are increasing at the rate of over \$1,600,000,000 a year. It is to be feared that when all necessary adjustments in the accounts are made, and advances in wages now pending are granted, it will be found that for handling a corresponding amount of traffic, operating expenses are running at the rate of \$1,500,000,000 a year more than those of 1917

The statistics for December are accompanied by statistics showing the results of the same roads for the twelve months of 1918. The 175 large roads included, having a mileage of 214,000 miles, had an increase in earnings during the entire year of \$824,000,000, or 21.6 per cent; an increase in expenses of \$1,090,000,000, or 40 per cent; and a reduction of operating income of \$265,000,000, or almost 30 per cent. Of the increase in total earnings, over \$600,000,000 must have been due to advances in rates. Without the advances in rates the Railroad Administration would have had a deficit at the end of the year exceeding three quarters of a billion dollars.

In spite of the enormous increase in expenses, officials of the Railroad Administration continue to point out economies which have been effected. These economies are real, but most of them cannot be permanent. For example, R. H. Aishton estimates the economies he has effected during the year, first as director of the Western Region and later of the Northwestern Region, at \$34,000,000. It is a notable fact, however, that Mr. Aishton's statistics show that over \$23,000,000 of these economies were effected by reductions of passenger train service, most of which cannot be continued permanently.

On the whole, the available statistics indicate that the present system of government operation of the railways would have proved enormously more expensive than private operation, even in the absence of any advances in wages.

## A Billion Dollar "Germ"

A. B. GARRETSON, president of the Order of Railway Conductors, testifying on behalf of 14 railroad labor organizations, claiming to represent 1,900,000 employees, told the Senate committee that the three other brotherhood executives and many of the heads of the other organizations had been opposed to government ownership on principle all their lives, but had been converted by the experience of the past year under government operation of the railroads. He said that government operation had not had a fair trial as to its efficiency during its first year but that the employees had seen in it the "germ" of what might be made of it after a fair trial. Therefore the representatives of the 14 organizations had unqualifiedly endorsed the plan proposed last week on behalf of the brotherhoods by their counsel, Glenn E. Plumb, which has been characterized as a plan for "government ownership and brotherhood operation."

The particular aspect of government operation during the past year which has been most visible to the employees has been the increases in wages awarded them by Mr. McAdoo, which are now estimated at between \$800,000,000 and \$900,000,000 a year and which will be increased by possibly \$60,000,000 to \$100,000,000 by the latest demands of the brotherhoods. If this is merely the "germ," the future possibilities looming up in the minds of the leaders of the brotherhoods and of the ten other organizations affiliated with the American Federation of Labor with whom they have joined forces must be rather interesting. Some of the roots and branches which might be developed from such a germ were described in the statement presented before the committee last week by Mr. Plumb. He proposed that the government buy the railroads by issuing its bonds in exchange for the outstanding securities, furnish all the working capital, and turn the operation over to a corporation administered by a board of directors, one-third to be chosen by the classified employees, one-third by the President of the United States—presumably by and with the advice and consent of the brotherhoods and the American Federation of Labor—and one-third by the appointed officers. After the plan got under way the officers would be appointed by this board of directors and no remarkable gift of vision is required to discern another germ in this part of the scheme.

Mr. Garretson spoke of furnishing transportation not for profit but at cost, but he said that no effort had been made to settle on all the details of the plan. Mr. Plumb's plan contemplated profits, to be divided one-half to the government and one-half to the employees in the form of a wage dividend. With the employees electing and assisting to elect the directors, who would appoint the officers, we can readily see how Mr. Garretson's ideal of transportation without profits might be attained, but Mr. Plumb presents a sample array of figures from which, by assuming an operating ratio of 70 per cent, he produced a profit, after payment of fixed charges, of \$500,-000,000 to be divided equally between the government, which would furnish all the capital, and the employees, who would have been paid their wages. This would leave \$250,000,000 for a wage dividend, which, divided among 2,000,000 employees, would give an average of \$125 to each.

After the precedents set by Mr. McAdoo in the way of two or three increases in a year with back pay we fear that Mr. Plumb's assumed figures are too modest to satisfy his clients, but as a germ the idea has great possibilities.

## New Books

*Proceedings of the International Railway Fuel Association, edited by J. G. Crawford, secretary, 200 pages. Illustrated, 6 in. by 9 in. Bound in leather. Published by the association, 702 East Fifty-first street, Chicago. Price, \$1.50.*

The convention of the International Railway Fuel Association held in Chicago in May, 1918, was a notable event. The association met at a time when the fuel situation was most serious and the addresses delivered at the convention represent the ideas of some of the most distinguished men who were called on to deal with that problem during the war. These addresses are published in full in the proceedings of the association which have just been issued. There is hardly a phase of the railroad fuel problem that is not covered. The viewpoint of the miner is presented by John P. White. The mine operators are represented by Harry N. Taylor. The work of the Fuel Administration is outlined by P. B. Noyes and M. L. ReQua; of the Railroad Administration by R. H. Aishton, Eugene Auliffe, F. McManamy, E. H. DeGroot and W. S. Carter. There are also addresses by the president of the association, E. W. Pratt, Robert Quayle, Thomas Britt and several returned soldiers.

*Modern Management Applied to Construction, by Daniel J. Hauer, consulting engineer. 6 in. by 9 in., 194 pages, illustrated. Bound in cloth. Published by McGraw-Hill Book Company, Inc., 239 W. 39th Street, New York City. Price, \$2.50.*

This is a new book on scientific management and, whereas most of the previous treatments of this subject have referred primarily to manufacturing and building construction, this book treats the subject from the standpoint of the construction contractor handling grading work, building bridge masonry, etc. The subject is handled in a style that is entertaining, primarily because of the frequent use of examples and hypothetical conversations. This has been applied most aptly in the initial chapter defining scientific management, and the one following on the old versus the new management. The author's justification for the application of scientific management is covered in a chapter entitled "Finances and Efficiency." In handling the subject from the standpoint of the construction contractor, it is divided under the separate heads of plant design, motion study, modern management, cost keeping and bookkeeping, organization, and the effect upon the workmen. The final chapter deals with the organizations of the large war construction projects.

## Letters to the Editor

### A Suggestion for a Seniority Index

PORTSMOUTH, Ohio.

#### TO THE EDITOR:

When employees' records are kept and used in connection with the promotion of employees on a seniority or service basis, a numerical index often takes considerable burden off the office and makes the work more pleasant and easier.

By assigning a certain number to each employee immediately on entering the service, each successive employee being assigned the next higher number, an automatic seniority index will be obtained for daily use in the assigning or placing of employees in proper positions according to their respective seniority, and for use in other ways as may be necessary.

For the information of the employees themselves the usual seniority list arranged in date order showing the names of employees should be kept, each employee should be informed of his service number and he should use it in turning his reports into the office when bidding for a new position.

In this way one employee will only be burdened with one number (or seniority record) instead of one employee burdened with all seniority records, making for greater accuracy and speed to the benefit of all concerned.

The necessary care should be exercised to see that a correct number is assigned in the first place, and that no change is made in numbers after once assigned, unless there is an absolute necessity therefor.

The lower number would of course indicate the man longest in the service. If a class of promotion made it necessary to distinguish that service with some mark, in order to avoid changing any employee's number, a letter may be affixed or prefixed to the number, a certain letter indicating a certain class of service, and so on.

As employees leave the service for any cause their numbers then become obsolete as far as the working seniority list is concerned and these numbers should not be assigned to any other employee again, but should be retained to cover the employee to whom first assigned, or discarded entirely.

In order to keep the number record accurate at all times, a small book should be used, showing names of employees consecutively in the order employed, with the number assigned at the time of employment, which will indicate at all times what number is assigned to any certain employee, and what is the next number to be assigned. The alphabetical index which is already used in most offices, should, of course, carry opposite the employee's name his assigned number. These two records are easily kept and assure correctness of assignment.

I believe that this method will be found to be a great convenience and a time saver. It should prove of special value in view of the fact that recent awards of the Railroad Administration to various classes of railroad employees gives to each class a seniority standing, and many positions will no doubt be hereafter filled more or less on that basis. The numerical index provides a ready and accurate reference in determining the relative standing of one or any number of employees. If it is desired to designate numbers from one central office to cover several subdivisions, the addition of a letter prefix or suffix will admit of that without change or confusion, and permit the use of only one series of numbers—that is, commencing with number 1, or any desired number, and progress in consecutive order indefinitely. PAUL JONES.

# Further Light on Work of Railway Men in the War

## Transportation Corps Shows Marked Adaptability in Solving Problems Under Strange Conditions

Tours, France, January 5, 1919.

NOTHING HAS CONTRIBUTED MORE to the success of the transportation efforts of the American forces in France than the adaptability of the officers and men in charge of this work. In a strange country, unfamiliar with the language, on a railway system utilizing operating methods foreign to their experience, the Americans handled a rapidly increasing flow of troop and freight traffic with such evident efficiency that they won the unqualified praise of the French with whom their activities were co-ordinated. Whether engaged exclusively in the movement of American trains, or assisting the French either by bolstering up their weakened railway organizations or by operating lines in the danger zone near the front, the transportation officers and men from the United States proved ready and able to meet every emergency which confronted them.

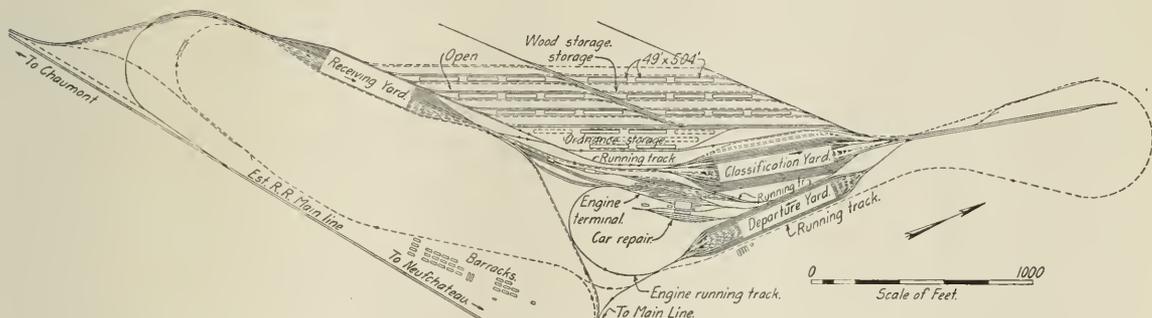

Contrary to the general impression that the railway forces constituted one unit of the American Army, they formed three classes: (1) those who operate on the railways of France independently of the existing French organizations; (2) those who were merged with the French transportation forces and became substantially French employees, and (3) those regiments which operated lines close to the fight-

of railway men, in the Transportation Corps commanded by Gen. W. W. Atterbury. This article pertains wholly to the work of the first two classes of railroad forces, and not to the third just mentioned.

### The Housing of Railway Troops

It is not generally known in the United States that the American railway troops, while engaged in work similar to that in which they were employed in civilian life, nevertheless are subject to the same discipline and the same living conditions as the other army contingents. All railway men work in uniform, live in barracks—most of which were built by themselves—and are organized according to the military plan, with various ranks ranging from general down to private. Each railroad employee has been provided with a special design of cap with a visor, similar in appearance to the headgear of automobile chauffeurs, and also with a 21-jewel Hamilton watch.

The problem of providing these men with sanitary and properly equipped barracks, and with food and water, as well as with adequate medical care, has been by no means simple, especially in view of the fact that the railway offi-

Regulating Station at Liffol Le Grande. Full Lines Show Portion of Yard Completed on November 15

ing front under the direction of the French military authorities. The first class constitutes a complete railroad organization superimposed upon and co-ordinated with the French organizations which operate trains over the same lines. The second class was a contribution to the French railway personnel which was seriously depleted by the drain of the war upon the man power of the railroads of France. In this connection, it is interesting to note that bitter experience taught the French, as well as the English, the folly of permitting their transportation organizations to be crippled by the loss of officers and employees drafted into military service. Tardy efforts were made to recall these men to their civilian occupations and, while a considerable number were returned to service, the initial loss was by no means made up.

The third class of American railway forces consists of regiments which first arrived in France and were employed in operating trains from regulating stations to light railways close to the front. There were three of these units out of the first nine regiments organized in the United States, which worked under the direction of the French military authorities. While these contingents remained a part of the American army, they were not, like the other two classes

of railway men, in the Transportation Corps commanded by Gen. W. W. Atterbury. This organization keeps a careful record of every man in the service, which includes information concerning his education, a detailed statement of all the positions he ever held, his military rank and the promotions he has received, if any, and also a rating of the quality of his work. Equally careful records of the officers are maintained, each of which is given a quarterly standing according to his efficiency, intelligence, leadership and general value to the service. The distinct advantage of this classification is that it makes the source of weaknesses in the organization evident by an examination of the records and therefore greatly facilitates the intelligent application of corrective measures. Though all railway troops were organized into military units and were given various ranks according to that scheme of organization, it does not always happen that one's

### The Personnel Bureau

Another duty imposed upon those in charge of the railway forces by army regulations was the maintenance of a personnel bureau. This organization keeps a careful record of every man in the service, which includes information concerning his education, a detailed statement of all the positions he ever held, his military rank and the promotions he has received, if any, and also a rating of the quality of his work. Equally careful records of the officers are maintained, each of which is given a quarterly standing according to his efficiency, intelligence, leadership and general value to the service. The distinct advantage of this classification is that it makes the source of weaknesses in the organization evident by an examination of the records and therefore greatly facilitates the intelligent application of corrective measures. Though all railway troops were organized into military units and were given various ranks according to that scheme of organization, it does not always happen that one's

military grade conforms to his importance as a railway man. Sometimes, for instance, an engineman would be a private while the fireman on the same train would have the rank of sergeant. Irregularities of this kind, however, did not interfere with the conduct of the work of the transportation troops.

**The Work of the Railway Troops**

The American Expeditionary Forces first loaned railway men to the French operating organizations in the middle of April, 1918. About May 1, 1918, the American railway organization commenced the operation of its own trains over the French roads under trackage rights. Some idea can be gained concerning the relative number of men in the two services from recent statistics regarding the distribution of engine and trainmen under the general manager of the Service of Supply of the Transportation Corps. While the engine and trainmen operating in exclusively American service numbered 4,531, those engaged in French service numbered 2,222.

Because of the difference between French and American operating methods no officers or men have been permitted to engage in actual railway work until they have received a course of instruction from French railway officers, who have grounded them thoroughly in roundhouse and shop practice, train rules, the signal systems, etc. No man was discharged from this course of instruction without passing a successful examination and receiving a certificate as evidence that he has done so.

When the Americans first began to operate trains they used French and Belgian locomotives and both French and American cars. Later, when the American locomotives arrived, some were loaned to the French and the others were utilized by the Americans to take care of existing needs. This mixing of equipment continued up to the time of the signing of the armistice, and while American cars were equipped with air brakes, it was not until late in the fall that it was possible to make up trains entirely of American cars and thereby make full use of the air brake system. This circumstance was due to a large extent to the fact that the French railroads were continuously confronted with a serious shortage of cars and it was necessary to avoid any waste movements of equipment. In fact, at times it was necessary to cover open cars with tarpaulins and thereby put them into service ordinarily performed by box cars. The readers of the *Railway Age* have previously been advised that the French had no car record system until a car record bureau was established by the American railway organization. To facilitate car tracing, the French turned over to the Americans a number of wires, which the signal corps of our forces adapted to our needs. At first telephone service was established for this purpose, but later telegraph lines were opened and utilized.

When the Americans commenced the operation of their own trains they were assigned certain stalls in French roundhouses for the use of their locomotives. Later, however, the Americans erected their own engine houses, generally, at other locations. The difference in the sites of the engine terminals was determined by the difference in the length of the engine runs of the two operating organizations. In general, two American engine runs equaled three French runs.

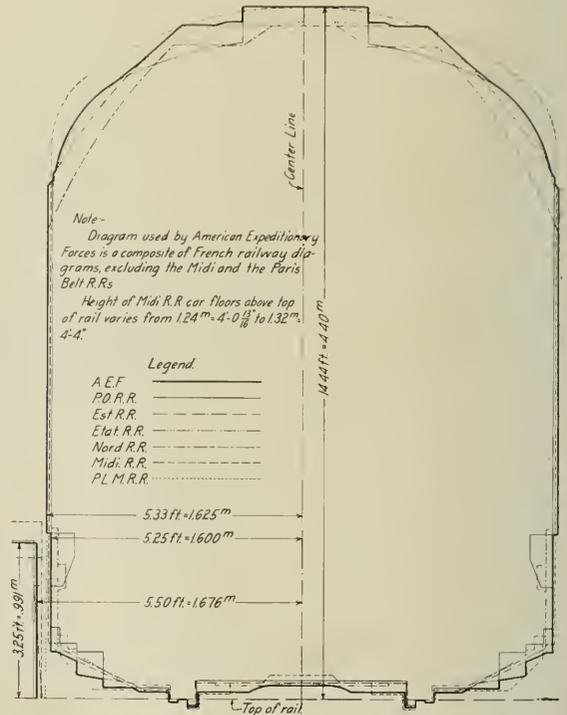

As has been previously pointed out in the *Railway Age*, the Americans conform with the French operating methods. In the absence of a train despatching system in France, the chef de gare, or station agent, controls the operation of trains. With him is associated a Railroad Transport Officer representing the American forces, who looks after the interests of our army. As the tonnage on French rails increased, the operating difficulties under this scheme became more evident, at least from our point of view. Trains were moved in what the French term "marches." This plan calls for the departure of trains so many minutes apart according to the

volume of traffic. If a train fails to leave at the scheduled time of departure, it is not permitted to move until it is assigned to another marche.

To assist the American forces in their work under these strange conditions, the officers of the American organization prepared a book of rules adaptable to all French lines, which was corrected and approved by French railway officers. Left-hand operation, which is the rule on French roads, did not simplify the problem of adaptation to French methods.

**Handling American Traffic**

The transportation burden assumed by the American railway forces became increasingly great with the progress of the war. The American supplies received at the ports in February, 1918, totalled 192,239 short tons, while those handled in November aggregated 921,972 tons, or an increase of 379 per cent. In all cases possible the traffic received from vessels has been moved from the docks to ad-

**Composite Diagram of Clearances of American and French Equipment**

adjacent storage points or other available storage facilities on the railways serving the ports. Under war conditions military officers determined the priority in the movement of supplies from these bases, in accordance with which traffic was worked up into solid train lots and moved to regulating stations, where the jurisdiction of the Service of Supply of the Transportation Corps ended. At these stations a regulating officer reclassified the freight received, with other supplies stored there, and it was taken by military trains to the light railways at the front.

American trains had equal rights with French trains on all lines, the priority of one train over another depending entirely on military necessities. A few recent statistics regarding the movements on different parts of the lines operated by the Americans are indicative of the volume of American traffic at the conclusion of the war. Between Saumur

and Tours, a distance of 39 miles, the average daily eastbound movement was 23 American supply trains, 27 French trains and one American troop train. The tonnage rating of American engines in this stretch was 2,400. Between Coutras and Perigueux, a distance of 47 miles, on a line serving the Gironde river group of ports, the eastbound movement consisted of 20 American supply trains daily, one American troop and 14 French trains. The tonnage rating of American engines between these points was 1,500. Between Pont Vert and St. Germain du Puy, a 7-mile line which has been aptly characterized "the neck of the bottle" because it connects roads from most of the ports with lines which led to the front, there was a daily eastbound movement of 36 American supply trains, 5 American troop trains and 38 French trains. The tonnage rating on American engines from Pont Vert to Bourges, 3 miles, was 1,570, and from Bourges to St. Germain du Puy, 4 miles, it was 3,000.

#### The Relations Between the French and American Railway Men

The relations between the French and American railway troops, both officers and men, have been consistently cordial. On the whole, the American railway private is more intelligent than his brother of the trenches and has been exceedingly industrious and cheerful under the exacting demands of army discipline and the onerous duties which he was called upon to perform. The French are free to admit that our railway men work faster than theirs, but at the same time state that they are more careless. It is a fact that at one point while the French turned an average of 65 engines a day, that record was increased by the Americans to 140 engines daily. It may be fairly said that the French are more thorough in their work but are less resourceful and less inclined to deviate from long standing and traditional practices. On the other hand, it is admitted by American railway officers that American operation did increase the number of railway accidents as compared with the number experienced under French operation.

While the French equipment at first seemed ludicrously light as compared with American rolling stock, observation and study of conditions in France has added strength to the conviction that small equipment is best suited to the transportation needs of France. In general, traffic is handled in smaller quantities than in the United States, and the average haul is considerably below that of American roads. Light equipment has the further advantage of making possible an ingenious method of switching which is in practice in French yards. When it is desired to set out a car from a freight train, the car is moved to a small turntable located in the main track, uncoupled from the cars to which it is attached, turned at right angles and moved by electric power to a turntable on a parallel track, where it is turned and moved to the desired point on that track.

Although American railroad men were disposed at first to disparage French equipment, they are unanimous in their commendation of the condition of French roadbeds. They are built more substantially than American roads, are ballasted with rock and provided with excellent drainage. It might have been anticipated that the heavy American locomotives and cars would play havoc with the French lines which were constructed for much lighter equipment. On the other hand, however, the French lines stood the test very well, and showed no signs of wear under the strain, except to a small extent during the rainy season of the past autumn.

Maintenance of way in France was entirely in the hands of the French except in yards used by Americans. This was due to the fact that the French had large numbers of German prisoners, and some civilians, available for manual labor, and also to the military difficulty of assigning to this work small American contingents, which could not be uti-

lized except under the supervision of commissioned officers and after being provided with suitable living quarters in advance. In yards used by the Americans, however, all maintenance work was done by American troops, ranging from roadmasters down to section men.

The experience of the American railway men in France has proved an education both for them and the French forces with whom they were associated. The mutual respect of the transportation forces of both countries for the methods and practices of the other was very materially increased.

It is safe to predict that in the future American railroad supply manufacturers will receive a more ready hearing in France than formerly, and will be able to market their products without conforming to specifications with mathematical exactitude. In fact, it is probable that American devices in a modified form will find their way to the French market in increasing numbers.

#### Sailing Day Plan Applied to Company Freight\*

By H. E. Ray

General Storekeeper, Atchison, Topeka & Santa Fe.

THERE HAS BEEN MUCH interest in the plan of handling commercial freight on certain sailing days; that is, instead of shipping every day to local points a certain sailing or shipping date for that particular point would be adhered to, with the result that straight carloads would be made rather than mixed carloads of less than full tonnage.

As a matter of fact, it is just as applicable, if not more so, to the handling of company freight. No doubt most storekeepers, particularly those employed on larger roads, have made it a practice of handling supplies for their various division stores on certain days, shipping to each point possibly once a week, by holding up the various items for a particular store until the sailing date arrived, at which time a full carload for that particular point has probably accumulated. It has been found that handling company freight in such a manner has enabled the main or general store to utilize the full capacity of the cars to a much better advantage than if it attempted to ship daily to all stores.

I have found from personal experience that it pays to have a man on the general store platform, whose sole duty it is to look after the cars as they come in, line them up for unloading, see that they are properly switched and properly reloaded. Under his direction the materials going out to division stores are so combined that they can be forwarded with the least expenditure of car service; his duties also include checking the unloading, which enables him to so speed up this feature that the resultant delay to the car is only a legitimate one. Such a man will earn his salary many times over in avoiding delays to equipment and in seeing to it that such cars as are loaded are filled to their capacity.

At large central stores the problem of properly utilizing and consequently conserving freight cars is not so difficult as it is at the smaller stores where on account of the relatively small amount of business it is sometimes difficult to combine daily business so as to utilize the cars properly. It is at the division stores that a great deal of our future work will have to be done if we reach the full measure of success in this important feature. The division storekeeper is very prone to utilize a car for a comparatively small amount of material simply to get it off his hands.

\*From a paper entitled, Conservation of Freight Cars, presented before the Railway Storekeepers' Association at Chicago, January 28.

# The Standard Heavy Santa Fe Type Locomotive

## Heaviest Single Unit Freight Locomotive Among the Designs of the Railroad Administration

THE FIRST LOCOMOTIVE of the Railroad Administration's standard heavy 2-10-2 type was recently completed at the Brooks Works of the American Locomotive Company. This locomotive was designed on the basis of driving axle loads of 60,000 lb. and has a total weight on drivers of 293,000 lb. The total weight of the locomotive in working order is 380,000 lb. and it is capable of exerting a calculated maximum tractive effort of 74,000 lb.

The design of this locomotive possesses no unusual

features, the type of details throughout being similar to those used in the construction of other standard locomotives which already have been described, interchangeability of parts between the various types having been effected wherever

motive included among the Railroad Administration's standards it is of interest to compare it with a number of other heavy locomotives of the same type. By an inspection of the table it will be seen that it can by no means be ranked

A COMPARISON OF HEAVY 2-10-2 TYPE LOCOMOTIVES

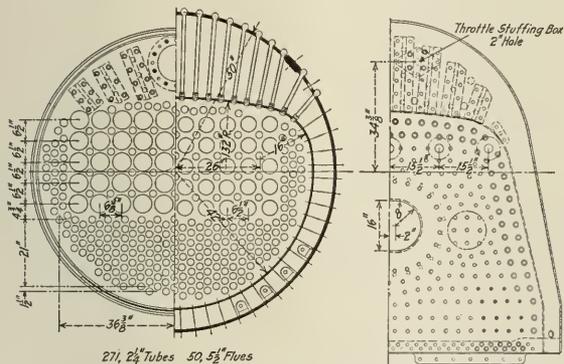

Road	U.S. Std.	Pa. Lines	D. & R. G.	Erie	N. Y. O. & W.
Year Built	1918	1918	1916	1916	1916
Tractive effort, lb.	74,000	80,900	81,200	83,000	71,200
Total weight, lb.	380,000	435,400	428,500	401,000	353,500
Weight on drivers, lb.	293,000	351,300	337,500	335,500	298,500
Diameter of drivers, in.	63	62	63	63	57
Cylinder diameter and stroke in.	30x32	30x32	31x32	31x32	28x32
Steam pressure, lb. per sq. in.	190	205	195	200	190
Heating surface, total evap., sq. ft.	5,156	4,725	5,369	4,959	4,498
Heating surface, equivalent*, sq. ft.	7,001	7,152	7,362	6,870	6,009
Grate area, sq. ft.	88.2	80.0	88.0	94.8	80.2
Tractive effort x diam. drivers ÷ equiv. heating surface*	665.9	701.7	695.0	760.0	677.0
Firebox heating surface ÷ equiv. heating surface, *per cent	6.3	5.2	5.0	5.0	5.4
Grate area ÷ volume cylinders	3.3	3.1	3.2	3.4	3.5

\*Equivalent heating surface—total evaporative heating surface ÷ 1.5 times the superheating surface.

among the heaviest or most powerful 2-10-2 locomotives which have been built, although there have probably been none of better balanced design from the standpoint of boiler capacity.

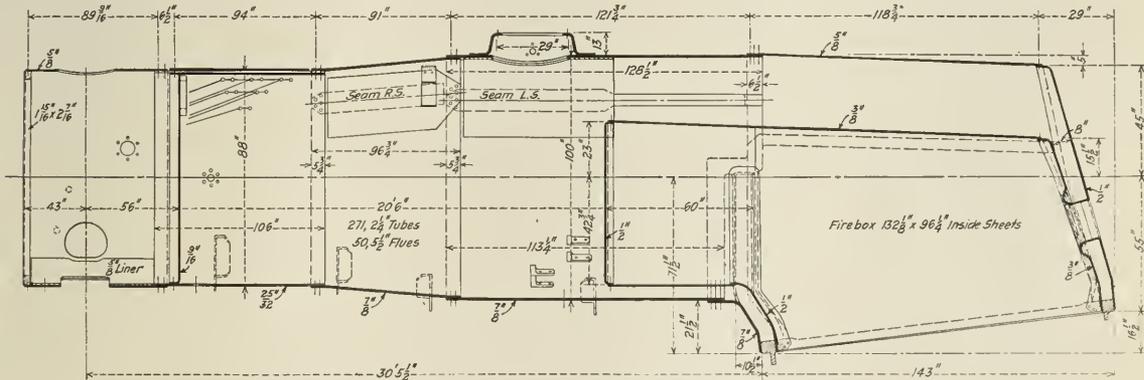

The boiler barrel is of the telescopic type, with an outside diameter at the first course of 88 in., increasing to a maximum diameter of 100 in. There are three courses, the middle one of which is conical; the third course is 113¼ in. in length and is long enough to carry the dome ahead of the combustion chamber.

The firebox includes a barrel combustion chamber, the tube sheet of which is 60 in. ahead of the throat sheet, thus providing for tubes 20 ft. 6 in. in length. The firebox is fitted with a brick arch carried on five tubes and is fired by a Hanna mechanical stoker. Other equipment includes

Back Boiler Head, Front Tube Sheet and Section Through the Combustion Chamber

features, the type of details throughout being similar to those used in the construction of other standard locomotives which already have been described, interchangeability of parts between the various types having been effected wherever

The Boiler of the Standard Heavy 2-10-2 Type Locomotive

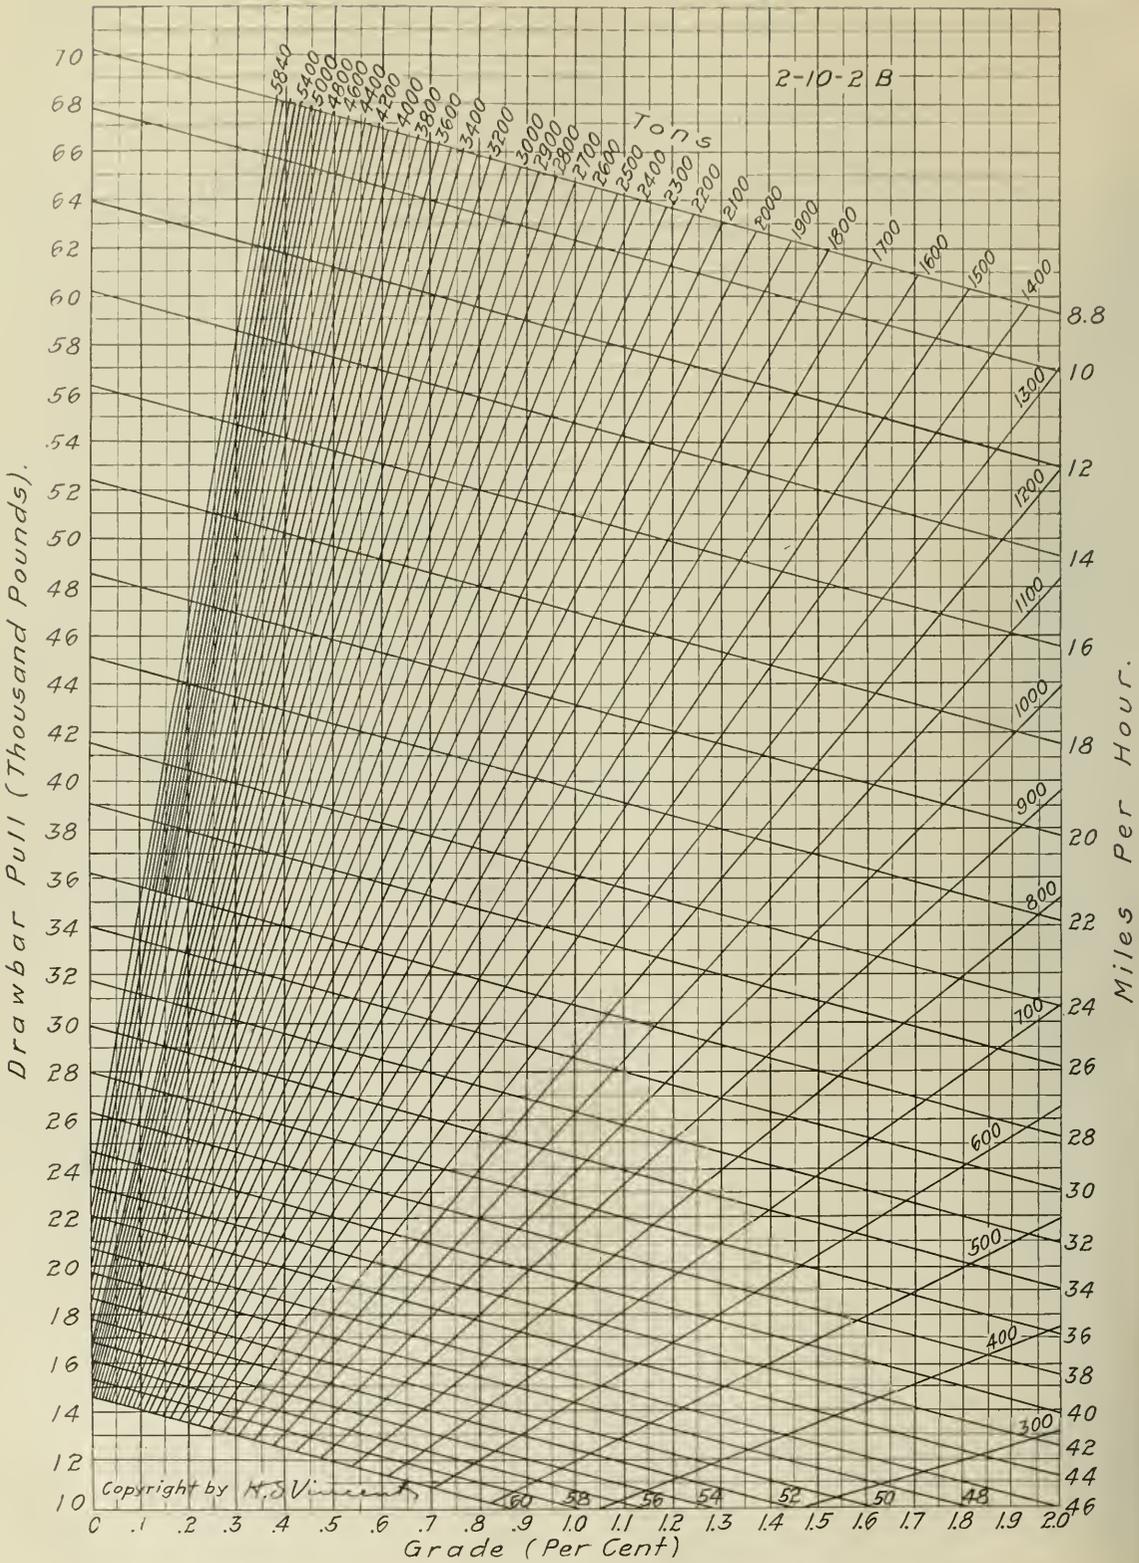

stresses and dimensions would permit. The relation of boiler capacity to the cylinder demand, calculated in accordance with Cole's ratios, shows ample boiler capacity both as to heating surface and grate area. The steam generating capacity is 104 per cent of the cylinder demand at a piston speed of 1,000 ft. per minute; the size of grate also shows up favorably, the ratio being 102.3 per cent.

As this is the heaviest single unit type of freight loco-

Franklin Railway Supply Company's firedoor and power grate shaker.

The tube sheet is laid out for 271, 2¼-in. tubes and 50, 5½-in. flues for a 50-unit type A superheater. The tubes are spaced ¾ in. apart while the flues are one inch apart.

The general features of the frame design are identical with those of other single unit standard locomotives. The cylinders are carried on a single front rail cast integral with

Tonnage Rating Chart of the Standard Heavy Santa Fe Type Locomotive

the main frame, and a Commonwealth cradle casting is spliced to the main frames just back of the rear driving pedestals.

The frames are six inches wide and have a maximum depth of top rail of 8 3/8 in. over the pedestal jaws. The minimum depth of the top rail is seven inches. The maximum and minimum depths of the lower rail are 5 1/2 in. and 5 in., respectively. The front rail under the cylinders is six inches wide and tapers from a depth of 12 3/4 in. at the rear and 11 1/2 in. at the front of the cylinder fit.

The driving axles have journals 10 in. in diameter by 13 in. in length with the exception of the main, the diameter

Spiller gun iron is used for cylinder and valve chamber bushings and piston and valve bull rings and packing rings. The steam distribution of these locomotives is effected by the Southern valve gear and the locomotive is fitted with the Lewis power reverse gear.

Among the principal specialties with which these locomotives are equipped are Chambers backhead type throttle, Ashton 3 1/2-in. open safety valves, Hancock No. 13 non-lifting injectors, Everlasting blow-off cocks, Detroit six-feed lubricators, Barco flexible pipe joints and Radial buffers and Unit safety bar between the engine and tender.

The tonnage rating diagram was prepared and is copyrighted by H. S. Vincent. The curves of hauling capacity are constructed for a car resistance of four pounds per ton. The chart may be used for any other car resistances by converting them into terms of grade as follows:

- 1 lb. car resistance ..... = .05 per cent grade
- 1 deg. curve uncompensated ..... = .04 per cent grade

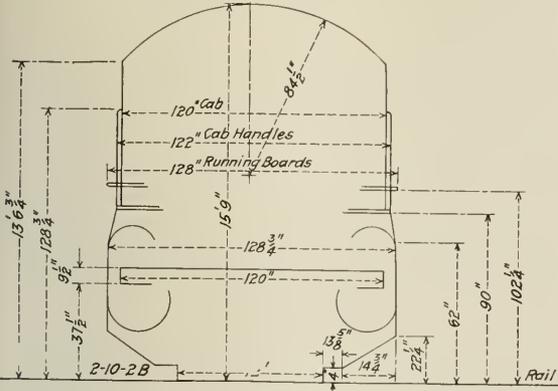

For example, find the tonnage capacity of the locomotive at 20 m. p. h. on .6 per cent grade combined with five-degree uncompensated curve and with a train resistance of five pounds per ton.

The combined resistance in terms of grade is:

$$.6 + (5 \times .04) + (1 \times .05) = .85 \text{ per cent.}$$

At the intersection of the ordinate for .85 per cent grade with the drawbar pull curve for 20 m. p. h. we find 2,100 tons as the capacity of the engine.

The clearance and wheel loading diagrams were prepared in the office of F. P. Pfahler, chief mechanical engineer of the Division of Operation of the Railroad Administration. The weights shown on the wheel loading diagram are actual. Other data and dimensions for this locomotive are as follows:

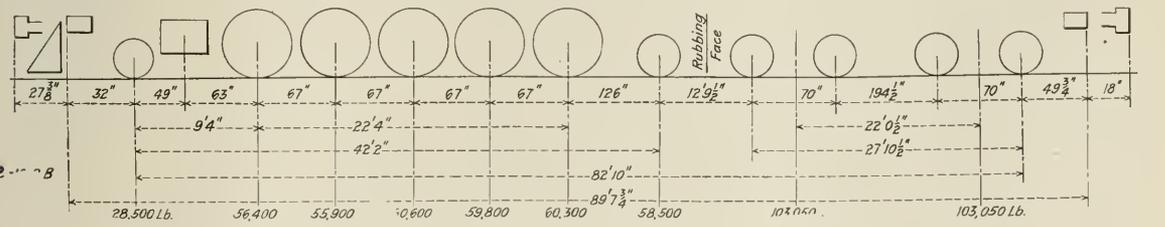

Clearance Diagram of the Standard Heavy 2-10-2 Type Locomotive

of which is 12 1/2 in. The axles and driving boxes having the 10-in. journals are interchangeable with those of the same journal size on other types of locomotives. This includes the light 2-10-2 type and both the light and heavy Mikado type locomotives. The engine truck under these locomotives is of the constant resistance type and is identical with that used on the 2-6-6-2 Mallet type locomotive. A number of the engine truck details, including the center pin, pedestal, pedestal crosstie, swing bolster, swing frame and link are also identical with those used on the trucks for both Mikado type locomotives and the light Santa Fe type.

General Data	
Gage	4 ft. 8 1/2 in.
Service	Freight
Fuel	Bit. coal
Tractive effort	74,000 lb.
Weight in working order	380,000 lb.
Weight on drivers	293,000 lb.
Weight on leading truck	28,500 lb.
Weight on trailing truck	58,500 lb.
Weight of engine and tender in working order	586,100 lb.
Wheel base, driving	22 ft. 4 in.
Wheel base, total	42 ft. 2 in.
Wheel base, engine and tender	82 ft. 10 1/2 in.

Ratios	
Weight on drivers ÷ tractive effort	4.0
Total weight ÷ tractive effort	5.1

Wheel Loading Diagram of the Standard Heavy 2-10-2 Type Locomotive

With the exception of the radius bar these details are also used on the light Mallet locomotive.

The trailer truck is of the Cole-Scoville type and as a whole is not interchangeable with any other class of locomotives. The frame, however, is identical with that used under the light Santa Fe type, both Mikados and the light Mallet locomotives.

The cylinders are 30 in. in diameter with a stroke of 32 in. and are fitted with pistons of single plate dished section similar in design to those used on all the standard locomotives. The valve chambers are designed for the use of 14-in. piston valves. As on the other standard locomotives Hunt-

Tractive effort × diam. drivers ÷ equivalent heating surface*	665.9
Equivalent heating surface* ÷ grate area	79.4
Firebox heating surface ÷ equivalent heating surface,* per cent.	6.1

## Orders of Regional Directors

**SETTLEMENT OF FREIGHT CLAIMS.**—A. H. Smith, regional director, eastern region, by file 2000-63A490, advises federal managers of the grievance of a large shipper who says that the amount of money which his firm has tied up in claims is out of all reason, and unprecedented. Traffic Department representatives have recently been directed to take an active interest in seeing that claims receive proper and effective consideration, and prompt advice is now requested as to what is being done to relieve the situation.

**Fish Fry Free.**—The regional director of the eastern region advises federal managers of revised regulations shown in the latest baggage tariff for the free transportation of small shipments of live fish in cans and fish eggs in crates on request of federal or state authorities.

**Shortening of Hours of Station Forces.**—The regional director, eastern region, by file 1600-88A494, cautions against undue shortening of hours of station forces so as to result in closing stations at the time of arrival of passenger trains or in preventing proper care of freight unloaded from local freight trains. Where it is contemplated to close stations during certain hours that they have heretofore been open sufficient advance notice must be given to patrons with full information as to the arrangements for handling business, so that the public may accommodate itself to the change and no occasion be given for complaint as to lack of essential service.

**Assessments for Public Improvements.**—The eastern regional director, by file No. 2700-A492, notifies federal managers that the Division of Capital Expenditures no longer requires notice of certain expenditures for public improvements. Authority for railroad expenditure in connection with street or road construction or other public improvements will now be governed by Supplement No. 1 to General Order No. 12, but all cases involving such expenditures in excess of \$1,000 must be brought to the attention of the regional director, before entering into any commitment, in time to make it possible, if it should be decided to do so, to take any steps provided for by statute in connection with the proceedings through which such improvements are ordered or the cost thereof assessed, so that the matter may be considered without embarrassment resulting from legal steps that have already been taken.

**Freight Car Distribution.**—Circular No. 421 provides

that the distribution of freight cars between railroads in the southern region will be handled through the office of the regional director. The Car Service Section at Washington will issue orders covering movements between regions only. An exception will be made in the movement of refrigerator and tank cars, orders covering which will be issued as heretofore direct to railroads by the Refrigerator and Tank Car Bureau of the Car Service Section located at Chicago.

**Inspection at Interchange Points Covering Loading.**—Circular No. 422 issued by the southern regional director says that there has been some duplication of inspection at interchange points covering loading, bracing, stability of packages and general condition of freight offered in interchange. Such inspection and records must be made only by the receiving railroad.

**Sale of Relayer Rail.**—The eastern regional director February 5 announces the abrogation of the rule that relayer rail weighing over 60-lb. per yard should not be sold without first being reported to the Regional Purchasing Committee for disposition. It will now be proper, when advantageous prices can be obtained, to be determined by the purchasing agent, to sell surplus S and Y rail (fit for sidings and yard tracks), and poor quality relayer rail, weighing less than 80 lb. per yd. Any rail weighing 80 lb. or over which may be graded as relayer or good quality siding and yard rail should be reported to the regional director before being sold. All such rail should be used on the home line for repair work as far as practicable.

**Agents' and Operators' Wages.**—A. H. Smith, regional director, eastern region, by file 1200-4-56A483, furnishes federal managers with a memorandum of a long list of questions decided at a conference on January 27 relating to the requirements of Supplement No. 13 to General Order No. 27 as affecting agents and telegraphers.

**Maintenance of Industrial Side Tracks.**—A. H. Smith, regional director, eastern region, file 401-14A487 explains to federal managers the policy of the administration concerning General Order No. 15, containing the provisions governing the maintenance of industrial side tracks. In general the maintenance of the tracks from the clearance point to the right of way line is to be paid for by the industry. Special cases should be referred to the regional director.

**Transportation of Corporation Officers and Employees.**—Order 109 Supplement 11, cancelling Supplement 9, of the Southwestern regional director, similar to Supplement 14 to Circular 29 of the Central Western regional director, abstract of which appeared in the *Railway Age* of January 10 (page 159).

**Information Regarding Movement of Troops or Troop Trains.**—In Order 159 the Southwestern regional director removed the restrictions on furnishing information concerning movement of troops or troop trains published in Order 112 issued on November 12, 1918.

**Earnings of Passenger Trains.**—In Order 157 the Southwestern regional director asks that reports be made of passenger earnings for all trains with sub-divisions where the train consist is changed materially. This report should be for the second calendar week in each month, beginning with Sunday, and starting with February. The report is intended to supersede other forms of reports of passenger train earnings now made.

**Locomotive Rental Charges.**—Supplement 1 to Circular 3 of the Northwestern regional director similar to Order 150 of the Southwestern regional director abstract of which appeared in the *Railway Age* of January 24 (page 257), with the following appended: Joint inspection must be arranged by interested roads upon delivery and return of old locomotives and upon delivery to owner of new locomotives. The government inspection of acceptance from builders will constitute the only inspection necessary on de-

livery of new locomotives. Repairs will be made in all cases by borrowing roads who will keep up running repairs and make repairs due to damages or wrecks.

**Transmitting Railroad Initials in Address and Signature of Off-Line Telegrams.**—Order 156 of the Southwestern regional director states that when sending messages to points on other railroads, not directly connected with the originating railroads, the initials of railroads to which messages are destined will be placed in the address and the initials of railroads from which messages originate will be placed immediately after the signature. Railroads sending messages to the Railroad Administration at Washington and

to officials of the organization of regional directors, other than the Southwestern regional director, will also place their initials immediately after the signature.

**Railroad Business Mail.**—Order 158 of the Southwestern regional director amplifies instructions contained in order 151 of the Southwestern regional director, abstract of which appeared in the *Railway Age* of January 24 (page 257), and appends the following statement, "This does not permit handling mail for or from roads not under federal control, except to direct first line connection and care must be taken not to route any U. S. R. A. business mail across non-controlled roads."

# Annual Reports of the Regional Directors

## Estimates of the Economies Effective and Examples of Co-operative Action Under Unified Control

THE RAILROAD ADMINISTRATION has made public the annual reports of the regional directors for the Allegheny, Southern and Northwestern regions, in addition to those published in last week's issue.

### Northwestern Region

The annual report of R. H. Aishton, regional director for the Northwestern region, to the director general of railroads, gives the following recapitulation of economies effected during the year by unified operation:

	Savings per annum		
	Western Region to June 30	Northwestern Region after June 30	Total
Unification of terminals and stations:			
Consolidations .....	\$1,769,987.00	\$1,350,434.40	\$3,120,421.40
Joint switching .....	785,190.00	198,510.00	983,700.00
Miscellaneous economies.....	660,000.00	124,871.60	784,871.60
Reduction passenger-train mileage .....	22,355,235.00	925,165.00	23,280,400.00
Reduction duplicate freight-train mileage .....	1,806,636.00	463,916.00	2,270,552.00
Estimated savings, salaries, general office forces .....		781,439.18	781,439.18
Closing off-line freight and passenger traffic offices.....		1,744,335.00	1,744,335.00
Consolidation, city ticket offices .....		310,730.16	310,730.16
Estimated saving in advertising (except newspaper) .....		445,934.10	445,934.10
Estimated saving in newspaper advertising .....		510,899.02	510,899.02
Grand total .....	\$27,377,048.00	\$6,856,234.46	\$34,233,282.46

An abstract of the report follows:

### OPERATION

Terminal managers were appointed for the more important traffic centers, but at Seattle only was the supervision of owning roads discontinued and the terminal placed under the jurisdiction of one man. We believe this arrangement will finally prove entirely satisfactory. Ninety passenger and 136 freight stations have been closed.

At Chicago, greater use has been made of the Elgin, Joliet & Eastern and the Indiana Harbor Belt, resulting in better handling of local business in the downtown districts. Heretofore, 19 different railroads, in some cases, served one plant largely for competitive reasons. Wherever possible, switching at one plant is now done only by one line.

The sailing day plan is in effect at every important station in the Northwestern Region. Through cars run from Illinois, Minnesota, Wisconsin, North and South Dakota and Iowa, and from certain Pacific coast points. The operation of pick-up cars on certain days at division points has resulted in a saving of 15,000 cars per month for the region. At Chicago, this plan is under the immediate supervision of the terminal manager.

There has been a reduction of 23,280,400 miles a year in passenger train mileage. The saving per train mile is estimated at \$1.00. Competition prevented a like saving before the government took over the roads.

Based on an estimate of \$2.00 per freight train mile, there was a saving made through elimination of duplicate freight service of \$2,270,552.

The saving of \$781,439 in salaries of general officers is made by transferring these salaries to the corporation pay-rolls.

### TRAFFIC

The closing of off line passenger and freight offices saved \$1,744,355 and, in my opinion, it will finally prove as satisfactory for local roads to furnish information, etc., as for off line traffic officers to do so. The consolidation of ticket offices saved \$310,730 and I am entirely satisfied that it will never be changed.

### CO-OPERATIVE ACTION

An organization was formed at Kansas City to co-operate with the oil people, resulting in an increase in tank car mileage per day of from 57 to 117. There was an increase in tank car loading, January 1 to June 30, 1918, of 28,569 cars, of which 19,500 was in the period April 30 to June 30. This was accomplished by moving tank cars in solid trains of 25 or more and totally disregarding routing. When the government took over the roads, there was an extreme car shortage in the west, whereas now we can furnish a car for every load offered. The work of the Car Service Section has been most satisfactory. Re-routing of traffic resulted in a reduction of 9,963,633 car miles.

The consolidated purchasing department has not been in operation long enough to determine its ultimate success.

Intensive car loading has been greatly helped by the Food Administration, but now that administration has ceased its activities.

A manager was placed in charge of the upper Lake Michigan and Lake Superior ports to supervise the handling of ore, grain and coal and to co-operate with a committee representing vessel and ore interests. Re-routing by this organization made a saving of 3,577,434 miles. The steaming of ore was almost entirely eliminated; saving, it is estimated, \$197,000.

Budgets of the roads in the Northwestern Region for 1918 amounted to \$24,180,740, but were reduced by \$19,658,887, and, despite labor shortage and influenza, 70 per cent of the improvements authorized was completed on December 15. Co-operation with municipalities resulted in

the postponement of public improvements which would have cost \$19,332,593, which includes \$924,195 savings made by the unification of terminals.

Since the last wage award, there has been a rapid improvement in maintenance of equipment work, and standard equipment will eliminate the necessity of carrying large quantities of material. A very careful analysis and study of the entire railroad situation under unified control has shown that there are very wasteful practices in effect under separate operation.

**Allegheny Region**

C. H. Markham, regional director for the Allegheny Region, has submitted a report, of which the following is a summary:

	Men. released for other service	Saving per annum
(a) Unification of terminals and stations, 875...	1,562	\$4,037,526
(b) Elimination of passenger service, saving train miles per annum, 7,683,432.....	658	5,914,203
(c) Reduction in organizations contrasted with same under corporate control: Saving due to the elimination of corporate organizations .....		1,828,071
Unifications and discontinuance of operating and traffic offices.....	692	1,168,866
(d) Miscellaneous economies, the result of causes other than the above: Advertising discontinued .....		450,640
Road unifications .....	290	1,710,954
Grand total (a), (b), (c), (d).....	3,192	\$15,110,260
(e) Recapitulation of co-operative action, the results of which are in the direction of efficiency but intangible as to economics:	Number Cars diverted	
Freight traffic diversions.....	251	317,604

The above figures include unifications made on the roads in this region prior to the formation of the Allegheny region.

The Allegheny Region was the center of most intensive war work activity. Baltimore & Ohio freight trains between McKeesport and New Castle were routed over the Pittsburgh & Lake Erie, one locomotive handling the same tonnage over this road as five locomotives over the Baltimore & Ohio, between the same points. Westbound coal from the lower Connellsville region and the Fairmount district was routed over the Monongahela, Pittsburgh & Lake Erie, and the Pennsylvania, releasing the Baltimore & Ohio for east-bound business. Baltimore & Ohio business from West Virginia and from Pittsburgh was routed by way of the Rutherford gateway and by the Philadelphia & Reading, thus keeping the business out of Baltimore and Philadelphia. Anthracite coal from Pottsville and Shamokin was moved to Baltimore and Washington by way of Harrisburg instead of Philadelphia.

The Western Maryland and the Baltimore & Ohio lines between Cumberland and Connellsville were operated as one division, as were also the Cumberland Valley, Western Maryland, and Philadelphia & Reading between Cherry Run and Harrisburg. The Huntington and Broad Top Mountain was operated as part of the Juanita division of the Pennsylvania. The Philadelphia & Reading, New England coal fleet was operated from Port Reading instead of Port Richmond, saving 185 miles of water movement with an increase of only 70 miles road haul.

Appointment of terminal managers in charge of operations of all lines at Baltimore, Philadelphia, and New York, and the permit system regulating the flow of traffic in accordance with ability to handle at seaboard destination, have been of great value.

From June to October there were over 900 passenger cars exclusively assigned to the transportation of war workers, and during the same period nearly 9,000 troop trains were moved in the region. During the period there were many unifications of terminals and stations made, among the most important of which to the traveling public was the use of

the Pennsylvania terminal at New York by Baltimore & Ohio and Lehigh Valley for through trains.

As illustrating the density of freight traffic, in October, 1918, the region had 5.6 per cent of the average mileage of federal controlled railroads in the United States while it transported 14 per cent of the total net ton-miles of all such railroads. The results of operation are not available for November and December, but for the period from June to October, inclusive, the region handled 1,233,396,959, or 4.4 per cent more tons one mile and transported 447,002,496, or 14.7 per cent more passengers one mile than in the corresponding period the previous year.

Considering the large increase in business and the fact that many experienced employees entered the military and naval service or were engaged at munition plants or other lines of war work, their places being taken by less experienced employees, both passenger and freight business was well handled. I am pleased to say that we have had the hearty co-operation of all the officers and employees of railroads in the region, and to this I attribute in a large measure the success in handling the business.

During December, 1918, weather conditions in Allegheny region were favorable to operation, and the railroads were able to furnish ample transportation to handle an increase in both freight and passenger traffic compared with December, 1917.

Anthracite coal loading increased 1,456 cars, or 2.9 per cent; bituminous loading increased 35,944 cars, or 17.7 per cent; all coal loading increased 37,400 cars, or 14.8 per cent, compared with December, 1917. Total revenue freight loaded increased 64,803 cars, or 8.9 per cent; and total revenue freight received from connections increased 108,913 cars, or 17.2 per cent, compared with same month last year.

Tidewater coal dumped was 2,158,491 tons, increase of 471,117 tons, or 21.8 per cent, compared with December, 1917.

At close of month there were stored 12,000 open-top and 10,000 closed cars for which there was no demand. Including this surplus, cars in Allegheny region equaled 99 per cent of ownership, compared with 115 per cent June 1, 1918.

With the exception of movement controlled by permits, the region continued clear of embargoes on carload freight, and no embargoes at transfer platforms against l. c. l. freight.

Report of blast-furnace operations December 31 shows no furnaces out due to transportation deficiencies.

Passenger travel was heavy, due to holidays and the large number of soldiers and sailors on furlough and discharged. Generally speaking, the travel was satisfactorily handled. Extra coaches and parlor cars, and in many cases extra sections of passenger trains, were operated to handle the holiday travel. Passenger-train schedules were maintained with reasonable regularity, considering the volume of traffic handled. United States mail and express were satisfactorily handled. Troop movements continued light. Due to cessation of hostilities, 24 trains serving war industries were withdrawn during the month.

The bad-order car situation compares favorably with November, 1918, although repairs were retarded, due to a week of rainy weather in early part of the month. Locomotive output also compares favorably with previous month. Railroads received 14 locomotives built in their own shops and 19 from locomotive builders, leaving 383 locomotives (including Pennsylvania lines west) to be received to complete 1918 program.

Thirty-four unifications of facilities were effected during the month, resulting in an annual saving of \$326,243.

Ability to recruit labor forces, along with open weather, enabled satisfactory progress being made on addition and betterment work. Completion of engine-house and yard im-

provements is being pushed, and a large portion of these facilities are already completed.

**Southern Region**

B. L. Winchell, regional director of the Southern region, has submitted his report, of which the following is a summary:

C. H. Markham was director general from January 18, to June 1. Prior to January 18 the roads in the Southern region dealt directly with the Washington administration.

The financial outcome of the regional operation for the year (December estimated) was as follows:

Railway operating revenues.....	\$547,777,171	
Railway operating expenses.....	423,276,752	
<b>Net revenue from railway operation.....</b>		<b>\$124,500,419</b>
Railway tax accruals, less war taxes.....	19,270,592	
Uncollectible railway revenues.....	100,990	
		<b>19,371,582</b>
<b>Railway operating income.....</b>		<b>\$105,128,837</b>
Equipment rents, net (Cr.).....	665,804	
Joint facility rent, net (Dr.).....	1,286,101	
		<b>620,297</b>
<b>Net railway operating income.....</b>		<b>\$104,508,540</b>
Estimated average annual standard return.....	\$92,183,911	
Excess above standard return.....	12,324,629	
Percentage relation of net railway operating income to standard return.....		<b>113.4</b>

*Summary of certain savings*

Unification of terminals and stations.....	\$2,182,260
Elimination of passenger trains.....	1,625,941
Reduction in organizations as contrasted with the same under corporate control.....	2,925,073
Miscellaneous economies the result of causes other than above—	
1. Saving in advertising expenses.....	\$402,938
2. Reduction in freight-train service.....	312,309
3. Consolidation of general office forces and elimination of special departments, etc.....	253,728
4. Telegraph and telephone unification.....	76,260
5. Sundries.....	197,406
	<b>\$1,242,641</b>
<b>Total of above.....</b>	<b>\$7,975,915</b>

By the co-ordination and connecting up of telegraph and telephone service of the various roads, the use of commercial telegraph companies' wires for railroad messages has been greatly reduced and the service improved.

Based on the actual re-routing of freight during one week, it is estimated that there is an annual saving from this source of approximately 41,452,216 car miles or 40,560 cars (on a basis of 28 miles per car per day) or of \$81,120,000 in investment (based on \$2,000 per car). The saving in operation at five cents per car mile would be \$2,072,610.

Average car loading in the nine months to August, 1918, was 25.5 tons as against 23.8 tons for the corresponding period in the previous year.

Safety work is being pressed with vigor.

*Number of accidents to employees of railroads in the Southern Region during the months of August, September, October and November, 1918*

	Killed	Injured.
August.....	43	2,067
September.....	36	1,787
October.....	26	1,441
November.....	31	1,269

This shows a reduction of 27 per cent in fatalities and 38 per cent reduction in injuries, November compared with August.

There was a saving through elimination of \$1,618,107 passenger train miles, of \$1,625,941. (It is estimated that passenger train service costs about \$1 a mile.) The percentage of increase or decrease in average train load, April to October, inclusive, in 1918, as compared with the same months in 1917, are as follows:

April.....	increase	0.8 per cent
May.....	decrease	7.2 per cent
June.....	decrease	5.7 per cent
July.....	increase	2.1 per cent
August.....	increase	5.4 per cent
September.....	increase	4.0 per cent
October.....	increase	6.7 per cent

In the 10 months ended December 31, there were 4,796,833 cars loaded, compared with 4,955,006 in 1917, and

2,796,832 cars received from connections, compared with 2,602,986 in 1917, an increase in total cars of 135,682.

In the Southern region 23 consolidated ticket offices took the place of 75 separate offices, and the expense of operation of the consolidated ticket offices was \$200,167 as compared with an expense of \$197,667 for the separate offices in 1917, an increase in expenses of \$2,500. There was an increase in the sales of tickets in 1918 of \$1,041,903 or 10.93 per cent. The expenses of depot ticket offices in 1918 was \$338,474, as compared with \$208,885 in 1917, and there was an increase in ticket sales of \$14,827,283, or 55.12 per cent.

Passengers carried one mile totalled 4,847,029,611 for the ten months ended October 31, 1918; an increase of 1,402,351,278 over the corresponding ten months of 1917, or 40 per cent.

*Statement showing for class I roads in Southern Region the increase in freight and passenger revenues (accounts 101 and 102) by six months' periods, January to June and July to December, inclusive, 1918, over 1917 (December estimated).*

<b>Freight:</b>				
	This year	Last year	Increase	Per cent
First period.....	\$155,552,228	\$138,703,792	\$16,848,436	12.1
Second period.....	203,577,951	147,860,322	55,717,629	37.7
<b>Total.....</b>	<b>\$359,130,179</b>	<b>\$286,564,114</b>	<b>\$72,566,065</b>	<b>25.3</b>
<b>Passenger:</b>				
First period.....	\$66,081,693	\$42,802,295	\$23,279,398	54.4
Second period.....	82,022,350	57,922,426	24,099,924	41.6
<b>Total.....</b>	<b>\$148,104,043</b>	<b>\$100,004,721</b>	<b>\$47,378,322</b>	<b>47.4</b>

Few of the public, except large employers of labor, can have any fair conception of the difficulty of railroad operation during the past year with such a considerable proportion of untrained men in the service, replacing those skilled operatives who responded so loyally and so freely to the call to arms.

Now that the war pressure is somewhat relieved, the feeling will be more or less generally and naturally held that the transportation troubles of the roads are over. It should be made plain to everyone that but few of the many train and enginemen, shop, bridge, track and station forces, superintendents and trainmasters, general managers, general superintendents, and other skilled and valuable factors in the successful operation of our railroads have as yet been released from the colors and actually back in our service.

We need them to "carry on" in our best manner.

Three American Majors and a German Representative in the Freight Yards of Coblenz Inspecting a Trainload of German Field Pieces Surrendered to the Yankees Under the Terms of the Armistice

## The Railway Supply Industry Is Hard Hit

IN LAST WEEK'S ISSUE the *Railway Age* published a large number of communications from railway supply companies, sent in reply to a night letter from the editors asking for a statement as to what the policy of deferring maintenance and renewals, not to speak of betterments, means "to your organization and labor, now and in the future." The following letters sent in reply to the telegram were received too late for publication in last week's issue.

### Barco Manufacturing Company Chicago.

We are being seriously affected in our business by the attitude of the Railroad Administration toward improvements and railroad expenditures. If their policy continues we will be running our shop on half time, and probably not that much.

The motive power has not yet been brought to a proper state of efficiency, but it has reached the point where it is giving the public and the railroad officials some satisfaction. Under the apparent policy of the Railroad Administration our motive power and tracks will be a national disgrace inside of three months, with the shops, roundhouses and working conditions as they are, and with the railroads laying off men and refusing to buy material.

It is astonishing that the administration should demand that manufacturers re-employ returned soldiers and keep their factories busy when they refuse to keep active the only industry that they control, and the largest industry in the world—the railroads.

Money invested in the railroads at this time will be a national benefit for generations to come. The Railroad Administration should play fair with the public, the railroads, the railway supply industries and their employees.

There will be no substantial reduction in prices unless the supply industries are busy.—*F. N. Bard, Vice-President.*

### Boss Nut Company Chicago.

Our railway department operated at less than one-half its capacity during the year 1918 as compared with 1917. Shop force in this department reduced to about 60 per cent of 1917 average. To continue operations profitably it will be necessary to reduce our sales force and other selling expense, which we have not done up to the present time.—*J. A. MacLean, Vice-President.*

### Onondaga Steel Company, Inc. Syracuse, N. Y.

In conversation yesterday with a prominent engineer connected with one of the steel mill equipment manufacturers of the Pittsburgh district we were informed that the steel companies had several months before the armistice was signed placed orders with them for rolls and equipment designed especially for the reconstruction period.

Today the steel corporation and other large producers are fully equipped for the enormous demands that they have every reason to expect should be made on them.

Our own efforts have been along this line, not only in equipment but in organization as it is particularly difficult to build up the personnel of a tool steel mill.

Every department calls for a high degree of expert knowledge. Even the common labor in a mill producing exclusively high-speed steel must be trained to a knowledge of the value of the material produced and the care necessary in handling it, as a few pounds waste means many dollars loss.

We steel people who have dug into our own pockets—thus giving proof of our faith in the country and its capacity for reconstruction—feel that we have every right to demand of our leaders in Washington a similar policy as applied to our railroads.

We depend upon the railroads and railroad equipment people for 40 per cent of our business, and if they cannot take the attitude of faith and confidence in the future shown by the manufacturing public we must face not only a 40 per cent reduction in our working force—but an added reduction because of the railroads being unable to handle adequately the business of the country. Consequently, the inability of other lines of business to carry on as they had every reason to plan.

Come on, you railroads! Your country needs you—*S. S. Buckley, President.*

### Reading Steel Casting Company Reading, Pa.

The sudden ending of the war has made necessary a curtailment of production of iron and steel products. In turn it has been necessary for the manufacturers to lay off a great many employees regardless of the fact that it is practically impossible for these employees to obtain work elsewhere. If the Railroad Administration continued its purchases for maintenance, renewals and betterments at this time it would be possible for the industries to continue the employment of practically all the men on their payroll during the war period.

We are firmly of the belief that the greatest destroyer of social unrest is steady employment. The best way to maintain steady employment in the steel and iron industry is for the railroads to continue their purchase of material for maintenance renewals and betterments.—*J. Turner Moore, President.*

### Joseph T. Ryerson & Son Chicago.

This policy of deferring maintenance and renewals cannot but work havoc with our railroad business if continued long enough. Just now our mill is full of work on orders placed sometime ago which we were unable to get out before on account of lack of raw material and fuel, but we will finish up these orders in the course of time, and as there is no new business coming in the result will be a shutdown of the mill affecting the employment of some 300 men, as the entire output of this particular mill goes to the railroads. This action, however, will not be necessary for some months under the present condition of our order books. The immediate effect of the government's policy, however, is that we have stopped buying pig iron and fuel for future requirements, as we cannot buy raw materials without the prospect of their sale.

In our warehousing department the effect is immediately apparent in lack of orders which will, no doubt, cause some reduction in our working force and stoppage in the purchase of steel, for the percentage of this business which ordinarily goes to the railroads. As stated before, there is no immediate lay-off of men contemplated, but unless there is a resumption of buying within the next 30 to 60 days results cannot help but be serious.—*Howard A. Gray, Manager Railroad Sales.*

The American Train Dispatchers' Association has organized a local assembly at Chicago, with O. J. Schwartz, train dispatcher on the Chicago & North Western, as chairman, and W. A. Kraemer, also a train dispatcher on the North Western, secretary and treasurer. About 150 chief train dispatchers and dispatchers were present at the first meeting. The second annual convention of the association will be held in Chicago, June 17 to 20, inclusive.

# Railroad Hearings Before Senate Committee

## Labor Organizations Unite for Government Ownership—Want Share in Management and Profits

WASHINGTON, D. C.

**F**OURTEEN RAILROAD LABOR ORGANIZATIONS, claiming to represent nearly 1,900,000 employees, have endorsed the plan proposed last week by Glenn E. Plumb, representing the four brotherhoods, providing for government ownership of railroads and operation by the employees on a profit-sharing basis, A. B. Garretson, president of the Order of Railway Conductors, testified before the Senate committee on February 10. The plan as outlined by Mr. Plumb was described in last week's issue. It provides for operation by a single corporation, administered by a board of directors, of which one-third would be chosen by the President, one-third by the classified employees and one-third by the appointed officers, profits above the fixed charges necessary to pay interest on the bonds to be divided between the government and the employees, who would receive a wage dividend in proportion to their wages. Mr. Plumb also opposed the plan for a five-year extension of the present federal control but said that this opposition would be withdrawn if the general order issued by Mr. McAdoo restraining political activities on the part of railway employees should be revoked, and both he and Mr. Garretson presented several arguments for the five-year plan.

Mr. Garretson appeared before the committee as the representative of all the 14 organizations that have agreements with the Railroad Administration, the Brotherhood of Locomotive Engineers, the Brotherhood of Locomotive Firemen and Enginemen, the Order of Railway Conductors and the Brotherhood of Railroad Trainmen, which he said represent 400,000 men, and also the following organizations affiliated with the Railroad Employees' Department of the American Federation of Labor, which he said represent 1,500,000 men: International Association of Machinists; International Brotherhood of Blacksmiths and Helpers; International Brotherhood of Boilermakers, Iron Shipbuilders and Helpers; Amalgamated Sheet Metal Workers' International Alliance; International Brotherhood of Electrical Workers; Brotherhood of Railway Carmen; Brotherhood of Railway Clerks, Freight Handlers and Station Employees; Switchmen's Union of North America; Order of Railroad Telegraphers and United Brotherhood of Maintenance of Way Employees and Shopmen. All of the members of these organizations are not employed on railroads, some being employed in contract shops. The organizations affiliated with the American Federation of Labor have recently taken a referendum, which resulted in an almost unanimous vote for government ownership and the executives of the 14 organizations held a meeting in Washington last week for the purpose of agreeing on a plan to be presented to the committee and of drafting a proposed bill.

### Converted by Results of Past Year

Mr. Garretson said that these 14 organizations represented almost the entire body of railroad employees, with the exception of a few small unions, the men who have not been in service long enough to be eligible to membership, and those who have not joined the unions. The Plumb plan, he said, has the unqualified endorsement of the representatives of the organization as far as its principle is concerned, but there has been no endorsement of any given detail of the plan. Because of the diversity of opinions as to the various phases of any scheme, he said, there has been no attempt at agreement on the mechanics of the application of the plan. Three of the executives of the four brotherhoods, W. S. Stone, Timothy Shea and W. G. Lee, had always been opposed to government

ownership. Mr. Garretson said, while he had been an advocate of it, and many of the heads of the other organizations had also been against government ownership, but they had been converted to government ownership as far as railroads are concerned by the experience of the past year of government operation as contrasted with the old conditions under private management. The plan has not had a fair trial as to its efficiency because the government took over the roads at a time when they were in bad condition and operated them under the abnormal war conditions, and the wonder is, he said, that the Railroad Administration succeeded as well as it did, not that it failed in some particulars, but the employees had seen in the year's operation "the germ of what might be after a fair trial".

"The real question before Congress," Mr. Garretson asserted, "is not the adoption of a comprehensive plan for the operation of the railroads but a declaration of policy for the future as to whether the railroads are to be administered as an appanage of the government or as a private enterprise. We are of the strong belief that they can best be administered through a direct government agency furnishing transportation not for profit but at cost. If you make the government responsible for any deficits you have gone far towards government ownership, and the government should be entitled to share in the profits. All of the plans presented here that demand a government guarantee of returns recognize the principle of government ownership. If government regulation creates a deficit on some roads and it is proposed to have the government make it up by a guarantee it is only consistent to go to government ownership and put all the earnings in one jackpot."

Mr. Garretson elaborated on his idea that any plan of guarantee comes very close to government ownership, saying that all the plans come to the same thing, a proposal that the government stand the deficits and the corporations keep the profits. He said the idea of a guarantee necessarily carries with it supervision of operation to ascertain that operation is on an efficient basis and that the government cannot effectively equalize conditions on different railroads unless it can avail itself of the surplus earned by some railroads, and he declared that the removal of the speculative element in railroading would kill all hope of competition or efficient operation. He also insisted that under any plan of guarantee a valuation would be essential.

Mr. Garretson traced the history of railroad consolidations into the present large systems and said that now the director general proposes a further consolidation into six to 12 regional systems. The next logical step, he said, is consolidation of all the roads under one head because if six consolidations would be a good thing, one would be still better and such a consolidation would never be permitted to be handled by a private corporation. Returning to his idea of transportation at cost, Mr. Garretson declared that a public utility serving the common necessity should furnish its service at cost without any increase of the cost to pay a profit. The basic purpose of a corporation is to make a profit and the tendency is toward constantly increasing rates. Under the plan proposed by the brotherhoods there would not only be a saving in interest rates but the balance over fixed charges would be divided equally between the government and the employees so that the government's share could be used as a sinking fund, which would eventually retire the bonds so that the public would get its transportation at cost. He did not refer to the share which would be divided among the employees as a profit, but as an

"incentive to efficiency." Senator Underwood pointed out that we have had a test of one year of government operation and that it had cost more to operate the roads than under private management. He asked if Mr. Garretson could explain why this was the case. Mr. Garretson did not directly answer the question, but said he had pointed out to Mr. McAdoo four days after he became director general that government operation would not have an honest test if faced with a time limit and uncertainty as to whether the railroads would be returned. Railroad officials, he said, have been trained to look to Wall Street for preferment and until they have become absolutely convinced that their future lies with the government instead of Wall Street the operation will not be successful. He made no direct charge against the railroad officers, but referred to a "passive resistance," manifested "not in what a man does, but in what he does not do." He illustrated the position of the railroad officials by the story of the donkey-driver who encouraged his animal by suspending a cabbage in front of his nose just out of his reach, saying that when the railroad officials realize that the cabbage is held by the government they will give just as honest service to the government as they ever did to Wall Street.

Mr. Garretson said that many newspapers had described the brotherhood plan sarcastically as meaning a proposal that the employees run the railways. He said he was willing to discuss this question seriously as a legitimate business proposition and without sarcasm. Other interests, he said, are willing to propose a government partnership in the losses, but are silent as to partnership in the profits, whereas the employees are willing to go into partnership with the government and are willing to take the officials into partnership also. He asked whether it would be better for the government to enter into partnership with corporation seeking a profit or with the men who do the work and who only ask wages and a share of the profits. There have been thousands of profit-sharing schemes, Mr. Garretson said, but this is the first true profit-sharing scheme ever presented to any industry.

As to the desirability of the plan for a five year extension, Mr. Garretson said the representatives of the 14 labor organizations have varying opinions. Personally, he thought there were arguments both for and against it. If the extension would defer a final conclusion as to the railroad problem it would be a calamity, but if the period were used for studying and laying out a permanent plan of action it would be desirable. Congress should first, however, lay down a policy as between government ownership and private management. If the policy is to be private management the machinery is in existence and can be oiled up and refurbished in three or four months. If the policy is to be government ownership much time will be required to develop the new machinery. But, he said, it is not desirable that the railroads be returned until there has been a decision as to what the policy is to be because the return will doubtless be attended with the same chaotic conditions which existed for a time after the railroads were taken over and the public will suffer. Mr. Garretson argued that one advantage of government ownership would be the opportunity to eliminate seasonal unemployment. He said the world owes every man a living and society has to support the burden in one way or another. If free transportation or transportation at cost could be furnished to move labor from regions where there is a surplus to others where it is needed, unemployment could be done away with to a large degree.

In concluding his statement, Mr. Garretson uttered a warning that any attempt to reduce the wages established during the past year would arouse the army of discontent in a way that would shake the social structure. He said he was not in sympathy with Bolshevism, I. W. W.-ism, Socialism or Anarchism, but he recognized some of the causes of which they were the result and which must be relieved.

Replying to questions by Senator Cummins, Mr. Garretson said that never before has a profit-sharing plan been proposed

which provides for any equitable division of profits among all who participate in the enterprise. The idea of profit-sharing carries with it the idea of limitation on unreasonable profits and the problem of industrial unrest can never be settled until this question is settled. He declared that wage increases alone would not solve the problem because a wage increase merely gives to a favored class at the expense of those who do not get corresponding increases, not at the expense of the employer, and that increases in wages may leave labor worse off than before if the purchasing power of money is thereby decreased. He said he had made a study of the family budgets of 2,500 conductors, which showed that in 1910 or 1912 when a freight conductor's rate was \$4.18 a day they had \$11 less surplus at the end of the month than in 1890 when a freight conductor's pay was \$3 a day.

He said that wages should be fixed by a tribunal so constituted that no one element should determine its own wages, as the official class had been able to fix its own compensation, and he advocated a plan similar to that put in effect by the Railroad Administration when it constituted boards of adjustment composed of an equal representation of employees and officials. The board that deals with brotherhood affairs he said had settled 300 cases without a dissenting vote, but whereas the present boards do not deal with wages and the director general is in effect an umpire, the Plumb plan provides for similar boards to fix wages with an appeal in case of a disagreement to the board of directors of the proposed national corporation.

#### Right to Strike Reserved

Senator Cummins asked if under government ownership the employees would insist on their right to strike. Mr. Garretson replied that the relation between the government and the employees should be the same as between the employees and any employer and that the rights of citizens should not be affected by government employment. The right to strike must necessarily be retained, he said. Any body of men will always obey the law until a stage of irritation has been reached that carries them beyond control, when they will exercise their right to overturn existing arrangements in the same way that men have always acted. He referred to the Canadian Lemieux Act as proof that the enactment of a law that it is known will be broken is the height of unwisdom, saying the time will always come when men will break a law which they think violates their inherent rights.

Mr. Garretson concluded his testimony on Wednesday and was excused from appearing on Thursday because the brotherhood leaders had an appointment for a conference with the director general and his staff, on the proposed increase in wages now under consideration by the Board of Wages and Working Conditions, but he may be recalled later.

#### Opposition to Five-Year Plan Based on Political Order

While reading his prepared statement last Friday outlining the plan for Government ownership proposed by the brotherhoods, Mr. Plumb indicated that the opposition to the five-year plan would be withdrawn if General Order No. 48 restraining political activity on the part of the employees is modified, and in discussing conditions on the assumption that the order would be modified he presented several arguments in favor of the five-year plan as providing a period of stability during which a permanent plan could be worked out. He said, however, that if a permanent plan can be worked out in less time, the present system of Federal control should be terminated without running for the full five years. While Mr. Plumb was discussing the political order, Senator McLean interrupted to ask: "If the order should be revoked, would you still be against the five-year plan?"

"That is our only objection to the five-year plan," replied Mr. Plumb. "The purpose of an extension is to allow time for a political solution of a great social issue, and under this order we would be precluded from full participation in the

working out of that solution. We cannot afford to leave to the financial interests complete freedom while we were limited in participation. If we were not debarred from participation in the final solution, then I am frank to say our objection to the five-year plan would be eliminated. Mr. Hines' arguments are very cogent. We agree that 21 months is not sufficient for a complete solution."

"Have you or your associates had any intimation that this order will be revoked?" asked Senator McLean.

"I have no such intimation," replied Mr. Plumb, "but Mr. Hines has impressed me and my associates with his supreme fairness toward every question and it, therefore, seems to me there is hope for the elimination of this objection. However, Congress should get busy at once, and if it is possible to get a solution in one or two years, the extension should be made subject to that possibility and the present system should not be continued longer than is necessary. If there can be a period of stabilized conditions while Congress is working on this problem it would be in the interest of the public and labor is particularly interested. The railway executives did not say that the wage level is too high, but none would say the status would be preserved and one said that wages should be governed by the law of supply and demand. As between a great monopoly and a body of organized employees, that don't mean supply and demand at all. It merely means a trial of strength. If we can protect the status while the solution is being worked out, that would be very desirable.

Mr. Plumb concluded his prepared statement near the end of the session and was not questioned at length. Senator Underwood pointed out that efficiency does not depend entirely upon the employees, but "comes from the top down" and goes with the appointing power. Mr. Plumb admitted the force of this statement, although he had emphasized the skill and industry of the employees, but he said that the labor plan proposed to retain efficient executives but did not want to continue in office inefficient men who may happen to be in control of capital.

Senator Cummins said that we must think now and then of those who pay the bills for railroad service as well as those who receive the money, and he asked how the Interstate Commerce Commission in fixing rates would determine how much surplus to allow to retain the interest of labor. Mr. Plumb suggested that the present level of wages and rates be taken as a starting point and said that labor would get nothing by way of a dividend until by efficiency it produced enough to pay it and that the Government would receive a surplus to be used as the basis for a reduction in rates before there would be any profits for labor to share. He said the commission would be dealing with a mathematical problem in fixing a general level of rates, but that it would sit practically as a tax-fixing body in distributing the rates as between classes and commodities. Senator Cummins also asked Mr. Plumb if he had considered the probability that if Federal control is extended for five years it will be accepted as disposing of the subject for the time being and that Congress will not be likely to take up the permanent solution until shortly before the expiration of the period. Mr. Plumb agreed that that might be so, but thought that the danger of loss to capital in letting the situation become more complicated will be a force that will impel them to seek an early solution and that the public will feel it is paying too much and will demand a quick settlement. Also, he said, labor will lend all its force toward a quick solution which would remove the uncertainty, but he felt that 21 months might be too short a time in which to accomplish permanent results. Senator Cummins declared he was of the deliberate opinion that if the time is extended for five years nothing will be done of a decisive character until immediately before the expiration of that period. Now, he said, is the psychological time to work out a permanent plan. Everybody is interested

in the question, all the various interests are proposing plans, and if this opportunity be allowed to pass the whole inquiry must be made all over again. Mr. Plumb said that the proposed five-year extension of the present system does not approximate any plan which is being suggested and that the sooner a definite, permanent plan can be agreed on the better, but by no means, he said, should the roads be permitted to be turned back until a permanent plan is adopted, whether one or five years is required.

#### Southern Shippers Opposed to Five-Year Plan

Charles E. Cotterill, general counsel of the Southern Traffic League, presented a statement of policy adopted by the league after a referendum of the 46 chambers of commerce which composed its membership opposing Government ownership or any extension of Federal operation beyond the period now provided by law and favoring the return of the railroads to private control and operation subject to Government regulation as speedily as may be practicable. The league favored preserving under private control and operation such economies of transportation as may have been developed under Federal control to the extent that the service may be improved without inflation of charges or undue inconvenience of the public or the impairment of wholesale competition. The league opposed any governmental guarantee of income, and, while favoring the principles of fair return upon the investment, opposed any system of rate construction designed to accomplish this without due regard to other factors properly to be considered in the making of just and reasonable rates and also the unrestrained assertion of Federal authority in the regulation of traffic that is purely domestic to the several States.

Mr. Cotterill said his clients could not appreciate the argument that Congress should enact a radically new system of legislation before returning the railroads to their owners. They felt some requirements ought to be adopted, but saw no reason why the railroads could not be returned as soon as the practical obstacles to their return can be overcome. He said the present period of Federal control has been one continual wrangle between the Administration and the shippers, during which they have had to call on their representatives in Congress several times for protection, and they wanted this condition terminated. He referred particularly to the proposal of the Administration to substitute the interstate basis for State rates before applying the 25 per cent increase, which had been withdrawn on account of the opposition of the Southern shippers, and to the proposals of the Administration to put into effect a uniform mileage scale of class rates. He said the shippers were not interested in State rights but that the jobbing business of the South was seriously menaced by the efforts to abolish the State rate basis and that the Director General has said he would put the mileage scale into effect, although the Interstate Commerce Commission has recommended against its being taken up at this time. Mr. Cotterill severely criticised some of the acts of the Railroad Administration and the effects of the elimination of competition and presented numerous arguments against the policy of Government ownership.

"We doubt the value of the sociological experiment of Government ownership and operation of our railways," he said. "Were our mileage one-fourth as great and the traffic one-fourth as large, Government ownership might be a success, but with the vastness of our railways and their operations before us we would be gravely concerned over any prospect that the Government itself might enter into such a domain and take over our greatest industrial activity. Under private initiative our railways have developed into the greatest transportation system in the world, which might not have been the case had the Government owned the railways from the beginning."

Regarding the plan of Federal control, Mr. Cotterill said:

"From the standpoint of physical operation it may be conceded that during the past year a very difficult war situation was met in a very effectual way. But it must be remembered that, after all, it was the railway men themselves who achieved those operating results, the only difference being the disregard of all legal restrictions formerly placed upon the railways and the advantage of compulsory co-ordination of their activities.

"But it has been an expensive enterprise for the shipping public. If cost be disregarded it would be possible to build and operate our railways in an ideal way. There is no way by which to calculate the precise additional cost of Federal operation during the past year, but the fact remains that it increased almost beyond comprehension. We take no broad exception to the wage increases that were allowed; but we cannot avoid the remark that the rate of pay accorded negro railway labor in the South has exceeded all bounds of reason and has brought about a very unhealthy condition. Perhaps that phase of the matter must be regarded as a necessary incident of the war.

"Had the Railway Administration confined itself to the fulfillment of its immediate purposes as a war tribunal, perhaps there could be no criticism of its past record. But the shippers of the South have had to contend with a very difficult situation arising from the fact that the Railroad Administration did not confine itself to war activities but instead entered upon and indulged in all sorts of innovations and revolutionary changes which threatened to work great hardship upon them, and in many cases did so.

To be more specific, the director general built up an organization and surrounded himself mainly with former railroad officials and employees. In the nature of things the director general personally did not and could not know the full consequences of all that was proposed in his name. To us in the South it seemed at times as if the former railway officials, anticipating the eventual return of their railroads, were taking advantage of Mr. McAdoo and of the situation generally, to put into effect cherished ideas of reform which, without the very great power of the director general, could never be made effective."

C. W. Bunn, general counsel of the Northern Pacific, testified before the Senate Committee on Thursday, advocating a plan by which the Interstate Commerce Commission be given power to review State-made rates to bring them into harmony with interstate rates. S. Davies Warfield also presented a supplemental statement regarding his plan which was presented last week. G. M. Freer, president of the National Industrial Traffic League, and N. L. Amster, president of the Investors' Protective Association, were to follow on Friday.

The committee has decided hereafter to hold hearings only on Tuesdays and Thursdays. The House Committee on Interstate and Foreign Commerce proposes to begin hearings soon on the railroad question.

## Rivers and Harbors Congress

FEDERAL SUPERVISION of water transportation under a department of transportation or a bureau of the Department of Commerce and extension of the jurisdiction of the Interstate Commerce Commission over rail and water rates together with improvement of all navigable streams upon which commerce could be established were recommended to Congress in a declaration of principles adopted by the National Rivers and Harbors Congress at its fourteenth annual meeting in Washington last week. Co-ordination of rail and water facilities and the elimination of destructive competition between them were also favored.

Walker D. Hines, director general of railroads, addressed

the meeting on the subject of the co-ordination of rail and water facilities and urged extension of the present system of federal control for the purpose of giving it a better opportunity to work it out. "I cannot reconcile myself," he said, "to the view that a great national highway like one of our waterways can properly be regarded as economically useless. The government has devoted a great deal of attention and money to the improvement of these waterways, but so far there has been a missing link which was of vital importance to supply. It is not sufficient merely to provide a waterway. It is equally important to provide the means for an interchange of traffic between the waterway and other means of transportation. I have been tremendously interested ever since I came into the Railroad Administration in seeing how we could make a practical, sympathetic and helpful experiment with a view not only to furnishing the desire to have the railroad feed the waterway so as to get a really economical and beneficial use of the waterway, but with a view also to finding a practical method of effecting this rehandling of the traffic between the railroad and the waterway so as to get a really economical result. The Railroad Administration has attempted to do that, and I am directing that work with a definite belief and conviction that with these great national waterways we can and must find a way to make them an economic success." But, he said, this will take time, and if the administration is facing a relinquishment of the railroads in a short time, it will be hampered in working out the problem of waterway development. Mr. Hines said nobody expects the present form of federal control to continue indefinitely, and he did not suppose that anybody wants it to continue indefinitely.

Discussion of railroad questions occupied a considerable part of the program of the meeting. Secretary of the Navy Daniels said that the railroads had broken down under their increased burden after the United States entered the war, "while the waters have run idly to the sea," and that they had broken down because they were built on a program based on the destruction of water traffic. He declared that not a ton of the raw materials which lend themselves to water transportation should be carried by rail if water transportation was available. Senator Ransdell of Louisiana, president of the National Rivers and Harbors Congress, urged the appointment to the President's cabinet of a secretary of transportation whose duty would be to regulate railway, waterway and highway transportation. Major General William M. Black, chief of engineers, United States Army, also urged the creation of a secretary of transportation, charged with the development and co-ordination of all the transportation agencies of the nation. He said the Railroad Administration is a railroad administration with a waterway appendix because its officials are almost all men trained in the railroad viewpoint.

The question of government ownership versus private ownership of the railways was discussed by Luther M. Walter, general counsel for the National Association of Owners of Railroad Securities, who opposed both government ownership and the proposed extension of federal control, and advocated the plan for railroad regulation proposed by that association before the Senate committee; by William Jennings Bryan, who advocated a dual plan of state ownership of branch lines and federal ownership of trunk lines of railroad; and by Samuel O. Dunn, editor of the *Railway Age*, who declared that private operation under wise and fair regulation would be far more beneficial to the public than the result of government operation would be.

The Traffic Club of St. Louis, Mo., recently adopted resolutions declaring that the extension of government control of railroads is prejudicial to public interest. The resolutions were ordered sent to Missouri representatives in Congress.

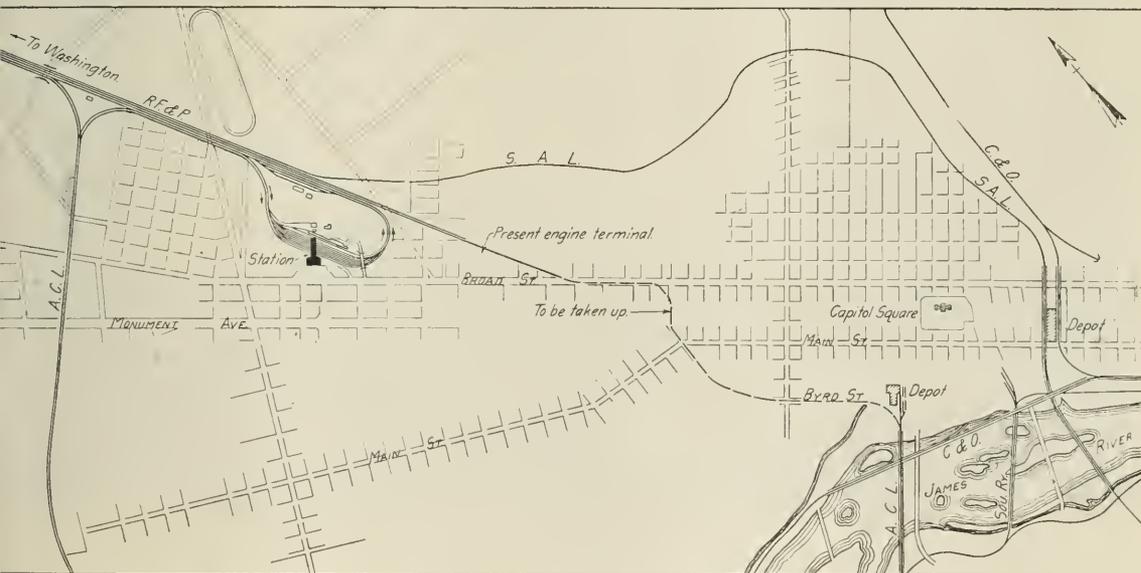

The Station from Broad Street

## A New Passenger Station Completed at Richmond, Va.

This Project Involves a Terminal With Facilities for Two Roads and an Improved Main Line

THE OLD UNION PASSENGER STATION facilities in Richmond, used jointly by the Atlantic Coast Line and the Richmond, Fredericksburg & Potomac, having become inadequate and incapable of expansion to meet present day requirements, the Richmond Terminal Railway was organized early in 1916 for the purpose of providing an im-

proved and modern passenger layout for the use of these two railroads. The project embraces a new station and auxiliary buildings, a complete and interesting terminal track layout and the development of an improved main line through the city for passenger traffic which eliminates the objectionable operating features of the old line and numerous crossings at grade with important thoroughfares and lengthwise occupancies of other streets. The contracts for the terminal construction were let early in 1916 and the new terminal was opened to traffic on January 4 of this year.

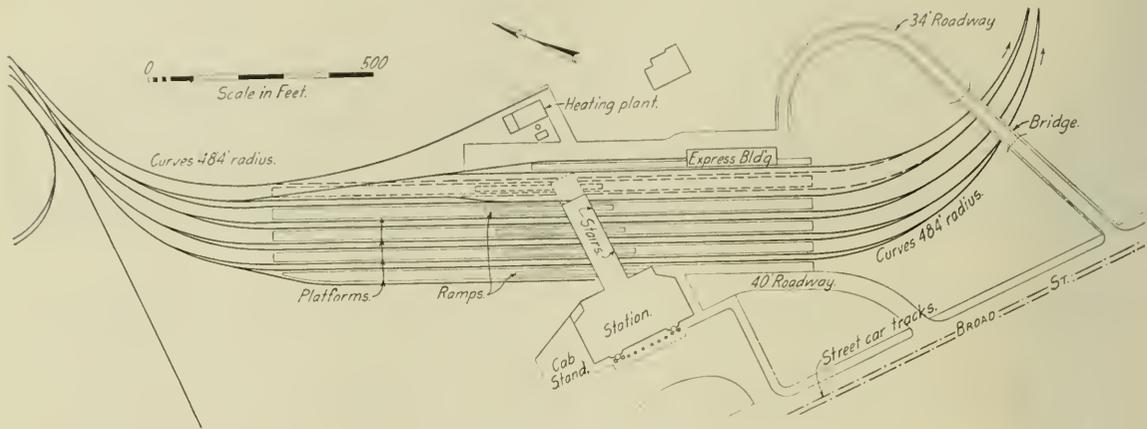

Map of Richmond Showing the New Station Site in Relation to the Old Station

proved and modern passenger layout for the use of these two railroads. The project embraces a new station and auxiliary buildings, a complete and interesting terminal track layout and the development of an improved main line

As may be seen on the map of Richmond, the old facilities for passenger service were situated at Byrd street in the heart of the business section of the city on the lower level along the James river. The land available for railway purposes

in this district is limited on the south by the James river and on the north by the abrupt rise from the low ground along the river to the higher level of the city. The property adjoining the site is built up solidly with industrial and business plants, making the acquisition of additional property for railway purposes difficult and expensive, even if the location was desirable otherwise, which was not the case. The old station, while serving as a through station, was of the stub-end type, constructed in this manner because of the

Potomac and the tracks of the Petersburg Connecting Company, which operates between Byrd street and Elba stations. In this section and north to Broad street the single track lies in and across important thoroughfares, an arrangement which is unsatisfactory both to the city and to the railroads. These objectionable features, coupled with the urgent necessity for amplified freight facilities on the lower level of the city with the area now occupied by the passenger layout necessary to the development of the freight project, led to the

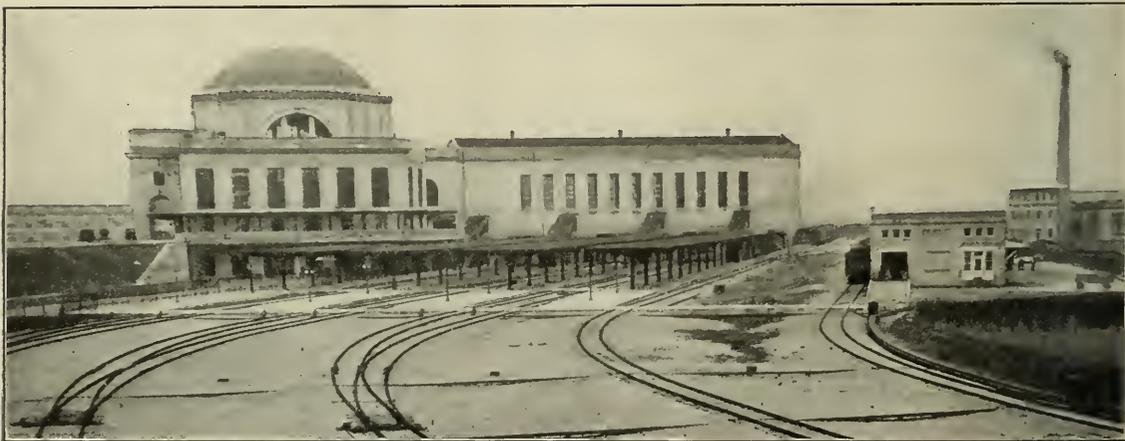

Track Layout at the Station

limitations of the site. It was served with six stub-end station tracks, each having a capacity for six cars only, the limited track capacity being also occasioned by the topographical features of the location.

Because of its type, reverse movements were necessary in getting trains in and out of the old station, and as the through trains using the terminal often carried 16 to 18 cars, two cuts were necessary in getting one train into the station. This, of

decision to locate the new terminal in a different section of the city.

The location chosen is in the western end of the city in a rapidly growing residential section on land purchased some years ago by the Richmond, Fredericksburg & Potomac. This site is convenient to the hotels and retail section of the city, thus fulfilling the needs of the transient public, and is particularly convenient to the newer residential sections.

The Track Layout and Platforms

course, required a liberal time allowance in the schedule for the station stop, and in the event of trains arriving at the station off their schedule and on the time of other trains, delays and congestion resulted.

The approaches to the old site also embrace objectionable features. From the south the approach is over the Atlantic Coast Line's single track bridge over the James river, while from the north it is via the Richmond, Fredericksburg &

To utilize this site as a terminal it was necessary to develop a new line for passenger traffic.

### The New Passenger Line

Again referring to the map of Richmond it may be seen that the old through passenger line entering Richmond from the south embraces the Atlantic Coast Line main tracks over the James river into the old station and those of the

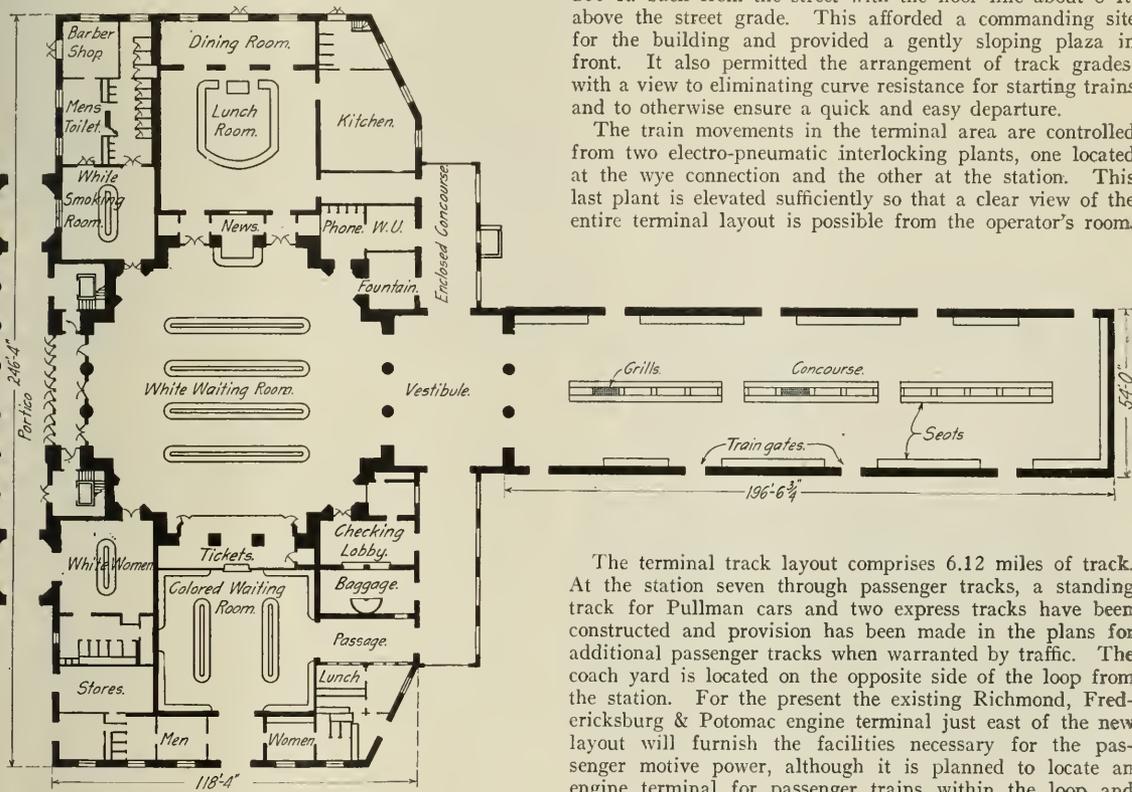

Petersburg Connecting Company and the Richmond, Fredericksburg & Potomac to the north leaving the city on the west. For freight purposes a single-track line had previously been provided around the south and west of the city, leaving the Atlantic Coast Line main line at a point about two miles south of the old station and joining with the Richmond, Fredericksburg & Potomac main line at the point where those tracks leave the city. Under the new plan through passenger trains will follow this route and, incident to the terminal project, this belt line has been double-tracked and otherwise improved. The Atlantic Coast Line main line into the old station will be operated only for freight service.

The new terminal layout is located approximately one-half mile east of the junction of the Richmond, Fredericksburg & Potomac main line with the belt line. Between this

Trains from the south approach the station over the northbound main track of the belt line and the wye track shown on the map, entering the station layout from the west. Southbound trains enter the station from the same end by means of a second approach track leading off the Richmond, Fredericksburg & Potomac main line. All trains will leave the station from the east, passing around the loop. The movement of northbound trains is direct, and southbound trains will use the second track of the wye connection mentioned above to reach the southbound main track of the belt line. From the foregoing it will be noted that all trains enter the station headed in the same direction—east. Thus baggage will be handled at one end of the platforms only.

In planning the layout the platforms and tracks were located at an angle with Broad street. The station was placed 200 ft. back from the street with the floor line about 8 ft. above the street grade. This afforded a commanding site for the building and provided a gently sloping plaza in front. It also permitted the arrangement of track grades, with a view to eliminating curve resistance for starting trains and to otherwise ensure a quick and easy departure.

The train movements in the terminal area are controlled from two electro-pneumatic interlocking plants, one located at the wye connection and the other at the station. This last plant is elevated sufficiently so that a clear view of the entire terminal layout is possible from the operator's room.

First Floor Plan of the Station

junction and the new location two of the tracks of the Richmond, Fredericksburg & Potomac main line will be utilized as a part of the new passenger line, there being five tracks between these points. That portion of the Richmond, Fredericksburg & Potomac main line east of the new layout will be abandoned as main line, but retained in service to reach the existing engine terminal, yard facilities and industries just east of the new terminal, while between Broad street and the old Byrd street station the line will be abandoned entirely, thus doing away with the occupancy of the city streets by the passenger track.

While the new station facilities are located outside of and are comparatively remote from the new traffic line, the station track layout is so planned that reverse movements are eliminated. The tracks are arranged in a loop, as shown in the map of the station grounds on which the direction of traffic is indicated by means of arrows.

The terminal track layout comprises 6.12 miles of track. At the station seven through passenger tracks, a standing track for Pullman cars and two express tracks have been constructed and provision has been made in the plans for additional passenger tracks when warranted by traffic. The coach yard is located on the opposite side of the loop from the station. For the present the existing Richmond, Fredericksburg & Potomac engine terminal just east of the new layout will furnish the facilities necessary for the passenger motive power, although it is planned to locate an engine terminal for passenger trains within the loop and move the freight engine terminal to Acca, about four miles to the north on the main line of the Richmond, Fredericksburg & Potomac.

Curves with a radius of 484 ft. have been installed at both ends of the loop. This is the maximum curvature in the layout, the curve at the west end of the main line having a radius of 1,194 ft.

The track layout includes 52 frogs, 44 in the main line and 8 in the coach yard. In the main line the frogs are of the manganese insert type and in the coach yard of bolted open-hearth construction. The frogs in the main line are all special, ranging from No. 8 to No. 15 and, in spite of the difficulty of design occasioned by the curves, only six types were used, thus effecting material savings in manufacturing costs.

The natural surface of the ground at the layout is generally higher than the track grades established and 150,000 cu. yd. of material was moved in the preparation of the site of which 145,000 cu. yd. was occasioned by the depres-

sion of the tracks and 6,000 cu. yd. by the station building excavation. About 40,000 cu. yd. of the material was utilized in the fill required in the station plaza and the remainder in filling the low ground at the connection with the Richmond, Fredericksburg & Potomac main line at the north end of the loop. This last embankment was placed in such a manner that a complete loop track can be constructed without further grading.

The material moved in these operations was chiefly clay with gravel pockets in places. In making the excavation the top soil was stripped by teams and piled for use in the parking scheme. All of the excavation except 25,000 cu. yd. removed by teams was handled by a steam shovel and moved to place in the fills by means of narrow-gauge equipment. The embankment for the plaza in front of the station was also placed by teams.

The presence of gravel pockets in the clay made necessary an elaborate system of sewers. The main sewers of the plot which connect with the city sewers are all of brick and include 584 ft. of 4-ft. 6-in. sewer; 1,000 ft. of 3-ft. 6-in. sewer, and 500 ft. of 3-ft. sewer. The lateral sewers range from 8-in. terra cotta to 24-in. These are specially built to collect the surface water, the back filling in the trenches being of coarse material.

In planning the improvement one of the important objectives has been to secure pleasing surroundings and the plan of landscape treatment is of particular interest. The greater portion of the site was formerly the location of the Hermitage golf grounds and a baseball park, free from extensive building improvements, a site which lent itself readily to landscape treatment. Because of the large area occupied simple methods of treatment in the landscape plan were essential. It is proposed to establish and maintain fine turf on the oval in front of the station and between Broad street and the entrance roads to the right and left. The oval area will be left in simple lawn, because it seems most de-

simple turf, is surrounded by flowering shrubs in which dogwoods and redbuds predominate.

The semi-circular loop which extends from the overhead express road bridge down to the express building is a simple shrub flower garden. The level ground is turfed. Back of this will be a belt of winter or yellow jesamine, redbuds, dogwoods and other flowering shrubs with certain hardy perennials, giving a succession of bloom through much of the season. The embankment approaches to the bridge over the tracks are covered with Armour privet which in this climate is practically evergreen.

The great central part of the loop, formerly used as golf

The Train Shed and Platforms

grounds, is already in good grass and the extensive rough ground area in the northern part of the loop is covered with a dense planting of black locust, edged around with flowering shrubs of great variety, which will require no maintenance and will produce a striking effect.

All of the railway banks and the slopes of the cuts, which are very flat, are thickly planted with Japanese honeysuckle and Armour privet, forming a mass covering, requiring little attention and being practically evergreen. Lombardy poplars are planted in clumps or rows in many places to screen off factory buildings in the near and middle distance. This landscape work was done by Warren H. Manning, landscape designer, of Boston, Mass.

### The Station

The plans for the station building were prepared by John Russell Pope, architect, of New York City, and the construction work has been carried out under his supervision. The building is a fireproof structure of steel and concrete with exterior walls of Indiana travertine limestone. The face of the building is 200 ft. north of the street line, permitting a broad plaza with sweeping curves and grass plots. The structure is 240 ft. long, 118 ft. wide and three stories high on the plaza front. Facing the interior courts an additional story is obtained in the east and west wings. These three upper floors are used for railroad business offices.

The entire main floor is given over to the uses of the traveling public. The waiting room for white people, with its lofty domed ceiling extending up entirely through the building, occupies all the space included within the central motif. The concourse, 50 ft. wide and over 200 ft. long, joins the domed waiting room through the concourse vestibule on the north, extending at the same level as the waiting room over the seven tracks. The concourse vestibule is 50 ft. by 50 ft. in plan. Access to the tracks is obtained through enclosed stairways on the east for outgoing, and ramps on the west for incoming passengers. The platforms are covered by canopies that extend far over the cars and are supported by single Ionic columns of cast iron and of massive proportions. The ramps, stairs and platforms are in harmony with the central structure. Enclosed passages flank the building on the northeast and northwest, giving

The Lunch Room and Restaurant

sirable to have a simple green foreground for the building, that will not be broken by beds of flowers and shrubs. The turf areas to the right and left of the entrance road are to be bordered with flowering shrubs such as spraeas, wigelias, altheas, golden bell, and the like, faced down with borders of hardy perennials.

To the north of the station a sloping triangular area, that is above the cut slopes at the railroad tracks, will be covered with ground-cover plants including Japanese honeysuckle, Japanese bitter-sweet and Chinese wisteria. To the south of the station between the tracks and the express and baggage road, the comparatively level ground covered by

direct access to the concourse from the cab stand on the west and the plaza and colored section on the east.

The main entrance to the station faces Broad street and consists of two groups of seven doors each, leading from the portico through the vestibule directly into the waiting room for white people. The vestibule is planked by two entrance hallways, also opening from the portico, served by two doors each. Stairways and elevators run from each of these hallways to the office floors above.

The plan of the main floor and concourse is of particular interest. Entering the waiting room through the portico and vestibule, outbound passengers must keep to the right to reach the information bureau, the ticket office and the baggage checking room. These facilities are reached in the

Interior of the Concourse

trip to the concourse in the sequence mentioned and are arranged in a straight line, allowing the passenger to reach his objective in the minimum time. On the left in the west wing are the smoking room, men's toilet and barber shop, followed by the restaurant, lunch room, telephone and telegraph offices and soda fountain. The rest room and toilet for women are on the right of the main waiting room. A large portion of the main floor of the east wing is given over to the waiting room, restaurant, rest room and toilets for colored people. Their entrance is from the east passage to the concourse.

The ticket office and baggage checking rooms separate the white and colored waiting rooms, thus permitting both sections to be served by the same respective offices. At the extreme southeast corner of the main floor are two shops for rental purposes.

The baggage is handled on the basement floor of the station, with a separate drive from Broad street. A spiral chute and elevator for hand baggage extend between the main baggage room and the checking room on the main floor. The baggage trucking platform is independent of the platforms used by passengers, and, as the traffic through the station is all in one direction, the greater part of the trucking will also be in one direction. Cross-overs are provided from the baggage platform to the passenger platform.

The basement level will also provide space for a United States mail room, a rest room for trainmen and conductors, the office of the station master, storage for the restaurant and other auxiliary facilities. The mechanical room contains the main electrical switchboard, ventilating apparatus, and a refrigerating machine for cooling the drinking water circulated throughout the building.

In design, both the exterior and interior are simple and dignified. Classic architectural orders, the Doric outside and Ionic inside have been used. These have simple moulding and almost no ornaments. The only exception is the

carved setting for the tower clock in the front pediment, typifying progress and industry, and the two seals. The latter are also used again in a modified form on the walls of the concourse.

Plain coursed limestone walls and Napoleon gray marble wainscoting are used in the white waiting room and concourse. All other rooms on the main floor have wainscoting of gray Tennessee marble and plaster walls. The latter are tinted in pleasing tones of gray.

The ticket grills and all other interior metal work are a soft greenish gray, harmonizing with the walls and wainscoting. All floors are of marble terrazzo with marble slab borders.

A feature of special interest is the great illuminated sphere representing the world. It is suspended from the center of the domed ceiling of the main waiting room, and supported within a double ring ornamented with the signs of the zodiac. The entire fixture is made of wrought metal and glass and is eight feet in diameter.

#### Auxiliary Facilities

The express building, which is 40 ft. wide and 200 ft. long, is located across the tracks from the station. This is served by two tracks, one through and the other stub, separated by a platform 12 ft. wide and 350 ft. long. A ramp platform is provided east of the building.

The road leading to the building, which is 34 ft. wide,

A Corner of the Waiting Room

widens into a 40-ft. driveway at the house. This drive leads off of Broad street east of the station and is carried over the track layout by means of a reinforced concrete bridge in the design of which special attention was given to the appearance of the structure in order that it might harmonize with the surroundings.

The express building is of brick on a concrete foundation with seven doors on the driveway side and 14 on the track side. Wilson steel rolling doors are provided throughout. The platform is protected by a canopy and the drive is sheltered by the overhanging roof. The office is 15 ft. by 19 ft. with toilet facilities located in the south end of the building. With the exception of provision for these fa-

cilities the entire building is free from partitions. Two Howe scales, one 7 ft. by 9 ft., of 5,000-lb. capacity, and one 4 ft. by 5 ft., of 500-lb. capacity, are provided.

The heating plant, which adjoins the express facilities, is a two-story building 40 ft. wide by 90 ft. long with space provided on the second floor for lockers and other facilities for the mechanics. The brick stack for this plant, which was built by the Alphons Custodis Chimney Construction Company, is 11 ft. 3 in. in outside diameter at the bottom, 5 ft. inside and 110 ft. high. It is supported on a concrete base 4 ft. deep, octagonal in shape and 18 ft. 6 in. in di-

ameter. The foundation rests on twenty-four 15-ft. Raymond concrete piles which were driven with a steam hammer.

The remaining buildings in the layout in addition to the interlocking plants previously mentioned, are the supply, the oil and the ice house. These are located adjacent to the coach yard tracks.

The plans for the improvements were made by Harry Frazier, consulting engineer, of Richmond, Va., who was also in general charge of the work. C. C. Strong was the resident engineer. The J. H. Parker Company, of New York, was the contractor for the main building.

## Doings of the United States Railroad Administration

### Director General Has Meeting With Executives to Discuss Senate Hearings and Other Matters

WASHINGTON, D. C.

THE POSSIBILITY of facilitating the return of the railroads to private management by turning over their operation to the railroad corporations as agents or representatives of the government for a short period prior to the actual termination of federal control was discussed by Director General Hines at a meeting of the Association of Railway Executives at Washington on February 7, which was attended by about 75 railway executives. The meeting was called for the purpose of giving the executives an opportunity to discuss among themselves the progress of various plans for remedial railroad legislation which have been presented before the Senate Committee on Interstate Commerce and also for the purpose of discussing with Mr. Hines various questions relating to the relations between the Railroad Administration and the railroad companies. The plan of making the corporations the agents of the government as they were during the first three or four months of federal control before federal managers were appointed was discussed only tentatively, but it has been considered by many who have considered the problem as a practical way of effecting the transition from federal control to private management, in the event the President decides to relinquish control at an early date, as he has said he would do if no prospect for early legislation on a permanent plan appeared, and as Director General Hines has said he would recommend. This would give the corporations an opportunity to reinstate their organizations, so that they would be in a position to resume management on their own account at the termination of federal control. The transition would be made while the central organization of the Railroad Administration was still in charge and while the government guarantee of compensation was still in effect.

Mr. Hines was questioned as to what period of time he contemplated in saying that the railroads must be returned in a reasonable time unless the five-year extension is approved by Congress. Mr. Hines said he had no definite period in mind, but that it would be his idea to recognize the conditions existing in the railroad business and allow sufficient time and give sufficient notice to enable the changes to be made in an orderly manner.

Another subject discussed was the position of the Railroad Administration regarding the allocation of cars and locomotives. Mr. Hines took the position that there would have been less objection to accepting the standard equipment if the war had not terminated so suddenly, but pointed out that it was ordered at a time when everyone expected the war to continue longer than it did. He said the railroad control act provided two ways of purchasing equipment, but that if

the government had purchased it for its own account it would have been faced with a difficult problem in disposing of it by lease or by sale after the termination of federal control. He said the railroad companies would probably have had to buy about the same amount of equipment if they had been in charge of the railroads and that the administration felt it was fully justified in the plan it had adopted of purchasing the equipment and requiring the companies to accept and pay for it at its cost to the government.

#### Report of Exports Control Committee

Considerable improvement in the movement of overseas traffic for the week ended February 4 over the previous week is shown in a report of the Exports Control Committee. There were 9,180 cars of export freight received at North Atlantic ports for the week and 10,131 cars delivered to boats. The total number of cars on hand at North Atlantic ports on February 4 was 32,343, while for January 28 there were 38,201, a decrease in accumulations of 988 cars.

Commercial export freight is moving freely to New York, the steamship lines displaying a desire to get cargo as fast as possible. Further space in British vessels will soon be available for commercial cargo. Permits are being granted covering commercial freight to Newport News to meet steamers due this month. The total commercial freight on hand for the week ending January 30 at North Atlantic ports increased 12,500 tons. There was a decrease of 2,800 tons at South Atlantic ports; an increase at Gulf ports of 2,600 tons making a gross increase of commercial freight on hand at all ports of 12,300 tons over the previous week.

Effective on March 1 the Exports Control Committee will be abolished, but part of its work, including the development and co-ordination of export traffic, will be continued under the direction of C. E. Spens, who has been appointed assistant director of the Division of Traffic, in charge of export and import traffic matters.

#### Bill for \$750,000,000 Appropriation to Be Reported

The Appropriations Committee of the House expects to report within a few days a bill for the appropriation of an additional \$750,000,000 for the revolving fund of the Railroad Administration asked for by Director General Hines. Whether it will be reported as a separate bill or as a rider to a general appropriation bill has not yet been decided. Director General Hines has held several conferences with a subcommittee of the appropriations committee, explaining the reasons why it is needed and fortifying them with material for use in case opposition develops on the floor of the

House or in the Senate later. Some Congressmen are known to hold the opinion that the amount asked is too much, while others who are opposed to the Railroad Administration might seek to oppose it as a means of embarrassing the administration, but the general feeling seems to be that the amount will be granted.

**Freight Traffic Movement for 1918**

The Operating Statistics Section of the Railroad Administration has issued a report covering freight train and car performance for December and the calendar year 1918, some of the figures of which were briefly noted in last week's issue. Net ton miles of freight handled for the year amounted to 434,997,928,000, an increase of 1.8 per cent as compared with 1917. By heavier loading this traffic was handled with a decrease in train miles and car miles but the average number of freight cars on lines shows an

increase of 2.9 per cent and the mileage per car per day decreased from 26.1 to 24.9, while the net ton miles per car day show a decrease from 495 to 490, or 1 per cent. The percentage of serviceable cars was 5.7 in 1918 as compared with 5.6 in 1917. The average tonnage per car increased from 27 to 29.1 or 7.8 per cent, but the tonnage per train was increased from 653 to 682, or only 4.4 per cent. The figures by regions are given below.

**Salaries to Be Reported**

Accounting Circular No. 71 directs federal auditors to prepare and submit a statement showing the names and salaries at January 31, 1919, of the below designated officers who exercise jurisdiction on the reporting railroad: Federal or general manager, principal assistant to the federal or general manager, federal auditor, federal treasurer, officer in charge of traffic department. If any of the above classes of

### Locomotive and Car Deliveries in 1918

According to figures made public by Director General Hines, there were 2,622 locomotives shipped to railroads under federal control during the year ended December 31, 1918. Of this number, 744 were constructed under orders of the Railroad Administration, while 1,410 were contracted for prior to government operation. In the total were 200 Russian decapods, constructed for the Russian government, but never delivered owing to the situation which arose in that country. Of the total number of locomotives delivered during the calendar year 1918, 540 were assigned to the Allegheny region, 375 to the Central Western region, 902 to the Eastern region, 236 to the Northwestern region, 105 to the Pocahontas region, 361 to the Southern region, and 103 to the Southwestern region.

For the calendar year 1918 there were 700 passenger cars delivered to Class I railroads, while for the same period 40,850 freight cars were delivered. Of the freight cars built during the year 15,230 were U. S. R. A. standard cars. Of the total number of freight cars delivered, 8,683 were built in railroad shops.

### Piece-Work Being Abolished

In addition to the roads mentioned in last week's issue on which the piece work system is being abolished by vote of the employees it has been decided to discontinue piece work in the shops of the Michigan Central, Lehigh Valley, Erie, Chesapeake & Ohio, and Central of New Jersey. The Railroad Administration is following a policy of reducing the shop hours at many places where there is a surplus of labor in preference to laying off men, and the Pennsylvania shops at Harrisburg and Altoona, and shops on the Baltimore & Ohio, Hocking Valley and other roads in the Eastern region have been placed on a 40-hour a week basis. While the number of employees has been reduced at various shops on many roads, there is still a shortage of men on a large number of roads, and efforts are being made to transfer men from places where there is a surplus to where there is a demand for them. It is stated that places are being made for all returning soldiers and that in some cases they are replacing inexperienced men who were employed during the war.

### Not in Position to Finance Extensive Improvements

Director General Hines explained the attitude of the Railroad Administration toward railroad improvements involving large capital expenditures at a conference at Washington on February 8 with a group of Chicago aldermen and business men who had called upon him to urge the importance of the immediate carrying on of railroad improvements in the city of Chicago outside of those involved in the Union Station project, which have already been provided for. Mr. Hines said he did not think there is anything in the country of greater importance at this time than to resume the improvement work which was held up by the war. Not only do the public need the improvements, but it is of the highest importance to give labor the employment, he said. The Railroad Administration will do everything in its power to co-operate in promoting that policy, but when it comes to what the Railroad Administration can do it is confronted with uncertainty. If there is no extension of federal control anything the administration plans for the railroads could not be carried out because there would be a change of management before the plans could be carried out. But the Railroad Administration, even in the face of that uncertain situation can and will use whatever moral suasion it can to get the railroad corporations to consent to going ahead with improvements, and whenever it can finance the work it will be glad to go ahead with it. But, in the face of the uncertainty,

the government is not in position to enter upon an extensive program of financing itself. Mr. Hines took advantage of the occasion to urge upon his callers the argument for a five-year extension in order to enable the Railroad Administration to take the initiative in a confident way in such matters.

\* \* \*

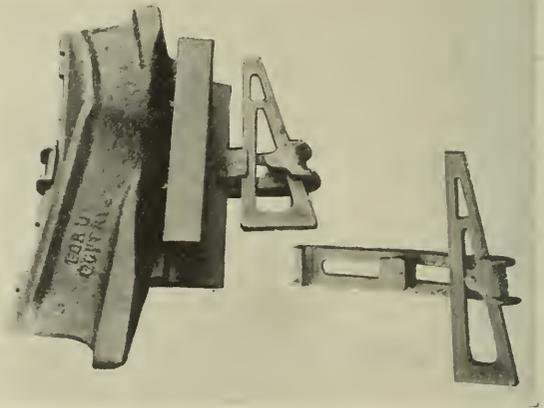

The Car Service Section in Circular CS-53 has issued the following instructions: When the terms of Division of Operation Circular 20 or Revisions thereof, movement of freight equipment to the home road is requested by proper mechanical department officer such equipment shall be promptly billed and moved to owners via direct routes. The full routing, including junctions, must be shown, billing to carry the following notation: "Billed via short route. Authority Division of Operation Circular 20, revised, and Car Service Section Circular CS-53. Not to be diverted." The originating line will be held responsible for proper short routing via Federal controlled roads.

\* \* \*

Director-General Hines has instructed the regional directors that a la carte dining car service may be resumed March 1, when it can be done without congestion in dining cars. Where table d'hote service is continued the price is to be \$1.25 and the meals are to be worth the price.

## An Attachment for Car Replacers

ALL OPERATING MEN are familiar with the difficulties experienced in holding a car replacer in position while endeavoring to return derailed wheels to the track, and various means have been suggested for eliminating the necessity for spiking the replacer to the tie, as this is a

The Replacer Clamp in Position and Detached

rather difficult and time-consuming operation when attempted underneath a car. The photograph shows the latest development for overcoming this difficulty with a clamp to hold the replacer against the rail by means of a wedge. This device consists essentially of a long slotted bar with a grip on each end, a perpendicular one on one end to take hold of the replacer and a beveled one at the other end to engage the wedge. A movable block is free to slide back and forth in the slot and is used as a filler between the rail flange and the inner side of the wedge. A rivet passing through the large opening in the center of the wedge, keeps it from becoming detached and lost when not in use and offers no interference with the tightening or loosening of the wedge. This device is manufactured by the Reading Specialties Company, Reading, Pa.

# Railway Business Association's Recommendations

## Conditions for Transportation Progress—Centralization of Authority and Responsibility—Independent Railroads

THE COMMITTEE ON RAILWAYS AFTER THE WAR of the Railway Business Association, of which W. W. Salmon, president of the Railway Signal Company, is chairman, has filed with the Committee on Interstate Commerce of the United States Senate a statement of which the following is an abstract:

The part which our industry performs in the national economy is to furnish the physical facilities with which transportation is carried on. We look with disfavor upon any project for a transportation system which would end American leadership in mechanical progress in this field. One of the conditions of such progress is that the discoverer, the inventor, or developer of improvements, no matter how poor or obscure, may carry his device, project or system from one railway to another until he finds a road willing to make a test of it.

This essential condition becomes less favorable as the number of railways decreases and would actually or in effect be a single system in which design, specification and purchase are centralized, since the discoverer or developer whose plea for trial is rejected by the one man or the one board representing such a unified railway system would have none other to whom or to which he could go. It is well to remember that certain of the discoveries and inventions which have contributed most vitally to the economy and safety of railway operation have been refused a trial by leading personages in transportation history.

The above observations apply also to commodities now more or less generally used and to staples not patented. Quality of output and of service improves if new concerns coming into the field can make a place for themselves by demonstration of some kind of superiority over the older companies. The selection of goods and of dealers is an administrative act, an exercise of judgment, in which able and honest men may and do differ. It is therefore in the public interest that the rejection of tenders by one road shall not close the door and that if rejected by one road there may be many roads to which a maker or dealer may go until one is found willing to give him a trial in the course of which he may demonstrate the quality and the character which in time will attract buyers who at first were indifferent and hostile.

### Standardization

It is common to inquire whether the standard locomotive or the standard car produced under government control is a good locomotive or a good car. It is also frequently asked whether it was wise or unwise for the railroad administration to attempt standardization under the conditions as they existed. From our point of view these are past questions which all concerned can well afford to ignore. The problem which should seriously concern us is the future. Whatever merits the standard locomotive and the standard car may have, these vehicles are made up of ingredients which were developed under a system of independent competing railroads. There is nothing to indicate that under unified purchase mechanical progress would continue. It is our judgment that it would not. We believe that if standardization had been adopted 10 or 15 years ago the standard locomotive of today or one as good could not have been constructed. We are convinced further that if central standards should be adopted now either under government control or through co-operation among railroads, 10 or 15 years from now the locomotive of that day will be little if any in advance of what we have now.

One of the conditions under which manufacturers of equip-

ment can best perform the service which the public rightfully expects of us is that in whatever adjustment Congress adopts the individual railroad shall remain clothed with full discretion as to design, specification and purchase, and that there shall be as little consolidation of lines as may be consistent with the financial strength and stability of the several roads.

### Government Leases for Operation

In advocating the preservation of numerous independent railway organizations we would lay stress upon the word "independent." Various recommendations are under public discussion which, in our judgment, would tend to defeat such independence.

One of those recommendations is that while leasing railroads to private operating companies the government should own the properties.

As furnishers of railway necessities, we assure you of our conviction that dealing with a railroad owned by the government would be dealing with the government, even though the government were to go through the form of delegating operation to a company nominally private. We would expect production of equipment to be centralized in due course. We would look upon such an arrangement as the beginning of the end of mechanical progress, and as the signal that inventors and developers of invention had better seek other occupations.

### Government Guarantee

Another recommendation which is before you is government guarantee.

Guarantee, like ownership, portends government directors on railroad boards. The guarantor as well as the owner has a stake in supervision over expenditures. The hour when you sanction government guarantees, that hour you place the hand of government on the management and give every employee an occupational interest in elections.

### Strong and Weak Road

Another recommendation from which we apprehend injury to the railway system and to the public is that excess income collected in a fund for improvements upon weak roads should be administered by the Interstate Commerce Commission, or some other branch of the government. Here once more we would have the hand of the government in management.

This particular proposal aims to solve a problem which must be solved in any workable adjustment. That problem, as it has been defined in questions asked of witnesses, particularly by Senator Cummins, is the dilemma where a strong and a weak road serve common termini. They take the same rates. They serve points not common. One of them is so impoverished that an increase in rates sufficient for it to give reasonably adequate service would merely enrich the other road, which is giving reasonably satisfactory service on existing rates.

The question has been asked whether the credit of the weaker lines will ever be strengthened with consent of any government authority so long as the result would be the unnecessary enrichment of the stronger competing roads. The proposal is to establish a fund from excess income. This is in essence a proposal to mobilize railway credit and diffuse the surplus income of roads which have any over the traffic needs of populations at present ill served.

Our point is this: If such diffusion of surplus income is to be employed, Congress should exhaust every other expedient before deciding that such a fund is to be administered by the

government itself. Can we not agree that any such arrangement should be under regulation? But if the government is to perform the function, who will do the regulating?

In this aspect the question is not dissimilar from the phases previously set forth in this brief.

Why not let or make the railroads themselves administer their own improvement fund? By a provision for co-operation among the corporations for this and perhaps for other purposes Congress would at a stroke rid the government of a cloud of embarrassments and complications. The simplest method, and the method growing most naturally out of experience, would be for the statute to lay down the duty which the common carriers are to perform in this particular and authorize some governmental agent to see that the law is carried out.

A broader question, of which the weak-and-strong-road problem is a part, is that of adequate revenue.

#### Many Millions Affected

"We have already remarked that concerns the whole or a large part of whose product was for railways, including everything from raw material to finished products, have employed about as many men as the railways employ—or upwards of one million and three-quarters. We have seen that those looking to these industries for livelihood largely increased in number since that estimate was computed. With those dependent upon them the number directly affected aggregates many millions. Add to these the people of the manufacturing communities who are engaged in trade and in making articles which are bought for consumption by those on the industrial payroll, not to mention the stockholders in all these industrial and commercial institutions, and it is evident that the rise and fall of activity in railway supplies is a barometer of the whole national prosperity."

The occasion for addressing this communication to the Director General was that unemployment has been rapidly spreading in our industry and apparently the proposed expenditure for additions and betterments in 1919 was to be very much less in what the dollars would buy and in the employment which those dollars would give to working men than actual outlays of previous years when enlargement of railway plant had been regarded as woefully insufficient. That particular question is before the Appropriation Committees of the Congress.

#### Facilities at Highest Cost

Provision of facilities by fits and starts is the most expensive possible process. By that process a very much larger amount of plant and size of organization in the railway supply industries is required than if the production could be equalized through all the years of every decade. Somebody has to pay for the idle weeks. Who is it that pays? On the one hand the public, either in rates unnecessarily high or in service unnecessarily poor. On the other hand our employees pay in a loss of working days which is never more than partly made up in the wage-scale and in demoralization which is never made up.

By deferring orders for equipment and improvements to a time when traffic is becoming large and earnings are on the mend, the railways enter the market at the one time when everything they buy will be at top prices. To spread the production equally over the years would make it possible to do business with a smaller industrial plant and would mean the acquirement of the facilities at a lower average price.

The provision of transportation facilities could be carried on more advantageously to all concerned if the railway companies were placed in position such that when traffic is large they may accumulate a surplus and in time of light traffic employ such surplus in the confidence that the rate and

revenue policy of the government will be adequate and stable through an indefinite future.

To us it has long been obvious that regulation affecting revenue must be unified. Our resolution on this point is as follows:

#### Exclusive Federal Rate Regulation

"We favor the adoption by Congress of a policy under which regulation of maximum and minimum rates of carriers engaged in interstate commerce would be federal only."

This resolution involves two changes in the existing situation. It proposes that the regulatory authority shall have power to order rates raised, which is not now a power granted under the Interstate Commerce Act. The other feature is that Congress shall formally announce its supremacy over all rates of all instrumentalities of interstate commerce.

Congress, we believe, should not alone declare rate regulation federal only, but should define the aim of federal rate regulation so as to include the development of transportation facilities and create such administrative functionaries as will assure the accomplishment of that purpose.

Those for whom I speak advocate the creation of some functionary other than the Interstate Commerce Commission for the task of restoring railway credit. The committee of which I am chairman, not having been in the confidence of the railway executives, put into type for consideration of our general executive committee a questionnaire to be sent to the railway supply industry. One of the propositions upon which the recipient could vote yes or no was as follows:

"Congress should adopt a policy of federal rate regulation under which a separate functionary would consider carriers' estimates of future railway traffic needs and, subject to abatement of discriminations by the Interstate Commerce Commission, would fix rates designed to yield revenue sufficient for future operations and credit."

At a meeting when this document was considered it became known that a similar idea was contained in the plan at that time, December 18, in process of concurrence by the railway executives. Our questionnaire went out as originally drawn, and upon the proposition above quoted those replying cast 280 votes in favor and 6 against.

When the results of this questionnaire and the details of the railway executives' plan were before us at our annual meeting in Chicago in January, it was decided to adopt in our tentative draft of suggestions to Congress the expression, "Secretary of Transportation."

Even if the function of promoting transportation development were one which could be effectively performed by a commission, this particular commission was born and bred to another type of task. If men of the requisite calibre could be found willing to accept a one-ninth part of the power so to serve the public it might take years before men chosen for development instead of restriction would come into control unless a ripper bill were passed. But how many men in the United States who have demonstrated executive capacity would accept appointment in what is virtually an appointment to attempt executive accomplishment through an agency which by its composition is adapted rather to deliberation than to action.

The new functionary proposed by us would be expected, as set forth in the resolution adopted by our association, "to consider carriers' estimates of future expenditures, including labor costs; to exercise exclusive supervision over security issues and to fix rates designed to yield revenue sufficient for future operations and credit."

The International & Great Northern will move its general offices from Houston, Texas, to Palestine on May 1. Arrangements are now being made for office and housing facilities at Palestine.

# General News Department

**Views of business men** on the relation of the government to the railroads, as gathered by the New York Evening Post, continue uniformly to show opposition to government ownership or operation. At St. Paul, the correspondent finds commercial interests "thoroughly alarmed over the state of affairs in the transportation world."

**Coal loading** for the week ending January 25 amounted to 95,529 cars, as compared with 222,582 for the corresponding week of 1918. Loading for the following week is estimated at 78,641 cars, as compared with 207,499. Grain loading for the five weeks ending February 1 amounted to 119,871 cars, as compared with 97,033 for the corresponding period of 1918.

**Three long established** coastwise steamship lines have been discontinued, the reason given being inefficiency of labor and high cost of operation. These lines are the Clyde Line, New York to Wilmington; the Clyde Line between Philadelphia and Norfolk, which has been in business half a century, and the Mallory Line between New York and Mobile.

**The sailing day plan**, which was introduced in Chicago some time ago to apply on l. c. l. traffic to destinations on western lines, will be extended next month to include all eastern lines as well. The plan not only includes the movement of merchandise on specific shipping days, but also the consolidation of business over certain lines for designated destinations to secure full car loads.

**Curtailement of expenses**, in all departments where curtailment is practicable, is reported as having been ordered by the railroads in the anthracite coal region and also on the Pennsylvania Railroad at Altoona. Shipments of anthracite are now only about one-half the regular movement a few weeks ago. At Altoona considerable numbers of shopmen were notified that their services would no longer be required.

**The Engineering Experiment Station** of the University of Illinois, Urbana, Ill., announces that eight research graduate assistantships will be open to graduates of approved American and foreign universities and technical schools at the conclusion of the current academic year. These positions carry an annual stipend of \$500 and freedom from all fees except the matriculation and diploma fees. Applications will be received until March 1.

**The bill for leasing coal, oil, gas, etc.**, deposits on the public domain, as reported to Congress by the conference committee on February 11, includes a provision that no railroad or other common carrier shall be permitted to take, or acquire through lease or permit, under the act, any coal lands or deposits of coal in excess of such area or quantity as may be required and used solely for its own use; and may be permitted to take, under the provisions of the bill, not to exceed one lease for each 200 miles of its line.

**Protests against the dismissal** of women employed as checkers in the parcel rooms of the Union Station at Washington have been made by the Women's Trade Union League in a statement filed with the director general, which indicated a belief that a general order for the dismissal of women workers had been issued. At the office of the Railroad Administration it was explained, however, that the women had been removed from the baggage work because the work was too heavy for them, on the strength of a report made by inspectors of the Women's Service Section.

**The American Railway Engineering Association** has created a committee on standardization whose function will be to co-operate with the other committees of the association in placing the recommendations of the association in effect on the railroads and among the manufacturers of engineering and maintenance equipment. The personnel of the committee consists in the main of the chairmen of those committees of the association which are interested in the preparation of standards.

**The conferees** appointed to reconcile the differences between the bills as passed by the House and the Senate to validate the "informal" war contracts for munitions and supplies have reported an agreement eliminating the section proposed by the Senate which was seriously objected to by the representatives of the manufacturers because it provided for a review of settlements made by the War Department by representatives of the Department of Justice. This provision the manufacturers feared would result in interminable delays.

**Alaska railroads** need an additional appropriation of \$13,800,000 to carry them to completion; and this sum has been asked of Congress by Secretary Lane of the Department of the Interior. This includes \$4,000,000 of the \$35,000,000 originally estimated as the cost of the construction of the road, and a deficiency appropriation of \$9,800,000, representing the unexpected increase in the cost of labor and materials. It is now estimated that the road can be finished for \$44,800,000 in three seasons more of work.

**Ohio Mine Workers**, declaring that the representatives of the Railroad Administration are using every possible effort to reduce the price of railroad coal to less than the price set by the President for the duration of the war, have sent a resolution to Congress, and it was presented in the House on February 6 by Representative Sherwood. The resolution declares that if the policy of reducing the price of railroad coal is adopted it will cause many of the mines to close. The miners ask the authorities at Washington to insist that the railroads pay the price fixed by the government.

## "No-Accident Week" in the Southern Region

The campaign on the railroads of the Southern Region which was begun by the safety supervisors of the roads in that region with a view to seeing how low the list of deaths and injuries of employees could be carried for a single week, January 19-25, resulted in a record showing three employees killed and 85 injured, as compared with ten killed, and 394 injured in the corresponding week of 1918.

This movement, as was noted in the *Railway Age* of January 17, page 186, was ordered by the regional director in emulation of the "no accident week" on the Central of Georgia in December, when, among the 9,000 employees of that road, none were killed and only one was injured, and that very slightly.

Of the fifty railroads participating in the regional campaign, 32 show safety records of 100 per cent. Eight reported only one injury and only four reported over ten each. Of all the 85 persons injured, only four cases have been reported as "serious." Four-fifths of the accidents are classed as "avoidable."

Of the 230,000 employees on the roads in the Southern Region about 90 per cent signed the pledge to do their best to make no-accident week a success. However, the one road, a small one, which had the lowest percentage of signatures to pledges, reported 100 per cent safety for the week.

Classifying the roads according to the proportion of injuries to employees to the total number of persons in service, the road standing at the head of the list is the Nashville, Chattanooga & St. Louis; one employee injured to 10,356 in service. Of the other five roads employing more than 10,000 persons each, the standing is as follows: Illinois Central, one in 4,400; Southern Railroad, one in 3,412; Louisville & Nashville, one in 2,908; Atlantic Coast Line, one in 1,874; Seaboard Air Line, one in 1,486. The roads reporting fatal accidents were the Atlantic Coast Line, the Southern and the Blue Ridge, one each.

## Chamber of Commerce Transportation Conference

The transportation conference called by the Railroad Committee of the Chamber of Commerce of the United States, held its second meeting at Washington on February 13.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF DECEMBER, 1918

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total Operating revenues, Maintenance of way and structures, Equipment, Trans-portion, Traffic, General, Total, Operating ratio, Net from railway operation, Railway tax accruals, Operating income (or loss), Increase (or decr.) comp. with last year.

Traffic News

A meeting of chamber of commerce and industrial traffic commissioners and managers was held at the Hotel Statler, Cleveland, Ohio, on February 10, for the purpose of organizing the Ohio State Traffic League. Memberships in the new association will be limited to traffic representatives of commercial organizations and industries in the state of Ohio.

The Western Freight Traffic Committee will hold a hearing in the Transportation building, Chicago, on February 18, on proposed increased minimum weights on a considerable number of commodities in carloads, the minimum weights of which have been fixed heretofore by the U. S. Food Administration. As the Food Administration regulations have been withdrawn, it is believed by the railroads that the minimum weights now shown in tariffs should be increased.

The Traffic Managers' Committee of the Omaha (Neb.) Chamber of Commerce, consisting of about 75 industrial traffic men, held its annual election on January 30. C. E. Child, traffic manager of the Chamber of Commerce, was elected chairman and W. F. Crosby, traffic manager of M. E. Smith & Co., was elected secretary. Resolutions were adopted opposing government ownership and operation of the railroads and the express company and advocating the return of these properties to their owners as soon as the passage of necessary legislation will permit. The chairman was instructed to urge upon the Railroad Administration the re-establishment of foreign line traffic offices and to protest against the limited "sailing days."

Disposal of 1918 Wheat Crop in Sight

In a statement made before the Agricultural Committee of the House of Representatives on February 5, J. H. Barnes, president of the Food Administration Grain Corporation, predicted that the wheat crop of 1918 will not complicate next year's problems by any material carryover or surplus. Roughly, the total crop of 1918 was 918,000,000 bu.; deducting 100,000,000 bu. for seed and 470,000,000 bu. for home consumption, a balance of 348,000,000 bu. remains available for export. Of this balance 180,000,000 bu. had already been shipped abroad by February 1. For the remaining 170,000,000 bu. the Grain Corporation has commitments, definite and estimated, for 165,000,000 bu. to be supplied to European allies, the Commission for Relief in Belgium, neutrals, and European relief.

Two Solutions of the Railroad Problem Proposed

Resolutions recently adopted by the Illinois Manufacturers' Association and the Traffic Club of Cleveland offer detailed recommendations regarding the solution of the railroad problem in this country. Both organizations are opposed to government operation or ownership and ask the prompt return of the railroads to a condition of regulated competition. While the Illinois Manufacturers' Association recommends that the Interstate Commerce Commission be relieved of executive and administrative duties, except those relating to accounts and the valuation of railroads, and that its activities be confined to judicial functions, the Cleveland Traffic Club asks for an enlargement of the commission and for equal representation of industries and railroads in its membership; it also would extend the jurisdiction of the commission to cover disputes regarding wages and working conditions of railroad employees.

The Illinois manufacturers propose the creation of a department of transportation, the head of which would be known as the secretary of transportation and they also advocate the creation of regional commissions, composed of one member from each state, which would hear and determine all complaints for causes arising in their respective regions and would make reports thereon to the Interstate Commerce Commission as in the case of reports by Masters in Chancery. The Cleveland Traffic Club, on the other hand, is opposed both to regional commissions and a secretary of transportation.

## Foreign Railway News

The railways of France on October 1 next, says a Havas despatch, are to be again put on a peace footing except for certain minor restrictions.

The Spanish Minister of Public Works is introducing in the senate a bill for the construction by the state of an electric railway from the French frontier to Algeciras in the extreme south of Spain, direct.

The Federal railway authorities in Australia have had offered for their consideration no fewer than 126 different devices to meet the break of gage difficulty, but none has found favor. They are of the following types: Sliding wheel, 23; double or multiple wheels, 40; telescopic and divided wheels, 9; adjustable truck frame, 3; changing truck, 7; transference of bodies, 13; treble or multiple rails, 6; unclassified 25.

The railways of India on March 31, 1914, had 170,444 freight cars. The number laid up for repairs at present is about 10,290, or about 6 per cent, of which 1,860, or about 1 per cent of the total, were laid up for want of materials. The number is lower than in normal times, owing to the efforts the railways were making to keep every available freight car on the road. The number of cars sent overseas was 4,251; all of these except 56 were of metre or 2 feet 6 in. gage.

**Sleeping Cars for Japanese "Thirds."**—It appears that there is a good deal of overcrowding on the long-distance railways in Japan, and even on an important trunk line like the Tokaido passengers suffer considerable inconvenience. In order to improve the condition, the Imperial Government Railways have designed a type of sleeping cars for third-class passengers and the scheme is included in the budget for next year. According to the Railway Times of Tokyo, the sleeping car is an ordinary day coach, the seats of which are convertible into lower berths while the upper berths are attachable at night. On the upper beds, which are located along the direction of car, passengers can sleep in the usual Japanese manner, and on the lower, which are located crosswise, they can lie on their sides and can stretch their feet. The fare will be about 1 yen (50 cents) per day, including the extra fare for the high-speed train, and it is hoped that fairly good rest may be enjoyed by third-class passengers, which is the most important class in local passenger traffic.

The British Military authorities, says a Reuter despatch, have taken over the administration of the Bagdad Railway, while the French have taken charge of the Oriental Railways of European Turkey. M. Huguenin, the Swiss general manager of the Bagdad Railway, has been relieved of his functions and is proceeding to Western Europe. As regards the railways in the Aidin Vilayet, the British have assumed control of the Aidin Railway, which is a British concern, while the French have taken over the Kassaba Railway, which is a French enterprise. The newspapers announce the arrest of Fesmei Bey, ex-Deputy for Diarbekr, who is accused of having taken an active part in the massacre of the Armenians.

### Railway Improvements in Jamaica

The approaching termination of the war sees Jamaica's government and progressive business interests taking up projects of public benefit and service which have been delayed by the existing circumstances, writes Vice-Consul Davis B. Levis from Kingston.

A foreshore railway to link up the government railway system with several miles of the harbor front, with its many warehouses and piers accommodating the seagoing traffic of the island, is one of the important measures considered in addition to the floating-dock project lately reported.

The proposal of the government to issue a \$1,500,000 loan to be expended for public improvements, such as new branch railway lines, public roads, etc., is expected to be consummated shortly. . . .

The projects named should afford trade opportunities for American manufacturers of steel products, railway equipment, road building and other machinery, hardware, implements, cement, lumber, and building materials.

### Plenty of Rolling-Stock in Germany

The London Times' special correspondent at Berne telegraphed to his paper recently that in view of the German "shrieks" about shortage of rolling-stock it is interesting to learn from a leading German railway magazine of December 4 that, in spite of the congestion of the railways with military trains, the transport of food and coal is being carried on without difficulty.

### Belgium Asks for Return of Locomotives

The State Department at Washington has received through the American Legation at Brussels a request from the Belgian government asking the United States to lend it 400 locomotives and 2,000 cars in addition to returning all of the 359 locomotives which were placed at the disposal of the American Expeditionary forces. The communication from Minister of Railways Kenkin, sets forth the urgent need for additional rolling stock in Belgium to replace that commandeered or destroyed by the Germans. The American army has returned 187 of the Belgian locomotives, but the remaining 172 still are in use by the Expeditionary forces.

### A Railway Line from Vigo, Spain

The Spanish press, says Consul Edward I. Nathan, writing from Vigo, Spain, has recently been publishing articles concerning an alleged project of American financiers to build a direct railroad line from Vigo (on the Atlantic Ocean) to Irun on the Franco-Spanish frontier on the Bay of Biscay side, and to run steamers from New York to Vigo. The advantage of this port arises from its geographical position which permits the distance from ocean travel between Europe and the United States to be considerably shortened. While there is at present a railroad line from Vigo to Irun, it makes many deviations and the service is far from adequate for heavy passenger traffic. The projected line to Irun will be only about 450 miles in length and with a good roadbed and heavy locomotives this distance could be covered by express trains in 10 hours. The project is a revival of plans that had been previously considered, but which the Spanish authorities had not acted upon.

### A Sidelight on the Swiss Railway Situation

The Federal Railways of Switzerland are reported to be showing a big deficit in spite of increased fares and a great curtailment of train services, including, toward the end of 1918, the total abolition of Sunday and express traveling. Private railway and steamboat companies, despite government aid, also are in sad straits. The war has brought home to Switzerland her dependence upon foreign countries for coal and most kinds of raw materials. She hopes and expects to remedy this weakness by electrifying her railways, developing her internal waterways and securing cheap access to the North Sea, Mediterranean and Adriatic by way of the Rhine, the Rhone and the Po. This, of course, requires the co-operation of the other countries concerned, but they are fully alive to the importance of water transport.

The Rhine is already navigable from Basel, where new docks and wharfage are under construction. Connection between Geneva and Lyons is being promoted, as also the linking up of the Rhine and Rhone systems.

### Railway Extension in Peru

As briefly noted in last week's issue, the Peruvian Congress has passed a law authorizing the construction of a railroad from Paita to the Marañon river, with a branch to Ferrenfe and another to Hualgayoc. The government guarantees to the capital invested a subsidy of 7 per cent per annum for 39 years, fixing as a maximum on which this subsidy is to be paid the amount of \$30,000,000. Further details concerning

this project are to the effect that the subsidy shall be obtained from the duties and taxes which the grantees must pay as follows: (a) Import and export duties on articles consumed either directly or indirectly by the concessionaire in the mines or mountain lands, which have been granted to him for exploitation. (b) Taxes on the profits and revenues which are obtained from the exploitation of the railroads and other associated enterprises, as well as the direct exploitation of mines and mountain grants. (c) Revenue stamps and registry fees on the contracts made. (d) Taxes on the mines which are conceded by the law. If in any one year these duties and imposts do not amount to the interest agreed upon, the State shall not be responsible for the difference; but, on the other hand, if the taxes should exceed the interest, the grantee must pay the excess. The subsidy mentioned above shall be paid until the line is finished, only in the proportion corresponding to the number of kilometres opened to public traffic. The guarantee for the carrying out of this contract or bid for the construction of this work shall be the sum of \$50,000 in cash or its equivalent in bonds of the internal loan, which will be refunded as soon as 100 kilometres (62 miles) of the railway have been completed. This railway shall enjoy all the benefits and concessions conferred by existing laws on railways and by the law of March 7, 1889, on docks.

**Siam's Purchases of Railway Material**

Practically all of the railway material used, both for the Siamese government and for private railways, is imported from foreign countries. The government railways now open to traffic consist of 588 miles of standard gage lines and 838 miles of meter gage lines, the former being known as the Northern and the latter as the Southern line. The total length of the four private lines open to traffic is 66 miles, namely, the Paknam Railway of 12 miles, the Tachin Railway of 20 miles, and the Meklong Railway of 21 miles, meter gage, and the Phrabad Railway, 12 miles, 2 ft. 6 in. gage.

The supplies imported for these railways and landed at the port of Bangkok are listed by the customs under the heads of "railway material" and "cars and trucks for railways or tramways and parts thereof."

The origin and value of the imports into Siam of railroad material and cars and trucks for railways, etc., from foreign countries during the four fiscal years ended March 31, 1917, was as follows:

Imported from—	1913-14	1914-15	1915-16	1916-17
<b>RAILROAD MATERIAL</b>				
United States	\$228,382	\$106,705	\$25,796	
United Kingdom	124,199	195,861	74,212	\$117,519
Belgium	28,008	86,783		
British North Borneo			3,574	18,582
Denmark	8,931			
Germany	111,897	85,176	115	
India	7,433		10,981	
Netherlands, India			4,746	
Singapore	70	489	3,768	1,082
<b>Total</b>	<b>\$508,920</b>	<b>\$475,014</b>	<b>\$123,192</b>	<b>\$137,183</b>
<b>CARS AND TRUCKS, ETC.</b>				
United States	\$3,033	\$1,952		\$2,943
United Kingdom	16,353	86,071	131,957	188,780
Belgium	660	14,767		
France	478			
Germany	60,970	1,529		
Singapore	50		25	764
<b>Total</b>	<b>\$81,544</b>	<b>\$104,319</b>	<b>\$131,982</b>	<b>\$192,487</b>

The customary method of buying railway material for the government railways has been through public tender, while for the private railways the supplies are bought through their respective directors.

It is reported that the Northern line of the government railways is sometimes as much as 400 wagons short per day, and that the usual shortage daily is 200 wagons, while on the Southern line the shortage occasionally reaches about 100 wagons. The need for rolling stock is likely to become still more acute as new sections on both lines yet remain to be opened up for freight traffic.

The old Siamese system of weights and measures is still in general use, although it was decided some time ago to adopt the metric system.

There are no local government restrictions on the imports of

railway material except the three per cent ad valorem duty which is paid at the port of landing by the importer and levied on the invoice value of goods, including cost of packing, freight, insurance, and all other charges up to the time of the arrival of the goods in port.

Communications may be addressed to the respective railways, the offices of which are all located in Bangkok.

**Sixth National Foreign Trade Convention**

James A. Farrell, chairman of the National Foreign Trade Council, has issued the formal call for the Sixth National Foreign Trade convention to be held in the Congress Hotel, Chicago, on Thursday, Friday and Saturday, April 24, 25 and 26.

Foreign Trade Essential to American Industry will be the theme of the convention.

A tentative program is announced as follows:

**FIRST DAY, THURSDAY, APRIL 24**

Convention called to order at 10 a. m. by James A. Farrell, chairman of the National Foreign Trade Council.

Organization of convention—Election of presiding officers, secretaries, etc.; address of president of convention; appointment of general convention committee. Session topic: America's Need of Foreign Trade, from the viewpoint of production, finance, labor and imports.

Afternoon session, 2.30 p. m.—Session topic: Post-War Foreign Trade Problems, a series of addresses dealing with general foreign trade matters.

Evening session, 8 p. m.—Group sessions.

Group I. Commercial Education for Foreign Trade.

Group II. Foreign Trade Merchandising, in co-operation with the American Exporters' and Importers' Association.

Group III. Financing Foreign Trade, in co-operation with the American Bankers' Association.

Group IV. Advertising for Foreign Trade.

**SECOND DAY, FRIDAY, APRIL 25**

Morning session, 10 a. m.—Session topic: The American Merchant Marine, in which will be considered American ship-building, provision of cargoes, establishment of trade routes and return cargoes, inland waterways, American and foreign navigation systems and the formation of an American maritime policy.

Afternoon session, 2.30 p. m.—Group sessions.

Group V. Foreign Credits, in co-operation with the National Association of Credit Men.

Group VI. Direct Selling, in co-operation with the American Manufacturers' Export Association.

Group VII. Export Combinations, describing the Webb Law in actual operation.

Group VIII. Ocean Service, in co-operation with the American Steamship Association.

Friday evening, 7 p. m.—Banquet, Congress Hotel.

A number of speakers of national prominence will present several highly important foreign trade subjects.

**THIRD DAY, SATURDAY, APRIL 26**

Morning session, 10 a. m.—Reports of group sessions, report of general convention committee, miscellaneous business adjournment.

The work of organizing the convention is being handled by O. K. Davis, secretary of the National Foreign Trade Council, 1 Hanover Square, New York. Requests for hotel reservations should be addressed to H. H. Merrick, chairman of the Hotel Committee, Chicago Association of Commerce, 10 South La Salle street, Chicago.

This year the convention has assembled a large amount of valuable technical information, which is available to all delegates who wish to use it. This information will be furnished by the volunteer trade advisors of some of the most experienced business houses and by the representatives of the government trade agencies. A number of prominent business men of long experience in every branch of foreign trade have offered their services as volunteer advisors. The information they can give is based on personal experience, and as such is doubly valuable. In addition, the Department of State will co-operate by assigning to the convention some members of the Consular Service, who will just have returned from Europe, Latin America and the Far East. The Department of Commerce will send

a number of its experts from the Bureau of Foreign and Domestic Commerce. The Shipping Board will be represented. The Pan-American Union will be present to give information on Latin-American relations. These men are thoroughly familiar with their respective fields and can supply a great fund of valuable information if called upon.

CHICAGO COMMITTEE

The Chicago Executive Committee is in charge of all local arrangements. It is composed of the following: John J. Arnold, chairman, vice-president First National Bank; Charles A. Munroe, vice-chairman, Chicago Industrial Club; M. A. Graettinger, secretary, Illinois Bankers' Association; John R. Washburn, treasurer and chairman of Finance Committee, Continental and Commercial National Bank; Harry H. Merrick, chairman of Hotel Committee, president Chicago Association of Commerce; George R. Meyercord, chairman of Publicity Committee, Illinois Manufacturers' Association; H. G. P. Deans, chairman of Entertainment Committee, vice-president Merchants' Loan & Trust Company.

Acting Secretary of State Polk Announces Acceptance of Trans-Siberian Plan

Acting Secretary of State Frank L. Polk on Wednesday announced that the United States Government had now accepted formally the proposal of the Japanese Government for a plan to secure the restoration of railway traffic in Siberia.

"The agreement," said Mr. Polk, "is the result of discussion begun last August, before the signing of the armistice. It has been accepted because it offers an effective means to assist the Russian population of Siberia, which has been suffering for many months from a gradual collapse of railway transportation. Not only have the people lacked many necessities of daily life, such as shoes, clothing and agricultural machinery, but they have been wholly unable to return to their normal occupations of marketing their own considerable stores of dairy products and grain.

"In May, 1917, John F. Stevens was sent to Siberia, and a few months later was followed by the Russian Railway Service Corps, composed of American railway engineers, who were to assist the Russian railway administration, and thus contribute in carrying out the expressed purpose of the United States to aid Russia in tangible form. The arteries of life in Russia, as elsewhere, are the railways. The problems, especially in Siberia, are similar to those in America, where the long haul is almost the rule and certainly not the exception.

"Under the plan of operation which is now to be effected, the Siberian railway system, which includes the Chinese Eastern Railway, is to be supervised by an interallied committee, the chairman of which is to be a Russian. In addition to Russia, Japan and the United States, the countries asked to be represented on the committee are Great Britain, France, Italy and China. The technical and economic management of the railways will be in the hands of the technical board, under the presidency of Mr. Stevens. A military board will co-ordinate matters affecting military transportation arising from the presence in Siberia of military forces of the United States, the Allies, and Russia.

"The purpose of the agreement is to assist the Russians in Siberia in regaining their normal conditions of life and has been reached upon a definite understanding that the railways are to be operated for the interests of the people of Siberia. The United States and Japan have expressly voiced their disinterested purpose not to infringe on any existing rights either of Russia or, where the Chinese Eastern is concerned, of China. The associated governments have been unanimous as to the urgency of the situation.

"The understanding was broached before the conclusion of the armistice, but the problem of aiding the people in Siberia remains the same and has become even more urgent. Russian railway officials have repeatedly urged the assistance of Mr. Stevens and expressed their cordial and special desire that they should be helped. Their co-operation is relied upon as a vital factor for success in assisting their fellow countrymen."

Locomotive Deliveries in January

THE RAILROAD ADMINISTRATOR HAS ISSUED THE FOLLOWING STATEMENT OF LOCOMOTIVES SHIPPED TO ROADS UNDER FEDERAL CONTROL FOR THE MONTH OF JANUARY

Works	For period January 1 to 4			For week January 5 to 11			For week January 12 to 18			For period January 19 to 25			For period January 26 to 31

## Freight Cars

**CHICAGO, MILWAUKEE & ST. PAUL.**—The Bettendorf Company, Bettendorf, Iowa, has received an order from the Chicago, Milwaukee & St. Paul for 1,000 steel center sills for use in the construction of 1,000 40-ton capacity box cars which the St. Paul is planning to build in its Milwaukee shops. The delivery is to be made between February 15 and March 1.

**CANADIAN NATIONAL RAILWAYS.**—The order for 3,000 freight and 180 passenger cars given in the *Railway Age* of January 31 was shown slightly incorrect. The order is correctly given as follows:

750 box cars	
00 stock cars	from the National Steel Car Co.
00 stock cars	
30 refrigerator cars	
50 ballast cars	
	from the Canadian Car & Foundry Co.
00 flat cars	
50 general service	
	from the Eastern Car Company.
50 colonist cars from the Pullman Co.	
00 colonist	
30 baggage	
	from the Canadian Car & Foundry Co.

## Passenger Cars

**THE HERSHEY CUBAN RAILWAY** advises that it is in the market for a number of light passenger cars for branch line service, either storage battery or gasoline, with a seating capacity of from 30 to 50 passengers. H. L. Hill is manager of the company, with headquarters at Prado 33, Havana, Cuba.

## Trade Publications

**THREADING MACHINES.**—The complete line of threading machines for bolts, nuts and pipe, manufactured by the Greenfield Tap & Die Corporation, Greenfield, Mass., is described and illustrated in Catalogue 41, which also gives the specifications for the machines and detailed information regarding parts for threading machines.

**INSLEY DERRICKS.**—The Insley Mfg. Company, Indianapolis, Ind., has issued bulletin No. 110 containing 20 pages descriptive of the steel guy and stiffleg derrick manufactured by that company. The booklet is illustrated with wash drawings of complete derricks and various details of them. Tables are also presented, giving principal dimensions and properties of this equipment.

Lieut.-Col. R. P. Lamont, division chief of ordnance department, with headquarters at Washington, resumed his duties as president of the American Steel Foundries at Chicago, February 1.

**William G. Denney**, treasurer of the Standard Truck Car Company, Chicago, died on February 7, at his home in Millerton, N. Y., at the age of 65 years. Mr. Denney had been with the Standard Car Truck Company since its organization.

The Browning Company, Cleveland, Ohio, has reopened a Chicago office in the Peoples Gas building in charge of **R. C. Forbes**. The Chicago office has been closed for the duration of the war, as the company's entire output was taken over by the government.

The Barber-Greene Company, announces the following appointments: **W. A. Buell**, sales engineer, formerly conveyor engineer of the Goodyear Tire & Rubber Company; **H. W. Cudding**, auditor, formerly general auditor of the Lyon Metallic Manufacturing Company.

**Fred M. Egolf**, who has been associated with the Acme Railway Supply Company and the Acme Steel Goods Company, has been appointed western railway and marine sales representative of the Glidden Company, Cleveland, Ohio, with headquarters in Chicago.

**Lieut. W. W. Glosser**, of the Production Division of the Air Craft Board, who has been in France for the past year, has been appointed general sales agent of the Madden Company, with headquarters at Chicago. Before entering military service, Lieut. Glosser was sales representative of the P. & M. Company at Cleveland, Ohio.

The Chicago Pneumatic Tool Company, Chicago, has established a branch office at St. Louis, Mo., under the management of **H. W. Buker**, who succeeds **J. D. Corby** as district manager of sales. A stock room and service station will be maintained at St. Louis, as well as the district office. Announcement of Mr. Corby's resignation appeared in the *Railway Age* of February 7 (page 376).

**P. C. Cady**, office manager of the mechanical department of the New York Central at New York, has been appointed assistant secretary of the International Railway Supply Company, New York, which is the purchasing agent for the American Railroad Company of Porto Rico and the Trinidad Government Railways, and also the export department of the Pyle-National Company. His appointment becomes effective February 15. Mr. Cady has been in railroad service since 1893, when he entered the mechanical department of the Lake Shore & Michigan Southern at Cleveland, Ohio.

**E. S. Nicholas** has been appointed traveling engineer for the American Arch Company, with headquarters at Detroit, Mich. Mr. Nicholas was formerly boilermaker foreman of the Missouri Pacific shop at Kansas City. **M. R. Smith** has been appointed traveling engineer, with headquarters at St. Louis, Mo. Mr. Smith was formerly master mechanic at Coxton, Pa., on the Lehigh Valley. **H. Darby** has been appointed traveling engineer of the company, with headquarters at St. Paul, Minn. Mr. Darby was formerly motive power inspector at the Transcona shop, Winnipeg, of the Grand Trunk Pacific. **J. D. Brandon** has been appointed traveling engineer of the company, with headquarters at Montreal. Mr. Brandon was formerly general foreman at the Brightwood shops, Indianapolis, of the Big Four. **E. T. Mulcahy** has again assumed his duties as traveling engineer of the American Arch Company after having been honorably discharged from the United States Army. Mr. Mulcahy's headquarters will be at Denver, Col. Before coming with the American Arch Company Mr. Mulcahy was connected with the Union Pacific at its Cheyenne shops.

## Financial and Construction

### Railway Financial News

**BOSTON & MAINE.**—A petition has been filed with the Massachusetts Public Service Commission seeking authority to consolidate its leased lines with the company in accordance with reorganization plans agreed upon by a majority of the stockholders. A hearing was set for February 21.

**CHICAGO & NORTH WESTERN.**—This road has applied to the Public Utilities Commission of Illinois for authority to issue first mortgage gold bonds of 1987 in the aggregate amount of \$1,000,000.

**ILLINOIS CENTRAL.**—Kuhn, Loeb & Co. are offering at 97½ and interest, to yield about 5¾ per cent, \$16,000,000 15-year 5½ per cent secured gold bonds.

**NORTHERN CENTRAL.**—The stockholders on February 4, authorized an increase in the company's indebtedness of \$8,216,000. The amount expended, and not yet funded, at the close of 1918, was about \$5,000,000. Allowance is made in the present provisions for future requirements.

**OCKLAWAHA VALLEY.**—This 50-mile road operating between Ocala, Fla., and Palatka, was sold at public auction on February 3, under an order in chancery on a suit brought by the bondholders. The complainant bought the property for \$225,000 for dismantlement.

**SOUTHERN RAILWAY.**—See editorial elsewhere in this issue.

### Railway Construction

**CHICAGO, ROCK ISLAND & PACIFIC.**—T. S. Leake & Co., Chicago, have been awarded a contract for the construction of a frame stucco railroad Y. M. C. A. building at Hulbert, Ark. The building will be 80 ft. by 80 ft. and two stories high, costing approximately \$40,000.

The Rock Island has also awarded a contract to the Railroad Water & Coal Handling Company, Chicago, for the construction of a 150-ton coal chute at Ola, Ark., to cost approximately \$10,000.

**FRANKFORT & SHELBYVILLE Electric.**—Preliminary surveys are now being made to build an electric line from Shelbyville, Ky., to Frankfort, about 22 miles. Two steel bridges, one 150 ft. long and the other 90 ft. long will be required on the proposed line. F. H. Frankland, president and chief engineer, 35 Nassau street, New York City.

**ILLINOIS CENTRAL.**—The Railroad Water & Coal Handling Company, Chicago, has been awarded a contract for the installation of pumping facilities at Dalton Springs, Ky. The work includes the construction of a pump house and the installation of two 25-hp. oil burning engines, a 100,000-gal. tank and a 10-in. discharge line.

**NORTHERN PACIFIC.**—Bids for the construction at Brainerd, Minn., of a two-story, reinforced concrete and brick passenger station and office building, 40 ft. by 160 ft., costing approximately \$65,000, are to be received in February or March. It is planned to start work on the building in the spring.

**SAND SPRINGS.**—This road, which now connects Tulsa, Okla., and Sand Springs, will be extended to Pawhuska within the next year. No contracts for the work have been let as the road expects to complete the extension with its own forces.

**BUILDING MILITARY CAMPS.**—Stone & Webster, Boston, Mass., have published a 12 in. by 14 in. album of photographs and plans of the cantonments and camps built under the direction of that company during the period of the war. In addition to matter descriptive of the camps there are several large folded inserts containing panoramic views and maps. Floor plans are also given of the buildings occupied by officers and enlisted men.

## Railway Officers

### Railroad Administration

#### Central

**D. E. Brown**, heretofore manager of the Accounting Section of the Division of Public Service and Accounting, has been appointed assistant director of the Division of Accounting.

**J. G. Walber**, secretary of the Bureau of Information of the Eastern Railroads and a member of Railway Board of Adjustment No. 1, has been appointed labor assistant to the director of the Division of Operation, with office at Washington, D. C.

**C. E. Spens** has been appointed assistant director, Division of Traffic, in charge of export and import traffic matters, with office at Washington. In addition, Mr. Spens will continue his present duties as manager of inland traffic, United States Food Administration. Mr. Spens was vice-president in charge of traffic of the Chicago, Burlington & Quincy.

**George F. Atkins, Jr.**, heretofore assistant to the director of the Division of Public Service and Accounting, has been appointed assistant to the director of public service, in charge of rates. **E. C. Niles** has been appointed assistant to the director of public service, in charge of service. Mr. Niles also retains his duties and title as manager of the Short Line Section. **Eugene H. Lamb** has been appointed acting chief of the Bureau for Suggestions and Complaints. This bureau will report to the assistant to the director of public service, in charge of service.

#### Regional

**E. H. Banker** has been appointed executive assistant to **H. A. Worcester**, district director of the Ohio-Indiana district of the Eastern region, to succeed **Hugh McVeagh**, who has been appointed assistant to **E. M. Costin**, federal manager of the Cleveland, Cincinnati, Chicago & St. Louis; the Cincinnati Northern; the Central Indiana; the Detroit, Toledo & Ironton; the Central Union Depot, and the Cincinnati, Indianapolis Union. Mr. McVeagh's headquarters will be in Cincinnati, Ohio.

#### Federal and General Managers

The jurisdiction of **George W. Stevens**, federal manager of the Chesapeake & Ohio; the Ashland Coal & Iron; the Sandy Valley & Elkhorn, and the Long Fork Railroad, has been extended over the Chesapeake & Ohio Railroad of Indiana, which road has been released from the jurisdiction of **E. M. Costin**, federal manager.

#### Operating

**A. C. Hartley** has been appointed supervising safety agent of the Michigan Central; the Chicago, Kalamazoo & Saginaw and the Detroit Terminal Railroad, with headquarters at Detroit, Mich.

**D. O'Connell** has been appointed chief special agent of the Southern Pacific, the Western Pacific, the Tidewater Southern and the Deep Creek, with headquarters at San Francisco, Cal., to succeed **P. J. Kindelon**, deceased.

**T. R. McCampbell** has been appointed supervising safety agent, with headquarters at Indianapolis, Ind. of the Cleveland, Cincinnati, Chicago & St. Louis and other roads under the jurisdiction of **E. M. Costin**, federal manager.

**W. D. Baker**, federal auditor of the Norfolk & Portsmouth Belt Line, at Norfolk, Va., has been appointed assistant to the federal manager of the Virginian Railroad; the Norfolk & Portsmouth Belt Line; the Norfolk Terminal Railroad, and the Hampton Roads Rail Terminals.

**A. D. Rosecrans**, trainmaster of the Arizona Eastern, has been appointed acting superintendent of the Globe division, with office at Globe, Ariz., vice **J. W. Williams**, resigned;

**H. Weitzel**, master mechanic, at Phoenix, has been appointed trainmaster, with office at Globe, vice Mr. Rosecrans.

**J. B. Stewart**, general superintendent of the Bangor & Aroostook and the Van Buren Bridge, with office at Bangor, Maine, has resigned to go to another position and **W. K. Hallett**, superintendent, succeeds Mr. Stewart as general superintendent; **F. A. Andrews**, trainmaster at Millinocket, has been appointed superintendent of the Southern division; both with offices at Bangor. **George W. Mayo** succeeds Mr. Andrews.

**Charles A. Plumly**, whose appointment as superintendent of telegraph of the Baltimore & Ohio, with office at Baltimore, Md., has already been announced in these columns,

C. A. Plumly

was born on October 15, 1876, at Big Run, Ohio, and was educated in the elementary schools. He learned telegraphy in the office of his father who was agent and operator at Stewart, Ohio, and in November, 1887, he began railway work on the Baltimore & Ohio Southwestern, serving as an extra operator during week ends and summer vacations. In June, 1903, he was appointed train dispatcher at Chillicothe, and in September, 1907, was made chief dispatcher at the same place. On July 31, 1910, he was appointed division operator at Cincinnati, Ohio, and in March, 1912, became trainmaster at Seymour, Ind. In January, 1913, he was appointed assistant superintendent of telegraph, at Cincinnati, and the following June became assistant to the general superintendent at the same place. On January 1, 1914, he was appointed inspector of transportation at Cincinnati, and since September, 1914, served as assistant superintendent of telegraph, at Baltimore, until his recent appointment as superintendent of telegraph of the Baltimore & Ohio, eastern lines; the Coal & Coke; the Wheeling Terminal Railroad; the Western Maryland; the Cumberland Valley, and the Cumberland & Pennsylvania.

### Financial, Legal and Accounting

**T. L. Shelton**, auditor of station accounts of the Southern Railroad, has been appointed assistant auditor of the Southern Railroad and other roads the accounts of which are audited in the Washington office, in charge of government transportation accounts, and **T. H. Seay** succeeds Mr. Shelton, both with offices at Washington, D. C.

**W. G. Sims** has been appointed auditor, and **D. F. Callahan** has been appointed federal treasurer, of the Wichita Union Terminal, with headquarters at Wichita, Kan. The jurisdiction of **L. J. Hensley**, federal auditor of roads under the jurisdiction of **J. A. Edson**, has also been extended over the Wichita Union Terminal.

**J. A. Robinson**, assistant auditor of the Southern Railroad, and temporarily assigned as auditor of its subsidiary railroads, with office at Atlanta, Ga., has resigned to accept service elsewhere, and the jurisdiction of **H. W. Oliver**, auditor of the Georgia Southern & Florida Railroad, has been extended over operating accounts of the Blue Ridge Railroad; the Tallulah Falls Railroad; the Danville & Western; the Hartwell Railroad, and the Lawrenceville Branch Railroad, with office at Atlanta, Ga.

### Traffic

**E. L. Whitney**, chief clerk to the resident traffic assistant of the Eastern region at Chicago, has been appointed division

freight agent of the New York Central, with the same headquarters, succeeding **James L. Clark**, deceased.

**F. R. Dalzell**, assistant general freight agent of the Gulf, Colorado & Santa Fe, with office at Galveston, Tex., has been appointed general freight agent of the Gulf, Colorado & Santa Fe, the Texas Midland and the Houston Belt & Terminal Railroad, with headquarters at Galveston, Tex.

### Engineering and Rolling Stock

**J. L. Starkie** has been appointed assistant chief engineer, with headquarters at Dallas, Tex., of the Gulf, Colorado & Santa Fe, and other roads under the jurisdiction of **J. S. Pyeatt**, federal manager at Dallas.

**W. S. Wilson**, supervisor of subdivision No. 12, Pittsburgh division of the Pennsylvania Railroad, at Trafford, Pa., has been appointed division engineer of the Allegheny division, with office at Oil City, Pa., succeeding **C. M. Wisman**, who has been granted a furlough; **C. W. Montgomery**, supervisor at Gallitzen, has been transferred as supervisor to Altoona Yards, succeeding **J. M. Kinkead**, promoted; **W. S. Johns, Jr.**, supervisor at Bowie, Md., has been transferred as supervisor to Trafford, succeeding Mr. Wilson; **F. H. Bently**, supervisor at Titusville, Pa., has been transferred as supervisor to Gallitzen, succeeding Mr. Montgomery; **C. F. Miller**, assistant supervisor, succeeds Mr. Bently, and **T. M. Woodward**, supervisor in the office of the division engineer, Philadelphia division, at Philadelphia, has been appointed supervisor, with office at Bowie, Md., succeeding Mr. Johns.

### Corporate

#### Traffic

**Henry Hilare Melanson**, who has been appointed passenger traffic manager of the Canadian National Railways, with headquarters at Toronto, Ont., as has already been announced

H. H. Melanson

in these columns, was born on March 9, 1872, at Scoudouc, N. B., and was educated at the public schools and St. Joseph's University. He began railway work in November, 1889, with the Intercolonial as a clerk in the mechanical department at Moncton. In August, 1892, he was transferred to the general passenger agent's office and subsequently served as chief clerk in the same office. He was appointed general baggage agent in 1901 and in 1909 became assistant general passenger agent. In August, 1913, he was promoted to general passenger agent and since June, 1917, was passenger traffic manager until his recent appointment as passenger traffic manager of the Canadian National Railway System as above noted.

### Operating

**H. C. Riddle** has been promoted to trainmaster of the Montana, Wyoming & Southern, with office at Belfry, Mont., succeeding **W. E. Ogden**, resigned.

**Andrew McCulloch**, chief engineer of the Kettle Valley, has been appointed acting general superintendent, with offices in Penticton, B. C., to succeed **J. W. Mulhern**, resigned.

**R. Wilson**, auditor of the Pacific Great Eastern, with headquarters at Vancouver, B. C., has been appointed acting manager to succeed **G. L. Courtney**. Mr. Wilson's office will be in Victoria, B. C.

The Canadian National Railways have made the following appointments in addition to those previously announced: **D. R. Campbell**, assistant general manager of the Pacific district of the Canadian Northern, with headquarters at Vancouver, B. C., has been appointed general superintendent of the Pacific district, Canadian National, with offices at Vancouver, B. C. **W. T. Moodie**, division engineer at Winnipeg, Man., on the Canadian Northern, has been appointed superintendent of Division No. 1, Central district, Canadian National, to succeed **J. E. Nelson**, who has been appointed superintendent of the Pacific district, Canadian National, with headquarters at Kamloops Junction, B. C. **W. I. Munro**, chief dispatcher on the Canadian Northern at Winnipeg, Man., has been appointed acting superintendent of Division No. 2 on the Prairie district of the Canadian National, to succeed **T. J. Brown**, assigned to other duties.

### Engineering and Rolling Stock

**A. M. Bouillon**, resident engineer on the Grand Trunk Pacific, at Regina, Sask., has been appointed assistant engineer, with headquarters at Prince George, B. C.

**Andrew McCowan**, supervisor of car works of the Canadian Northern system at Winnipeg, Man., was appointed master car builder of the Canadian National Railways, western lines, with the same headquarters, at the time of the recent assimilation of the former road by the latter. Mr. McCowan was born at Perth, Scotland, on December 5, 1867, and was first employed by the Perthshire Carriage Works (Scotland), as an apprentice car builder, between 1881 and 1887. He began his railroad experience in May, 1888, as a carpenter on the Canadian Pacific at Montreal, Que. In March, 1890, he was promoted to car foreman, and seven years later he was appointed shop foreman at Farnham, Que. From September, 1903, to April, 1910, he was car foreman at Cranbrook, B. C., and on the latter date left the Canadian Pacific to become general car foreman of the Canadian Northern at Winnipeg, Man. He was promoted to supervisor of car works, western lines, in September, 1915, and in May, 1916, had his jurisdiction extended over the entire system.

A. McCowan

The following appointments were recently made on the Canadian National Railways: **Thomas Turnbull**, assistant chief engineer of the Canadian Northern, has been appointed engineer maintenance of way of the Canadian National, western lines, with headquarters at Winnipeg, Man. **A. V. Redmond**, division engineer of the Transcontinental division, Canadian Government Railways at Cochrane, Ont., has been appointed district engineer of the Central district, Canadian National, with headquarters at Winnipeg, Man. **H. L. Vercoe**, special engineer at Winnipeg, Man., on the Canadian Northern, has been appointed district engineer, Prairie district, Canadian National, with offices at Saskatoon, Sask. **T. W. White**, assistant engineer in the bridge engineer's office of the Canadian Northern at Winnipeg, Man., has been appointed district engineer of the Western district, Canadian National, with headquarters at Edmonton, Alta. **R. M. Mitchell**, right of way agent of the Canadian Northern, has been appointed right of way agent of the Canadian National, western lines, with headquarters at Winnipeg, Man. **H. G. Reid**, assistant superintendent of rolling stock Canadian Government Railways at Transcona, Minn., has been appointed general master mechanic Canadian National, western lines, with offices at Winnipeg, Man. **H. A. English**, master me-

chanic, Central district of the Canadian Northern, has been appointed master mechanic of the Central district of the Canadian National, at Winnipeg, Man. **L. G. Roblin**, general master mechanic, Canadian Government Railways, western lines, with offices at Cochrane, Ont., has been appointed master mechanic of the Prairie district, Canadian National, with offices at Saskatoon, Sask. **T. J. Lowe**, fuel agent, Canadian Northern, western lines, has been appointed fuel agent, Canadian National, western lines, with headquarters at Winnipeg, Man. **J. A. Sutton**, fuel and tie agent, Transcontinental division of the Canadian Government Railways, has been appointed district fuel agent of Divisions No. 1 and 2 of the Central district, Canadian National, western lines, with headquarters at Cochrane, Ont.

### Obituary

**Walter T. Aylesbury**, formerly superintendent of car service of the Terminal Railroad Association of St. Louis, died at Bartlesville, Okla., on February 4, after an illness of two months. Mr. Aylesbury was long associated with the Chicago, Burlington & Quincy and was in the employ of the Terminal Railroad Association for 16 years, terminating his connection with that road in 1918.

**Lieut.-Col. Hiram J. Slifer**, commander of the 21st regiment of railway engineers, American Expeditionary Forces, died in France on February 3, of pneumonia, and was buried on February 5, at Sorey, Meuse. Lieut.-Col. Slifer was born in 1857, and, after graduating from the Polytechnic College of Pennsylvania, entered the employ of the Mexican National Construction Company. Subsequently he was assistant engineer of the Philadelphia division of the Pennsylvania, principal assistant engineer of the Milwaukee, Lake Shore & Western, division engineer on the Chicago & North Western, superintendent of the Iowa division of the same road at Boone, Iowa, general superintendent of the Eastern district and later the Central district of the Chicago, Rock Island & Pacific, railway expert and business manager of the construction department of J. G. White & Co., at New York, general manager and assistant to the president of the Panama Railroad & Steamship Lines at Colon, Panama, and general manager of the Chicago Great Western at Chicago. In 1912 he became a consulting civil engineer, specializing in railroad practice, with headquarters at Chicago. His death was due indirectly to a railway accident in France. A gas motor inspection car on which he was riding to inspect road beds which the Germans had mined and blown up, jumped the track near Buzancy, throwing Lieut.-Col. Slifer down an eight-ft. embankment and into a small stream. He was carried to a nearby field hospital, and then was transferred to a base hospital at Neufchateau where he suffered an attack of bronchial pneumonia. He was later sent to a convalescent camp at Cannes. In a letter to a friend he stated that he intended to rejoin his regiment on January 16, at Conflans. Until the announcement of his death by the Adjutant General at Washington, no further information concerning the colonel's condition had been received. He enlisted in August, 1917, as a major in the Twenty-first Engineers (Light Railways) and was commissioned lieutenant-colonel in October, 1917, sailing for France in December of the same year.

Lieut.-Col. H. J. Slifer

## Railway Age

### Natural Light in Roundhouses

ONE OF THE OBSTACLES to efficient roundhouse operation is poor lighting. From the very fact of its shape and occupancy an enginehouse is difficult to illuminate satisfactorily by natural light. With locomotives 80 ft. or more in length and having large, high boilers occupying most of the available clearance the problem today is much more difficult than it was with the short, low engines of 30 years ago. Even with the outer wall almost entirely of glass and with generous window areas in the doors, or in transoms over them, light in the aisles between engines is far from adequate, and resort must be had to the use of both stationary and extension-cord lamps. With stalls 100 ft. or more in length obviously some intermediate source of light is necessary, and in most cases an attempt is made to obtain additional daylight by the use of monitors, clerestories, etc. But many designers despair of success in this, saying that the additional glass is of little use since those who use the buildings cannot or will not keep it clean. The roundhouse of the Duluth, Missabe & Northern, described on another page of this issue, illustrates a new idea in the lighting of such buildings. A saw-tooth roof is introduced with one unit over each stall. In a sense the application is unscientific since saw-tooth roof construction, as ordinarily used, implies north exposure for all the glass, to avoid direct sunlight while securing an abundance of diffused light. However, this objection is negligible in a roundhouse; the removal of a heavy fall of snow would seem to be a more practical difficulty. But considering the opportunities for improvement in the lighting of roundhouses over its present stage of progress the success of this saw-tooth roundhouse will be watched with interest.

### Six Months' Earnings and Expenses Under Existing Rates

A VERY INTERESTING and important question is, whether present freight and passenger rates are high enough to yield earnings which will cover present wages and other expenses and taxes and leave enough net operating income to pay the guaranteed standard returns of the railway companies if government control is continued, and fixed charges and reasonable dividends if the railways are returned to private operation.

Very large increases of operating expenses occurred in the first six months as well as in the last six months of 1918. On the other hand the advanced passenger rates were in effect only during the last six months of the year. A considerable advance in freight rates was made on the eastern lines in March, but the 25 per cent advance in freight rates on all lines was in effect only during the last six months of the year.

All the advanced rates having been in effect only during the last six months of the year, it is interesting and instructive to consider the effects which the increases in rates and in wages and other expenses had during these six months. Statistics which have just become available show that the net operating income of large roads having 233,000 miles of line was almost \$4,000,000 greater in the last six months

of 1918 than in the last six months of 1917. The statistics of earnings, expenses, etc., of these roads during these two periods are as follows:

	SIX MONTHS ENDED DECEMBER 31.	
	1918	1917
Total operating revenues.....	\$2,831,549,935	\$2,152,533,078
Total operating expenses.....	2,190,940,218	1,504,200,501
Net operating revenue.....	640,609,717	648,332,577
Taxes.....	94,391,854	97,378,400
Uncollectible railway revenue.....	303,972	381,920
Railway operating income.....	545,913,891	550,572,257
Equipment rents (debtor).....	1,378,857	9,864,885
Joint facility rents (debtor).....	5,817,169	5,978,713
Net operating income.....	538,717,865	534,728,459
Operating ratio.....	77.38	69.88
Mileage operated.....	233,383	233,263

The Railroad Administration incurred a deficit of over \$200,000,000 in 1918. These statistics show it was all incurred in the six months of the year before the rates were advanced. Superficially, this looks encouraging. It might be inferred that with a net operating income of almost \$539,000,000 in the last six months of 1918 the railways could be operated by the government in 1919 without incurring a deficit, or could be returned to private control at once without any danger of serious trouble resulting. There are, however, several important facts, consideration of which make it very doubtful if this conclusion can be drawn.

First, there has been an increase of property investment since 1917 and the increase in net operating income in the last six months of 1918 was not sufficient to pay five per cent on this increased investment. Second, over two-thirds of the net operating income earned in the last six months of 1918 was earned in the first three months of this period. Because of rapidly increasing expenses the net operating income reported declined steadily month by month from \$137,000,000 in July to \$25,000,000 in December. Third, other large advances in wages are still to come. The impending advance in the wages of train service employees is estimated at \$60,000,000 to \$100,000,000 a year, which would make a difference of \$30,000,000 to \$50,000,000 in net operating income in six months. Fourth, traffic and gross earnings are declining. Now, the net earnings—difference between total earnings and expenses—in the last six months of 1918 were \$7,700,000 less than in the last six months of 1917, the increase in net operating income being due entirely to a decline of equipment rents, which is mainly a book-keeping matter. The ratio of expenses to earnings in the last six months of 1917 was less than 70 per cent, while in the last six months of 1918, in spite of higher rates, it was over 77 per cent. Therefore, it would require a relatively much smaller increase of expenses or decline of earnings seriously to deplete net operating income now than it would have required toward the end of 1917; and yet we know how quickly the advance of operating expenses in the first six months of 1918 almost completely swept away the net operating income.

The net operating income earned in the last six months of each year usually is larger than in the first six months, and the railways under private operation should now earn at least \$1,150,000,000 net operating income a year in order to meet their fixed charges, pay reasonable dividends and have an adequate surplus to invest in necessary but unproductive improvements. Relatively, the net operating income earned in the last six months of 1918 was too small. It

was only 19 per cent of the total revenues, while the net operating income of the last six months of 1917, although absolutely smaller, was almost 25 per cent of the total revenues. When net operating income is less than 20 per cent of the total earnings of the railways, their financial affairs will be in a state of unstable equilibrium, and any sharp reduction of earnings or increase of expenses is likely to have serious results.

Considering all the pertinent conditions, it cannot be concluded that the net operating income of the last six months of 1918 makes a showing that is satisfactory. The margin between total income and outgo must be made wider, whether we are to have government or private operation. Possibly it can be made wide enough by reductions of expenses. But any reductions of expenses made should be real, and not nominal. In other words, they should not be accomplished by more deferring of maintenance at a time when the deferred maintenance already accumulated is so large as it is now. Furthermore, they should not be accomplished at the cost of further deterioration of the service. The war is over, and there is now an entirely justifiable public demand for the restoration of many of the conveniences, comforts and luxuries of service which the public cheerfully gave up during the war, but which it now wants restored. If the margin between income and outgo is to be widened by reduction of expenses, this should be done by more efficient operation, and by that alone. Whether much more efficient operation actually can be secured under the present system of centralized government management is very doubtful. If more efficient operation cannot be secured the margin between income and outgo should be widened by advances in rates.

## Labor and Government

### Ownership of Railways

REPRESENTATIVES of several large unions of railway employees have presented to the Senate Committee on Interstate Commerce a plan for government ownership of railways. A. B. Garretson, head of the Order of Railway Conductors, told the committee that many railway employees who formerly were opposed to government ownership have been converted to it by a year's experience of government operation. If the question were referred to all the railway employees of the country many, and perhaps most of them, would vote against government ownership. It is unquestionably true, however, that government operation has caused many of them to favor government ownership.

The views of most people on important questions of politics and economics are strongly influenced by the way they believe the decision will affect them. Probably most of the railway employees who, within the last year, have decided to favor government operation have done so mainly because of the large advances in wages they have received. But in advocating government ownership they are not acting in accordance with their own permanent interest.

While the results of government operation are causing many railway employees to favor government ownership, they are causing a vastly larger number of persons who formerly were in favor of, or undecided about, government ownership, to become vigorous opponents of it. They also are being influenced largely by what they regard as their selfish interest. The advances in wages have been the principal cause of the enormous increase in railway expenses which has made it necessary greatly to advance freight and passenger rates, and has resulted in the government incurring a railway deficit. Those who pay railway rates and taxes dislike increases in them as much as railway employees like advances in their wages. The advances in wages have not been accompanied by increases but, on the whole, by decreases in the efficiency with which railway employees have

done their work. Those who ship freight and travel on passenger trains know this. The enormous increase in operating expense shows it. Therefore, the public believes that many railway employees have taken advantage of war conditions and government operation to get as much money as they can and to give as little in return as they can. The public thinks that while a policy which has these results may be good for railway employees, it is not good for the public. In consequence, the employees need feel no surprise that the plan for government ownerships which their representatives have proposed, is being very coldly received. The public's coldness toward it will increase the more the plan is examined.

The plan contemplates the purchase of the railways by the government—in other words, by the public—and payment by it of the interest on the bonds issued to make the deal. A board of nine members would be created to operate the roads, three to be appointed by the President of the United States, three by the railway officers and three by the railway employees. Under permanent government operation, the word "officer" would be merely a euphemism for an employee of high rank. Therefore, the proposal is that the employees should take over and run the public's railroads.

It is said the employees would have an incentive to operate the railways efficiently under their plan because it is proposed that all net earnings in excess of the amount required to pay interest on the government's investment should be divided equally between the employees and the government. But, obviously, there never would be any surplus. Wages are, and always will be, the major part of expenses. The plan of the unions contemplates that salaries and wages shall be fixed by boards composed of equal numbers of officers and employees—that is, in effect, entirely by the employees. Suppose, now, that on a given scale of wages a surplus of \$100,000,000 a year would be earned. In that case, the employees would get a bonus of \$50,000,000. Suppose, on the other hand, that the wage board should advance wages \$100,000,000. In that case, the employees would get the entire \$100,000,000. Would they get it? Or would there be a surplus? Will a duck swim?

But, it may be said again, at least the Interstate Commerce Commission would fix the freight and passenger rates. But it would have no control over wages or other expenses. Therefore, if it held the rates down while wages and other expenses advanced, the result would be that the taxpayers would have to pay a railway deficit—as they did under government operation in 1918 and probably will under government operation in 1919.

The plan of the railway labor unions has no chance of adoption. It is significant chiefly as a naive expression of the employees' desire to retain and even increase their present high wages, and as an illustration of the false economic philosophy which prevails widely among working people and even among business men. The desire of the employees to keep their present wages, and even increase them, is eminently human. It is easy to understand and sympathize with it. But they have no more right to high wages than other people doing equally hard and useful work, and how can it be made economically possible to maintain the present high wages in the railway and other industries, much less increase them? The thought which seems to be in the minds of many working people is that wages can and should be advanced at the cost of capital. But the *advances* in the wages of railway labor within the last year exceeded the largest amount of interest and dividends ever paid to capital upon the entire capitalization of the railways of the United States in any year. Labor cannot take from capital more than capital has. Most of the advances in wages which have been made are being paid, not by the rich capitalists, but by the "common people" in higher freight and passenger rates.

And yet there is a way by which almost unlimited advances in the wages of labor may be made possible. Furthermore, there is absolutely only one way in which this can be made possible. This is by increasing the efficiency of production. If the efficiency of railway labor had been increased last year as much in proportion as the average wage per employee was, the advances in wages would have caused no increase in operating expenses at all. But it may be said that the efficiency of railway labor does not depend entirely on the employees—that it also depends upon the officers. Sometimes the representatives of labor say this, and sometimes they say the opposite. Mr. Garretson implied in his testimony before the Senate committee last week that the decline of operating efficiency had been due to the officers. Another representative of labor estimated that if labor's plan were adopted, the employees would cause a reduction in operating expenses of a billion dollars a year.

If the employees could do that in future under government operation, why didn't they do it in 1918 when the country was at war, and needed an increase of efficiency in all lines as it probably never will again? And, on the other hand, if the efficiency of operation in 1918 depended upon the officers, why would it not in future?

The decline in the efficiency of operation and the increase of expenses in 1918 occurred largely because neither officers nor employees worked as efficiently as they formerly did under private operation. The officers could not, and never would be able to, work as efficiently under government as under private operation, because government operation denies them opportunities and incentives which private operation affords them. The employees have not worked, and could not work, as efficiently under government as under private operation, because the efficiency of the employees depends both upon the ability of the direction they receive from the officers and upon their own willingness and industry; and government operation does not afford them as competent direction or stimulate their industry as much as private operation. As has been tacitly conceded by the very spokesmen of labor who have appeared before the Senate committee, the amount of wages that railway labor can and will be paid in the long run will depend upon the efficiency with which the railways are operated. The rendering of railway service is merely a part of the entire industrial process of production. Upon the efficiency of production depends the amount of things of all kinds that are produced. Now things—food, clothing, houses—are the real wages of labor, and in the long run the only way in which labor can get more and better food, more and better clothing, better houses to live in, is for more and better food, clothing, houses, etc., to be produced.

Since the efficiency of railway operation will be greater under private than under government management, and since—in the long run—the wages of labor depend upon the efficiency of production, it necessarily follows that labor, in advocating government ownership and management, is acting directly contrary to its own permanent interest. Before the war the railways of the United States, under private operation, were paying relatively higher wages than any system of government railways in the world. Railway labor knew this, and it was one of the main reasons why a majority of railway employees were opposed to government ownership. During the war under government operation railway employees have been given huge advances in wages; but this proves nothing as to the relative advantages to the employees of government and private operation in time of peace. In advocating a policy the direct tendency of which would be to reduce the industrial efficiency of the United States, railway employees are advocating a policy the effect of which would be not to maintain or advance their wages, but to keep them down. Labor has everything to gain and nothing to lose by industrial efficiency; and therefore it is

hard to understand why it so often favors policies which would reduce industrial efficiency.

## Adequate Depreciation Rates Should be Established

IN THE PRESENT DISCUSSION of railroad matters little attention has been given to the important question of providing adequate depreciation rates both for equipment and for structures. Commissioner Woolley, in his supplement to the statement of the Interstate Commerce Commission, expressed the opinion that the carriers should be required to set aside fixed portions of their gross annual incomes for depreciation, the percentage to be determined in each case by the Interstate Commerce Commission. This is an acknowledgment of the inadequacy of the present depreciation accounts, but why Commissioner Woolley should wish to change the method now in use and base the depreciation funds on the gross incomes rather than on the cost of the equipment and the structures is not quite clear.

C. A. Morse, speaking before the New York Railroad Club, advocated the establishment of freight and passenger rates sufficient to take care of depreciation as well as to meet the cost of operation and maintenance, for the purpose of replacing all wastes concurrently and thus keeping the railroads in a healthy condition. Some of the worst trouble experienced during the war was due to the fact that obsolescence and depreciation had not been properly cared for. It is from this viewpoint that the problem should be approached at the present time.

In the Interstate Commerce Commission system of accounting no fixed percentage has been specified for the depreciation reserve. In fact, until 1915 no provision was made for accumulating a depreciation fund for structures. It has been charged that the commission had no definite purpose in mind when the depreciation account was established, but included it merely as a convenience for roads that wished to use it. At the present time, depreciation rates on locomotives and cars vary from two per cent to six per cent. Very few roads have depreciation accounts for shop equipment, road equipment or structures.

The low rates of depreciation, and the entire absence of depreciation reserves in some cases cause many roads to charge a large percentage of the cost of retirements to operating expenses. While the more prosperous carriers have been able to meet these heavy charges and have kept the properties in efficient condition by frequent replacements, the poorer roads have continued to use old and uneconomical equipment as they were not financially able to make extensive renewals and have postponed improvements in the hope that future years would bring larger earnings.

Accrued depreciation not taken up in the depreciation account is a liability that will ultimately be reflected in the earnings of the carriers and in the efficiency of operation. If too low a rate is carried and renewals are inadequate, the net revenue will be high. It requires courage on the part of railroad officers to increase the depreciation rate, while net income is stationary or decreasing. The remedies for the evils resulting from inadequate depreciation rates is to be found in the fixing of depreciation rates within narrow limits by the Interstate Commerce Commission.

The Railroad Administration has taken the first step towards standardizing depreciation rates by specifying that 4½ per cent per annum shall be used for all equipment placed in service during 1918. If a fixed rate could be applied not only to equipment but also to roadway and structures, the carriers' accounts would more nearly reflect the true financial condition of the roads and the railroad industry would stand on a sounder economic basis.

The Exterior of the Roundhouse

# An Unusual Concrete Roundhouse at Proctor, Minn.

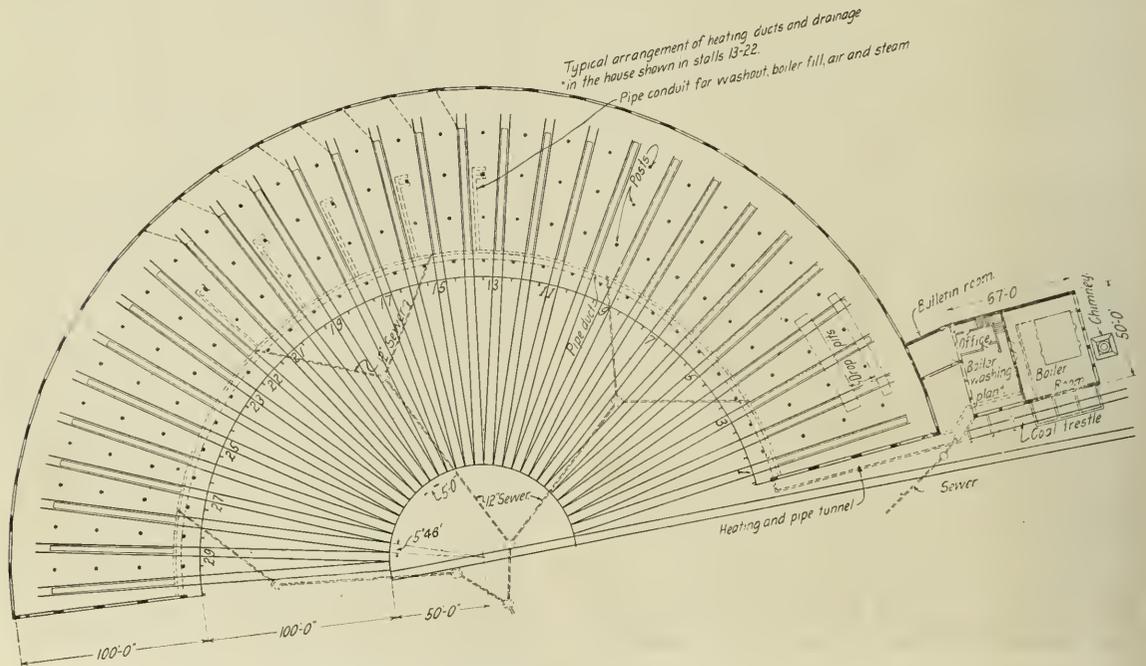

Saw Tooth Roof Applied to Circular Building; Cantilever Beams Support Walls Over Entrance Doors

By Wm. E. Hawley

Assistant Engineer, Duluth, Missabe & Northern, Duluth, Minn.

A NEW TYPE of reinforced concrete roundhouse has been completed and put into operation by the Duluth, Missabe & Northern at Proctor, Minn. The building, which was designed by the writer, introduces several novel features in roundhouse construction. Briefly these are saw-tooth roof construction applied to a circular building, the elimination of all beams which can form dead gas and smoke

around the circle; unit construction of each stall so that the forms may be used over again in the construction of additional stalls, and cantilever construction to support the roof at the front entrance to the stalls, thereby reducing the column thickness at doors to mere I-beams to carry the door guides and give maximum clearances at the door entrances. With these features an effort was made to include the best

Ground Plan of the Roundhouse

pockets on the underside of the roof; large ventilation areas over each stall throughout their length; large lighting windows over each stall; all roof drainage towards the rear and conducted by interior downspout pipes so as to remove the concentration of water at entrances to stalls; steep roof slopes which remove the importance of absolutely tight roof coverings; expansion and contraction provisions in each stall in order that expansion and contraction will not accumulate

points of previous designs of roundhouses of other railroads to give permanence and satisfactory operating service.

The importance of good, ample daylighting, electric lights at night, fresh air ventilation, smoke removal, resistance to corrosion and fire, complete piping service, and substantial construction were kept in mind during the designing. The results have fully justified the choice made although the first cost might have been kept lower by a simpler and less gen-

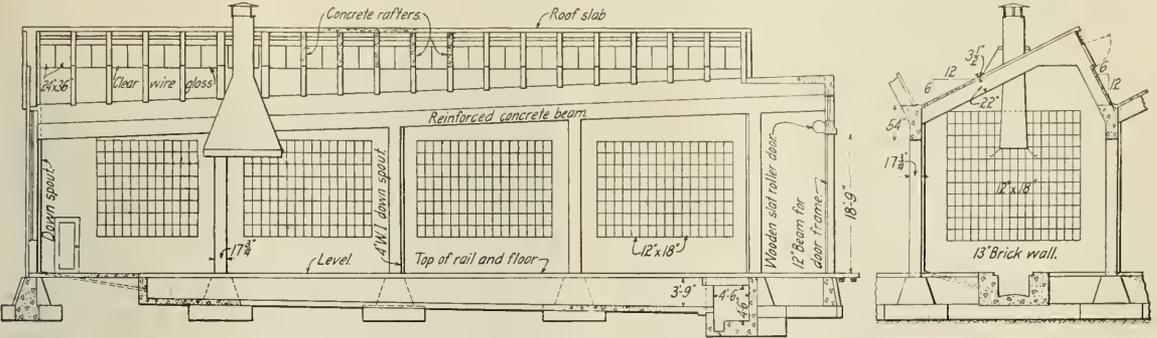

erous plan. As the railroad uses large and well equipped shops for the heavier engine repairs, it is not necessary to provide for any but the lighter repairs, upkeep and cleaning in the roundhouse. Excepting the saw-tooth roof windows and louvers, wood slat roller doors, and conduit covers of floors, fire resistant materials were used throughout. Wood was used for windows and doors because of its resistance to gases.

The plans were laid out for a 60-stall roundhouse with an

tions. Concrete was used to pave the bottom of the pits.

A pipe tunnel 4 ft. 6 in. by 4 ft. 6 in. with a lower extension or drainage channel 16 in. by 16 in. extends around the building at the inner end of the pits and connects with a tunnel leading to the boiler room. Branch conduits are constructed between every pair of stalls to provide for branch piping. The floor consists of six inches of concrete.

The foundation was a clay hard pan and required no piling. Four-inch drain tile, and 6-in. and 12-in. vitrified sewer

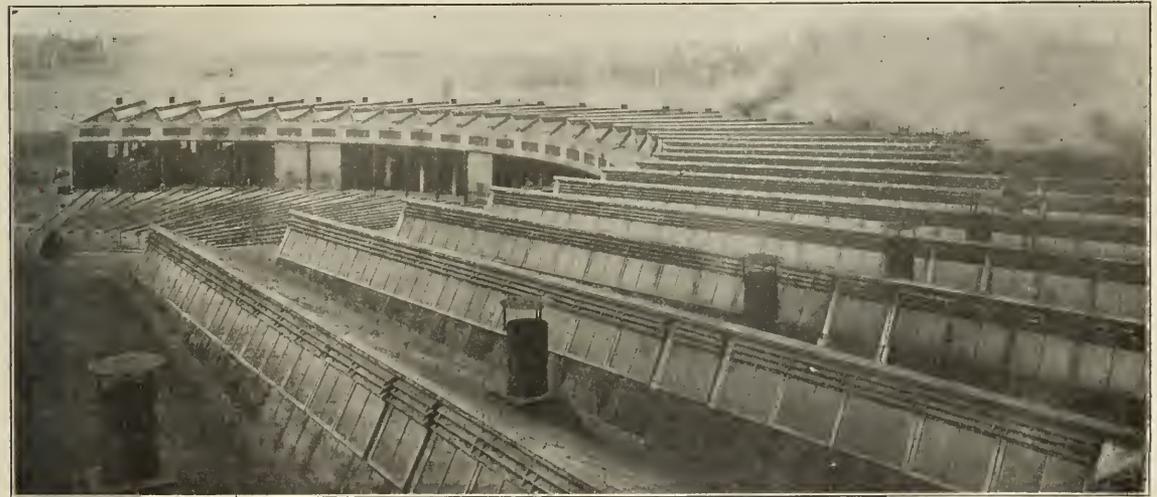

Longitudinal and Cross Sections of one of the Stalls

entrance track and an exit track when the development of the terminal is completed, but only 30 stalls were built with the first construction. At the center of the layout there is a 100-ft. turntable designed for a 304-ton Mallet or a 233-ton Mikado type locomotive. The table is of the through plate girder type on a 500-ton center, designed by the American Bridge Company.

The inside face of the inside curve of the roundhouse is on a circle of 150-ft. radius and the inside face of the out-

pipes were installed to carry off the seepage and roundhouse waters. The drain channel in the pipe tunnel was laid without any grade and serves the purpose of catching cinders and waste matter, the water overflowing through screens to the sewers. Roof drainage is carried inside the building by 4-in. wrought iron pipes to the pits and discharged therein.

Between each stall there are five columns 17 3/4 in. square supporting the main roof girder beams. These columns are reinforced with four steel rods 3/4 in. in diameter, wrapped

View of the Special Roof Construction

side curve on a circle of 250-ft. radius. The angle between stall tracks is 5 deg. 44 min., giving 15-ft. center to center of door I-beams and 25-ft. center to center of columns on the outer circle with a stall length of 100 ft.

The 30 stalls are divided as follows: 20 with pits 64 ft. long, 7 with pits 71 ft. long and three with pits 71 ft. long, crossed by one driver and one truck drop pit. All pits have concrete side walls 30 in. thick, giving good jacking founda-

with American Steel & Wire Company triangle mesh No. 23 (old style) in 48-in. widths, cut 62 in. long, using the 3/4 in. wires as circumferential reinforcement. The main roof girder beams are 17 3/4 in. wide by 54 in. deep, reinforced with 11 steel rods 1 1/8 in. in diameter and American Steel & Wire Company triangle mesh No. 23 (old style), laying the longitudinal wires down the sides and across the bottom of the beam for sheer reinforcement.

At the entrance end of the stall a cantilever beam 9 ft. 9 in. long, as an extension of the main roof beam, supports the front roof and front walls over the doors. Each of these front walls over the doors is in effect two cantilever beams balancing against one another and leaving expansion and contraction joints over the center of each stall door. The roof slab over this part has expansion joints and this provision with expansion slots in the main girder beams for roof rafters gives a complete line of expansion and contraction for the roof of each stall. As the building has an outside perimeter for 30 stalls of over 750 ft., it was deemed advisable to distribute contraction and expansion by providing for it in each stall. The adoption of the above cantilever construction, in addition to allowing narrow door posts, also reduces the damage which might be done because of anything on engines fouling the doors. It also brings one main column foundation wholly inside the building, away from uneven frost conditions.

The roof is supported by a simple set of concrete rafters, reinforced with  $\frac{3}{4}$  in. diameter rods and designed rigid enough to carry strains to the expansion joint at the valley between roof slopes. By using rafters and providing ventilation slits at the top, all dead air and gas pockets were eliminated, a feature which is not secured in beam and joist designs for roofs. This design is expected to remove the trouble of corrosion of imbedded steel by locomotive gases and consequent shortening of life of structure. This design with the ample ventilation provided at the top has also eliminated the condensed moisture problem which has developed in other types of concrete roundhouses.

The large ventilation provided throughout the length of the saw-tooth roofs has improved the smoke conditions in the building and no difficulty has developed from the glass becoming covered with soot. The roof windows can all be swung out and washed by a man working in the valleys of the roof.

The roof is a  $3\frac{1}{2}$  in. concrete slab, reinforced with No. 23 triangle mesh laid with length wires spanning from rafter to rafter. The covering on the saw-tooth roof slopes is one layer of three ply Black Diamond prepared roofing and one layer of 3 ply double sanded Amazon roofing nailed to 1 in. by 2 in. sleepers brush treated with Barrett grade one liquid creosote oil. The roofing was laid and sealed with hot Barrett specification pitch. The roof valleys and flat roofs at the entrances to stalls are covered with 5 ply Barrett specification tarred felt and pitch with gravel. Sheet lead was used to make connections to downspouts and the outside metal flashing was galvanized sheets of No. 20 gage of Keystone copper bearing steel.

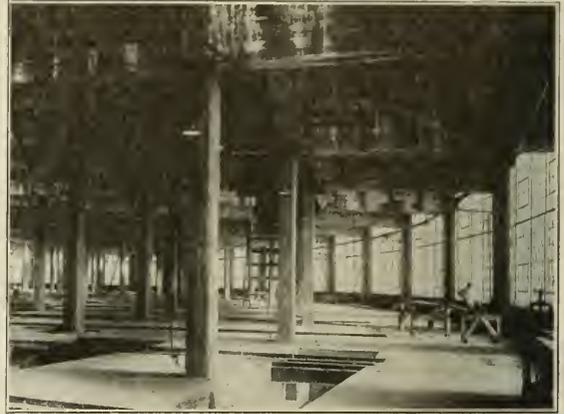

Standard roundhouse wooden slat roller doors were furnished by the J. G. Wilson Corporation. All small service doors in the roundhouse, office, boiler, boiler wash room, and locker room are Dahlstrom steel doors and frames. All windows except the saw tooth roof sash are Fenestra steel sash, glazed with  $\frac{1}{4}$ -in. wire glass. Ample ventilation sections are installed in each of the large windows. Dickinson cast iron smoke jacks of standard design are suspended from eyebolts placed in the concrete roof rafters.

The engine drop pits are provided with Watson Stillman hydro-pneumatic pit jacks using 45-ton 60 in. lift for the driver pit and 15-ton 54 in. lift for the front truck pit. Movable I-beam support the rails over the cross-pits. The National boiler washing system is installed throughout with blow-off main, washout and filling mains. The space for the boiler washing plant, steam boilers, and steam and vacuum pumps is provided in an adjacent building which also has office, locker, wash and toilet rooms for the employees.

All engine pits are heated by coils of five lines of 2-in. pipe of 140 lineal feet in each run, giving 440 sq. ft. of

radiation surface per pit, and in 30 stalls, 13,013 sq. ft. of radiation. In addition there is distributed in cast iron wall radiation, 7,776 sq. ft., making a total radiation of 20,789 sq. feet for the building. The Webster system of steam circulation, using live steam under reduced pressure and vacuum pumps to maintain circulation, is used for this heating system.

All electric wiring is installed in pipe conduits and cast iron boxes placed in the concrete. Forty-watt Mazda lights are placed on each of the interior columns about 15 ft. above the floor with shallow reflectors to give distributed light along the sides of the engines. Suitable outlets are also provided

Interior of the Roundhouse

to give chances for extension cords and hand lights for working under the engines.

The following is a part estimate of the material and work for one stall:

Approximate earth excavation.....	300 cu. yd.
Concrete in substructure.....	150 cu. yd.
Concrete in superstructure.....	97 cu. yd.
Steel rods in superstructure.....	10,586 lb.
Triangle mesh in superstructure.....	2,921 lb.
Concrete floor, 6 in. thick.....	1,300 sq. ft.
Brick wall, 13 in. thick.....	204 sq. ft.
Steel sash and glass.....	344 sq. ft.
Downspouts, 4 in. W. I. pipe.....	103 ft.
Steel beams and connections.....	1,400 lb.
Small steel angles, bolts, plates, etc.....	2,090 lb.
Roofing.....	22 squares
Drain and sewer tile.....	
Electric conduit, wiring and fixtures.....	
Pipe radiation.....	440 sq. ft.
Cast iron wall radiation.....	180 sq. ft.

The first preliminary work was started in December, 1915. Bids for the roundhouse, boiler and wash house were called for in May, 1916; the contract was signed on June 10 and work started in July, 1916. The contract was finished in November, 1917.

The designing work was done in the engineering office of the Duluth, Missabe and Northern by William E. Hawley under the supervision of H. L. Dresser, chief engineer and W. H. Hoyt, assistant chief engineer. The construction contract for the buildings was let to MacLeod and Smith of Duluth and was supervised by F. C. Baluss, engineer bridges and building of the railway. The National Boiler Washing Company installed the boiler washing system, and D. R. Black Company of Duluth had the contract for the heating system.

A fire at the Seaboard Air Line terminal, near Savannah, Ga., on February 14, destroyed large quantities of cotton, turpentine, rosin, nitrate of soda, and other freight, together with 30 or more freight cars; estimated loss \$4,000,000.

# Railroad Appropriation Bill Before the House

## Needed to Enable Railroad Administration to Discharge Its Obligations—Director General Hines' Testimony

WASHINGTON, D. C.

THE HOUSE COMMITTEE on appropriations on Monday reported favorably a deficiency appropriation bill appropriating the \$750,000,000 asked by the Railroad Administration to enable it to discharge its obligations as an addition to the \$500,000,000 revolving fund provided in the federal control act and "subject in all respects to the same authority for, and restriction of expenditure as the said \$500,000,000. On Tuesday a unanimous consent agreement was reached providing for the consideration of the bill in the House after the fortification bill is passed on, which will probably be this week.

Senator Cummins has announced that when the bill gets into the Senate he will propose as an amendment the bill he had previously introduced to take away the power of the President to relinquish railroads in less than 21 months after the proclamation of peace unless Congress specifically authorizes it.

The director general has estimated that the bill will provide \$381,000,000 necessary to settle accounts with the railroad companies for 1918 and \$368,000,000 for advances to railroads and waterways for capital expenditures in 1919, including \$286,000,000 to pay for equipment ordered by the Railroad Administration last year, \$20,000,000 for financing the Boston & Maine reorganization, \$12,800,000 for inland waterways and a margin of \$50,000,000. New capital expenditures for this year are estimated at \$491,000,000, which includes \$290,000,000 for additions and betterments and \$201,000,000 for equipment—of which \$109,000,000 is for equipment ordered by the railroads before 1918 and \$92,000,000 is for new equipment of special types, such as cabooses and passenger cars, and for rehabilitation of existing equipment. It is proposed to deduct \$150,000,000 from the compensation of the companies to be used for capital expenditures and it is estimated that they will be able to finance themselves about \$290,000,000 in addition to meeting about \$200,000,000 of maturities for this year.

Before reporting the bill the committee made public the printed report of the hearings in executive session before its subcommittee on deficiency appropriations, giving the testimony of Director General Hines, Secretary of the Treasury Glass, and Eugene Meyer, Jr., a director of the War Finance Corporation, which includes some interesting facts regarding the financial operations of the Railroad Administration heretofore unpublished.

### May Be Deficit for 1919

The possibility of another deficit for 1919 was admitted by Mr. Hines in his testimony on February 5, in reply to a question by the chairman of the committee as to whether it is likely the railroads will be able to earn the guaranteed rental. "That is a particularly difficult question this year," Mr. Hines said, "on account of the unusually disturbing factors as to the volume of business and also because we are going through these processes of readjusting operating expenses. The outlook is that in the first six months there will be a considerable falling off in business. On the other hand, the outlook is for an extraordinarily large crop which could readily make an unusually large business in the fall. I should say that, everything considered, it looks now as if we could not reasonably expect any substantial surplus over the rental. We may find a moderate deficit under the rental, but I do not think it will be enough to affect the estimate one way or another for the appropriation. That may be very

much upset unfavorably if there is a very radical falling off in business. On the other hand, it may turn out very much more favorably if there is in the latter part of the year a substantial increase in business."

In explaining the \$200,000,000 deficit for 1918, Mr. Hines said the expenses were abnormal for various reasons aside from the increases in wages "made because of the competition in other lines of industry." He mentioned the expense of cleaning up the congestion, the inefficiency of inexperienced labor, the large amount of overtime, and the necessity for repairing cars in foreign line shops. He said it was impossible to segregate the parts of the wage increase due to overtime and the inefficiency of labor, but he filed a statement estimating the payroll for 1918, excluding the increases, at \$1,822,793,000, and the increases at \$583,552,000, or 32 per cent. The statement is as follows:

STATEMENT SHOWING ESTIMATED PAY ROLL CHARGES, EXCLUDING INCREASES DUE TO INCREASE IN RATES OF PAY FOR THE YEAR 1918, AND SHOWING ESTIMATED INCREASES DUE TO CHANGES IN RATES OF PAY AND COLLATERAL INCREASES MADE NECESSARY THEREBY

Operating expense account	Estimated pay roll charges, excluding increases	Total estimated increase	Per cent total increases over rates of December, 1917
Maintenance of way and structure..	\$321,791,000	\$96,290,000	29.9
Maintenance of equipment.....	433,594,000	201,898,000	46.6
Traffic expenses.....	24,508,000	3,620,000	14.8
Transportation.....	972,480,000	266,334,000	27.4
General expense.....	70,420,000	15,410,000	21.9
Total, all operating expenses.....	1,822,793,000	583,552,000	32.0

The statement does not include the effect of increases covered by supplements 12 and 13, which were promulgated in December, 1918, with regard to which reliable data are not available.

A previous estimate had placed the increase in payroll for the year at \$642,000,000. Mr. Hines said he was satisfied that if federal control had not intervened there would have been a serious strike to force higher wages. He thought the real cost of the increased wages would be reduced in the future by rearrangement of the work so that a large part of the men will not have to work on Sunday as under the new wage scales they are paid for their time.

Another statement estimated the increase in revenues on account of the increased rates during the last half of the year at \$145,731,178 in passenger revenue and \$414,773,352 in freight revenue, a total of \$560,504,530. G. H. Parker, assistant to the director general, estimated the standard return for all roads under federal control at \$928,000,000 and for the Class I roads and large terminal companies at \$900,904,552. The expenses of the Railroad Administration, which are not included in the returns of the Interstate Commerce Commission, were given as \$3,528,946.

Mr. Hines said that for 1918 it had been estimated that \$214,000,000 could be taken from the guaranteed rental to be used for capital expenditures without impairing the payment of interest and dividends, but that for 1919 it was estimated that only \$150,000,000 could be so deducted, because of the probable increase of war taxes the companies must pay. Chairman Sherley asked why the government should appropriate money to loan to railroads while allowing them to continue paying dividends. Mr. Hines replied that if the administration should deduct against dividends there would be a general feeling that it involved a disregard of a very strong moral obligation on the part of the government and that the suspension of dividend payments would cause a state of disturbance. He expressed the opinion that by the

end of the year the companies, with comparatively few exceptions, will be able to finance themselves.

"Is that predicated on the belief that the increased rates will remain permanent?" asked the chairman.

#### No Prospect of Reduced Rates

"The question whether those rates can be reduced will be dependent largely upon the volume of business and the extent to which readjustments of operation will reduce operating cost notwithstanding the increased wages," said Mr. Hines. "I certainly do not make any prophecy that those rates are likely to be reduced in the near future, but on the basis of these rates my judgment is that when this year is passed the companies will be able to finance their additions and betterments; that this appropriation, while it is badly needed now and without it there would be very unfortunate consequences, will put the situation in shape where, even if federal control continues, it will take care of itself this year."

#### Appropriation Needed to Pay Bills

If Congress fails to make the appropriation, Mr. Hines said, the consequences, aside from the fact that the government would not be meeting its obligations, would be as follows:

"In the first place, not being able to settle with the railroad companies, they would be at once thrown into confusion in carrying on their own affairs with their bondholders and their stockholders, and it would be a most disturbing factor. It would be so at any time, but particularly so at a time immediately preceding the raising of another government loan.

"In the second place, it would very greatly interfere with the payment for this equipment, which is being constructed right along and being delivered very rapidly, the bills for which are due as equipment is delivered, and it would very seriously upset the ability of these manufacturing enterprises to make their settlements with their employees and to make their settlements with people from whom they have bought materials, and it would set in motion a general tightening of the situation which would be most prejudicial to the general interests of the government at any time.

"Now, there is another very important consequence, and that is this: If we got no appropriation or got an inadequate one, in addition to having to stand off the railroad companies on what we owe them, and the equipment companies on what we owe them, we would at once have to cut right down to the bone what we should expend for additions and betterments. Now, that would be at a time when the general government policy, evidently, is in favor of enlarging rather than cutting down the amount of work done, so as to help stabilize the industrial situation. It is perhaps not very bad yet, but it promises to get worse.

"There promises to be more unemployment, and to have that situation, which inevitably is unfavorable, accentuated by the Railroad Administration having to contract instantly and cut everything it does right down to the bone would be an exceedingly unfavorable factor. On the other hand, the prompt making of this appropriation would create a feeling of encouragement, and they would realize that the Railroad Administration was thereby put in a position to go ahead with a reasonable amount of improvement work and furnish additional employment and to develop a purchasing power which would be in the public interest.

"Even if the government should release the railroads this fall, and I doubt very much if there could be a relinquishment earlier than that," he said, the expenditures which he had indicated would be required in the interest of safety and obvious public convenience.

#### The Contract Situation

The number of standard contracts signed, Mr. Hines said, was 34 and 44 more were about ready to sign, while 23 others had been drawn and were in process of consideration. He

said that as far as he knew, practically every company whose road has been taken over is relying on the making of the contract and the Railroad Administration is assuming the standard return will be paid to all of them. He submitted a statement of the contract situation as of January 26, showing that 101 contracts, providing for \$599,190,646 of compensation, had been drawn by the Division of Law, 30 had been executed by both parties, 38 had been approved by the Division of Law and circulated among members of the administration staff for their opinion, 19 had been approved and sent to the companies to print and 14 had been drawn, but were awaiting the determination of special claims, etc. Since the statement was compiled four more had been signed. Of the total, 51 were with Class I roads, besides which probably 20 or more Class I roads were parties to the contracts as affiliated companies. In addition 13 short line contracts had been executed. The compensation provided for by the 34 signed contracts amounts to about \$360,000,000.

No contracts had been executed, Mr. Hines said, which include any allowance for compensation in addition to the standard return, except in the case of the Missouri & North Arkansas, which had a very heavy abnormal loss in one of the three years of the test period and which had been allowed \$161,230 in addition to its standard return of \$13,146. No contract had been executed for less than the standard return. Eighty-two companies had made claims for excess compensation, amounting to \$75,538,832 and claims amounting to \$1,316,538 had been tentatively allowed. The director general filed the following statement of the claims for additional compensation:

#### SUMMARY OF SPECIAL CLAIMS FOR COMPENSATION, IN ADDITION TO THE STANDARD RETURN, FILED WITH UNITED STATES RAILROAD ADMINISTRATION TO FEBRUARY 6, 1919

Mr. Hines also filed with the committee a list of the Class I railroads that have been relinquished and are not being operated by the Railroad Administration, as follows: Arizona & New Mexico Railway Co., Bingham & Garfield Railway Co., Canadian Pacific Lines in Maine, Colorado & Wyoming Railway Co., Colorado Midland Railroad Co., Cripple Creek & Colorado Springs Railroad Co., Duluth, Winnipeg & Pacific Railway Co., Nevada Northern Railway Co., Pittsburgh, Shawmut & Northern Railroad Co., and Spokane International Railway Co., also a list of the Class II and Class III roads and switching and terminal companies that have been retained. The list included 96 Class II roads, 73 Class III roads and 136 switching and terminal companies.

### Efforts to Resume Normal Basis

Since the armistice was signed, Mr. Hines said, the Railroad Administration has been trying to get the transportation service back to the normal basis and, realizing the probability that in the reasonably near future the railroads may go back to their owners, is endeavoring to give more consideration to individual railroads than during the war period, and to pursue a policy of considerateness so as not to interfere needlessly with the sort of traffic that would be handled by the corporation if it were in control of its own lines.

Asked whether it was proposed to adjust passenger service and rates back to normal, Mr. Hines said there is no thought of reducing the three-cent passenger rate, but that the three cents has no more purchasing power than the two cents before the war. The surcharge for Pullman passengers has been abolished and it will be the policy to give special rates where they will encourage an additional traffic that is profitable to carry, he said. As to freight rates, Mr. Hines said that it will be the policy to make rates that will develop traffic, but that it must be remembered that to a large extent, the increase in rates merely reflects the universal diminution in the purchasing power of money.

Mr. Hines said the railroad companies have a great many maturities to meet this year, but although they want assistance for that purpose, his policy is going to be that they will have to meet their own maturities as well as to finance largely the additions and betterments for 1919, but that until the next government loan is out of the way they would have

difficulty in borrowing money to pay the \$290,000,000 advanced to them for additions and betterments in 1918 and the \$100,000,000 of temporary advances. Charles B. Eddy, who had been assistant general counsel, was recently appointed associate director of the Division of Finance and charged with the duty of taking up the accounts of the companies for the purpose of finding out their ability to finance themselves and of endeavoring to collect various amounts due the government.

### Accounts With Corporations

As illustrating some of the administration's financial methods, Mr. Hines described the loan made to the New Haven, and the relations with the Atchison, Topeka & Santa Fe and the Illinois Central. On December 31 the administration owed the Atchison \$38,000,000 on account of its rental, none of which had been paid, but it had expended for the company \$22,385,000 for additions and betterments and the company owed it on open account \$1,828,236. The administration cannot deduct the entire indebtedness of the company from the standard return, under the terms of the contract, because that would impair its ability to pay its interest, taxes, etc., but it can deduct \$8,211,328, and after it has paid the balance, \$30,000,000, it can require the company to borrow part of the money to pay it. The rental of the Illinois Central is \$16,282,000, of which \$2,000,000 was unpaid, and \$24,830,199 of expenditures for additions and betterments had been made for its account, while the company owed the government \$7,311,365 on open account. The total deduction that may be made is \$1,125,144 and the net amount due the company was \$932,230.

At the request of the committee Mr. Hines put into the record a statement of the accounts between the director general and the companies as of December 31, 1918, showing the net amount due the companies as \$381,806,904, which is reproduced herewith.

He also filed an estimate of the capital expenditures made during 1918 which will have to be financed by the government, amounting to \$290,918,283. The capital expenditures for the year for the Class I roads were \$573,000,000, and it was estimated that \$214,000,000 of surplus, after fixed charges and dividends had been paid from the standard return and other income, could be applied to their payment. As \$68,000,000 was due the companies on open account this left a balance of \$290,000,000.

Mr. Hines explained that the figures of \$750,000,000 had been arrived at by taking the \$381,000,000 required to settle accounts, \$20,000,000 for the Boston & Maine, \$12,800,000 for the inland waterways, and a margin of about \$50,000,000. On this basis the companies will be required to finance about \$291,000,000 of the program for 1919 in addition to \$150,000,000 deducted from their compensation, and as they will have to finance something over \$200,000,000 for maturities this year, this contemplates that the railroads during 1919 will be able to borrow in the open market something like \$500,000,000. He thought that is all it is possible to hope they can do. In reply to questions, he said he hoped that in the latter part of this calendar year, if financial conditions are reasonably good, the government will begin to get back some of the money, but the administration will be needing it in the meantime.

Mr. Hines said that the economies effected by unified operation in 1918, so far as it has been possible to estimate them in money, have amounted to about \$91,000,000 a year, which served in part to offset the abnormal costs that the railroads were subject to in time of war.

"Have you gotten to the point where you believe you are shaking down your organization into any greater efficiency than has heretofore existed?" asked the chairman.

"We are just getting to the point where processes of readjustment can be undertaken," said Mr. Hines, "and this

month the regional directors and federal managers are hard at work on that proposition and, I might say, with a great deal of co-operation from labor. They are trying to adjust things to the basis that ought to exist after the cessation of hostilities."

Chairman Sherley said there seems to be a general impression that there is a complete demoralization existing in all branches of the railroad service. Mr. Hines said he thought the state of relaxation that came about after the signing of the armistice and the natural state of inquiry as to what would happen to the railroads have tended to produce a situation of that sort which will be cleared up largely as

soon as we can know something definite as to what is to happen to the railroads.

In connection with questions asked about the status of the short line railroads which were relinquished, Director General Hines filed a statement giving an estimate of the amount of the probable obligation of the Railroad Administration in connection with the co-operative short line contracts as \$2,500,000. This includes \$500,000 for adjustments of per diem and \$2,000,000 for adjustments of traffic.

Mr. Hines said the appropriation was imperatively needed to meet current payments for equipment and additions and betterments. On account of the shortage in its cash, the Rail-

road Administration, he said, was able to pay only about \$25,000,000 on equipment in January, whereas it ought to pay at the rate of about \$50,000,000 per month so that it is holding back bills that ought to be paid. The whole amount of \$286,000,000 ought to be paid by the month of June and the current program for additions and betterment work would run at the rate of about \$50,000,000 per month.

Appropriation Approved by Treasury Department

Carter Glass, Secretary of the Treasury, testified as to the general financial situation, urging the necessity for the

appropriation to avoid disturbance of the financial operations of the government which might result if the railroads were required to attempt to finance themselves and failed to do so. The Treasury Department, he said, was very earnestly in favor of the appropriation because it thinks that if the railroads were compelled to go into the open market it would have a disturbing effect on the next Liberty loan and that if the appropriation is not made it will have a very distressing and demoralizing effect upon business generally.

Eugene Meyer, Jr., a director of the War Finance Corporation, expressed the opinion that if the appropriation is

passed the railroads will be in a better position to do without the money than they will if it is not passed because the appropriation will restore credit to the railroads. He said it is well known among investors and bankers that the Railroad Administration faces a difficulty in carrying out its contracts with the railroads and that the credit of the securities of the railroads is impaired by knowledge of that condition. "In other words," he said, "the ability to get the money from the government will make it easy to get the money from the investors and that is a very important factor, not only as to the quantity of money that the railroads may call for from the government, but also the rate of interest to the railroads. He thought that a fair amount of money can be had from the market by the better railroads, provided the Railroad Admin-

istration is in a proper position to live up to its contracts."

In September, Mr. Meyer said, the matter of railroad loans was called to the attention of the War Finance Corporation and it passed a general resolution undertaking to help the railroads. Up to that time the railroads had not applied to it for any help, but subsequently a number of roads applied for assistance and the corporation has loaned about \$70,000,000 to railroads. Some of the money was used to repay advances which they had obtained from the Railroad Administration, some was used to meet current corporate needs, and some to meet maturing obligations. The Baltimore & Ohio had recently asked for \$14,750,000 and the War Finance Corporation agreed to take the loan, but the offer of assistance enabled it to get the money elsewhere.

## Acute Railway Situation Demands Prompt Action\*

New Revolving Fund Should Be Provided; Extra Sessions of Congress Should Be Called to Pass Needed Legislation

By Samuel O. Dunn  
Editor of the *Railway Age*

**I**N THE BRIEF ADDRESS I shall make I shall try to outline the present situation in the railway field, and also show how the way in which it is handled will affect the workers and the industries of the country, both during the period of readjustment we are in, and after it has passed.

For more than three years, beginning in the fall of 1915 and ending in the fall of 1918, the available traffic taxed, and even overtaxed, the facilities of our railways. Since the armistice was signed there has been a sharp reduction of traffic. This is still going on, and there is now a nominal surplusage of railway facilities and capacity.

During the period when the movement of traffic was so large there occurred an enormous increase in the cost of operating the railways and of providing new facilities. Most of this increase occurred in the year 1918. The increase in expenses last year was partly due to advances in the prices of fuel and materials, and partly to a decline in the efficiency of operation, but mainly to very large advances in the wages of labor. Since January 1, 1918, under government operation, advances in wages amounting to over \$800,000,000 a year have been made. Advances amounting to \$350,000,000 a year had been made in 1916 and 1917. Therefore, the advances within these three years amount to approximately \$1,150,000,000 per year. This is more per year than the largest net operating income the railways have ever earned, and exceeds by at least 50 per cent the largest amount of interest and dividends they ever paid on their capitalization. The average annual wage of a railway employee in 1915 was approximately \$850; in 1917 it was over \$1,000. It is now close to \$1,500.

The enormous increase in the cost of making additions and betterments on the railways, and even of maintaining them, would tend to cause their owners to hesitate to make large expenditures at this time, even though the management of the roads were in their hands. But the management is now in the hands of the government.

This combination of extremely high costs, with private ownership and government operation, is aggravated by complete uncertainty as to how long government operation of the railways will be continued. If it were certain that they

would be returned soon to the management of their owners, and the terms on which they were to be returned were settled, the companies would have an incentive to encourage and help provide funds for needed maintenance and improvement work. If it were settled that government operation was going to be continued for a long period or indefinitely, the government would have an incentive to proceed with an adequate program of maintenance and additions and betterments. But the government doesn't know how long it is going to keep the properties; the companies don't know when or whether they are going to get them back; and both, as long as there is such uncertainty and divided responsibility, are disposed to keep expenditures down as much as practicable.

The result is, that the maintenance work being done or prepared for is not sufficient to keep the properties in their present condition, much less improve it. As to addition and betterments, no program for 1919 is in preparation, or is contemplated, which would cause as large an expansion of railway facilities as occurred annually during the years immediately preceding the Great War, in spite of the fact that in those years the expansion of facilities had declined greatly as compared with that of earlier years.

### \* Situation Causing Unemployment

The state of affairs I have outlined, as long as it lasts, must have the effects of depressing American industry in general, and of substantially increasing unemployment. The railways normally employ about 2,000,000 men. There has been a marked decrease in the average efficiency of their employees and a large increase in the number of them under government operation. The heavy decline in traffic which has been occurring since the armistice was signed ought to result in a sharp reduction in the number of employees engaged in handling traffic. The public has to pay the cost of railway operation, and to keep on the payroll men whose services are not needed would be to impose upon the public an indefensible burden of expense. If, besides discharging men who have become unnecessary because of the decline of traffic, the railways shall also refrain from doing maintenance and improvement work which is needed, it is evident that, being such very large employers, the railways will

\*An address delivered before the Union League Club of Chicago on February 11.

directly contribute largely toward causing unemployment.

They will, by following this course, contribute indirectly even to a larger extent toward causing unemployment. The railways, beside employing approximately 2,000,000 men themselves, normally make purchases of equipment and supplies amounting to about \$1,000,000,000 annually from concerns which are themselves large employers of labor. Probably the railway equipment and supply manufacturers normally employ almost as many men as the railways. The equipment and supplies the railways buy are used in operation; in the maintenance of their permanent way and structures and rolling stock; and in making additions to and improvements in their facilities. By curtailing their outlays for maintenance, and for additions and improvements, the railways will curtail their purchases of equipment and supplies; and by curtailing their purchases, they will render it necessary for manufacturers of equipment and supplies to restrict their purchases of materials and to reduce the number of their employees.

Thus, directly and indirectly, the policy of drastic retrenchment which is being adopted on the railways tends very strongly to cause general industrial depression and to increase unemployment, not only in the railroad business, but in many other important lines of industry.

### Is Railway Retrenchment Justifiable?

There are certain arguments which might conceivably be advanced in defense of the present policy of retrenchment.

One is that railway properties are now in a good state of repair and do not need large expenditures for maintenance, and that present railway facilities are sufficient to handle, not only present business, but to develop and handle all the business which the welfare of the country may demand that they shall develop and handle in the comparatively near future.

Everybody familiar with conditions in the railroad industry and in business in general knows, however, that this argument would be without foundation. The railroads are not in a good state of repair. Some of them were not being normally or adequately maintained when government operation was adopted, and, as a whole, although there has been an enormous increase of expenses, they have not been normally or adequately maintained since government operation was adopted. The amount of new rail laid has been millions of tons less than was normally laid before the war. The renewals of ties have been tens of millions less annually than they should be. As a result of these and other things of like nature, the tracks of many railways are not up to their normal condition. It is fortunate for the Railroad Administration and the public that we have had a mild winter. If we had had such severe weather this winter as we had last winter, we probably should have had a very bad series of wrecks due to rail breakages and other failures of track.

The general condition of freight cars is relatively worse still. The normal number of new cars has not been bought for several years, and the normal number of old cars has not been retired. In consequence, there are at least 100,000 freight cars that are reported as "in service" which, under the conditions existing before the war, would have been "scrapped" because it would have been cheaper to have replaced them than to have operated them. Furthermore, there has been a serious deterioration of freight cars in general, and there are hundreds of thousands of them that need heavy repairs.

Not only are existing railway facilities not in a satisfactory condition, but there has been an abnormally small increase of facilities for several years. Formerly we built about 5,000 miles of new railway annually. During the entire last five years we have built only 5,263 miles of new line; and in 1917, and again in 1918, more miles of railway

were torn up or abandoned than were built. Now, there are some parts of the country in which, as a result of competitive construction, there is more railway mileage than is needed. But there are much larger parts of the country which have not enough railway mileage, or none at all. The resources of those parts of the country can never be fully developed, they can never be inhabited by the number of people they are potentially capable of sustaining, until they are provided with a larger mileage of railroads.

The needs of the public with respect to the railroads are not confined to the adequate maintenance of those existing and the construction of new lines. Experience has demonstrated that the present productive capacity of the country exceeds the transportation capacity of the existing railways, and that therefore extensive improvements in and additions to the facilities of the existing lines must be made to enable them to handle the country's traffic in periods of heavy business. In 1915 and 1916, before this country entered the Great War, the freight traffic overtaxed the facilities of the railways. In 1917, after we entered the war, the railways, under the Railroad's War Board, tried, by better co-ordination of their efforts, to handle all the available business, and they succeeded in handling a largely increased amount, but still they were unable to handle all that was offered to them. It was expected by many that, under unified government operation, there would be a very large increase in the business handled, but the number of passengers carried in 1918 was only 8 per cent greater and the amount of freight moved was only 2 per cent more than in 1917, in spite of an increase of at least \$1,250,000,000, or over 40 per cent, in the operating expenses incurred.

### Railway Rehabilitation and Expansion Needed

In view of all this experience, we are amply justified in reaching the conclusion that our existing railway facilities are incapable, under any system of operation, of satisfactorily handling all the business that our existing productive industries—agriculture, manufactures, mining, forestry, etc.—can give them when these industries are being run at their maximum capacity, or, at any rate, approaching it.

At present, many of our productive industries are not being run to their maximum capacity. This is the case because we are in a period of transition from a war to a peace basis. There is an enormous *potential* demand at home, and a world-wide *potential* demand abroad for things that America can and should produce. If we pass through this period of transition without disaster, our great productive industries should within a comparatively short time be operating at full capacity again.

Suppose that there should be no improvement in or expansion of the facilities of our railways before then. Suppose the railways should be so managed meantime that even the large amount of maintenance work which has been deferred should not be done. The result would be that the railways would increase depression and unemployment during the period of transition; that they would cause the period of transition to be prolonged and the resumption of full production by the country's industries to be delayed; and that when capacity production by other industries was renewed the railways would be unable satisfactorily to handle the increased traffic and even unable to handle a large part of it at all.

### Should Large Expenditures Be Made Now?

The need for carrying out an extensive program to make up deferred maintenance and to increase the facilities of the railways is clear. But, it may be said, the prices of equipment and materials, and the high wages of labor, make this a very bad time to carry out large programs of expenditures. Railway men are not the only business men who are reasoning thus. Most American business men are. This is

one of the main reasons why industry in general is slowing down.

Now the railways are either going to be kept by the government, or they are going to be returned to their owners. If it were settled that they were going to be kept by the government, it would be the duty of the government to consider this entire matter from the standpoint of the long-run interests of the industries and workers of the country. Nobody knows how long present prices and wages will last, or how great the reductions will be when they come. Therefore, considering the long-run interests of industry and the workers as a whole, it undoubtedly would be better if the government were going to retain the roads, for it to make large expenditures for the maintenance and expansion of railway facilities, so that they would be ready for service when they were needed, than for it to postpone these expenditures, at the risk of not having the facilities ready when they were needed. In other words, it would be better for all concerned for the government to provide needed facilities now, even if the cost should be so high as to make it necessary to advance rates in order to pay a return upon the new investment, than for it to so manage that it would intensify and lengthen the depression during the period of transition, and at the same time fail to provide facilities that will be needed when business again becomes good.

Would the argument for going ahead with needed expenditures be any less strong in case the railways were returned to private operation? No; and, yes. The reasons why, from the standpoint of the public, it would be desirable to go on with them would be equally cogent. But the companies would be in a very different position from the government. The government does not require a certain amount of net operating income to enable it to raise capital for railway purposes. If it did, it would be very hard put to it to raise capital for railway purposes just now, since, from the railway point of view, it is bankrupt. In 1918 it incurred a deficit of over \$200,000,000 in operating the railways; and if government control continues and the present disparity between income and outgo is not reduced, it will lose at least as much in 1919. The government can continue to raise capital for railway purposes only because it does not raise it on its credit as a railway manager, but on its general credit as the government of the people of the United States.

The railway companies, on the other hand, must, under private management, raise capital on their credit as owners and managers of railways, and their credit as such depends chiefly upon the amount of net operating income the railways make. In the three years ended on June 30, 1917, the railway companies earned an average of \$950,000,000 net operating income a year, and in the year ended on December 31, 1917, they earned approximately \$1,000,000,000. In June, 1918, under government operation, passenger rates were advanced 50 per cent and freight rates 25 per cent; and yet, in the year ended on December 31, 1918, the government, as a railway manager, earned only about \$750,000,000 net operating income, or about \$250,000,000 less than the companies earned in 1917, and about \$200,000,000 less than the average amount they earned in the three years ended on June 30, 1917.

#### New Revolving Fund Needed

Now, as to the present and the immediate future, the Railroad Administration is being obliged sharply to limit all its expenditures, including those for maintenance, because the revolving fund of \$500,000,000 granted to it by Congress has been almost exhausted by the deficit incurred last year, by loans to needy railway companies, etc. The Railroad Administration has asked Congress for another revolving fund of \$750,000,000. If it should be promptly granted this, there would be no good reason why it should not enter at once upon a vigorous program for making up

maintenance which has been deferred since it has been in control, for if it returns the roads to the companies, it must, under the law, return them in as good physical condition as it received them. From every standpoint, it is desirable that Congress, at its present session, should provide this new revolving fund. The Railroad Administration needs it now, and will need it, whether the railways are soon returned to private operation or not. The Railroad Administration must be provided with this new revolving fund in the near future, if it is to do merely the maintenance work on the railways, which conditions imperatively demand shall be begun at once.

Looking farther into the future, it is plain that if the government either should long postpone its decision on whether the railways are to be returned to private operation, or should return the railways to private operation without having first adopted remedial legislation, the consequences would be very serious. If a decision is postponed, the needed expenditures for permanent improvements and additions will also be postponed. On the other hand, if the railways should be returned to their owners without remedial legislation, many of them would find themselves in a situation where they would not only be unable to raise capital for extensive improvements but would be forced to adopt a policy of the most drastic retrenchment. This would be due to two things: First, under government operation much traffic has been diverted from some lines to others and the earnings of the lines from which it has been diverted have been unfavorably affected to a very serious extent. Second, in spite of the large advances in rates made last year the net operating income of the railways, as a whole, is at present very unsatisfactory.

The net operating income of the Class I (large) roads during the last six months of 1918, when the higher freight and passenger rates were in effect, was \$539,000,000, which was actually \$4,000,000 more than in the last six months of 1917. This might seem to indicate a satisfactory condition of affairs. The fly in the ointment is that in every month of that six months the net operating income was lower than it was in the immediately preceding month, and that it declined from \$139,000,000 in July to about \$25,000,000 in December. The heavy decline in operating income during the last few months of the year 1918, and especially in December, was largely due to the fact that big retroactive advances in wages were charged into the accounts for those months, and, therefore, the financial position of the railways is not as bad as might be inferred from the statistics for these particular months. On the other hand, their financial position is far from being as good as might be inferred from the results shown during the entire last six months of the year. The net operating income now being earned by the railways as a whole would hardly be sufficient to pay their fixed charges and normal dividends on their existing investment, and much less would it be sufficient to enable them to raise the new capital necessary to make a large amount of new investment. On the other hand, it is altogether probable that if the railways were returned to private operation, the managements would speedily effect large economies in operating expenses which cannot and will not be effected under government operation. Therefore, it is not probable that under private operation very large advances in rates would be needed in order to make the net operating income of the railway companies adequate.

#### Needed Constructive Measures May Speedily Be Adopted

It is by no means impracticable, then, to adopt within a short time, measures under which the railway companies could safely resume the operation of their properties, and could spend enough to make up any deferred maintenance

the Railroad Administration had not made up and also enter upon an extensive program of additions and betterments.

Now, if this could be done, it is clearly desirable that it should be done. It is desirable because if government operation should be continued much longer—for example, for five years as some contend it should be—the organization of the railways would be so completely destroyed, and the financial relations between the government and the companies would become so entangled, that it probably would be impracticable to restore the railways to private operation at all. Another potent reason why private operation should be restored as soon as practicable is that experience has shown that, on any given basis of prices and wages, private management is more efficient and economical than government management, and, therefore, even without any reduction of prices and wages, the companies would carry out the needed program of railroad rehabilitation and expansion at a smaller cost than the government would. In consequence, the burden of rates which would have to be imposed upon the public to enable the railway companies to carry out this program would be less than the burden of taxes, or both, which would have to be imposed upon the public to enable the government to do it.

The crux of the matter then is that the present railway situation demands, both for the immediate good and the future good of the nation, that legislation for the settlement of the railway question shall be passed and put into effect as soon as practicable. As I have indicated, I believe that this legislation should provide for the early return of the railways to the management of the companies. But even if it should be decided that government operation should be continued—a decision which now seems wholly improbable—it would be desirable that this decision should be reached and announced within the very near future.

But how can an early solution of the problem be arrived at? It cannot be done at the present session of Congress. But, from every point of view, it is extremely undesirable that it should be postponed until the next regular session of Congress, which would not begin until December. Nothing could be done with respect to the railways that would be more contrary to the welfare of the country during this period of transition from a war to a peace basis than needlessly to prolong the present uncertainty as to their future management. This point is emphasized as forcibly by those who, such as Director General Hines, favor a five-year extension of government control, as by those who favor an early return to private operation.

### The Solution of the Problem

There is nothing in the present railway problem which would render it impracticable for Congress to pass legislation for a satisfactory solution of it within a few months, if Congress was in session. Therefore, the situation demands that an extra session of Congress shall be called at an early date, if for no purpose but to settle what we are going to do with the railways. Of all of our important problems of reconstruction at home, the railroad problem is easily the most important. President Wilson, in the message he sent to Congress soon after the armistice was signed, indicated that he had no well-formed views on the subject, and that he wished Congress to take the lead in dealing with it. A special session is necessary to enable Congress to do this; and I venture to suggest that it would be appropriate and expedient for clubs and other organizations that believe there should be no avoidable delay in settling the railroad question one way or the other, to memorialize the President in favor of an extra session.

In conclusion, I shall venture to suggest certain steps I believe it is essential to take in order that our railways may soon be restored to a footing on which they will become once more one of the chief agencies in promoting the

country's progress and prosperity instead of a growing menace to its progress and prosperity.

First, Congress should pass at its present session legislation granting the Railroad Administration a new revolving fund of \$750,000,000, in order that it may immediately begin carrying out an adequate program of maintenance and renewals.

Second, while continuing the government guarantees of standard return until legislation for the financial protection of the companies may be passed, the government should restore the railways to *actual operation* by the companies that own them as soon as practicable. This is necessary in order to give the companies opportunity to rebuild their organizations and to direct traffic back into its normal channels before the government guaranties are withdrawn. It is also necessary in order to enable public authorities to determine what changes in rates should be made to protect the solvency of the companies.

Third, the railway companies should be authorized by legislation passed at an early extra session of Congress to make such consolidation or agreements between lines operating in the same territory as the Interstate Commerce Commission may hold are not prejudicial to the public interest. This is necessary in order to bring about needed coordination of the organizations and facilities of the railways and to eliminate the wastes of competition without, however, eliminating such competition as is both stimulating to the railways and beneficial to the public.

Fourth, the Interstate Commerce Commission should be authorized to regulate the issuance of all railroad securities. This is necessary to protect both the investor and the public.

Fifth, all state regulation of railways which directly or indirectly burdens or interferes with interstate commerce or with Federal regulation of interstate commerce, should be forbidden. This is necessary to prevent state regulation from rendering federal regulation nugatory.

Sixth, the principle should be established by legislation that the rates fixed by the Interstate Commerce Commission must be not only fair to the public but such as to enable the railways as a whole in each of the large sections of the country to earn upon their aggregate property investment an average return which shall be sufficient to enable them to raise enough capital adequately to develop their facilities. One of the best methods of establishing this principle which has been suggested is that of fixing at 6 per cent the average return which the roads of each territory shall be allowed to earn on their property investment, and providing that anything in excess of this earned by any individual road shall be divided, part being retained by the company, part going to its employees as a bonus, and part being paid into the public treasury.

Seventh, we should provide by statute for arbitration of labor disputes on railways either by the Interstate Commerce Commission, or by tribunals which shall be composed equally of representatives of the companies, of the employees, and of the public, and forbid any strike or lockout until the report of the arbitration board has been made.

It is my belief that if legislation providing for these things should be passed soon, the railways could be returned to the management of the companies with a reasonable certainty that there would be a marked improvement in their operation and service and an important and salutary renewal of the development and expansion of their facilities.

Grain cars loaded in the Central Western region in January, 1919, totaled 32,432 cars, as compared with 27,500 cars last year, an increase of 17.9 per cent. Coal cars loaded in January decreased 12.1 per cent, 135,589 cars, as compared with 154,254 last year. The loading of live stock increased from 48,277 cars to 65,048, an increase of 34.2 per cent.

# Forty-foot Automobile Cars for Illinois Central

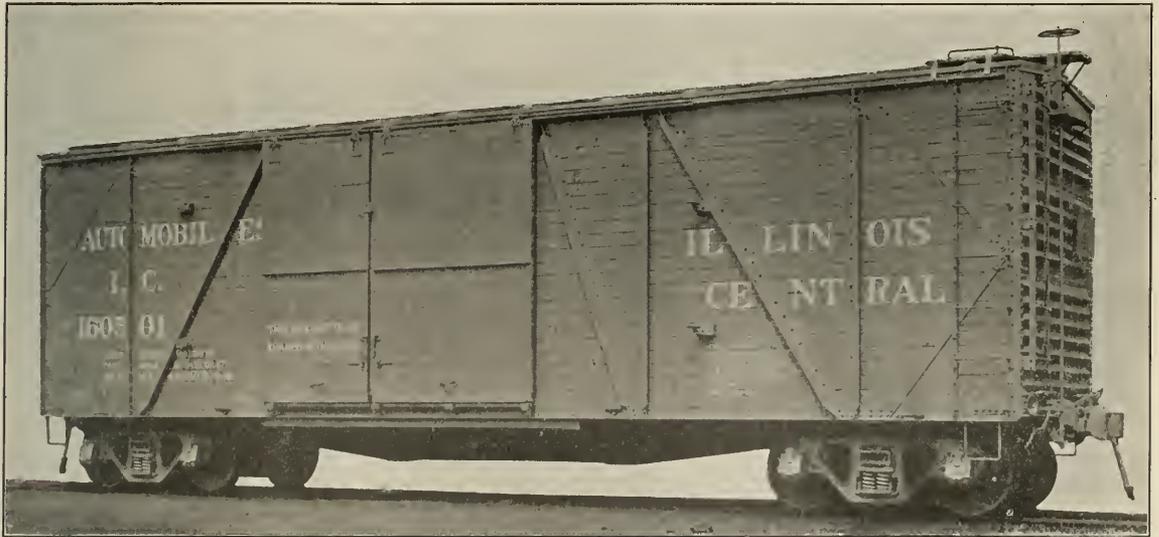

Single Sheathed Type with Steel End, Especially Designed  
for Carrying Various Kinds of Lading

PERSISTENT EFFORTS have been made by many roads during the past few years to secure freight cars which are adapted for many kinds of lading. This policy, if consistently followed out, would undoubtedly bring about a reduction in the empty car mileage and an increase in the average carload. The growing tendency to design cars built for a special traffic, so that they are adapted for various kinds of lading is well exemplified by an order of 500 40-ft. automobile-furniture cars of 80,000 lb. capacity recently delivered to the Illinois Central by the Standard Steel Car Company. While designed primarily for automobile and furniture loading, these cars are suitable for almost any commodity that is handled in box cars, excepting grain.

These cars have a light weight of 48,000 lb. They are 40 ft. 3½ in. long and 8 ft. 6⅞ in. wide inside. The height from the floor to the under side of the carlines at the side is 10 ft. ¼ in. The cubical capacity of the car is 3,435 cu. ft.

inner side of the center sill web plate and to the cover plate. The web plates are also reinforced between the bolsters by vertical stiffeners of 4-in. by 3-in. by ¼-in. angles, which are spaced approximately 3 ft. 6 in. apart and serve also as supports for the floor beams. Malleable iron cheek plates of the double pocket type are riveted inside the draft sills. The couplers have a 5-in. by 7-in. shank and 8½-in. butt. A cast steel yoke having an ultimate strength of 450,000 lb. is used. It is attached to the coupler by a key and is fitted with one M. C. B. class G draft spring and one Harvey friction spring. The Carmer release rigging and Imperial centering attachment are used.

The body bolster is of a box section. The diaphragms are of ¼-in. pressed steel plate with 3-in. flanges all around and are spaced 8 in. back to back. At the outer end of the diaphragm there is a spacer made of a 7/16-in. bent plate. The spacers between the center sills at the bolsters are of cast

Illinois Central Single Sheathed Automobile Car

The length over the corner post is 40 ft. 6½ in. and over the striking plates 41 ft. 11¾ in. The width at the ends is 8 ft. 9⅞ in., and between the steel side door posts 10 ft. 5¾ in. The extreme height to the top of the brake mast is 15 ft. 3 in., and to the top of the running board 14 ft. 8 1/16 in. The top of the floor is 3 ft. 8 1/16 in. above the rail.

The underframe is of the fishbelly type. The web plates are 5/16 in. thick and 24¾ in. deep at the center, and 10 11/16 in. at the draft sill, extending continuously from end sill to end sill, being spaced 13½ in. apart. Along the bottom of each web plate is riveted a 5-in. by 4-in. by ⅝-in. angle, with the long flange horizontal. The top chord angles are 3½ in. by 3½ in. by 5/16 in., and to them is riveted a top cover plate 5/16 in. thick and 21 in. wide, extending the full length of the sills. From the inside of the end sill to a point 21 in. beyond the center line of the body bolster, the center sill web is reinforced by a plate 5/16 in. thick extending the full depth of the sill, having at the top flanges 3 in. wide extending inward. These stiffeners are riveted to the

steel. The top bolster cover plate is 14 in. wide and ½ in. thick extending from side sill to side sill. The bottom cover plate is 14 in. by 7/16 in. and extends the full width of the car. The cast steel body center plate is fastened under the bottom cover plate and is riveted through the bottom chord angles on the center sills and the center sill spacer casting.

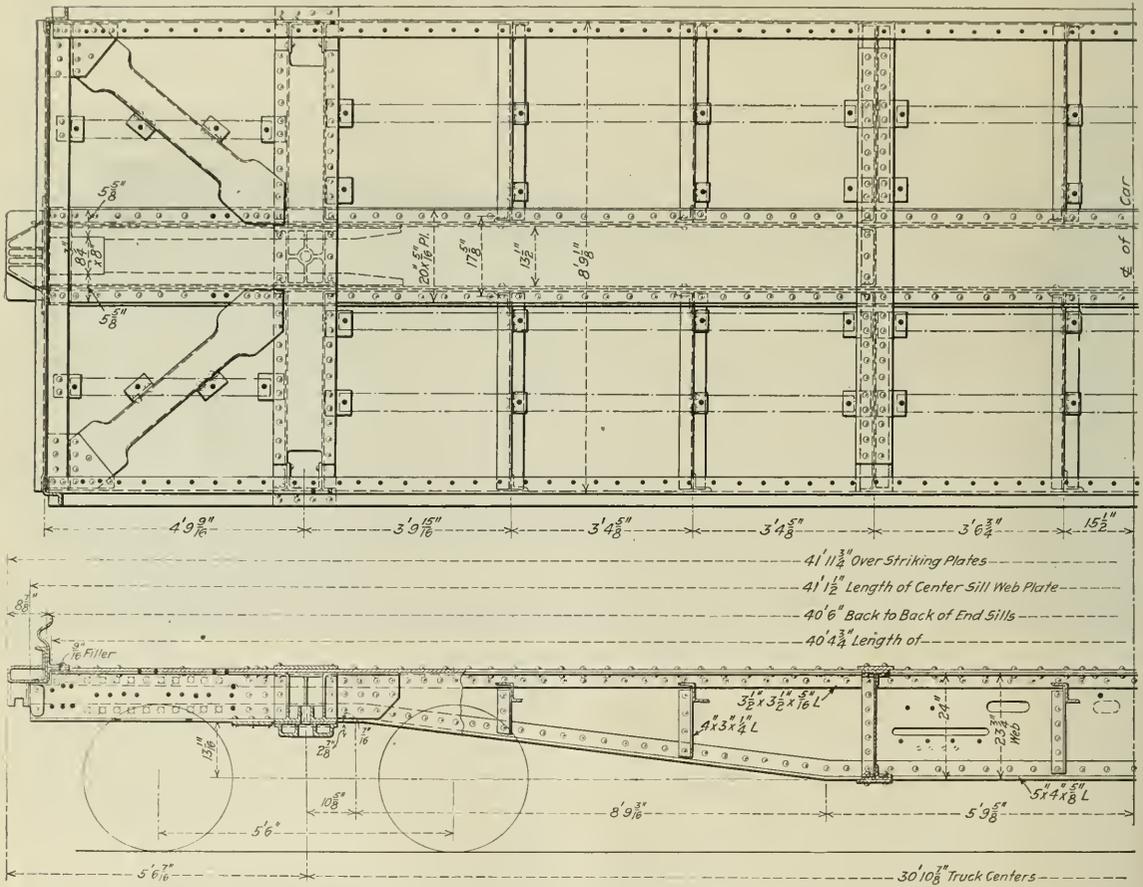

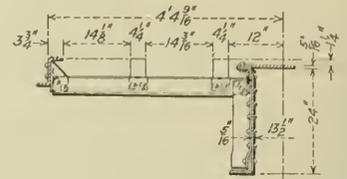

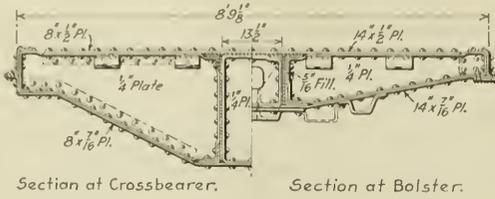

The end sills are 8-in., 18.75-lb. channels. To the back of these channels is riveted a 5-in. by 3-in. by ⅜-in. angle by which the end sill is fastened to the top of the center sill. The striking plate is a steel casting riveted to the end sill and to the webs of the center sill. There are two cross bearers on each side of the car, spaced 10 ft. apart. The diaphragms are of ¼-in. plate with a 3-in. flange all around, reinforced at top and bottom by 3-in. by 2½-in. by 5/16-in. angles. A pressed steel filler made of ¼-in. plate is fastened between the center sills at each cross bearer. The top cover plate is ½ in. thick and 8 in. wide, and extends out almost to the side sill, while the bottom

cover plate is 7/16 in. by 8 in. and is fastened directly to the side sill.

The side sills are made up of a 6-in., 16.67-lb. Z-bar of a special section incorporating a grain lock, extending from end sill to end sill. This Z-bar is reinforced under the door opening and for a short distance beyond at each end, by a 4-in., 8.2-lb. Z-bar riveted to the lower flange of the 6-in. Z-bar. The two sections thus form a channel which fits

3/8-in. plate 12 1/4 in. wide flanged in the center to a channel section. There are six floor beams on each side of the car made of 4-in. Z-bars riveted to the center sill stiffeners and to short sections of 4-in. by 3-in. angles riveted to the side sills.

The corner posts are 4-in., 8.2-lb. Z-bars and the side posts and braces are 3-in., 6.7-lb. Z-bars, with the exception of the door posts, which are of the same section as the corner

over the end of the crossbearer, the crossbearer bottom cover plate being riveted to the lower flange. The bottom cover plate of the body bolster is likewise fastened to the outwardly extending flange of the 6-in. Z-bar and a malleable iron jacketing casting is placed beneath the cover plate. The side sills and end sills are riveted together at the corners and are reinforced by a 5/16-in. plate. There are diagonal braces extending from the corner of the underframe to the intersection of the center sill and body bolster made up of

posts. The posts and braces are joined at the top to the 14 1/2-in. by 1/4-in. side plate girder which extends from the end post to the door posts and is riveted to the web of the 4-in. Z-bar side plate. The side plate is reinforced at the center by a 3-in. by 3-in. angle riveted to the web of the Z-bar and overlapping the side plate girder for a distance of 2 ft. at each end. The end posts are braced by 2 1/2-in. by 3/8-in. diagonal end straps and by flanged corner angles of 5/16-in. plate.

The end is of the Murphy pressed steel type, the two lower sections being of ¼-in. plate and the upper sections of 3/16-in. plate. The bottom section is flanged inward, and is riveted to the 5-in. by 3-in. angle on the inner side of the end sill. Five transverse furring strips are provided to hold the end lining.

The floor of the car is supported on yellow pine stringers 4½ in. wide and 4 in. high. Between the body bolster and the end sill there is but one stringer on each side, but in the center of the car there are two. The stringers are continuous over the floor beams, but end at the crossbearers to which they are attached by short sections of Z-bars riveted to the upper flange. The flooring is 2¼-in. yellow pine, shiplapped, bolted to the side sills and nailed to the stringers. The siding is 1½-in. by 5¼-in. yellow pine, tongued and grooved, bolted to the posts and braces. The lower course of the siding fits over one of the ridges on the side sill, thus forming a grain lock. The siding extends to the steel end sheet and an angle iron is fastened in the corner where it meets the 1-in. end lining, this angle being bolted through the side lining and the web of the corner post and also to the corner board in the end lining.

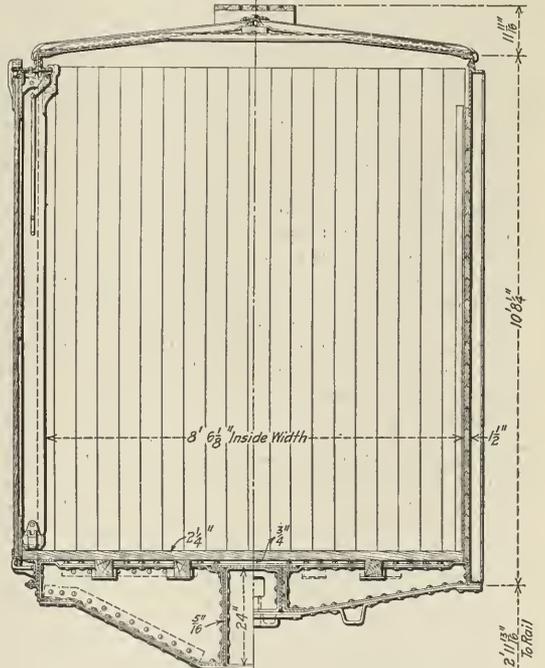

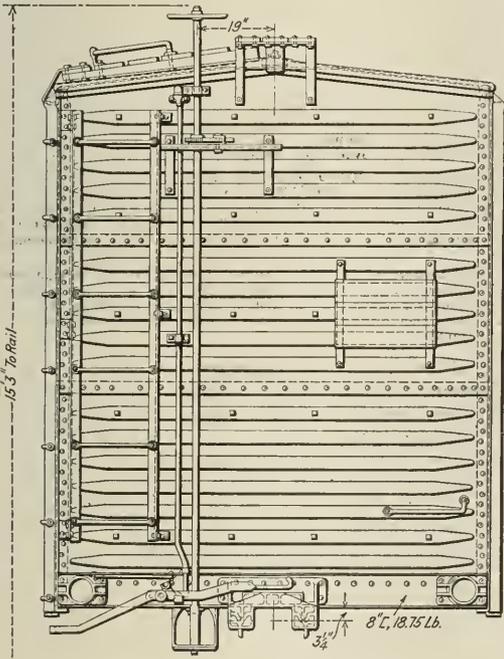

The door posts are spaced 10 ft. 5¾ in. apart, and are staggered, the distance from the center line of the car being

The roof is supported on 13 carlines made of ¼-in. pressed steel plate and riveted to the top flange of the side plate Z-bar. The roof is of the all-steel type with galvanized sheets of No. 16 U. S. gage. The trucks are of the Vulcan cast steel type with cast steel truck bolsters equipped with Barber lateral rollers and a drop forged truck center plate. Brake beam safety bars made of 3-in. by 3-in. angles are attached to the spring plank. The air brake is the New York Air Brake Company's schedule CF-C-10 with J. M. expander ring.

### Orders of Regional Directors

**R**ECONSIGNMENT OF COAL.—The Southern regional director in circular letter No. 423 quotes the order of the Fuel Administration forbidding the reconsignment of bituminous coal, and calls for careful attention to thwart the natural tendency to ship coal for purposes of speculation.

*Administration Passes Not Good Over Non-Federal Railroads.*—The Southern regional director, file 1557-6, calls attention to the fact that inadvertently several Railroad Administration 1919 annual passes were made good over the

End View and Section of the Illinois Central Automobile Car

3 ft. and 7 ft. 5¾ in. respectively. There is a movable center door post of white oak, 4 in. by 5½ in., with top and bottom shoes of malleable iron engaging malleable housings, one on the side plate and the other in the floor. When the center post is moved over adjacent to the door post, there is a clear door opening of 10 ft. 1¾ in. When it is brought over to the point where the two doors meet it is automatically locked in position and can be bolted to the frame of the smaller door leaving an opening 6 ft. wide. The doors have steel frames made up of Z-bars at the top and bottom and angle irons at the sides with a transverse reinforcing angle across the center. The stiles, rails and braces are 7/8 in. and the sheathing is 13/16 in. thick. Camel door fixtures are used throughout.

Fort Smith & Western, which is not under Federal control.

*Fire Losses.*—The Southern regional director, file 1585-58-6, refers to the director general's circular No. 67 relative to action to be taken in case of loss or damage to property by fire. It is necessary to secure the approval of the director of the Division of Capital Expenditures only for work chargeable to capital account costing more than \$1,000.

*Use of Great Seal.*—The Southern regional director, file 1848-6, says that the Great Seal of the United States has been used on the business card of an employee of one of the western railroads, and reminds all concerned that it is unlawful to use this seal on any stationery except that printed for the use of government departments. It is not desired that the seal of the director general of railroads be used on

business cards of railroad men. The Southwestern regional director has issued similar instructions.

*Associations Approved.*—The Southern regional director, file 841-6, advises that the director general has approved the Chief Interchange Car Inspectors' and Car Foremen's Association. Similar orders have been issued by the Southwestern and Northwestern regional directors.

*Motor Gasolene.*—The regional director, Eastern region, by file 2800-11-27A514, has promulgated the circular of C. B. Young, manager of the Inspection and Test Section, embodying a specification for railroad gasolene for general purposes.

*Cancellation of Permit System.*—The regional directors, Eastern and Allegheny regions, announce the discontinuance February 15 of the embargoes placed as a war emergency January 15, 1918, against carload domestic freight for Manhattan Island, the Bronx (New York City), and station deliveries on New York harbor, including Brooklyn terminal companies, which freight is now being moved under permits issued by the Freight Traffic Committee, North Atlantic ports. Such freight may now move without permits, subject to embargoes of the delivering railroads. No change is made in the method of requiring permits for export carload freight, and carload domestic freight must not be accepted for other than regular station deliveries. Reconsignment for export or lighterage deliveries will not be allowed.

*Secrecy in the Movement of Troop Trains.*—Supplement 4 to Circular 22 of the Northwestern regional director is similar to Order 159 of the Southwestern regional director, abstract of which appeared in the *Railway Age* of February 14 (page 392).

*Weighing Shipments of Forage Consigned to Army Camps.*—The Northwestern regional director, in a circular dated February 14, calls attention to the fact that the war department has amended Purchase and Storage Notice 73, issued November 21, 1918, by striking out the words "within 100 miles of destination" in paragraph 2 in order to eliminate the necessity for reweighing shipments of forage either at camps or at other points, and requests that instructions be issued to weigh shipments of forage, either at points of origin or en route, for the assessment of freight charges, in order to eliminate the requirement that these shipments be weighed at camps.

*Adherence to Restrictions on Administration Transportation.*—In Order 161 the Southwestern regional director requests that administration passes, limited both as to territory and trains of various railroads, be checked carefully when presented for passage, to determine whether or not they are good on the road and particular train upon which they are presented.

*Organization of the Southwestern Regional Association of Fire Prevention.*—In Circular 173 the Southwestern regional director announces the organization of the Southwestern Regional Association of Fire Prevention. All fire prevention inspectors in that region are to be identified with the association. Meetings will be held quarterly. The next one is at Dallas, Tex., on March 19. J. L. Durland, general fire prevention inspector at Houston, Tex., for lines under the jurisdiction of W. B. Scott, is chairman; W. R. Barton, general fire prevention inspector at St. Louis, Mo., of lines under the jurisdiction of A. Robertson, vice-chairman, and G. L. Ball, superintendent of fire prevention at St. Louis of lines under the jurisdiction of L. Kramer, secretary.

*Club and Association Memberships.*—Supplement 2-A to Circular 61 cancelling Supplement 2 to Circular 61 of the Northwestern regional director states that during the period of federal control lines of railroad and steamships under such control should be permitted to become members of chambers of commerce, boards of trade, cotton exchanges, traffic clubs and similar organizations; but such memberships should be limited to organizations in communities reached

by their lines, and such lines should not assume dues or contributions greater than are borne by the average industry in such community. Only one membership should be taken out by any one line in chambers of commerce, etc., and as a general rule but one membership in any traffic club. A maximum of four memberships representing one line in any particular traffic club is authorized, but where more than one membership is desired full details should be submitted to the office of the regional director.

*Operation of Over and Short Bureaus at Common Points.*—In Order 163 the Southwestern regional director outlines rules for the establishment and operation of bureaus for the purpose of matching "over" and "short" reports at points having from two to five freight stations and also at points having more than five stations where, according to the judgment of superintendents such bureaus should be established. The rules are as follows:

(a) Agents will promptly exchange legible copies of all "over" reports issued and a copy of joint reports of freight delivered on proof of ownership.

(b) Upon receipt by agents of "over" and "joint" reports (referred to in paragraph (a)) they will promptly check against their own "short" reports. Agents should maintain in alphabetical order by roads a permanent file of these two reports.

(c) When "over" reports match "short" reports, the agent holding "over" freight must be furnished full revenue waybill reference and accordingly arrange for distribution of freight. "Revenue waybill" and "short" report reference must be noted on matched "over" report. Freight received on "deadhead astray" waybill and delivered on proof of ownership should be handled in accordance with joint report of freight delivered on proof of ownership.

(d) A matching bureau consisting of representatives of each agency (with one of the agents as chairman who will serve in this capacity for a period of not less than three months) should be organized. This bureau should hold meetings semi-monthly on a designated day for the purpose of comparing records of "over" and "short" freight.

(e) A permanent secretary should be selected who will record in the minutes, attendance, number of "overs" and "shorts" listed, number of shipments matched at meeting and the number of shipments matched in previous meeting. A copy of the minutes should be furnished each agent and freight claim agent of each member road within three days following the meeting.

(f) Each agency should present at the meeting a complete alphabetical list of all "over" and "short" reports which have not been disposed of. Freight warehouses should be checked on the day preceding the meeting and all over freight should be included in the list previously referred to in this paragraph.

*Method of Handling Telegrams.*—Circular 71 of the Northwestern regional director similar to order 156 of the Southwestern regional director, abstract of which appeared in the *Railway Age* of February 14, (page 393).

*Complaint Bureau.* The regional director, Eastern Region, announces that there is to be issued a new edition of the posters, informing the public about the Bureau for Suggestions and Complaints, which are displayed in passenger cars and stations. Federal managers are called upon to see that no suitable place for these posters is neglected in the distribution.

*Exchange passes.* The regional director of the Eastern Region, by file 2100-41A518, calls the attention of managers to the rule regulating annual or time exchange passes requested by one road from another. These are to be issued only for regular daily travel of employees between their home and their work, or (secondly) for employees for regular daily travel between home and work outside of regular suburban territory; or on railroad business where frequent trips of this kind must be made. This "local" travel rule is to apply only for distances not exceeding 50 miles. Exchange transportation other than that here described must be secured from the director of operation, Washington.

*Stored cars.* The regional director, Eastern Region, by file 1801-22A524, gives notice that freight cars which are stored must be included in the daily records, either as serviceable, or as awaiting shop. If stored cars are not included in the records the averages showing efficiency will not represent the true facts.

*Bills Before Legislatures.*—A. H. Smith, regional director, Eastern region, February 13, announced the names of five

district representatives who have been instructed to keep in touch with proposed legislation in the several states and to confer, where necessary, with local representatives of employees' organizations. Where bills which are proposed affect the interest of railroad labor the matter should be at once reported to Washington, as there is an understanding between the Railroad Administration and the chiefs of the brotherhoods to deal with all such questions at Washington.

In the matter of bills not affecting the interests of railroad labor federal managers are to see to the presentation of opposition, before the legislature or the committees, if opposition seems to be desirable. All such action must be promptly reported to Washington. The chiefs of the four principal brotherhoods have sent out circulars explaining the arrangement which has been made for co-operation between the administration and the brotherhoods.

## Standard Specifications for Timber Preservation

The Forest Products Section, Division of Purchases, U. S. R. A.  
Has Drawn Up Uniform Requirements

**S**TANDARD SPECIFICATIONS for treating timber by the five processes commonly used in injecting creosote oil, or zinc chloride, or a combination of the two, have been prepared by the Forest Products Section of the Division of Purchases, United States Railroad Administration. These specifications will apply to the treatment of all ties and other timber used by the railroads under federal control.

This is a second step toward standardization of railway practice with respect to construction timbers and ties, since the Forest Products Section had previously promulgated a set of specifications for the purchase of ties, thereby simplifying the requirements under which the tie producers were required to operate. A similar result will be obtained in the timber preserving processes since previous efforts at standardization have not met with an appreciable degree of success. The specifications which are reproduced below cover three processes involving the use of creosote oil and creosote coal-tar solutions, the brometizing process for the use of zinc chloride and the Card process for the use of zinc chloride with creosote oil.

### FOR TREATMENT WITH CREOSOTE OIL BY THE FULL-CELL (BETHELL) PROCESS

(1) Except when ordered otherwise by the railroad's representative, the material to be treated shall be air-seasoned until in his judgment any moisture in it will not prevent the injection of the specified amount of preservative; it shall be restricted in any charge to woods into which approximately equal quantities of preserving fluid can be injected, and shall consist of pieces approximately equal in size and sapwood content, on which all framing, boring, or adzing shall have been done, so separated as to insure contact of the steam and preservative with all surfaces.

(2) The preservative used shall be the one most suitable and available of the following standards of the American Wood-Preservers' Association:

"Creosote Oil, Grade 1, for Ties and Structural Timber"

"Creosote Oil, Grade 2, for Ties and Structural Timber"

"Creosote-Coal-Tar Solution for Ties and Structural Timber"

"Creosote Oil, Grade 3, for Ties and Structural Timber."

(3) The material shall retain the amount of creosote oil necessary to permeate all of the sapwood and as much of the heartwood as practicable. The quantities specified may vary from 10 lb. per cu. ft. for material from needle-leaved trees from which most of the sapwood has been removed, to 24 lb. per cu. ft. for piling which has wide sapwood. The quantity of creosote oil retained shall be calculated, on the basis of 100 deg. F., from readings of working-tank gages or scales or from weights of at least one-tenth of the material on a suitable track scale before and after treatment, checked as may be desired by the railroad's representative.

(4) After the material is placed in the cylinder, a vacuum of at least 22 in. shall be maintained until the wood is as dry and as free of air as practicable. The creosote oil shall then be introduced, without breaking the vacuum, until the cylinder is filled. The pressure shall be gradually raised and maintained at a minimum of 125 lb. per sq. in. until the required quantity of preservative is injected into the material or until the railroad's representative is satisfied that the largest volumetric injection that is practicable has been obtained. The temperature of the preservative during the pressure period shall be not less than 170 deg. F., nor more than 200 deg. F., and shall average at least 180 deg. F. After the pressure is completed and the cylinder emptied of preservative, a vacuum shall be maintained until the material can be removed from the cylinder, free of dripping preservative.

(5) At least once each day the railroad's representative shall determine penetration by sampling ties at the middle and rail sections; from other material samples shall be taken as desired. Any holes that may be bored shall be filled with tight-fitting creosoted plugs.

(6) The treating plant shall be equipped with the thermometers and gages necessary to indicate and record accurately the conditions at all stages during the treatment, and all equipment shall be maintained in a condition satisfactory to the railroad. The owner of the treating plant shall also provide and keep in condition for use at all times the apparatus and chemicals necessary for making the analyses and tests required in this specification.

(7) When permission is given to prepare material for treatment by steaming instead of seasoning by air, it shall not be subjected to pressures or temperatures for periods sufficient to injure the wood.

### FOR TREATMENT WITH CREOSOTE OIL BY THE EMPTY-CELL PROCESS WITH FINAL VACUUM (RUBBING) PROCESS

(1) Same as Par. 1, full-cell process.

(2) Same as Par. 2, full-cell process.

(3) The material shall retain an average of at least 6 lb. of creosote oil per cu. ft. for cross-ties and 10 lb. per cu. ft. of other material, and no charge shall retain less than 90 per cent nor more than 110 per cent of the quantity per cubic foot that may be specified. The quantity of preservative retained shall be calculated, on the basis of 100 deg. F., from readings of working-tank gages or scales and from weights of at least one-tenth of the material on a suitable track scale before and after treatment, checked as may be desired by the railroad's representative.

(4) After the material is placed in the cylinder, the preservative shall be introduced, at not over 200 deg. F., until the cylinder is filled.

(5) The pressure shall be raised, and maintained until

there is obtained the largest practicable volumetric injection that can be reduced to the required retention by a quick high vacuum. The pressure and temperature within the cylinder shall be so controlled as to give the maximum penetration by the quantity of preservative injected. After the pressure is completed the cylinder shall be speedily emptied of preservative and a vacuum of at least 22 in. promptly created, and maintained until the quantity of preservative injected is reduced to the required retention.

(6) Same as Par. 5, full-cell process.

(7) Same as Par. 6, full-cell process.

FOR TREATMENT WITH CREOSOTE OIL BY THE EMPTY-CELL PROCESS WITH INITIAL AIR PRESSURE AND FINAL VACUUM (LOWRY)

(1) Same as Par. 1, full-cell process.

(2) Same as Par. 2, full-cell process.

(3) The material shall retain an average of at least five pounds of creosote oil per cu. ft., which shall permeate all of the sapwood and as much of the heartwood as practicable, and no charge shall retain less than 90 per cent nor more than 110 per cent of the quantity per cu. ft. than may be specified. The amount of preservative retained shall be calculated, on the basis of 100 deg. F., from readings of working-tank gages or scales or from weights of at least one-tenth of the material on a suitable track scale before and after treatment, checked as may be desired by the railroad's representative.

(4) After the material is placed in the cylinder it shall be subjected to air pressure of sufficient intensity and duration to provide under a vacuum the ejection of preservative necessary to insure the required retention. For example: With red oak, pressures of 40 to 60 lb. for 30 min., while with pine having a large percentage of sapwood pressures of 70 to 90 lb. for 30 min., will be required. The preservative shall then be introduced, the air pressure being maintained constant until the cylinder is filled. The pressure shall be gradually raised to at least 150 lb. per sq. in., and maintained until all of the sapwood and as much of the heartwood as practicable are saturated, or until the railroad's representative is satisfied that the largest volumetric injection that is practicable has been obtained. The temperature of the preservative during the pressure period shall be not less than 170 deg. F. nor more than 200 deg. F., and shall average at least 180 deg. F. After the pressure is completed the cylinder shall be speedily emptied of preservative and a vacuum of at least 22 in. be promptly created, and maintained until the material can be removed from the cylinder free of dripping preservative.

(5) Same as Par. 5, full-cell process.

(6) Same as Par. 6, full-cell process.

FOR TREATMENT WITH ZINC CHLORIDE (BURNETT PROCESS)

(1) Same as Par. 1, full-cell process for creosote.

(2) The zinc chloride used shall be acid-free and shall not contain more than 0.1 per cent iron. Dry zinc chloride shall contain at least 94 per cent soluble zinc chloride and in any solution purchased the percentage of zinc chloride specified shall be the amount of soluble zinc chloride required.

The material shall retain an average of 0.5 lb. of dry zinc chloride per cu. ft., which shall permeate all of the sapwood and as much of the heartwood as practicable, and no charge shall retain less than 90 per cent nor more than 110 per cent of this quantity.

(3) The treating solution shall be no stronger than necessary to obtain the required retention of preservative with the largest volumetric absorption that is practicable, and shall be thoroughly mixed before use. Its strength shall not ex-

ceed five per cent and shall be determined by analysis. Chemical titration, using a silver-nitrate solution with potassium-chromate indicator, will usually be satisfactory. For example: With red oak, the strength shall not exceed 4 per cent and the volume injected shall be not less than 20 per cent, while with pine having a large percentage of sapwood, it shall not exceed 2 per cent and the volume injected shall be not less than 40 per cent. The amount of solution retained shall be calculated from readings of working-tank gages or scales or from weights of at least one-tenth of the material on a suitable track scale before and after treatment, checked as may be desired by the railroad's representative.

(4) Air-seasoned material shall be steamed in the cylinder for not less than one hour nor more than two hours, at a pressure of not more than 20 lb. per sq. in., the cylinder being provided with vents to relieve it of stagnant air and insure proper circulation of the steam and being drained to prevent condensate from accumulating in sufficient quantity to reach the material. After steaming is completed, a vacuum of at least 22 in. shall be maintained until the wood is as dry and as free of air as practicable. Before the preservative is introduced the cylinder shall be drained of condensate, and if the vacuum is broken, a second one as high as the first shall be created. The preservative shall be introduced, without breaking the vacuum, until the cylinder is filled. The pressure shall be gradually raised, and maintained at a minimum of 125 lb. per sq. in. until the required quantity of preservative is injected into the material, or until less than 5 per cent of the total quantity required has been injected during the latter half of one hour throughout which the rate of injection has persistently decreased while the pressure has been held continuously at 165 lb. or more per sq. in. The temperature of the preservative during the pressure period shall be not less than 130 deg. F., nor more than 190 deg. F. and shall average at least 150 deg. F.

(5) At least once each day the railroad's representative shall determine the penetration by analysis. With woods on which potassium ferro-cyanide and uranium acetate will produce color reaction, the penetration may be determined by its visibility. From ties samples shall be taken at the middle and rail sections; from other material samples shall be taken as desired. Any holes that may be bored shall be filled with tight-fitting treated plugs.

(7) Same as Par. 6 for full-cell process for creosote.

FOR TREATMENT WITH ZINC CHLORIDE AND CREOSOTE OIL (CARD PROCESS)

(1) Same as Par. 1, full-cell process for creosote.

(2) Same as Par. 2 for treatment with zinc chloride only.

(3) The creosote oil shall meet the standard of the American Wood-Preservers' Association for "Creosote Oil, Grade 3, for Ties and Structural Timber," amended as follows: The specific gravity of the oil at 38 deg. C., compared with water at 15.5 deg. C., shall be not less than 1.03, nor more than 1.07.

(4) The material shall retain an average of 0.5 lb. of dry zinc chloride and 3 lb. of creosote oil per cu. ft., which shall permeate all of the sapwood and as much of the heartwood as practicable, and no charge shall retain less than 90 per cent nor more than 110 per cent of these quantities per cu. ft.

(5) The preserving mixture shall be composed of the volumetric proportions of creosote oil and of zinc-chloride solution of the necessary strength which are required to obtain the specified retention of the preservatives with the largest volumetric injection that is practicable, and shall be agitated in the working tank and cylinder so as to insure thorough mixing before and while the cylinder is being filled with preservative and while the preservative is being

injected into the material. The strength of the zinc-chloride solution shall not exceed 5 per cent and shall be determined by analysis. Chemical titration, using a silver-nitrate solution with potassium-chromate indicator, before the zinc-chloride solution is mixed with the creosote oil will usually be satisfactory. For example: With red oak, the proportions shall not exceed 77 per cent of 5 per cent zinc-chloride solution and 23 per cent of creosote oil, and the volume injected shall be not less than 20 per cent, while with pine having a large percentage of sapwood they shall not exceed 88 per cent of 2.5 per cent zinc-chloride solution and 12 per cent of creosote oil, and the volume injected shall be not less than 40 per cent. The quantities of preservatives retained shall be calculated from readings of working-tank gages or scales or from weights of at least one-tenth of the material on a suitable track scale before and after treatment, checked as may be desired by the railroad's representative.

(6) Same as Par. 4 for treatment with zinc chloride only.

(7) The temperature of the preservative during the pressure period shall be not less than 170 deg. F., nor more

than 200 deg. F., and shall average at least 180 deg. F. After the cylinder is emptied of preserving mixture, a vacuum shall be maintained until the material can be removed from the cylinder free of dripping preservative.

(8) Same as Par. 5 for treatment with zinc-chloride only, except that plugs are required to be creosoted.

(9) Same as Par. 6, full-cell process for creosote.

(10) When water-gas tar instead of creosote is used, it shall meet the following requirements:

It shall not contain more than 2 per cent of water.  
It shall not contain more than 2 per cent of matter insoluble in benzol.  
The specific gravity of the tar shall not be less than 1.03 nor more than 1.07.  
The distillate, based on water-free tar, shall be within the following limits:  
Up to 170 deg. C.—none.  
Up to 210 deg. C.—not more than 8 per cent.  
Up to 235 deg. C.—not more than 20 per cent.  
Up to 355 deg. C.—not less than 50 per cent.

(11) When water-gas-tar creosote instead of coal-tar creosote is used, it shall meet the requirements of the National Electric Light Association for "C-Specification covering water-gas-tar creosote oil."

# Doings of the United States Railroad Administration

## Director General Confers With State Commission Representatives

### —Cars to Be Returned to Owners

WASHINGTON, D. C.

THE DIRECTOR GENERAL desires to harmonize the relationships between the Railroad Administration and the state railroad and public service commissions and to agree with them on a plan of constructive co-operation under peace conditions. With this object in mind, and at his invitation, a conference was held on February 19 between the director general, Max Thelen, and E. C. Niles, of the Division of Public Service, and members of the executive committee, and the special War Committee of the National Association of Railway and Utilities Commissions, headed by Charles E. Elmquist, president of the association.

The conference developed the earnest desire on the part of both the representatives of the Railroad Administration and of the state commissions to work in the most complete harmony. The director general and Mr. Elmquist both voiced the desire to co-operate in this direction. As a result of the meeting, the director general plans to put into effect the following policy, involving police regulations of the several states, other than those affecting the transportation of troops, war materials or government supplies, or the issue of stocks or bonds or rates, fares and charges. With this policy the representatives of the state commissions expressed themselves as being in entire accord:

"Transportation systems under federal control continue subject to the lawful police regulations of the several states in such matters as spur tracks, railroad crossings, safety appliances, track connections, train service, the establishment, maintenance and sanitation of station facilities, the investigation of accidents and other matters of local service, safety and equipment. It will be the policy of the director general to cause the orders of the state commissions in these matters to be carried out. The attention of the state commissions, however, is invited to the present status of the railroads under federal control, and the responsibility of the federal treasury for any deficiencies in revenue, and it is assumed that expenditures will be ordered only in the light of this status and after full consideration of the bearing of the particular case upon the needs and difficulties of the United States in operating the railroads."

The director general also announced the following policy

with regard to investigations and reports on the part of the state commissions and with this policy also the state commissions' representatives expressed approval:

"The director general earnestly desires to accord to the public the best possible service. He requests the assistance of the state commissions in investigating and reporting to him the facts, with recommendations, as to the existing service. All state commissions are requested so far as they can conveniently do so to investigate the character of freight and passenger service, the physical condition of track and equipment, the prompt loading and unloading of equipment, and the general efficiency of the service, in their respective states, and to file reports with the director general, sending a copy to the regional director."

The conference was to be resumed on Thursday with the object of discussing questions involving rates and other subjects of interest to the railroad administration and the state commissions, the object of both being to bring about a perfectly clear understanding on all these matters.

### Cars to Be Relocated in Accordance with Ownership

W. T. Tyler, director of Division of Operation, has issued Circular No. 27, which states that present conditions with respect to car supply present an opportunity for:

(a) Relocation of equipment more in accord with ownership than has been practicable during war conditions, under which each unit has been used with the sole purpose of meeting the then existing traffic demands.

(b) Providing to a greater extent for use by the owner of equipment of its accepted standards.

(c) Providing for the return to the owning road when desired for rebuilding or application of betterments, cars which can be put in safe condition for movement at reasonable cost.

To accomplish the above, regional directors are instructed to direct federal managers and all concerned in the proper handling of cars in accordance with the following, without abandoning the principle of common use of cars:

1. In general, cars should be loaded to or in the direction of the home road. This will not apply to cars handled

under direction of the Refrigerator and Tank Car Department of the Car Service Section at Chicago, or those handled under direction of the Eastern Railroads Coal Car Pool at Pittsburgh.

2. The Car Service Section will, as may be agreed upon with regional directors, relocate equipment according to ownership by regions so far as practicable.

3. The regional directors will then relocate the same cars between owners on the basis of ownership so far as practicable.

4. Any railroad will accept its own equipment empty at any junction point.

5. Any cars already placed on storage tracks because of surplus will not be moved so long as relocation orders placed as provided in paragraphs numbered 2 and 3 can be filled from other available supply; or as may be specially directed.

6. When roads desire to rebuild their cars, regional direc-

Freight revenues increased \$616,000,000, passenger revenues were \$204,000,000 greater than in 1917, and express revenues were \$19,000,000 greater, while mail revenues decreased from \$58,793,643 to \$53,502,591.

Of the increase in expenses \$208,000,000 was in the maintenance of way and structures account, \$417,000,000 in the maintenance of equipment account, and \$517,000,000 in the cost of conducting transportation, while traffic expenses decreased \$17,000,000 and general expenses increased \$15,000,000. The report covers 180 Class I roads and 15 switching and terminal companies, making a total operated mileage of 232,561 miles.

For December the operating revenues were \$440,100,165, an increase of \$103,000,000, expenses were \$395,034,562, an increase of \$144,000,000, and the net operating income was \$28,237,190, a decrease of \$36,000,000. The statistics are as follows:

RAILWAY REVENUES AND EXPENSES, DECEMBER, AND TWELVE MONTHS ENDING WITH DECEMBER

Item	December				Calendar year 1918			
	Amount		Per mile of road operated		Amount		Per mile of road operated	
	1918	1917	1918	1917	1918	1917	1918	1917

\*Debit item.

tors should make application through the mechanical department of the Railroad Administration, and upon its approval the Car Service Section will authorize the owners to call upon holding roads (as determined from car records) for the return of the cars in such numbers and at such times as their shop operations require. These cars to move on billing stating the authority and that they must not be diverted.

7. In carrying out the policies here indicated caution should be observed by regional directors so as not to bring about burdensome empty car mileage.

Railway Returns for 1918

Net operating income of the railways in 1918 as reported by the Interstate Commerce Commission was \$690,418,778, or about \$210,000,000 less than the standard return guaranteed by the government and \$284,000,000 less than the net in 1917. Operating revenues for the year amounted to \$4,913,319,604, an increase of \$863,000,000, or 21 per cent, while operating expenses were \$4,006,894,762, an increase of \$1,148,000,000, or 40 per cent. Taxes amounted to \$186,652,095, an increase of about \$4,000,000.

The Railroad Administration has issued a statement compiled by the Operating Statistics Section, giving the returns for the Class I roads, which places the net federal income for the 12 months at \$688,200,083, representing a deficit of \$202,135,602 as compared with the standard return for those roads, \$890,335,685. This is the first of a series of monthly statements to be issued covering both earnings and expenses and also the statistics of freight train movement and car performance. It is stated that the commission's summary includes a few railroads not under federal control. The statement explains that in December there are ordinarily many adjustments in the accounts correcting over-estimates or under-estimates in previous months based on those accounts which are conducted monthly on a basis of accruals. These adjustments in December, 1918, particularly in charges for retroactive wage payments, have resulted in disturbing the figures in comparison with December, 1917, but the results for the 12 months as a whole are comparable. The statement also says:

"In considering the results for 1918 it should be borne in mind that that year was almost wholly one of war conditions.

It was necessary to move freight expeditiously, in many cases regardless of cost. Preference had to be given to munitions traffic, and this naturally militated against economies. In addition, the railroads were compelled in many instances to employ inexperienced and inefficient labor. The railroads had to supply the demands of the military service generally, just as other industries did, but also had the special demand made upon them of supplying the men for the military railways in France.

The wage increases altogether had the effect of increasing the 1918 operating expenses by approximately \$583,000,000, or about 32 per cent over what the payrolls would have been if there had been no increases in 1918. This does not give the effect of the wage increases if applied to a full year, because many of them did not become effective until the latter part of the year. The increased cost of materials also added heavy burdens, locomotive fuel alone accounting for \$125,000,000. It is also pointed out that the 1918 results were adversely affected by the extreme weather conditions of January and February and the traffic congestion which obtained at that time. In January operating expenses took 95 per cent of the revenues and in February 90 per cent.

In commenting on the statistics for freight operation, which were published in our issue of last week, the statement points out that notwithstanding the heavy losses during the first two months under federal control the summary for the year shows that 228,729 miles of railroad produced 435,000,000,000 ton miles in 1918, an increase of 1.8 per cent. The decrease in the percentage of loaded to total car miles is attributed principally to the relatively greater proportion of empty car miles as the result of the policy of the Railroad Administration of moving empties in solid trains to the regions where they would be needed for prospective traffic. This policy had the favorable result of ameliorating the car shortage and of expediting movement of traffic.

The passenger traffic for the year, it is estimated, will show an increase in passengers carried one mile of approximately 9 per cent. The complete figures for the 12 months are not yet available. Those for the 11 months, which are published herewith separately, show an increase of slightly over 9 per cent. These figures include the movement of troops. It is estimated that the passenger train miles for the year were approximately 9 per cent less than in 1917 as the result of the policy of curtailing passenger train service.

**Passenger Traffic for November and Eleven Months**

The number of passengers carried one mile by the railroads under federal control during the month of November, 1918, decreased 7.1 per cent as compared with November, 1917, according to the monthly report of the Operating Statistics Section. For the eleven months' period there was an increase over the corresponding period of 1917 of 9.2 per cent. The Allegheny and Pocahontas regions continued to show increases in November. The figures by regions follow:

**A la Carte Service in Dining Cars to Be Resumed**

Director General Hines has sent the following instructions to the regional directors:

"Commencing March 1 next, a la carte service may be resumed on trains where, in the opinion of the federal manager, this can be done and avoid congestion in dining cars with the resulting delays to passengers. On trains where table d'hote service is continued, it is desired that a well-balanced meal be provided of not to exceed five courses, exclusive of relishes and beverages, of good food, well cooked and served, appropriate to the occasion. The price of all table d'hote meals to be \$1.25, and be made worth the price. It is required that a prompt and thorough inquiry be made as to the trains on which table d'hote service should be continued with the first purpose of rendering the most efficient and satisfactory service to the traveling public. It is to be clearly understood that the a la carte service is not to be substituted for the table d'hote service on trains where such action would result in overcrowding the dining cars and resultant delay to passengers in obtaining service."

The table d'hote service was put into effect as a war measure because of heavy passenger travel during the war and a shortage of passenger equipment due to the necessity of using a large amount of passenger equipment in the transportation of troops. As these conditions disappear, it is desired to return to the a la carte service, which it is believed will be more satisfactory to the traveling public.

**Exports Control Committee Discontinued**

The Exports Control Committee, formed by agreement between the secretary of war, the secretary of the navy and the director general of railroads, will be disbanded on March 1 in accordance with a suggestion from the members of the committee that its continuance is no longer necessary. Following the signing of the armistice on November 11 there was a large amount of export war freight enroute to and at the several ports. The disposition of this tonnage has progressed very satisfactorily, either by storage at the ports or diversion to interior points. There remains a heavy food program for overseas, which is well under control by the respective port committees, i. e., Freight Traffic Committee, North Atlantic ports, covering the northern range; Southern Export Committee, covering the South Atlantic and Gulf. The congestion at Pacific ports is now under control through the committees recently appointed as follows: North Pacific Export Committee, Portland, Ore., having jurisdiction over Puget Sound ports, and California Export Committee, headquarters San Francisco, over California ports. The committee recommended that with the view of preventing port congestion hereafter, the committees of control mentioned shall be continued, with authority to regulate the flow of traffic under the present permit system.

The director general has announced the appointment of Conrad E. Spens as assistant director, Division of Traffic, in charge of export and import traffic, in addition to his present

d Decrease.

duties as manager, inland traffic, U. S. Food Administration. Mr. Spens will co-operate very closely with the Department of Commerce, the State Department, and the Shipping Board, also with import and export commercial interests, to enable them to compete successfully in foreign fields. In co-operation with the Shipping Board, assistance will be given in establishing new steamship service in American bottoms to foreign countries that will best serve the commercial interests in this country, and also give complete information as to inland and ocean freight rates and other necessary transportation data that will assist in developing foreign commerce. Particular attention will be given to port conditions and the routing of import and export freight to prevent congestion at our ports.

For the time being, the present permit system on export freight will be continued. Necessary improvements at the various ports will be made a special study. Under the Webb act, consolidation of competing industrial concerns for the purpose of developing their export business is permitted. It is expected that consolidated interests, formed as a result, will make for the larger export of manufactured goods from the country.

George D. Ogden, chairman of the Exports Control Committee, will continue as freight traffic manager of the Pennsylvania Railroad, with office at Philadelphia, and R. L. McKellar, secretary, will continue in charge of the foreign commerce service of the Southern Railway System, with office at Washington.

### Coal Purchasing Policy Outlined

Director General Hines, in a conference on February 18 with J. L. Lewis, vice-president of the United Mine Workers of America, and Warren E. Pippin, of the Labor Bureau, United States Fuel Administration, representing the organized coal miners of the country, discussed the coal purchasing policy of the Railroad Administration and requested the co-operation of the officials of the United Mine Workers in getting specific instances in which it can assist the general coal mining labor situation, having in mind the limitations necessarily surrounding the Railroad Administration.

The director general outlined the policy of the Railroad Administration in this respect as follows:

"The policy of the Railroad Administration is to avoid any action calculated to depress wages of coal miners or the amount of coal produced. Some time ago our attention was called to the fact that there was a concentration of orders for the Railroad Administration in certain fields so as to leave other fields without railroad orders. We promptly met this situation by giving instructions that coal should be bought as far as possible by each railroad on its own railroad. The point was also made that we were using our storage coal to such an extent as to reduce very largely the current production. We promptly met this by giving instructions that we should diminish our withdrawal of coal from storage and use a large amount of current production.

"It was also claimed that the Railroad Administration was trying to force down prices to such an extent as to bring about a decrease in the price of labor. We met this point not only by requiring the wider distribution of purchases already mentioned, but also by providing that we should not suggest any prices to the operators, and to stipulate that any prices named by the operators must be based on existing wages.

"The point has also been made that publicity ought to be provided in the obtaining of bids and making of contracts. We have met this point by providing that any prices which are established will be available to representatives of the miners or others who may be interested, and who may request the information, both as to prices and as to the names of the sellers.

"This represents our general policy, which is actuated by our earnest desire to protect the general situation. The Railroad Administration has a very important selfish interest to accomplish this, because whatever will protect the general situation will help general business, and this is of vital importance to the Railroad Administration.

"It is very important, however, to bear in mind the fact that the Railroad Administration's part in these matters is much more restricted than is generally assumed. Only about one-fourth or a little more of the total bituminous coal production is consumed by the railroads. To a very large extent the mines whose output can actually be used for railroad purposes is restricted on account of the quality of coal needed. A further important point is that at the request and, indeed, at the insistence, of the Fuel Administration, the Railroad Administration has made contracts for a large part of its coal, with the result that only about 20 per cent of the coal used by the Railroad Administration is not covered by contract. Naturally the contract coal cannot be modified except with the consent of the operators.

"Moreover, the very large amount of storage coal which the railroads have accumulated was accumulated at the request of the Fuel Administration, and while we are endeavoring to use this storage coal in such a way as not to embarrass the situation the fact remains that the coal is there and must be consumed.

"It must also be remembered that the volume of coal which the Railroad Administration consumes is limited by the volume of business, and as business is now falling off this operates to reduce the volume. It seems to me we have met substantially the various needs that have been presented to us. The only other possibility that occurs to me is that if the operators with whom we have made contracts for about 80 per cent of the coal are willing to release us from those contracts we will be glad to distribute that coal among the various mines which can produce the necessary quality of coal and which will be willing to sell at the same prices we have under the contracts."

### Weekly Traffic Report

Director General Hines has announced the cancellation effective February 15 of requirements to obtain permits on carload shipments of domestic freight to New York City except for local lighterage. Embargoes against domestic freight to Philadelphia and Baltimore as well as to New York were materially modified on February 15. According to the weekly traffic report for the week ended February 17, the condition at the various ports was in fairly good shape, 4,920,000 bushels of grain having been exported during the week, and a number of ships are now loading. This affords considerable space in the elevators and permits are being issued freely for the movement of freight from the west to both the Atlantic and Gulf ports. The movement of principal fruits and vegetables so far this season, greatly exceeds that of last year. Cattle and hog receipts at the Union Stock Yards, Chicago, decreased 12 per cent under the same period of last year, although sheep receipts showed an increase of 11 per cent. Passenger travel from practically all parts of the country continued unusually heavy, this being particularly noticeable to Florida points. A summary of the report follows:

**EASTERN REGION:**—The automobile business is reported as being extremely prosperous, and one large concern has acquired 300 additional acres in order to enlarge its plant. Cars of the week permits were issued covering about 25,000 cars of export freight, of which 10,000 were commercial freight.

**ALLEGHENY REGION:**—A new plan for the delivery of perishable freight at New York, Philadelphia and Baltimore was established on February 15, which should greatly

improve the service. On account of heavy export movement of grain from the elevators at Atlantic seaboard, permits are being issued freely on grain from the West.

**POCAHONTAS REGION:**—The movement of coal and coke continues very light, showing a decrease of 3,000 cars under the previous week, while local loading of general freight also shows a slight decrease. Twelve pig iron furnaces and steel plants are reported out of blast, some for repairs, and others account lack of orders. Dumping of coal at tide-water showed a decrease of 98,846 tons. Passenger travel continues very good, requiring extra equipment on regular trains, as well as the operation of forty-four extra passenger trains.

**SOUTHERN REGION:**—The number of cars loaded and received from connections showed an increase of 56,027 cars, as compared with the previous week, although the increase was only 5,473 cars greater than the same period of 1918. There are no accumulations at terminals, or embargoes, but the surplus of box cars still continues. Movement of fruits and vegetables from Florida shows about 25 per cent increase over last year, and the demand for refrigerator equipment is heavy; however, no difficulty in filling requisitions. The low price of cotton continues to retard the movement of this commodity. The domestic demand for lumber continues light, but European bookings are reported. Passenger business was very heavy, and tourist hotels in Florida are having an exceptionally good season.

**NORTHWESTERN REGION:**—The general strike situation at Seattle has cleared and all laborers have returned to their work, with the exception of the shipyard workers, who will doubtless resume operations within ten days. During the week 101,118 cars of freight were loaded in the Northwestern region, which was a decrease of about 1 per cent under the corresponding week of last year, but an increase of 17 per cent over the corresponding week of the previous month. The elevators at Duluth and Milwaukee are filled to capacity, retarding the movement of grain to primary markets. Live stock loadings continue to show increases as compared with the previous week, as well as with the same period last year. Passenger traffic is heavy throughout the entire region.

**CENTRAL WESTERN REGION:**—During the week 103,680 cars of freight were loaded, a decrease of about 11 per cent under loading for the corresponding week of last year, partially accounted for by heavy snows, sleet and high winds throughout Nebraska, Kansas and Colorado. The export freight on hand at San Francisco is being gradually reduced, and at the present time is equivalent to 890 carloads. Passenger travel has been about normal, although the movement to California continues heavy. Thirty-four troop trains and a number of extra cars were operated during the week to move discharged soldiers. Passenger schedules are being revised with a view to giving improved service, and observation and buffet cars are being restored on some of the through trains.

#### Export Traffic

A considerable improvement in the movement of overseas traffic for the week ended February 11 over the week previous is shown in a report from the Exports Control Committee. The total number of cars on hand at North Atlantic ports for the week ended February 13 was 31,436, while for the week ending February 4 there were 32,343, a decrease in accumulation of cars for the week of February 13 compared to the previous week of 907 cars. The deliveries of export freight at the various ports for the months of August to December, 1918, inclusive, amounted to 260,488 cars; apportioned as follows: North Atlantic range, 234,428 cars; South Atlantic range, 4,991 cars; Gulf range, 21,069 cars. The average monthly deliveries for the same period amounted to 52,097 cars.

It is announced that the food administration will purchase within the next 10 days about half a million barrels of flour, and probably an additional half million barrels within the succeeding 10-day period. Permits will not be requested on any of this material for about two weeks.

#### Automatic Train Control Committee

The Committee on Automatic Train Control devoted its meeting in Washington, February 14, to clearing the decks by eliminating from consideration about 180 plans for automatic train control systems which had previously been passed on and condemned by the Interstate Commerce Commission as having no merit. The committee had before it approximately 250 plans, most of which had never been submitted to any practical test, and most of which had previously been submitted to the commission, but including some 15 new ones proposed to the committee. At the next meeting on February 28 the committee will devote itself to the consideration of 50 or 60 plans which include those that possess a greater degree of merit with a view to reducing the number to those which are worthy of careful investigation. These will be taken up one at a time alphabetically with the persons interested, and from them the committee will probably select one of each type for test.

#### Rate Policies

The director general has instructed the freight traffic committees that they are not to docket or send out for consideration by the public any case involving a general advance or a general readjustment, as to rates, fares, charges, regulations or practices, in a territory or district, on one or more commodities, until the matter has first been submitted to him and approved for consideration with the public.

The existing policy of the Railroad Administration as to differential freight rates on rail and water routes was established on the basis of war conditions and to meet a war situation, and now that the armistice has been signed very careful consideration is being given to a revision of this policy to meet peace conditions and to make certain that an entirely just and equitable basis for these rates is established under peace conditions. Much complaint has been made because the Railroad Administration has fixed water rates at so near the level of the rail rates as to make the cost of water transportation practically the same as by rail.

#### Contracts Signed

The director general has signed compensation contracts with the Union Pacific, covering also the Oregon Short Line, Oregon-Washington Railway & Navigation Company, Des Chutes Railroad, Green River Waterworks Company, Rattlesnake Creek Water Company and Union Pacific Water Company, for \$38,552,928 yearly; with the Central New England, for \$1,468,123; with the Washington Southern, for \$468,482; and with the Trinity & Brazos Valley, for \$100,000.

#### Seniority Rights for Russian Railway Service Corps

In supplement No. 1 to General Order No 51, issued by the director general, the provisions of General Order No. 51 are extended to include employees in the service of the Russian Railway Service Corps.

**The Train Despatcher's Relaxation (?)**—The train despatcher, in addition to his other duties, is required to keep the Information Bureau posted at all times on the prospective arrival of trains, in order that proper time may be posted on all the bulletin boards—this applies not only at terminals, but also at all stations on the line where the trains stop. It is not a case of do it if you have time; the law says we must. We do. It's part of the day's work.—*J. A. Shockey, S. P.*

# Railroad Hearings Before Senate Committee

Transportation Problem to Pass to Next Congress—House Committee Decides Not to Hold Hearings

WASHINGTON, D. C.

THE FACT THAT THERE is practically no prospect for any railroad legislation at this session of Congress, beyond the appropriation of the addition to the revolving fund asked for by the Railroad Administration, was emphasized when the House Committee on Interstate and Foreign Commerce on Monday decided not to hold any hearings on the proposal to extend the period of federal control. Chairman Sims of the committee had introduced a bill providing for an extension for five years, and had planned to begin hearings on Tuesday with Director General Hines as the first witness, but when the committee met on Monday it was decided to "table" the subject, as there is not sufficient time for even committee action at this session.

The Senate committee, which has been holding hearings almost daily since January 3, and has listened to a variety of plans for the solution of the railroad problem, has also indicated a loss of interest in the subject as far as this session is concerned, and decided last week to hold only two hearings a week. It also began to limit the time of the witnesses. After holding a session on Tuesday and Wednesday this week it was decided to bring the hearings to a close on Thursday.

Immediate interest in the prospects for the railroads is now centered in the attitude to be taken by President Wilson when he returns to Washington next week from the peace conference. He is planning to leave again for Europe in a few days, but during his stay he is expected possibly to decide regarding an extra session of Congress, which would give an opportunity to work out a new plan of railroad regulation, and also as to the relinquishment of the railroads. There has been some expectation that he might issue a proclamation setting a future date for the return of the roads during his stay here, but there are no indications that the date has been decided.

Director General Hines, in testifying before the House appropriations committee, referred to the possibility of releasing the roads this fall, and doubted very much if there could be a relinquishment earlier than that. He also told the committee that the Railroad Administration is working on a policy of restoring transportation to its normal basis in view of the probability of a return, and the administration is preparing in many ways to facilitate the transition back to private operation. The purpose of the appropriation is to enable the administration to settle its accounts with the railroads and to assist the roads in financing during the transition period.

"And there is a possibility that shortly before the actual relinquishment, the roads will be restored to the corporate organizations for operation under the general direction of the director general.

Testimony before the Senate committee during the past week has included statements by Daniel Willard, president of the Baltimore & Ohio; S. Davies Warfield, president of the National Association of Owners of Railroad Securities; G. M. Freer, president of the National Industrial Traffic League, and N. L. Amster, president of the Investors' Protective Association.

Statements by Howard Elliott, president and chairman of the Northern Pacific and chairman of the committee on intercorporate relationships of the New York, New Haven & Hartford, and by Samuel Rea, president of the Pennsylvania, also were filed with the committee. Senator Underwood filed a statement by E. D. Kenna, formerly vice-president of the Atchison, Topeka & Santa Fe, and Senator

Cummins has also put into the records of the hearing plans for the disposition of the railroads proposed by Paul M. Warburg and Jules S. Bache.

## Daniel Willard's Statement

Mr. Willard said in part:

"My experience convinced me that it was desirable, in fact necessary, that in time of war or unusual emergency, all of the more important agencies of transportation should be so co-ordinated that, taken together, and as a whole, they might be said to form a national system of transportation. But unified control, like all things else of real value, must be paid for in some manner, and the price is the sacrifice of competition of service. There cannot be unity of control and competition of service at one and the same time—the two things are incompatible. Competition of service has probably done more than any other one thing or influence to raise the standard of equipment and performance of American railroads, and as a policy it should not be lightly given up, and in no event should it be abandoned unless something else of equal or greater value be obtained in its place. I do not, however, share the views of the director general that unified control, when desirable, cannot be had under private ownership with governmental regulation, and the information which Mr. Kruttschnitt has laid before this committee concerning the results of unified control of the steam railroads obtained by the so-called Railway War Board, for a period of nine months preceding federal control, affords a most substantial basis for my belief. That a condition finally developed which the voluntary organization created by the railroads, subject as it was to many statutory restrictions, was unable to deal with promptly and effectively, must be admitted, but we have the direct statement from the director general that he also would have been unable to deal effectively with the same situation had it not been for the fact that he was authorized by law to ignore the restrictions which applied to the railroads under private operation.

I doubt if there has ever been a proper appreciation of the confusion that was caused in this country in connection with all industrial and transportation matters, incident to the sudden change in 1917 from a peace-time to a war-time basis, and much was required besides the mere unification of the railroads to bring order out of the confusion so resulting. As time went on, however, the necessary remedies were first discovered and then applied, the war-time basis became the normal basis, and order was gradually re-established. It was not possible at that time, or in any event did not seem wise, for the railroads to place such restrictions upon the ordinary peace-time commerce of the country as were found to be necessary and practicable later on.

The congestion of freight at the eastern terminals in the fall of 1917 was due largely to an unprecedented condition of commercial and industrial readjustment which the railroads were obliged to deal with, while at the same time having some regard for the existing rules and regulations established by law.

These questions were not primarily and entirely matters of railroad control and operation, although closely related thereto, but were problems that developed, and naturally so, out of a condition of world war, and later on were dealt with more or less effectively by the different governmental agencies established for that purpose.

It has frequently been asserted that the steam railroads

in the United States under private ownership had broken down, and that it became necessary on that account for the government to take possession and assume control of the physical properties. I cannot agree with those who hold that opinion, nor can I find anything in the record of performance of the carriers under private control and operation, or in the record of performance during twelve months of federal control and operation that gives support to that assertion. On the contrary, the record of actual performance under federal control with almost exactly the same facilities and with substantially the same official staff, is the best and most convincing evidence that the railways, both as to physical properties and personnel, had not only *not* broken down, but were in fact most efficient agencies of transportation.

I was not opposed to the taking over of the railroads by the President in December, 1917. Congress itself had foreseen the possible necessity for such action as a *war measure* and had provided for it by suitable legislation passed 18 months before, and at a time when the railroads were carrying a greater volume of traffic than ever before, and when no one ventured to suggest that they were even threatened with breakdown.

A policy of enforced competition did not and could not readily adapt itself to the unforeseen situation. Further, the control over railroad rates and practices which had been vested in the state and interstate commissions could not be, or in any event was not, so exercised as to promptly and amply satisfy the changed conditions brought about by the war, and consequently the financial condition of many of the carriers, because of rapidly mounting cost of operation, became critical. In short, a policy of regulation designed to deal with peace-time conditions, failed to satisfy the requirements created by war, and we are now confronted with the problem—if private ownership is to continue—of providing such a system of regulation as will not only properly protect and promote the interests of the public and the carriers in times of peace, but which will also quickly and easily adjust itself to the requirements either of peace-time or war-time emergency.

Private ownership and operation of the railroads as a policy have not failed. Regulation as a government policy has not failed. It has been clearly shown, however, that a system of regulation designed for peace-time conditions might not, and, in fact did not, properly function in time of war, and as it was necessary to act promptly, the government assumed control of the railroads and proceeded to run them as if there were no restrictive laws and regulations.

“Actual experience now leads to the conclusion, so it seems to me, that the railroads under private ownership, and subject always to governmental regulation, should be lawfully authorized to do whatever would be done in the public interest under government ownership and operation, or is actually being done in such interest at the present time under governmental control and operation.

“I am familiar with the recommendations that have been submitted on behalf of the Association of Railway Executives, and I approve and endorse the general plan so outlined, because I believe that if adopted and put in effect with a firm desire to make it succeed, it would provide such method of procedure and such agencies of control as would enable the railroads in the future under private ownership to deal promptly and effectively with any probable emergency which might arise, and, if in connection therewith Congress will establish a definite and adequate rule for rate-making as related to the invested capital, the credit of the carriers which has been seriously disturbed by the uncertainties of the past will again and in time be sufficiently restored to attract the large sums of new capital constantly required for the additional facilities and equipment necessary to keep pace with the growing commerce of this country.

“I have listened to the report and recommendations submitted by Mr. Clark on behalf of the Interstate Commerce Commission, and I believe they also would go far toward meeting the requirements. The two plans have much in common, but the one suggested by Mr. Cuyler would give to the Interstate Commerce Commission exclusive authority to deal with all rates and security issues, would have Congress provide a definite rule for rate-making, and would create a new Department of Transportation, the head of which would have a seat in the President's Cabinet. Such a department, in my opinion, is desirable primarily in order to bring about that co-operative development and use of the different agencies of transportation which are needed in the public interest.

“Mr. Warfield on behalf of the National Association of Owners of Railroad Securities, has proposed a definite rule for rate-making. His recommendation, as I understand it, contemplates that rates shall be established in each of the so-called rate regions so as to yield, as nearly as may be, a fixed percentage return upon the combined value of the property devoted to the public use by the railroads in that region, with the limitation that if any individual carrier in such region shall be able to earn from rates so fixed a greater return upon the value of its property than the rate per cent fixed for the region, two-thirds of such excess shall go to the government. While this plan does not contemplate a positive guarantee of any fixed amount, it would afford a definite guide or measure and would in my opinion be a decided improvement upon the methods of the past. He suggests that 6 per cent be the fixed rate of return upon the value of the property as shown by the book investment account of road and equipment. I think there can be no difference of opinion concerning the soundness of the principle underlying his recommendation, and I firmly believe that no less a rate of return than 6 per cent upon no less an amount than the combined book property investment account of all the railroads taken as a whole, will be sufficient to establish and sustain the credit of the carriers. My own study leads me to the conclusion that a rate of 6½ per cent upon the combined property investment account, and a rate of 6 per cent, I fear, may prove to be too small, and it may be fairly said that the success or failure of private ownership of the railroads as an economic policy, rests upon the wise and correct determination of this particular phase of the problem.

“All are seemingly willing that railroads should be permitted in the public interest to pay a fair return upon the fair value of their property devoted to the public use, but I am convinced that it has now become necessary that some one speaking with authority should say definitely what is a fair rate of return and upon what definite amount. Congress undoubtedly has authority to fix the rate of return on property devoted to the public use, and until some fairer or more accurate basis is found for determining the value of the railroad properties so used, I respectively submit that the book investment accounts of the carriers as a whole afford the best evidence of such value.

“It would, of course, be the duty of the Interstate Commerce Commission or some other agent of Congress to see that an adequate rate structure was established and maintained, and in that connection it would be a mistake, I believe, to minimize the difficulties growing out of our present dual system of rate regulation. It seems clear that Congress has ample authority to deal with this matter if it chooses to do so. I am in favor of leaving the states as free as possible to deal with all matters affecting transportation, subject only and always to the one qualification that they shall not seek or be permitted in the interest of any particular state to place an undue burden upon the commerce of all the other states.

“The labor phase of the railroad problem is indeed most important as has already been pointed out, but, as has been

shown by Mr. Garretson, it is a common factor to be dealt with under any form of control or operation. Clearly it is in the public interest that those who man the trains and engines or whose duties are in any way related to the safe and proper operation of the roads, should be a selected and reliable class of men, and it is also in the public interest that they should be well paid and provided with safe and suitable working conditions, and further, after they have become incapacitated for the more exacting duties of the railroad service, they should be provided if possible either with work more suitable to their physical condition, or with a pension or annuity based upon their average earnings over a period of years, and the expense incident to this reasonable arrangement should be included in the cost of the service rendered to the public.

"I am not in favor of such a division of excess profits with labor as Mr. Warfield suggests, because such a plan in my opinion would be extremely difficult of fair application and does not rest upon the right principle. I believe thoroughly in good wages, and if a man does work of unusual value he should receive unusual reward, but the two should go together, and that would not necessarily follow under Mr. Warfield's plan. I agree fully with the idea advanced by Mr. Plumb on behalf of the four brotherhoods, that the best results will be obtained when men are actuated by hope of reward, and not by fear of punishment, and in no line of gainful endeavor has there been greater opportunity for advancement and reward than in the railroad service. Private ownership will preserve the conditions which have made such advancement possible. The very great majority of the railroad officers today have reached their present positions through well established lines of promotion and because they were believed to be fitted for the enlarged responsibilities placed upon them. Having entered the railroad service as an unskilled laborer when only eighteen years old, I have seen and know the things of which I speak. Private ownership and operation will preserve and enlarge the opportunities to which I have referred. Government ownership and operation, in my opinion, would in a large degree destroy them.

"Director General McAadoo referred to a number of reforms which he recommended be continued under whatever form of control might ultimately be decided upon. I agree fully with his recommendations in that connection with two or possibly three exceptions. I am opposed, however, to the five-year extension of the period of federal control, recommended by the director general, because I believe that if such extension is granted, that by the end of that period it would be practically impossible to restore the roads to the owners, and government ownership would be the only alternative, and I am opposed to the policy of government ownership and operation of the railroads. The occasion which justified the taking over of the railroads having passed, it is now, so it seems to me, the clear and peremptory duty of the government to restore, as soon as may be, the properties so taken, to the rightful owners. This should be done as soon as Congress can provide, by suitable legislation, for the relinquishment of federal control. In the meantime, it is certainly the moral duty of the government to protect the property from unnecessary harm or disarrangement, in order that it may be restored in 'as good repair and in substantially as complete equipment as it was in at the beginning of federal control.'

"I have carefully considered the plan submitted by Mr. Plumb on behalf of the four brotherhoods. Aside from the fact that I believe his conclusions are erroneous concerning the possible savings to be effected in cost of capital, it seems to me that his plan has all the objections which in my mind are associated with government ownership and operation. He proposes that the government should furnish the facilities and capital needed, and that the railroad officers and em-

ployes should operate the properties, and, having a two-thirds majority of the board of directors, they would evidently be in a position to manage the properties as they might elect, and while I have no doubt it would be their honest purpose to operate the roads efficiently, I simply do not believe that efficient operation would be possible or probable under the plan they propose.

"If Congress, as a minimum program:

1. Will provide a definite and workable rule for ratemaking as related to capital, by fixing an adequate percentage ratio of railway operating income to the combined property investment account of the railroads as a whole, along general lines such as I have discussed; and
2. Will affirmatively authorize the railroads to combine their properties and operations, subject to governmental approval, as and when shown to be desirable in the public interest; and
3. Will affirmatively authorize the carriers to issue securities for construction, equipment, enlargement of their properties, and for the refunding of obligations, subject to exclusive supervision of the federal commission; and
4. Will provide for the extension, for a reasonable period, of the indebtedness of the carriers to the United States for advances and loans made by any governmental agency during federal control; and
5. In addition thereto, will either create the new agencies which have been suggested, or enlarge and extend the existing regulating agencies so that matters requiring governmental determination may be promptly disposed of;

"Congress will then have dealt with the matters fundamentally essential at this time. With such legislation, I believe that the difficulties which have confronted private ownership and operation of the railroads in the past will be very greatly reduced, if not entirely eliminated, that the railroad credit will be re-established, and that the public will be provided with ample transportation facilities at reasonable rates and at lower rates than they would be required to pay under government ownership or control."

#### Corporations Should Be Reinstated

Senator Cummings asked whether it would be wiser, assuming that federal control is not extended, to turn the railroads back immediately or to hold them until Congress acts. Mr. Willard replied that he was not sure either alternative was necessary. He would like to see the Baltimore & Ohio under the management of its own company as soon as possible and would not like to see the period indefinitely extended. If Congress thought it could legislate in six months or a year he did not see why the corporations could not be put back in charge of the properties subject to the direction of the director general so they could begin again the development of their properties in their own way. Assuming that the war emergency made it necessary to set aside the corporation organizations, he said, that occasion is now past. There is now no congestion, no car shortage, no shortage of engines or shortage of labor and no reason why the railroads should be managed today differently than in the past. If the corporations were reinstated, the director general could still issue any instructions he considered necessary to meet any particular situation. Senator Pomerene remarked that if the railroads were not competent to manage their own affairs they could probably employ most of the men who have been connected with the director general's organization. "I assume they could," replied Mr. Willard, "as they had most of them before."

Senator Cummins said it is obvious that there will be no general railroad legislation this session nor until after next December and that if the President and the director general carry out their announced intention the railroads will have been returned before that time. Mr. Willard said he was not in a position to know exactly what position his road would be in under such circumstances because he had not been in charge of its operations and did not know whether the present rates would be sufficient under normal conditions because some of the road's traffic has been diverted to other lines. Moreover, lawyers differ radically as to whether the state rates would remain in effect; if rates were reduced, he said, the railroads could not get along if returned immediately.

"We know," he said, "that wages have been increased by

the government by substantially \$900,000,000 a year. If the government having put on that increased charge should turn the railroads back with lower rates than the director general got, the effect would be so serious that I cannot conceive that the government would treat private property that way. I hate to accept the conclusion that the President would do that. I cannot believe that any administration would do what has been suggested."

"If they believe what they say, they intend to turn the roads back very soon," said Senator Cummins.

Senator Pomerene remarked that in view of the fact that the director general still has 21 months, if he asks for a five year extension and cannot get it and then turns the roads back precipitately he would not be acting fairly toward either the public or the railroads. Senator Cummings thought that Congress ought to do something to prevent such a contingency. When Senator Kellogg declared that it was useless to speculate on that subject because if the administration made up its mind to do so it could turn the roads back before Congress could pass a bill, Senator Cummins said he at least proposed to make an attempt. He proposed to offer as an amendment to the appropriation bill his bill to take away from the President the power to relinquish the railroads until authorized by Congress. Chairman Smith of the committee remarked that that would look as if Congress were afraid the President and the director general would not do the right thing.

"It would look as if we were afraid they would do exactly what they have said they would do," said Senator Cummins.

Mr. Willard said that the two fundamentals of the problem are the money that the railroads owe the government and the rate question. In view of the prospective government financing the companies would be unable to pay their loans to the government but doubtless an extension of time could be arranged. The railroads, however, like any other institution, must have money to pay their bills and he pointed out that general commodity prices have increased to a far greater extent than railroads rates. For instance, he said, from 1914 to 1919, the price of wheat had increased 117 per cent and the freight rate on wheat 53 per cent, lumber had increased 119 per cent and the rate 38 per cent, steel rails 89 per cent as compared with 53 per cent, stone ballast 107 per cent as compared with 40 per cent and dressed meats 87 per cent as compared with 53 per cent. Senator Pomerene asked whether Congress ought to authorize the additional appropriation of \$750,000,000 for the Railroad Administration or should attempt to arrange things so that the railroads can finance themselves. Mr. Willard said that it seemed to him there was no alternative, in view of the prospective Liberty loan, because unless the government could finance the railroads in part they would be unable to carry out an improvement program. It might be possible for them to borrow money at 6, 7 or 8 per cent, but this would have to be taken care of eventually in the rates and it would be cheaper for the government to advance part of the money.

If Congress should accept the five year plan now, Mr. Willard declared, it might as well recognize that it would be merely accepting government ownership under another name. If the plan succeeded the government would naturally want to continue the operation and if it were unsuccessful the railroads would hardly want their properties back. He pointed out that the Baltimore & Ohio corporate organization now includes only 70 or 80 persons, whereas the 70,000 employees of its operating organization have been taken over by the government. If the director general should carry out the policy that Mr. McAdoo indicated, expending \$2,000,000,000 or \$3,000,000,000 on the roads for common purposes, it would practically require the government to take over the roads.

Mr. Willard objected to the plan of consolidating the railroads into regional companies, but suggested that they

be allowed to be consolidated along natural lines into about 25 large systems. This would preserve competition and would take care of the problem created by the weak roads. Senator Cummins asked why the Interstate Commerce Commission should not be authorized to require such consolidations. Mr. Willard said that the railroads have made such efforts to do this very thing, sometimes to the extent of running against the law, that he thought the only thing necessary was to remove the restrictions and let natural laws work it out. If they did not work out the plan could be made compulsory. Mr. Willard said he had endorsed the plan for a secretary of transportation proposed by the Association of Railway Executives, but did not think it was so fundamental as to whether the cabinet officer or some other agency were created for the purpose. The important thing was to have some agency to study the whole transportation problem, not for the purpose of administering the railroads, but for the purpose of establishing a national transportation policy. Senator Underwood asked to what extent the executives were in favor of the principles of Mr. Warfield's plan. Mr. Willard said the executives had recommended that Congress establish a definite rule of rate-making which would provide an adequate return but did not attempt to state the rule. He was authorized to say that Chairman Cuyler of the Association of Railway Executives had endorsed the fundamental principles of the Warfield plan, but he did not know to what extent the executives generally would agree to it.

In connection with Mr. Willard's testimony, S. T. Bledsoe of the law committee of the Association of Railway Executives filed with the committee a statement comparing the state and interstate passenger fares in effect on December 31, 1917.

#### Howard Elliott's Statement

An abstract of Mr. Elliott's statement follows:

The Interstate Commerce Law was passed in 1887. Not unnaturally, after 30 years, some defects have been developed in a plan created out of the thought and opinion of people 30 to 40 years ago, and it has been found lacking under the conditions of today, and this is also true of restrictive and conflicting state laws and regulations.

We talk about *solving* the railroad problem. Probably none of our great economic problems can be actually solved permanently. We can, and always will, improve on past practices, and we should approach this matter with that idea in mind and not with the idea that an absolutely perfect plan can be developed and put into effect. Congress in its wisdom can surely take the accumulated information and the best thought obtainable on this important matter and produce a law that will make better the present situation and provide a basis, perhaps, for another 30 years of railroad operation during which period, no doubt, new men, new minds, and new conditions will make it clear that some other arrangement is more desirable for the general welfare of the nation.

What has been accomplished under private ownership and operation in the past is good evidence of what can be accomplished in the future if private energy and initiative are encouraged and repressive and conflicting regulation removed.

The war produced conditions which showed clearly that the then existing regulatory system was not adjusted properly for that emergency. The demands of many classes of employees for heavy increases in pay could not be dealt with successfully by the owners and managers of the railroads. It also showed that in the part of the United States east of Chicago and north of the Ohio river the sudden and rapid increase in the volume of business necessary for carrying on the war was greater than some of the railroads could handle. There was little or no trouble confronting the railroads in handling the business in other parts of the country. This was not a breakdown of the American railroad system any more than the inability of the steel companies to furnish all the steel wanted, the cotton mills all the cotton wanted, and

the shipyards all the ships wanted, was a breakdown of these industries. In these cases immediate steps were taken to increase capacity, some of which steps are only finished now, when the war is over. Similar steps were undertaken to the extent of the ability of the railroads to get money, men and material, but they, too, have been delayed in completing their work just as other industries have been. The real trouble was that under the regulatory system not enough latitude or margin was given to the railroad business to permit it to keep its plant ahead of the demands of the country. There should be a "factor of safety" in the transportation machine so it will at all times be "ready to serve" and able to carry the "peak" load.

To obtain the results needed for the protection and development of the nation it will be necessary to change and modify some practices and ideas that have long prevailed. The owners should assent to a very large measure of federal control, but they should also have federal protection and encouragement. The great labor organizations should assent to some orderly way of settling disagreements over wages and working conditions so that the railroads will continue to serve the public pending the adjustments of disputes. The government in its regulating practices should be more responsive to changing conditions, there must be less interference by states in the national regulation and development of the railroads, and there must be protection as well as regulation.

#### Present Great Systems Should Be Preserved

The present great systems of railroads have been built up in the last 40, 50, even 70 years, and they have developed along certain lines and are now a part of the industrial and financial structure of the nation. They are co-ordinated to themselves, to the communities they serve, to their connections and competitors as to tracks, terminals, equipment and other physical facilities, and their financial structure is very complicated; and they should be allowed to preserve their identity and integrity physically and financially. Small, unsuccessful and so-called "weak lines" that are dependent upon their connections with the great trunk lines must gradually be absorbed and become a part of some of the larger systems, just as has been done in the past.

Regulated competition, especially as to service, should be continued between the great systems. Without reasonable competition, development and the introduction of the most improved and advanced methods for giving service to the public will be checked. It will be better for the general growth of the territory between Chicago and the Atlantic seaboard if the New York Central is maintained in its entirety, the Pennsylvania System, and the Baltimore & Ohio; in the West, the Burlington system, the Union Pacific, and North Western; in the Northwest, the Northern Pacific and Great Northern; in the South, the Southern Railroad, the Atlantic Coast Line, etc.; in the Southwest and Pacific coast, the Santa Fe and Southern Pacific, and other examples could be given. The continuation of these great systems will develop a greater spirit of effort on the part of officers and employees than if all competition were eliminated, and this spirit means much for the future development of the railroads and greater satisfaction to the public.

#### Credit to Be Maintained

By means of adequate rates that will reflect promptly changing costs, increasing wages and taxes, and higher cost of new capital, the credit of the railroads and the stability of their securities should be protected because they form so large a part of the assets of banks, insurance companies, trust funds, etc., and because so many people are interested directly in insurance policies and deposits in savings banks. And further, because more capital must be put constantly into the business, and it should be made attractive to the investing public. Capital may be timid, but it is also in-

telligent. If it is once seen that the government is going to sustain constantly the railroads in the legitimate conduct of their business instead of confining itself so largely to the restraint of activities, there will be no lack of adequate capital, nor will the railroads themselves fail to give good service and justify the capital in its investment.

The man who puts a dollar of his savings into the transportation business does so knowing that his dollar is subject to the power of the government to make the rules and regulations governing the business. The man who decides to earn his dollar by working for the railroad should be willing to submit to reasonable wages and regulations just as much as does the man who puts in his dollar already earned. In a complex civilization like ours there must be continuous service by the transportation agencies, just as much as a continuous supply of water.

To bring this about there must be some method devised for reasonable federal supervision and regulation of wages and working conditions, and such regulation should eventually receive the final approval from the same power that is responsible for the rates of fare and freight charged by the transportation agencies so that the question of income with which to pay will be considered at the same time and by the same final deciding power as the outgo to be paid.

#### Federal Power Supreme in Cases of Doubt

The power of final decision as to rates and practices must rest with the federal government, and when it is to the interest of the nation as a whole to have a given basis of rates, or to adopt a given practice, rules and regulations of states, counties and municipalities must give way and must be subordinate to federal power.

Any benefits resulting from the management of the director general should be retained where it is reasonably clear that such benefits are of a permanent character and in the interest of the public in peace times. The director general names 17 reforms that he thinks should be continued. Those that prove of permanent value can be carried out successfully under private operation if the platform outlined by Mr. Cuyler and Mr. Thom is put into effect.

Railroads and water carriers should be permitted to make agreements between themselves covering such practices, as well as the making of rates and the division of earnings, all for the purpose of saving waste and giving better service to the public; but such agreements should be subject to close inspection, supervision and approval by federal authorities.

The director general commented on some of the difficulties being encountered in keeping up the organization and morale of the service, and intimated that unless the roads could be kept for a 5-year period they ought to be turned back promptly to their owners because of the difficulty of handling the intricate business satisfactorily under present laws and conditions for a shorter period. I can well understand the difficulties confronting the director general and his administration in view of the centralization of detailed management and operation. There is, however, a method of helping that situation that can be utilized very promptly. If all the information accumulated in the so-called "Newlands inquiry" and that to be obtained from the Interstate Commerce Commission, state commissions, railroads and from other students of the situation, is utilized, does anyone believe that some conclusion cannot be reached within the period fixed by the present law—that is, 21 months after peace?

#### Let Companies Help the Director General

While this work is going on the President should continue the central organization in Washington under a director general, who will supervise the whole situation, direct policies, and make those adjustments with the various railroads that will be required after governmental control ceases. The

present contracts between the government and the railroad companies should continue until the new protective legislation is passed. But this central organization should direct the operation of the railroads through the companies themselves rather than through a system of regional directors. In other words, say to the boards of directors and executive officers of each company that from and after a given date they are to take charge of their properties and manage, maintain and operate them for account of the United States and as may be ordered by the President through the central organization in Washington. At once there will begin to be a better feeling among officers and men, and less uncertainty about the future; the intricate and delicately adjusted organization on the great systems of railroads will begin to function better and work more smoothly and effectively; there will be less lost motion and crossing of wires than under the very highly centralized system now in existence with regional directors.

Most, if not all, railroad managers have reached the conclusion that what is known as the "divisional system" of operation is better than the "departmental." In other words, that someone must be in the driver's seat on a small enough unit of property to control the ordinary maintenance and operation subject to a central directing authority as to general methods, standards of work, maintenance and accounts. Where the departmental system has been tried it has not proved effective because of conflict of authority between heads of different departments at long distances from a central directing authority.

In making this suggestion I, of course, have no criticism to make of the director general, or of the staff in Washington, or of the various regional directors and their assistants (nearly all of whom I know personally), and they are all good and experienced men, loyal to the country, to the director general, to the railroads, and all have worked unceasingly. I believe the plan of operation adopted for the war period had advantages and helped to produce the results needed during the critical time, but the present methods in my judgment are not the best for peace times, either now or in the future, whatever system of regulation is finally adopted. I am perhaps freer to make this suggestion than many others because any change does not affect me personally for the reason that my work is of such a character that it will not be affected by the proposed change, dealing as it does with the corporate, financial and general questions of policy, organization, finances and management, and not with the detailed operation of the roads.

#### Morale Can Be Improved

I believe very strongly that a new basis of regulation can be worked out within the 21 months' period, and that if the management and operation of the properties is returned to the directors of each company, subject to the orders of the director general, there will be an improved esprit de corps, less unrest, and that greater efficiency will be obtained; that all of the plans about unification, economy, etc., that the central administration may wish to carry out can be made effective by the corporate organizations promptly. Under this plan there will be some saving in money because there is now more or less unavoidable duplication of effort, and a better preparation will be made for carrying on future constructive work under whatever plan Congress may adopt.

#### Fear of 5-Year Plan

There has also been some suggestion by the director general of lack of co-operation by the corporations, and that this is one of the difficulties in the situation that might be cured under a 5-year extension of time. On the contrary, I believe that a 5-year extension would make the companies hold back because of fear that the properties would never be restored to the owners. There may have been some differences of opinion, which is not unnatural, in the very large

and complicated problems presented to the director general and to those of the corporation charged with the duty of protecting the property rights for which they are responsible.

As a matter of fact, outside of a very proper desire to scrutinize the purchase of equipment at the very high war prices, I think there has been very little difference of opinion between the corporate officers and the federal officers.

Some objection has been made to the distribution of charges for betterments and improvements, and in some cases objections have been made to the work actually undertaken, but these have been small in number and amount.

It would seem to be right and proper to those representing the ownership of the property to point out to the director general that if capital is used for the purchase of unnecessary cars and engines, that reduces the ability of the corporations to make other improvements that may be found more desirable, like repair shops, in order to serve the public by keeping existing cars and engines in first-class order, and large terminal and track improvements that increase the ability of the railroads to make better use of existing cars and engines. In fact, the director general comments on this in his general statement.

#### The Future

In a growing and still undeveloped country like the United States, and with a future before it more wonderful even than its past, any system of internal transportation should provide for:

1. Inducement for the individual citizen to engage in the business by permitting reasonable rewards for brains, energy, industry and the capital employed, substantially equal to the same kind of rewards in other forms of human effort.
2. Constant developments of the transportation machine so as to keep it at all times ahead of the needs of the growing country.
3. Adoption of improved and improving methods of carrying on the business so as to obtain the maximum of efficiency and economy.
4. Reasonable and regulated competition and co-operation for the purpose of producing development of different sections of the country and improvement in the methods employed by the transportation agencies serving the country.
5. Continuity of service so that the transportation machine will always be in a position to serve the country unless prevented by act of God or by war.
6. Regulation by the United States through suitable government agencies, which regulation must be of such a form as
  - (a) To attract capital and permit a steady improvement in, and expansion of, the facilities;
  - (b) Which must protect the interests of the public using the railroads and promote the comfort, convenience and safety of that public;
  - (c) Which must protect the officers and employees who maintain and operate the road, and which must work constantly in the direction of improving working and living conditions; and which must provide some method of adjustment of any controversies about wages and working conditions;
  - (d) And which also must protect the interests of those who have invested money in the securities representing the railroads, and who are also directly interested because of their insurance policies, savings bank deposits, etc.

The suggestions outlined by Mr. Cuyler and Mr. Thom, representing the crystallized opinion of the principal railroad men in the United States, point the way to a system of ownership and regulation which will, in my judgment, produce the results desired by the majority of the people. Mr. Kruttschnitt and Mr. Willard have pointed out how much was accomplished under war conditions during 1917 by the united action of all the railroads, hampered as they were by restrictive laws. Much, if not all that can be accomplished by government ownership and operation can be obtained under the plans suggested and the value of individual initiative retained.

It is very gratifying to find that the Interstate Commerce Commission, out of its experience, makes many suggestions that are in line with those made by the railroad executives. Whether to put all the regulatory power in the hands of the Interstate Commerce Commission, or to relieve the pressure on that body somewhat by giving it help in the form of regional commissions, who will be nearer to the people and to the state commissions, and whether to recognize the great importance of the transportation business by having a cabinet officer to take charge of some of the executive work connected with regulation and to watch and protect the trans-

portation agencies, are, of course, questions of individual judgment. I believe, on the whole, better results for the nation will be secured by the plan suggested by the railroads.

### Secretary of Transportation

An effective transportation machine is vital to the interests of the nation in war and peace; its importance justifies having a man in the cabinet to confer on an equality with other cabinet officers dealing with great national questions and resources, and to present the transportation needs of the nation directly to the President and his advisers. He will not manage and operate the railroads any more than the Secretary of Agriculture manages and operates the farms of the country. He will not exercise the vast powers conferred upon the director general as a war measure, and he will not have (as some have suggested) 2,000,000 or more railroad employees reporting to him, directly or indirectly. He will have powers of supervision, of correction, and, what is equally important, of protection to the largest single business of the country after agriculture. With his aid, that of the interstate and regional commissions, and the state commissions, and with changes in laws as suggested, I believe government ownership and operation can be avoided, and that the railroads will enter on another period of stability, and that they will be able to serve the country wisely and well and give to their owners reasonable rewards for their investments.

### Statement by Samuel Rea

Samuel Rea, president of the Pennsylvania Railroad, said in part:

The records demonstrate that the American railways under the system of ownership by the people and their institutions, and private management and operation as distinguished from government ownership and operation, have produced the most efficient and cheapest transportation service, have paid the highest wages, and, I have little doubt, the highest taxes, in the world. Therefore, the system that has achieved this for the country should, as a matter of national policy, be continued, suitably modified to meet changing conditions.

The necessity for exclusive national regulation of interstate carriers arises from the many state and federal regulatory laws and the numerous separate and independent commissions created have naturally resulted in multiple and confusing regulation and policies that have seriously restricted the development of the railroads and the country's business and resources. The conclusion, after many years of experience, is that sound railroad credit and improved facilities can be systematically secured only by concentrating the regulatory power and responsibility in the federal government, administered, however, through agencies convenient to the public of the several states.

The necessity for relief from such confusing laws and regulatory policies, with no single governmental body responsible for final results, may be illustrated by the financial condition of most of the roads for several years prior to the war.

The waste and lack of responsibility behind such multiple regulations, with the resultant insufficient net profits, has caused capital to be reluctant to enter into new railroad projects, and new railroad construction has been brought to a standstill, notwithstanding the increase of population and traffic.

The railroad question is chiefly one of national transportation facilities, national traffic and national finance. Therefore, in a complete system of federal regulation, the exclusive power to supervise and authorize the issue of securities by interstate carriers should be the function of the national government. The railroads should have the approval of the secretary of transportation, for the issue of securities to

provide for their needs, and similar approval for important capital expenditures for extensions, branches and terminals. These duties are exceedingly important from a financial and traffic standpoint, and they will require prompt action in their discharge, for which some executive officer of the government should be responsible. The termination of federal control will again burden the commission with the stupendous work of handling numerous rate cases and tariffs, railroad accounting, safety appliance acts, hours of service laws, railroad valuation, traffic congestion and car distribution. The suggestions in the plan presented by us to relieve it from executive and administrative duties, and constitute it a judicial body to pass upon complaints concerning the reasonableness and adequacy of rates and traffic practices, and to deal with discriminations, but retaining the supervision of railroad accounting and railroad valuation, are demanded in the interests of good business, and the welfare of the public and the railroads.

To undertake the administrative and executive duties of the commission with reference to the railroads, the suggestion is made for the creation of a department of transportation with a Cabinet officer called the "Secretary of Transportation" as its head, and such administrative assistants as may be essential to properly observe the transportation needs, and adequately provide for the same by such orders as he may be authorized to make, by suggestions and co-operation with the carriers, and by representations to the Interstate Commerce Commission and the President. He would also be responsible for the approval of adequate rates and revenues to provide and maintain such proper service and facilities, and create railroad credit sufficient to meet public demands. He would also be required to protect the just interests of employees, shippers and the traveling public. He would recommend to the President such measures and policies as would promote the public interest and the adequacy of the transportation service. He would deal with suggestions of the railroads as to traffic distribution, and the joint use of terminals, distribution of equipment, and also a proper car supply for shippers. His approval should be essential to new issues of securities, and important capital expenditures for extensions, branches and terminals. He would have power to approve or disapprove decisions of the wage regulation board on questions respecting wages and working conditions.

To my mind, if there has been one helpful situation during the war to prevent delay and secure results, it was the power of the director general to decide transportation questions promptly. The railroad companies and the secretary of transportation, charged with executive and administrative duties, should be left in relatively an equally strong position to act promptly and decisively in executive and administrative questions, subject, however, to appeals to the Interstate Commerce Commission if the public interests are not properly safeguarded. Through this officer, the transportation necessities would become the direct responsibility of the government to the country at large, but this officer would not operate the railroads nor appoint any of its officers or employees.

Suggestion is made that the Interstate Commerce Commission may divide the United States into such number of regions as it may deem wise and as the President may approve, and regional commissions should be created, consisting of one member for each of the states embraced in such region, to provide some regulating agencies convenient to the people of the several states. Decisions of the regional commissions should be final unless the Interstate Commerce Commission shall otherwise order.

The state commissions, however, should continue to deal with the regulation of state public utilities, and to perform such other duties as may be imposed upon them by their respective states, but as to interstate commerce their powers

should only include the regulation of such of the intrastate duties of interstate carriers as do not affect other states, or the relative burden of furnishing and sustaining the facilities and instrumentalities of commerce on which other states are likewise dependent. It seems quite clear that no state should possess the power, or be willing for any other state to possess the power, to create discriminations between the traffic in one state and the traffic in another, or by inadequate rates to make a smaller contribution than their sister states to the support of the transportation facilities on which both states are obliged to rely for the carrying of their traffic. No matter how able, or just, the state commissions may be, they are of themselves unable to relieve interstate carriers from the conflicts or burdens imposed by their own and other state laws.

The ability to promptly initiate reasonable rates would be helpful to business, and would remove the uncertainty that has hurt railroad credit in the past.

The Interstate Commerce Commission should also have the final power to decide minimum as well as maximum rates, and to determine the relations of rates and differentials whenever necessary.

No scheme of railroad regulation can be successful unless there is provided in the statute itself an assurance that the returns from railroad operations will be sufficient to pay operating expenses and taxes, to give a proper return on the investment, and to furnish a basis of credit adequate to provide for the public needs for improved and extended facilities. Otherwise we will see a repetition of restricted railroad credit with its disastrous consequences of limited facilities, inadequate for the commerce of the country. Practical experience demonstrates that only by accommodating the public is it possible for the carriers to be successful, and continue a sound system of finance for any period of time.

It is clearly in the public interest, and equitable to both labor and capital, that there should be no impairment or interruption of the movement of trains. Accordingly the secretary of transportation should have a wage regulatory board on which the public, the employees and the employers should have equal representation. Its conclusions should go to the secretary of transportation, who should be the final authority to decide wages and conditions of service. Pending such investigation there should be no lock-outs and no interruptions of service. The scale of wages and the expense incident to any change in working conditions recommended by the wage board, and approved by the secretary of transportation, when put into effect should be recognized in the making of rates as a legitimate expense in transportation in the public interest.

It is clear from the experience of the past and from the testimony already before this committee by the director general, and from the suggestions of the President of the United States to Congress, that existing laws should be modified to bring about further railroad unification and co-operation among the carriers. In the Pennsylvania System there are 140 active corporations constituting the railroad system. While these 140 companies represent what were originally about 600 separate small companies, further unification is desirable on equitable terms, and could be accomplished better and quicker under national legislation. Therefore, as I assume the conditions on the Pennsylvania System to be typical of many of the larger systems, the interstate carriers should be given authority to acquire the property, stocks and securities of feeding and connecting lines in their territory, including lesser companies, and to accomplish consolidations and mergers subject to the approval of the secretary of transportation. In view of the manifest tendency of public opinion toward proper and useful consolidation of railroad properties, it is necessary to remember that the laws of many of the states, in their conflicting statutory provisions, and in

their prohibitions against consolidations, constitute an insuperable obstacle in the way of carrying out any such policy unless national authority is obtained for it.

Subject to his approval, the carriers should also be able to enter into agreements and understandings in respect to any co-operative arrangements based upon experience, which may be found in the public interest, and consistent with efficiency and economical railroad transportation.

As a safeguard against delay or uncertainty that may ensue in making final financial settlements between the railroads and the government when released from federal control, and to avoid any disruption of the financial structure of the country, it may be essential that provision should be made to fund the indebtedness of any carriers to the United States growing out of federal control.

Federal incorporation of the existing interstate carriers may be essential to more effectually carry out the foregoing plan. All contract rights, assets and all powers and franchises, as far as possible, of the existing corporations should be preserved, in addition to such general powers as may be conferred upon the corporations by such federal incorporation act.

Under such a general system of responsible national regulation, containing statutory provisions that will insure reasonable and adequate rates, the railroad companies should be self-sustaining and able to properly serve the public, and they should not become an obstacle to industrial and commercial progress, nor weaken the financial and credit stability of the nation. Many different plans have been referred to in the public press as a basis for future railroad relations with the public and the government, but I believe that the principles of the plan suggested by the railroad executives should form the basis of future Congressional legislation, and will prove more satisfactory, and less costly than any other system of public regulation, control or ownership so far suggested.

Benjamin C. Marsh, executive secretary and director of legislation of the Farmers' National Council and the Farmers' National Committee on Transportation, entertained the committee with an argument for government ownership and operation of the railroads, proposing that they be paid for by inheritance taxes and the taxation of profiteers. Pending the death of the rich men, he proposed a Liberty Loan to obtain \$11,000,000,000 or \$12,000,000,000 by popular subscription to buy the railroads. He objected to the proposal that railroad officers and employees should elect two-thirds of the directors of a government corporation and suggested five groups of directors, consisting of representatives of farmers, employees, merchants and manufacturers, non-commercial municipal associations and one-fifth to be selected by the President. He suggested that there should be at least one woman in each group. He opposed a five-year extension of federal control.

#### Mr. Warfield's Statement

S. Davies Warfield, president of the National Association of Owners of Railroad Securities, submitted a supplemental statement on February 13 regarding the plan which he had previously presented and regarding the suggestions for a permanent solution made by Director General Hines. Mr. Warfield said in part:

"The question has narrowed down to the well-recognized fact that a *measure* must be applied by one method or another, by which a given return to the railroads is assured whether guaranteed or not, that is sufficient to attract capital for their legitimate purposes; at the same time earnings are to be limited to a fair and reasonable return. Whether you make this *measure* the bonds or stocks, guaranteed by the government, or unguaranteed, of new and fewer regional corporations to be formed, to be exchanged for the bonds or stocks of present railroad companies in such amounts to the

security owners of each railroad as may represent their proportion of property and earnings of the company issuing them; or whether you make the *measure* a fixed reasonable return on the aggregate of the investment in railroads taken in groups by adjusting rates to produce this return, the amount each railroad receives being dependent entirely upon its competing actively for business and as the result of efficient methods of operation—excess earnings beyond this return being used in the public interest—is the real question now before your committee. For, after all is said, one method or the other must be adopted sooner or later, unless you decide to turn the railroads back under the regulatory methods of the past, and without defining what a “reasonable” or “fair” or “adequate” return to them means. This leaves the Interstate Commerce Commission to define it, without instruction as to policy, which has not been satisfactory or successful in the past.

“Under the regional method guaranteed bonds or stocks of the new and larger regional companies to be formed are to be exchanged for the bonds or stocks of each of the existing companies, in the proportion that you scale down the securities of each or adjust them. Under the second or the method we propose, present outstanding bonds or stocks remain, but the value of the securities of each railroad is dependent upon the *actual property* they represent and the *percentage* of return each railroad earns entirely through its own efforts, earnings in excess of the reasonable return being taken from it and under rates adjusted to the requirements of the plan we have submitted.

“The regional method means government ownership, for in any event, if a governmental guarantee on railroad securities is to be thought of, it must necessarily carry with it, if not at first, eventually, the complete control and management of the companies, whose securities it guarantees. Incentive and initiative cannot be continued under this method of dealing with the subject. For as you exchange your bonds or stocks for bonds or stocks guaranteed by government, of larger regional companies organized under federal incorporation, whether permissive or compulsory or under a federal franchise, with federal management, in whole or in part, we have entered government ownership. Experience has proven that the return on such bonds or stocks would be limited to the guaranteed bonds or other senior securities issued in exchange and intended to represent the main part of the supposed value of your property. What would represent so-called equity would likely never be reached in the distribution of earnings.

“The concentration of railroad facilities in the larger regional companies managed by the government defeats real competitive service. Incentive, initiative and service will shrink in the proportion that you concentrate facilities. The readjustment of business and financial enterprise must await the settlement of the railroad problem under the regional method. The realignment of railroad values would be necessitated in the formation of new companies. The uncertainty attending the exchange of securities would disastrously affect general credit.

“To endeavor to *enforce* consolidation of existing railroad companies into fewer larger regional companies is not in the public interest. Enforcement of consolidation could be secured only through the operation of law of extremely doubtful validity. Enforced or voluntary, it would involve waiting until valuations are made of the properties, now in progress by the Interstate Commerce Commission, or another valuation body must be established, now hardly practicable.

“If consolidation is not enforced but voluntary, the larger corporations become holding companies, and unless and until owners of billions of underlying bonds consent to exchange, which would be unlikely, you would have great companies organized issuing collateral trust securities. Their credit

would consequently not be high, even though the government should guarantee their securities for exchange and for sale for improvements to railroad properties. Any plan to secure the exchange of securities that permits underlying bonds of individual railroads to remain outstanding, or parts of other securities to stay undisturbed and hopes to secure the voluntary exchange of securities, whether bonds or stock, under valuation to be determined, and contends this can be done fairly rapidly is misleading. To institute consolidation into larger (holding) companies with issues of securities for exchange and for sale subject to underlying bonds, would not be attractive or calculated to give financial credit to future issues of railroad securities. Voluntary exchange of securities would not get you anywhere. An offer to exchange a collateral trust security to be issued by the larger companies secured by such bonds and stocks as may voluntarily be turned in for exchange, would not attract investors. The proportions of this class of investment required to be given to induce exchange would likely result in small reduction, if any, in capitalization. We have had the experiences of the past in security exchanges of a single corporation, with the usual ‘hold up.’ Do you not think this would become universal when the whole country would be filled with ‘protective committees’ and similar ‘helpful’ agencies? It might constitute a harvest for the bankers, but at the expense of the shippers, the public and the security owners.

“For years past we have seen the general railroad situation dominated by the managements of a few of the larger and more favorably situated railroads; for, through their influences in respect to the rate-making gateways of the country, in division of rates, and through their power, they have been able to favor certain seaport cities, certain localities and railroads in the disposition of freight. This policy will continue only in more aggravated form under this method. In the exchange of securities of present corporations for those of the larger divisional corporations the same influences would necessarily control the larger corporations, for they would receive the greater amount of new securities issued. The advantages expected to be secured by dominating railroad interests through compulsory federal incorporation of railroads, will be just as well attained through the control of the larger corporations. Foreseeing this would not government take full control and complete management to prevent these things happening? We contend, therefore, that this method means government ownership. There cannot be worked out practically a partnership between government and the owners of the railroads, both in ownership and management, and it should not be. Any enterprise, the people, through government, guarantee, through government also should be operated. And if we are to have government ownership, let us have it unconcealed, ‘naked and unashamed.’

“If present federal control and operation is continued during the period when the proposed new companies are forming, securities guaranteed and present securities scaled, as suggested, you head the railroads directly into permanent government ownership. It is idle to say, as has been stated, that present federal control and operation can be extended, with definite purposes in the minds of those in control of it, and at the same time state that you do not favor government ownership, when, perforce, you bring it about whether you favor it or not. Give me the direction of extended federal control and operation of the railroads for five years, or even three years, and under my direction they could be so operated that at the end of the period they would find themselves in the position of being forced to accept the larger company proposition, or government ownership, if it was my belief that it was desirable to eventually land them in one or the other direction. The attitude of one man, so placed, could determine and control the policy of the

nation in respect to these great enterprises. His political power, if he chose to exercise it, would be dangerous in the extreme. The power to enforce the payment of government loans to railroads is, in itself, an effective means to an end. One man wielding this great financial power alone, with the government back of him, can do many things to accomplish his aims.

"It is neither fair nor economically sound for the army of railroad employees to be placed under the control and under the political influences possible of being exercised by any such system. To say that it will not be so exercised by an appointee under a government as partisan as our own is not in accordance with the facts. And the higher in the councils of the administration that appoints him you place the man at the head, the greater political power you give him and the more he will exert it. If representatives of labor favor an extension of this system then they are misguided. It is unsafe for either employees, shippers, the public or the owners, notwithstanding the fact that the railroad executives have recommended the continuance of this system in even a more aggravated form.

"The federal control act did not anticipate the operation of these individual railroad properties for the purpose of carrying out the theories of any one government official or set of officials. If Congress should unfortunately determine that larger regional companies shall be organized, then Congress at that moment ought to direct the federal official who will continue to operate the properties during the 21 months remaining, just what he is to do with them in order that their owners and the country may promptly know the final result. But to extend the time for such operation with the power to continue to divert traffic and 'unify' railroad systems or parts of systems, so that under a war measure the business of the railroads, and in fact, part of their property, may be gradually absorbed, one by another, until you reach the point where it will not be possible to return them, is not what your act said, nor is it fair to the owners of the properties for this to be permitted. If Congress by act, will remove the legal barriers to the regulated combination of railroads, and will let the railroads of the country work out their own combinations along natural lines, not enforced lines, you will eventually secure service by such combination, as may be desirable, and such as the public interest demands. But this should proceed orderly under the supervision of the Interstate Commerce Commission (and under the corporation we have proposed).

"By the use of the means you have at your command, supplemented as proposed in our plan, early action can be secured without disturbing the existing railroad structure or financial credit, which the present situation, if nothing else, demands should not be done. Things are at a standstill. Revolutionary policies, such as government ownership or compulsory consolidation, carry profound dangers. Congress might set in motion movements that it could not check."

### Shippers Oppose Government Operation

Guy M. Freer, president of the National Industrial Traffic League, said the league had adopted resolutions unalterably opposing government ownership or long-continued government operation of the railroads and expressing the belief that, prior to the return of the roads to corporate control and operation, some legislation should be enacted in the interest of the railroads as well as for the benefit of the public. Realizing that the time remaining will not permit thorough consideration of the subject and the passage of necessary legislation at this session, he offered recommendations for early consideration, followed by a general outline of the program proposed for future legislation.

For immediate action the league recommended definite rejection of the proposal to extend the period of government

operation because it is convinced that necessary legislation can be enacted to permit the return of the properties to the owners within the time now fixed by law, and that diligent efforts be made to effect the return at an earlier date if necessary legislation can be had so that the return may be accomplished in an orderly way and with due regard to the interests of the public, including the investors in railroad securities. Pending the return to corporate control and operation the league recommended that Section 10 of the federal control act be amended to provide that during the continuance of government operation, all rates, fares, charges, rules and classifications of the railroads under federal control, as shown in tariffs on file with the Interstate Commerce Commission, shall remain in full force and effect until changed by authority of the Interstate Commerce Commission. After return to corporate operation jurisdiction over such rates, fares, etc., should be the same as prior to March 21, 1918. It was also recommended that provision be made requiring the director general to pay final judgments in suits for recovery of claims for losses, damages, overcharges, etc. Mr. Freer said that shippers never were convinced as to whether the director general has the authority to set aside state rates, but that the power has been exercised and they want it made certain during the remaining period of federal control. He then gave an outline of the suggestions of the league with respect to future legislation, which will be expressed more specifically at a later date if the committee desires, as follows:

"We suggest repeal of anti-trust and anti-pooling legislation as affecting railroads, and the enactment of legislation permitting, encouraging and, in proper cases, requiring co-operative activities among common carriers, such as the pooling of cars, locomotives and other equipment; the joint use of terminals; also the merger of railroads within reasonable limitations and when approved by the commission as in the public interest.

"In permitting pooling of traffic and of the revenue derived from such traffic it should be provided that the approval of the commission be first obtained, and that the service of the carriers to the public be not impaired by such pooling, and that the commission be authorized to dissolve such pools whenever the public interest may so require.

"The commission should be given clear and complete authority to fix the divisions of joint rates, whether or not such joint rates were prescribed by the commission.

"Amend fourth paragraph of Section 15 of the act to regulate commerce eliminating the provision that the commission may not, without the carrier's consent, embrace in a through route substantially less than the entire length of its railroad, etc.

"Amend Section 15 of the act to regulate commerce to give the commission authority to prescribe minimum rates, where the commission finds such action necessary in order to remove unjust discrimination or to correct rates found to be so low as to place an undue burden on other traffic.

"Give to the commission authority to regulate the issuance of railroad securities, and supervise the expenditure of the proceeds thereof.

"Confer upon the commission power to authorize or require extensions, additional facilities and equipment of common carriers and to exercise general supervision over service, operation and maintenance.

"Authorize the Interstate Commerce Commission to co-operate with state commissions, and to utilize, where practicable, the services and facilities of such state commissions.

"Enact such further legislation as may be necessary to give the commission jurisdiction to fully control interchange of traffic between rail and water carriers, the establishment of joint routes over such carriers, and to prescribe joint rates and the divisions thereof, or proportional rates where desirable, in order to encourage the development and use of water

transportation where economical and in the public interest.

"We do not favor continuance of the amendment of August 9, 1917, to Section 15 of the act to regulate commerce, which requires that schedules of rates must be approved by the commission before filing by carriers. We advocate initiation of rates by the carriers, subject to the suspension power of the commission as now embodied in Section 15. In connection with the initiation of rates by the carrier, we recommend that the commission be authorized to establish such machinery or prescribe such procedure as may be deemed desirable to provide for publicity by the carrier of contemplated rate changes, and for conferences between the carriers and the interested public before tariffs are filed, in order to prevent unnecessary litigation before the commission, and minimize demands upon the commission for the exercise of its suspension power.

"We earnestly insist that federal regulation of common carriers be vested in the Interstate Commerce Commission exclusively, and protest against legislation investing federal regulatory authority in whole or in part in any other governmental department or agency."

Mr. Freer recommended that no legislation should be attempted at this session to interfere in any way with regulation by state authorities, saying that the shippers hope it will be possible to work out a plan of co-operation between the state and the federal commissions.

The league, he said, is substantially in accord with the recommendations presented before the committee by the Interstate Commerce Commission and with the features of the Warfield plan that deal with regulation. As to the financial features of the plan the shippers felt that that represented a field which they should not enter into. Mr. Freer declared that the committee should give no heed to the suggestion that the Railroad Administration has not had a fair test. The people of the country never authorized it to make any test and never would have consented to government operation except for the war emergency. It undoubtedly could show an improvement over the first year's operation, but the system is all wrong and ought to be abandoned. If the step of extending it for five years is taken, Mr. Freer declared, it can never be retraced. The Cincinnati Chamber of Commerce, with 3,000 members, had taken a referendum vote which was ten to one against government ownership or continued government operation and he thought that reflected the sentiment throughout the country.

#### State and Interstate Rates

C. W. Bunn, general counsel of the Northern Pacific, testified briefly on February 13 advocating giving the Interstate Commerce Commission power to harmonize state and interstate rates. No system of regulation will be successful, he said, unless it contains the elements of a power in the federal government, to be quickly and effectively exercised, to control the whole rate situation. He did not suggest that state commissions be abolished nor any limitation of their functions, except that their rates from time to time ought to be reviewed by the Interstate Commerce Commission and if necessary brought into harmony with the interstate rates. The rate subject, he said, is essentially a unit and cannot be dealt with piece-meal or by state laws. He spoke with great respect for the state commissions, but insisted that the weakness of the state situation is that no state authority can look beyond its own borders and cannot regulate with reference to the entire system. He submitted a plan comparing the Minnesota intrastate rates with the interstate rates in the same territory as of January 1, 1918, which, he said, showed that the state rates are approximately two-thirds of the interstate rates. These represent cases of plain discrimination against interstate commerce, he said, but no lawyer can say what a court or a commission will hold to be discriminatory. The Shreveport decision does not provide an adequate remedy without long proceedings and to determine what is

a reasonable rate ought not require three or four years of litigation.

The plans which have been proposed for co-operation between the state and interstate commissions, Mr. Bunn declared, represent a weak solution of the problem because each compromise is to some extent a surrender of federal authority and, moreover, would be ineffectual because a large proportion of the state rates are made, not by commissions, but by the legislatures, and the state commission is, therefore, powerless. As an example, he said the North Dakota legislature had recently passed a new rate bill making drastic reductions on all rates in the state.

"No general and consistent policy can possibly be pursued and no definite aim can be realized," Mr. Bunn said, "if the federal government and the states as heretofore are all free to act on the subject of rates within the field occupied by each under the old system. The closer one comes to a true appreciation of the problems of railway regulation, the more apparent it becomes that a railway is a unit; that it can no more be divided by state lines than by county lines; that any attempt to parcel out its regulation is doomed to failure, and that it cannot successfully serve several masters."

He proposed that the commerce act be amended by striking out the proviso in section one which excepts state rates and inserting the following: "and also to the extent hereinafter stated to the transportation of passengers or property wholly within any state," and by adding to Section 13 a new paragraph providing that the Interstate Commerce Commission may after due notice and hearing establish such rules, orders, rates and practices applicable to transportation wholly within any state as it may find necessary to bring into harmony and to the same basis that the rates, orders, rules and practices applicable from time to time to commerce among the states.

#### N. L. Amster Makes Suggestions

Nathan L. Amster, president of the Investors' Protective Association, filed with the committee a discussion of the railroad problem and a plan for the future management and operation of the railroads. Mr. Amster included a long discussion of railroad financial scandals and declared that his association is unalterably opposed to having the railroads return to pre-war conditions. Asked how many security holders his association represented, Mr. Amster said that he could probably claim 50,000 or 60,000 stockholders through his membership in protective committees of New Haven and Rock Island security owners. He declared that a repetition of the financial scandals cannot be prevented unless the management and financing of the railroads is forever put out of reach of the Wall street banking interests and he presented a plan providing for the incorporation of a national transportation corporation to absorb the stocks of all the railroads now operated under federal control and possibly others, with an authorized capital stock of \$15,000,000,000, to be managed by a board of governors composed of seven members named by the President to hold office for life, four members to be selected from the stockholders, one from the employees, one from the commercial or shipping interests and one to represent the government.

The stock of the federal corporation would carry cumulative dividends up to 5 per cent and be limited to 6 per cent, all earnings in excess of the 6 per cent dividend to be distributed as follows: 40 per cent to be distributed among the employees on a percentage basis in proportion to their wages, 30 per cent to be set aside as a fund to be known as a bonus or merit fund as an incentive to employees for unusual service or inventions, and 30 per cent to be used for property improvements. Mr. Amster also proposed the creation of a permanent valuation adjustment commission appointed by the President to determine the fair value of the stocks to be acquired by the federal corporation. The board of governors under his plan would select its own chairman

annually and would employ a staff of five of the best technical and practical railroad engineers obtainable to co-operate with the board in all matters pertaining to the technical operation of the railroads. For the purpose of economic operation the railroads would be divided into five regional systems, each managed by a regional director. The plan also provided for a trust and finance corporation with a capital of \$500,000,000 owned by the federal railroad corporation to do the financing for the railroad corporation, also a labor adjustment commission to settle labor disputes and adjust wage scales.

**Employees Representatives**

E. H. Morton, president of the Order of Railway Station Agents, which has a membership of about 4,000, endorsed the plan for an extension of federal control for three or five years, but said that if such a plan is not adopted the railroads should be returned by July 1, in order to relieve the uncertainty. He opposed permanent government ownership or the profit-sharing plan proposed by the brotherhoods, saying that either would destroy initiative and incentive and that the profit-sharing plan would be conducted at the expense of the great middle class. He also cited figures which he said he had seen in the *Railway Age* to show that the American railroads perform their service with a much smaller number of employees per mile of line than the government-owned railroads in Europe.

P. J. Coyle, president of the Brotherhood of Railroad Station Employees, which he said had a membership of about 15,000 baggage men, freight handlers, etc., endorsed the plan for a five-year extension, saying that this would afford time in which to work out a permanent plan. Asked his opinion as to government ownership, he said he had not made up his mind definitely, but that he would prefer government ownership to the former plan of private management. He said the attitude of railroad employees who are in favor of government operation is influenced mainly by the fear that if the railroads were returned to private management their wages would not be maintained.

**Commissioner Woolley's Standard Rate Structure**

Robert W. Woolley, member of the Interstate Commerce Commission, who testified before the committee in January recommending that the period of federal control be extended for five years in order, among other reasons, that a standard rate structure based upon a uniform mileage rate plus terminal charges might be substituted for the numerous rate-making plans now in effect, has filed with the committee a plan giving a general idea of what, in his judgment, would form a sound basis for such a standard rate structure, based on cost of service, including a return upon the investment. Assuming 6 per cent to be a fair return, he finds the total transportation cost borne by the public, based on 1916 figures, assumes 25 per cent of this to be assignable to passenger service, estimates that approximately one-third of the cost assignable to freight is required to meet the terminal expenses and finds that the average cost per car mile for the road haul service was approximately 11.37 cents. Estimating the carloads of freight originated by dividing the car miles by the average haul, he gets an average terminal cost per car of approximately \$15.75. Using as units 12 cents per car mile and \$16 per car to be generous, Mr. Woolley has worked out a series of mileage scales, compared with the rates in effect on June 30, 1916, on certain selected commodities for varying distances. "Where the rate is uniform," Mr. Woolley said, in explaining his plan, "and available alike to all shippers of like commodities, there can be no unjust discrimination, undue preferences and rate inequalities, either voluntary or involuntary—such as the present statutory regulations aim to eliminate, but with which the present rate structure nevertheless is saturated."

**Central Western Region;  
First Annual Report**

THE ANNUAL REPORT submitted to the director general by Hale Holden, regional director for the Central Western region, gives the following statement of economies effected:

**(A) Unification of Terminals and Stations**

	Estimated saving per annum
Stations consolidated, passenger.....	\$284,018
Ticket offices consolidated (25 cities).....	507,421
Stations consolidated, freight.....	447,653
Stations consolidated, joint passenger and freight.....	228,484
Rearrangement of service into terminals.....	435,937
Consolidation of car-inspection forces.....	1,360,196
Consolidation of switching.....	1,886,602
Consolidation of mechanical forces and facilities.....	174,696
Rearrangement of freight-train service.....	272,151
Consolidation and abandonment of railroads.....	291,900
Telegraph department consolidations.....	29,171
Rerouting of freight trains.....	198,182
Consolidation of general office forces and miscellaneous.....	326,204
Total .....	\$6,442,620

**(B) Elimination of Passenger-Trains**

Passenger trains eliminated made a reduction of 15,500,784 passenger-train miles per annum, resulting in an estimated annual saving of \$11,231,317. In addition there was a reduction in Pullman car service of 38,703,614 passenger-car miles, the saving resulting from which has not been translated into terms of money.

**(C) Reduction in Organization**

General officers.	
Amount of salaries:	
Under corporate control, 1,466 officers.....	\$7,714,120
Under federal control, 1,174 officers.....	5,415,981
Saving.....	2,298,138
Elimination of off-line offices, saving.....	2,674,256
Reduction in valuation expenses chargeable to operating-expense accounts, amount.....	100,449
Discontinuance certain New York executive offices, amount.....	860,000
Total .....	\$5,932,844

**(D) Miscellaneous Economies**

Folders.....	\$119,376
General advertising.....	1,345,842
Discontinuance of membership in various associations.....	111,661
Increased use of railroad wires for telegraph messages.....	45,523
Miscellaneous.....	107,208
Total .....	\$1,729,612
Saving through economies by reason of simplified accounting between federal-controlled lines.....	475,118
Total .....	\$2,204,730
Grand total, A, B, C, and D.....	\$25,811,512

**Intangible Economies**

Since April, 1918, 124 Baltimore & Ohio locomotives have been received for general repairs, 95 of which have been repaired and returned. During the past six months 95 locomotives have been in service on eastern lines, and 39 are still on foreign lines.

**Rerouting of traffic.**—Many shippers have adopted direct routing of traffic as a policy of their own besides what the roads have done.

An average of 4,672 cars per week are now saved by means of the sailing-day plan. Especial attention has been given to the most economical and direct routes in the handling of traffic between San Francisco territory, southern California points on the one hand and northwestern territory on the other, and middle west terminals and junctions. In consequence, as an important illustration, the movement of California deciduous and citrus fruits has been handled with better general satisfaction than ever before.

From September 1 to December 21, reports from lines in this region show a total of 29,137 cars rerouted by railroad direction, with an aggregate saving of 3,977,844 car miles, or an average of 137 miles per car, but the voluntary action of shippers has resulted in a larger saving of car miles in the aggregate than that accomplished by the railroads.

### Movement of Business

Not at any time has there been a congestion or accumulation of freight traffic of consequence, because the loading and movement were closely policed and when necessary the proper regulating measures were enforced, as evidenced by the grain permit system adopted and in effect since September 18, which action was necessary on account of the unprecedented heavy grain movement during the months of July and August, resulting in all available storage facilities at primary markets being rapidly filled.

The influenza epidemic incapacitated a very large number of operating and mechanical department employees, interfered to a certain extent with the free movement of traffic, but no serious congestions or delays resulted. The car supply generally was ample to meet requirements, with the exception of short periods during the peak movement of seasonable commodities.

Some difficulty was experienced in fully meeting the car requirements for early movement of range cattle and sheep, due primarily to the desire of all shippers to move at the same time, and it was impossible to protect all loading upon demand, but the business was moved with general satisfaction and consistent with facilities at primary markets to receive. In November and December the offerings of hogs for shipment have been greatly in excess of capacity of markets to absorb, which has made necessary the adoption of the permit plan.

During six months 581 solid trains of California fruit were run to the Missouri River and Chicago, with a total of 22,561 cars, an average of 38 cars per train; also 147 special trains from Colorado, containing 4,514 cars, an average of 31 cars per train. All special trains have been operated upon conservative schedules, and the trains filled to reasonable tonnage with non-perishable freight. The growers and distributors have expressed general satisfaction with the service rendered.

Since July 1, 1,037 special oil trains have moved over roads within this region from the mid-continent field, with a total of 30,821 cars, an average of 29 cars per train. In addition to this, 124 special trains were operated from Wyoming and California, with a total of 3,983 cars, or an average of 33 cars per train.

Troop movements to the Atlantic seaboard have aggregated 682 trains and 301,869 men, averaging 443 men per train. With but few exceptions, all trains were operated upon schedule and without any serious accidents. Wherever possible special trains have been run for all commodities moving in volume for certain destinations (fruit, oil, grain, etc.), enabling us to route the trains so as to avoid congested terminals. A total of 1,969 trains, with 63,939 cars, an average of 32 cars per train, have been so handled. The sailing-day plan has been made effective at 106 points in this region, resulting in a saving of 261,508 cars per year.

Some complaint has been made by the shipping public in connection with the sailing-day plan, due to alleged discrimination from a competitive standpoint. I feel that these complaints will be eliminated when the plan is more generally adopted in the other regions and is put into effect as between the eastern producing centers and the western consuming points.

### Engines and Cars

The number of locomotives on lines in this region July 13 was 12,364, and the number out of service was 1,907, or 16.15 per cent of power. The number of locomotives on line December 14 was 12,454, with 2,150 out of service for repairs, or 17.2 per cent. The number of locomotives turned out of shops during the week of July 13 was 856, against 811 December 14. This decrease of 45 engines was due to shops going on eight hours December 9, but shows an in-

crease of 137 locomotives repaired over December 14 last year. Total men employed in locomotive department July 13 was 61,870, and on December 14, 65,867, an increase of 3,997 men.

The number of revenue freight cars on lines June 22 was 352,484, of which 5.5 per cent were on shop tracks for light and heavy repairs. Comparing June 22 with December 14, shows that while there were 16,179 more revenue cars on the region, the percentage of total bad orders to revenue cars on lines was 4.9 per cent.

### Maintenance and Construction

Railroads in the Central Western Region have been well maintained, although the full quota of rail and ties, because of war conditions, has not been received by all lines. Labor supply likewise has, for the same reasons, been subnormal during most of the year, but by reason of the favorable climatic conditions during the fall and the late arrival of winter weather in the territory east of the Rocky Mountains, it has been possible to overcome a great deal of the delay which existed in the earlier part of the season.

All lines have reported that their general maintenance conditions compare favorably with a year ago, particularly as far as track and roadbed are concerned. Marked progress has been made in specially authorized work during November and December. With an improved supply and delivery of rail, ties, and other material, which is now anticipated, it may be confidently predicted that before the year 1919 is far advanced such maintenance work as has been delayed will be fully completed and all new work authorized, excepting where delayed or deferred for special reasons, will be well on toward completion.

The regional purchasing committee has attended to the distribution of ties reaching this region on the north bank of the Ohio river, and in addition there was shipped between August 15 and December 15 to railroads outside of this region approximately 1,000,000 ties. The tie-treating department has been productive of much benefit and the quality of tie treatment has been improved. Investigations have been made under the direction of the committee toward the location of one or more tie-treating plants in the Rocky Mountain territory so as to utilize vast supplies of native timber available for tie manufacture in that general territory. The organization of the stores department is expected to develop material saving in the handling of stores and reduction in the amount of stock necessary to be carried.

### Fuel Conservation Section

A supervisor of fuel conservation has been appointed and good results are already in evidence. The fuel practices of each line have been examined; locomotives in service are ridden and aid given to firemen in improving firing practice. Staff meetings on each line have been held, attended by all officials concerned in the problem of fuel conservation, and enthusiasm to accomplish results has thereby been aroused. On all roads fuel departments have been organized with a man in charge, with necessary assistants to ride locomotives instructing engineers and firemen.

### Safety Section

A regional supervisor of safety has been appointed, and active work has been carried on throughout the region. Safety supervisors are now employed on each line, devoting practically all their time to intensifying safety work. There has been an appreciable decrease in accidents during the past four months and further improvement in results is certain to occur from the ample support which the movement is securing from all lines in the region. General, division, shop, terminal and local committees, aggregate 362 committees, representing a total of approximately 6,800 committeemen.

### Freight Claims

A supervisor of loss and damage has been appointed and conferences have been held with officials in charge of this work at various points. Rapid progress is being made

toward uniform methods of handling claims and for prevention work, and meetings are being held at local points with officers and employees connected with the handling of freight.

## A Suggestion Concerning Today's Railroad Problem\*

### Railroads Cannot Eat Their Cake and Have It; Government Guarantee and Private Operation Irreconcilable

By Otto H. Kahn

IT IS ONE OF THE CHARACTERISTIC QUALITIES of the American people to learn quickly. One year's experience has sufficed to demonstrate to the people at large that government operation of railroads means deterioration in service, higher cost, lessened eagerness to please the shipper and study his convenience—not to mention the menace of politics becoming a determining factor in the fixing of wages, in new construction, betterments, etc.

The program, in support of which I believe public opinion crystallizing more and more, is:

Let the government exercise strong and comprehensive control, but fair and constructive, not punitive or strangling.

Let those features of operation, which under government management have proved advantageous and convenient to the public, be preserved and those features of legislation and administration, which experience has shown to be unduly and unwisely hampering, be abolished.

Without eliminating state commissions, let their functions be so adjusted as to avoid conflict with the federal commission in matters of rate-making and security issues.

Let railroading then be thrown open to private initiative and enterprise, and competition in service; make it an attractive field for capital, and, above all, for men of ability and vision.

If there is one thing less desirable than outright government operation, it is government control so minute, hampering and all-pervasive as to be tantamount to government operation without corresponding responsibility. Most of the plans which have been put forward within recent weeks from individual quarters, would mean this very thing. Their authors start by declaring themselves utterly opposed to government operation, and then devise a set of provisions, which to all intents and purposes, are equivalent to government operation, or would necessarily lead to it. A feature common to all such plans, and, in my opinion, their fatal defect and largely the explanation of their self-contradictory character, is that they are based upon a permanent government guarantee of minimum earnings for the railroads.

The two things, i. e., private management and permanent government guarantee of earnings, are simply not reconcilable. The railroads cannot eat their cake and have it. You cannot rent your house to some one and then expect to be master in your house. If the railroads want to have private management in fact, instead of merely in name, they must take their chances and rely upon public opinion for a square deal. If they are not willing to do that, if they ask the people to protect them by giving them a permanent guarantee of minimum earnings, the people will rightly

insist upon such minute and exacting safeguards as to amount to government operation.

Personally, I am wholly opposed to the timid opportunism which would barter away the reality of private initiative and enterprise for a permanent governmental guarantee of earnings. If we cannot as citizens be convinced that bureaucratic management is preferable to individual effort, we must not as stock or bondholders permit ourselves to be bribed into making a compromise with our convictions. And I am optimistic enough to believe that by deserving the goodwill and confidence of the people, and making adequate efforts to keep them correctly informed, the railroads will get a square deal from the people.

I think, indeed, that public opinion has come to recognize, not from tender regard for the railroads, but from enlightened self-interest, that the roads must be given such treatment henceforth and permitted such opportunity as will attract a free flow of capital; because, otherwise, one of two things is bound to result: stagnation in the railroad industry, which means inadequate and insufficient service for a growing and developing country, or government ownership and operation.

If we are agreed that what we want is real private management under strict but fair, workable and constructive government supervision and regulation, with no permanent guarantee of earnings (but rather profit-sharing with the government and perhaps with labor), it seems to me that the framing of appropriate legislation presents no extraordinary difficulty, provided that an equitable basis of rate-making is established and defined with sufficient preciseness to enable the railroads to obtain actually, instead of merely theoretically, as heretofore, the protection of the courts against the imposition of unduly low rates.

Scientific rate-making is an impossibility. A mathematical, uniformly applicable formula for rate-making might have been possible when the railroads started to come into being. It is no longer possible now. The rate structure is the product of a great many years of testing, experimenting, adapting, bargaining between the railroads and shippers, consumers, ports, etc., in short, of evolution. It is of infinite intricacy, of manifold and subtle inter-relationship.

Even the true value of railroad properties, as ascertained by valuation (to the extent that it can be so ascertained) can merely be one of the factors in rate making. As a matter of fact, I believe that from the practical point of view a valuation of railroad properties such as the Interstate Commerce Commission has been engaged in for several years at the expense of prodigious labor and of many millions of dollars, will prove largely futile, because I think a fair appraisal on such principles as the courts will uphold, will show that the railroads on the whole are not over-capitalized and that existing rates certainly do not err on the side of giving more than a fair return.

\* An abstract of a paper read before the Brooklyn Chamber of Commerce, February 18, 1919.

But I realize that to satisfy public opinion, a large portion of which suspects the railroads of taxing the people to pay dividends on watered stock, an authoritative appraisal of the true values of railroad properties must be had.

Until the valuations are completed, let the I. C. C. or other authority (having first been granted exclusive power in rate-making) be directed to consider the existing rates as prima facie fair and reasonable on the basis of existing wages and costs, subject to such adjustment of inequalities or injustices between localities and shippers as the I. C. C. may determine (or better still, a committee of railroad presidents and shippers subject to the I. C. C.'s casting vote in case of disagreement).

If wages and cost of materials decrease, let rates decrease proportionately (as determined, say every six months), but in no event, pending the completion of the valuation, below figures which would produce as near as may be an aggregate return equivalent to the rental now being paid by the government for the use of the railroads, plus a fair return upon such new money as may be put into the properties.

In the new railroad legislation about to be framed by Congress let it be precisely defined, instead of having merely a vague and unenforceable formula as heretofore, what items are to be considered by the I. C. C. (or such regional bodies as may be appointed) in fixing rates. The principal ones amongst those items are, of course: Wages, cost of materials, a return on the fair value of railroad properties at a sufficient rate to attract new capital and stimulate enterprise. It is surely not beyond the capacity of language to define with clarity what items enter into the cost of a product. The product which railroads are selling is transportation of passengers and goods. The price of the product is the rate.

I should like to add that, whilst I believe the number of separate railroad corporations could with advantage be greatly diminished and the absorption of the weaker lines by the strong lines should in the interest of good service to the public be facilitated and encouraged, I am opposed to the suggestion that the number of independent systems should be so reduced as to give the country over to a very few great regional combinations. My antagonism to this proposal rests on the ground that I believe it would diminish competition to the vanishing point and soon lead to government operation in fact, if not in name.

## The Largest Plate Mill in the World

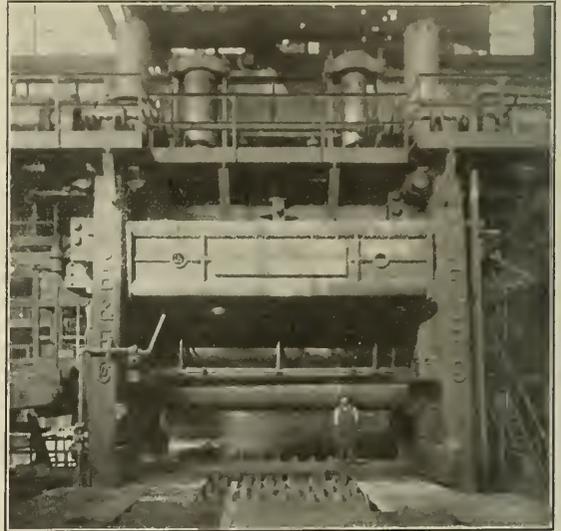

THE LUKENS STEEL COMPANY, Coatesville, Pa., has for the fourth time in its history the largest plate mill in the United States. This company, at whose plant the first boiler plate in America was made in about 1820, had in 1890 a 120-in. plate mill which was later rebuilt to the 134-in. size; in 1903 a 140-in. unit was placed in service, and now with a 204-in. No. 5 mill it has for the fourth time the largest mill in the United States. This mill also exceeds anything in any other country, exceeding the 178-in. mill of the Witkowitz Works in Austria and the 168-in. mill in the British Isles.

This new mill is capable of rolling plates up to 192 in. in width and circular pieces a few inches wider, with comparatively little variation in the gage at the center of the plate. When the construction of this large mill was contemplated attempts were made to build a 180-in. three-high mill after the accepted American practice. When it came to obtaining the chilled rolls of the size and weight desired, however, there was no manufacturer to be found in this country who could be persuaded to undertake the contract. Such a mill required chilled rolls 50 in. in diameter, which was larger than anything the roll makers had ever attempted. This new mill is built on the principle of the two-high reversing

plate stand commonly used in the British Isles. This arrangement enables the use of operating rolls of smaller diameter and thereby overcomes the difficulty of obtaining the large chilled rolls. These operating rolls are 34 in. in diameter and have a working face of 204 in. with 27-in. necks. They weigh about 30 tons each. The 50-in. diameter backing rolls are made of cast steel with 36-in. necks and weigh about 60 tons each. Special provision was made for removing the smaller chilled rolls for grinding, which is done in a special grinding machine built by the Norton Company. This is the largest grinder ever constructed for this class of work.

It was necessary to use a housing of a built-up type as it is so large that the machining and transportation of a housing cast in one piece would be impossible. Each housing weighs 400,000 lb.

The mill will handle ingots up to 60,000 lb. in weight. When it is operated to full capacity it is estimated that it will roll from 4,000 to 5,000 tons a week. With the other fur-

The New No. 5 Mill for 192-in. Plates, Lukens Steel Company

naces in operation and an additional two more which are contemplated, the Lukens Steel Company will have an estimated annual capacity of about 500,000 tons of finished plate. This company furnishes the greater part of the railroad locomotive boiler steel used in this country.

**Abolition of the office of comptroller of the currency,** held by John Skelton Williams, who is also director of the Division of Finance and Purchases of the Railroad Administration, which has been under discussion in the Senate, was taken up in the House last Saturday by Representative McFadden, of Pennsylvania, who introduced a bill and a joint resolution to abolish the office of comptroller of the currency and to provide for an investigation of the official conduct of Mr. Williams in his capacity as comptroller and also in his capacity as director of finance and purchases. Mr. McFadden presented a letter stating that the comptroller of the currency had notified a bank in Pennsylvania that unless steps were taken to convert the company into a national bank the railroad deposits would be removed to a national bank. He also said that Mr. Williams had refused to grant advances to railroads in certain cases unless the trusteeship under a mortgage was changed to some other trustee that was acceptable to Mr. Williams.

# General News Department

The Rivers and Harbors bill, containing appropriations aggregating \$33,000,000, was passed by the Senate on Wednesday of this week. It contains amendments calling upon the International Joint Commission to ascertain what improvement of the St. Lawrence river from Lake Ontario to the sea is necessary to make the stream navigable for ocean-going vessels, and instructing the United States Board of Engineers to report what water routes are practicable between the Great Lakes and the Hudson river for ocean-going vessels.

Engineering Council, New York, has sent a letter to the Governors of all States urging the appointment of a reconstruction committee in each State, a proper proportion of whose members shall be engineers of prominence, to study means whereby employment may be provided for skilled men of various trades in constructive work. The large number of men now returning from military service makes it possible to recruit organizations of men of above average ability and they can be employed to good advantage on the large public works which must be done.

The Secretary of War has announced that the President has approved the sending of two companies of American railway troops to Murmansk to facilitate the prompt withdrawal of American and Allied troops from North Russia. The desire for the railway troops is based on the fact that supplies and reinforcements for Archangel during the winter have to go by railroad south from Murmansk to a point near the southern extreme of the White Sea and that the operation of this railroad is believed to be absolutely necessary to guarantee the prompt movement of reinforcements and supplies to Archangel and the movement of troops south of that point.

The running of freight trains on Sunday has been partially suspended on the main line of the Pennsylvania Railroad. On February 8, and again on February 15, orders were issued at Altoona to send out no slow freight between 6 p. m. on Saturday and 12:01 on Monday morning, except for coke and limestone. This arrangement is similar to that which was in force several years ago. The Youngstown (Ohio) Vindicator of Monday, February 17, reports that, for the first time since 1907, the switching crews in that city were idle on Sunday, the 16th, except in the yards of the Baltimore & Ohio and the Pennsylvania, where also there was considerable shrinkage of traffic. It was estimated that more than 500 men were enjoying an unusual Sunday rest.

Gustav Lindenthal, designer of the Hell Gate bridge, has laid before the New York-New Jersey Port and Harbor Development Commission an elaborate plan for the improvement and enlargement of transportation facilities in and near New York city involving an estimated expenditure of \$211,000,000, not including river front improvements. The plan includes a single span bridge across the North river, a belt railroad in New Jersey laid on a semi-circle of 15 or 20 miles radius; a tunnel under the North river and another to connect with Staten Island; an elevated freight railroad on the west side of Manhattan; a freight classification yard on the meadows between Jersey City and Newark, a passenger station in New York, subway connections to the Grand Central Terminal, and other facilities. Mr. Lindenthal does not overlook the high prices now prevailing, but says that the preparation of plans and the studies preliminary to doing actual work should be begun at once.

The New York Central Magazine, announced several weeks ago, made its initial appearance on February 10. It is a book of 100 pages, 8 in. x 10½ in., and about 40 pages are filled with advertisements; and, says the editorial announcement, the advertisers are to pay the cost of producing the magazine. The reading pages are filled with a great variety of matter, of interest to different classes of employees, much of it con-

sisting of letters from officers and employees, and other original matter. There are departments for men in the operating, the mechanical, the accounting, the engineering, the traffic, the claim, the marine and the safety departments. The personal matter relating to employees has evidently been prepared with great care and there are numerous portraits.

## Denver & Rio Grande

In last week's issue of the *Railway Age*, page 412, total operating expenses of the Denver & Rio Grande were erroneously shown as \$2,955,559. A 9 was substituted for a 4 and the correct figures are \$2,455,559.

## Railroad Club of Washington

One hundred and twenty employees of the Railroad Administration in the city of Washington have organized the Railroad Club of Washington. W. C. Kendall, manager of the Car Service Section of the Railroad Administration, was elected president.

## Lehigh & New England

In last week's issue of the *Railway Age*, page 416, the operating revenue of the Lehigh & New England was shown as \$2,989,895, although freight revenue alone was shown as \$3,679,107. Total operating revenues should have been shown as \$3,989,895.

## American Institute of Consulting Engineers

At the annual meeting of the American Institute of Consulting Engineers the following members of council were elected to take the place of those retiring: S. Whinery, Desmond FitzGerald and J. Parke Channing.

At the council meeting on February 5, the following officers were elected: L. B. Stillwell, re-elected president; A. M. Hunt, vice-president, and F. A. Molitor, secretary and treasurer.

## Association of Railway Executives

Robert S. Lovett, president of the Union Pacific; R. M. Calkins, president of the Chicago, Milwaukee & St. Paul, and W. H. Finley, president of the Chicago & Northwestern, have been elected members of the standing committee of the Association of Railway Executives to succeed to the places temporarily held by C. B. Seger, who recently resigned as president of the Union Pacific; A. J. Earling, who recently resigned as chairman of the Chicago, Milwaukee & St. Paul, and E. M. Hyzer, vice-president of the Chicago & Northwestern.

## Automatic Train Control

One of the things for which we think the U. S. Railroad Administration is to be commended is the recent appointment of a committee reviving the study and testwork looking to the possible adoption of automatic train control apparatus. In every accident investigation for many months made by the Bureau of Safety of the I. C. C., in which it has been feasible to imagine how an automatic stop would have been a sure preventive, the report has intimated that the failure to have the automatic stop in use was a matter of neglect. If what Mr. Borland says holds water, i. e., that such devices are now available for use, Mr. McAdoo would have ordered their installation. The fact that he ordered standardization of locomotives showed, and showed only, that he was ready to go any length to make the newspapers talk of the great improvements he was bringing about, away in advance of any-

thing the private managements had ever done. As a publicity value, automatic train control would have beaten standardization of locomotives all hollow. Why didn't McAdoo order it on? There is still no report of any definite action. Study, study, test, test, is all that is contemplated. Why not immediate action?—*Railroad Herald*.

### Michigan Central Has Good Showing

The table in the January 31 issue, page 323, "Revenues and Expenses of Railroads," showed a net operating income for the Michigan Central for 11 months of the calendar year, 1918, of \$13,533,030. Through a typographical error, the next column of the table showed this as a decrease of \$2,362,331, as compared with the net operating income of the corresponding 11 months of 1917. As a matter of fact, this was an increase of \$2,362,331 over the corresponding 11 months of 1917. The Michigan Central is among the enviable minority of roads that did better in net in 1918 than it did in 1917.

### Government Price Adjustment

Following a series of conferences between members of the Cabinet and others, a meeting was held in Washington on February 5, called by the Secretary of Commerce, to consider the industrial situation, with particular reference to unemployment and the prospect of resumption of active buying. The establishment of a satisfactory level of prices at this time offers particular difficulties, because war prices, as fixed, are recognized as abnormal; on the other hand, there is no prospect in the immediate future of the restoration of pre-war prices. It was felt that wages would remain on a higher level than before the European war and that no readjustment in the true wages of labor, as measured by purchasing power, should be attempted now. It was the sense of the meeting that the fine spirit of voluntary co-operation in industry which had proved such a valuable factor in the conduct of the war should be availed of to ease and expedite the processes of readjustment and that the manufacturers of the country would be willing to take the first step.

Carrying out the spirit of this meeting, the Secretary of Commerce, acting with the approval of the President, will organize a Board to confer with representatives of the basic industries of the country to examine conditions in industry with a view to the formulation of a scale of prices at which the government departments and other buyers would be justified in buying freely and at which the manufacturers would be willing to sell with a view to maintaining or restoring business activities to a full volume. George N. Peek of Moline, Ill., a former member of the War Industries Board, is to be chairman of the new board. He will select six associates, one of whom will be named by the Railroad Administration. W. M. Ritter, formerly head of the hardwood section of the War Industries Board, has been appointed to supervise organization executive work. Secretary Redfield has announced that neither price-fixing nor price maintenance is contemplated but that immediate action is proposed to suggest proper price levels.

If this conference results in reductions of prices in basic industries, it is probable that the Railroad Administration will place some large orders for railroad materials and supplies, provided Congress makes the \$750,000,000 addition to its revolving fund. The Railroad Administration has been in negotiation with the steel companies regarding orders for rails, but there has been a disagreement on the price question.

### Future of Gas and Electric Welding

At a joint meeting of the American Institute of Electrical Engineers and American Institute of Mining Engineers, on Wednesday afternoon, February 19, five papers were presented on the subject of welding, as follows: Microstructure of Iron Deposited by Electric Arc Welding, by G. F. Comstock; Path of Rupture in Steel Fusion Welds, by S. W. Miller; Welding Mild Steel, by H. M. Hobart; Electric Welding in Shipbuilding, by S. V. Goodall, and Fusion in Arc Welding, by O. H. Eschholz.

A lively discussion followed their presentation during which it was suggested that as so much had been done in the way of making repairs, particularly by the railroads during the past two years, the time was ripe for bringing the welding processes permanently into the field of construction. It was pointed out that there are many variables to be determined in order to secure a good weld and that successful welding is dependent upon uniformity of results. For this reason it was stated that the welding operator must be both skilled and conscientious, and a diversity of opinion was expressed in the discussion as to whether the operator should be a skilled engineer or whether the average worker could be taught to do good welding work.

The particular significance of the presentation of the papers and the discussion lies in the fact that welding is demanding so much of the attention of our best engineers. This in itself is sufficient indication that the constantly increasing use of welding is to be expected. Conclusions indicated by the discussion were that both gas and electric welding had come to stay and that we may prepare for the time when the average mechanic must learn the use of the welder, just as he has had to learn the use of the hammer and chisel.

### Railway Regiments' Tobacco Fund

The Railway Regiments' Tobacco Fund, to which 146 railway supply companies contributed, made seven shipments of tobacco, amounting to approximately eight tons, to railway regiments in service in France. Owing to the congestion in the transport service during the summer on account of the great number of troops going over, it was found that this tobacco was not being delivered to the regiments to which it was consigned, and shipments were, therefore, postponed until the transport service could be organized to the point where delivery was assured; but the movements of the various railway regiments were so uncertain that it was finally decided not to make any further shipments. The total amount subscribed to this fund was \$16,129.94, of which \$10,056.05 was spent for tobacco, leaving \$6,073.89 still in the hands of the committee handling the fund. This sum is approximately 37.5 per cent of the amount subscribed, and the committee, in making arrangements for the closing of the fund, has decided to return to the contributors 37.5 per cent of each subscription received. This will amount to practically all the funds available, with the exception of a few dollars, which will be utilized to defray expenses. In requesting subscriptions it was specifically stated that they were only to be made up to the end of the year 1918, and accordingly, all checks received since December 31, 1918, are to be returned.

The Railway Regiments' Tobacco Fund was initiated by F. A. Poor, president of the P. & M. Company, Chicago, and in order to raise the necessary funds, a committee, composed of Mr. Poor, as chairman, and R. P. Lamont, president of the American Steel Foundries; George A. Post, president of the Standard Coupler Company and of the Railway Business Association (1918); E. H. Bell, president of the Railway Supply Company and of the Railway Appliances Association (1918); J. M. Hopkins, president of the Camel Company, Chicago, and A. C. Moore, vice-president, Safety Car Heating & Lighting Company as members, was organized. Samuel O. Dunn, editor of the *Railway Age*, was secretary of the committee, and John R. Washburn, vice-president of the Continental Commercial Bank, Chicago, acted as treasurer of the fund.

### American Electric Railway Association

Arrangements are progressing rapidly for the dinner in connection with the annual meeting of the American Electric Railway Association to be held at the Waldorf-Astoria, New York, March 14. The speakers for the evening are announced as follows: Warren G. Harding, United States Senator from Ohio; Lindley M. Garrison, former secretary of war, and now receiver of the Brooklyn Rapid Transit System, and B. A. Hegeman, Jr., representing the manufacturer members of the association. J. H. Pardee, president of the American Electric Railway Association, will preside.

## Traffic News

Coal loading for the week ended February 1 was 178,688 cars, as compared with 207,547 in the corresponding week of 1918. Loading for the following week is estimated at 165,716 cars, as compared with 215,867.

Major Gen. W. M. Black, chief of engineers of the United States Army, has been elected chairman of the Port and Harbor Facilities Commission of the United States Shipping Board, succeeding E. F. Carry, who resigned recently.

War time regulation of the coal trade virtually will cease on March 1, according to an announcement of the Fuel Administration. That date has been tentatively fixed for the abrogation of the order prohibiting the shipment of coal for reconsignment and also the order under which all shippers of coal at tidewater were required to consign their coal to the Tidewater Coal Exchange.

Counting barges already built or in course of construction and twenty new power barges soon to be ordered, the United States Railroad Administration will have for service on the New York State barge canal a fleet of 95 barges; three wooden, 50 of steel, 21 concrete and 20 self propelled steel barges. It is said that the aggregate carrying capacity of these vessels will be 50,000 tons.

At a representative meeting of shippers, wholesalers and consumers of coal held recently at the office of the National Coal Association, at Washington, resolutions were adopted declaring that the present demurrage regulations on coal are unreasonable and in contravention of the law in that the free time allowed at tidewater is insufficient and the per diem charge is excessive and discriminatory. The Fuel Administration was asked to abrogate at once its order requiring all shippers of coal to tidewater to use the tidewater coal exchange.

Gratifying results of co-operation of the shippers of the Minneapolis district in the intensive loading of flour and mill products are shown in the following report to the Railroad Administration:

	1916	1917	1918
Number of tons shipped.....	2,624,549	2,546,462	2,577,295
Number of cars used.....	102,289	75,058	62,180
Average tons per car.....	25.66	33.9	41.4

A comparison of the 1916 and 1918 figures shows a decrease of 1.8 per cent in tonnage with a decrease of 39.2 per cent in number of cars used.

Wooden barges plying on the Mississippi river have greatly lessened the strain on railroads in that section, according to claims of A. W. Mackie manager of the Mississippi river section of the Mississippi-Warrior Waterways of the United States Railroad Administration. Mr. Mackie estimates that the saving for the railroads for the 94 days that the service operated out of St. Louis before ice closed the port. was 7,274 car loads. About 17,430 tons of grain were moved for the Food Administration by these lines, which operated between St. Louis and New Orleans.

Secretary Redfield of the Department of Commerce has authorized the employment of the service of the department's legal staff in behalf of a private litigant, the Solvay Process Company, of Syracuse, N. Y., in a case in which the company seeks to have the Interstate Commerce Commission reduce freight rates on its products and order the return of \$60,000 alleged over-charges. "The farmer has the Department of Agriculture to represent his interests," Mr. Redfield said, "and the laboring man has the Department of Labor. I believe the business man should have the proper assistance of the Department of Commerce."

### Addresses at Chicago Traffic Club

Henry A. Palmer, editor of the Traffic World and the Traffic Bulletin and William Gourlay, general agent of the American Railway Express Company at Chicago, addressed the Traffic

Club of Chicago at a noonday luncheon at Hotel La Salle on February 11. Mr. Palmer's subject was "The Patriotism of Peace," and Mr. Gourlay's "Better Express Service."

An abstract of Mr. Palmer's speech follows:

"It is unfortunate that the whole subject of what we ought to do with our railroads had to be taken up at this time. Such problems as the relative powers of the Interstate Commerce Commission and the state commissions and the question of whether there ought to be regional commissions were problems before the war was ever thought of and are no more so now than then \* \* \* and should have gone over until the immediate question of whether the railroads should be returned to private ownership or not, was settled. It is also unfortunate that those who are appearing before the Senate committee could not have reached some sort of agreement as to fundamentals before they appeared to confuse the lawmakers with their remedies, no two of which contain the same ingredients \* \* \*"

Mr. Palmer emphasized the fact that the great mass of the American people, who have no intimate knowledge of transportation, nevertheless control legislation through their votes and may fall into the error of favoring government ownership unless those who are well informed concerning the railroads take it upon themselves as a duty to spread the truth.

If the traffic clubs of the country could unite on some general plan for the regulation of our railroads they would be doing a service that no one else could do. Representing both the industries and the carriers, their united opinion would carry weight with Congress. The New York Traffic Club, the Transportation Club of Maryland (Baltimore) and the Traffic Club of Newark, N. J., have already adopted identical resolutions. While the industrial members of the Traffic Club of Chicago seem favorable to similar action, some of the railroad members seem to think that their participation in such resolutions would prove a source of embarrassment. On this point Mr. Palmer said:

"Carried to its logical conclusion such a theory means that every employee of the Postoffice Department should think as Mr. Burleson thinks about public ownership \* \* \*; every employee of the telegraph or cable companies should think as Mr. Burleson thinks; and every employee of every railroad and every employee of the express company should think as Mr. Hines thinks. A fine state of affairs that would be, wouldn't it? That there is any danger of its prevailing is the very best argument that could be furnished against government ownership or government operation of anything. If it is to produce a race of spineless individuals afraid to express their own opinions or to vote for what they believe to be right, the sooner we know it the better, that we may choose between an absolute monarchy and a republican form of government \* \* \*"

Mr. Gourlay began with a discussion of claims. These cause a constant waste in time and money and they engender ill feeling. The American Railway Express Company has inaugurated a campaign to reduce loss and damage and is anxious to secure the hearty co-operation of shippers.

If those claims could be eliminated which result from improper or insufficient packing, wrapping and marking, a considerable part of the difficulties of the company and the public would be overcome. During the past few years the poor quality of paper, twine and containers has resulted in much damage to goods. The nature of express service is such that in the course of transit the shipments are handled much more frequently than are freight shipments. Every express car must be loaded to its maximum capacity with articles of all sizes, and weights. All packages cannot ride on the top of a load and the loading of the car cannot be postponed until the entire lading is arranged on the platforms so that the heavy articles can be put in first.

The use of second-hand containers is a fruitful cause of claims. If these containers do not break open they can almost certainly be depended upon to send shipments astray on old marks. It is important that the marking on packages whether written, nailed or pasted thereon, should be done in crayon, lamp-black or ink. The express company has to maintain 19 "No Marks Bureaus" throughout the country. From July 1, to November 30, 1918, these bureaus received 127,859 shipments, or an average of over 25,500 shipments a month. Automobile tires or shoes found without marks average about 1,400 a month.

## Foreign Railway News

Exports of locomotives through the port of New York during December, 1918, amounted to \$1,755,891, according to figures given in the monthly foreign trade record issued by the National City Bank. The report also shows rails exported to the value of \$1,354,795 and car wheels and axles valued at \$413,720. Freight cars are not separately shown in the tabulation.

The influence of the influenza epidemic upon the South African Railway traffic necessitated the curtailment of the service as the result of disorganized conditions. At one time there were 15,660 employees, including 8,369 Europeans, off duty. It may be mentioned that there are approximately 39,000 employees in the railway service, so that the department has been seriously handicapped, and the fact that there has been no marked restrictions in the service is a tribute to efficiency and organization.—*Johannesburg Correspondent.*

### Chilean Railroad Loan Passed

American Ambassador Joseph H. Shea, cabled from Santiago, February 8, that the Chilean Senate on that day passed a law authorizing a loan of 89,000,000 pesos at 18 pence value for the purpose of supplying the necessary expenses of the State Railroad. Further, an increase of 20 per cent on the passenger and freight rates has been agreed upon.

### Increased Railway Rates in Jamaica

Consul Davis B. Levis, at Kingston, Jamaica, has reported that the governor of Jamaica has approved the recommendation of the advisory board of the Jamaican Government Railways that freight rates should be advanced 15 per cent and passenger fares 25 per cent, and the new tariff has been operative since December 1.

The increases allowed were found to be imperative in view of the higher operating costs of the railway and the further necessity of purchases of additional rolling stock and other equipment during the coming year, the present equipment being deemed inadequate for the movement of the anticipated increase of the sugar production.

### Serbia's Railroads Ruined

The extreme difficulty of transport through Serbia, and the ruinous condition of the country's railways as a result of wanton destruction wrought by Bulgarians and Austrians in their forced retreat, is strikingly shown, says an Associated Press despatch, by the fact that the American Red Cross, in order to get relief supplies to the Nish section, has had to route its shipments by rail east from Salonica to Deagatch, then north to Adrianople, then west to Sofia, and finally across the Bulgarian border to Pirot, a total distance of more than 800 miles.

The regular railroad route north from Salonica to Nish is only about 275 miles, and can be travelled in ordinary circumstances in 24 hours. Red Cross supplies have taken ten days to reach their destination.

From Uskub to Belgrade, nearly 300 miles, the railroad at points is wholly destroyed and dozens of bridges and tunnels are in ruins. It is estimated that the work of reconstruction will require more than a year.

The food and clothing situation in northern Serbia is reported to be very acute.

### Mexican Railways in Bad Shape

Felipe Pescador, general manager of the National Railways of Mexico, including the old Mexican Central system, has just issued a frank statement in the City of Mexico of the physical and traffic conditions of these lines. He says:

"To pretend that railroad service in Mexico is given with the accommodations of former days would be a statement

devoid of reflection. Many passenger coaches are lacking in the usual interior equipment; in some the window glass is broken, in many the seats are worn out, and it is impossible to get prompt repairs. Coaches which have been used in the military service are in a dilapidated condition. Train schedules are difficult to maintain as precautions have to be taken against rebel bands. Generally speaking, however, the service is normal and accidents are not frequent.

"On the Interoceanic we have not been able to control the situation. The rebels have frequently torn up the rails and attacked the trains. They have been very bad between Puebla and Jalapa, destroying the road, thus requiring guards of 100 or more soldiers to protect each repair gang. Often we find newly repaired track again destroyed before a train can be gotten over it.

"The Mexican Central from Mexico City to La Colorado in Zacatecas may be said to be open. North of the latter point repairs of the road have been made only as the military situation would permit work to be done. Between Torreon and Chihuahua City and north of the latter place there have been frequent interruptions of that line by Villa rebels.

"On the old Mexican Central's Gulf line, which runs from Monterey to Tampico, the roadbed is in bad condition and repair work has been effected only with great difficulty. This is on account of the scarcity of laborers and danger from rebels which infest that section. A tri-weekly service is maintained, however. Also, tri-weekly trains are run each way between San Luis Potosi and Tampico. This last is also a part of the old Central system.

"Construction work on the projected line from the city of Durango to Mazatlan, Sinaloa, continues, but the completion of it is very remote. Laborers and money are needed in large amounts and are both lacking. Over 100 kilometers of this line are in operation and material trains are being run over it.

"A part of the revenues of the National Railways is being used to rebuild stations and other structures as well as for renewing rails."

### The Damage to the Belgian Railways

Press despatches from Paris on Saturday last report that the Supreme Council has appointed a special committee to study the claims of Belgium for an indemnity. The American members of the committee are Charles H. Haskins and Col. S. D. Embick.

The Belgian commission which is investigating the damage done by the Germans to railroads in occupied territory, while it has not yet finished its work, is in a position to give interesting figures relative to the destruction caused by the Germans.

The figures show that nearly 690 miles of railroad tracks were destroyed and nearly 260 miles made useless out of a total standard gage mileage of approximately 2,600 in Belgium. This destruction was mostly in the Mons coal valley in the region of Tourmal and around Ghent, Bruges, Ostend and Courtrai.

Seventy per cent of the destruction was carried out during the period from the start of the Belgian offensive on September 28, 1918, to the signing of the armistice.

The Germans appropriated 2,614 locomotives out of a total of 4,534, or about 57 per cent; 9,062 passenger coaches, out of a total of 10,812, or 93 per cent, and 80,568 freight cars, out of a total of 94,737, or 86 per cent.

The block signal system in Belgium was destroyed and replaced by a German system with which the Belgian locomotive engineers are not acquainted. It will have to be removed and the Belgian system again installed. The commission is not able to make public yet the number of bridges or stations destroyed.

All the bridges leading in and out of Ostend and Bruges have been destroyed and virtually all in West Flanders, as well as those over the Meuse at Liege, Namur, Huy, Dinant and Enseremme. Eight bridges over the Ghent-Terneuzen Canal were blown up.

Two of the bridges, at Salzaete, near the Dutch frontier, weighed 1,500 tons each. It is estimated by the Commission that more than 50,000 tons of steel will be required to rebuild the bridges in Flanders alone.

The Commission estimates the damage to railroad material, tracks, bridges and other equipment at more than \$1,000,000,000.

France is faced with a most formidable task in reconstructing the important coal and industrial districts of the Department of the Nord and the Pas de Calais, and it will cost \$15,000,000,000, according to a statement made to the French Senate by Louis Loucheur, minister of industrial reconstruction. The Germans destroyed 101 coal pits. The French, he said, might be able to produce 3,000 tons daily by the end of 1919 instead of 75,000 tons, the output before the war. Repairs will cost more than \$400,000,000, and cannot be accomplished in less than ten years.

The factories in the district have no raw material and the machinery has been destroyed or carried away to Germany. M. Loucheur said it would take several years and 40,000 freight cars to bring back the machinery.

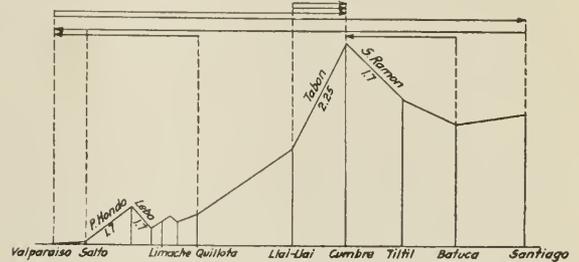

### The Proposed Chilean Electrification

Further details are now available concerning the visit to this country of two prominent Chilean engineers to continue their investigations of the proposed Valparaiso and Santiago electrification, briefly noted in this column in the issue of February 7, page 373.

The two engineers are Rafael Edwards and Ricardo Solar. Mr. Edwards has been connected with the Chilean State Railways for several years as a consulting engineer in electrification. He is a professor of electrical engineering at the Catholic University at Santiago. Mr. Solar is a civil and electrical engineer and is the head of the laboratory of electrical engineering in the State University at Santiago. They are expected to arrive shortly and will have their headquarters at the office of the Chilean State Railways, 141 Broadway, New York.

The line which it is proposed to electrify is that from Valparaiso, Chile's principal seaport, to Santiago, the capital,

Valparaiso the average daily freight train tonnage handled amounts to 4,316 inland and 4,127 towards Valparaiso. Between Llai-Llai and Santiago the traffic is less, 3,832 tons being handled towards Santiago and 3,175 towards Llai-Llai. The trains average about 450 tons. All trains over 300 tons are double-headed. Trains from Santiago to Valparaiso require pusher locomotives from Batuco to the top of the S. Ramon grade at Cumbre and between Quillota and Valparaiso. Those inland from Valparaiso require pusher service inland as far as Llai-Llai, with additional assistance up the

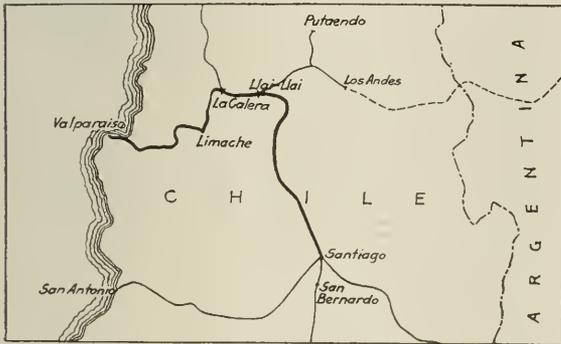

Profile of the Proposed Chilean Electrification.

Tabon grade to Cumbre. The locomotives used are Consolidations weighing 62 tons on drivers, and Mikados weighing 72 tons on drivers.

The principal reason for the proposed electrification is the high cost of coal and to a lesser extent to increase the capacity of the stretch of single track from Llai-Llai to Santiago, physical conditions very largely preventing double tracking. Bituminous coal at present costs \$24 a ton in Chile, and even in normal times costs as high as \$12 to \$14. For the proposed electrification water power is available from the Aconcagua river, which parallels the railroad for a considerable distance. It is proposed to put the generating station at a point on the river about 30 miles from Llai-Llai.

It is hoped that electrification will permit of 500 ton trains with a speed on the heavy grades of 16 to 18 miles an hour. Passenger trains will make a speed of about 30.

Map Showing the Proposed Chilean Electrification.

The heavy line shows the portion which it is proposed to electrify, and the light lines the connecting lines of the State Railway system. The broken line eastward from Los Andes is the Transandine Railway.

and is 116 miles in length. It is a part of the first zone of the state owned Central Railway and consists in reality of an important branch from Valparaiso inland to La Calera, 43 miles, connection being made at La Calera over the main line itself to Santiago, making the other 73 miles. The line is of 5 ft. 6 in. gage. It is double tracked from Valparaiso inland to Llai-Llai and single track only from there to Santiago. As shown on the profile there are four heavy grades. The highest point on the line is at Cumbre, about 2,400 ft. above sea level. To surmount this there is the Tabon grade against traffic towards Santiago, 16 miles in length and of 2.25 per cent. Traffic towards Valparaiso on the other side meets a grade of 1.7 per cent on the S. Ramon grade, about 11 miles long. Just inland from Valparaiso are the Paso Hondo and Lebo grades against traffic from and to the seaport, respectively, both 1.7 per cent.

The traffic handled over the line is of miscellaneous character and is fairly evenly balanced. Between Llai-Llai and

### Japan's Growing Influence in Chinese Railway Affairs

Special Correspondence from Peking.

With one exception, all of the reports made in these columns of rumored Japanese railway enterprises in China are now confirmed—and one more is added. The Industrial Bank of Japan opened for subscription between October 19 and 23 an issue of bonds in the amount of Yen 50,000,000 (\$25,000,000) at 94.5, bearing interest at the rate of 5.5. The payment of interest and principal is guaranteed by the Japanese Government. The purpose stated is "to cover the new investment made by the bank in China in the form of four railways in Mongolia and Manchuria and two others in Shantung and Kiangsui." "The proceeds of the loan will be employed in refunding the temporary loan made to the amount of Yen 40,000,000 (\$20,000,000) from the Imperial Treasury and the Bank of Japan of that amount to China as part of the loans contracted for."

While not a foot of earth is turned nor a pound of rail is at hand to show for the Yen 40,000,000 already officially said to be advanced to China, it is interesting to know that the above is only part of a loan of \$320,000,000—according to the Manchuria Daily News, which is the official mouthpiece for the Japanese owned South Manchurian railway. This paper continues the report as follows:

"It may be added that the question of financing China for the construction of the six railways in project in Manchuria and Mongolia and Shantung has been long pending, and the Chinese side has conducted surveys of the proposed routes on their own account.

"The four railways in Manchuria and Mongolia are: 1, Changchun-Taonanfu Line; 2, Taonan-Jehol Line; 3, Kirin-Hailungcheng-Kaiyuan Line; 4, a line from a point of Taonan-Jehol Line to a seaport. The two railways in Shantung are: 1, Tsinan-Shunte; 2, Kaomi-Tsuechow.

"In each case, excepting the Kirin-Hailungcheng-Kaiyuan Line, the proposed route runs through a comparatively level country, and bridging work is the only feature taxing engineering skill.

"On the Kirin-Hailungcheng-Kaiyuan Line, the Kirin-Hailungcheng Section traverses a hilly country in which the preponderance of rocky structure

is the most striking geological feature. How soon the construction work will be started is unknown.

The first and second of these lines is a direct invasion of a route under contract with Kuhn, Loeb & Co., dated October 2, 1909, but since held in abeyance on account of pressure brought by Russia and Japan jointly. The fourth of these is no doubt intended to run to Hulutao, a harbor about 150 miles north of Chinwantao, and will cross the Peking Mukden only seven miles away. This certainly violates the agreement with the Peking Mukden bondholders that "the construction of any new railway within a distance of 80 miles of any portion of the existing lines \* \* \* shall not be undertaken by the Administrators-General of the Imperial Northern railways (Peking Mukden)." The Kaomihsuchow line is very effectively counter to the French agreement concerning the Lung-Ilai line which permits it to choose its maritime port north of the Yang Tze river and to build branches.

It has been pointed out in former notes how the lines in Shantung will not only confirm the control of this province to Japan but will also make Tsing Tau the outlet for all interior China north of the Yang Tze basin. The Manchurian and Mongolian lines will wrest away the remainder of the vanishing sovereignty of China in those regions. Taken together, the two Japanese spheres will nearly surround Peking. Besides, the position of Japanese islands off the coast give the situation a decidedly military aspect. This will make these agreements a very live topic at the peace conference. There are but two turns which the subject may take. One is to let matters take their course, which will require Great Britain to set up as rigid a control in South China as Japan does in North China, with French and American interests playing a subordinate part to either party, depending upon whichever district they wish to enter. The other is for all railway operations in China to be surrendered by all parties to an international board or syndicate to be administered in trust for the Chinese Government until it is in a position to maintain its own rights vis-a-vis any power. The former procedure will undoubtedly lead to a situation not unlike the Balkans prior to the great war with a corresponding depression in China and discouragement to all progress. The latter would insure the upbuilding of China into a great nation of power and wealth which seems to be contrary to the policy of at least one interested party.

Undoubtedly, if any program of internationalization is to be considered, it will have to be championed first of all by America. The spirit of Great Britain may be sympathetic, but she is probably under such promises to Japan with respect to the war that she cannot more than passively enter into such discussions as this would involve. China herself has always relied upon trading one nation against another, and her thinking in the conference will most likely follow that tradition somewhat. Besides the dominance which Japanese interests now have over her officialdom will probably be able to prevent any constructive program from emanating from railway quarters. Particularly is this true because even the most forward of Chinese public men have for some years past had a nightmare of the "Egyptization" of China. Such a powerful organization as an international syndicate to administer her railways would appear to them as falling not far short of putting China into the same financial category as Egypt.

**Italy's Railroads Not Prepared for Tourist Traffic**

A recent despatch to the New York Times is authority for the statement that the Italian Government has assigned \$360,000,000 to urgently needed reorganization of the State railways, \$200,000,000 of this being devoted to purchase of new rolling stock, considerable orders for which have been placed with the United States.

The single Milan-Rome daily express takes up hours in making the journey, and the railway directorate warns intending foreign tourists that a return to anything like normal conditions cannot be expected until at least the end of next year.

Italy has lately undertaken to provide prompt facilities for demobilization of the allied armies from Macedonia and bases in the Orient.

**Equipment and Supplies**

Prices for the steel castings used on cars and locomotives purchased by the Railroad Administration were discussed at a conference between the manufacturers and the price-fixing committee of the War Industries Board at Washington, on Wednesday. It was agreed to leave the decision to the board.

**Locomotive Deliveries**

The following new locomotives were shipped during the week ended February 8:

Works	Road	Number	Type
American	C. B. & O.	3	USRA Santa Fe.
	C. & O.	1	10W. Sw.
	Oregon Short Line.	3	USRA 6W. Sw.
	Grand Trunk	2	USRA 6W. Sw.
	C. & O.	1	USRA Mallet
	* Chic. & N'w.	1	Mikado
Total		11	
Baldwin	Atch., Top. & Santa Fe.	1	Mikado
	B. & O.	4	USRA Mikado
	Great Northern	2	Mikado
	Penn. R. R.	1	Mikado
	Lehigh Valley	2	Pacific
	Phil. & Reading	2	Consol.
	Ill. Cent. R. R.	2	Mikado
Atlantic C. L.	1	Mikado	
Total		15	
Grand total		26	

\*One Mikado locomotive constructed for the Chicago & Northwestern was shipped to Potomac Yards, Va., to be stored as part of an emergency pool.

**Car Deliveries**

The Railroad Administration has given the following statement of new standard cars accepted by roads for the week ended February 1:

Road	Number	Type	Manufacturer	Total accepted for week
A. C. L.	136	40 ton D. S. Box.	Am. Car & Fdy. Co.	183
C. & W. C.	68	40 ton D. S. Box.	Am. Car & Fdy. Co.	203
C. C. C. & St. L.	45	40 ton D. S. Box.	Am. Car & Fdy. Co.	750
C. C. C. & St. L.	51	40 ton D. S. Box.	Am. Car & Fdy. Co.	91
Georgia R. R.	134	50 ton S. S. Box.	Haskell & Barker	300
Ill. Cent.	73	50 ton Comp. Gond.	Am. Car & Fdy. Co.	150
Ill. Cent.	38	55 ton Steel Hop.	Am. Car & Fdy. Co.	38
Ill. Cent.	146	55 ton Steel Hop.	Pressed Steel Car.	200
Ill. Cent.	335	50 ton Comp. Gond.	Pressed Steel Car.	500
Ill. Cent.	150	55 ton Steel Hop.	Pullman Car Co.	250
Ill. Cent.	45	55 ton Steel Hop.	Ralston Steel Co.	200
Ill. Cent.	100	55 ton Steel Hop.	Standard Steel Co.	200
Ill. Cent.	52	50 ton H. S. Gond.	Standard Steel Co.	300

L. & N.	40	55-t. steel hopper.	Standard Steel Car	
L. & N.	94	55-t. steel hopper.	Pressed Steel Car	
Ill. Cent.	112	55-t. steel hopper.	Am. Car & Fdy. Co.	
Total				1,470

**Locomotives**

THE CANADIAN NATIONAL RAILWAYS have ordered 25 Pacific type locomotives from the American Locomotive Company, these locomotives to have 23½ by 28 in. cylinders and a total weight in working order of 260,000 lbs. each.

**Freight Cars**

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for 10, 30 cu. yd., 50-ton capacity steel automatic air dump cars.

## Supply Trade News

The eastern branch of the Independent Pneumatic Tool Company, will be removed on March 1 from 170 Broadway to larger quarters at 1463 Broadway, New York.

The Patterson Sargent Company is now represented by L. J. McComb as railroad paint and varnish salesman, with office at 201 Devonshire street, Boston, Mass. Mr. McComb succeeded F. Howard Childs, who died December 15, 1918.

W. W. Butler, vice-president of the Canadian Car & Foundry Company, Montreal, Que., has been appointed president. Mr. Butler is also president of the W. W. Butler Co., Ltd., and a director of the Page-Hersey Iron Tube & Lead Co.

Ezra S. Taylor, assistant to the vice-president of the Pullman Company, has been elected assistant to the president, with office in the Pullman building, Chicago. Mr. Taylor

was born at Chicago in 1880. When 17 years old he entered the employ of the Atchison, Topeka & Santa Fe as a member of a surveying gang in Texas. After three years in this work, he came to the Chicago office of the Santa Fe as a clerk in the freight department, and in 1900 he entered the employ of the Pullman Company as a clerk in the auditing department. From 1902 to 1905 he was assistant to the storekeeper, and later to the operating superintendent of the Chicago Elevated Lines at Chicago. The

following three years he was assistant purchasing agent for the Western Steel Car & Foundry Company, at Anniston, Ala., and later at the Hegewisch (Ill.) plant. To increase his knowledge of the steel business, Mr. Taylor subsequently entered the employ of the Illinois Steel Company at its open hearth plant in South Chicago, where he remained for one year. In 1909 he returned to the Pullman Company as chief clerk in the sales department, and was subsequently general eastern agent at New York and assistant to the vice-president, which position he held until his appointment as assistant to the president on February 6, 1919.

William M. Ryan, president of the Ryan Car Company, Hegewisch, Chicago, has been elected president of the Calumet Manufacturers' Association, organized last month to promote the business interests of the Calumet district, Chicago, which comprises 300 factories.

W. W. Hayward, secretary and treasurer of the Butler Drawbar Attachment Company, Cleveland, Ohio, died of pneumonia on February 12. Mr. Hayward had served as secretary and treasurer of the company since its organization. He will be succeeded by W. B. Waggoner.

Leslie W. Millar, who has been connected with the Navy Department at Bethlehem Ship Yards, Quincy, Mass., for the past year and a half, has been appointed special railroad representative of the Mark Manufacturing Company, Chicago, with offices in the Conway building.

The United States Switch Company, Eau Claire, Wis., originally incorporated with a capital stock of \$1,750,000 in Delaware, has been reorganized as a Wisconsin corporation with an authorized capital of \$300,000, divided equally into preferred and common stock. The company manufactures

automatic switches, signals and other railroad specialties. J. W. Hubbard is president and general manager.

The Menasha Filtermass Company, Menasha, Wis., manufacturer of paper mill and pulp-making machinery and equipment, has added a new type of railroad car-mover to its line of products. A shipment of these devices has been made to a customer in Japan and orders have also been booked from domestic buyers.

A. W. Preikschat, formerly assistant to the engineer of tests, of the Pullman Company, and later special representative in the purchasing department of the Steel Tube Company of America, has been appointed sales representative of the Liberty Steel Products Company, Inc., with offices in the McCormick building, Chicago.

W. S. Quigley, president of the Quigley Furnace Specialties Company, Inc., sailed for Liverpool on the Baltic, February 15, for the purpose of further developing European connections of his company. Mr. Quigley will spend several weeks in England, France and Italy, and visit the plants installing the Quigley system for preparing and burning pulverized coal and lignite.

Captain John M. Taylor has been made publicity manager for the Ferguson Company. He was the first uniformed officer on the grounds at Camp Devens, Mass. There he was assigned to the construction division, Quartermaster Department, for six months and for the balance of the war remained in the south in the Military Intelligence Department. Captain Taylor had considerable experience in the work in which he will henceforth be engaged prior to his entrance into military service.

C. C. Farmer, until recently assistant western manager and resident engineer for the Westinghouse Air Brake Company, has been advanced to the position of director of engineering in

the same company. Mr. Farmer has been connected with the air brake company for many years. He was born in California, where he received his education. After a number of years as machinist on the Southern Pacific, he began, in 1891, a study of brake action and train control in the Westinghouse Air Brake Company instruction car, on various roads throughout the country. In the same year, the Missouri, Kansas & Texas offered him the position of supervisor of air brake repairs, from

which he was advanced in a few months to air brake inspector of the entire road. In 1896 he became general air brake instructor of the Central of New Jersey and soon after became an inspector for the Westinghouse Air Brake Company. Not long after his second association with the Westinghouse Air Brake Company, he was transferred to the Chicago district as mechanical expert. Then he was appointed resident engineer, and later, with the understanding that he would still retain the title of resident engineer, he was made assistant western manager, from which dual position he has now been advanced to that of director of engineering.

L. F. Phipps, president of the American Frog & Switch Company, Hamilton, Ohio, since its organization, has retired from the presidency and has been appointed chairman of the board of directors. C. E. Hooven, president of the Cincinnati, Lawrenceburg & Aurora Electric Railway; vice-president of the Dayton Rubber Manufacturing Company, and president of the Hooven Automatic Typewriter Company, has been appointed president to succeed Mr. Phipps. Don

E. S. Taylor

C. C. Farmer

**Hooven**, secretary and treasurer of the Cincinnati, Lawrenceburg & Aurora Electric Railway and a director in the Dayton Rubber Manufacturing Company, has been appointed secretary. **E. S. Griffiths** has been re-elected treasurer, and **W. H. Rabbe**, chief engineer. The control of this company has passed to the Hooven estate.

**John S. Y. Fralich** has been appointed resident engineer of the western district for the Westinghouse Air Brake Company, succeeding **C. C. Farmer**, promoted to director of engineering. Mr. Fralich has been with the Westinghouse Air Brake Company since 1904. He was born at Harrisburg, Pa., September 19, 1880, was educated in the grade and high schools of Philadelphia, and received his engineering training at Williamson School. He then served a regular three years' apprenticeship as a machinist and was employed for two years as a machinist in the Altoona shops of the Pennsylvania Railroad. He became connected with the Westinghouse Air Brake Company in June, 1904, having been hired as a machinist and shortly thereafter assigned to the inspection force. He was then respectively shop inspector, special inspector, with the experimental test department, supervisor of shop tests, acting assistant to mechanical engineer. He did special engineering work in the Chicago office from March to December, 1913, was appointed assistant resident engineer in December, 1913, and resident engineer of the western district February 1, 1919, as above noted.

J. S. Y. Fralich

### New York Air Brake Company

The gross sales of the New York Air Brake Company for the year ended December 31, 1918, totaled \$10,380,584, as compared with \$10,157,038 in 1917. Net profits for the year after the deduction of charges, were \$2,052,553, an equivalent of \$20.52 a share earned on the \$10,000,000 capital stock, as compared with net profits of \$1,893,825, or \$18.94 a share earned in 1917.

In his remarks to stockholders, accompanying the annual report, President **C. A. Starbuck** said in part: "It will be noticed that the net earnings for the year are more than sufficient to continue the payment of the dividend at the rate of 20 per cent. However, the board of directors decided to pay at this time a dividend at the rate of 10 per cent, being of the opinion that the past earnings and future prospects justify the belief that this rate can be permanently maintained and still permit the company to continue to enlarge its working capital to enable it to take on some special business now under consideration."

### The Pulverized Fuel Equipment Corporation

The Pulverized Fuel Equipment Corporation has recently been organized for the purpose of taking over the business of the Locomotive Pulverized Fuel Company, and to broaden the activities of the latter to cover the central power station, metallurgical and industrial fields. The head offices are at 30 Church street, New York, with Canadian office in the Transportation building, Montreal.

This corporation installs and delivers in operation complete plants of its "Lopulco" system for the preparation, distribution, storage, feeding and burning of pulverized fuel for any steam generating or heating purposes whatsoever. The development by the Locomotive Pulverized Fuel Company of its "Lopulco" system for the burning of anthracite and bituminous coals, lignite and peat in pulverized forms,

has already commercially demonstrated its adaptability for not only steam locomotives and steamships, but for central power station and other direct and waste heat stationary boilers, and for metallurgical and chemical furnaces and cement and other kilns. Many such installations are now in use and in process of construction in connection with public utility properties and large industrial and manufacturing plants.

The officers of the Pulverized Fuel Equipment Corporation will be: **J. S. Coffin**, chairman; **J. E. Muhlfeld**, president; **H. F. Ball**, vice-president, executive; **H. D. Savage**, vice-president, in charge of sales; **V. Z. Caracristi**, vice-president, in charge of engineering; **Samuel G. Allen**, secretary-treasurer.

### Pressed Steel Car Company

The annual report of the Pressed Steel Car Company for the year ended December 31, 1918, shows a big increase in earnings over the report for 1917. The surplus last year, after charges and taxes, amounted to \$3,950,785, equivalent after the deduction of preferred dividends to \$24.60 a share on the \$12,500,000 common stock. In 1917 the surplus was \$2,130,308, equivalent after preferred dividends to \$10.04 a share on the common.

The profits for 1918 after federal tax deductions were \$4,350,785, an increase of \$1,920,477 over the preceding year. Depreciation charges were \$400,000, as compared with a depreciation charge in the preceding year of \$300,000. The surplus for last year, after preferred and common dividends, was \$2,107,035, as compared with \$380,308 in 1917. The profit and loss surplus now stands at \$12,704,412. The inventory at the close of 1918 stood at \$3,364,479, only a trifle more than half of the inventory item in the balance sheet of the preceding year.

Unfilled orders on hand January 1, 1919, including the business of the Western Car and Foundry Company, amounted to \$73,000,000, and of this only about 15 per cent was for the ordinance department and subject to termination. All other business was covered by contracts containing no cancellation clauses. About 25 per cent of this business was for the military railways overseas and about 35 per cent for the United States Railroad Administration.

### Railroad Administration Takes Over Superheater Company

Director **General Hines** announced on February 18 that the United States Railroad Administration, at the instance of the alien property custodian, had purchased more than 51 per cent of the stock of the Locomotive Superheater Company. According to Mr. Hines' statement, this stock originally belonged to German interests. The alien property custodian suggested that the interests of this government could be best protected through some governmental agency acquiring the stock. The purchase by the Railroad Administration will prevent effectively the passing of the stock back to German control.

At the annual meeting of the Locomotive Superheater Company, held at the office of the company, 30 Church street, New York City, the following directors were elected: **J. S. Coffin** (chairman), **S. G. Allen**, **George L. Bourne**, **H. B. Spencer**, **Sanford H. E. Freund**, **J. N. Wallace**, **F. W. Scott**, **T. C. Powell** and **Henry Morgenthau**. Five of these, Messrs. **Spencer**, **Freund**, **Wallace**, **Scott** and **Powell**, are representatives of the Railroad Administration.

It was announced that as the affairs of the company have been satisfactorily managed by its officers, no change was made in the management. **George L. Bourne**, **R. M. Osterman**, **F. A. Schaff**, and **S. G. Allen** were re-elected, respectively, president, vice-presidents and secretary; **Henry Morgenthau** was elected treasurer, and **T. C. Powell**, director of the Division of Capital Expenditures of the Railroad Administration, was elected an additional vice-president.

The hearing on regulations for the transportation of explosives and other dangerous articles by freight and express, assigned for February 24, has been reassigned for hearing March 25, at Washington.

## Financial and Construction

### Railway Financial News

**DENVER & RIO GRANDE.**—See item in General News about Denver & Rio Grande operating expenses.

**HOCKING VALLEY.**—This company has sold \$7,500,000 five year 6 per cent notes to Kuhn, Loeb & Co. The notes will be offered at 98¼ and the proceeds will be used to meet \$5,000,000 6 per cent notes which matured February 1 and were extended for a month.

**LEHIGH & NEW ENGLAND.**—See item about operating revenues in General News.

**MICHIGAN CENTRAL.**—See item on net operating income for 11 months in General News.

**NEW YORK, NEW HAVEN & HARTFORD.**—An application for the appointment of a limited receiver to prosecute suits against certain of the former directors of this company was made to Judge John C. Knox in the United States District Court in New York City on February 13 by a stockholder's committee (Harold Norris, secretary), representing 1,738 shareholders holding 51,959 shares of stock.

### Railway Construction

**CHICAGO UNION STATION COMPANY.**—The John Griffiths & Son Company, Chicago, has been awarded a contract for the construction of the foundation of the head house of the new Chicago Union station. Approximately 100 men began work on that part of the project on February 17. The contract for the construction of the Harrison street viaduct substructure has been awarded to the W. J. Newman Company and work is to be started immediately. The American Bridge Company, New York, which was awarded a contract some time ago for work in connection with the Polk street and Taylor street viaducts, is now fabricating the steel to be used in their construction. It is estimated that the project will soon afford employment for more than 5,000 men, and the applications of discharged soldiers for work are to be given preference.

**ILLINOIS CENTRAL.**—This road has awarded a contract to the Railroad Water and Coal Handling Company of Chicago for the construction of a complete pumping installation at Bois, Ill. The pump house will be of brick and concrete and the pumping equipment will consist of duplicate installations of 30-hp. oil engines with centrifugal pumps.

**QUEBEC & UNGAVA.**—A bill has been introduced in the Quebec legislature to authorize this company to build a railway from a point near Seven Islands on the north shore of the St. Lawrence river, Saguenay county, Quebec, north to a point at or near Lake Menihék, thence west or northwest to a harbor between the mouth of Big river and Nastapoka sound on Hudson Bay; also to build branch lines. The provisional directors include W. Perceval, E. S. Holmwood and H. C. Thomson, all of London, England. The head office of the company will be in Quebec.

**ST. FELICIE & UNGAVA.**—A bill has been introduced in the Quebec legislature to incorporate this company. The plans call for building a railway from St. Felicien, Lake St. John county, Quebec, north to a point on Lake Mistassini, thence in a northeasterly direction via Lake Nichikun to Lake Petitsikapau, or from St. Felicien direct to Lake Nichikun, thence to Lake Petitsikapau; also to build branch lines. The provisional directors include H. C. Thomson, London, England, and J. T. Ross, Quebec. The head office of the company will be in Quebec.

**Pullman employees,** taking a straw vote, have decided that government management of the railways is a good thing. Note—The government has increased their salaries three times.—*Los Angeles Times.*

## Railway Officers

### Railroad Administration

#### Central

**Sanford H. E. Freund,** formerly assistant general counsel of the Great Northern, has been appointed assistant general counsel of the Railroad Administration, with office at Washington, D. C.

#### Operating

**D. M. Driscoll,** trainmaster of the Northern Pacific, with office at Duluth, Minn., has been appointed assistant superintendent of the Lake Superior division, with headquarters at Duluth.

**C. B. Dugan,** assistant superintendent of dining car service, has been promoted to superintendent of dining car service of the Illinois Central, the Yazoo & Mississippi Valley, and the Chicago, Memphis & Gulf, with headquarters at Chicago, succeeding **W. C. Francis,** deceased.

#### Financial, Legal and Accounting

**W. W. Dowell,** cashier of the Atlantic Coast Line, with office at Savannah, Ga., has been appointed paymaster, with office at Wilmington, N. C.

**J. H. Conley,** auditor of the Georgia & Florida and the Augusta Southern, with office at Augusta, Ga., has been appointed federal auditor; **W. Blanchard,** treasurer, has been appointed acting federal treasurer, and **Barrett & Hull,** general counsel, have been appointed general solicitors; all with headquarters at Augusta, Ga.

#### Traffic

**W. F. Griffiths,** assistant general passenger agent of the Delaware, Lackawanna & Western, has been appointed general passenger agent, with headquarters at New York.

#### Purchasing

**G. E. Scott,** purchasing agent of the Missouri, Kansas & Texas, and the St. Louis-San Francisco, has been appointed a member of the southwestern regional purchasing committee, with headquarters at St. Louis, Mo., to succeed **J. L. Cowan.**

#### Engineering and Rolling Stock

**J. W. Peck,** signal inspector on the Chicago Great Western, at Chicago, has been promoted to assistant signal engineer, with headquarters at the same point, and **W. J. Mullins,** recently discharged from the army, has returned to his former position as general signal inspector of the same road.

**James M. Kinkead,** who has been appointed division engineer of the Trenton division of the Pennsylvania Railroad, with office at Trenton, N. J., as has already been announced in these columns, was born in Altoona, Pa., and was educated at Lafayette College, graduating with the class of 1895. After graduation he entered the maintenance of way department of the Pennsylvania and has since been constantly in its employ. He served successively as chairman, rodman, transitman, assistant supervisor and then as supervisor at York, Pa.; Parkton, Md.; Baltimore; Huntingdon, Pa., and Altoona. His appointment as division engineer became effective on February 1.

**Axel S. Vogt,** mechanical engineer of the Pennsylvania Railroad, Eastern lines, with office at Altoona, Pa., on February 1, retired under the pension rules of the road. He was born on January 19, 1849, at Christianstad, Sweden, and was educated in the public schools. He began railway work in June, 1874, with the Pennsylvania Railroad, and remained in that position until 1882, when he went with Schutte & Goehring, Philadelphia, Pa. In November, 1883, he returned to the service of the Pennsylvania Railroad as assistant engineer of tests. On September 1, 1886, he was appointed assistant engineer, and since March, 1887, served

as mechanical engineer, until his retirement under the pension rules of the road as above noted.

**William Frederic Keisel, Jr.**, assistant mechanical engineer of the Pennsylvania Railroad, Eastern lines, has been appointed acting mechanical engineer, with office at Altoona, Pa., succeeding A. S. Vogt, who has retired under the pension rules of the road. Mr. Keisel was born on September 1, 1866, at Scranton, Pa., and was educated in Lehigh Preparatory School; and in 1887 graduated from Lehigh University with the degree of mechanical engineer. He entered the service of the Pennsylvania Railroad as a draughtsman, in the office of the mechanical engineer, in April, 1888, and was promoted to chief draughtsman in March, 1899. On July 1, 1900, he was appointed assistant engineer, and in September, 1902, he became assistant mechanical engineer, in which capacity he also had charge of the test department at Altoona, until the separation of the two departments. Mr. Keisel's appointment as acting mechanical engineer of the Pennsylvania Railroad, Eastern lines, became effective on February 1.

W. F. Keisel, Jr.

## Corporate Operating

**D. C. Smith**, general manager for the receivers of the Georgia Coast & Piedmont, with office at Brunswick, Ga., has been appointed also general manager of the Savannah & Statesboro Railroad, succeeding **S. T. Grimshaw**, resigned to go with the Seaboard Air Line.

## Engineering and Rolling Stock

**Albert H. Eager**, assistant superintendent of rolling stock, Canadian Northern, western lines, with headquarters at Winnipeg, Man., has been appointed mechanical superintendent of the Canadian National, with office at Winnipeg. Mr. Eager was born at Waterloo, Que., in 1868, and entered railway service as a machinist apprentice with the Canadian Pacific at Farnham, Que., in 1885. He remained with the Canadian Pacific until 1910, being successively machinist, locomotive foreman, general foreman at Cranbrook, B. C., and at Calgary, Alta., district master mechanic at Kenora, Ont., and again locomotive foreman at Calgary. In 1910 he went to the Canadian Northern as superintendent of shops at Winnipeg, and in 1915 became assistant superintendent of rolling stock of the Canadian Northern, western lines at Winnipeg, which position he held until his appointment as mechanical superintendent of the Canadian National.

**Alan T. Fraser**, district engineer on the western district of the Canadian Northern, has been appointed chief engineer of the Canadian National, western lines, with headquarters at Winnipeg, Man. Mr. Fraser was born at Pembroke, Ont., in 1872. He was educated in the public and high schools of Pembroke and graduated from the School of Practical Science at Toronto, Ont., in 1892. He immediately entered the employ of the Gatineau Valley, at Wakefield, Que. From 1893 to 1895 he was successively chairman, rodman and leveler for the Canadian Pacific and the Lake Timiskaming, at Mattawa, Ont. Subsequently he was timekeeper on the Ottawa-Montreal Short Line at Vankleek Hill, Ont., transitman and resident engineer of the Crows Nest Pass at Fort

McLeod, assistant engineer on the Pipestone extension of the Canadian Pacific, resident engineer of the Ontario & Rainy river at Fort Arthur, Ont., locating and division engineer on the Canadian Northern, with headquarters at Winnipeg, and assistant district engineer of the National Transcontinental at Ottawa, Ont. In 1905, Mr. Fraser entered the employ of the McDonald & McMillan Company, which held a Grand Trunk Pacific contract for work from Portage La Prairie to the Touchwood Hills. The following four years he spent in mining and prospecting in Northern Ontario. In 1910 he returned to the Canadian Northern as locating and division engineer at Edmonton, Alta., and in 1911 he was appointed district engineer at Edmonton, in charge of the location and construction of the main line and branches in Alberta. In 1915 he was promoted to district engineer of the Western district of the same road, which position he held until his appointment as chief engineer.

## Purchasing

**A. E. Cox**, general storekeeper of the Canadian Northern, western lines, has been appointed general storekeeper of the Canadian National, western lines, with headquarters at Winnipeg, Man.

## Obituary

**W. C. Francis**, who was for seven years assistant superintendent of dining car service on the Illinois Central, at Chicago, died in the Illinois Central hospital, at Chicago, on February 9, at the age of 65 years.

**Bruce W. Duer**, traffic expert for the Public Service Commission of Maryland, at Baltimore, died, on February 15, of pneumonia. He was born on February 17, 1867, at Princess Anne, Md., and was educated at Princess Anne Academy. He began railway work in 1884, with the New York, Philadelphia & Norfolk, serving consecutively as agent, operator and despatcher. In 1888, he went to the Baltimore & Ohio as agent and operator, and was steadily promoted until he became superintendent at Pittsburgh, Pa. In February, 1913, he was elected vice-president of the Georgia & Florida, and later became traffic specialist of the Public Service Commission at Baltimore.

**FEMININE CURIOSITY.**—A young lady operator working at the summit of Blue Mountain reported a train out at 5 p. m. and then asked: "What did the conductor mean when he said he was going to steal twenty minutes?" The despatcher then ascertained the exact time the train did leave [5:20]. This train went down the hill about eight miles, where it was derailed on account of making excessive speed. Well, they did not find out at the investigation until the conductor and his entire crew had nearly slipped out of the responsibility, when the despatcher remembered the conversation with the operator. Comparing the time the accident happened with the time the train left the last station it was plainly shown that the cause was excessive speed. That's the reason we require all operators to tell the despatcher all conversations and anything that happens at their respective stations.—*J. A. Shockey, S. P., before Pacific Railway Club.*

**ABSOLUTE CONFIDENCE.**—The train and engine crews receiving a train order written on tissue paper from an operator, have absolute confidence in what that train order tells them. If they didn't have, the system would break down. If you received a messenger boy with a note to go down and jump off Pier 13 into the bay, would you do it? I don't think you would; but train and engine men, receiving train orders, in effect do that very thing. They ramble through the night at any speed you might wish them to make, pick up a train order by hoop in the crook of the arm, then read it before they get to the switch past which they must not go until it has been read. They know the operator has gone through certain requirements and rules before the train order can be delivered to them and they trust the life and limbs, not only of themselves, but of the passengers in their charge.—*J. A. Shockey, Southern Pacific Train Despatcher.*

Those who attended the meeting of the New York Railroad Club last Friday evening and who had any doubts in their

### The Value of the Standard Statistics

minds as to the practical value of the standard operating statistics, must have left the meeting with these doubts pretty well cleared away. Professor William J. Cunningham, manager of the Operating

Statistics Section of the Railroad Administration, told of the purposes of these statistics and of their advantages; in addition, he outlined the more salient features of the different forms. During the discussion reasons were advanced as to why the standardized statistics were of importance and value from the operating and engineering departments' viewpoints. The new forms were severely criticised by two of the speakers, but Professor Cunningham met their objections so fully at the close of the discussion that the meeting gave him quite an ovation. While he emphasized the value of the standard operating statistics for the purposes of administrative control, he showed clearly their great importance in securing improved results when properly used by the local officers. While they in no way interfere with initiative on the part of these officials, they furnish, with more or less promptness, an accurate measuring stick with which to gage their efforts. That the forms were not developed on a theoretical basis, but are eminently practical is indicated by the fact that similar data have been used to a greater or less extent on a number of roads with excellent results. Because they are based upon sound fundamental principles and are logically arranged, they make possible an intelligent and thorough analysis of operating conditions, thus helping to locate and eliminate lost motion and friction, and to develop the most economical and efficient methods. Not a few operating officers have been startled when the facts concerning the performance of the equipment and of operation were clearly and accurately placed before them. Another advantage of these statistics is that they make possible the setting of a definite goal toward which the men may be encouraged to aspire and which intelligent efforts on their part will make it possible to achieve.

The New York State report on the South Byron collision, noticed elsewhere, is a thorough and complete document. It

### Report On South Byron Collision

is very long, but the author found, no doubt, that completeness and brevity could not be combined. This report should be specially useful to railroad directors, state commissioners and other

persons in responsible positions who are inclined to evade the duty of reading a report like this because of their unfamiliarity with the details of signalling and train running. One reason why this country has so large a train-accident death list is the division of the responsibility for the safety of trains among such a large number of individuals—from railroad directors and congressmen down to repairmen and track-walkers—and a report intelligible to all classes has a distinctive usefulness. The outstanding feature of this report is the discussion of automatic train stops and audible signals. South Byron was a notable example of the class of collisions in which these expedients constitute the only "indicated" remedy, and the situation is here fearlessly and

trenchantly analyzed. It could not be dealt with exhaustively, of course; that would require a treatise; but Mr. Vanneman has set forth the principal issues very clearly, and any state or federal or railroad officer who has felt that he was in the dark on this subject can here find light for his path. Discussing the question of the cost of providing a safeguard to supplement our best visual signals, Mr. Vanneman states the obvious fact that during the past few years even our richest railroads—most of them—would have found it difficult or impossible to get the necessary money; which reminds us that the government has a very definite responsibility for the safety of passengers' lives, for it is the government that has limited the railroads' income. A railroad president who would spend a half million dollars for automatic stops has before him the very definite question, How many years shall I have to wait for an unwilling Congress or commission to permit me to recoup this expenditure?

After a fairly thorough trial of the table d'hote dining car service by the Railroad Administration, it has been decided

### Change in Dining Car Service

to discontinue it except where there are special and important reasons for not so doing. In many respects this action is to be regretted, although the administration is doubtless forced to take it because of the numerous complaints which it has received. One of the principal advantages of the table d'hote system is that it makes it possible to serve the meals quickly, with a fairly good variety of food, and at considerably less expense than under the a la carte system. The very fact that the service is quicker has been criticised by those making long journeys, who feel that the slower service under the a la carte system is a distinct advantage in helping to break the monotony of the trip. On the other hand, the quicker service is a very distinct advantage when the trains are crowded and it is advisable to serve the diners as quickly as possible in order not to force some of them to wait an unreasonable time. A student of psychology claims that the greatest objection to the table d'hote system is the fact that Americans as a class insist upon receiving individual attention and do not like to be forced to do anything. He suggests that if a choice could be given of the table d'hote and the a la carte systems at the same time, very few people would order a la carte. The most serious objections to the table d'hote system were made by mothers traveling with small children. It is rather pitiable to watch a small child served with a regular course, a large part of which may not be suited to its needs or tastes. While the dining car conductor is given a certain latitude in cases of this kind, he is told to stick as closely as possible to the table d'hote meal and not to allow any variations unless, in his judgment, it is really necessary. The result has been that most of them have made no allowance for the children. Several dining car conductors who were interviewed, admitted that the table d'hote system made it possible to serve the people more quickly and more satisfactorily and at less cost than the a la carte system, but that they would be greatly relieved to go back to the a la carte system, because it would relieve them of many arguments which were not at all pleas-

ing. While some of those travelers who do not care how much they spend for their meals may be glad to welcome back the a la carte system, those who enjoy a well-balanced meal at a reasonable price will greatly miss the table d'hôte meals.

## The Situation Becoming Desperate

THE FOREST PRODUCTS SECTION of the United States Railroad Administration has done highly constructive work in preparing and putting into effect standard specifications for cross ties and for their treatment, and other measures tending to improve the quality of the ties used by the railroads. These measures should be retained permanently, regardless of the form of railway control ultimately adopted. However, the primary function of this department is the securing of an adequate supply of ties and timbers to meet the requirements of the roads. This it is failing to do. The production of ties has fallen to such an extent during the year since the Forest Products Section has been in existence that maintenance men, particularly in the east, are becoming genuinely alarmed over the outlook.

A falling off in tie production last year would not have been surprising, owing to the shortage of labor and the unsettled conditions in all industries. But the manufacture of ties was even more seriously interfered with by the promulgation of several "reforms" by the Forest Products Section, designed to eliminate certain practices of long standing in the industry. Principal among these was the order eliminating the tie contractor, which destroyed the organization through which a large part of the ties had been secured in the past without building up any other organization to replace it. While we hold no brief for the tie contractors and do not overlook certain abuses which had grown up within their organizations, we do question the advisability of introducing such radical changes at a time when so many other conditions were tending to restrict the output.

As a result of these conditions the production of ties last year was not much over half that of normal years. Drastic as such a curtailment in supply was, the full effects were not evidenced on many roads which entered the season with their usually large stocks on hand. These have since been used and in large part have not been replaced. As a result the roads, particularly in the Eastern and Allegheny regions, now have few ties on hand at the opening of their season of tie renewals when they should normally have their largest supplies.

At a meeting of representatives of the railroads in the Allegheny region a few days ago, it was ascertained that the roads in that region, one of the smallest of the seven, were 11,000,000 ties short. Conditions in the Eastern region are even worse, while the roads in almost all parts of the country have less than their normal supplies on hand.

Ties are a primary necessity for track maintenance. Their deterioration is continuous. Their replacement should therefore be uniform. Railway men are familiar with these facts. Facing this shortage, they are resorting to measures which in many instances are worse than those which it is aimed to correct. Rumors are frequent of the lax inspection and incorrect grading of ties produced along the lines of the purchasing roads. The acute shortage is also leading to greatly increased prices. Only a few days ago the purchasing agent of an eastern road accepted without hesitation the offer of a shipment of Douglas Fir ties from the Pacific Coast (one of the few regions now producing a normal supply) at a cost of over \$1.80 each, delivered at New York. Roads which have used treated ties in large measure or exclusively are now using untreated ties because of their inability to hold the ties

out of track long enough to season and treat them properly. The effects these measures will have on maintenance costs in future years is evident.

Important as are the improvements which the Forest Products Section is endeavoring to make, it is even more essential that the roads be provided with the ties necessary for their proper and safe maintenance. No further time can be lost in the development of theories. Ties are needed and needed at once.

## Vast Increases of Expenses Not Due to Advances in Wages

AS THE STATISTICS of the Interstate Commerce Commission and of the Railroad Administration regarding the operating expenses of the railways in 1918 become more complete they grew more startling. The *Railway Age* estimated that when complete statistics were available they would show that the total increase in expenses over 1917 was \$1,250,000,000, and that two-thirds of this would be due to advances in wages and one-third to other causes. The final summary of the Interstate Commerce Commission for the year 1918 which has recently come out, and which covers railways operating 234,000 miles of line, shows an increase in operating expenses for these railways of \$1,149,000,000. Director General Hines, in testifying before a committee of Congress last week, estimated that the advances in wages which actually had been charged into the accounts for 1918 amounted to \$583,550,000. The conclusion must be drawn that the increases in expenses in 1918 attributable to causes other than advances in wages were about \$565,000,000, or almost one-half of the total. In view of the "economies" which Mr. McAdoo anticipated would result from unification, and which the advocates of government ownership predicted would result from government operation, it will probably astound the public to learn that the increase of expenses during the year would have greatly exceeded a half billion dollars without any advance of wages at all.

This showing accentuates the uneasiness that must be felt as to the future of railway net earnings. It has been estimated that the advances in wages made under government control have amounted to over \$800,000,000 annually, and much discussion in our own columns and elsewhere has been predicated on the understanding that substantially this amount was charged into the accounts for 1918. It also has been understood that further advances of \$60,000,000 to \$100,000,000 are yet to come. Why the discrepancy between these figures and the one which Mr. Hines gave? It is largely explained by the following note which is given in Mr. Hines' table regarding the estimated advance in wages in 1918: "The statement does not include the effect of increases covered by Supplements 12 and 13 which were promulgated in December, 1918, with regard to which reliable data are not available." Presumably, therefore, the increases covered by Supplements 12 and 13 to telegraph operators and some other classes of employees, some of which are retroactive, are not included in the operating expenses for 1918 as reported by the Interstate Commerce Commission. Therefore, either part of these advances will yet have to be charged back into the 1918 accounts, thereby increasing the operating expenses shown for that year, or charged into the operating expenses for 1919.

In any event, the amount of wages paid in 1919, unless there should be a drastic reduction in the number of employees, will be far larger than the amount included in the operating expenses for 1918, as reported by the Commission. Assuming the same number of employees, if the wage advances made under government control should prove to run

at the rate of \$800,000,000 a year, the total wages paid in 1919 would be over \$200,000,000 more than in 1918, while if they should prove to run at the rate of \$900,000,000 a year, the total wages paid in 1919 would be over \$300,000,000 more than in 1918.

This \$200,000,000 to \$300,000,000 additional wages must be included in operating expenses at a time when the traffic handled and, in consequence, the total earnings made, are declining. To estimate with any confidence what future earnings and expenses will be when both earnings and expenses are being affected by such influences is impracticable. Theoretically, it ought to be possible to effect large economies, but as a practical matter it will be very difficult, especially under government operation. The railways are overmanned in certain departments, and there ought to be a sharp reduction of the number of employees in those departments, accompanied by a marked increase in efficiency of those retained. It is, however, very difficult substantially to reduce forces under government operation, because it is naturally assumed that under government operation there should be a large measure of consistency and uniformity in the methods used on all the railways, and the varying conditions existing on different railways are not adapted to consistent and uniform reductions of employees. Besides, there is a large amount of deferred maintenance, and there ought to be an increase of expenditures for maintenance.

Nobody familiar with railway conditions in general can study the available statistics regarding earnings and expenses without being driven to the conclusion that regardless of the advances in wages government operation has been more expensive than private operation would have been. What is even more pertinent to the present situation is that nobody can study the figures without being driven to the conclusion that with existing rates, prices and wages it will be difficult for either the government or the railway companies to operate the railways and earn a reasonable net operating income in 1919.

These two conclusions once reached, there should be little difficulty, it would seem, in deciding upon the general policy of dealing with the railways which should be adopted. They should be returned to private operation as soon as practicable in order that the country may benefit by the more economical management which the companies will provide. Before they are returned, however, there should be adopted legislation which will protect the companies from financial disaster due to the vast increases of expenses which have occurred under government operation. The public wants the railways returned to private operation. The great difficulty in the way is the enormous increase in expenses for which the government itself is responsible.

We frequently hear it said that if the railways are returned to private operation the government will not give the companies guaranties of net return in any form—that they will have to take their chances with the regulating commissions and the courts. But why should the companies be told they must take their chances with increased expenses the government itself has piled up? The railway companies took their "chances" with the regulating commissions and the courts before the war with the result that the expansion of railroad facilities almost stopped. If the railways should be turned back to their owners, and existing rates should prove insufficient, the result might be the bankruptcy of many companies and a financial panic before the regulating bodies, even though disposed to do so, could make readjustments of rates which might prove to be necessary. It would be the public as much as the companies that would be taking "chances," and very dangerous chances, if a policy which did not recognize actual conditions should be adopted.

The railways should be returned soon to private operation because under private operation they will be run more eco-

nomically and give the public more satisfactory service, provided they are fairly treated. They should be protected from financial disaster either by specific government guaranties of net income or by legislation such as that proposed in the Warfield plan requiring the regulating bodies to so fix rates as to yield an adequate return, because if this is not done they may and probably will be unable to accomplish for the public the results which the public wishes accomplished, and failure to accomplish which will hurt the public as much as it will the companies.

## Government Operation An Unauthorized Experiment

G. M. FREER, president of the National Industrial Traffic League, gave a pointed answer to some of the arguments advanced by Mr. McAdoo and Mr. Hines in favor of another five years of government operation of the railroads when he urged the Senate committee not to heed the suggestion that government operation has not had a fair test. He made the point that the people have never authorized any test of government operation, and further, that they never would have consented to such a test as has been made of it had it not been for the war emergency. He expressed the opinion that the Railroad Administration might, if given further opportunity, show an improvement over the results of its first year, but declared that the whole system is wrong and should be abandoned as soon as practicable.

The primary purpose for which the railroads were taken over has been accomplished and in a fairly successful manner, considering the matter entirely from the standpoint of meeting the war emergency. In doing so, however, the Railroad Administration has made itself more unpopular than the railroads have been for a long time, and the former director general and the new director general who has assumed the accumulated load, naturally would like to have an opportunity to vindicate the policies that have been followed. Mr. Hines has sought to explain the flow of criticism that has been unloosed since the signing of the armistice removed some of the restraints upon free speech, by attributing it to the natural reaction from the restrictions and inconveniences experienced during the war. It might be more correct to attribute these criticisms to the fact that Mr. McAdoo persisted in ignoring the emergency character of the autocratic powers conferred upon him and in taking advantage of them to conduct an unauthorized experiment in railroad unification and standardization in the midst of a great war.

He seemed to regard not merely government control, but government operation as a desirable thing in itself, not as a necessary evil forced upon the country by the short-sightedness of its former policies of regulation. The railroads had been shackled and throttled until they could no longer function properly under the difficult conditions confronting them, which, as Mr. Willard has pointed out, were not all matters of railroad operation, and the government, having got them into such a situation, had to step in and assume the burden of responsibility. If Mr. McAdoo had been content to confine himself to the object for which he was placed in charge of the railroads—or the officially stated object—he might now be receiving congratulations upon his success, in spite of any inconvenience to the public or increased expense, instead of being put in a position to demand five more years in which to allow his policies an opportunity to make good.

But the task of conducting transportation to win the war was not big enough for him. He must also conduct an experiment, which he was so confident would be successful, that

while adding some \$1,200,000,000 to the operating expenses in a year he kept bragging about the "enormous economies" he was effecting by unified operation. These economies, so far as the regional directors have been able to calculate them in dollars and cents, have amounted to about \$91,000,000. Many of them cannot be continued under normal conditions, and they also include such items as the saving of \$4,000,000 or \$5,000,000 in officers' salaries by charging them to the corporations or to the revolving fund while the expenses of the central and regional organization built up by Mr. McAdoo have been \$3,528,946 for a year, and for several months have been running at the rate of \$6,000,000 for the year.

If Mr. McAdoo had not laid such great emphasis on the comparatively trivial economies that were being effected, or if they had been regarded merely as a slight offset to the war time cost of railroad operation, the increase in expenses might now attract less attention.

By airily ignoring the mounting expenses, and by referring to the rate increase as a war emergency measure to be followed later by reductions, while promising to maintain the high wages that chiefly made the increase necessary, Mr. McAdoo succeeded for a time—a time during which the slightest criticism of the government was regarded as pro-German—in creating a popular impression that he was "showing up" the former railroad managements. Neither he nor Mr. Hines should resent the criticisms that are now being made as the results for the year become known, or regard them as representing a lack of appreciation of the creditable things that the Railroad Administration has done; they should attribute them mainly to the wide discrepancy between the results which actually have been secured and the results which it was predicted the unauthorized "test" would produce.

From an operating point of view, the principal purpose for which government control was adopted was to enable the railways to handle a large amount of essential traffic during the war, and to handle it better. Mr. McAdoo deserves full credit for having placed in direct charge of operation railway men whose experience and ability were beyond question. It would have been difficult, on the whole, to have made better selections for the operating positions at headquarters in Washington, for regional directors, for district managers and for federal managers, than he made. Furthermore, it would be impossible to express too strongly the appreciation that the nation should feel and show for the loyalty, energy and ability with which the railway men who took important positions in the Railroad Administration did their work. They did not create the organization; Mr. McAdoo created it; but they did their best to make it a success; and in spite of its inherent faults the railway men did make it work well enough to move the traffic.

Unfortunately, the system adopted by Mr. McAdoo was obviously designed far more to conduct an experiment to prove the correctness of his theory of "unified government operation" than merely to meet the war emergency. The result was the development of an over-centralized departmental organization, under which, even with the ablest personnel, the railways could not be operated efficiently and economically, and which, with a less able personnel would have been absolutely ruinous.

The nation has good reason to thank railway officers trained under private management for having prevented Mr. McAdoo's "experiment" from causing all the calamitous results it might have produced; and at the same time it has good reason for condemning him for having undertaken, in the midst of a great national emergency, an experiment which has had many very bad results in spite of all the antidotes the able and experienced railway men in his organization have been able to administer.

## Efficiency in Telegraph Service

IS A SAVING of several thousand dollars a year by a properly censored telegraph service worth consideration? In the handling of railroad business, three methods of communication may be said to exist, viz., the telegraph, the traingram and the railroad mail service. The telegraph is used for quick action; the traingram for important matters on which a delay of a few hours will not be serious, and the mail service is used for routine correspondence.

Unless a railroad has a properly supervised telegraph service the wires become congested with messages which should properly have been carried by train. As a consequence, the most efficient use cannot be made of the railroad wires and there is a corresponding decrease in the efficiency of the system, as delays are experienced in the transmission of important messages, while the increased number of messages requires a large force of operators.

The traingram service (some form of which is in use on most railroads) should be effective in order to retain the confidence of officers and employees. But it is often remarked that business may as well be handled by ordinary correspondence as by traingrams because little more attention is given to the proper handling of such letters than to ordinary mail. Consequently, it is felt that more consideration will be given to a telegram; and as handing a message to the operator is the easiest way to handle the matter, a message is sent. Another reason for the reduced efficiency of traingram service is the fact that the traingram envelopes are allowed to be used by every employe, and when traingrams are employed little or no check is obtained on the sending or receipt; therefore, they are too often considered as of little importance, and the recipient is liable to be slow in acting on the contents. Rather than permit these conditions to exist this service might better be eliminated. However, a proper censoring of messages and supervision of traingram service can readily correct these conditions, allowing a more efficient use of both classes of service, with a saving in the number of employees needed.

Elsewhere in this issue there appears an article outlining the methods employed in handling this class of service on one railroad. The methods used there give to each class of service the importance it deserves, with the result that an estimated saving of approximately \$10,000 a year is accomplished, in addition to greatly increased efficiency in operation. The methods employed are worth careful consideration by other roads having this class of service in use.

## New Books

*Lining and Loading Cars of Potatoes for Protection From Cold.*  
By H. S. Bird, investigator, and A. M. Grimes, scientific assistant, 26 pages, 22 illustrations, 6 in. x 9 in. Published by the United States Department of Agriculture, Bureau of Markets, Washington, D. C., Markets Document 17.

Approximately 75 per cent of all cars prepared to protect potato shipments from cold during the winter months are either lined or loaded incorrectly. Protection from cold depends largely upon a constant current of warm air from the heater directly to the ceiling, spreading between the ceiling and the top potatoes, thence through openings at the opposite end of the load down to the space beneath the false floor and from there under the false floor back to the heater again.

The pamphlet explains methods of lining and loading potatoes in the four principal types of cars with heaters, and refrigerator cars without heaters under favorable shipping conditions.

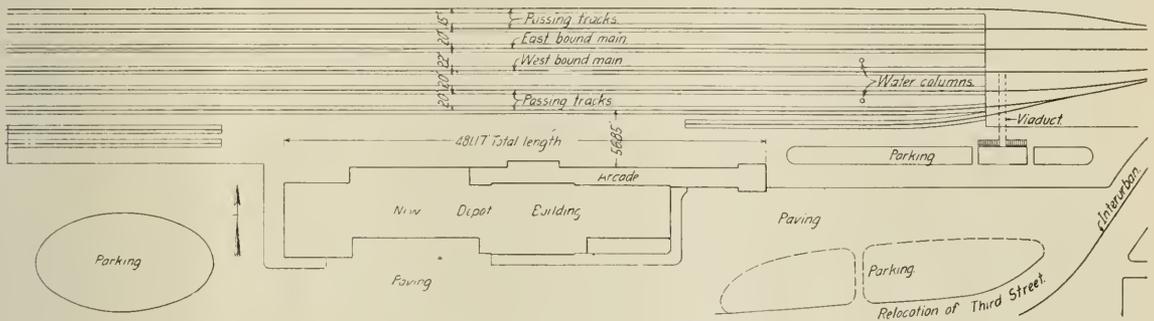

# A New Station for the Santa Fe at San Bernardino

Handsome Structure Affords Accommodations for Passengers,  
Railway Eating House and Division Officers

THE ATCHISON, Topeka & Santa Fe Coast Lines have recently completed a new passenger station, eating house and division headquarters building of unusual design at San Bernardino, Cal. In accordance with the Santa Fe's policy to erect stations typifying the spirit of the locality, the new San Bernardino structure has been built in the mission style, which is so expressive of the Southwest. The project had its inception with the destruction of the old

upon the purchase of sufficient property to permit of a relocation of the street south of the new station site. The freight house has also been moved to this new property on a location west of the passenger station.

As shown in the photographs, the building presents an unusually pleasing appearance. The predominating feature in the design is a group of four flat domes surmounting the central portion of the structure. These domes receive minor

Layout of the Station Grounds

station building at that place by fire in November, 1916, and involved a change in the arrangement of facilities, including a new site for the passenger station, and the movement of the local freight station to another location. These changes, including the preparation of the site, occupied about two years and involved a total expenditure of about \$850,000.

The construction of a building adequate for present and

repetition on the west wing of the building and also on a shelter structure at the east end. In place of a canopy or train shed, the track side of the structure is embellished by a covered arcade consisting of a succession of semi-circular arches extending each way from the track entrance to the waiting room. The roofs are of red terra-cotta tile.

Passing into the station from the track side the passen-

The Station from the Track Side, Eating House End

estimated future needs necessitated this change in site, and the only available location that seemed to meet the situation was one on the other side of Third street bordering the railroad right-of-way. In order to make this site available it was necessary to secure the vacation of this street for a distance of 1,875 ft., a change which was permitted by the city

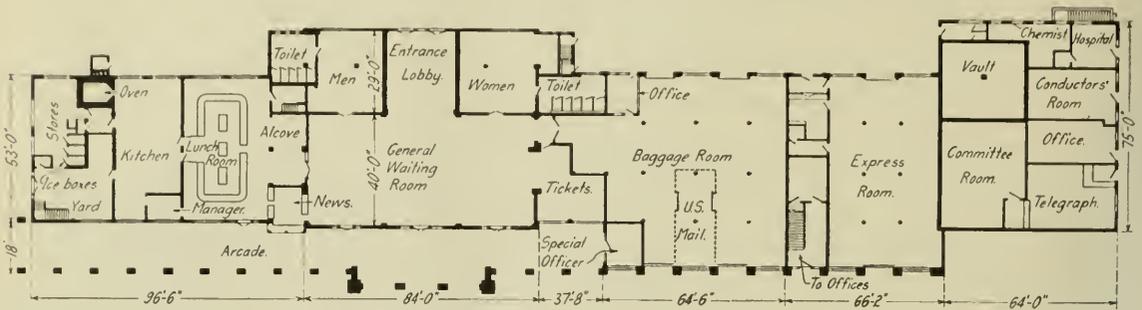

ger enters the main waiting room, 80 ft. long, 40 ft. wide and 22 ft. high. Directly opposite this entrance is a 24-ft. corridor leading to the street door, while on either side of this corridor are separate accommodations for men and women. The walls of the waiting room and the entrance lobby are paneled in art tile wainscot to a height of 9 ft.

The floors are of quarry tile, while the ceilings are laid off in heavy beamed panel work. Special convenience in handling the business of the passenger is afforded by the position of the ticket office at the west end of the waiting room, adjacent to the baggage room, so that it was possible to place the baggage counter immediately adjacent to the ticket counter. The passengers are served at the latter without any grill or top enclosure.

At the end of the waiting room opposite the ticket office

known as Lytle creek, which later had been diverted into another channel. To bring the site to grade required 75,000 cu. yd. of earth filling. It also introduced a complication in the building of the central part of the structure and entailed the extending of the foundations to a depth of 28 ft. below the first floor level. The building is heated by a vacuum steam-heating system.

One of the drawings shows the location of the station with respect to the tracks and the new location of Third street.

First Floor Plan of the Station Building

a double door leads to the lunch room which occupies a space 30 ft. by 53 ft., with an additional entrance direct from the arcade. This room has an interior finish similar to that of the general waiting room, while the lunch counter has a tile front with a white glass top. An alcove adjoining this lunch room provides space for dining tables. A news stand occupies space between the waiting room and the lunch room adjacent to the track side of the building. Beyond the lunch room a space 30 ft. by 53 ft. is devoted to the workrooms of the restaurant, including kitchen, manager's office, kitchen yard, storeroom and bake oven. The entire space above the

The space between the building and the nearest passing track, 57 ft., has been laid with white paving brick, and between each passenger track five platforms averaging 1,100 ft. long have been laid with paving bricks. The city side of the station has also been laid out with paved driveways and enclosed parking spaces, so that altogether 280,000 sq. ft. of street paving, 17,870 sq. ft. of cement sidewalks and 3,457 lin. ft. of cement curbs were required. The project also entailed the construction of a steel viaduct for vehicle traffic and a viaduct for foot traffic over the tracks.

This structure was designed and built under the direction

View of the Building from the Street, Office Wing in the Foreground

first floor of this wing of the building is used as living quarters for the employees of the eating house.

Ample space is provided in the building for the division railway offices. With the exception of the eating house wing, the entire second floor is equipped for office use, while additional office space is provided on the first floor of the west wing for a committee room, storage vaults, telegraph office, conductors' and brakemen's room, two additional office spaces, an emergency hospital and a toilet room for baggage and express employees.

The building is of permanent construction, being largely of reinforced concrete, although a structural steel frame is used under the central portion to support the four domes. Originally a large part of the site was the bed of what was

of W. H. Mohr, architect for the Santa Fe Coast Lines, and under the general supervision of G. W. Harris, at that time chief engineer of the Coast Lines, and now chief engineer of the Atchison, Topeka & Santa Fe corporation.

Return of telephone and telegraph properties to private management by June 30 is recommended in a letter to President Wilson by Charles E. Elmquist, president of the National Association of Railway and Utilities Commissioners, made public last week. "The net results of six months of operation by the Postmaster General of these wire systems," said the letter, "is inferior service and very substantial increases in charges to the public. No military necessity can now be pleaded in support of government control" \* \* \*.

# Why Test Should Be Made of Government Operation\*

Suggestions Also as to What Additional Features Are  
Necessary to Give It a Fair Trial

By C. A. Prouty

Director of Public Service, United States Railroad Administration

FOR 22 YEARS I have been associated with the federal regulation of railroads, and never in all that time has the railroad problem been in such utter confusion as today. It is highly desirable and perhaps possible that out of the present uncertainty may come some permanent disposition of this question. To that end it is desirable that all phases of the subject shall be fairly presented and fairly considered.

I have never been an advocate of government ownership or government operation. I have, however, always realized that this was the only possible answer to many of the difficulties surrounding our so-called railroad problem. As I read the papers and observe what is transpiring before Congress, it rather seems to me that there is a disposition upon the part of unthinking persons, fostered with great skill by those interests which profit by private ownership, to eliminate the possibility of government operation. It seems to be assumed that government operation has been tried and failed and that no further consideration need be given to this subject.

A majority of the world's railways outside the United States of America are owned or operated, one or both, by the government. In recent years there has been a continual progress in favor of government operation, and in no well-considered case has any nation ever gone from public to private ownership. England in the past has been unalterably opposed to every suggestion of public ownership, but I am told that, as a result of the war, public sentiment will insist upon the nationalization of railways. I feel that the question is one for serious consideration, and as an insignificant contribution to the discussion I desire to affirm three propositions:

1. Government operation in the United States under war conditions was not a failure, but a success.
2. There has been up to the present time no fair test of government operation under peace conditions.
3. Advantage should be taken of the present situation to make such a test, and the public should suspend its judgment until the result of that test is known.

## I.

The government took over our railroads for two purposes. First, to stabilize the financial condition of the railroads. The war produced a most serious and unfortunate effect upon all public utilities. As a rule, the rates of such utilities were fixed and could not be immediately increased. Their operating expenses enormously advanced. The result was to bring upon all financial disaster and to produce in many cases absolute bankruptcy. The three great express companies which were not taken over by the government all operated for the first six months of the year under a heavy deficit. The Adams company lost in that brief period \$6,000,000, more than one-half the value of all its operative property.

The railroads alone were taken care of. Their security holders are being paid a sum equal to the largest earnings

ever known in the history of these properties. Broadly speaking, interest has been paid upon every security and a dividend declared upon every stock which had been regularly paid for the last three years. The first purpose of government control has been abundantly accomplished, and yet these railroad gentlemen are virtually saying to the country that the government which has protected them from bankruptcy in the hour of their financial stress and is today paying them a most liberal return upon the value of their property is no better than a ravening wolf which is seeking to mutilate and destroy those properties.

The second purpose was of a different character. This government was engaged in a deadly war. It must act speedily. As a part of that action certain transportation by rail was imperatively needed. Food must be taken from the point of production to the port of embarkation with which to feed our starving allies and maintain our own troops. Raw materials must be carried to the munition factory and the completed product transported to the port. Supplies for the erection of cantonments, troops to those cantonments and from those cantonments to the port must be handled. The railroads under private ownership had broken down. They were not rendering and they could not render this service. To obtain that service by rail which must be had, the government was compelled to take over these agencies of transportation.

Now, the government did those things which must be done. I spend no time in detail, but I simply say that the things were done—the food was carried, the munitions were produced, the troops were handled—and all this never could have been done by railroads operated through private ownership. This is a fact which can not be disputed. The second purpose of government operation was therefore accomplished.

## II.

You say that the methods of the government were autocratic. Of course they were. War is not a pastime. Every military operation to be effective must be autocratic, and the operation of these railroads for the time being was part of a military scheme. What had to be done under war conditions is no indication of what might be done under peace conditions.

There never has been, up to the present time, any fair test of government control in times of peace. Immediately after the signing of the armistice the director general resigned. With that, the enthusiasm of his administration vanished. The director of operation, next in importance to the director general, also resigned. The director of capital expenditures and the director of inland waterways followed suit. There was a letting go all along the line at the top, and this permeated the whole administration. Under these conditions it is impossible, as every one must know, to maintain morale or discipline or to secure effective operation. You must agree with me, therefore, that up to the present time there has been no fair test of the ability of the government to render a satisfactory and an efficient service in times of peace and that my second proposition is well taken.

\*From an address at the annual meeting of the Atlanta Freight Bureau, Atlanta, Ga., January 17, 1919.

## 111.

This brings me to my third proposition, which is that before the public passes judgment upon this railroad problem there ought to be an actual test of government operation under peace conditions, for the reason that the doubtful questions connected with government operation can only be answered by an actual test. To make this plain, I must say a word as to government operation itself.

And first of all I desire to impress it upon you—and it should never be forgotten in all these discussions—that the thing itself about which we are talking, the rendering of a transportation service by rail, is in essence a function of the government. This has been so declared by the Supreme Court of the United States, and the principle is accepted in all our present-day treatment of the railroads. Why, if this is a government function and if the government finds it necessary in case of private operation to exercise this measure of supervision and control, should not the government discharge that function itself?

It would not be possible today, under present world conditions immediately following the conclusion of the war, to finance the railroads of this country upon a 4 per cent basis; but if the past is to be taken as any guide to the future, if our experiences even of the present are at all convincing, it would be possible for the government in the immediate future to convert the securities of our railroads into a 4 per cent government bond or a 4 per cent railroad bond guaranteed by the government. The net revenue, therefore, which the government requires, and the only revenue which it requires, is a sufficient income to pay 4 per cent upon the value of these properties.

Turn, now, to the private side and listen, as I have listened for many days, to the pleas of these railroad gentlemen for additional revenues. They will assure you that it is not possible to maintain their credit, to provide for the development of their properties, which must be done if the public is adequately served, without a return of substantially 9 per cent; and I am bound to admit that what they say is not without force.

The railroad finances of this country are not in satisfactory shape and they have been continually growing worse in recent years. But little money has been raised by the issue of stock. New money has been provided mainly by mortgage security. The margin between value and the amount of the mortgage has been continually shrinking. The time has already come when many of our railroad companies can no longer borrow additional funds, and the time will come sooner or later when nearly every company will find itself in that condition. Additional railroad facilities must be provided, and if those facilities are to be furnished by the railroads themselves, they must, in my opinion, either receive direct assistance from the government or be granted the right to impose rates which will yield an income beyond a fair return upon the value of their property and beyond what they have been receiving in the past.

If it be assumed that 9 per cent is the correct figure, you have the difference between 4 per cent, which the government must pay, and 9 per cent, which must be paid to the private owner, or 5 per cent. The value of our railroads upon the basis of pre-war prices is somewhere between \$15,000,000,000 and \$20,000,000,000. Five per cent means, therefore, between \$1,000,000,000 and \$750,000,000 annually. The people of this country start out, therefore, by paying the private owners of this property that sum to discharge for them this public function.

I do not say that this may not be best. Upon the contrary it may even be a good investment, but I desire to call your attention clearly to the fact that the government could save upon the face of things annually by operating these properties itself this enormous sum.

It is true that the effect of this might be somewhat ameliorated in various ways as I have myself elsewhere pointed out, but I know of no way which does not involve the handing over to the private owner of many millions each year which the government itself might save.

Another question which must be solved if these railroads are to be passed back to their owners is that presented by the short line—the weak sister. All over this country, but perhaps especially in the Southeast, are railroads from 25 to 150 miles in length which are known ordinarily as short lines. They are independent properties, having no connection with any larger system. They connect with some trunk line, but there is no financial relation between the two.

In the past these lines have managed to eke out a precarious existence, but the recent increases in operating costs which they have shared along with larger systems have brought them to the pass where earnings are no longer sufficient to pay operating expenses. Almost every day there comes to my desk at Washington a suggestion that some one of these lines must go out of business. Its equipment is to be sold, its rails are to be taken up, for the reason that under the highest rates which can be applied revenues will not equal the cost of operation.

These lines are a vital part of the existence of the communities which they serve, and which can not normally exist without them. Some way must be devised by which their operation can be continued. I have always believed myself that the railroads of a given section, and perhaps of the entire country, must be considered as a whole. This little railroad transports the cotton grown along its line for but 50 miles, but that cotton is subsequently transported over other railroads 1,000 miles to the mill where it is consumed. The supplies which that mill uses, the cloths which it produces, are all the subject of transportation by rail. The articles which are consumed in the community served by this little railroad, the fertilizer, the boots and shoes, the groceries, everything, are only handled a few miles by that road, but they have all involved before they reach that road a great amount of transportation by rail. Now, it is not possible to shake this short line free from every other railroad in that section or in the country and say that the rates upon it should be sufficient to maintain the property. In essence your short line is a part of the railroad system of this nation and must be taken care of as such. The difficulty may be in a degree mitigated, but the only perfect answer which leaves nothing to be desired is that the government operate these railroads as a whole, applying just and reasonable rates, and that every part of the transportation system of this country shall contribute properly to every other part.

Another matter which must be dealt with is this general question of unified operation. It has just dawned upon this country that competition is wasteful and ought to be restrained. People are beginning to realize that unnecessary trains have been operated, that freight has been carried by circuitous routes and in most extravagant ways without any real benefit to the public, and that for all this foolishness the public has been required to pay. It has become perfectly apparent both by reasoning and by actual demonstration that if the railroad facilities of this country could be used as a whole, if equipment and joint facilities could be employed to the best advantage, if all duplication of effort could be avoided, the same amount of transportation might be accomplished, the same service rendered to the public with a saving of millions of dollars annually. It is generally conceded, therefore, that when these roads go back the law ought in some way or other to permit of the restraint of competition.

While it has always been my own belief that competition between carriers might to some extent be eliminated with-

out injury to the public, it is apparent that this can not be made effective to a high degree unless we are prepared, not only to permit but to compel. This administration has provided in the city of Chicago an ideal joint ticket office. While our joint ticket offices are not in all cases perhaps satisfactory, that Chicago office is complete and meets the approval of every one. I recently asked the traffic representative of one of the large lines using that facility whether it would be continued if government control were to end. His reply was that the stronger lines would probably favor its continuance, but that the weaker lines would be likely to withdraw and establish offices for themselves and that this might lead to a disruption of the whole project. It has usually been the competition of the weak line which has disturbed the situation, and unless some way can be found to check that competition but little will be accomplished.

For my own part, I do not feel that it is at all certain that competition ought to be eliminated. The great objection in my mind to government ownership has always been that competition would be and must be thereby destroyed. I have doubted whether the same service could be rendered without competition which was rendered under the competitive spur. If the government can render a satisfactory service, then a great saving can be made by unified control and the only perfect unification is under the government itself. Can the government and will the government render a satisfactory service?

I have already said to you that up to the present time there has been no trial of government operation under peace conditions. Plainly stated, the first purpose of the Railroad Administration hitherto has been to win the war, not to serve the public. As a result the service has not been satisfactory. The principal complaint of the public is that its wants are not properly respected and its complaints not properly heeded by the railroads. The off-line solicitor has been called in and there is no one to give the information and render the service which he formerly supplied. It is difficult to obtain information of any sort either as to the location of your freight or the movement of trains. Even the abounding time table of the past has largely disappeared and the public is left without means of self-information. These and many other things have created the impression in the minds of the public that the operators of these railroads who ought to be the servants of the public are entirely disregarding of the wishes of the public.

I can not deny that these allegations are true to an extent, but I do most earnestly insist that the conclusion ought not to be drawn that a proper and satisfactory service can not be rendered by the government. That question can only be answered by an actual test. What the conditions of that test ought to be to make a satisfactory one will be considered later; what I desire to emphasize now is that this question, can the government render a service satisfactory to the public, can not be answered except by actual experience. The public should suspend its judgment until the result of an actual test under fair, normal working conditions is known.

Let it be distinctly understood, however, that I am not today advocating government ownership or government operation.

After being with this problem for 22 years, I feel that whether government ownership should be tried in this country of ours can only be determined by actual experiment. In the absence of that experiment, I would myself vote against it, but I do think that advantage should be taken of the present opportunity to make the test.

Today the United States government is in the operation of these railroads. Under the federal-control act two courses were open to the director general. He might leave

the operation of the properties largely in the hands of the owners under his control. That plan would not have involved in any proper sense government operation. The railroad official would have continued to direct the operations of his road, acting under the direction of the government and accounting to the government for the result.

Or the director general could affirmatively take over the operation of the properties and appoint his men, responsible to him alone and acting for him alone, to perform that operation. The latter course was adopted. It was, in my opinion, necessary to adopt it. So far as I can see, it would be impossible for the government to more completely take over the operation of these properties than it has done.

Many things necessary to a unified control have been accomplished, often at considerable expense. Joint ticket offices have been established. In some cases freight offices have been consolidated. Methods of unified operation have been put into effect. From my viewpoint most of those which must be done in order to give government operation a fair test have been done.

This being so, what additional is necessary to give government operation a working test?

First, and principally, it is necessary to know the period during which these properties are to be retained by the government. Today it is uncertain whether this period is to be 6 months or 21 months or 5 years, and this uncertainty permeates and paralyzes the whole railroad operating force from top to bottom. The first thing which should be done in any view of the situation is to definitely fix the term of government control.

Mr. McAdoo has stated that five years were needed for this purpose, and I understand that Mr. Hines will take the same position. I do not in anywise desire to set my own opinion up against theirs, but before Mr. McAdoo testified I had already expressed an opinion that three years would be about the proper time. The matter rested in my mind as follows:

It will take six months for the director general to formulate his plans and reorganize his forces. The point of view has entirely changed. In the past we have been operating these railroads to win the war, and public convenience has been largely sacrificed to that end. In the future they are to be operated to serve the public. This change in the point of view requires many operating changes. Trains must be restored, schedules must be revised, rules for the receipt, routing and transportation of freight and passengers must be recast.

One of the most important things, from my viewpoint, is the working out of some co-operative arrangement with the state commissions. Many of my railroad friends have insisted that the state commission should be eliminated, but this opinion I have never shared. Assuming that it would be possible to establish any system of operation or control which ignored the state commission, it would be, in my opinion, most unwise. The local commission has a kind of knowledge and experience which can not be supplied by any federal tribunal and which should be recognized and perpetuated in any solution of this railroad problem. It has been my belief, and still is, that it ought to be possible to work out under government control some plan of co-operation which should demonstrate the possibility of obtaining results from proper collaboration between the federal and the state authorities.

But all this takes time, and I have felt that it would be at least six months before the new director general could be fairly ready for action, before he could formulate his plans, organize his forces, and get his machine into working shape under peace conditions. The ensuing year should show whether the government can render a service with which the people of this country will be satisfied and at a

cost which they can afford to pay. This would bring us to July 1, 1920. By that time Congress would have accumulated and digested the necessary information from which to formulate legislation. If as seems probable today, government operation was not satisfactory, then a plan for private ownership could be worked out; but if by chance the experiment should disappoint the common expectation, government operation might be continued under some proper plan. It will require from a year to a year and a half to get these properties back into the hands of their owners and arrange for the termination of government control.

I also call your attention to the fact that by the first of July, 1920, the valuation work of the Interstate Commerce Commission will have gone far enough so that a definite idea of the general result can be had. No proper disposition of this railroad problem can be effected until we know what these properties are worth.

## Orders of the Regional Directors

**L**OCAL EXCHANGE TRANSPORTATION.—In Order 109, Supplement 12, the Southwestern regional director has issued instructions concerning the issuing of local exchange passes between carriers, the same as those published in the *Railway Age* of January 3 (page 105).

*Surgeons Appearing as Witnesses.*—In Circular 174, cancelling Circular 131, the Southwestern regional director calls attention to the fact that surgeons for one railroad under federal control are appearing in court as witnesses against other railroads under federal control. Such action is inconsistent. There is no objection, however, in cases where the surgeon has actually attended the injured person and who testifies from his knowledge of facts acquired in his professional capacity. The intention of the order is to forbid a railroad surgeon from appearing as an expert witness in proceedings against another carrier under federal control.

*Rejected Scrap Iron Shipments.*—In order 164 the Southwestern regional director issues instructions to watch closely and report promptly any cases where shipments of scrap iron are rejected by consignees or where cars containing scrap iron are not promptly unloaded because of the present unsettled market conditions. This will guard against serious delay to cars.

*Fire Loss, Capital Expenditures.*—In Order 175 (exception to director general's Circular 67) the Southwestern regional director advises federal managers that in cases of fire damage, where a charge to capital account for rebuilding is less than \$1,000, the work may be done without obtaining authority from his office or from the director of the Division of Capital Expenditures.

*Mechanical Department Circulars of Instructions.*—In Order 166 the Southwestern regional director orders the issuance of all circulars to date pertaining to repairs to freight cars. The circulars so far issued which refer particularly to freight equipment are Nos. 1, 4, 7 and 8 of the mechanical department and 7 and 20 (revised) of the Division of Operation. In cases where roads reissue such circulars they must be issued in their entirety, no portions being left out.

*Mileage on Pullman Cars Moved Deadhead.*—In Circular 176 of the Southwestern regional director, Public Service and Accounting Circular 58, abstract of which was published in the *Railway Age* of January 17 (page 223), is augmented by quoted instructions from C. A. Prouty, Director of Accounting, which states that mileage charge should be made against the Pullman Car Lines for Pullman cars moved deadhead on the request of the Pullman Company, where no return haul was due or intended. This particular feature was not covered by P. S. & A. Circular 58.

*Return of Cars to Non-Federal and Canadian Roads.*—

In Freight Car Distribution Notice 3 the Northwestern regional director directs the return to Canadian roads and roads not under federal control of all freight cars on federal roads on which per diem payments are being made. The home movement of these per diem cars should be under load, if possible, or empty where the movement can be made in the direction of light tonnage and without serious empty mileage.

*Senders' Symbols for Telegrams.*—In Supplement 1 to Circular 71, the Northwestern regional director states that for the purpose of securing brevity, all telegrams from regularly established offices (not applying in cases of trainmen, officers or agents when traveling, etc.), must bear symbol numbers as prescribed below:

1. Where but one person files telegrams over one signature, messages shall be numbered consecutively commencing with No. 1 (number to be written at end of telegram), on the first day of each calendar month, the number to be prefixed by the letter A.

2. Where more than one person files telegrams over the same signature and separate files are kept, such person will number his telegrams consecutively, commencing with No. 1 (the number to be written at end of telegram), on the first day of each calendar month, prefixing the number by a letter to be assigned him.

In answering a telegram the number of the message being answered shall be quoted at the beginning of the body of the message and no further reference made, the symbol identifying the date and subject matter. The letters E, L, P and T should not be used as prefixes; and I, H, V and X may be used only to avoid duplication.

*Posting Notices in Stations.*—Supplement 2 to Circular 112 of the Southwestern regional director describes signs advertising the United States employment service (Department of Labor) which are approved for display in station waiting rooms.

*Intensive Loading of Fertilizers.*—In Supplement 1 to Circular 67 the Northwestern regional director announces that all shippers of fertilizer who are members of the Chemical Alliance, Inc., and all shippers of agricultural lime who are members of the National Lime Association will furnish the railroad agent an extra copy of the bill of lading for each carload of these commodities sent on the seventh, fourteenth, twenty-first and last days of each month. This copy, which is to be forwarded by the local freight agent to the Car Service Section, at Washington, will be used in compiling data for comparative purposes. Statements are to be furnished to each shipper showing the average loading of these commodities, the object being to educate local dealers and farmers to order in maximum carload lots or, when necessary, to club together for this purpose.

*Appeals Concerning Out-of-date Wage Questions.*—A. H. Smith, regional director, Eastern Region, by a circular of February 21, number 1200-4-90A535, cautions federal managers against too ready acquiescence in appeals to the boards of adjustment concerning questions of pay which were not properly pending under the terms of the agreements between the roads and employees. It appears that many very old cases have been appealed to the various boards—cases which had been officially dead for a long period before the government took control of the railroads.

*General Foremen's Association.*—The Northwestern regional director, file 61-1-20, advises that employees who are members of this association be allowed to attend the annual convention, which will be held in the fall of 1919, where they can do so without detriment to the service; transportation should be furnished and necessary expenses allowed.

*Corn Embargo—Primary Market.*—In Supplement 19 to Circular 34 the Northwestern regional director announces that permits are no longer required for shipments of corn and oats to Milwaukee, Wis., when billed from country stations.

# Government Standards for Freight Car Repairs

## Railroad Administration Requirements Ambiguous— Will Be Costly If Rigidly Enforced

By A Mechanical Engineer

A CLOSE STUDY of the effort to establish "Material Standards for Freight Car Repairs," as outlined in U. S. R. A. Mechanical Department Circular No. 8 cannot but serve to convince the unprejudiced reader that it contains many ambiguities which are difficult of interpretation, that in many cases its observance is impracticable, and in other cases if followed would accomplish the introduction of the specified standards only at an expense totally unwarranted by the actual benefits realized. The introductory clause of this circular reads: "When renewing parts or applying betterments to freight cars owned by railroads under federal control, if suitable material, either new or second-hand, that is standard to the car, is in stock, it shall be used. Where such material is not in stock, material standard to United States standard cars should be used, if available."

Interpreting the above clause in strict accordance with its reading, it would appear that should parts "standard to the car" not be in stock they may not be manufactured or purchased even if readily available by manufacture or purchase, and regardless of all considerations of economy of repairs "material standard to the United States standard cars should be used, if available." Just what does "if available" mean, and to permit the observance of the most elementary principles of economy should not the conclusion of these general instructions have read, "if readily applicable to the cars to be repaired?"

Some of the rules set forth appear to be particularly impracticable of application and unwarranted.

*Rule No. 3 reads:* "Side bearings—If body or truck side bearings require changing or renewing, frictionless type should be used, interchangeable in capacity and dimensions with those used on United States standard cars."

The committee appointed to consider the general subject of freight car repairs doubtless acted in accordance with its best judgment in deciding to extend the use of a device standardized for new cars by adopting it for repairs to cars in service. Nevertheless, it would seem that frictionless side bearings had not received a sufficiently strong majority endorsement by railroad mechanical department heads to warrant anything more than their recommended use in freight car repairs where conditions permit application without radical change in body or truck bolsters. Any one with a knowledge of the varying side bearing conditions obtaining on the multiplicity of freight car designs in service today can appreciate the problem involved in replacing the ordinary rub side bearings with the frictionless type interchangeable in dimensions with those used on United States standard cars. In many cases such replacement could not be effected for lack of space between the bolsters at the point of attachment of the side bearings; in other cases because of the rub side bearings being cast integral with the bolsters.

As to the stipulated "interchangeability in capacity" with frictionless side bearings used on United States standard cars, an investigation will show that frictionless side bearings have not been and are not rated in accordance with capacity, the efforts of each individual designer being all in the direction of the development of devices whose several parts would continue to function properly and which could

be maintained in working condition at minimum cost under the maximum side bearing loads obtaining under modern freight cars.

*Rule No. 4 reads:* "Side truck frames—When necessary to renew side truck frames, cast steel U-shaped section, United States standard car type, with separable journal boxes, to be used."

The superiority of the cast steel side truck frame to the built-up arch bar type in rigidity, ultimate strength and durability no doubt justified its selection for the United States standard cars, but from the standpoint of supply available for quick repairs there are many who will question the propriety of designating the U-shaped section to the exclusion of the several T-shaped section designs that have given satisfactory service.

With respect to the specified exclusive use of the cast steel truck side frame for renewal of side frames in service: The intent and purpose of rule 4 evidently is the gradual elimination of all arch bar side frames and their replacement by the cast steel U-shaped section United States standard car type. A rigid adherence to this rule would obligate all railroads to immediately secure and carry a stock of the standard cast steel frame. Further, the wording of this rule is so indefinite that it seems necessary that supplementary instructions be issued stating the extent of failure which would constitute sufficient cause for renewal; that is, what proportion of the several members of the arch bar side frame should fail to warrant complete replacement with the cast steel side frame in preference to making easy and quick repairs by renewal of one or more of the individual parts.

The very extensively used M. C. B. arch bar side frame, being a built-up structure composed of solid rectangular bars, columns and column bolts, is very seldom subject to failure in its entirety, and as all of its component parts have been M. C. B. standards for many years and as such are carried in stock by all railroads, this type of side frame lends itself to quick and economical repairs.

The quite extensive adoption and use in recent years of cast steel side frames of the pedestal type, requiring a design of journal box differing from the strictly M. C. B. standard type, presents an obstacle to the use of the standard side frame required by rule No. 4 in making renewals that could be overcome only by entire disregard of all consideration of economical repairs. It can be readily seen that in replacing a failed side frame of this pedestal type with the United States standard car type it would necessitate scrapping the journal boxes or assigning them to storeroom stock for a possible future need which might never develop.

If the foregoing criticism is pertinent it would seem that rule No. 4 requires the issuance of supplementary instructions or the exercise of considerable judgment in its observance to avoid unwarranted expense and unnecessary delays in making repairs.

*Rule No. 6 reads:* "Draft gear.—(a) Friction draft gears, either Cardwell, Miner, Murray, Sessions Type "K," Westinghouse, or similar gears, to be of not less than 150,000 pounds capacity with a maximum travel of  $2\frac{3}{4}$  in.

"(b) Spring draft gears, if used, to be at least equal in capacity to two M. C. B. Class "G" springs, interchangeable with friction gear without change in car construction.

"(c) Clearance between coupler horn and striking casting to be 3 in.

"(d) Coupler to be key connected to draft gear."

Clause (b) of rule 6 seemingly permits the use of spring draft gears of a minimum capacity of 60,000 lb., but the qualifying stipulation reading "interchangeable with friction gear without change in car construction" effectually nullifies this seeming concession, as the most casual investigation will show that no known modern arrangement of draft castings suitable for tandem or twin M. C. B. class "G" springs can be designed so as to likewise provide the length and width of the standard pocket required for friction draft gears.

This qualification being present in rule No. 6, the use of friction draft gears becomes obligatory on steel reinforcements (either draft arms or through center construction) applied to wood underframe cars, or in the replacement of spring draft gears on steel cars where suitable draft attachments standard to the car are not in stock.

The difficulties and expense incident to replacing spring draft gears, either tandem or twin, on the many steel cars so equipped, by friction draft gears are too obvious to dwell upon, and if investigated would convince operating officials of the entire impracticability of this clause of rule No. 6 and the enormous expense which would eventually result in its observance.

Metallic draft arms in the past ten years have been found a very satisfactory, adequate and economical means of reinforcing wood underframe cars, but under rule No. 6 such draft arms must now be used in conjunction with friction draft gears. This brings about the concentration of the entire buffing shock on the center line of draft, with a resultant moment of force about the neutral axis of the section of draft arms above the bolster (which is limited by the design of the car) of such magnitude that stresses will be set up in the metal that are in excess of its elastic limit. This condition does not obtain with a 60,000-lb. capacity spring draft gear and a 2-in. coupler horn clearance, because the buffing shock delivered on the center line of draft is limited to the spring capacity, after which, with the coupler horn in contact with the striking plate the eccentricity of shock is very materially reduced. In other words, in using spring draft gears with metallic draft arms and two-inch coupler horn clearance it is possible to keep within the M. C. B. maximum ratio of unit stress to end load of .15, while in many cases it is not possible to meet this requirement with friction draft gears. Are we to eliminate an altogether satisfactory and economical method of reinforcing wood underframe cars which, when used in conjunction with spring draft gears can be designed to meet a very essential M. C. B. requirement, but which in many cases cannot be so designed when combined with a friction draft gear in an underhung draft rigging.

The foregoing is predicated in the case of spring draft gears on a clearance of two inches between the coupler horn and striking casting. Clause (c) specifies a three-inch coupler horn clearance, but when and how this is to be obtained is left to the ingenuity of the railroad making repairs. On many existing designs of underframes its reduction to practice would result in overstressing the center or draft sills between end sill and bolster.

The statement is ventured that in the opinion of many mechanical department heads spring draft gears are entirely satisfactory on any design of adequate steel reinforcement for wood underframe cars and that the greatly increased cost of applying friction draft gears to equipment of limited life and value is not justified.

*Rule No. 8 reads:* "Doors—Side doors on box or stock cars (except double deck stock cars) will be bottom supported, and the attachments uniform with those on United States standard cars."

While there may be but few railroad men who will question the superiority of the bottom hung side door to the top hung door, it is difficult to understand the viewpoint of the committee on car repairs in making the bottom hung door an absolute requirement for repairs. In many cases this would necessitate extensive alterations at the side plate and side sill, and possibly involve rebuilding the doors themselves at a cost many times greater than that involved in merely replacing all the original door fixtures. In fact, the design of bottom support attachments for many existing designs of freight cars which would at the same time be "uniform with those on United States standard cars" is a problem which will be found impossible of solution. It would seem imperative to waive this rule for cars with side sill construction which does not readily lend itself to the application of the bottom track with its supporting brackets.

*Rule No. 9 reads:* "Ends—Box cars with weak constructed ends requiring two-thirds of end to be renewed should be reconstructed as follows:

"(a) Horizontal corrugated steel ends (two or three-piece) having top section three-sixteenth inch thick, and bottom section or sections one-fourth inch thick and corrugations  $2\frac{1}{4}$  in. deep.

"(b) Vertical reinforced ends with 4 or 5 in. 'Z' bars securely fastened to place on end sills and end plates. End plates to be diagonally braced on inside of car, under roof, to side plates, or with reinforcements equivalent in strength."

While a certain latitude is permitted in renewing weak constructed ends because of the two different methods stipulated, an analysis of clause (a) of this rule discloses the fact that it becomes necessary to use one proprietary structure, notwithstanding the fact that the U. S. R. A. specifications for new cars permit the alternate use of three different types of steel ends. To those railroads to whose cars another design of steel end might be more economically applied the injustice of this very narrow restriction is most apparent.

*Rule No. 12 reads:* "Roofs—When roofs are changed or renewed, outside flexible type metal roof made of 22 or 24 gage galvanized iron with mullions between roof sheets and with flexibility at eaves and ridges, will be applied. Roofs should be interchangeable with United States standard cars having same length and width sheets. To permit the use of standard sheets, the following changes may be made:

"(a) Increase or decrease in thickness, or omitting eave molding, fascia, or both.

"(b) Increase the width of roof flashing at eaves.

"(c) Where cars are equipped with all metal roofs, such construction may be continued when renewals are necessary, if considered desirable to do so."

The effect of this rule on freight car repairs and its practical application is largely a question of interpretation. Taken by itself its observance is required only "when roofs are changed or renewed," but when linked up, with the introductory clause of the circular, which requires that when material standard to a car is not in stock material standard to United States standard cars should be used, it apparently becomes necessary to remove without regard to expense a partly worn-out roof (all wood or inside metal) and apply one particular design of patented outside flexible type metal roof.

There are many who endorse the benefits and economy to be derived from standardized freight cars and locomotives building and hereafter built, while there are also many who oppose such rigid standardization as has been adopted for United States standard cars, but those who advocate standardized new equipment could not pursue a plan better calculated to discredit their views than by acquiescence in the enforcement of Mechanical Department Circular No. 8. If held to be mandatory and put into execution, it would add such a burden of increased cost of freight car maintenance as to rival the increase in direct labor operating costs already

imposed by government control. It is an abortive attempt to extend standards never originally contemplated for anything but new cars of one general predetermined design to some two million (2,000,000) cars of a multiplicity of designs now in service without regard to the enormous cost involved, and it would seem that the Railroad Administra-

tion in approving it had acted with a very indefinite knowledge of what its actual reduction to practice would mean. The statement is ventured that thus far it has but served to confuse and delay the normal schedules of individual railroads for freight car reinforcements and maintenance.

## The Central Western, the Largest Railroad Region\*

Comprising Two-Fifths of Country's Area, It Includes but One-Fifth of Operated Mileage

THE CENTRAL WESTERN REGION is by far the largest of the seven railroad districts in the United States, comprising approximately 40 per cent of the area of the country. It is more than twice as large as the Northwestern region, the second district in point of size, but despite that fact it contains about the same operated mileage. With two-fifths of the area of the country and about one-fifth of the total operated mileage, the Central Western lines own about one-sixth of the equipment in the United States and produce slightly more than one-quarter of the net revenues from railway operation.

Roughly speaking, the Central Western region includes the states of Nebraska, New Mexico, Colorado, Nevada, Arizona, Utah, Wyoming, California, one-third of Oregon, two-thirds of Idaho, one-sixth of Montana, one-half of South Dakota, two-fifths of Iowa, one-half of Missouri, most of Illinois and Kansas and small portions of Indiana, Oklahoma and Texas, or approximately 1,220,000 square miles. The operated mileage under government control in this territory is about 53,000 miles, or about 21 per cent of the total mileage in the United States. With a relatively large area in comparison with its mileage, the region is not so generously supplied with railways as other sections of the United States. The territory contains even a smaller share of the equipment of the country, for the Central Western lines own about 360,000 freight cars, 11,000 locomotives and 9,100 cars in passenger service, or between 16 and 17 per cent of the total equipment of those respective classes in the United States.

Like the roads in the Northwestern region, the Central Western lines compare more favorably with the roads in the more thickly populated sections of the United States from the standpoint of operating income. According to statistics compiled by the Interstate Commerce Commission for the fiscal year 1916, the operating revenues of these lines amounted to about \$639,000,000, or between 21 and 22 per cent of those of all roads; operating expenses were \$401,000,000, or about 19 per cent of those of all American lines, while net revenues from railway operation were \$238,000,000, or from 27 to 28 per cent of those of all lines. Similar percentages for the same period show that the Northwestern region produced 18 per cent of the operating revenues, incurred 15 per cent of the operating expenses and made net revenues from railway operation equal to 24 per cent of those of all railroads.

### A Region of Strong and Weak Lines

The Central Western region contains both strong and weak lines. The Atchison, Topeka & Santa Fe, developed under the able leadership of E. P. Ripley; the Southern Pacific, Union Pacific, Los Angeles & Salt Lake and Oregon Short

Line, built up under the guidance of E. H. Harriman; and the Chicago, Burlington & Quincy, reorganized and strengthened under the supervision of James J. Hill, are among the best managed railway systems in this country, not to exclude the world. The Illinois Central, although only a portion of it is included in the region, is also a well-managed line. Some of the other important roads, however, have suffered severely from unwise financial manipulation.

### Fourteen Roads Over 1000 Miles Long

Fourteen railroads in the Central Western region operate more than 1,000 miles each, and together constitute 91 per cent of the entire mileage of the territory. Four of these railroads penetrate other regions; about 32 per cent of the Chicago, Rock Island & Pacific, 35 per cent of the Illinois Central, 18 per cent of the Southern Pacific and 45 per cent of the Wabash are outside the Central Western district. Taking into account only the mileage within the region, the 14 large lines rank as follows with respect to length: Atchison, Topeka & Santa Fe (including the Panhandle & Santa Fe), Chicago, Burlington & Quincy, Southern Pacific, Chicago, Rock Island & Pacific, Union Pacific, Illinois Central, Denver & Rio Grande, Oregon Short Line, Wabash, Los Angeles & Salt Lake, Chicago & Eastern Illinois, Colorado & Southern, Chicago & Alton and the El Paso & Southwestern.

### The Trend and Character of Traffic

The dominant direction of the Central Western lines is east and west. The Santa Fe and the Harriman lines connect the Mississippi valley with the Pacific coast, and, under old competitive conditions, the Burlington in conjunction with the Northern Pacific and the Great Northern constituted another avenue of transportation from the Central West to the Pacific; likewise the Chicago, Rock Island & Pacific had traffic agreements with the El Paso & Southwestern and the Southern Pacific which gave it a share of trans-continental passenger and freight business, while other traffic moved through Denver and over the Denver & Rio Grande and Western Pacific. The westbound freight movement consists mainly of manufactured products and merchandise required by the farms and mines and the trans-Pacific trade. Considerable coal is also shipped to western points.

As in the Northwestern region, the heaviest traffic in the Central Western territory is in products of mines. In the fiscal year ending July 30, 1916, the 14 large lines in the region moved over 92,000,000 tons of this class of freight, or 45 per cent of their total tonnage. By way of comparison, mine products constituted 37 per cent of the tonnage of the nine largest Northwestern lines constituting 88 per cent of the operated mileage of that region. While ore alone made up 17 per cent of the business on those Northwestern roads in 1916, it accounted for but 8 per cent of the total business of the Central Western carriers for the same year. Despite

\*This is the fourth of a series of articles describing the characteristics of the seven railway operating districts. The article on the Southwestern region appeared in the *Railway Age* of August 9, 1918, page 235; that on the Allegheny region, August 23, 1918, page 331; and the discussion of the Northwestern region, September 13, 1918, page 483.

this difference the Central Western territory is a prolific producer of ores and particularly of those bearing the more precious metals, which do not move in large quantities. Whereas very little coal is mined in the Northwestern region, Illinois and that strip of Indiana included in the Central Western region contain very rich bituminous coal fields. It is not surprising, therefore, that soft coal constitutes one-fourth of the tonnage moved in the territory.

Agriculture is second to mines as a source of tonnage in the Central Western region. In the fiscal year 1916 the 14 largest lines hauled nearly 40,000,000 tons of agricultural products, or 19 per cent of the entire tonnage handled during the year. Containing a large portion of the Mississippi val-

lines and the Santa Fe for the California perishable traffic. The Santa Fe Refrigerator Despatch, affiliated with the latter system, and the Pacific Fruit Express, which served the Harriman lines, provided the latest and most improved types of refrigerator equipment for this business and maintained prompt and expeditious service between points of origin and Eastern markets.

Manufactures are third in importance as a source of traffic, over 32,000,000 tons having been moved in 1916, or about 15.5 per cent of the total traffic handled. In the same period the nine large lines in the Northwestern region moved a tonnage in manufactured products equivalent to 13 per cent of all the freight handled by them. Forest products rank fourth

ley, the largest fertile region on the globe, the Central Western territory includes lines originally built to serve the farms which are still called "granger" roads. The Burlington is the heaviest carrier of farm products, with a tonnage of 7,650,000 in 1916, and the Santa Fe, the Union Pacific and the Southern Pacific are next in importance. The Central Western lines enjoy a large fruit and vegetable traffic. In 1916 the 14 important roads moved approximately 10,500,000 tons of this class of freight; this was five per cent of their total tonnage. The Southern Pacific, the Santa Fe, the Union Pacific, the Rock Island and the Illinois Central are important fruit and vegetable carriers. Under competitive conditions there was a keen rivalry between the Harriman

as creators of tonnage in the Central Western region; in 1916, 17,400,000 tons of this class of freight were moved on the 14 important lines in the district, or about 8.5 per cent of the total business handled by them. It will be noted that forest products hold a relatively less important position from the standpoint of tonnage in the Central Western than in the Northwestern region, where the nine largest lines handled a tonnage in this business equivalent to 16 per cent of their entire traffic.

Although products of animals rank fifth as producers of tonnage, accounting for about 10,500,000 tons in 1916, or five per cent of the business handled by the 14 large lines, the Central Western region is undoubtedly the most impor-

tant live stock territory in the country. The great packing industries at Chicago, Kansas City and other points in the Middle West receive the major portion of their cattle, sheep and hogs from the Central Western lines.

Oil is rapidly assuming greater importance as a source of traffic in the region. The Oklahoma-Kansas and the California oil fields now produce more petroleum than any other districts in the United States. These two sections are relatively new as oil producers, and will undoubtedly show a steady increase in output for some time to come.

#### Traffic Density of Region Low

Like the Northwestern, the Central Western region is one of great distances and of long hauls. The average haul of revenue freight on the Union Pacific in 1916 was 412 miles; that of the Santa Fe (exclusive of the Panhandle & Santa Fe) was 293 miles, while that of the Burlington was 275 miles. The traffic density is low compared with that of eastern roads. The ton mileage of revenue freight per mile of road averages about one-fifth of that on roads in the Allegheny region.

Under competitive conditions there was keen rivalry for traffic in the region. As previously pointed out, trans-continental business was shared between the Santa Fe, the Harriman lines, the Hill lines, the Gould lines and the Rock Island and El Paso & Southwestern in conjunction with the Southern Pacific. In the passenger field competition resulted in the operation of exceptionally well-equipped trains. Naturally some duplication of train service obtained because of the sharp struggle for business, and this was one of the first conditions to attract the attention of the Railroad Administration during the war when the conservation of power and equipment was highly important. Accordingly, quite a number of trains were removed from service and likewise competitive advertising for passenger business was prohibited. The Central Western region, however, is an exceptionally fertile field for the development of passenger traffic. Containing both winter and summer resorts and some of the most important national parks and monuments, it is in a position to maintain a high class passenger service the year round.

#### A Region of Promising Possibilities

Like the Southwestern and Northwestern regions, the Central Western territory is rich in possibilities for further development. Undoubtedly new oil wells and mines will be opened and new farms and industries created more extensively as time goes on. This will mean additional mileage for the Central Western roads and consequently additional traffic.

The Central Western region has no serious terminal problems such as exist in the East. Although lines of the territory operate into the Chicago and St. Louis switching districts, those terminals are under the jurisdiction of the Northwestern and Southwestern regional directors respectively. The only terminal of consequence is the Kansas City district, which is under the immediate authority of W. M. Corbett, terminal manager, who was formerly president of the Kansas City Terminal. In the past, when congestion has appeared on lines in the Central Western territory it has generally constituted a reflection of operating difficulties in Chicago, St. Louis or other gateways to the East.

The region has one subsidiary district roughly constituting the area west of the Rocky mountains. William Sproule, who is district director in charge of this section with headquarters at San Francisco, Cal., has jurisdiction over all lines west of Ogden, Utah, and Salt Lake, Albuquerque, N. M., and El Paso, Tex., and south of Ashland, Ore. Mr. Sproule was formerly president of the Southern Pacific, and is therefore thoroughly familiar with the district over which he has supervision.

#### The Regional Director

Hale Holden, regional director of the Central Western lines, is like the director general, a lawyer by training. He was born at Kansas City, Mo., on August 11, 1869, and was educated at Williams College and the Harvard Law School. After practicing law at Kansas City he entered railway service on July 1, 1907, as general attorney for the Chicago, Burlington & Quincy. From January 1, 1910, to November, 1912, he was assistant to the president. In the ensuing two years he was vice-president, and on August 27, 1914, was elected president. Mr. Holden has the distinction of being a former protege of James J. Hill and, although an attorney, acquired a broad conception of the best operating principles through his close association with the "empire builder." During the early days of the war Mr. Holden was a member of the Central Department District Committee of the Railroads' War Board, and when the carriers were taken over by the government in December, 1917, he was appointed a member of the temporary advisory committee of the director general. In June, 1918, when the Western railroad region was divided into three parts, Mr. Holden was appointed regional director of the central portion which was designated the Central Western region. When he assumed these duties he resigned his position as president of the Chicago, Burlington & Quincy, the Colorado & Southern, the Ft. Worth & Denver City and the Wichita Valley.

#### New York Report on

#### South Byron Collision

THE NEW YORK STATE Public Service Commission, second district, has issued a report, signed by C. R. Vanneman, chief of the division of steam railroads, on the circumstances and causes of the rear collision of passenger trains on the New York Central at South Byron, N. Y., at 3:42 o'clock on the morning of January 12, when westbound passenger train No. 11 ran into the rear of westbound passenger No. 17, second section, killing 22 passengers and injuring as many more.

The present report gives the facts substantially as they were shown in the *Railway Age* of January 17, page 212, except that the testimony of the flagman concerning his action is quite different as regards distances; and there are some additional details.

The stopping of the train at this place to have a helping engine attached is not usual; it was necessary in this case because the engine was not steaming well. The ascent westward to Batavia, 7 miles, is at about 44 ft. per mile. The helper was just backing toward the train at the moment the train was struck by No. 11, and thus there was a double collision; and this, says the report, no doubt accounts for the completeness of the destruction of the steel sleeping car at the rear of the standing train. The train was pushed forward about 250 ft.; and when it had thus moved about ten feet it met the pushing engine, moving backward. No. 11 had been running at about 60 miles an hour and its speed was not appreciably slackened; the inspector believes the engineman did not apply brakes until within about 700 ft. of the standing train. He believes that the engineman "for a temporary period was not in possession of his full senses," although both engineman and fireman claimed at the hearing, that the runner was wide awake.

The engineman of No. 11, John Friedley, is 61 years old, and has been running a locomotive since 1885, all of the time in passenger service. In his testimony he said that he never had slept while on a locomotive. The flagman of the standing train, Thomas Groves, has served in that capacity on the New York Central 28 years. His first statement was that

he had gone back about 2,200 ft., and had used torpedoes and a fusee; but he afterward changed his story, and the inspector believes that he had got back not more than 700 ft.; had not used either torpedoes or fusees; but had lighted a fusee after No. 11 had passed him.

Friedley had been out of bed about 17 hours 42 minutes. His fireman, David Brill, had fired on passenger trains only two trips before this one. He claimed that the signals were clear (as the engineman had said) and that he called them properly to the engineman. The line of the road is straight for three miles, and, from tests made after the collision, the inspector believes that anyone looking forward from the locomotive must have seen the block signal lights and the tail lights on the standing train. The engineman claimed to have had his attention attracted by a lantern or lanterns on or near the ground; but he could not have seen these without also seeing the tail lights. The weather was clear. The temperature was about five degrees below zero.

In his conclusions as to the cause of the collision the inspector discusses rule 99, the flagging rule, which was modified in October last when a new code of rules was issued. Formerly, on the passenger tracks, a flagman going back to protect his train was required to remain out until a following train arrived, but this has been abrogated, and whistle signals are now provided for calling in the flagman. After considerable discussion of the reasons for and against this change the inspector concludes that it is not open to criticism. No other railroad, so far as he knows, has a rule under which a flagman must not return to his train.

Another change in the rules discontinues the practice of carrying a red tail light on the platform of the car at the rear of a passenger train, and in the top of the caboose on a freight train. The inspector believes that these lights should have been retained; but that this question has no real bearing on the collision under consideration.

### Automatic Train Stops

Under the head of "The Remedy" the report discusses automatic train stops. Frank J. Sprague, an eminent electrical engineer, who has devised an automatic train stop, was called by the representative of the Interstate Commerce Commission, and testified at the hearing on this collision; he said that he had tried to secure the adoption and test of his apparatus on the New York Central. About two years ago plans apparently had been nearly perfected for installing the apparatus, between Poughkeepsie, N. Y., and Peekskill, but the railroad company deferred taking final action, and when this country entered the World War, everything was dropped. Mr. Sprague has reported these facts to the director general of railroads at Washington.

Continuing, the report says:

"The fundamental principle on which an automatic device of this character must be evolved is that it should act when and only when the engineman fails to properly control his train. In other words, the control of the train should remain with the engineman at all times, until he fails to do that thing which in the regular operation of his locomotive he would normally do. If on approaching a section of track which is occupied by another train or which is in some other way obstructed, the engineman reduces his speed to such an extent that he will stop short of the obstruction, then complete control of the train should be left in his hands, with a further provision that this control shall be removed at the instant when it becomes unsafe for him to longer retain it.

"Obviously, the obstacles in the way of such an accomplishment are numerous. To eliminate them requires the employment of intricate and somewhat delicate instruments, among which must be the track relay, a highly developed and wonderfully efficient instrument now used in the operation of automatic signal systems. These instruments have

been known to permit clear failures of signals chiefly because they were improperly set up or have been removed from their proper normal positions. Such an accident might occur in the case of the automatic stop, and then we should have a stop inoperative at the crucial time. Of course, such occurrences are remote, clear failures of signals resulting from all causes occurring about once in every 1,000,000 movements of a signal. \* \* \*

"Since all automatic stop or train control devices developed up to this time require the use of certain apparatus on the locomotive or train, it becomes immediately obvious that an additional factor of maintenance over that necessary for the signal is introduced. This is the roundhouse maintenance; and in considering it, it seems well to point out that the introduction of an automatic device on any part of a railroad system means that maintenance of the motive power apparatus must be provided for at all engine terminals at which locomotives are housed which may operate on the part of the railroad so equipped. It can readily be seen what this means for a railroad of the character of the New York Central. Reduced to the minimum, there are but two alternatives; viz., either the whole railroad must be provided with the device, or unequipped locomotives from branch lines must not be permitted on that portion of the railroad on which the device may be installed.

"At best the stop must be an adjunct of the signal system, unless the design replaces the signal system entirely. It seems to be entirely obvious that the roadside portion of the stop may be developed in the laboratory from an initial point of perfection equal to that of the present signal systems, but there are no criterions by which the locomotive apparatus may be measured. Hence the questionable propriety of development under service. I believe that this difficulty can be surmounted if it is concluded that this is the course which should be pursued; but I am not yet fully convinced that there is the necessity for an automatic stop for a train control device. I dislike very much to see the installation of anything which in the least interferes with the supreme authority of the engineman, or which directly or indirectly may be the cause of any relaxation of his normal vigilance.

"In view of the catastrophe under consideration this state of mind leads to inquiries as to what may be done without providing such a device. I know of but one thing. It is certain that something must be provided which will restore the engineman to the proper mental condition if he be other than dead, and in the latter case, the fireman must be impressed into service. To accomplish this there seems to be but one means available; viz., by conveying audibly to the engineman or fireman a notice of the fact that he has failed to do that which is required of him. The most effective audible signal so far devised which does not introduce complicated mechanisms on the locomotive in addition to the already complicated but highly developed roadside signals is the explosion of a torpedo. Such devices in a crude state have been used in England and on the continent, with considerable success, as I am informed. In England, the laborious method of requiring track men to place torpedoes on the rails at signals to warn the engineman of his location in foggy weather has been employed with marked success. On one of the French railroads, it is stated that there have been no accidents resulting from the failure of enginemen to observe signals for many years, during which time the torpedo has been in service. Devices have been under development in the United States for some time but I am not aware that any have been perfected sufficiently to warrant their installation. I believe they can be developed and further that they can be installed at much less expense than a stop device. I am also of the opinion that since such a device need not involve a further distribution of responsibility, beyond the relatively small amount of additional mainte-

ance which would fall upon the signal maintainer, the efforts of those charged with securing greater safety of operation on the railroads should be directed to its development.

"It is entirely obvious that it has been necessary, especially within the last few years, for executives to give the utmost consideration to every item of expense, and those items in the annual budget covering the future existence of the property as well as the necessities with which to render service to the public have rightly been given first consideration. The dwindling difference between income and expense has left little for the consideration of such items of additions or betterments as the automatic stop, especially when installations estimated to cost upwards of \$14,000 per mile have been urged. Of course systems designed to cost much less have been patented and partially developed, but the efficiency of these less expensive devices has been seriously

open to question. It seems doubtful therefore, if censure may rest on the executives for not having proceeded with extensive trials, irrespective of the expense involved.

"I do not believe that the problem of perfecting an automatic train control device is impossible, assuming that such a device is essential to the safe operation of the railroads. \* \* \* It is fortunate that the Railroad Administration has appointed a strong committee to consider the matter, and it is to be hoped that the many recent developments of the electrical art have produced features which will soon place the automatic train control in the realm of an unquestioned possibility, provided of course it is concluded that such a device is absolutely essential. The committee should include within its investigations the subject of audible signaling, a relatively unexplored field but one in which I believe the real solution lies."

## Second Track Construction on the Hocking Valley

Improvements Undertaken Where Work Was Lightest  
Constitute Typical Example of a War Project

THE SECOND TRACK now being built by the Hocking Valley between Columbus, Ohio, and Toledo, clearly falls in the class of war work, not only from the standpoint of the results obtained for the amount of work done but from the nature of the auxiliary facilities that are being provided simultaneously at various points along the line. The work has also been conducted in a way that was designed

to make the results available as rapidly as possible, but an unavoidable circumstance, also a result of the war, interfered seriously with the program as planned.

There are few localities in the country where an equivalent amount of double-track line with a 0.2-per cent grade opposing the traffic could be obtained at a smaller cost. By selecting those portions of the line where conditions were most favorable, it was possible to plan 39½ miles of second track involving a total of only 478,000 cu. yd. of grading or about 12,000 cu. yd. per mile, while the bridge work involved is almost negligible. A further evidence of the favorable character of the original location is indicated by the fact that the 0.2-per cent grade was obtained without any change in alinement and only one change in grade.

In accordance with the urgent needs of the times, this work was completed in sections so that portions of the new track could be placed in service as rapidly as possible and thereby relieve the single track. That this pro-

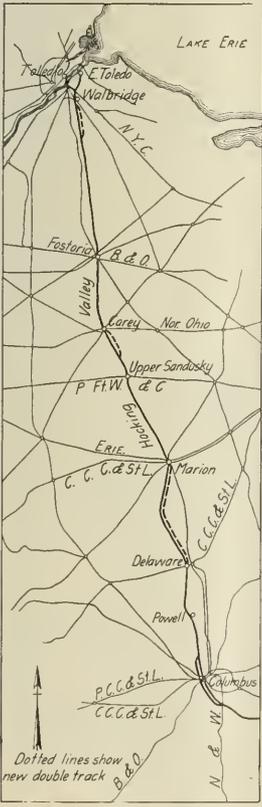

gram could not be carried out in full resulted from an inability to obtain rail in adequate quantities. Therefore, although nearly all of the grading is completed, only about 15 miles of track has been laid and placed in service to date.

Simultaneous with the construction of the second track, terminal improvements have been carried on at several points on the line which are designed to increase the capacity without the necessity for radical changes. The most important ones include the addition of several tracks to the yards and additions of 12 stalls to roundhouses at Parsons Ave. (Columbus) where traffic is exchanged with the Chesapeake & Ohio Northern and at Walbridge where the road trains from the south are classified and coal cars are turned over to transfer crews for delivery to the Hocking Valley coal dock at East Toledo.

The business of the Hocking Valley is primarily coal from mines on its own lines in the Hocking valley in southeastern Ohio, and from West Virginia mines tributary to the Chesapeake & Ohio. Coal from the latter is delivered by the Chesapeake & Ohio Northern at Columbus. In 1918 the coal hauled from Columbus to the lake aggregated 5,300,000 tons, all of which was moved between April 15 and December 12.

The present line has a ruling grade of 0.3 per cent against northbound movements except for a grade of 0.5 per cent extending most of the distance from Columbus to Powell (14 miles) which is operated as a helper grade. The ultimate plan is to provide a 0.2-per cent grade against northbound traffic and a 0.4-per cent grade against southbound movements for the entire distance from Columbus to Toledo. In pursuance of this plan the second-track work undertaken in the stretches shown on the map has been constructed to conform to these limits of grade. It will be noted that the double-track work undertaken thus far does not include the section between Columbus and Delaware. The elimination of the pusher grade within these limits will require a more or less complete change of location and this has been deferred until some later date.

One unique feature of the plan for the work is the manner in which it is proposed to operate the double track to suit the peculiar nature of the traffic. Coal trains moving northward loaded and coming back light constitute the bulk of the traffic; the remaining train movements comprise two passenger trains and a local freight in each direction. Since the greatest capacity of a single track can be secured with

Location of the New Second Track

all trains moving at a uniform speed in one direction it is planned to assign the east track exclusively to the northbound tonnage trains. The west track will be used by the northbound high speed trains, both passenger and freight, in addition to all of the southbound traffic. To this end an adequate number of 100-car passing tracks are being provided on the west side of the southbound track with no passing tracks on the northbound side and only a limited number of cross-overs between the two main tracks. Tonnage trains are now being hauled by Mallet locomotives rated at about 5,000 tons (northbound). This rating will be increased appreciably with the completion of the 0.2-per cent grade line.

### Grading

The grading is primarily fill made from borrow. There are very few cuts. With one exception the fills are low. Just north of Delaware an embankment about 1,000 ft. long with a maximum height of 38 ft. was widened for second track, with material from a shovel pit east of the right-of-way near Troy, operated by N. K. Sneed of Huntington, W. Va., who has the general contract for the work from Delaware to Prospect. This same pit was also used to supply material for building the smaller embankments that could not be made readily by team work from side borrow. The material was handled in Kilbourne & Jacobs cars, unloaded from the main track and pushed into place with a Jordan spreader.

Between Prospect and Marion the work is under contract to the J. T. Adams Company, Columbus, who conducted the work in a manner similar to that above described. A shovel pit was opened at Owens, this being over a limestone quarry where an arrangement was made with the owners to remove the stripping. About 150,000 cu. yd. were taken out to a depth varying from six to eight feet. The grade change mentioned above is located at Owens, extending from about a mile south to a half a mile north and with a maximum depth of fill near the station of about seven feet.

While this work is of limited proportions, the manner in which it is done is of interest. The embankment was widened to the level of the existing track by unloading from the main track and using a spreader. A construction track was laid on this new embankment which was then completed to the new grade by raising the track with material from the pit. It was proposed to transfer the traffic to the newly raised track and repeat the operation under the old track but the possibility of interrupting traffic through soft conditions in the new embankment led to the discarding of this plan in favor of one requiring the raising of the operated track under traffic, using blast furnace slag for the filling material. This plan worked out very well except that the coarseness of the material caused some difficulty in handling it.

The raises were made in depths of about one foot, averaging from 1,500 to 2,000 ft. in length per day. The grade change at Owens included the elimination of a highway grade crossing just north of the station through the use of an underpass of 24-ft. span with 13 ft. vertical headroom. The structure consisted of two concrete abutments with a longitudinal steel through deck.

North of Alveda some light work is being done with rather unusual equipment for railway grading, a Thew revolving shovel being used to load  $1\frac{1}{2}$ -cu. yd. Koppel cars operating on a track of 2-ft. gage. Strings of these cars are pulled by a Koppel steam locomotive for the long hauls and by a horse for the shorter hauls.

### Terminal Facilities

One of the most important features of the auxiliary facilities in the way of an entirely new installation is a coal

and water station south of Carey. Here two passing tracks will be provided between the two main tracks, each with a capacity of two 100-car trains. At about the mid-length of the passing tracks a Fairbanks, Morse & Company reinforced concrete coaling station of 500-ton storage capacity will be provided to serve all four tracks. Water cranes will also be installed, water being piped from the city water supply at Carey.

At Walbridge, the additional engine terminal facilities include a nine-stall addition to the existing roundhouse. This is of timber construction with brick walls. Eight of the stalls will be 110 ft. deep and one 90 ft. The center line of the ninth stall is on a line with the approach track on the other side of the turntable, so that this stall can be used as a push-in track for dead engines. The extension to the roundhouse is of the same construction as the old part and will be heated by direct radiation in the pits and along the back wall.

In addition to the roundhouse extension, a 500-ton coaling station of the Fairbanks, Morse & Company reinforced concrete type and two Robertson ash hoists are also being installed, while adjoining the roundhouse is a new toilet and washhouse. Considerations of sanitation in the absence of a sewer system in the vicinity led to the provision for a complete sewage disposal plant consisting of septic tanks and settling basins.

Another improvement of largely local utility is a new engine terminal at Marion for the use of switch and local freight engines. This comprises a five-stall roundhouse with a 100-ft turntable and a Roberts & Schaefer coaling station. The engine house is of reinforced concrete with brick curtain walls.

All of the work between Carey and Toledo including the building work is being done under a contract with the A. S. Hecker Company of Cleveland. In conformity with the custom on most work undertaken during the war all contracts in connection with this work have been conducted on a cost-plus-percentage basis. The work has been handled under the general direction of William Michel, chief engineer of the Hocking Valley and under the supervision of W. L. Roller, resident engineer, both with headquarters at Columbus, Ohio.

Turkish Troops and Refugees at Seidler

# Standards for the Maintenance of Freight Equipment\*

## Keeping Up the Condition of Cars to Meet Demands of Traffic; Uniform Classification of Repairs

By H. L. Shipman,

Equipment Inspector, Atchison, Topeka & Santa Fe

**D**URING THE PAST YEAR the maintenance of freight cars has been influenced by new conditions, due to the general pooling of equipment. This change is particularly noticeable in the box car. Formerly there was a normal percentage of from 35 per cent to 40 per cent of the box cars on the home lines. At the present time this percentage has fallen as low as 7 per cent to 12 per cent. Thus each road has less control over the maintenance standard of its own equipment. It would seem that some standard of maintenance should be established and all roads compelled to keep all freight cars on their lines up to that standard. This percentage should undoubtedly be higher than the standard now maintained by many of the smaller railroads, but some method should be devised to force all roads to come up to this standard. Unless this is done, under present conditions, the average standard of all cars will fall considerably lower, and those roads, which under normal conditions would maintain this standard, will be helpless to keep it up.

There is a limit to the maintenance of equipment beyond which it is not practical or economical to go. If it were possible to maintain all freight equipment in 100 per cent condition, it would not be economical because there are many commodities that can be handled just as efficiently and satisfactorily in a car in fair condition as in one in 100 per cent condition. Since all cars in service are continually wearing out, or deteriorating, all that can be hoped for is to maintain in good condition a sufficient number of cars to handle the commodities that require a first-class car.

There are certain kinds of freight that require a box car, others a refrigerator, stock car, tank car or gondola and other freight may be handled just as well in several of the different kinds of freight cars. Some loadings require the cars to be in first-class condition and others only in fair condition. For example, a box car to handle grain, flour, sugar, or groceries, should be in the best condition possible. The siding must be tight, the roof non-leaking, and the floor and lining level and smooth, so as not to chafe or injure the contents. Wool, raw cotton, hay, brick, etc., may be handled in a car in fair condition without damage. A leaky roof or open siding will not injure these articles, and they cannot fall through cracks in the floor as would bulk grain. The only essential for cars handling the last mentioned articles is that the frame work of the car be strong enough to hold the load and that the trucks and draft gear be in good condition.

A refrigerator car must always be in good condition in order to protect its lading, due to the fact that the requirements of this service are very rigid. A stock car should be in good condition in order to handle live stock without damage, but the same car in fair condition will haul barreled goods, rough lumber, ties, lump coal, and many other articles, very satisfactorily. A gondola must be in very good condition to hold slack coal without loss, but will hold lump, coal, coke, scrap iron, etc., if in only fair condition.

On a typical western road there was a total of 1,240,324 car loads of revenue freight handled during the year 1917. This freight was subdivided under five general headings, namely, Products of Agriculture, Products of Animals, Products of Mines, Products of Forests, and Manufactured and

Miscellaneous Articles. The number of car loads of each of these classes of freight was as follows:

Products of agriculture.....	298,717
Products of animals.....	172,836
Products of mines.....	385,836
Products of forests.....	99,301
Manufactured and miscellaneous articles.....	283,634

A close analysis of this freight as a whole shows that 72.6 per cent should be handled in cars of first-class condition in order to avoid possible loss or damage due to the condition of the cars; 27.4 per cent of the freight could be handled just as satisfactorily in cars of fair condition.

An extended investigation in the train yard and in a large repair shop of the causes of repairs to freight cars disclosed the fact that only a very small percentage of freight car repairs become necessary due to "time and the elements," or, in other words, rust and decay. To make this study, the repairs to freight cars were subdivided into four general headings representing the principal parts of the car, as body, draft gear, truck and air brake repairs. The investigation showed that most of the repairs required by the bodies of these cars became necessary due to time and the elements, and the next important cause of repairs to the body was starting, stopping and switching or load shift under shock. The draft gear and truck repairs became necessary chiefly due to the starting, stopping and switching of the car. Load shift causes the ends of the car to be pushed out, and posts broken and the siding and lining broken. A very small percentage of the repairs to draft gear or trucks was necessitated by time and the elements. Nearly all of the repairs to draft gear was caused by starting, stopping and switching. The draft gear is broken or weakened by shock in switching and the trucks need repairs because of stopping, as well as shock. The items of the greatest expense in truck repairs are brake shoes, brasses and wheels. It is very seldom a truck has a broken side frame or bolster. The air brakes need repairs because of running and stopping the car. These parts seldom are renewed because of rust.

Combining the causes of repairs of the several parts of the car, the results showed that 47.2 per cent of the repairs to cars became necessary due to the running of the car, and time and the elements; 52.8 per cent of repairs to cars was necessitated by starting, stopping and switching, and the loading and unloading of the car. The 52.8 per cent in starting, stopping and switching and loading and unloading should be again subdivided to show the repairs due to the necessary wear of starting, stopping and switching and the unnecessary wear or abuse of the car. The subdivision shows that 33 per cent of the repairs to freight cars would be eliminated if there were no draft gear, no end sills, posts, siding or lining broken by shock or cornering the car, and no slid flat wheels or cut journals.

The next question to be considered is what percentage of the freight equipment can economically be maintained in first-class condition. As mentioned above, 72.6 per cent of the freight equipment should be in first-class condition to carry the freight of this trunk line without damage or loss due to the condition of equipment. Is it feasible or practical to maintain this percentage as a standard of condition?

In a recent survey of bad order cars on several of our Western roads, it developed that the higher the percentage

\*From a Paper Presented Before the Western Railway Club.

on all the sills. This takes the load off the draft sills to a certain extent, and for that reason I think it is useless to have a heavy underframe under cars equipped with spring gear.

G. S. Goodwin (C. R. I. & P.): I agree entirely with what Mr. Milton has said. Incidentally, it might be of interest to note that mechanical department Circular No. 8 provides that draft sills must be constructed to accommodate friction draft gear, and also that the coupler shall be applied with 3 in. clearance between the coupler horn and the deadwood. The circular permits the application of two class G draft springs which have a travel of about  $1\frac{7}{8}$  in. That means that the spring gear must take all the shock, since the horn of the coupler is  $1\frac{1}{8}$  in. away from the dead wood. It is easy to see what will happen under those conditions.

E. H. Hall (C. G. W.): I do not see how there can be much improvement in the condition of equipment as long as the present rules are enforced. Order No. 12 states that Interstate Commerce Commission accounting rules must be

observed. These rules provide that when the cost of repairs exceeds the major portion of the cost of the car to the carrier, the equipment must be retired. With the present high cost of labor and material the cost of repairs often exceeds 50 per cent of the book value, particularly when equipment has been acquired second hand or through receivership. To get such cars back into service requires additions and betterments which are chargeable to the corporation. It seems that the only thing to do in such cases is to put the cars on a side track until the Railroad Administration or the corporation can agree on the distribution of cost.

F. C. Kroff (Pennsylvania Lines): We have filed the inspection report on a considerable number of cars and have them set aside awaiting disposition. Up to the present time we have received no instructions from the Railroad Administration regarding this equipment.

C. J. Juneau (C. M. & St. P.): We are holding about 200 cars between Minneapolis and Milwaukee awaiting disposition and many more are coming in.

## Conservation of Material by the Store Department\*

### Care in Ordering and Handling Will Prevent Waste; Systematic Methods Needed in Reclamation

By J. G. Stuart

General Storekeeper, Chicago, Burlington & Quincy

CONSERVATION LIKE MANY other good things should begin at home. The storekeeper should begin his conservation when he is ordering material. In many cases he orders material which is not really needed and thereby builds up a condition which will call for conservation later. Too much care cannot be exercised in ordering supplies—whether they be for store stock or for special material which is not ordinarily carried in stock. Once an article is ordered that is not really needed we are very fortunate indeed if we are able to get 100 per cent of the value out of it, but if we can prevent the ordering of the article we have surely saved 100 per cent right at the beginning and have also saved the labor of ordering, handling and hauling.

Often the work of ordering material is delegated to someone else. This is bad practice, as there is no more important work in the store department than looking after the ordering of material.

#### Proper Handling as Important as Intelligent Ordering of Material

The next step in conservation and really one of very great importance is proper care and handling of material. A great deal of money is lost to railroads every year by breakage, leakage and marring of material in various ways, which unfits it for service. These sources of loss can be materially reduced if supplies are properly handled and cared for.

Every man having to do with the handling of material and particularly those who are handling it after it is unpacked should be instructed, so far as it is possible, as to the nature of the material, the use to which it is to be put, the way in which it may be damaged, so that it loses its usefulness entirely, or at least is injured so that only partial service may be had from it. A little rough treatment, in most cases entirely unintentional on the part of the man handling the material, causes expense away out of proportion to the value of the article itself.

A great many articles, many of them of considerable value are left exposed to the weather and thereby rendered almost valueless, or they are handled roughly and must be scrapped because of broken threads or other damage. A carton of electric light bulbs is given a little rough handling and a lot of the lamps are spoiled; although there may be no great difference in the appearance. Iron or steel castings are often finished and then left exposed so that finished surfaces become rusty. Oil applied to the finished part will preserve the casting.

Rubber hose and all kinds of rubber naturally deteriorate after they have been on hand any great length of time. This should be thoroughly understood by those handling them so the sheet rubber, packing and hose which have been on hand longest will be used first. Proper care should be taken so that rubber is not stored in the bright sunlight or in some unusually dry place; when rubber hose is dated, these dates should be observed by mounting and using the oldest first.

Oil is sometimes shipped from oil houses in cans, barrels and transportation tanks which have not been properly cleaned or have previously contained oil of a different kind. Occasionally illuminating oil is put in a container that has contained lubricating oil and the oil is contaminated so that it is not fit for use. In other cases containers are not properly inspected and after being filled and shipped, leaks develop which cause considerable waste of oil and often damage to other freight in the same car or perhaps makes the floors oil soaked and prevents the use of the car for high grade shipments.

#### Exposure of Material Causes Waste

Finished lumber is often stored out of doors and considerable loss is occasioned by warping and splitting. It is a common sight to see a railroad lumber yard where practically all of the lumber is stored outside and only a short distance away a commercial lumber yard where the lumber of the same kind is under cover.

Track bolts are often piled outside and the nuts rust in the

\*From a paper presented at the annual meeting of the Railway Storekeepers' Association in Chicago on January 25.

bolts to such an extent that considerable extra labor is needed when the bolts are put in the track. If it is necessary to store outdoors and the bolts are not oiled when purchased they can be easily oiled by immersing the keg in an oil bath at time the bolts are received. The oil bath and the extra handling does not amount to more than a couple of cents per keg.

Track spikes as well as bolts are often piled outside in such a way that the kegs are apt to fall apart and a great deal of extra labor is necessary to handle the spikes although the contents may not be injured.

Machine bolts and all kinds of rods and forgings having thread connections are often left piled in such a way the threads are exposed and in many cases entirely spoiled or if not there is extra work in getting the nuts on and off, which would not be necessary if the threads were properly cared for.

Frogs and switches are generally piled outside and often rust badly. A little oil applied to the bolts and nuts will in most cases prevent the rust.

When packages reach the destination with the contents broken or damaged, it not only means that the value of the material has been lost but perhaps a further loss will be entailed waiting for a duplicate shipment.

Even though material has deteriorated to some extent the store department can charge it out at its stock value. But even though we do charge it out at its original value something has been lost. In order properly to conserve material every man on the road must look at it from the standpoint of the railroad and not from the viewpoint of his department alone.

With proper attention to the housing of material large losses can be avoided and while there are perhaps no figures to show that these losses are, anyone who has ever been around a storehouse realizes that they are really serious.

A storekeeper is always in a position to call attention to defects in large amounts of material used. Many times a design is not as good as it should be, or there is a weak spot in a certain casting or for other reasons an unusually large number of the items are being used. By carefully watching the stock book the storekeeper will note this unusual consumption and is in a position to report to the department interested so it may investigate and correct the design or strengthen the casting so as to prevent excessive breakage.

### Reclamation

One phase of conservation that has come to the front very prominently is reclamation. Notwithstanding the exercise of every possible care in the ordering and caring for material, there is still a great deal of material that is available for reclamation; material that has been used once and by repairs or reworking can be made fit for service again, or material that has been used and by a change in form may be made fit for other purposes.

Some may still question the need of reclamation on railroads, but if these had visited a certain scrap dealer's yard in Chicago, where railroad scrap is handled, a short time ago, I am positive they would be convinced that reclamation is needed and needed badly. In this particular yard there were several thousand tons of scrap and in the scrap were many nuts, bolts, washers, small parts of couplers, knuckles and other smaller items which were perfectly good or could have been made so with very little work. In addition, there were many couplers that did not require any work; in fact, the scrap dealer wanted to sell a carload of good couplers. In addition to the couplers which should have been saved and which did not need any repairs whatever there were a great many which could have been repaired in any up-to-date reclamation plant. There were many brake beams, some needing heads, some fulcrums and some other small parts, but in the great majority of cases very small repairs would have made them fit for use again. In fact,

one brake beam, so far as could be ascertained, needed only one nut to make it fit for service.

Reclamation is a subject that requires constant and careful attention and unless most careful attention is given we are apt to find that instead of making a saving we are only incurring additional expense.

Two objectives stand out clearly in reclamation. One is the need of the material after it has been reclaimed, and the other the fact that material can be reclaimed for less money than it can be purchased for. It is true that it often pays us to reclaim material even though it costs decidedly more than it can be purchased for, but this can only be practiced in emergencies or when the item reclaimed is such as will enable us to put a far more expensive item into service. For example, it might not pay to reclaim brake heads under certain conditions, and yet, if we were short of brake beams and also out of brake heads, it might pay us to spend considerable extra money in order to reclaim brake heads so as to enable us to put brake beams into service. As stated above, however, such cases should be the exception.

The constant danger in reclamation is that, unless stock is very carefully watched, material will be reclaimed even though it is not needed, merely because it has been the practice to reclaim it.

The maintenance of accurate and reliable records is essential to prevent the reclamation of material which will cost more than its purchase price new. One thing should be borne in mind at all times—that records must be correct. There may be some justification for a man endeavoring to fool someone else, but it hardly seems possible that there is any justification for his fooling himself, and the man who makes false entries in his reclamation record is simply practicing self-deceit.

To maintain a proper cost record we should have the different articles reclaimed, accounted for separately. It is not at all wise to group a lot of items; for, even though we may be making a saving on the group as a whole, some of the items may be costing too much to reclaim and therefore should not be reclaimed.

The saving made by reclamation will, of course, be the difference between the market value and the total cost of the reclaimed article (including its value as scrap, plus the value of any additional material used in reclaiming it, and the cost of labor, including supervisory and clerical forces and shop expenses). This cost should be checked up often enough to reflect the changes in market conditions or labor costs.

A scrap dock is usually located at a point which will provide good shipping facilities to points where scrap is sold. Generally the reclamation plant is located close to the scrap dock. In many cases a better location for the reclamation plant could be found, but on account of the extra handling which would be necessary on the material it is generally found better to have the reclamation plant at the scrap dock.

In most cases material which is fit for further use should be reclaimed at the point at which it is released—that is, as much of it as can be used at that point. Strict attention should be given to this to prevent long hauls to scrap docks and back to the point where the material will be used. Of course, all of the material cannot be reclaimed at the point at which it is released, therefore plants with larger capacity and better facilities should be established at central points where the minimum haul will be obtained.

Material can be reclaimed more cheaply and in a great majority of cases better at large centrally-located points, as in this way it is possible to get laborers who specialize on reclaiming work with special machinery and therefore do this work better than regular mechanics, although they are in many cases not as highly paid as mechanics would be. In fact, until recently a reclamation plant was a splendid place in which to use handy men.

In establishing or maintaining a reclamation plant it is important to get the co-operation of the other departments in using the material that is reclaimed. There seems to be a natural prejudice against using second-hand material or material that has been worked over and it seems that even workmen prefer to work with new material. We must secure the aid of the foremen of the other departments so they will be firm in their insistence that reclaimed material be used wherever it is suitable.

It is certain that some material will come to scrap or reclamation plants which should not have been scrapped. If the store department makes a great stir over this and perhaps brings down criticisms on those who send it in, such action will, to a great extent, defeat our object. Other departments should not be allowed to become careless in sending in a great deal of usable material, but where there are occasional slips the matter may be called to the attention of those who are to blame as a matter of information, rather than censure. I heard one man remark that he would spend \$10 in sorting over his scrap rather than have ten cents' worth of usable material found in the car which his men had loaded. Let us endeavor to keep away from such uneconomical practices.

#### Learn from Reclamation Methods of Other Roads

It is interesting to go over various roads and investigate the different practices and to note that one road effects large savings on certain items while on another road the same things are not reclaimed at all. No two roads seem to be reclaiming all of the same kind of material, so there is something for each one to learn from every other road.

Recently an inspector was sent to a road when they were loading out scrap couplers and knuckles to pick out such couplers and knuckles as in his opinion could be reclaimed. He was instructed not to take anything until the employees of the road had decided that the article was scrap. Out of one carload of scrap which was shipped he picked out 131 couplers and 263 knuckles which in his opinion could be reclaimed. After allowing for the expense of repairing them and also allowing for their value as scrap, the net saving amounted to over \$1,500, considerably more than the entire carload of scrap was worth. This is not an exception—the same thing was tried on another railroad with almost the same results.

Our reclamation men must be broad minded. Those who stay at home generally lag behind and the men of small minds who go to other places, not with the idea of learning anything but to satisfy themselves that their own methods are best, usually are the ones who will fail on reclamation work. The men having to do with reclamation must be broad minded and constantly on the lookout for improvements, constantly searching for additional items to reclaim. Many items were legitimately scrapped five years ago which can now be reclaimed by the use of acetylene. Constantly keeping up to date on methods is necessary in reclamation work.

#### Items Reclaimed with Profit

I do not wish to give an entire list of all material that can be reclaimed on the railroads. Such a list would be almost endless. In making mention of the few cases of reclamation which follow I have picked out those which are not so common and those which have come to my notice within recent months.

Steam hose gaskets usually costing about 35 ct. each may be reclaimed for 6 or 7 ct. and put back into service. Bolts of one inch diameter and larger, where the head is good, may have an end welded on for threading at a saving of perhaps 50 per cent of the cost of new material. Cast iron wheels may have the flat spots ground out of them by grinding the entire tread of the wheel and making them perfectly round again.

Cattle guards, gates and sign posts may be made from scrap flues. Good scrap pipe and short pieces of new pipe may be made into nipples. Several railroads are welding six-foot lengths on flues which would otherwise be scrapped.

Long time burners usually costing about 35 ct. may be reclaimed and put back into service for not to exceed 3 ct. One road has been saving all of the scrap stay bolts and double refined iron, rattling the lime from them and making slabs of this scrap which are forged into driving rods. Track spikes are reclaimed on most roads. One road has been reclaiming them and sorting them into No. 1 and No. 2; the better to be used in yard and other tracks where there is no great speed and the No. 2 which are a poorer grade, to be used on tracks around shops, rubble car tracks and storage tracks.

Old track shovels, when worn to such an extent as not to be serviceable on sections, can be used for stations, way cars, watch shanties and other places where a coal shovel or small shovel is needed. Second-hand scoops not fit for firing engines are perfectly good for handling cinders on sections.

All kinds of sheet iron as well as scrap flues may be used for making washers. Tie plates, after having been in service, may be repunched and used with lighter rail. Frogs, crossings and switch points may be built up, either in the track or at scrap rail yards.

Cement sacks in all cases are returnable to the shippers. The great question is, does the store get back all of the empty sacks? To accomplish this one road is keeping a very careful check on all of the sacks of cement sent out, showing the car number, date of shipment, consignee, and point to which shipped and is tracing to see that the same number of empty sacks are returned after the cement has been used. Each individual job must be followed up or the best results will not be obtained.

A large number of roads are upsetting their larger car axles and making them into the next smaller size. This accomplishes a large saving. Most roads are insisting that old material be turned back when new material is issued. This has the effect of bringing back to the store many articles which can be reclaimed. One road has made a saving by numbering each lantern issued, charging it to the individual and insisting that the old lanterns be turned in.

There is room for a great saving in the use of secondhand lumber. Roads are constantly taking out old bridges and, though the lumber may not be good enough for use in bridges again, it is satisfactory for other purposes. A resaw established in a lumber yard will generally pay 200 per cent per annum on the investment. In addition to cutting up and getting second-hand lumber in service it enables the lumber yard to furnish any odd size pieces that may be called for.

Wonderful results have been obtained by welding and building up couplers, knuckles, bolsters and other steel castings by the use of acetylene.

In many cases a rerolling mill will give excellent results. I do not think that the returns are nearly as large from a rerolling mill where large sizes can only be reduced to smaller ones, as from a rolling mill where scrap iron may be piled and rolled into any size bars needed. A rolling mill, of course, can only be worked to good advantage on a large road where there is a great deal of scrap of the proper kinds for rolling obtainable and where there is a large demand for bar iron.

To get the best results from a reclamation plant the work should be kept up to date. If large quantities of reclaimable material are allowed to accumulate it is almost certain that the road will buy new material when other material might be reclaimed and put back into use. A reclamation plant has many other advantages. One is that it enables a road to help itself in emergencies as it can generally get from the reclamation plant a few of almost any article needed. It

also has the advantage of cutting down the investment in stock as material is immediately available after reaching the reclamation plant; in fact in many cases it can be reclaimed and put back into service on the same day on which it is received and in most cases within two or three days.

I have not attempted in any way to exhaust this subject;

in fact the subject is inexhaustible. I have merely tried to point out some of the fundamentals of conservation and some few particular items. I believe that it is a work that should be given a great deal more attention than has been given to it in the past and if this attention is given I am sure we will get results that will make good returns to the railroads.

# The Elimination of Unnecessary Telegraph Messages

Traingram System in Use on the St. Louis-San Francisco  
Prevents the Abuse of This Service

By J. H. Brennan

Superintendent of Telegraph, St. Louis-San Francisco, Springfield, Mo.

THE DESPATCHING of important communications by train mail in specially provided envelopes to distinguish them from ordinary railroad mail is not a new idea. Most railroads have had in effect such a service in one form or another for several years. The St. Louis-San Francisco, prior to the inauguration of the present traingram system, had a standard mailgram envelope, which was originally designed for mailgrams, but because of the lack of proper supervision and restrictive instructions it became so commonly and indiscriminately used that the purpose for which it was designed became nugatory.

The present traingram plan on the St. Louis-San Francisco is, in part, the outgrowth of a campaign to eliminate unnecessary telegraphing. The stereotyped explanation that the wire was used because the mailgram service (or railroad

was assigned a sub-letter, to be followed by a number, the numbers to run consecutively on each desk. These letters and numbers are preceded by the telegraph call of the office at the point of origin. For example, assuming that the office of the superintendent of transportation at Springfield is assigned the letter *S*, and the chief clerk in that department is assigned the letter *B*—the telegraph call for Springfield being *S*, his first traingram on the first of each month bears the following symbol: "S-S-B-1."

Consolidating offices were established at the more important points and placed under the authority of the managers of the relay offices; or, where there was no relay office, under the division operator or agent. At these points outgoing traingrams are delivered, open, to the consolidating office, where they are consolidated and their numbers entered in duplicate on a form provided for that purpose which shows the envelope number, symbol, destination, train, date and time. The duplicate copy of this record is enclosed with the traingrams in an envelope. This envelope is delivered by special messenger to the train baggageman, who is required to receipt for it. At the receiving stations, the contents of the envelopes are checked against the forwarding record, and if any discrepancies are found they are adjusted with the forwarding office by wire.

All traingrams addressed to individuals at a point where there is a consolidating office are, as far as practicable, placed in one envelope and addressed to the consolidating office, instead of being addressed to the individuals direct. All traingrams are "tied out" by the train baggagemen. This method of handling eliminates delays that might occur if these envelopes were to pass through the regular railroad mail channels.

At consolidating offices messengers meet all passenger trains on which traingrams are forwarded, delivering outgoing traingrams and receiving incoming ones. The latter are taken immediately to the consolidating office, where they are checked with the forwarding offices' record; and they are then time-stamped and delivered. It will readily be seen that with the traingrams listed at the originating station, together with the number of the envelope in which such traingrams are forwarded, and a check of the forwarding record at the receiving office, it is possible to trace a traingram from the sender's desk to the addressee's desk.

mail) could not be depended upon, especially for deliveries, made it apparent that the objectionable features must be overcome if the wires were to be relieved of the correspondence that did not actually require telegraph service. Recognizing that a dependable traingram service was a necessary adjunct to a campaign to abolish unnecessary telegraphing, a circular was issued by the chief operating officer inaugurating the system under the supervision and control of the telegraph department.

## The Application of the System

Traingram blanks and envelopes of a distinguishing color (blue) were provided, and their use restricted to the traingram service. For the purpose of identifying and maintaining a service record on traingrams, each department was assigned a letter or a combination of letters, and each desk in the department that was authorized to send traingrams

## Numbering and Checking the Traingrams

Traingram envelopes between consolidating offices are numbered consecutively. Where there are several trains a day between these offices, as is the case between St. Louis and Springfield, certain trains between the two points are designated as the ones on which traingrams will be for-

This Envelope will be used only for forwarding

warded. If traigram envelopes are forwarded on other than designated trains, the receiving office is notified by wire of such irregular forwarding.

Numbering the traigram envelopes consecutively enables the receiving office to check failures. If the sequence of the numbers is broken, the forwarding office is immediately notified by wire, and the senders of the traigrams in that envelope are immediately advised. Traigrams addressed to individuals at points where there are no consolidating offices are recorded at the sending but not at the receiving stations.

The term "traigram," as describing this service, is used advisedly. The service covers only communications that are to be forwarded by train. Interchange of memos and correspondence between offices located in the same city is not contemplated.

This system has been in effect on the St. Louis-San Francisco for over four years, and has proved entirely satisfactory and dependable. The loss of a traigram is as rare as is the loss of a telegram, and as explained above, when necessary, the service of a traigram can be investigated and determined as accurately as that of a telegram. On a railroad situated as is the Frisco, where practically every division headquarters can be reached from operating headquarters by overnight train service, the service can be used as an auxiliary to the telegraph, with a resultant improvement in the preferred service by wire and a decrease in the cost of operation.

**The Saving Accomplished**

During the month of December, 1918, a total of 33,418 traigrams, or an average of 1,078 a day, were handled between consolidating and the more important offices. While it is true that not all of these communications would have been forwarded by telegraph had there been no traigram service, it safely may be stated that 75 per cent of this business, or an average of 809 messages a day, would have been filed for transmission by wire.

The telegraph service may, therefore, be credited with a saving of 809 messages daily. This number of messages reduced to operator hours (one sending operator and one receiving), means that seven operators would be required to handle this business, at an average monthly salary of \$159 each, a total of \$13,356 per annum. From this should be deducted \$3,000 yearly for additional messengers and clerks employed to handle the traigram service, leaving a net theoretical saving of \$10,356 per annum, made by the traigram service.

A further feature of value of this service is the absence of any restriction in the length of the traigrams, such as obtains under a censored telegraph service. In the above estimate, approximately 300 traigrams handled daily between local points, of which no record is maintained, were not taken into consideration.

The traigram blank, on blue paper, is like a telegraph blank, with a note at the top to the effect that it must not be used for any purpose except traigram service. The traigram envelope shown, reduced in the engraving, is 9 inches long. The record, form 1214, filled out to be enclosed with the traigrams in each envelope which is sent from a consolidating office, is on a sheet 8½ in. wide and 10¾ in. high. The headings of this sheet are shown at the bottom of the page.

**The Belgian Railwaymen and German Oppression\***

**B**ELGIUM HAS, IN PROPORTION to her size, the greatest length of railway of any country. There are 2,859 miles of line, representing 30.29 miles for every 100 square miles, as against 22.38 in Great Britain, 15.72 in Germany and 11.72 in France.

These railways are state property, and besides them there are 2,091 miles of light railways worked under the control of the National Society for Local Railways, administered by a council of members, two appointed by a council of four members, two appointed by the state and two elected by the shareholders. The state also appoints the chairman and general manager, and the shareholders elect a supervising committee of nine members (one from each province).

Though these light railways are partly state controlled, the employees are servants of the company, whereas service on the main railways is government work and ranks with the posts and telegraph as "civil service."

**Drivers Refuse to Work for Germans**

At the time of the invasion (August-September, 1914) the engine-drivers whenever possible took the engines into France. Many of their engines, not being immediately required there, were dismantled and sent to Russia where the transport crisis was most acute. Comparatively few mechanics, however, escaped in this way, and owing to the terrible congestion on the lines, by no means all the engines, so that the invader would have soon been able to use the lines and rolling stock left. The Belgian railwaymen, however, refused to carry on the service, and German employees had to be introduced, who, owing to their lack of experience, especially of the lines constructed on an inclined plane, were the cause of many accidents and the dislocation of urgent military transport.

After their failure to break through to Paris or Calais, and their defeats of the Marne, on the Yser and before Ypres, the Germans began to organize for a long war and to draw all fit men into essential services. As many Germans as were required for an army corps were employed on the Belgian railways, and, in order to free them for military service, the occupying government tried to persuade the Belgian railwaymen to return to work, pointing out to them that the railways were still of service to the civil population when not required by the military. The Germans offered an all-round increase of wages and specially high rates to drivers (at Liege £2 (\$10) per day was offered to drivers accustomed to the inclined plane of Haut Pré). All the railwaymen refused these offers, and resisted with the same courage when the Germans tried force instead of persuasion.

**Bribery and Threats Useless**

By the spring of 1915, after six months' vain attempts to bribe the railwaymen, finding the rolling stock badly in need of repair and being unable to spare mechanics to deal with it, Germany began her policy of force. At Luttre (where the great Belgian repair works are) a deputation of 30 workmen was called and formally offered 5s. to 7s. per day for ordinary workmen and £1 per day for drivers. They refused on behalf of all their comrades. They were then shut up in railway carriages and threatened with de-

portation to Germany, where they would be obliged to work without payment. Their families were told the same thing, and asked to persuade them. Next day a large crowd gathered at the station, and when the train containing the still resolute workmen moved off it was loudly cheered, the prisoners replying with shouts of "Vive la Belgique." After all, the men were liberated at Namur.

Next, 100 men were collected in a canteen and harangued by a German officer, who promised them a certificate stating that they had only gone to work when forced to do so. "Let those who agree to work step forward," he ended. All the men stepped backward, shouting "Vive la Belgique, Hurrah for our soldiers." After the men, the master, M. Kesseler, manager of the Luttre Railway workshop, was arrested and kept two days in prison. On April 12, 1915, he was sent under military escort to meet his men, who were also guarded and had each been served with a written threat of imprisonment in Germany if they refused to work. The German officer in charge ordered M. Kesseler to persuade his men. He replied that both he and the foremen had taken the oath of allegiance to their King and could not do anything contrary to it. On being again urged and threatened, he consented to speak. He read aloud the German communication, adding: "I leave you to judge what your duty is." The men cheered and refused to work. M. Kesseler and two of the staff men were imprisoned, 190 men were immediately sent to Germany, and 60 more were arrested on June 5.

Another typical instance took place at Malines the same month. Under pressure from the military the burgomaster placarded notices stating that the German authorities called upon the railwaymen to present themselves at the office of the German engineers in charge of the works. No one responded. The Germans then secured the names of the men, arrested them singly in their homes and escorted 500 of them to the works, where, on their refusal to work, they were incarcerated. Finding the men stubborn, the Germans penalized the town. No one was allowed to enter or leave it, and the population had all to be indoors by 6:30 p. m. Still the men would not give way, and eventually the Germans were obliged to raise the embargo without having achieved their object.

### Railwaymen Deported

Throughout 1916 the administration in Belgium took every step calculated to increase unemployment, with a view to forcing the men, through distress, to work for Germany. The two main features of this policy were the requisitioning of raw materials and refusal to allow the communes to carry out public works on which they might have used the unemployed.

By the autumn there was an enormous number of unemployed, and the Germans made this an excuse for introducing forced labor. In October began the deportation to Germany of Belgian workmen, whereby, during a few months, between 150,000 and 200,000 men were enslaved. Some of the railwaymen from Nivelles were among the first victims. No discrimination was made between employed and unemployed. At Quaregnon, for instance, 1,000 men were called up and 304 chosen, of whom 227 were employed. After quoting this and 19 similar instances, the senators and deputies of the district of Mons, in a written protest to the German government, add, "Is this the effect of chance? No; generally the choice of men who have work in Belgium is deliberate. The recruiting officers seem to have a marked predilection for the most experienced workmen of certain industries; foremen, men from machine shops and rolling mills, glassmakers, shoemakers, fitters, electricians and farmers."

As regards the railwaymen, the Germans were really more anxious to use their services in Belgium than in Germany,

and instances of pressure brought to bear on them, and which amounted to a regular persecution, are too numerous to mention. At Tournai the railwaymen were condemned to four months' imprisonment for refusing to work on German engines. Finding them equally obdurate at the end of their sentence, it was in December increased to a year's imprisonment, during which time they were nearly dying of hunger. During 1916 in Brussels some mechanics were summoned to drive German trains, and were kept three weeks at Kommandantur, alternatively threatened and cajoled. Finding them still determined to give no assistance to the enemy, the Germans ordered the banks to cease any payments of money to their wives and families. The mechanics, still resolute, were deported to Germany, leaving their families either to live on charity or to starve.

### Workshops and Plant Destroyed

In 1917 the occupying power increased its demands on the factories and workers of Belgium. It sequestered every workshop for which it could find the personnel, either by importing German or prisoner labor, or by bribing a few of the former workmen. But the majority of the factories could not be worked for lack of labor, and the Germans determined to get what use they could out of them, either by taking the machinery to Germany or smashing it up for shrapnel. At Thy-le-Chateau a lot of railway material, including the cast-iron pillars for the Nord-Midi junction in Brussels, a number of buffers, grease boxes, etc., were thus reduced to scrap iron. Some light railway material had been contracted for at Bruges before the war to the Argentine government, and was all seized.

At the same time they tore up many hundreds of miles of light railways in Belgium and seized the material and rolling stock belonging to the companies. It is supposed that the lines were relaid on the Western front. Rails were one of the main productions of the flourishing Belgian iron and steel factories, but most of the heavy machinery employed in their manufacture was removed to Germany or broken up.

The names are on record of 42 factories thus destroyed in 1917, among which are the railway shops at Malvourt, while others, chiefly in Hainaut, are mentioned in groups of 10 or 20. From this list it can plainly be seen how the owners and men of factories whose production might be useful to the enemy preferred to see their property destroyed or to suffer distress caused by unemployment rather than to put themselves under German guidance.

### Railwaymen Resist to the End

Passive resistance in its various forms was still carried on in the occupied provinces during the earlier part of 1918. Life was hard everywhere, but especially in the zones immediately behind the front, which were under military rule, and where compulsory labor was enforced drastically on all who could in any way be useful to the armies.

Transport was, there especially, a vital question for the Germans, and no one with any knowledge relating to it was exempted from the trial of enslavement under threat of German machine guns, often within range of Allied shell fire. Even in this zone of horror patriotism still lived, and the railwaymen were not unworthy of their 10,000 comrades serving with the colors the other side of the Yser. In February, 1918, at Mouscron, a small town in West Flanders, two guards and a railway laborer were sentenced by a military court for "acts opposed to German interests." One of the guards was condemned to death and immediately executed, the two others were sentenced to 15 years' hard labor. In order to terrorize the population the town was placarded with their names and punishments. We may be grateful thus far to Germany for giving us their names to honor, Achille Debacker, executed; Henri Debavoy and Jules Leuridan, imprisoned.

# Railroad Prospects Are Still Uncertain

Five-Year Plan Side-Tracked—President May Postpone  
Decision as to Relinquishment of Roads

WASHINGTON, D. C.

WITH FORMER DIRECTOR GENERAL McADOO'S plan for a five-year extension of federal control finally side-tracked as far as this session of Congress is concerned and with the prospects for an extra session of the new Republican Congress still uncertain, the question as to the disposition of the railroads is still an unanswered one. There has been a strong expectation that President Wilson, who is spending this week in Washington, might reach some decision as to a future date for the relinquishment of the railroads before leaving next Wednesday on his return trip to the peace conference at Paris. It was also thought that he would decide on the question of an extra session of Congress which would afford an opportunity for the consideration of permanent railroad legislation, but it was announced on Tuesday that he had decided under no circumstances to call an extra session until after his second return from Europe, which may be as late as June, and it is said to be quite possible that no decision as to the relinquishment of the railroads will be reached during his present stay.

In his address to Congress in December the President said: "The only thing that is perfectly clear to me is that it is not fair either to the public or to the owners of the railroads to leave the question unanswered and that it will presently become my duty to relinquish control of the roads, even before the expiration of the statutory period, unless there should appear some clear prospect in the meantime of a legislative solution." If there is yet any clear prospect of a legislative solution it is by no means apparent to a casual observer and there are many in Washington who have believed that the roads would be returned as of June 30, but Director General Hines, who is expected to confer with the President on railroad matters before he leaves, although he has said the roads must be returned soon unless there is an extension, testified before the appropriations committee of the House that he doubted very much if there could be a relinquishment earlier than this fall.

The principal concern of the Railroad Administration at this time is to get the additional appropriation of \$750,000,000 for its revolving fund, which was passed by the House on Friday, February 21, and which is still pending in the Senate. Director General Hines and Secretary of the Treasury Glass appeared before the appropriations committee of the Senate on Tuesday, urging the necessity for the passage of the bill at this session in order that the administration may meet its obligations as they come due. The committee is expected to report the bill as a rider to the general deficiency appropriation bill which is one of the measures that must be passed before Congress can adjourn, and the President is using his influence to insure its passage.

The Senate Committee on Interstate Commerce concluded its hearings on Friday, February 21, and at an executive session on Tuesday of this week decided to make no recommendation to the Senate either as to the five-year plan or as to any permanent plan for the solution of the railroad problem. The House Committee on Interstate and Foreign Commerce had previously decided not even to hold hearings. The Senate committee did order a favorable report on Senator Cummins' bill, introduced immediately after the armistice was signed, to amend Section 10 of the federal control law. The purpose of the bill is to restore to the Interstate Commerce Commission its former authority over increases in rates by eliminating the provision which authorizes the President to initiate rates without suspension by the commission, but as the section now provides for a final review by the interstate com-

mission of all rates initiated by the President, it is believed that the amendment might also remove the ground on which the Railroad Administration has asserted its independence of the rate authority of the states.

The committee also reported favorably a bill introduced by Senator Poindexter of Washington, to amend the fourth section of the commerce act.

Senator Poindexter's bill, S. 313, proposes to amend the fourth section to make the long and short haul clause of the federal act absolute, that is, to prohibit the charging of a higher rate for a shorter distance than for a longer distance, eliminating the authority granted to the Interstate Commerce Commission in the present law to permit exceptions. The bill is, of course, directed against the practice of the railroads which has been permitted by the Interstate Commerce Commission of making lower rates to the Pacific coast terminals than to the intermediate points. The subcommittee to which the bill was referred had taken 700 pages of testimony, but the bill received only a few minutes' consideration by the full committee and it is recognized that it stands no chance of passage in the few remaining days of the present session. Its enactment would cause a revolution in the rate structure, upsetting the thousands of adjustments authorized by the commission in its fourth section relief orders. It would amend the present section to read:

"It shall be unlawful for any common carrier subject to the provisions of this act to charge or receive any greater compensation in the aggregate for the transportation of passengers, or of like kind of property, for a shorter than for a longer distance over the same line or route in the same direction, the shorter being included within the longer distance, or to charge any greater compensation as a through rate than the aggregate of the intermediate rates subject to the provisions of this act, but this shall not be construed as authorizing any common carrier within terms of this act to charge or receive as great compensation for a shorter as for a longer distance.

"Whenever a carrier by railroad shall, in competition with a water route or routes, reduce the rates on the carriage of any species of freight to or from competitive points, it shall not increase such rates unless after hearing, and an order granting permission therefor by the Interstate Commerce Commission.

"This act shall take effect 60 days after its approval by the President."

No action was taken on Senator Cummins' bill to prevent the President from relinquishing the railroads short of the 21 months period after the proclamation of peace unless authorized by Congress. The senator announced that he would press the measure on the floor of the Senate either as an independent measure or as an amendment to the \$750,000,000 appropriation bill.

After his hearing before the Senate appropriation committee Mr. Hines gave out the following:

"While the committee gave no indication of its attitude, I feel that I have succeeded in demonstrating to the committee the absolute necessity for the entire appropriation and its extraordinarily urgent character. The Railroad Administration needs practically the entire appropriation inside of the next 60 to 90 days to meet obligations which it assumed in the calendar year 1918, partly for rentals to the railroad companies and partly for equipment and other additions and betterments. The appropriating of this money at once will be

of immense value in clarifying the situation, enabling the government to pay without any delay whatever all its obligations as they fall due. This will greatly improve the financial situation of the railroad companies and of the equipment companies and therefore will have an important bearing on the financial conditions generally. It will also enable the Railroad Administration to go ahead without question on its conservative program of maintenance and improvements. I believe I made it clear to the Senate committee that this entire appropriation is really needed merely on account of capital temporarily tied up in the government's control of the railroads; and indeed that of the entire \$1,250,000,000 which will have been appropriated if this appropriation shall be granted, practically \$1,000,000,000 will be returned to the government as the railroad companies liquidate from time to time their indebtedness to the government. I believe that this process of liquidation will go forward with greater and greater rapidity. This fact of reimbursement of the government for nearly all the money appropriated for the railroads differentiates this appropriation from nearly all other appropriations made by the government. The fact that these moneys are largely due now and that the rest will become due so rapidly differentiates the appropriation from the ordinary supply bills which will not begin to be needed until July 1st next, and makes the appropriation a peculiarly urgent one."

#### Appropriation Bill Passed by House

The bill appropriating a \$750,000,000 addition to the revolving fund of the Railroad Administration was passed by the House on February 21 by a vote of 311 to 14, but not until after a strenuous effort had been made to tie a string to it by amendments to prevent the relinquishment of the roads by the President before Congress has had an opportunity to enact remedial regulatory legislation. An amendment offered by Representative Rayburn of Texas adding a proviso that the roads should not be returned until December 31, 1919, was defeated by a vote of 103 to 51, and a similar amendment by Representative Esch fixing the date as July 1, 1920, was defeated, 91 to 73. Another amendment, to limit the amount to \$381,000,000, was also lost. The debate, which covered five or six hours, brought out a storm of criticism of the government's handling of the railroads from the standpoint of expenses and service, and most of the representatives who spoke in favor of the bill took occasion to express their opposition to government ownership or continued government control beyond the time necessary for Congress to enact permanent legislation. The amendments were only defeated after strong appeals had been made to the Democrats by Chairman Sherley, of the appropriations committee, and to the Republicans by Representative Cannon, a member of the committee, to disregard collateral issues and grant the appropriation necessary to enable the Administration to discharge its contract obligations. Many of the speakers indicated their disinclination to vote for the bill except for the necessity for paying the amounts owed by the Railroad Administration to the railroad companies and to the car and locomotive companies for the equipment ordered. Many added the amount of the two appropriations, \$1,250,000,000, to the amount of the increase in freight and passenger rates as representing the cost of a year's experiment with government operation, in spite of the promises that most of the appropriation represented temporary advances to be repaid to the government.

Representative Fess of Ohio and Dyer of Missouri said that members of Congress were being bombarded with letters from railroad employees urging them to vote for government ownership or operation, and Representative Dyer read a letter which he and others had received reminding them that they had been elected by the votes of railroad employees and saying that if they wished to remain in office

they should vote for the continuation of government control. This letter bore a notation "carbon copy to John Scott, A. F. of L. Building, Washington, D. C.," and, Mr. Dyer said, indicated that the propaganda was organized at Washington.

Chairman Sherley, of the committee, in urging the appropriation, said he was unalterably opposed to government ownership and in favor of turning back the roads at the earliest possible date, but that the question of government ownership is not involved in meeting the condition with which the Railroad Administration is faced.

While Mr. Cannon was speaking for the bill, Mr. Juul asked if the two appropriations represent the entire cost to the nation for its first year's experiment in railroad management, or if there were more that Congress had not been informed about. Mr. Cannon replied that he was neither a prophet nor a son of a prophet. Mr. Denison wanted to know if the appropriation can be used in any way as an argument for continued government operation.

"On the contrary, I think the bill itself, connected with all that has been done, is a very strong argument against government ownership," replied Mr. Cannon. While Mr. Cannon urged the appropriation, he said that unnecessary expenditures had been made "in hiring people to be good."

Mr. Rayburn in advocating his amendment said: "This lesson in government operation has been a costly one and a bitter one, but I believe we will be at least partially compensated for all the money that we will lose by an actual demonstration of the heresy of the whole idea of government ownership. I believe that it is the death knell, at least for a generation, of government ownership of the railroads." He thought, however, that the roads ought to be retained at least until Congress has had an opportunity to enact remedial legislation.

Representative Esch thought a little longer period ought to be provided because of the uncertainty as to whether there will be an extra session.

#### Senate Committee Hearings

The Senate Committee hearings on proposed railway legislation begun on January 3 were concluded on Friday, February 21.

S. H. Cowan, representing the Texas cattle raisers, testified on February 20, strongly urging legislation at this session to restore the legal remedies of the shippers such as the commission's power to suspend rates. "If Congress is asleep at the switch," he said, "the only course left to the public is an appeal to their public-spirited representatives in the Railroad Administration." Mr. Cowan vigorously opposed both government ownership and continued government operation and demanded that Congress put a stop to the "saturnalia of useless expense." He filed a statement entitled "What Shall We Do to Be Saved?" "The people are tired of having their rights relegated to Washington for some man to determine," he said. "This ought to be a government of law and before it adjourns Congress ought to restore the remedies of the law. Now the shipper has rights only by the grace of the Railroad Administration. The farmers and the shippers generally want the roads turned back to their owners and they want this business of government operation ended just as soon as it is practicable to do so.

"They talk about their economies of unified control. There have been no such economies. There has been a veritable riot of extravagance. They have given wage increases and back pay to men who, knowing they were not entitled to them, have donated their pay back to the Red Cross. The power to initiate rates and to get appropriations simply invites inefficiency and extravagance, but there is a limit to the amount of increased rates the traffic can stand and the roads ought to be put back in the hands of the men who

know how to get economical operation." Mr. Cowan declared that the loss and damage to perishable freight during the past year has exceeded the amount of the rates paid on that class of traffic.

On February 21 Thomas C. Atkeson, representing the National Grange, which he said included 1,000,000 farmers, presented a statement and resolutions supporting the Cummins bill to prevent the President from turning back the roads until Congress has had an opportunity to legislate. He said that he had never been very strong for government ownership, but had been converted against it during the past year and thought that the majority of the farmers do not favor government ownership. "There are some who do," he said, "but there are fewer of them now than 18 months ago because the government's handling of the roads had not been satisfactory."

A. M. Todd, president of the Public Ownership League, objected when the committee limited him to 10 minutes because he said 90 per cent of the time of the hearings had been taken up by opponents of government ownership. He spent most of his 10 minutes in displaying photographs of expensive tunnels, passenger stations, etc., on the Swiss government railways and filed his prepared statement. The photographs, he said, were to show that the Swiss railways cost five times as much as American railways to build, yet, he said, their rates were lower. To prove this he showed

a season ticket on which he had ridden for 45 days for \$27. Senator Robinson said he thought that was a discrimination against the ordinary passenger, who, Mr. Todd said, paid 3.1 cents per mile, because the season ticket rate must be below the cost of service and he thought that represented a poor argument for government ownership.

Theodore Prince, of New York, a financial writer, outlined a plan for the creation of a finance corporation, with a capital stock of about \$500,000,000 to be subscribed by the railroads, to assist in financing the weaker roads, to handle co-operative improvements, and to finance the debts of the railroads to the government at the end of federal control. He also had a plan of railway regulation.

T. H. Condon, vice-president of the American Federation of Railroad Workers, advocated a continuation of government control or government ownership, because, he said, if the railroads were restored to their owners wages might be reduced.

Thomas F. Blunt, a "private citizen," of Washington, D. C., presented "a 14-point plan" for the ownership, operation and control of the railroads under a government guarantee.

The committee decided to receive briefs from Luther M. Walter, general counsel for the National Association of Owners of Railroad Securities, Bruce V. Crandall and Benjamin Catchings.

## Doings of the United States Railroad Administration

### Director General and Short Line Association Reach Agreement for Revised Short Line Contracts

WASHINGTON, D. C.

**D**IRECTOR GENERAL HINES and a committee of the American Short Line Railroad Association have reached an agreement on a revised form of contract to be executed by short line railroads which are not being operated by the federal government as an amendment to the form approved by the director general on October 30 which has been the subject of protracted negotiations as to the interpretation of some of its features. W. M. Blount, assistant to the president of the short line association, has devoted several months to the special work of inducing the Railroad Administration to stop diversions of traffic from the short lines and to make reparation for the traffic that has been diverted and Mr. Hines announced on February 26 that he had approved two standard forms of co-operative short line contracts which are satisfactory to the short line association. The two forms are the same, except that the first covers roads having no competitive traffic and the second covers roads having competitive traffic. In this a clause has been added providing for reparation for diversions of competitive traffic from the short lines between April 1 and November 1, 1918, and for giving to the short lines subsequent to November 1, 1918, the same proportion of competitive traffic as they had in the years 1915, 1916 and 1917. This makes the effective date of the contracts April 1, 1918, a question which has been somewhat in dispute after the approval of the previous form.

The contracts provide:

- (1) That all joint rates shall be fairly divided between the director general and the company.
- (2) That the short lines shall receive an equitable allotment of cars.
- (3) That short lines having a length of 100 miles or less shall be allowed two days' free time for cars owned by a road under federal control and used by the short lines.
- (4) That the short lines shall have the right to use the

purchasing agencies of the director general in the purchase of materials and supplies and shall have repairs done in the shops of the director general upon the same terms as were enjoyed before federal control.

(5) That in the publication of tariffs and routing, the short lines shall be treated in the same manner as roads under federal control.

(6) That if in the opinion of the director general, it becomes necessary for him to operate the short line railroad, he shall have the right to do so upon the payment of compensation as provided by the federal control act.

For the purpose of finally removing the impression which the short line representatives stated to exist widely over the country, that the Railroad Administration was unfriendly to the short lines, the director general announced that he would make appropriate arrangements to make certain that all officers and employees of federally controlled railroads give fair, just and friendly consideration to questions affecting the short lines which may come up for consideration in connection with the application of the contracts.

Edward Chambers, director of the Division of Traffic, has written a letter to Mr. Blount, requesting the members of the short line association to prepare claims for the diversion of traffic upon blanks to be supplied by the administration and place the claims through the office of the association so that they may be analyzed and prepared in accordance with the direction of the association. This will avoid extra handling and permit of the preparation of the claims in proper form while the execution of the contract is receiving attention. The matter of per diem will be handled by the Division of Operation, which will provide proper forms upon which claims should be presented and will be prepared to handle the matter with reasonable promptness when contracts are executed.

In a letter to Bird M. Robinson, president of the Amer-

ican Short Line Railroad Association, Director General Hines expressed gratification that a complete agreement has been reached on the form of contract to be executed. He also stated that the short line railroads which sign the contract secure all the advantages of railroads which are under federal control, including increases in rates and freedom from levy of attachment on their property. In addition, they will secure the specific advantages as to reimbursement for diverted traffic, two days' free time, and otherwise, specified in the contract. Short line railroads which do not sign the contract, of course, will not receive these advantages and while it will be the policy of the Railroad Administration to deal justly and fairly with non-signatory as well as signatory railroads, Mr. Hines said, those who do not sign the contract but who accept the special advantages of two days' free time and reimbursements for traffic diversions in accordance with the terms of the contract will do so with the understanding that they waive all claims against the government and will execute appropriate papers.

The representatives of the short lines had also called attention to the fact that the Railroad Administration has not heretofore rendered financial assistance to short lines and that they contemplated asking Congress when considering the appropriation of an additional \$750,000,000 for the Railroad Administration, to provide express authority for the Railroad Administration to use \$50,000,000 of the amount, in its discretion, in making advances to meritorious short line railroads. Mr. Hines said in his letter that careful estimates indicated that \$750,000,000 as a minimum and probably more would be needed to carry through the year 1919 the various capital expenditures, advances to corporations and working cash capital, which must be carried in respect of the railroads which the government is directly operating. He, therefore, hoped that any such request would be coupled with a request for a corresponding addition to the appropriation. In transmitting a copy of Mr. Hines' letter to the members of the association and other interested short lines, however, Mr. Robinson advised that after conference with the director general it had been decided to withdraw the request that Congress set aside a part of the fund for the benefit of the short lines because the director general has advised that he will advance out of the \$750,000,000 to any meritorious short line having the short line contract, any funds that he would advance to such a line in the event a part of the fund was set aside especially for that purpose.

Mr. Robinson said to the short lines that he was convinced that the majority, if not practically all, of the short line railroads should definitely secure their legal rights by entering into a contract with the government and he recommended that this be done. He said the director general's letter was most gratifying as a definite recognition of the status of the short line railroads and of the work done for such roads by the association.

#### Relations with State Commissions

The Railroad Administration and the state railroad commissioners have agreed to disagree as to the jurisdiction over intrastate rates during the period of federal control, and efforts will be made to expedite a test case so that the question may be passed upon by the Supreme Court. As to matters pertaining to service an understanding was reached at a conference last week between Director General Hines and Max Thelen and E. C. Niles, of the Division of Public Service, and the executive and special war committees of the National Association of Railway and Utilities Commissioners by which the authority of the state commissions is restored to a large extent. The terms of the understanding as to all matters except rates were reported in last week's issue. The rate subject was taken up on the second day of the conference, on February 20, and Mr. Hines insisted that the federal control act does not preserve the jurisdiction of the states. Fol-

lowing the conference he issued the following General Order No. 58, providing that:

"In order to clarify the relationship between the United States Railroad Administration and the state railroad and public service commissions, all officers and employees of the United States Railroad Administration shall be governed by the policies and regulations herein set forth, as follows:

"1. Transportation systems under federal control continue subject to the lawful police regulations of the several states which were and are applicable to privately operated transportation systems, in such matters as spur tracks, railroad crossings, safety appliances, track connections, train service, the establishment, maintenance and sanitation of station facilities, the investigation of accidents, and all other matters of local service, safety and equipment. It will be the policy of the director general to cause the orders of the state commissions in these matters to be carried out.

"2. In all proceedings of the character specified in paragraph 1 hereof, formal or informal, officers and employees of the United States Railroad Administration shall recognize the jurisdiction of the state commissions and shall assist them in developing the facts and in applying such remedy as may be necessary and shall fully co-operate with them.

"3. In all formal proceedings of the character specified in paragraph 1 hereof, to which the director general may be a party, he will consider service as having been made on him if made on the federal manager or general manager, as the case may be, of the transportation system affected, or on such official as the federal manager or general manager, respectively, shall designate and whose name he shall file with the state commission for that purpose. The federal manager, or if none, the general manager, shall designate to each state commission an officer conveniently located on whom such service may be made. The legal officers of the United States Railroad Administration are directed to appear in such proceedings and to present fully the facts.

"4. The federal control act empowers the President to initiate rates, fares, charges, classifications, regulations and practices by filing the same with the Interstate Commission, and empowers said commission to review the justness and reasonableness thereof. The state commissions take the position that the intrastate rates are nevertheless subject to their jurisdiction and it will be the policy of the director general to expedite in every way a final decision by the appropriate tribunal of the question thus raised.

"5. The directors of traffic and public service of the United States Railroad Administration are directed, before authorizing advances of any importance in rates, fares or charges either interstate or state, to submit the same to the state commissions in the states affected for their advice and suggestions.

"6. It is important that the records of the state commissions be continued intact. Transportation systems under federal control shall file with the state commissions, for information, all their rate schedules heretofore or hereafter issued during the period of federal control, and annual and other reports and information as to matters within the scope of federal control requested by state commissions according to the provisions of state statutes.

"7. All officers, agents and employees of the United States Railroad Administration are directed to supply information and render assistance as requested by state commissions, in accordance with the provisions of this order.

"8. This order shall be effective on and after its date."

#### Barges Ordered for New York Canal

The Railroad Administration has let contracts for 20 self-propelled barges for service on the New York Barge Canal, to be delivered in four months. They will be of 400 h. p., and will each haul 75 tow barges.

### Taxation of Railway Materials

A difference of opinion has arisen between the federal managements of the railroads and the state authorities of Indiana regarding the taxation of railway materials and supplies. A. H. Smith, Eastern regional director, issued a circular last November to federal and general managers asking them to call the attention of their tax representatives to the fact that material and supplies on hand are the property of the United States government and therefore not subject to taxation. The circular stated that where tax reports heretofore have been prepared listing such items the notation "none subject to tax" should be inserted, with any further explanation deemed necessary. The state board of tax commissioners referred the matter to the attorney general of the state, who has recently given an opinion that all property which under private control would have been exposed to taxation should be regarded as subject to taxation under federal control. This was based on the statement that "the active operation of the railway systems was left in the hands of the organizations which existed and had control thereof" before the period of federal control. The opinion also stated, however, that property "not in the possession of a given railway system for its use but merely moving in due course for use of some other system would not properly be assessed to the company so possessing said property at the taxing period" and it is understood that the position taken by the Railroad Administration that the materials and supplies taken over by the government are government property was based on the fact that such materials have been pooled and are being used in common so that the location of certain supplies on one road temporarily does not make them the property of that road. State officials and many of the federal government officials have been slow to recognize the fact that the railroads are not being operated by their former organizations but as a single system by the government. The assessing officers in Indiana have been referred to the attorney general's opinion and instructed to list this property as formerly with a possibility of correction at a later date.

### Coastwise Steamship Situation

Appreciating the conveniences furnished in the past to various communities by coastwise steamship lines, the Railroad Administration, for some time past, has been seeking means of protecting this service.

On April 12, 1918, the President took over the boats and other property of the Clyde Steamship Company, the Mallory Steamship Company, the Southern Steamship Company, and the Merchants and Miners Transportation Company, placing them under the direction of the director general of railroads. Such action appeared necessary in view of the fact that during the stress of war requirements these coastwise steamship lines were needed to relieve congestion on rail lines then under federal control and because there appeared to be danger that at least some of the ships in this service would be transferred by their owners to trans-Atlantic service. Following the signing of the armistice it was decided that the maintenance of these lines under federal control was no longer necessary, and therefore Director General McAdoo issued an order on December 5 releasing them. Assurances having been repeatedly given those lines by the Railroad Administration of liberal treatment in the division of traffic and in the division of joint rates, the Clyde Steamship Company, the Mallory Steamship Company and the Southern Steamship Company, accepted this relinquishment and are maintaining service except on a few routes where the combination of light business and high operating expenses have caused temporary suspension pending the return to normal tonnage movement.

One element operating for the benefit of the coastwise steamship lines has been the cancellation of permit require-

ments which were necessary during the war in the shipment of coastwise freight through ports handling overseas traffic. The permit requirements have been cancelled on account of relief of congestion at North Atlantic ports.

As a further aid to restoring normal conditions, announcement was made by the director general on February 17 that very careful consideration was being given to a revision of the war policy of the Railroad Administration as to differential freight rates on rail and water routes. Differential rates via rail and water routes between the Eastern states and the South and Southeast were not withdrawn during the war period and are still in full force. Because of the return to peace conditions differential rates via rail and water between New England and Central Freight Association territory, Southeastern—Mississippi Valley territory, the West and Southwest, are now being considered and some change in this situation should become effective during the month of March. Some time is necessary to work out details of this contemplated readjustment.

The Merchants and Miners Transportation Company, however, has not so far accepted the relinquishment. In order not to inconvenience the communities served by this company, the Railroad Administration as a temporary measure has been operating the ships since December 5 for the account of the company. But it has been decided to deliver the boats of this company definitely to it at various home ports on March 1. There have been intimations that the Merchants and Miners Transportation Company is giving consideration to the discontinuing of its service, but it is announced, the Railroad Administration will do everything reasonably in its power to facilitate and encourage the continuance of the service by the company.

### Automatic Train Control Committee to Inspect Devices

The Committee on Automatic Train Control is planning a trip to begin some time next month for the purpose of examining the operation of automatic train control devices which are now in service. At its meeting in Washington this week the committee expects to dispose of a considerable number of devices which will not meet the requirements, after which it will be free to devote more attention to those which have already demonstrated their practicability. The western trip will include an inspection of the operation of the automatic train control systems on the Chicago & Eastern Illinois between Chicago and Danville, on the lines of the Washington Water Power Company near Spokane, Wash., on the Key Route, out of San Francisco, and on the Western Pacific. Later the committee will visit installations in the east, including that on the Chesapeake & Ohio and one or two in New England.

### Post Office May Object to Handling of Railroad Business Mail

The postoffice department may contest the legality of the orders recently issued by the Railroad Administration through the regional directors providing for the carriage of railroad business mail without payment of postage via lines under federal control. Under the laws giving the postoffice department a monopoly in the handling of mail railroads have been allowed to handle as railroad mail matter to or from connecting lines, that is mail in which each carrier has an interest, but have not been allowed to route such mail over an intermediate carrier. The question whether the railroads under federal control came within this limitation came up last year and in August W. H. Lamar, solicitor for the postoffice department, gave an opinion to the second assistant postmaster general that it cannot be assumed that it was the intention of Congress to relieve railways of expense for postage. The federal control law, he held, has not changed the status of the railroads as regarding their legal entity and therefore where it would have been a violation for a railroad

to carry mail prior to the passage of the control act such procedure at this time would still constitute a violation of the law. Since then John Barton Payne, general counsel for the Railroad Administration, has given an opinion that the railroads under federal control are one system and that therefore there are no intermediate carriers among the roads in the federal system. As has recently been noted in our columns the regional directors have given instructions for the handling of railroad mail provided it is not routed over a line not under federal control and while the postoffice department has as yet made no protest it is said to be considering the matter. In case of a difference the matter would naturally be referred to the attorney general for a decision. The action of the Railroad Administration will cause a considerable reduction in the revenues of the postoffice.

#### Accounting Circular No. 74

Army regulations forbid the payment of transportation charges on a shipment covered by a government bill of lading when a part or all of the shipment has been lost or damaged, until such loss or damage has been adjusted. In order to avoid delay in settlement of accounts for transportation of War Department material and supplies, the following plan will be made effective immediately, according to Accounting Circular No. 74:

The transportation and telegraph section, quartermaster branch, central disbursing division, office of director of finance, is authorized by the Railroad Administration to deduct the amount of any claim for loss or damage from the freight charges due in connection with a bill of lading covering the shipment, a part or all of which has been lost or damaged. Under this arrangement, however, no deduction will be permitted from transportation charges due on other shipments.

When payment is made by the quartermaster's department there will be forwarded a statement explaining the deductions, and a claim will be presented for investigation by the carrier. If such investigation develops no liability on the part of the carrier supplemental bill for the amount deducted in previous settlement will be paid.

The War Department in presenting claim will give all available data regarding the loss and damage in lieu of forms and documents required by paragraph 2 of General Order No. 41.

This plan supersedes any arrangements which may have been entered into by individual carriers.

#### Government Still Entitled to Land Grant Rates

Federal control of the railroads has brought up many interesting questions as to the relation between the railroads as a government institution and the regular government de-

partments. Acting on an opinion by Judge Payne the Railroad Administration took the position that railroads under federal operation were not bound by the provisions of the land grants to certain railway companies which require them to give reduced rates on government business. With the large volume of government traffic moving during the war period this would have meant a considerable increase in the revenues of the railroads. The controller of the treasury, however, took the opposite position and declined to approve the payment of the freight bills on the basis of regular rates and as there is practically no appeal from his rulings the matter was dropped.

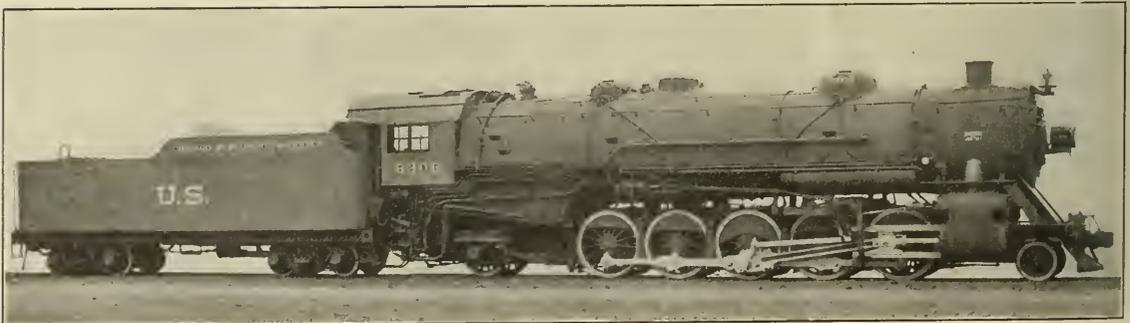

#### Contracts Signed

The Railroad Administration has executed a compensation contract with the Southern Pacific, providing for the annual payment of \$47,959,898. The contract covers the following subsidiaries: Arizona Eastern; Houston & Texas Central; Galveston, Harrisburg & San Antonio; Houston East & West Texas; Houston & Shreveport; Morgan's Louisiana & Texas Railroad & Steamship Company; Louisiana Western; Lake Charles & Northern; Iberia & Vermillion, and Texas & New Orleans. A compensation contract with the Chicago River & Indiana providing for an annual compensation of \$108,525 has also been executed.

#### The Export Situation

Commercial exports continue to show an increase at North Atlantic and Gulf ports, while South Atlantic ports show a slight decrease, according to a report from the Exports Control Committee for the week ended February 18. Total export commercial freight on hand was 259,520 tons as compared with 241,160 tons the previous week. The average number of cars handled at New York per day February 1 to 18 was 381 cars as against 253 for January.

The report states that there are 9,640 cars of food for export on hand, exclusive of bulk grain, at the North Atlantic ports. It is announced that the grain exchanges at Boston, New York, Philadelphia and Baltimore have been notified that applications may now be filed with the Grain Corporation for permits for the shipment of grain and grain products by the various dealers on account of sales made directly by them for foreign markets. In this connection the report states that there is due at Hampton Roads between now and March 5 on account of the Wheat Export Company a total of 51,000 tons of vessel space which will be distributed among the North Atlantic ports. There is a total of approximately 40,000,000 bushels of grain for the food administration and the Wheat Export Company which it is expected will be forwarded prior to April 1.

U. S. R. A. Standard Heavy 2-10-2 Type Locomotive

A description of this locomotive was published in the *Railway Age* of February 14, page 389

## The English Channel Train Ferry

**T**HE CHANNEL TRAIN FERRY is one of the interesting developments in transportation brought out by the war. It was instituted in 1917 to meet the demands of the British military authorities and plies between certain French ports and the newly created Port of Richborough, on the River

Stour, near Sandwich, in Kent. The rise of Richborough as a great forwarding depot is one of the romances of the war. Its creation as a port and the institution of the cross-channel barge and ferry services for the conveyance of military requisites has played a very important part in the

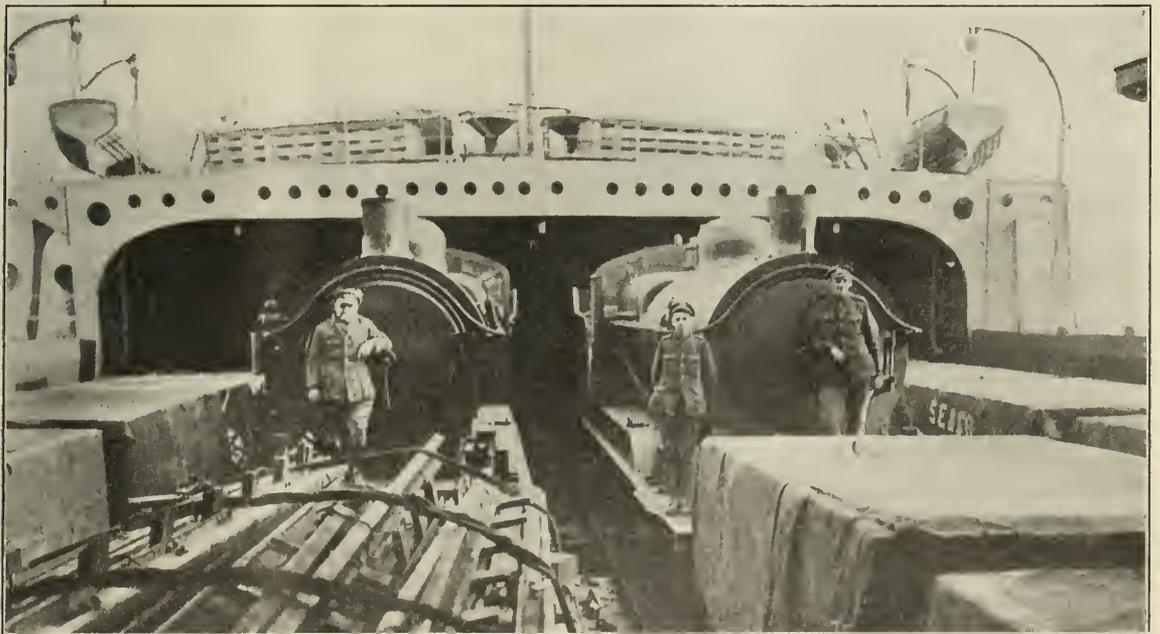

Freight Cars on Board the Boat

The Weigh Bridge at Richborough

of the French canal system to depots established at no great distance from the firing line. The train ferry came into existence in January, 1917, the French ports of Calais and Dunkirk being equipped with terminal facilities corresponding to those at Rich-

borough. The steamers employed are 363 ft. 6 in. long and 61 ft. 6 in. broad and their draft, when loaded, is 9 ft. forward and 10 ft. aft. They have a speed of 12 knots and displace 3,654 tons. The average load carried is about 900

Two Locomotives With Their Loads in the "Well"

conduct of the campaign on the western front. Wharf construction on the Stour was begun in June, 1916, and so well did it progress that by December a regular service of barges was in full operation. From first to last upwards of 4,000

borough. The steamers employed are 363 ft. 6 in. long and 61 ft. 6 in. broad and their draft, when loaded, is 9 ft. forward and 10 ft. aft. They have a speed of 12 knots and displace 3,654 tons. The average load carried is about 900

tons, and up to the end of the week ending October 23 the tons (deadweight) imported amounted to 58,981. Large numbers of railway trucks, brake vans, locomotives, tanks, etc., were carried across, the work of loading having proceeded with the utmost smoothness, the engines being taken over on their own wheels and the tanks on the special railway trucks on which they had traveled from the works. By this means an immense saving was effected in time, labor and expense, and there is no doubt that the ferry—to quote the words of one of the many correspondents who have lately written about it—“added enormously to our facilities for quick transport during critical months of the present year in France, and it will probably continue to render valuable service in the coming demobilization.”

## The Industrial Board of the Department of Commerce

THE INDUSTRIAL BOARD of the Department of Commerce is the official name of the organization being formed under the direction of Secretary Redfield of the Department of Commerce, with the approval of the President, “to put into direct effect a program for the readjustment of prices for basic materials,” to meet post-war conditions in the hope that this will result in the stimulation of industry. The board is to be composed of representative men from industry, labor and the government who are being selected under the chairmanship of George N. Peek, formerly vice-chairman of the War Industries Board. It is understood that Hugh Frayne, who represented labor on the War Industries Board, also will represent it on the new board and that T. C. Powell, director of the Division of Capital Expenditures of the Railroad Administration, will also be a member.

Secretary Redfield has given out a statement regarding the conditions to be met and the purpose of the committee, in which he says:

“It will be the endeavor of the board to act promptly by consulting and interchanging views with these representatives of industry in the fullest and freest manner possible, with a view to aiding and assisting industry in general to resume activities to the fullest practicable extent. The immediate object is to bring about such reduced prices as will bring the buying power of the government itself, including the railroads, telephones and telegraph, into action and make it possible for the government to state that it is willing to be a buyer for its needs at the reduced prices. If these conferences result in such an understanding on the part of the government with respect to the important basic industries concerning proper prices and bases for prices at which purchases may be made by it, and these are approved by the board, it is believed that upon announcement thereof to the country in general the public will feel justified in promptly beginning a program of extensive buying.

“Such a procedure will in substance establish immediately a basis upon which to resume activities, and in this way the law of supply and demand will be enabled to come into play and from that time forward it will control the changes and readjustments in selling prices of materials and the trend of prices, it is believed, will be upward and not downward.”

Secretary Redfield also says it is felt that the proper basis of selling prices will be found to be upon a scale higher than those of the pre-war days, but on the lowest plane possible, having due regard for industry, labor and government, in an effort to wholly eliminate the abnormal unbalanced stimulation that business has had and the inflated prices that have resulted and to start anew upon a normal level.

## Train Accidents in January<sup>1</sup>

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of January, 1919:

### Collisions

Date	Road	Place	Kind of accident	Kind of train	Killed	Inj'd
7	Texas & Pacific	Texarkana	xc	P. & F.	1	1
12	New York Central	South Byron	rc	P. & P.	22	20
13	Phila. & Reading	Pt. Washington	rc	P. & P.	14	30
18	Pennsylvania	W. Philadelphia	rc	P. & F.	1	4
20	Chicago & N. W.	Irving Park	rc	P. & F.	2	12

### Derailments

Date	Road	Place	Cause of derailment	Kind of train	Killed	Inj'd
7	Southern	Melrose, N. C.	runaway	F	1	2
7	Ches. & Ohio	Hardware	b. rail	F	2	0
25	Seaboard A. L.	Mooresboro	.....	F	0	1
31	Chi. & Alton	Fulton	.....	P	0	18

The trains in collision at Texarkana, Tex., on the 7th were a through passenger train, switching at the station, and a freight engine which had become uncontrollable and had run some distance unattended, and collided with the passenger train. One fireman was killed and one engine man injured.

The trains involved in the rear collision at South Byron, N. Y., on the 12th were westbound passenger No. 17, second section, and westbound passenger No. 11, which struck No. 17, which was at rest, at full speed. The rear car of No. 17 was crushed, and the car next ahead of it was wrecked; 22 passengers were killed and 20 or more injured. Train No. 11 had run past automatic distant and home block signals set against it; and also had disregarded a flagman's red light. This accident was reported in the *Railway Age* of January 17.

The trains in collision at Fort Washington, Pa., on the evening of the 13th were northbound local passenger train No. 381 and northbound express No. 319, the express running into the rear of the local, which had been stopped because of a freight train, delayed, ahead of it. Fourteen passengers were killed and 30 injured. Train 319 had run past distant and home automatic block signals set against it; also had disregarded the red light of a flagman who was back 1,500 feet. The engine man of No. 319 had had two nights' rest since his last trip, and had been on duty only three hours.

The trains in collision at West Philadelphia, Pa., on the 18th were an eastbound freight train, consisting of fourteen cars of coal, a caboose and two locomotives, the locomotives at the rear, and a following passenger train, No. 20. The freight had become stalled in the tunnel beneath the southbound tracks of the New York Division. The caboose, three locomotives and one baggage car were damaged. The flagman of the freight, who was in the caboose, was fatally injured, and three passengers and one employee on the passenger train were less severely hurt.

The trains in collision near Irving Park, Ill., on the morning of the 20th were a northbound passenger, carrying sailors and workmen to the Great Lakes Naval Training Station, and a following train of empty coaches. There was a dense fog at the time. One sailor and one brakeman were killed, and twelve passengers were injured. The empty train had run past distant and home automatic block signals set against it.

<sup>1</sup>Abbreviations and marks used in Accident List:  
rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, obstr., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P, or Pass., Passenger train—F, or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

The train derailed near Melrose, N. C., on the morning of the 7th about 4 o'clock was a freight train of 22 cars descending Salute Mountain. The train became uncontrollable soon after passing the summit, and the engine and five cars were thrown off the track at safety track No. 2, the engine being overturned. One trainman was killed and two were injured.

The train derailed near Hardware, Va., on the night of the 7th was an eastbound freight. The engine was thrown off the track by the breaking of a rail, and, with eight cars, fell down a bank. The engineman and fireman were killed. The rail had been weakened by a transverse fissure.

The train derailed near Mooresboro, N. C., on the 25th was an eastbound freight. The tender of the locomotive ran off the track while crossing a trestle, and, with nineteen cars of coal, fell into Sand Creek. The engineman was injured.

The train derailed near Fulton, Mo., on the 31st was a southbound combined passenger and freight. Eighteen passengers were injured. The cause of the derailment was a defective truck.

*Electric Car Accidents.*—Near Strasburg, Ohio, on the 10th an interurban car was derailed at a bridge and plunged 20 ft. to the creek below; of the 25 persons in the car nearly all were injured. On the Third Avenue Elevated, New York City, on the 30th, a rear collision of passenger trains resulted in the death of one passenger and the injury of 20 or more.

## New Type of Ditcher Effects Economies

SOME DATA COMPILED RECENTLY on the results secured by several railroads in using power ditchers to clean out cuts, remove slides and do miscellaneous excavating, clearly demonstrate the advantages of this type of equipment over hand methods. In the cases cited the machines were the Erie power ditchers, manufactured by the Ball Engine Company, Erie, Pa. These machines differ from other types

Operating a Ditcher Between Dump Cars

in common use in that the dipper handle is attached to the boom in the same manner as on the ordinary steam shovel; that is, it may be advanced or withdrawn through the boom with the aid of crowding engines mounted on the latter. No craneman is employed, however, since the three engines provided for the separate functions of hoisting, crowding and

swinging are controlled by three levers and a foot brake which are handled readily by one man. The boom is 19 ft. 6 in. long and the dipper handle 16 ft. long, thus affording a maximum reach from the center line of the dipper to the center line of the occupied track of 28 ft. 6 in., or enough to permit the wasting of material beyond an adjoining track. These machines are used according to the usual plan, with the ditcher mounted on a flat car placed between two dump cars.

On the Chicago, Burlington & Quincy ditching machines of this type cleaned up side ditches in light cuts, loading four 20 cu. yd. cars about half full of material per hour. On one division a machine averaged 560 cu. yd. per 10-hr. day. In similar work on the Renovo division of the Pennsylvania Railroad one machine loaded 10 60-cu. yd. hopper cars in a 12-hr. day. Eight of these machines were used on the Pennsylvania Railroad last season.

Some information was also obtained from the Pennsylvania Railroad on cleaning up slides. One maintenance officer estimated that the machine was equivalent to 50 men, and would do the work in one-third the time. In one place a slide was cleaned up in 1½ days at a cost of \$20 for labor,

Ditching on the Pennsylvania Railroad

coal, interest and depreciation, while experience in a similar location with hand labor indicated that it would have taken 20 men at least six days to accomplish the same results. At the rate of pay then prevailing, \$2.40 per day, this would have amounted to \$288.

On the Canadian Pacific in the province of Quebec the use of one of these machines for excavating a depressed ash pit illustrates how they may be adapted to such miscellaneous work. In this case, the machine was mounted on a flat car as in ordinary ditching. The excavation was carried to a depth of about 12 ft. below the surface, the material being loaded on cars spotted on a track alongside on the original surface. The average performance under this arrangement was 90 to 100 cu. yd. of material per hour.

A special feature sometimes provided with these ditchers is an automatic crowding device which may be applied to the boom, and has the effect of limiting the position of the dipper teeth to a certain fixed level. By this means the bottom of the excavation can be maintained automatically at a certain depth below or above the level of the track occupied by the ditcher.

# General News Department

The Chamber of Commerce, of Cincinnati, Ohio, by a vote of 1,130 of its members, has gone on record as opposing government ownership of railroads, the vote being 1,030 to 100.

An appropriation of \$2,500,000 for continuing the valuation work of the Interstate Commerce Commission is included in the sundry civil appropriation bill now before Congress. Last year's appropriation was \$3,500,000.

The Senate on February 22 passed a resolution extending until July 1, 1920, the effective date of Section 10 of the Clayton act, except that the section will become effective on March 1, 1919, as to any corporations hereafter organized.

Traveling railroad auditors, to the number of 141, met in Cincinnati on February 23 to prepare a program for beginning negotiations with regional directors for improvement in salaries and working conditions. It appears that similar meetings were held on the same day in a dozen other cities, throughout the country.

C. E. Corcoran, trainmaster of the Chicago, Milwaukee & St. Paul, at Beloit, Wis., was killed on February 23 in the derailment of passenger train No. 301, at Latham Park, Ill., eight miles north of Rockford. The cause of the wreck has not been determined. One passenger was killed, and two seriously and 20 slightly injured. Three coaches rolled down a 20 ft. embankment.

The Minnesota legislature has before it two bills concerning railroads: the Hubert bill, requiring adequate and safe plank crossings, and the Swanson-Hitchcock joint resolution, advocating the reduction of rates on iron ore from Minnesota iron mines to Lake Superior ports from \$1 to 63½ cents per gross ton. The Swanson-Hitchcock resolution refers to General Order 28 (June 25, 1918), and declares that the higher rate on iron ore can only result in the closing of Minnesota iron mines and at the same time aiding the mines and mills of Alabama, Pennsylvania, and other states.

The shipper who loads bulk freight to the full capacity of every car assigned to him by the railroad is doing a good thing for himself, for the railroad and for other shippers; but there is such a thing as carrying a good thing too far. This is the substance of a notice that has been sent out by the Car-Service Section of the Railroad Administration, calling attention to the excessive enthusiasm of certain shippers of news print paper who insisted on having 30-ton cars, even when they had to wait for the cars to be brought from some distant point. Cars of higher capacity were available, but to use them for 30-ton lots the paper shippers would have had to lower their record for full-capacity loading!

The proposed restriction of immigration to the United States for four years is the subject of a resolution which has been adopted by the general executive committee of the Railway Business Association, in which all members of the association are urged to use their influence, in every direction possible, against the proposed legislation. The bill pending in Congress is opposed to the prosperity of the United States; desirable immigration should be fostered and not restrained. The satisfactory solution of the railroad problem may be in a measure dependent on immigration; proposals to build new lines or lay additional tracks might fail because of a famine in unskilled labor; and skilled labor has no job until the track is laid.

The vital importance of an early settlement of the railroad question, is the subject of a resolution adopted by the executive committee of the Railway Car Manufacturers' Association on February 18. This association, embracing the 19 principal car builders in the country, represents an industry employing about 100,000 men, and the resolution

calls upon all members to make every possible effort to secure the authorization of the addition of 750 millions to the revolving fund, asked for by the director general of railroads, and to use their influence to bring about an extra session of Congress as a means toward early settlement of certain questions, which early settlement is necessary to the revival of business in the car building industry. Without business the car shops cannot co-operate with other agencies in giving work to idle men.

Fourteen bales of silk were thrown out of a car of a west-bound freight train of the Delaware, Lackawanna & Western, west of Stroudsburg, Pa., on the morning of February 20, about two o'clock, and some thieves were waiting to carry off the freight in automobile trucks; but it is said that the railroad police and employees thwarted the plan of the robbers and recovered the silk; and one man is under arrest. It appears that the car containing the silk was watched all the way from Paterson, N. J., 69 miles, to a point beyond Stroudsburg, and that the theft occurred within a section of three miles between the point where the watchmen left the train and where other watchmen were to board it. The Scranton Times, which reports the occurrence, believes that one robber had secreted himself in the car before it started from Paterson and that other robbers followed the train all the way in automobiles. Among the measures taken to capture the robbers was the sending out of locomotives to stand on highway crossings and thus interfere with the movement of automobiles.

## Audible Signals on the Great Western of England

The Great Western Railway of England, as appears from a statement in the Great Western Railway Magazine, now has torpedo-placing apparatus at several hundred signal cabins, or about 2,000 placers in all; and from 30 to 40 per cent of these instruments have been installed during the past two years. The Great Western has in operation several hundred locomotive cab signals, but the torpedo-placers, we may assume, are on those sections of the company's lines where the cab signals are not used. Some additional interlocking signaling have been installed during the past year and the total number of signal levers in service now, on the company's 3,000 miles of line, is 47,339. The number of cells of storage battery charged during the year 1918 in the signal department was 54,000.

## Railroad Y. M. C. A.

Railroad men of the Chicago district and Young Men's Christian Association secretaries who are interested in railroad activities held a conference on February 20 and 21 at Chicago for the purpose of promoting a nation wide campaign to increase the membership of the railroad Y. M. C. A. This conference for the Northwestern and Central Western regions is the last of a series of regional meetings held throughout the country. Among the important changes that are contemplated are the adoption of a standard program in each railroad Y. M. C. A. throughout the country; the establishment of a rigid standard for the officers who are in charge of these departments and the adoption of a continental membership program. The latter contemplates the adjustment of the expiration dates of membership so that the dues of all members will be renewable annually, the country over, on the same date. The plan further contemplates a standard membership fee with a universally exchangeable membership ticket among railroad associations. It is proposed to increase the Chicago association membership from approximately 114,000 to 200,000 by this campaign, which is to be started in the near future. William J. Jackson, federal manager of the Chicago & Eastern Illinois, presided at the Chicago meetings.

### Sidell & Olney Railroad to be Sold

The decision given by Federal Judge George W. English at Danville, Ill., ordering the sale of the Sidell & Olney railroad now operated by the Cincinnati, Hamilton & Dayton and the Cincinnati, Indianapolis & Western has been confirmed. Accordingly the road which operates between Sidell, Ill., and Olney, a distance of 85 miles, will be sold at public auction on April 15, at Casey, Ill., although an appeal has been entered in the United States Court of Appeals. The court has set the sale price at \$200,000 with the understanding that the road from Sidell to Kansas be operated with a privilege of junking the southern end of the road, from Kansas to Olney. If there is no bid above \$200,000 the property will go to Frank H. Potter of Chicago, who has bid that amount.

### Snow Blockade in Kansas and Nebraska

A heavy fall of snow accompanied by a high northwest wind demoralized traffic in Nebraska and Southern Kansas for three days, February 13, 14 and 15. Telegraph and telephone wires were down and communication between many points was suspended. A train of the Union Pacific was caught in a drift west of Salina, Kan., and held for 48 hours. The passengers had nothing to eat but eggs, and the men on the train were forced to plow through snow drifts to the nearest town for food. Many Union Pacific trains were held at various points until snow plows cleared the road. Missouri Pacific trains in this section had to be annulled, but the Chicago, Rock Island & Pacific maintained an irregular service. The Golden State Limited of the latter road was 30 hours late before it was finally delivered to the road's southern lines. The Atchison, Topeka & Santa Fe had to send its California trains over the Santa Fe southern lines.

### Nine Passengers Killed at Pittsburgh

In an accident to the "Versailles local" passenger train on the Baltimore & Ohio, near Swinburn street, Pittsburgh, Pa., on the evening of February 22, nine passengers were killed, and 70 or more were injured. The train was moving at about 40 miles an hour when its three passenger cars were struck on one side, and partially wrecked, by a locomotive which had been derailed while running on the adjacent main track. This locomotive appears to have been thrown off the track at a point where repairs were in progress and where a rail was not securely spiked. It was running at low speed. The local reports indicate that this engine had passed a block signal set against it. The foreman in charge of the repairs to the signal apparatus is quoted as saying that he waved a white lantern to stop the locomotive, but that after waving the light a few minutes the flame went out. He says that the engineman acknowledged this hand signal by two blasts of the whistle. The engineman is said to have claimed the block signal showed clear and also that he had not been flagged.

### Trans-Mississippi Readjustment Congress

The Trans-Mississippi Readjustment Congress with 2,000 delegates from 18 states west of the Mississippi river passed resolutions opposing government ownership and operation of railroads at the closing session of a three-day convention at Omaha, Neb., on February 18, 19, 20. The purpose of the conference was to discuss the readjustment problems of the trans-Mississippi section.

The convention was divided into 18 groups, each of which considered questions pertaining especially to the industry represented by that group and resolutions passed by each of these groups were presented to the general congress for action. Practically all of the groups advocated private ownership and operation of the railroads, subject to governmental regulation and supervision. The composite resolution concerning the disposition of the railroads adopted by the general congress was as follows: "We are opposed to government ownership and operation of the railroads. The roads now operated by the government should be returned as soon as possible to former private ownership and management, subject to governmental regulation

and supervision which will prevent abuses of the past and secure to the public the greatest good to be derived from economical, efficient and co-operative management, eliminating restrictive legislation which has heretofore hampered much needed improvements." Harry A. Wheeler, president of the United States Chamber of Commerce in his address before the congress stated that "there has been a sluffing of enthusiasm, ingenuity and initiative under government control."

### Getting Trains Over the Road

You are called and ready to leave at 10 p. m., but the brakeman comes up and tells you they are going to throw out a car on account of being crippled, and you pick out the bill for this car and go back to the office with it and get out fifteen minutes late; you have received a message from the despatcher to pick up a car of stock and two cars of powder at Newark and couple a second helper-engine in behind forty cars; the powder has to be cut in in a certain place in the train to comply with the law. Now you are at Redwood and have a time order to make Newark against a manifest train, but you find you must brass a car that is running hot, so you find after you are ready to go that you have not enough time to make Newark and you go to the first siding and side track. Finally you arrive at Newark, get your powder and live stock picked up and your second helper-engine in the train air-tested and ready to go; but a short-time stock train has shown up which must be given preference, and you are again delayed. On the way up the grade you find that the tonnage in the train is in excess of the figures shown and one of your engines has run out of water, so you cut it off and send it to the water tank for water, and wait its return. Several other things are liable to happen. Are you ready to quit? Probably "yes." Does the conductor who ordinarily handles this train quit? Not much. He will probably show up at Tracy not over thirty minutes late, because he has had all the assistance the despatcher can give him in the way of additional helpers, cutting out cripples and giving him help on opposing trains.—*J. A. Shockey (S. P.) before Pacific Railway Club.*

### Automatic Audible Warning for Trackmen

A tunnel of the Metropolitan Railway, in London, which much of the time is filled with smoke or steam, has been equipped for its 2,200 ft. of length with an iron tube for giving notice of the approach of trains, the tube to be agitated so as to produce a noise, by means of treadles, and being so arranged that it can be put out of service when no men are at work in the tunnel.

It was found that horns or gongs could be heard not over 700 ft. in a clear atmosphere and a much shorter distance when the atmosphere was filled with smoke or steam. A galvanized iron tube, of about  $\frac{3}{4}$  in. internal diameter, is slung along the side of the tunnel at the height of a man's ear. Hammers, to strike on this tube, are fixed, one at the middle of the tunnel and one on either side of it, each about two-thirds of the distance to the mouth, so that the distance which the sound must be conveyed is about 367 ft. from each hammer. The hammers are actuated by electro magnets enclosed in waterproof iron boxes, and the electrical energy is supplied by six two-volt storage cells; twelve volts, 60 amperes hours. The depression of a bar, at the entrance of the tunnel, opens an electric contact, and this causes the hammers to produce the desired sound in the tube; not very loud, but easily recognized. When the track bar is in its normal position no sound is made. The vibration of the tube may be felt, so that even a deaf man could avail himself of the warning by putting his hand on the tube. Any defect in the electrical circuit causes the warning to sound. As the train passes out of the tunnel it depresses a second bar, which energizes a relay and opens a contact, silencing the hammers.

The apparatus has received the approval of the Board of Trade. It is patented, and is made by the McKenzie, Holland & Westinghouse Power Signal Company, London.

## Sauce for the Goose—and for the Gander

[From the Railroad Herald]

The government, in taking charge of the railroads, deferred grade-crossing improvements, so far as possible, until after the war, requesting state, county and municipal authorities also to withhold action. The way is now clear to resume this work. Two considerations are involved. The one is to abolish the grade crossing danger. The other is to safeguard the danger until it can be abolished.

We have so far noticed but one press comment excited by Mr. McAdoo's action; and it is amusing to note that all the criticism of the matter is now turned against the stupid oxcart driver and the impatient motorist, whereas the editors used to gather up the faults in one and lay it all at the door of the railroads. Not a fragment of it ever fell elsewhere. This menace that neither city nor rural life could escape was everywhere solely an evidence of the bold schemes of corporate greed. Must we conclude that the "freedom of the press" means that under government ownership one opinion as to a given set of facts should be moulded in the public mind, and a different set when railroads are owned by private companies? This newspaper critic commits himself, apparently, to a policy which amounts to saying, in case of an accident, that when the government is the owner of the railroad, the victim of the accident had no business being there, and, if a private corporation is the owner, then the railroad had no business being there!

Mr. McAdoo's administration has also enlightened the public in regard to the freight-car robber. Many articles have appeared, the keynote of which was that now, since the government is the proprietor, railroad property will come in for a brand new form of protection against the trespasser and the thief. As if the government upon assuming the operation of the railroads entered upon a duty that did not already devolve upon it, to protect this property against any violation of law, and as if some new reason had arisen for the penalty of the car thief to be more severe!

## Interesting Railroad Library for Sale

At the Anderson Galleries, Park avenue and 59th street, New York city, on the afternoons of March 10 and March 11, about 450 volumes of railroad history of England, America and other countries, are to be sold at auction. These books and other documents were selected by an Englishman and include dates from very early in the nineteenth century down to 1880. Included in the list are numerous important manuscripts, drawings, and prints. Manuscript journals of I. K. Brunel and autograph letters of George Stephenson, and others, are among the curiosities. There are large numbers of colored drawings, including a volume of Robert Stephenson's work for the London & Birmingham. Among the American material is a colored plate of the first train crossing the Humboldt river, original reports, charters, etc. There are many minor volumes as, for example, the train rules of the Concord Railroad, and of the Grand Trunk, the latter dated 1857.

There are six volumes of Herapath's Railway Magazine, and a book about subways (proposed) for London dated 1835. There are numerous original early advertisements and early passenger tickets and a collection of 21 medals commemorating the opening of various railroads. French, German, Dutch, Australian, Italian and Russian railroads are covered by publications dated in the thirties and forties of the last century, and other European countries, as well as Asia, Africa, Australia and South America are represented by very early publications.

Among the American railroads named in the index to this library are the Baltimore & Ohio, the Boston & Lowell, the Boston & Worcester, the Buffalo & Pittsburgh, the Central Pacific, the Chicago & Aurora, the Corning & Blossburg, the Delaware, Lackawanna & Western, the Eastern, the European & North American, the Galveston, Houston & Henderson, the Great Western (Canada), the Hudson River, the Providence & Bristol, the Reading, the Rutland & Burlington, the Southern Pacific, the Troy & Greenfield, the Union Pacific, the Vermont Central, the Virginia & Tennessee, and the Western. The dates on these documents range from 1830 to 1852, and a few later.

## Traffic News

The Kalamazoo (Mich.) Chamber of Commerce announces the establishment of a traffic bureau under the direction of George J. Bolender as traffic manager.

The traffic bureau of the Sioux City (Iowa) Commercial Club has adopted resolutions urging on the President and Congress the enactment of legislation that will permit the early return of railroads to their owners.

Coal loading for the week ended February 8 amounted to 165,183 cars, as compared with 215,832 during the corresponding period of 1918. The estimated loading for the following week was 157,215 cars, as compared with 239,261 for the corresponding week of 1918.

J. L. West, formerly traffic manager of the Missouri, Kansas & Texas, is now at the head of the Transportation Bureau of the Dallas (Texas) Cotton Exchange. This bureau, which has just been established by the Exchange, will be conducted under the direction of a transportation committee.

The number of railroad tickets required for occupancy of a drawing room for seat service on day rides is now three instead of five; and three, instead of four, is the number required for the occupancy of a compartment for seat service on day rides. The number of sleeping or parlor car tickets required remains unchanged.

The Western Freight Traffic Committee has requested the various district freight traffic committees to docket for early consideration the question of cancelling all rules requiring the equalization of loaded and empty mileage on privately owned cars moving between points in western territory. This is not, however, to affect the charges on new or newly acquired cars.

Commercial organizations and corporation traffic managers in Cleveland and other points in Ohio, have created a temporary organization looking to the establishment of the "Ohio State Traffic League." The temporary officers are C. M. Andrus of the Otis Steel Company, Cleveland, Ohio, chairman; L. C. Macomber of the Toledo Commercial Club, Toledo, Ohio, secretary, and H. G. Brentlinger of the Standard Register Company, Dayton, Ohio, treasurer. A permanent organization will be formed at a meeting to be held in Columbus on March 24.

The Senate Committee on agriculture has favorably reported the Kendrick bill to place the distribution of refrigerator cars owned by the meat packers under the jurisdiction of the Interstate Commerce Commission. The bill also provides for the licensing of packers' facilities and would require the packers to dispose of their interests in stock yards within two years. The committee disregarded recommendations of the Federal Trade Commission that ownership of refrigerator and stock cars be acquired by the government.

A meeting of the livestock interests of the United States (shippers and receivers) for the purpose of agreeing to rules governing the presentation and adjustment of claims of loss and damage to livestock in transit and also to give consideration to necessary accessorial service in the transportation of livestock in the interest of shippers and carriers alike will be held at St. Louis, Mo., on March 18. The meeting was called by T. S. Walton, chairman of the livestock committee representing all railroads under federal control, at the direction of John H. Howard, manager of the Claims and Property Protection Section of the Railroad Administration.

## Tidewater Coal Shipments Freed

The Fuel Administration has suspended its order requiring shipments of coal to tidewater to go through the Tidewater Coal Exchange, and also suspending an order prohibiting re-consignments of coal. Suspension of the governmental requirements in nowise affects the continued operation of the Tidewater Coal Exchange through voluntary arrangements made by shippers and the Railroad Administration.

## Commission and Court News

### State Commissions

The New York State Public Service Commission, first district, has asked the legislature of the state for an appropriation toward the abolition of dangerous grade crossings on the Long Island Railroad between East New York and Jamaica, about four miles. On this section of the road trains are very frequent and there are 21 crossings. The commission desires to authorize the expenditure of \$1,000,000, of which one-fourth should come from the treasury of the state, one-fourth from the city of New York, and the remainder from the railroad company. It does not appear that this sum will be sufficient to complete the work.

The New York State Public Service Commission, Second District, in connection with the publication of the report on the disastrous rear collision which occurred at South Byron, N. Y., on January 12, announces its purpose to hold an informal inquiry on the general subject of the prevention of collisions, the sessions to be held probably in New York City in the near future. The Commission expects to invite to participate in this inquiry prominent railroad officers and signal engineers, both from within and without the state of New York, the purpose being to seek authentic facts and well-informed opinions on the whole range of questions relating to the possible solution of the problem.

### Court News

#### Recent Decisions Under Federal Employers' Liability Act

The Illinois Appellate Division holds that a checker employed by a railroad company is engaged in interstate commerce when checking freight out of a car which had been loaded in another state and brought therefrom into Illinois by the company.—*Connelly v. Michigan Central*, 207 Ill. App. 25.

The New York Appellate Division holds that a laborer, fatally injured while cleaning soot from a boiler in a railroad's power plant, generating electricity for operation of trains on one railroad wholly in New York state and on another partly in New York and partly in New Jersey, was engaged in interstate commerce within the act.—*Guida v. Pennsylvania*, 171 N. Y. Supp 285. Decided July 1, 1918.

The Texas Court of Civil Appeals holds that where lumber is loaded in a box car in one state and is shipped to another state to be used in the manufacture of doors for grain cars designed for the handling of interstate shipments of grain, an employee who unloaded the lumber in the latter state was engaged in "interstate commerce."—*Gulf, Colorado & Sante Fé v. Drennan* (Tex.) 204 S. W. 691. Decided June 29, 1918.

A yard brakeman was a member of a crew attached to a switching engine, and his day's work was in switching cars in interstate and intrastate commerce. He had just assisted in switching a string of 50 or 60 cars, some of which were loaded with interstate shipments and was returning to his engine when he was struck and injured. It was held he was engaged in interstate commerce. *Erie v. Downs* (C. C. A.) 250 Fed. 415. Decided April 10, 1918.

The Maryland Court of Appeals holds that a freight brakeman, who is a member of a crew taking a train from a point in one state to a point in another state, is within the act. Two companies had an agreement whereby each had the right to use the tracks of the other. It is held that an employee of one road who was killed while working on the tracks of the other road, was not at the time of his death an "employee" of the latter road, under the federal act, although the agreement specified that train employees should be subject to the regulations and orders of the company owning the tracks on which they worked.—*Hull v. P. & R. (Md.)*. Decided April 3, 1918.

## Foreign Railway News

Service between London and Paris for civilians was introduced over the route via Folkestone on February 3.

The Nyassaland Government is proposing to spend \$4,000,000 on a new railway, to serve the country bordering on Lake Nyassa.

All French mobilized reservists who are railway employees, with the exception of those belonging to the active army, are to be immediately placed at the disposal of their respective railways.

The Belgian Government, on February 5, took over the management of the whole Belgian State Railway system, which has hitherto been run by the British, French and United States armies.

A new Italian port will result from the decision of the Italian government to establish a great commercial port at Varano Garganico, on the Adriatic, with a view to improving communications with Southern Dalmatia. A new railway terminating at Varano will place the port in direct communication with Rome and Naples.

The British railway supply export figures for the whole year 1918 are given in the Board of Trade returns for December. They are as follows, the corresponding figures for 1917 being given in parentheses. Locomotives, \$5,377,435 (\$8,147,270); rails, \$2,421,000 (\$3,452,375); carriages, \$2,807,380 (\$825,880); wagons, \$1,644,055 (\$2,215,120); wheels and axles, \$1,722,340 (\$783,165); tires and axles, \$3,098,795 (\$2,697,645); chairs and metal sleepers, \$820,450 (\$368,410); miscellaneous permanent way material, \$2,785,165 (\$2,472,210); total permanent way, \$6,105,475 (\$6,319,630). The weight of rails exported was 26,335 tons (38,900 tons), and of chairs and metal sleepers, 10,173 tons (5,650 tons). Of the locomotive exports \$147,950 (\$1,138,850) in value went to South Africa and \$1,237,050 (\$882,965) to British India.

The International Railway Congress has resumed its headquarters at Brussels with the return to that city of M. L. Weissenbruch, the general secretary. The Congress, before the war, held its meetings every five years, meeting in 1895 in London, 1900 in Paris, 1905 in Washington, 1910 in Berne, and the 1915 meeting was to have been held in Berlin. The Congress, before the war, also proved of service to railway men the world over by the publication at Brussels of a monthly bulletin.

#### Daily Train Service from Nogales, Mexico

Consul Bartley F. Tost, at Guaymas, Mexico, in a recent issue of Commerce Reports says that he is reliably informed that after March 1, the tri-weekly passenger train service of the Southern Pacific Railroad of Mexico between Nogales and Guaymas, Sonora, will be converted into a daily service, except Sundays. From Guaymas south to Mazatlan a tri-weekly service will be maintained.

#### Books on World Trade

With a view to guiding business men as well as general readers "who take an interest in ships and the sea, and other lands," the United States Shipping Board has recently issued several interesting booklets giving a bibliography of books on world trade in its various aspects. The lists were compiled for the Shipping Board by the Free Public Library of Newark, N. J., and include a list of books on world trade; a list of books on foreign languages; a list of books on foreign countries, including a list of 100 of the best books on modern travel, and a list of books on ships, commerce and the merchant marine. The Board is also issuing a table entitled "Tonnage Explained," describing the five kinds of tonnage in use in the shipping business.

### Locomotive Building in Glasgow

The firm of William Beardmore & Co., Ltd., Glasgow, which during the war period and previously played an important part in the construction of ships, armaments, and munitions, has now added to its works at Dalmuir a locomotive building department. The work of constructing the locomotives is to be undertaken in the department which, during the past four and a half years, has been devoted to the making of gun-carriages and gun-mountings, as there were no workshops set apart for locomotive construction at Dalmuir previous to the war. A new plant of an up-to-date design is being installed and the necessary alterations carried out. It is understood that the firm have already on hand a number of contracts, including one from the government to build 35 locomotives for an Indian railway. Although the firm has not hitherto undertaken locomotive building from start to finish, it has manufactured certain important parts of locomotives for many years.

### London to Jerusalem: The New Orient Express

Germany's much-advertised Balkan express ceased to run when the Serbians re-occupied their invaded country, but the International Sleeping Car Company intends to re-establish the Orient express from Ostend to Constantinople at the earliest possible date. Plans are also being considered for the running—possibly next winter—of a service from London to Jerusalem, with a through train from Calais. The company is now running services from Paris direct to Mayence via Strasbourg, and from Paris to Trèves via Metz and Luxemburg. Restaurant cars are also now running between Paris and Lille and Paris and Brussels. Naturally the pre-war time schedules have not yet been restored. The Brussels train, for instance, leaves Paris at 7:30 a. m., reaches Lille at 2:50 a. m., Tournai at 4:45 p. m., and Brussels at 9:20 p. m. Before the war the journey could be covered in  $\frac{3}{4}$  hours. The Mayence train leaves Paris at 8 p. m., and reaches its destination at 12:52 p. m., the following afternoon. Over 16 hours is also allowed for the journey from Paris to Trèves.

### New Light Railway Projected for South Korea

Under date of July 5, official permission was granted by the Government-General of Korea, for the establishment of a light railway starting at Masan and connecting with the Honam line at Songchyonli. A branch line will also run from Wanchom to Chonju, the capital of North Chonia Province.

The main line measures 157 miles and the branch line 46 miles, making a total of 303 miles. The gage of the railway will be 2 ft. 6 in., and the building expenses are estimated at 6,000,000 yen (\$3,000,000).

According to the plan as it now stands, the building of the railway will be started during autumn of 1919, and finished as follows:

First period—Songchyonli to Tamyang and Masan to Kumpuk; from autumn 1919 till spring 1921.

Second period—Tamyang to Wanchon, Wanchon to Nanwon and Kumpuk to Chinju; from spring 1920 till autumn 1921.

### The Value of the Railways of Alsace-Lorraine

The financial correspondent of the Daily Telegraph (London), dealing with the return of Alsace and Lorraine to France, said recently that just before the war 40,000 railway men worked on this system, and the traffic was estimated at 2,800,000 tons of merchandise and 48,000,000 passengers. However valuable this acquisition may be, he said, this railway system cannot be allowed to remain in the condition in which it was delivered to the French by the Germans. It is arranged in such a manner as to multiply communications between Alsace and Germany to the serious disadvantage of those existing between Alsace and France. The first are assured by 17 lines, of which 11 are double tracked, whereas the second, that is, with France, have to be satisfied with

three main lines, three secondary lines and a tramway. The contrast is significant, and shows that the whole economic activity of the annexed provinces under German domination was compelled by the law of the conquerors to turn toward Germany. Now the three departments of Alsace and Lorraine look to the west. As soon as possible new lines must be opened which will admit of a transformation in economic activity. It will be necessary now to establish easy means of communication between the iron and steel basin of Briey and the coalfields of La Sarre. By the union of these two important mining regions a matchless metallurgical center should be developed which would place France in the front rank of the great nations producing iron and steel.

### Proposed Electrification of Swedish State Railways

According to a report issued by the Administration of the Swedish Railways, the plan of electrifying the whole of Sweden's railway system is now approaching its realization, says the Railway Gazette of London. In 1915 the Railway Administration found it necessary to make a closer inquiry into this question, as it appeared that the high cost of fuel made it advisable to adopt electrical power. It is estimated that if the transition had been made in the year 1913 it would not have cost more than the actual cost of fuel in 1915. As the war proceeded it was found necessary to have recourse to wood instead of coal for firing the engines, and this naturally considerably reduced the speed. That, however, was not the worst of the matter. In the year 1917 40,000,000 cubic meters of timber were consumed, whereas the annual increase in the supply of timber was only 25,000,000 to 30,000,000 cubic meters, and at the same time a large quantity of coal was also used. The steady increase in the time of the train journeys was also a serious matter. A journey from Stockholm to Kiruna (Lapland) now occupies 39 hours; with electrical working the journey could be done in 18 hours. The journey from Stockholm to Gothenburg now occupies, even in the most favorable circumstances, 11 hours, whereas an electrically-driven train could do it in  $5\frac{1}{2}$  hours. The Railway Administration estimates that the electrifying of the railways can be carried out in about 10 years. There is plenty of water power in the country, and already several large power works are in existence. It is also suggested that cables strung along the railway lines will be able to supply power for agricultural purposes.

### Bagdad Railway in Good Condition

With the elimination of Turkey from the control of Mesopotamia and Syria great developments may be expected in those regions in which the Bagdad Railway will take a commanding part. A correspondent of The London Times says of the section of the railway including the Taurus tunnels:

"The railway between Bozanti, in the Taurus range, and Aleppo, is, on the whole, in first class condition. Some excellent work has been done. The organization near the Taurus tunnel is extremely interesting. . . . Trains can run all the way, but the tunnels need lining with masonry. This is urgent, otherwise they will fall in after the heavy rains; indeed, some of the new cuttings have already fallen. The scenery is magnificent in the tunnel area, and there is a very fine bridge with piers 220 feet high.

"On the Amanus range the tunnel work has been finished, though there are many difficulties owing to the sinking of the high banks. The track is laid and well ballasted for heavy trains to run at forty-five miles per hour. There is ample rolling stock and materials to meet present needs.

"The most striking feature of the railway construction work has been the survey. Owing to the precipitous nature of the mountains, ordinary methods were impossible. A special stereo-photographic theodolite was invented for photographing the mountain passes, and tunnels of a total length of eleven kilometres were plotted and planned from maps made from photographs."

Concerning the economic possibilities of the region touched by this part of the railway, the correspondent says:

"Adana vilayet has an extremely rich soil and two or three

crops are possible every year. At present, owing to the unsettled state of the country, land is very cheap. Under good government, labor should be plentiful, and it is probable that, other things being equal, more progress could be made there than in Palestine and Syria.

"There are many mines in the Taurus area. Coal also is found in the vicinity, but the quality has not yet been proved. Forests are plentiful and magnificent, and all the requirements of Egypt could be supplied if cutting were organized and the necessary shipping could be provided."

### Japan's Growing Interest in Chinese Railway Affairs

The details given in this column last week, page 471, by the *Railway Age's* correspondent in Peking, concerning the six Japanese railway enterprises in Manchuria, Mongolia, Shantung and Kiangsu, China, have also been covered in an Associated Press despatch from Paris, Tuesday.

The despatch gives a translation of the notes exchanged between China and Japan in September, 1918, granting to Japanese financiers the privilege of making loans to China for the building of railways in China proper and to Japan the right to participate in the operation of the railways now constructed in Shantung province.

These notes, which are now before the Peace Conference, supplement the treaty and notes of May 25, 1915, between

German owned lines with the other principal railway lines in north China. The third set stipulates the conditions under which Japan may participate with China in Shantung province affairs.

The Associated Press despatch follows with the translations of the three sets of notes, but lack of space and the fact that full details were given in last week's issue makes it unnecessary to reproduce them here.

The railway lines in question are shown on the map. The four in Manchuria include: (1) A line from Kaiyuan northeast to Hailung, thence to Kirin, a total of about 180 miles; (2) one from Changchun, north of Mukden, northwest to Taonan, in Mongolia, a distance of about 200 miles, and (3) from Taonan southwest toward Jehol, in Chili province, north China, with (4) a spur extending to the sea at a point still undetermined, but probably Hulutao.

The proposed new railways in Shantung province include (1) a line from Kaomi, 20 miles west of Tsingtau, running southwest to Suchow, about 250 miles, connecting with the partly constructed Belgian line from Lanchow, in Kansu province, to the sea, and (2) a line from Tsinan, in Shantung province, directly west to Shunte, a distance of about 150 miles. This would connect with the railway operating from Peking to Hankow, on the Yang-Tse river and connect Tsingtau with all the important railways in north China.

### The British Import Restrictions

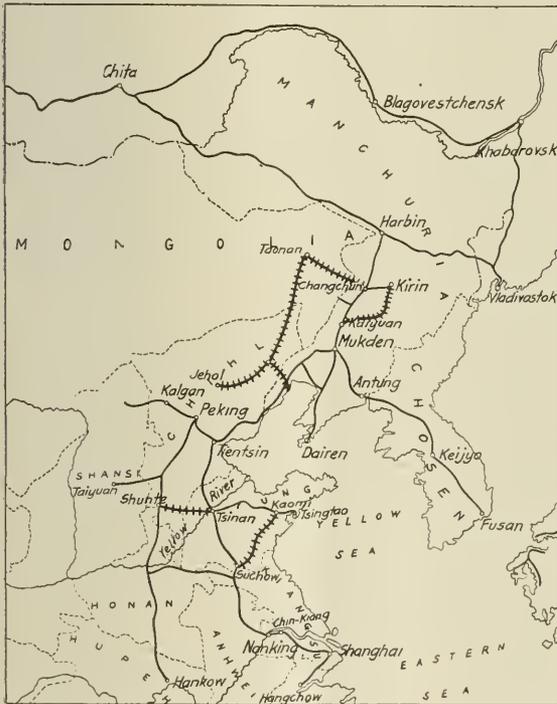

George Ed. Smith, president of the American Manufacturers' Export Association and president of the Royal Typewriter Company, discussing the British import restrictions, said, in part, in a statement issued by the association Monday: "From information which has reached the association since it was announced that the British import restrictions would be resumed on March 1, it would appear that the imposition of these restrictions is simply a temporary expedient rather than an indication of a permanent English policy. From statements of government officials as well as well informed business men in England there is no reason to believe that Great Britain intends to erect a permanent wall against the manufacturers of other countries.

"What has happened is that England has determined to get back upon a normal basis, and is readjusting her business affairs more quickly than we are. She has felt the necessity for giving her own people a chance to put their house in order before opening up her markets to the world. This means that for a certain period a certain percentage of goods manufactured in other countries will be kept upon a restricted list, and that until these restrictions are removed any attempt to expand the sale of these products in England is impracticable.

"The American manufacturer realizes that England is under the necessity of readjusting her domestic affairs. It is true that this readjustment will work considerable hardship on American firms which have a large investment in Great Britain and which cannot supply their English branches with stocks for some time to come. On the other hand, it does not mean that the American manufacturer must abandon his English branches because we are assured that within six months or at most a year, England will once more resume importation upon normal lines. Prior to the war we were England's best customer and she was ours. Excluding the raw materials exported from the United States to Great Britain, the total manufactured exports from us to England and from England to us were approximately the same. We need English markets and England needs American markets, and it is not likely that England would seek to delay longer than necessary the resumption of a mutually beneficial trade.

"While no market could possibly compensate the American exporter for the permanent loss of his English markets, he can make the best of the present situation by devoting himself, heart and soul, to developing his other export fields. He will never have a better opportunity for establishing himself in these new markets than he has at present when there is an abnormal demand for the things which he can supply.

"The manufacturer who promptly adopts this policy under the spur of present necessity should be able to rebuild his

The Railways in China Showing in the Cross-Hatched Lines the Railways Mentioned in the News Despatches

Japan and China, in which the Chinese government engaged to recognize all agreements between the Japanese and Germans respecting the disposition of German rights and interests in Shantung province.

Baron Goto, the Japanese minister of foreign affairs, and Tsung-Hsiang Chang, Chinese minister to Japan, signed the three sets of notes exchanged on September 24 last year. One set outlined the new railways which Japanese capitalists may finance in Manchuria, Mongolia and Chile province, north China.

The second set outlines the railways Japanese capitalists may finance in Shantung province, to connect the existing

English trade at the proper moment and with a larger volume of export sales in other markets than would be possible if he now continued to send his accustomed exports to Great Britain."

### France Needs 3,000 Locomotives and 100,000 Cars

France, as a result of the war, finds itself short of 3,000 locomotives and 100,000 cars, says an Associated Press despatch, while the transportation material that is still nominally on the active list is badly out of repair. The shortage of rolling stock has become very acute lately, for the number of locomotives and cars out of commission for various defects has increased since July last by 10 and 30 per cent respectively. To meet the growing difficulties in the matter of repairs, the State munition factories at Lyons, Toulouse and Roanne have, since the armistice, been turned with all speed into railway repairing shops.

The French Government has long hesitated to place orders in the United States, the despatch continues, where alone new rolling stock could be procured, for fear of depressing the French rate of exchange unduly; but the country's needs became so pressing that orders have now been given, it is understood, for purchasing 800 locomotives and 32,000 cars, while 27,000 American cars that were to have been shipped to France for the use of the American Expeditionary Force have also been acquired. Perhaps the biggest task before the French transportation experts is the restoration of the destroyed railway tracks in the invaded part of France. An army of 75,000 workers will be engaged on this great work for months. It includes the reconstruction of fourteen tunnels and 16,000 bridges for which 50,000 tons of metal are required.

In addition, hundreds of miles of main and branch lines have been temporarily "borrowed" for military purposes from elsewhere, and must now be relaid. The departments affected have been divided up into sections, for each of which a "chief reorganizer" has been appointed. Each of them has been required to give an undertaking that he will have his section in proper working order, as regards transportation, in the course of the present year. An appropriation of 120,000,000 francs has been made by the government to enable the railway companies to purchase rolling stock for urgent public needs. The Minister of Public Works has declared that, in his view, the restoration of France's Northern and Eastern railway systems should be made a first charge upon the war indemnity to be paid by the enemy.

### Railway Construction in Mexico

Manuel Aguirre Berlanga, Secretario de Gubernacion of the Mexican Government, has officially announced that construction is now in progress on about seven hundred miles of new lines of railway, says a correspondent in the City of Mexico. This work is being done at the joint cost of the federal government and the respective states traversed by the roads. While the primary purpose of inaugurating extensive railroad construction at this time is to give steady employment to thousands of laborers, the new lines will also afford transportation outlets to rich mineral and agricultural districts, it is pointed out by Mr. Berlanga. All of the materials for the building of these railroads are obtained in Mexico. The cross-ties come from the native lumber mills, and the steel rails are manufactured at the Monterey Iron & Steel Company's plant at Monterey. Mr. Berlanga said:

"The railroads now under construction by the government are to run between Cuatro Ciénegas, in the state of Coahuila, to Chihuahua, via Sierra Mojada, a distance of about 450 miles; from Durango to the Pacific port of Mazatlan, a distance of about 135 miles; and from Durango to Canitas, a distance of about 130 miles. All of these lines are important. The building of a railroad from Durango to Mazatlan has been under consideration for 30 years or more. Many surveys were made to locate a feasible route across the Sierra Madres. This has been finally accomplished and the road will be finished in due time, thus establishing a new trans-continental line across Mexico. The Cuatro Ciénegas-Chihuahua line will be the means of opening to development

vast coal fields in Northern Mexico, while the Durango-Ciénegas road will shorten the rail distance between Durango and the capital about two hundred miles and will give a shipping outlet to some rich mining districts.

"Durango is a rich mining state and this railroad construction will be important in adding to the wealth of the nation. The government has enough money to undertake all these works and, in addition, it has established many commercial museums to which natural and manufactured products are brought. Then, besides, the government is expending money to bring all kinds of agricultural implements for the farmers, these implements being distributed along the government-controlled railroads to the farmers at cost price on long-time payments. This has all been done while there has been so much talk of distress in Mexico! It is obvious that if we were in such a shape as has been represented the government could not do these things.

"It is very probable the railroads in the state of Yucatan will be bought by the government, financial arrangements now under way having assumed such shape already, the tendency is to shortly take control. The money will be found to buy these railroads.

"I am aware of the fact that many persons in the United States are misinformed about the real conditions in Mexico. They hear that a train has been blown up or a bridge has been burned. Perhaps life has been lost.

"Take the railroad from Mexico City to Vera Cruz, the line from San Luis to Tampico, or that on the Isthmus of Tehuantepec, to Salina Cruz. These railroads cross a country densely wooded. Two or three men can approach to within ten or fifteen yards of the railroad track with no one aware of their presence. They easily can reach the track, place a bomb, and the train, when it passes, is blown up.

"When the people of the United States read of this they think Mexico is not settled and they pass judgment on the entire country. They do not know that those bandits or train wreckers exist mainly due to topographical conditions. In rugged mountains and practically trackless forests they have their hiding places and it is almost impossible to pick up their trail once they have disappeared. They are not a force, these violators of the law. They are in small groups, and eventually must succumb to the law.

"It is simply a question of time before Mexico will take her place as a big producer. As soon as the world is ready to trade, then the great nations will bring to Mexico what we need in raw materials and the finished products, and Mexico will export to them what they need in all those materials so richly abundant here. As our custom house receipts increase the local commerce in the various states also will increase. Profits of the merchants will grow larger from the stimulated business and more money will be in the country.

"Our budget heretofore has been nearly 75 per cent higher than formerly, due to the great demands of the reconstruction program, yet the revenues are almost meeting it and soon we shall not only be able to cover it but will have a surplus, a certain amount of cash. There is this to be considered: Many of the mines are not working, the owner is not getting returns and the government is not receiving its share, but despite the fact that there is no paper money in circulation, the country for two years having been on a strictly coin basis, there is enough gold and silver for all transactions. Right now coinage of gold and silver is necessary and, say, six months from now, we will have not only sufficient money coined but a surplus.

"Though many of the mines are not working, Mexico produces much gold and silver and, from those mines that are working, a percentage comes to the government as revenue. At our customs house gold is paid. All this is brought here and coined. Then, too, many persons buy silver bars that are bought in by the government.

"If things continue on the same footing as now, very soon we will be able to cover our budget, and, if so, we will begin paying part of the overdue interest on our foreign debt. It is only a question of a little patience, six months, I believe, is all that will be required. Just now, we're a little short of money but we're progressing fine. If we could get financial assistance we'd be glad; however, it is not absolutely necessary."

## Equipment and Supplies

### Locomotive Deliveries

The following new locomotives were shipped during the week ending February 15:

Works	Road	Number	Type
American.....	Virginian .....	5	USRA Mallet
	C. & O. ....	2	LOW. SW.
	C. R. & O. ....	2	USRA Santa Fe
	Cent. of Ga. ....	1	Mountain
	Oregon S. L. ....	2	USRA 6W. Sw.
	Total .....	12	
Baldwin.....	Atch. Top. & St. Fe. ....	3	Mikado
	B. & O. ....	4	USRA Mikado
	Penn. R. R. ....	1	Mikado
	Phila. & R. ....	1	Mallet
	Lehigh Valley .....	1	Pacific
	Norf. & West. ....	1	Mallet
	Great Northern. ....	1	Mikado
	Total .....	12	
	Grand total.....	24	

### Cars Constructed in Railroad Shops

### Locomotives

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for a second-hand, standard gage locomotive weighing 15 to 20 tons.

### Freight Cars

THE UNITED STATES NAVY DEPARTMENT, Washington, is inquiring for 4 rotary dump cars.

THE ANACONDA COPPER MINING COMPANY, New York, is inquiring for 4 50-ton ore cars.

THE MARQUETTE CEMENT MANUFACTURING COMPANY, La Salle, Ill., has ordered 100 mine cars from the Lincoln Steel & Forge Company, St. Louis, Mo.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for 2 second-hand box cars, equipped preferably with automobile end doors.

## Supply Trade News

Geo. N. VanSweringen, sales representative, has been appointed assistant to the vice-president of the Chicago Railway Equipment Company, with headquarters at Chicago.

The Norbom Engineering Company, Inc., designers and builders of hydraulic dredges and ship yard machinery, announces the transfer of its offices from the Denckla building, Philadelphia, Pa., to its plant at Fifth and Ellis avenues, Darby, Pa.

The annual meeting of the Chicago Pneumatic Tool Company, Chicago, scheduled for February 24, in Jersey City, N. J., has been postponed until March 17. On account of a recent reorganization of the company's auditing department, the annual report is delayed.

The Interstate Car Company, Indianapolis, Ind., is erecting a steel car and tank car repair shop and fabrication plant at Indianapolis, Ind. The building will be of structural steel, 83 ft. by 245 ft., and 40 ft. high, costing approximately \$50,000. George J. Dive is in charge.

At the organization meeting of directors of the Air Reduction Company, Inc., New York, held on February 19, the following officers were elected: A. S. Blagden, president; A. R. Ludlow, vice-president; C. E. Adams, treasurer; M. W. Randall, secretary; C. L. Snow, assistant treasurer; C. E. Emerson, assistant secretary.

Lieutenant Sherman C. Amsden, formerly connected with Mudge & Co., Chicago, has been appointed assistant to president, in which position he will have charge of publicity, special sales plans, and investigations. Mr. Amsden was born at Manchester, Mich., in 1889, and was educated in the public schools at Manchester and the high schools of Brooklyn, N. Y., and Detroit, Mich. His first business experience was in the employment of Burnham, Stoepel & Co., a wholesale dry goods firm at Detroit. One and one-half years later he entered the service of the Atchison, Topeka & Santa Fe, at Topeka, Kans., as chief clerk to the division freight agent, later becoming assistant editor

Lieut. S. C. Amsden

of the Employees' magazine of the Chicago, Rock Island & Pacific, at Chicago. Mr. Amsden entered the employ of Mudge & Co. in 1914, and on November 1, 1917, enlisted in the air service, taking ground training at the United States School of Aeronautics at the University of Illinois, and flying training at Carruthers Field, Love Field and Langley Field, receiving a commission as lieutenant on July 1, 1918. Upon his honorable release from the service he returned to Mudge & Co. to become assistant to president.

Fred Mathews, sales representative of the Union Metal Products Company at Chicago, has been appointed southern manager of the Standard Railway Equipment Company, the Pressed Steel Manufacturing Company, the Imperial Appliance Company and the Union Metal Products Company, with headquarters in the Candler building, Atlanta, Ga.

W. B. Gibson, manager of the mining machinery department of the Allis-Chalmers Company, of Milwaukee, Wis., has been appointed manager of the small tank department,

and R. C. Huntington, manager of sales promotion of the Fuller Rubber Company, Hampton, Ohio, has been placed in charge of department of sales, promotion and advertising of the Wm. Graver Tank Works at Chicago.

Emerson Knoff, sales agent for the United States Steel Product Company for a number of years at Seattle, Wash., has been appointed vice-president and general manager of the Gerrard Wire Tying Machines Company, Inc., with offices in the Century building, Chicago. Mr. Knoff was born in 1882, at Cheyenne, Wyo., and received his early education in the public schools of Seattle. Upon his graduation from a Seattle business college at the age of 17 years, he entered the employ of the Seattle Hardware Company as office boy, remaining with that company in minor positions for three years. In 1900, Mr. Knoff entered the employment of the American Steel & Wire Company as clerk in the sales department, and four years later was appointed sales agent at Seattle. The American Steel & Wire Company became a subsidiary of the United States Steel Corporation in 1901, and when the United States Steel Product Company formed a Pacific coast department in 1911 to handle the Pacific coast business of the United States Steel Corporation, Mr. Knoff continued as sales agent, until his recent appointment.

Emerson Knoff

### The Baldwin Locomotive Works

The highest gross sales ever recorded in the history of the Baldwin Locomotive Works are shown in the annual report for the year ended December 31, 1918, the total amounting to \$123,179,251, compared with \$98,263,865 in 1917, the previous record year. The business of the company last year was largely confined to government orders, 11 railway mounts for 14-inch guns and 16 caterpillar mounts for 17-inch guns being constructed as well as 3,532 locomotives, the total having a value of \$109,515,970; other regular work was completed amounting to \$13,663,281.

Operating costs totaled \$105,322,455, and gross profits were \$19,760,441, from which deductions for taxes and interest left \$18,262,112. From this was deducted reserves for depreciation, amortization of buildings and machinery and reserves for taxes, along with other charges, amounting to \$12,509,816, leaving a net profit before preferred dividend payments, which amounted to \$1,400,000, of \$5,752,292. The surplus, after the preferred dividend payments, was \$4,352,295, equal approximately to \$21 a share on the \$20,000,000 common stock; but as \$2,500,000 has been appropriated for plant improvement, which is still unexpended, the surplus for the year was reduced to \$1,852,295, equal to about \$9 a share on the common stock. The amount set aside for taxes, \$6,500,000, was unusually large when compared with \$1,750,000 set aside for that purpose last year.

The Eddystone Munitions Company, controlled by the Baldwin Locomotive Works, and which was formed in 1917 to manufacture munitions, last year completed contracts aggregating \$14,636,479. Contracts have been suspended subject to adjustment amounting to \$6,179,620. Owing to the ending of the war the report stated that this company is now undergoing liquidation.

The Standard Steel Works, another subsidiary, had gross sales of \$24,912,467 and net profits of \$934,600. Bills payable of \$2,500,000 were paid off during the year. Government contracts cancelled after the signing of the armistice totalled \$2,500,000. Bills payable of \$8,250,000, which the Baldwin company had outstanding at the end of 1917, the report showed, had been paid off last year.

In reviewing operations, President Alba B. Johnson says:

"When the greatest production had been reached the armistice was signed and \$68,400,000 of contracts were cancelled. The prior contracts received and set aside to give precedence to government orders had been taken when costs were lower than at present. The completion of these delayed contracts will undoubtedly entail a reduction of profits, and in many cases considerable loss. The uncancelled government contracts are now largely completed and there are no immediate prospects of further government orders. The railroads of the United States, whose needs would naturally tend to relieve the present situation, are under control and operation of the United States Railroad Administration, which is pursuing a policy of retrenchment of expenditures.

"So long as this curtailment of domestic business continues the foreign markets must be the chief source of orders. But in view of the political unrest abroad and the time it will take for readjustments to be made so that business can be obtained from foreign sources," Mr. Johnson says, "the board of directors have adopted the conservative policy of strengthening the company's finances, believing that the interests of the stockholders were best served by placing the company in the strongest financial position to meet the uncertainties of the future. For this reason they have continued the policy of omitting the dividends on the common stock"

J. W. Hackett has become associated with the Okonite Company, New York, as sales engineer, effective February 17. Mr. Hackett was connected with the signal department of the New York Central until 1913, when he became sales engineer of the Federal Signal Company, with office at New York, with which company he remained until January 1, 1918. On October 1, 1917, he was commissioned first lieutenant of engineers in the United States army, and ordered into active service on January 5, 1918. After spending three months at the Engineer Reserve Officers' Training Camp at Camp Lee, Petersburg, Va., he was ordered to the office of the chief of engineers at Washington, D. C. He was put in charge of the production, inspection and transportation of sound and flash ranging apparatus.

H. A. Jackson, president of the Chicago Pneumatic Tool Company, Chicago, returned February 19, from England, where he has been inspecting the foreign plants of the corporation. The Consolidated Pneumatic Tool Company, Ltd., and the Pneumatic Tool Company (respectively the selling agency and the manufacturing corporation), subsidiaries of the Chicago Pneumatic Tool Company in England, were found to be in excellent condition. During the war the company has made some profit manufacturing bayonets for the British government while carrying on its regular tool business to capacity. News of the disposition of the International Compressed Air & Electric Company of Berlin, Germany, which the Chicago Pneumatic Tool Company owns, has not yet been received, although Mr. Jackson has been striving for a year to get word of this property.

### Trade Publications

**ELECTRIC INDUSTRIAL TRUCKS.**—Three types of electric industrial trucks designed for different services including a carrying truck, an elevating platform truck and a tractor, manufactured by the Buda Company, Chicago, are described in its bulletins 327, 328 and 329. These give a general description of the construction and specifications for each type as well as illustrations and drawings. Bulletin 326 contains a brief description of the mechanical features common to all three types.

**RUST PREVENTIVES.**—The Dearborn Chemical Company, Chicago, Ill., has issued a booklet entitled The Prevention of Rusting or Corrosion of Iron and Steel, for the purpose of presenting evidence of the success that has followed the use of No-Ox-Id, a rust preventive developed by the Dearborn Chemical Company, as well as to describe other Dearborn products, including Dearboline, a preparation for cleaning machined parts of emery or grease, Klean-Kleen, for use in cleaning metal during various stages of manufacture, and cutting, quenching and drawing oils, etc.

## Railway Officers

### Railroad Administration

#### Regional

**W. G. McEwan**, superintendent of dining cars of the Louisville & Nashville, has been appointed a member of the Inter-Regional Dining Car Committee, representing the Southern region, to succeed **W. C. Francis**, deceased.

#### Federal and General Managers

**J. B. Yohe**, general manager of the Pittsburgh & Lake Erie, the Lake Erie & Eastern, the Monongahela Railroad, the Pittsburgh & West Virginia, and the West Side Belt Railroad, has been appointed federal manager, with office at Pittsburgh, Pa.

**W. E. Williams**, general superintendent of the Missouri, Kansas & Texas, has been promoted to general manager of the Missouri, Kansas & Texas (exclusive of the Trinity branch, the Beaumont & Great Northern and lines west of Whitesboro, Texas), the Union Terminal of Dallas and the Houston & Texas Central, with headquarters at Dallas, to succeed **W. A. Webb**, who has resigned.

#### Operating

**S. T. Grimshaw** has been appointed trainmaster of the Seaboard Air Line, with office at Hamlet, N. C., vice **C. L. Sauls**, transferred.

**W. C. Sloan**, having returned from service overseas resumed his duties as superintendent of the Pasco division of the Northern Pacific, with headquarters at Pasco, Wash., on February 22.

**William K. Hallett**, who has been appointed general superintendent of the Bangor & Aroostook, with headquarters at Bangor, Maine, as has already been announced in these

W. K. Hallett

columns, was born on March 15, 1873, at Fredericton, N. B., and was educated in the grammar schools. He began railway work on November 11, 1893, with the Canada Eastern, now a part of the Canadian National Railways, as station agent. He remained in that position until July of the following year, and then went to the Bangor & Aroostook as a telegraph operator and agent, and has been in the continuous service of that road ever since. In January, 1896, he was appointed despatcher, and chief clerk to superintendent. He then served as assistant superintendent until March, 1905, and was then appointed division superintendent, which position he held until January 1, 1919, when he was promoted to general superintendent of the same road, as above noted.

#### Financial, Legal and Accounting

**T. S. Ford** has been appointed federal auditor, and **C. H. Hueston** has been appointed acting federal treasurer and paymaster of the Des Moines Union, the Iowa Transfer, the Des Moines Western and the Des Moines Terminal, with headquarters at Des Moines, Iowa.

### Traffic

**J. R. Wells** has been appointed assistant general passenger agent of the Southern Railroad, with office at New Orleans, La.

### Engineering and Rolling Stock

**A. L. Morgan** has been appointed chief engineer of the Des Moines Union, the Iowa Transfer, the Des Moines Western and the Des Moines Terminal, with headquarters at Des Moines, Iowa.

**C. L. Bunch**, shop superintendent of the Southern Railroad, at Spencer (N. C.) shop, has been promoted to master mechanic of the Memphis division, with office at Sheffield, Ala., vice **J. W. Gibbs**, resigned.

**George W. Rink**, mechanical engineer of the Central of New Jersey, has been appointed assistant superintendent of motive power, with office at Jersey City, N. J. Mr. Rink

G. W. Rink

was born on September 4, 1875, at New York, and graduated from Cooper Institute, New York City, with the degrees of B. S. and M. E. He began railway work on March 14, 1892, as a machinist apprentice on the Erie Railroad. From March, 1896, to March, 1899, he served as a machinist and shop draftsman, and then to September, 1900, as a draftsman on the Northern Pacific. He then entered the service of the Central of New Jersey, as a draftsman and from 1901 to 1902, was roundhouse foreman and inspector of

new equipment. Later he was engaged in road testing of locomotives and as draftsman, until 1903, when he was promoted to chief draftsman. From April, 1904, to January, 1909, he was instructor of apprentices, and then was appointed mechanical engineer, which position he held until his recent appointment as assistant superintendent of motive power of the same road, as above noted.

**J. E. McQuillen**, mechanical superintendent of the Gulf, Colorado & Santa Fe, the Fort Worth & Rio Grande, the St. Louis-San Francisco & Texas, the Texas Midland, the International & Great Northern (from Spring to Fort Worth and the Madisonville branch), the Fort Worth Belt, the Fort Worth Union Passenger Station, and the Houston Belt and Terminal, has also been appointed mechanical superintendent of the Fort Worth & Denver, the Wichita Valley, the Missouri, Kansas & Texas (west of Whitesboro), the Wichita Falls & Northwestern, the Abilene & Southern and the Quanah, Acme & Pacific, with headquarters at Galveston, Texas.

**William S. Wilson**, who has been appointed division engineer of the Pennsylvania Railroad, with office at Oil City, Pa., as has already been announced in these columns, was born on March 12, 1880, at Philadelphia, Pa., and graduated in June 1899, from the Central Manual Training School, Philadelphia. The following August he began railway work in the construction department of the Pennsylvania Railroad, and in 1900 was transferred to the office of the engineer maintenance of way, at Philadelphia. In November, 1902, he was promoted to assistant supervisor on the Trenton division, and later was transferred to the Pittsburgh division. He subsequently served as supervisor consecutively on the Bellwood division, the Erie division, and the Pittsburgh division until his promotion on February 1, 1919, to division engineer of the Allegheny division, with headquarters at Oil City, Pa., as above noted.

## Corporate Operating

**J. J. Horn** has been appointed superintendent of the Kenora division of the Canadian Pacific, with headquarters at Kenora, Ont., to succeed **J. L. Jamieson**.

**J. L. Jamieson**, superintendent of the Kenora division of the Canadian Pacific, with headquarters at Kenora, Ont., has been appointed superintendent of the Vancouver division of the same road.

## Traffic

**F. A. Mitchell** has resigned as general traffic manager of the Manistee & North Eastern, and that office has been abolished. **D. Riely**, general freight and passenger agent, will handle matters pertaining to traffic, with headquarters at Manistee, Mich.

**A. C. Albertson** has been appointed general agent of the passenger department of the Canadian Pacific, with office at Minneapolis, Minn., succeeding **R. S. Elworthy**, who has been transferred to Chicago, as general agent of the Canadian Pacific Ocean Services, Limited.

**E. F. L. Sturdee**, general agent of the passenger department of the Canadian Pacific, at Boston, Mass., has been transferred to Seattle, Wash., and **L. R. Hart**, general agent at Buffalo, has been transferred to Boston to succeed Mr. Sturdee. **Captain George O. Walton**, formerly city passenger agent at New York, who has been serving in the ordnance department and has been connected with the supply department of the artillery branch, at Washington, has just been relieved of military duty, and has returned to the service of the Canadian Pacific, as general agent at Buffalo, to succeed Mr. Hart, effective March 1.

## Purchasing

**A. E. Cox**, whose appointment as general storekeeper of the Canadian National, Western Lines, with headquarters at Winnipeg, Man., was announced in the *Railway Age* of February 21 (page 476),

A. E. Cox.

was born at Huddersfield, Eng., in 1863, and received his education in private schools at Hamburg, Germany, and college at Huddersfield. Mr. Cox first entered railway service in 1883 as time keeper on the Canadian Pacific Western division, with headquarters at Moose Jaw, Sask., which position he held for four years, when he was appointed chief clerk in the stores department of the Manitoba & Northwestern. In 1893 he was appointed storekeeper when the Manitoba & Northwestern was ab-

sorbed by the Canadian Pacific, and the following two years was assistant to the superintendent of construction of the Ontario and Rainy River section of the Canadian Northern. Since 1912 he has been storekeeper of the same road, until his recent appointment as general storekeeper of the Canadian National.

## Railway Officers in Military Service

**Major B. O. Johnson**, now in the Russian Railway Service Corps, engaged in reorganizing the Trans-Siberian Railway, has been promoted to Lieutenant-Colonel. Lieutenant-Colonel Johnson was superintendent of the Montana division

of the Northern Pacific when he entered military service in October, 1917.

## Obituary

**Pollok H. C. Remone**, personal injury claim agent for the Wabash Railroad, with headquarters in St. Louis, died on February 17, at his home in Hinsdale, Ill., at the age of 44 years.

**John F. Livingston**, president of the Columbia, Newberry & Laurens, died in a hospital at Columbia, S. C., on February 24, at the age of 50.

**Frank Tremble**, superintendent of telegraph of the Texas & Pacific, and associated lines, at Dallas, Texas, died on February 20, from the effects of injuries received in an accident while making an inspection in a motor car on the line near Weatherford, Texas. Mr. Tremble was born in 1865, at Mattoon, Ill.; he had been in railway service since 1881, and since June, 1903, served as superintendent of telegraph until the time of his death.

**Charles B. Compton**, freight traffic manager of the Louisville & Nashville, with office at Louisville, Ky., died at his home in that city on February 24. He was born in 1854, at New Albany, Ind., and was educated in the high schools. He began railway work on August 1, 1871, with the Louisville & Nashville, and previous to January, 1882, was general agent of the same road at Birmingham, Ala. He was then promoted to general freight agent, and since April 1, 1901, served as freight traffic manager of the same road.

**Carl Stradley**, chief engineer of the Oregon Short Line, died on February 11, at Salt Lake City, Utah, of pneumonia. He was born in Indiana, where he received his education, and later moved with his parents to Colorado, and in 1886 began railway service on construction surveys for the Union Pacific. In 1889-90 he was engaged in surveys for the Pacific Short Line, between Lander, Wyo., and Ogden, Utah. In 1890 he was engaged in engineering work for the city of Ogden and later engaged in mining in Colorado, but returned to railroad service, becoming identified with new construction work on the Union Pacific. In 1901 he was engaged in location work for the Oregon Short Line, until appointed chief engineer, April 15, 1911, succeeding William Ashton, who resigned. Mr. Stradley was appointed assistant chief engineer of the Union Pacific System, including the Union Pacific, the St. Joe & Grand Island, and the Oregon Short Line when the government took over the railroads.

# EDITORIAL

Director General Hines, on February 18, at a conference with the vice-president of the United Mine Workers of

### Labor and Railway Purchases

America and a member of the Labor Bureau of the United States Fuel Administration, representing the organized coal miners of the country, made the statement that "The policy of the

Railroad Administration is to avoid any action calculated to depress wages of coal miners or the amount of coal produced." Any possible action that might be taken by the Railroad Administration in the interests of the public could not very greatly affect the wages of the miners or the amount of coal produced, and it is rather strange that the director general should have gone on record in this way, particularly since the policy of the Railroad Administration in curtailing purchases for the railroads has resulted in a greatly decreased production of the railway supply companies, who, of course, employ more men than do the coal mines. This has resulted in throwing thousands of men out of work at a time when every department of the government should do all that it can to keep up production. This was done in the face of the fact that the Railroad Administration is responsible for a large amount of deferred maintenance which must be accounted for when the railroads are returned to their owners. Is it conceivable that the railway supply companies, in appealing to the director general, could have secured better results had they been represented in their requests by representatives of organized labor in their employ?

Scientific study and analysis of railroad operation and its various details have been largely responsible for the remarkable improvements in efficiency and economy in recent years. So great

### A Long Step Backward

have been these improvements that the roads up to the opening of the war were able steadily to improve their

service in spite of greatly increased expenses without a proportionate increase in rates. To make these improvements it has been necessary to prepare accurate records, and, on the basis of these, to improve detail methods and operations by cutting out unnecessary movements or awkward operations and making every move count for the most. In the locomotive and car repair shops, piece work was introduced in order to secure the hearty co-operation of the men by rewarding them in proportion to the greater interest and effort displayed by the individual. Piece work has now been eliminated because the Railroad Administration, in raising the wages, has made the guaranteed day work rate so high, without increasing the piece work prices, that any incentive has been removed on the part of the men for remaining on a piece work basis. This was bad enough, but where the railroad shops, in reorganizing to meet the new conditions, have attempted to make studies of the time used on the different jobs, the government inspectors have interfered and have advised the officers that while they could not order the discontinuance of these studies, the cost, if they were continued, would have to be paid by the railroad corporations. Doubtless, this is a fair example of what might be expected under government ownership of the rail-

roads. If so, it would spell an end to progress since it means that if records are to be done away with and all incentives are to be removed for doing good work, then it is only a matter of time when the magnificent railroad system that has been developed in this country would fade away and become a third-rate institution.

The executive committee of the American Railroad Association adopted the following resolution at a meeting on

### June Convention Exhibits

February 21: "Resolved, That the executive committee, recognizing the educational value of the manufacturers' exhibits, is in favor of the continuance of these exhibits at the conventions of the various sections of the American Railroad Association." The railway supply industry has made a number of important and far-reaching improvements in its products since the last exhibit at the mechanical department conventions at Atlantic City three years ago. Moreover, the railroad situation has changed in respect to the greater need for capacity increasing and labor and time-saving devices. The exhibit this year, therefore, promises to be of even greater educational value than in years past. This fact must be kept clearly in mind by the exhibitors and special efforts should be made to arrange the exhibits in such a way as to show clearly the construction, application and advantages of the various methods and devices. Moreover, special attention should be paid to having thoroughly trained men in charge of these exhibits in order that they may be properly explained to those railroad officers who are seeking practical information, and particularly to the younger men, who are attending the conventions for the first time. The railroad companies should also specially delegate different men whom they send to the conventions to study various classes of the exhibits in order that they may report back and bring to the attention of the higher officers those things that seem to possess the greatest merit and which are specially suited to the peculiar conditions on the roads with which they are connected.

The rearrangement of the lines in the Southwestern region to restore the units of the original systems to the jurisdiction of

### Rearrangement of Lines in the Southwest

one federal manager is a big step preliminary to the ultimate restoration of these properties to their owners. While the breaking up and regrouping of the component parts of the different railway systems was followed out in varying degrees in most of the regions, the most radical rearrangement occurred in the Southwestern region. Its abandonment here follows similar steps in several of the other regions; the Pittsburgh & Lake Erie has been transferred from the Allegheny to the Eastern region, in which is located all the remainder of the New York Central system; the Western lines of the Pennsylvania and the Baltimore & Ohio have been transferred from the supervision of the Eastern to that of the Allegheny region, which controls the parent lines; the Chesapeake & Ohio of Indiana has been transferred from the Eastern to the Pocahontas region and placed under the jurisdiction of the federal man-

ager of the eastern lines of that system, etc. These restorations bring to an end, in large measure, one of the experiments which was heralded as affording large opportunities for operating economies. There has been bitter complaint from the owners of many of the properties affected which have been broken up and merged with their competitors with results from which they will not recover for many years. The railway systems of this country have been developed along the lines of traffic movement, competing for business at its source and endeavoring to transport it as far as possible before turning it over to connecting lines. The radical rearrangement of the roads in the Southwestern region largely ignored the traffic consideration, while the confusion incident to the rearrangement largely neutralized any operating economies which might have been secured. As in other instances, the Railroad Administration is finding that many of the conditions which it criticized at first are the result of natural economic developments, the justification for which becomes more evident with increased knowledge of the properties and experience in their management.

## Who Was Right About Standardization?

JUST ABOUT ONE YEAR AGO Mr. McAdoo announced his intention of standardizing the equipment of American railroads. In an interview the director general stated that this was one of the greatest reforms that could be accomplished in the railroad business. The committee on locomotives and cars appointed by the Council of National Defense was delegated to recommend standards, which were then referred to a committee of railroad mechanical officers.

Mr. McAdoo stated that the principal reasons for adopting standardized locomotives were, first, to reduce to a minimum the time required to prepare drawings, patterns and dies, and thus expedite deliveries; second, to secure the increased production resulting from quantity methods of manufacture; and, third, to provide a supply of equipment which would be available for use in the event of congestion without the trouble which results when repair parts must be ordered from some distant owning road. The advocates of standardization claimed that it would result in a tremendous increase in production and made extravagant promises regarding the advantages which would accrue.

The standardization project was opposed by the great majority of railroad men, and the *Railway Age* published numerous articles setting forth the disadvantages that would result. Our opposition was based largely on the ground that any increased production that could be secured by standardization would come too late to be of any benefit during the war. We also pointed out that efficiency of operation would be sacrificed if standard equipment was introduced, as the motive power could not be adapted to the grades, clearances, weight of rail and character of fuel found on the individual lines; that standardized locomotives would require the making of new drawings, patterns and dies on every road on which they were introduced; and that the necessity for a liquid reserve of power could have been met by building a comparatively small number of locomotives of some type already in existence, which the builders were prepared to turn out without delay.

In spite of the opposition, not only from the *Railway Age* but also from other sources, the director general persisted in his plan for standardizing motive power. The first orders for cars were placed on April 25 and for locomotives on April 30, quantity deliveries being promised in July. From time to time the Railroad Administration issued optimistic reports concerning the progress of the standard equipment. The first car, it was announced, was completed

on June 20, and the first locomotive on July 4, but up to February 1, 1919, almost a year after the standardization program was announced, out of 2,030 locomotives ordered by the Railroad Administration only 880 had been delivered, and of the 100,000 cars ordered for delivery last year, and which we were assured would be ready for handling the heavy business of last fall, only 19,037 had been delivered. This could hardly be called "quantity production."

The volume of traffic during the past two months has not been large enough to tax the facilities of the railroads. Weather conditions have been unusually favorable and there is now a surplus of locomotives and cars. These conditions exist not because of, but rather in spite of, the director general's policy. It is interesting to speculate what would have happened if the war had not ceased, if traffic had continued to increase, and if the weather this winter had been as severe as it was last winter. Locomotive standardization has escaped the test. Under more severe conditions it would have proved one of the worst blunders that America made in the conduct of the war.

The policy of standardizing equipment was adopted because a superficial examination by persons unfamiliar with practical railway matters led to the conclusion that it had great advantages, while the great disadvantages were not so apparent. The outcome has vindicated, and more than vindicated, the stand taken by the *Railway Age*, that if an attempt to standardize equipment were made, the result would be not "quantity production," but a postponement and decline of production. We emphasize this point now because this paper was severely criticised in some quarters last year for opposing standardization. As it has slowed down, instead of speeding up, the production of equipment, so in the long run it would increase rather than reduce operating expenses; and the sooner the program entered upon by Mr. McAdoo is completely abandoned the better it will be for the railways and the country. It is easy to conceive of a program of reasonable standardization which might result in good; but his program of wholesale over-standardization was adapted to do much more harm than good.

## Justice for Officers of Lower Ranks

ATTENTION WAS DIRECTED REPEATEDLY in these columns during the latter part of last year to the injustice done to the supervisory forces on the railroads and the serious menace to effective management resulting from the failure to advance the salaries of railway officers in proportion to the advances accorded the men in the ranks. The situation resulting was particularly unfortunate with respect to the technically trained men, not only those classed as officers but also those in minor positions. Comprising a rather small class of employees, their plight was seemingly overlooked by the wage board in dealing with the demands of the large bodies of railway men. While certain classes of lower officers, such as roadmasters, received a measure of recognition early last fall, the technical men in most classes, from rodmen and draftsmen to division engineers and higher, were not specifically mentioned in any of the supplementary wage orders. On some of the eastern roads liberal interpretations of Supplements 7 and 8 afforded moderate advances to most of these men, but in the West this position was not so generally taken and as a result the men suffered keen disappointment and humiliation. Fortunately this situation is now rapidly being overcome. Commencing about the first of the present year the railways have been granting advances in salaries to the supervisory forces and technical men, and while this action is by no means complete on all of the roads, there is promise that all these men will soon be granted just compensation. One

of the causes for the long delay in making these salary advances has been the complexity of the problem involved. Owing to the variations in the degree of responsibility and the duties imposed on positions carrying the same titles on different roads it was impossible to provide for these various classes of men by a blanket order covering the entire country or even an entire region. The only equitable solution was to deal with the matter by individual roads, a method naturally causing considerable delay.

## Early Extra Session Vitally Needed to Pass Railroad Legislation

THE FAILURE OF CONGRESS to pass the bill to create a new revolving fund of \$750,000,000 for the Railroad Administration is adapted to cause disastrous consequences. It leaves the Railroad Administration almost without money and without any source from which to get it. It cannot get it from railway earnings because the railways are not earning enough net operating income to pay the guaranteed standard return to the companies. The Railroad Administration may be forced to make the most drastic economies in maintenance, regardless of future consequences. This would at once, directly and indirectly, throw hundreds of thousands of men out of employment at a time when government bodies and officials are urging private industries to give all the employment they can. In spite of any retrenchments it may effect, the Railroad Administration will continue to be unable to provide the railways with sufficient funds with which to pay their bills to the railway supply companies. It may become unable to pay the railway companies enough of their standard returns to meet their interest and normal dividends.

There is but one remedy for the condition the non-action of Congress has created. This is for President Wilson to call the new Congress in extra session immediately. It has been reported that Congress will not be reconvened until June. Conditions affecting the transportation and related industries are such that to postpone providing a new revolving fund until June or later might be disastrous, not only to these industries, but to the industries and workers of the country as a whole. Congress is responsible for the failure to create a new revolving fund at this session. President Wilson will be responsible if an extra session is not promptly convened at which the needed legislation can be enacted.

An extra session is needed at once, not only to provide the Railroad Administration with funds it is essential it should have for the welfare of the country, but also to enable Congress to proceed immediately with the framing of legislation under which the railways can be returned to private operation.

The *Railway Age* is not a political paper. It is no part of its function to attempt to say whether the Republicans or the Democrats in Congress should be blamed for the failure of the railroad appropriation bill to pass and for the consequences to which this may lead. But it is our function as a journal devoted to transportation to call attention to the fact that this incident affords one of the most powerful of the many strong arguments the government has forged

within the last fifteen months against government ownership and operation.

It always has been argued against government ownership and operation that, under it, the management of the railroads would become a football of politics, to the great material detriment of industry and the people, and with the effect of corrupting politics itself. The failure of Congress to pass this railroad appropriation bill, whose enactment was recognized on all hands as necessary for the welfare of the country, is the best evidence yet afforded of the soundness of the political argument against government ownership. It is a peculiarly fine sample of the kind of thing which would occur over and over again under permanent government ownership and operation. The welfare of the nation, and especially of its laboring people, has been utterly disregarded, while members of Congress have engaged in a struggle which has been carried on largely from political motives.

If the record made by the government in handling the railways during the last fifteen months, including the failure to pass this vitally needed piece of legislation, is not sufficient to convince the American people that permanent ownership and operation is wholly undesirable, we cannot conceive what kind of evidence could be required to convince them.

## Wherein Government

### Operation Has "Failed"

IT IS BEING CHARGED that those who are criticising the results of government operation are trying to take unfair advantage of effects produced by abnormal conditions to discredit the entire cause of government ownership and operation. It is even alleged that such criticism reflects unfairly on the patriotism and work, not only of former Director General McAdoo, but of the railway officers who accepted places in his organization as directors of divisions, regional directors, federal managers, and so on.

The point needs to be emphasized that systems and not men are being discussed. Everyone knows that under one kind of system a certain personnel will get one kind of results in any line of human effort, and that under another kind of system, the same personnel will get a different kind of results. There have been wide differences of opinion and much discussion regarding the relative advantages of the system of private operation of railways and the system of government operation of railways. On January 1, 1918, the United States changed from the former to the latter.

Director General McAdoo showed his confidence in the ability and patriotism of the higher officers of the railways who had been trained under private operation by giving to them most of the important places in his organization. Therefore, while there were radical changes in the positions these men held, the official personnel of the railways under the new system was much the same as under the old. That the men who consented to serve under Mr. McAdoo supported him with energy and ability has been recognized by Mr. McAdoo himself in the most generous and unreserved language. Furthermore, nobody familiar with the facts questions the ability, energy and patriotism with which Mr. McAdoo did his work. The *Railway Age* has said before, and repeats now, that if government operation was to be adopted, it was desirable that a public man should be put in charge; that Mr. McAdoo probably was the best man in the

present national administration for director general; and that he probably worked the particular system he adopted as well as any other man in the country could have.

The system which Mr. McAdoo adopted was fundamentally and in detail different from that which preceded it. It was the very system which advocates of government ownership had contended would enable the government to get better results than could be obtained under private operation. They had advocated consolidation, unification, and standardization of the railways. Mr. McAdoo adopted consolidation, unification and standardization as the fundamental principles of his policy.

Can it be said truly that under the system Mr. McAdoo adopted the operation of the railways has been a "failure"? That depends on what is meant by "failure." Government control was specifically declared by President Wilson in his Railroad Control message, and by the Railroad Control Law, to have been adopted solely as a war measure. Regarding it solely as a war measure, it accomplished its purposes. One of its principal purposes was to save the railway companies from bankruptcy and thereby prevent a collapse of the financial structure of the country. It did this. Another of its principal purposes was to enable the railways to handle the traffic which it was essential should be handled during the war. This was done and done well. Another object of government control was to enable the government to so deal with the labor situation on the railways as to prevent strikes during the war. This was done. These things could and would have been done, and probably better done, under private operation, if the government had done the things necessary to make this possible; but the fact is that the purposes mentioned were accomplished under government operation.

How, then, can it be said that government operation has been a failure? It is true operating expenses have increased greatly, but they would have increased, although probably not so much, under private operation. It is true freight and passenger rates have been increased, but they would have had to be increased under private operation. It is true railway service deteriorated, but it would have deteriorated under private operation. The necessities of war were paramount. Those necessities could not be met without increasing expenses, advancing rates and making radical changes in freight and passenger service.

Wherein, then, has government operation been a failure? It has been a complete failure in that it has utterly failed to justify the criticisms which for years have been heaped upon private operation of railways in this country or the claims which for years have been made regarding the great improvements which could and would be effected under government operation. These unjust criticisms of private operation and extravagant claims regarding government operation continued to be made, not merely up to the time when government operation was adopted, but after it was adopted. They are still being made.

The critics of private operation repeatedly have said that "the railways under private ownership had broken down." Judge Prouty, director of accounting of the Railroad Administration, made this assertion in a public address as recently as January 17, 1919. It was claimed that under government operation the railways would be able to handle a vastly increased traffic. The outcome failed to support this claim. Under government operation, with all the important law-made advantages the government had over the companies, the railways handled only two per cent more freight than in 1917, and nine per cent more passengers. It was claimed that under government operation the facilities of the railways would be largely increased. The results failed to support this claim.

The traffic handled under government operation in the year 1918 was moved almost entirely with facilities the railways had provided under private operation. It was charged by

critics of private operation that it was inefficient and extravagant, and claimed that under government operation vast economies could and would be effected. Director General McAdoo made this claim after he took office. On the contrary, the expenses of the Class 1 roads increased \$1,150,000,000 in 1918, of which about one-half was due to advances in wages and one-half to other causes. It was claimed that under government operation much better service could and would be rendered than had been rendered under private operation. This was not done.

Why have the predictions which the advocates of government ownership made regarding the outcome of government operation been completely discredited by the event? Is it because the conditions under which government operation has been conducted have been abnormal? Government operation was adopted solely because the conditions under which the railways had been operated for months had been abnormal, and would continue to be abnormal; and these extravagant predictions continued to be made in face of that fact. The real reason why the results predicted have not been produced is that it was humanly impossible to produce them, under any system of operation, private or government. The advocates of government operation grossly underestimated the efficiency of private operation. They grossly overestimated the efficiency that could be attained under government operation. This is the main reason for the very wide disparity between their claims and predictions and the actual outcome.

But the defenders and advocates of government operation are not discouraged. They continue to descant upon the enormous savings which could be made under government ownership. Judge Prouty recently made the astounding estimate that the government could raise the capital required to buy the railways at 4 per cent; that the railway companies would have to pay an average of 9 per cent, the difference being 5 per cent; and that, therefore, the saving in the cost of capital under government as compared with private ownership, would be from 750 million to one billion dollars annually!

This particular saving might possibly be one-fifth as great as Judge Prouty estimates it, and that it would be far more than offset by increases in operating expenses all experience indicates. Which recalls that a little over a year ago a man named Brookhart from Iowa estimated before a Congressional committee that the saving in operating expenses under government operation would be over \$400,000,000 a year. His estimate and the actual outcome of the first year of government operation differed by one and one-half billions of dollars; while Mr. McAdoo missed his guess on the same point by about \$800,000,000. In spite of the enormous increase in operating expenses which has occurred, the advocates of government ownership still have the hardihood to try to tell us how much more economical permanent government operation would be than permanent private operation.

As long as the defenders and advocates of government operation persist in making such extravagant claims, it will continue to be necessary, however invidious, to recall their past claims and predictions, and the tremendous discrepancy between these claims and predictions and the actual record of government operation. This must be done in order to enable the public to form a rational opinion as to how much weight it should give to their present and future claims and predictions.

Government control did not fail as a war measure. It accomplished the purposes for which it was adopted. On the other hand, government operation has utterly failed to justify a single one of the claims which have been made regarding the economic results it would produce, and it will continue to fail to justify them in future. And it is as an economic measure, and not as a war measure, that its continuance is being advocated.

# Railroad Appropriation Defeated by Filibuster

Government's Financial Program Seriously Embarrassed—Relinquishment Not Under Consideration

WASHINGTON, D. C.

**C**AUGHT BETWEEN the upper and nether millstones of a political contest between the President and the Republican senators, the bill to appropriate an addition of \$750,000,000 to the revolving fund of the Railroad Administration failed of passage at the final session of the Sixty-fifth Congress, which adjourned at noon on March 4. As a result the Railroad Administration is confronted with a situation very similar to that found by Old Mother Hubbard when she went to the cupboard. Along with many other important appropriation bills and other measures the bill needed by the Railroad Administration to enable it to pay the railroad companies their guaranteed rental for 1918, to pay for the cars and locomotives it had ordered and to assist the railroads in financing their improvement program for this year, was sacrificed to a filibuster conducted by a number of Republican senators who resented being asked to vote for important administration bills with little opportunity for consideration in the last few days of the session and who were endeavoring to force the President to call the new Republican Congress in extra session at an early date. No opposition was manifested to the appropriation itself, which had passed the House almost unanimously and which it was generally assumed would be allowed to pass in the Senate, but almost every time-killing expedient known to parliamentary practice was brought into play to prevent its consideration. It has been suggested that the Railroad Administration and the Democratic leaders may have overplayed their hand by their insistence that the passage of the bill was absolutely necessary to avoid a panic, because the purpose of the Republicans was to create a situation which would make an early extra session imperative.

The railroad appropriation was favorably reported by the Senate committee on appropriations as a rider to the general deficiency bill and after an all-night session of the Senate Saturday night the bill was made the unfinished business for Monday. Speeches on the league of nations and the consideration of minor matters which were allowed to intervene took up most of the Monday session and the bill was not even reached until early Tuesday morning. About 3 a. m. Director General Hines was called to the Capitol to use his influence to help the bill but by that time only the President could save it and he preferred to attempt to place the responsibility on the men who had caused the filibuster rather than allow Congress to stay on the job while he is in Europe.

The President left Washington and sailed for France insisting he was taking the proper course in refusing to call Congress in special session during his absence from the country. He declared that "a group of men have deliberately chosen to embarrass the administration of the government," and "to imperil the financial interests of the railway system of the country."

Director General Hines saw the President before his departure and later conferred with the Secretary of the Treasury and the managing director of the War Finance Corporation. On Wednesday he gave out a statement indicating that the question of relinquishment is not being considered but that an effort will be made to tide over the situation by private financing and the co-operation of the Treasury Department and the War Finance Corporation. The latter has available some \$300,000,000, some of which it is believed might be loaned to railroad companies on their own application and some of which might be loaned to equipment companies. If some of the railroads can in this way or from the banks raise

money to repay to the Railroad Administration advances made for capital expenditures the administration would be able to pay a larger proportion of the rentals. It is evident, however, that the Railroad Administration will not be in a position to order any equipment or to make any capital expenditures except such as can be financed by the companies and the latter in proposing improvement work for this year are to be asked to state whether they can finance it. It is not the policy of the Railroad Administration to cut off any improvement work now under way if it can be avoided by private financing but it had been hoped to avoid the necessity for private financing during the time the government itself will be trying to sell its own securities.

## Director General Hines' Statement

"The adjournment of Congress without the passage of the railroad appropriation leaves the United States Railroad Administration confronted with the necessity for the adoption of radically different methods of dealing with its financial problems, than it had contemplated when the adoption of the appropriation was expected," Mr. Hines said.

"The Railroad Administration had felt justified in counting upon the passage of this appropriation. This is true because the money asked for was necessary to meet government obligations duly incurred and because also it promised to improve and stabilize the general industrial situation through enabling the Railroad Administration to go forward confidently in carrying out its policy as to improvements and also as to maintenance. Confidence in obtaining the appropriation was confirmed by the fact that the House Appropriations Committee after extensive hearings reported the appropriation favorably without any dissent, the House passed it by a vote of 272 to 15, and the Senate Appropriations Committee, after hearing, likewise reported it favorably without any dissent. The recognized urgency of the matter brought the appropriation before the Senate for debate, but the debate was not concluded before the session adjourned.

"This unexpected result puts upon the director general the necessity for devising radically different methods of dealing with the extremely difficult situation. I approach the matter in the spirit and with the purpose of finding ways to meet the requirements and to avert financial embarrassments and industrial depression. It would be improper, however, to minimize the difficulties of the situation; but I believe that the very difficulties themselves will result in obtaining patriotic co-operation of all the business interests involved including the railroad corporations and equipment companies and other producers of material and the bankers. At the moment, there is no occasion to discuss the question of relinquishment of the railroads. My first purpose is to try to solve the problem in other ways.

"I am not prepared at the moment to outline specific plans because numerous methods must be devised for dealing with different phases of the subject and each will require its separate study and perhaps a separate plan of co-operation. But I believe that on the part of all responsible interests affected there will be prompt response to my own definite purpose of finding a way to meet the difficulty, and I do not believe anyone should give way to alarm on account of the condition which has been so unexpectedly produced.

"The Treasury Department and the War Finance Corporation are co-operating in the matter with the utmost cordiality.

"In connection with the consideration of this question there

has been no discussion of raising rates, either passenger or freight, because the money derived from rates goes into operating revenues which primarily are not affected by the present situation.

"Generally speaking it will be my object to solve the problem facing the Railroad Administration through financial means, rather than through interfering with work involving the employment of labor. I consider it important that there be no industrial disturbances.

"In connection with necessary financing which will have to be done by the railroad corporations it is the rule that no such corporate financing be undertaken except on certificate of the Railroad Administration, and therefore the Railroad Administration in a sense acts as a clearing house for such financing, thus minimizing the danger of financial confusion."

The failure of the appropriation will not only embarrass the government in its prospective Victory loan campaign but also creates a serious situation for the Railroad Administration, which has exhausted its original revolving fund, and owes several hundred millions more, for the railroad companies that have not received their rental for 1918, and for the car and locomotive builders and the supply companies that are looking for payment for the cars and locomotives as they are delivered.

According to the estimates of the Railroad Administration, the \$750,000,000 was required to pay the \$381,806,904 which the government owed the railroads for 1918, and to provide \$368,193,096 to meet capital requirements for 1919, including \$12,840,000 for inland waterways, \$20,000,000 for the Boston & Maine reorganization, \$286,000,000 for equipment ordered in 1918 and \$49,353,096 for financing other necessary capital expenditures in addition to the amount which could be financed by the railroad companies. Mr. Hines has stated that the entire amount for equipment will be due by the end of May and ought to be paid at the rate of about \$50,000,000 per month whereas on account of the shortage in cash only about \$25,000,000 was paid in January. The money for the Boston & Maine was expected to be required almost at once, that for the inland waterways will be due about May 1 and money for improvements to the railroads is needed throughout the year. Before the appropriations committee of the Senate he said that \$700,000,000 of the amount would be needed by June 1.

A statement of the accounts between the director general and the railroad companies as of December 31, 1918, which shows how the item of \$381,000,000 is made up, was published in the *Railway Age* of February 21, page 434.

### Other Bills

Senator Cummins' bill to restore the Interstate Commerce Commission its former authority over rates by authorizing it to suspend rates initiated by the director general was also lost in the shuffle. The Senate Committee had reported the bill favorably and Senator Cummins made a strong effort to have it considered on the floor as an amendment to the appropriation bill. Senator Cummins received some support, particularly from Senator Pomerene and Senator Trammell, but was unable to get a vote on his amendment.

Appropriations for the next fiscal year for the expenses of the Interstate Commerce Commission, including its valuation bureau, and for the continuation of work on the Alaskan railway, were included in the sundry civil bill, which was passed by the House but was also held up by the filibuster in the Senate. The appropriation for the valuation was \$2,500,000, which is \$1,000,000 less than has been appropriated for this work in recent years. The reduction was made by the commission in asking for the appropriation. The appropriation for the Alaska railway was \$4,002,380, representing the balance of the \$35,000,000 originally appropriated for the construction of the road. A deficiency appropri-

ation of \$9,800,000 which the Interior Department asked as being necessary to complete the road because of the greatly increased costs was not approved by the appropriation committee of the House.

A resolution to extend until July 1, 1920, the effective date of Section 10 of the Clayton law, which had been passed by the Senate for the benefit of the short lines, failed of passage in the House after it had been favorably reported by the judiciary committee.

### No Sudden Relinquishment

A continuation of federal operation of the railroads for at least the remainder of this year and possibly for a longer period was thought to be assured by an announcement issued by Director General Hines on February 28, after a conference with the President, which indicated that the President had decided to give the new Republican Congress a chance to try its hand at working out a permanent legislative plan for the future regulation of the railroads before relinquishing his present control. Mr. Hines addressed the following letter to Chairmen Smith and Martin of the Senate committees on interstate commerce and appropriations and to Representatives Sims and Sherley, chairmen of the House committees on interstate and foreign commerce and appropriations:

"As you are aware, there has been some inquiry as to whether there might be an immediate or precipitate return of the railroads to private management. The Railroad Administration has indicated whenever this inquiry has been made that it would not recommend that any such step be taken.

"For your further information, I am glad to say that I have now discussed the matter with the President, and he has authorized me to state that not only will there be no sudden relinquishment of the railroads, but further, that it is not his purpose to relinquish the railroads until there has been an opportunity to see whether a constructive permanent program of legislation is likely to be considered promptly and adopted within a reasonable time."

Some of the Senators who conferred with the President after the failure of the appropriation bill urged him to take this opportunity to return the roads to their owners and wash his hands of the whole affair, but he gave no indication of assent to the proposal, and Mr. Hines' later statement indicated that such a plan is not yet being considered.

The letter was sent to the chairmen of the Congressional committees because a strong effort had been made in the House and a similar effort was to be made in the Senate to amend the bill appropriating the \$750,000,000 addition to the revolving fund by a provision taking away the President's authority to relinquish the roads before the expiration of the 21 months' period without the consent of Congress.

As the new Congress does not meet until December, unless called in extra session before that time, and as the President has stated he will not under any circumstances call a session until after his second return from Europe, probably not before June or July, there is little likelihood of any permanent legislation much before the first of the year and a much longer time might be required. How long would be required to convince the President of the likelihood of a program being adopted and what he would consider a reasonable time were left for surmise.

It is assumed that the new Congress would at once take up the study of the railroad question as soon as it is assembled, and the extensive testimony already taken by the Senate Committee on Interstate Commerce would represent that much progress made, although the House committee did not get around to the subject at the session.

A bill prepared by the attorneys of the National Owners of Railroad Securities, embodying the features of the Warfield plan for the return and regulation of the railroads, as submitted recently before the Senate Committee on Interstate

Commerce, was introduced in the Senate at four o'clock in the morning of March 4 by Senator Underwood. The Senator stated that in consequence of the great importance of the subject, this bill was introduced that it might be printed and given wide circulation among the members of Congress and the public. He also requested that the bill appear in the Congressional Record, which was agreed to by the Senate. Senator Watson also introduced a bill to provide for the regulation of the railways after their relinquishment and to enlarge the powers of the Interstate Commerce Commission.

#### Final Report of Joint Committee on Interstate Commerce

Shortly before the adjournment of Congress, Chairman E. D. Smith presented the final report of the Joint Committee on Interstate Commerce, generally known as the Newlands Committee, as follows:

"The joint subcommittee, created by public resolution No. 25 of the Sixty-fourth Congress, made its report to Congress on January 9, 1917, and recommended therein that the time for making a complete report be extended to the first Monday in December following. Congress approved the recommendation, and in public resolution No. 44, Sixty-fourth Congress, approved January 15, 1917, so provided.

"It was the purpose of the joint subcommittee to enter upon this investigation actively upon the adjournment of Congress on March 4 of that year. However, war with Germany was declared in April of the same year, and conditions became so abnormal that no investigation conducted would elicit information affording a safe basis for a comprehensive revision of existing laws and methods of railroad operation believed to be susceptible of material improvement under normal conditions. Recognizing the difficulties and importance of the task, Congress, in an act approved October 6, 1917, extended the time for the making of this report until the first Monday in December, 1918.

"Notwithstanding the work incident to the war, your committee has taken a large amount of testimony and devoted much time to the study of the questions covered by the resolution. Since the creation of the joint subcommittee the Government has taken over the railroads and operated them as a war necessity.

"In view of the fact that the appropriate committees of the Senate and of the House of Representatives, respectively, have the whole subject under consideration—the Interstate Commerce Committee of the Senate having just concluded, for the time being at least, exhaustive hearings—it is deemed inadvisable that the said joint subcommittee resume its activities, and it is so recommended."

## Railroad Administration Faces New Situation\*

Will Be Approached in Spirit of Trying to Secure Co-operation  
in Providing the Necessary Finances

By Director General Walker D. Hines

THE PROBLEMS that you have come here to discuss are, of course, exceedingly close to the Railroad Administration. The Railroad Administration not only has the same motive to promote general industrial prosperity that every other agency of the government has, and it not only has that motive accentuated by the tremendous scale on which it has to conduct this important industrial business, but it has a further distinct motive and perhaps a motive peculiar to itself, that if it can encourage general business prosperity through the management of its own industrial activities it thereby improves its own situation by stimulating the general business and consequently increasing its general revenues. So, from every standpoint I approach this matter with the liveliest interest and sympathy and with the desire to do everything that is practicable to promote the important objects which you have assembled to consider.

In studying this matter we felt that we had a promising program which would go far toward meeting the important necessities of the present situation. We contemplated that we would go ahead and could go ahead without any difficulty, keep up our maintenance of the railroads and their equipment to the standard which the railroad companies themselves had established during the three years ending June 30, 1917, which are generally spoken of now as the three-year test period, that we would also be able to go ahead on a substantial though conservative scheme of improvements and that through ability which we anticipated we would have to pay the amounts due the railroad companies, equipment companies and other creditors we would establish a general credit situation which would enable the railroad companies to borrow substantial amounts of money

for the purpose of engaging upon a larger improvement program than the conservative program we had fixed upon. So, from every standpoint we felt encouraged to believe that we could see our way clear at the outset to be a very important factor in this development. When I accepted the invitation which was extended to me to speak to you this afternoon, I hoped to be able to tell you the way was clear to do that without any difficulties whatever. But our program as originally planned rested upon our anticipation that we would get the appropriation of \$750,000,000 for which we had applied to Congress.

Therefore, yesterday at noon we were confronted with the problem of endeavoring to remake our program in the face of radically different conditions from those we had anticipated, and I come before you today to tell you in a very few words what I now see is the outlook for the Railroad Administration in dealing with these important problems.

I approach the matter in the spirit that it is my clear duty from every standpoint to try, notwithstanding the failure of this appropriation, to find a way to accomplish the things which you gentlemen want to accomplish. It might be exceedingly easy, under the circumstances, to approach it in the spirit of trying not to find a way, but it is in exactly the opposite spirit that I come before you, and my belief is that, in view of the very difficulties of the situation which has so suddenly confronted us and the business interests of the country, there will be an impulse toward a patriotic co-operation to contrive ways and means to carry forward the reasonable program of the Railroad Administration despite the failure of the appropriation. I have this further guiding principle in dealing with the matter: There would be two general ways in which we might attempt to adapt ourselves to this new situation so suddenly created. One way would

\*Address before the Governors' and Mayors' Conference, Interior Department Building, Washington, D. C., March 5, 1919.

be to cut down expenditures as rapidly as possible in every direction, even though these expenditures were highly desirable. The other way would be to try to resort to every possible expedient to prevail on the railroad companies and the other business interests affected to borrow the necessary money to enable us to go forward with these expenditures, and I am emphatically in favor of the plan which contemplates financing these matters so we can go forward with the expenditures rather than of the plan of cutting off the expenditures so we can avoid the financing. From every standpoint it seems to me this is the proper and expedient course to pursue, and in addition to the other reasons which actuate me in approaching the matter in this spirit is the reason which is a controlling consideration with me that I am absolutely out of sympathy with any policy which contemplates the slowing down of industries for the purpose of throwing men out of the employment with the idea in mind that thereby the rates of wages may be cut down for the future.

Approaching the matter along these lines it is going to be my policy and with the most cordial co-operation of the Secretary of the Treasury and of the War Finance Corporation to try to find every way we can to reimburse the Treasury and the Railroad Administration through getting the corporations to borrow the money to pay back advances which have been made and which it will be necessary to make to carry out our program. It would be unwise to create the impression that is going to be an easy task. It is going to be very difficult, but we are approaching it with the determination that we will make it succeed in a very large extent, and that we will get a large measure of patriotic co-operation from all the interests which are affected.

That states the situation as to the general policy with which I am undertaking to face the new problem. The specific proposition which you gentlemen have had much in mind, and which I, too, have already been considering with care, is the question as to what ought to be done by the Railroad Administration with reference to the rates on road-building materials. There has been the feeling which has been conveyed to me from various quarters entitled to the most careful consideration that the advances which were made in rates effective last June to meet the conditions of increased cost growing out of the war had borne too heavily on road-building materials, and that, in order to encourage a program of resumption of road-building, which everybody now appreciates is the thing to be done in the public interest, there ought to be a substantial reduction in those rates. The matter is having the most careful and expeditious consideration in the Railroad Administration, and I am approaching it in the most sympathetic spirit to do everything that is reasonably practicable to meet the expectations in that regard and to accomplish thereby a reasonable encouragement so far as it is possible in view of the very great limitations that rest upon us to bring about the encouragement of the resumption of road-building. I hope very shortly, perhaps in the next week or ten days, to get a final report on that matter upon the basis of which I can take definite action, and while it is impossible to forecast at the moment the action that I can take, I do want to assure you that I am fully alive to the importance of the object which you gentlemen seek to accomplish, and of the fact that not only do we want to help in general, but we have a distinct selfish interest in encouraging the resumption of this industry at the earliest possible moment.

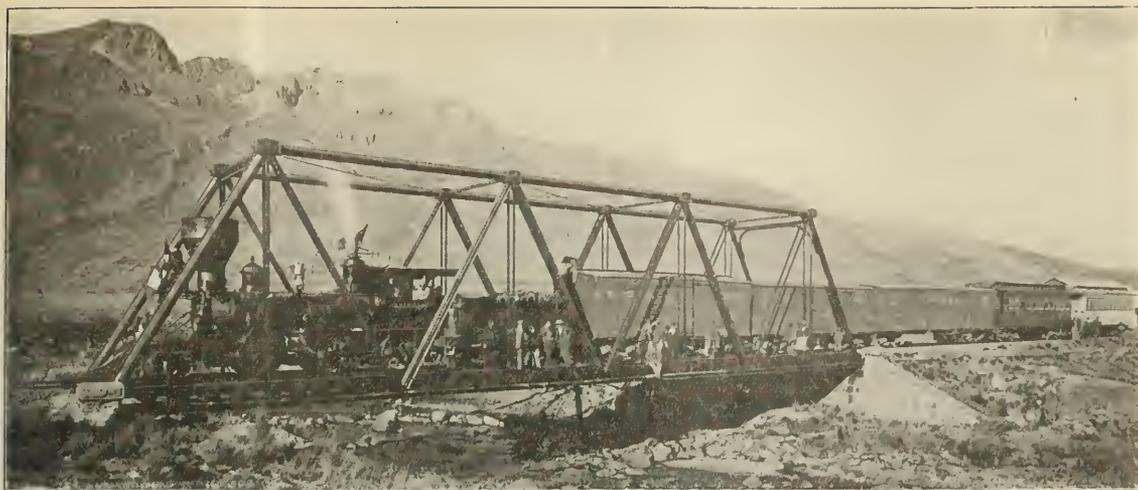

The only other matter that I wanted to mention to you is one which perhaps does not primarily concern the object of this meeting, but I am selfishly taking advantage of this opportunity to mention it to you; and that is, to tell you my general feelings as to what my job is. I welcome an opportunity like this to speak to representatives who have

come here from all parts of the country and try to make clear to you that an important factor in undertaking to administer this tremendous task which rests upon me is not to try to bring about one solution of the railroad question rather than another, not to impose my own notions upon the public in any respect in that regard, but to confine myself to the job of rendering the best possible and most adequate possible public service. I am as fully appreciative as any one in this audience of the fact that during the war the railroad service of the country in many respects was cut down to a basis where a citizen did not get the same amount of service and consideration which he got before the war. I would like to impress upon you the thought that that was not due to this temporary federal control of the railroads, but due to the war, and that now that the war is over my own idea is during the remaining period of federal control to do everything in my power to bring back the railroad service of the country to the more favorable conditions that existed prior to the war, and, where the opportunity appears to arise, to make the service even better than that. I do not say this in any idle spirit of promising. I know the difficulties in the way, and I want to ask you ladies and gentlemen to realize the spirit in which I am approaching this difficult task and to give me the benefit of your sympathetic support in enabling me to do what I am trying to do in that regard.

Not long ago I had a very satisfying conference with the representatives of the state railroad commissions, who came here and discussed this whole problem with me, and as the result of the discussion, continuing over two days, I got the distinct impression that those highly important public agencies were going as a general thing to aid me in improving this public service by inspecting how the public service is being rendered in their respective states, and giving me the benefit of their suggestions from time to time as to what ought to be done in order to get back to the more favorable conditions prior to the war and in order to improve those conditions where the opportunity presented. I want as far as I can to carry that message throughout the United States of a desire on my part and on the part of my associates in this tremendously important short period of government control to give the public the very best service possible and of my earnest desire to get the benefit of the greatest possible measure of public support in making that policy a success.

When you find things in the railroad service which are not comfortable, which are inconvenient, which fall short of what you think the service ought to be, I hope you will not form in your own mind the impression that that is what the Railroad Administration is trying to do. I want you to realize that that is what the Railroad Administration is trying to avoid, and it is looking for all the help and all the suggestions it can get, and I do earnestly ask you to do what you can to help, through making suggestions to me, to my associates in Washington, or to the federal managers or regional directors, bearing in mind that they all are direct representatives of the government of the United States, and that the watchword of the Railroad Administration is to render an adequate and convenient public service.

The Missouri House of Representatives has adopted a resolution petitioning Congress to return railroad, telegraph and telephone lines and cables to their owners as soon as possible. The resolution also states that private ownership should be safeguarded by federal regulation of service, capitalization, income and disbursements. The Denver Commercial Traffic Club on February 19 directed its officers to prepare a memorandum to be submitted to Congressmen from Colorado stating the view of the club that the railroads should be returned to their owners at the earliest possible date.

## Peru's Railways Need Many Connecting Links

Unrelated Short Lines of Different Gages and Inadequate Mileage Characterize Country's Transportation

PERU DOES NOT POSSESS, strictly speaking, a railway system, but rather only a number of unrelated short railways which follow inland along the river valleys and which lack a connecting longitudinal system. The mountainous character of the country, the fact that it is not well knit politically, and its poor financial condition have all helped to retard a comprehensive scheme of transportation development. Peru needs railways and it seems a logical

### Geography

Peru consists of three distinct sections each of which extends from the extreme northern part of the country to the extreme southern. The first of these sections is the narrow, western coastal belt, arid except for its numerous river valleys. These river valleys are the avenues by means of which civilization is slowly pushing inland; a very large per cent of the white population live in them; the country's chief ports are located at their mouths; they produce the country's foodstuffs, in short, they are the centers of the industrial and commercial life of Peru. The second distinct section is composed of the two and some times three ranges of the Andes which reach some of their most forbidding heights in Peru. In the high Andean plateau between these mountain ranges lies hidden the mineral wealth of the country. The third section consists of the eastern slope of the Andes or the montana as it is called, a wild jungle still unexplored except along the upper Amazon and its tributaries. The principal product of this montana region is rubber which is taken down the Amazon and exported through Brazil.

The impenetrability of the Peruvian Andes is directly responsible for the fact that Peru, with an area of nearly 700,000 square miles, has only 1,700 miles of railway or only about 2.5 miles of railroad per thousand square miles of area. Indirectly, railway development has been retarded by other factors; more than half the population is Indian and a very large per cent is illiterate; political unity has been lacking and the government has been involved in a long series of border disputes which has kept the treasury drained.

### Railways in Operation

Peru does not possess, strictly speaking, a railway system. The railways are slowly pushing their way across the coastal belt and already two lines, the Central and the Southern, scale the coastal mountain barrier and tap the mineral region of the Andean plateau but no railway has yet penetrated farther east than this. The montana on the east of the Andes is unconnected with the coastal region on the west except by difficult mountain trails over which it is impracticable to

Southern Railway of Peru on the Road to Cuzco

conclusion that American engineers and supplies will probably play a leading part in supplying them.

These are some of the features of a report issued this week by the Latin-American Division of the Bureau of Foreign and Domestic Commerce in Latin-American Circular No. 53. The report follows similar reports on Colombia, Mexico and Brazil, the latter two of which have been abstracted in the *Railway Age*. The Peruvian report follows:

transport freight. There are only three short stretches of longitudinal railroad in Peru; one in the southern part of the plateau section; one in the central part of the plateau section; and one from the port of Callao north along the coast. The ocean is still the only highway available for travel from north to south.

With the exception of the two lines which penetrate the Andean plateau and the three short stretches of longitudinal road, the railways now in operation are short, isolated lines extending from Pacific ports short distances up the river valleys and have but a single function, the connection of interior points of a special river valley with its ocean port.

The following table lists the railways now in operation and gives a few details of each location, length, gage, chief products of the area served, and equipment. Some interesting deductions may be drawn from each of these columns regarding conditions of the lines throughout the whole country. There are some thirty lines listed and only six of this number are over 60 miles in length. Practically all of the railways begin at a Pacific port and follow the course of a river inland. The gages vary from standard to only 2 ft. In every case the roads are dependent on the success of a few plantations or mines for the bulk of their export freight. The figures for equipment which were purposely taken for a previous year show the meagerness of the equipment of most of the roads even in normal times.

In 1890, the entire foreign debt of Peru was taken over by the London Corporation of Foreign Bondholders and in

return the Peruvian government granted that organization certain concessions including the control of all state railways for a period of 66 years. The Peruvian Corporation was then created by the Corporation of Foreign Bondholders to administer these concessions. In 1907, a new contract was effected between the Peruvian Corporation and the Peruvian government by which certain disputes were adjusted and under which the railway lease was extended for an additional 17 years during which time the government was to receive 50 per cent of the net profits resulting from the operation of the railways after the service of the corporation's railway bonds had been met.

The Peruvian Corporation controls some 1,300 miles of Peru's 1,700 miles of railways. As the following list of roads controlled by the corporation indicates, this 1,300 miles includes all the more important lines of the country with the exception of the Cerro de Pasco Railway.

#### Railways Controlled by Peruvian Corporation

Central Railway	Pacasmayo
Southern	Pisco to Ica
Trujillo	Chimbote
Paíta	

The extensions of the Central to Huancayo and of the Southern to Cuzco were constructed by the corporation. According to the 1907 contract, the government is to provide the necessary state land for further construction work and is to

(Included in Trujillo Railway)

allow the corporation to import construction and repair machinery free of duty. According to this contract, the corporation also has the right to construct and own in perpetuity a railway which shall extend from any point on one of the state lines to a point on one of the navigable rivers of the interior. The government is to furnish the land for this line and to give the corporation 6,000 hectares of land for each kilometer completed. Tariffs are fixed by this contract.

The Peruvian Corporation has a capitalization of \$80,190,-

quired by debenture resolution, making 6 per cent for the year.

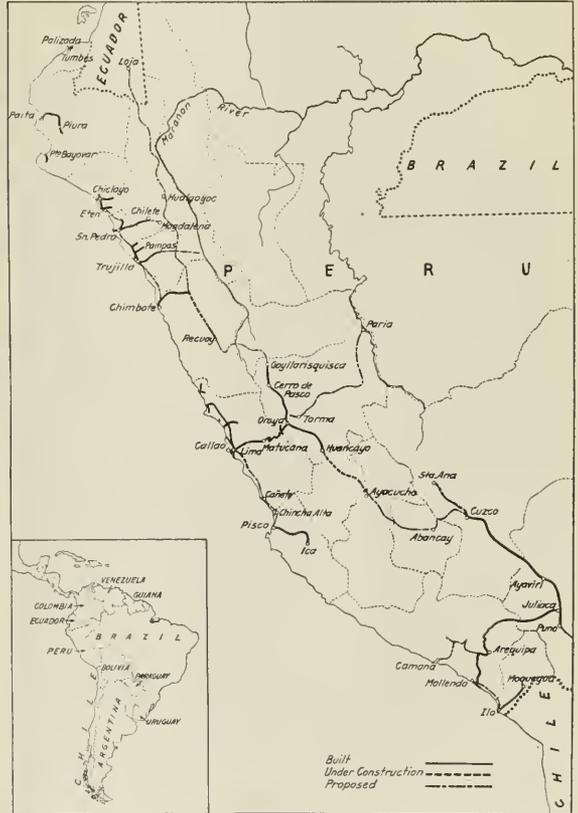

The government owns and operates on its own account three short lines which have been built since the 1890 agreement with the Peruvian Corporation. These lines are as follows: Tumbes Railway, Ilo-Moquegua, Lima-Lurin (in operation for most of its projected length). According to the state budget for 1918-19, the net receipts of the Tumbes for the coming year are estimated at \$2,430; of the Ilo-Moquegua at \$16,524; and of the Lima-Lurin at \$17,496.

The Lima Railways Company and the North Western Railway Company are English; the holdings of the former are operated by the Lima Light, Power & Tramways Company. The Cerro de Pasco Railway is owned and operated

Switch Back on the Cerro de Pasco

000, of which \$43,740,000 has been issued as ordinary stock and \$36,450,000 as 4 per cent preference stock. In addition, debenture bonds have been issued to the amount of \$26,244,000. No detailed statement of the 1917-18 accounts of the corporation are available but according to a short item in the London Economist of December 7, 1918, the net revenue account (after provision for amortization and interest on

The Railways of Peru

In addition to the lines shown, the government has passed a law authorizing the construction of a line from Paita inland to the Marañon river (see the Railway Age of February 14, page 418.)

by the American mining company of the same name. The Chicama to Pampas Railway is owned by the Casa Grande Company and is the only German owned railway in Peru. The other railways are owned by local companies or individual planters.

Fuel

The Peruvian railways are not dependent on imported fuel as the Brazilian railways are and hence have not been affected by the curtailment of the exports of coal from Europe and the United States since the beginning of the war, but the Peruvian railways are facing a fuel famine nevertheless.

The coal deposits at Jatunhussi, Oyon, Recuay and other points are sufficient to supply Peru with all the fuel she needs, but these fields are still inaccessible and consequently

"Mount Meiggs," Under Which the Central Railroad of Peru Passes. The Elevation of the Peak is 17,775 ft. and the Elevation of Tunnel at Summit, 15,665 ft., the Highest Point Reached by Any Standard Gage Railroad in the World.

debenture issue) amounted to \$2,206,979 which amount included \$240,672 brought forward. The directors propose to apply in respect of income tax and other items \$351,237; to declare a dividend of 1½ per cent on preference stock; and to set aside an additional 2 per cent on debentures as re-

undeveloped. The fuel for Peru's industrial establishments and railways is supplied by a single foreign corporation, the International Petroleum Corporation, whose holdings are near Tumbes in the extreme northern corner of the country. As a result of the dispute between the Peruvian government and this corporation, no tankers are now operating between Talara and the central and southern ports, which are consequently without fuel.

The railways depend almost entirely on oil from Talara for fuel and are equipped with oil burning locomotives. The Central alone consumes nearly 3,000 tons of oil monthly and consequently last fall the fuel shortage became so acute that the Peruvian Corporation petitioned the government for permission to reduce its passenger service on this road and others using oil for fuel until such time as oil shipments from Talara should be resumed. This request was refused.

#### Equipment

The following table, taken from the official Peruvian statistics, gives imports of railway equipment for the pre-war year 1913 and for the last three war years for which figures are available. Since quantities were only available for a few

Scene on the Central Railroad

of the articles included, values have been used throughout. Figures are for calendar years, and are given in Peruvian pounds (official value \$4.0665).

The 1913 statistics demonstrate the successful introduction of American locomotives, cars, rails, etc., into Peru prior to the cutting off of the European sources of supply by the war.

The Central has well equipped and up-to-date shops at Guadalupe where necessary repairing is done and also a small amount of new construction work. The Southern has small but well equipped repair shops at Arequipa. Native Indian laborers are successfully employed by both organizations.

#### Construction Work

Peru, like most South American countries, has many railways "proyectados," but has only the following three extensions actually under construction at the present time.

"Infernillo" Bridge on the Central Railroad

Chimbote Railway—kilometer 104 to Recuay.

Central Railway—south from Huancayo toward Ayacucho.

Southern Railway—Cuzco toward Santa Ana.

The Recuay extension will tap an important coal deposit which the government is especially anxious to open up in view of the present fuel shortage. The Huancayo-Ayacucho extension will make the coal deposits at Jatunhussi accessible and will open up a country suitable for the raising of wheat and other grains. Congress has recently authorized a loan of \$1,500,000 for the extension to the Jatunhussi coal fields. The Cuzco-Santa Ana line will be 168 kilometers in length when finished, will cost \$2,500,000 (estimated), and will be narrow gage. The Urubamba valley, which this road traverses, produces coca leaves, rubber, cacao, and fruits. The expense of the enterprise is being partly defrayed by the Federal Government and partly by the government of the Department of Cuzco, which is devoting the proceeds of the internal revenue tax on coca leaves and alcohol to this undertaking.

A law was passed by the Peruvian Congress early in 1918 which provided for an annual appropriation of \$2,500,000 to be used for railway construction, but this law was vetoed by the President and a law providing for \$1,000,000 for one year substituted by the Minister of Fomento. No information is available as to whether this amount was written into the budget or not.

The construction work is under the direct charge of the Director General de Obras Publicas, Ministerio de Fomento, Lima.

The plans of the Peruvian Government for a comprehensive railway system which shall unite the east with the west and the north with the south are slowly beginning to assume definite outline. These plans include two longitudinal railways and one or more railways connecting the western coast with the navigable rivers of the eastern frontier. One of these longitudinal railways is to extend along the coastal belt and will include the present line from Lima north to Huacho. The second will extend along the plateau section and will include the lines from Cerro de Pasco south to Huancayo and from Puno north to Cuzco. Three possible routes across the Andes have been discussed; one from a point on the Southern Railway to the Rio Madre de Dios, a second from Oroya to the Ucayali river, and a third from Paita or Chimbote to the Rio Marañon and down the Marañon valley. The route from Paita to the Marañon is generally conceded to be the most practicable. Commerce Reports for November 27, 1918, published the text of a decree authorizing this railway from Paita to the Marañon, with extensions south to Ferrenafe and Hualgayoc. (See also the *Railway Age* of February 14, 1919, page 418.)

Among the extensions likely to be built in the near future

may be mentioned the following: Sayan to the Oyon coal fields, Chile to Magdalena, Chuquicara toward Cajabamba. Government engineers have recently surveyed this last extension which is part of the proposed longitudinal railway along the plateau and have estimated the cost of construction. Their report to the Minister of Fomento is technical and quite unemotional, but presents a most vivid picture of the difficulties attendant on the construction of a Peruvian railway.

These engineering difficulties and the almost prohibitive cost of construction have been directly responsible in the past for the slowness with which the railways have pushed up the river valleys and preclude any chance of a rapid development in Peru such as seems likely to occur in Brazil now that construction materials from the United States and Europe will be once more available. However, the hidden riches of the Peruvian Andes and the unknown riches of the plains beyond are beckoning as they never did before; the Peruvian Government is on a sounder financial basis than ever before and anxious to weld its people, isolated in the various river valleys, into a united nation, and hence it seems probable that Peru will slowly push to realization her dreams of a comprehensive railway system and it seems likely that American engineers and supplies will play an important part in this future development as they have in the past.

## Mechanical Section of American Railroad Association

### Rules of Order; Program of Atlantic City Meeting and Personnel of the General Committee

THE FORMATION of the American Railroad Association with its five sections covering operating, engineering, mechanical, traffic and transportation was announced in the January 17 issue of the *Railway Age* on page 194, and is considered in detail in another article in this issue.

Circular S-3, No. 1a has been issued by the American Railroad Association giving the personnel of the general committee which will be in charge of the convention at Atlantic City next June, together with the rules of order and a list of the committees which will report at the convention.

The general committee is made up as follows:

- C. E. Chambers, mechanical assistant, Allegheny Region, chairman.
- W. J. Tollerton, general mechanical superintendent, Rock Island Lines, vice-chairman.
- Frank McManamy, assistant director, Division of Operation, U. S. R. A.
- C. B. Young, manager, Inspection Test Section, Division of Operation, U. S. R. A.
- F. F. Gaines, chairman, Board of Railway Wages and Working Conditions.
- I. S. Downing, general master car builder, C. C. C. & St. L.
- J. S. Lentz, master car builder, Lehigh Valley.
- M. K. Barnum, assistant to general superintendent, maintenance of equipment, Baltimore & Ohio.
- J. R. Gould, superintendent motive power, Chesapeake & Ohio.
- A. Kearney, superintendent motive power, Norfolk & Western.
- C. E. Fuller, superintendent motive power and machinery, Union Pacific.
- T. H. Goodnow, superintendent car department, Chicago & North Western.
- J. W. Small, mechanical assistant, Southern Region.
- C. F. Giles, superintendent machinery, Louisville & Nashville.
- J. E. O'Brien, mechanical superintendent, Missouri Pacific.
- A. P. Prendergast, mechanical superintendent, International & Great Northern.
- H. R. Warnock, general superintendent motive power, Chicago, Milwaukee & St. Paul.
- James Coleman, superintendent car department, Grand Trunk.
- W. H. Winterrowd, chief mechanical engineer, Canadian Pacific.

#### Rules of Order

The following are the rules of order which will govern the conduct of the section:

1. (a) The membership of Section 3—Mechanical—shall consist of three classes; representative, affiliated and life.

(b) Representative members shall be those officials of railroads above the rank of general foreman having charge of the design, construction or repair of motive power or rolling stock, who shall be designated by the federal manager or executive official of the member of the association to serve in the section.

(c) Any person having such knowledge of science or practical experience in matters pertaining to the construction of motive power or rolling stock as would be of special value to the section may become an affiliated member on being recommended by three representative members. The name of such candidate shall then be referred to the general committee which shall report to the section on his fitness for such membership. He shall be elected by written or printed ballot at any regular meeting of the section held not less than six months after the candidate has been proposed and five dissenting votes shall reject. Affiliated members shall be entitled to all the privileges of representative members excepting that of voting and being elected to office in the section and may serve on committees on appointment by the general committee, in addition to the regularly elected members of such committee.

Such membership shall continue until written resignation is received by the secretary or the membership is terminated by the general committee or by the members becoming engaged in business which, in the judgment of the general committee, would impair his usefulness to the section or discriminate against others similarly engaged. Affiliated members shall not be subject to dues or assessments.

(d) Representative members who have been in good standing twenty years, or members who have served as chairman of the section may become candidates for life membership on the recommendation of the general committee. The names of such members shall be referred to the section in convention for election by written or printed ballot at any regular meeting of the section and five dissenting votes shall reject.

(e) Those persons, active or representative members, who have been in good standing in either the Master Car Builders' Association or the American Railway Master Mechanics' As-

sociation for twenty years, or members who have served as president of either association or as chairman of the section may also become candidates for life membership. Those now carried by the Master Car Builders' Association as life members or by the American Railway Master Mechanics' Association as honorary members will be continued as life members of Section Three—Mechanical.

2. (a) In addition to the chairman, vice-chairman and the general committee of the section, a nominating committee shall be elected.

(b) The general committee shall consist of sixteen elected members including the chairman and the vice-chairman of the section, and, in addition, during the period of federal control, of three representatives of the United States Railroad Administration to be designated by the director of the Division of Operation. The elected members during federal control shall consist of two representatives from each region and two representing the Canadian railroads.

3. The duties of all officers shall be such as shall pertain to their offices or as may be delegated to them by the general committee of the section.

4. (a) The general committee shall exercise general supervision over the interests and affairs of the section, call, prepare for and conduct general conventions.

(b) The general committee shall exercise such supervision over the standards, recommended practice, or rules of this section as may be necessary to meet any emergency that may arise during the year in the conduct of the affairs of the section.

(c) It shall make a report at each convention which shall cover the action it has taken on such general or emergent supervision and make such recommendations as it may deem necessary on questions of importance to the section.

(d) The general committee shall select and appoint the members of the several standing committees and of such special committees as may be found necessary from time to time for conducting the business of the section and for investigating such matters as may be referred to the section or the committee may deem expedient to carry out the purposes of the section. It shall make appointments in the membership of any of the committees that may be necessary to fill any vacancies which may occur.

(e) The general committee shall receive, examine and approve before public reading all communications, papers and reports and it shall decide what portion of the reports, papers and drawings shall be submitted to each convention and what portion shall be printed in the annual report. It shall also determine which, if any, of the subjects presented at the convention or by members shall be referred to the executive committee of the association.

(f) The general committee shall offer to the convention the names of ten representative members not officers of the section as candidates for the committee on nominations.

(g) The general committee may call special meetings of the section to be held not less than thirty days after the notice thereof has been mailed to each member of the section.

(h) Nine members of the general committee shall constitute a quorum for the transaction of business.

5. (a) It shall be the duty of the committee on nominations to offer to the convention the name of one representative member as a candidate for chairman and one for vice-chairman, and the names of seven representative members as candidates for the general committee.

(b) When twenty or more members desire to propose the name of a member for any office, in addition to the names suggested by the committee on nominations, the secretary shall place the name or names of such persons for said office on the printed ballot, making a statement to the effect that such name or names has been proposed by a certain number of members.

6. (a) It shall be the duty of the secretary to issue a circular annually, intimating the date and place when and where candidates may be examined for the scholarships of the section.

(b) Acceptable candidates for the scholarship shall be first, sons of members or of deceased members of the section.

If there is not a sufficient number of such applicants for the June examination, then applications will be received from other railroad employees or the sons of other railroad employees for the fall examination. The secretary shall issue a proper circular

in this case as before. In extending the privilege outside of the families of members, preference shall be given to employees or the sons of employees or the sons of deceased employees of the mechanical departments.

(c) Candidates for these scholarships shall apply to the secretary of this section and if found eligible shall be given a certificate to that effect for presentation to the school authorities. This will entitle the candidate to attend the preliminary examination. If more than one candidate passes the preliminary examination, the applicant passing the highest examination shall be entitled to the scholarship, the school authorities settling the question.

(d) The successful candidate shall be required to take a course prescribed by the general committee.

7. (a) The officers, excepting as otherwise herein provided, shall be elected at the regular meeting of the section held in June of each year and the election shall not be postponed except by unanimous consent.

(b) The chairman and the vice-chairman of the section shall be elected by written or printed ballots alternately every second year, the candidate receiving a majority of the votes cast shall be declared elected and shall hold office for two years or until his successor shall be elected.

(c) Members of the general committee and the committee on nominations shall be elected by written or printed ballots. Seven members of the general committee will be elected at each regular session to serve for two years. Five members of the committee on nominations will be elected annually.

(d) In the election of members of the general committee and the committee on nominations each representative member is entitled to one vote.

8. (a) At the first session of the annual meeting the report of the committee on nominations announcing the names of the nominees for officers and the general committee of the section shall be read. Elections shall not be held before the day after such announcement except by unanimous consent. Votes may be cast for any member eligible to serve as chairman, vice-chairman, members of general committee or members of committee on nominations by adding the name to the printed ballot.

(b) In all ballots for chairman, vice-chairman, members of general committee and committee on nominations or for affiliated or life members at the meetings of the section, the following form of voting shall be adhered to: An envelope shall be provided on which there shall be a blank space for the name of the railroad, and the name of the official voting; smaller envelopes shall be provided on which shall be printed the words "For Officers," "For Members General Committee," "For Members Committee on Nominations," "For Affiliated and Life Membership," and otherwise unmarked. In these envelopes the ballots shall be placed by those voting them and they shall then be placed within the larger envelope and presented to the general tellers. When a ballot is to be taken the chairman will announce the names of all required tellers. Three general tellers shall have charge of receiving and recording the ballots cast. When all ballots have been cast these tellers will announce that the polls are closed. They shall then remove the smaller envelopes, count and announce the vote for officers and shall deliver the envelopes marked "For General Committee" to two tellers, who shall count and announce to the general tellers the vote for general committee and those marked "For Committee on Nominations" to two tellers who shall count and announce to the general tellers the vote for the committee on nominations, and those marked "For Affiliated and Life Members" to two tellers who shall count and announce to the general tellers the vote for affiliated and life membership.

(c) The general tellers shall record and announce the total number of votes cast, the result of the vote, and shall be the judges of eligibility of any ballot presented.

(d) When a ballot for officers or membership on committees shall be announced as having eventuated in a tie vote, or be otherwise undecided, upon such announcement the final result shall be determined by the majority of the members present.

9. (a) Unless otherwise provided herein, a vote in the session of the section may be taken *viva voce*, by arising, or by written or printed ballot in any of which only representative members and representatives of the United States Railroad Administration shall participate. Letter ballots may be ordered to be taken in such manner and under such conditions as the section

may by resolution from time to time or the general committee may direct.

(b) Printed ballots for use in the election of officers, members of the general committee and the committee on nominations, and for affiliated and life memberships to be of the form as prepared by the committee on nominations.

10. (a) At each annual meeting, the chairman shall appoint a committee on subjects whose duty it shall be to report at the next annual meeting subjects for investigation and discussion, and if the subjects are approved by the section, the general committee as hereinafter provided, shall appoint committees to report on them. It shall also be the duty of the committee on subjects to receive from members questions for discussion during the time set apart for that purpose. That committee shall determine whether such questions are suitable ones for discussion, and if so, it shall report them to the section.

(b) When the committee on subjects has reported and the section approved of subjects for investigation, the general committee shall appoint individuals or special committees to investigate and report on any subject which a majority of the members present may approve; or individual papers may be presented to the section after approval by the general committee. Papers and reports shall be presented by abstracts, which shall not occupy more than ten minutes in the reading unless otherwise ordered by the section.

(c) Any proposition recommending the adoption of standard construction or practice shall be in writing and be accompanied by drawings, if the latter are necessary for a clear understanding of the subject. Such proposition shall then be submitted to the section for discussion, after which a vote shall be taken to decide whether the proposition shall be submitted for decision by letter ballot to all the members entitled to vote. If decided in the affirmative, the secretary within two months from the time the vote of the section is taken on such measure, shall send by mail to each member a blank ballot, and a copy of the proposed recommendation, with a report, to be approved by the general committee of the discussion thereon; such ballot to be returned to the secretary, who will count all the ballots received within thirty days from the date they were sent to the members, and he shall then announce the vote in such manner as the general committee may prescribe. Any recommendation securing two-thirds of the votes cast shall be adopted by the section.

(d) All reports, resolutions and recommendations involving the use, or proposed use, by railroads, of any device or process which forms the subject matter of any existing patent, shall first be submitted to the general committee, and shall be submitted to the section only by the general committee.

11. (a) The regular annual meeting of the section shall be held in June of each year. The dates of such meeting shall be fixed by the general committee.

(b) The regular hours of session shall be arranged by the general committee and published on the program for each meeting.

(c) The place for each annual meeting shall be fixed at least four months before the annual meeting by the general committee.

(d) At any regular meeting thirty or more members entitled to a vote shall constitute a quorum.

(e) The business of the meetings of the section shall, unless otherwise ordered by a vote, proceed in the following manner:

1. Address by the chairman.
2. Acting on the minutes of the last meeting.
3. Report of secretary.
4. Appointment of resolutions and other committees.
5. Unfinished business.
6. New business.
7. Reports of committees.
8. Reading and discussing questions propounded by members.
9. Routine and miscellaneous business.
10. Election of officers.
11. Adjournment.
12. The revision of the rules of interchange shall be the special order of business at 10:00 a. m. on the second day of each annual convention, unless otherwise ordered.
13. Unless otherwise ordered, the discussion of questions proposed by members shall be the special order at 12:00 noon of each day of the annual meeting.
14. The votes of a majority of the members present shall be required to decide any question, motion or resolution which

shall come before the section, unless otherwise ordered. Matters upon which authoritative action is required after approval by the section shall be submitted to the executive committee of the association, through the general secretary.

15. (a) The reports of all committees must be in the office of the secretary not later than April 1 in order that the same can be printed and advance copies issued 30 days prior to the opening date of the convention.

(b) Committee reports which do not reach the secretary as provided for in paragraph (a) will be referred to the general committee to decide whether the report shall be submitted to the convention.

(c) An abstract of the report of each committee will be read to the convention, together with whatever additional data may have been accumulated after the publication of the reports.

(d) The members of committees who may individually or collectively submit a minority report must prepare the same so that it can be issued with the report of the majority to substitute for the majority report in the event the section shall so decide.

(e) Each member of a committee must approve either the majority or a minority report.

16. These rules of order may be amended at any regular meeting by a two-thirds vote of the members present provided that written notice of the proposed amendment has been given by the general committee at least four months before.

### Reports of Committees

Thirty-one committees will report at the convention. The first 20, ordinarily considered as Master Car Builders' committees, will report from June 18 to June 20, and 11 committees which would be considered strictly as committees of the Master Mechanics' Association will report from the period of June 23 to June 25. The election of officers will take place on Saturday, June 21. The list of committees is as follows:

June 18-20, 1919, Inclusive.

1. Arbitration, J. J. Hennessey (C. M. & St. P.), chairman.
2. Standards and Recommended Practice (M. C. B.), T. H. Goodnow (C. & N. W.), chairman.
3. Train Brake and Signal Equipment, T. L. Burton (N. Y. C.), chairman.
4. Brake Shoes and Brake Beam Equipment, B. B. Milner (N. Y. C.), chairman.
5. Couplers, R. L. Kleine (Pennsylvania), chairman.
6. Loading Rules, J. J. Burch (N. & W.), chairman.
7. Car Wheels, W. C. A. Henry (Pennsylvania Lines West), chairman.
8. Safety Appliances, C. E. Chambers (U. S. R. A.), chairman.
9. Car Construction, W. F. Keisel (Pennsylvania), chairman.
10. Specifications and Tests for Materials (M. C. B.), F. M. Waring (Pennsylvania), chairman.
11. Car Trucks, J. T. Wallis (Pennsylvania), chairman.
12. Prices for Labor and Material, P. F. Smith, Jr. (Pennsylvania Lines West), chairman.
13. Train Lighting and Equipment, J. R. Sloan (Pennsylvania), chairman.
14. Nominations, F. W. Brazier (N. Y. C.), chairman.
15. Tank Cars, A. W. Gibbs (Pennsylvania), chairman.
16. Draft Gears, R. L. Kleine (Pennsylvania), chairman.
17. Welding Truck Side Frames, Bolsters and Arch Bars, W. O. Thompson (N. Y. C.), chairman.
18. Standard Blocking for Cradles of Car Dumping Machines, James McMullen (Erie), chairman.
19. Revision of Passenger Car Rules of Interchange, H. H. Harvey (C. B. & Q.), chairman.
20. Depreciation for Freight Cars, M. K. Barnum (B. & O.), chairman.  
June 23-25, 1919, Inclusive.
21. Standards and Recommended Practice (A. R. M. M.), W. E. Dunham (C. & N. W.), chairman.
22. Mechanical Stokers, A. Kearney (N. & W.), chairman.
23. Fuel Economy and Smoke Prevention, William Schlafge (Erie), chairman.
24. Powdered Coal, C. H. Hogan (N. Y. C.), chairman.
25. Specifications and Tests for Materials (A. R. M. M.), F. M. Waring (Pennsylvania), chairman.
26. Design and Maintenance of Locomotive Boilers, C. E. Fuller (Union Pacific), chairman.
27. Locomotive Headlights, H. T. Bentley (C. & N. W.), chairman.
28. Superheater Locomotives, W. J. Tollerton (C. R. I. & P.), chairman.
29. Design, Maintenance and Operation of Electric Rolling Stock, C. H. Quereau (N. Y. C.), chairman.
30. Train Resistance and Tonnage Rating, O. P. Reese (Pennsylvania Lines West), chairman.
31. Subjects, M. K. Barnum (B. & O.), chairman.

all of these track facilities, it should be borne in mind that every switch is a source of expense during the winter.

Inspection Pits

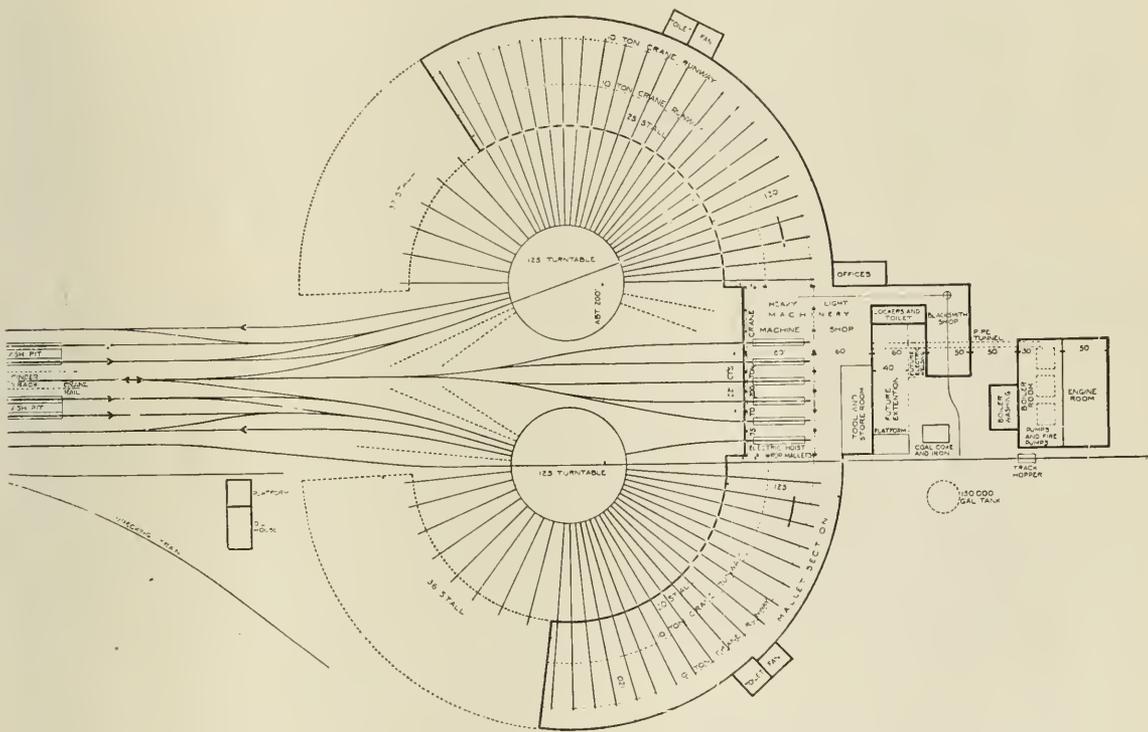

At present most of the locomotive inspection pits are located near the entrance to the terminal. This location may be changed, however, in cases where washing pits are also provided. Facilities of this nature have been installed by the Lackawanna and the Erie, where engines are cleaned with a spray of water and oil, applied by air, after they have dropped the ashes and cleaned the fires. This washing is done to afford better inspection, hence, the ash pit should be located in advance of the washing pit, and it, in turn, precedes the inspection pit if they are all arranged in their proper sequence.

While there is no doubt that the washing and cleaning of a locomotive before it is inspected facilitates that work, it means that the ash pit, particularly in the colder climates,

The logical place for the service building is near the inspection pits. Such a building should contain rooms for the inspectors, the engine despatcher, and engineers, lockers, toilets, and space for tools for the engine crews. If this building be located at some other point, say near the machine shop or roundhouse, a smaller building should be provided for the inspectors beside the pits. A pneumatic tube, connecting this service building with the roundhouse foreman's office is a facility for handling reports which is well worth the cost of installation.

The Ashpit

Inasmuch as the average time required to drop ashes and clean fires is about 20 min., the ashpit is a dominating influence in arriving at an efficient layout. In climates with long cold winters, the ashpit should be located as close as possible to the turntable. Approximately 500 ft. seems to be about right, being gaged by the distance a locomotive safely can

Plan copyrighted by the Austin Company, Cleveland, Ohio

Suggested Layout for a Large Terminal with Two Turntables

may be located too far from the house. It is possible, however, that a thorough study of the arrangement of these several facilities may result in providing them all, without this disadvantage. On the other hand, it is possible to do the inspecting in the roundhouse. This has many drawbacks, however, besides that of adding greatly to the fixed charges for inspection, owing to the higher cost of the roundhouse as compared with the inspection pit.

In the latest designs of terminals, the lengths of inspection pits have been increased to 90 and 100 ft. As a rule they are placed in the open, but at all the terminals being constructed by the Pennsylvania Lines in the past year, fully enclosed shelters of reinforced concrete have been provided. No attempt will be made to heat these buildings, as they are only intended to shelter the inspectors from the weather.

run without a fire on the grates. Cold air has a detrimental action on the flues.

In this case the ashpit is assumed to be of the water type, serving two tracks, and should be about 180 ft. long, which is sufficient to serve three engines, except Mallets, per track. It may be operated either by a large locomotive crane, or by a gantry crane. Local conditions, however, may make it advisable to install a small additional ashpit for yard engines.

The floor should be reinforced and quite often rails are laid with their heads projecting about two inches to protect the concrete from the bucket. The girders carrying the rails and the cast iron pedestals, if they are used, should be of liberal dimensions to allow for considerable loss of section from the acid action of wet cinders.

The tanks are filled with water and provided with drainage

facilities. Water supply pipes, fitted with sufficient plugs for the hose, should be installed along the sides of the ashpits. The large tanks should have barriers at the ends, removable series grates between tracks, and danger signals or lights to prevent accidents. The pits should be arranged in pairs and sloped at about 50 deg. beneath the ashing tracks toward a large tank between the tracks. The bottom of the tank should be at least 18 in. below the tops of this slope, and it should have sufficient width to allow for turning a large clam-shell bucket.

Other types of cinder handling equipment may be applied to terminals of the size in question, including those in which the cinders are handled in hopper pits or in buckets placed in the pits and from which they are hoisted by various means. For unimportant and smaller terminals the depressed track type of ash pit has been found quite satisfactory. While the method is simple, and no mechanical equipment is required, a pit of this type has its limitations. In some cases the depressed type of pit is installed for one track, and in others for two. In either case, all the work has to be done by manual labor, and the cinder storage space is limited. When labor was plentiful and cheap this type of pit was not so objectionable. Aside from these disadvantages, the depressed track occupies space which might be utilized to better advantage. In order to increase the storage space, it is necessary to lengthen the pit, which is not always economical, because it may seriously delay engine movements to the house.

### The Coaling Station

The coaling station should be of the transverse type, and have a pocket capacity for at least one day's supply. A station serving several tracks is preferable to the longitudinal type because it facilitates engine movement to and from the pockets. The loaded coal car tracks should have a down grade toward the track hopper to permit easy feeding of the cars. Lately a good many coaling stations have been built of concrete with bucket type conveyors, the coal being lifted or elevated to the top of the pockets. Under certain ground conditions, a belt conveyor has also been found to be very satisfactory and economical. For any type a demand has developed recently for a coal weighing or measuring device.

At very busy terminals, a second track hopper may be desirable to obtain continuity of service and greater capacity. A shelter over the track hopper is also advisable, as it permits the unloading to be done in all kinds of weather. Moreover if there is an increased demand (which appears certain), for the new 100-ton coal cars, the lengths of the coal track hoppers should be lengthened accordingly in all future coaling stations.

Many railroads are providing for coal storage, close to the coaling station, at all important terminals. At least a month's supply should prove of great value in most cases. Where a storage of about 20,000 tons is provided, a large locomotive crane is an economical appliance for loading and unloading purposes. This crane is also useful at even moderately important terminals. Inasmuch as a crane of this type can switch and unload about 75 tons of coal per hour from cars, it can do this work when it is not otherwise employed. Such equipment can also be used for handling ashes.

In the case of all coal storage, the fixed charges per ton of coal stored, resulting from the cost of the plant, should be fully considered. Coal stored in the open loses heat value, and it may have to be fired differently from the regular run of coal.

### Other Facilities

As a general rule the sanding facilities are installed in conjunction with the coaling station. This permits both coal and sand to be taken with one spotting of the locomotive. The amount of storage depends entirely on local conditions. Where the sand required for the winter months is taken out

by steam shovel in the fall, the storage, of course, has to accommodate the entire winter supply.

The sand house should be large enough for the easy handling of the wet sand to the top of the stove. The dry sand is usually delivered from the stove to a large tank or pit, from which it is forced by air pressure to smaller tanks located above the track in the coaling station, or to tanks placed on a bridge over the tracks. From these tanks the dry sand is spouted by gravity to the engines.

The oil house should be of a fireproof construction, and a reinforced concrete frame with brick walls is preferred. If a Bowser-type oil system is used the design should be based accordingly. The importance of the terminal fixes the oil tank capacity, and correspondingly the size of the building. The outside platform beside the oil delivery track should be of liberal dimensions, and the basement for the storing of tanks should extend under the platform. This arrangement gives an economical design and provides a liberal storage capacity.

The location and number of the water columns will depend on the importance of the terminal and local conditions in the terminal and yard. Water supply for yard engines should be especially considered. The storage tanks should be of very liberal proportions, and for the layout under consideration, the water columns should be 10 in. or 12 in., depending on the distance away from the supply tanks. The size of the tanks depends entirely on local requirements, particular attention being given to prevent failure of the supply through breakdown. The location and size of the water storage tanks is not shown on the layout, because they depend on local conditions.

### The Turntable

The lengths of turntables on some roads in the eastern district have now been increased to 110 ft., while the maximum at practically all other new terminals is 100 ft. At new important terminals, where over six Mallets are handled per day, it would be more economical and save time and delays for this class of engines to install a 125-ft. table instead of one of 100 ft. usually employed. At terminals with a preponderance of passenger engines and where a house of about 40 stalls is required, it would be advisable to study the question of two tables. As a matter of fact, new layouts for all important terminals, requiring more than 40 stalls, should take the question of two turntables under consideration.

A 100-ft. turntable will accommodate a car and a switching engine. This feature will absorb the extra cost over a 90-ft. table for a new engine terminal, where the building of the table precedes that of the roundhouse. A 125-ft. turntable will make possible a roundhouse based on 72 stalls in the full circle, without the use of frogs. It will also greatly extend the balancing sphere for a larger number of locomotives of various types.

### Twin Turntable Installation

In the accompanying layout, with twin roundhouse facilities, there are two 125-ft. turntables installed in connection with two 120-ft. roundhouse sections. One of the roundhouses contains a 125-ft. Mallet section. A layout of this kind is practical and economical where the terminal handles 150 to 350 engines per day. The need for two tables with 150 engines depends entirely on prevailing traffic conditions. The tendency toward consolidation of terminals should greatly increase the demand for terminals of this kind. The arrangement of the two 125-ft. turntables makes a very flexible and efficient layout possible. By utilizing the extension of the center or cinder track, a clearing track is created in case both tables should be out of commission at the same time.

The plan shows one roundhouse of twenty and one of twenty-five stalls, and they will accommodate between 200

to 250 engines per day. The cost of these 125-ft. turntables, and two houses of twenty and twenty-five stalls, is about the same as a combination of 100-ft. tables with the same number of stalls. The extra cost of the 125-ft. turntables is about equal to the saving in construction of the two houses, resulting from the reduction in floor area and the length of the rear walls. In addition there is the greater advantage of the turntable in better balancing and accommodating the largest locomotives. The greater distance between the table and the house also has many advantages; one of these is that in case of fire every other track will clear an engine.

Wheel removals will be made in the machine shop, by means of a crane of 75 tons to 200 tons capacity, instead of raising the locomotives with jacks. The drop pits installed in the roundhouse are only intended for emergency purposes. For the Mallets, one pit could be provided with an electric hoist.

A 10-ton crane section is provided in each house and the proportions of the shop are such that these house crane runways may extend into the shop proper. The shop plan shows six pits, but this number could be increased to eight and the machine shop extended as indicated. The blacksmith shop is connected to the machine shop by an enclosed passageway which also contains rooms for lockers and toilets.

The power house is of liberal proportions, and space is provided in the boiler room for a fire pump. There is also

indicated a tentative location for an auxiliary water tank of 150,000 gal. capacity. This is intended as a reservoir for all water service, boiler washing, etc.

A liberal estimate at present prices for this engine terminal complete and fully equipped is approximately \$1,400,000. This would result in fixed charges at 10 per cent, of \$140,000 a year, and in a fixed charge for 250 engines of \$1.55 per engine per day.

The details of this estimate are as follows:

Grading and drainage .....	\$40,000
Track .....	90,000
Four inspection pits including covered shed....	20,000
Service building .....	7,000
Coaling station, sand house, etc.....	105,000
Four water type ashpits—gantry crane.....	50,000
Two 125-ft. turntables in place.....	50,000
Oil house and equipment .....	12,000
Two roundhouses, 25 and 20 stalls, and 2 10-ton cranes .....	405,000
Boiler washing .....	40,000
Machine shop and blacksmith shop.....	105,000
Power house .....	80,000
75-ton crane, electric hoist .....	45,000
Electric equipment .....	40,000
Power house equipment .....	170,000
Shop equipment .....	50,000
Miscellaneous .....	30,000
Total .....	\$1,400,000

## Developments in American Railroad Association

### Committees Appointed, Tentative Rules of Order Adopted and Meetings Held or in Prospect

THE DEVELOPMENT OF PLANS in connection with the reorganization of the American Railway Association has been progressing rapidly in order to comply fully with Circular 70 of the director general to provide a responsible channel through which he might obtain recommendations for the advancement of railroad practice. The new organization consists of five sections, viz., Operating; Engineering; Mechanical; Traffic and Transportation (the articles of organization, the reorganization chart and by-laws appeared in the January 17 issue of the *Railway Age*, page 194.) In the development of the organization it has been necessary to hold meetings of representatives of each of the various sections to arrange for the proper amalgamation of the different societies with the association; to draw up tentative rules of order and to transact any other necessary business. Three sections of the association have now been organized, these being the Engineering, Mechanical and Transportation sections. The Operating and Traffic sections have not been organized as yet, although steps have been taken in this direction.

The tentative rules of order adopted for those sections already organized cover the membership requirements for each section and the number of members which shall make up the general committee and outline the duties of the general committee and the chairmen of the sections. The general committee selects and appoints the members of standing committees and special committees for conducting the business of the sections and for investigating such matters as may be referred to them. The methods to be employed in the election of officers are outlined and the manner in which the order of business shall be handled at the annual sessions is covered.

The tentative rules of order for the various sections will remain in force until the first meeting of each section takes place. At this meeting the members present will either ratify

these rules or make such changes as may appear to be desirable.

#### Committee Appointments

Temporary general committees have been appointed by the executive committee of the association for each of the five sections. The temporary general committees will handle such business as comes before them until the first meeting of the sections take place at which time permanent general committees will be selected. The temporary general committees appointed for each of the sections are as follows:

##### SECTION I—OPERATING

- W. J. Fripp, general manager, New York Central (chairman).
- J. H. Young, senior assistant director, Division of Operation, United States Railroad Administration.
- A. F. Duffy, manager, Safety Section, United States Railroad Administration.
- C. G. Burnham, federal manager, Chicago, Burlington & Quincy.
- A. D. MacTier, vice-president, Eastern Lines, Canadian Pacific.
- R. E. McCarty, general manager, Pennsylvania, Lines West of Pittsburgh.
- C. L. Bardo, general manager, New York, New Haven & Hartford.
- M. H. Clapp, manager, Telegraph Section, United States Railroad Administration.
- J. F. Caskey, superintendent of telegraph, Lehigh Valley.
- G. G. Yeomans, member, Advisory Committee, Purchasing Section, Division of Finance and Purchases, United States Railroad Administration.
- E. J. Roth, manager, Stores Section, Division of Finance and Purchases, United States Railroad Administration.

##### SECTION II—ENGINEERING

- Earl Stimson, general superintendent maintenance of way and structures, Baltimore & Ohio (chairman).
- C. A. Morse, assistant director, Engineering and Maintenance Department, Division of Operation, United States Railroad Administration.
- H. R. Safford, engineering assistant, Central Western Region, United States Railroad Administration.
- C. F. W. Felt, chief engineer system, Atchison, Topeka & Santa Fe.
- R. S. Parsons, chief engineer, Erie.
- J. A. Atwood, chief engineer, Pittsburgh & Lake Erie.
- George Gibbs, chief engineer of electric traction, Long Island.
- E. B. Katte, chief engineer of electric traction, New York Central.
- R. E. Trout, signal engineer, St. Louis-San Francisco.
- W. H. Elliott, signal engineer, New York Central.
- F. P. Patenall, signal engineer, Baltimore & Ohio.

## SECTION III—MECHANICAL

C. E. Chambers, mechanical assistant to regional director, Allegheny Region, United States Railroad Administration (chairman).

Frank McManamy, assistant director, Mechanical Department, Division of Operation, United States Railroad Administration.

C. B. Young, manager, Inspection and Test Section, Division of Operation, United States Railroad Administration.

F. F. Gausse, chairman, Board of Railroad Wages and Working Conditions, United States Railroad Administration.

T. H. Goodnow, superintendent car department, Chicago & North Western.

H. R. Warnock, general superintendent motive power, Chicago, Milwaukee & St. Paul.

J. E. O'Brien, mechanical superintendent, Missouri Pacific.

A. P. Prendelgast, mechanical superintendent, Texas & Pacific.

J. W. Small, mechanical assistant, Regional Director, Southern Region, United States Railroad Administration.

C. F. Giles, superintendent of machinery, Louisville & Nashville.

W. J. Tollerton, general mechanical superintendent, Chicago, Rock Island & Pacific.

C. E. Fuller, superintendent motive power and machinery, Union Pacific.

I. S. Downing, general master car builder, Cleveland, Cincinnati, Chicago & St. Louis.

J. S. Lentz, master car builder, Lehigh Valley.

J. R. Gould, superintendent motive power, Chesapeake & Ohio.

A. Kearney, superintendent motive power, Norfolk & Western.

M. K. Barnum, assistant to general superintendent maintenance of equipment, Baltimore & Ohio.

James Coleman, superintendent car department, Grand Trunk.

W. H. Winterrowd, chief mechanical engineer, Canadian Pacific.

## SECTION IV—TRAFFIC

R. C. Wright, assistant director, Division of Traffic, United States Railroad Administration (chairman).

Traffic assistants of the seven regional directors of the United States Railroad Administration

J. H. Howard, manager, Claims and Property Protection Section, Division of Law, United States Railroad Administration.

H. C. Pribble, general claim agent, Atchison, Topeka & Santa Fe.

H. C. Howe, freight claim agent, Chicago & North Western.

## SECTION V—TRANSPORTATION

George Hodges, chairman.

C. M. Sheaffer, general superintendent transportation, Pennsylvania Railroad.

H. G. Kelley, president, Grand Trunk.

E. J. Fearson, federal manager, New York, New Haven & Hartford.

E. H. Coapman, federal manager, Southern.

J. J. Bernet, federal manager, New York, Chicago & St. Louis.

G. E. Evans, staff officer, Operation, Louisville & Nashville.

W. L. Park, federal manager, Chicago Great Western.

G. E. Simpson, general supervisor transportation, Chicago, Milwaukee & St. Paul.

W. C. Kendall, manager, Car Service Section, Division of Operation, United States Railroad Administration.

J. W. Roberts, superintendent freight transportation, Pennsylvania, Lines West of Pittsburgh.

J. W. Nowers, car accountant, Atchison, Topeka & Santa Fe.

J. A. Wagner, general manager, Des Moines Union.

These Committees will organize their respective sections and serve as provided in the rules of order until their successors are elected.

E. H. Fritch, secretary of the American Railway Engineering Association, has been appointed secretary of the Engineering section. V. R. Hawthorne, secretary of the Master Mechanics Association and the Master Car Builders Association, has been appointed secretary of the Mechanical section. H. S. Balliet, formerly secretary-treasurer of the Railway Signal Association, has been selected as secretary of the Signal division of the Engineering section, and J. E. Fairbanks, general secretary of the Association, is acting for the present as secretary of the Transportation section.

## Meetings Held and Contemplated

A meeting of the Committee of Direction of the Signal division of the Engineering section will be held in Chicago on March 16. The stated meeting of the Signal division of the Engineering section will be held at the Auditorium Hotel in Chicago on March 17. The Transportation section will hold its first meeting in Chicago on March 25. At this time various committee reports will be submitted for consideration. The Telegraph and Telephone division of the Operating section will hold a meeting in Chicago on June 11, 12 and 13 while the annual meeting of the Mechanical section will be held at Atlantic City, N. J., on June 18 to 25 inclusive.

At a meeting of the board of direction of the Railway Signal Association held in Chicago on February 24 and 25,

a statement was prepared for the members outlining briefly the steps leading up to the amalgamation of the R. S. A. with the American Railroad Association; the Railway Signal Association, in compliance with Order 70 issued by the director general of railroads, will be known as the Signal division of the American Railroad Association effective at midnight February 28. The necessary details in connection with the transfer of the activities, funds and securities of the Railway Signal Association were consummated by the Board of Direction and the interests of the association will be properly safeguarded. The statement further says that the work will be handled as in the past and that the status of the association has in no way been modified while the scope of its activities will be greatly enlarged. All memberships in the Railway Signal Association are transferred to the Signal division of the American Railroad Association.

Various committees of the Transportation section held meetings in Chicago during the week of March 3 to 8. On March 3 the Committee on Handling Railroad Business Mail discussed problems pertaining to this branch of the service; on March 4, the Committee on Methods was in session; on March 5, the Committee on Demurrage and Storage considered subjects pertaining to this field while on March 6, the Committee on Car Service held a meeting. The reports drawn up by these committees are to be submitted to the Transportation section at its meeting in Chicago on March 25.

## Annual Meeting of the Bureau of Explosives

The annual meeting of the Bureau of Explosives of the American Railroad Association was held in Chicago on Tuesday, March 4, and Colonel B. W. Dunn, chief inspector for the bureau, submitted a report which was discussed at this time. This meeting is the first held by the Bureau of Explosives since 1917. The executive committee consists of nine members and ordinarily three members are elected at the annual meeting each year but owing to the failure to hold a meeting in 1918, six members were elected this year. Those elected to the committee were: J. W. Meredith, general superintendent, Central Railroad of New Jersey; W. B. Storey, federal manager, Atchison, Topeka & Santa Fe; A. Robertson, federal manager, Missouri Pacific; N. D. Maher, regional director, Pocahontas region; W. J. Fripp, general manager, New York Central Lines East, and F. N. Pease, chief chemist, Pennsylvania Railroad. Those members holding over were: J. E. Gorman, federal manager, Chicago, Rock Island & Pacific; A. D. MacTier, vice-president, Eastern Lines, Canadian Pacific; C. H. Ewing, federal manager, Philadelphia & Reading.

Following the annual meeting N. D. Maher, regional director of the Pocahontas region, was re-elected president; W. J. Fripp, general manager, New York Central Lines East, was re-elected vice-president; J. E. Fairbanks, general secretary, American Railroad Association, was re-elected secretary-treasurer and Colonel B. W. Dunn was re-elected chief inspector for the bureau.

Information concerning the Mechanical Section will be found in this issue on page 535.

The Automatic Straight Air Brake is the subject of an exhaustive report by the Bureau of Safety of the Interstate Commerce Commission, covering its investigation of the brake in the early part of 1918, which was submitted to Congress by the Commission on March 4; but the record indicates that the report was not officially received by Congress, as its introduction was prevented by the filibuster during the final session. The investigation was made at the request of Congress, and the report makes a volume of some 2,000 pages. This brake was described in the *Railway Age* of July 26, 1918.

## The Progress of the Alaskan Railroad

### Detailed Explanation Regarding the Cost of Construction and Present Condition of the Work

By Secretary of the Interior Franklin K. Lane

THE FOLLOWING MEMORANDUM by the Secretary of the Interior regarding the progress on the construction of the Alaskan Railroad, was filed in the Congressional Record on February 26 by Representative Kettner of California, in connection with the debate on an appropriation of \$4,002,380 to continue the work on the road. This appropriation was included in the sundry civil bill which was passed by the House but was among the bills the Senate failed to pass before adjournment and the lack of appropriation will delay the work.

The Alaskan Railroad, which is under construction from Seward to Fairbanks, is about two-thirds done. It has been built without graft; every dollar has gone into actual work or material. It has been built without giving profits to any large contractors, for it has been constructed entirely by small contracts or by day's labor. It has been built without touch of politics; every man on the road has been chosen exclusively for ability and experience. It has been well and solidly built as a permanent road, not an exploiting road. It has been built for as little money as private parties could have built it, as all competent independent engineers who have seen the road advise.

In the summer of 1918 I sent Edwin F. Wendt, of the Interstate Commerce Commission, in charge of valuation of the railroads of the United States from Pittsburgh to Boston, to make an investigation into the manner in which the Alaskan Railroad was constructed and its cost. He reported to me as follows:

"In concluding, it is not amiss to again state that after the full study which was given to the property during our trip we are satisfied that the project is being executed rapidly and efficiently by men of experience and ability. It is believed that it is being handled as cheaply as private contractors could handle it under the circumstances."

The road has not been built as soon as expected because each year we have exhausted our appropriation before the work contemplated had been done. We could not say in October of one year what the cost of anything a year or more

later would be, and we ran out of money earlier than anticipated. It has not been built as cheaply as expected because it has been built on a rising market for everything that went into its construction from labor, lumber, food supplies, machinery, and steel to rail and ocean transportation. I believe, however, it can safely be said that no other piece of government construction or private construction carried out during the war will show a less percentage of increase over a cost that was estimated more than four years ago.

The men have been well housed and well fed. Their wages have been good and promptly paid; there has been but one strike and that was four years ago and was settled by Department of Labor experts fixing the scale of wages. The men have had the benefit of a system of compensation for damages like that in the Reclamation Service and Panama Canal. They have had excellent hospital service, and our camps and towns have been free of typhoid fever and malaria. That the men like the work is testified by the fact that hundreds who "came out" the past two years attracted by the high wages of war industries, are now anxious to return to Alaska, and for them and in the interest of the Territory, I think we should have a large enough appropriation to speedily complete the road.

There has been but one set-back in construction and that was the washing out of 12 miles of track along the Nenana river. This is a glacial stream which, when the snows melt, comes down at times with irresistible force. In this instance it abandoned its long accustomed way and cut into a new bed and through trees that had been standing for several generations, tearing out part of the track which had been laid. But this damage has been repaired and the road relaid in what is thought to be a safer place. Such accidents may be expected on any road laid through the western mountains. There is not a single railroad from the Copper River road in Alaska to the Southern Pacific in Arizona which has not been closed for weeks, and sometimes months at a time, because of such washouts. Nor is there a western railroad

which has not been compelled to relocate scores and scores of miles of track.

### Alaskan Engineering Commission

The credit for the work done is to be given to the men and to the Alaskan Engineering Commission who have had charge of construction. This commission consisted of Mr. Edes, Lieut. Mears, United States Army, and Mr. Riggs. The work of locating and constructing the road has been left in their hands entirely. The only instruction which they received from me was that they should build the road as if they were working for a private concern, selecting the best men for the work irrespective of politics or pressure of any kind. I have not asked them to appoint one man. As a result we have a force that has been gathered from the construction camps of the Western railroads, made up of men of experience and proved capacity. That they have done their work efficiently, honestly, and at reasonable cost is my belief.

### Road Constructed

The road as projected is to run from Seward to Fairbanks, a distance of 471 miles. In addition there is a line to the Matanuska coal fields (completed) of 38 miles. The southern end of the road is the old Alaska Northern, running for 71 miles north of Seward, which was bought. The northern end of the road is a part of the old Tanana Valley Road (7 miles), leading directly into Fairbanks, which was also bought. (This was part of a line 44½ miles long running out of Fairbanks, but 37 miles of this road is not counted in any mileage figures here given.)

Between the 71 miles of the Alaska Northern on the south and the 7 miles of Tanana Valley road on the north there was

A Natural Water Tank Used to Water Locomotives

a stretch of 393 miles to be built through a waste. Of this there has been built 206 miles of main-line track, leaving 187 miles of this direct road from Seward to Fairbanks to be yet constructed. But of this stretch 48 miles have been cleared and graded, ready for track, and 30 miles have been cleared. In addition, the Matanuska line running into the Matanuska coal field, 38 miles, has been completed.

So that out of the total of road projected of 509 miles, there has been fully constructed all but 187 miles. And of this 78 miles of right of way have been either cleared and graded or cleared. There has also been constructed 30 miles of yard tracks, switches, sidings, etc., not included in the main-line mileage given above.

The total of track built amounts to 274 miles, this is made

up of 244 miles of main-line track and 30 miles of siding. A full statement of the road constructed and purchased is as follows:

Miles of road constructed .....	244.0
Miles of yard tracks, etc. ....	30.0
Alaska Northern, purchased .....	70.9
Tanana Valley, purchased .....	44.4
Total .....	389.3

### Cost Per Mile

It is not possible during the construction of a railroad to tell what it costs per mile, because all the foundation work, the construction of bases from which to work, the equipment for construction, and much of the material is a charge which must be spread over the entire completed line. If the cost per mile is figured when but a few miles of road have been

Approaching Tunnel on the Seward Division

built, it might be said to cost a million dollars a mile. This road four years ago could be said to have cost ten times as much per mile as it could be said to cost to-day. So that as to an uncompleted road the best estimate of cost is one that is approximate.

The best estimate that can be made to-day as to the newly constructed road is that it has cost between \$70,000 and \$80,000 per main-line mile, or between \$60,000 and \$70,000 per mile of track.

This cost per mile includes the building of the most difficult and expensive stretch of line along the entire route from Seward to Fairbanks—that running along Turnagain Arm, which is sheer rock rising precipitously from the sea for nearly 30 miles. There are miles of this road which have cost \$200,000 per mile. Even to blast a mule trail in one portion of this route cost \$25,000 a mile.

This cost per mile is increased by reason of the fact that it includes the expense of 48 miles of clearing and grading new right of way and of 30 miles of additional clearing and 30 miles of yard tracks, sidings, and switches.

The basis for the estimated cost of the main-line mileage above given is a table prepared by Mr. Wendt, of the Interstate Commerce Commission, as an expression of the correct deductions from total expenditures that should be made in arriving at cost exclusive of equipment and terminals which are necessary to the road as a going concern and whose cost should be spread over the whole road when completed.

The new construction exclusive of sidings, as we have seen, is 244 miles. The total which has been appropriated for the road is \$31,086,684. Of this amount there was a balance on hand December 31, 1918, of \$1,214,407, thus making the amount expended \$29,876,277.

But all of this has not gone into new construction. Much

of it has gone into the purchase of the old roads referred to (Alaska Northern and Tanana Valley) and their partial rehabilitation, to the construction of two permanent towns (Anchorage and Nenana) as termini, for rolling stock, material, and supplies on hand, etc.

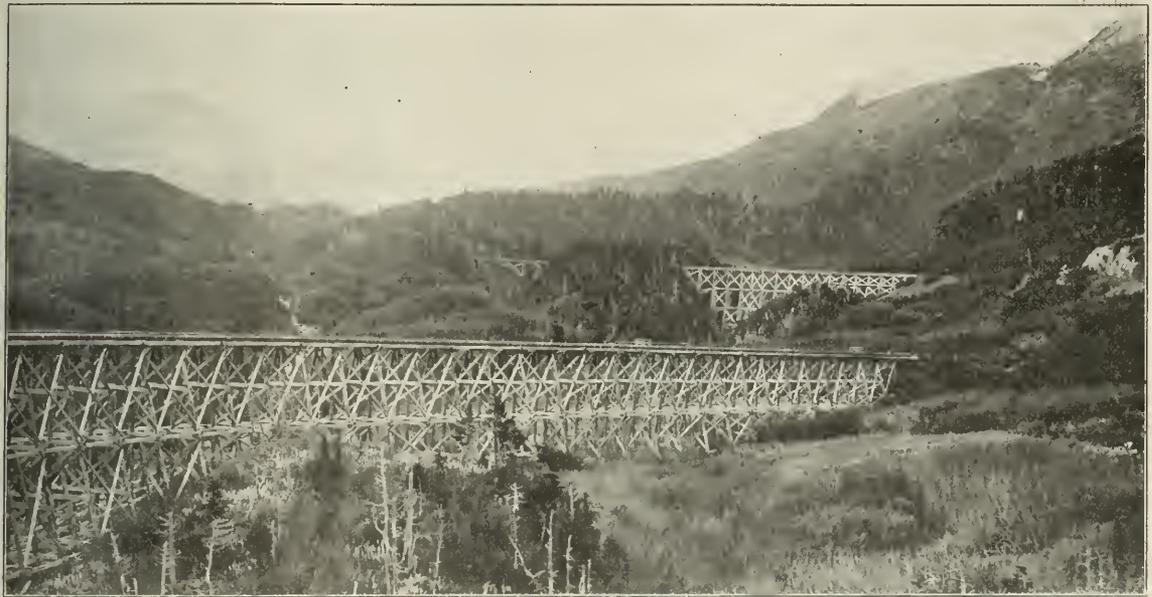

The full table of deductions made by Mr. Wendt is as follows:

Purchase Alaska Northern Railroad.....	\$1,157,839
Its rehabilitation, repair, etc.....	2,403,564
Purchase Tanana Valley Railroad.....	300,000
Its rehabilitation, etc.....	46,407
Material and supplies on hand and in transit.....	2,889,249
Operation and maintenance expense.....	628,627
Town site expenditures (reimbursable in part).....	364,731
Rolling stock for use in operation, consisting of locomotives, freight cars, passenger cars, etc.....	570,741
Construction equipment, consisting of steam shovels, ditchers, unloaders, scrapers, etc.....	1,382,137
Marine equipment.....	244,058
Coal mines.....	193,725
New wharf at Anchorage.....	123,618
Shop and plant machinery.....	126,703
Machine shops, engine houses, etc.....	218,314
Plants at Anchorage and Nenana, consisting of office buildings, storehouses, quarters for employees, mess houses, hospitals, heating and lighting plants, freight-handling machinery, etc....	1,538,947
	<hr/>
	\$12,129,662

If now we deduct this amount, which should be excluded as not properly chargeable to construction cost of new main

would have had it as salvage. Much of it would have had to be bought for the maintenance of the road after completion. Whether it will be worth what it cost or how much less at that time is a question no one can answer. This is also true as to marine equipment.

The two termini which have been built at Anchorage and Nenana are permanent towns. They were built not as construction camps, but with a view to the necessities of the road in the future, as permanent parts of a working railroad, and would have had to be built after construction was completed in order to properly operate and maintain the road. It is to be noted that this work has been undertaken in a region where it was necessary to build through a forested wilderness, where there were no wharves at the water's edge (where, indeed, a way had to be dredged from the channel to the wharf); where there were no roads, no towns, no experienced labor, and where everything had to be imported a distance of from 1,500 to 5,000 miles. And it was thought best to build not a mere pioneer road like those that are driven into our western forests for the bringing out of lumber or for the reaching of some coal or gold mine; but a road that would attract passenger travel for its scenic beauties and be always the main connecting line between the interior of Alaska and the

Trestle Work on the Seward Division

line road from the total amount expended, the result is as follows:

Amount expended.....	\$29,872,277
Less deductions.....	12,129,662
Cost of newly constructed road.....	\$17,742,615
Cost per main line of track.....	72,716

If the sidings and yard tracks are included, the cost per mile of track would be approximately \$64,754. (No allowance is made for the 78 miles of grading and clearing.)

In arriving at his cost per mile Mr. Wendt has deducted as part of his cost construction equipment which cost \$1,382,137, consisting of steam shovels, ditchers, unloaders, scrapers, and other tools. This was in large part bought in the first year of the work partially from the Panama Commission, and is in the opinion of Mr. Wendt worth as much today as when purchased, owing to the increase in values since the war. Its value evidently is what it would bring on the completion of the road. Had private contractors built the road they

ocean. For this reason the work has been done not with the end of having so many miles of road built but of having a complete road with all the equipment for its operation, which includes not only cars, locomotives, and tracks, but complete and well-supplied bases and developed miles for fuel.

Two estimates were made in 1914 by the Alaskan Engineering Commission as to the cost of the road: (1) From Portage Bay to Fairbanks, at an estimated cost of \$59,742 per mile; (2) from Seward to Fairbanks, in which the figure estimated for the road from Kern Creek, or mile 72 north, where all of the new construction has been done, was \$55,340 per mile.

The only government-built railroad—that across the Isthmus of Panama—cost \$221,052 per mile. The only two recently built railroads in the United States are (1) the Virginian, built by H. H. Rogers, which cost, exclusive of equipment, \$151,000 per mile, with labor at from \$1.35 to \$1.75

per day, and all machinery, fuel, rails, and supplies at its door, and (2) the Milwaukee line to Puget Sound, which is estimated as having cost \$130,000 per mile, exclusive of equipment.

**Present Condition**

The work has been conducted with its main base at Anchorage, which is at the head of Cooks Inlet. This point was chosen as the nearest point from which to construct a railroad into the Matanuska coal fields. That was the primary objective of the railroad, to get at the Matanuska coal. From Anchorage it was also intended to drive further north through the Susitna Valley and across Broad Pass, and to the south along Turnagain Arm toward the Alaska Northern track. To secure coal for Alaska was the first need. So, in addition to Anchorage as a base, one was also started at Nenana, on the Tanana River, from which to reach the Nenana coal fields lying to the south. If these two fields were open one would supply the coast of Alaska and one the interior. This program has been acted upon, with the result that the Matanuska field is open to tidewater, with a down-grade road all the way. The Nenana road has been pushed far enough south to touch a coal mine near the track, which may obviate the immediate necessity for reaching into the Nenana field proper. From Seward north and from Anchorage south the road has been built, so that last fall there was through communication from Seward to Anchorage, Matanuska, and the Susitna Valley.

There is an open stretch across Broad Pass to connect the Susitna Valley with the road coming down from Nenana,

Rock Cut and Tunnel on the Seward Division

and another reach of a few miles on the north of the Tanana River before connecting with the Tanana Valley road outside of Fairbanks. These gaps closed there will be through connection between Seward and Fairbanks.

**Overhead**

The road has been built by men on the job in Alaska, not by men in Washington. The only bureau maintained in Washington consisted of four clerks in one room. All the rest of the force is in Alaska with the exception of the purchasing division in Seattle.

The commission adopted the system of construction approved by the most competent engineers consulted at the beginning of construction—a combination of letting out the work to small contractors and of day's labor. The only contractor who ever talked of building the road asked a guar-

antee against loss from the government—what we now know as a "cost plus contract"—and as this would involve a large staff of government superintendents and checking officials, with no guarantee of a minimum cost to the government, but every reason to believe that a maximum cost would be reached, it was thought wise to follow the course we have pursued. As the price of labor, supplies, and other things have risen, we have not had to pay a contractor a percentage on the increasing cost.

In 1918 the wage employes numbered 3,329 and the salaried employes 725. The road has 1,982 wage employes and 441 salaried employes, as estimated for in the book of estimates for 1920.

**Rates**

It is difficult to know what rates should be charged on such a railroad as this, which is as yet in the process of building, which originates so little traffic as to be negligible, and

Some of the Traffic Possibilities

will not in all likelihood for some years pay operating and maintenance charges, without any return on investment. Plainly, the traffic can not be made to bear charges that would be reasonable from the standpoint of making the railroad pay its own way. To do this would be to retard the growth of Alaska and of the railroad itself. The freight rates on the Alaska Railroad are from 25 to 50 per cent of the rates charged by other Alaska roads. The Copper River and the Skagway roads charge from twice as much to four times as much as does the government road. If, therefore, there is anything in the test so often applied by the Interstate Commerce Commission in judging of the reasonableness of a rate by the rates charged on similar traffic on neighboring roads, the rates on the Alaska road certainly meet that test.

The rates now in force on the Alaska road are approximately the same as those which the Railroad Commission of the State of Washington approved on the Seattle, Port Angeles & Western Railroad between Maynard and Majestic a distance of 60 miles, as the following comparison furnished by the Interstate Commerce Commission shows:

Commodities	Government railroads Per ton	Seattle, P. A. & Western R. R. Per ton
Household goods .....	\$6.40	\$13.80
Canned goods .....	9.80	9.30
Flour .....	9.80	9.30
Eggs .....	13.80	11.50
Dried fruits .....	9.80	10.50
Fresh fruit .....	16.20	13.80
Meat, cured .....	9.80	9.30
Kerosene .....	11.40	10.50
Sugar .....	9.80	9.30
Vegetables .....	16.20	20.70
Butter .....	13.80	11.50
Hardware .....	13.80	11.50

It would hardly be regarded as unfair to say that on the Alaskan road the rates should be twice as high as on the main line of the Northern Pacific in Washington, considering the fact that the Northern Pacific has several hundred thousand times the density of traffic per mile that the Alaskan Railroad has. Yet a comparison of the two rates shows that the rates on the Alaskan road are not that high by from 25 to 50 per cent. They are, indeed, but a small percentage higher than many of the rates on the Southern Railway running immediately out of this city, which carries in any one hour more traffic than the Alaskan road carries in a year. I am satisfied, however, that the rates in existence on the Alaskan road are not those which will best promote the interest of the Territory and in the end that of the road. And last summer I asked E. O. McCormick, vice-president of the Southern Pacific in charge of traffic, to make a study of the actual conditions in Alaska with the purpose of devising a simpler tariff which would induce whatever traffic could be induced to move over that road and still preserve some justifiable relation between commodities. This is not an easy task. And there must be some experiments tried before anything like a stable schedule can be arrived at.

**Water Transportation**

One of the serious disadvantages that any new enterprise in Alaska suffers under is the long distance by water which all machinery and supplies must be carried. During the war this has been particularly embarrassing in the carrying on of this work. Because of the highness of the rates charged and the uncertainty of the movement, the commission gave over employing the regular lines and chartered a transport from the War Department which ran from Seattle to Anchorage for two seasons. This service is invaluable to the railroad. While we were without it last season, some such arrangement must be renewed if the railroad is to be completed at as fair a figure as has been thus far maintained. Some months since negotiations were entered into with the Shipping Board looking to the establishing of a line between Puget Sound and Alaskan ports which would serve the railroad, or at least to the putting on of a single boat to Anchorage and Seward. The board offered to charter to the commission a new steel ship at \$25,000 per month, which was thought to be too high a figure, and negotiations are still under way in the hope that this offer can be bettered.

**Matanuska Coal**

By decisions of the Commissioner of the Land Office all of the claims in the Mantanuska coal field were set aside, and by act of Congress a leasing bill was put into effect over the entire field. Under this law a number of claims must be reserved to the government. The field was surveyed and some of the most promising portions of the field have been so reserved.

Two leases have been entered into by the government. Neither of these parties have any other interests of any kind, so far as is known, in Alaska or any connection with any railroad, and neither of them have been successful in developing any large amount of coal. There are many thousands of acres in this field which are open for lease and which will be leased to any responsible parties who will undertake their development. There is no possibility of monopolizing this field, even if some one wished to do so, for the government reserves are kept to be operated in case such monopoly should arise. Thus far, however, the government in operating its own mine has been no more successful than the private lessees, for the coal is so badly broken and faulted that exploration work to follow the seam must be undertaken before development work can be wisely done. And this is being undertaken. Government experts who have examined this field do not promise without further exploring a larger output of coal from this field than 150,000 tons a year.

**Population**

The population of Alaska has fallen off during the war. She sent, I am told, 5,000 men into the Army, the largest proportion to population sent by any part of the United States. The high cost of labor and materials closed some of the gold mines, and the attractive wages offered by war industries drew labor from Alaska to the mainland. All prospecting practically closed. But with the return of peace there is evidence of a new movement toward that Territory, which should be given added confidence in its future by the completion of the Alaskan railroad.

**Interstate Commerce Commission  
Accident Bulletins**

**A**CCIDENT BULLETIN NO. 66 for the quarter and the year ending December 31, 1918, and Bulletin No. 67 for the quarter ending March 31, 1918, have just been published by the Interstate Commerce Commission. The annual bulletin differs in numerous respects as to size, contents and arrangement from prior yearly reports. The present report, and the two last preceding, are summarized as follows:

CASUALTIES TO PERSONS, 1916 AND 1917

Item	Year ended Dec. 31, 1917		Year ended Dec. 31, 1916		Year ended June 30, 1916	
	Killed	Injured	Killed	Injured	Killed	Injured
<b>Passengers</b>						
In train accidents.....	131	4,460	111	3,651	141	3,850
Other causes .....	212	3,914	180	4,357	142	4,529
<b>Total .....</b>	<b>343</b>	<b>8,374</b>	<b>291</b>	<b>8,008</b>	<b>283</b>	<b>8,379</b>

Annual table No. 61, dealing only with train accidents (which term here includes crossing accidents, where trains strike automobiles, etc.) shows for the year 131 passengers, 451 employees and 109 other persons killed, and 4,460 passengers, 4,289 employees and 473 other persons injured; a total of 691 persons killed and 9,222 injured. The term "other persons" does not include trespassers; these are shown in another table.

Annual table No. 104 is a summary of highway grade crossing accidents, showing by states with reference to Class 1 roads the number of such accidents and the resulting casualties. The total number of highway grade crossing accidents involving non-trespassers was 3,673; number of persons killed, 1,777; injured, 4,356.

The summary by states of accidents resulting in casualties

to trespassers shows the trespassers classified as between employees, persons under 14 years of age, from 14 to 21 years of age, and adults, which are further subdivided between hoboes or tramps and other adults. This table covers 7,813 train and train service accidents, and of the trespassers killed no less than 149 were employees. Of trespassers walking along the track, 189 were hoboes, while 991 were "other adults." Of those killed riding on trains, 259 were hoboes,

while 422 were other adults. Annual table No. 60 shows that the number of train accidents per million locomotive miles was 10.22 and that the damage to cars, engines and roadway, was \$15,181,810.

First Quarter, 1918

Bulletin 67, for the quarter ending with March, 1918, shows for train accidents and train service accidents, 109

passengers, 869 employees and 1,145 other persons killed, and 2,008 passengers, 13,306 employees and 1,883 other persons injured. Of the 109 deaths of passengers 61 were due to train accidents. The details, including also 163 killed and 28,188 injured in "nontrain accidents," are shown in the table on the preceding page.

Both of the bulletins have appendices containing reports

of train accidents which have been investigated by the Bureau of Safety. Bulletin No. 66 has 30 pages of this matter, and Bulletin 67 has 24 pages. Among the prominent accidents included in this list are Spartanburg, S. C., October 17, 1917; Caribou, Me., February 5, 1918; Frost, S. C., February 25, 1918; Elizabethtown, Pa., March 15, 1918.

## Doings of the United States Railroad Administration

### Regrouping of Lines to Restore Pre-War Conditions—Automatic Train Control Committee Makes Progress

**T**HE DIRECTOR GENERAL has issued a circular, effective March 1, transferring the St. Louis-San Francisco line (between Memphis and Birmingham) from the Southern to the Southwestern region, the Illinois Central line (north of Cairo and Paducah) from the Central Western region to the Southern region, also the following railroads from the Southwestern to the Central Western region: Chicago, Rock Island & Gulf, Chicago, Rock Island & Pacific (from St. Louis to Kansas City, Herington to Salina and all lines south and east of main line between Herington and Tucumcari), Ft. Worth & Denver City, Wichita Valley, Wichita Falls & Oklahoma, and Abilene & Southern.

These changes are being made in the interest of restoring pre-war conditions.

Hale Holden, regional director of the Central Western region, is placing the part of the Rock Island Lines transferred from the Southwestern to the Central Western region under the jurisdiction of the federal manager of the Rock Island. He is also placing the Ft. Worth & Denver City, the Wichita Valley, the Wichita Falls & Oklahoma, and Abilene & Southern, under the jurisdiction of the federal manager of the Colorado & Southern.

B. F. Bush, regional director of the Southwestern region, is regrouping some of the lines in that region as mentioned elsewhere in this issue.

#### Rules for Disposition of Grain Claims

Director General Hines has issued General Order 57-A modifying General Order No. 57, referring to the disposition of claims for loss or damage of grain loaded in bulk, which had aroused opposition on the part of many shippers.

The director general states in the order that the rules established by General Order No. 57 were adopted as administrative regulations and were not intended in any way to change or alter any existing rule of law. The original order is modified by eliminating reference to a number of disputed questions including payment for the installation of grain doors, liability for leakage through grain doors and the use of the hammer test in determining whether a car is grain tight. These matters are left to the Interstate Commerce Commission for decision in a proceeding now pending before the commission.

The new order is as follows:

Rules Governing the Inspection, Selection and Coopering or Rejection of Cars for Bulk Grain Loading, the Recording of Loss of Grain from Car by Leakage (if any) During Transit, and the Disposition of Claims for Loss and Damage of Grain.

General Order No. 57, issued November 28, 1918, is hereby amended to read as follows:

Claims on grain shipped in bulk constitute a large proportion of loss and damage claims. Some of the widely varying practices of both shippers and carriers with respect thereto are of doubtful propriety, and in many cases result in undue preference and unjust discrimination.

This condition may be attributed largely to the great number of intricate factors entering into the grain business; the condition of scales and weighing practices, which, in many instances, result in weights of doubtful accuracy. Grain in bulk is sometimes loaded at large terminal elevators

where so-called official weights are obtained; in other instances, at country elevators where weights are obtained on small scales in many drafts; and in other instances where scale weights are not used but loading weights obtained on measurement basis; and at some points where no elevators are located, grain is weighed over wagon scales, loaded into cars and the sum of the wagon scale weights used to represent the amount shipped.

Destination weights are arrived at in as many different ways as the loading weights, but, as a general rule, the bulk of the grain shipped is destined to terminal markets where official weights are secured, and the differences between those loading and destination weights constitute the basis of claims, although losses resulting from the taking of samples for inspection purposes and the failure of consignee to unload all the grain and other wastage, over which the railroad has no control, are not taken into consideration or accounted for.

At the present time there is a lack of uniformity in the disposition of grain claims. It is intended to clear up this situation and to dispose promptly of such claims as come within the rules hereinafter set forth.

The following rules shall apply until superseded by others that may be adopted as a result of investigation and study of the subject now being carried on by carriers and shippers in connection with the Interstate Commerce Commission.

These rules are adopted as administrative regulations, and they are not intended in any way to change or alter any existing rule of law:

**Rule 1.—Selection of Cars for Loading.**—Suitable cars will be furnished for bulk grain loading. (See definition.)

**Definition.**—A suitable car for bulk grain loading is one that is grain tight and fit, or can be made so at time and place of loading by ordinary and proper care in use of cooperage material and by a reasonable amount of cleaning.

**Rule 2.—Rejection by Shipper.**—While carriers are expected to furnish suitable equipment, the shipper should reject a car which is manifestly unfit for the loading intended.

Shippers should not load bulk grain in a car with door post shattered or broken, or with other defects of such character as to render car obviously unfit, or with inside showing the presence of oil, creosote, fertilizer, manure, coal or other damaging substance of like or kindred character.

**Rule 3.—Cooperage.**—Grain doors, or grain door lumber of proper quality and dimensions, to cooper side and end doors and other openings of cars used for bulk grain loading, and accessories such as nails, paper, cheese cloth, burlap or similar material for caulking or lining cars, required to prevent loss of grain by leakage, shall be supplied by the carrier, installation to be in accordance with existing rules and practices until changed by competent authority.

**Note 1.**—Carrier's agent at loading station will ascertain the number of temporary sectional grain doors, or the number of feet (board measure) of grain door lumber used to cooper the car and the approximate weight thereof, and note same on waybill.

**Note 2.**—Should the carrier's supply of grain door material run short, local agent will promptly notify his superintendent, who will immediately send the required material or authorize local agent to purchase a supply to take care of the emergency.

**Note 3.**—Shippers or consignees must not appropriate carriers' grain doors or grain door material, neither shall they use the same without specific authority from the carrier.

**Rule 4.—Consignor, Consignee or Owner Required to Load and Unload Carload Freight.**—Except as otherwise provided by tariff, owners are required to load into or on cars, grain carried at carload ratings, and consignee or owner is required to unload the car, which includes the removal of entire contents, including sweeping of the car. Loading includes adequate securing of the load in or on car; also proper distribution of the weight in the car by trimming or leveling.

**Rule 5.—Shipping Weights.**—While shipper weighs the grain for shipment, he shall furnish the carrier with a statement of the car initials and number, total scale weight, the type and house number of the scale used, the number of drafts and weight of each draft weighed, the date and time of weighing, and state whether official Board of Trade, Grain Exchange, State or other properly supervised shipping weights; also state number and approximate weight of grain doors used. This information shall be furnished as soon as practicable, forwarding of car not to be delayed for this record.

**Rule 6.—Destination Weights.**—Consignee shall furnish the carrier with a statement of the car initials and number, the total scale weight, the type and house number of the scale used, the number of drafts and weight of each draft weighed, and date and time of weighing, and state whether official Board of Trade, Grain Exchange, State or other properly supervised unloading weight.

WASHINGTON, D. C.

**Rule 7.—Leakage or Damage Record.**—If damage to or leakage of grain is detected while in carrier's possession, the necessary repairs must be made to prevent further loss or damage, and a complete record made thereof. In case of a disputed claim, the records of both carrier and claimant on said car shall be made available to both parties.

If shipper, consignee, owner or his or their representative should discover leakage of grain from car, he must immediately report the facts to carrier and afford reasonable opportunity for verification.

**Rule 8.—Claims for Loss.**—(a) **Clear Record Cars.**—If, after thorough investigation by the carrier, no defect in equipment or seal record is discovered, such record shall be accepted as prima facie evidence that the carrier has delivered all of the grain that was loaded into the car. If, however, evidence is produced by the claimant showing a defective record, such evidence shall be investigated, and where sustained, the car shall be considered a defective record car. (See paragraph b.)

(b) **Defective Record Cars.**—Where investigation discloses defect in equipment, seal or seal record, or a transfer in transit by the carrier of a car of grain upon which there is a difference between the loading and the unloading weights, and the shipper furnishes duly attested certificates showing correctness of weights, and the carrier can find no defect in scale or other facilities and no error at points of origin or destination, then, the resulting claim will be adjusted subject to a deduction of one-eighth of one per cent of the established loading weight as representing invisible loss and wastage.

**Note 1.**—Transfer in transit, as referred to in Section "b" of this rule, is a transfer for which the railroad is responsible, and not a transfer because of a trade rule or governmental requirement, or because of orders of consignor, consignee, owner or their representative.

**Freight Traffic Movement and Car Performance**

Net ton miles of freight handled by the railroads under federal control during January amounted to 30,383,169, an increase of 10 per cent as compared with January, 1918, when

the movement was very slow on account of congestion and severe weather. The table shows a summary of the report of freight traffic movement and car performance compiled by the Operating Statistics Section.

**Automatic Train Control Committee Makes Progress**

The Committee on Automatic Train Control at its meeting in Washington on February 28 continued its work of passing on the various devices which had previously been submitted to the Interstate Commerce Commission and a few new ones submitted to the committee; and eliminated from consideration about 40 which are not considered to possess sufficient merit to warrant further study. The committee still has before it about 40 devices, of which many have been passed on and will receive no further consideration unless the proprietors wish to submit additional information. The committee has now reached a stage where it can give more detailed consideration to the devices which have been developed and given an experimental or service test, and its next meeting will probably be in connection with a western trip for the purpose of examining on the ground several devices that have been installed. It is proposed to examine the system in operation on the Chicago & Eastern Illinois between Chicago and Danville on March 21 or 22, after which the committee will inspect the system in operation on the Wash-

ington Water Power Company's line near Spokane, Wash., that on the Key Route interurban line near San Francisco, the test installation on the Western Pacific at Oroville, Calif., and possibly others. Train control systems installed in the east will be visited on a later trip or trips.

#### Rules Governing Issuance of Passes

W. T. Tyler, director of the division of operation, has issued the following instructions governing the issuance of transportation to corporate officers, employees and their families:

1. Federal managers are authorized to issue *annual* or *trip* transportation to corporate officers, employees and their families, over the railroad with which they are connected, upon request from the chief executive officer of the corporation. The federal managers upon request from the chief executive officer may also request off line trip transportation for corporate officers, employees and their families direct from federal managers of the line over which they desire to travel.

2. Off line *annual* transportation desired by corporate officers, employees and their families should be requested of the director, division of operation, Washington, D. C., by the chief executive officer of the corporation.

The following instructions will govern the issuance of transportation to directors:

1. Annual transportation for directors, good only over line or lines of which they are directors, will be issued by director, division of operation, Washington, upon request of chief executive officer of the corporation.

2. It is not permissible for federal manager to issue trip transportation for directors on home line.

3. It is not permissible for federal managers to request or secure from other federal managers off line trip passes for directors.

4. As passes for dependent members of the families of directors cannot be furnished, requests should not be made.

#### Monthly Traffic Report to Be Compiled

The Railroad Administration has taken steps to keep itself fully and accurately posted this year regarding the tendency as to the volume of freight traffic and the revenues therefrom. To the end that the Division of Traffic may be fully advised, Director General Hines has issued General Order No. 59, providing that effective with waybills settled after the close of December, 1918, accounts, Class I carriers shall compile and render during the period of federal control monthly reports showing the number of carloads separately as to the 58 principal classes of commodities and all l. c. l. freight, also the number of tons and the total revenue. Special blanks have been provided for this purpose, and the order gives specific definitions and instructions as to reporting the information called for. Shipments moving under any-quantity rates are to be counted as carloads when they weigh 10,000 pounds or more. The tonnage and revenue to be reported are the tons and total revenue shown on the waybills compiled by each carrier from the audited records. In addition to showing the volume of traffic and the revenue, the reports are also to show the movement of the traffic by points of origin and of destination, between points within the same state, between each state and the District of Columbia and each other state, and between each state and the District of Columbia and Mexico, Canada and all other foreign countries. To serve as a corrective, a special report will be required from carriers accepting and forwarding carload grain from terminal elevators. The reports are to be compiled monthly and forwarded to the Bureau of Statistics of the Interstate Commerce Commission on or before the last day of the second month succeeding that for which they are compiled. No other freight traffic statistics are to be compiled by accounting officers except those re-

quired by the Interstate Commerce Commission annual report except by special permission from the director of accounting.

#### Handling of Claims

The Division of Accounting has issued Accounting Circular No. 76, which provides that in order to bring about uniformity in investigation, checking and apportioning overcharge and agency relief claims, in compliance with General Order No. 55, the following rules and practices shall be put in effect at once:

1. Overcharge claims incident to refining, milling, stopping, storing, fabricating, and other similar service in transit should be presented to the carrier granting the privilege for investigation and settlement. No apportionment is to be made of such claims, except that where non-federal carriers participate in the service the adjustment shall be made with such non-federal carriers on the basis of established divisions. Where waybilling and accounting methods, such as waybilling from transit point at balance of through rate, are in effect for the handling of this class of traffic and which protects the proper charges without the presentation of a claim, such practices may be continued. If the amounts assumed under this paragraph constitute a substantial proportion of the revenues of any carrier, the particulars should be brought to the attention of this office.

2. Overcharge claims shall be registered against records in such a manner as will indicate that claim has been presented, and in addition thereto when an initial carrier refunds an overcharge on a collect shipment, or when a destination carrier refunds an overcharge on a prepaid shipment, or when either the initial or destination carrier refunds on account of double collection, a notice giving full waybill reference, claim number, name of claimant, amount paid, and date of payment must be sent to either the destination or initial carrier, as the case may be. The carrier receiving notice shall register on its records necessary information to prevent duplicate payment and to properly adjust Account No. 778, Unrefundable Overcharges.

3. Agency relief claims covering charges on all freight short at destination shall be carefully investigated, and if delivery can not be shown and charges collected, the charges shall be assumed by the settling carrier; provided, however, that carriers not under federal control shall be charged with amounts due from them.

4. Agency relief claims covering charges on freight damaged in transit, refused, or unclaimed, and deficits on account of freight sold shall be carefully investigated, and if amount outstanding is not due from shipper, consignee, or owner of freight, it shall be assumed by settling carrier; provided, however, that amounts due from carriers not under federal control shall be charged in accordance with responsibility.

5. Payments for special services performed, purchases of property, payment of heat, light, and water bills, and other similar items do not in the application of this order come within the meaning of "Relief Claims."

6. Agency relief claims covering charges resulting from the misrouting of freight shall be carefully investigated, and if the charges are not collectible from shipper, consignee, or a carrier not under federal control, they shall be assumed by carrier whose agent is outstanding.

7. When overcharge claims in which non-federal carriers are interested are settled by a federal carrier, the apportionment to non-federal carriers shall be made on the basis of established divisions, the settling federal carrier assuming the entire amount due from or to all federal carriers. When such claims are adjusted by a non-federal carrier, the amounts due to or from all federal carriers shall be settled with the destination carrier. If such carrier be not under federal control, settlement shall be made with the federal carrier that handled the shipment nearest to the non-federal carrier in the direction of destination.

8. Freight confiscated in transit (paragraph 14) does not refer to coal or other freight taken by carriers for their own use, but to freight confiscated by government health departments, revenue officers, or others. Waybills covering such shipments should be reported in interline accounts with freight charges and advances and prepaid, if any. If charges prove to be uncollectible, they should be assumed by settling carrier, except that carriers not under federal control shall be charged with amounts due from them.

9 When in the investigation of overcharge claims it is necessary to obtain rates from other carriers under federal control, the communication shall in all cases be addressed to the accounting officer handling overcharge claims, who shall be responsible for the furnishing of such information.

### Through Service Expenses Need Not Be Apportioned

Accounting Circular No. 75 provides that, effective February 1, it will be no longer necessary to apportion among interested carriers the expense of heating, lighting, cleaning, etc., of passenger train equipment employed in through service over railroads under federal control. A fair proportion of the expenses should be charged against any non-federal road which participates in the through service.

### Division of Inland Traffic

H. P. Anewalt, manager of inland traffic of the Navy Department, has issued a circular stating that the division of inland traffic is about to discontinue its functions under the management of a representative of the Railroad Administration. Transportation matters will continue to be han-

dled by and under the direction of the Bureau of Supplies and Accounts by Navy personnel exclusively. The circular says the division has been of great assistance in reasonably securing the necessary transportation for the successful prosecution of the Navy war program, and pays a tribute to the hearty co-operation of the various departments and bureaus as well as the transportation lines.

### Comparison of Maintenance Work to Be Required

The engineering and maintenance section of the Division of Operation has prepared, and will send out as soon as it is printed, a circular and five blank forms calling for a comparison of the expenditures for maintenance of way and structures to measure the amount of upkeep during the period of federal control as compared with that during the test period. The preparation of these forms has been under discussion for several weeks as to the amount of information required to fully measure the amount of work performed; taking into consideration the difference in unit costs. The accounting section is also preparing to collect somewhat similar data from the accounting standpoint.

## Reorganization of the Southwestern Region

### Extensive Restoration of Former Conditions—Jurisdiction of Many Officers Changed

**A**T THE DIRECTION of B. F. Bush, Southwestern regional director, the lines under his jurisdiction have been re-grouped, placing the constituent properties of the old systems under the same federal managers. Evidently this is the first step in returning the roads to private control. The re-grouping was effective March 1.

LeRoy Kramer has resigned as federal manager of the Kansas City, Clinton & Springfield, the Missouri, Kansas & Texas, the Missouri, Oklahoma & Gulf, the St. Louis-San Francisco and the Paris & Great Northern, on February 28, to become vice-president in charge of production of the Willys-Overland Company at Toledo, Ohio, effective March 1.

J. S. Pyeatt, federal manager of the Abilene & Southern, the Fort Worth & Denver City, the Fort Worth & Rio Grande, the Fort Worth Belt, the Gulf, Colorado & Santa Fe, the Houston Belt & Terminal, the International & Great Northern (Spring to Fort Worth and the Madisonville branch), the Quanah, Acme & Pacific, the Houston & Texas Central, the Texas Midland, the Union Terminal of Dallas, and the Wichita Falls & Northwestern now has under his jurisdiction the St. Louis-San Francisco; the St. Louis, San Francisco & Texas; the Kansas City, Clinton & Springfield; the Fort Worth & Rio Grande; the Brownwood North & South; the Paris & Great Northern; the West Tulsa Belt; the Quanah, Acme & Pacific and the Rock Island-Frisco Terminal. Mr. Pyeatt's headquarters will be in St. Louis, Mo.

C. N. Whitehead, general manager of the Missouri, Kansas & Texas, with headquarters at St. Louis, has been appointed federal manager of the Missouri, Kansas & Texas, the Missouri, Kansas & Texas of Texas (including the Trinity branch and the Beaumont and Great Northern), the Wichita Falls & Northwestern, the Oklahoma Belt and the Missouri, Oklahoma & Gulf.

Alexander Robertson, federal manager of the Arkansas Central, the Louisiana & Arkansas, the Memphis, Dallas & Gulf, the Missouri Pacific, the Natchez and Louisiana Transfer, the Natchez Southern and the St. Louis-Southwestern, now has jurisdiction over the Arkansas Central, the Coal Belt Electric, the Memphis, Dallas & Gulf, the

Missouri Pacific, the Natchez & Louisiana Transfer and the Natchez & Southern.

William Neff, general manager of the St. Louis Southwestern at St. Louis, has been appointed federal manager of the St. Louis Southwestern system with headquarters at Tyler, Tex., and his jurisdiction extended over the Dallas, Terminal, the Eastern Texas, the Southern Illinois & Missouri Bridge, and the Louisiana & Arkansas.

J. L. Lancaster, federal manager at Dallas, Tex., of the Dallas Terminal and Union Depot, the Denison & Pacific Suburban, the Galveston, Houston & Henderson, the Gulf, Texas & Western, the Houston & Brazos Valley, the International & Great Northern (excluding the line from Spring to Fort Worth and the Madisonville branch), the Missouri, Kansas & Texas of Texas (Trinity branch), the St. Louis-Southwestern of Texas, the Texas Pacific, the Trans-Mississippi Terminal and the Weatherford, Mineral Wells & North Western now has jurisdiction over the Denison & Pacific Suburban, the Fort Worth Belt, the Galveston, Houston & Henderson, the Gulf, Texas & Western, the Houston & Brazos Valley, the International & Great Northern, the Texas & Pacific, the Trans-Mississippi Terminal and the Weatherford, Mineral Wells & Northwestern, with offices at Dallas.

The office of district director at Dallas has been abolished and F. E. Pettibone, district director, has been appointed federal manager of the Pauls Valley, Lindsay and Sulphur districts of the Atchison, Topeka & Santa Fe, the Galveston Wharf Company, the Gulf, Colorado & Santa Fe, the Texas Midland, the Union Terminal of Dallas and the Ft. Worth Union Passenger Station, with headquarters at Dallas.

W. B. Scott, federal manager of the Galveston Wharf Company, the Gulf Coast Lines, the San Antonio & Aransas Pass, the San Antonio, Uvalde & Gulf, and the Southern Pacific, Louisiana and Texas Lines, has been appointed federal manager of the Beaumont, Sour Lake and Western, the Galveston, Harrisburg & San Antonio, the Houston & Shreveport, the Houston Belt & Terminal, the Houston & Texas Central, the Houston East & West Texas, the Iberia St. Mary's Eastern, the Iberia & Vermillion, the Lake Charles

& Northern, the Louisiana Western, the Morgan's Louisiana & Texas, the New Orleans, Texas & Mexico, the St. Louis, Brownsville & Mexico, the San Antonio & Aransas Pass, the San Antonio, Uvalde & Gulf, the Southern Pacific Terminal, the Texas & New Orleans and the Trinity & Brazos Valley. Mr. Scott's headquarters will be in Houston, Tex.

J. A. Edson, federal manager of the Joplin Union Depot, the Kansas City, Mexico & Orient, the Kansas City, Mexico & Orient of Texas, the Kansas City Southern, the Midland Valley, the Missouri & North Arkansas, the Houston East & West Texas, the Texarkana & Fort Smith and the Vicksburg, Shreveport & Pacific, becomes federal manager of the Arkansas Western, the Joplin Union Depot, the Kansas City, Shreveport & Gulf, the Kansas City, Mexico & Orient, the Kansas City Southern, the Midland Valley, the Missouri & North Arkansas, the Poteau Valley, the Texarkana & Fort Smith, the Vicksburg, Shreveport & Pacific and the Wichita Union Terminal.

#### Consequent Changes in Subordinate Positions

The change in grouping of the lines in the Southwestern region consequently meant changes in subordinate officers under these federal managers, and immediately upon their appointment each of the six men named issued circulars appointing subordinates for the roads under their respective jurisdiction.

J. S. Pyeatt made the following appointments: B. T. Wood, assistant to the federal manager of the Missouri, Kansas & Texas and the St. Louis-San Francisco, to be assistant to the federal manager of all lines under Mr. Pyeatt's jurisdiction; J. M. Kurn, general manager of the Kansas City, Clinton & Springfield, the Paris & Great Northern and the St. Louis-San Francisco, has had his jurisdiction extended over the West Tulsa Belt, and the Rock Island-Frisco Terminal, with headquarters at St. Louis; O. H. McCarty is appointed general manager of the St. Louis-San Francisco & Texas, the Fort Worth & Rio Grande, the Brownwood North & South and the Quanah, Acme & Pacific, with offices at Fort Worth, Tex.; A. Hilton, assistant traffic manager at St. Louis for the Missouri, Kansas & Texas, and the St. Louis-San Francisco, is appointed assistant traffic manager of the St. Louis-San Francisco, the Kansas City, Clinton & Springfield, the Paris & Great Northern, the West Tulsa Belt and the Rock Island-Frisco Terminal; P. O. Jackson, general baggage agent at Dallas for the Missouri, Kansas & Texas of Texas, is appointed general passenger and freight agent of the St. Louis-San Francisco & Texas, the Fort Worth & Rio Grande, the Brownwood North & South and the Quanah, Acme & Pacific; W. F. Evans, general solicitor for the Paris & Great Northern and the St. Louis-San Francisco, is appointed general solicitor for all lines under Mr. Pyeatt's jurisdiction, with headquarters at St. Louis; F. G. Jonah, chief engineer of the Katy-Frisco lines, retains jurisdiction over the St. Louis-San Francisco, the Kansas City, Clinton & Springfield, the Paris & Great Northern, the West Tulsa Belt and the Rock Island-Frisco Terminal with headquarters at St. Louis and also the St. Louis-San Francisco & Texas, the Fort Worth & Rio Grande, the Brownwood North & South and the Quanah, Acme & Pacific, with headquarters at Fort Worth; G. E. Scott, purchasing agent of the St. Louis-San Francisco, and the Missouri, Kansas & Texas at St. Louis, is appointed purchasing agent for all lines under the jurisdiction of Mr. Pyeatt; H. J. Cornin, auditor of the St. Louis-San Francisco at St. Louis, is appointed federal auditor of the St. Louis-San Francisco, the Kansas City, Clinton & Springfield, the Paris & Great Northern, the West Tulsa Belt and the Rock Island-Frisco Terminal, with headquarters at St. Louis; C. S. Snow, assistant auditor of the Missouri, Kansas & Texas of Texas at Dallas, is appointed auditor of the St. Louis-San Francisco & Texas, the Fort Worth & Rio Grande,

the Brownwood North & South, with offices at Fort Worth; E. M. Smith, auditor of the Kansas City, Clinton & Springfield at Springfield, Mo., continues in that position; T. K. Hawkins is appointed auditor and federal treasurer of the Quanah, Acme & Pacific, with headquarters at Quanah, Tex.; F. H. Hamilton, acting federal treasurer of the St. Louis-San Francisco, is appointed acting federal treasurer of the St. Louis-San Francisco, the Paris & Great Northern, the West Tulsa Belt and the Rock Island Frisco Terminal, at St. Louis; L. C. Wilds is appointed acting federal treasurer of the St. Louis-San Francisco of Texas, the Fort Worth & Rio Grande and the Brownwood North & South, with headquarters at Fort Worth, and R. F. McGlothlan continues as acting federal treasurer for the Kansas City, Clinton & Springfield at Springfield.

For the roads under the jurisdiction of C. N. Whitehead, the following appointments are announced: W. E. Williams, auditor of the Mississippi Eastern at Quitman, Miss., is appointed general manager of all roads under Mr. Whitehead's jurisdiction, with headquarters at Dallas; C. Haile, traffic manager of the Missouri, Kansas & Texas, and the St. Louis-San Francisco, is appointed traffic manager of the Missouri, Kansas & Texas, the Oklahoma Belt, the Missouri, Oklahoma & Gulf, with headquarters at St. Louis, and also traffic manager of the Missouri, Kansas & Texas of Texas, and the Wichita Falls & Northwestern, with headquarters at Dallas; Joseph M. Bryson, general attorney of the Missouri, Kansas & Texas, is appointed general solicitor of all roads under Mr. Whitehead's jurisdiction, with headquarters at St. Louis; E. L. Martin, engineer of maintenance of way of the Missouri, Kansas & Texas at Parsons, Kan., is appointed chief engineer of the Missouri, Kansas & Texas, the Oklahoma Belt and the Missouri, Oklahoma & Gulf with headquarters at St. Louis and also chief engineer of the Missouri, Kansas & Texas of Texas, and the Wichita Falls & Northwestern, with headquarters at Dallas; G. E. Scott, purchasing agent of the Missouri, Kansas & Texas and the St. Louis-San Francisco at St. Louis, has been appointed purchasing agent of all lines under Mr. Whitehead's jurisdiction, with headquarters at St. Louis; J. G. Livengood, general auditor of the St. Louis-San Francisco and the Missouri, Kansas & Texas at St. Louis, is appointed federal auditor of the Missouri, Kansas & Texas, the Oklahoma Belt and the Missouri, Oklahoma & Gulf, with headquarters at St. Louis; O. H. Bower, general auditor of the Fort Worth & Denver City, and the Houston, Belt & Terminal and federal auditor of the Gulf, Colorado & Santa Fe, is appointed auditor of the Missouri, Kansas & Texas of Texas, with headquarters at Dallas. O. B. Womack continues to act as auditor of the Wichita Falls & Northwestern, with headquarters at Wichita Falls, Tex.; C. T. Carson also retains the position of auditor of the Missouri, Oklahoma & Gulf, with headquarters at Muskogee, Okla.; F. Johnson, acting federal treasurer of the Missouri, Kansas & Texas at St. Louis, is also appointed acting treasurer of the Oklahoma Belt; W. O. Hamilton continues as acting federal treasurer of the Missouri, Kansas & Texas of Texas at Dallas; A. W. Eichenberger, local treasurer of the Wichita Falls & Northwestern, is appointed acting federal treasurer of the Wichita Falls & Northwestern, with headquarters at Wichita Falls; W. P. Dewar, corporate treasurer of the Missouri, Oklahoma & Gulf, is appointed acting federal treasurer of the same road, with headquarters at Muskogee, Okla.; V. G. Hopkins is appointed special assistant, with headquarters at St. Louis, of all lines under the jurisdiction of Mr. Whitehead.

W. N. Neff has organized the control of roads under his jurisdiction as follows: J. E. Callahan, superintendent of the Pine Bluff division of the St. Louis Southwestern, is appointed general manager of all lines under Mr. Neff's jurisdiction, with headquarters at Tyler, Tex.; J. P. Park, general freight agent of the St. Louis Southwestern at St.

Louis, is appointed general freight agent of the St. Louis Southwestern and the Southern Illinois and Missouri Bridge, with headquarters at St. Louis; E. W. LaBeaume, general passenger agent of the St. Louis Southwestern at St. Louis, is also appointed general passenger agent of the Southern Illinois & Missouri Bridge; J. F. Lebane is appointed general freight and passenger agent of the St. Louis Southwestern of Texas, the Eastern Texas and the Dallas Terminal and Union Depot, with headquarters at Tyler; B. S. Atkinson continues to act as general freight and passenger agent of the Louisiana & Arkansas at Texarkana, Ark.; Daniel Upthegrove, general solicitor for the St. Louis Southwestern, with headquarters at St. Louis, has had his jurisdiction extended over the Southern Illinois & Missouri Bridge and the Louisiana & Arkansas, with offices at St. Louis; E. B. Perkins, general attorney of the St. Louis Southwestern of Texas is appointed in addition, general attorney of the Eastern Texas and the Dallas Terminal and Union Depot; A. A. Mathews is appointed chief engineer at Tyler of all lines under the jurisdiction of Mr. Neff; C. A. How, purchasing agent at St. Louis for the St. Louis Southwestern, the Arkansas Central, the Louisiana at Arkansas, the Memphis, Dallas & Gulf, the Missouri Pacific, the Natchez & Southern and the American Refrigerator Transit Company, is appointed purchasing agent for all lines under the jurisdiction of Mr. Neff, with headquarters at St. Louis; R. D. Cobb, auditor of the St. Louis Southwestern at St. Louis, is appointed federal auditor of the St. Louis Southwestern, the Southern Illinois & Missouri Bridge and the Louisiana & Arkansas; A. R. Wood, auditor of the St. Louis Southwestern of Texas at Tyler, has had his jurisdiction extended over the Eastern Texas and the Dallas Terminal and Union Depot; W. J. Wright, auditor of the Louisiana & Arkansas Railroad at Texarkana, Ark., continues to act in that capacity; C. Messick, federal treasurer of the St. Louis Southwestern at St. Louis, is also appointed acting federal treasurer of the Southern Illinois & Missouri Bridge; J. W. Hogan, local treasurer of the St. Louis Southwestern of Texas at Tyler, is appointed acting federal treasurer of the St. Louis Southwestern of Texas, the Eastern Texas and the Dallas Terminal and Union Depot, with headquarters at Tyler. W. F. Wright continues as acting federal treasurer of the Louisiana & Arkansas at Texarkana.

The following appointments are made by F. G. Pettibone, to cover all lines under his jurisdiction: W. E. Maxson, general manager of the Fort Worth & Rio Grande, the Fort Worth Belt, the Gulf, Colorado & Santa Fe, the Houston Belt & Terminal, the International & Great Northern (Spring to Fort Worth and Madisonville branch), and the Texas Midland, is to be general manager, with headquarters at Galveston, Tex.; J. S. Hershey, general freight agent of the Gulf, Colorado & Santa Fe and the Texas Midland, is to be freight traffic manager, with offices at Dallas; W. S. Keenan, general passenger agent of the Gulf, Colorado & Santa Fe and the Texas Midland, is to be passenger traffic manager at Galveston; J. W. Terry, general solicitor of the Fort Worth & Denver City, the Fort Worth Belt, the Gulf, Colorado & Santa Fe, the International & Great Northern (Spring to Fort Worth and Madisonville branch), the Missouri, Kansas & Texas of Texas, the Quanah, Acme & Pacific and the Texas Midland, is to be general solicitor, with headquarters at Dallas; F. Meritt, chief engineer of the Fort Worth & Denver City, the Fort Worth & Rio Grande, the Colorado, Gulf & Santa Fe, the International & Great Northern (Spring to Fort Worth and Madisonville branch), the Missouri, Kansas & Texas of Texas, and the Texas Midland, is to be chief engineer, with headquarters at Dallas; R. L. Irwin, purchasing agent of the Galveston, Houston & Henderson, the International & Great Northern (Spring to Fort Worth and Madisonville branch), the Missouri, Kansas & Texas of

Texas (Trinity branch), the St. Louis & Southwestern of Texas and the Texas & Pacific, is to be purchasing agent, with headquarters at Dallas; W. D. McLeod, auditor of the Gulf, Colorado & Santa Fe and the Houston Belt & Terminal, is to be federal auditor, with headquarters at Galveston; T. E. Corley continues to act as auditor and acting federal treasurer of the Texas Midland at Terrell, Tex. A. C. Torbert, local treasurer at Galveston for the Gulf, Colorado & Santa Fe, is appointed acting federal treasurer of the Gulf, Colorado & Santa Fe, the Fort Worth Union Passenger Station, the Union Terminal of Dallas, and the Galveston Wharf Company.

The re-grouping of roads in this region has made necessary the issuing of instructions to the superintendents of the Fort Worth, the Galveston and the San Antonio terminals, who will report respectively to J. L. Lancaster, F. G. Pettibone and W. B. Scott.

The Fort Worth & Denver City, the Wichita Valley, the Wichita Falls & Oklahoma and the Abilene Southern have been placed under the jurisdiction of Hale Holden, regional director of the Central Western region, who in turn has extended the jurisdiction of Robert Rice, general manager of the Colorado & Southern over all departments of these roads. No further changes in connection with these lines have been announced.

In accordance with the regrouping of the lines of the Southwestern region, W. B. Scott has made the following appointments with jurisdiction over the Trinity & Brazos Valley, the Houston Belt & Terminal, the Houston & Texas Central, the Houston East and West Texas and the Houston & Shreveport; G. F. Waid to be general manager; Messrs. Botts, Parker and Garwood to be general solicitors; Gentry Waldo to be traffic manager; I. A. Cottingham to be chief engineer, M. P. Randolph to be purchasing agent and G. R. Cottingham to be federal auditor. L. H. Attwell, Jr., is appointed auditor and G. A. Gandre, acting federal treasurer of the Trinity & Brazos Valley. M. Eckert is appointed auditor and J. H. Lauderdale is appointed acting federal treasurer of the Houston Belt & Terminal. C. B. Udell is appointed acting federal treasurer of the Houston & Texas Central, the Houston East & West Texas and the Houston & Shreveport. The offices of all of these men will be at Houston, Tex.

The St. Louis-San Francisco line between Memphis and Birmingham has been transferred from the Southern to the Southwestern region effective March 1. The Illinois Central lines north of Cairo and Paducah are transferred from the Central Western to the Southern region and the Chicago, Rock Island & Gulf, the Chicago, Rock Island & Pacific (from St. Louis, Mo., to Kansas City, Herington, Kan., to Salina and all lines south and east of the main line between Herington, Kan., and Tucumcari, N. M.), the Fort Worth & Denver City, the Wichita Valley, the Wichita Falls & Oklahoma and the Abilene & Southern are transferred from the Southwestern to the Central Western region.

The part of the Rock Island Line transferred from the Southern to the Central Western region has been placed under the jurisdiction of J. E. Gorman, federal manager of the Rock Island Lines in the Central Western region.

The Brotherhood of Railway Clerks held a southwestern district convention at Houston, Texas, on February 22. This district is composed of the states of Arkansas, Oklahoma, Missouri, Kansas, New Mexico, Arizona, Louisiana and Texas. J. E. Morgan, of Dallas, Texas, president of the Southwestern Federation, presided. The next semi-annual southwestern district convention will be held at New Orleans on August 23.

## Orders of Regional Directors

**SHIPPING DAY GUIDES.**—The regional director of the Allegheny region has issued instructions governing the preparation of consolidated shipping day guides of different roads together with an outline of the procedure which should be followed in analyzing tonnage statistics preparatory to fixing "sailing days" for less than carload freight. At larger stations the traffic movement should be studied for at least twelve days, and at smaller stations thirty days, in order to get reliable data concerning the aggregate volume of tonnage. A consolidated guide for New York city has already been issued, to go into effect on March 10. This is a book of 235 pages, 4½ in. by 10½ in. With this book a shipper has before him in compact form all the data for all of the roads of the city. For example, freight will be taken for Los Angeles on Monday by the Lehigh Valley, pier 34, or the Erie at Harlem Transfer; on Tuesday by the Baltimore & Ohio, at pier 22; on Wednesday, by the New York Central at 37th street; on Thursday by the Lehigh Valley, at pier 34; on Friday by the Baltimore & Ohio, at pier 22, and the Erie at the Harlem Transfer; and on Saturday by the New York Central at 37th street. The delivering road, whichever route is taken, will be the Atchison, Topeka & Santa Fe. For Long Beach, Cal., the instructions are the same except that the delivering company is the Southern Pacific. For San Francisco, shipments may be made every day by three different roads, two of them delivering to the Southern Pacific, and one to the Santa Fe; and on two days in the week the Santa Fe has another route.

**Back Pay as Affecting Monthly Comparisons.**—The regional director, Eastern Region, by his circular of February 21, numbered 1801-22A536, conveys to federal managers the request of the Operating Statistics Section (Washington) for monthly statements for this year, made out to show true comparisons with the same months of 1918. Statements should show actual expenses in each year, but a supplement should be attached giving a restatement of general accounts with allowances for back pay. In reporting unit cost of train service the seven primary accounts must also be restated. For example, for January, 1918, the expenses actually accrued in that month must be given, plus the January proportion of back pay which was paid subsequent to June 1, 1918; while the expenses for these later months should be those actually accrued in that month minus all back pay which is included but is applicable to previous months. Where the comparisons cannot be given with accuracy, close estimates will be accepted.

**Grain Embargo—Primary Market.**—Supplement 11 to Circular 161 of the Central Western regional director similar to Supplement 19 of Circular 34 of the Northwestern regional director, abstract of which was published in the *Railway Age* of February 28 (page 486).

**L. C. L. Sailing Day Plan.**—Circular 178 of the Southwestern regional director directs representatives of railroads who come in contact with shippers and consignees to post themselves as to the merits of the sailing day plan and to overlook no opportunity to discuss it with patrons of the road. Traffic men in particular should keep in touch with the local conditions at local points and co-operate to the fullest extent. This action is to offset adverse agitation by shippers which is due principally to unfamiliarity with the plan. It is the duty of all concerned to give particular attention to the working out of this plan and the handling of merchandise in general at all points to insure, (a) that freight is properly loaded in accordance with the sailing day plan, (b) that cars leave originating terminal on day scheduled to depart, and that under no circumstances must cars be held over for additional tonnage, (c) that shipments move on schedule time to destination.

*Relations Between the Federal Administration and State*

**Commissions.**—In a letter to Northwestern railroads dated February 27, the Northwestern regional director calls attention to general order 58 of the director general and suggests (1) the selection from the staff of employees of one or more persons in each state whose duty it shall be to frequently and not less than once a week call upon the commissioners of that state for the purpose of advising with them, learning whether or not there are complaints as to service or efficiency and adjusting any of those minor matters which intelligent personal attention can ordinarily satisfy; (2) that an agent of the Federal Administration, ordinarily the state attorney, general manager or superintendent, be designated in each state, filing his name and address with the commission, upon whom service can be made as to any pending proceeding; (3) that all officers, agents and employees of the United States Railroad Administration be directed to supply information and render assistance as requested by any state commission. In all matters of doubt or unusual importance advise with the regional director. Copies of all notices and reports of complaints and the progress of same must be furnished to the regional director who desires to keep in touch with all proceedings before the state Commissions.

**Stored Equipment.**—The Northwestern regional director File 57-1-27 calls attention to the necessity for such action as seems appropriate to protect from fire empty cars standing in storage yards. A letter is quoted from Charles N. Rambo, manager of the fire loss and protection section, of the Division of Finance and Purchases, citing the article in the "Manual of Fire Protection on Railroad Property" on pages 34 and 35 entitled "Fire risk in connection with storage or concentration of cars on sidings, in yards, or at terminals."

**United States Employment Service Posters.**—File 3-1-21 of the Northwestern regional director similar to Supplement 2 to Circular 67 of the Southwestern regional director, abstract of which was published in the *Railway Age* of February 28 (page 486).

**Telegrams Sent Over Railroad Wires.**—Circular 242 of the Central Western regional director similar to Order 156 of the Southwestern regional director, abstract of which was published in the *Railway Age* of February 14 (page 393).

**Transportation of Directors, Corporate Officers and Employees.**—Order 109 Supplement 13, Cancelling Supplement 11 of the Southwestern regional director similar to Supplement 14 to Circular 29 of the Central Western regional director, abstract of which was published in the *Railway Age* of January 10 (page 159).

**Carloading Efficiency.**—Circular 177 of the Southwestern regional director calls attention to the practice of shippers ordering small capacity cars and insisting on such cars being furnished, notwithstanding empty cars of larger capacity are available for their loading. This involves additional switching and empty haul. Shippers should be encouraged to continue to load heavily but extraordinary switching service and empty car movements are not warranted.

**Car Efficiency—Intensive Loading.**—By Circular 179 the Southwestern regional director calls attention to the importance of continuing the campaign which brought about successful loading of freight cars. Agents or others who receive orders from shippers for cars should inquire as to the weight of the freight which is to be shipped and if below the maximum try to induce the shipper to load to the maximum. If the amount ordered does not provide for the maximum loading, try to get the consignee to increase the order.

**Lettering of Locomotives.**—The Eastern and the Southwestern Regional Directors have announced that on locomotives ordered by the director general for individual roads, and which are paid for by the roads, the letters "U. S." need not be shown on the engines or tenders.

**Freight Claims.**—The regional director, Eastern region, by circular 600-19A544, calls attention to the necessity for prompt reply to communications from the freight claim de-

partment J. H. Howard, manager of the claims and property protection section, reports that where claims are not dealt with promptly, the delay, in a large percentage of cases is found to be due to the inability of the freight claim department to get prompt and satisfactory replies to inquiries addressed to agents. Mr. Howard also calls attention to the fact that some freight claim officers do not promptly advise the "special agent" (police) in regard to shortages which indicate pilferage. There should be close co-operation between the freight claim officers and the special agents. The Northwestern Regional Director's circular No. 24-1-44 covers the same subject. The Southwestern Regional Director, in order No. 168, gives instructions on pilferage for all freight claim offices.

**Passenger Train Performance.**—The regional director of the Eastern region, by circular 1801-14A553, gives instructions for making daily reports of passenger train performance, to be sent by telegraph both to Washington and to the regional director. Besides the usual data showing the number of trains, minutes late, etc., all unusual operating difficulties such as storms must be briefly explained. Trains making runs of less than 50 miles are to be omitted, also branch trains dependent on main line connections; and delays of ten minutes or less are not to be considered. The circular prescribes a cipher to be used to economize telegraphing. The Northwestern Regional Director, by circular No. 95-1-12 gives instructions on this subject.

**Requests for Statistical Data.**—The regional director of the Eastern region, by circular No. 1801-118A543, promulgates the instructions of the director general to the effect that when requests are received from governmental departments, not a part of the Railroad Administration, asking for statistical information, they should be referred to C. A. Prouty, director of the Division of Accounting, Washington. It is believed that these matters can be handled with more expedition and economy at Washington than by the regional or local offices. The Southern regional director, by file 1831-2-6., and the Southwestern Regional Director, by circular No. 182, give similar instructions.

**Journal Box Packing.**—The regional director of the Eastern region, by circular No. 500-13-14A540, advises federal managers that journal box packing for locomotives and cars may be bought under the individual roads' specification, the Railroad Administration specification R-94-A not being compulsory.

**Gas Masks.**—The Eastern regional director by circular No. 1800-10-5A541, and the Southern regional director by file 1862-6 call attention to the fact that gas masks used in the army are not effective against poisonous constituents of coal smoke or coal gas, as found in railroad tunnels. Dr. D. Z. Dunott, chairman of the Committee on Health and Medical Relief, of the Division of Operation, has advised the regional directors of this fact, and it is suggested that roads which have bought gas masks with a view to using them in the railroad service make further investigation. Dr. Dunott says:

"If smoke consists merely of liquid and solid particles, with some hydrogen sulphide, sulphur dioxide and some irritant gases, it would be possible to use an ordinary army gas mask: if, on the other hand there is more than .05 per cent of carbon monoxide present the mask will be more of a danger than an assistance. Further, the Hayward respirator which has been purchased by one road, is not designed for eliminating gases; it simply protects against particles \*\*\*"

**Car Distribution—Use of Open Top Cars.**—In Freight Car Distribution Notice No. 4 the Northwestern regional director states that notwithstanding the present car surplus there are roads which are forcing the restrictions on the use of open top cars for materials other than coal, coke or raw materials used in blast furnace operation, formerly in effect under Circular CS-13 and Supplement 1 thereto issued by

the Car Service Section. While it should be understood that in the use of this class of equipment preference still is required where necessary for coal and iron ore traffic, there is at the present time such an abundant supply that there can hardly be any occasion for failure to supply all such cars required for any class of loading.

**Southern Freight Inspection Bureau.**—The Southern Freight Inspection Bureau has been established to take over the duties of the following existing organizations: Southern Weighing and Inspection Bureau, Virginia & West Virginia Demurrage and Storage Bureau, North Carolina Demurrage Bureau, Southeastern Demurrage Bureau, Alabama Demurrage and Storage Bureau, Tennessee Demurrage and Storage Bureau, East Tennessee Demurrage and Storage Bureau, Louisville Demurrage and Storage Bureau, and St. Louis Demurrage and Storage Bureau, within the boundaries of the Southern region. The new bureau will enforce the regulations dealing with: freight car demurrage, freight storage, descriptions of carload and less than carload freight, carload and less than carload weighing, milling and other transit arrangements (where specifically arranged for), packing and marking regulations, stowage of carload freight, and veterinary inspection. In instances where the railroads are now individually performing any of the stated duties, they will either be supervised or taken over by the new bureau. I. G. Markey is appointed manager, and F. M. Hardin, assistant manager, of the bureau, with headquarters at Atlanta, Ga.

**Storage l. c. l. Shipments.**—The regional director, Eastern region, by file 600-2-46A554 suggests that where freight houses are not being used to capacity, l. c. l. shipments should be stored in freight houses instead of being sent to public warehouses. Storage is to be charged in accordance with Agent Boyd's Tariff No. 139, I. C. C. No. U. S. 1.

**Rental Rate for Locomotives.**—The regional director, Eastern region, by file 500-1-3A555, prescribes the rental rate for locomotives as one mill per pound of tractive power per day, with a minimum of fifteen dollars a day. This cancels circular, file 3000-42, of March 12, 1918. The Northwestern and the Southwestern regional directors have issued similar orders.

## The Use of the Railograph in Valuations for Taxation Purposes

By Cuthbert E. Reeves

Ellsworth, Barrows & Reeves, Engineers,  
Buffalo, N. Y.

THE RAILOGRAPH has been used increasingly of late years to determine the wear of rail under various conditions and the necessity of renewals, but, so far as known to the writer, it has not heretofore been employed as a test of value for taxation. In the State of New York the courts have held that the measure of value for local assessment of railroad property, in the case of a paying railroad, is the cost of reproduction less depreciation. During the trial of a recent case to determine the proper assessment of a section of its four-track main line in a taxing district of this state, one of the trunk line railroads introduced testimony as to the value of the rails in its main tracks and side tracks based upon the theoretical condition of it under the application of the "Straight Line" theory of depreciation. In brief, a life of eight years was allotted all rail in the passenger or high-speed tracks, at the end of which time they were assumed to be equivalent to relayer; an additional life of eight years in the low-speed tracks was then allowed, at the expiration of which their value was predicated to be scrap. Rails in sidetracks were considered to have reached a condition equivalent to scrap when laid.

For purposes of taxation it is of course desirable to arrive at a valuation fair to both the owner of the property assessed and to the community at large, and, in the case of a property involving special construction beyond the ability of the ordinary assessing body properly to appraise, it is especially to be desired that such valuation shall be applicable over a period of years. In a given taxing district the present value of some elements of such property may vary somewhat from year to year, but it is beyond the powers of the ordinary assessing board to follow up these changes, such as rail renewals, repainting of bridges and buildings, repointing of masonry, etc.

It is well known that the practice of our railroads in general is to maintain their properties at a uniformly high standard of efficiency, and in so far as track, bridges and other items classed as "Road" are concerned, there will be little change in value from year to year aside from that occasioned by additions and betterments. In valuations for the purpose of equalizing such assessments our practice has been for years to use the "Average Condition" theory in determining the present value of many items of construction.

the original laying to a face. Side-track rail was taken to be in a condition half-way between cost to lay as relayer and value as scrap.

While the application of these rules in certain cases, such as that of a stretch of new rail recently laid, or, a section about to be renewed, would fail to give a technically correct value as of a given date, we believe that over a period of years the result would be eminently fair to both parties.

Although it is not recommended as being practicable or considered desirable, ordinarily, to ascertain the exact condition of rail for purposes of taxation, the necessity of introducing evidence as to the same in this action, and the adaptability of this section of the railroad to such a test, owing to the numerous different brands and years of rail and the freedom from curvature and excessive grade, led to the decision to take exact measurements by means of the railograph. The field work was carried out under the direction of the writer. Sections were taken on both rails of each of the four main tracks at uniform spacing, no effort being made to select or to miss certain rails.

They were all inscribed directly upon standardized cards, a sample of which is shown. All data as to location, weight, brand, etc., were noted in the field. The space provided for cross-sectional areas new and as found in the field was filled in later in the office, the present areas being run three times with a planimeter and the average result used. From this the percentage of loss was computed and listed, being resolved later into terms of percentage of the loss allowable to reduce the rail to relayer condition, to wit, three pounds per yard, the standard of the railroad involved. This was computed for the head of the rail, as it was found that the sections were practically unchanged in web and flange, and in many instances over-ran the theoretical original area.

The loss in 100-lb. rails was found to be 2.83 per cent, averaged by the number of rails measured and 2.99 per cent averaged by the mileage of the various brands and years. The loss of the 80-lb. by the number of rails measured proved to be 5.43 per cent and by mileage 5.63 per cent. The average loss of head in the 100-lb. rails after an average use of 6.75 yr. was but 35.8 per cent of that required to reduce them to relayer condition, being remarkably uniform and very much less than that which an application of the straight line depreciation from new to relayer in eight years would imply. The 80-lb. rail in the freight tracks showed an average loss of 62 per cent of that allowable, in spite of their average length of use of 7.9 yr. under heavy traffic. The average condition of all main track rail proved to be slightly better than half-way between new and relayer. While other factors than loss of section enter into the classification of rail as relayer, etc., for this discussion they may be neglected, the rails under consideration being well maintained, straight, free from surface bends, no curve wear, and ends free from battering.

Examination of some of the first sections taken disclosed a width of head in some cases  $\frac{3}{64}$  in. greater than the theoretical, and check measurements taken with a micrometer caliper corroborated the railograph prints, the extra width probably being due to variations in the rolls. Deviations from the standard were also noted in the fillets of the flanges and in the angles of the under side of the heads, these probably being due in part to wear in the rolls and in part to excess shrinkage.

Data are not available as to the tonnage passing over these tracks during the period involved, and it is regretted that comparison with the data disclosed by other railograph observations is not possible. Conclusions as to wear based solely upon the factor of length of use are of course reliable only when taken in conjunction with the tonnage borne and other factors entering into such an analysis.

A Typical Record Sheet

This is especially applicable to rails, where the age is but one of many factors affecting its condition. Replacements of breakages, varying degrees of wear on curve and tangent, excessive wear at stations, water plugs and other stopping places, standard of roadbed, and many other considerations entering into the finding of an exact result.

The condition of fencing is subject to much the same determination. Posts are renewed here and there and wire patched in other places. In fact, all articles which are constantly renewed in kind lend themselves much more to the "Average Condition" theory of depreciation than to the better known and commonly accepted "Straight Line."

In the case referred to in this article we were retained by the taxing district to report upon the value of the railroad property, and to assist in upholding the assessment. As in all such cases, our valuation of the rail was based upon the "Average Condition" theory. For example, all main track rail was considered to have reached a point half-way between its cost as laid new and its value as relayer when removed from main track. On roads with good standards of maintenance the percentage of rails too poor to be classed as relayer is ordinarily very low, and offset by the superior condition of those replacing breakages, etc., subsequent to

# General News Department

W. H. Finley, president of the Chicago & North Western Railway Company, will present a paper on the design and construction of the large grain elevator recently built by that company, at Chicago, before the Western Society of Engineers, Chicago, on Monday evening, March 10.

Charges of grand larceny were preferred against nine employees of the Baltimore & Ohio, at Youngstown, Ohio, last week—one chief clerk, one general yard master, one round-house foreman, two freight conductors and four brakemen. One conductor was also charged with carrying concealed weapons. These arrests follow the investigation of a large number of robberies of freight cars.

A strike of boatmen in New York harbor paralyzed local traffic on Tuesday, Wednesday and Thursday of this week, the passenger ferries of the Delaware, Lackawanna & Western being the only railroad craft which were kept running. Embargoes were placed in all directions against freight for New York over routes which have to use ferries or floats to reach the city, and the outbound freight stations on the docks refused practically all shipments. Passengers crossed the river, with some delay, through the tunnels. As we go to press it is expected that the Railroad Administration will grant the eight-hour day and other demands of the strikers; but the attitude of the owners of other boats has not been disclosed.

Major C. W. Cochran has been appointed assistant professor of military science and tactics at Northwestern University, Evanston, Illinois. Until March, 1917, Maj. Cochran was engineer of maintenance of way of the Cleveland, Cincinnati, Chicago & St. Louis at Galion, Ohio, at which time he received leave of absence to take a three-months' course at the Officers' Training Camp at Fort Meyer, Va., after which he was commissioned a captain. He was assigned to duty in the office of the chief of engineers, U. S. A., where he served from September, 1917, to February, 1918. He was then assigned to the 32nd Engineers and assisted in organizing that regiment, which was a special railway and bridge unit. Shortly after he was ordered to France, where he was placed in charge of work on lines of communication and of a number of construction projects. In July, 1918, he was promoted to the rank of major of engineers and was ordered back to the United States to assist in organizing regiments for overseas service, but just before returning to America he was sent to the front lines for a period of observation and study. Soon after Major Cochran reached the United States the armistice was signed and the new regiments were disbanded. He was then assigned to the 2nd Engineers, from which he was assigned to his present duty, as stated above.

## Railway Troops Coming Home

A number of the railroad units of the army in France have been assigned for early return to the United States, according to an announcement issued by the War Department. The list of organizations assigned to early convoy includes companies 20, 60, 81, 82, 92, 93, 94, 95, 96, 98, 102, 104, 106, 107, 108, 115, 129, and 137 and casual companies No. 5 and No. 9, of the Transportation Corps, also the Twelfth Engineers' regiment.

## Correction

Owing to an error in the article entitled "Standard Specifications for Timber Preservation," published on page 445 of the issue of February 21, the process for Treatment with Creosote Oil by the Empty Cell Process, with Final Vacuum, was designated as the Rueping process. This should have been the Lowry process. On the following page the process for Treatment with Creosote Oil by the Empty Cell Process

with Initial Air Pressure and Final Vacuum, should have been designated as the Rueping instead of the Lowry process.

## Black Tom Verdict Stands

The Supreme Court of the United States on March 3 refused to review the decision of the lower court holding the Lehigh Valley Railroad liable for damages resulting from the explosion in New York harbor ("Black Tom Island") in July, 1916. While this case involves a judgment of only \$23,687, claims for nearly \$12,500,000 have been made against the company and the outcome of the majority of them was said to depend upon the result in this case.

## Director General to Address A. R. E. A.

Walker D. Hines, director general of railroads, has accepted an invitation to address the American Railway Engineering Association at its annual dinner at the Congress Hotel, Chicago, on Wednesday evening, March 19. The Railroad Administration will also be well represented among the guests at the dinner. C. A. Morse, assistant director, division of operation, is president of the association, and W. T. Tyler, director of the division of operation, and possibly one or two of the other directors will be present, as well as several of the regional directors.

## Program for Engineering Week at Chicago

Programs for the meetings of the American Railway Engineering Association and the Railway Signal Association to be held in Chicago in the week of March 17, are assuming definite form. The Railway Signal Association will hold its stated meeting at the Auditorium Hotel on Monday, the 17th, and the American Railway Engineering Association will hold a three-day convention at the Congress Hotel on Tuesday, Wednesday and Thursday. The National Railway Appliances Association's exhibit in the Coliseum will continue through the four days. An outline of the program of the signal meeting appears below:

- Report by Committee II—Mechanical Interlocking.
- Report by Committee III—Power Interlocking.
- Report by Committee X—Signal Practice.
- Report by Committee XII—Contracts.

A paper on Concrete Trunking will be presented by B. A. Lundy, assistant signal engineer, New York Central, and Kurt C. Barth, of the Barrett Company, will present a paper on Treated Timber Trunking.

Three other organizations will hold meetings during that week which will be of interest to men attending these conventions and through a coincidence three meetings will be held on Monday evening.

The Western Railway Club will hold its monthly meeting in the Louis XVI room of the Hotel Sherman, at 7:45 p. m. following a get-together dinner in the Italian room at 6:15 p. m. The program will include papers as follows:

- "U. S. Naval Batteries in France," by Lieutenant Commander D. C. Buell, U. S. N. R. F., now director of the Railway Educational Bureau, Omaha, Neb.
- "The Mechanical Stoking of Locomotives," by W. S. Bartholomew, president of the Locomotive Stoker Company, Pittsburgh, Pa.

The Western Society of Engineers will hold a meeting in its rooms in the Monadnock block for the presentation of a paper on the Railway Terminal Situation in Chicago, by Edward J. Noonan, chief engineer of the Chicago Railway Terminal Commission. This will cover a general discussion of the terminal policy of the Railroad Administration and an enumeration of some of the difficulties of the larger problems with special reference to the solution of the Chicago "down town" problem. It is the intention to ask several prominent railway men to discuss the paper.

Another activity of that week is the Railroad Conference of the American Association of Engineers to be held on Monday, March 17, both in the afternoon and evening in the Gold room of the Congress Hotel. The following program has been arranged:

AFTERNOON SESSION 2 O'CLOCK.

Willard Beaban, equipment engineer, New York Central Western Lines, presiding.

"Shall Engineers be Paid Overtime?" by H. P. Gillette, editor, Engineering & Contracting.

"Principles and Procedure in Classification and Salaries of Railroad Engineers," by J. L. Jacobs, Professional and Special Branch, United States Employment Service, Chicago.

"Schedules of Pay," preliminary report by a sub-committee of the "Railroad Committee."

EVENING SESSION—7.30.

W. H. Finley, president of the American Association of Engineers and president of the Chicago & North Western, presiding.

"How Shall Proper Recognition be Obtained?" by W. W. K. Sparrow, corporate chief engineer, Chicago, Milwaukee & St. Paul.

Application of Order 27, and Supplements 7 and 8 to the Railroad Engineer.

Report of the Bureau of Explosives
