"We have set out this series of powers in detail. They are extremely far reaching. If exercised—and Sir Eric Geddes is not the man to leave power unused—the first result will be to reduce railway boards of directors to the position of ciphers so far as the control of the shareholders' property is concerned; the Minister of Ways and Communications would be in the position of managing director of the railways, harbors, etc. A company's line might be closed wholly or in part; its engines and rolling stock, and even fixed appliances and equipment might be inextricably mixed up with those of other lines; its organization might be upset; in short, the value of the undertaking might be seriously affected. All this on a guarantee for two years of the same terms as to payment as during the past four years, while at any time the minister might decide to force a purchase of the whole or any part of the undertaking, in the manner to which we shall refer later.

"We quite agree that it is necessary promptly to deal with the question of railway rates and charges which need to be overhauled not only with the object of raising revenue to meeting the enormous increase in the cost of working the lines, due to concessions granted by the government to the employees, but to remove anomalies and to improve the system of charging. Power might also be given to facilitate and co-ordinate inter-railway working, and to authorize and finance works for the more efficient and economic working of the railways, but so long as there is the possibility of a complete return to private ownership there should be some respect for the property and corporate existence of the systems which have been built up on the basis of Acts of Parliament. From this point of view we regard the provisions of the bill as excessive. In this we are supported by the Federation of British Industries, . . . etc. These bodies have placed on record their opinion that in any form of control which it may be decided to adopt, the government should not in any case be concerned with the detailed administration of the railways. The bill certainly provides for very considerable interference in administrative matters, and should it emerge as an act in anything like its present form there will be an enormous extension of the civil service. The Ministry of Munitions—with whose organization Sir Eric Geddes was associated—expanded to enormous dimensions largely on borrowed staff, and it is significant that the bill with which we are now dealing contemplates the transfer to the minister of any officer or servant of an undertaking of which possession is taken whose services the minister may require, 'either permanently, with the consent of the officer or servant, or temporarily, with the consent of the undertakers.' Moreover, the bill is far from specific as to the payment of staff transferred to the Ministry. During the war hundreds—if not thousands—of men have worked in

various departments of the state but have been paid by railway and other companies. What may have been justifiable in war time should not be tolerated in future.

"We now come to the question of State purchase. As has been pointed out, there is the astonishing proposal that so important a matter shall be done by an Order in Council. We cannot think that this will be sanctioned by Parliament, but it is seriously proposed. The bill provides that the minister may purchase by agreement or compulsorily and work the whole or any part of any railway, light railway, tramway, canal, waterway, or inland navigation, harbor or dock. The only limitation is that a tramway, belonging to a local authority, shall only be acquired with the consent of the authority. Railway companies will doubtless have noticed that the basis of any purchase is not defined; the minister is to have the right to specify the financial arrangement, the only appeal being to a court of arbitration 'constituted in accordance with the provisions of the Order authorizing the acquisition.' Railway directors and shareholders may well contemplate this scheme with misgivings. But in addition to purchasing railway and other undertakings, the minister may establish new ones, for which purpose he may compulsorily acquire land; he may lease the whole or any part of an undertaking which he acquires or establishes; he may purchase, hire or lease railway wagons belonging to private owners; and may establish, maintain and work transport services by land or water—all by Order in Council. Over undertakings acquired or established the minister would have absolute control. 'He shall be entitled to fix such rates, fares, tolls, dues and other charges as he thinks fit, notwithstanding any statutory provision limiting the amount of such charges or increase therein affecting the undertaking, and shall have all such other powers of management as may be necessary for the purpose,' and he may 'discontinue the working of any part of the undertaking where he considers such discontinuance is expedient in the national interest.' When it is remembered that railway companies own large engineering works, manufacturing anything from furniture to locomotives; operate steamboat services; run hotels, motor cars, and goods and parcels road services; such diverse branches of industry as laundries, printing establishments, gas works, etc., the potentialities of this project for nationalization, and state competition with private enterprise will be apparent.

"In our opinion, the association of roads and the supply of electricity with railways is wholly unjustifiable. . . . It is the most unconvincing special pleading to suggest that the control of electric supply should be vested in the Ministry of Ways and Communications because the railway property might be used for lines of overhead high-tension wires, while as regards railway electrification we are far from sharing the opinion of a labor correspondent of a non-technical journal that 'railways will in the near future be electrified and canals will carry electrically driven barges.'

"What has to be secured is that the financial position of the railway companies shall be restored. This can be done by reducing expenditure or increasing the revenue, and it might be facilitated by a well-considered form of government control. The Board of Trade have always had considerable powers over the railways, and there is no harm in transferring those powers to a new authority, especially if that authority proves to be broader minded and less bound by red tape than the Board of Trade. It is also necessary to invest some department of the state with the power of varying railway rates and charges and simplifying the present basis of charging. Further, as the railway companies will not be in a position to raise capital, it is necessary that, under certain conditions, the state should finance schemes of improvement, but having said this, we hold strongly to the opinion that the detailed administration of the railways should be vested in the individual companies, and that the state should not em-

bark on a scheme of nationalization until the whole matter has been threshed out in a much more complete manner than has, so far, been the case."

## Mexican Railway Executives

### Visit New York

By P. Harvey Middleton,

Executive Assistant, Railway Business Association

THE VISIT to New York City on March 26 of two of the principal operating officials of the Carranza Railway Administration, M. Muñoz, general superintendent of the National Railways of Mexico, and Rafael Zerecero, assistant general manager of the southwestern lines of Mexico, afforded an opportunity of obtaining at first hand a few facts to supplement my article in the *Railway Age* of March 14.

"We are handling," said Mr. Muñoz, "16,000 tons of freight daily on a 3½ to 4 per cent grade. About 7,000 tons of this is on the Interoceanic route from Mexico City to Vera Cruz, Puebla, and branch lines. The principal commodities carried are sugar, flour, oil, coffee, corn, rice, cattle, lumber, rubber plant and tobacco. We export all our high grade lumber such as mahogany to the United States.

"Our locomotives are principally from the Baldwin Locomotive Works. We have a number of Mallet compound locomotives and also some double header Fairlie engines of English manufacture. We are fairly well supplied with equipment, but we need tank cars. At present only 5 per cent of our tonnage is export or import, the rest of it being domestic. Our tracks are in first class condition with good solid beds. We use principally hardwood ties, but we have some steel ties, although I don't like them. Some of our roadbed is ballasted 5 meters deep; it is good and solid.

"Señor Fontes, our general manager, is doing everything possible to encourage traffic into Mexico through the Pacific ports, and English steamers are making regular calls at the Gulf ports. It may interest you to learn that it takes an average of only 68 hours to unload a 5,000 ton steamer at Salina Cruz on the Pacific and carry it across the Isthmus of Tehuantepec to Puerto Mexico on the Gulf coast.

"The Mexican government has recently acquired by purchase from the Pearsons of London the National Railway of Tehuantepec, and this railroad, on the narrowest part of the continent with the exception of Panama, has been put in first class condition. We have two steamers running from Vera Cruz to Puerto Mexico making three trips a week carrying passengers and express packages. We have an ice plant at Salina Cruz and we have refrigerator cars for perishable freight like fish and fruit. The Tehuantepec Railway furnishes the electric light service in Salina Cruz and Puerto Mexico and we are going to establish competitive rates from Salina Cruz to Mexico City to meet the same rates as those from Manzanillo, which is the port of entry for traffic from the western ports and from Asia.

"Through our purchasing offices in America we buy rolling stock, cars, locomotives, rail fasteners, bridge material, brake equipment and tires. We make our own rails and we also operate machine shops at Orizaba, Mexico City, Vera Cruz and in several other places. We are now building hospitals at different points on our lines and we are getting prices from American firms for the necessary equipment. There are now no rebels on our lines, for we have just captured the town of Cauatla, in the state of Morelos, which was Zapata's former headquarters, and we have daily passenger service there. There is, of course, an occasional bandit raid in an out-of-the-way place, but I am told that even in New York City there is an occasional holdup. Generally speaking, Mexico is today normal and business is proceeding briskly. American manufacturers are sending their repre-

sentatives in increasing numbers, and a party of several hundred American business men representing the Mississippi Valley is leaving for Mexico in a few days to be the guests of President Carranza on a trip to Mexico City, Vera Cruz and Tehuantepec. We are most anxious to have American manufacturers come to Mexico and see for themselves the

progress we are making. I can assure you that foreign capital will be protected by the Carranza Administration. One of the great obstacles at present is the delay on the part of the American government in granting passports. Everything should be done to facilitate commercial intercourse between Mexico and the United States."

## Railway Developments in Foreign Countries

### Proposed New Railway in Pará, Brazil—Interesting Figures of Exports from United States by Countries

#### Concession Granted for Railway to Be Built in Pará, Brazil

A CONCESSION has recently been granted to Antonio Amorim do Amaral for the building of a railroad from Amapá to Oyapock, both in the State of Para, Brazil, the latter town being located on the boundaries of French Guiana and called San Antonio, according to a report from Consul George H. Pickereil, Para. The region covered by this concession, which also embraces a strip of land estimated to be 9½ miles on either side of the line, is said to be rich in lands suitable for cattle raising, and to possess immense forests of timber of all kinds, especially that containing essences. The

The railroad shall have, besides, a branch line to the last navigable port of the Calcoene River, thus bringing great advantages to all the vast and rich region above the falls which is at present inaccessible to exploration. This undertaking will be, as may be easily noted, one of the most gigantic steps toward the progress of this State.

The plan for the railroad lines reaches all the latitude of Brazilian Guiana, crossing the richest and most fertile regions of Brazil, the same that old explorers used to refer to as the El Dorado of the New Continent.

In an article published in the Journal do Brazil, in Rio de Janeiro, Senhor Otto Prazeres says: "In those Brazilian regions can be found enough gold to serve as security to numberless issues of paper currency." Three ports have been constructed by France at her old colony, viz, Cayenne, Lourenço, and Oyapock, which are the outlet of all products from the Amapá (Guyana), causing thus considerable loss to our budget.

According to the statistics published in the "Association Française," for 1917, products worth 24,719,302 francs were exported through these ports. Before such splendid results the French Government which has already spent 1,000,000 francs in improving the harbor at Cayenne, is prepared to continue this work, its conclusion being estimated at 8,000,000 francs.

The Revista Commercial do Pará says: "The export of gold from the French Guiana for 1916-17 came to the stupendous total of 177,000,000 francs.

Not gold alone, but also other products which are its equivalent, valuable to us through lack of transport, have their outlet through the French ports.

To ease our financial condition, and to acquire a good security for our issues, it would suffice to explore or to give an outlet to the gold and other products accumulated in our territory and which are being exported to foreign countries through foreign channels.

#### What the South African Railways Buy

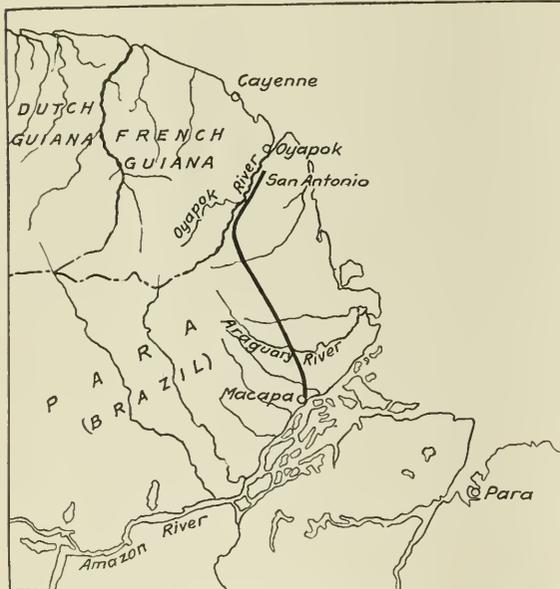

The South African railways in normal years purchase in the neighborhood of \$63,000,000 of supplies yearly, but in the last two years their purchases have amounted only to about \$20,000,000. These figures are taken from an article in the February issue of the British and South African Export Gazette, which contains the following interesting information:

Many factors contributed to make the volume of stores bought by the South African Department of Railways and Harbors during the 12 months ending March, 1918, smaller than in preceding years, particularly in regard to imported goods. The total purchases from all sources—in normal years they have amounted to over \$63,000,000—were valued at \$19,619,300, as compared with \$19,676,800 in 1916. Out of this sum the High Commissioner's "list," representing purchases made through his office in London, amounted to no more than \$3,041,820, against \$6,155,270 in the previous fiscal period, and between \$15,000,000 and \$20,000,000 in the years before the war.

The extent to which the war reduced the proportion of purchases from overseas and correspondingly increased that of goods obtained locally may be judged from the fact that in 1913, 49 per cent of the purchases were of oversea origin and 51 per cent were bought in South Africa, whereas in 1917-18, 15 per cent of the purchases were made overseas and 85 per cent in South Africa; but as the general manager of the South African Railways states in his report, "The present position has been influenced in some measure by deferred deliveries of material unobtainable locally." For example, it has been exceedingly difficult to obtain rails, as they have been in demand for the various theatres of war in quantities beyond the present output.

#### WIDE RANGE OF PURCHASES.

Such being the case, there can be no wonder that South Africa has been unable to obtain delivery of goods long ago on order in the United Kingdom. Indeed, the purchases of

Approximate Line of the Proposed Railway in Pará

famous gold mines of the Guianas which have produced so much alluvial gold in the past are crossed by this line, and it is proposed to build a branch line that will touch the famous French Guiana mines, which are still producing large amounts with the most primitive machinery.

The consul quotes from the Estado do Para of December 15, 1918, commenting upon the benefits to be derived from the concession:

The State congress of Pará voted and made public the law which grants to Mr. Antonio Amorim de Amaral, or the company organized by him, the concession for the construction of a railway line starting from the left bank of the Amazon River from a port, accessible at all times to ships of deep draft, near the town of Macapá, and continuing by the right bank of the Oyapock, in the neighborhood of a settlement known as Santo Antonio, crossing the Araguay River below the first waterfall from its mouth.

rails through the High Commissioner's Office in London during the year 1917-18 amounted to only \$2,740, comparing with \$1,022,500, 1916, and with amounts ranging up to half a million sterling in the years before the war. That is an extreme case, but it does not stand alone. Cement worth \$16,335 was purchased through the High Commissioner in 1917-18, against \$257,950 worth in 1916; electric gear to the extent of only \$1,155, against \$40,485; iron and steel, \$26,475, against \$77,750; locomotive, carriage, and wagon spares \$359,620, against \$552,450; machinery, \$11,200, against \$37,870; oils, \$6,300, against \$31,315.; piping, \$1,385, against \$9,810; and uniform clothing, \$43,970, against \$139,410.

On the other hand, rolling stock was represented by a figure which stood out among the rest, viz., \$1,210,435, which though it showed a decrease on the \$2,550,820 for 1916 and on the amounts for other years, was more comparable with them. Some items actually showed increased purchases, as, for example, brake gear, \$26,425, against \$11,445; copper, \$49,320, against \$36,625; fencing material, \$6,400, against \$975; and rope, \$26,545, against \$19,615. There were no oversea purchases of galvanized iron, timber, telegraph material, cotton and wool waste, and signal material, though all of these showed amounts in previous years.

**BIG PURCHASES WHEN NORMAL CONDITIONS ARE RESUMED**

Quite apart from the interest attached to such figures as revealing the effect of the war on South Africa railway buying respectively from overseas and locally, these returns are of value to manufacturers as indicating the varied requirements of this great Government buying department, while they also suggest how much leeway will have to be made up when normal commercial and industrial conditions return. Indeed, the indents placed through the High Commissioner during the year under review are in themselves proof of this. They include rolling stock to the extent of \$7,791,025; permanent-way material, \$29,400; materials for tarpaulins, \$426,140; locomotive spares and tires, \$327,835; tin and metals, \$72,525; carriage and wagon spares, \$216,385; new machinery, \$98,725; clothing, \$504,025; catering, \$53,500; stationery, \$84,915; signal and telegraph material, \$12,825; harbor and lighthouse material, \$54,120; vacuum brake gear, \$84,650; steam-heating gear, \$2,870, and other goods, \$96,285. These indents make a total of no less than \$9,855,225, or two and a half times as much as the actual deliveries through the High Commissioner's Office in the same year.

[The South African Railways have been large buyers in the American market in the past three years. In 1917 they ordered 8 Mallet and 30 Mountain type locomotives in this country; in 1918, 20 Mountain type locomotives, and in February additional orders for 70 more were reported.—EDITOR.]

**A Madrid-Valencia Direct Line**

Following upon the Bill for the proposed direct line from the French Frontier to Algeciras (See the *Railway Age* of March 14, Page 611), a "Project of Law" has been published in the Gazette of February 15, by the Spanish Minister of Public Works, for the construction of the much talked of direct line from Madrid to Valencia, with a branch to Pasajes in Asturias. The proposed line is to be of standard 4 ft. 8½ in. gage, and in other respects is to follow the scheme authorized by the Royal Order of December 13, 1917, under the law of December 18, 1914, for the construction of various secondary railways. "The most extraordinary feature of these proposals, which mean spending \$100,000,000 in second tracking existing railways," says the *Railway Gazette* (London, "is that they should come from a man like the Marques de Cortina, who in private life is a lawyer and banker, and who showed himself, on the occasion of his visit to England in connection with the 'Cortina' convention, to be endowed with the average amount of com-

mon sense. It is hardly to be expected that Congress will pass the schemes, in view of the formidable deficit, accumulated during the past five years, which must be liquidated by the 1916 budget. The cortes will surely recognize that if money is to be spent on railways there are plenty of blanks in the map without duplicating existing lines and creating a question of different gages. If a second line of railway is required between Madrid and Valencia, this could be obtained at relatively small cost, by connecting Cuenca and Utiel. Possibly the new schemes simply mean that the Minister wants to make a show of doing something during his brief term in office."

**Exports of Locomotives in January Total \$3,076,543**

During the month of January, 1919, there were exported from the United States 87 steam locomotives, valued at \$3,076,543, according to figures prepared by the Special Statistical Service Section, Division of Statistics of the Bureau of Foreign and Domestic Commerce. Well over half, both from the standpoint of number and value, were destined for eastern Asia, namely, 28, of a value of \$1,077,898 for Russia in Asia, and 17, valued at \$959,260, for Japanese China. Italy received 19, valued at \$931,000. The figures in detail follow:

UNITED STATES EXPORTS OF STEAM LOCOMOTIVES, BY COUNTRIES, DURING JANUARY, 1919

Countries.	Number	\$
France	1	75,050
Italy	19	731,000
Spain	1	30,700
Canada	4	53,213
Nicaragua	1	5,000
Mexico	5	52,805
Cuba	6	110,650
Colombia	1	23,200
Japanese China	17	959,260
Japan	1	10,927
Russia in Asia	28	1,077,898
Australia	2	11,615
Philippine Islands	1	3,225
Total	87	\$3,076,543

Exports of railway track material during January included totals of \$4,221,563 in rails, \$189,408 in spikes, and \$543,330 in switches, frogs, etc. In the case of rails, France, Japan, Russia in Asia and Cuba were the largest buyers. The figures in detail follow:

UNITED STATES EXPORTS OF RAILWAY TRACK MATERIAL, BY COUNTRIES, DURING JANUARY, 1919

Countries	Railroad spikes		Rails of steel switches, frogs, etc.	
	Pounds	\$	Tons	\$
Belgium	422,920	\$16,606	1,271	\$113,590
France	1,016,800	75,427	25,848	1,539,257
Italy			13,025	865,920
Netherlands			233	18,196
England			373	20,079
Canada	587,840	16,965	2,638	107,338
Costa Rica	800	68		
Honduras	2,000	100	11	1,200
Nicaragua	1,800	100	7	500
Salvador	500	33	20	1,949
Mexico	98,545	6,241	101	8,845
Barbados	14,118	800	81	7,626
Jamaica	6,000	416	33	2,066
Trinidad and Tobago				1,350
Other British W. Indies	3,000	210	14	906
Cuba	542,669	24,124	5,125	324,318
French West Indies	800	65		73
Haiti				355
Dominican Republic	14,850	1,547	56	4,000
Brazil	75,200	6,428	105	7,860
Chile	151,160	9,405		20,945
Colombia	12,300	950	545	30,239
Ecuador	20,000	1,340		81
British Guiana			38	5,082
Peru	103,900	7,157	294	19,379
Uruguay				47
Venezuela	2,496	420	22	1,580
China			899	61,169
British India				168
Straits Settlements	18,817	1,124	99	6,728
Dutch East Indies			372	36,277
Japan	257,823	13,161	7,533	627,748
Russia in Asia	100,890	3,312	5,538	363,638
French Oceania	3,290	285		
Philippine Islands	51,126	3,124	663	46,023
Belgian Congo				3,160
Total	3,509,054	\$189,408	65,024	\$4,221,563

The Special Statistical Service Section has also compiled figures showing that in the same month there were exported

car wheels and axles to the value of \$278,393, of which nearly half went to Canada. The figures follow:

U. S. EXPORTS OF CAR WHEELS AND AXLES, BY COUNTRIES, JANUARY, 1919	
Countries	Value
France	\$26,171
Greece	1,762
England	2,789
Canada	119,586
Honduras	2,031
Mexico	17,600
Other Br. W. Indies	55
Cuba	18,507
Virgin Islands	192
Argentina	46,001
Brazil	1,065
Countries	Value
Colombia	\$1,070
Ecuador	878
British Guiana	3,480
Peru	857
British India	2,400
Dutch East Indies	9,435
Japan	2,997
Russia in Asia	17,384
Philippine Islands	645
British South Africa	3,500
Total	\$278,393

### British Railway Supply Firms Secure Foreign Orders

The railway supply field in the United Kingdom is apparently busily engaged in getting back on its feet in export business in supply materials. The Railway Gazette (London), in a recent issue notes the following items, representing orders placed principally by railways in India:

The East Indian Railway has recently placed an order for 14 locomotives, 0-6-0 type, broad gage, with the Vulcan Foundry Company, Newton-le-Willows.

The Rohilkund & Kumaon Railway (India) has placed an order for two engines, 4-6-0 type, metre gage, with Kerr, Stuart & Co.

The South African Railways have, we understand, placed an order with the Gloucester Railway Carriage & Wagon Company, Ltd., for 16 second class bogie carriages, and 25 day and night sleeping saloons.

The Great Eastern Railway (England) is considering tenders for 40 bogie carriages.

The Nizam's Guaranteed State Railways (India) have recently placed an order for five engines, 4-8-0 type, with Nasmyth, Wilson & Co.

The Eastern Bengal State Railways (India) have an order on hand with Head, Wrigton & Co., Stockton, for 300 four-wheeled covered goods wagons (broadgage).

### American Builder Gives Best Price and Delivery

American competition in the supply of locomotives in what have hitherto been British markets, has excited attention in the British House of Commons. The Times (London), recently gave the following item in its Parliamentary news:

"Colonel Amery, Under-Secretary for the Colonies (Birmingham, Sparkbrook, C. U.), replying to Sir R. Cooper (Walsall, N. P.), said: 'An order for 12 locomotives for the Federated Malay States was placed in the United States of America in January last; the contract sum was \$28,450 each, or £71,723 approximately in all. No British firm quoted a firm price. The lowest offer mentioned, £8,600 each, or £103,200 in all, as a probable sum, but was on a time and cost basis; and therefore liable to variation. This order was not secured to Great Britain because early delivery of the engines was of urgent necessity, and British firms could not begin delivery till November next, and could not definitely promise that; whereas the American firm promised delivery in six months.'

[The order in question included 12 Pacific type engines, and went to the Baldwin Locomotive Works, as mentioned in the *Railway Age* of February 7.]

### Standard Specifications for Industrial Materials

Four additional publications in the Industrial Standards Series of the Bureau of Foreign and Domestic Commerce are ready for distribution. These pamphlets contain standard specifications of the American Society for Testing Materials in English and Spanish, and are designed primarily for distribution in Latin American countries to assist in introducing American construction and engineering materials. The serial numbers of the specifications just issued and the products to which they relate are: No. 15, wrought solid carbon-steel wheels for steam railway service; No. 17,

steel castings; No. 22, boiler rivet steel; No. 25, engine-bolt iron. Copies are for sale by the Superintendent of Documents, Government Printing Office, at 5 cents each.

### Railway Development in Ecuador

Commerce Reports, issued by the Bureau of Foreign and Domestic Commerce in a recent issue contains a communication on trade conditions in Ecuador, from Consul General Frederic W. Woding, Guayaquil, in which he says:

There are four railways under construction, which will be completed in the near future. The one to the coast is being constructed by the municipality of Guayaquil, under the direction of an American engineer, extending from this city to Salinas on the coast, with a branch line from Amens to Playas. More than two-thirds of the roadbed is finished, including most of the culverts. All explosives and tools used are purchased in the United States. The Quito-Esmeraldas Railway extends north from Quito, eventually to reach Tulcan, then west to Esmeraldas; about 20 miles of the roadbed have been finished, including many concrete bridges and culverts. It is a government work. The Ambato-Curaray Railway starts at Ambato, the eastern terminal to be at Curaray on the eastern side of the Andes Mountains. It is completed to Pelileo, about 30 miles, and is in operation. All materials used were purchased in the United States, and it is being built by American engineers. The Babahoyo Railway is to extend toward Quito. The grading for some 15 miles is finished.

### Japanese Railways Will Guarantee Freight Delivery On Time

The Japanese Government Railways Bureau has inaugurated a new system of freight transportation as from January 16. This new system consists in guaranteeing the delivery within a fixed period of time of all shipments. This innovation on the government railway service has been considered for some time, with a view to facilitating commercial transportation overland. On application the government railways guarantee the delivery of consignments in a fixed period, which is worked out on the basis of the time required for preparations for forwarding, the time required for transportation on lines, the time required for ferry transportation in case of cargo being carried beyond the main island of Japan, and the time required for delivery. When cargo is overdue or delay is caused in delivery, freight charges are rebated at officially fixed rates; when delay is within two days, 10 per cent of charges is rebated; when overdue beyond 10 days, 10 per cent of the charges is repaid. However, when the delay is caused by unavoidable circumstances, such as examination by the police officers of customs authorities, or accidents, the railways do not take any responsibility. Under this system baggage signed at Tokio will reach Osaka within four days. Ordinary cargo will reach there within six days. By express train, cargo will reach Osaka within four days. The full text of the new regulations was published in the Official Gazette of December 12. An increase of about 20 per cent in freight rates and passenger fares came into force on the Imperial Japanese Railways on September 1 last.

### Concession for Projected Peruvian Railway

By a Government decree dated December 27, 1918, advises Consul General W. W. Handley, Callao-Lima, Felipe Marinovich has been granted a concession to make the studies and surveys necessary for the construction of a railway from the town of Sayan, the present terminus of the Northwestern Railway of Peru (a narrow-gage railway which runs from Ancon on the coast to Sayan via Huacho, and operated by the Peruvian corporation) to the Checras coal fields.

The preliminary plans are to be presented within one year. On the basis of these plans it is expected that arrangements will be made with the concessionaire for the construction and exploitation of this railway.

# General News Department

The Montana House of Representatives has passed a joint resolution requesting Congress to return the railroads to private operation as soon as possible.

The Virginian Railroad has abolished the office of general manager, and has dismissed about 100 men, because of dullness in the coal traffic, which normally furnishes 90 per cent of the road's business.

The loans to be made by the War Finance Corporation to railroads, secured by the Railroad Administration certificates of indebtedness, will be on demand notes at 6 per cent for 80 per cent of the face of the certificates or 100 per cent if additional collateral is furnished.

Two employees of the claim department of the Virginian Railroad were arrested at Norfolk, Va., on March 19, charged with selling unclaimed freight at private sale, instead of by auction as is required by the rules, and also with having retained money realized from such sales. One of the men is divisional claim agent, and the other is a chief clerk.

Telephone rates in Massachusetts, established by the postmaster general, will not be disturbed by the Supreme Court of that state. Acting on a petition for reduction of toll rates presented by the Massachusetts Public Service Commission, against the New England Telephone & Telegraph Company, the court held that the United States was a party involved and could not be sued.

One hundred and forty-seven train despatchers of New York City and vicinity held a meeting at Hotel Biltmore, New York, on Monday last and organized the New York Assembly of the American Train Despatchers' Association. The purpose of the assembly is to promote sociability and educate despatchers by debates on co-operation, efficiency, economy, safety, train rules, etc. O. H. Braese (N. Y. C.), was elected chairman of the Assembly.

The striking clerks of the Nashville, Chattanooga & St. Louis, the Tennessee Central and the Western & Atlantic have been ordered back to work by the officers of the Brotherhood of Railway Clerks, who held that the strike was unauthorized, and large numbers of them appeared at the railroad offices on Monday morning of this week seeking reinstatement. The policy of the Nashville, Chattanooga & St. Louis, as announced by W. L. Mapother, federal manager, is to reinstate the men as fast as they can be assimilated, but not to take the strikers back in a body. Officers of the clerks' brotherhood held a conference with officers of the Railroad Administration at Washington last week, and it is understood that the grievances of the clerks against the federal auditor of the Nashville, Chattanooga & St. Louis system, which were the cause of the strike, will be given consideration by the Railroad Administration's Board of Adjustment No. 3. A press despatch from Chattanooga says that but a small percentage of the men and women who walked out were taken back by the road, as their places had been pretty well filled with substitutes, who will be retained. In one office it was stated there were open only fifteen places for the 48 who walked out.

## Livestock Losses on Railroads in the Southwestern Region

At a conference of claim agents representing the railroads of the Southwestern region called for the purpose of solving the problem of livestock losses that annually run into millions of dollars, the statement was made that during 1918 railroad trains in Louisiana killed enough livestock to furnish meat for an entire army division for three months, or enough to furnish two pounds of meat to each man, woman and child in the state. Proportionate losses have been sustained in

other states of the Southwest region, including Texas, Oklahoma, Arkansas and Missouri. A campaign of education for railroad employees is to be inaugurated as a result of the conference.

## Inspection of Automatic Stops on C. & E. I.

The Automatic Train Control Committee which was appointed by the Railroad Administration on January 14 to investigate train control devices made its first inspection trip on Friday and Saturday of last week when it went over the installation of the Miller train control system which is in service on the main line of the Chicago & Eastern Illinois, between Chicago and Danville, Ill. The committee examined the apparatus in the shops of the train-control corporation at Danville on Thursday afternoon, and on the following day a number of tests were made on the road by stopping trains, etc. The committee then visited the railway shops and roundhouse where the engines in service are inspected and maintained. All of the members of the committee were present except C. A. Morse, chairman, who was confined to his room at his hotel in Chicago by illness. Because of Mr. Morse's sickness the further trip to inspect other train control installations in the West was postponed until about the middle of April.

## Chicago Commerce Association on Railroad Regulation

The executive committee of the Chicago Association of Commerce has adopted a resolution addressed to Congress containing 11 points embracing the question of railway ownership, operation and control. The reforms recommended are, briefly: (1) that railroad legislation should be the first that may be enacted, (2) that the ownership of the railroads should be in private hands, (3) that operation of the railroads should be left in the hands of experienced men with the government having no part or influence in the appointment of such officers, (4) that existing lines and companies be consolidated to induce economy of equipment, terminal facilities and operation, (5) that recognition be given the transportation needs of sparsely populated districts, (6) that freight and passenger rates be fixed at a figure that will give a fair return on a proper capital valuation, (7) that a regulatory body be provided to fix rates and provide good service, (8) that this regulatory body approve extensions of existing lines or the construction of new lines, (9) that this body also consent to the issuance of new securities, (10) that all questions of wages and conditions of service be placed in the hands of a commission, whose findings shall be final, and (11) that measures be adopted to protect the railways from state laws that interfere with the operation of the lines.

## Liability of Railroads to Capital Stock Tax

Under section 407 of the Act of Congress of September 8, 1916, every domestic corporation was required to pay annually a special excise tax with respect to the carrying on or doing business, equivalent to 50 cents for each \$1,000 of the fair value of its capital stock. The act approved February 24, 1919, increased the tax to \$1 for each \$1,000, and reduced the exemption from \$99,000 to \$5,000. Questions have been raised as to the liability to the capital stock tax of corporations owning railroads controlled and operated by the federal government, and for the purpose of determining the matter the Secretary of the Treasury has announced a decision that:

(1) A corporation owning a railroad operated by the federal government may, without incurring liability to this tax, (a) maintain its corporate organization; (b) own property; (c) collect and distribute the income therefrom; (d) purchase stocks and bonds of other organizations; (e)

sell all or part of the property used in the operation of its railroad or other business; (f) enter into long-term leases whereby it is divested of control of and is not obligated to maintain the property; and (g) borrow money for the purchase of government bonds or for the financing of obligations previously incurred.

(2) A corporation will incur liability if it (a) manages, (b) maintains, or (c) purchases railroad or other tangible property; (d) sells property not used in the conduct of the railroad or other business; (e) borrows money for the financing of new operations; or (f) makes leases of property held for renting purposes, or whereby it is obligated to maintain the property. The extent of the activity, if it is of a kind causing liability to incur, is unimportant. Each corporation owning a railroad under federal control and claiming exemption from the tax will be required to file an affidavit supplying certain information.

### Engineering Advertisers' Association Formed

Advertising and sales managers representing manufacturers in various engineering lines, at a meeting recently held in Chicago, formed the Engineering Advertisers' Association as a means of friendly interchange of ideas and business methods pertaining to the advertising and selling of engineering products and to provide a medium where there might be free discussion of problems arising in this particular field. Active membership in the association is open only to those in responsible charge of advertising or sales of companies selling engineering products. Meetings of the association will be held monthly except during July and August and the annual meeting will be held in March. Provision has been made to accept as associate members publishers and their representatives, solicitors and service agency men whose interests are confined to engineering products.

H. L. Delander, advertising manager of the Crane Company, Chicago, was elected president, H. Colin Campbell, director of advertising for the Portland Cement Association, Chicago, vice-president; G. H. Eddy, publicity manager of the Green Engineering Company, East Chicago, Ind., secretary and Edward J. Pratt, advertising manager of the Kellogg Switchboard & Supply Company, Chicago, treasurer. The board of directors is composed of G. S. Hamilton, advertising manager of the American Steam Conveyor Corporation, Chicago, J. J. Arnsfield, advertising manager of Fairbanks, Morse & Company, Chicago, A. P. Hauck, director of advertising of the Allis-Chalmers Manufacturing Company, Milwaukee, Wis., H. W. Clark, advertising manager of the Chicago Pneumatic Tool Company, Chicago, C. A. Powers, advertising manager of the Benjamin Electric Manufacturing Company, Chicago, and J. C. Kinsley, secretary of the C. M. Davis Regulator Company, Chicago.

## Traffic News

The Chicago Passenger Club, an organization of about 450 passenger ticket men of Chicago and surrounding suburbs, claims the distinction of being the only railway club that remained intact during the war.

William H. Spears, district passenger agent of the American Express Company at Chicago, has resigned that position and has been appointed secretary and manager of the T. & S. Tours Company at Chicago. The offices of the new organization will be in the Western Union building, and the company will conduct a national parks and general steamship ticket business.

The Wholesale Merchants' & Manufacturers' Association of Buffalo, N. Y., L. W. Elias, president, is preparing to run a special train through western New York and Pennsylvania on May 20, 21, 22 and 23, to renew friendships between Buffalo merchants and retailers in that region. About 35 towns will be visited and it is expected that 150 representatives of Buffalo business concerns will go on the trip.

The Traffic Bureau of Savannah, Ga., has been abolished. It appears that the bureau was maintained by the city, and the city administration is now being criticized by business men for taking away an element vital to the prosperity of the city. At a largely attended meeting on March 21 a strong plea was presented for the restoration of the bureau.

Consolidation of the army embarkation service and its inland traffic service has been announced by the War Department. Brigadier General Frank T. Hines, chief of embarkation, has been appointed chief of the consolidated service (which will be known as the transportation service) "with responsibility for and authority over the transportation of supplies and the personnel of the army by rail and water."

The Wisconsin Poultry, Butter & Egg Association at a recent meeting adopted resolutions advocating the placarding of cars laden with eggs in order to notify train men to take care in switching. The economic loss to the country because of breakage and damage to eggs in transit from western farms to eastern markets is large and these losses are a serious indirect tax upon the entire trade. The resolutions will be sent to Washington and to the regional directors.

Despite the continued unsettled labor conditions at the port of New York, grain is being cleared actively in considerable quantities at all North Atlantic ports with the exception of Newport News. The Railroad Administration reports, for the week ended March 20, 21,491,000 bushels of grain in elevators at these ports, or about 90 per cent of capacity. There were received during the week 4,473,000 bushels, while 3,935,000 bushels were cleared. At South Atlantic and Gulf Ports there were 12,585 carloads of export freight on hand as against 11,821 for the week previous.

Major-General William M. Black, Chief Engineer, United States Army, speaking before the New York Traffic Club on March 25 declared that the railroads of the country had exterminated inland water traffic. Continuing, he said:

"Are not our common carriers simply agencies of the people for the general good? One class of our carriers has been permitted so to order its business as practically to wipe out another class. As a general proposition inland water transportation has been killed. This has been accomplished by a manipulation of railroad freight rates, rendered more easy by an arbitrary system of freight classification. In what other class of business is a scale of charges permitted which is independent of the scale of values of the service rendered? Where else within our country is it permitted to make one charge to one community and a different charge to another for the same article? Is there any insuperable difficulty in devising a just system of rates, a freight classification based on the cost of handling and moving freight? In the case of competing roads of unequal length, cannot the scales of charges be adjusted to the cost by the cheapest line? Would not this be exactly in line with the practice of manufacturers in general?"

# Equipment and Supplies

## Trade Acceptances Not to Be Used

It was announced Thursday that the plan of financing the obligations of the Railroad Administration to equipment companies by means of trade acceptances had been abandoned because of complications, and that a substitute plan would be adopted somewhat similar to that of issuing certificates of indebtedness to the railroads.

## 485 Locomotives and 1,986 Cars Sold to French Government

The French government, through the French High Commission, has bought from the Director General of Military Railways 485 standard gage, Pershing type locomotives now being built by the Baldwin Locomotive Works and 19,860 freight cars of various types that were under manufacture in the United States when the armistice was signed. There remains a comparatively small number of locomotives and cars yet to be disposed of and it is expected that they will be sold to some of the Allied governments.

## Locomotive Deliveries to March 15

The following new locomotives were shipped to railroads under federal control during the week ended March 15:

Works	Road	Number	Type
American	G. R. & I.	5	USRA Mikado.
	Penn. L. W.	5	Santa Fe.
	Erie R. R.	5	USRA S. Fe.
	Chic. & N'w.	4	USRA 6W. Sw.
	P. & L. E.	2	USRA Mikado.
	Cent. of Ga.	2	Mallet.
	P. McK. & Y.	5	USRA Mikado.
	A. C. L.	3	USRA Pacific.
	Cent. of Ga.	1	Mountain.
	T. & P.	2	USRA 6W. Sw.
Chic. G. W.	1	USRA 6W. Sw.	
		38	
Baldwin	A. T. & St. Fe.	2	Mikado.
	Union Pacific	1	Pacific.
	Ill. Cent.	2	Mikado.
	Great Northern	2	8W. Sw.
	Penn. L. W.	1	Mikado.
C. C. & O.	1	Mikado.

Total		47	

## Delivery of Standard Cars to March 1

The Railroad Administration has issued the following statement of the delivery of U. S. R. A. standard cars as of March 1:

## Car Deliveries to March 15

The following is a statement of the new standard cars accepted during the week ended March 15:

Road	Number	Type	Manufacturer	Total accepted for given roads
C. C. & O.	31	50-ton S. S. Box	Bettendorf Co.	124
N. Y. C.	140	50-ton S. S. Box	Haskell & Barker	917
Norfolk & Western	36	50-ton S. S. Box	Pullman Car Co.	36
L. & N.	20	50-ton Comp. Gon.	Am. Car & Fdy. Co.	129
N. Y. C.	110	70-ton L. S. Gon.	Pressed Steel Car	345
Total	337			

## Locomotives

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for a second hand, 4-ton, Westinghouse narrow gage electric locomotive.

## Freight Cars

THE A. J. ALSDORF COMPANY, Chicago, is inquiring for the iron work for 100 to 200 twenty-ton freight cars for export.

THE MAGNOLIA PETROLEUM COMPANY has ordered 5 10,000-gallon tank cars from the American Car & Foundry Company.

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for 50 steel hopper and 50 steel gondola cars of 100,000 lb. capacity.

## Passenger Cars

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for three combination passenger and baggage cars.

## Iron and Steel

### Steel Rails for Sale By War Department

The office of the chief of engineers of the War Department, Washington, advises that the government plans to sell at prevailing market prices, the surplus stock of 80-lb. rail and 25-lb. rail ordered for the American Expeditionary Forces overseas, but not required due to the signing of the armistice. There are about 50,000 tons of 80-lb. rail and about 7,000 tons of 25-lb. rail. There are large quantities of crossings, slip switches, and turnouts. The bulk of this material is at port readily accessible for loading. All sales are being conducted through the office of the director general of military railways, Washington, where further information can be obtained.

Iron and Steel Prices Reduced

Representatives of the steel industry and the Industrial Board of the Department of Commerce at a conference in Washington last week reached an agreement on a schedule of reduced prices for the principal articles of iron and steel which will apply to all purchases by the various government departments and below which the board says the public should not expect to buy during the current year. The purpose was to bring about such a lower level of prices as will effect stability and stimulate trade to the end that business and industry can proceed and build up with confidence a profitable maximum employment. The price schedule is of especial interest to the railroads, which are the largest purchasers of steel, and as the government is operating most of the railroads the prices will apply to purchases for railroad use. The reduction in standard rail prices is from \$55 for Bessemer and \$57 for open hearth, to \$45 and \$47, respectively, which sets the price at approximately the figure which was set before the United States entered the war, although practically all railroad contracts were placed at a lower figure under the option given on orders for future delivery at the time the prices were increased. No orders were placed by the Railroad Administration during 1918 and the prices of \$55 and \$57 applied only to some comparatively small purchases by the Army and Navy Departments. The schedule agreed upon, which is effective at once, is as follows:

	November 11 price	Present price	New price	Reductions	
				From November 11	From present
Pig iron basic.....	33.00 G.T.	30.00	25.75	7.25	4.25
Billets 4-inch .....	47.50 G.T.	43.50	38.50	9.00	5.00
Billets 2-inch .....	51.00 G.T.	47.00	42.00	9.00	5.00
Sheet bars .....	51.00 G.T.	47.00	42.00	9.00	5.00
Slabs .....	50.00 G.T.	46.00	41.00	9.00	5.00
Skelp sheared .....	3.25 cwt.	3.00	2.65	12.00 N.T.	7.00 N.T.
Skelp universal .....	3.15 cwt.	2.90	2.55	12.00 N.T.	7.00 N.T.
Skelp grooved .....	2.90 cwt.	2.70	2.45	9.00 N.T.	5.00 N.T.
Merchant bar—base .....	2.90 cwt.	2.70	2.35	11.00 N.T.	7.00 N.T.
Sheared plates .....	3.25 cwt.	3.00	2.65	12.00 N.T.	7.00 N.T.
Structural—base .....	3.00 cwt.	2.80	2.45	11.00 N.T.	7.00 N.T.
Wire rod .....	57.00 G.T.	57.00 G.T.	52.00 G.T.	5.00 G.T.	5.00 G.T.
Plain wire .....	3.25 cwt.	3.25	3.00	5.00 N.T.	5.00 N.T.
Nails .....	3.50 cwt.	3.50	3.25	5.00 N.T.	5.00 N.T.
Black sheets, No. 28 .....	5.00 cwt.	4.70	4.35	13.00 N.T.	7.00 N.T.
Blue annealed No. 10 .....	4.25 cwt.	3.90	3.55	14.00 N.T.	7.00 N.T.
Galvanized sheets					
No. 28 .....	6.25 cwt.	6.05	5.70	11.00 N.T.	7.00 N.T.
Tin plate No. 100 box .....	7.75	7.35	7.00	15.00 N.T.	7.00 N.T.
Tubular products.....	3 1/2 points off card				
Hoops—base .....	3.50 cwt.	3.30	3.05	9.00 N.T.	5.00 N.T.
Light rails .....	3.00 cwt.	2.70	2.45	11.00 N.T.	5.00 N.T.
Rails standard Bessemer .....	55.00 G.T.	55.00 G.T.	45.00 G.T.	10.00 G.T.	10.00 G.T.
Nails standard O. H. .....	57.00 G.T.	57.00 G.T.	47.00 G.T.	10.00 G.T.	10.00 G.T.
Ore .....	No change				

\* Basing points and differentials unchanged. Prices effective at once.

After careful consideration and full discussion relating to cost of production and all other facts and circumstances relating to the iron and steel industry, the committee of steel men submitted a schedule of proposed reduced prices which, after modifications suggested by the board and accepted by the industry, was approved by the board. A statement issued by E. H. Gary, of the United States Steel Corporation, said the object was to secure a basis which, so far as practicable, would yield a moderate and reasonable return to the investors and at the same time would not disturb wage rates or interfere with wage agreements and, having determined upon prices which it is expected will not be reduced during this year, it is believed that the volume of business will be promptly increased and that furnaces and mills will be operating at a largely increased capacity. A statement issued by the board said it had asked the industry to take the first step toward the readjustment and voluntarily make temporary sacrifices in the interest of all and that while the reduction may involve the necessity of some high cost plants either shutting down temporarily or running at a loss for a period, it is expected that with an increased volume of business soon to be developed a reasonable return to the average and better than average producers will be effected. In view of the higher costs developed throughout the world as a result of the war a return to anything like pre-war prices was regarded as out of the question.

Similar conferences are to be held by the board with representatives of other basic industries. Representatives of the lumber trade met with the board on March 22.

Supply Trade News

George Walter Spahr, formerly sales manager of the Tabulating Machine Company, New York, has been appointed sales manager of the Elliott-Fisher Company.

J. J. Haigh has been appointed assistant district manager of sales for the Chicago Pneumatic Tool Company, with headquarters at 175 First street, San Francisco, Cal.

The Chicago Pneumatic Tool Company announces the removal of its Boston, Mass., office to 182 High street. F. F. Eggleston, district manager of sales, will represent the company in that territory.

The Pollak Steel Company announces that the G. F. Cotter Supply Company, Houston, Texas, will represent it as Southwestern sales representatives. They will endeavor to sell the products, consisting of forgings of all kinds, axles, locomotive parts, as well as the Pollak special heat treated products. This covers the material produced both at the Cincinnati as well as the Chicago works.

C. E. Hague, formerly production engineer of the Midwest Engine Company, Indianapolis, Ind., has been appointed sales manager of the American Steam Conveyor Corporation, Chicago, manufacturers of the American steam ash conveyor and other ash handling equipment. Mr. Hague assumed his duties March 17.

F. R. Still, vice-president and secretary of the American Blower Company, of Detroit, Mich., has left on an extended trip for the far East where he will investigate trade conditions in connection with export work. Mr. Still's itinerary includes Japan, China, Australia and most of the European countries, and he expects to cover approximately 36,000 miles before returning, about November 1.

Captain A. C. Nell, who has been in charge of the purchase of power and mechanical equipment for the construction division of the United States Army, has been released from active duty in the army and has been appointed district manager for the Lea-Courtenay Company and the Schutte-Koerting Company, with offices in the Conway building, Chicago. Mr. Nell was formerly connected with the Allis-Chalmers Manufacturing Company, Milwaukee, Wis.

P. Harvey Middleton, executive assistant of the Railway Business Association, was invited by Señor M. Muñoz, general superintendent of the Mexican National Railway Administration, during his visit to New York this week, to make a trip with him over all the lines under the control of the Carranza government. Mr. Middleton has accepted the invitation and will leave for Mexico shortly. He will be met at Laredo, Texas, by Señor Muñoz and will visit all points of interest, including the steel mills and railway machine shops. Mr. Middleton speaks Spanish, which will aid him greatly in his investigations.

W. J. Austin, general manager of The Austin Company, industrial engineers and builders, Cleveland, Ohio, has just returned from a three-months' trip to France, Belgium and England. Mr. Austin, in company with J. K. Gannett, export sales manager of the Austin Company, sailed from New York City on December 5. The party which included Alvin T. Fuller, member of Congress from New England, were for a time the guests of the British Government and were taken on a thousand-mile trip over the battlefields. The 13 buildings which were erected by the American forces for the U. S. Army Transport Service, under the Austin Company's supervision, were inspected by the party. The first building was erected at St. Nazaire by the 17th Engineers in December, 1917, and the remaining buildings were erected at Verneuil, 30 miles east of Nevers.

## Financial and Construction

### Railway Financial News

**BALTIMORE & OHIO.**—This company has sold to Baltimore bankers \$3,000,000 five-year 6 per cent collateral trust notes. The security given is the Coal & Coke Railway, which the Baltimore & Ohio acquired about two years ago. The proceeds of the notes, together with other funds borrowed from the War Finance Corporation, will be used to pay off at their maturity, on April 1, an issue of \$5,000,000 Coal & Coke Railway 5 per cent mortgage bonds.

The notes are being offered at 97½ and interest, to yield about 6.60 per cent. Holders of the maturing bonds have the prior right to take the new notes. The Baltimore syndicate is headed by the Mercantile Trust & Deposit Company, Robert Garrett & Sons, Baker, Watts & Co., and Townsend, Scott & Sons.

**NEW YORK CENTRAL.**—The Court of Appeals has handed down a decision unanimously affirming, without opinion and with costs, the judgment dismissing the complaint on the merits in the action brought by Clarence H. Venner against the New York Central Railroad and other companies constituting the New York Central lines. The purpose of the action was to prevent or undo the consolidation of the New York Central & Hudson River Railroad with the Lake Shore & Michigan Southern Railway, which was accomplished in December, 1914. The plaintiff Venner also sought, in case his effort to undo the consolidation was unsuccessful, to destroy the unity of control of all the railroads of the Vauderbilt system and attacked not only the Harlem Railroad lease made in 1873, the West Shore lease made in 1885, the Michigan Central control obtained in 1878, the Nickel Plate control obtained in 1882, but that of the Big Four, the Lake Erie & Western, the Toledo & Ohio Central and other lines. His contention briefly stated was that the unity of control of those lines violated the Sherman act and the anti-trust and anti-monopoly statutes of the six states through which the railroads of the New York Central system extend.

**PENNSYLVANIA.**—At the annual meeting held in Philadelphia on March 25, George Wood, C. Stuart Patterson and Clement B. Newbold were elected directors to serve for four years. The resolution approving of the increase of the company's indebtedness to the extent of \$75,000,000, upon which, at the stockholders' annual meeting, a stock vote was ordered to be taken at the same time, was adopted.

**WESTERN MARYLAND.**—J. Kemp Bartlett, of Baltimore, has been elected a director.

### Railway Construction

**OREGON, CALIFORNIA & EASTERN.**—Robert E. Strahorn, president of the Oregon, California & Eastern with offices at Spokane, Wash., is supervising the completion of a 20-mile railroad from Klamath Falls, Ore., to Dairy, which will be the first link of a projected railway into Central Oregon. The new line will extend from Bend, Ore., to Silver Lake, at which point it will branch, one line running to Klamath Falls and the other line to Lake View, Ore. Another line will extend from Bend to Crane and will connect the Oregon Short Line at the latter point with the Oregon Trunk and the Oregon-Washington Railroad & Navigation Company at Bend. The new line will connect the Oregon Trunk and the Oregon-Washington Railroad & Navigation Company at Bend with the Southern Pacific at Klamath Falls and the Nevada, California & Oregon at Lake View. The company also plans to complete a seven-mile spur from Dairy, Ore., to Bonanza this fall, the farmers having agreed to furnish the grade and ties if the company will lay the steel and operate train service.

## Railway Officers

### Railroad Administration

#### Federal and General Managers

**George E. Johnson**, who has been appointed assistant to the general manager of the Denver & Rio Grande, the Rio Grande Southern, the Denver Union Terminal, the Pueblo Union Depot and the Salt Lake City Union Depot, with headquarters at Denver, Colo., began his railway career in August, 1897, as a clerk in the freight agent's office on the Minneapolis & St. Louis, at Minneapolis, Minn. Until December, 1907, Mr. Johnson served in various positions with the Great Northern, including clerk and chief clerk to the superintendent, the assistant general superintendent and the general superintendent; assistant superintendent, inspector of transportation, and assistant to the general superintendent. During the following ten years he served as chief clerk to the general superintendent and to the general manager; trainmaster and superintendent on the Spokane, Portland & Seattle and affiliated lines. Prior to his recent appointment he was general superintendent of the Gales Creek & Wilson River (under construction), with headquarters at Portland, Ore.

#### Operating

**A. M. Smith** has been appointed superintendent on the Western Maryland, with headquarters at Hagerstown, Md.

**J. D. Stack**, general manager of the Virginian Railroad, with office at Norfolk, Va., has resigned and his former position has been abolished.

**H. E. McGee**, general superintendent of the Missouri, Kansas & Texas of Texas, with office at Dallas, Texas, has had his authority extended over the Wichita Falls & Northwestern.

**H. C. Ferris**, receiver and chief operating officer of the Missouri, Oklahoma & Gulf, with office at Muskogee, Okla., has been appointed general superintendent of the same road, with office at Muskogee.

**W. M. Whitenon**, superintendent of the Missouri, Kansas & Texas, with office at Muskogee, Okla., has been appointed general superintendent of that road and the Oklahoma Belt, with headquarters at Parsons, Kansas, vice **W. E. Williams** resigned to accept service with other lines.

**Major Mott Sawyer**, who served in the aviation service of the United States Army, has been discharged from military service and has been appointed assistant to the general superintendent of the Chicago, Milwaukee & St. Paul, lines west of Moberly, with office at Seattle, Wash. Major Sawyer was superintendent of the same road, with office at Tacoma, when he entered military service.

**Captain Frank O. Fernald**, Engineers, U. S. A., commanding Company F., 147th Engineers, has received his honorable discharge from the army and has been re-appointed superintendent, operating department, Pullman Car Lines, U. S. R. A., at Dallas, Texas. Captain Fernald was formerly engaged in railway construction and maintenance of way in the Northwest.

**C. L. Beals** has been appointed trainmaster on the Illinois Central, at Fordham, Ill., to succeed **T. Whitby**, who has been transferred to trainmaster of freight service south of Twenty-seventh street, Chicago, with headquarters at Fordham, succeeding **C. R. Smith**, who has been transferred to the territory north of Twenty-seventh street, with headquarters at Chicago, in place of **F. Ehretzman**, deceased.

The following appointments have been made on the Missouri, Kansas & Texas and all the roads under the jurisdiction of **C. N. Whitehead**, federal manager, with headquarters at St. Louis, Mo.: **O. C. Smith**, superintendent of transport-

tation, at Dallas, Tex., W. H. Hall, superintendent of telegraph, at Denison, Tex., and J. L. Walsh, superintendent of safety, at Dallas, Tex.

**W. Mosby**, superintendent of car service of the St. Louis-Southwestern of Texas, the Missouri, Kansas & Texas of Texas, the International & Great Northern and the Galveston, Houston & Henderson, has been appointed superintendent of transportation of the St. Louis-Southwestern, the St. Louis-Southwestern of Texas, the Eastern Texas, the Dallas Terminal & Union Depot, the Southern Illinois & Missouri Bridge and the Louisiana & Arkansas, with headquarters at Tyler, Texas; **W. J. Williams**, assistant superintendent of telegraph of the Louisiana & Arkansas, has been appointed superintendent of telegraph of the St. Louis Southwestern and affiliated roads, with headquarters at Tyler, Texas; **E. Richards**, assistant superintendent of safety of the Louisiana & Arkansas and the St. Louis-Southwestern, has been appointed superintendent of safety of the above roads, with headquarters at Mount Pleasant, Texas; **L. M. Hill**, superintendent of dining and parlor cars of the Missouri Pacific and the St. Louis-Southwestern, has been appointed superintendent of dining cars of the latter road and its affiliated lines, with headquarters at St. Louis, Mo.

### Financial, Legal and Accounting

**Ernest Gent**, chief clerk in the accounting department of the Illinois Terminal and the Missouri & Illinois Bridge & Belt, has been appointed acting federal treasurer of these roads, with headquarters at Alton, Ill., to succeed **K. E. Wilson**, resigned.

**E. T. Nelson**, paymaster of the Missouri, Kansas & Texas, with office at Parsons, Kan., has been appointed acting federal treasurer of the Missouri, Kansas & Texas of Texas, with headquarters at Dallas, Texas, vice **W. O. Hamilton** resigned to accept service elsewhere.

### Traffic

**W. V. Galbreath**, general live stock agent of the Missouri, Kansas & Texas of Texas, with office at Ft. Worth, Texas, has had his authority extended over all the other roads under the jurisdiction of **C. N. Whitehead**, federal manager, with headquarters at St. Louis, Mo.

**J. R. Wells**, whose appointment as assistant general passenger agent of the Southern Railroad lines, with headquarters at New Orleans, La., has already been announced in these columns, was born on December 17, 1870, at New Orleans, and was educated in the Jesuits College of his native town. He began railway work in November, 1896, in the passenger traffic department with the New Orleans & North Eastern, part of the Queen & Crescent Route. He served continuously in that department and with the Southern Railroad lines, after the consolidation, until the present time, consecutively as assistant ticket agent, city passenger agent, city ticket agent, district passenger agent and as division passenger agent, at New Orleans.

**R. H. DeButts**, division passenger agent of the Southern Railroad, has been promoted to assistant general passenger agent, with office at Washington, D. C.; **S. E. Burgess**, division passenger agent at Charlotte, N. C., has been promoted to division passenger agent, with office at Washington, D. C., and **R. H. Graham**, division passenger agent at Greenville, S. C., has been promoted to division passenger agent, with office at Charlotte, N. C.

J. R. Wells

**W. M. Fenwick**, assistant general passenger agent of the Missouri, Kansas & Texas, has been appointed general passenger agent of that road, and the Oklahoma Belt, with office at St. Louis, Mo. **Randolph Daniels**, division passenger agent of the Missouri, Kansas & Texas of Texas, with office at Dallas, Texas, has had his authority extended over the Wichita Falls & Northwestern. **W. A. Kellond** is now general baggage agent of the Missouri, Kansas & Texas, the Oklahoma Belt, the Missouri, Kansas & Texas of Texas and the Wichita Falls & Northwestern, with offices at Parsons, Kan., and at Dallas, Texas. **W. G. Crush**, passenger traffic manager of the Missouri, Kansas & Texas of Texas, and the Wichita Falls & Northwestern, with headquarters at Dallas, Texas, has had his authority extended over the Missouri, Kansas & Texas and the Oklahoma Belt.

### Engineering and Rolling Stock

**W. J. McDermott**, roadmaster on the Northern Iowa division of the Chicago & North Western, with headquarters at Eagle Grove, has retired from active service after a period of 36 years in the employment of this road. Mr. McDermott is succeeded by **J. Bolan**.

**H. H. Johntz** has been appointed engineer maintenance of way of the Missouri, Kansas & Texas and the Oklahoma Belt, with headquarters at Parsons, Kan., and **A. E. Triplett**, district engineer of the Missouri, Kansas & Texas of Texas, has been appointed engineer maintenance of way of the same road and the Wichita Falls & Northwestern, with headquarters at Dallas, Texas.

**W. H. Vance**, engineer maintenance of way of the St. Louis-Southwestern and the Louisiana & Arkansas, has been appointed engineer maintenance of way of the St. Louis-Southwestern lines, including the St. Louis-Southwestern of Texas, the Eastern Texas, the Dallas Terminal & Union Depot, and the Southern Illinois & Missouri Bridge, with headquarters at Tyler, Texas.

The following appointments have been made on the Missouri, Kansas & Texas, and all the roads under the jurisdiction of **C. N. Whitehead**, federal manager, with headquarters at St. Louis, Mo.: **H. P. Anderson**, superintendent of motive power of the Missouri, Kansas & Texas, at Parsons, Tex., has been appointed mechanical superintendent with office at Denison, Tex.; **W. H. Maddocks** has been appointed mechanical engineer, with office at Parsons, Kan., and **R. W. Burnett** has been appointed assistant mechanical superintendent, with office at Denison.

### Purchasing

**J. E. Anderson**, purchasing agent of the Ft. Worth & Denver City; the Ft. Worth & Rio Grande; the Gulf, Colorado & Santa Fe; the International & Great Northern; the Missouri, Kansas & Texas; the Missouri, Kansas & Texas of Texas, and the Texas Midland, with office at Dallas, Texas, has been appointed assistant purchasing agent of the St. Louis-San Francisco; the Kansas City, Clinton & Springfield; the Paris & Great Northern; the West Tulsa Belt, and the Rock Island-Frisco Terminal, with headquarters at St. Louis, Mo.

### Corporate

#### Engineering and Rolling Stock

**Richard W. Moore**, general car foreman on the Canadian National, at Cochrane, Ont., has been promoted to district car foreman, with headquarters at Saskatoon, Sask. He was born at Listowel, Ont., on October 20, 1882, and received his education in the Brandon high school of that place. He entered railway service in July, 1906, as a car repairer on the Grand Trunk Pacific, which position he held for two years when he was promoted to car foreman, serving in that capacity for nine years at Melville, Sask., Rivers, Man., and Fort William, Ont. When the National Transcontinental was taken over by the Canadian Government, Mr. Moore was transferred to that road as car foreman. In November, 1917, he was appointed general car foreman, with headquarters at Cochrane, Ont., which position he held until his recent appointment as district car foreman of the Canadian National, with headquarters at Saskatoon.

### Indiana Repeals Fare Law

The seventy-first General Assembly of Indiana has repealed the two-cent fare law. The state of Indiana is to be congratulated upon taking this step in the direction of fairness and justice in the treatment of its railroads. It is to be congratulated because it is a move which will bring stabilizing influences to the public, to commerce and to industry; because it has opened the way for other states to repeal laws inimical to progress and the growth of transportation facilities, and because it has voiced the need of constructive methods rather than a policy of restriction. The passage of this law brings to light a four-year educational campaign carried on by the passenger traffic officers of the Indiana lines together with the operating legislative committee. This campaign was presented first to the people and business interests of the state and later to the assemblies in order that an understanding might be reached as to the needs of the steam roads which were serving them. Under government control the efforts in this campaign were redoubled and success was finally attained with the repeal of the two-cent fare law. With the action of the Indiana General Assembly in taking the lead in this reform it is to be hoped that other states, which still retain arbitrary laws that fail to meet the increased costs of material and labor, will follow. However, it may be necessary for the roads in the other states which hope to follow the lead of Indiana to duplicate its educational campaign.

### The Mechanical Conventions

The convention of the American Railway Engineering Association which was held in Chicago two weeks ago was, in every respect, one of the most successful in the history of that organization. The indications are that the same thing will hold true of the June conventions of the Master Car Builders' and Master Mechanics' Associations. The Railroad Administration is co-operating in the preparations for the meeting and will undoubtedly follow the same course as has been done in the case of other conventions in asking federal managers to see that as many of the mechanical officers as possible attend the meetings. This will do much to insure a record-breaking registration. The secretary of the associations is already receiving the reports from the committees and the prospects are that advance copies will be in the hands of the members much earlier than in previous years. In order that the best results may be secured, the members should attend the conventions prepared to discuss the reports and papers freely, and it will be wise also to thoroughly thresh out the questions and perplexities in the minds of many as to the amalgamation of the associations. A thorough and frank discussion of these things will do much to clear the atmosphere and make it possible for the new association to function to the best possible advantage. The reports received from the Railway Supply Manufacturers' Association indicate that the exhibits will surpass those of any previous year both in number and scope. It is expected that the exhibitors will give special attention to preparing their exhibits so as to make them as effective as possible from an educational standpoint. This is particularly im-

portant since the meetings will undoubtedly be attended by a large number of mechanical department officers and foremen who have never before had that privilege, many of whom are young men who have been promoted to positions of importance since 1916.

### The Standard Locomotives

A striking illustration of the difficulty in adapting common standard locomotives to all conditions is illustrated by the experience of the Pittsburgh & Lake Erie. While this road uses fairly heavy freight locomotives it has never felt the necessity of equipping them with mechanical stokers because the line is almost level and high-grade Pittsburgh coal is used for locomotive fuel, thus making the fuel consumption comparatively light. The Railroad Administration has furnished this road with some of the heavy Mikados having a tractive effort of 60,000 lb., a weight on drivers of 240,000 lb. and a grate area of 70.8 sq. ft. Ordinarily, such locomotives would burn considerably more than 4,000 lb. of coal per hour and stokers could be used upon them to advantage. The average fuel consumption per hour for these locomotives drawing full tonnage trains (6,000 tons) is only about 2,000 lb. of coal per hour, thus bringing them well within the limits of efficient hand firing. The introduction of the stoker under these conditions cannot be justified, and, indeed, has caused a great deal of trouble in the way of delays because the men are not familiar with stoker operation, and there have been a very considerable number of stoker failures. The experience emphasizes what the *Railway Age* has consistently pointed out, and that is that in order to secure the greatest efficiency, the locomotives must be carefully designed and equipped to suit the conditions under which they are to be used.

It is now the season when maintenance of way and improvement work should be getting actively started. Yet it is practically at a standstill with no immediate prospect of active inauguration and with greater uncertainty regarding the volume to be done than in any recent year. Owing to the desire to make a favorable financial showing it has been the custom of some roads in the past to do the minimum amount of work until the close of the fiscal year on June 30 and then endeavor to make up for lost time later in the summer. Because of a recognition of the waste resulting from this practice, the Interstate Commerce Commission changed the fiscal year a few years ago to terminate on December 31. This gave a marked impetus to the starting of work as early as the season permitted and has been the means of effecting important economies, the nature of which is familiar to all railway men. One of the advantages which the advocates of government ownership of the roads have claimed for it has been the removal of the incentive for financial showing which has led to interference with orderly programs of work under private management. It has also been contended that the roads would be kept in repair with the sole consideration

of their best and most economical maintenance. While it is true that recent experiences have made government ownership a dead issue insofar as this country is concerned, it is not out of place to call attention to the stagnation in the maintenance and improvement of the railway properties which now exists, at a time when there is more than the usual demand for such work to bring them up to their proper standards. Although the stagnation and delay in starting work is not the result of deliberate intent on the part of the Railroad Administration, and, in fact, is contrary to the desires of those in control and to what they know is good railroad practice, it is nevertheless the result of the system under which they are working, which makes possible the submerging of the interests of economical railway operation to those of political considerations.

## A New Cycle of Railway Wages

WE ARE ENTERING a new cycle of changes, or proposed changes, in railway wages.

Less than a year ago the Railroad Wage Commission made its report recommending advances in wages to all classes of employees which it was estimated would amount to about \$300,000,000 a year. There were numerous complaints that the advances made were too small. The first employees to be granted an additional advance were those in the shops, who had been given more in General Order No. 27 than the Commission had recommended. Director General McAdoo appointed a Wage Board composed of three railway officers and three officers of employees' organizations. After receiving the recommendations of this board, the director general made advances in the wages of the shop employees roughly estimated at \$150,000,000 to \$200,000,000 a year. This was the first of a series of advances made to special classes of employees which have amounted to \$500,000,000 a year, and which, with the advances made on the recommendation of the wage commission, have made the total advances to date under government control \$800,000,000 a year.

The shop employees who were granted the first special advance last year have recently presented a petition for another large advance. It is estimated that the advance now asked would amount to \$150,000,000 a year. The action taken on their petition will be important in itself, but still more important as a precedent. If another advance in wages should be granted to the shop employees, of whom there are over 500,000, there would immediately be received petitions for at least proportionate advances to the other million and a half employees. If another advance should be granted to the shop employees, it is hard to see how it could be refused to other employees, since the shop employees are both absolutely and relatively among the highest paid men on the railways. To begin another cycle of advances in wages would mean further increases of hundreds of millions of dollars annually in railway expenses. It is only necessary to recall the experience of the last year to show that this statement is justified.

Are the shop employees entitled to higher wages? They base their petition on the grounds that the rates established last year are inadequate and that a further increase is needed "to meet the ever-rising cost of living and to maintain a more equitable differential between classes of railroad employees and those engaged in similar capacity in other industries." But the cost of living will continue to tend upwards rather than downward if vast advances of wages in the various industries are to continue. It may be that mechanics employed in shipbuilding are paid higher wages than railway shop employees; but practically all other mechanics are now paid less, and substantially less than those of railways; and comparison should be made with mechanics of all classes

working under conditions comparable to those on railways, not merely with the one class, which, because of exceptional conditions, happens to be the highest paid.

The expenses of the railways are now out of all proportion to their earnings, in spite of the large increases in rates. The government incurred a deficit of over \$110,000,000 in operating them in the months of November, December and January. It will have to advance the rates again to avoid a huge deficit in 1919 even if wages stay where they are. Every further advance in wages will mean a corresponding increase either in the deficit that the taxpayers will have to pay or in the rates that travellers and shippers will have to pay. Have railway employees, whose wages now average 45 per cent more than a year ago, a better right to still further advances than the public has to protection from the increases of taxes, or rates, or both, that further advances in wages would render necessary? That is the question really raised by the beginning of a new movement for advances in railway wages.

The enormous advances in wages following those made on the recommendation of the Railroad Wage Commission last year were made in such a way that the press and public were not informed, and do not know now the exact grounds upon which they were asked for and granted. The failure to give adequate publicity to these matters was not justifiable even in time of war; it would be still more unjustifiable in time of peace. The public has to pay the bill and has a right to know what and why it is asked to pay. The United States, we are occasionally reminded, is a democracy, and it is not consistent with the principles of a democracy for wage advances that will cost the public hundreds of millions to be made as advances in railway wages amounting to over a half billion dollars a year have been made within the last year.

The Railroad Administration should see that the public is informed as to exactly what the railway shop employees are asking; as to the reasons advanced for and against granting their demands; and as to the reasons for the decision finally reached by the Administration. Then the public will be able to form an intelligent opinion as to the reasonableness and justice of what is demanded and what is done; and there will be less danger that things that are neither reasonable nor just will be done.

## Canadian Pacific

THEY CALL THE INCREASED railway wage scale in Canada the McAdoo scale of wages. As a matter of fact, the Canadian roads, in so far as rates and wage scales were concerned, followed the course adopted in the United States. There is one fundamental and vitally important difference, however, between the conditions in Canada as regards the Canadian Pacific and the conditions in the United States as regards the government operated railroads. The Canadian Pacific's wage scale is dependent on that of the United States Railroad Administration, but the Canadian Pacific management is free to deal effectively with labor in regard to efficiency, whereas the federal manager of each American road under the administration is nearly helpless in this respect. Thus, the Canadian Pacific may hope to reduce operating expenses, if not in full proportion to a reduction in traffic, at least in some reasonable measure.

The most striking thing about the Canadian Pacific situation to a man going there from the United States is the contrast between the way the Canadian public regards the service of the Canadian Pacific during the past year and the way the American public regards the service of the roads under the United States Railroad Administration. There is almost an entire lack of hostile criticism of the Canadian Pacific's service under war conditions. The Canadian Pacific was

\$7,000,000 surplus had been paid as a tax, any remaining surplus was to be divided equally between the company and the Canadian government. In 1917, the Canadian Pacific had a surplus from railroad earnings above dividend requirements of \$12,424,000 so that the Canadian tax in 1918 would have been, if the company had done as well in that year as in 1917, approximately \$9,500,000. As it is, the government will get \$2,204,000 unless some flaw is found in the law.

The Canadian Pacific has always adhered to a high standard of maintenance. This policy was pursued in 1918, and \$22,646,000 was spent on maintenance of way as compared with \$17,470,000 in 1917. It is an interesting fact that in figuring replacements the Canadian Pacific has scrupulously charged to expenses the full present cost of steel and other materials. Thus, if a steel bridge is replaced by a concrete structure, operating expenses are charged not with the book cost of the steel structure, less scrap value, but with the amount that it would cost today to build the steel bridge, less scrap value; on the other hand, a very conservative policy is pursued in regard to scrap value as, for instance, when rails are taken up their scrap value is figured not at the present cost of steel but at the original cost.

During all the four years of the war the Canadian Pacific has been restricted in its maintenance expenditures by a shortage of labor, but apparently in 1918 it managed to get sufficient labor to put the property in fine shape. Thus, \$2,073,000 was spent for ties in 1918 as against \$1,600,000 in 1917; and \$1,559,000 was spent for rails as against \$500,000 in 1917. Both of these are materials accounts but the unit costs of materials in Canada did not increase by any means as much as this difference between 1918 and 1917 tie and rail expenditures, so that more material was actually used and more work done in 1918 than in 1917. Track laying, a labor account, amounted to \$6,840,000 in 1918 as against \$5,071,000 in 1917. There is a decided contrast between the Canadian Pacific's policy toward maintenance of way in 1918 and that of most of the roads under federal control in the United States.

On the other hand, maintenance of equipment on the Canadian Pacific did not take the big jump in cost that it did on many American roads. Total maintenance of equipment expenditures in 1918 were \$28,227,000 for the Canadian Pacific, comparing with \$23,404,000 in 1917. The following figures which, so far as we know, have never been published heretofore, show the average cost of repairs per unit of equipment, exclusive of renewals and overhead charges.

	1918	1917
Locomotives .....	3,814	2,964
Freight cars .....	91	68
Passenger cars .....	1,677	1,366

In December, 1918, the Canadian Pacific had, on the lines east, 17.1 per cent of its locomotives awaiting or under repairs and on the lines west 16.8 per cent. The Canadian Pacific has no locomotives stored; this fact should be remembered when comparing percentage of equipment under repair and needing repair with the figures given out by the United States Railroad Administration since there are a large number of locomotives in the United States in storage, many of them in need of repairs.

Transportation expenses, the out-of-pocket cost of handling the business, amounted to \$59,109,000 in 1918, as compared with \$51,350,000 in 1917. Compare this increase of a little over 15 per cent in transportation expenses with an increase of 40 per cent in the transportation expenses of the Pennsylvania, 35 per cent of the Erie, 36 per cent of the Chicago & Northwestern, 26 per cent of the St. Paul, 28 per cent of the Atchison, Topeka & Santa Fe, and 48 per cent of the Illinois Central. A difference of from three to six months in the effective date of wage increases is hardly sufficient to account for the contrast between the increases in Canadian

Pacific transportation expenses and the others which are fairly typical of the larger American roads, and some other circumstances furnish an explanation. One of these other circumstances is the more effective work which the Canadian Pacific has been able to get out of its employees under private management as compared with the work gotten out of the American railroad employees reporting nominally to federal managers but actually dealing direct on labor questions with the central administration. It is interesting to note how well the Canadian Pacific was able to hold down loss and damage and injury expenses. Loss and damage to freight cost \$1,229,000 in 1918 as against \$967,000 in 1917, and injuries to persons cost \$405,000 in 1918 as against \$458,000 in 1917.

The Canadian Pacific is a financial institution of tremendous strength. It came to the financial aid of Canada and the empire in the war and it is today a shining example of a North American railroad privately owned and operated with a credit comparable to the strongest companies engaged in other industries. At the end of 1918, the company had \$39,548,000 cash on hand and had loaned \$40,000,000 debenture stock to the imperial government and it bought and owned \$30,682,000 imperial and dominion government securities, besides having \$60,704,000 deferred payments on lands and townsites due to it. The company has no mortgage bonds except about \$3,500,000 on the Algoma branch, and its 4 per cent consolidated debenture stock has no power to put the company into the hands of a receiver although its holders can take over the operation of the property if their dividends are not paid. The Canadian Pacific carries on its balance sheet a surplus of \$127,275,000 from operation of the railroad and \$106,724,000 surplus in other assets.

The company did not very much more than earn its dividends in 1918. If additional wage increases are made to the brotherhoods in the United States, the Canadian Pacific will have to follow suit probably with increases to its engine and trainmen. This would apparently mean an increase of about \$800,000. Assume that there are some further increases in wages in the states which would necessitate further increases in Canada and assume also that the pressure of public opinion or some other reason prevents the increase of freight rates in the United States and, therefore, in Canada, is there any danger of the Canadian Pacific's failing to earn its dividends in 1919? Traffic is falling off to some extent in Canada, but not to the extent that it is on most of the larger roads in the United States, nor is the Canadian Pacific dependent, to any great extent, on coal traffic.

There is small chance of any serious surplus of labor in Canada. The 400,000 Canadian troops who volunteered and have seen service in France are being absorbed quite easily as they return without as yet, at least, displacing the women who entered such industries for which women have proved to be well adapted. The serious danger which threatened Canada from the war was being bled white of man-power. This danger has been averted by the armistice and the introduction of women into industry has actually increased the available "man-power." Furthermore, the cost of materials in Canada is decreasing fairly rapidly and on a scale which would suggest that further increases in wages could be almost entirely offset by the lowered cost of materials. The Canadian Pacific has been so conservative in its accounting methods and so liberal in its policy toward upkeep and has written off so promptly the full extent of losses due either to the increased cost of material or the direct effect of the war that it faces the future with no aftermath of financial difficulties to be taken care of. It is conceivable that a crop failure would so reduce revenues as to prevent the earning in full of the 10 per cent dividend, but even were some unforeseeable disaster such as this to occur, the company's current assets and great reserves are amply suffi-

cient to warrant the payment for a year or two years of dividends out of surplus. No such necessity, however, confronts the road at present. It stands a monument of financial strength in striking contrast to the English, French and most of the United States roads.

The following table shows the principal figures for operation in 1918 as compared with 1917:

	1918	1917
Mileage operated .....	13,380	13,389
Freight revenue .....	\$110,187,288	\$103,635,795
Passenger revenue .....	30,837,254	30,238,986
*Total operating revenue.....	157,537,698	152,389,334
Maintenance of way expenses.....	22,646,106	17,470,069
Maintenance of equipment expenses.....	28,226,991	23,404,263
Traffic expenses .....	3,011,579	3,084,944
Transportation expenses .....	61,047,813	53,029,260
General expenses .....	5,421,601	5,023,609
Taxes .....	2,518,727	2,129,604
Total operating expenses.....	123,035,310	105,843,317
Net operating income.....	34,502,388	46,546,018
Interest, including debenture charges.....	10,177,513	10,229,143
†Railroad income available for dividends.....	23,630,898	33,848,129
Other income .....	8,129,750	10,703,298
Net corporate income.....	31,760,648	44,551,427
Dividends .....	29,227,276	29,227,276
Surplus .....	2,533,372	15,324,151

\*Including commercial telegraph and miscellaneous expenses for the whole year in 1917 and for two months only in 1918.

†The net from commercial telegraph and Atlantic steamship lines is deducted before arriving at this figure and is included in the other income in the next item.

### New Books

*The Earning Power of Railroads; 1918-19 edition. Compiled and edited by Floyd W. Mundy, of James H. Oliphant & Co., 61 Broadway, New York.*

In this little volume, which, although it contains 422 pages, is printed on such thin paper that it is but half an inch thick and can be slipped into a coat pocket, there is contained a simple, clear statement of the Interstate Commerce Commission's system of railroad accounting, an analysis of what constitutes earning power of a railroad and security for the holder of bonds or stocks; a set of tables for 144 railroads in the United States, Canada and Mexico, showing mileage operated, gross earnings and surplus for a series of years, capitalization, income account for 1917 and the percentage of maintenance, of other operating expenses, and of fixed charges to total income, with a statement of freight and passenger density and second-track and siding mileage; and, in addition, notes in regard to each one of these 144 roads, describing something of the characteristics and history of the road. If an investor desires to get a picture of the main characteristics of a railroad property there is probably no reference work published to which he could turn to find the information so easily and quickly as to this. It makes no pretense of being comprehensive in the sense that Poor's Manual of Railroads is, but it is admirably adapted to the needs of a man or woman who does not have the time or the knowledge to go into an exhaustive and analytical study of a particular railroad property.

The introductory chapters, describing the Interstate Commerce Commission's accounting system and commenting on railroad earning power, are especially good.

The notes in general are painstaking and intelligent commentaries on the characteristics of the property and its financial structure which should be thoroughly understood by an investor in its securities. Occasionally a bit of information is omitted that, if included, would seem to have been of value. For instance, in the notes on the Boston & Maine, while the leased lines are mentioned, there is no statement showing the proportion of mileage operated for these leased lines, although the fact that of the total 2,259 miles of road operated by the Boston & Maine 1,520 miles are leased under high guaranteed rentals, is one of the fundamentals which have shaped the history of the property; but this is an exception, and in general the notes are remarkably comprehensive, considering the space which they occupy.

## Letters to the Editor

### Are the Railroads Fair to the Public?

LONDON, England.

TO THE EDITOR:

It may interest "A Thinking American," whose letter you published in your issue of January 10, to know that his statement as to lax practices on English railways in reference to season tickets no longer holds good.

Since the war season ticket holders are required to produce their tickets on all occasions just like ordinary passengers. Further, if a holder leaves his ticket behind, he is required to pay the fare (at least on short distance travel, I cannot speak as to the practice in other cases), and it is not refunded. Allowance for non-use during holidays or illness has also been restricted. As every season ticket is issued subject to these conditions, there is surely no question of the railway company "taking advantage of the passenger on technicalities."

I cannot think that the statement of the "head of one of the great English railroad systems," to the effect that frauds were unimportant, would be generally accepted in the English railway world. So far from spending \$500,000 a year to detect \$50,000 worth of fraud, one company with whose affairs I am acquainted, in addition to prosecuting to convict many scores of exceptionally bad cases per annum in the police courts, recovers in excess payments from passengers who are not prosecuted enough to pay the wages of the whole force of traveling inspectors employed.

W. M. ACWORTH.

### Value of a Personnel Department

ST. LOUIS, Mo.

TO THE EDITOR:

I was very much interested in an article appearing in your February 14 issue, in regard to the necessity for railroads having a personnel department. Two or three years ago I addressed a letter to several railroad executives, presenting to them the desirability of a department of this kind, but was unable to secure any satisfactory replies, all seeming to think that such a department was a development of the future, with the single exception of the president of one company, who was interested, but not sufficiently so to go forward with the proposition.

My suggestion was that a department be formed to canvass all employees, find out their ages, size of families, when they entered the service, at what salary they started, what promotions they had, education, special training, etc. Then add similar information regarding new employees entering the service. All of this information was to be placed on a regular service card, together with notations regarding habits, personalities, physical and mental qualifications or disqualifications, etc., and was to be used as a basis not only for a study of the possibilities for increasing efficiency in the personal element, but was to be used in filling vacancies at various points on the line, especially in the line of promotions. In other words, to cite an example, if Bill Smith was holding down a revising desk at a local freight office, and his record showed him to be a man worthy of promotion, when a vacancy occurred at a larger station, or in the general office, the management would be in a position to tell from the card record whether his family affairs, together with his personal habits, would render it desirable to promote him to the vacancy.

Another feature I had in mind was to use such a department as a sort of educational clearing house to assist ambitious employees to better their condition, by investigating various mail and personal training schools, so that the department would be in position to tell any ambitious young man or woman where training along a certain line would be best secured, and at what cost, under what circumstances, etc.

Another thought was to use the department to prepare articles that could be presented to high schools, colleges and other educational institutions, presenting the matter of transportation in its more elemental phases, and possibly bringing about an increased understanding and appreciation of the necessity for transportation, and its relation to every phase of human endeavor. In connection with this feature, I had thought of attempting to bring to the attention of young men in the high schools, colleges, etc., the wonderful opportunity afforded by the transportation field, for those well equipped to enter it, and thus endeavor to bring about an increased desire on the part of the brighter young men to enter this field.

It seems to me that a department of this kind, properly conducted, would go far toward bringing about a better feeling between the public and the carriers, and of equal importance, it would bring about a better feeling between the companies and the employees, because in the practical working out of the idea every employee would come to realize that the matter of promotion had become one of merit, rather than personal influence.

T. ERSON.

### The Question of Safety

CHICAGO, ILL.

TO THE EDITOR:

Much has been said lately concerning the safety of the railroads, both material and personal, under government operation. No less than the Hon. James Hamilton Lewis,

senator from Illinois, stated not long ago that "we see now no railroad collisions and deaths of passengers and crews." Nevertheless there have appeared from time to time newspaper reports of wrecks which somehow seldom failed to contain a fair-sized casualty list. The divergence between the opinion of certain advocates of government control of the railroads and the opinions one forms from periodicals and newspapers, led me to compile the following statement of accidents, comparing the year 1918, when the roads were under government operation, with 1917, when the roads were privately operated. My only source of information in compiling this was the statement of wrecks which appears monthly in the *Railway Age*. I realize that this statement is not entirely complete, but since the records for both years were obtained from the same source, I believe it is representative of the true relations of the accident and casualty list for the two years.

I do not believe that any explanation of these figures is necessary other than the qualification already stated.

—OBSERVER.

Inspectors of Locomotives, at \$3,000 a year, are called for by the United States Civil Service Commission and examinations will be held on May 21 and 22 to fill vacancies under the Interstate Commerce Commission. Applicants must have reached their 25th but not their 55th birthday on the date of the examination, and must have not less than three years' railroad experience in the capacity of master mechanic, road foreman of engines, locomotive boiler maker, locomotive boiler inspector, roundhouse foreman, shop foreman, locomotive machinist, or locomotive engineer; not less than five years as locomotive inspector or locomotive fireman; and must have been within three years next preceding the date of application in active service in any such capacity or in the capacity of inspector of locomotive equipment under the government of the United States or of a state or territory.

# Railway Buying and Industrial Readjustment\*

The Barometers of General Business and Equipment Purchases Show an Interesting Relationship

By E. B. Leigh

President of the Chicago Railway Equipment Company, Chicago

EMPLOYMENT OF LABOR during the transition from war to peace is complicated by the fact that the government itself, through the Railroad Administration, has greatly reduced its purchases of equipment, material and supplies. The director general has proposed estimates for 1919, which the House Committee on Appropriations has approved. Apparently the sums named would provide additions and betterments in quantity much less than the actual provision in recent years. Indeed, Mr. Hines has stated that no large program of capital improvements could be expected, unless Congress grants the five-year extension.

As a result of meagre purchases since the armistice was declared, unemployment has already manifested itself in the railway supply industries, while new orders are abnormally low. This in due course will increase the prevalence of short time and shutdowns in these industries.

Soldiers coming home are greeted with posters on every

in authority at Washington should be aided in grasping the relation between railway purchases and the employment of labor, in general industry and trade. For many years past I have observed the effect of railway purchases upon general business prosperity—induced by the fact that in my business (a portion of which is that of railway supplies) I had noted that when the railways of the country entered the field of substantial capital purchases, there invariably followed a period of general business prosperity; and, likewise, the cessation of such purchases was invariably followed by a decline in general business.

In 1913, and with data carefully collected from the year 1904 to that time, I set to work to test out this principle.

## Rolling Stock the Index

As the iron and steel industry has long been recognized as being the truest index of general business conditions, and

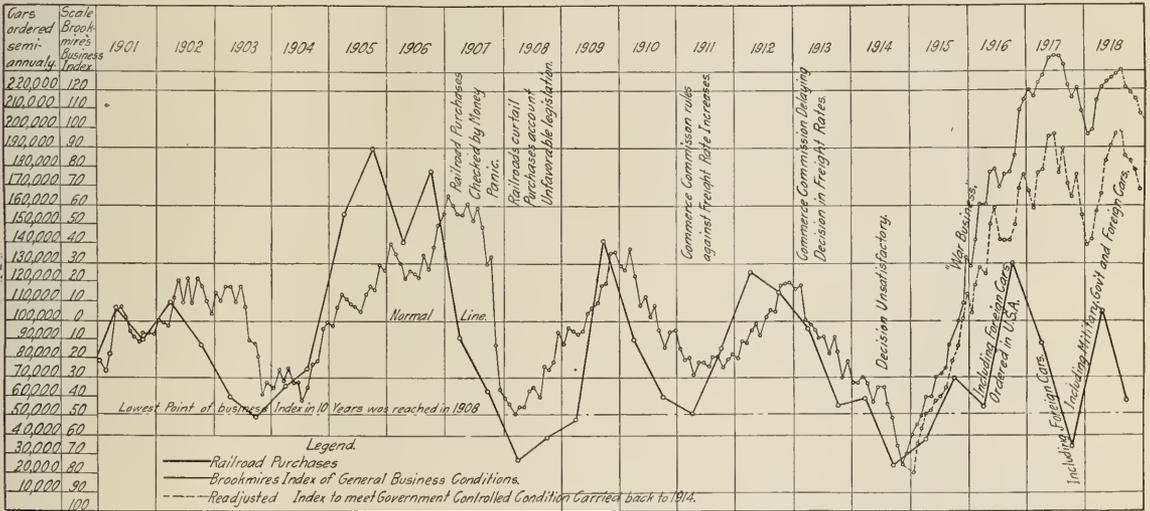

Chart Showing Relation of Railway Purchases to General Business Conditions

fence urging employers to give them jobs. These are proclamations by the United States government. Yet the government itself, through the Railroad Administration, is withholding the orders upon which employment for soldiers and others depends. It is being urged upon the director general and upon Congress that the railways under governmental control should have at least a normal program of additions and betterments.

A representative of the Railroad Administration, we are told, is to be a member of the new government price conference board, the function of which is to determine prices at which the government departments, including the railways, will enter the market.

In this situation it seems of highest consequence that those

as prior to 1914 it was reliably estimated that the railways consumed, directly and indirectly, between 40 per cent and 50 per cent of the iron and steel production of the country, it is manifest that the expansion or restriction of railway consumption must vitally affect this barometer.

The ramifications of railway purchases make it impossible to classify them in the aggregate. But few of the more important items, such as rails, for example, are made the subject of public information and statistical compilation. However, the conditions under which rail purchases are made are not believed to be such as to reflect the railways' prosperity, their purchasing ability in a broad sense, or their influence upon general business.

Many years of observation led to the belief that of those items officially compiled, tabulated and made public, perhaps no one so clearly and typically reflects the railways'

\*Abstract of an address delivered February 20, 1919, before the National Industrial Conference Board.

general purchasing ability as that of new equipment, and no other tabulation has been as regularly and accurately kept. When the railways bought freely of new equipment, they were generally likewise buying freely of all other articles essential to maintenance, operation and betterment. During the past 10 or 15 years the purchasing of new equipment had a greater influence upon the iron and steel industry because of the transition from wooden to steel construction.

Accordingly, the number of freight cars built each year taken as a unit and termed "railway purchases," was projected on the chart of the Brookmire Economic Service for the period of 1904 to October, 1914, inclusive—and later, as shown on the accompanying chart, brought up to date, and extended back to the year 1901.

The general business line is shown in monthly periods, while the railway purchase line is given in six-month periods.

Prior to 1907 railway purchases were influenced by and preceded under normal conditions. In this earlier period one of the important factors influencing advanced car orders and the business outlook was the "crop prospects." In the days of the so-called "granger" roads the crop prospects of Iowa, Kansas, Nebraska and the Northwest almost determined the market prices of these "granger" stocks. Necessary betterments and new equipment were determined in the light of money conditions, and the probable needs of the roads.

The period preceding 1907 was one of increasing net income for the railways. Their revenue keeping pace with expenses, it was the custom of railway managers generally to discount future requirements in ordering equipment, and they felt they could with prudence count upon resources warranting these large operations. The chart shows that car orders reached a maximum in 1905 and 1906.

But in 1908 a new condition or factor appeared, due to the investment of the rate-making power in the hands of the Interstate Commerce Commission—the beginning of a regulation which had in it no element of responsibility for transportation development. Thus, for the first time were "railway purchases" controlled by abnormal rather than normal conditions; and have so continued, more or less, from 1908 to the present time.

### Three Elements for Good Business

The year 1908 was notably the leanest of business years up to 1914, notwithstanding bumper crops, plentiful money and absence of disturbed political conditions—the three recognized elements making for good business. It likewise recorded the smallest number of cars ordered during the period, 62,999, and the minimum of railway purchases for many years prior.

The conditions of 1908 were continued well into 1909, but the last half of the year witnessed a substantial buying movement by the railways, the total cars ordered for the year aggregating 193,874, nearly 70 per cent of which, however, were ordered within the last four months, with particularly heavy orders in November and December. This gave a fairly good business year, with a heavy "carry over" to 1910.

In 1910 general business promptly followed, and with the heavy "carry over" business from 1909 referred to, coupled with fairly good buying on the part of the railways during the first six months, made the year 1910 a still better year than 1909, although the total of car purchases was only 145,085. The falling off in car orders after the middle of the year was duly reflected in the decline of business until at the end of 1910 the probabilities of 1911 were clearly foreshadowed.

In 1911 the decline in general business, together with the falling off of railway purchases, continued throughout almost the entire year, but at its close a buying movement on the part of the railways set in. The total number of cars

ordered for the year was 135,740, nearly 30 per cent of which were placed at the very end of the year, and necessarily carried forward into 1912.

### A Complete Test

We reached a high point in railway purchases about May, 1912, continuing with normal purchases for most of the remainder of the year, again reaching a high point at the very end of the last quarter, the total car purchases being 238,400, the largest number in any year since 1906. It is here significant to note that the foregoing conditions in railway purchases were followed by a phenomenal revival of general business during the last half of 1912; this too in the face of a national election fraught with more uncertainties as to its outcome than any we had had for years. Business seemed to ignore these conditions, however, while the heavy purchases made by the railways filled the steel mills of the country with orders toward the close of the year, so overtaxing their capacity as to compel buyers to anticipate deliveries by orders placed four, six and even nine months in advance of shipping dates—a condition theretofore unprecedented, while general business assumed almost the aspect of a boom.

At this point it may be interesting and illuminating to note a comparison of conditions prevailing in 1908 and 1912:

In 1912 we had only normal reserves, normal crops and very disturbed political conditions—on the other hand, notwithstanding these unfavorable conditions, we had an almost boom year, with the railways buying heavily.

Just why was "1912" the exceptional year? Why were the political conditions and political policies almost ignored? If there had been any doubt as to the basic factor of railway purchases, it was brought into bold relief in 1912, and that year furnishes an answer.

### Repression

Heavy purchases of new equipment continued during the first three months of 1913, but sharply declined at the beginning of the second half of the year—almost immediately sinking to a very low level.

It was here that the "danger signal" was set by this barometer; but, naturally, general business did not immediately feel this falling off of railway purchases at the time (because of the accumulations), being sustained by the unfilled orders or what might properly be termed the "unspent momentum."

The condition clearly foreshadowed at the middle of the year eventuated, and brought to us the memorable depression of 1914, and when railway purchases reached their lowest mark.

### War

It was stated in 1913 that it was believed railway purchases were and would continue to be the controlling factor in general business until or unless some other great purchasing power developed or came to take their place.

Then the unexpected happened; the great European war broke out, resulting in war buying supplanting railway buying. It was not until well within 1915 that the effect of foreign, munition and warwork orders was substantially felt by us; but the chart shows a gradual yet steady climb of the business line during the first six months, somewhat accelerated throughout the last half of the year, and not measurably accounted for by railway purchases.

In 1916 we find the phenomenon of steadily advancing general business with declining railway purchases during the first six months, although railway purchases were greatly augmented during the last half of that year, aided by the foreign cars bought in this country.

Up to 1913 the highest point of possible record of the business index shown on the chart was 100. This, you will

see, was pierced by the business line in 1916, and when a "Mansard" was built on, up to 130. Even this had not sufficed to record the business line of 1917 and 1918.

### Further Proof

The years 1917 and 1918 are interesting; and, with 1916, would seem to more surely confirm the doctrine stated. The greater part of the railway buying—particularly during 1918—has been that of the United States government order for 100,000 cars placed in April last, and the United States military railway cars, and the cars for the French, Italian and Russian governments.

In August, 1918, Brookmire readjusted his barometer index owing to the government control of prices of a number of basic or fundamental commodities, and then he carried this readjustment back to the year 1914. This I have shown in the open spaced lines; but for the purposes of uniformity and comparison, have continued the business index in the solid line, as shown.

One of the most natural questions, and one frequently raised, has been: "Is it cause or is it effect?" That is to say, in times of depression do railway capital purchases precede and initiate an upward trend to general business, or on the other hand must business prosperity precede to initiate railway capital buying?

There is one point on which there can be no question—that is: that munition and war orders were the cause of the revival of business after the great depression of 1914, as they likewise were the great sustaining factor during 1916, 1917 and 1918. War buying simply supplanted railway buying.

However, whether you are, or are not, convinced that railway capital purchases habitually precede or initiate general business activity, there is something in which you will have no difficulty in concurring, and that is this—that once the country enters upon a period of general business depression, however caused, such condition is aggravated and protracted by the absence of railway buying; and that once general business activity is resumed, no matter through what stimulus, the presence of railway buying is a major factor in sustaining and prolonging such activity.

This appears to be evidenced even in the lines of 1917 and 1918, where it is noted that the force and effect of railway capital purchases are reflected in a continuing trend in their relation to general business—although naturally, and because of the extraordinary conditions, in a considerably reduced degree.

Even the upheaval of the war has failed to obscure the principle of the doctrine; while on the other hand its manifest presence in this situation seems only to further emphasize its soundness.

The railway system of the United States is the greatest in the world—our own largest industry excepting agriculture. Our iron and steel industries have been developed to meet the railways' enormous requirements, and hence the railways have constituted the one industry whose purchases are upon such a scale as necessarily to affect the great barometer of iron and steel.

Buying is contagious; and particularly is this true of initial buying which, when upon a large scale, stimulates still greater buying and in the many directions of its influence, thus inspiring confidence—one of the most essential of the underlying factors of high and sustained prosperity.

### Capital and Operating Purchases

Strange to say, railway men themselves have been those least willing to believe that railway purchasing is the "cause" of increased business activity. Their view is, that it is increase of traffic which stimulates their railway buying and that, accordingly, buying follows traffic.

This arises from their failure to discriminate between

"capital" and "operating" buying. It is undoubtedly true that operating buying is, and very logically, the result of traffic conditions and traffic needs.

Capital buying, however, is of another character; it generally precedes operating buying, and is by no means entirely controlled by the then existing traffic demands. Cars cannot be obtained in a day: they must be anticipated, and contracted for long in advance of probable or possible delivery.

In periods of depression and when prices were low, car buying has been inaugurated by the larger and more far-seeing roads; and when on a considerable scale, it has almost at once prompted other roads to do likewise, thus giving initial momentum to a general buying movement.

### Pulse of General Business

If the iron and steel industry, heretofore broadly recognized as the great barometer of general business conditions, and as basic to them, is dependent upon "railway purchases" to the extent of the absorption of 40 to 50 per cent of its production, how much more really basic are "railway purchases" as the initial force in starting and sustaining the circulation of general business? Are they not manifestly the pulse of general business?

Had I the time I might trace for you, in graphic form, the flow of this controlling current. Issuing forth from the railways, it proceeds first to the great car-building plants; thence on to the iron and steel plants and to the very large number of railway supply industries. By the latter it is again directed toward the iron and steel and other industries—thence in turn influencing a highly increased number of other and contributory industries, until this influence has reached or set in motion the entire industrial machinery—while at every turn and in every direction it has furnished employment to labor.

Thus, labor as a matter of fact is more directly and vitally concerned in this great problem than any other single element.

### Increased Industrial Capacity

At the present time we have an interesting problem due to the greatly increased capacity of our iron and steel industry. Just what proportion of this increased capacity can or will be taken up by the railways is yet to be determined. Exports may take up this excess, or, if the hope of many people can be realized, they may, like war work, become the element that will sustain, if not control, the business situation.

German Prisoners Working at the Salvage Depot, Tours, France

## Distribution of Railroad Security Holdings

THE NUMBER OF STOCKHOLDERS for 572 Class 1 railroads and their non-operating subsidiaries was on December 31, 1917, 627,930, and the aggregate number of shares was 97,475,776, according to a report compiled by the Bureau of Statistics of the Interstate Commerce Commission. The number of shares held by the 20 largest holders in each road, aggregating 8,301 names of persons, estates, corporations or partnerships, was 50,873,322, or a little more than one-half of the total. This means that 1.3 per cent of the number of stockholders in railroads of this country hold about one-half of the number of shares of stock. The subdivision of the holdings of the 8,301 stockholders is shown in the following statement:

Classification of 8,301 Largest Stockholders	Number of shares	Per cent
1. Individual females .....	1,082,868	2.1
2. Estates .....	1,333,961	2.6
3. Other railway companies.....	24,638,407	48.4
4. Other corporations or partnerships.....	11,565,838	22.7
5. Individual males .....	6,945,205	13.7
6. Voting trustees .....	5,307,043	10.4
Total shares held by 8,301 largest security holders, reported as 20 largest on each road .....	50,873,322	100.0

The number of holders counted under Item 1 in the table is 958, and under Item 2, 1,092.

The annual reports of steam roads to the commission give the number of stockholders and the names of the 20 largest stockholders, or holders of other securities where these have voting rights. The figures have been compiled from these returns for all Class 1 roads and their non-operating subsidiaries which filed reports for the calendar year 1917. These two classes of roads have about 97 per cent of the stockholders of all steam roads.

"What the distribution is among the stockholders below the 20 largest we cannot say," the report says. "The average holding of the 619,629 remaining stockholders on the basis of the preceding facts was 75 shares. It is obvious that if the roads are regarded as one system, the inter-railway holdings being disregarded, the proportion of the stock not held by railways in the hands of so small a percentage of stockholders would be considerably less than one-half. However, an exact statement could be made only after the holding of stock by the same individual in more than one railroad had been considered.

"There are great variations among the individual roads in the extent of distribution of their stock. The following statement is illustrative:

Name of road	Total number of stockholders	Per cent of shares held by 20 largest holders
Pennsylvania .....	100,038	8.9
New York Central.....	27,062	27.1
Baltimore & Ohio.....	29,360	15.4
New York, New Haven & Hartford.....	25,249	15.3
Pennsylvania Company .....	17	100.0
Erie .....	9,571	19.7
Philadelphia & Reading.....	13	100.0
Lehigh Valley .....	12,325	18.1
Southern .....	9,564	38.7
Illinois Central .....	10,783	41.6
Southern Pacific .....	37,853	23.0
Atchison, Topeka & Santa Fe.....	44,561	14.3
Chicago, Milwaukee & St. Paul.....	20,549	18.5
Chicago & North Western.....	12,770	20.9
Chicago, Burlington & Quincy.....	326	99.5
Great Northern .....	26,716	18.5
Northern Pacific .....	25,780	19.8
Union Pacific .....	33,875	17.8

"The Erie; Philadelphia & Reading; Wabash; Southern; Chicago, Milwaukee & St. Paul; Great Northern; Northern Pacific; Chicago, Rock Island & Pacific, and Union Pacific are cases in which the holdings of corporations or partnerships other than railways are more important than the holdings of other railways. Thus, of the Wabash stock, 46,642 shares were held in Amsterdam, Holland, and 36,321 were held by 14 New York and 1 Boston companies or partner-

ships. Of the stock of the Chicago, Milwaukee & St. Paul, 216,528 shares were held by 11 New York concerns. The Philadelphia & Reading stock is all held by or for the Reading Company. That of the Virginian is largely held by The Tidewater Company. The stock of the Bessemer & Lake Erie is held for the United States Steel Corporation.

"Among the cases in which a part of the stock is in the hands of voting trustees are the following: Pere Marquette; Chicago & Eastern Illinois; Chicago, Terre Haute & South-eastern; Cincinnati, Indianapolis & Western; Buffalo & Susquehanna; Southern Railway; Mobile & Ohio; Gulf, Mobile & Northern; Atchison, Topeka & Santa Fe; Missouri Pacific; Saint Louis-San Francisco; Chicago Great Western; Missouri, Kansas & Texas Railway of Texas; Los Angeles and Salt Lake; Midland Valley; Chicago, Peoria & Saint Louis; Denver & Salt Lake; Missouri, Oklahoma & Gulf; New Orleans, Texas & Mexico; Missouri & North Arkansas.

"The preceding figures are subject to certain limitations. As above indicated, they take no account of the fact that one person may be a stockholder in more than one railroad. The individuals named as stockholders may represent other corporations, although that fact may not be a matter of record in the books of the reporting carrier.

"The names of large bondholders are not given in the annual reports of carriers. The following figures as to the holdings of banks and life insurance companies are of interest. The figures regarding bank holdings are from the annual report of the comptroller of the currency and refer to 1917 conditions:

	Investment in railroad bonds
State banks .....	\$1,626,298
Mutual savings banks.....	406,272,169
Stock savings banks.....	2,663,188
Loan and trust companies.....	33,753,533

"To obtain an approximation of the railroad bonds owned by life insurance companies, a compilation has been made of the par value of the railroad bonds shown in the assets of the life insurance companies reporting to the superintendent of insurance of the state of New York, as shown in his report for 1918. The aggregate is \$1,681,242,371. The New York Life heads the list with \$337,885,211. The Mutual Life has \$304,498,457, the Equitable \$222,696,748 and the Metropolitan \$210,875,682.

"Thus, savings banks and life insurance companies have over two billions of railroad bonds. A further \$2,135,-086,517 was held by other railroad companies on December 31, 1916. The bonds actually outstanding on December 31, 1916, amounted to \$11,202,607,096."

In an attached table details are given for each of the large railroads included in the tabulation of stockholders. The information is taken from page 109 in the annual reports of the railroads to the Interstate Commerce Commission for the year ending December 31, 1917. The distinction between males and females is not required in the report, but was made in the tabulation from the given name.

William D. Carroll, signal supervisor, and Joseph Christian, maintainer, employees of the Baltimore & Ohio, were charged with manslaughter by a coroner's jury at Pittsburgh, Pa., on March 27, and were committed to jail without option of bail. These men were held responsible for a train wreck at Laughlin Junction, near Pittsburgh, on February 22, when ten persons were killed. They were in charge of, or connected with, the repairing of a switch where a freight car had been derailed some hours before. While the repair work was going on and while the track was insecure a locomotive came along and was derailed and fell against a passing passenger train, wrecking passenger cars. Reports indicate that the light locomotive had passed an automatic signal set against it; also that it had been flagged in sufficient time to allow it to be stopped before running upon the insecure track.

# A Possible Solution of the Railroad Problem

Weak and Strong Roads Combined End to End So as to Increase  
Competition and Greatly Strengthen All Railroad Credit

By F. J. Lisman

## PART II

THE EIGHT MAPS show the possible combinations of railroad systems, and are, of course, tentative, merely indicating the possibilities of combining strong and weak systems, so that the strong will easily be able to carry the weak. These combinations, however, are not only worked out from a point of view of credit, but traffic relations, geography, etc., have also been taken into consideration.

### The Central System

Map No. 1, called the Central system, shows the combination of the strong New York Central and Northern Pacific systems, each with about \$250,000,000 of capital stock, on which substantial dividends are earned and paid. The Rock Island system supplements these lines to the west and southwest and with its present fixed charges could hardly be called a burden. The Denver & Rio Grande and Western Pacific are the legitimate extensions of this system to the west to the Pacific coast and the present fixed charges of these companies are not an overburden, though their credit is poor.

Connecting with the Rock Island lines to the southwest there is added the El Paso & Southwestern, a strong company which takes the system to the borders of Mexico and also might form a new line to southern California in connection with the San Diego & Eastern, now in course of construction.

In southern Texas there is added to this system, the New Orleans, Texas & Mexico, which will furnish long haul vegetable and other tonnage, and will get a large Mexican tonnage whenever Mexico is rehabilitated. This line connects with the Louisiana division of the Rock Island and would give the system a line into New Orleans from the west and also give lumber tonnage to the Rock Island lines in Arkansas and Oklahoma.

By adding the Mobile & Ohio to the system, a large lumber tonnage is provided for the Illinois and Indiana lines forming a through route to the Gulf from Chicago to Mobile and New Orleans, and also a line from the northwest to the Gulf.

By adding the Virginian to the system, access is had by the New York Central system to Hampton Roads for the grain traffic and to a coal field producing the highest quality of coal. This coal would be hauled not only to the Lakes at Toledo, but also to Chicago and points beyond.

The Chicago, Peoria & St. Louis is added to this system, because the Rock Island is weak in coal resources and the mines along the Chicago, Peoria & St. Louis are naturally tributary to the Rock Island system.

The Lake Erie & Western is left out of this system, although at present controlled by the New York Central.

### The Northern System

Map No. 2, the Northern system, might almost be called the Hill system. Its backbone is the Great Northern with \$250,000,000 of capital stock, paying 7 per cent dividends and earning more, and the Chicago, Burlington & Quincy, with \$110,000,000 capital stock, paying 8 per cent and earning more. To these roads is added the Erie, in which the late James J. Hill was at one time interested.

The Shawmut road is added to the Erie in order to

strengthen its hold on the bituminous traffic for the East. With short running rights from the southern end of the Shawmut for about thirty miles from Freeport the system would have access to the city of Pittsburgh.

The Hocking Valley would strengthen the Erie's coal traffic for Chicago and points beyond.

The Ann Arbor, together with the Green Bay & Western, makes a trans-lake line for coal and other commodities from Toledo practically straight to St. Paul.

The Toledo, St. Louis & Western forms a direct connection for the Erie to St. Louis and the Southwest.

The Kansas City Southern furnishes a through route for the Chicago, Burlington & Quincy's grain to the Gulf and furnishes lumber northbound.

By adding the Louisiana Railway & Navigation to the Kansas City Southern, an entrance for the system is secured into New Orleans, making an excellent Kansas City-New Orleans line. The Louisiana Railway & Navigation is also added to this road in order to strengthen its hold on the lumber situation.

### The Midland System

Map No. 3, called the Midland system, has as its backbone the Illinois Central, with \$110,000,000 of stock, on which 6 per cent is being paid and more earned and the Lehigh Valley with \$60,000,000 of stock, on which 10 per cent is being paid.

The Nickel Plate is the logical connection of the Lehigh Valley between Buffalo and Chicago, and forms an excellent New York-Chicago line.

By adding to this system the Lake Erie & Western, out of the New York Central system, it secures an entrance into Indianapolis and also in connection with the Illinois Central lines a fairly good line from eastern points to St. Louis.

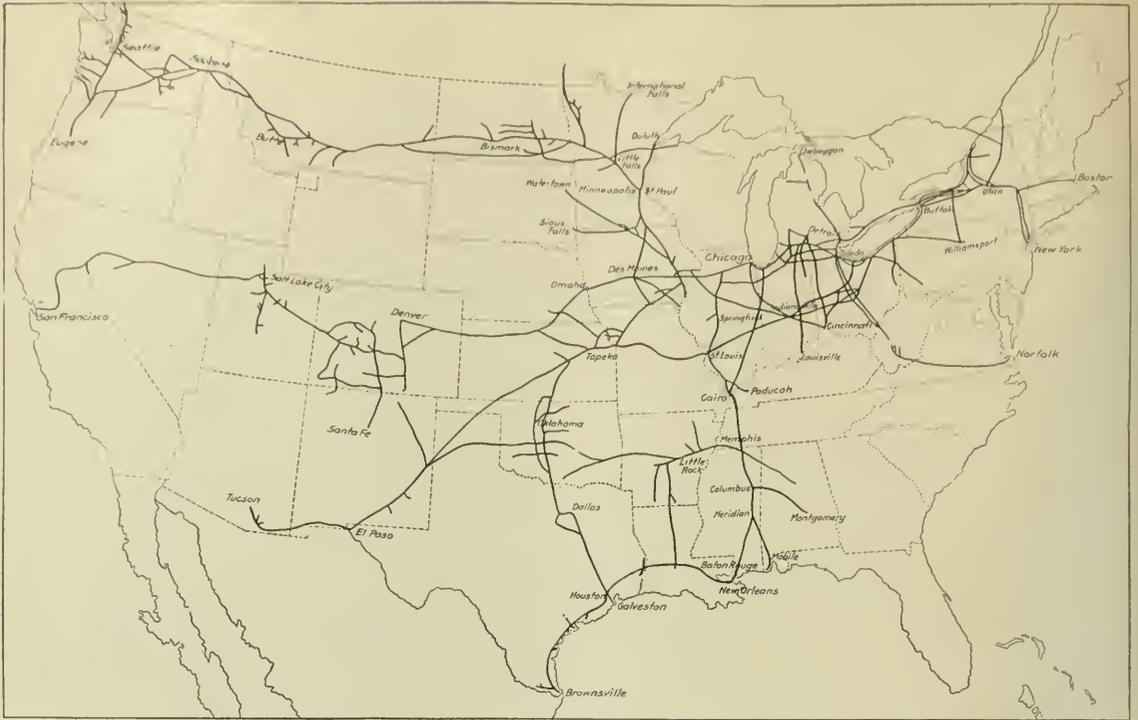

The Minneapolis & St. Louis forms the logical extension of the Illinois Central lines to the northwest and makes a fairly good line from Chicago to the Twin Cities.

By adding the Chesapeake & Ohio lines the old Newport News and Mississippi Valley route of C. P. Huntington would be realized. The Chesapeake & Ohio would feed heavy coal tonnage to the Lake Erie & Western and the Illinois Central lines and will in return take grain to Hampton Roads.

The Chesapeake & Ohio in connection with the Carolina, Clinchfield & Ohio and the Seaboard Air Line makes an excellent through line from Chicago and all points in the Middle states to the Southeast and whenever the Illinois Central builds its long contemplated line from Birmingham to Jackson, Miss., through the Pearl River valley, a New York-New Orleans through line is created in competition with the present line over the Atlanta & West Point and the Louisville & Nashville roads. This combination also makes a direct line from St. Louis, Mo., to Savannah, Ga., and Jacksonville, Fla.

The St. Louis Southwestern, together with the San Antonio & Aransas Pass form a logical extension of this system to the extreme southwest.

By adding the Missouri & North Arkansas, with running rights from Joplin to Kansas City, Kansas City secures a

new connection towards New Orleans, via the Illinois Central route and also a connection with the St. Louis Southwestern system.

### The Interocean System

Map No. 4, called the Interocean system, has as its backbone, the Atchison, Topeka & Santa Fe, with \$222,000,000 of common stock on which 6 per cent dividends are paid and much more earned and \$125,000,000 of preferred stock, paying 5 per cent dividends; also the Delaware, Lackawanna & Western, with \$42,000,000 stock on which 20 per cent is being paid, and the Delaware & Hudson, with \$42,000,000 of stock on which 7 per cent is being paid. This huge system can easily carry the Boston & Maine, which is to have running rights from Albany to Buffalo, at which point it would connect with the Wabash, and thus secure a direct route to the West.

There is also added the Buffalo, Rochester & Pittsburgh to strengthen the Lackawanna's hold on the bituminous tonnage of the East and also to give an outlet to the Boston & Maine direct to the Pittsburgh district.

The Wabash forms an excellent connection for the Lackawanna to the west, touching as it does the most important points in the Middle West.

There is added to this system the Western Maryland, the Pittsburgh & West Virginia and the Wheeling & Lake Erie, making a through line from Toledo to Baltimore on Chesapeake bay. Thus the eastern end of the system, the Boston & Maine, would become part of a system with its own rails into the anthracite region as well as into the bituminous region of western Pennsylvania and also forming water connection with another coal road running to the Fairmount, Somerset and Georges Creek regions.

The Chicago Great Western would form the logical line for this road to the northwest and would also give access for the Santa Fe system to the Twin Cities.

### The Union System

Map No. 5, called the Union system, has as its backbone the Pennsylvania Railroad, with \$500,000,000 of stock, on which 6 per cent is being paid and more earned and the Union Pacific with \$100,000,000 of preferred stock, on which 4 per cent is being paid and \$222,000,000 common on which 8 per cent is being paid, and more earned.

There is added to this system the New York, New Haven & Hartford and the New York, Ontario & Western, also the Lehigh & New England. New England thus gets direct access via the Poughkeepsie bridge with both the anthracite and bituminous regions.

The New Haven and Ontario & Western lines should also have running rights from near Poughkeepsie to Buffalo, where they would connect with the Pere Marquette lines and thus the New Haven would have a direct through route to Chicago through the manufacturing districts of Michigan. Thus the large manufacturing interests there would be brought directly on a railroad running to the coal and iron districts of Pittsburgh and, as stated, also have their New England connections improved.

As a connection between the Union Pacific and the present Pennsylvania system, the Chicago, Milwaukee & St. Paul road with its double track line between Chicago and Omaha serves admirably.

The Oregon-Washington part of the Union Pacific system makes an excellent connection for the Chicago, Milwaukee & St. Paul at Spokane for Portland and the competition between the present Union Pacific system and the Chicago, Milwaukee & St. Paul in Eastern Washington, is not important.

The Missouri, Kansas & Texas is a natural extension of the Union Pacific to the Gulf of Mexico. There is added to this system in the Middle West the Chicago, Terre Haute &

Southeastern, which handles about 5,000,000 tons of coal annually which would strengthen the St. Paul system which is weak in its coal supply. This system also serves the Bedford stone district and would give the Pennsylvania lines a hold on this traffic which they now do not possess.

### The Continental System

Map No. 6, called the Continental system, has as its backbone the strong Chicago & North Western, with \$145,000,000 of common stock, paying 7 per cent and earning more, and \$23,000,000 of preferred stock, paying the same rate.

The eastern end of the system is formed by the Baltimore & Ohio, which is paying 4 per cent dividends on \$160,000,000 common and 4 per cent on \$60,000,000 preferred. There are added two strong roads in the East, which form a natural connection with the Baltimore & Ohio, that is the Reading, with \$70,000,000 of 4 per cent preferred stock and \$70,000,000 of common stock, on which 8 per cent dividends are being paid, and also the Central of New Jersey.

In the southwest there are added to these roads the original Missouri Pacific system, consisting of the Missouri Pacific, the St. Louis, Iron Mountain & Southern and the International & Great Northern and Texas & Pacific.

There is also added, in order to strengthen the Missouri Pacific system, the Missouri, Oklahoma & Gulf, running from Joplin southwest to Denison and forming a through line from Kansas City to the southwest. This forms a very strong system with a heavy coal, grain and lumber traffic.

### The Southern-Pacific System

Map No. 7, called Southern-Pacific system, consists of the present Southern Pacific with its \$275,000,000 of stock, on which 6 per cent is being paid and more earned, together with the Southern Railway, which of late years has grown much stronger, also the St. Louis-San Francisco, which is more or less supplementary to both of these lines, forming a direct line to St. Louis and Kansas City for the Houston & Texas Central division of the Southern Pacific, and also forming a direct line via Memphis to Kansas City, for the Southern Railway system from Birmingham, and from Chattanooga.

The Kansas City, Mexico & Orient, in connection with the Southern Pacific at Alpine, and the 'Frisco at Wichita, forms a short connection for the Southern Pacific into Kansas City and also an excellent line to Mexico, whenever things settle down in that unfortunate country.

The Chicago & Alton forms the logical connection for this system from Kansas City and St. Louis to Chicago.

The Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific form a line into Texas through the Shreveport gateway.

The Texas Midland is a link between the Paris Division of the Frisco and the Houston & Texas Central and the Gulf & Ship Island, should be a natural feeder to the New Orleans & Northeastern Division of the Southern Railway.

### Southeastern System

Map No. 8, called the Southeastern system, has as its backbone the Norfolk & Western, paying 8 per cent on \$120,000,000 common and 4 per cent on \$22,000,000 preferred stock; the Atlantic Coast Line, paying 7 per cent on \$67,000,000 common stock, and the Louisville & Nashville, also paying 7 per cent on \$72,000,000 of common stock.

There is added to this system the Norfolk Southern on the southeast, which forms the natural supplement to both the Coast Line and the Norfolk & Western, Atlanta, Birmingham & Atlantic, which makes a better through line from Birmingham easterly.

The Georgia, Florida & Alabama is the natural feeder of the Atlantic Coast Line.

The Savannah & Augusta makes a new through line in

connection with the Georgia Railroad from Savannah via Atlanta to all Ohio river points.

The Chicago & Eastern Illinois forms the logical entrance for this system into Chicago via Evansville and in connection with the Gulf, Mobile & Northern and Paducah division of the Nashville, Chattanooga & St. Louis, makes a new Chicago-New Orleans through line.

The Detroit, Toledo & Ironton brings the Norfolk & Western into Detroit and also in connection with the Norfolk & Western via Roanoke and the Winston-Salem Southbound makes a good through line from all points in the Southeast to points in Middle West. This would be a system touching all points on the Atlantic Gulf coast from Washington to New Orleans, forming a strong through line from the East, Middle West and Chicago and St. Louis to all points in the Southeast.

#### Terminals and Belt Lines, Canadian Lines, Etc.

The matter of consolidating the terminals and the building of belt lines for joint use has been dealt with separately in the body of the plan.

There are a number of comparatively short railroads, as well as lines controlled by the three large Canadian railroad systems, which have not been apportioned under the above plan.

Some method can undoubtedly be worked out, under which the consolidated railway companies may be allowed to increase their dividends above 6 per cent whenever rates are

reduced below a certain level; in other words, in order to maintain the inducement for close operation the railroad companies might be allowed for their stockholders one-third or one-half of reductions given to the public.

Undoubtedly the personal initiative to operation officials will be perpetuated under the above plan, because the subordinate will always look for promotion as a reward for successful results.

This whole plan will probably be objected to on the ground that these railroad systems seem entirely too big and that it is beyond human ken for any set of officials to manage and supervise 40,000 miles of railroad, earning annually nearly one billion dollars. This should be no more difficult than the management of the United States Steel and other large corporations earning usually around a billion dollars or more. The public wants fewer railroad companies; it wants them to be strong financially and in every other way so it may be well served, and it wants competition. The above plan appears to be the only one under which the weak lines can properly be co-ordinated with the strong lines without reducing competition.

The question of physical valuation has been the bugbear of the railroad situation for many years. Earning capacity is probably the best test of a fair value of properties, but judging from the testimony before the Congressional Committee the bulk of the people and members of Congress themselves still seem to think the railroads are over-capitalized; therefore, the time and expense necessary for valuation must be spent.

## Work of American Railway Forces in France\*

### A Review of the Problems Encountered by the Sixteenth Engineers in Building Transportation Facilities

By Major O. C. F. Randolph

Manager of Sales, Building Department, H. K. Ferguson Co., Cleveland, O.

THE SIXTEENTH ENGINEERS was recruited from railway engineering and operating men principally from Cincinnati, Cleveland, Toledo, Detroit and Grand Rapids, immediately after war was declared. H. Burgess, United States district engineer at Detroit, was made colonel, and G. H. Webb, chief engineer of the Michigan Central, lieutenant colonel. The regiment was mobilized at the Detroit fair grounds under a war department order of June 5, 1917. On July 27 it left for Is-sur-Tille, France, via Halifax and England. On arrival at its destination, the regiment was assigned immediately to the construction of needed facilities for an advance base at this point.

The distribution of material across the front for the northern sector in France was to be made from Gievre and for the southern sector from Is-sur-Tille. Gievre was at the same time to serve as a main storehouse. Each depot was to hold reserve supplies for a million men—Gievre for six months and Is-sur-Tille for one month. In addition, each one necessarily maintained a mobile supply, so that they could constantly keep a million men operating in the field without disturbing the permanent reserve.

This was our problem: the building of docks of sufficient size to handle supplies; a terminal at the base to facilitate their handling; an intermediate base at Gievre and an advance base at Is-sur-Tille, and engine terminals and divisional yards to handle the increased traffic.

All materials and tools had to be bought in the same manner that they would in this country. Of course, some of the supplies were secured from some of our own forces, but this involved as much trouble as buying them here. For a large job, the source had to be located, availability determined upon and the initiative for that necessity rested upon the man desiring the supplies. In this connection it is worthy of note that we never caught up with lumber, or rather, it never caught up with us, as up to the time I left we still had a man looking for lumber and were taking every stick that we could secure. At Is-sur-Tille the vast majority of the lumber was secured from Switzerland. The Swiss Government several times threatened to shut down on it, but never did. We even received numerous cars from German railroads, some of them having shipping tags on them which indicated they had come from Germany and at a recent date. Our agreement with the Swiss mills called for our furnishing cars and they returning them to us. Probably the Germans had the same arrangement, and they possibly secured some of our cars as we secured some of theirs. Lumber was also secured in large quantities from Scandinavia. Toward the latter part of the work at Is-sur-Tille we began to secure lumber from the American mills. These mills were operated by the 10th and 20th Engineers, who were foresters recruited from the lumber regions of this country. They brought their own equipment, and set up the mills in the French forests.

Although our men were experienced lumbermen and operated in the forests they could only cut, even under the stress of war conditions, such trees as were indicated by French

\*Abstracted from an address delivered before the Cleveland, Ohio, Engineering Society on March 25. Major Randolph joined the army in July, 1917, as second lieutenant with the Sixteenth Engineers, Railway, with which unit he was connected until discharged on December 15, 1918.

forestry authorities. We could not cut a single tree, although we bought the land, or made proper arrangements with the owners, without receiving the consent of the government forestry officials. When the lumber started coming, it came by the train load and contained nothing but 3 in. by 9 in. and 1 in. boards. The boards had not been edged, but were delivered just as they came from the gang saw.

Our labor was supplied by the 1,700 men in our regiment, 3,000 infantrymen and 2,000 other engineers. There were also 600 Spanish contract laborers present.

In order to secure the maximum output of work from these men, every project was scheduled and time was the reward given the men. A portion of work was given to a man and any time saved was his own. This really produced wonderful results. The man day output for 4,000,000 board feet of lumber was 350 ft. per man. That includes all overhead hanging of warehouse doors, excavation and other labor. When in Washington I looked over the costs for American camps, and using their rate of wages, they averaged about one-half that output on their carpentry. Their work was but little more difficult than ours and their figures included carpentry alone with no overhead.

On one occasion we had a camouflage factory to build in Dijon. We were notified one Thursday to get ready to build it, the site was indicated, and we shipped the lumber from Is-sur-Tille at once. On Saturday we received word that we might go ahead with the work. The project was to include two buildings of the warehouse type, one 300 ft. and one 400 ft. long, also an open shed 40 ft. by 500 ft., with nothing except a roof. Our gangs were well organized at that time and the camouflage company was at full strength of 250 men.

The superintendent and I went to Dijon Sunday and laid out the buildings on the ground, also scheduled the work. Monday at 8 o'clock our men arrived from Is-sur-Tille and at 9 were working. The lumber had arrived on Saturday and we had started six trucks hauling it the two miles to the site, at 7 a. m. Monday. The project was finished on Thursday, and on the same day we received a request from the chief of engineers to submit monthly progress reports on the work and to send him the date of completion.

We left Is-sur-Tille in March for the British front. There we built a narrow gage track and a standard gage rail head, the narrow gage connecting the rail head, an engineering dump, an ammunition dump with the front, with leads to light artillery positions. The ruling grade was 2 per cent and the sharpest curve was of 30-meter radius. I believe the speed limit was supposed to be 8 miles per hour, though they ran 15 and 20. In 20 miles of track, a cut of 4 ft. and a fill of 5 were the largest; a 2-foot cut was heavy and most of the grading consisted of 6-in. cuts or fills. The cuts were 9 ft. wide and the fills 10. We used corrugated iron in half segments for culverts. Everything except the large cut and fill mentioned was waste and borrow.

As this work progressed we were short of labor for the excavation. The British had a number of Chinese companies scattered around the country, there being a camp of them not far from us. We convinced the British commanding officer that we could stake out the dirt work and give them piece work. We finally secured one company of about 500 Chinese for one end of the work. We cross sectioned it all and laid the work out each morning for the Chinese. They worked in groups of 60 and we gave them as close to 4½ yards each as possible, a little over, if anything. They usually finished around 4 o'clock.

On the completion of this work, we had to double track a section of the railroad from Abbeville to Revent. Our section was from St. Requet to Coulevilles. This was the only line of lateral communication left after the March drive. The line from Annes to Arras was not actually taken,

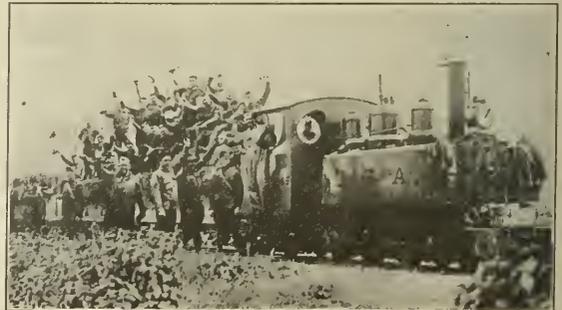

but it was under shell fire and certainly was threatened. A good example of what, in our Yankee assuredness, we were pleased to call European stupidity and lack of progressive methods, was exhibited here. The section we were on was heavy work, the cuts and fills being about 50 or 60 ft. Most of the fills had been made for double track as well as part of the cuts. The single track ran down the center of the grade and the British and French authorities would not permit us to throw the track, so a great part of this good grade had to go to waste. They would not permit the existing main to be touched, claiming that if we attempted to throw it the interference to traffic would be more than they could afford. It follows, of course, that they refused to let us use the main line to haul dirt over. The only time we could use it was to unload ties and rail. We handled all the dirt by hand on meter-gage track with ½-yd. and 1-yd. Decauville cars.

After completing this double track we went back to the Nevers cutoff, which was quite a project. The line was 5½ miles long and was a short cut across a meander of the Loire river, which the Paris, Lyons, Mediterranean line from San Mojan had to negotiate on the way to Is-sur-Tille. The saving in mileage was slight, but the saving in elapsed time because of terminal congestion was from 12 to 24 hours. The line to be built involved about 200,000 yards of rock excavation and 300,000 yards of fill. There was also a bridge over the Loire river, which was perhaps 3,000 ft. long, the approach to which constituted one of the heavy fills, most of which was secured from side borrow.

The bridge across the Loire was built with pile approaches and had 14-ft. spans. The river spans were 60 ft. girder spans on pile clusters. River piles were driven from either end with two steam hammers on scows and the approaches were driven by a steam track driver.

We placed the girders over the P. L. M. main line with a Bay City crane. The girders weighed about seven tons, so this was no particular problem, but it was of great interest to the French. They had their superintendent on the job with their division engineer; they came with many misgivings as to what might happen to their track. They left, much impressed with our boys. They were never, however, sufficiently impressed to permit us to put a switch into their main line. Whenever it became necessary to cut the main line it became necessary to have the P. L. M. men do it.

What is to become of these projects we built was always a problem to us, and probably is a big problem to the men that are now in France. Our contract with the French for the railroad work was made with the provision that if they operated over the lines, or the yards, or both, for a period of five years after the war, they should pay the actual cost of the construction as the purchase price for the properties. If they did not so operate over them, they were not to become involved at all. In other words, the lines were thrown back on our hands.

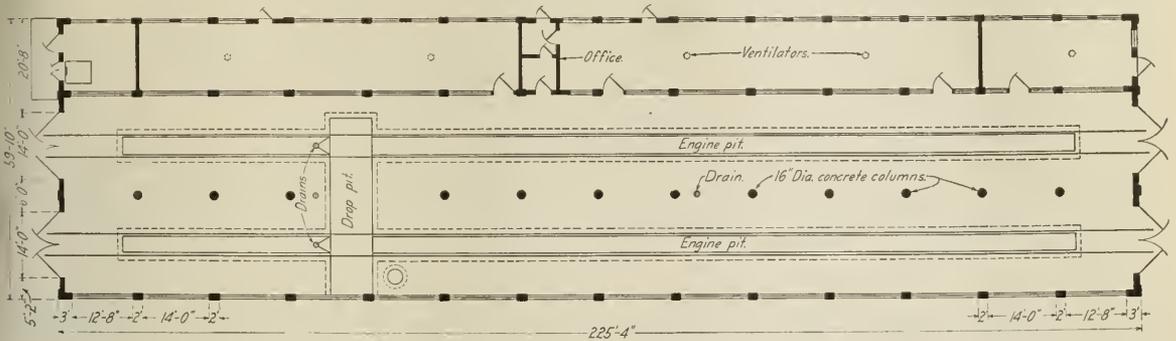

Railway Engineers' Supply Train

# A Rectangular Reinforced Concrete Enginehouse

This Design Was Particularly Adaptable to a Location  
Where Space for Expansion Was Restricted

THE LONG ISLAND RAILROAD recently completed at Long Island City, N. Y., a rectangular reinforced concrete enginehouse to replace an old brick and timber building, also rectangular in shape, erected in 1888, which had become obsolete. The old building was one of a number of

The new enginehouse provides for two tracks spaced 20 ft. center to center and supported over the pits to within 10 ft. of each end of the building. It is designed to accommodate three locomotives on each track and consists of 14 panels spaced 16 ft. center to center of columns, the space

Floor Plan of the Engine House

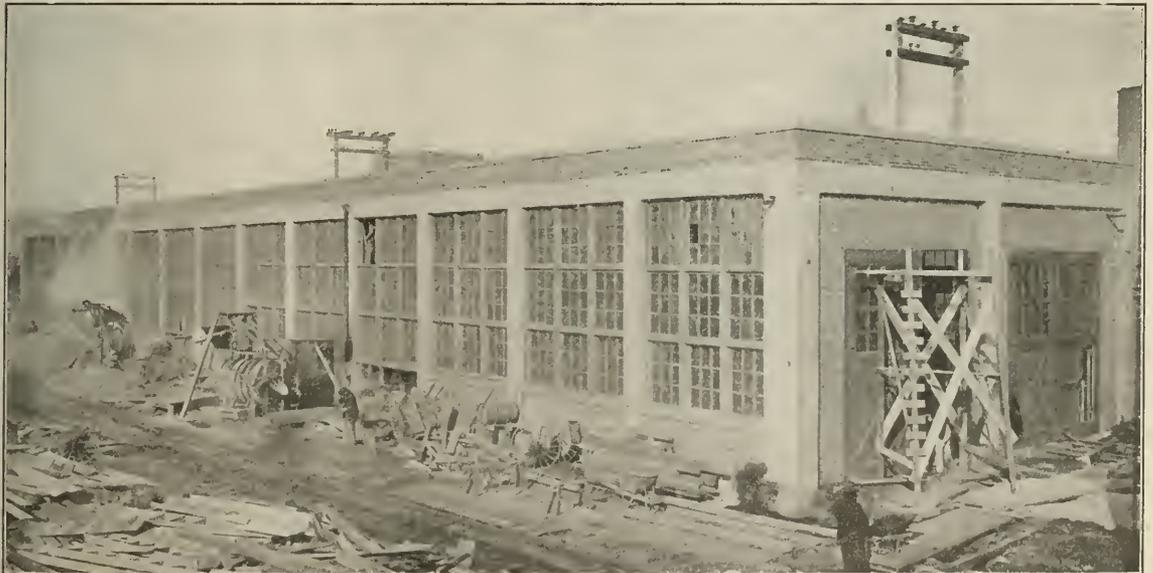

facilities at this terminal, and because of the restricted space available for expansion any relocation of the building would require changes in the other facilities.

To meet this situation it was decided to build a rectangular house on the site of the old building. The new structure is 225 ft. 4 in. long by 44 ft. 4 in. in width with a lean-to 15 ft. 6 in. wide also of reinforced concrete construction,

between columns being occupied by windows and brick curtain walls.

The building is located within 150 ft. of tidewater and is on made land. The entire structure is carried on wood piles 30 to 35 ft. long, some of which supported the old building. New piles were driven where necessary.

The character of the foundation made it necessary to sup-

An Exterior View of the House Shortly Before Completion

extending the full length of the north side of the house proper. Like the old house, the new structure accommodates light repairs only, the lean-to housing the air compressors, generators, machine shops, storeroom, office and oil house.

port the tracks in the house and to make provision for jacking foundations. To provide this support, piles, spaced 5 ft. between centers, were utilized or driven along the lines of the rails. The manner in which this single line of piles

was utilized to provide support also for jacking by extending the engine pit walls laterally and the provision of a batter inwardly is indicated on the drawing showing a section through the engine pits. A drop pit 8 ft. 8 in. wide and 5 ft. 6 in. deep connects the two track pits.

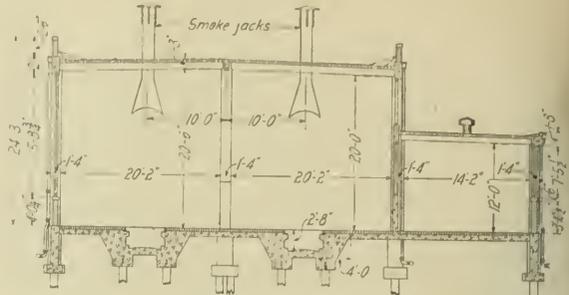

The floor in the house proper consists of an 8-in. concrete mat upon which vitrified paving blocks were placed on edge to accommodate the heavy trucking. The lean-to has the same paving as the engine house and the entire building is steam-heated and electric-lighted.

The roof, like the building, is of reinforced concrete construction, and consists of three panels in each 16-ft. bay. The roof beams are 1 ft. 3 in. deep, while the slab is 3½ in. thick and is protected by Barrett specification roofing. The roof supports two pairs of reinforced concrete poles carrying electric light and power lines and a pent house for the accommodation of the transformers and the electrical equipment.

Owing to the proximity of salt water and the atmospheric conditions obtaining wooden sash were installed instead of metal. Copper flashing was specified instead of galvanized iron for the same reason. The 12 smokejacks are of the Johns-Manville asbestos-board type.

Outside of the building and to the east, two wash-out pits

of reinforced concrete construction, 40 ft. long, have been installed adjacent to an installation of the National Boiler Washing Company. The area occupied by this facility is also paved with vitrified brick on a concrete base.

Cross Section of the House

The plans for this project were prepared and the building constructed by the Austin Company, Cleveland, Ohio, under the supervision of L. V. Morris, chief engineer of the Long Island, and G. C. Bishop, superintendent of motive power.

# An Important Development in the Railways of Spain

With an Account of a Project for a Proposed New Trunk Line from France to the Straits of Gibraltar

By F. Lavis

IN THREE PARTS—PART II.—STATISTICS AND LAWS

F. C. Del Norte

GENERAL RAILWAY STATISTICS for Spain are published by the government in the "Statistics of Public Works," and an abstract of the results for some of the principal lines is given below. These figures, for the years 1908, 1909, 1910 and 1911, will give an approximate idea of conditions before the war, and some of the data for the Norte, M. Z. A., Andaluces and Central Aragon for 1914, 1915 and 1916, obtained from other sources, will show what changes have been caused by the increased costs of operation, principally the higher cost of coal in those years. No figures were available for the year 1917, but it is known that the operating costs were much higher in 1917 than in 1916, and even in this latter year evidence of an increased operating ratio and consequent decrease in net returns were observable. On the Central Aragon Railroad, where the operating ratio had been approximately 50 per cent, the greatly increased cost of coal was expected to bring it up to nearly 80 per cent in 1917, although the gross revenue was higher.

This is the most important system in Spain; it operates principally to the north and west of Madrid but has a line through the Ebro valley to Barcelona and down the coast from Tarragona to Valencia.

	Kilometres	Miles
The total length is.....	3,692	2,289
Second track .....	426	264
Total main line track.....	4,118	2,553
Under construction .....	67	42
	4,185	2,595

The revenues from operation, and expenses for 1915 and 1916, the last two years available, were as follows (in pesetas):

	Gross receipts	Expenses	Net	Ratio
1915 .....	154,309,816	78,402,533	75,907,283	48.5
1916 .....	172,713,940	100,225,800	72,488,140	58.1

## RAILWAYS OF SPAIN REVENUES OF SOME OF THE PRINCIPAL LINES

Railway Laws

The following is a very brief outline of some of the general conditions governing the construction of railways under the laws of Spain.

Spanish railway law is based on the broad theory that the State is the owner of all lines conceded, whether for general service or private use, the concessionaires whether private individuals or companies being solely usufructs for the time of the concession.

Foreign capital employed in railway construction as well as loans for this object are under the safeguard of the State, and are exempt from reprisals, confiscations, or embargoes on account of war.

Railway construction is governed by the provisions of two "general" laws, modified in detail by many "Royal Orders" and decrees, and by the regulations promulgated from time to time by the General Direction of Public Works.

The original basic law was that of 1855; this however, after the revolution of the late 60's was superseded by the Law of November 23rd, 1877, which with the Regulations of May 24th, 1878, constitutes the general law relating to the construction of railways.

This law, however, was intended to govern only the construction of the main system of railways. It specified in detail certain lines, including those already in existence at that time which were to form the "General plan of railroads," and to which this law applied. The regulations of May, 1878, however, provided means for, and the conditions under which, other lines might be added to this system, and on December 25, 1912, a law of complementary lines was passed, the object of which was to procure the prompt construction of certain specified lines.

Besides this main system, it was proposed to build other lines of lesser importance as branches and feeders, and the construction of these lines is provided for in the Law of Secondary and Strategic Railroads of February 23, 1912, and the Provisional regulations for the application of this law of August 12, 1912. This law and the regulations "reformed" the original law of 1908 and the complementary

law of 1909. (Note—A detailed list of secondary and strategic lines authorized under this law with additions to June, 1916, will be found in the Railway Annual for 1916, p. 241, et seq.)

In general the law of 1877 was designed to provide lines of 1.67 meter (5 ft. 6 in.), gage for fast heavy traffic, as this was then understood. The secondary railways were to be of narrower gage and lighter construction, though there is nothing in the provisions of the law of secondary railways which would prevent its application to the construction of more substantial lines of any gage, and in any event the provisions of the law of 1877 provide for a type of construction much lighter than that necessary to meet modern main line traffic conditions.

**Subsidies**

Both laws provide for the construction of lines, with and without government aid, the latter having certain privileges which the former do not have. Lines receiving subventions in any form carry the mails free of charge.

The law of 1877 makes provision for the payment of a subvention equal to 25 per cent of the estimated cost, but in no case can this subvention exceed Pts. 60,000 per kilometre. The law of complementary railways of 1912 provides for an advance (Anticipo reintegrable) of Pts. 15,000 per kilometre in addition to the Pts. 60,000. This Pts. 15,000 is, however, to be returned to the state from "the first products obtained from operation."

The secondary and strategic railways may receive from the government a guarantee of interest of 5 per cent on the cost of construction up to an amount not exceeding Pts. 250,000 per kilometre unless the guarantee on a larger amount is specially authorized by the Cortes. The total amount payable under this law must not exceed Pts. 15,000,000 per annum.

If payments under this guarantee are still necessary after ten years from the date of commencing operations, the government may nominate a delegate to intervene in the management; this delegate ceasing his functions as soon as the line produces at least 5 per cent for three successive years.

When the net earnings exceed 6 per cent for three successive years, one-third of the excess after the third year shall be used toward reimbursing the government for any payments made on account of the guarantee of interest.

All concessions for lines built under the provisions of the law of secondary and strategic railways of 1912, and for all those receiving government aid, are for a period not exceeding 99 years, after which the lines revert to the State without compensation to the owners. (Some of the first lines built in 1850 and 1860 are beginning to look with some anxiety to the comparatively near approach of the termination of their concessions, as on none of them has provision been made for amortization within the specified period.)

No concession constitutes a monopoly.

The general supervision of railway construction and operation is a function of the Minister of Public Works (Fomento) acting through the General Direction of Public Works, and this in turn through five "Divisions of Railways."

On presentation of the application for a concession, which must be accompanied by detailed maps, plans, estimates, etc., in specification form, this is passed for "confrontacion y informe" to one of these railway divisions, designated by the General Direction of Public Works. This involves the checking of the maps and profiles on the ground, and of the general design of the railway, track layouts, stations, amount and kind of rolling stock, etc., etc. Modifications or changes are suggested, if necessary or desirable, and finally all these things being in order, the project is approved. This examination is at the expense of the applicant for the concession.

Up to this point the procedure is the same for any railway, but where the project receives government aid, the estimates of quantities and costs, have also to be checked and approved by the government.

**Tariffs**

The maximum tariffs chargeable on the proposed lines are submitted by the author of the project, and if not acceptable to the Council of Public Works, must be authorized by the Cortes. Generally speaking, the tariffs are regulated entirely by distance.

When the State guarantees the interest, the tariff rates cannot be reduced or changed without the consent of the government.

During the time the State pays any part of the guaranteed interest, it reserves the right to fix the maximum tariffs on minerals, poultry, cattle and in general, on foodstuffs, fertilizers and seeds.

Secondary lines not receiving guarantees of interest may fix their tariffs without intervention of the government, and apparently by Article 26 of the law of 1912, those lines receiving a subsidy may come under this provision, if this condition is fixed before the letting, that is, specified in the concession.

**Status of Concessionaires**

All corporations formed for the construction of railways must be domiciled in Spain, and are subject to Spanish laws.

All plans, etc., must be signed by a duly qualified engineer, which usually means the employment of an "Engineer of Caminos Canales y Puertos" for this purpose, notwithstanding the professional standing, etc., of any foreign engineer.

**Traffic Performance in 1918**

THE VOLUME of traffic handled in 1918, on which the railroads fell short of earning their standard return by approximately \$200,000,000 in spite of increased rates during the latter half of the year, shows an increase compared with the test period on which the standard return is based of more than one-fifth in ton miles of freight and one-fourth in passenger miles. These results are shown by a preliminary study of the statistics of Class I railroads compiled by the Bureau of Railway Economics. Freight traffic performance in 1918 approximated 440,000,000,000 revenue and non-revenue ton miles, an increase of 1.8 per cent over 1917 and of 21 per cent as compared with the average for the test period, the years ending June 30, 1915, 1916 and 1917. This freight performance was the greatest in the railway history of the United States, surpassing even the excellent performance of 1917, nine months of which was accomplished under the supervision of the Railroad's War Board.

The following percentage comparisons of the several months of 1918 with the corresponding months of 1917 are of interest:

Month of 1918	TOTAL TON-MILES	Per cent of increase over 1917
January	.....	d 16.4
February	.....	2.9
March	.....	7.1
April	.....	8.3
May	.....	d 4.5
June	.....	d 3.6
July	.....	4.4
August	.....	6.7
September	.....	8.6
October	.....	3.5
November	.....	d 2.4
December	.....	5.3
The year	.....	1.8

The passenger business for 1918 approximated 43,000,000 passenger-miles, an increase of 7.9 per cent over 1917 and of 25.7 per cent over that of the test period. As in the case of freight, this was a record-breaking achievement.

As a result of the increased freight and passenger rates made effective during the year 1918, the average receipts per ton-mile rose from 7.15 mills in 1917 to 8.56 mills in 1918. This average does not reflect the full effect of the increase in freight rates, the greater proportion of the new rates being in force only half the year. During January, 1918, the average was 7.26 mills and during December 9.85 mills, the latter month more nearly reflecting the extent of the increased rates than the year's average. The spread between January and December was 2.59 mills, or more than 35 per cent.

Average receipts per passenger-mile increased from 2.09 cents in 1917 to 2.40 cents in 1918. Here again the full effect of the increase in passenger fares is not reflected, since the increases were only in force a little over one-half the period. Statistics are not available for the month of January,

but the average for December was about 2.55 cents, an increase over 1917 of 0.46 cent, or slightly over 22 per cent. It should be noted in connection with this average for December that there was an unusually heavy movement during the month of soldiers and sailors on holiday furlough, who were granted a special rate of one cent a mile, while a large number of men discharged from service were proceeding home at a special rate of two cents a mile. These factors tended to keep the December average below what would be the normal average of the passenger rate level now in effect.

The statistics of earnings and expenses of the Class I roads, which have already been published, show an increase in operating revenues as compared with the test period of 44.9 per cent, and of expenses of 74.7 per cent, while the net operating income was 23.7 per cent less than that of the test period, which represents approximately the standard return. The average receipts per ton-mile in 1918, 8.56 mills, represent an increase of 20 per cent over the average for the test period, 7.13 mills. The average receipts per passenger-mile, 2.4 cents, represent an increase of 19.4 per cent as compared with the average for the test period, 2.01 cents.

## Temporary Treating Plant Pays Big Returns

Facilities Installed for Contractor Building Yard at Homewood, Ill., Reduced Boiler Repairs and Delays

**S**AVING of the entire cost of a water softening plant in less than two months' time through the resultant economy in the fuel used in locomotives constitutes an unusual demonstration of the value of water treatment. This, in short, is the nature of the results secured by a contractor on railroad construction in the boilers of two steam shovels, six locomotives and two hoisting engines. The demonstration is especially conclusive because the isolation of the equipment limits its supply of water to a single source and because the record of performance gives a check not only on the total quantity of fuel but also on the relative amount of fuel used per unit of equipment performance.

The Walsh Construction Company of Davenport, Ia., contractor for the grading for the new Markham yard of the Illinois Central at Homewood, Ill. (near Chicago), found the water upon which it was dependent for its boiler supply so unsatisfactory as to cause serious difficulty in the operation of equipment. As a result, a water softening plant was installed which has treated all the water used in the boilers after October 27, 1918, and records of the fuel used before and after the installation of the softener constitute the basis for the conclusions reached with regard to the fuel economy. Some data were also secured on the cost of the boiler repairs, which also bear out established conclusions on the value of water treatment.

The water used was taken from a drilled well 170 ft. deep, the consumption being about 40 gal. per min. An analysis of this water made on September 26, 1918, which is reproduced below, shows that the water contained a considerable quantity of incrusting solids.

Silica .....	0.677 grains per gal.
Oxides of iron and aluminum.....	0.093 grains per gal.
Carbonate of lime.....	9.794 grains per gal.
Sulphate of lime.....	3.916 grains per gal.
Carbonate of magnesia .....	10.776 grains per gal.
Sodium and potassium sulphates.....	13.704 grains per gal.
Sodium and potassium chlorides.....	1.360 grains per gal.
Loss, etc. ....	.209 grains per gal.
Total mineral solids.....	40.529 grains per gal.
Organic matter .....	Trace grains per gal.
Total incrusting solids.....	25.256 grains per gal.
Total non-incrusting solids.....	15.273 grains per gal.

This water was used in six 46-ton, six wheel switching-type locomotives, having 155 2-in. flues, 13 ft. 6 in. long, operated at 180 lb. pressure. There were also two 70-ton steam shovels equipped with locomotive type boilers approximately equal in fuel and water consumption to the locomotives in use. In addition there was one 40 hp. locomotive-type boiler and one 25 hp. upright boiler, both used for hoisting engines. All of the boilers were in good condition when the work was started on July 24, 1918. The normal operation of the plant on the day shift was two steam shovels, four locomotives hauling dirt, one locomotive switching and spreading, and one locomotive for reserve. On the night shift one steam shovel was operated and three locomotives were used in hauling and spreading.

With water of the kind available, trouble was experienced in a short time because of the formation of scale in the boilers, which had attained a thickness of  $\frac{1}{8}$  in. to  $\frac{1}{4}$  in. by the time it was concluded to install a water softener. As matters grew worse, there were engine failures almost daily, and practically all stay and crown bolt flues and mud-rings were leaking more or less. Repairs were good for about three days on the average, the time to make the repairs being from three to five hours on each boiler. One of the engines was in need of new flues and it was estimated that it would be necessary to remove all flues and many stay bolts in the rest of the boilers within two or more months. Electric welding of the flues helped for some time, but in three weeks the leaky condition was about the same as before the welding, although undoubtedly it would have been worse had no welding been done. Trouble was also being encountered with leaky boiler checks, pumps and lubricator valves, while the throttle packing was eaten or corroded by the water. Matters were not as bad as they might have been owing to the fact that there was practically one locomotive on reserve at all times, so that the boiler work on the locomotives did not interfere seriously with the operation.

As a consequence of these conditions studies were made of the possibilities of installing a water softener, and a plant was finally arranged for, which was completed ready

for operation on October 27. This consisted of temporary equipment supplied by the Railroad Water and Coal Handling Company of Chicago. It was composed essentially of a tank of 10 ft. diameter inside, an 18-ft. diameter tank, both tanks being 18 ft. high. In addition to these tanks there was a shallow mixing box mounted on top. The operation of this equipment is simple. Raw water and reagents are pumped independently into the mixing box, from which they pass as a mixture through a 10-in. pipe extending almost to the bottom of the inside tank. The water escaping in this tank rises upward in the tank slowly while the chemical action is taking place, the solid matter precipitated in the meantime being deposited for the most part in the bottom of the tank, which is equipped with a sludge valve through which the sludge may be allowed to escape at intervals. As the treated water approaches the top of the interior tank it encounters a filter which consists of a diaphragm of excelsior interposed between two grids of wooden slats. Passing through this filter the water reaches the top of the interior tank, where it is allowed to escape into the outside tank through two 4-in. pipes extending from the top of the inner tank to near the bottom of the outer tank, the latter serving as storage for the treated water.

The treating plant was placed in service on October 27. In the period from September 6 to October 27 there were a total of 650 boiler shifts in the course of which an average of 4.2 tons of coal per boiler shift was used. Comparing this with the quantity of earth moved by the contractor during this period, it was found that the cost of the coal used per cubic yard of earth handled amounted to \$.0306 per cu. yd.

For a period of not quite two months following the installation of the water softener, the coal consumed amounted to 3.1 tons per boiler shift at a cost of only \$.0204 per cu. yd. of material graded.

As in all other cases where water softeners have been installed, supplying water for equipment that has been badly incrustated with water that had not been treated, considerable trouble was experienced with foaming as the scale in the boilers was loosened. This necessitated the use of anti-foaming compounds. Some difficulty in the treatment has arisen from the fact that the water obtained from the well is muddy. An increased consumption of water of from 40 gal. per min. to 100 gal. per min. about the time that the softener was installed may be responsible for this condition.

Later information on the coal consumption shows that in the period from December 23 to February 1, during which a total of 437 boiler shifts were worked, the average consumption of coal was 3.8 tons per boiler shift. In a fourth period from February 1 to February 28, inclusive, during which 314 boiler shifts were used, the average coal consumption was 3.3 tons of coal per boiler shift.

Aside from the data on fuel economy the following information is available with respect to the boiler work done on the engines before and after the inception of the water treatment:

BOILER WORK COST ON BOILERS USED BY CONTRACTOR IN MARKHAM YARD			
Untreated water period, for two months previous to using treated water:			
	Average per day	Per Boiler day	
Boilmaker, 12 hr. ....	\$7.85		
Boilmaker's helper, 12 hr. ....	4.80		
Total cost .....	\$12.65		\$1.405
Treated water period during January and February:			
	Average per day	Per Boiler day	
Boilmaker .....	\$0.62		\$0.07

Aside from the above there were several items of special expense on the boilers that cannot be included readily in these statistics. For instance, before the water was treated considerable expense was incurred in electrically welding the flues, amounting to \$233.33 per boiler.

## Saving Labor in Shop Accounting

By a Traveling Auditor

THE ACCOUNTING DEPARTMENT of the railroad was not the least to be affected by the lack of men due to the demands of war. The question of using women was put aside for the reason that in accounting, especially at the shops, getting the reports in on time, entailed more or less overtime, and we were "tied" by state laws so that we could not work female employees in excess of a certain number of hours each week. It behooved us, therefore, to systematize to the point where we could get a greater amount of work out of the individual without greatly increasing his labor—increase his efficiency, as it were.

We were all requested to endeavor to systematize, and in this effort the honors fell to the chief accountant at our central shops; it will be my endeavor clearly to describe his plan (which, by the way, has worked out better than we ever dreamed it would) for the benefit of others. There were 4,500 men in these shops with a total pay roll disbursement of \$300,000 and a total material disbursement of \$410,000. He first considered the foundation of the accounting system, i. e., the daily time slips made out by each employee and the individual material ticket filled in by the gang foreman.

Under the old system the time slips were sorted by shops, then by rates, then by account, then posted in the first distribution, after which the totals were obtained with considerable labor. The same course was followed in the handling of the material tickets. They were priced, turned over to the accounting department, sorted, totaled by lots and posted in the distribution books. The greatest loss of time was suffered through arriving at the totals, this being done by "mental man power" and the first step therefore was in the direction of reducing the time consumed. As an experiment a calculating machine was procured. A junior clerk was put to work on the machine, and the results shortly justified the elimination of an \$80 position and the employment of an experienced operator at \$55 per month.

The original idea was to use the machine for handling the daily time and material tickets, but step by step the experienced operator took over additional work until at the present time not only these features are covered but all calculations, pro-rata included, are expeditiously handled by machine. As an example, classification of accounts provides that shop expenses (overhead charges) be spread over the various accounts in the individual department where the expense is incurred. As a result we find it necessary at the end of the month to make approximately 4,000 to 5,000 prorations. Calculating machines are now doing this for us, and one need only give this a passing thought to appreciate the efficiency with which machines handle these intricacies of accounting, to say nothing of the reduction in brain fag.

Having systematized the distribution details the next move was to reduce the time put in on the pay-rolls. (Keep in mind the fact that the average number of men handled by this department was 4,500.) This meant that by "man power" it was necessary to write the name, occupation and check number of 4,500 men twice each month.

After casting about for some time the bright idea of an addressing machine was thought of. One was purchased, and in a test case, with an inexperienced operator, this machine in one hour and twenty-five minutes performed work that formerly consumed 50 man hours. The first move after employing a man is to make up a plate (from approved employment application) showing his name, occupation and check number. His service record card is then stamped; a loose leaf time record sheet is next stamped; the time sheet is stamped and the plate is then put in a plate cabinet in its proper place. Thus the name, occupation and check number is always the same on all records.

The progress thus far made did not satisfy our chief accountant. He still felt there was room for improvement, especially on the pay-rolls. The purchase of a pay-roll machine was his next recommendation. Due to his previous success he had little trouble in getting a requisition through. It was necessary that some additional features be incorporated in the standard pay-roll machine in order to meet his requirements, and this was done, with the result that we now turn out our pay-rolls as indicated in the form shown.

As only the one central shop was using the addressing machine the standard form pay-roll sheet is used as it would not have been economy to make a new form to accommodate the one point. It will be noted that occupation is placed on the right of the sheet instead of on the left. The addressing machine takes care of the name, check number (which appears under the caption "line numbers") and the occupation. The pay-roll machine handles all other details on the form. The entire pay-roll is first run through the addressing machine, after which it is turned over to the pay-roll machine operator for listing the time.

The time-keepers close their time-books, the earnings being determined by use of regular rate tables and the figures appearing in the first four columns are those which have already been determined, but in putting these items through the listing machine the figures are checked; that is, the total items under the caption "items" are automatically derived and printed in the "total earned" column. Next the deductions are set in and the amounts are automatically deducted from the "total earned" and placed in either of the columns "amount due." If time check has been issued the time check numbers are set in the "remark column," as shown on lines 3 and 5. By use of portable stops on the machine the carriage automatically travels from column to column. For example: The first figures in the column are set in, the lever

timekeeper to be in the vicinity of the employees whose time records he maintained. This made it necessary to have a timekeeper in each of the large departments. It was found that the segregation of these men, putting them in one office under the direct supervision of the chief accountant, would be beneficial for two reasons: First, it would keep the men under a direct head at all times; second, it would permit one man helping another in case his particular work was not up to date. The only inconvenience brought about by this segregation was that of having someone watch the check boards at 7:00 a. m., 12:00 noon, 12:30 p. m. and 4:30 p. m. The timekeepers in the various shops took care of this work, and in the rearranged system it was put up to apprentice boys with very good results, as it only took a very few moments at the hours mentioned.

The saving effected by this segregation and the adding machine, plus the addressing machine, is shown in the following list of employees in the department:

ORIGINAL FORCE		PRESENT FORCE	
Main office	1 Chief accountant	Main office	1 Chief accountant.
	1 Asst. chief account.		1 Asst. chief accountant.
	3 Asst. accountants.		3 Asst. accountants.

Pay Roll Form Made Out by Machine

pressed and the carriage moves to the second column, then to the upper portion of the third column, then it moves backward and up one line in order to put the figures in the lower part of column three, etc., until it reaches the end of the line, after which the carriage rolls up one space and travels back to column one. A few seconds to a line are all that is necessary, and after becoming acquainted with the machine the entries are made with much greater speed than by hand.

Attention is called to the special features of the machine which show by abbreviations DA, CT and PW, meaning days, constructive time and piece work, respectively; also to the fractions of 2/6, 4/6, 1/2, 1/4 and 3/4. These hieroglyphics and fractions are special details of the machine included for our special purpose. The ribbons in both machines are copy ribbons and a number of tissue copies can be made.

In its inception the system of keeping time required the

of \$340 was effected. The office appliances needed to effect this saving were:

- 1 pay-roll machine.
- 2 calculators.
- 1 addressing machine (including a machine for making plates and one cabinet for filing the plates).

One-half of the annual saving more than pays for the cost of the machines. Added to this is the uniformity in which the work is handled, the neatness, the elimination of errors (so costly in locating) and the fact that not only can the machines be used in the accounting department, but they can and are being used by the numerous other clerks in the same office.

The change from the old to the new system was gradual; a man dropped from time to time and now, eight months from date of inauguration of the system, we find it working out in every detail with absolutely no negative features.

## Orders of Regional Directors

**G**AS MASKS.—A. H. Smith, regional director, Eastern region, in a circular dated March 26, and referring to his circular of a month ago on this subject, advises federal managers that gas masks are not to be used for tunnel and similar work. It appears that some railroad men have worn these masks in tunnels, and have been overcome by smoke or gases, and have with difficulty been resuscitated. C. H. Markham, regional director, Allegheny region, has made a thorough investigation, and concludes that the gas masks which have been investigated are not sufficiently promising to warrant further consideration.

*Eastern Freight Inspection Bureau.*—The regional directors, Eastern region and Allegheny region, in a circular dated March 25, announce the establishment on April 1 of the Eastern Freight Inspection Bureau, C. C. McCain, manager, 143 Liberty street, New York City, which is a consolidation of the bureaus in Eastern trunk line and Central territories. This bureau will attend to inspection, weighing, demurrage, storage, transit arrangements and other similar work.

*Bill-of-Lading Forms.*—C. H. Markham, regional director, Allegheny region, by Circular No. 127, sets forth the changes which must be made in the headings of the uniform bill of lading—and in the substitution of "carrier" for "company" in the body of the document—when printing new supplies of blanks. As the Interstate Commerce Commission is to make recommendations concerning the terms to be printed on bills of lading, it is desirable at present to supply only as many blanks as may be needed during four months.

*Use of Lock Nuts and Grip Unit Nuts on Boilers.*—Order 186 of the Southwestern regional director calls attention to the fact that lock nuts and grip unit nuts are being used on studs which are screwed into boilers, and instructs that hereafter lock nuts and grip unit nuts must not be used in this manner, and that where a lock nut is required a jam nut is to be used.

*Light Weighing of Cars.*—The Central Western regional director finds that freight cars are not being light weighed within the time specified by Master Car Builders' Rule 30 and calls for observance of this rule.

*Routing Via Non-Controlled Roads.*—Supplement 1 to Circular 234 of the Central Western regional director states that in some instances freight is being diverted from non-controlled lines on account of the route being unduly circuitous, although there is a reasonably direct route in connection with the non-controlled lines by way of another junction or with other lines under federal control, and instructs that in such cases the non-controlled line should be given a haul by way of the reasonably direct route.

*Routing in Connection with Boat Lines.*—Circular letter No. 432, issued by the Southern regional director, calls attention to the amendment to the federal control act, contained in the rivers and harbors act, approved March 2, that "No provision of this act shall be construed to prevent the routing of freight by a shipper or consignee over any inland canal or coastwise waterway, or part way over such waterway and part way by rail. In case the shipper or consignee shall so route the freight, no provision of this act shall be construed as giving power to change the routing." The circular says that this provision relates merely to the acceptance of shipper's routing from rail line points in connection with water lines; it does not in any way deal with rates, issuance of bills of lading, and similar matters.

*Embargo Regulations.*—Circular 75 of the Northwestern regional director outlines regulations for the method of handling embargoes in the Northwestern region under the new plan to be instituted by the Car Service Section on April 1.

*Embargo Rules.*—The regional director, Eastern Region, by circular 2000-15A642, promulgates the revised rules governing embargoes which went into effect on April 1. Zone embargo committees are to be discontinued as soon as possible. Federal managers and terminal managers are cautioned to issue embargoes only as a last resort, and to see that great care shall be taken to make them as little burdensome as possible.

The regional director authorizes federal directors and terminal managers to issue embargoes, when promptness is necessary, without first asking permission, but the reasons must be promptly telegraphed to him so that he may take any practicable measures to have the embargo cancelled at the earliest possible day.

*Maintenance Budget for 1919.*—The Eastern regional director, by circular 2700A628, announces that the assistant director of operations will allow until May 1 for the completion of these budgets; but the utmost effort must be made to finish them before that time, and they must be submitted as soon as completed.

*Reports from Freight Claim Department.*—The Eastern regional director, by circular 1801-126A620, sends to federal managers a form to be used in reporting the work done on loss and damage claims. Each freight claim agent is to make this report for the month of March and for each month thereafter, showing the number of unsettled claims on hand at the beginning of the month, new claims received, claims reopened, claims paid, claims not allowed and claims remaining unsettled at the end of the month; with comparisons with previous periods showing amounts in suspense and amounts realized from sales of unclaimed freight.

*No-Accident Month Campaign.*—Circular 194 of the Southwestern regional director announces that during the month of May a campaign will be carried on in this region which will be referred to as "no accident month."

*Cross Tie Inspection.*—Supplement 16 to Northwest Region Purchasing Committee Circular 19, quotes rules issued by the director of the Division of Purchases relative to the responsibility of the exporting railroad for the proper inspection of railroad ties shipped by them to importing railroads.

*Payment for Ties.*—The Northwestern regional director, in file 113-1-10, quotes a letter from the director of the Division of Purchases which states that railroads are not paying promptly for ties, and that this failure to pay promptly is affecting production. Railroads in the Northwestern region are directed to report on the situation at once to the regional director's office.

*Removal of Whiskey Placards.*—Circular 196 of the Southwestern regional director calls attention to the fact that shippers of liquors are placarding cars with cards that read "Whiskey" and the firm name. Because of the fact that these placards invite pilferage due to the increased value of liquor and the extension of "dry" territory, their use is now forbidden. Such placards already on cars should be promptly removed.

### American Lumber Congress

The first "American Lumber Congress" will be held in Chicago, April 14, 15 and 16, under the auspices of the National Lumber Manufacturers' Association. The question of zone freight rates on lumber, which has been proposed by the Railroad Administration, and the details of which have been entrusted to the Portland (Oregon) District Freight Traffic Committee and J. B. Baird, general traffic manager of the Northern Pacific, will be one of the topics to be discussed. It is proposed by these readjustments in trans-continental lumber rates to simplify the eastbound lumber tariffs, but the lumber men claim that the proposed rates would increase their freight burden a million and a half dollars a year.

# Doings of the United States Railroad Administration

## Director-General Has Declined to Accept Prices for Steel and Coal Suggested by Industrial Board

WASHINGTON, D. C.

**D**IRECTOR GENERAL HINES is much concerned over the freight claim situation throughout the country, which was the cause of considerable complaint by representatives of shippers at the recent hearings before the Senate committee, and has brought the matter to the personal attention of the regional directors in a letter asking them to take the matter up with the federal managers in a vigorous effort to clean up the immense number of accumulated claims as well as along the line of prevention.

The matter resolves itself into three aspects, he says, the prevention of loss and damage to freight, the assessment of correct charges, and the prompt disposition of claims for loss and damage and for overcharges. "The need for energetic and sustained effort under each of these three heads is apparent," Mr. Hines says, "but without minimizing the importance of the first two items, the imperative need is to 'clean up' the immense number of accumulated claims. I realize that these matters have already received more or less attention, but to accomplish the results which are absolutely necessary from now on we must maintain an intensive campaign of prevention and prompt disposition of claims." This agrees with what has been said by some of the critics of the Railroad Administration who have claimed also that if the roads had paid their claims more promptly last year the deficit would have been much larger than it was. Each regional director is asked to take action as follows:

1. Take up with each federal manager the necessity of giving immediate attention to both the prevention and the disposition of freight claims and enlist his personal interest in the establishment or perfection of adequate organizations to accomplish these ends.

2. Instruct each federal manager to submit to the regional directors promptly a report as to the steps which he proposes to take to accomplish these purposes, including his organization and his proposed policies and procedure.

3. Instruct each federal manager to submit to the regional directors monthly a report showing as to loss and damage claims the following information covering the month for which report is rendered: (a) number of claims received; (b) number of claims disposed of; (c) number of claims unsettled at end of month. Overcharge claims are now being reported under P. S. & A. Circular No. 60.

4. Send to the director general as promptly as possible copies of the reports submitted by the federal managers together with any additional suggestions and, thereafter, monthly tabulations of the reports, so that the director general may be in a position to give credit where credit is due.

"These matters," Mr. Hines says, "vitaly affect the quality of service rendered by the railroads. They are of great importance both because of their effect on our relations with the shipping public and of the conservation of our revenues."

### BASIS OF SETTLEMENT OF LOSS AND DAMAGE FREIGHT CLAIMS

At the present time there is lack of uniformity in determining the measure of damages under section 3 of the uniform bill of lading in the adjustment of claims for loss and damage to freight paragraph 2, of section 3, of the uniform bill of lading provides that—

"The amount of any loss or damage for which any carrier is liable should be computed on the basis of the value of the property at the place and time of shipment under this bill of lading, including the freight charges, if paid."

Circular No. 6 issued by the Claims and Property Protection Section says:

It is intended to clear up this situation and to dispose of

promptly such claims as come within the rules hereinafter set forth. The following rules shall apply on all unsettled claims under federal control pending decision by the Interstate Commerce Commission in the bill of lading investigation.

**RULE 1.**—The measure of railroads' liability shall be the value of the property at the place and time the property is received by the carrier for transportation, except where the property is reshipped from the original destination under a new bill of lading, the measure of liability shall be the value of the property at the place and time the new bill of lading is issued.

In either case such value shall be arrived at from the bona fide invoice price, if any, to the consignee, provided the date of the invoice concurs substantially with the date of shipment; and the invoice price to the consignee shall govern, whether the invoice is made by the consignor, the jobber, or wholesaler.

**RULE 2.**—When claim is filed upon the invoice price of the property delivered at destination, the freight charges shall not again be included in the claim.

**RULE 3.**—Where property is shipped for sale on consignment from points at which there is no established market value, and where no invoice is made, the measure of railroads' liability shall be the market value of the property at destination at time shipment should arrive, less the transportation charges, cartage and commissions.

**RULE 4.**—Where the property shipped includes articles, commonly called premiums, which are not included in the invoice, the railroads' liability for such articles shall be the cost price of the articles to the shipper.

### CASH AND TRADE DISCOUNT ALLOWANCES

**RULE 5.**—In the settlement of claims for value of shipments lost or destroyed while in possession of the railroad, the railroad shall receive the benefit of any cash discount or allowance contemplated by the terms of sale to the consignee, provided the claim is paid within the time limit for such discount or allowance.

**RULE 6.**—When shipments are partially damaged while in possession of the railroad and delivery is taken by the consignee, thus enabling him to obtain benefit of any discount or other allowance, such discount or allowance shall be given the railroad, provided settlement of the claim is made within the time limit for such discount or allowance.

**RULE 7.**—In case of either loss or damage, the railroad should have the benefit of all trade discounts.

This circular is not in any way intended to establish a liability, but is intended to be used as the basis of settlement when liability has been otherwise established.

### CIRCULAR NO. 7

The Claims and Property Protection Section has issued Circular No. 7, prescribing regulations covering the disposition of loss and damage freight claims on fresh meats and packinghouse products.

At the present time there is lack of uniformity in the disposition of loss and damage freight claims presented on carload shipments of fresh meats and packinghouse products. In order to establish certainty and uniformity in the handling of this class of freight claims, the following rules are prescribed:

**RULE 1.**—All shipments of fresh meats and packinghouse products shall be made under the conditions provided by published tariffs, and bills of lading issued accordingly.

**RULE 2.**—The agent at loading station shall insert on way-bills accompanying cars, instructions as given by shipper on shipping order and bill of lading, and agent at each icing station shall insert on billing, date and time iced and amount of ice and salt used.

**RULE 3.**—Loss or damage existing at destination at time of unloading must be reported by consignee to railroad agent prior to or during the time of unloading, or as soon thereafter as discovered, and a record kept by consignee of time and date of such notification and name of party notified. Railroad agent

shall inspect the car and make permanent record as to its physical condition, amount of ice in the bunkers after tamping, and the condition of the commodity.

Rule 4.—When the protection given a shipment by the railroad conforms to the shipper's instructions, as provided in published tariffs, and additional icing is properly performed to offset delay and there is no negligence with the railroads, claims for damage will not be paid.

NOTE.—In case of delay, which might be termed unreasonable, all facts presented by shippers shall be given due and proper consideration and claims disposed of upon their merit and in conformity with legal liability.

Rule 5.—One lapse of an hour or two in icing over and above the regular icing schedule, in itself, will not be considered as a basis upon which to pay claims for damage to fresh meats and packinghouse products. However, when this lapse occurs in two or more of the icings, then such facts as presented by the shippers should be given full consideration and claims disposed of upon their merits and in conformity with legal liability.

Rule 6.—Claims for loss or damage to fresh meats and packinghouse products must be supported by a statement of an officer or an authorized representative of the firm presenting the claim. This statement to show the value of the property at place and time of shipment, also the actual amount realized from the sale of such property in a damaged condition. The original account of sales, or a certified copy of same, must be attached to the claim.

Rule 7.—Where property is shipped from points at which there is no established market value and where no invoice is made, the measure of railroad's liability shall be the market value of the property at destination at time shipment should arrive, less the transportation charges, cartage and commissions.

Rule 8.—When the railroad negligently fails to perform its services properly, resulting in damage and a loss is sustained, claims for such loss will be paid or adjusted upon the merits of the case.

These rules shall be applied in their entirety to carload business moving on and after March 15, 1919. They shall also be applied to all unsettled claims on carload business which moved during federal control and prior to March 15, 1919, except that portion of the rules as to the inspection at destination and the statement in substantiation of the claims.

### Cases Before Wage Board

Committees representing the shop craft organizations affiliated with the American Federation of Labor and the United Brotherhood of Maintenance of Way Employees and Shopmen are still negotiating with committees of representatives of the regional directors regarding uniform agreements as to rules and working conditions to be applied on all railroads under federal control. The committees in each case consist of 14 representatives of the employees and two representatives of each of the seven regional directors, and they are to submit recommendations to the Board of Wages and Working Conditions which makes recommendations to the director general. The proceedings are confidential until the decision of the director general is announced, but a cartoon published in an official circular issued by the Railway Employees' Department of the A. F. of L. indicates a belief that an agreement will result in its case at least. It shows Mr. Organized Labor listening outside the door of the conference room and a voice from within says: "I'm on the inside but can't slip you any dope, but you're gonna get an agreement, and when the censor permits I'll have some funny things to tell." The maintenance of way employees also submitted with their proposed rules and working conditions a request for a further increase in wages, but it was declined by the director general and has been withdrawn or postponed by the organization. The Order of Railroad Telegraphers has also presented a similar request which will be given consideration at an early date.

In reply to many inquiries from its members "relative to the delay in the settlement of wage increases" asked of the director general by the shop craft organizations on January 7, the Railway Employees' Department has explained that after having presented its arguments to the wage board on

March 12, 13 and 14, its committee was notified that the representatives of the regional directors were not prepared to present their side of the matter, and the hearing was postponed by the board till April 14. The employees committee protested vigorously against this delay, but the board declined to alter its decision. This case is also being presented by 14 representatives of the employees, with B. M. Jewell, acting president of the Railway Employees' Department, as chairman, and 14 representatives of the regional directors, with C. E. Chambers, mechanical assistant to the regional director for the Allegheny region, as chairman.

### Back Pay for Short Line Employees

Director General Hines has recently announced a decision that employees of the short line railroads which were not taken under federal control because the general counsel of the Railroad Administration ruled that they were not "systems of transportation," are not entitled to back pay under General Order No. 27, and that employees of railroads relinquished and subsequently taken under federal control are not entitled to back pay for the period back of the date of the contracts subsequently executed. As to the employees who might have been induced to subscribe for Liberty bonds by the appeal sent to all railroad men early last year by Director General McAdoo, calling attention to the fact that they were about to receive increases in wages and back pay, Mr. Hines says that unfortunately these assurances were not restricted, as they ought to have been, to employees of railroads operated by the government, but that there was no intent to mislead any employees, and that those who bought Liberty bonds on the strength of such assurances have only done what every class of citizenship was urged to do; and have made a splendid investment unless they have lost because it became necessary to sell the bonds at a discount.

These conclusions, adhering to the position formerly taken by Mr. McAdoo, were expressed by Mr. Hines in a letter to the chief executives of the organizations representing railway employees, who had asked for back pay for the short line employees back to January 1, 1918. "I am frank to say I do not see any escape from the conclusion that the only procedure practicable in these cases is to begin paying the increased wages only from the date the standard contract taking a short line railroad under federal control is made," said Mr. Hines, "because prior to that time the director general had nothing whatever to do with the expenses of operating the railroads in question and has assumed no responsibility therewith, and has always refused to assume any. The mere fact that these employees purchased bonds of their government to help in the war is not a sufficient reason for the director general assuming responsibility for additional pay to all employees of all short line railroads back to January 1, 1918, in the face of the position he has always taken with the owners of these roads." The letter was not made public, but was communicated to the employees by officers of the organizations.

### Disposition of Unclaimed Freight

General Order No. 34-B, issued on March 29, amends General Order No. 34-A to read as follows:

Carriers subject to federal control shall sell at public auction to the highest bidder, without advertisement, carload and less than carload non-perishable freight which has been refused or is unclaimed at destination by consignees after the same has been on hand 60 days. Consignee, as described in the waybilling, shall be notified of arrival of shipments in all cases, and such notice shall contain provisions that after freight is unclaimed or undelivered for 15 days after expiration of free time at destination it will be treated as refused and will be sold without further notice 60 days from date of notice of arrival.

Consignors shall be notified when freight is refused or is

unclaimed, as provided above, when the consignor can be determined from the billing or when shipments are marked with the consignor's name and address; such notice to contain provisions that unless proper orders for disposition are received on or before a specified date, not earlier than 60 days from date of arrival and notice to consignee, the shipment will be sold for charges without further notice.

Perishable freight may be sold in the discretion of the carrier whenever necessary to prevent waste without notice except that such reasonable effort shall be made to notify both consignor and consignee, as described in the waybilling, as the circumstances will permit.

Deposit in the mail of notices in accordance herewith shall be construed as sufficient notice to all concerned, and a record shall be made thereof by the employee who mails the same.

The place of sale of both perishable and non-perishable freight shall be determined by the carrier; the net proceeds, if any, after deducting freight and other legitimate expenses, will be paid to the owner on proof of interest.

Nothing herein contained shall affect the provisions for notice to consignor of unclaimed or refused shipment of explosives or other dangerous articles, or for telegraphic notice to consignors of unclaimed and refused shipments at his expense and on his request, or other special provisions for notice to consignors, where such provisions are contained in the storage rules of the carrier, or other rules contained in tariffs on file with the Interstate Commerce Commission, except that when notice of refusal is given to the consignor under such tariff rules, it shall include the notice of sale after 60 days above provided for, and notice need not be repeated under this order.

**Economy in Consumption of Coal in 1918**

Good results attained in 1918 as a result of the campaign for fuel economy are shown in a compilation prepared by the Fuel Conservation Section of the Railroad Administration comparing some of the principal statistics relating to the consumption of coal for 1916, 1917 and 1918. The tons of coal consumed in freight service in 1918 amounted to 86,634,345 as compared with 79,454,966 in 1916 and 86,795,339 in 1917, but the pounds of coal per 1,000 gross ton miles show a decrease in 1918 as compared with 1917, although an increase compared with 1916. The amount was 199.7 in 1918, 200.9 in 1917 and 192.1 in 1916. In passenger service the tons of coal consumed in 1918 amounted to 30,570,030 as compared with 32,583,171 in 1917 and 30,494,233 in 1916. The pounds of coal per passenger train car mile used in 1918 averaged 19.3 as compared with 19.4 in 1917 and 18.5 in 1916. In the last six months of 1918 the pounds of coal per 1,000 gross ton miles were only 190.7 as compared with 201.8 in 1917, a decrease of 5.5 per cent, and the pounds per passenger car mile were 18.2 as compared with 18.8, a decrease of 3.2 per cent.

The report also compares the average cost of coal per ton in December, 1918, and December, 1917. The figures for some of the principal roads, which do not include the cost of the haul on the user's rails, are as follows:

Road	December, 1918	December, 1917
New York, New Haven & Hartford.....	5.78	5.25
Delaware & Hudson.....	3.99	3.61
Boston & Maine.....	6.21	5.44
Lehigh Valley.....	3.49	3.77
Michigan Central.....	3.62	3.06
New York Central.....	3.78	3.63
Baltimore & Ohio—Eastern Lines.....	3.43	3.07
Baltimore & Ohio—Western Lines.....	2.66	2.30
Pennsylvania Eastern Lines.....	2.65	2.30
Pennsylvania Western Lines.....	2.88	2.48
Philadelphia & Reading.....	2.76	2.48
Atlantic Coast Line.....	3.75	3.51
Louisville & Nashville.....	4.25	4.00
Southern.....	3.13	2.15
Chicago & North Western.....	3.48	2.68
Chicago, Milwaukee & St. Paul.....	3.01	2.19
Atchison, Topeka & Santa Fe.....	3.42	2.87
Southern Pacific.....	3.53	2.97
Union Pacific.....	6.02	6.72
Missouri Pacific.....	2.77	2.48
St. Louis-San Francisco.....	3.09	2.51
	3.32	2.69

**New Embargo Regulations**

The Car Service Section, W. C. Kendall, manager, in Circular CS-57 has issued revised regulations regarding the handling of embargoes, effective on April 1, which place the issuance of embargoes under the direction of the regional directors.

A road desiring to place an embargo will notify regional director, specifying what, if any, exceptions are desired. If regional director approves, he will authorize the embargo and transmit it to all federal-controlled roads in his region, to the car service section, and to all regional directors and embargo bureaus interested. Each federal-controlled road will notify its own agents and the non-federal-controlled roads assigned to it. Embargo information will be interchanged with Canadian roads through zone chairmen at Montreal and Winnipeg.

Embargoes and extensions of embargoes must be promptly transmitted by wire, and become effective 24 hours from 11.59 p. m. of the date of issue; freight in transit will be accepted. In the event of strikes, washouts, or similar contingencies the embargo may stipulate that it will become effective immediately.

Each embargo must state the reason why it is placed and be given an identifying number. A telegraphic cipher is prescribed.

Each railroad must have a practical system for filing embargoes which should be uniform at all stations. A complete file of outstanding embargoes must be maintained at all freight loading stations for guidance of shipping public. When necessary to cover more than one kind of freight, each item must be specified.

Freight for export is subject to control of designated committees who are empowered to issue permits authorizing the movement of export shipments against embargoes. For domestic shipments permits may be issued by the car service section, the regional directors and by special committees.

**Rules for Issuance of Passes**

The Division of Operation has issued Circular No. 19-A, giving revised rules for the issuance of passes, superseding Circular No. 19, dated September 1, 1918, as follows:

**ANNUAL AND TIME PASSES**

1. The issuance of annual and time passes will be confined to the offices of the director general, director of operation, the several federal managers, the general manager on lines where there is no federal manager, and the federal manager of Pullman car lines.

2. Annual and time passes issued over the facsimile signature of the federal managers (or general managers on lines where there is no federal manager) and countersigned by the person indicated thereon will be limited to—

(a) For, or on account of, their own officers and employees who do not require annual or time transportation on lines beyond their jurisdiction.

(b) For, or on account of, such officers and employees of the corporation as may be specifically authorized by the director general.

(c) To officers and employees of the American Railway Express Company whose duties are confined solely to lines under their jurisdiction.

3. Annual and time sleeping or parlor car passes will be issued by the federal manager of Pullman car lines to officers and employees under his jurisdiction.

4. All annual and time passes not included in paragraphs 2 and 3 will be issued only by the director general or director of operation.

5. Annual passes bearing the personal signature of the director general will be good on all lines under federal control, on all trains, and for seats in railroad-operated parlor or chair cars.

6. Annual and time passes bearing the facsimile signature of the director general will be issued by the director of operation and will be good on all lines under federal control or

within the territory or over the lines specified thereon, and will bear express limitation as to certain trains upon which the pass will not be honored. Such passes will bear the countersignature of W. T. Tyler, director; J. H. Young, senior assistant director, E. H. DeGroot, Jr.; or L. L. Lapp.

7. Annual and time sleeping or parlor car passes, other than for officers and employees of the Pullman Car Lines, and annual and time steamship passes, bearing the facsimile signature of the director general, will be issued by the director of operation with the same countersignature as provided in preceding paragraph.

8. Federal managers, and general managers on lines where there is no federal manager, will forward to the director of operation, on or before November 1, a list of annual or time passes (including sleeping-car or steamship passes), required for officers or employees over lines other than those under their control, indicating the lines or territory over which the passes are desired.

#### TRIP PASSES

9. Trip passes will be issued over the facsimile signature of the director general or of the federal managers (or of general managers on lines where there is no federal manager) and the federal manager of Pullman car lines, and will be countersigned by the person indicated thereon. Trip passes issued by the federal and general managers and federal manager of Pullman car lines will be limited to the lines under their respective jurisdiction.

10. Trip passes bearing the facsimile signature of the director general, with countersignature of person indicated thereon, will be issued by the director of operation, regional and district directors. Such trip passes will be honored for transportation over the lines indicated thereon.

11. Federal managers, and general managers on lines where there is no federal manager, and the federal manager of Pullman car lines desiring trip passes for, or on account of, their officers or employees over other lines under federal control, will make request for same to the federal or general manager of such railroad in the same manner that exchange trip passes have heretofore been handled.

#### GENERAL

12. Passes will not be issued which include the privilege of free meals in dining cars, at restaurants, or on steamships.

13. The current regulations of the Interstate Commerce Commission covering the issuance and record of passes must be observed.

### Steel Prices to Be Reconsidered

The plan fostered by Secretary Redfield and approved by President Wilson to stabilize prices and stimulate industry by voluntary agreements between the basic industries and the Industrial Board of the Department of Commerce on reduced prices to be paid by the government as an example for other consumers, has encountered a serious obstacle in the refusal of the Railroad Administration to play the part of a self-starter for the scheme. Not only did the Railroad Administration decline to accept the steel prices fixed by the board, but without waiting for the action of the board it allowed the individual railroads to go into the market for coal at the best prices it could get. The result was a conference of various representatives of the government on Wednesday, at which it was decided to re-commit the scale of steel prices agreed upon by the board and the steel interests to the board for further consideration with the Railroad Administration, which has been making an investigation of costs, preliminary to accepting the prices. It is understood that the Railroad Administration has not given its final decision but that it protested against the prices before they were fixed and also against the price-fixing plan; and it is now inclined to hold out for a further reduction.

The scale, which included a price of \$45 for Bessemer rails and \$47 for open hearth rails was published in last week's issue.

Mr. Redfield and his coadjutors had counted on the Railroad Administration to start the buying movement by making the large purchases that might be expected of the railroads

as the largest consumers of steel, coal, lumber, etc., at the prices fixed, and T. C. Powell, director of the Division of Capital Expenditures of the Railroad Administration, was made a member of the board; but apparently the plan was inaugurated without any definite assurance that the administration would consider itself bound by it and the Railroad Administration has been hoping to save some money as compared with its fuel bill for last year, which amounted to approximately \$473,000,000 for 180,000,000 tons.

An agreement was reached two weeks ago on reduced prices for rails and other steel products, but the Railroad Administration, forced by the political exigencies that have delayed its appropriation to be conservative in its expenditures, withheld its orders. Therefore, when the board called in representatives of other industries whose prices it proposed to stabilize, including coal, lumber, cement, sand and gravel, they expressed some curiosity as to whether the government would buy at the prices when fixed, particularly after they learned that individual railroads, during the time the coal men were in conference with the board, were asking for bids for coal for the year beginning April 1 without reference to the possible action of the board.

The coal men, after being in conference with the board for two days, withdrew and issued a statement that the Railroad Administration had failed to extend its co-operation, and the sand and gravel people declared that their attitude toward reducing prices would depend somewhat on what the Railroad Administration would do in the direction of reducing freight rates. Director General Hines recently announced that a reduction in rates on road materials when the freight is paid by a government was under consideration, but that it was proposed to ascertain what, if any, reduction in price will be made by those producing and supplying the materials.

The statement issued by the National Coal Association explained that approximately 40 per cent of the bituminous coal is consumed by the railroads and therefore would be purchased by the Railroad Administration. "Under these circumstances," it said, "the operators consider it vital for the board and the industry to know at the outset whether or not the Railroad Administration would accept the decision of the conferences as to prices and make its purchases at those prices. It developed at the meeting that in spite of Director General Hines' publicly announced policy in the purchase of railroad fuel, the Railroad Administration had adopted unfair practices, which would drive the price of railroad fuel below the cost of production. This would necessitate advancing the price of coal for the general consuming public to a point sufficient to absorb the loss involved in the production of coal for railroad use. It was therefore apparent that, unless the Railroad Administration would lend its co-operation and bind itself to accept the findings of the conference, no beneficial results for the general public could be secured. Such assurance of co-operation on the part of the Railroad Administration was not forthcoming. The operators accordingly made clear to the board their readiness to resume the consideration of the question of prices whenever the co-operation and support of the Railroad Administration and other governments buying coal had been secured."

H. B. Spencer, director of the Division of Purchases, denied the statement that the administration had adopted unfair practices. "We have requested the members of this association to bring to the attention of the Railroad Administration any failure to carry out the instructions issued by the director general so that we could investigate the matter and remedy the fault, if any existed," he said. "So far as we are advised, the purchasing departments are absolutely adhering to the policy laid down by Mr. Hines. The Railroad Administration has co-operated to the fullest extent with the National Coal Association."

As a result, the activities of the board were practically suspended for several days. Chairman Peek of the board went to Chicago for a conference with Mr. Hines on Friday, and it is reported that a cablegram was sent to President Wilson on Saturday asking him to instruct the government departments to observe the prices fixed. When Mr. Hines returned to Washington on Wednesday an effort was made to secure an understanding with him as to what the Railroad Administration proposed to do, and a conference was held presided over by the secretary of the treasury and attended by Secretary Redfield, members of the Industrial Board, the War Finance Corporation and representatives of the various government purchasing departments, including Mr. Hines and H. B. Spencer, director of the Division of Purchases. Fuel Administrator Garfield and a representative of the Food Administration were also present but after it had been announced that the Railroad Administration would not accept the steel prices but was holding out for lower prices, there was no particular object in discussing the coal or other prices. The views of the Industrial Board, whose first action has now been repudiated, were expressed by Secretary Redfield, Mr. Peek and other members of the board, while Mr. Hines spoke for the Railroad Administration.

The indications following the meeting were that the board would soon cease to exist unless the President intervenes and that it had to some extent exceeded its authority. It was stated that the original plan was not that the board should fix prices that would be binding on any one but that it was hoped they could induce prices that would be sufficiently attractive to induce buying. It is also stated that the department of justice considers the fixing of minimum prices in violation of the anti trust law.

**February Increases Railroad Deficit**

The net operating income of the railroads in February again fell short of the standard return guaranteed by the Railroad Administration, according to preliminary returns to the Interstate Commerce Commission, covering about 223,000 miles of operated line. For these roads the net operating income was \$9,747,050, a decrease of 0.1 per cent as compared with February, 1918. The total operating revenues amounted to \$336,880,496, an increase of 21.7 per cent, showing the effect of the increased rates which have been in effect since last June, as the volume of traffic during the month as measured by net ton miles was 13½ per cent less than for February, 1918. Operating expenses were \$310,465,245, an increase of 23.9 per cent.

The standard return for the month of February is about \$47,000,000, so that the Railroad Administration's deficit for the month was approximately \$37,000,000 on top of a deficit of \$35,000,000 as compared with the standard return in January. While the standard return averages approximately \$75,000,000 a month, seasonal variations in the volume of traffic are so great that it is inaccurate to compare monthly returns with that figure. The Association of Railway Executives has compiled a table showing what the average monthly return of the carriers in the pre-war test period was, as follows:

January .....	\$55,000,000	July .....	\$76,000,000
February .....	47,000,000	August .....	83,000,000
March .....	68,000,000	September .....	92,000,000
April .....	67,000,000	October .....	95,000,000
May .....	77,000,000	November .....	84,000,000
June .....	83,000,000	December .....	73,000,000

By quarters, the average net income in the test period compares with the quarterly payment of about \$226,000,000, which the government has to make, as follows: First quarter, \$170,000,000; second quarter, \$227,000,000; third quarter, \$256,000,000, and last quarter, \$252,000,000. For the first half of the year in the test period the average was \$397,000,000, while in the second half it was \$507,000,000. These figures are for the Class I roads and the principal switching and terminal companies.

Taking into consideration only the Class I railroads under federal control, the net operating income for 1918 was \$688,-200,083, which was 77.3 per cent of the standard return. An article recently published in the *Railway Age* gave comparisons of the net operating income of the various roads with their standard return. The percentages of the standard return earned by the railroads in the various regions created by the Railroad Administration were as follows: Eastern region, 69.4 per cent; Allegheny region, 46.4 per cent; Pocahontas region, 101.8 per cent; Southern region, 108.8 per cent; Northwestern, 61.8 per cent; Central Western, 95.4 per cent, and Southwestern, 93 per cent.

**Temporary Financing for the Railroads**

The War Finance Corporation up to Wednesday had made loans to railroad companies on demand notes at 6 per cent to the amount of \$27,700,200, on the security of certificates of indebtedness issued by the Railroad Administration. This represented loans for the purpose of enabling the roads to meet their April 1 requirements. The finance corporation had previously made railroad loans amounting to \$116,555,-270, including \$50,000,000 to the Railroad Administration. The new loans were for 80 per cent of the face of the certificates of indebtedness unless additional collateral was deposited and in making their application for certificates the companies made them for 125 per cent of the amount desired. The certificates bear interest at only 5 per cent, while the loans from the War Finance Corporation bear 6 per cent, but it is understood that an arrangement will be made by which the companies will lose nothing as a result of the difference. Five per cent on the face of certificates issued for 125 per cent of the amount of the advances made by the finance corporation amounts to 6.25 per cent on the face of the loans.

The advances made by the War Finance Corporation were as follows:

Chicago, Burlington & Quincy.....	\$4,000,000
Western Maryland.....	931,000
Boston & Maine.....	728,000
Chicago, Rock Island & Pacific.....	2,800,000
New York Central.....	2,000,000
Lehigh Valley.....	2,400,000
Chicago, Milwaukee & St. Paul.....	1,600,000
Michigan Central.....	992,000
Chesapeake & Ohio.....	800,000
Wheeling & Lake Erie.....	618,800
Cleveland, Cincinnati, Chicago & St. Louis.....	340,000
Buffalo, Rochester & Pittsburgh.....	208,800
Lake Erie & Western.....	62,400
Baltimore & Ohio.....	6,600,000
Erie.....	2,500,000
Missouri Pacific.....	1,120,000

The Baltimore & Ohio received \$4,600,000 on the security of a certificate of indebtedness for \$5,750,000 and \$2,000,-000 additional secured by its refunding and general mortgage 6 per cent gold bonds.

In order to meet the increased drafts units resources the War Finance Corporation has issued \$200,000,000 of short term bonds at 5 per cent.

**Equipment Financing**

The plan of issuing trade acceptances to pay for equipment fell through, as announced in last week's issue, largely because of the refusal of the federal reserve banks to rediscount them and also because of the reluctance of the specialty companies to accept them from the equipment companies. The car and locomotive builders who have contracts with the Railroad Administration and who attended the conference with Director General Hines, at which the acceptance plan was proposed, were willing to take them, but proposed to pay the specialty manufacturers with them in turn. The latter, whose contracts were with the equipment builders, although the prices and terms were fixed by the purchasing committee of the Railroad Administration, were not represented at the conference, but were dealt with by the committee of equipment builders, and some of them thought that the equipment companies ought to get the money from the

banks on the acceptances and pay them in cash. This brought up the question of the possibility that the acceptances might have to be renewed at the expiration of 90 days in case the appropriation should not have been passed in that time, and as they were to be secured only by the contingency of the appropriation, the responsibility might be transferred to the endorsers.

The certificates issued to the railroads are not dependent merely upon the appropriation, since they represent money the administration has guaranteed to the roads under the standard contracts, and payable "whenever and as soon as the director general shall have funds available . . . whether received by appropriation of the Congress or by virtue of moneys arising out of the use and operation of the railroads . . . or otherwise." The proposed acceptances for equipment were not to be backed by the operating income and were therefore less secure than the certificates upon which the War Finance Corporation will make loans.

Therefore it was decided to try to meet the equipment obligations in some similar way and the subject was discussed at a meeting between the Railroad Administration representatives and the equipment builders at Washington on Tuesday.

Director General Hines, in a speech before the Pittsburgh Chamber of Commerce on March 27, tried to remove any impression that the \$750,000,000 appropriation was needed to make up for losses sustained by the Railroad Administration and also to emphasize the fact that it is still needed. He also sought to emphasize that in the last analysis it is needed to help the railroads finance capital expenditures. He said that after allowing for a \$200,000,000 deficit in 1918 the balance of the two appropriations represents money only temporarily tied up as follows: About \$340,000,000 for working capital which will be released upon the termination of federal control; \$340,000,000 advances to railroads in 1918, which will be returned when they can refinance it, and about \$370,000,000 to be advanced to railroads this year pending opportunities to refinance. When the accounts for 1918 are settled, he said, the administration will be carrying additions and betterments which the roads were unable to finance to the amount of \$290,918,283, together with long time loans and deferred collections from some of the railroad companies amounting to \$151,866,104.

### Freight Traffic in February

Freight traffic during the month of February as measured by net ton miles fell off 13.5 per cent as compared with February, 1918, according to the monthly report of freight traffic movement and car performance compiled by the Operating Statistics Section. The net ton miles amounted to 25,681,943, as compared with 29,678,260. This was handled with a decrease of 15 per cent in train miles but the saving in loaded car miles was only 11.3 per cent and the empty car mileage increased 4.5 per cent. The average tonnage per train increased from 618 to 629, or 1.8 per cent, but the tonnage per car fell off 2.5 per cent, from 28.4 to 27.7. The percentage of unserviceable freight cars was about the same as in February, 1918. The car miles per car day declined from 21.6 to 20.3 and the net ton miles per car day from 435 to 379 or 12.9 per cent.

### Contracts Executed

The Railroad Administration has executed a standard contract with the Union Freight Railroad for \$32,009 and also co-operative short line contracts with the Urcina & North Fork and the White River.

**Pointers for the Yardmaster**—Be careful in districting your crews. If they are assigned to classification tracks you can usually satisfy yourself as to the extent of their work. At industrial plants, take care that mill foremen do not encourage them to spot around the mill doing an unimportant job under pretense that work is anticipated.—H. D. McKee.

## Railroad Men\*

By T. C. Powell

Director, Division of Capital Expenditures, U. S. Railroad Administration

**WE HEAR THE PHRASE**, "Railroads operated by the government." The railroads are being operated by railroad men from top to bottom and all the credit and all the blame will be given to railroad men.

When the director general of military railways organized his engineer regiments for service abroad, he hired railroad men, and when he wanted to set men to handle the boats and barges on the canals and rivers of France, he cabled over for expert tow-boat men. These railroad men in France got down to brass tacks and built docks and terminals, operated trains and transported men and ammunition like the loyal and enthusiastic railroad men they were and are.

When Commander Buell told of the work of mounting the big guns that bombarded Metz, he said that the trouble was not to get the railroad men to work, but to get them to take the necessary rest. They started up before the whistle blew in the morning and kept at it at the rate of 16 to 18 hours per day. And so when General Pershing sent in his report to the secretary of war he felt that the formal commendation of the engineer corps was not enough, but made a separate and special reference to their splendid services.

The first civilian in the history of this country to receive the distinguished service medal of the United States was a railroad man—S. M. Felton, president of the Chicago Great Western. That is the record we have before us.

The public will not be deceived, and any departure from the high standard of which we are capable cannot be blamed on "government operation." It will be blamed on us. You cannot fool your neighbors. The neighboring public knows that the men who are operating the railroads today, from the highest to the lowest, are practically the same men, with only a slight change in personnel, who were operating the railroads two years ago, before the war.

A short time ago I saw a picture which wasn't very much of a picture. There was a fence, and a woman looking through the fence, and a small boy on the pavement outside. The woman was calling—"Violet Marie! Come into the house!" The small boy helped out by calling, "Hey, Carrots, your mother wants you!" We may try to fool the public by calling out "Violet Marie"—otherwise "government operation"—but the public will respond, "Hey, Carrots"—otherwise "railroad men."

I like the military phrase "carry on!" Somehow it expresses vigor and continued forceful action, and if it were not stealing army thunder, I would like to adopt it as our motto. Few of those here actually operate the railroads, but all of us enter into the general scheme. The prompt delivery of a letter may be *the* thing in a day's work.

I never had much sympathy for the man who bet on a horse for "place." If he hasn't the nerve to bet on a horse to *win*, he is simply playing safe, and if our marines had merely played safe on the St. Mihiel salient, where would their honor and glory be, and what would be the status of the war today?

You have all heard of "The Message to Garcia," the story of Andy Rowan, who, in spite of all obstacles, delivered to General Garcia the vital message he was charged with. The account written of it has become a classic, but we have as the head of our organization one who in his early business life carried through with the same promptness and effectiveness the errand with which *he* was charged.

I was told the following story by M. H. Smith, president

\*From an address before the Railroad Club of Washington, D. C., February 12, 1919.

of the Louisville & Nashville Railroad. At that time it was reported to Mr. Smith that a bill had been prepared for presentation to Congress, giving the Interstate Commerce Commission extended powers, and which bill, as the report reached Mr. Smith, would have been injurious to the prosperity of the railroads. Mr. Smith felt that it was necessary for him to have a copy of the draft of the bill, and he sent for the general counsel of the railroad to find out if he could make the trip from Louisville to Washington immediately and secure this copy. The general counsel could not spare the time as he was engaged on a lawsuit of a pressing nature, but said that perhaps one of the younger men in his office could do the work as well, and he sent this young man in to President Smith. Before that the two had not met except in a casual way. Sufficient to say that the trip was made; a copy of the bill secured and delivered to Mr. Smith even more promptly than he required.

This was an incident in the career of Walker D. Hines, afterwards vice-president of the Louisville & Nashville, general counsel and chairman of the board of the Santa Fe, and now director general of railroads.

With that example before us, we must "carry on" as railroad men and "deliver the goods."

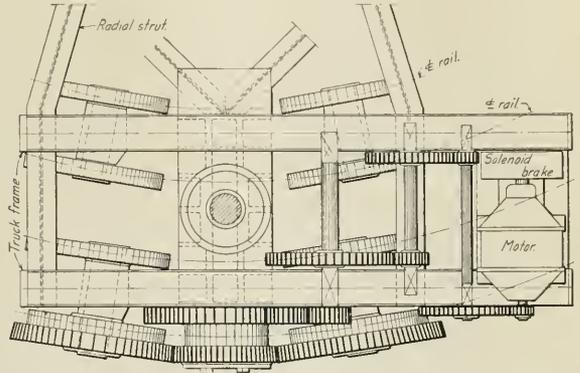

## A Radical Departure in Swing Bridge Design

A SWING BRIDGE EMBODYING several radical departures from the designs in common use has been submitted to the consideration of railway men by the Strauss Bascule Bridge Company of Chicago. This design was originated and patented by Joseph B. Strauss, president of this company, some years ago, but had not been offered to the public until the present time. The design is unique in several ways; the truss system, the turning machinery and the means of supporting the span on the pivot pier under both dead and live loading and the method of clearing the end bearings when ready to swing, all embody unusual features.

The truss system consists of a combination of a double cantilever over the pivot pier with semi-suspended simple spans on either side. In place of two simple spans extending from the pivot pier to the end piers and made partially

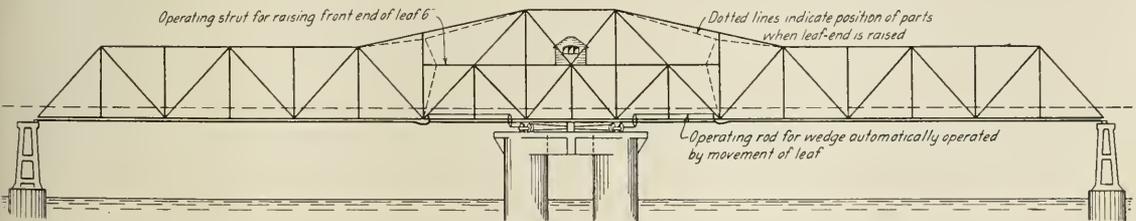

stead of providing these toggles at the top of the tower as has been done previously, a double toggle system is provided at each end of the cantilever trusses where the semi-suspended spans are supported. As a consequence of this, the load to be lifted is considerably less than if the full half spans had to be lifted, as is the case with the toggles directly above the pivot pier. These toggles are actuated by a set of operating struts provided with racks and extending horizontally from pinions forming a part of the machinery in the operating house.

The most radical departure in the design is the manner

Trucks Carry the Dead Load When the Span Is in the Swinging Condition

of supporting the span on the center pier, both for carrying the traffic and for swinging the span. The span is supported under both conditions at the four corners of the tower, that is, directly under each of the main posts, thus dispensing entirely with loading girders. Under the swinging condition the dead load is carried at each of these points on a truck of either four or eight wheels operating on two to four lines of circle rails. One drawing illustrates the character of these trucks. Each one is attached to the superstructure by means of a center pin, thus allowing considerable independence of movement. Two of the trucks are provided with power machinery for the movement of the span and considerable simplification with respect to this is

General Elevation of the Span

continuous by means of the tower structure over the pivot pier, the two simple spans in this case do not extend over the entire clear distance between the piers, but are supported at an intermediate point at some distance from the pivot pier by the cantilever portion of the span which overhangs the pivot pier on each side. By this arrangement a more economical design of the truss system is obtained. This arrangement also is of considerable importance in connection with the manner of clearing the end piers when swinging. Instead of lowering the end bearings to obtain the necessary deflection for cantilever action of the entire structure, the ends of the spans are lifted clear of the bearings by means of a toggle system in the truss framing. But in-

accomplished by mounting the motor directly on the truck frame, so that it is a simple matter to provide a train of gears from the motor to the wheels. There is thus eliminated the usual circular rack with its difficulty of maintenance.

For the closed condition the load is removed from the wheels by means of a simple wedge arrangement directly under the center pin which transmits the load directly into a bearing shoe. The general elevation of the span illustrates one form of substructure applicable to this type of span in which four cylinder piers are provided, one under each point of loading, these piers being connected at the top with a system of reinforced concrete girders to carry the turning track.

## Train Accidents in February<sup>1</sup>

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of February, 1919:

COLLISIONS						
Date	Road	Place	Kind of accident	Kind of Train	Kil'd	Inj'd
5	N. Y., N. H. & H.	Danbury	xc	P. & F.	0	20
†24	F. & N. Nashville	Sylacauga	xc	F. & P.	1	12
9	C. R. & I.	Cadillac	bc	P. & F.	2	20
†28	Minn. & St. Louis	Norwood	bc	P. & F.	2	7

DERAILMENTS						
Date	Road	Place	Cause of derailment	Kind of Train	Kil'd	Inj'd
4	Pennsylvania	Birm'ghm, Pa.	d. coupler	F.	0	0
4	Pennsylvania	Birm'ghm, Pa.	acc. obst.	P.	3	1
†8	Piedmont & N.	Chick Spgs.	d. eq.	P.	6	20
8	West Shore	Jersey City	unx.	F.	3	0
9	Seaboard A.	Anderson	malice	P.	1	5
14	Pennsylvania	St. George	b. wheel	P.	0	3
†17	Pennsylvania	Sturgeon, Pa.	unx.	F. & P.	1	9
*19	Louisville & N.	Versailles, Ky.	exc. speed	F.	0	0
†22	Balt. & Ohio	Pittsburgh	neg.	P.	9	10
†23	Chi. Mil. & St. P.	Latham Park	neg.	P.	2	20

The trains in collision on the fifth were a westbound passenger, running at about 30 miles an hour, and a train consisting of a locomotive and a caboose, which was at a standstill. Both locomotives were thrown off the track. About twenty passengers were injured. The inferior train was on the main track without right, and with no flag protection.

The trains in collision at Sylacauga, Ala., on the 24th were a southbound passenger of the Louisville & Nashville, and a through freight train of the Central of Georgia, the freight train running into the side of the passenger train at the crossing of the two roads. One passenger car was damaged and one passenger was killed. Twelve passengers were injured. The freight approached the crossing at uncontrollable speed in disregard of the law requiring a full stop.

The trains in collision near Norwood, Minn., on the 28th were eastbound passenger train No. 12 and westbound freight No. 417. The westbound train was stalled in a snowdrift and the engine, which had been sent forward to Young America with a part of the train, was returning for the rear portion and had nearly reached it when the collision occurred. Of twelve stockmen riding on the freight, two were killed and seven were injured.

The trains in collision on the Grand Rapids & Indiana near Cadillac, Mich., on the 26th, were northbound passenger No. 5 and southbound freight No. 52. The freight had become stalled in snow and a flagman had been sent forward to stop the passenger train, but his flag was not seen by the engineman. The day was clear but there was some snow blowing in the air. The flagmen threw a fusee at the engine but with no result. The flagman had not used a torpedo, but from the engine of the passenger train the freight was visible at a distance of 1,000 ft. Both engineman and fireman, however, appear to have been working on some part of the engine in the cab and keeping no lookout; and their engine was working when it struck the freight. Both of these men were killed. Twenty passengers were injured. Estimated damage to engines, cars and roadway, \$10,000. The engineman is said to have had the reputation of being one of the most careful on the road.

The freight train derailed near Birmingham, Pa., on the 4th was a westbound extra. Three loaded cars were wrecked by the emergency application of the brakes and fell on the eastbound track, derailing eastbound passenger train No. 18. The brake application was caused by a break-in-two, due to

the opening of a knuckle, the lock of which had become worn.

The passenger train derailed near Birmingham, Pa., on the night of the 4th was eastbound Chicago mail No. 18. The locomotive fell down a bank and seven baggage cars were thrown off the track. The engineman, fireman and one other employee riding on the locomotive were killed, and one passenger was injured. The cause of the derailment was as noted in the preceding paragraph.

The train derailed near Chick Springs, S. C., on the 8th was a northbound passenger. The rear coach ran off the track on a high trestle and fell to the ground about 90 ft. below. The car was demolished and every person within it was injured. Four were killed outright, two fatally and 20 less seriously injured. The cause of the derailment was the failure of a steel brakebeam which was caught in a guard rail.

The train derailed at Jersey City, N. J., on the night of the 8th, was a northbound yard train of the Lehigh Valley running on the track of the West Shore. The engine was badly damaged and one freight car was wrecked. Three trainmen were killed. The cause of the derailment was not determined.

The train derailed at Anderson, Ga., on the 9th was northbound passenger No. 4. The engine and first three cars were badly damaged. The fireman was killed and the engineman and four other trainmen were injured. The derailment occurred at a switch, believed to have been tampered with.

The train derailed at St. George, Pa., on the 14th was northbound express passenger No. 907. Four coaches ran off the track and 16 passengers were injured. The cause of the derailment was a broken wheel.

The trains involved in the accident on the Pennsylvania Lines near Sturgeon, Pa., on the 17th were a westbound work train and eastbound express passenger No. 114. The tender of the work train (the engine running backward), was derailed and thrown against the side of the passenger train which was moving eastward at full speed on the adjacent track. The sides of nine cars, including three passenger coaches, were badly torn; 10 passengers were injured, one of them fatally. The cause of the derailment of the tender was not determined.

The train derailed near Versailles, Ky., on the 19th was a westbound through freight. Thirteen cars of oil, two cars of coal, and one of coke, were destroyed by fire. The cause of the derailment was excessive speed over a soft spot in track, and an overloaded high hopper dump car. The cause of the fire was not determined.

The trains involved in the accident at Pittsburgh, Pa., on the evening of the 22nd of February were the Versailles local passenger train and a freight locomotive, without train, which was derailed at a point where the track was being repaired, and fell against the passenger train. The passenger train was moving at about 40 miles an hour, and three coaches were wrecked. Nine passengers were killed, and several were injured.

The train derailed near Latham Park, Ill., on the 23rd was a southbound local passenger train. Two persons were killed, a passenger riding in one of the coaches, and G. G. Corcoran, trainmaster of the division; and twenty passengers were injured. Two coaches fell down a bank. The derailment was due to insecure track, shims having been used without sufficient spikes and braces, though an experienced foreman was in charge.

*Electric Car Accidents.*—Accidents to electric cars—including two cases where locomotives ran into cars at crossings, and one collision on an elevated line in New York City—were reported in February from Terre Haute, Philadelphia, New York City and Cincinnati; but in no case was there any fatal injury. The number of injured, altogether, including serious and minor cases, was 72.

<sup>1</sup>Abbreviations and marks used in Accident List:  
 rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, obst., Accidental obstruction—malice, Malignant obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—F, or Pass., Passenger train—F, or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

# Railway Developments in Foreign Countries

## The Channel Tunnel Project Excites Discussion in England— Transportation Demoralization in Russia

THE ANNOUNCEMENT by Bonar Law in the House of Commons, March 10, that the British government was considering beginning immediately the construction of the English Channel tunnel (*Railway Age*, March 14, page 611), had an additional factor of importance in the eyes of Englishmen than was given the project at the time in this country. That factor is that this is the first time that the British government has decided in favor of the construction of the channel tunnel in principle. The French government, on the other hand, has been favorable to the tunnel for many years, but in England the fear that the tunnel might be a means of invasion has always ruled against the project.

"There are few subjects on which the policy of British governments has up to now been so consistent as on this," says the *London Times* editorially. "It was considered and condemned by a committee of both Houses in 1883, and year after year bills were regularly introduced into Parliament, and all were decisively rejected. The Liberal Prime Minister in 1907 made an announcement on the project, based on an exhaustive inquiry by the Committee of Imperial Defence, and it was hostile. A fortnight before the beginning of the war the committee again condemned the project. Since then government spokesmen have several times fenced with proposals, but never a word has been said until yesterday to show that the government had changed their mind."

"The military arguments against the tunnel are very familiar, and there is no need to rehearse them. On the whole our experience in this war has not strengthened them. We should have been better off if there had been a tunnel, for at critical moments we could have reinforced our armies more promptly, and we should have saved a great deal of shipping. German tactics at sea were singularly unenterprising in this war, and in consequence our communications were never seriously threatened. We could never count on having such luck again, and the risk of interruption of our sea communications across Channel must be reckoned as much more serious than the risk of a sudden surprise attack by way of a tunnel that would give the enemy control of the bridgehead on our side of the water."

The *Times*, speaking in its news columns of the fact that this is the first time the British government has decided in favor of the construction of the channel tunnel in principle, says that instructions have been issued in this sense to Sir H. Llewellyn Smith and a Board of Trade delegation who are now in Paris examining the question. The Committee of the Peace Conference on which they are serving is considering not only the channel tunnel, but projects for constructing tunnels under the Straits of Gibraltar and the Bosphorus.

"As the French government has long been in favor of the channel tunnel, the moment for action seems to be approaching," it continues. "Surveys have recently been made on both sides of the channel, and it is asserted that the construction of the tunnel does not present any exceptional engineering difficulties. The recent falls of cliff between Dover and Folkestone have led to a modification of the original plan. When the tunnel is built its British mouth will be some miles from the coast, and a new railway to make the connection with the existing trunk lines will have to be built. The tunnel will be about 30 miles in length, and the proposal which finds most favor is that two tubes should be built and electric traction used. The cost of the scheme is now put at £20,000,000 (\$100,000,000)."

By means of the tunnel London will be put in rail communication with almost all of Europe, except Russia and Spain. It is expected, according to a recent statement by Sir Arthur Fell, M. P., chairman of the House of Commons Channel Tunnel Committee, that construction will take almost five years. Of the total length of 30 miles, 20 miles will be under water. It will be possible to traverse the tunnel in 40 minutes, and the trip from London to Paris on the best trains will require about six hours.

"The tunnel," Sir Arthur Fell said, "would run from a point near Dover to the village of Wissont, between Boulogne and Calais. The railway through it would be electrified. There would be two tubes—one for outward and one for the return journey.

"Each tube would be about 150 ft. under the sea, and it was estimated that without pressure it would be possible to transport in both directions 30,000 passengers and 30,000 tons of goods every 20 hours, leaving four hours a day for repairs, renewals, etc."

### Railway Conditions in Mexico

According to information obtained at the general offices of the Southern Pacific Railroad of Mexico, at Empalme, Mex., writes a correspondent, that road is now in regular operation between Nogales and Mazatlan. Train service will soon be re-established to the end of the line just beyond Tepic, it is stated. An enormous amount of rehabilitation work is necessary to bring the road up to the physical standard it was before the long period of revolutionary disturbances began. The company has a claim of \$12,000,000 gold for damages to its property pending against the Mexican government. Considerable quantities of steel rails are being imported from the United States for relaying stretches of track.

If the Mexican government revives its former policy of granting concessions for the construction of railroads several important projects of this character will be undertaken by American financial interests when the internal conditions here become more stable, according to advices from the City of Mexico. It is stated that an application has just been made by a syndicate of Americans and Mexicans for a government concession to construct an extensive system of railways in the northern part of Mexico. The proposed line is to follow a route closely paralleling the border between Mexico and the United States, with several branches. It is to run from Ensenada on the west coast of Lower California, to Tia Juana; thence eastward to Mexicali; thence crossing into Arizona just above the head of the Gulf of California; thence south into the state of Sonora, with branch lines to several mining districts and towns; thence eastward along the border into the state of Chihuahua to Juarez, opposite El Paso; thence southeastward to Ojinaga, opposite Presidio, Tex. The main line and branches will be more than 2,000 miles long. The National Chamber of Commerce of Mexico, with headquarters in the City of Mexico, is lending assistance to the project, and it is said that the granting of the application for the concession is practically assured.

If the Mexican government is able to put through its plans for extending the old Mexican International Railroad to the Pacific port of Mazatlan it will have accomplished something that the late Collis P. Huntington, for many years head of the Southern Pacific Railroad, was unsuccessful in

doing, the correspondent adds. Mr. Huntington's failure to carry out the project was due to the inability of expert American engineers to locate a feasible route over the rough range of Sierra Madres that mark an almost impassable barrier between the high plateau and the lowlands bordering the Pacific Ocean. He inspired and built the Mexican International from Eagle Pass, Tex., to Durango, where the rail-head remained because the way to Mazatlan was blocked by the mountains. After the Mexican International passed into government control and became a part of the National Railways of Mexico, a railroad was constructed from Durango to Llano Grande for the primary purpose of affording a transportation outlet for a large area of commercial forest that was owned by José Ives Limantour, who was at that time minister of finance of Mexico. This road is 75 miles long, and is now a part of the government railway system. According to announcement of Engineer Manuel Rodriguez Gutierrez, sub-secretary of the Department of Communications and Public Works of the Carranza government, the route for a proposed extension of the line across the mountains to Mazatlan has been located and construction is now in progress. He says that extensive improvements will also be made to the port of Mazatlan in order to accommodate the prospective increase of railroad traffic and ocean-going shipments.

### Railroad Disorganization in Russia

Lack of fuel for locomotives and lack of factories for repairing them are responsible to a considerable extent for the present condition of the railways of Russia, according to a despatch from Stockholm under date of March 20 which is given in a recent issue of Commerce Reports. At the beginning of 1917 the length of the Russian railways was 64,000 versts (42,000 miles); when the government of Kerensky fell (November, 1917), the length of railways in operation had been reduced by 19 per cent. The length of railways in operation and the usable locomotives and cars further decreased under the Bolshevik régime. In October, 1917, the length of railways was 52,000 versts (34,000 miles), the number of locomotives in working order, 15,000, and the number of cars, 520,000; in October, 1918, the length of railways in operation was 22,000 versts (15,000 miles), the number of locomotives in working order was 5,000, and the number of cars 227,000. These latter figures refer only to those portions of Russia under the control of Bolsheviks. At the end of 1918 only 4,500 locomotives were in working order and of these 1,500 are expected to become unfit for use during the current year.

In October, 1917, one locomotive was in good condition for every 3.47 versts (2.3 miles) of railway, one damaged locomotive for every 9.79 versts (6.5 miles), and 10 usable cars per verst. A year later for every 4.4 versts (2.9 miles) there was one locomotive in good condition, one locomotive damaged for every 5 versts (3.3 miles), and 10.3 cars per verst. The percentage of damaged locomotives is growing rapidly and the supply of skilled labor for repair work is decreasing. In 1916, 559 locomotives were repaired; 396 in 1917, and 80 in 1918. Even with this record, it is proposed to repair 700 to 800 in 1919; but it is doubtful whether the figures for 1918 can be exceeded.

### LACK OF FUEL AND FOOD—DEFECTS OF ADMINISTRATION

There is only 1½ months' supply of crude oil at Soromovo, one of the best railway machine works, and the other shops are beginning to use wood. The bread ration given to workmen from July to October in the three most important railway machine shops varied from 2 pounds per person per month to 26 pounds. The condition of semi-starvation partly explains the fact that out of 8,000 locomotives ordered only a few were turned out, as well as 3,500 freight cars, 30 special cars, and 170 passenger cars.

There are many reasons for the present deplorable state

of the Russian railways. The principal ones are lack of food, fuel, and iron, and added to these is the disorganization in the administration of the railways. The Supreme Council of National Economy is supposed to control all railway questions and the Commissar of Ways and Communications to conduct actual operations; but, in fact, the railways are run practically by the railway men and the railway unions, which have men of small caliber vested with great authority. These organizations, as well as private individuals, have too much to say on questions of railway management. There is no co-ordination between the central and the provincial authorities. There is no central administration, no efficient utilization of usable rolling stock, and no practical distribution system. On some small branch lines with small junctions 40 per cent of the locomotives remain idle and great numbers of cars, with supplies that are most essential for the economic life of the starving country, are sidetracked by local agents. These cars, sometimes unknown to the higher officials, often remain for six months.

### LABOR CONDITIONS—RAILROAD CRISIS IMMINENT—ATTEMPTS AT IMPROVEMENT

Discipline in labor has decreased enormously. The wages of railway mechanics and laborers are lower than those in any other lines of industry and the result is that the best technical men, specialists, etc., find more profitable work in others of the numerous institutions of the Soviet Government.

It will be seen from the conditions described that unless immediate improvement be made the entire railway traffic of Soviet Russia will be practically at a standstill in a short time.

Realizing the critical condition of railway transportation, the All-Russian Central Executive Committee recently appointed a committee representing all persons actively engaged in railway repair work and railway operations. The question of rolling-stock repairs is to be concentrated in a special department of the Supreme Council of National Economy. These measures are well meant and would accomplish something if carried into effect, but up to the present time the excellent and practical decisions of the cleverest authorities of Soviet Russia remain on paper to a considerable extent.

### Railways of Portugal in Poor Repair

Portugal has two state-owned railways, says an item in Commerce Reports, totaling 1,180 kilometers (733 miles) in length, and five privately owned lines with an aggregate trackage of 2,167 kilometers (1,314 miles). General conditions of the railroads in Portugal are bad. Owing to the war, practically no repairs have been made on the roads; part of the rolling stock had to be taken out of service and could not be replaced. Owing to the lack of coal the locomotives mostly use wood for fuel; the service is slow and many trains have had to be suppressed, as, for instance, the Sud express to Paris and the express trains to Spain and Oporto. The passenger and freight rates have been raised several times during the war, amounting on certain lines to 100 per cent over the pre-war tariff. It is expected that when normal conditions return the government and private companies will be able to improve the roads as well as replace and repair the rolling stock, thus restoring more frequent service.

Similar conditions prevail in regard to the railways in the colonies, where government construction enterprises had been provided for by large appropriations, but had to be suspended because of war contingencies.

The most important railways in the colonies are Companhia dos Caminhos de Ferro através d'África and the state-owned Mossamedes line and Malange line, all in Angola. The traffic on these roads is intensive—large quantities of colonial products being transported from the interior to

the ports—and they are able to handle only a small part of the cargo awaiting shipment. Angola could produce vast quantities of cotton, wheat, corn, cattle and all kinds of colonial products if the railway system were developed. Under the present conditions the transport of the goods from the interior is mostly by river boats and ox-carts. It is planned to connect the railway system of Angola with that of British Central Africa, and by this connection arrange communication between Portuguese West and East Africa.

#### Russian Railway Commission Sells 6,500 Tons of Rail

The Russian Railway Commission has sold to K. J. Joyce, 32 Nassau street, New York, acting for interests in China, 6,500 tons of rails and accessories which it finds it will not be possible to include in the large shipments of railway material it is now forwarding to Siberia for use by the Stevens commission. In explaining the sale, A. I. Lipetz, who heads the commission in New York, representing the Ministry of Ways Communication of the Provisional (Kerensky) government, issued the following statement:

"Upon consideration of the amount of rails stored in Vladivostok and the available space in steamers from this country to Russia, we have promised to the war department, in order to help the common allied cause, to sell all rails and accessories in excess of the amount needed to be shipped to Russia, and have allotted to the war department a considerable quantity of rails and accessories.

"After the armistice was declared the war department began to return to us unused rails, and has returned up to this time 13,100 tons of rails and accessories; we have, therefore, found it possible to dispose of about 6,500 tons of rails and accessories, which is only a part of the rails returned to us by the war department."

Discussing his statement, Mr. Lipetz also said it was the intention to sell only the rails returned by the war department and that the mission would retain all other supplies in this country in anticipation of successful rehabilitation of the railways in Russia and Siberia. He said that about 20,000 tons of rails remained in storage in Seattle and Vancouver awaiting transportation to Siberia, and that shipments are being made from this total from time to time.

Other property in this country includes about 88 locomotives of an original consignment of 110, about 4,000 freight cars and accessories, making a total weight of more than 60,000 tons and a value of more than \$12,000,000. Mr. Lipetz said that all these stores would be retained and shipped to Siberia as soon as ships were available. The United States Shipping Board has agreed to furnish ships for the transportation of these railroad materials to Siberia, as they are needed there, and three vessels have sailed from Seattle since January 1 with locomotives and accessories.

By agreement with the United States Government after the Russian revolution, Mr. Lipetz said, about 150,000 tons of rails and materials and 200 locomotives were turned over to the Allies for military use here and abroad. He added that the rails now being returned by the war department were included in this agreement.

It was the belief of the Russian Railway Mission, Mr. Lipetz said, that when all the rails had been returned there would be a surplus, because shipping would be available in the next few months only for transportation of about 50,000 tons, including the 20,000 tons of rails. If the work in Russia progressed so that more would be needed, he said, the rails could be bought in a few months at lower price. He asserted that the sale of the 6,500 tons of rails had been negotiated at a profit, the price being higher than the present price delivered at Seattle.

The money paid for the rails under the terms of the agreement, Mr. Lipetz said, would be put into the fund of the Russian Embassy in this country. It is estimated that the amount will be nearly half a million dollars.

Discussing the reasons for the sale, Mr. Lipetz denied that it was carried out because of any fear that the Bolshevik government would be recognized or that any other political change was impending. If another Russian government were recognized, he declared, the money on deposit for the Russian government in this country, as well as supplies, would revert to it immediately, so that sales of materials now would withhold nothing from the Soviet régime because the money arising from the sale was to be included in the Embassy fund here.

#### Belgian Transportation Difficulties

Wrecked factories, lack of materials, and wholly inadequate railway transportation are impeding the work of restoration in Belgium to such an extent that but little activity along this line is yet to be found in that stricken country, says Herbert Samuel, president of the Anglo-Belgian Union, writing in the Times, London. Speaking particularly of the transportation difficulties, he says:

"There are overwhelming difficulties of transport. They impede every measure of industrial revival. Through large tracts of country, railway bridges and culverts have been blown up; the signaling system has been dismantled; the Germans have carried off the connecting hose of the Westinghouse brakes, so that the trains dare not travel at more than a snail's pace; hundreds of Belgian locomotives were withdrawn behind the Army to France at the beginning of the war and have been lent to the French and American military authorities, who have not yet consented to return them; of the few that are still available, a large proportion are in a state of disrepair and continually break down. I was advised that I should find railway traveling impossible, and made my journeys entirely by motor car. On arriving at Charleroi, I was told by the manager of a bank, to whom I had a letter of introduction, that in order to return there that morning from Brussels, a distance of 35 miles, he had been obliged to start at 5.15 a. m. and had not arrived till 11. A railway manager informed me that it had recently taken some of his own officials 14 hours to reach Courtrai from Brussels, a journey of about 50 miles. Although the waterways for the most part are still available, the present condition of the railways is a severe handicap on the restoration of industry, as well as on the distribution of supplies."

#### French Railway Deficits

Some striking figures as to the three French railways were given recently in a paper read by the head of the financial department of the Paris, Lyons & Mediterranean Railway at a recent meeting of the Statistical Society in Paris. The railways selected were the State, the P. L. M. and the Midi. It appears that in 1917, out of 1,000 fr. of receipts, the expenditure on personnel amounted, respectively, to 469 fr., 216 fr. and 242 fr.; on fuel to 283 fr., 266 fr. and 234 fr. For each 1,000 fr. of receipts the State Railway spent 1,536 fr., the P. L. M. 1,134 fr., and the Midi 1,175 fr., and the deficits for 1917 were 220,500,000 fr., 94,000,000 fr. and 34,000,000 fr. The situation grew so much worse in 1918 that in April the commercial community readily agreed to the raising of the general tariff by 25 per cent. In June the "petite vitesse" tariff was raised 10 per cent. Yet in spite of this rather belated relief the total deficit for 1918 amounted to 1,000,000,000 fr., and in 1919 it is expected to be 1,200,000,000 fr. Presumably the above figures relate to the entire State railway system (i. e., the former Western as well as the earlier State lines), but in any event the State expenditures under both headings are far the highest, and their deficits are the largest. This is considered the more noteworthy, as the State system has advantages which the companies do not possess, that of being able to load its coal at the ports which it serves and being in a position to raise money at less than 2½ per cent.

What Brazil Buys and Sells

The *Railway Age* is in receipt of a booklet issued by the Brazilian Ministry of Agriculture, Industry and Commerce, entitled "What Brazil Buys and Sells." The booklet, printed in English, is intended for circulation in the United States. In its introduction it says that, "It is not an exhaustive manual of information about Brazil, its purpose being rather to place before the American reader the important facts regarding the foreign trade of Brazil, in two distinct periods, namely before and since the beginning of the great war."

The booklet gives details concerning the possibilities of trade between the United States and Brazil, practical suggestions to exporters to Brazil, and information about the country itself, in the way of area and population, finances, railways, shipping, industries, tariffs, consular invoices, etc. Very detailed figures are given concerning the imports into and exports from the country, it being the object of this data to show the possibilities of the Brazilian market.

The figures for imports of railway materials are quoted from the tables in the booklet. It will be noted that even before the war the United States had a large share of the railway supply business in Brazil. The large totals under "other countries" in 1913 refer chiefly to exports from Belgium:

26. The statement on the meeting of the commission that day said in part:

"M. Clavelle, French Minister of Public Works, reported to the Commission the protocol conveying to the representatives of the interested nations a new transportation agreement, designed to assure relations between England, France and Italy, and to secure a route to the Orient by railroad without passing through territories of the Central Empires. To this end a train de luxe, to be called the 'Simplon-Orient Express,' will be run between Paris and the Orient via Lausanne, Simplon, Milan, Venice, Trieste, Laibach, Agram and Vinkovce. At Vinkovce the road will divide, one branch connecting with Bucharest, Constance and Odessa, and the other with Belgrade, Constantinople and Athens. The train will connect at Paris with the London-Calais-Paris train and at Milan with a fast train for Rome.

"Part of this program will be put into operation commencing April 15, and the other part beginning May 1."

Proposed Railway Tunnel Under Shimonoseki Strait

The long-talked-of building of a railway under the waters of the Shimonoseki Strait is at last to be undertaken, according to the Japan Advertiser, issue of December 29, 1918, writes Consul-General George H. Seidmore, Yokohama, Japan, in Commerce Reports. The strait is at present

Figures are given in United States dollars.

Railway Repairs Necessary in Egypt

In writing in Commerce Reports on industrial conditions in Egypt, Consul Arthur Garrels, Alexandria, says concerning the railways that they are in need of rehabilitation and expresses his belief that American manufacturers should be able to get considerable of the business necessary for such work.

"The railroads of Egypt," he says, "are state-owned. The road beds, rolling stock and equipment have been taxed to the utmost during the war by the movement of troops and supplies for the various campaigns for which Egypt was the base. Not only have the wear and tear been very extensive, but a great deal of material in actual use on small side lines and sidings has been removed for the use of military lines in belligerent territory. The rehabilitation of the entire railroad system of Egypt will be one of the important works to be undertaken as a part of reconstruction in Egypt. It is believed that the United States could furnish a large proportion of the needed material and equipment, and it is suggested that preliminary correspondence be taken up with Sir George McCauley, K. C. M. G., director general of the Egyptian State Railways, Cairo, Egypt. The unsatisfactory conditions of the railways, however, will in no way hinder the adequate movement of cotton and the supply of the general demand for internal transportation."

Paris-Orient Line to Be Opened May 1

The operation of through trains between Paris and the Orient will begin over part of the line on April 15, and the whole system will be inaugurated by May 1, according to an official statement issued by the Commission on the International Regime of Ports, Waterways and Railways March

crossed by ferryboats, a method which is inconvenient and results in considerable waste of time. The ferry traffic is, moreover, subject to frequent interruption on account of storms. The railway authorities have, therefore, decided to construct a tunnel 3½ miles in length, one mile of which will be under water, by means of which the towns of Shimonoseki on the mainland and Moji on the island of Kiushu, will be connected by rail. The estimated cost of this undersea railway is 18,000,000 to 20,000,000 yen (\$8,973,000 to \$9,970,000). The work will take ten years' time and will be in charge of Dr. Tanabe, of the engineering college of the Imperial University, Kyoto.

\* \* \*

GREECE is another country whose railroads need considerable quantities of equipment and supplies to bring them up to their pre-war standard. Consul General Alexander W. Weddell, writing on trade conditions in Greece, says concerning the railroads: No new railways or extensions are now under discussion, but, without doubt, large quantities of material of all kinds will be needed for the rehabilitation of existing lines as soon as deliveries can be effected. In general, conditions of railway traffic are bad, there is a sad lack of fuel, and equipment is worn out; while, because of reduced train service and troop and supply movements, the density of traffic has increased.

\* \* \*

THE FIRST DETACHMENT of American railroad troops destined for work on the Murman Railway has arrived on the Murman coast, according to an Associated Press despatch from Archangel on March 28. Other detachments are expected to follow soon.

## What Yardmen Can Do To Save Fuel

**A**N INTERESTING BULLETIN as to the possibilities of saving fuel has been issued by A. E. West, general yardmaster of the Baltimore & Ohio Western Lines at Hamilton, Ohio, to the men under his jurisdiction. It came as a direct result of an enthusiastic employees' meeting held at Hamilton a short time before, at which the opportunities of the transportation men for saving fuel were thoroughly discussed. The bulletin covers the following points:

1. Agents should get the billing to the yards promptly so that cars coming from the industries can be properly switched and thus save re-handling from the "no bill" tracks to the train yards, and also furnish immediately re-consigning orders on all cars in order to save unnecessary switching.

2. Yard clerks should mark all cars promptly as soon as the bills are received from the agent so that the cars may be properly switched and not lined up as "no bill" cars to be switched again. If yard clerks fail to mark these cars immediately on the receipt of the billing it makes unnecessary switching.

3. Yard crews switching industries and cuts in transportation yards will not train up cars known to be "no bills," nor cars not properly marked even though they are not shown on "no bill" list, as this would cause delay to outbound trains while cars were again cut out of such train, causing loss of time and fuel to both road and yard crew engines.

4. The yard crews and the assistant yardmaster should see that the cars are not "kicked" too hard while switching as this is liable to crack or break the drawheads and the train lines, which might be overlooked by the car inspectors. This would cause a delay to both the train and yard crews in switching the defective cars out of the train and thus cause a waste of fuel.

5. When making up trains care should be taken to see that all couplings are made, and as much of the slack as possible pulled out of the train so that leaks in the train lines can be detected and repaired before the train is ready to go. If the slack is bunched in the train when the inspections are made many of the leaks will be closed and thus will not be detected before the train starts. If this is watched very closely there will be a big saving both in the delay to the train and the cost of fuel.

6. Yard conductors should tell the locomotive engineer as near as they can about the time the engines will go to the roundhouse so that the fireman will not load his firebox with green coal which will be wasted in cleaning the fires. If this is done a large saving of fuel will result.

7. The yard crews before entering upon the main track should consult the dispatcher or look at the indicator which is located at each main track switch, and be assured that they are not going to be in the way of any heavy tonnage freight trains. A large amount of fuel is wasted whenever a heavy tonnage freight train is stopped or retarded unnecessarily.

8. When a locomotive is relieved in the train yard, or when any engine is going to the roundhouse, it should be given a clear track if it is possible to do so, as every minute of delay means so many pounds of coal lost.

9. Of two trains leaving a terminal at the same time bound in the same direction, the last one should be given any cars that are to be switched out on the line. If the switching is done by the first train the second one will of necessity be delayed, which means wasted fuel.

10. It has been observed that some firemen make a habit of using a certain number of shovels of coal each time they fire. Now, if the fire is carefully watched and only the amount of coal that is actually needed is fired, at least

one shovelful of coal could be saved each time the fire is fixed.

11. Coal should be used as if it belonged to the man using it and he did not know where the next ton was coming from.

12. Everyone should seek to save fuel, and any wastage noted should at once be reported to the general yardmaster's office.

13. To co-operate means good railroading, and good railroading means the saving of fuel.

14. Everyone can do something to save fuel; let us pull together and show our superintendent and his staff that we are going to help and save coal. At the next fuel meeting I want you all to come prepared with a good answer to the question as to what are you doing to save coal.

## Experience of French Argument Against Guaranteed Incomes

**T**HE FRENCH POLICY of guaranteeing the income on railroad investments has deadened private initiative and put the railroad problem in France in the forefront of politics, and the same policy, if adopted in this country, may likely result similarly and ultimately bring about government ownership and operation. These are the conclusions reached by Frank H. Fayant, assistant to the chairman of the Association of Railway Executives, in a report which he has made public on the French railways. Mr. Fayant spent some months last year in France, where he was attached to General Pershing's headquarters.

The report follows:

The experience of France with a government guarantee of income on private capital invested in railroads is now of special interest to us because of the proposals recently made in this country for a permanent guarantee from the government when the carriers are returned to their owners.

In studying the French guarantee system these fundamental facts must be kept in mind:

(1) The guarantee of income in France is not a free guarantee, like the war control contract in the United States; it is a loan by the state to the railroad company to make up the amount needed to pay interest, minimum dividends and amortization, and must be repaid out of future earnings.

(2) The guarantee plan was adopted early in the development of the railroads to attract private capital into what was considered a more or less hazardous enterprise, and to bridge the companies over the construction period to the time when they were expected to rise above the need for any help from the state.

(3) Government ownership of all the roads comes automatically at the expiration of the concessions, from 1950 to 1960.

While the guarantee plan has been in operation in France for more than a half century, the contracts now in force date from 1883. The conventions of that year provided:

(a) Six regional monopolies, radiating from Paris.

(b) State participation in the first cost of a number of weak lines to be absorbed by the great companies, and in the construction of certain new lines.

(c) State guaranty of interest and amortization of bonded debt, and guarantee of minimum dividends and amortization of share capital; funds advanced by the state under the guarantee to be loans at 4 per cent to be repaid from future earnings or to be balanced against the rolling stock at the end of the concession, or in case of purchase by the state.

(d) Earnings in excess of the guarantee (after payment of any debt to the state) to go to the shareholders up to a certain level; two-thirds of any excess to go to the state.

(e) At the expiration of the hundred-year concessions (1950-60) the properties to revert to the state, the companies to be paid for their rolling stock and supplies.

(f) The state (after 1898) to have the option of purchasing any system by paying for the rolling stock and supplies, and by paying the company for the remaining years of the concession an annual sum equal to the average net income of the best five out of the preceding seven years.

The expectation was that, after a few years of development, during which time the state would be obliged to advance the companies' funds with which to pay charges on capital not yet yielding a profit, there would follow a period of expanding business and rising earnings that would enable the companies, first, to repay their advances from the public treasury and, later, increase their dividends to the point of profit sharing with the state. It was confidently anticipated that at the end of the concessions the six great lines, developed to the point of perfection under private ownership and operation, would automatically become the property of the state, free of all capital charges, and with such profit-making possibilities that they would provide the funds to meet a large part of the general expenses of the state.

But the results of the French guarantee system have been disappointing. There has been no profit-sharing. The Western, after 44 years' continuous appeal to the state on account of its guarantee, became so hopelessly involved in the treasury finances that the state in 1908 was compelled to exercise its purchase option. Incidentally it has become a greater burden to the treasury under state operation than it was under private operation. The Midi (Southern) in the half century prior to the war, was able in only a dozen years to meet its interest and dividends out of earnings. The Paris-Orleans, which at one time had some hopes of becoming self-supporting, was just before the war making large appeals to the treasury. The Est (Eastern) was self-supporting before the war. The Nord (Northern) and the Paris-Lyon-Méditerranée have always been prosperous and had no need of a guarantee.

State aid in the pioneer days of railroad building in France was of great assistance in providing the capital needed for these enterprises, and in bridging the companies over the early lean years, but in later years the guarantee has only served to entangle the weaker roads in politics and public finance. It has been a handicap to progress and has stunted private initiative. The spirit of the initiative is killed, and there is lowering of operating efficiency.

The war, of course, immediately upset French railway finance. The territory of the Northern and the Eastern was invaded by the enemy, hundreds of miles of line and great quantities of equipment were lost, and these two prosperous companies piled up in the next four years deficits aggregating 650,000,000 francs. The rails of the other companies were not in the war zone, and, after the first shock of war, their business expanded beyond what it had been before the war. Their annual receipts rose to 1,575,000,000 francs in 1917, as compared with 1,378,000,000 in 1913, but the great rise in operating costs absorbed all their new gross and piled up in four years 900,000,000 francs in deficits.

The effect of the war on French railway earnings is shown in the following summary, giving the figures for the prosperous year 1906, the two years immediately before the war, and the four years of the conflict:

FINANCIAL RESULTS OF THE FRENCH RAILWAYS

	Net Earnings	Charges	Deficit
1906.....	Fr. 771,000,000	722,000,000	49,000,000 (Surplus)
1912.....	731,000,000	800,000,000	69,000,000
1913.....	744,000,000	824,900,000	80,000,000
1914.....	480,000,000	846,000,000	366,000,000
1915.....	497,000,000	867,000,000	370,000,000
1916.....	505,000,000	886,000,000	381,000,000
1917.....	483,000,000	937,000,000	454,000,000

The above figures are for all roads, 5,600 miles of state railways and 18,700 miles of private lines. Taking the reports only for the five private companies, it is seen that, while in 1913 their total debt on account of advances to pay interest and dividends was 636,000,000 francs, at the end of 1917 it had reached 1,400,000,000 francs. This debt of \$270,000,000 to the State for guarantee advances is very large when it is considered that these five companies have gross earnings of less than \$350,000,000 as compared with \$5,000,000,000 for American railroads. It would be the equivalent of upward of two and a half billion dollars for the American roads.

The uneven working of the French guarantee plan before the war made the administration of the railways a continuously discussed political problem, with a constantly recurring agitation for the repurchase of the companies and their operation by the state. The opponents of state operation, of course, pointed to the failure of the state to make any success of its experiment with the Western and urged that what was demanded was not an extension of state meddling in an industry that was being better conducted by the private companies, but a modification in the light of experience of the conventions of 1883. The plight in which all the companies now find themselves, as a result of the heavy burdens of the war, has again placed the railway problem in the forefront of the domestic political questions that France must at once grapple with.

The experience of one country is seldom an unerring guide for another, because of differences in economic conditions, racial characteristics, and national traditions and ideals, but if in this country we embark on a policy of government guarantee of income on railroad investments, we must do so with our eyes open to the possibilities it invites. If the government directly guaranteed the income on private investments, how long would it be before the government assumed control of the business, especially if the private managements failed to earn the income guaranteed, and the public treasury had to make up the deficit? And would not a guarantee of this character inevitably deaden private initiative?

It is the fear of failure as well as the hope of reward that drives men to do their best: to give insurance against failure is to remove one spur to achievement. If Congress inaugurated such a partnership between the government and private capital, and a large burden eventually fell on the treasury, as has been the case in France, how long would it be before Congress would turn the whole arrangement upside down? Instead of getting the railroads out of politics, would not such a partnership inevitably drag them more deeply into the meshes of partisan struggles? In a word, would not direct guarantee of railroad income inevitably lead to government ownership and operation?

If we are to retain the advantages of private initiative, and save our transportation system and all our machinery of production from the deadening blight of political meddling, we ought to consider well the dangers involved in any proposal for a financial partnership between the railroads and the government. While, before the war our system of public control had its obvious faults, under it was developed the most perfect transportation machine in the world. The best railroads of Europe are many years behind ours in engineering development and operating efficiency. With this achievement before us, should we not attempt to correct the recognized faults in our system of regulation, and build on the sure foundation of the past, rather than enter on an era of political experimenting with new and untried policies? If we are to have a more definite guarantee that capital and brains devoted to the production of transport shall be fairly rewarded, let us find a formula that will not admit of too easy translation into government ownership.

# General News Department

W. G. McAdoo, of New York City, former director general of railroads, has been appointed special counsel to the Railroad Administration on matters arising in the state of New York, to serve without pay.

The United States Supreme Court on Monday affirmed a decision of the Court of Claims sustaining a claim of the Union Pacific for payment for the transportation of discharged, retired or furloughed soldiers, military prisoners and applicants for army enlistment at the usual rates of fare. The case arose before the period of government control. The decision holds that such men are not troops entitled to reduced rate on land grant railroads.

Clocks were changed on March 30 by the railways of Canada, to correspond with changes made by their connections in the United States, notwithstanding the decision of the Canadian Government to order no daylight saving this year. Without this change of clocks the Canadian roads would have been obliged to change schedules of trains crossing the border, and of those making important connections at the border. Reports from Ottawa say that the Government has called upon the railroads to explain.

Representatives of railroad commissions in Northwestern states have formed a committee of five to advance as rapidly as possible pending litigation seeking to establish the exclusive right of states to regulate intrastate commerce. Representatives from Iowa, Nebraska, North Dakota, South Dakota, Minnesota, Washington, Oregon and Idaho, gathered in a meeting, have adopted a resolution directing this committee to keep in touch with the progress of all litigation involving the rights of states to prescribe state rates, regulations and charges and to co-operate with all other state commissions and assist any effort of the National Association of Railroad & Public Utilities Commissioners in the prosecution of similar cases. The committee is composed of commissioners from five states: John A. Guiber, Iowa, chairman; Fred W. Putnam, Minnesota; V. E. Wilson, Nebraska; S. J. Aandahl, North Dakota, and J. J. Murphy, South Dakota.

Rates for telegrams have been increased 20 per cent. This increase in domestic commercial telegraph rates, put into effect on April 1, was made by the postmaster general over the protest of the Postal Telegraph Company. The higher rates were declared to be necessary to meet the increased cost of operation occasioned by increases in wages. The rates also apply to government telegrams, but not to press messages, although leased wires are to be charged for at an advance of 20 per cent over existing leased wire rates. Clarence H. Mackay, president of the Postal Company, declares the new rates unwarranted. He says: "The total telegraph business of the country is approximately \$80,000,000, and this 20 per cent increase ordered by Mr. Burleson means an increase of \$16,000,000 to telegraph users. If we had been allowed to keep our property and operate it we would not have thought of increasing the rates. The real fact is that Mr. Burleson has agreed to pay the Western Union more than he should have agreed to, and in order to realize that amount he has to raise the rates. A second reason is that the Western Union is not administered carefully and economically. Even now, when the government is supposed to be in control of both companies, the Western Union has a horde of solicitors running around trying to get business away from the Postal. These solicitors are as useless as would be solicitors for a street railway. What Mr. Burleson intends to do with the profits which he is taking away from us we do not know. As it is now, the Western Union is ahead of the game, but the public loses \$16,000,000 a year, and we lost about \$2,000,000 under Mr. Burleson's award to us. If Mr. Burleson will return our lines to us at once we will carry on the telegraph business at the old rates."

## Walker D. Hines Visits Chicago

Walker D. Hines, director general of railroads, and party spent Friday, March 28, in Chicago in conference with regional directors and federal managers of the Central West. On Friday evening he was the guest of the Chicago Press Club, where he repeated portions of his speech made at Pittsburgh the night before. R. H. Aishton, regional director of the Northwestern region; Hale Holden, Central Western regional director, and W. T. Tyler, director of the Division of Operation, also addressed the members of the Press Club. Mr. Hines and his party left Chicago the following day, for Atlanta.

## Y. M. C. A. Campaign

The Railroad Y. M. C. A. is planning an intensive all the year round campaign among its 300 local railway associations to bring its facilities more directly to railway men and to make the association a more important factor in the community life of railroad towns in which it is working. A "membership drive" will be inaugurated on May 18 and will extend for one week. It has been found that the war has reduced the membership in the Railroad Y. M. C. A. in America from 130,000 to 110,000 and the goal of the May drive will be to bring it up to 150,000. It is proposed that all memberships shall be made to expire on April 30 of each year. This campaign has been developed at recent conferences of association leaders in New York, Philadelphia, Atlanta, St. Louis, Chicago and other places.

## U. S. R. A. Before Ohio Courts

General Order No. 18 of the director general of railroads was held invalid as applied to state courts by Common Pleas Judge William E. Duncan, of Ohio, in over ruling a motion to dismiss the case of J. R. Eyestone, against the Cleveland, Cincinnati, Chicago & St. Louis and the Hocking Valley for \$515 personal injuries. The plaintiff lives in Wyandot county, where the cause of action arose, but suit was brought in Hancock county. The railroad attorneys cited General Order 18, requiring all suits against carriers while under federal control to be brought in the county or district where the plaintiff resided, or in the county or district where the cause arose. The court held the order invalid as applied to state courts for the reason that its effect would be to suspend operation of a section of the Ohio general code fixing the territorial jurisdiction of the court of common pleas of Ohio and specifying that an action against the railroad company owning or operating a railroad within this state may be brought in any county through or into which such railroad extends. The fact that the accident occurred in 1917, prior to the government taking over the railroads, is believed to have influenced the decision.

## State May Purchase Colorado Midland

To prevent the Colorado Midland from being scrapped the government of the State of Colorado is contemplating the purchase of the property. This road traverses the central part of the state, and its principal competitor is the Denver & Rio Grande. Two years ago it was bought at foreclosure for \$1,450,000 by interests representing the Porphyry Copper Companies, terminating a receivership. By a system of through routing between eastern and western points, the business of the road had been built up to a point where it was earning a small profit. When the Railroad Administration assumed charge the traffic was diverted to the Denver & Rio Grande with the result that the small monthly profit which the road had been earning was transformed to a deficit which amounted to \$750,000 in six months. Upon relinquishment of control by the Government, the copper men, who had invested approximately \$2,000,000, started to scrap it as the through business was gone and nothing remained but unprofitable local business.

A bill for the operation of the Denver & Salt Lake (Moffat road) by the state and construction of the James peak tunnel has been passed by the Colorado House of Representatives by vote of 31 to 30.

### Conference of Tie Producers

A meeting of the regional vice presidents comprising the board of directors of the National Association of Tie Producers met at the Planters' Hotel, St. Louis, last week, to receive reports from the different tie producing regions and to consider conditions confronting the industry. The Railroad Administration's lack of money is already having its effect upon tie production. Some roads are said to be adopting a policy of forcing loans from the larger tie producers while giving preference to producers who are less able to carry an account. It is felt that the Railroad Administration thus discredits its declaration, made earlier in the year, that large and small producers would be treated alike.

Considerable interest was expressed in the outlook for an export demand for cross ties, some of the producers showing much concern about the inquiry which is now out for 10,000,000 cross ties for British and French railroads. One member of the board of directors of the Tie Producers' Association has also received an inquiry for 2,000,000 ties for export to Italy.

A resolution was adopted authorizing the president of the Association to appoint a committee to confer with the Railroad Administration at Washington.

### Valuation Progress

In a statement issued under date of March 11, by Frederick H. Lee, secretary of the Presidents' Conference Committee on the Federal Valuation of the Railroads, there are published abstracts from statements made by Director C. A. Prouty before the Appropriation committee of the House of Representatives on February 3, 1919. In this statement Director Prouty said that the road and track parties in all districts will substantially complete their work this year and that four parties have already been disbanded in the Pacific district and five in the Southern district. The land and the field accounting work will be completed in about two years, while the office work will be completed in about three years.

The complete engineering, accounting and land reports for the Boston & Maine system have been received, while the director stated that similar reports had been completed for the Rock Island. It is estimated that the division will receive completed reports from the engineering section on 50,000 miles of road during 1919, similar reports having been received on 25,000 miles of road up to January 1 of this year. The inventory of the Western Union properties has been practically completed while the most important part of the inventory of the Postal Telegraph properties will be completed in about six months. Work is just about to begin on the properties of the American Telephone & Telegraph Company. Up to December 31, 1918, \$13,706,197 had been expended by the Federal Valuation Department, of which \$13,206,831 had been expended on the valuation of the railroads. The Commission has authorized the appointment of about 1,525 men and the average force of the Division of Valuation during 1918 was about 1,325 men.

### Preparations for Railroad Legislation

Representative John J. Esch, the next chairman of the House Committee on Interstate and Foreign Commerce is making preparations for beginning active consideration of proposed railroad legislation as soon as Congress is called in extra session, which it is now believed in many quarters will be by June 1. Mr. Esch's views, in a general way, correspond to the plan suggested by the Interstate Commerce Commission before the Senate Committee. He wants the roads returned to their owners as soon as legislation can be provided and he has also discussed the idea of including legislation for the future regulation of telegraph and telephone lines and of motor truck freight routes. He proposes to hold a series of hearings.

Representatives of the organized railroad employees,

headed by the officers of the train service brotherhoods and of the Railroad Department of the American Federation of Labor, who have joined hands, are planning an active campaign to exert their influence on the proposed legislation and it is reported that headquarters will shortly be opened in Washington for the purpose of carrying on their propaganda under the direction of Glenn E. Plumb, counsel for the brotherhoods. A bill to carry out the provisions of the so-called Plumb plan of government ownership is being drafted and will be supported by the organizations, but it is understood that if congressional sentiment against government ownership appears too strong they will demand, as a minimum, representation for labor on the Interstate Commerce Commission or whatever body is put in control of the railroads.

### Organization of the American Welding Society

The first meeting of the American Welding Society was held on March 2, 1919, at the Engineering Societies building, 33 West 39th street, New York, and the constitution and by-laws were adopted as recommended by the Organization Committee. The outline of the organization, its aims and activities, and the qualification requirements for members were published in the March 14, 1919, issue of the *Railway Age*. The following officers were elected:

President—C. A. Adams, President American Institute of Electrical Engineers, Cambridge, Mass.  
 Vice-President (for 1 year)—J. M. Moorehead, Union Carbide Company, New York.  
 Vice-President (for 2 years)—G. L. Brunner, Brunner Manufacturing Company, Utica, N. Y.  
 Directors for 1 year—  
 W. M. Beard, Linde Air Products Company, New York.  
 M. H. Roberts, Air Reduction Sales Company, New York.  
 M. M. Smith, Commercial Acetylene Company, New York.  
 L. D. Lovckin, American International Ship Building Corp., Philadelphia, Pa.  
 Alexander Churchward, Wilson Welders and Metal Company, New York.  
 W. H. Patterson, Westinghouse Electric & Mfg. Company, Pittsburgh, Pa.  
 Walter J. Jones, Chester Shipbuilding Company, Philadelphia, Pa.  
 C. A. McCune, Page Steel & Wire Company, New York.  
 Directors for 2 years—  
 R. R. Browning, Oxweld Acetylene Company, New York.  
 A. S. Kinsey, Professor of Experimental Mechanics, Stevens Institute, New Jersey, N. J.  
 Victor Mauck, John Wood Manufacturing Company, Conshohocken, Pa.  
 E. L. Hirt, Bethlehem Shipbuilding Corporation, South Bethlehem, Pa.  
 J. F. Lincoln, Lincoln Electric Company, Cleveland, Ohio.  
 H. M. Hobart, General Electric Company, Schenectady, N. Y.  
 D. C. Alexander, Quasi Arc Weldrode Company, New York.  
 H. R. Swatley, Jr., Davis-Bourdonville Company, Jersey City, N. J.  
 Directors for 3 years—  
 L. H. Davis, Linde Air Products Company, New York.  
 E. L. Mills, Air Reduction Sales Company, New York.  
 D. B. Rushmore, General Electric Company, Schenectady, N. Y.  
 James Burke, Burke Electric Company, Erie, Pa.  
 H. H. Wilson, Jr., Wilson Welders & Metal Company, New York.  
 Hermann Letmy, General Electric Company, Erie, Pa.  
 C. J. Nyquist, Torchweld Company, Chicago, Ill.  
 Alexander Jenkins, Alexander Milburn Company, Baltimore, Md.

It was voted that the charter should be held open for ten days, and that those applying for membership in the American Welding Society before April 8 should be considered charter members.

At a meeting of the directors in the afternoon, W. E. Symons, Galena Signal Oil Company, Franklin, Pa., was appointed treasurer, and H. C. Forbes, consulting engineer, New York City, was appointed secretary.

### American Gear Manufacturers' Association

The annual convention of the American Gear Manufacturers' Association will be held at the Hotel Statler, Cleveland, Ohio, April 14, 15 and 16.

The organization includes in its membership representative companies engaged in making gears in the United States and Canada. For some years past it has been striving to effect an organization that would develop definite means for standardizing products. The coming convention will center its attention on this problem.

Papers will be presented as follows:

- (1) "Gear Steels," by Dr. Parker, of the Carpenter Steel Company.
- (2) "Proper Sizes and Materials for Gears."
- (3) "Worms and Worm Wheels," by a representative of the Timken-Detroit Axle Company.

Officers of the association are: President, F. W. Sinram, of the Van Dorn & Dutton Company, Cleveland, Ohio; vice-

president, H. E. Eberhardt, of the Newark Gear Cutting Machine Company, Newark, N. J.; secretary, Frank D. Hamlin, of the Earle Gear & Machine Company, Philadelphia, Pa., and treasurer, Frank Horsburgh, of the Horsburgh & Scott Company, Cleveland, Ohio.

### American Foundrymen's Association

The 1919 convention and exhibit of the American Foundrymen's Association will be held in Philadelphia, Pa., from September 29 to October 4. It is planned to make this convention an international one and invitations will be sent to foundrymen and industrial engineers all over the world. Details of the program will be announced later.

### Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

**AIR BRAKE ASSOCIATION.**—F. M. Nellis, 165 Broadway, New York City. Next convention, May 6-8, 1919, Chicago.

**AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.**—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

**AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.**—E. H. Thayer, St. Louis-San Francisco R. R., St. Louis, Mo.

**AMERICAN ASSOCIATION OF FREIGHT AGENTS.**—R. O. Wells, Illinois Central, Chicago.

**AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.**—J. E. Quick, Port Huron, Mich.

**AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.**—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

**AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.**—J. Rothschild, Union Station, St. Louis, Mo.

**AMERICAN ELECTRIC RAILWAY ASSOCIATION.**—E. B. Buttritt, 8 W. 40th St., New York.

**AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.**—F. C. J. Dell, 50 E. 42nd St., New York.

**AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.**—Otto E. Schluck, 485 W. 5th St., Peru, Ind.

**AMERICAN RAILROAD ASSOCIATION.**—J. E. Fairbanks, 75 Church St., New York.

**Operating Section** (including former activities of Association of Railway Telegraph Superintendents and Railway Storekeepers' Association).

**Engineering Section** (including former activities of Railway Signal Association).

**Mechanical Section** (including former activities of Master Car Builders' and Master Mechanics' Association).

**Traffic Section** (including former activities of Freight Claim Association).

**Transportation Section** (including former activities of Association of Transportation and Car Accounting Officers).

**AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.**—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Austin Station, Chicago. Next convention, October 21-23, 1919, Cleveland, O.

**AMERICAN RAILWAY ENGINEERING ASSOCIATION.**—E. H. Fritch, 910 Michigan Ave., Chicago.

**AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION** (see American Railroad Association, Mechanical Section).—Acting Secretary, V. R. Hawthorne, 735 Transportation Bldg., Chicago. Next annual convention, June 23-25, 1919, Atlantic City, N. J.

**AMERICAN RAILWAY PERISHABLE FREIGHT ASSOCIATION.**—E. F. McPike, 135 E. 11th Place, Chicago. Regular meetings, 2d Wednesday in March and September.

**AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—R. D. Fletcher, 6202 Greenwood Ave., Chicago.

**AMERICAN SOCIETY FOR TESTING MATERIALS.**—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Next meeting, June, 1919, Atlantic City, N. J.

**AMERICAN SOCIETY OF CIVIL ENGINEERS.**—Charles W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

**AMERICAN SOCIETY OF MECHANICAL ENGINEERS.**—Calvin W. Rice, 29 W. 39th St., New York.

**AMERICAN SHORT LINE RAILROAD ASSOCIATION.**—T. F. Whittelsey, 708 Union Trust Bldg., Washington, D. C.

**AMERICAN TRAIN DESPATCHERS' ASSOCIATION.**—D. L. Darling, Northern Pacific Ry., Spokane, Wash. Next convention, June 17-20, Hotel La Salle, Chicago.

**AMERICAN WARDEN AND WARDEN'S ASSOCIATION.**—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md.

**ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.**—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.

**ASSOCIATION OF RAILWAY CLAIM AGENTS.**—Willis H. Failing, C. C. R. R. of N. J., Jersey City, N. J.

**ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.**—Jos. A. Andreucetti, C. & N. W., Room 411 C. & N. W. Sta., Chicago. Next meeting, October, 1919, Chicago.

**ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS** (see American Railroad Association, Operating Section).—W. L. Connelly, N. Y. C. R. R., Gibson, Ind.

**ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS** (see American Railroad Association, Transportation Section).—G. P. Conard, 75 Church St., New York.

**BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.**—M. J. Trece, Chicago Bridge & Iron Company, Chicago. Next annual convention, October 21-23, 1919, Cleveland, O.

**CANADIAN RAILWAY CLUB.**—James Powell, 46 Aberdeen Ave., St. Lambert (near Montreal), Que. Next meeting, 2d Tuesday in May, 1919, Windsor Hotel, Montreal, Que.

**CAR FOREMEN'S ASSOCIATION OF CHICAGO.**—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

**CENTRAL RAILWAY CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November, and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.**—W. R. McMurry, New York Central, New York, Va.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.**—D. B. Wright, Lehon Company, 45th and Oakley Sts., Chicago.

**EASTERN RAILROAD ASSOCIATION.**—D. G. Stuart, Washington, D. C. Next annual meeting, May 8, 1919, Railroad Club, New York.

**FREIGHT CLAIM ASSOCIATION** (see American Railroad Association, Traffic Section).—Lewis Pilcher, R. F. & P., Richmond, Va.

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—A. L. Woodworth, B. & O., Lima, O.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. C. Crawford, 702 E. 51st St., Chicago. Next meeting, May 19-22, 1919, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hail, 1061 W. Wabasha Ave., Winona, Minn.

**MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION.**—F. W. Hager, 1323 Hurley Ave., Ft. Worth, Tex. Next annual convention, October 21-23, 1919, St. Louis, Mo.

**MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York. Next meeting, May 26-29, 1919, Hotel Sherman, Chicago.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.**—A. P. Daine, B. & M., Reading, Mass. Next meeting, September, 1919, Chicago.

**MASTER CAR BLOKERS' ASSOCIATION** (see American Railroad Association, Mechanical Section).—Acting Secretary, V. R. Hawthorne, 746 Transportation Bldg., Chicago. Next annual meeting, June 18-21, Atlantic City, N. J.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES' COMMISSIONERS.**—James B. Walker, 49 Lafayette St., New York. Next annual convention, October 14, 1919, Indianapolis, Ind.

**NATIONAL FOREIGN TRADE COUNCIL.**—O. K. Davis, 1 Hanover Square, New York. Next convention, April 24-26, Congress Hotel, Chicago.

**NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago.

**NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

**NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

**NIAGARA FRONTIER CAR MEN'S ASSOCIATION.**—George A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Regular meetings, 3d Tuesday in each month, Tenjost Hall, Buffalo, N. Y.

**PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal.

**RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson, 1116 Woodward Bldg., Washington, D. C. Next annual meeting, June 11, 1919, Hotel Commodore, New York.

**RAILWAY BUSINESS ASSOCIATION.**—Frank W. Noxon, 30 Church St., New York.

**RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month except June, July and August, Colonial Annex Hotel, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION.**—D. C. Welty, Missouri Pacific R. R., St. Louis, Mo.

**RAILWAY ELECTRIC SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

**RAILWAY FIRE PROTECTION ASSOCIATION.**—G. L. Ball, St. Louis-San Francisco Ry., St. Louis, Mo.

**RAILWAY REAL ESTATE ASSOCIATION.**—James P. Nelson, President, C. & O., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION** (see American Railroad Association, Engineering Section).—H. S. Ballitt, Asst. Terminal Manager, Grand Central Terminal, New York. Stated meeting, on Monday, before 3d Tuesday in March, Chicago.

**RAILWAY STOREKEEPERS' ASSOCIATION.**—J. P. Murphy, N. Y. C. R. R., Box C, Collinwood, Ohio.

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Next annual meeting, June 18-25, 1919, Atlantic City, N. J.

**RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 16-18, 1919, Chicago.

**ST. LOUIS RAILWAY CLUB.**—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, West Nyack, Rockland County, New York.

**SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, Western Ry., of Ala., Atlanta, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.

**TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Next annual convention, September 16-18, 1919, Auditorium Hotel, Chicago.

**TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, N. Y. C. R. R., Cleveland, O. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

**WESTERN ASSOCIATION OF SHORT LINE RAILROADS.**—Clarence M. Oddie, Mills Bldg., San Francisco.

**WESTERN RAILWAY CLUB.**—A. F. Steubing, 750 Transportation Bldg., Chicago. Regular meetings 3d Monday in month, except June, July and August.

**WESTERN SOCIETY OF ENGINEERS.**—Edgar S. Nethercut, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except July and August.

## Traffic News

Territorial and district freight traffic committees will hereafter make monthly reports to Washington of the subjects which they have on their dockets.

A traffic association has been organized in connection with the Massillon (Ohio) Chamber of Commerce. The president is S. S. Swaney; secretary, M. L. Underwood.

A bill has been introduced in the Illinois legislature to give railroads the right to grant transportation privileges in exchange for advertising space in newspapers or magazines.

Export rates on cotton via the Pacific coast ports will not be reduced below the basis established by the last 15 per cent increase. A delegation of representatives of the coast cities asked the Railroad Administration to establish a lower rate but was told that the 15 per cent increase must be maintained.

With the reopening of the season of lake navigation the Railroad Administration has announced its decision to establish differential freight rates by lake and rail. Compared with the pre-war situation the differentials will be somewhat smaller and the territories of origin and destination somewhat modified.

Manufacturers of Illinois represented by the Illinois District Traffic League and the Illinois Manufacturers' Association are planning to contest any attempt of the Railroad Administration to take control of Illinois intrastate freight rates from the Public Utilities Commission. The controversy has grown out of the complaint of Indiana shippers regarding Illinois intrastate rates. Thomas E. Demcy, chairman of the Public Utilities Commission has asked that the Illinois shippers be heard by the Western Freight Traffic Committee before any action is taken to put in effect, in Illinois, Central Freight Association class rates and official classifications.

At the annual election of the Traffic Club of Chicago, held in the club rooms on March 25, Carl Howe, traffic manager of the Michigan Central, was elected president; E. L. Dalton, traffic manager of Montgomery Ward & Co., first vice-president; William Gourlay, general agent of the American Railway Express Company, second vice-president; Captain A. Fletcher Marsh, secretary of the Marsh & Truman Lumber Company, third vice-president; C. B. Singer, freight representative of the Nickel Plate of Chicago, secretary; and J. F. Coykendall, federal treasurer of the Chicago Great Western, treasurer. The directors elected for two years were J. H. Brinkerhoff, terminal manager of the Chicago District; C. G. Burnham, federal manager of the Chicago, Burlington & Quincy; Charles Deitrich, freight claim agent of the Chicago, Milwaukee & St. Paul; Robert C. Ross, traffic manager of Joseph T. Ryerson & Sons; and Luther M. Walters, commerce counsel for Morris & Co.

### Ohio State Industrial Traffic League

The Ohio State Industrial Traffic League was permanently organized at Columbus, Ohio, on March 24. A temporary organization was created several months ago for the purpose of considering interstate transportation problems until a permanent organization could be perfected. The officers of the new organization are: President, F. H. Baer, traffic commissioner of the Cleveland Chamber of Commerce; first vice-president, Guy L. Cory, manager of the Springfield Traffic Association; second vice-president, H. D. Rhodehouse, traffic commissioner of the Youngstown Chamber of Commerce; secretary, J. G. Young, traffic commissioner of the Columbus Chamber of Commerce; treasurer, L. G. Macomber, traffic commissioner of the Toledo Commerce Club.

**POINTS FOR THE YARDMASTER.**—If you are not an operator at least learn the office call; this will enable you to know when to tell your operator to get busy. \* \* \* See that your clerks keep the office in a thoroughly clean and neat condition; desks and drawers should be entirely free from books and papers that are of no current interest. File closed records and papers methodically in a convenient place, but out of the way, and do not allow useless junk to accumulate.—*H. D. McKee.*

## Commission and Court News

### United States Supreme Court

#### Taxation of Leasehold Interests

The Supreme Court of the United States has reversed the judgment of the Supreme Court of Georgia, refusing an injunction sought by the Central of Georgia against the collection of certain taxes upon the leasehold interests in the roads leased from the Augusta & Savannah and the Southwestern, which by the charters of the lessors were to be taxed only in a certain way and to a certain amount. The leases were for 101 years, renewable in like periods on the same terms forever. It was argued that if the leases produce a profit in excess of the rental the value is required by the state Constitution to be taxed. But the United States Supreme Court holds that the Constitution, being subsequent to the charters that created the exemption, must yield to them if they apply to the present attempt. The court adopted the reasoning in the case of *Wright v. Central of Georgia*, 236 U. S. 674, where an attempt to tax the real estate, roadbed and franchise value of the two lessors was held unconstitutional. *Central of Georgia v. Wright*. Decided February 3, 1919.

#### Necessity for Notice of Claim for Damage to Live Stock

In an action for damages sustained en route by cattle carried from St. Louis, Mo., to Georgetown, Ky., the railroad in defense set up non-compliance with a provision in the bill of lading requiring claims to be made in writing, verified by affidavit, to the company's general freight agent at Cincinnati. This averment was not denied; but the shipper replied that he promptly advised the agent at Georgetown of all essential facts and maintained that the requirement in respect of written notice to the general freight agent had been waived. The Kentucky Court of Appeals affirmed judgment for the shipper.

The point involved has been discussed in recent opinions of the United States Supreme Court and it finds nothing which takes this case out of the rule requiring compliance with a provision in a bill of lading like this. (*St. L. M. & So. v. Starbird*, 243 U. S. 592; *Southern Pacific v. Stewart*, decided January 13, 1919). The judgment below was therefore reversed. *B. & O. v. Leach*. Decided March 10, 1919.

#### State Taxation of Interstate Commerce Cars

The Supreme Court of the United States, in an appeal by a tank line from tax assessments in Georgia, was called upon to consider the power of a state to lay and collect taxes upon instrumentalities of interstate commerce.

The Union Tank Line has never carried on business or had an office in Georgia. It owns 12,000 oil tank cars, which it rents to shippers. The roads over which the cars move also pay therefor stipulated compensation. Under contract the Standard Oil Company of Kentucky ran certain of these cars into Georgia. They were not permanently within that state, but passed "in and out." The Tank Line for 1913 made a tax return of an average of 57 cars in the state during the year, at a value of \$47,310. The Comptroller General assessed the company's property for the year at \$291,196. The company contested the validity of the assessment. The trial court adjudged the assessment good. The Supreme Court has now reversed that judgment for the following reasons:

A state may not tax property belonging to a foreign corporation which has never come within its borders—to do so under any formula would violate the due process clause of the Fourteenth Amendment. Insofar, however, as movables are regularly and habitually used and employed therein, they may be taxed by the state according to their fair value along with other property subject to its jurisdiction, although devoted to interstate commerce. While the valuation must be just it need not be limited to mere worth of the articles considered separately, but may include as well "the intangible

value due to what we have called the organic relation of the property in the state to the whole system." How to appraise them fairly when the tangibles constitute part of a going concern operating in many states often presents grave difficulties; and absolute accuracy is generally impossible. The Supreme Court has accordingly sustained methods of appraisal producing results approximately correct—for example, the mileage basis in case of a telegraph company, and the average amount of property habitually brought in and carried out by a car company. But if the plan pursued is arbitrary and the consequent valuation grossly excessive it must be condemned because of conflict with the commerce clause or the Fourteenth Amendment or both.

In the present case the Comptroller General made no effort to assess according to real value or otherwise than upon the ratio which miles of railroad in Georgia over which the cars moved bore to total mileage so traversed in all states. Real values—the essential aim—of property within a state, cannot, it is held, be ascertained with even approximate accuracy by such process; the rule adopted has no necessary relation thereto. During a year two or three cars might pass over every mile of railroad in one state while hundreds constantly employed in another moved over lines of less total length. The court considered the company's property was appraised according to an arbitrary method which produced results wholly unreasonable, and that to permit the enforcement of the proposed tax would deprive it of property without due process of law and also unduly burden interstate commerce. Justices Pitney, Brandeis and Clarke dissented. *Union Tank Line vs. Wright*. Decided March 24, 1919.

**Terminals and Hours of Service Act**

The Supreme Court of the United States holds that an independent freight terminal may be a common carrier and subject to the Hours of Service Act.

In proceedings in the Federal District Court for the Eastern District of New York against the Brooklyn Eastern District Terminal for alleged violation of the Hours of Service Act, the defendant contended that it was not a common carrier; that it was not engaged in interstate commerce by railroad; and that its employees were not "connected with the movement of any train." Upon facts which were agreed the trial court entered judgment for the Government. The Circuit Court of Appeals reversed the judgment on the ground that, while the Terminal was engaged in interstate commerce and the employment in question was connected with the movement of trains, it was not a common carrier. (239. Fed. 287.)

The substantial question before the Supreme Court was whether the Terminal was within the scope of the act, as being a common carrier. The court held that it was. In no respect does the service actually performed by the Terminal for or in respect to shippers differ from that performed by the railroad companies at their other stations. True, the service is performed by the Terminal under contracts with the railroad companies as agent for them and not on its own account. But a common carrier does not cease to be such merely because the services which it renders to the public are performed as agent for another. The relation of connecting carriers with the initial carrier is frequently that of agent. The relation of agency may preclude contractual obligations to the shippers, but it cannot change the obligations of the carrier concerning the physical operation of the railroad under the Hours of Service Act, which as the Supreme Court has said, must be liberally construed to secure the safety of employees and the public. (*A., T. & S. F. v. U. S.*, 244 U. S., 336.)

It is now admitted that the Terminal is engaged in interstate commerce; and it is held clear that at least "switching crews" engaged in moving at one time a locomotive with seven or eight cars between the docks and the warehouses or team tracks, a distance of nearly a mile, are engaged in the movement of a "train." Those decisions under the Safety Appliance Acts, which do not support this view, depend upon the particular context in which the word "train" there occurs, and are held not applicable here. *United States v. Brooklyn Eastern District Terminal*. Decided March 24, 1919.

**Equipment and Supplies**

**Certificates of Indebtedness to Supply Companies**

A telephone message from Washington, just as we are going to press, advises that Director General Hines has entered into an agreement with the equipment companies to issue certificates of indebtedness similar to those issued to the railroads and for the amounts now due. It is understood that these certificates may be used as collateral on loans from the banks.

**Standard Locomotive Deliveries for Week Ended March 22**

The following new locomotives were shipped to railroads under federal control during the week ended March 22:

Works	Road	Number	Type
American	A. C. L.	4	USRA Pacific
	C. of G.	2	Mallet
	C. & Nw.	4	USRA 6W. Sw.
	C. & Nw.	1	Mikado
	C. St. P. M. & O.	4	USRA Mikado
	Erie R. R.	5	USRA St. Fe
	G. N.	4	USRA Mikado
	Penn. L. W.	3	Santa Fe
	Penn. L. W.	7	USRA S. Fe
	T. & P.	4	USRA 6W. Sw.
		<hr/> 38	
Lima	L. & N.	1	USRA Mikado
		<hr/> 1	
Baldwin	C. B. & O.	3	Mikado
	P. & L. E.	6	USRA Mikado
	Ill. Cent.	1	Mikado
	P. R. R.	1	Mikado
	P. & R.	1	Mallet
	A. T. & S. Fe.	1	Mikado
	G. N.	2	SW. Sw.
	C. C. & O.	1	Mikado Pacific
		<hr/> 17	
Total		<hr/> 56	

**Standard Car Deliveries to March 22**

The following new standard cars were accepted during the week ended March 22:

Road	Number	Type	Manufacturer	Total accepted for given roads
C. C. & O.	38	50 Ton S. S. Box	Bettendorf Co.	162
N. Y. C.	83	50 Ton S. S. Box	Haskell & Barker	1,000
Sou. Pac.	49	50 Ton S. S. Box	Haskell & Barker	49
N. & W.	364	50 Ton S. S. Box	Pullman Car Co.	400
L. & N.	21	50 Ton Comp. Gon.	Am. Car & Fdy. Co.	150
N. Y. C.	98	70 Ton L. S. Gon.	Pressed St. Car Co.	443
Total	653			

**Locomotives**

THE SOUTH MANCHURIAN RAILWAYS have ordered 26 Decapod locomotives from the American Locomotive Company. These locomotives will have 23 by 28 in. cylinders, and a total weight in working order of 202,000 lb.

THE KAIJAMA MINING COMPANY, China, has ordered two 6-wheel switching locomotives from the American Locomotive Company. These locomotives will have 12 by 18 in. cylinders, and a total weight in working order of 60,000 lb.

**Freight Cars**

THE WORTHINGTON PUMP & MACHINERY CORPORATION, Cudahy, Wis., is inquiring for 25 scoop ore cars.

**Passenger Cars**

THE CANADIAN NATIONAL RAILWAYS are inquiring for a private car.

## Supply Trade News

The American Blower Company, Detroit, Mich., has purchased a plot of ground containing approximately 15 acres upon which it intends to build a new plant. Plans are now being prepared for the construction of a foundry upon which work will be started in the near future.

Frederick G. Zimmerman, assistant secretary of Harry Vissering & Company and the Okadec Company of Chicago, has been appointed secretary, to succeed Marshall E. Keig, who has resigned to accept the office of assistant to the president of the Consumers Company at Chicago.

Frank Walsh Haskell, president of the Carborundum Company, Niagara Falls, New York, died April 2 at his winter home at Daytona, Fla. Mr. Haskell was born in Brooklyn, New York, in 1861, and was educated in the schools there and in Bloomfield, N. J. He was for a time in railroad service as a rodman in the engineer corps, which laid out the Chicago, St. Paul, Minneapolis & Omaha. In 1885 he moved to Pittsburgh and there affiliated himself with Henry C. Frick as secretary and treasurer of the Southwest Connelville Coke Company, owned jointly by the Frick and Illinois Steel Companies. In 1897 he moved to Niagara Falls, representing the Mellon interests of Pittsburgh, and becoming president of the Carborundum Company, then in its infancy. This company under his leadership became the greatest abrasive manufacturing concern in the world. It is not generally known that at the request of H. C. Frick and E. H. Harriman in 1905 Mr. Haskell made the investigation of the Equitable Life Assurance Society, which later brought before the public the disclosure resulting in the entire change in the method of life insurance business in the United States. The Armstrong and Hughes Investigating Committees, so-called, were the subsequent results, their facts being largely based on Mr. Haskell's masterly accomplishment.

The Chicago Pneumatic Tool Company has discontinued its branch office at Wichita, Kan., and has transferred the stock from that place to Eldorado, Kan., where an office and warehouse have been established. A new office has also been opened by the company at Tulsa, Okla.

The Firth Sterling Steel Company, McKeesport, Pa., announces the removal of its New York and Boston warehouses to new quarters. The New York warehouse will henceforth be at 310 Hudson street and the Boston warehouse at 35 Oliver street. The latter was previously occupied by the company from 1873 to 1914.

I. H. Cohn, formerly of the National Steel Rail Company, has become associated with the Standard Rail & Steel Company, St. Louis, Mo., and will be in complete charge of the rail department, handling all matters relative to relaying rails and railroad equipment. The company's plant of 15 acres in Madison, Ill., is now nearing completion.

Lieut. Joseph P. Schneider, who for the past nine months has been on duty with the Railway Transportation Corps, U. S. A., as railway transportation officer with headquarters at Paris, France, has received his honorable release from the

service and has resumed his duties as Western office assistant with the Locomotive Superheater Company at Chicago.

C. F. Massey, president of the Massey Concrete Products Corporation, Chicago, has been elected chairman of the Board of Directors of that company, and J. S. Hobson, western manager of the Union Switch & Signal Company, at Chicago, has been elected president of the Massey Concrete Products Corporation, to succeed Mr. Massey. Mr. Hobson will retain his position with the Union Switch & Signal Company.

Samuel T. Fulton, vice-president of the Railway Steel Spring Company, died in New York, March 29, at the age of 52 years. He was born in Topeka, Kan., and spent many years in railroad service in the west, becoming assistant to the president of the Chicago, Rock Island & Pacific Railroad in 1904. He resigned in 1909 to become associated with the Railway Steel Spring Company.

Lieut.-Colonel Merrill G. Baker has been elected president of the American International Steel Corporation, effective April 1. Colonel Baker was formerly assistant manager of sales of the Cambria Steel Company and has been for many years one of J. Leonard Replogle's right hand men. He succeeds the late Edward M. Hagar, who died over a year ago. The American International Steel Corporation is a subsidiary of the American International Corporation.

The Onondaga Steel Company, Inc., Syracuse, N. Y., announces the addition to its board of directors of Morton D. Whitford, treasurer of the Semet-Solvay Company, and Charles H. Canfield, general auditor of the Onondaga Steel Company. The company is planning to remove its offices and remaining furnace and melting equipment this spring from its original plant in Syracuse to a large tract of land recently acquired at Eastwood on the outskirts of Syracuse, and plans have been made for the immediate construction of a large temporary office building and an addition to the main building, 40 ft. by 40 ft., which will house the blacksmith shop and the small hammer shop.

### Elected President of Westinghouse Air Brake Co.

At the annual meeting of the stockholders of the Westinghouse Air Brake Company, held Monday at the general office of the company in Wilmerding, Pa., A. L. Humphrey, who has been vice-president and general manager of the company since 1909, was elected president, succeeding John F. Miller. This action was taken at the solicitation of Mr. Miller, who after a service of thirty years, during which period he rose from the position of real estate agent for the company to its highest executive office, is desirous of being relieved of some of the active duties in the management of the air brake interests. He will remain, however, a member of the board of directors of the company and hold the position of vice-chairman of the board, with H. H. Westinghouse as chairman.

Mr. Humphrey has been connected with the Westinghouse Air Brake Company since 1903 when he was appointed western manager with headquarters at Chicago. He was born in Buffalo, New York, and his family moved to Iowa when he was less than a year old. At the age of 14 after the usual amount of country schooling he struck out for himself and engaged in various occupations. At the age of 22 he organized a general machine shop and foundry in Seattle which afterwards became the present Moran Iron Works. He then entered railroad service and became constructing division foreman of the Mojave division of the Cen-

F. W. Haskell

A. L. Humphrey

tral Pacific, then master mechanic and later superintendent of motive power of the Colorado Midland. At about this time he took an active part in politics and was twice elected to the Colorado House of Representatives and during his second term served as speaker of the House. He then went back to railroad service on the Colorado & Southern in 1899 and went to the Chicago & Alton in 1903 as superintendent of motive power, soon after which he was appointed western manager of the Westinghouse Air Brake Company at Chicago. He went to Pittsburgh in 1905 as general manager of the air brake works, and was elected a director of the company in 1909 when he was also given the dual position of vice-president and general manager, which he has held ever since. When the Union Switch & Signal Company was taken over by the air brake company in 1916, Mr. Humphrey was also elected president of that corporation. In addition he has been active in an executive capacity in all the other interests associated with the Westinghouse Air Brake Company, such as the Locomotive Stoker Company, Pittsburgh; the National Brake and Electric Company, Milwaukee; the American Brake Company, St. Louis, and the Westinghouse Pacific Coast Brake Company, San Francisco.

During the war the companies of which Mr. Humphrey is in charge accepted from the British and Russian governments, contracts for the manufacture of shrapnel and explosive shells as well as time fuses numbering approximately four to six million units and component parts of war material, involving the expenditure of about \$20,000,000 which contracts had to be completed in a specified time. Mr. Humphrey not only put up factory buildings, installed special machinery and created an entirely new and separate organization for the construction of this work, but he also finished the job on time without having a single piece rejected. When the United States entered the war Mr. Humphrey received for the Union Switch & Signal Company a contract to produce 4,100 aeroplane engines of the Le Rhone type. Besides his activity as a manufacturer, Mr. Humphrey also acted in a consulting and advisory capacity to the government in Washington on many committees and boards. He was industrial "staff expert" for Brigadier General C. C. Williams, chief of the Ordnance Department, he was a member of the committee on Labor of the Council of National Defense, as well as a member of the War Industries Board and the War Resources Committee in Washington.

He is president of the Employers' Association of Pittsburgh and a director of the Chamber of Commerce.

Besides the election of a president, the stockholders also completed the regular business of the annual meeting Monday by electing the following board of directors: Ben V. Becker, James D. Callery, E. M. Herr, A. L. Humphrey, John F. Miller, John R. McCune, John R. McGinley, Charles McKnight, M. S. Rosenwald, W. D. Uptegraff and H. H. Westinghouse.

**American Steel Foundries**

R. P. Lamont, president of the American Steel Foundries Company, in a statement to stockholders explaining the proposal of the company to issue \$25,000,000 of 7 per cent, cumulative, non-voting preferred stock and the cutting of the par value of the common stock in three, increasing the number of shares proportionately, presents some interesting financial history of the company. The statement, in part, says:

"In 1908 in the recapitalization and readjustment of the securities, the net worth of this company was placed at \$17,184,000. Since then over \$2,000,000 has been spent on fixed properties, after ample allowance for depreciation, and the capacity of the plants has been increased over 30 per cent. Bonds to the extent of \$3,398,913.68 have been paid off; the outstanding debentures have been reduced from \$3,436,800 to \$1,372,800; the working capital has increased from \$4,799,546.02 to \$10,547,593.64—all resulting in an increase in net worth of about \$13,000,000. The undivided surplus has increased \$7,182,845.75.

"The annual net earnings of the company for the past seven years are as follows:

1912	profit	\$962,000
1913	"	1,490,000
1914	"	241,000
1915	"	264,000
1916	"	3,969,000
1917	"	5,532,000
1918	"	2,696,000

"With this condition of the company's resources and earnings, it is deemed wise and essential to take means looking to the enlargement, development and diversification of the activities and products of the company, the stabilization of its earnings, and as nearly as may be freed from the vicissitudes and fluctuations heretofore experienced, as also to steady and strengthen its standing in the security market; and to that end the company be enabled, if the occasion arises, to acquire other properties and means making for a prompt realization of this purpose."

The change in the capitalization will be acted upon at a meeting of the stockholders in Jersey City, N. J., on April 22. According to Mr. Lamont's statement the change is being made in order to afford an opportunity to acquire other properties. It is believed that the smaller units of common stock will stimulate and encourage the buying of shares by small investors and particularly by employees of the company.

**Westinghouse Air Brake Company**

As a change has been made in the fiscal year of the Westinghouse Air Brake Company to correspond with the calendar year, the figures given in the report for 1918 cover a period of 17 months. The additional fact that earnings of the Union Switch & Signal Company, now owned by the Air Brake company, are included in the Air Brake's statement, makes it impossible to compare earnings and expenses with previous years.

The net profits of the Union Switch & Signal Company for 12 months and of all other companies for 17 months, less taxes, aggregated \$7,461,900. Deducting Westinghouse Air Brake dividends paid during this period leaves balance to surplus account of \$2,384,923.

Federal taxes paid for the calendar year 1917 by all companies, including the Union Switch & Signal, totaled \$549,638. For the year 1918, the liability set up to cover estimated federal taxes of the same companies amounts to \$2,250,000, an increase of over 325 per cent.

**Haskell & Barker Car Company**

The net earnings of the Haskell & Barker Car Company for the fiscal year ended January 31, 1918, as published in its annual report show a substantial gain compared with the preceding year, before making allowances for federal taxes. However, after tax reductions and reserve for renewals, the amount left available for dividends totaled \$1,366,916, equal to \$6.21 a share on the 220,000 shares of stock, as compared with \$1,599,743, equal to \$7.27 a share, the previous year. The gross earnings for the year ending January 31, 1918, were \$4,409,210, an increase of \$1,775,017 as compared with the previous year. Edward S. Cary, president of the company, in his statement to the stockholders, said: "The industrial situation in this country is deeply involved in uncertainty due to transition from intensive war time production to peace time pursuits and the equipment business is further affected by the uncertainty that surrounds the railroad situation. This company is particularly fortunate, however, in having business on its books approximating \$30,000,000 to tide it over the period of reconstruction. Due to various causes the railroads have not kept their equipment up to standard and it is only a question of time till normal conditions return and the equipment business comes into its own."

The company's balance sheet is as follows:

BALANCE SHEET		
Current assets	.....	\$11,077,520
Property and plant account	.....	5,222,596
		<hr/>
		\$16,300,116

		\$16,300,116

**Trade Publications**

AIR TRANSPORT SYSTEM.—The Quigley Furnace Specialties Company, New York, has developed a system of carrying pulverized fuel which differs from screw conveyor and high pressure blast systems in that the fuel is transported in bulk from

the pulverizing plant through small diameter standard wrought iron or steel pipe by compressed air to bins at the furnace, without the use of return piping. This system and the various apparatus used for the transport, distribution and burning of the fuel are described and shown in a diagrammatic drawing in bulletin No. 11, containing 14 pages.

**TIME ZONES.**—A large calendar and wall map of the United States and the greater part of Canada, 28 in. by 40 in., is being issued by the Metal & Thermit Corporation, New York, the map showing the new railroad time zones in the United States, which went into effect on January 1, 1919.

**ROLLER BEARINGS.**—The distinctive features, together with price lists for the different sizes of its type "C" roller bearings, which are recommended for use under conditions of medium loads at medium speeds, such as inspection cars, baggage trucks, etc., are set forth in bulletin No. 1004, issued by the American Roller Bearing Company, Pittsburgh, Pa.

**CREOSOTE OIL.**—The Barrett Company, New York, has issued a 16-page booklet with the sub-title "When and How to Use Barrett Carbosota Grade-One Liquid Creosote Oil." Two pages are devoted to a description and detailed plan of a simple and inexpensive wooden treating plant and several photographs of home made plants are shown. The booklet includes full directions for the application of creosote oil and its various uses are treated in detail, special attention being given to the treatment of poles and fence posts.

## Railway Financial News

**BOSTON & MAINE.**—The Massachusetts Public Service Commission has voted approval of the proposed reorganization of this company, and has authorized the issuance of \$13,306,000 of bonds to fund the outstanding notes.

Judge Morton on March 26 authorized the receiver to accept from the director general certificates of indebtedness amounting to approximately \$919,416, or such part thereof as he may be willing to issue, and to apply to the war finance corporation for an advance of \$735,532 needed to meet payments coming due. The receiver was also authorized to issue notes for the advance and pledge the certificates as security, as well as other securities which may be required.

**CANADIAN PACIFIC.**—See editorial comment elsewhere in this issue.

**ERIE.**—The New Jersey Public Utility Commission has approved the application of this company for authority to mortgage \$8,372,000 of its series D bonds, issued under its general mortgage of April 1, 1903, as collateral security for a proposed issue of its three-year 6 per cent collateral gold notes to the amount of \$15,000,000.

## Canadian Pacific Railway Company—Thirty-Eighth Annual Report

DIRECTORS OF THE CANADIAN PACIFIC RAILWAY COMPANY.  
YEAR ENDED DECEMBER 31ST, 1918.

### To the Shareholders:

The accounts of the Company for the year ended December 31st, 1918, show the following results:—

Gross Earnings .....	\$157,537,698.05
Working Expenses .....	123,035,310.38
Net Earnings .....	\$34,502,387.67
Deduct Fixed Charges .....	10,177,512.98
Surplus .....	\$24,324,874.69
Contribution to Pension Fund.....	500,000.00
	\$23,824,874.69
Deduct Net Earnings of Commercial Telegraph, January and February, transferred to Special Income Account.....	193,976.64
	\$23,630,898.05

From this there has been charged a half-yearly dividend on Preference Stock of 2 per cent., paid October 1st, 1918,..... \$1,613,638.42  
And three quarterly dividends on Ordinary Stock of 1 3/4 per cent. each, paid June 29th, 1918, October 1st, 1918, and December 31st, 1918 .....

13,650,000.00  
15,263,638.42  
\$8,367,259.63

From this there has been declared a second half-yearly dividend on Preference Stock, payable April 1st, 1919,..... \$1,613,638.42  
And a fourth quarterly dividend on Ordinary Stock of 1 3/4 per cent., payable April 1st, 1919 .....

4,550,000.00  
6,163,638.42

Leaving net surplus for the year..... \$2,203,621.21  
(which amount has been placed in reserve to meet special taxes imposed by the Dominion Government)  
In addition to the above dividends on Ordinary Stock, three per cent. was paid from Special Income.

### SPECIAL INCOME FOR YEAR ENDED DECEMBER 31st, 1918.

Balance at December 31st, 1917 .....

\$15,785,750.86

Less: Dividend paid April 1st, 1918..... 1,950,000.00

Net Revenue from Investments and Available Resources, Exhibit "C" .....	\$13,835,750.86
Interest on Deposits, and Interest and Dividends on Other Securities .....	1,928,483.52
Net Earnings Ocean and Coastal Steamship Lines.....	2,779,854.22
Net Earnings Commercial Telegraph and News Department, Rentals and Miscellaneous .....	1,214,869.22
	2,205,544.57
	\$21,964,502.37

Less: Payments to Shareholders in dividends: June 29th, 1918, October 1st, 1918, and December 31st, 1918.....

5,850,000.00

\$16,114,502.37  
From this a dividend has been declared payable April 1st, 1919 \$1,950,000.00  
2. The working expenses for the year amounted to 78.10 per cent. of the gross earnings, and the net earnings to 21.90 per cent., as compared with 69.46 and 30.54 per cent., respectively, in 1917.

3. There were no sales during the year of Four per cent. Consolidated Preference Stock, Four per cent. Preference Stock, or other Capital Securities.

4. In consequence of the provisions of the Order of the Governor-General-in-Council passed in March of last year, imposing Special Taxes upon the Company, the net surplus from railway operations for the year has been placed in reserve to meet such special taxes, and a notation to that effect appears in the accounts.

5. The sales of agricultural land in the year were 842,191 acres for \$15,375,996, being an average of \$18.25 per acre. Included in this area were 64,424 acres of irrigated land which brought \$42.94 per acre, so that the average price of the balance was \$16.22 per acre.

6. Pursuant to the policy adopted by your Directors in 1916 one hundred farms for returned soldiers were prepared for occupation and qualified men have already been placed on a number of them. In the opinion of your Directors it is desirable that the Company should continue, as conditions warrant, the preparation of farms and the sale of them on favorable terms to soldiers who have served in the Canadian or Imperial Forces and to Canadians who have served in the Allied Armies.

7. At the outbreak of hostilities your Company had in commission in Atlantic and Pacific service 38 steamers, with an aggregate gross tonnage of 342,000 tons. Since August, 1914, the construction of 4 steamers previously authorized, having a gross tonnage of 54,000 tons, has been completed, and 12 steamers of 69,000 gross tonnage have, in the same period, been purchased. During the war 15 steamers were lost by enemy action or through accidents at sea, and 9 have been sold to the British Admiralty after having been requisitioned. The construction at the yards of the Fairfield Shipbuilding Company of a ship 625 feet in length between perpendiculars, having a gross tonnage of 21,000 tons, is to be proceeded with pursuant to the authorization previously given, and three passenger ships of what is known as the intermediate class, for Atlantic service, two of which have been previously authorized, will be put under construction as soon as possible at the yards of John Brown & Son and the Fairfield Shipbuilding Company. At the end of the fiscal year your Company had in ocean service 28 steamers having a gross tonnage of 264,000 tons, and 6 steamers under order or purchased but not delivered having a gross tonnage of about 80,000 tons. On their delivery the total tonnage of the fleet will be slightly in excess of aggregate tonnage of the vessels in commission on 3rd August, 1914.

8. In May of last year, in consequence of the demands for increases in wages made to the Railroad Administration of the United States, substantial increases in all wage scales on American Lines were authorized, and were accompanied by increases in freight and passenger rates. Demands for wage increases were likewise made in Canada, and, by Orders-in-Council passed under the War Measures Act in July last what is known as the McAdoo Scale of Wages was made effective in Canada, and increases in freight rates generally similar to those granted in the United States were made effective on all Canadian railways.

9. There will be submitted for your consideration and approval a lease of the Kaslo and Slocan Railway, extending from a point of junction with the Whitewater Creek Branch of the Nakusp and Slocan Railway at Retalack to Kaslo, in the Province of British Columbia, a distance of 17.7 miles, the control of which was secured by your Company with your approval under agreement with the Province of British Columbia in 1912.

10. With your approval the Directors in 1893 concluded an agreement for the leasing of the railway of the Nakusp and Slocan Railway Company at a rental of 40 per cent. of the gross earnings. Bonds of the Nakusp and Slocan Company to the amount of £132,960 were issued, guaranteed as to principal and interest by the Province of British Columbia and matured on July 1st, 1918. The rental paid by this Company has not been sufficient to pay the interest on the Bonds, and \$321,698 has been advanced by the Province for this purpose up to December 31st, 1917. The lease of the railway of the Nakusp and Slocan Company will expire in 1920, and during its existence your Company has expended very substantial amounts in necessary betterments and improvements. In consequence of representations made by the Provincial Government your Directors have agreed to the purchase by the Company from the Government of Bonds of the Nakusp and Slocan Company to the above amount at the

actual cost to the Province of acquiring them, but not exceeding their face value, upon conditions which involve the extinguishment of all claims of the Province against the railway. All the issued capital stock of the Nakusp and Slocan Company is held by your Company, and the arrangement is, in the opinion of your Directors, warranted by the value of the railway as a traffic contributor to your Company's system.

11. Subject to your approval your Directors have concluded an agreement with the Grand Trunk Pacific Railway Company providing for the use by that Company of your Company's railway from a point east of Sutherland to a point west of Saskatoon, together with the use of your Company's passenger, express and freight facilities at Saskatoon station. The agreement is for a term of 21 years from the 2nd September, 1918, the rental payable by the Grand Trunk Pacific being based upon interest at the rate of 5 per cent. per annum on half the agreed capital account and the payment of maintenance expenses on a wheelage basis.

12. You will be asked to sanction the issue and sale of Consolidated Debenture Stock to defray the cost of construction of that portion of the Moose Jaw Southwesterly Branch from Mileage 35 to Mileage 66, to an amount not exceeding £6,000 per mile.

13. Your Directors are of the view that the construction of additional branch line mileage in the West will be necessary in the near future, and your authority will be asked for proceeding with the construction of the following lines when conditions warrant such construction, and for the issue and sale of a sufficient amount of Four per cent. Consolidated Debenture Stock to meet the expenditure, viz:—

- Empress to Mildeu Branch, 132 miles.
- Empress to Acme Branch, 132 miles.
- Vidota East Branch, 35 miles.
- Russell North Branch, 15 miles.
- Lanigan North Branch, 150 miles.

14. Subject to your approval your Directors have authorized expenditures on capital account during the present year of \$4,482,000, apportioned to the following works, namely:—

Replacement and enlargement of structures in permanent form.....	\$545,000
Additional stations, roundhouses, freight sheds, ice houses and extensions to existing buildings.....	525,000
Additional terminal and side-track accommodation.....	400,000
Tie plates, rail anchors, and miscellaneous roadway improvements.....	1,017,000
Lining tunnels, British Columbia district.....	185,000
Automatic block-signal protection.....	112,000
Surveys for new lines and power possibilities.....	125,000
Miscellaneous improvements, and additions designed to improve the facilities of the Company and to effect operating economies.....	1,103,000
Improvements in connection with telegraph service.....	470,000
Loan and was allotted \$12,447,000 of its subscription. Included in this latter amount was \$4,866,666 allotted in exchange for the surrender by the Company of £1,000,000 Dominion of Canada 3½ per cent. Bonds maturing in 1919.	

16. The gross earnings of your transportation system in the fiscal year exceeded those of any previous year in the history of the Company,

and exceeded those of 1917 by \$5,148,363, but the net earnings were less by \$12,043,630. This large addition of \$17,191,993 to the working expenses is principally due to the great advances in wages, though the increased cost of fuel and materials of every description also added a substantial amount to the year's expenses.

17. The Board of Railway Commissioners having amended in certain respects the general train and interlocking rules effective upon the lines of all railway companies subject to the jurisdiction of the Parliament of Canada, the appropriate changes in the existing By-laws of your Company will be submitted for your confirmation and approval.

18. The Right Honorable Lord Shaughnessy, K. C. V. O., who has been President of the Company for the past nineteen years, expressed his desire to retire from office in October last and his resignation was accepted with the deepest possible regret. During his tenure of office the Company has enjoyed extraordinary and uninterrupted prosperity and now stands among the foremost transportation companies in the world. Your Directors appreciate that this result has been due to Lord Shaughnessy's able and most devoted services which have earned the admiration of the community and the gratitude of the shareholders. Your Directors learned with gratification of Lord Shaughnessy's willingness to continue as Chairman of the Company, and that the benefit of his counsel and advice will not therefore be lost to the Company. Mr. E. W. Beatty was elected President of the Company.

19. You will be asked to approve verbal amendments to By-laws of the Company passed by your Directors and made necessary by the separation in the positions of Chairman of the Company and President.

20. In order to give his entire time to your Steamship interests, Mr. George M. Bosworth, who for twenty-two years has been in charge of the Company's freight traffic and for seventeen years Vice-President in charge of Traffic, resigned his office and will hereafter be exclusively identified with the Company's Steamship enterprises as Chairman of the Canadian Pacific Ocean Services Limited. Mr. W. R. MacInnes, formerly Freight Traffic Manager, was appointed Vice-President in charge of Traffic in succession to Mr. Bosworth.

21. Vice-President Sir George Bury, after a service of over thirty-five years during which he held many positions of increasing responsibility and importance and in all of which he showed energy and ability of a very high order, resigned from the Company's service in October. He at the same time retired from the Board and from the Executive Committee. Mr. Grant Hall, Vice-President of Western Lines, was elected Vice-President, a member of the Board of Directors and of the Executive Committee in succession to Sir George Bury.

22. The undermentioned Directors will retire from office at the approaching Annual Meeting. They are eligible for re-election:—

- MR. RICHARD B. ANGUS,
- SIR EDMUND B. OSLER,
- SIR HERBERT S. HOLT,
- BRIG.-GEN. FRANK S. MEIGHEN, C.M.G.

For the Directors,

E. W. BEATTY,  
President.

MONTREAL, March 19th, 1919.

# Railway Officers

## Railroad Administration

### Central

C. F. Stewart has been appointed manager of the Troop Movement Section, with office at Washington, succeeding George Hodges, deceased. Mr. Stewart has been an assistant to Mr. Hodges in charge of passenger routing. He was formerly general passenger agent of the Western Maryland.

### Regional

H. M. Adams, manager of inland traffic, Division of Traffic, has been appointed traffic assistant to B. F. Bush, regional director of the Southwestern region, to succeed W. B. Biddle, who has been assigned to other duties.

### Federal and General Managers

W. L. Mapother, federal manager of the Louisville & Nashville and associated roads, with headquarters at Louisville, Ky., has had his authority extended over the Cumberland Railroad (Artemus, Ky., to Anchor, Ky.).

F. P. Pettibone, federal manager at Dallas, Texas, has had his jurisdiction extended over the Beaumont Sour Lake & Western, the Houston Belt & Terminal, the Iberia, St. Mary's & Eastern, the new Iberia & Northern, the New Orleans, Texas & Mexico, the Orange & Northwestern, and the St. Louis, Brownsville & Mexico. These roads have been released from the jurisdiction of W. B. Scott, federal manager at Houston, Texas.

W. E. Williams, whose appointment as general manager of the Missouri, Kansas & Texas (exclusive of the Trinity branch, Beaumont & Great Northern and lines west of Whitesboro, Texas), the Union Terminal of Dallas and the Houston & Texas Central, with headquarters at Dallas, was announced in the *Railway Age* of February 28, was born at Houston, Texas, May 29, 1864. He began railway work in 1881 with the International & Great Northern as clerk to the roadmaster, and was subsequently in the bridge department, clerk in the superintendent's office, time keeper, transportation clerk, chief clerk to the superintendent of transportation, to the general superintendent and to the general manager, and secretary to the receivers, until June, 1895. Mr. Williams was then appointed purchasing agent and general storekeeper, in which position he continued for two years. He entered the employ of the Missouri, Kansas & Texas in September, 1897, as chief clerk to the general superintendent, and was consecutively car accountant and trainmaster. In November, 1902, he was promoted to superintendent at Greenville, Tex., and from December, 1905, to October, 1911, he was successively superintendent at Denison, Tex., McAlester, Okla., and Sedalia, Mo. He was then appointed general superintendent, which position he held until his recent appointment as general manager.

### Operating

W. B. Veazey, treasurer and general manager of the Gainesville Midland, has been appointed superintendent, in charge of operation and traffic, with office at Gainesville, Ga.

W. A. Gore, superintendent of the Norfolk & Portsmouth Belt Line, with office at Portsmouth, Va., has been appointed superintendent of the Norfolk division of the Virginian Railroad, vice B. E. Nevins, transferred.

F. C. Smith has been appointed assistant superintendent of the Salt Lake division of the Southern Pacific, lines south of Ashland, with headquarters at Ogden, Utah, vice H. W. Winstner, who has been transferred to Sparks, Nev., vice J. T. Bell, assigned to other duties.

L. C. Sauerhammer, superintendent, office organization on the Baltimore & Ohio, at Baltimore, Md., has been appointed assistant to federal manager of the Baltimore & Ohio, Eastern Lines; the Coal & Coke; the Morgantown & Kingwood; the Western Maryland; the Cumberland & Pennsylvania; the Cumberland Valley, and the Wheeling Terminal Railroad, with office at Baltimore, vice E. E. Hamilton, resigned.

J. Cannon, general superintendent of the Eastern district of the Missouri Pacific, with headquarters at St. Louis, Mo., has been appointed general superintendent of transportation of the same road and the Memphis, Dallas & Gulf, the Natchez & Southern, and the Arkansas Central, with headquarters at St. Louis, succeeding J. A. Somerville, resigned to go to another road. C. B. Wildman, superintendent of the Eastern division of the Missouri Pacific at Jefferson City, succeeds Mr. Cannon, with headquarters at St. Louis; W. E. Merrifield, superintendent of the Omaha division, at Falls City, Neb., succeeds Mr. Wildman; L. A. David, superintendent of the Southern Kansas division at Coffeyville, Kan., succeeds Mr. Merrifield, and Phil Carrol has been appointed superintendent of the Southern Kansas division, with headquarters at Coffeyville, to succeed Mr. David.

J. W. Deneen, superintendent of the Cumberland division of the Baltimore & Ohio, with office at Cumberland, Md., has had his authority extended over the Keyser division, which has been consolidated with the Cumberland division, and the new division is now known as the Cumberland division. C. B. Gorsuch, relief superintendent, has been appointed superintendent of the Pittsburgh division, with headquarters at Pittsburgh, Pa.; T. J. Brady, superintendent of the Keyser division, has been appointed superintendent of the Connellsville division, with headquarters at Connellsville, Pa., vice H. R. Hanlin, transferred, and J. D. Beltz, acting superintendent of the Pittsburgh division, has been appointed assistant superintendent of the same division, with office at Pittsburgh, Pa., vice C. P. Angel, transferred.

### Financial, Legal and Accounting

H. H. Dean, general counsel of the Gainesville Midland, has been appointed general solicitor; G. H. Purvis, auditor, has been appointed federal auditor, and W. E. McKinney has been appointed acting federal treasurer; all with offices at Gainesville, Ga.

R. G. Shorter has been appointed auditor of the Carolina, Clinchfield & Ohio; the Carolina, Clinchfield & Ohio of South Carolina, and the Black Mountain Railroad, vice J. M. Featherston, transferred to other duties; G. A. Masengill has been appointed auditor of revenue, and L. J. Hopper has been appointed auditor of disbursements, vice R. G. Shorter; all with offices at Johnson City, Tenn.

### Traffic

W. C. Staley has been appointed supervisor of oil traffic of the Southwestern region, with headquarters at Kansas City, Mo., to succeed B. L. Swearingen, who has resigned.

W. J. Mullin, general freight and passenger agent of the Delaware & Hudson, has been appointed traffic manager of that road and the Greenwich & Johnsonville; the Wilkes-Barre Connecting; the Schoharie Valley; the Lake Champlain Steamboat Line, and the Lake George Steamboat Line, with headquarters at Albany, N. Y.

John S. Hershey, whose appointment as freight traffic manager of all roads under the authority of F. G. Pettibone, federal manager in the Southwestern region, with headquarters at Dallas, Tex., as announced in the *Railway Age*

W. E. Williams

of March 7, page 554, was born at Nebraska City, Neb., on June 30, 1868 and received his education in the public schools at Nebraska City. Mr. Hershey entered railway service on August 21, 1890 as a clerk in the local freight depot of the Chicago, Burlington & Quincy at Chicago, remaining in that position until 1893 when he became a clerk in the auditing department of the Elgin, Joliet & Eastern. The next year he was employed as rate clerk in the general freight department of the same road and from 1896 to 1902 he served in the office of the freight traffic manager of the Atchison, Topeka & Santa Fe at Chicago. From January, 1902, to June of the same year he was general freight and passenger agent of the Gulf, Beaumont & Kansas City and the following two years he was in the employ of the Gulf, Colorado & Santa Fe as assistant general freight agent until his appointment as general freight agent of the same road, and in addition the Texas Midland and the Houston Belt and Terminal, in which capacity he remained until his recent appointment as noted above.

### Engineering and Rolling Stock

A. A. Schenck, engineer of maintenance on the western lines of the Chicago & North Western, with headquarters at Omaha, Neb., has been appointed assistant to the chief engineer, with jurisdiction over lines west of the Missouri river, with offices at Omaha. A. K. Gault has been appointed division engineer of the Eastern division of the western lines of the Chicago & North Western and the Missouri Valley & Blair Bridge, with headquarters at Omaha, Neb. W. T. Main has been appointed division engineer of the Black Hills division of the Chicago & North Western and the Wyoming & North Western, with headquarters at Chadron, Neb.

Walter Shepard, consulting engineer of the Boston & Albany, with headquarters at Boston, Mass., retired under the pension rules on March 1, after 44 years of continuous service in the engineering department of that road. He was born on March 1, 1849, at Dorchester, Mass., and was educated in the Dorchester grammar and high schools, Boston Latin School, and in 1870 graduated from Harvard University. In 1872 he graduated from the Massachusetts Institute of Technology, and in June of the same year began railway work with the Boston & Albany as an engineer's assistant. He was then out of railway work until March, 1875, when he returned to the service of the Boston & Albany. In April, 1882, he was promoted to division engineer and was made assistant chief engineer in December, 1886. He served as chief engineer from November, 1891, until May, 1908, and since that time as consulting engineer of the same road.

Orlando H. Frick, whose appointment as district engineer of the Middle district of the Chicago, Milwaukee & St. Paul, with headquarters at Milwaukee, Wis., was announced in the *Railway Age* of March 14 (page 619), was born at Manitowoc, Wis., on September 25, 1879, and graduated from the University of Wisconsin in 1902. Mr. Frick began his railway career in the same year as a levelman with the Louisville & Nashville, and after a short time he entered the employ of the Chicago, Rock Island & Pacific as assistant engineer, in which capacity he served until early in 1904 when he was appointed resident engineer of the Missouri, Oklahoma & Gulf, in which position he remained until September of the same year. The following two months he served as resident engineer on the Appalachian Northern and then entered

the employment of the Chicago, Milwaukee & St. Paul, with which road he has served consecutively until his recent appointment as assistant engineer for ten years, pilot engineer and field engineer on valuation.

## Corporate Operating

W. Culligan has been appointed chief dispatcher on the twentieth and twenty-first districts of the Grand Trunk, with office at Stratford, Ont.

### Executive, Financial, Legal and Accounting

G. W. Muller has been appointed transfer agent and assistant secretary of the Kansas City Southern, with headquarters at New York, succeeding D. W. Leitch, who has resigned.

William H. Williams, chairman of the board of the Wash Railway Company, with headquarters at New York, has been elected also president to succeed Edward F. Kearney, deceased. A portrait of Mr. Williams and comments on his career were published in the *Railway Age Gazette* of December 10, 1915, page 1092.

### Traffic

R. F. Clark, general agent of the Canadian Northern, with office at Chicago, has been appointed general agent of the Canadian National Railways, with office at Chicago, and J. A. Boak, western United States agent of the Canadian National Railways, with headquarters at Chicago, has resigned. D. O. Wood has been appointed traffic manager of the export and import department, with office at Toronto, Ont.

### Engineering and Rolling Stock

M. K. Barnum, assistant to general superintendent maintenance of equipment of the Baltimore & Ohio, with office at Baltimore, Md., has been appointed mechanical engineer for the corporation.

C. S. Ogilvie has been appointed assistant engineer of the Grand Trunk, with headquarters at Ottawa, Ont., vice H. Mowat, assigned to other duties. Mr. Ogilvie was formerly assistant engineer of the Grand Trunk, at Belleville, but went overseas with the first contingent of the Canadian Expeditionary Force in the 13th Royal Highlanders. He was a prisoner in Germany for more than three years, being released after the signing of the armistice.

Harold R. Miles, assistant engineer on the Canadian Pacific, with headquarters at Montreal, Que., has been promoted to division engineer with headquarters at Winnipeg, Man. He was born at Lethbridge, Alberta, on March 14, 1879, and entered railway service in March, 1899, with the Washington County Railway Company in the state of Maine. The following year he was employed by the Algoma Central on location work, and in 1901 he entered the service of the Canadian Pacific as assistant engineer of maintenance, with headquarters at North Bay, Ont. Later he was appointed resident engineer of maintenance on the Lake Superior division, in which capacity he served until July 1, 1915, when he was transferred to Montreal, Que., as assistant engineer which position he held until his appointment as division engineer, with headquarters at Lethbridge. Mr. Miles succeeds H. K. Yorston, who has been appointed locating engineer of the Canadian Pacific, Western Lines.

## Obituary

Edward Lawless, master mechanic of the Illinois Central, with office at Freeport, Ill., died at his home in that city on March 9, at the age of 51.

Allen T. Fraser, chief engineer of the Canadian National Railways, Western lines, with office at Winnipeg, Man., was killed by a snow slide near Mount Robinson, in the Yellowhead Pass, on March 31.

## Railway Age

# EDITORIAL

The idea that a sale completes a business transaction is out of tune with modern business methods. Nowadays it is almost universally accepted as a fact that the sale is only the beginning and that it must be backed up by service. Generally speaking a railroad has nothing to sell but transportation, freight and passenger. That the organizations built up by the railroads under private control for the sale of freight transportation were founded on the service idea was amply demonstrated to shippers. They, however, constitute but a small proportion of those who come in direct contact with the railroads when the general traveling public is considered. Unfortunately the "service" idea has not been so clearly demonstrated to the traveler. Unless seriously inconvenienced by a lapse in the service, the traveler is apt to take everything for granted. It is the lapses, however, that stick in his mind, and as it is not practical to force on his attention all that is being done to insure him a pleasant trip, a special effort should be made to reduce these lapses to a minimum. There are many means which suggest themselves to accomplish the desired end. One of the most obvious is to place responsible representatives of the railroad in the traveler's shoes, so to speak. Their duties would be to travel, making use of the various conveniences set up for aid to the traveler, putting questions to trainmen, to the attendants at information bureaus and to other employees having duties of informational character. If the service rendered is satisfactory, well and good. If not, the remedy will suggest itself. There is no doubt that such measures will more than pay for the trouble.

The article on "Railroad Purchases as a Stabilizer of Business," by F. B. Ernst, on another page, is of more than ordinary interest because it amplifies and supplements the address on this subject which was made by Dr. W. F. M. Goss at the March meeting of the New York Railroad Club (*Railway Age*, March 28, 1919, page 854). While railway supply manufacturers are, of course, the greatest sufferers from the "feast and famine" conditions in that industry, the railroads, the industries generally and the public as a whole are also affected. The problem is so great and such a large percentage of the population of the country is affected that it should be given the most serious consideration. E. H. Harriman, when he was alive, did much to stabilize conditions by buying heavily of the equipment manufacturers when business was light; while he was probably actuated largely by the fact that prices were at their lowest point, he not only did a service to his own properties but gave a real impetus to an increase of business in other lines of industry. As Dr. Goss pointed out, the depreciation of equipment goes on at a fairly regular rate, and this is also true of the growth of the country and the increased demands upon the railroads. These factors enter so largely into the demands for equipment that it would seem that they must have a most important bearing upon the final solution of the problem. E. B. Leigh, president of the Chicago Railway Equipment Company, has for a long time insisted that general industrial prosperity was depend-

ent upon and followed closely on periods of heavy buying of equipment on the part of the railroads. His reasons for this belief are given clearly in the article entitled "Railway Buying and Industrial Readjustment" which was published in the *Railway Age* of April 4. While the Railroad Administration, under the present conditions, is more or less handicapped in the ordering of equipment, it would seem that it might properly give critical consideration to the relation of railway purchases to general prosperity and that it might prepare plans to develop a greater regularity in the purchasing of equipment and be in a position to make recommendations in this respect to the American Railroad Association when the railroads are turned over to the private managements at the end of government control.

The Transport Bill, providing for the establishment of a Ministry of Ways and Communications in control of practically all means of transportation in the United Kingdom and Ireland passed its second reading in the House of Commons on March 18, although it was only introduced by the government

### The British Transport Bill

on February 27, not three full weeks earlier. This does not mean that it has progressed so rapidly for lack of strong opposition—a fact which makes all the more striking the contrast between the rapidity with which this bill is moving to its passage and the slowness with which the plans for the disposition of the railroads have matured in our own country. The British Ministry of Ways and Communications bill is all-inclusive from the standpoint of transportation. From the abstract of the bill in the *Railway Age* of March 21, page 787, it will be seen that it puts under the control of the ministry which it is proposed to establish, not only railroads, but light railways, canals, waterways and inland navigations; roads, bridges and ferries, and vehicles and traffic thereon; harbors, docks and piers; and the supply of electricity; (a provision to include tramways also was dropped before the second reading). As has been mentioned in the *Railway Age*, there has been much opposition to the bill, particularly on the part of the road transportation and dock interests, who object to having these facilities put under the control of the railway man or, at any rate, of a man who will look at their problems from the railroad point of view. These objections, however, as strongly as they were presented in the House of Commons on March 17 and 18 following the explanation of the necessity for the bill by Sir Eric Geddes and his motion for its second reading, were not sufficient to impede the progress of the bill. It is interesting, however, to observe that but little opposition has been evinced by the railroad interests. The railroad situation in Great Britain is exceedingly serious—Sir Eric Geddes pointed out that at present the railroads are suffering a deficit of £100,000,000 a year and that the transportation services "are financially in a semi-paralyzed state." The government is pledged for two years more to pay the guarantee of earnings on the basis of 1913. The term of the bill is for two years and, therefore, merely takes up, as it were, this guarantee. There was serious opposition manifested to a provision of the bill which provided in brief that the minister might "purchase the whole or any part of a railway," by authority

of an order in council which should lie before the Parliament for not less than 30 days, etc., which it was feared might lead to nationalization without sufficient opportunity for consideration, but this was amended before the second reading. But enough has been said to show that the bill is of epoch-making character and deserves careful consideration on the part of American students of the railway problem.

## Liquidation of War Contracts

A VALUABLE AND IMPORTANT SERVICE for the business interests of the country is being performed by the Federal Liquidating Association, recently formed to facilitate and hasten the liquidation of reduced, suspended, terminated or cancelled war contracts, formal and informal, many of which are held by companies primarily engaged in the railway supply field. Thousands of contracts were suspended by the government following the signing of the armistice in the midst of performance, and as a result billions of dollars, a substantial part of the currency of national commerce, is frozen in the treasury pending liquidation of these agreements, under circumstances such that there is little precedent to guide. The Association of Manufacturers of War Materials, whose officers constitute the directing personnel of the new association, was largely instrumental in procuring the enactment of a satisfactory bill validating informal war contracts and in obtaining a modification of the rulings of the war department affecting settlements with sub-contractors. Now that a plan of settlement has thus been afforded, experience has demonstrated the necessity for a co-operative agency for presenting the case of the contractors in respect of the whole matter of liquidation.

The tedious process of litigation must be avoided and settlement must be made just as the contracts were made, by newly negotiated settlements and agreements fair to the government and to the contractor. This negotiation cannot proceed with the freedom of private business. Government departments are necessarily restricted by statutory and regulatory limitations which are intricate and involved. Official action on each separate negotiation must be had in Washington by responsible officers with full authority. Yet the field is so vast that the government has been forced to set up a complicated mechanism radiating from the capital, so that each case must be followed through from the field to Washington. Moreover, the settlement of so vast a number of suddenly terminated contracts presents a new problem, each contract presenting an infinite variety of terms and conditions. To meet this situation, the Federal Liquidating Association has been formed by a process of reorganization to meet the new conditions of the former co-operative Association of Manufacturers, with a view to obtaining the same kind of centralized organization with a decentralized auxiliary organization as has been formed by the government.

While the installation of an adequate organization entailed a considerable sacrifice, the officers of the association were persuaded to undertake it as a public service of such difficulty and magnitude that its successful accomplishment must challenge general attention. Every effort has been made to secure the services of the best men for the work and to create an organization which will make their services available to all contractors. Brig. Gen. Hugh S. Johnson is president of the association, and the personnel throughout has been carefully selected for its familiarity through service in governmental bureaus with department methods and with war contracts. W. S. Symington, Jr., general counsel for the Symington interests, and C. J. Symington, president of the Symington Machine Corporation, also share in the direction of its affairs. The secretary is H. H. Dinneen, who was secretary of the Association of Manufacturers of War

Materials. The Washington headquarters will keep in close touch with the various governmental departments, presenting the contractors' point of view generally and attending to the expedition and presentation of all matters pending before any departmental agency. Local officers have also been established in the principal large cities convenient to the local boards of adjustment.

The war department has this week announced that it is now able to adjust and settle all of its war obligations, both formal and informal, and is prepared to do so with the greatest possible speed. It has issued complete instructions regarding the process and basis of effecting settlements and the character and the spirit of the men who are representing the business interests seem to assure the sort of co-operation needed to bring about the speediest possible settlement of this important question.

## Train Service Employees' Wage Settlement

DIRECTOR GENERAL HINES this week granted an advance in wages to the four classes of train service employees—engineers, conductors, firemen and other trainmen. It is estimated that the advances granted will average about 9 per cent and that their total cost will be \$55,000,000 a year. The same order which grants these advances refers to Adjustment Board No. 1 of the Railroad Administration, which is composed of four officers and four employees, the question as to whether and, if so, under what conditions, overtime at the rate of time and a half shall be granted to road train service employees for work in excess of eight hours a day.

This order raises two very interesting questions. The first is, as to the justifiability of an advance in wages to the train service employees at this time. The second is, as to the wisdom of the action taken in referring the consideration of the question of punitive overtime to a board of officers and employees.

The advance in wages made was expected by those who have been familiar with recent developments in railroad affairs. The Railroad Administration takes the position that it practically closes a cycle of advances in wages under government operation and that it was necessary, in order to place the compensation of the train service employees on a parity with that of other employees.

The question of when the present cycle of advances in wages began is open to discussion. The Adamson law went into effect on January 1, 1917. By establishing the principle of the "basic eight-hour day," it gave the train service employees an advance in wages of about \$60,000,000 a year. This, in the opinion of many who closely follow railway developments, was the real beginning of the new wage cycle, and on that theory the cycle really was ended before the advance made to the train service employees this week. As a matter of fact, however, the passage of the Adamson act was followed, under private operation, by advances to many other classes of employees. When government control went into effect on January 1, 1918, there were still pending demands for advances in wages from many classes of railway employees, including those in train service, and advances to practically all classes of employees undoubtedly would have had to be made under private operation. In accordance with the recommendations of the Railway Wage Commission, Director General McAdoo issued order No. 27 which made general advances in the wages of the employees, including an advance of 29 per cent to those in train service.

While this order at first looked like a reasonable one, its application disclosed the fact that it provided for relatively much larger advances to some classes of employees than to

others, and that it substituted many glaring inequalities for the inequalities which had been known to exist before. The advances made to some classes of employees were insufficient to hold an adequate number of them in railway service against the competition from other industries in which much larger advances to similar classes of workers had been made. In consequence, it was immediately found necessary to make a large additional advance to the employees in shops.

From the standpoint of the Railroad Administration, this really opened the latest cycle of railroad wages. It made the wages of the shop employees relatively much higher than those of almost all other classes of employees. In consequence, other classes of employees demanded further advances and they were granted; and it is unquestionably true that, until the advance to the train service employees was made this week, their wages were lower in proportion to those of other classes of employees than they were before government control was adopted. The order issued this week makes their wages approximately 40 per cent higher than they were before government control, and practically re-establishes, except in some extreme cases, the relationship between their wages and those of other employees, which formerly existed. Assuming that the other advances which have been granted are reasonable, it would be difficult to show that this advance to the train service employees is unreasonable.

The reference of the question of punitive overtime to a board of officers and employees promises to result in some developments which will be more interesting and important than these advances in wages. Under the terms of the director general's order, the board is instructed to make a study of and to report upon the practicability and propriety of granting punitive overtime at this time. It is to consider, in connection with this matter, what rules and working conditions should be eliminated or changed in consideration of granting punitive overtime in case it is decided that it should be granted. While the representatives of the employees may attempt to get punitive overtime while retaining the existing rules and working conditions, it is difficult to believe that any rational person, familiar with the facts, can actually believe that it would be reasonable or just both to grant time and a half for overtime and retain some of the most important rules and working conditions now in effect.

For example, in numerous cases, under the existing rules, train service employees may be paid two days' wages for work, all of which is done within eight hours, merely because they rendered in a single working day two classes of service which are held to be different kinds of work. If the employees are to be paid time and a half for any work done in excess of eight hours or any mileage run in excess of 100 miles, there surely can be no good reason why they should, under any circumstances, be paid for more than a day's work when they have not worked more than eight hours or run more than 100 miles. In other words, if they are to be paid time and a half for working more than a day they should not be paid, under purely arbitrary rules, for working more than a day when they actually have not worked more than a day. It is very questionable whether punitive overtime should be paid in train service at all because it is manifestly impossible, without a revolution in railway operation, actually to limit the working day in train service to eight hours; and certainly, unless the employees are willing to make concessions in respect to other matters which will save many millions of dollars, they should not be granted punitive overtime, which would be sure to cost much more than all the savings which could be effected by the abolition of all the arbitrary rules and working conditions.

Punitive overtime is to be granted to train service employees engaged in yard work upon the theory that the working day in yard service actually can be limited to eight hours. Even in yard service, the working day cannot be limited to

eight hours without a large increase in railway expenses, and before punitive overtime in road service is granted, if it ever is granted, there should be a very clear understanding as to what it is going to cost and as to what savings are to be effected by the concessions granted by the employees.

The wage advances which have now been granted under government operation run to a very large total. Principally as a result of them there has been an enormous increase in railway expenses, which the public must pay. The Railroad Administration and the public are entitled to expect that in return for the present high wages, employees will do the most efficient work of which they are capable. It is universally conceded that, for many months, the efficiency of railway labor has been not high but low. Reports indicate that this condition is improving. Let us hope that it will continue to improve, for the present situation in respect to railway expenses and earnings is extremely serious and the public, which is paying higher rates than ever before and, in addition, bearing a large deficit which has to be met from taxes, has a right to demand a great increase in the efficiency of operation.

## The Need for Another

### Advance in Rates

**A**N EARLY and substantial advance in rates must be made if the Railroad Administration is to stop piling up a large deficit. This fact is clearly demonstrated by the statistics of earnings and expenses for the last five months for which they are available, and especially for the months of January and February. The Class I railways earned in February a net operating income of only \$10,000,000, whereas the average net operating income earned by them in February, 1915, 1916 and 1917, was \$47,000,000. In other words, in February they incurred a deficit for the government of \$37,000,000. Their deficit in January was \$36,000,000, making a total deficit for the first two months of this year of \$73,000,000. The armistice was signed early in November. In the four months immediately following it, the railways should have earned \$259,000,000 net operating income in order to have covered the guaranteed standard return to the companies. They actually earned only \$114,000,000.

It is useless to try to dodge the plain implication of these figures. During the first four months following the signing of the armistice the railways earned only 44 per cent of the guaranteed standard return to the companies. During the first two months of the year they earned only 30 per cent of the standard return guaranteed to the companies. It is not conceivable that the results throughout the year would continue to be so bad, but it is probable that, if existing rates should be continued, the deficit for the year would be at least \$400,000,000. In some respects the conditions have been abnormally unfavorable. For example, traffic has been declining very greatly. On the other hand, some of the most important conditions were abnormally favorable. Never in the history of railroad operation in America were there four winter months when the conditions were more conducive to economical operation than they were in the four months under review.

The statistics reflect a situation which it is hardly an exaggeration to describe as appalling. The standard returns guaranteed to the companies are based upon the average net operating income earned in the three years ending on June 30, 1917. Therefore, to say that the railways are earning only about one-third of their guaranteed standard returns is equivalent to saying that they are earning only one-third as much net operating income as they earned in those

three years. Nothing is to be gained and everything is to be lost by not squarely facing the facts. The facts are that the government as a railroad manager is bankrupt, and that if the railways should now be returned to private operation, many of the companies would be bankrupted.

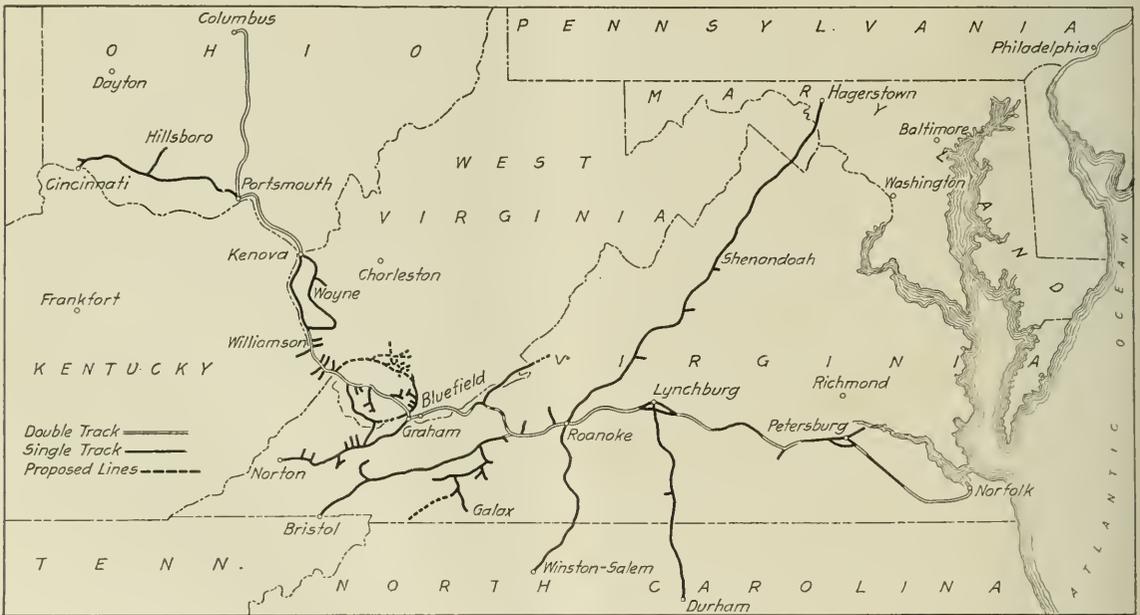

There is only one remedy for this situation, and in the interest of the national welfare it must be applied and applied promptly. The margin between earnings and operating expenses must be greatly increased. This can be done by reducing operating expenses or by advancing rates, or by both. We believe that even on the basis of present wages operating expenses can be reduced, but we do not believe they can be substantially reduced under government operation. In the first place, the system of centralized management adopted by Mr. McAdoo was fundamentally wrong. Really good operating results will never be obtained until it is abandoned. It is impossible under this system to create the needed competition and emulation between the officers of individual lines and to re-establish the needed discipline among employees. In the second place, the very fact that the roads are in the hands of the government militates against efficiency. Theorists may denounce with all their might the operation of the railways for private profit, but the desire and opportunity to make profits constitute the greatest incentive to efficiency known, and until that incentive is restored the greatest operating efficiency will not be restored.

In view of the results of operation within recent months, however, it is perfectly evident, as the *Railway Age* has said

exceeds \$300,000,000. The shippers and travelers of the country should be made to bear the expense of operating the railroads. The burdens under which the taxpayers are staggering are heavy enough. The rates should immediately be advanced at least 10 per cent, and as soon as practicable legislation should be enacted under which the railways can and will be restored to private operation. Furthermore, now that the advance in wages to the train service employees has been made, advances in wages to large classes of railway employees should be stopped. There doubtless will remain some readjustments in the salaries of the lower ranks of railway officers which should yet be made, but with the railroads in the condition they are now the public has a right to insist that no more advances to large classes of employees involving increases in expenses of many millions a year shall be made until a very different relationship from that now existing has been established between railway earnings and expenses.

### Norfolk & Western

THERE IS NO RELATION between the income account of a railroad corporation in 1918, the property of which is being operated by the government, and the earnings and expenses of the property. The income account of the corporation is a simple statement of the rental due from the government, other income, cost of maintenance of the corporate organization, interest charges, dividends, etc. From this

The Norfolk & Western

before, that with present wages and present rates the railways cannot be made under either government or private operation to earn an adequate net operating income. If the government continues to operate them it will, unless rates are advanced, continue to incur a large deficit. Unless rates are advanced many of the companies, if the railways should be returned to private operation, would be ruined.

The Railroad Administration should not continue to impose additional burdens upon the taxpayers by continuing to operate the railways at a heavy loss. Already the deficit which it has incurred, and which the taxpayers must pay,

the security holder can get no inkling of what the property itself is doing under government management. For instance, the Norfolk & Western in 1918 receives (only part payment has so far been made) \$20,634,000 rental from the government and, after having paid \$1,716,000 war taxes and taken into its account other income such as dividends and interest on security owned, has \$19,918,000 gross income. From this it paid its interest charges, leaving \$15,805,000 available for dividends. This compares with \$18,946,000 available for dividends in 1917, when the corporation was itself operating the property.

What investors and Norfolk & Western officers and other railroad officers want to know is the revenues and expenses resulting from the actual operation of the property itself. President L. E. Johnson sums up the point in his annual report to stockholders for 1918. He says: "The agreement stipulates that the director general shall, during federal control, furnish the company copies of the operating reports relating to its property. The results of these operations do not directly concern your company and do not affect its annual compensation, but they are interesting and important for the series of yearly comparisons and will, therefore, be set out in this report and in the accompanying tables."

The actual operation of the property came pretty near furnishing enough net operating income to meet the government's rental requirements. Total operating revenues—we are now talking about the property itself, not the corporation—amounted to \$82,004,000, an increase of \$16,095,000 or 24.42 per cent over 1917. Operating expenses amounted to \$61,579,000, an increase of \$20,418,000 or 49.60 per cent over 1917. Net revenue amounted to \$20,425,000; this compares with \$20,634,000, the rental which the government pays, but from the net revenue must also be subtracted all taxes other than war taxes. No estimate is made of what these will amount to, but the Norfolk & Western's taxes in 1916, before war taxes were assessed, amounted to \$2,480,000. Thus the property has failed by only about two to three million dollars to earn its rental, and this notwithstanding the fact that money was spent freely for both maintenance of way and maintenance of equipment in 1918. There was apparently a quite generous co-operation between the Railroad Administration and the Norfolk & Western corporation in doing everything possible to provide railroad facilities to move the business offered and, above all, to move coal. Evidences of the government's part are to be found in the large amounts spent for maintenance, and the company, from its corporate funds, spent large sums for additions and betterments, chargeable to capital account.

The company spent \$5,585,000 in 1918 for additions and betterments to roadway and structures. Of this amount, \$1,030,000 was for sidings and spur tracks and \$1,217,000 for terminal yards. Further extensions of the electrical operation of the road were held up, but \$646,000 was spent on capital account for additions to the electric power transmission plants. There was \$333,000 spent for additions and betterments to shops, enginehouses and turntables. Besides the amount spent for additions to road, there was \$8,271,000 spent for additions to equipment, the net charge to capital account for equipment being \$7,930,000 after making a credit of \$341,000 for equipment retired. These are large capital expenditures, especially in view of the fact that the Norfolk & Western had, just prior to 1918, completed a 15-year program of additions and betterments to the property. As President Johnson points out, however, "While your company has at all times aimed to protect the interests of its security holders, the great emergencies created by the declaration of war with Germany in the spring of 1917 have made co-operation with the federal government its paramount duty." In all, the corporation has approved of the expenditure for additions and betterments of about \$27,000,000, of which, as noted above, \$13,515,000 was charged to property account in 1918. The annual rental is figured without the full interest on capital expenditures made in 1918, and the 1919 rental, therefore, will not only include interest on this amount for one year and on the additional amount spent in 1919, but will also include a certain amount of the 1918 interest not as yet determined upon.

The personnel of the Norfolk & Western was little disturbed by the change to government operation, except that N. D. Maher, president of the road in 1917, resigned in June, 1918, to accept the regional directorship of the newly

created Pocahontas Region. A. C. Needles, who had been vice-president in charge of operation, was appointed federal manager. The imperative need for adding in every way possible to the facilities for carrying coal, recognized so fully by the corporation, led the Railroad Administration to authorize expenditures for maintenance which were probably limited only by the need for maintenance work and by the availability of men and materials.

The total maintenance of way expenses in 1918 amounted to \$9,525,000, an increase of \$3,348,000 over 1917, or 54.21 per cent. There was \$1,370,000 spent for ties, an increase of 97.80 per cent over 1917. Roadway maintenance cost \$1,455,000, an increase of 102.77 per cent. Track laying and surfacing cost \$2,011,000, an increase of 68.55 per cent. The Norfolk & Western has been one of the roads which, following the permission and suggestion of the Interstate Commerce Commission, has in recent years been charging depreciation on structures. It is particularly interesting, therefore, to note that the Railroad Administration has continued this practice and has, apparently, approved of the rate of depreciation determined upon by the company, since under the administration the charges for depreciation are fairly close to the charges made by the company, although in the case of station and office buildings, the administration has made a considerably larger appropriation than the company did. The maintenance of way expenses per mile of road averaged \$4,563 in 1918 as against \$2,960 in 1917. The Norfolk & Western, operating 2,087 miles of road, has 557 miles of second track and 1,410 miles of siding and yard tracks, but even with this large proportion of other than first tracks, the maintenance charges in 1918 appear to be generous.

Maintenance of equipment cost \$21,273,000 in 1918, or \$9,221,000 more than in 1917. The Norfolk & Western has maintained its equipment in first-class condition, and an increase of 76.51 per cent in maintenance of equipment expenditures seems high. In maintenance of equipment as in maintenance of way, the Railroad Administration apparently accepted the rate of depreciation used by the company as substantially correct and made charges only a little higher in 1918 than in 1917. The repairs, including depreciation and retirements of equipment per unit in 1918 and 1917 were as follows:

	1918	1917
Steam locomotives (freight).....	\$9,220	\$4,681
Electric locomotives (freight).....	21,179	16,254
Steam locomotives (passenger).....	8,154	4,397
Passenger train cars.....	1,679	1,006
Freight train cars.....	198	123

The increase in transportation expenses was large—38.11 per cent. The freight business handled in 1918 was less, measured either in number of tons or ton miles, than in 1917, and the passenger business handled was more only because the average length of passenger journey was longer in 1918 than in 1917, the number of passengers carried being less last year than the year previous. The transportation expenses that stand out as having greatly increased are yard enginehouse expenses which amounted to \$434,000 in 1918 or to more than twice as much as in 1917; train enginehouse expenses which amounted to \$1,663,000 in 1918, an increase of nearly 90 per cent; and loss and damage to freight which amounted to \$420,000, an increase of 76 per cent.

The character of traffic handled did not change greatly except for the falling off in tonnage of lumber and of bituminous coal. Of the total 51,404,000 tons of freight carried in 1918, 58.77 per cent was bituminous coal and 4.46 per cent lumber. In 1917, of the total 53,089,000 tons of freight carried, 60.18 per cent was bituminous coal and 5.62 per cent lumber.

The Norfolk & Western was able to maintain the high

standard of train load and car loading that had been set for it under private management. The train load averaged 1,041 tons in 1918, an increase of nearly 20 tons over the previous year, and the average loading per loaded freight car was 37.37 tons in 1918, an increase of 2.50 tons or 7.17 per cent over 1917. The Norfolk & Western has 1,669 100-ton capacity gondola cars, but even so, an average car load per loaded car of over 37 tons is quite remarkable.

The following table shows the principal items of income and expense for operation of the property under federal management, in 1918 as compared with 1917. It must be remembered that this is not the income account of the corporation:

	1918	1917
Mileage operated	2,087	2,086
Freight revenue	\$68,752,260	\$56,381,036
Passenger revenue	10,237,600	7,023,153
Total operating revenues	83,004,034	65,910,247
Maintenance of way and structures	9,524,659	6,176,369
Maintenance of equipment	21,273,002	12,051,912

## New Books

*Test of a Flat Slab Floor*, by Arthur N. Talbot and Harrison F. Gonneman. Bulletin No. 106, Engineering Experiment Station, University of Illinois, Urbana, Ill. Price, 25 cents.

The tests reported in this bulletin have the distinction that they were carried practically to destruction, this being possible because the building in which they were made was about to be removed to make room for the new Chicago Union Passenger Station. Because of this, and the fact that the concrete was afterwards broken away so as to expose the exact position of the reinforcement, it was possible to learn more concerning the action of flat slab floors under heavy loads than in previous tests. The conclusion reached by the authors, tends to confirm the more generally accepted assumptions on flat slab design; and, to use their own words "should give added confidence in the suitability and reliability of flat slabs as a load carrying structure."

*Boston & Lowell, Nashua & Lowell, and Salem & Lowell, Railroads*. By F. B. C. Bradlee. 64 pages, 6¼ in. by 9¼ in. Illustrated. Bound in cloth. Published by the Essex Institute, Salem, Mass.

This is a well written monograph filled full of interesting data, gossip and local miscellany concerning the railroads named, and with much collateral local matter concerning railroad life in Eastern Massachusetts from 1830 down to the time that these roads were absorbed in the Boston & Maine System. The illustrations consist of portraits of prominent railroad officers of that time and reproductions of timetables, pictures of old locomotives, etc. The Tyler switch, an attachment to stub switches to prevent derailments, was in use as early as 1850. Interlocking, however, was not even thought of. At Lowell, where the Nashua & Lowell joined the Boston & Lowell "a lantern in the night placed on the switch frame shows the switch is wrong. Absence of lantern signifies the switch to be right." Block signaling also, had not been heard of, and the author tells of the practice—name of road not given—of keeping trains apart by a show of fingers. The station agent held up to the engineman as many fingers as would indicate the number of minutes which had elapsed since the passage of the last preceding train.

## Letters to the Editor

### Standard Freight Car Repairs

PITTSBURGH, PA.

TO THE EDITOR:

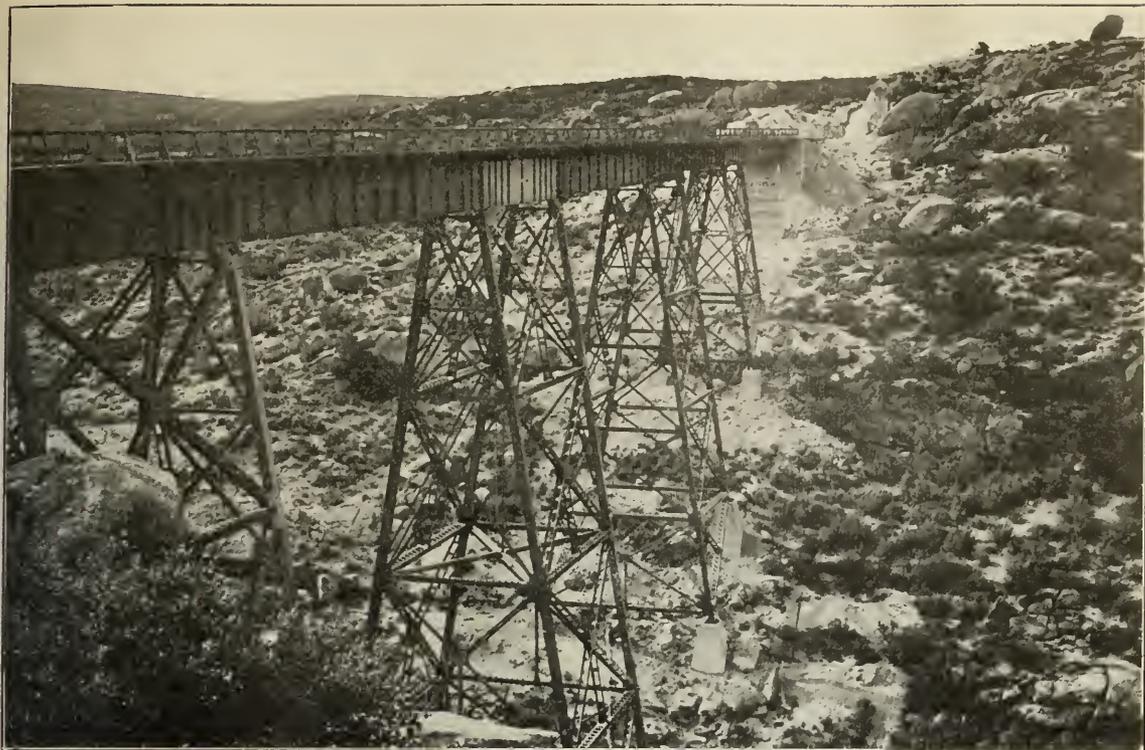

I have read with interest the article written by a Mechanical Engineer on Government standards for freight car repairs, published in the *Railway Age* of February 28, page 487, and I wish to first note that Mechanical Department Circular No. 8, in my opinion, is a step in the right direction. The requirements, however, in some parts may be thought by some engineers to be a step too far; but if there are any mistakes in these requirements, the proposal to use friction draft gears in repairing old cars is not, in my opinion, one of them. I am sure that a friction draft gear is a good thing upon new cars, and it is doubly necessary upon old cars that are in constant use, mixed up with new cars.

The conclusion of the writer of the article above mentioned is that spring draft gears are a better appliance for old cars that are repaired with draft arms. I wish to point out what I think to be a fact in regard to the use of friction gears in connection with draft arm appliance to wooden underframes. The writer says that draft arms have proved satisfactory. I am sure that this has been the case, but if, as he says, draft arms have proved their worth with the use of spring gears, they have also doubly proved their worth with the use of friction gears. So far as the car being better protected with a spring gear when the line of draft is below the sills, as when draft arms are applied to wooden underframe cars, I am sure if a little thought is given to this, the error of this conclusion will be appreciated. All of the draft arms which I have seen are of greater strength than the final force necessary to close any friction draft gear recommended by the authors of Circular No. 8 and the statement that after the spring gear goes solid the horn of the coupler will transfer the line of force more nearly to the center of the sills is probably true if the support for the horn of the coupler is strong enough; but as it usually is made of a block of wood or of metal supported by wood, it soon is pounded back and the draft arm gets all of the force even after the draft gear has gone solid. The M. C. B. recommended practice of making the draft arm extend 30 in. or more behind the center line of bolster makes the draft arm of sufficient strength to well support the downward tendency of the average wooden car.

The small capacity of a twin or tandem spring draft gear gives practically no protection to the car and as soon as this spring gear goes solid the underframe or sills of the car must absorb the balance of the energy in an impact between two cars. This remaining energy often is enough to cause several hundred thousand pounds' pressure on the end of the car; while if a car of this description is equipped with a friction draft gear having three or four times the capacity of the spring gear there will be many shocks that would overstrain the car equipped with the spring gear which would not close the friction gear and thus the end force would be kept below that necessary to close the friction gear. In any case if the force of impact was enough to close the gear, the line of draft would be the same in both cases, that is, on the center line of draft, after the horn of the coupler had imbedded itself into the striking block. I, myself, think that those who originated Circular No. 8, which recommends friction draft gears, took a step that is bound to protect cars and their lading.

*Campo Creek Viaduct*

## Heavy Railway Construction Along Mexican Border

San Diego & Arizona Is Driving 17 Tunnels in 11-Mile Gap  
Nearing Completion in 148-Mile Line

THE SAN DIEGO & ARIZONA RAILWAY is now completing a line extending east from San Diego, Cal., 148 miles to a connection with the Southern Pacific at El Centro, which involves an expenditure of approximately \$16,500,000 and includes some exceedingly heavy and difficult construction work. This line, which provides a direct eastern outlet for San Diego, is owned half by the Southern Pacific and half by J. D. and A. B. Spreckels. Its construction was undertaken 12 years ago, but its completion has been delayed by a series of unexpected obstructions so that progress has been slow until the past year.

Leaving San Diego, the road passes in a southerly direction for a distance of 15 miles to Tijuana, where it enters the Republic of Mexico. It then turns in an easterly direction, generally parallel to the International border, passing through Mexico for a distance of 44 miles before again entering California at Lindero, from which point it continues to El Centro, 148 miles from San Diego, where it connects with the Southern Pacific line in the Imperial Valley. The road is now completed from San Diego to the head of Carriso gorge, a distance of 98 miles and from El Centro to the foot of Carriso gorge, a distance of 39 miles, leaving 11 miles yet to be completed in the gorge.

The construction through this gorge involves some of the most expensive railway work that has ever been undertaken in the United States. This 11-mile section contains 17 tunnels, ranging from 180 ft. to 2,650 ft. in length, and

with an aggregate length of 13,392 ft., while the line between the tunnels is carried on a bench cut in the side of the mountain from 250 ft. to 350 ft. above the bottom of the gorge. This heavy work is compensated for in a measure by the contour on the western end of the line where it crosses a level plain for 30 miles.

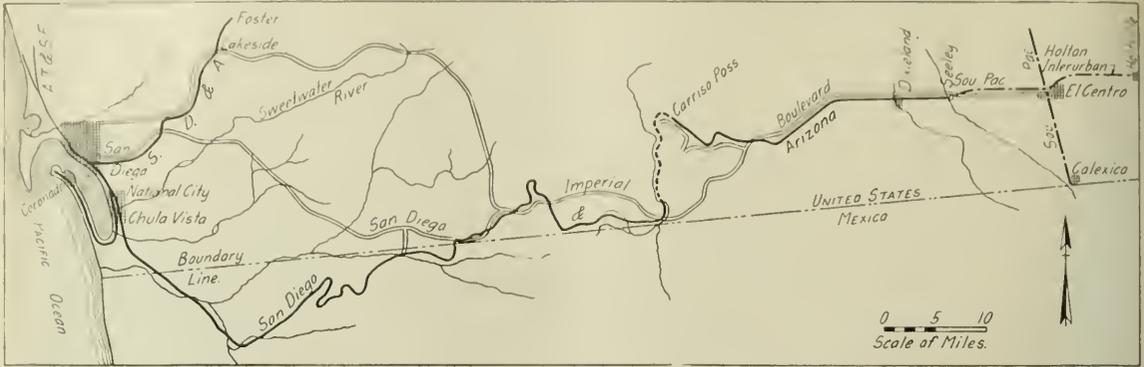

Starting from San Diego the line rises on a practically continuous grade for 85 miles to the summit which is at an elevation of 3,657 ft. above sea level. The maximum grade eastbound is 1.4 per cent which is practically continuous for 47 miles. Westbound the line rises from an elevation of 44 ft. below sea level at Seeley, 10 miles west of El Centro, with a maximum grade of 2.2 per cent for 15.28 miles near the foot of the slope and again for 6.91 miles at the summit and with a 1.4 per cent grade for 15 miles between. This line through the gorge possesses unusual scenic attractions, the coloring resembling that of the Grand Canyon of the Colorado in appearance. The section of the line through the gorge will be protected by block signals.

The completion of this line will enable through train service to be inaugurated between San Diego and the East in connection with the Southern Pacific and its eastern connections and will form a new transcontinental line into San Diego, effecting a saving in distance of approximately 135 miles between Chicago and San Diego. This line also affords a direct outlet for the Imperial Valley of Southern California, one of the most productive valleys in the world. The

area now under irrigation in this valley is 523,000 acres while the acreage under cultivation is 400,000. An additional 100,000 acres are "under the ditch" but not yet actually irrigated while approximately 100,000 acres are now under cultivation across the line in Mexico. The total irrigable area in this valley is 800,000 acres while 200,000 acres additional can be reached by pumping. In January, 1901, there

and lemon culture. This purchase also includes a line from San Diego to Coronado and to North Island, the government army and navy flying field being located at the latter point.

The San Diego and Arizona Railway line crosses the Laguna range in the passage of which it traverses some exceedingly rugged country requiring heavy construction, particularly in the vicinity of Carriso Pass as referred to above.

Map Showing the Location of the San Diego & Arizona

was no white man in the Imperial Valley. Today it has 10 towns and a population of 50,000. The crops for 1918 were valued at \$40,000,000, and included 11,330 cars of barley, 3,300 cars of corn, 32,540 cars of hay, 1,925 cars of cotton, 3,560 cars of canteloupes and 1,100 cars of cattle.

Much of the traffic from the Imperial Valley will move to San Diego for export to China and Japan and for loading on seagoing vessels for shipment through the Panama Canal, San Diego being the nearest port in the United States to the canal. The city of San Diego has recently completed a municipal dock with 53,200 sq. ft. of floor area and other docks are soon to be built to handle this export traffic.

In October, 1917, the San Diego & Arizona Railway pur-

Through this pass the maximum grade was held down to 1.4 per cent because the cost of reducing this at a later date would be prohibitive. Elsewhere grades up 2.2 per cent were permitted. The maximum curvature on the permanent line is 10 deg.

In the section between Jacumba and Carriso gorge there

A Section of the Line in Mexico

Interior of a Timber Lined Tunnel

chased the San Diego & Southeastern Railway, with 43 miles of line serving the country immediately tributary to San Diego, including El Cajon Valley, noted for its raisin, orange

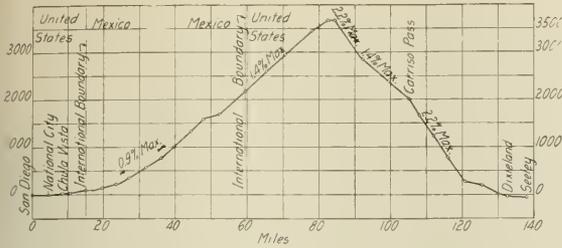

are 17 tunnels with a total length of 13,392 ft. Of these, two are about 2,650 ft. long, and about 1,200 ft. respectively and the remaining 15 are between 180 and 900 ft. in length. Although the rock was quite hard, the formation was loose so that 75 per cent of the total length in tunnel required timbering. In Carriso gorge itself there was ten miles of almost continuous rock cut so that altogether the section of the line near the pass had exceptionally heavy construction costs. Another item of additional cost, resulting from

the rugged territory traversed, was the fact that no road had previously been built along the route followed by the railway. A wagon road, therefore, had to be constructed on

Campo Creek which is 580 ft. long and 180 ft. high, costing \$112,000. In planning for the placing of the large girders of this structure an ordinary locomotive crane had been provided with a 60-ft. boom, reinforced with cables and set up on a freight car to which the locomotive crane truck was attached. When the towers were completed an endeavor was made to place the long girders, holding them steady in the wind by means of block and tackle attached to each end.

Before the work had progressed far it was noticed that as soon as the steel work had been carried up some distance from the ground, a wind velocity was encountered which did not exist near the ground. As the work advanced, this became more serious and caused delay. Even the painting was held up by the high winds.

The first attempt to erect the girders was unsuccessful, because of the wind and it was decided to await more favorable conditions. The wind proved to be almost continuous however during daylight hours at least, and the attempt was repeated many times before the girders were finally set. When this was accomplished 300 hr. time had been charged against the locomotive crane in the work of handling the girders,

Profile of San Diego & Arizona

which to bring in supplies. The cost of the roadway serving this section of the line was about \$100,000.

In one instance a compressor plant for construction purposes was located at the bottom of Carrizo gorge, the ma-

A Section of the Line Under Construction in Carrizo Gorge

chinery, lumber and other materials for which had to be hauled in over the wagon road and then over another road built down the side of the mountain to the site of the plant, for there was not sufficient space available to erect the plant on the side of the mountain. At this point the railroad is about 700 ft. above the bottom of the gorge.

The largest structure on the line is a steel viaduct at

instead of the 40 or 50 hr. that would have been sufficient had it not been for the high winds.

The same difficulty with wind affecting other parts of the work so delayed the erection of the viaduct that the construction required three times what it should have under ordinary conditions; that is, the viaduct required 6 months for completion instead of 60 days.

In designing this viaduct, it was decided to use 100-ft. girders on one of the spans and to lift them bodily into position. Considerable interest attached to the job because no girders of equal length had previously been so placed on the lines of the Southern Pacific.

The viaduct has a total length of 580 ft. and consists of six spans, two of which are 80 and 100 ft. long respectively. At the central point the track is about 180 ft. above the bed of the stream, the highest tower having a base length of 50 ft. parallel to the track. The towers were designed to be self-sustaining during construction and were erected by the usual structural method, piece by piece. Materials were delivered to the site of the viaduct by motor truck, and were hoisted by

a donkey engine with two lines running to a carrier on a cableway spanning the viaduct site.

At the present time it is expected that the entire line will be completed and placed in operation during the latter part of the coming summer. The tunnels in the 11-mile section remaining unfinished are over 75 per cent completed. The shops, engine houses and other buildings necessary for operation are nearly ready while work on the remaining buildings will be undertaken within the next few weeks.

This line is being built under the direction of J. D. Spreckels, president; D. W. Pontius, general manager, and E. J. Kallright, chief engineer. We are indebted to Mr. Kallright for the information contained in the above article.

## Railroad Purchases as a Stabilizer of Business

### Fluctuations and Uncertainties Seriously Affect General Industrial Situation

By F. B. Ernst

**A**N AVERAGE annual purchase of materials and equipment by the railroads of the United States would assist appreciably in the stabilization of business. Under their own control, railroads, like individuals, bought when they had money and curtailed drastically as soon as earnings began to decrease. No other alternative was open to railroads of uncertain financial standing and in recent years it has been necessary even for roads in stronger positions to follow this plan due to the greater difficulty of obtaining money and

in the *Railway Age*. Consider, for the purpose of illustration, freight cars only. The great variation from year to year in the number of these cars purchased is amazing. The greatest variation is shown during the period from 1905 to 1908, when from more than 340,000 cars purchased in 1905 the number decreased three years later in 1908 to less than 65,000 cars—18.4 per cent of the number purchased three years before. While this is somewhat extreme, the chart shows a series of wide fluctuations from "feast to famine"

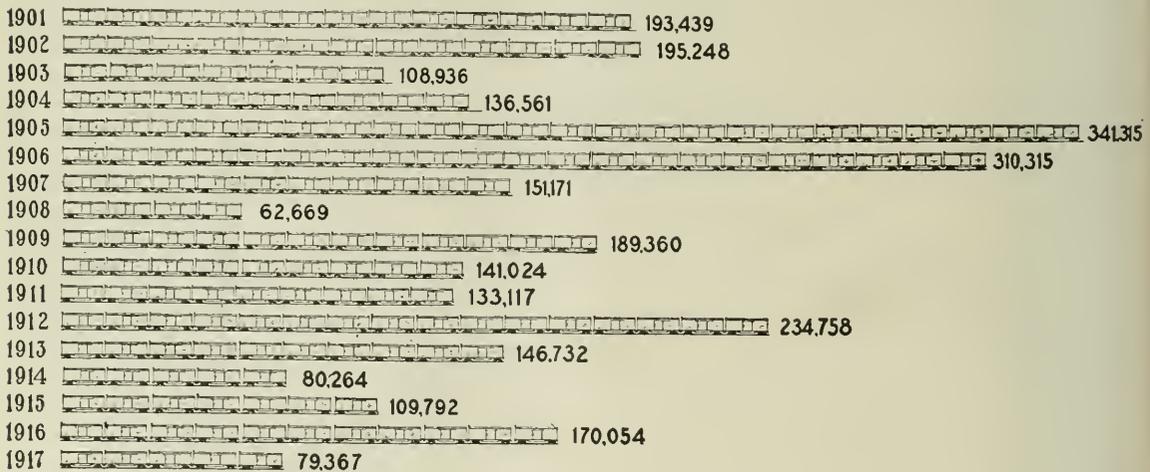

Chart No. 1—Showing Graphically the Number of Freight Cars Ordered for Domestic Use During the Past 17 Years

the none too friendly attitude of the public. During times of depression in business few cars were purchased, while during boom times cars were ordered far beyond the capacity of the carbuilding plants. A more uniform program of buying alike over good and bad times would have resulted in considerable economy and great industrial advantages to the manufacturers and employees as well.

In Charts Nos. 1, 2, 3 and 4 are shown the number of freight cars, passenger cars, and locomotives purchased and built per year during the period 1901 to 1918 inclusive. These charts were prepared from statistics published yearly

over the entire period of 19 years. The difficulties of the manufacturer in regulating his organization to meet these fluctuations and the disadvantages to the railroads of operating on this basis are apparent.

#### The Manufacturers' Problems

The manufacturer during normal or boom times builds up a complete organization and the shops are operated to full or even beyond their rated capacity. A year or two later there may be only sufficient work to operate the plant at 50 per cent, or even 30 per cent of capacity. This necessitates

the laying off of a great number of men and disrupting the organizations which had required years to build up. Entire communities surrounding large carbuilding or railway specialty plants are in a state of depression; the workmen who had become trained in the carbuilding industry must seek employment in other lines. These men are naturally not available a year or two later when the plants are again

railroads, to take care of their normal business, is approximately 170,000 freight cars. While the tonnage to be hauled increases from year to year, this has been largely provided for in the larger capacity of the individual units of equipment and the greater efficiency, at the present time, in the method of handling freight.

To meet this annual program of car construction the car-

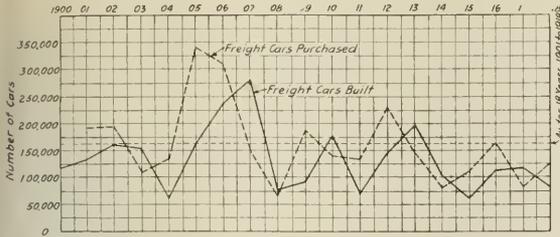

Chart No. 2—Showing Variations in the Number of Freight Cars Purchased and Built During the Past 19 Years

placed in operation, and it is necessary to train new and inexperienced men for the work.

The conditions are unfair to the men in that their work is not permanent and their living is transient. Difficult

TABLE NO. 1—FREIGHT CARS ORDERED AND BUILT FOR EACH YEAR SINCE 1901

Year	Domestic orders per year	Cars built per year
1899	.....	117,982

1917	1,167	1,969
1918	131	1,481

building capacity of the United States should be approximately 170,000 cars per year. As a matter of fact the capacity in the United States is almost double this figure, made necessary in providing for the larger number of cars

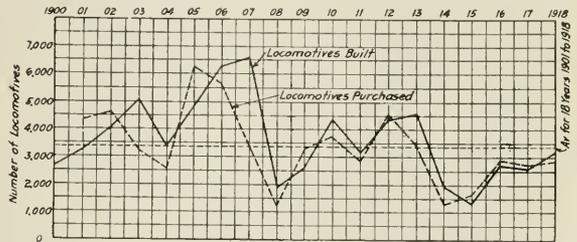

Chart No. 4—Showing Variations in the Number of Locomotives Purchased and Built During the Past 19 Years

financing is necessary and workmanship, particularly of new men, in the rush of plants running beyond their rated capacity, naturally is not satisfactory. With a more uniform output, the same laborers would continue in one line of work,

ordered during prosperous years. This excess represents an economic waste, as many of these plants stand idle during all but boom times. If, however, a definite number of cars were ordered each year the carbuilding industry could adjust

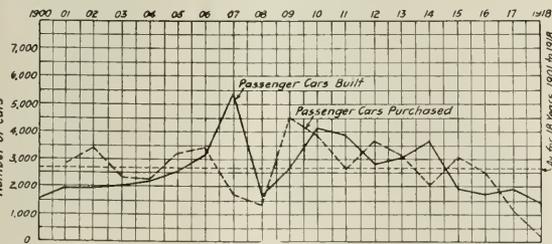

Chart No. 3—Showing Variations in the Number of Passenger Cars Purchased and Built During the Past 19 Years

become more efficient, and a better class of work and lower costs would result. Carbuilding companies would benefit further in having uniform financial obligations from year to year.

The average number of freight cars purchased for the entire 19-year period, 1901 to 1918, including the lean years at the opening of the war, was 161,635 per year. Assume for the purpose of illustration that the yearly requirements of the

TABLE NO. 3—LOCOMOTIVES ORDERED AND BUILT FOR EACH YEAR SINCE 1901

Year	Domestic orders per year	Locomotives built per year
1899	.....	1,951
1900	.....	2,648
1901	.....	3,384
1902	4,340	4,665

1915	1,612	1,250
1916	2,910	2,708
1917	2,704	2,585
1918	2,802	3,668

itself to take care of the normal amount of equipment required and there would be eliminated the overwhelming peaks of prosperous times and the discouraging recessions of poor times. Inasmuch as the carbuilding plants on this basis could operate more economically, the results would

eventually be lower prices to the railroads, better workmanship and more uniform equipment.

### How the Railroads Are Affected

The situation from the standpoint of the railroads is equally unsatisfactory. With business at a low ebb, the railroads contribute further to this depression by withholding orders and depriving themselves of the great tonnage incident to the building of cars and locomotives. This tonnage at such times could be hauled at little additional expense, as train crews must be maintained and cars and locomotives are available. With the freight movement below normal, this additional tonnage would come when badly needed and would increase very materially gross and net receipts. As it is, large numbers of cars and locomotives stand idle, and there is not sufficient freight fully to utilize the carrying facilities of the roads.

A year or two may pass. The country may then enter on a period of increased business activity. The railroads find themselves confronted with great quantities of freight to be moved and do not have the necessary equipment to move it, owing to the fact that during the two or three previous years of depression few new cars or locomotives were built and the equipment on hand had not been kept in good repair. The railroads are embarrassed and the business of the country is handicapped by the fact that the roads do not have sufficient equipment for moving the freight that is offered. Yards and terminals are congested, and as a consequence freight not only moves slowly but is carried uneconomically. All the roads enter the market for cars and locomotives and, allowing for the time required to build up new organizations in the carbuilding plants, train new men, and secure materials, most of the cars are not actually available for service for six months or even a year after they are ordered.

In Chart No. 2, it may be seen that the peaks and depressions of carbuilding occur about six months to a year later than the corresponding peaks and depressions of car buying. If there had been uniform annual buying, equipment ordered during poor times would be immediately available for the increased tonnage resulting in boom times. To the already over-burdened roads is now added the great quantities of material required in the building of equipment. This additional tonnage comes at a time when it is not needed by the roads already operating at 100 per cent capacity. In fact, the additional revenue obtained is largely given out in overtime and premiums which must be paid because of the roads operating on an over-capacity basis. It would have been infinitely better if the railroads could have had this extra freight at less prosperous times when they were badly in need of tonnage.

### Effect Upon Allied Industries

The building of railroad equipment in poor times would stimulate many other dependent lines, as in the building of ordinary freight cars there are required considerable quantities of structural steel, cast steel, forged steel, malleable iron, cast iron, lumber, brass, springs, bolts, nuts, etc. In an ordinary 50-ton steel gondola car, for example, there would be required about 12 to 15 tons of structural and plate steel. In connection with the manufacture and use of this steel, pig iron, coal, coke, limestone, scrap and other ingredients, representing several times the tonnage of the finished steel, must be handled by the railroads. Stimulation of these various lines of industry, dependent upon the steel industry, likewise stimulates other lines in turn dependent upon them, so that the effect is far-reaching in its fan-like extensions to the various dependent lines.

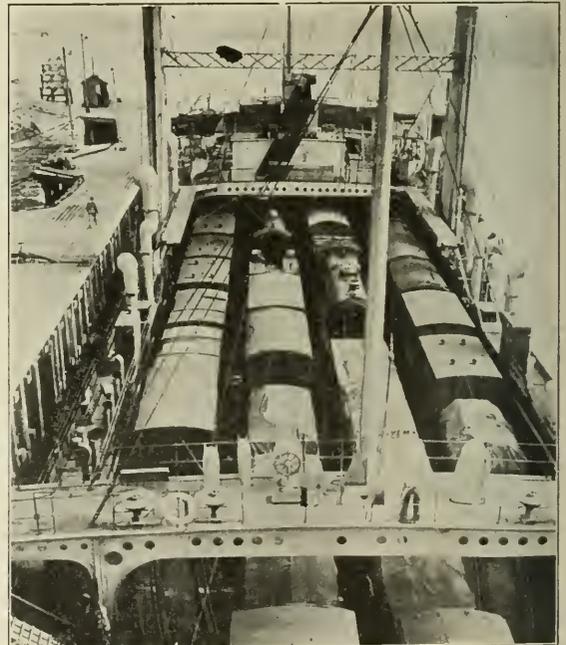

It is estimated that in the manufacture of steel castings, such as couplers, bolsters, side frames, wheels, etc., the tonnage of raw materials, etc., to be hauled is three to four times the weight of the finished product, and it would probably not

be far wrong to assume that a finished freight car weighing 20 tons, would be productive of not less than 60 to 80 tons of freight to the railroads. Stimulation of other dependent manufacturing lines would add materially to this figure. On this basis, the total tonnage involved would help considerably during periods of depression and would also be of material relief to the railroads in freeing them of this additional tonnage during boom times when it is not wanted.

The above discussion has dealt largely with freight cars, and incidentally with passenger cars and locomotives; that is, with motive power and rolling stock. The plan would apply equally as well to the maintenance of way department, as well as shops, roundhouses and terminals, and would add to the stabilizing effect which the railroads could exert.

The principal reason why railroads when under their own management, did not avail themselves of the advantages of a more uniform program of purchasing, was, in most cases, that of finance. Even those roads that were financially able, as a rule followed the conservative curtailment which always accompanies periods of uncertainty and depression. While the carbuilders of the United States, now operating largely on the recent lot of Railroad Administration cars, still have a reasonable amount of work ahead, many of the railway supply companies have already begun to curtail operations, with apparently no relief in sight in the way of new orders which will be available in time to prevent practical shutdown. Carbuilders will be in a similar position a few months hence.

Whatever the future of the railroads, the government should continue to exercise supervision that will perpetuate certain practices in administration and operation that have unquestionably proven of value. To these should be added some plan providing for more uniform annual purchases of equipment and supplies. The idea of equalized purchases by the railroads could be extended to a much broader field, in fact, to the government itself, and the opportunities are such as possibly to justify a branch of "Business Stabilization" in some one of the departments at Washington.

## Prices Recommended by Industrial Board of Department of Commerce Still Under Discussion

WASHINGTON, D. C.

THE CONTROVERSY over the price to be paid for steel, which also involves the entire question of the policy to be pursued by the Industrial Board of the Department of Commerce, has occupied the attention of a large part of official Washington during the past week. The question of steel prices, and particularly the prices to be paid for rails, was discussed at a meeting of the Industrial Board on Saturday, April 5, with R. S. Lovett and Henry Walters, members of the Advisory Committee on Purchases of the Railroad Administration, H. B. Spencer, director of the Division of Purchases, and Commissioner McChord of the Interstate Commerce Commission, at which the railroad representatives presented arguments for lower prices for rails than those of \$45 and \$47 a ton agreed to by the Industrial Board, but no conclusion was reached. Director General Hines also discussed the subject with George N. Peek, chairman of the Industrial Board, on Tuesday, but no conclusion was reached and another conference was arranged for Thursday, at which it was hoped some definite development would be reached.

Mr. Peek had issued a statement on April 4, denying that the board had adopted hard and fast policies that would not be subject to change under any circumstances. "I have never said or intimated that the Industrial Board would stand pat on the prices formulated with the steel industry no matter what objections were brought up by other departments," Mr. Peek said. "Shown a good and sufficient reason for doing so, the board will reconsider." One of the principal points made by the Railroad Administration is that the Industrial Board had officially announced the steel price schedule over the protests of the Railroad Administration and before such reconsideration. The Railroad Administration has been studying the figures on steel production costs as compiled by the Federal Trade Commission and believes that the prices announced are too high to offer it any inducement to enter the market.

On the other hand it is understood that the Industrial Board has laid before the Railroad Administration data showing that of the five principal steel companies involved in the production of rails, two have production costs in excess of the rail prices agreed upon, two can produce at the price without counting overhead, and one, which has an output exceeding by more than 50 per cent the combined production of the other four, can produce at a cost low enough to show some profit at the price named, but a narrower margin of profit than it received during the pre-war period. It is understood that the steel companies also have stated to the board that in some instances the rails produced during the past year on pre-war contracts have been delivered at a loss to the steel companies.

Railroad men, however, point to the fixed price of \$28 a ton which prevailed before the war as having given the steel companies a handsome profit for years. The Federal Trade Commission's figures show that the U. S. Steel Corporation's cost for producing rails in October, 1918, was \$40 a ton, for open-hearth, including \$4 of inter-company profits, so that \$47 a ton would give a profit of \$11. E. H. Gary was quoted in a New York paper on Tuesday as saying the cost in January was \$40 for open-hearth and \$46 for Bessemer. The price for steel billets named by the Industrial Board was \$38.50 a ton, and it has been calculated that adding 50 per cent more than the pre-war differential to this would give \$41.36 as a price for open-hearth rails.

As a result of the conference of the representatives of the government purchasing departments with the Secretary of the Treasury and the Secretary of Commerce on April 2, the entire question of the policy to be pursued by the Industrial Board was reopened for further consideration. The vague statement issued by Secretary Glass at the close of the conference indicated that this would be done, but it was amended later in the evening by Chairman Peek of the board to indicate only that the question of steel prices was to be further discussed with the Railroad Administration. Secretary Glass made it plain on the following day that Mr. Peek's amendment of the statement was unauthorized. The entire plan of price stabilization in an effort to stimulate industry was originated by Secretary Glass, who turned it over to Secretary Redfield to carry out. The controversy which has arisen, with Secretary Glass and the Railroad Administration on one side and Secretary Redfield and his Industrial Board on the other, springs from a difference of understanding as to the function of the board, as well as over the price of steel. The Railroad Administration and Secretary Glass understand that it was appointed to act as a mediator rather than as an arbitrator, to attempt to bring about an agreement with the producers on prices which would be sufficiently attractive to the government purchasing agencies, of which the Railroad Administration is the largest buyer, to induce them to buy freely on the assumption that the general public would regard the prices accepted by the government as fair. The first public statements regarding the formation of the board bear out this idea, but apparently the board had a larger view of its authority and assumed to establish official prices. T. C. Powell, director of the Division of Capital Expenditures of the Railroad Administration, and its representative on the board, distinctly notified the board that the Railroad Administration would not buy steel at the prices fixed. The Railroad Administration takes the position that until a price was reached which would be satisfactory to it, the board had failed to accomplish its intended functions and that there was nothing to announce, but the board gave out a scale of prices, proposed by the steel interests and somewhat modified by the board, as the official scale, while Mr. Powell's membership on the board created the general impression that the Railroad Administration was a party to the agreement. The fact was that the announcement was not made until nearly two weeks after the prices had been announced nor until after the administration had come in for considerable criticism for its failure to give effect to the plan by placing orders at the prices fixed.

On January 1 there were on order undelivered about 1,100,000 tons of rails, which were being delivered at the rate of about 40,000 tons a week. This has now been reduced to about 35,000 tons, as one of the steel companies has completed its orders and another company will soon be out of orders.

At this rate the administration still has about 600,000 tons to come, which would run till about September 1.

The question of steel prices as affecting the Navy Department has also come up. Acting Secretary of the Navy Roosevelt announces that under the laws the department is required to advertise for bids, but when bids were opened on April 4 for a considerable tonnage of structural steel they were all found to be based on the prices announced by the board, and the department has not yet announced its acceptance or rejection. The Shipping Board has announced

its acceptance of the scale as a basis for future contracts, but stated that few new contracts are now being let because its requirements have been so largely contracted for ahead. The War Department has asked for bids on coal to be opened on May 7.

In relation to sand, gravel and crushed stone, the Industrial Board has announced that owing to the large number of firms and individuals engaged in the business, and the local character of their operations, competitive conditions within the industry are so definite and persistent that nothing more can be done by the board than to recommend a continuation of the practice of competitive bidding in governmental purchases.

The Railroad Administration was also criticized by the National Coal Association for not awaiting the action of the board before proceeding to make purchases in the open market under competitive conditions. It is understood that Mr. Hines takes the position that he can manage his own purchases without the assistance of the board and that it has no purpose unless it can secure better prices than he can. Under the theory that the board should act as an arbitrator of prices, he regards the plan as illegal and it is understood that the Department of Justice takes the same position, although the question has not yet been put up to it in concrete form. Secretary Redfield cabled to the President asking him to instruct the government departments to accept the board's prices, but there have so far been no indications that the President would intervene in any way.

Pending the settlement of the steel price question, a decision in the controversy with the coal association has also been held in abeyance while the administration continues to pursue its policy in negotiating for coal without reference to any proposed price-fixing. This has led to the issuance of various statements by both sides. Mr. Hines on April 3 issued a statement which was in effect a reply to the coal operators' charge, in which he referred to "the interesting fiction that the Railroad Administration is conducting its purchase of coal in such a way as to force producers to sell to it below the cost of production, thus in turn forcing them to increase their prices to the rest of the community."

"The assertion of this fiction," he said, "seems to carry with it the suggestion that in order to prevent the Railroad Administration from accomplishing this purpose, it is important to find a way to remove all competition in bidding for such government business and instead to fix in the respective mining districts uniform prices at which all producers would be willing to sell and at which the Railroad Administration would have to buy. The remedy thus suggested for this fictitious evil would, of course, have the result of giving the coal operators the relatively high prices fixed without any competition, which they could use as a basis for selling to the general public, so that the element of competition would fade from the picture and virtually the whole consuming public would be paying prices which in the aggregate would be far in excess of what would be necessary to maintain existing wages and pay sufficient profits.

"While it hardly seems necessary to do so, I wish to give the country the assurance that the Railroad Administration has no such unjust and shortsighted purpose as to force producers to sell below cost or impose a burden on the rest of the public. There is no institution—public or private—in the country that has a greater interest in the promotion of prosperity than the Railroad Administration has, because the more the business of the country increases the more net revenues the Railroad Administration will enjoy. At the same time I believe it would be opposed to the interests of the general consuming public, as well as of the government, to forego absolutely all benefits of competition and buy coal for the government at unnecessarily high prices, which in turn will immediately become the standard prices for all

purchasers. Such a course would have a strong tendency to continue to preserve in the present period following the war, profits having entirely too strong a resemblance to the extraordinary profits which were realized during the war."

As an illustration of the caution which the Railroad Administration is observing in this matter, Mr. Hines said, it has established the policy that each railroad shall buy its own coal, thus avoiding any greater concentration of purchasing power than existed under private management. It has also instructed that in purchasing coal, railroads must take into consideration the director general's policy to make as wide a distribution of the tonnage bought as conditions will permit, considering quality, transportation and price, at the same time confining so far as practicable, purchases to producers on the individual roads. It has also directed that no railroad should accept any bid which would involve the cutting of the existing scale of mining wages. It has further provided that coal prices actually contracted for shall not be secret, but shall be available for the information of any interested coal operator and also of the miners. Very few specific instances have been brought forward of failure on the part of any railroad to observe these policies, and the complaints which have been brought forward have been and are being properly adjusted. Most of the complaints appear to have been made to the press rather than to the Railroad Administration.

"It must be remembered that the purchasing power immediately available of the Railroad Administration with respect to coal is by no means as great as is generally assumed in discussions on this subject," Mr. Hines added. "To a large extent the Railroad Administration's current supply of coal must be taken on unexpired contracts which were made many months ago and which have yet several months to run. Again, the volume of coal currently consumed by the Railroad Administration at the present time is decidedly below the normal, because in the present readjustment period the business handled is below normal. A further factor which cannot be ignored is that the railroads, like enterprises generally, stored unusually large quantities of coal last April to be prepared for the exigencies of a long continued war. To meet the present situation the railroads are using this stored coal with caution so as not to interfere unduly with current coal production, but a considerable storage of coal still exists, which eventually will have to be used by the railroads."

The National Coal Association then issued another statement, saying that a request that all bids on railroad coal be made public had been refused and that the only information made public is as to the price at which the business is finally placed. "Despite the director general's public statement of February 19 that this information would be available to any interested party," the statement added, "it has been refused coal operators and their accredited representatives as late as the 28th day of March on the ground that local representatives of the Railroad Administration have no instructions to give out such information.

"In short, the bituminous coal operators have endeavored to obtain the co-operation of the United States Railroad Administration in an effective manner to deal with a question which they consider of vital interest to the general public. The Industrial Board appears to them to afford a medium by which a practical solution of the difficulties could be obtained with all the rights and interests of the general consumers of coal entirely safeguarded. They are still ready to co-operate with this board and the director general of railroads in what to them seems an eminently broad and sensible program to meet an extraordinary condition."

To this Mr. Hines replied in part as follows:

"It is of the highest importance that every consumer of coal and every person interested in the high cost of living

should understand exactly what is involved in the effort of the National Coal Association to escape competition and get its members again under cover of government prices for coal. The statement issued last night by the coal association makes it perfectly clear that it is trying to prevent competition or, as it euphemistically expresses it, its members have 'declined to discuss prices,' and instead is trying to get some governmental agency to assume the responsibility for naming a uniform price for coal in each district. Such a uniform price will have to be high enough to take care of the greater costs of the high cost producers and thus produce an excessive profit for the low cost producers. The Fuel Administration removed its prices some time ago. The question is whether the public now wants other government prices established so as to continue to keep coal at high price levels which will keep up the cost of living and continue to produce in the aggregate abnormal profits to the coal operators.

"Their present proposal is that the government fix in each district a uniform price (without any opportunity for competition) at which the Railroad Administration and other government agencies must purchase. But the effect of this will immediately be to create a standard which the coal operators will try to maintain in selling to everybody else and the government will be giving its support therefore to a price level which will be unnecessarily high and far more than is necessary to yield a handsome profit for the low cost producers. I firmly believe that any such policy is opposed to the interest of every member of the community who is suffering instead of profiting by the present high cost of living.

"In an enterprise involving the operation of 250,000 miles of railroad and perhaps 150 different railroad organizations, it is natural that there may be specific instances where there will be temporary shortcomings in carrying out the definite policies of the administration. Such shortcomings will be promptly corrected as they arise and will become less frequent as the policy is more clearly understood. But the mere fact that they may arise is no reason why the American public should continue to be deprived of the opportunity for all competition in the coal business and I have therefore been unwilling to comply with the suggestion that the Railroad Administration withdraw requests for bids and instead undertake to buy its coal at uniform prices for the various districts fixed by some government agency."

The Southern Pine Lumber Manufacturers' Association at a meeting in New Orleans on April 2 announced that it had declined a proposal of the Industrial Board that they enter into a joint price agreement. In reply to this, Mr. Peek stated that neither the Southern Pine Association nor any other representative industry has ever been invited to enter into a price agreement, but that they had been invited to co-operate with the board in an effort to stabilize prices by getting industries voluntarily to make prices as low as present cost and labor conditions will justify.

#### Plans for Additional Temporary Financing

The most pressing April 1 requirements of the railroad companies having been met by temporary financing on certificates of indebtedness issued by the Railroad Administration, the committee representing the Association of Railway Executives, of which Howard Elliott is chairman, has been conferring this week with Director General Hines, the War Finance Corporation and the bankers, on the measures to be adopted to take care of the further requirements until the Railroad Administration can secure its appropriation from Congress. Although it is hoped that Congress will be called in extra session, possibly by June 1, it is necessary to provide for the contingency that the date may be later and that there will be some delay before the bill is passed, and the conferences with the director general have been based on the probable requirements up to August 1. It is estimated that the

requirements of the railroad companies, up to that time for interest, dividends and other corporate expenses, as well as maturing notes and payments for additions and betterments, will be between \$400,000,000 and \$500,000,000. The amount depends to a considerable extent upon the amount of additions and betterments which it will be possible to provide for.

This \$400,000,000 to \$500,000,000 it will be necessary to provide for by temporary financing and as the resources of the War Finance Corporation are not sufficient to provide more than \$150,000,000 to \$200,000,000, it will be necessary to arrange for the balance through the banks, which have already taken care of a large share of the April 1 requirements. These were estimated at approximately \$70,000,000 and the Railroad Administration has issued its certificates to the roads making application to the amount of about \$54,000,000, but the War Finance Corporation has found it necessary to make loans on their security only to the amount of approximately \$30,000,000, while the balance has been taken care of by the banks. The Railroad Administration also advanced about \$10,000,000 in cash. The conferences this week have had to do with the arrangements to be made with banks before making loans on further issues of certificates.

The executives' committee held some meetings with Mr. Hines on Monday and both the committee and Mr. Hines conferred with the War Finance Corporation, after which the executives' committee held a meeting with five leading bankers in New York on Tuesday. This was to be followed by a later meeting with Mr. Hines and the bankers. The executives asked Mr. Hines to make an appeal to the bankers to lend their assistance in meeting the situation caused by the failure of the appropriation and the plan discussed was that the War Finance Corporation and the banks should divide the loans made on the director general's certificates under some plan by which the bank loans may be pro-rated among the federal reserve banks by districts. It is understood that the arrangement will be continued by which Mr. Hines will protect the railroad companies against any loss occasioned by the difference between the rate of interest which the certificates bear, 5 per cent, and the rate which they must pay for loans, which has been 6 per cent in the case of loans made by the War Finance Corporation. Mr. Hines has also agreed to make no distinction between the companies which have signed contracts with the Railroad Administration and those which are willing to do so, except that in the latter case he cannot issue certificates for more than 90 per cent of the standard return, after making the deductions for additions and betterments chargeable to the company. In the case of roads that have executed contracts, it is not necessary for the director general to make this deduction and it is hoped that any plan enacted by Congress for the return of the roads will provide a period for repayment to the government of amounts charged against the companies for additions and betterments.

A list of the loans made to the railroad companies by the War Finance Corporation on the security of certificates issued by the director general was published in last week's issue. A large number of the roads, instead of asking loans from the War Finance Corporation, made their loans through local banks.

#### Standard Freight Cars Held in Storage

Freight cars have come to be about a drug on the market since the signing of the armistice. In addition to the large number of idle cars which have been in service, several thousand of the new standard cars built on the orders placed by the Railroad Administration last year have been completed by the builders, but cannot be stenciled because the railroad companies, which are expected to take them and pay

for them, have not yet accepted them. Over 26,000 of the 100,000 standard cars ordered had been accepted by the roads to March 31, according to a statement compiled by the Railroad Administration, but this does not account for at least 10,000 more that have been built, and are being held in storage until it can be ascertained whether the Railroad Administration can force the companies to take them at the high prices. The administration takes the position that it can, because they were ordered under war conditions and allocated to the various roads, but many of the companies are not in a position to finance them, and meanwhile the Railroad Administration is paying for them at the contract price minus an amount to cover the cost of stencilling. The standard locomotives, on the other hand, are being accepted as fast as they are turned out.

#### Committee on Automatic Train Control

The Committee on Automatic Train Control will hold its next meeting at Washington on April 15 and on the following day will inspect the automatic stop and cab signal of the American Train Control Company on the Chesapeake & Ohio between Gordonsville and Charlottesville, Va. The committee expects to resume its western trip, which will include Spokane, Wash., San Francisco and Oroville, Cal., about April 28. The committee started on this trip last month and inspected the train control system on the Chicago & Eastern Illinois, but postponed the rest of the trip because of the illness of C. A. Morse, chairman. Some 75 or 80 plans for train control devices have been submitted direct to the committee in addition to those which had previously been submitted to the Interstate Commerce Commission, but the number believed to be worthy of further consideration has gradually been reduced and there are now about 36 different devices before the committee for further consideration.

#### Arrangements for Equipment Financing

Arrangements have been completed for temporarily financing the amounts now due the car and locomotive builders by the Railroad Administration, amounting to approximately \$40,000,000, by the issuance of certificates of indebtedness, bearing interest at 5 per cent, which may be used as collateral for loans from the banks or possibly from the War Finance Corporation, but up to Wednesday the certificates had not actually been issued. Some of the certificates, which are to be in convenient denominations for that purpose, will be passed by the equipment companies to the sub-contractors who furnished materials and specialties, but whose contracts are with the builders rather than with the government. For this reason the specialty people were not admitted to the conferences between the builders and the Railroad Administration representatives, but conferences between the sub-contractors and builders were held afterward. Some of the specialty men were inclined to insist on being paid in cash rather than certificates, but it is stated that if they insist on cash they will have to wait until it is available, as the companies to whom the certificates are issued will have to give their own notes to the banks and might thus be left "holding the bag" for a time in case of unexpected delay to the railroad appropriation.

Whatever interest above 5 per cent is charged by the banks will be reimbursed by the government.

A sub-committee was appointed to represent the equipment companies at Washington in connection with the issuance of the certificates, consisting of George Shaw, Standard Steel Car Company; H. W. Wolf, American Car & Foundry Company; L. O. Cameron, Pressed Steel Car Company, and F. O. Riener, Haskell Barker Car Company. Companies having contracts with the builders were requested to telegraph their bills as of April 1 to J. M. Hansen, secre-

tary of the car and locomotive manufacturing committee, at Washington.

The form of certificate issued to the equipment companies is practically the same as that issued to the railroads, and certifies that the director general is indebted for the amounts "due and payable for motive power, cars and other necessary equipment or parts thereof, or materials and supplies therefor, furnished to the director general for use on or in connection with the property of carriers under federal control . . . which sum the director general hereby promises to pay to or upon the order of the corporation . . . whenever and as soon as the director general shall have funds available for the payment of this certificate and of all other like certificates issued by the director general and then outstanding, whether received by appropriation of the Congress or by virtue of moneys arising out of the use and operation of the railroads . . . or otherwise."

#### Fifty-eight Contracts Executed

Contracts with railroad companies which cover more than half of the standard return to be paid by the government as rental for the use of railroad properties had been executed up to April 5. A total of 58 contracts had been signed for a total of \$524,290,351. Although the number would indicate only a small portion of the number of railroads involved, the contracts in most instances cover a large number of subsidiary companies, some of which are themselves Class I railroads.

In addition to those previously mentioned, contracts have been executed with the Chicago, Milwaukee & St. Paul, providing for \$27,946,771, and also with the Alabama, Tennessee & Gulf; Delaware & Northern; Rome & Northern; Tennessee Railroad; New Orleans, Natalbany & Natchez; and the Atlanta Northern.

#### Payments to Railroad Companies

The total payments to the railroad companies on account of compensation and loans which can be regarded substantially as payments on account of compensation during the 15 months of federal control ended March 31 aggregated \$494,478,265, according to a statement authorized by Director General Hines, explaining the cash receipts and disbursements by the Railroad Administration treasurer at Washington. The total amount loaned the railroad companies by the director general for the 15 months was \$231,911,459 and of this amount \$61,356,000 has been repaid. The statement explains that all of the balance, practically speaking, can be deducted in settlement of the compensation so that these items, while termed loans, can be regarded substantially as payments on account of compensation. The total standard return for all roads is approximately \$928,000,000 and for the Class I railroads, whose statistics are the ones usually used, the standard return is approximately \$890,000,000. The usual statement of the cash transactions of the Railroad Administration for the month of February was not issued, but a statement in a new form was given out on April 5 for the month of March and in some instances for the 15-month period. According to this statement the cash receipts from all sources, including payments on account of transportation furnished the War and Navy departments, loans by the War Finance Corporation, repayments of loans by the railroad companies, amounts transferred from railroad treasuries, and collections from express companies, aggregated \$176,973,719.

Cash disbursements, including payments to railroad companies on compensation, and on account of loans, advances to federal treasurers, payments to waterways and canals, and for standardized equipment, amounted to \$98,487,977.

Of the foregoing amount, \$78,142,925 represented payments to federal treasuries for current requirements, and these are still being further supplemented.

The total payments for standardized equipment during the 15-month period amounted to \$163,950,402.

The above relates to the cash receipts and disbursements of the central administration, and does not include the receipts and disbursements of the federal treasurers in connection with the operation of the properties under federal control, as these figures are not yet available.

Plans for Agricultural Development

More than 100 heads of agricultural development of railroads under federal control held a conference in Memphis,

and state authorities in looking after the interests of newcomers through the dissemination of information regarding methods of soil preparation, seeding, cultivation, etc., in order that they may be successful in the localities in which they have settled.

3—To improve marketing conditions by the widest circulation of information about where and when farm products will be ready for sale and where and when there will be need of such products, thus enabling the farmer to send his stuff to markets which are not glutted, and to obtain for it a price that will mean a profit on his investment, rather than a loss.

Tenn., April 2, 3 and 4 for an exchange of views regarding methods of obtaining the best results and to make plans for their activities during the reconstruction period. The program adopted includes four general propositions, as follows:

1—To collect the latest information about opportunities for farming, stock-raising, dairying, fruit-growing, etc., in the several states having undeveloped resources, and furnish it free to those who wish to engage in such pursuits, special attention to be given to discharged soldiers and sailors.

2—To co-operate with county farm agents and other gov-

ernment and state authorities in looking after the interests of newcomers through the dissemination of information regarding methods of soil preparation, seeding, cultivation, etc., in order that they may be successful in the localities in which they have settled.

3—To conduct a campaign in co-operation with government and state authorities with the view of increasing the livestock output, not only because it is a profitable feature of the farming business, but also for the purpose of building up the soil.

J. L. Edwards of Washington, manager of the Agricultural Section, who called the Memphis conference, expects much good to come of the marketing feature of the program. According to Mr. Edwards' report for the first three months of 1919, approximately 12,000 homeseekers have written to

him, asking about farm opportunities in various states. These inquiries are answered by the Homeseekers' Bureau, which is an organization of agricultural representatives of federal controlled railroads working as state committees under Mr. Edwards' supervision. The state committees are prepared to give homeseekers the specific information they want. About 15 per cent of the inquiries are from discharged soldiers and sailors. The Memphis conference adopted a resolution urging Congress to assist soldiers and sailors to obtain farms on easy terms of payment.

#### Modification of Shipping Day Plan Agreed On

At a conference held under the direction of Max Thelen, director of the Division of Public Service, of representatives of the railroads, the shippers and the state commissions, at Washington this week, an agreement was reached on a modification of the "shipping day" plan for handling less than carload merchandise, which removes many of the objections made by shippers while still preserving the principle and advantages of the plan. The shippers, represented by a committee of the National Industrial Traffic League, and a committee of state commissioners, agreed to support the principle of the plan and to co-operate to make it a success. The shipper is given the right to deliver his freight to the carrier on any day, but the railroads may continue the plan of "staggered service" by agreement. The railroads were represented by the chairman of the sailing day committees for each region and by Fred Zimmerman, representing the Division of Traffic, and F. M. Lucore, representing the Division of Operation. The plan as drawn up by a sub-committee representing the various interests and approved is as follows:

1. The shipper shall not be deprived of his right to route his freight over any line at the legal rates applicable and to deliver his freight at point of origin to such carrier on any business day during regular business hours.

Except as to freight specifically routed by shipper preferred routes should be established based on the following considerations:

- (a) Convenience to shippers and consignees.
- (b) Economy and expedition of movement.
- (c) Proper recognition of non-federal controlled roads.

2. Daily service will be given to the greatest possible extent.

At shipping points where it can be mutually arranged by representatives of the shipping public and the carriers, schedules will be published covering the movement of L.C.L. freight, tendered at freight houses, to be forwarded in through cars or set-out cars on specified days.

The specified days shall be known as "Shipping Days."

3. Peddler cars shall be operated daily, except where more limited service is agreed upon between shippers and carriers or authorized by lawfully constituted regulating authorities, and schedules shall show peddler car service maintained from shipping points.

4. It is earnestly recommended by the committee that in order to secure improved service for the shipping and receiving public and to make possible economical and efficient operation by the carriers, the fullest co-operation should be observed in carrying out the principles agreed to herein, and the committee pledges itself to this end.

Two thousand employees of the Pere Marquette and the Grand Rapids & Indiana attended a safety rally at Grand Rapids, Mich., on April 3. N. Ferris, ex-governor of Michigan; Frank H. Alfred, federal manager of the Pere Marquette and associated lines; R. C. Richards, chairman of the central safety committee of the Chicago & North Western, and George Bradshaw, supervisor of safety of the Pere Marquette, addressed the employees.

## Orders of Regional Directors

**G**UESSING AT WEIGHTS.—A. H. Smith, regional director, Eastern Region, in a circular to Federal managers, calls attention to the importance of showing the gross weight of car and contents on every running slip, for the purpose of calculating the gross weight of trains, and adjusting this weight to the capacities of locomotives. In the absence of the figures, the yardmaster must guess at the weight. A recent examination of a large number of running slips on one of the Eastern railroads showed that approximately 75 per cent of the bills on hand in yard offices failed to show the weight in the space provided on the bill.

**Fire Protection.**—Circular 198 of the Southwestern regional director calls for the burying of gasoline storage tanks outside of tool houses or other structures because of frequent losses sustained by fire.

**Light Weighing of Freight Cars.**—Order 187 of the Southwestern regional director similar to an order issued by the Central Western regional director (*Railway Age*, April 4, page 898).

**Embargoes.**—Circular 248 of the Central Western regional director similar to Circular 75 of the Northwestern regional director (*Railway Age*, April 4, page 898).

**National Travelers' Aid Society.**—The Northwestern regional director, file 8-1-52, promulgates rules for the co-operation of employees on roads in this region with representatives of the National Travelers' Aid Society. Permission is extended to representatives of this society for desk room in terminals, to put up properly worded signs advising of their presence, to use the station facilities and to place notices in time table folders. No extension to present telegraph service between workers at various points will be authorized.

**Grain Embargo—Primary Market.**—Circular 197 canceling Circular 96 and all supplements thereto of the Southwestern regional director states that the embargo placed against the movement of grain to primary markets has been entirely lifted. It is now permissible to ship all grains to primary markets without grain control committees' permits.

**Automobile Cars.**—Order 191 canceling Order 184 of the Southwestern regional director similar to Circular 430 of the Southern regional director (*Railway Age*, March 28, page 834).

**Embargo Regulations.**—Order 189 of the Southwestern regional director similar to Circular 75 of the Northwestern regional director (*Railway Age*, April 4, page 898).

**Bill of Lading Form.**—Supplement 7 to Circular 6 of the Northwestern regional director similar to Circular 127 of the regional director of the Allegheny region (*Railway Age* of April 4, page 898).

**April Estimates.**—A. H. Smith, regional director, Eastern Region, has called on federal managers for an estimate of earnings for April; estimate of operating ratio; of number of men employed, of the number of man hours, and an estimate of the total payroll for each department; all to be shown compared with the actual figures obtained for the month of April, 1918.

**Per Diem Allowances to Short Line Railroads.**—Circular 78 of the Northwestern regional director states that the per diem allowance of two days free time under the standard contract with short line railroads will only apply when a contract has been executed between the short line and the Railroad Administration. When this is done the free time allowance will apply retroactively to April 1, 1918, and The Car Service Section will instruct the assigned federal railroads to make prompt settlement. Such allowances are in lieu of reclaims already made or provided for in the local agreements.

**Specifications for Cross Ties.**—Supplement 17 to North-

western Regional Purchasing Committee Circular 19 contains diagrams of those types of ties which are acceptable under the Standard U. S. R. R. Administration specifications as well as some that should be rejected.

*Public Health Placards.*—The regional director, Eastern Region, by order No. 1600-38A665, authorizes compliance with requests from the Bureau of Public Health Service, Treasury Department, and from State Boards of Health, for permission to post placards listing the locations and hours of treatment of the free government and state clinics for venereal diseases. These notices are to be worded substantially as prescribed by the Division of Operation and are to be not larger than 6 in. x 10 in. in size. They are to be posted only in men's toilets at stations and not, under any circumstances in men's waiting rooms or in cars.

*Errors in Interchange Reports.*—The regional director, Eastern Region, by circular 2000-19-43A661, calls attention to the large number of errors found in interchange reports, vitiating the accuracy of car records. The Car Service Section requests that interchange points, especially at large industrial centers, be carefully supervised and a report rendered monthly of errors in interchange reports. A form is given showing the number of errors of different kinds and the percentage of erroneous entries. One or more traveling men must be assigned to properly police interchange points, and these traveling men will meet at interchange points for the purpose of making joint analyses and application of remedies. Each road will make its report to the Car Service Section on or before the close of each month, and also distribute same information to such local agents as may be necessary.

*Separation of Accounts between Federal and Corporate Interests.*—The regional director, Eastern Region, by circular 700-26A664, promulgates a letter from C. A. Prouty, director, Division of Accounting, requesting that each federal manager of a Class 1 road delegate one or more experienced accountants to the work of inspecting the separation of the accounts between federal and corporate interests as of December 31, 1917; the period of service being estimated at about six months and the men to return to their positions at the end of such service. Each railroad is to continue to carry its employees so designated upon its payroll and pay their expenses while engaged in this special work.

This order contemplates the establishment of a temporary accounting organization at Washington, and a competent accounting force cannot be secured from sources other than the railroad accounting departments. The men to be detailed to this work must be above the ordinary clerical grade, one, at least, of whom must have had some experience in the general accounting features in the separation of accounts as well as the lap-over features. Men having experience in disbursements and freight accounts may act as assistants. In the event that any of the men detailed for this work are not properly qualified therefor, they will be returned to the office of the federal auditor who assigned them, and more experienced men called for.

These accountants will be required to take service upon any line determined upon by Director Prouty. In the event that the Accounting Department of one railroad falls behind in its work, because of this temporary assignment of men to this work, it is proposed to assign some of the force of other lines in the same region to the office of the line which has fallen behind.

*Employees killed and injured on the New York Central* in the twelve months ending with December, 1918, totaled fewer than in 1917; five less killed and 1,154 less injured. This improvement was made notwithstanding that conditions in 1918 were very unfavorable throughout the year; a large increase in traffic and many inexperienced employees.

## The Ticket Agent as a Salesman\*

By George A. Cullen

General Passenger Agent, Delaware, Lackawanna & Western

**I**N A MUCH LARGER DEGREE than is generally realized, the man behind the ticket counter (and only to a less extent behind the ticket window) serves in three capacities which rank him high as a salesman in the best sense of that word.

First: He is a creator of business. It is universally recognized that a very considerable proportion of railroad travel is what may be expressed as volatile, or better yet, as vaporous in the sense that it is not tangible and may become entirely dissipated unless condensed by the actual purchase of a ticket. The volatile traveler is one, for example, who has a vacation ahead of him which he may spend in his automobile or by a railroad trip to Atlantic City, yielding the railroads \$7 revenue, or by a trip to Glacier National Park, for which the railroad fare is \$150. The vaporous individual is one who needs a rest from his business, but who does not know where to go if he should take a vacation and so is likely to remain at his desk, let his health run down and instead of contributing \$300 or so to help the director general overcome the deficit by buying a ticket to California, compels his heirs to spend a like amount with the undertaker to convey his remains to Woodlawn.

Now, let either of these men go to a ticket office and fall into the hands of a listless and inattentive ticket seller of the vendor class and the potentialities of the situation remain entirely undeveloped. Let him, however, approach a real live transportation salesman and note the difference. He is immediately shown the attractions of this or that resort, the excellent facilities for getting there, the Pullman accommodations, the ease with which his baggage will be handled from home to hotel, etc. Just the right literature is placed in his hands so that he can talk it over with his wife, the agent's personal card is handed him, and a cordial invitation is given him to return and buy his ticket, and, lo, the seed is sown that will bear golden fruit in railroad dividends.

Second: Important as is the feature just mentioned, I do not know but that even more so is the element of salesmanship which a ticket man possesses as a creator of good will. There is no one spot at which the traveling public comes into contact with the personnel of the railroad so intimately as at the ticket counter or windows. Here it is that a soft answer may turn away wrath. Here the perplexities of the aged and the ignorance of the young may alike be relieved. Here the busy man of affairs may get his ticket to Chicago and his "choice upper berth near the wash room" at the same time that he gets his impression of the great courtesy and real interest in endeavoring to furnish him a drawing-room which the tactful agent has displayed and consequently go on his way with a determination to vote for whoever at the time, administration or corporation, is running the roads.

Third: He is a creator of service. Every business house in these enlightened days looks to its selling organization not only to induce the public to purchase the goods it has manufactured, but to keep its finger on the public pulse to ascertain what the public demands and is willing to buy if the house will only manufacture it. Here the ticket agent is and can in increasing measure be of vital service to the railroad management. He listens every hour of the day to the comments of the public and should be encouraged to analyze those comments and report them to his higher officers. The intelligent and progressive managements have so encouraged him in the past, and when this practice has pre-

\*From an address at the Railroad Ticket Agents' dinner, Hotel Astor, New York, March 29, 1919.

valled the men have shown a high intelligence in discriminating between the idle suggestions of the habitually dissatisfied and the genuinely helpful comments of the sober minded and reasonable among the traveling public. Reports of ticket salesmen on business lost on account of inconvenient hours of trains, on infrequency of service, improper equipment, absence of necessary Pullman accommodations, etc., are the best guide a railroad management can have as to how to develop passenger traffic.

## Railroad Construction in Spite of Snow, Glaciers, Floods and Forest Fires

**R**AILROAD CONSTRUCTION and operation in Alaska have been impeded by extraordinarily adverse weather conditions during the past year. Some idea of the difficulties encountered is conveyed by a recent report from the Seward division and an annual report by William Gerig, engineer in charge of construction work on the Anchorage division.

Ice on the track of the Seward division between Mile 57 and Mile 68 interfered with the operation of the trains during the week ended December 7, states the Alaska Railroad Record of December 10. Warm weather, accompanied by rain, early in that week caused a flow of water over the flats between Mile 57 and Mile 68, and then a sudden change to cold weather left about an inch of ice on the rails. Trains could not run until the ice had been picked away by hand labor, as no machinery was available to remove it.

A train which left Anchorage for Seward on Saturday, December 7, with 82 passengers reached Mile 58 on the night of that day, and being unable to proceed farther over the iced rails returned to Kern Creek, Mile 71, where there were roadhouse accommodations for the passengers. In returning to Kern Creek, the train experienced a difficult trip, for since the cars had run over the rails from that point to Mile 58 the track had glaciated again. Leaving Kern on the forenoon of the following day, the train reached Mile 54 late Sunday night, December 8, where the passengers and their baggage were transferred around a 1,200-ft. snow slide and then entered another train that got them into Seward at seven o'clock Monday morning. Gangs of laborers, with the temperature at 12 deg. below zero and a strong wind blowing, worked continuously in relays on Saturday, Saturday night, Sunday and Sunday night picking the ice ahead of the trains.

The glaciated route between Mile 57 and Mile 68 is low and flat. In the opinion of government railroad officials, the most feasible method of preventing ice blockades is to raise the tracks four or five feet. This improvement, of course, cannot be made this winter.

In a report on the construction work on the Anchorage division, William Gerig, engineer in charge for the Alaskan Engineering Commission, states that the winter of 1917-1918 was the coldest and longest experienced since the beginning of work on that part of the Alaskan line. Cold weather, he says, set in during the latter part of October, 1917, and continued until late in May, 1918. Considerable snow fell in the Turnagain Arm district, causing many snow slides on the south end of the district. This created such a dangerous situation that it was necessary to suspend all grading during the month of March. It was not until the last week in April that the danger was past and that the men returned to work.

Thawing weather late in April caused mud slides and soft tracks. Track forces were increased for maintenance work, but as the ground was still frozen, permanent repairs could not be made. During May the ground had thawed sufficiently in the Turnagain Arm and Matanuska districts so that forces were increased and permanent repairs to track

were made. When the weather did moderate the temperature rose rapidly, causing floods in the Matanuska and other rivers. As these glacial streams change their channels rapidly during floods, it became necessary to do an excessive amount of riprapping, which ordinarily would have been done with the maintenance forces. On the branch to Chickaloon some ten miles of track was protected by placing riprap, and a steam shovel with two trains was employed here during two months. The thawing weather came at the same time as the maximum high tides and two pile trestles on Turnagain Arm were badly damaged by ice frozen to the piles which lifted them.

From Houston northward in the Talkeetna district, the roads were practically impassable during the month of May on account of the depth of snow during the earlier part of the month and subsequently on account of heavy rains and thaw, which made them very muddy. Throughout nearly the entire month the Susitna river was frozen over and ice did not commence breaking up until May 26. It formed gorges and floods and did damage to both roadbed and supplies.

There was a big flood in the Knik river, extending over a period of three weeks, which required constant patrolling by a large force in order to prevent damage to railroad bed and bridges. Little damage was done outside the loss of some 8,000 ties which had been stored on ground supposed to be above high water. During July and August, there was little rain and consequently many forest fires occurred. One very destructive fire at Mile 83 destroyed a construction camp and supplies valued at about \$40,000, but fortunately no lives were lost. In September at highest tide, a wind storm damaged the road bed between Mile 83 and Mile 88.

On the southern end of the division favorable working conditions extended over a period of five months and on the Talkeetna district about four months. Labor of all kinds were short on account of the war, as many men volunteered and others were drafted and no outside labor was brought in. Rails which should have been delivered in June and July, were not received until August and September, and consequently track laying was considerably delayed. Lumber and material for bridge construction were also delayed owing to the conditions in Seattle and to the scarcity of vessels. There were several periods when no vessels arrived for three weeks.

## The Trainmen's Wage Increase

**A** GENERAL ORDER allowing further increases in wages to the train service employees, as a revision of General Order 27, for the purpose of restoring to some extent the former relationship between the wages of train employees and other classes, is expected to be issued by Director General Hines shortly, to be retroactive to January 1.

The order was practically completed several days ago but has been somewhat modified following conferences between the director general and his staff and the executive officers of the brotherhoods, who have been in Washington since Monday. It is understood that one of the results of the conferences has been to refer back to the Board of Wages and Working Conditions the question of time and one-half for overtime, and other matters relating to rules and arbitraries, also that in order to secure satisfactory revisions of the compensated wage schedule the brotherhoods consent to waive the saving clause they have always insisted upon in arbitration agreements, and that they have surrendered some rates or rules in return for general increases.

Train employees were included in the general advances which were ordered last May, but action on their request for a revision was postponed until after some other classes of employees had been dealt with. The new order practically completes the 1918 cycle of wage increases.

# An Important Development in the Railways of Spain

With an Account of a Project for a Proposed New Trunk Line  
from France to the Straits of Gibraltar

By F. Lavis

IN THREE PARTS—PART III.—THE PROPOSED LINE

MADRID is now connected with France and the rest of Europe by two lines of railway, which cross the northern frontier at its extreme ends, at Irun (France-Hendaye) on the west and at Port Bou on the east. Between these lies the main range of the Pyrenees Mountains which forms a formidable barrier as well as the boundary between France and Spain.

Port Bou is the gateway into France from Barcelona, and would naturally be used from Madrid only for traffic to the south of France and Italy. From Madrid, Paris is now reached via the line of the "Norte" railroad through Irun.

ago by American engineers, among others, P. W. Henry and John F. Stevens, but for various reasons nothing further was actually done. Interest in the project was, however, revived a few years ago by King Alphonso, and a government commission to study the project was appointed in 1914, which made a report a year or so later recommending a line running through Soria and Pamplona which would connect with the French railways at Dax (Fig. 3, Part I, *Railway Age* of March 28, page 826).

The instructions to this commission were such that they felt they were limited in many ways, and the project set forth

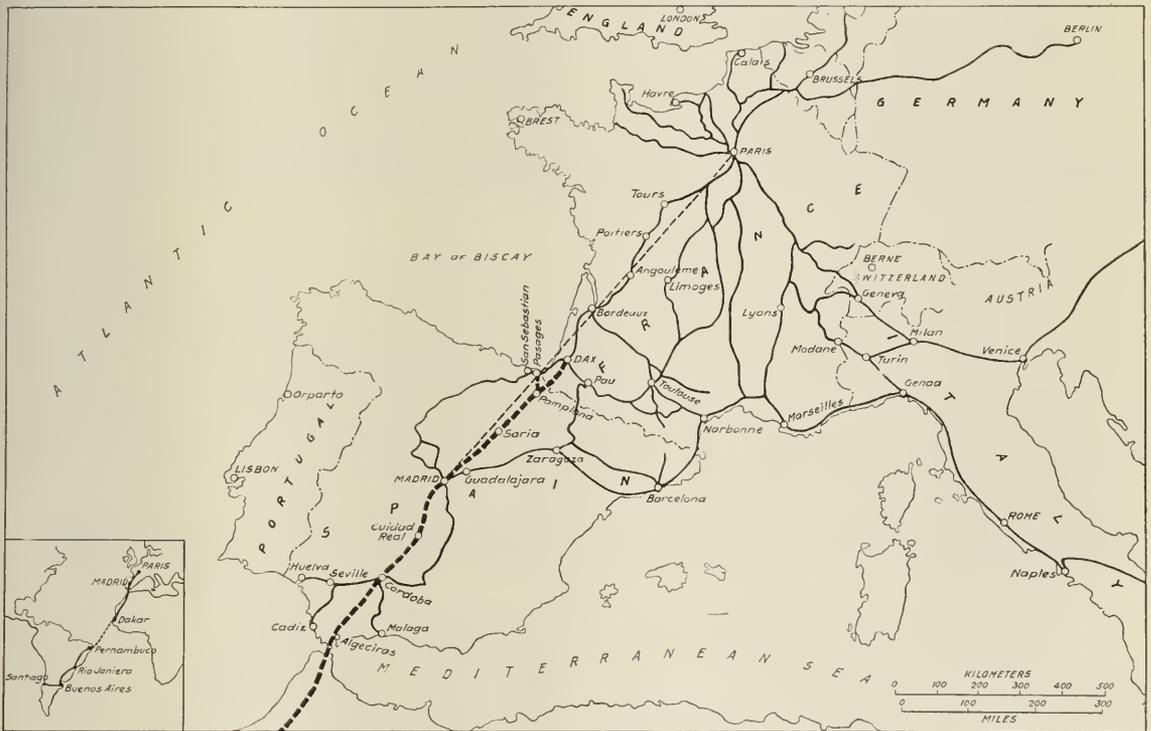

Fig. 16.—The Proposed Direct Line Through Madrid and Its Relation to the Other Railways of Europe and, as Shown in the Insert, to Those of South America

This line, as will be seen by the map in Fig. 16 first runs westerly from Madrid for nearly 125 miles to Medina del Campo, crossing the Guadarrama mountains, then follows the plains of Old Castile northerly through Valladolid, Burgos, etc., to the Cantabrian mountains, which are crossed to reach San Sebastian and Irun on the Bay of Biscay. This line is 628 kilometres (389 miles), in length and follows a very roundabout route.

For many years (since as long ago as 1853) various attempts have been made to build a more direct line, and studies of this project and variations of it were made several years

in their final plans was for a double track line of first class construction, equipped for electric traction, which involved a cost of approximately \$257,000 per mile, as shown in detail in the following table:

	Per kilometre, pesetas	Per mile, dollars
Structures and stations.....	536,652	173,113
Track .....	127,742	41,206
Rolling stock .....	55,139	17,785
	<hr/>	<hr/>
	719,533	232,104
Electrification of line.....	49,666	16,020
Development of power.....	29,030	9,364
	<hr/>	<hr/>
	797,229	257,488

The General Council of Public Works and the responsible heads of the government, thought that this large expenditure was hardly warranted by the expected traffic or by the political benefits which might be derived from the construction of the line, but in the spring of 1918 the matter was brought to the attention of the American International Corporation and the writer was requested to make a detailed study of the whole project. It was thought that perhaps, not being hampered by limiting instructions, a less costly line might be found, which would still fill the requirements for a through line for fast express service, and it was felt that the more general application by American railway engineers of economic principles to problems of this kind, and their better knowledge of the relation between cost of construction and cost of operation, might be of value.

As a result of these investigations a route was selected, the cost of which was expected to be much less than that given above, and which compared very favorably with that of the existing railway, as shown by the following table and the comparative profiles, Fig. 17.

COMPARISON OF PHYSICAL CHARACTERISTICS F. C. DEL NORTE AND THE DIRECT LINE, MADRID TO THE FRENCH FRONTIER

Other Proposed Routes

There have been several proposals for the construction of other connections between the railways of Spain and those of France; and a few years ago a Trans-Pyrenean railway com-

afford direct communication between Barcelona and Toulouse, and through this latter city, direct to Paris and all parts of France. The work, however, is said to be very heavy and the gradients and alignment rather bad. The need for the second line is not very apparent and the construction, it is said, will be very difficult.

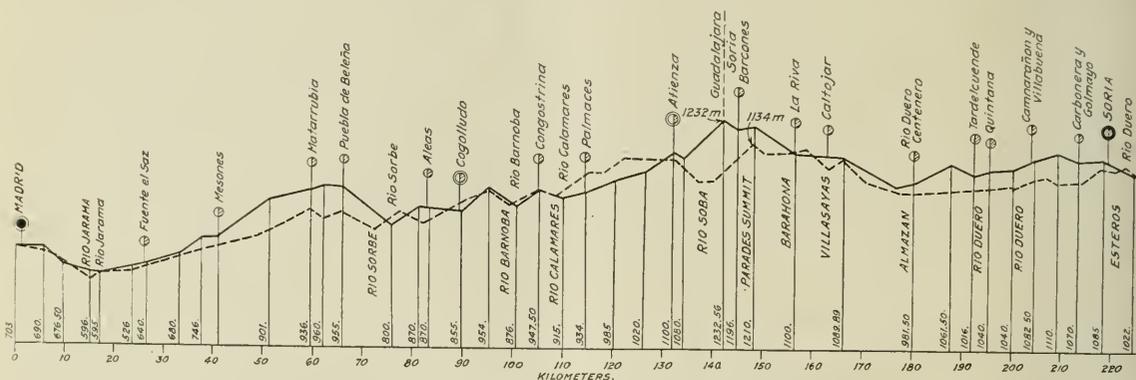

Through Route to Africa

As already noted, the proposed "Direct" line, if built, besides furnishing more direct communication between Madrid and Paris, may eventually form part of a through transcontinental route from western Europe to Africa and South America.

The report of the original commission discussed at considerable length the question not only of the desirability, but also the need of a direct line of railway from north to south through Spain, as a means of easy sure communication between the countries of western Europe and the northwestern part of Africa.

Sr. Echarte, the chief engineer, in his report, referred to the long discussed plan of a railway from Paris and, incidentally, of course, from Germany, Holland, Belgium, etc., through Spain and northwestern Africa to Dakar and thence by a short ocean trip to Pernambuco in Brazil. That such a route is an inevitable development of the future, seems almost sure, and the experience of the great war is likely to create a tremendous impulse in the development of transportation facilities everywhere, especially in Spain, so that its realization may not be so far in the future as may seem at first thought to be likely and considering the matter solely from a purely commercial standpoint.

The development of this through route as a whole is, however, probably too large a plan and too far ahead of the

It Will Be Noted that the Names in Capitals Relate to the Broken Line and Those in Lower Case Letters to the Full Line

Fig. 17. Profile of the Proposed Direct Line from Madrid to the French Frontier. Showing in the Full

mission was organized in Spain to construct three lines, across the border, which had been agreed upon by the governments of the two countries, which are the following: (See also Fig. 3.)

Barcelona-Toulouse via Puigcerda and the valleys of the Llobregat and Ariege.

From Lerida via the valley of the Noguera Pallaresa.

From Zaragoza via Jaca and Canfranc.

The last is nearly completed and should be opened for traffic within the next year or two. By reason of its heavy gradients, rise and fall, alignment, etc., it probably will not carry much through traffic. No work has been done on the second of these lines but some progress has been made on the Pyrenees section of the first, the summit tunnel having recently been completed. There seems to be some justification for this line as Barcelona is the largest and commercially the most important city in Spain and the proposed line will

needs of Spain or the world to be undertaken just now, but it is mentioned in passing as an incidental though not unimportant feature of the project under consideration.

The "Direct" Line

A straight line drawn from Madrid to Paris (see Fig 16), will pass close to the western end of the frontier and near the city of Pamplona, the capital of the province (and former kingdom) of Navarre. This is the only important city in this section of Spain, except San Sebastian on the coast, and every indication points to it as a controlling point on any proposed direct line between Madrid and Paris, unless topographical conditions interfere.

In some respects the Pyrenees form the most important topographical feature in the consideration of a through route between Madrid and Paris. Given the fact that it is desired to cross near their western end, the pass of Urtiaga, just north

of Pamplona, and reached on the Spanish side by the valley of the Arga and on the French side by that of the Alduides, is the most easily accessible. There are two passes to the east, those of Roncesvalles and the valley of the Roncal, and one to the west, the pass of Otsunda, but for reasons which are discussed in detail in the report, Pamplona and the Urtiaga pass are shown to be the controlling objective points at the northern end. The problem, therefore, was the location of a line between Madrid and these points.

**Methods of Investigation**

The object of the investigation was to determine, without going into too much detail, the best route, between Madrid and the French frontier, adapted for fast passenger traffic, and whether such a line could be obtained at a reasonable cost compared with the traffic to be expected and in view of the political advantages and other controlling circumstances.

The writer had the advantage of the surveys of the original commission and of the advice of Sr. Gonzales Echarte, the former chief engineer. It was decided to make a stadia reconnaissance of such variations of the original route as might seem to be desirable or necessary, and the writer took with him to Spain three assistants: W. L. Gibson, F. O. Pease and H. A. Ayres, all of whom had had considerable experience in railway location and construction in South and Central America as well as in the United States. The party left New York on July 18, 1917, and arrived in Madrid on August 1. The field work was completed early in December and the office work by the last of the year, the party reaching New York again a little more than six months after sailing.

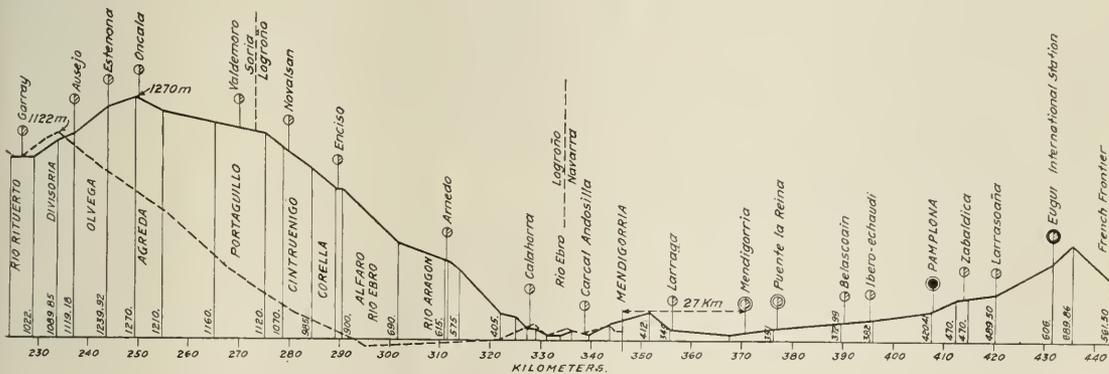

Preliminary investigations of the territory were immediately commenced on arrival in Madrid, and as soon as pos-

ough to permit the assurance that absolutely the best line had been obtained. The estimates of quantities and cost, however, are believed to show within reasonable limits the approximate cost of building a line through this territory, and although further studies will undoubtedly show the desirability of modification of details, some of which may lessen the cost, and others possibly improve the alignment or gradients, at a somewhat increased cost of construction, on the whole this should not change materially the general aspect of the situation.

Both the writer and his assistants have all been accustomed to work in Spanish-speaking countries and in South and Central America, but found in Spain many differences, due principally to the more strongly established customs of the older European country, which were generally less susceptible of modification than those of the newer countries of North and South America. This is mentioned, not only because it involved some little delay from time to time and modifications of the plans for the prosecution of the work, but it is important to keep in mind in connection with any enterprise which may be undertaken in the future in Spain. It will be quite feasible, under proper management, to introduce some American ideas, but there are many which will either not be admitted at all, or only after considerable modification.

**Location and Design**

The primary object of the line is to obtain fast, convenient passenger service between Madrid and Paris and also, incidentally, with London, Brussels, Amsterdam, Berlin, etc. In passing it may be noted that convenient access to Bordeaux is desirable on account of the wine traffic. To avoid the necessity of changing cars at the frontier it was proposed that

Line the Spanish Survey and in the Dotted Line the Survey by the American International Corporation

sible after complying with the necessary formalities, three field parties were organized, with Mr. Gibson in general charge, and Messrs. Pease, Ayres and Lacroix (the latter a Frenchman resident in Spain), each in charge of a party of five Spanish assistant engineers and the necessary peons, all obtained in the country. An office with necessary draftsmen and assistants was established in Madrid for the compilation of the necessary maps and data.

Stadia lines were run over the route selected, which involved an entirely new line for some 345 kms. (215 miles) from Madrid north. The topography obtained was plotted on a scale of 1:4000 (about 333 feet to the inch), and a line projected on this map, from which the quantities of earthwork, bridging, etc., were calculated.

This study, while developing the main controlling features of the route and a close approximation of the final location, was, of course, far from detailed enough or sufficiently thor-

ough to permit the assurance that absolutely the best line had been obtained. The estimates of quantities and cost, however, are believed to show within reasonable limits the approximate cost of building a line through this territory, and although further studies will undoubtedly show the desirability of modification of details, some of which may lessen the cost, and others possibly improve the alignment or gradients, at a somewhat increased cost of construction, on the whole this should not change materially the general aspect of the situation.

A secondary object is the usual local freight and passenger business of a railway which in the case of this line, will probably not be very large for the first 10 or 15 years, unless there is some, at present, unexpected mineral or industrial development. There may be developed an additional express passenger service from Valencia and Madrid to San Sebastian and to Pasages, in connection with an ocean steamship service. There may be developed a fairly large business also in the haulage of iron ore between Mt. Moncayo (Soria) and Pasages, and coal from Pasages to the interior, and possibly also to Madrid and Valencia.

There is a possibility of eventually building a line from a point near Soria westerly to Burgos and to the coal fields of Leon and Palencia, which can be used for the distribution of coal to Madrid, Valencia and Barcelona.

Traffic

The traffic estimates show that aside from the thorough traffic the business will probably not be very heavy during the first 10 or 15 years, and the estimate of the number of trains and the character of the rolling stock indicate that these will be comparatively light, compared with modern practice in the United States, though considerably heavier than anything now in use in Spain.

Design

The general characteristics controlling the design are, therefore, a country with a rather badly accidented topography, a line for fast passenger service with only moderately heavy rolling stock and the possibility of a fairly heavy low-grade freight service on the northern half of the line.

This indicates a line of first-class construction, with the best gradients and curvatures reasonably obtainable in a difficult country.

The standards of construction adopted for the purpose of the investigation were as noted, briefly, below. They are a compromise between good American practice, the requirements of the Spanish authorities, and the existing conditions in Spain.

A single track line, with provision for the location of passing sidings 1 km. in length every 10 kms., but it was expected that only half of these would be built at first; tunnels to be excavated for double track and bridges to be so located that the abutments can be extended when required. In consideration of this procedure, it should be noted that the cost of tunnel excavation and masonry construction is very low in Spain.

Track to be laid with 90 lb. rails, with 2,000 ties to the mile. Ties of oak are very expensive, so fewer were used with a somewhat heavier rail than would otherwise be necessary. Screw spikes were proposed, with tie plates on the sharper curves. Stone ballast was estimated 12 ins. under the tie and of a typical American cross-section. The European practice is to cover the ends of the ties outside the rails level with the top of the rail.

Bridges were estimated in accordance with A. R. E. A. specifications. Coopers E 50 loading, solid floors. On account of the cheapness of masonry and in accordance with the custom in Spain, masonry viaducts were estimated for many crossings where steel would ordinarily be used in the United States.

In accordance with American practice the quantities of steel, masonry, etc., were calculated from tables and diagrams, and the excavation quantities scaled from the profile. In Europe even for a preliminary estimate it seems to be customary to draw more or less detailed plans of each structure and actually calculate all the quantities, cross-sections being platted from the topography for estimating the earthwork, and this is necessary in the submission of plans to the government.

A 2 per cent grade compensated for curvature was adopted tentatively for the reconnaissance survey, but it is expected that this can be bettered at little additional expense when the final studies are made; the minimum radius of curvature adopted was that of a 5 degree metric curve, i. e., about 230 metres (760 ft.) radius.

A discussion of the reasons which will probably control the final choice of the proper rates of gradients on this line were given in the report, but this is a matter with which engineers are generally familiar, but in regard to curvature European engineers, largely, perhaps, on account of the types of rolling stock available, are generally prejudiced against the use of sharp curvature on main lines, and the following extract from the report may, therefore, be of interest; as it was written for the purpose of attempting to overcome this prejudice.

Curvature

The minimum radius of curvature for our surveys, namely, 230 metres (760 ft.), while not unduly sharp for American practice in heavy country, is rather less than that customary in Europe. The minimum permitted for the main lines in Spain is 300 metres (practically 1,000 ft.). It must be admitted, of course, that curves with as short a radius as 760 ft. cannot be traversed at high speeds, i. e., at speeds much over, say, 40 miles per hour, but they can be at 30 to 35 miles per hour.

The nature of some of the country traversed by this line, however, is such that the use of flatter curves would quite considerably increase the cost without any commensurate advantage in operating economy. As a concrete example the difference was calculated on a certain given section.

On this section two and a half kilometres (1.5 miles) in length, by the use of 3 degree (metric) curves instead of 5 degree, the excavation quantities would be increased by some 40,000 cubic metres with probably some increase in the masonry for culverts. This may be assumed to involve an additional cost of, say, \$25,000. There will be, however, a saving of about 75 degrees of curvature, but even assuming 10 trains daily in each direction and the additional cost of operation at, say, 60 cents per train, per degree, per annum (which is reasonably high for operating conditions in Spain, with comparatively light trains and low wages), will be only \$450 per annum. Assuming that capital is worth 7 per cent, the saving of this amount of curvature would only justify an expenditure of about \$6,500.

These values, of course, are subject to such revision as more careful and detailed study of the traffic and characteristics of the line may indicate, but the figures tend to confirm the writer's opinion that in a country of this nature the minimum radius adopted for our surveys should be retained, though on the other portions of the line the minimum radius could probably easily be established at 382 metres (1,200 ft.), or that of a 3 degree metric curve.

It was recommended that the use of the shorter radius curves be confined to three sections having a total length of 85 kilometres, as follows:

KM. 78 to Km. 108  
 KM. 253 to Km. 275.  
 Pamplona to the frontier.

On all the rest of the line the minimum radius can be that of a 3 degree metric curve (1,260 ft.), and by thus confining the heavy curvature to certain sections the objection from the point of view of speed is reduced to a minimum.

So far as this line in Spain is concerned, we are rather handicapped by the need of having the rolling stock conform to French practice in the matter of couplings, and the use of side buffers, which does not permit the flexibility on sharp curves which our center couplings do.

The use of bogie trucks, however—i. e., the common American practice—permits much greater flexibility than the stiff frame 3-axle coaches with long rigid wheel base, still quite generally used in Europe today. (See Fig. 12, Part I, *Railway Age*, of March 28, page 829.)

It is impossible within the limits of an article of this kind to discuss the location in detail. Practically an entirely new line was located for a distance of 345 kms. north of Madrid to Mendigoria. From that point to the frontier, a further distance of 71 kms., the general route of the original commission was adopted. An approximate comparison of the physical characteristics of the two lines between Madrid and Mendigoria is as follows:

	Spanish Government Commission	Survey of 1917
Length Kms.....	372	345
Curvature degrees.....	15,095	10,000
Rise and fall meters.....	1,799	1,500
Rise and fall on 2 per cent gradients.....	1,093	690
Tunnel Kms.....	55	11

In connection with this proposed direct line to France it is proposed to build a branch from a point near Soria to Calatayud, where connection would be made with the Central of Aragon Railway permitting through service from Valencia to the north coast of Spain and to France. It was proposed also to build a line from Pamplona to San Sebastian and to Pasages, on the north coast.

San Sebastian is the well-known summer resort on the Bay of Biscay, and Pasages, a small hand-locked harbor just east of San Sebastian, has possibilities of development as a point of export for the iron ore of Mt. Moncavo, for the importation of coal either from Gijon or England, and as a terminus for a transatlantic steamship line.

Besides facilitating the through traffic between the capitals of France and Spain, and serving as a link in a new trans-continental route, the "Direct" line is of extreme importance from a military strategic point of view. It offers also an opportunity to further develop the iron ore resources of northern Spain, and would be an important factor in the distribution of coal from the north coast to the interior plateau and the eastern Littoral. The statistics of commercial development show that the railroad and port facilities have not kept pace with the requirements of business and this line with the development of Pasages will overcome at least partially this lack of transportation and terminal facilities.

The writer was given every facility in his investigations and every courtesy was extended by officials of all kinds, both of the national and provincial governments, and while some of the regulations were thought vexatious at times on account of the delays involved, it is realized on looking back that they were not more so than might be expected in attempting to do things differently in any country with fairly fixed notions of procedure, and possibly no more so than are often experienced here at home in dealing with our own officials. It is believed that Spain will welcome the co-operation of Americans in carrying out public works which are needed, if the financial participation can be satisfactorily arranged.

## American Railway Engineering Association Committee Work

THE AMERICAN RAILWAY ENGINEERING ASSOCIATION has just issued a bulletin giving the personnel of committees and assignment of committee work for the 22 regular committees and 2 special committees of that association, as organized for the coming year. Duplicate information is contained in Circular No. S II-I, issued by the American Railroad Association, Section II—Engineering. Only four new chairmen have been selected for the standing committees of the association, 20 chairmen having been held over. J. R. W. Ambrose, chief engineer, of the Toronto Terminals Company, Toronto, succeeds W. M. Dawley, assistant engineer of the Erie at New York City, as chairman of the Committee on Roadway. H. L. Ripley, valuation engineer of the New York, New Haven & Hartford, Boston, Mass., succeeds H. E. Hale, group engineer for the Presidents' Conference Committee on Valuation, New York City, as chairman of the Committee on Ballast. J. J. Yates, bridge engineer of the Central Railroad of New Jersey, New York, succeeds F. L. Thompson, chief engineer of the Illinois Central, Chicago, as chairman of the Committee on Masonry. Arthur Crumpton, assistant valuation engineer of the Grand Trunk, Montreal, Can., succeeds W. F. Strouse, assistant chief engineer, Public Service Commission of Maryland, Baltimore, Md., as chairman of the Committee on Signs, Fences and Crossings.

Owing to the nature of the subjects assigned to the committees for investigation and to the fact that not more than two can be reported to the convention for action any one

year, many of the subjects submitted last year have been carried over. Among the new subjects assigned to the committees for investigation during the present year are the following:

**Ballast**—Report on the use of reinforced concrete slabs or other devices to assist the ballast in distributing the load on soft roadbed.

**Rail**—Present revised specifications for steel rails. Present sections for rails heavier than 120 lb. per yd. Report on the effect of usage on the physical properties of rail steel.

**Track**—Investigate and report upon the design and use of a "clamp" type of frog.

**Buildings**—Review recommendation as to the applicability of the high platform.

**Masonry**—Investigate the distribution of loads through ballast and embankment as affecting the design of masonry structures. Report on methods of conveying and depositing concrete.

**Signals and Interlocking**—Investigate and report upon the effect of the use of ties treated with any solution which affects the length of signal track sections.

**Water Service**—Report on the water service organization. Submit definitions applicable to water service. Report upon plans and specifications for typical water station layouts, collaborating with the committee on Yards and Terminals and on Economics of Railway Operation.

**Yards and Terminals**—Report on unit operation of railroad terminals in large cities, revising the catechism as a statement of principles for inclusion in the Manual.

**Wood Preservation**—Report on the availability and use of sodium fluoride as a preservative for cross ties. Report on creosote treatment to be used in the protection of piles and timbers in teredo-infested water, specifying the amount of creosote to be used. Report on comparative value of grades 1, 2 and 3 creosote oil and creosote coal tar solutions as preservative agencies.

**Electricity**—Continue collecting statistical data relative to clearances of third rail and overhead working conductors and submit revised tables at the next annual meeting. Co-operate with the Bureau of Standards in the preparation of the proposed National Electrical Safety Code and other safety codes of similar character. Submit specifications for insulated wire and cables.

**Economics of Railway Labor**—Study and report upon methods for training and educating engineering and maintenance department employees.

Headquarters Siding on the Archangel Front

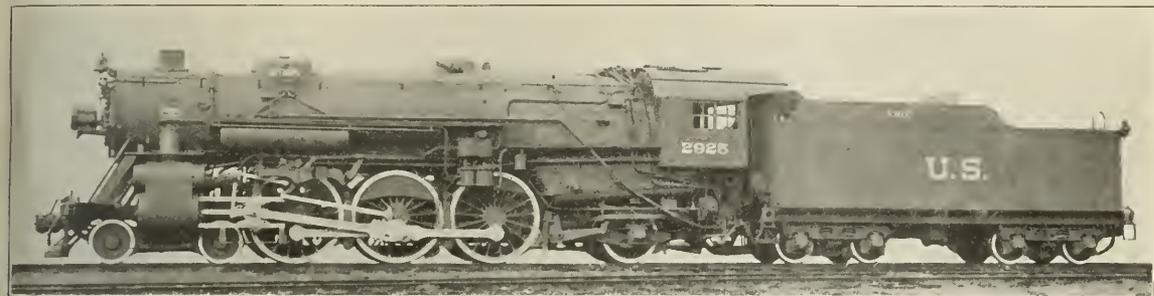

# Light and Heavy Standard Pacific Type Locomotives

Straightforward Designs Having Many Details Interchangeable with the Other Standard Types

THE FIRST OF THE TWO CLASSES of Pacific type locomotives built to the United States Railroad Administration's standard designs have recently been turned out of the Richmond Works of the American Locomotive Company, the light locomotive for delivery to the Atlantic Coast Line and the heavy locomotive for delivery to the Erie. The light locomotive is one of a total of 59 of these locomotives which have been ordered by the Railroad Administration, 26 to be built by the American Locomotive Company and

an average of 66,000 lb. on each axle. The total weight of this locomotive in working order is 306,000 lb. and it has a maximum tractive effort of 43,900 lb.

In Table II will be found a comparison of this locomotive with several other heavy Pacific type locomotives. The heavy standard locomotive compares more closely with the Pennsylvania K4s Pacific than with any of the others. It has about 4,000 lb. less weight on drivers than the Pennsylvania locomotive, with a total weight 3,000 lb. less, and

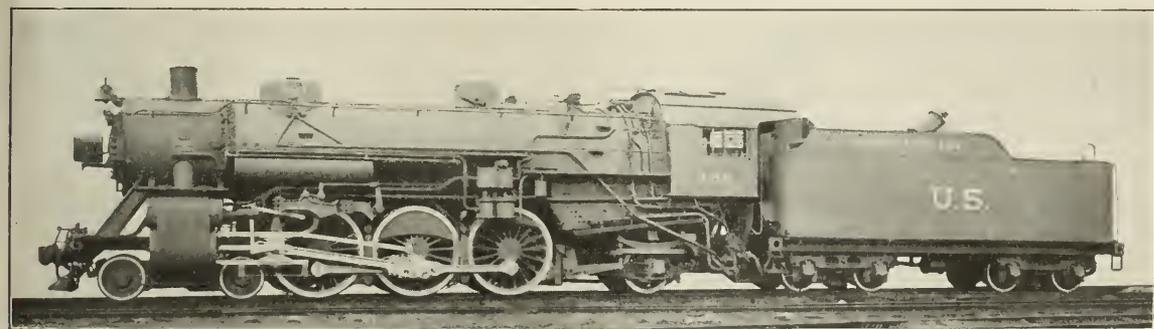

The Railroad Administration Standard Heavy Pacific Type Locomotive

33 by the Baldwin Locomotive Works. Orders have been placed for a total of 20 of the heavy locomotives, 10 with each of the above mentioned builders.

The light Pacific type was designed on the basis of driving wheel loads of 55,000 lb. per axle and has a total weight of 277,000 lb. in working order. The actual driving axle loads are 54,000 lb. each, and a tractive effort of 40,700 lb. is developed. In Table I will be found a comparison of this locomotive with a number of others of the same type

on a comparative basis is rated at 600 lb. less starting tractive effort. A comparison of the heating surfaces of the two locomotives would indicate that the Pennsylvania locomotive had a considerably greater capacity for high sustained speed when handling similar loads.

The boilers of the two standing Pacific type locomotives are generally similar in construction, both being of the conical wagon top type with combustion chamber fireboxes. The outside diameter at the first ring of the two boilers is

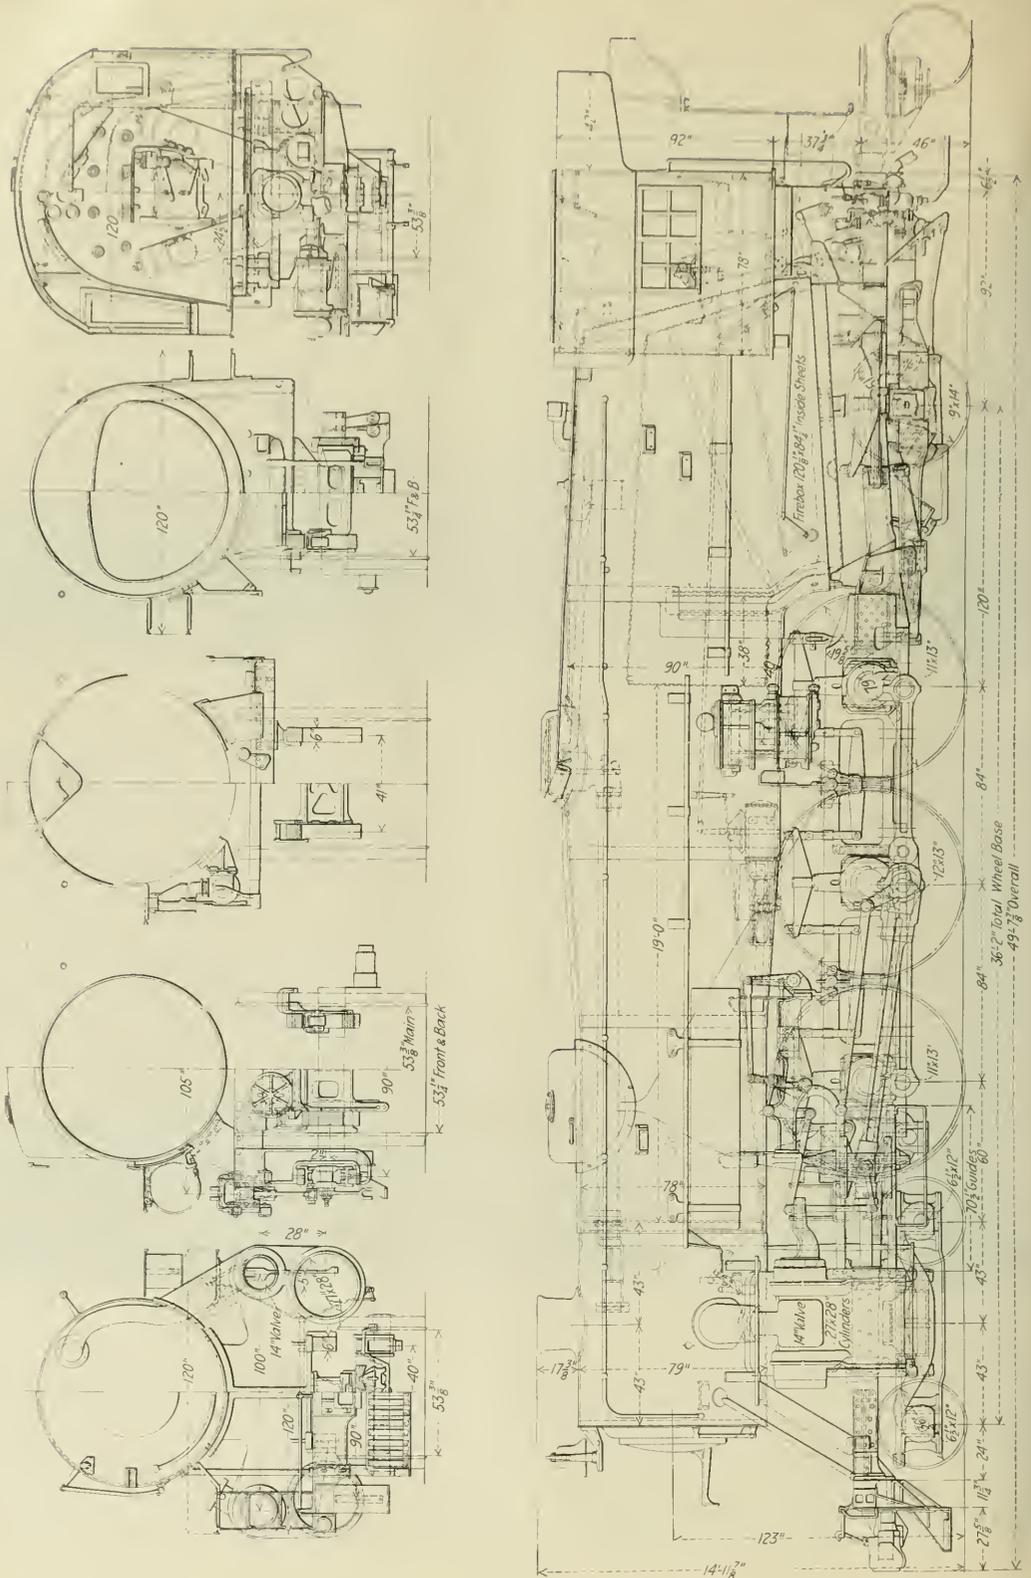

The Standard Light Pacific Type Locomotive

designed on the basis of approximately the same axle loads. It will be seen that the standard locomotive is somewhat similar in its proportions to the Missouri, Kansas & Texas locomotive, which, however, has more heating surface, but a considerably smaller grate and a smaller ratio of firebox heating surface to total heating surface.

The design of the heavy Pacific locomotive was based on driving axle loads of 60,000 lb. The actual weight on drivers, however, is 197,000 lb., equivalent to slightly less than

76 in. and 78 in., respectively, increasing to 86 in. and 90 in., respectively, at the dome course. The light locomotive has 188  $2\frac{1}{4}$ -in. tubes and 36  $5\frac{1}{2}$ -in. flues, while the heavy locomotive has 216 tubes and 40 flues of the same diameters. The tubes of both locomotives are 19 ft. long, while the combustion chamber of the light locomotive is  $23\frac{1}{2}$  in. long and that of the heavy locomotive 38 in. long. The maximum diameter of the boilers at the dome course is 86 in. for the light locomotive and 90 in. for the heavy locomotive. The

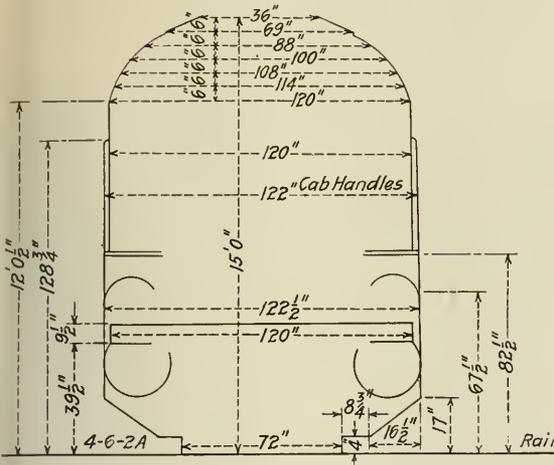

Elevation and Sections of the Standard Heavy Pacific Type Locomotive

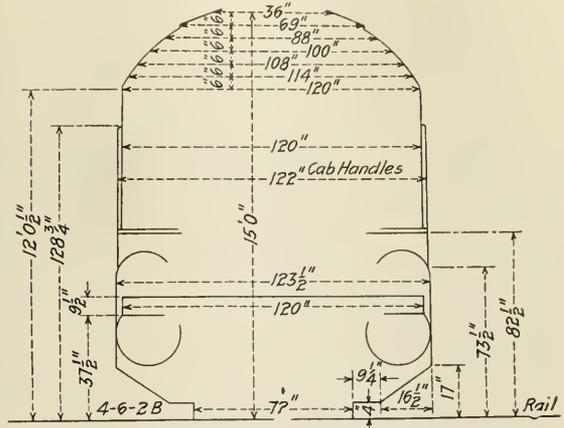

light locomotive is hand fired, while the heavy engine is equipped with a Duplex stoker.

The design of the frames for both types is essentially the same. Both are of the single front rail type, each frame be-

the light Pacific type are 25 in. in diameter, while the heavy locomotives have 27-in. cylinders, the stroke being 28 in. in both cases. The pistons are of the single plate dished type, the specifications calling for either cast or rolled steel, with a cast iron bull ring and packing rings of Hunt-Spiller gun iron. In both cases the cylinders and valve chambers

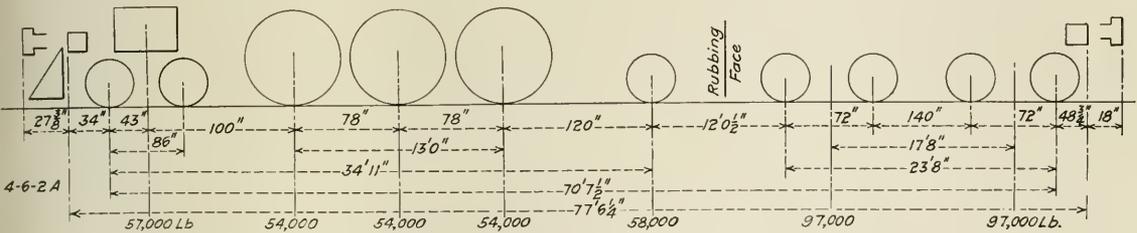

Clearance Diagram for the Light Pacific Type Locomotive

The Heavy Pacific Type Clearance Diagram

ing cast in one piece with a splice back of the rear driving wheels for Commonwealth cradle castings. In both cases the frames are six inches wide. The lighter frames have a depth of top rail of 6 1/8 in. over the driving boxes and a minimum depth of 5 1/8 in. between the drivers. The max-

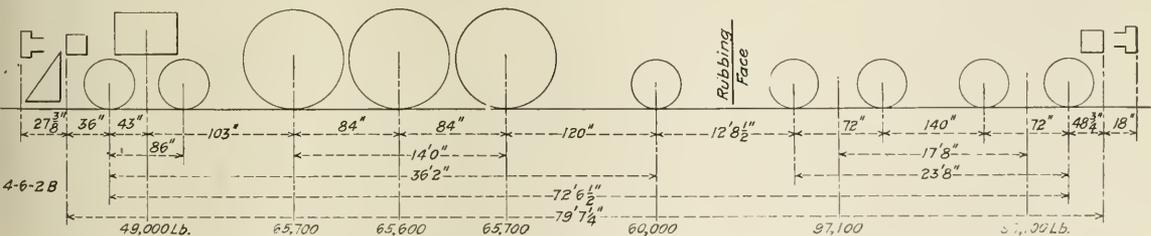

imum and minimum depths of the lower rail are 4 1/4 in. and 3 3/4 in., respectively. The frames for the heavy Pacific have a depth over the driving boxes of 7 1/8 in. and a minimum depth of top rail of 6 in., while the maximum and

imum and minimum depths of the lower rail are 4 1/4 in. and 3 3/4 in., respectively. The frames for the heavy Pacific have a depth over the driving boxes of 7 1/8 in. and a minimum depth of top rail of 6 in., while the maximum and

Santa Fe type. The crosshead is also essentially the same as that used on all the other locomotives and that of the light Pacific interchanges with the crosshead of the Eight-wheel switcher and the light Mikado type locomotive. While

Weight Distribution Diagram for the Heavy Pacific Type Locomotive

minimum depths of the lower rail are 4 3/4 in. and 4 1/4 in., respectively.

The cylinders of both types are similar in design to those on all of the other single unit standard locomotives and both are designed for the use of 14-in. piston valves. Those of

none of the cylinder designs are interchangeable, the front and back heads have been made interchangeable where the diameter of the cylinders is the same, those for the light Pacific interchanging with the Eight-wheel switcher, and those for the heavy Pacific interchanging with the heavy

Mikado and the light Santa Fe and Mountain type locomotives.

Both the main and side rods are of channel section, the main rod design for all of the standard locomotives being the same in all details with the exception of the necessary variation in dimensions. The two Pacific type locomotives are the only ones having the channel section side rods, the others all being of slab section.

Wherever the journal sizes permit, the driving boxes have

The clearance diagrams and wheel load diagrams were prepared by F. P. Pfahler, chief mechanical engineer, division of operation, of the Railroad Administration. The distribution of wheel loads as shown are actual weights of the completed locomotive.

The principal dimensions and data for the two Pacific type locomotives are as follows:

TABLE I—COMPARISON OF LIGHT PACIFIC TYPE LOCOMOTIVES

Road	A. C. L.	M. K. & T.	C. B. & Q.	N. Y. N. H. & H.

been made interchangeable on all of the locomotives. The light Pacific type locomotive has main journals 11 in. in diameter by 13 in. in length, while the front and back journals are one inch less in diameter. The front and back driving journals of the heavy Pacific are the same size as those of the main journals on the light Pacific, while the main journals of the heavier locomotive are 12 in. in diameter by 13 in. in length.

Both locomotives have the constant resistance type engine truck with 6½-in. by 12-in. journals and 33-in. wheels, while the trailer trucks are of the Cole-Scoville design with 43-in. wheels and 9-in. by 14-in. journals. A considerable degree of interchangeability exists between the details of this type of truck in use on the standard Mountain and Pacific type locomotives, although complete interchangeability of

\* For anthracite coal.

the trucks as a whole has not been maintained in every case.

The tenders of both locomotives are built with Commonwealth cast steel frames and have tanks of 10,000-gal. capacity. The tender trucks for both are of the Commonwealth equalized type, differing from the trucks under the heavy Mountain type, which were equalized swing motion trucks of the locomotive builder's design.

Aside from the parts already mentioned a large measure of interchangeability has been carried throughout the various standard designs, including a large number of minor details, such as rod brasses, grate frames, bumper beams, many of the small castings, and in a number of cases, crank pins, axles and springs as well. A complete list of the specialties on all of the standard locomotives was published in the January 3, 1919, issue of the *Railway Age* on page 91.

\*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.  
 †Includes arch tube heating surface.

The directors of the Illinois Manufacturers' Association have telegraphed to President Wilson that they strenuously protest against the present attitude of the director general of railroads in refusing to make purchases of supplies and material "necessary to the due maintenance of the railroads and to the public safety." They declare that "the elements which enter into prices today are fundamental and should be maintained, including the present standard of wages; and the government should take the immediate initiative in this matter."

# Increasing Trainloads By Reducing Grades

By S. S. Roberts

Engineer, Office of Regional Director, Southern Region,  
Atlanta, Ga.

IN AN ARTICLE in the issue of the *Railway Age* of January 17, 1919, entitled "The Railroad Problem and Economics," by Charles A. Morse, assistant director in charge of engineering and maintenance, Division of Operation, and particularly under the captions "Financing Capital Expenditures" and "Ignorance as to Economics", some simple facts are very plainly stated which have influenced the writer to submit the accompanying table showing the relative efficient hauling power of the U. S. standard light Mikado locomotive on various grades and the number of trains required to handle like net tonnage, in the belief that consideration of this subject

is timely and that the table will be helpful to some engineers and to those operating men who will ponder it.

The statement that one locomotive has a tractive effort of 54,000 lb. and that another has a tractive effort of 40,000 lb., is a clear cut expression which at once conveys the suggestion that by substituting the first for the second the hauling power will be increased approximately 35 per cent, and that the number of trains required to handle a like tonnage will be decreased about 26 per cent. The prospect of hauling with three trains that which now requires four is alluring. The saving being in terms of trains, appears to the operating man at once as a determined sum of money. Thinking in terms of locomotives only, all this good may be had for the cost of the new locomotives less the salvage on the old. The economy seems self-evident and the adoption of the proposal is urged on the maxim, "Res ipsa loquitur".

But does "the thing speak for itself"? How about the new bridges, new engine pits, enlarged engine houses, new

EFFECT OF GRADIENTS ON EFFECTIVE HAULING POWER OF U. S. STANDARD LIGHT MIKADO LOCOMOTIVES

Tractive effort = T = 54,600 lb.

Grade resistance = R<sub>g</sub> = 20 (rate per cent grade).

Train resistance = R<sub>t</sub> = 6.1 lb. per ton of 2,000 lb.

Weight locomotive, tender and caboose = W = 260 tons.

Columns give effective hauling power referred to gradient at top of column as 1 or 100 per cent. Lines give number of trains on various gradients for one train on gradient shown at left of line.

Gradient per cent.	Rise in feet, per mile.	C = $\frac{T}{R_g + R_t}$	Gross rating = $\frac{T}{R_g + R_t} \times$ tractive effort	Net rating in tons of 2,000 lb. = $\frac{T}{R_g + R_t} - W$	EFFECT OF GRADIENTS ON EFFECTIVE HAULING POWER OF U. S. STANDARD LIGHT MIKADO LOCOMOTIVES

turntables and, on occasion, heavier rails, additional cross ties and more ballast which may or will have to be provided before the advantages of the more powerful locomotives are available?

There are cases in which heavier power has been urged where, in addition to the above, even the embankments would first have to be strengthened, the excavations widened and the spouts on water tanks and the floors of existing coaling platforms would have to be raised to serve the heavier power, and this on roads having 1 per cent and 1.2 per cent ruling gradients. Suggest that the ruling gradients be reduced from 1 per cent to 0.7 per cent which may frequently be done without unusually heavy expenditure, for the ruling gradients generally occur in few places. In how many minds will this suggestion stir the thought that by this reduction in gradients the same increase in effective hauling power and the same decrease in number of trains will be effected as by the change in locomotives first considered? Or that the locomotives already in service will on the reduced gradients haul in three trains that which they before hauled in four. Should the reduction in gradients be from 1 per cent to 0.5 per cent the increase in hauling power of the present locomotives would be 71 per cent and the decrease in the number of trains required for like tonnage would be 41 per cent. In round numbers 10 trains could do the work which formerly required 17.

The anticipated saving accruing from a reduction in gradients is just as sure of realization and the certainty of predictions based on them is equally as reliable as those based on the increased tractive effort of the locomotive. It would seem logical to first improve, so far as practicable, the line and grades and thereby prolong the period of usefulness of existing power and structures to the fullest. Such improvement is permanent. The beneficial results obtained are unaffected by time and are independent of any other causes. Under present conditions this should be an important factor. On roads that have improved alignment and reduced gradients so far as is reasonably practicable, increased hauling power is properly obtainable through increasing the power of the locomotive. Otherwise there is the question whether to increase the power of the locomotive or to decrease the ruling gradient, and that man who decides this economic point without thorough investigation of each side of the question fails in his duty. Present increased returns is not necessarily economy. Economy is the selection of that thing or process which will perform the required service at the least ultimate cost.

The accompanying table was developed for the purpose of aiding in comparing the relative efficiency of different lines having different ruling gradients and gives a reasonable indication of what may be expected from the reduction of ruling gradients. It is comprehensive in that by means of it a broad field of comparison may be made by inspection without computations. And since it gives an answer in "trains", it offers a means for economic comparisons readily reducible to a money basis. The table is based on the net rating of the U. S. standard light Mikado locomotives. The columns give the effective hauling power (cars and contents, exclusive of engine, tender and caboose) on various gradients referred to the gradient indicated at the top of the column as a basis and which may be considered as 1 or 100 per cent. The lines give the number of trains required on the various gradients referred to the gradient indicated in the first or last column as a basis and which may be considered as 1 or 100 per cent.

For a given gradient divide the ascertained tonnage by the net rating in column five opposite that gradient, which gives the number of trains required to move that tonnage. This number of trains multiplied by the quantity on the same line under any other gradient gives the number of trains required to move a like tonnage on the new gradient.

Thus, in the column headed 1 per cent on the line oppo-

site 0.5 per cent, the effective hauling power on a 0.5 per cent gradient is 1.709 times that on a 1 per cent gradient, or the locomotive is 171 per cent efficient on a 0.5 per cent as compared with 100 per cent on a 1 per cent gradient. Similarly on the line opposite 1.5 per cent, the effective hauling power of the locomotive is 0.683 times that on a 1 per cent gradient, or the locomotive is 68 per cent efficient on a 1.5 per cent as compared with 100 per cent on a 1 per cent gradient.

On the line opposite the 1 per cent gradient under the column 0.5 per cent, it is indicated that for each train on a 1 per cent gradient there will be required 0.585 trains on a 0.5 per cent gradient and under the column 1.5 per cent it is shown that for each train on a 1 per cent gradient there will be required 1.463 trains on a 1.5 per cent gradient.

The table may also be used to suggest reductions in gradients to balance trains for unequal tonnage. Thus say the tonnage is in the ratio of 3 in one direction to 4 in the other and the gradients are 1 per cent in each direction. To what gradient should reduction be made against the heavier traffic to balance the trains? The difference in tonnage is  $3\frac{1}{3}$  per cent of the lighter tonnage, so the efficiency of the locomotive must be  $133\frac{1}{3}$  per cent of that on the 1 per cent gradient. In the column for 1 per cent gradient on the line opposite 0.7 per cent is found an efficiency of 134.1. Therefore, a reduction to 0.7 per cent will balance the trains.

Or looking at it the other way: To balance the trains the locomotive should show an efficiency of 75 per cent on the 1 per cent gradient as compared with that on the new grade. On the line opposite 1 per cent 0.746 or 74.6 per cent is found in the column headed 0.7 per cent.

The above may be checked from the net ratings given in column four.

$$\begin{aligned} \text{Thus:—} \quad \frac{\text{Tons}_1}{\text{Rating}_1} &= \text{Trains} = \frac{\text{Tons}_2}{\text{Rating}_2} \quad \text{since the trains} \\ &\text{must be equal.} \\ \frac{3}{1832} &= \frac{4}{\text{Rating}_2} \quad \text{therefore Rating}_2 = \frac{4 \times 1832}{3} = 2442\frac{2}{3} \end{aligned}$$

but 2,456 is the rating on 0.7 per cent gradient, which indicates that 0.7 per cent in the nearest even one-tenth per cent to the gradient required to exactly balance the trains.

While the table is worked out for the light Mikado it is believed that it will not be sufficiently different from one worked out for other locomotives to make material difference in the results and it therefore will serve generally for a comparison of the efficiency of different gradients.

Train Wreck Caused Through a Turk Panic Results in Many Fatalities Outside Salonika

# Railway Developments in Foreign Countries

## British Transport Bill Passes to Its Second Reading—The Problem of Unification of the Railways in China

THE BILL proposing the establishment of a Ministry of Ways and Communications in control of practically all means of transportation in the United Kingdom and Ireland, introduced in the House of Commons on February 27, passed to its second reading without a division, and was committed to a standing committee on March 18, following a two days' discussion in the House and a detailed explanation of its terms by Sir Eric Geddes, who is slated to be the first minister.

Strong opposition was presented to the bill on the part of the road transportation and dock interests, both in the press and during the two days' discussion of the bill in the House of Commons, but without effecting a change in the bill or without impeding its progress. This opposition, as has been noted in the *Railway Age*, was chiefly centered around the idea of putting such extensive powers in the hands of one man—more particularly in the hands of a man who was likely to work out the problems concerning the road and dock interests from a railroad point of view.

Labor has been in favor of the bill, one labor member even going so far as to express his approval of it in the discussion because it would represent an important step in favor of ultimate nationalization. J. H. Thomas, member from Derby, and general secretary of the National Union of Railwaymen, said: "So far as the railwaymen were concerned, they would not consent to allow themselves to be sweated simply for the benefit of the traveling public."

The opposition that might have been introduced in the discussion on the part of the railway interests was largely forestalled by a very important change that the government made in the bill before the second reading by way of eliminating the provision that the minister might purchase any railway, etc., on authority of an order in council a draft of which should be laid before both Houses for 30 days, etc. This, it was feared, might lead to nationalization without opportunity for sufficient consideration, and so great was the opposition to the provision that it had to be radically changed.

The clause in question read in brief as follows:

The minister may be authorized by order in council at any time after the passing of the act to purchase by agreement or compulsorily and work any railway, light railway, canal, waterway, or inland navigation, harbor or dock undertaking.

The minister is also to have power to establish and work any such undertaking, to lease the whole or any part of any undertaking, acquired or established, to purchase privately-owned railway wagons, and to establish and work transport services by land or water.

All such powers are to extend to any shipping or other services carried on as auxiliary to the principal business of the undertaking.

Before an order in council is made a draft must be laid before each House of Parliament, for not less than 30 days, during which it is sitting, and, if either presents an address against it or any part of it, no further proceedings can be taken on it, without prejudice, however, to the making of any new draft order.

The changes mentioned were outlined in Sir Eric Geddes' speech in the following words:

It was proposed to take any permanent action by order in council. That order in council would be discussed in this House. It was thought that it would afford reasonable facilities for discussion. But in view of the fact that there is undoubtedly a strong feeling in the House against that procedure the Government will now amend clause 4, eliminating the procedure by order in council. On the other hand, dealing particularly with the provisions of clause 4, sub-section (1) (e) and (f), as regards (e) the Government will definitely seek power in the bill to acquire by purchase or hire, and to maintain, work, or lease privately owned railway wagons on terms, failing agreement to be settled by the Railway and Canal Commission. The government will also seek under the bill powers to prohibit the use of privately-owned wagons in future except under license. It is also proposed to transfer the powers in clause 4, subsection (1) (f), which were permanent powers, and make them temporary powers under clause 3, and to provide that in addition during the two years the minister shall have the right, subject to treasury control, to construct such works as may be necessary. That is really essential, if we are to have powers to carry out the scheme—it may be railway development or something of that kind—which we could not reasonably expect the existing railway companies or other transport agencies to undertake.

Sir Eric Geddes' speech was abstracted very briefly in the *Railway Age* of March 21, page 787. Inasmuch as he spoke an hour and a half it is impossible for lack of space to reproduce what he said in detail. He emphasized the necessity for the bill, by showing that the means of transportation were "financially in a semi-paralyzed state," and brought out the point that the railways which had earned a return of 4.3 per cent before the war were now losing from 3 to 4 per cent, or suffering a loss of £90,000,000 to £100,000,000 yearly. He explained the necessity for a continuance of unified control of the several railroad companies and of the inclusion of all transportation facilities in general and expressed the opinion of the government that it must work out a definite "transportation policy" for after the war. As far as the two years control mentioned in the bill was concerned, he emphasized that this "temporary period of two years" "was really fixed for us by a letter of Mr. Runciman, president of the Board of Trade in the late government, to the railway companies, when he intimated to them that the cabinet approved the continuance of the guarantee for two years after the war." "Two years," he said, "seemed not an excessive time in which to consider in detail the whole of this very complicated problem," and then emphasized that after the government had had this time to consider a definite policy it could not proceed further without authority from the House.

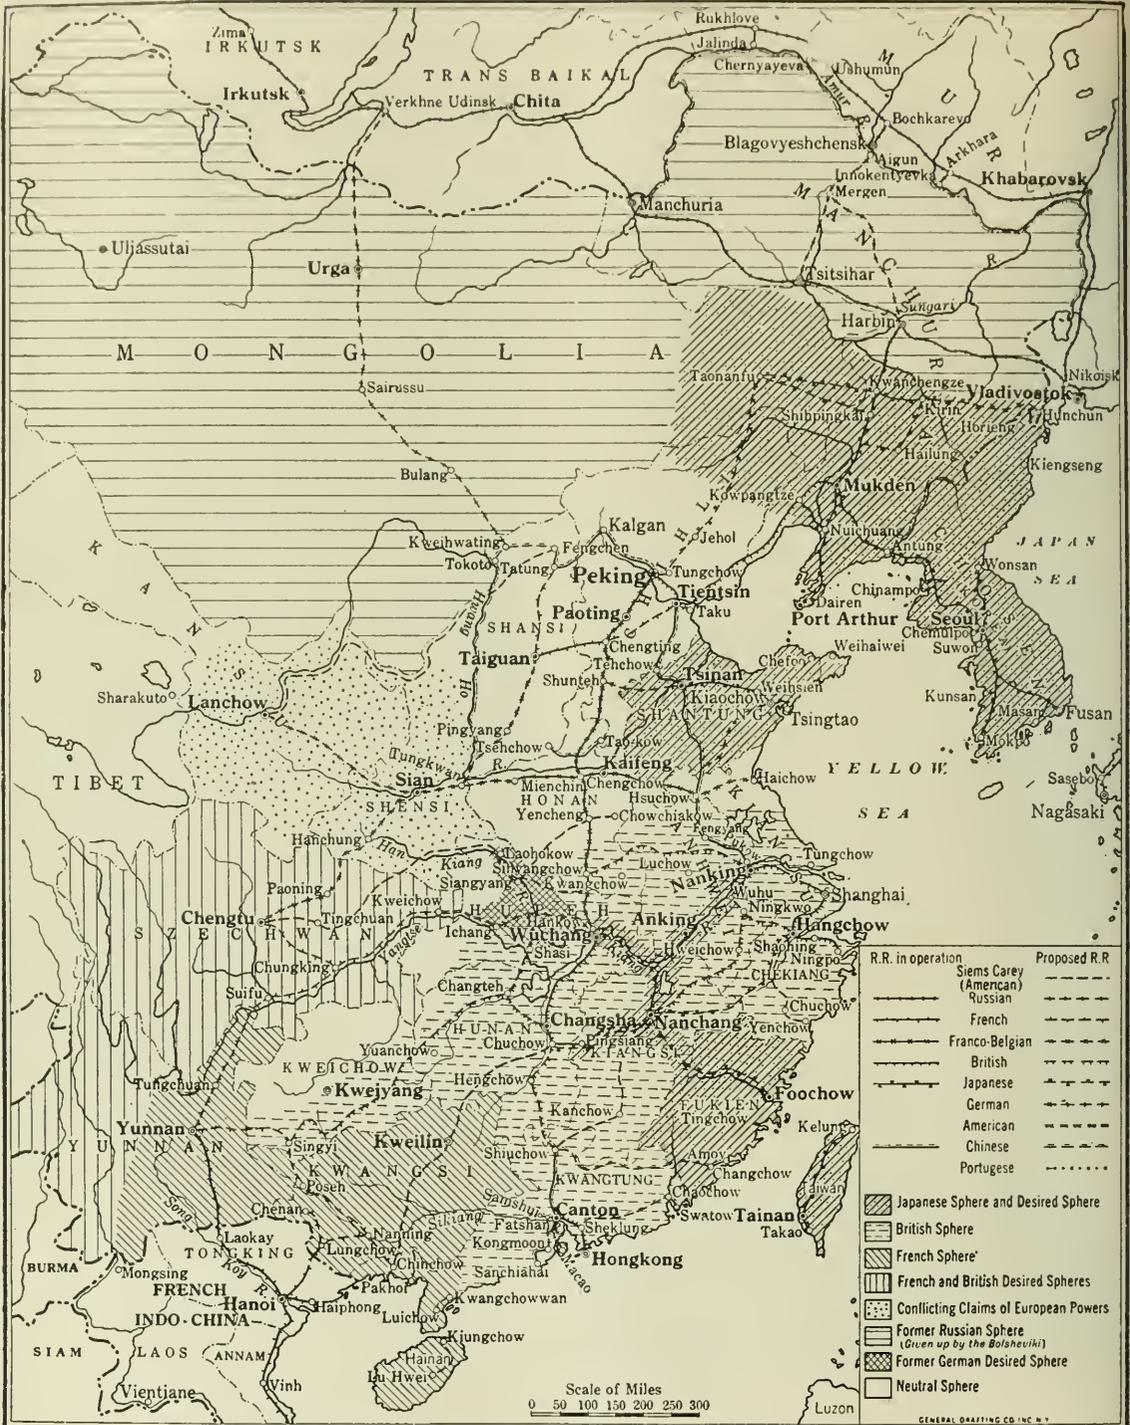

Mr. Shortt, the home secretary, later added along the same line that: "The withdrawal of the system of orders in council made it clear that the question of nationalization or no nationalization must subsequently be determined by the House"; but that Sir Eric Geddes "had also made it equally clear that whether the railways were internationalized or not, they could never again go back to the system of unfettered competition which existed before the war," the last statement being greeted with cheers.

The London Times says editorially that it was not convinced by Sir Eric Geddes' reasons for taking over such extensive and broad powers as are proposed in the bill. Concerning the railroad problem, however, it says in its issue of March 18:

"When Sir Eric Geddes declares that we have no transportation policy, he is on far surer ground, and we are able to agree with him without reserve. If the great programs of reconstruction and betterment are to be carried into effect, the very first necessity is a drastic improvement and development of our facilities of transportation. Such reforms lie at the root of the schemes for better health, better housing, the expansion of our trade, and all the other projects now being hopefully initiated. The government is therefore right to put transportation in the forefront of their legislation for the new era. Their claim that the railways require some form of amalgamation and unification, in order to eliminate wasteful competition and reduce working expenses, is admitted by the companies themselves. We doubt whether there will be effective opposition in any quarter to the proposal to establish some form of state control over the railways. In no other way is real progress now possible. The intense hostility already visible regarding the bill, even in quarters wholly friendly to the government, is not in the least due to the proposal to place a minister in supreme charge of the railways. It arises, in the first place, from the most unwise attempt to subvert the rightful powers of Parliament, and, in the second place, from the vast scope of the bill itself. We

need not dwell upon the clause which originally gave Sir Eric Geddes an unprecedented degree of authority which he was to use by orders in council. The government have promptly amended the clause by eliminating the procedure in

council. The storm this provision provoked should be a wholesome lesson. Henceforth, we may be sure, Parliament will watch most vigilantly any fresh proposals to extend the use of orders in council, a medieval expedient which is

Map of the Spheres of Influence in China, Showing Also the Railway Lines—Present and Proposed

entirely opposed to the spirit of Parliamentary government in peace time. The powers sought were in any case unnecessary, as the minister showed by implication. The bill is at present really experimental, as it should be. No question of 'nationalization' of the railways, or any other form of permanent control, arises under it. Sir Eric Geddes admitted that he fully agreed with the committee on transport that much more investigation and experience are required before the final shape of state control over the railways can be determined. It is therefore difficult to understand why such autocratic powers were ever introduced into the measure. What will happen, we gather, is that for two years the new Ministry will gradually and tentatively exercise a general centralized control over the railways, with authority to enforce improvements and to check wasteful working. At the end of two years, when the guarantees to the companies expire, Parliament will be invited to consider some scheme of permanent state control. This is the right way to set to work."

### The Proposed Unification of Railways in China— Special Correspondence From Peking

PEKING, March 12.

No subject connected with China in recent years possesses more interest for Americans with railway affiliations than the current proposal for a general unification of all railways in China. For over a month, the topic has been discussed officially and unofficially with a great deal of heat,—being opposed by the subsidized Japanese press, the arms of the present government known to be under Japanese influence and by the Chinese press owing allegiance to such officials. The final decision of the cabinet to present the subject at the Paris Peace Conference indicates that Japanese opinion has veered to the support of the proposition, for only two weeks ago, the Minister of Communications announced that if the cabinet should over-rule his opposition, he would resign.

The motives which have impelled the Chinese government to take this step and the bearings which the move has upon American interests are many. It will be recalled that every principal line, except one, in China has been built by foreign money. At the conclusion of the Chino-Japanese war, Russia, Germany and France extorted from China (as a reward, partly, for forcing Japan to forego her claim to the Liaotung peninsula) the privilege of building railways as private ventures. England and Belgium (the latter with French and Russian backing) secured the privilege of lending China money to build railways in the Yangtze valley and the interior. All of these privileges (it was considered a privilege then, to lend China money) were conceived to give to the nation holding them certain preferred rights in the territory occupied. When it is remembered that extra-territoriality takes foreign law into the interior with the foreign personnel of such railways, it will be appreciated how Chinese feared their sovereignty to be slipping away. Because of this the American government would not be a party to the intrigues for such concessions, and so although American companies first surveyed the Peking-Hankow line, made the first agreements for the Canton-Hankow line and the Tientsin-Pukow line, and later contracted for a line from the Siberian border through Manchuria south to the Gulf of Pechihli, the Americans were obliged to yield in every case, as the alternative to applying the same pressure to China as other nations were doing. By withdrawing thus, they gained the friendship of China, while others gained some part of China—at least so it seemed for the time being.

Each of the lines so built was constructed without any reference whatever to the standards and practices upon the other lines. There are three gages in China—standard, five

feet, and metre. There are two heights of drawbar—the American standard and the English standard some five inches higher. The accounts followed the personal preferences of the chief accountant who happened to be employed. The practice thus followed English, German, French, Russian, Japanese, Indian, and purely Chinese practice. Equipment was invariably purchased in the home country of the loaning syndicate. This privilege is a term in every agreement. As a result the statement made by a railway supply man that "there are not films enough in China to take a picture of each of the different types of equipment," is not wide of the mark. This monopoly of the market upon each line possessed by some European country has had the natural result that American manufacturers could never get an order, unless the European factories were "full up." On the purely Chinese lines Americans have been able to get a good share of the orders, but purely Chinese lines are few and short—and there are no American lines.

And up to the present, it looked as if there would never be any American lines. A prominent American contracting firm came to China early in 1916. It had no difficulty in getting an agreement with the Chinese government to build 2,000 miles of line, the routes to be agreed upon later. Then it started out to locate a route. It found one that looked good in south China. But the French protested that they had had a letter from a former vice-minister promising them that route. Another line was located as an extension to the purely Chinese Peking-Suiyuan. But the Russians produced an agreement on the part of China not to build in the direction of the Siberian border without consulting Russia. Then a line into Szechuan was marked down, but the British clearly proved that this was a legitimate extension of a line which they proposed to build some day. There were still other minor projects which met the same fate, until in exasperation the American asked, "Where in hell is CHINA?"

During the past two years, the Japanese have been very industriously complicating the situation with respect to routes, by loaning the Chinese government large sums upon the undertaking to give Japanese contractors the privilege of building along most of these disputed routes. While not a spadeful of dirt has been turned or a blue print made to represent actual attempts at construction, at least \$100,000,000 Mex. has been advanced upon such security. The sudden termination of the war with the unexpected victory of the Allies leaves the Japanese with this considerable sum out on very doubtful security. Nevertheless, they have such an influence over Chinese officialdom with a certain nebulous "special position" recognized by other powers, that it is difficult to see how the situation could be cleared up without a wiping of the slate clean.

With the beginning of the Republic modern minded Chinese clearly perceived that some order must be introduced into railway affairs, and straightaway attempted standardization of accounts. With surprising rapidity they succeeded in getting out uniform classifications of capital expenditures, operating revenues and expenses, income account, balance sheet and a form of annual report. An American adviser was employed in this connection, and a successor still keeps American influence present. But a reactionary ministry followed the death of Yuan Shih Kai and seriously crippled the continuation of that work, and it is charged that there are many ministerial orders directing what is in effect a disregard of the classification. At the same time, certain of the lines have maintained their privileges of deviating from the prescribed classifications in a few matters in which they conceived the foreign interest to be affected.

Some attempt has been made during the same period to weld the service of the same lines into a whole. Through passenger tickets were put into effect and a clearing house established to take care of the division of revenue. But

nothing has been done for goods and when the ministry tried to put through a plan for the general interchange of rolling stock during the past summer, the lines would have nothing to do with it. They make the point that the car supply on several lines is so inadequate that to let a car get off from the home line is to lose it forever, and that the types differ so much that not only are there no spare parts suitable for repair, but that the mechanics of foreign lines can not be trusted to make repairs properly. With the purchase of new equipment which will follow the reduction of war prices, this condition will be perpetuated and intensified. The ministry is powerless to prescribe uniform specifications. It can merely recommend them—but the recommendation is very likely to be ignored, for the new specifications will make it more difficult for the home manufacturer to bid successfully on the order.

The only remedy then is at a time when foreign sentiment is lenient toward changes to secure relief from these conditions. The Yunnan, Shantung, South Manchurian and Chinese Eastern lines have never been governed even by the attempts at uniformity which have been described above. They are private lines purely. But to the forward looking, the present situation if continued will be intolerable. Think of it! If a shipment be attempted from no farther than Harbin to Tientsin, at Changchun the cargo must be transferred from a car of five-ft. gage to one of standard gage, at Mukden it must be transferred again from a car with a low drawbar to one with a high drawbar. If the load went on to Shanghai it would have to be lightered across the Yang Ste river, for there is no ferry. What chance is there against water competition in such a situation. If the car were diverted, instead, to Kalgan, it would have to be transferred again at Peking in order to get into a car with air brakes, necessitated by the grades over the Nankow Pass. There is some reason, therefore, to the present objections toward a general interchange of rolling stock.

But in addition, there is the strong political desire of removing the cloud from the Chinese title to these outlying provinces. If, as it is proposed, these lines, government and foreign, all be redeemed by means of a large refunding mortgage, the whole to be under the trusteeship of an international board, the "sphere of influence" will automatically disappear. Right here is the biggest commercial factor in the whole situation. It has been the fashion to rail at the inability of the Chinese to make progress. As a matter of fact they are to be complimented for their ability in preventing progress. The silently pursued goal of the Chinese has been the prevention of foreign investment in anything, either good or bad, because every foreign investment by so much solidified the foreign power in the affected territory. While competitive armaments, competitive propaganda, competition for "places in the sun" were the order of things in China, there was no other way for foreign governments to advance their interests in China, than by "spheres of influence." But every one familiar with the situation knows that the results were not worth the cost. In 20 years of railway competition there were less than 7,000 miles of line built. During the last ten years there has been barely a thousand miles added, and of this a fifth was added by the Chinese themselves. But with the fear of putting themselves in bondage to the foreigner removed, we may expect to see within the next generation some realization of the hopes which have been entertained of the most numerous, the most industrious, the most patient, and the shrewdest of all peoples—the Chinese.

#### Orders for American Coal

Coal circles in Glasgow and the west of Scotland, says the London Times, are concerned over the report that the Swedish State Railways have purchased 30,000 tons of American

coal for delivery over the next few weeks at Gothenburg, and that the Dutch government has bought 50,000 tons for delivery at Rotterdam. It is admitted that the lower free-on-board prices in America may compensate for the higher Atlantic freights, and developments will be closely watched in British centres.

#### Shortage of Railway Equipment in Germany

The difficulties Germany is having in fulfilling the terms of the armistice as to railroad equipment were shown in an article in the *Vossische Zeitung* of December 18, 1918, which has been translated and sent to Commerce Reports by Consul Wallace J. Young, Goteborg, Sweden. The article follows:

The new armistice negotiations in Treves make it necessary to publish exact figures regarding all available rolling stock in Germany, as the question of revising the agreement covering the delivery of locomotives and freight cars will be an important part of the negotiations.

The German national railroads are credited with possessing 36,008 locomotives and 782,529 freight cars. As a matter of fact, there are only 30,709 locomotives available at the present time, and according to a count made last October there are approximately 46,000 passenger cars, 12,000 baggage cars, and 459,000 freight cars. The remaining locomotives and cars were lost in consequence of war or are in the occupied districts or in allied or neutral foreign countries, from which it is not probable that they can be returned in the near future. Locomotives that require repairs figure from 30 to 50 per cent of the total. This is due to the strain put upon them by the war. In addition, there are approximately 43,000 freight cars that require repairs.

#### RAILWAY TRAFFIC HINDERED

In consequence of these conditions it has not only been impossible to deliver our rolling stock to the extent that the allies required but the German railway traffic has been seriously hindered. The factories and roundhouses responsible for repairs should not bear the smallest part of the blame for this condition. Their numerous strikes and reduced working efficiency have made it impossible during the last few weeks to accomplish the absolutely necessary work that the changed conditions have brought about. The rolling stock on hand is still further reduced through the necessities of demobilization. To date it has been possible to furnish only 57 trains to return the Western Army from the front and 16 trains for the Eastern Army.

To this we must add the demands made by the Allies. To start with, they require that we return between 20,000 and 25,000 prisoners daily, which will require no less than 14 trains. Then they require the immediate delivery of 5,000 locomotives and 150,000 cars. This was the original demand, which was made even more severe after the conclusion of the armistice. The Entente now demands that 2,000 locomotives be of the heaviest type, 2,000 of heavy type, and 1,000 of a light type, and that the cars include 15,000 passenger cars, 6,500 baggage cars, 60,000 open gondolas, 40,000 covered freight cars and 28,500 cars of a special type.

#### CONFISCATED ROLLING STOCK

The following figures covering confiscated rolling stock prove conclusively that the Allies' demands are far greater than what we secured from enemy countries. From the Belgian railway system, the heaviest type of locomotives comprise only about 9.5 per cent of the total. Among the captured French and Belgian locomotives only 230—that is, 11.3 per cent—were of the heavier type. Among the German locomotives on hand, including those left in Belgium, we figure about 13,500; deducting 40 per cent as unfit for service, there are 8,100 available.

Our booty in Belgian and French railway cars is approximately 100,000 cars, including 9,000 passenger and

baggage cars and 71,000 open and 20,000 covered freight cars. The Allies demand the delivery of 150,000 cars, including 88,500 of the open or of a special type and 40,000 covered. Thus we lose 50,000 more than we confiscated. Herewith it is to be noticed that German freight cars usually have a much larger tonnage than the Belgian. In 1912 only about 45 per cent of Belgian cars possessed a tonnage capacity of 15 tons or more, whereas 85 per cent of German cars have this capacity.

#### DELIVERY OF EQUIPMENT TO ALLIES

The period set for delivery—that is, the 11th of December—has not been followed. It has become evident that the recent inquiries from the Entente regarding the prompt delivery of this rolling stock does not constitute an ultimatum. The German Armistice Commission has in fact made a counter proposition that will be considered in the new armistice negotiations. It is to be noticed that a not inconsiderable proportion of the rolling stock to be delivered is already in the hands of the Allies, as Germany left no less than 3,000 locomotives and 100,000 cars in the districts since occupied. According to the original demands of the Entente, we would have to deliver 2,000 locomotives and 50,000 cars in 10 days. Such an achievement of transportation, simultaneously with the return of the troops from the western front, would certainly have led to a stoppage of railway traffic to the districts in question. The new negotiations over the extension of the armistice are giving opportunities to get easier terms in the question of delivery.

#### REPAIRS NECESSARY—FURTHER REDUCTION IN TRAFFIC

According to the new armistice terms, the period for delivery of the locomotives and cars expires on the 16th of January. In the next 10 days 1,000 must be delivered; that is, 100 daily. The delivery of the freight cars also causes extraordinary difficulty. In the next few days 48 full trains must be turned over. This figure becomes 70 very soon. In addition to this, the Allies have shown themselves extremely strict in this proposition and positively refuse to accept anything not in perfect condition. Hence the railway management is forced to turn practically the entire rolling stock to the repair shops to have them put in fit condition to meet the requirements.

It is already customary to work in three shifts in both the railway and private shops. Under these circumstances, it seems absolutely certain that we will not be able to avoid a further reduction in military and passenger traffic. From now on the return of troops will be much slower, owing to the missing rolling stock. The Railway Ministry has instructed all branches to reduce present traffic 50 per cent. The manner of fulfilling this instruction is left to the discretion of the branches. Furthermore, hereafter no one may use the railways without a travel permit. It has not been considered advisable to enforce this restriction in the city of Berlin, but it may still be necessary to insist upon a travel permit even there. At present it seems impossible to make any further saving in freight traffic, inasmuch as it is doing practically nothing but transporting coal and provisions, but one must figure upon having postal matters delayed still more in the future.

#### An Important Bridge Project in Uruguay

Among the recommendations voted by the Fifteenth Annual Rural Congress of Uruguay, writes Consul William Dawson from Montevideo, was one providing for the building of three bridges, the most important of these being that over the bar of the Santa Lucia river in the vicinity of Montevideo. The width of the river at the point to be bridged is some 500 meters (1,640 feet).

The bridge, which would place the southern part of the Department of San José in easy communication with Monte-

video and give new life to the state-owned Ferrocarril del Norte, has been under consideration for a number of years. Some time before the war a definite project was drawn up and contracts for the building of the bridge were let. About \$400,000 was expended in the erection of the pillars, the work being done by a Montevideo firm. The superstructure was contracted for with a German firm, which was unable to secure shipment of its materials on account of the war. This contract has since been canceled by the Uruguayan government.

The consulate is informed that no decision has been taken with respect to a second call for tenders and that it is not known whether such a call would be based on the original or new specifications. Copies of the plans used for the first call may be obtained from the Dirección de Vialidad, Ministerio de Obras Publicas, Montevideo, at a cost of 3.50 pesos (\$3.62).

#### Electric Railway Projected from Stockholm to Goteborg

Electrification of all the principal railroads of Sweden is most logical in view of the dearth of coal and the wealth of water power, writes Commercial Attaché Erwin W. Thompson, Copenhagen, Denmark. The plan recently discussed in the Danish press for an electric road connecting Goteborg and Stockholm, is most timely. Goteborg has many advantages as a port for the unloading of freight from the Atlantic, but Stockholm is a more advantageous center for the distribution of foreign goods. The proposed railway should therefore be of advantage to both cities. The following comment on the project appeared in the Berlingske Tidende (Copenhagen) for February 11:

As economic life in the neutral northern countries resumes normal conditions efforts from all sides are directed toward becoming fully equipped for the enormous boom in commerce and traffic which is prophesied for all these countries. The American plans for making Copenhagen the center of food distribution to the hungry Baltic States have enhanced the expectations. Sweden has great chances for transit traffic in a new big north European main route. An important link in this work is the great plan for building a new electric express from Stockholm to Goteborg, at the head of which is the well-known Swedish traffic expert, Hjalmar Cassel. The present route is old and inadequate, and Mr. Cassel claims that the time is ripe for building a new railway. This would not only take care of the transit traffic between England and Finland-Russia and the express traffic from Stockholm to Goteborg and from Stockholm to Christiania, but also the express traffic south to Denmark and the Continent, and between Denmark, the Continent, and Norway. The new route would mean a considerably quicker connection between Sweden and Finland, Denmark and Scandinavia. This would be of greatest importance in the general scheme for Scandinavian co-operation.

#### Mexican Government Proposes to Purchase Yucatan Railways

According to advices from Merida, the proposition of the Carranza government to purchase a controlling interest in the United Railways of Yucatan is received unfavorably by several of the larger stockholders of that company. It is considered doubtful if the plan of taking over the property by the government is put through. The system embraces 1,141 miles of road, including many branch lines that gridiron a considerable portion of the more developed parts of Yucatan. Besides affording a direct rail connection from the sea at Progreso to Merida, the chief city, it has a line running south to Campeche, 107 miles. It also extends into the territory of Quintana Roo, which was created out of Yucatan during the administration of the late President Diaz. The United Railways of Yucatan are owned by a syndicate of bankers and sisal fibre growers of Merida.

The announced plan of the Carranza government of constructing a standard gage railroad from Santa Lucrecia, on the National Tehuantepec Railroad, to Campeche, about 450 miles, is the same project which was promoted by a British syndicate eight years ago. The revolutionary troubles put a stop to the scheme. The route of the proposed line is through one of the richest and most remote parts of tropical Mexico.

Notwithstanding the revolutionary disturbances, the con-

struction of a 25-mile railroad from La Capilla, on the Guadalajara-Irapuato division of the National Railways of Mexico, to Lake Chapala has been accomplished. The road was recently opened for regular freight and passenger traffic. It affords a direct rail outlet for one of the most delightful pleasure and health resorts in Mexico.

After a long period of suspension traffic has been resumed on the Guadalajara-Manzanillo line of the National Railways of Mexico. Temporary repairs have been made to the track, bridges and other parts of the road and a large amount of permanent reconstruction work will be done as soon as the materials can be obtained, it is stated. The federal government plans to make important improvements to the port facilities at Manzanillo. In order to develop the trans-continental traffic between Manzanillo and Tampico low freight rates will be established. The line that runs from Guadalajara to Manzanillo was originally a part of the old Mexican Central system.

**Railways in Morocco**

The study of the Tangier-Fez Railway scheme was suspended at the outbreak of the war, says a recent issue of the Near East, as quoted in Commerce Reports, but lately the project has been taken up again, the plans, etc., have been proceeded with, and actual work has commenced on some sections in the French zone. The construction of the line will presumably be proceeded with as quickly as possible.

The public works in progress in the Spanish zone on the outbreak of the war were harbor works at Larache and a railway between that port and Alcazar, both of them in the hands of a German company. The former has been handed over to the Spanish authorities in an incomplete state, and the work on the railway has been practically at a standstill for some time. This railway, as also the Spanish zone section

of the Tangier-Fez Railway, with which it will connect, will presumably be pushed on when circumstances permit. A light railway has been built connecting Centa with Tetuan, and a line to join up the latter place with the Tangier-Fez railway is contemplated, but it is not likely to be taken in hand for some time.

**Russian Railway Paralysis**

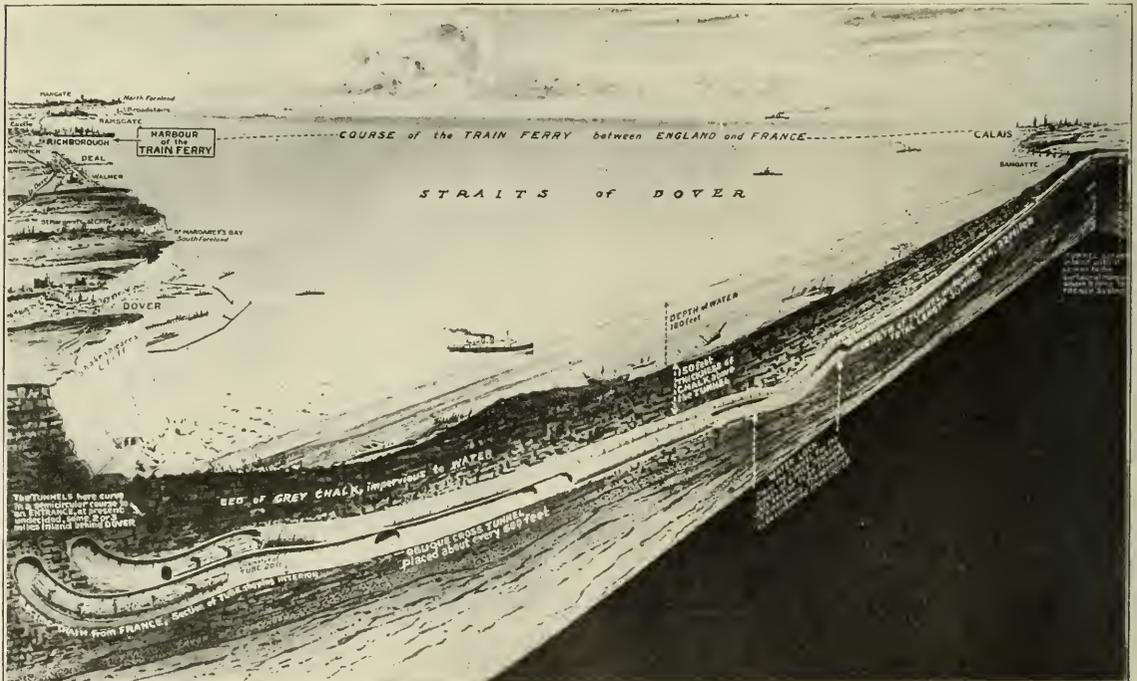

The paralysis of railway communications in the whole of Central and Northern Russia, it is officially admitted in Moscow, is rapidly approaching, writes a correspondent in the Times (London) from Helsingfors, under date of March 5.

The principal cause seems to be the lack of fuel, and then the dearth of skilled workmen for the repair of locomotives, and the huge masses of snow which have accumulated during the winter. From February 26 to March 1 only one passenger train arrived at Moscow from Petrograd, carrying exclusively Bolshevik delegates. On the Moscow-Kursk-Kharkov line many trains have been snowed up for 1 days. The official Severnaya Kommuna publishes an urgent order of the Soviet mobilizing all peasants up to the age of 55 exclusively for obligatory service on the railways.

**Exports of Railway Supplies Through New York**

Exports of railway material from the port of New York, during February, according to figures of exports compiled by the National City Bank of New York included the following:

Steam passenger cars.....	\$40,708
Steam freight cars.....	211,151
Car wheels and axles.....	165,771
Steam locomotives .....	1,990,171
Railroad spikes .....	216,497
Steel rails .....	3,178,224
Switches, frogs, etc.....	445,933

## Professional Engineers Given Hearing

THE NEED FOR A CLASSIFICATION and standardization of conditions and salaries for railroad professional engineers was urged by representatives of the American Association of Engineers and the Engineering Council at a hearing before the Board of Wages and Working Conditions of the Railroad Administration at Washington on March 31 and April 1 and 2. The American Association of Engineers, represented by C. E. Drayer, secretary, presented the resolutions and schedule of salaries for engineers adopted at the Chicago conference on March 17, which were published in the *Daily Railway Age* of March 18, and also the following argument in support of its position:

"Two illustrations are mentioned for the purpose of making plain the need. From questionnaires recently sent out, the American Association of Engineers finds that three roads are paying instrumentmen \$105 a month, while several other roads are paying the same class of help from \$165 to \$175 per month. An instrumentman on the Pennsylvania Railroad is doing resident engineer's work, consisting of the construction of engine terminal and is receiving instrumentman's pay.

"The benefits to be derived from classification and standardization are: 1. Elimination of the discrimination that exists between engineers in railroad service. 2. It will permit re-adjustment of salaries and working conditions on a definite and sound basis.

"It is admitted by all that there should be certain definite relations in pay among men who are doing the same kind of work; that there should be certain definite standards whereby a man who is qualified to perform a certain kind of work and does, should receive a certain pay.

"We find on the different roads, from the 1,200 questionnaires sent out and received last week from 60 different roads, that men doing precisely the same kind of work are being paid salaries differing by large percentages.

"The following principles should govern in classification and standardization of positions and salaries: 1. Standard and distinctive details of all positions having similar conditions and working requirements. 2. Definitions of duties and responsibilities of each position. 3. Definitions of classifications and requirements of each position. 4. Placing of positions into classification according to the character of duties and according to responsibility and division of work. 5. Positions of the same kind, made distinctive according to duties and responsibilities, should carry the same rate of pay.

"In view of the data submitted by the American association at this hearing showing lack of uniformity of rates being paid to engineers in railroad service;

"In view of the testimony as to lack of proper consideration of engineers as a class in any of the orders heretofore issued by the board;

"In view of the evidence introduced as to the desirability of defining and standardizing titles and positions,

"We respectfully ask the Board of Wages and Working Conditions to make a thorough investigation of the pay and working conditions of employee engineers of all classes, civil, mechanical, electrical, signal, testing and any others in order that exact justice shall be done.

"We ask that age, seniority, responsibility and ability be given consideration in determining a schedule of wages and in establishing rules governing promotion.

"We ask that the American Association of Engineers be given an opportunity to be represented in the final study of data and in the preparation of the schedule of wages and rules of promotion.

"We ask that a decision be reached as speedily as possible and that the new schedule of wages be made retroactive in the discretion of the board."

The following was also presented on behalf of the Engi-

neering Council by Francis Lee Stuart and Frank H. Clark, of the Railroad Section Committee on Classification and Compensation of Engineers:

"Engineering Council is an organization of national technical societies of America, created to provide for consideration of matters of common concern to engineers, as well as those of public welfare in which the profession is interested, in order that united action may be made possible. The present member societies are the American Society of Civil Engineers, American Society of Mechanical Engineers, American Institute of Electrical Engineers, American Institute of Mining and Metallurgical Engineers and American Society for Testing Materials, representing some 40,000 members. A large number of the members of council's constituent societies are directly or indirectly connected with the transportation system of the country.

"Engineering Council has been advised: first—that engineers and engineering assistants of the more important classes on the railroads have been individually considered as belonging to the officer or supervisory force and certain increases of salary have been granted them by the Railroad Administration; second—that the men in subordinate positions in the civil, mechanical, electrical and signal departments not included in the above class, while not having been given a classification, have been granted certain increases under Order No. 27—Supplements 7 and 8.

"The Engineering Council through this committee desires to express to your board its belief that it is to the best interest both for the social and economic welfare of the railroad professional engineers of the United States that the case of these younger engineers or engineers holding these subordinate positions be further considered.

"Before the war the compensation of the engineers was notably inadequate and the increases which have been granted the men in the subordinate positions do not seem to them sufficient. Engineering Council, through this committee, asks that the employees of the engineering departments—civil, mechanical, electrical and signal, who were not considered in the officer or supervisory force, but who will, from their technical education or training, at some later date occupy the higher positions in these departments, be given a classification and the titles of these positions standardized, and a proper remuneration be given them in order that their physical welfare and mental interest may be provided for so as to insure efficient service to the public.

"The members of the founder societies of Engineering Council have occupied these identical positions in their day and hence speak to you from experience, but we recognize that Engineering Council has not the direct touch with these younger engineers employed by the railroads of the country, to handle the details of the matter in the way you may desire and we are therefore further requesting that your board have the necessary data collected and considered so that it may be certain that this particular class of employee has been treated with justice comparable with other classes of employees who have been given separate classification in the railroad service.

"Associated with Engineering Council in this hearing is the American Association of Engineers, a national engineering organization which includes in its membership a large proportion of the younger engineers in railway service who occupy subordinate positions. The American Association of Engineers has held a conference of railway engineers to consider wage matters, and comes before you with the direct support of the larger proportion of railway engineers in the country."

The clause in the resolutions against overtime pay for supervisory engineers was the subject of considerable discussion. H. E. Stevens, chief engineer of the Northern Pacific, testified regarding conditions in the railroad engineering field as a representative of the northwestern regional director.

# General News Department

Pittsburgh to New York, 411 miles, in 11 hours, 20 minutes, is an automobile record recently reported. It was made by J. M. Sterling in a Marmon 34 touring car. The average rate is 36.28 miles an hour.

The transportation conference called by the Railroad Committee of the Chamber of Commerce of the United States is to hold its final session at Washington on April 17, at which resolutions will be adopted for presentation at the annual meeting of the Chamber. The conference has already gone on record as favoring the return of the railroads to their owners.

The Interstate Commerce Commission on Thursday issued a modification of some of its rules for the inspection and testing of locomotives, restoring, effective May 1, some of the changes made in September, 1917, to assist carriers in meeting war conditions, but making permanent until otherwise ordered, some of the modifications then made which experience has shown may be retained without adversely affecting safety.

Train robbers stopped St. Louis-San Francisco passenger train No. 801 two miles west of Bridge Junction, Ark., on March 27, and forced the express messenger to open a safe from which they obtained about \$6,000. The robbers uncoupled the baggage car and mail coach from the remainder of the train and ran some distance toward Memphis. Then the express messenger and his assistant were forced to turn over currency which they had in the car, and the two bandits got away.

Portable ticket cases are now in use at the Grand Central Terminal, New York City—large cases, each with room for all of the forms used at that station, mounted on casters so that they can be moved from one window to another. This office carries about 3,000 forms and under ordinary arrangements the ticket sellers have to do a large amount of walking from one case to another. In the new cases all very long tickets are folded so as to occupy the minimum amount of space. Each clerk, having a case assigned to his individual use, is provided not only with all forms of railroad tickets but also with Pullman tickets. The standard case, when shut up, is 3 ft. 9 in. wide, 2 ft. deep and 7 ft. high. By making all tickets with stubs, so as to simplify the accounting, one case is used, where necessary or desirable, by two sellers simultaneously. The simplification of the seller's work by the use of these cases has greatly relieved congestion at the ticket windows. The New York Central uses at the Grand Central Terminal 13 ticket windows.

## Western Railway Club Will Discuss Electrification

The April meeting of the Western Railway Club will be held at the Hotel Sherman, Chicago, on April 21. W. B. Potter, chief engineer of the Railway and Traction Engineering Department of the General Electric Company, and S. T. Dodd, also of that department, will present a paper on the Electrification of Trunk Line Railroads. The meeting will be held in the Louis XVI room at 8 p. m. and will be preceded by a dinner in the Italian room at 6:30 p. m.

## Pacific Railway Club

The April meeting of the Pacific Railway Club was held on the 10th at Oakland, Cal. The transportation of perishable freight was discussed. W. C. Phillips, general superintendent of ice plants of the Pacific Fruit Express, spoke on the production of ice and the icing of refrigerator cars; L. L. Yates, on the construction and maintenance of refrigerator cars; H. Giddings, on the transportation of perishable products; F. B. McKeiv, on the assembling and shipment of fruit, and S. M. Fulton, on fruit train schedules.

## National Chamber Asks New Trust Legislation

Reconsideration by Congress of all anti-trust legislation is recommended by the Chamber of Commerce of the United States as the result of a referendum vote. The membership of the chamber voted in favor of all of the four proposals advanced: (1) Congress should be asked immediately to consider the present situation of all statutes constituting our anti-trust legislation—for, 1,543; against, 51. (2) In reconsideration of existing legislation there should be formulation of standards of general business conduct, these to be administered by a supervisory body—for, 1,159; against, 389. (3) An enlarged federal trade commission should be made the supervisory body—for, 1,102; against, 437. (4) The membership of the federal trade commission should be increased to nine—for, 1,104; against, 422.

## Double Tracking on the Big Four

It was erroneously reported in our issue of March 21, page 781, that 300 workmen engaged in laying a second track on the Cleveland, Cincinnati, Chicago & St. Louis, near Winchester, Ind., had been dismissed by the contractors because the Railroad Administration had held up the appropriation for the work. We are officially advised that if any workmen were dismissed it was because their part of the work had been completed. The work has proceeded without interruption and grading for the second track between Winchester and Union City is over 90 per cent completed and the track is actually in service except for a short distance. Beyond Union City and between that point and Ansonia, grading is about 60 per cent completed and track laying almost entirely completed.

## Convention of Master Tinnners', Copper-smiths' and Pipefitters' Association

The American Railroad Master Tinnners', Copper-smiths' & Pipefitters' Association has announced that the next annual convention will be held on June 2, 3, 4 and 5, 1919, at the Marquette hotel, St. Louis, Mo. The officers of the association are: President, W. J. Moffett (N. Y. C.); first vice-president, G. B. Hosford (M. P.); second vice-president, W. W. Nash (I. C.); third vice-president, T. E. Holderby (C. & O.); secretary-treasurer, O. E. Schlink (C. & O. of Ind.).

## Thirteenth Engineers Commended

The enviable record made by the 13th Engineers (railway) in France has earned for this regiment the following letter of commendation issued by Brigadier General Moseley, assistant chief of staff, at the order of General Pershing, commander-in-chief of the American Expeditionary Forces.

The letter says:

"Official report has just been received at these headquarters of the decorations and citations awarded you with the approval of the French High Command by the Commanders of the French Armies, Army Corps, Divisions, Brigades and Regiments under whom your regiment has served during its tour of duty in France. It is very gratifying to know that the efficient service of your regiment has been so recognized and rewarded.

"At the request of the French Government, presented in the spring of 1917, your regiment was organized at an early date and under the most favorable auspices. By reason of the great number of men who presented themselves for service in France and the selection which was thereby made possible, the character and qualifications of the officers and men composing the 13th Engineers were such as to make it a true representative of the very highest type of railway personnel in the United States.

"It was your good fortune to come to France in the formative

period of the American Expeditionary Forces, and you were at once placed on duty with the French Armies in the sector of Verdun—a name which is the apotheosis of the glory and honor of France. Here you took up the task of transporting men, material and supplies to our Allies under conditions of service utterly unlike anything in your previous experience. Railway equipment and methods of operations were entirely new to you, and the situation was made still more difficult by the lack of common language.

"The cheerfulness, the adaptability, the loyalty and the self-sacrificing devotion to duty, uniformly displayed under these trying circumstances by the officers and men from the regimental commander to the most recently arrived private, have added a new luster to the traditions of our railway service.

"I therefore take advantage of this occasion to express to you, and through you to the officers and men of your command, our high appreciation not only of the valuable service rendered by them, but for the great assistance they have been to one of our allies. As a token of its appreciation for these services, the military authorities of the French Republic have awarded you these decorations. These medals and citations should be more highly prized by you when you realize that in receiving them, you have won at the same time the real appreciation and gratitude of the French military authorities under whom you have served.

"By order of Commander-in-Chief,

"(Signed) GEORGE VAN HORN MOSELEY,

"Brigadier General, G. S.,

"Assistant Chief of Staff, G-4."

On February 22, 1919, thirty-one officers and men of the 13th Engineers were awarded the Croix-de-Guerre. The decorations

better than anyone else, been in a position to appreciate their valor and good spirit."

Those to whom the decoration was presented were:

Colonel N. L. Howard, formerly division superintendent on the Chicago, Burlington & Quincy, at Hannibal, Mo.

Lt. Col. C. E. Whiting, formerly division superintendent on the Chicago, Milwaukee & St. Paul, at Lewistown, Mont.

Major E. Schultz, formerly division master mechanic on the Chicago & North Western, at Chicago.

Captain W. Haberland, formerly roadmaster on the Chicago, Rock Island & Pacific, at Rock Island, Ill.

Captain J. W. Kern, formerly supervisor on the Illinois Central at Mounds, Ill.

Lieut. Hugh MacKee.

Lieut. H. Halverson, formerly roadmaster on the Chicago & North Western at Eagle Grove, Iowa.

Lieut. E. E. Deyo, formerly yardmaster on the Chicago Great Western at Oelwein, Iowa.

Lieut. R. Harrison.  
Lieut. L. A. Weary.  
Master Engr. F. Williams.  
Master Engr. B. Berryhill.  
Sergeant L. Face.  
Sergeant O. Olsen.  
Sergeant H. Lightner.  
Sergeant Thomas J. Ross.  
Sergeant J. E. Morrel.  
Sergeant W. N. MacMahon.  
Sergeant A. G. Crozier.  
Sergeant W. Dresher.  
Corporal C. T. Barnes.  
Corporal W. Lish.  
Corporal W. T. Mott.  
Corporal M. H. Bootler.  
Private D. C. Steinmeyer.  
Private V. Nicholls.  
Private G. Tichy.  
Private F. Bitte.  
Private E. Vandevelde.  
Private W. B. Muller.

Revenues and Expenses for February

Net operating income of the class I roads and 18 switching and terminal companies, as reported by the Interstate Commerce Commission for February, amounted to \$10,106,268, as compared with \$11,877,297 in February, 1918, and about \$47,000,000 in the three-year test period. Operating revenues were \$351,946,353, as compared with \$290,021,416 in February, 1918; operating expenses were \$324,520,617, as

were presented at Simmeilles-Nettencourt by Colonel Boquet, Director General of Military Transports of the French armies, in bestowing the decorations upon the engineers, Colonel Boquet said in part:

"I am very happy to have been directed to hand today the Croix-de-Guerre, which it has been Marshal Petain's good-will to award some of you in accordance with the proposals made by Lieut. Colonel Marchand, Military Commissaire of the Eastern Railroad, and myself.

"These rewards you fully deserve for the untiring zeal and devotion you have shown. . . . I have known the 13th Regiment of American Engineers ever since their arrival in France. I have constantly watched their work and efforts, and I have,

compared with \$261,344,313; tax accruals were \$14,938,289, as compared with \$14,498,480, and railway operating income was \$12,429,102, as compared with \$14,132,407. For the two months, January and February, the net operating income was \$28,835,957, as compared with \$7,775,227 last year, but about \$102,000,000 for the test period.

The eastern railroads for the two months had a deficit of \$2,387,383, as compared with a deficit of \$34,060,687 in 1918; the southern roads had net operating income of \$8,632,827, against \$15,360,218, and the western roads \$22,590,513, against \$26,475,696.

The details, as reported by the Commission, are shown in the double-column table.

REVENUES AND EXPENSES OF RAILWAYS

Month of January, 1919

Table with columns: Name of road, Average mileage operated per period, Freight, Passenger, Operating revenues, Total (inc. misc.), Maintenance of way and equipment, Traffic, Trans- portation, General, Total, Operating ratio, Railways accruals, Operating (or decrease) last year.

MONTH OF FEBRUARY, 1919

Table with columns: Name of road, Average mileage operated per period, Freight, Passenger, Operating revenues, Total (inc. misc.), Maintenance of way and equipment, Traffic, Trans- portation, General, Total, Operating ratio, Railways accruals, Operating (or decrease) last year.

(c) Not operated.

REVENUES AND EXPENSES OF RAILWAYS

## Traffic News

Harry F. Masman has been appointed manager of the Traffic Bureau of the city of Charleston, S. C.

Grain loading for the period from January 1 to March 22 amounted to 247,221 cars, as compared with 266,129 cars in the corresponding period of 1918.

In Providence, R. I., sleeping car berths may now be ordered by telephone, on the understanding that payment shall be made at the ticket office within one hour from the time that the transaction by wire is completed. Berths sold in this way cannot be paid for on trains.

The Jackson (Mich.) Traffic Club has elected W. P. Hobart, agent of the American Railway Express Company, president; J. E. Manley, Mott Wheel Works, vice-president; H. A. Plummer, L. H. Field Company, secretary, and J. R. Gibbs, Michigan State Prison, treasurer.

Hearings will be held by the Public Utilities Commission of Illinois on four complaints made by Illinois dealers in sand and gravel against the rates to Chicago. The complaints are filed against the Chicago Switching Committee, the Chicago & North Western, the Chicago, Milwaukee & St. Paul and the Illinois Central.

The Railroad Administration has announced that because of the decision of the Grain Corporation to sell reserve stocks of wheat to local millers, the situation at interior elevators is now in such shape that the permit system on all grains, including wheat, will be temporarily suspended. Grain control committees will, however, be maintained so that further emergencies may be met promptly.

The directors of the Chamber of Commerce of Kansas City, Mo., have adopted resolutions urging the Railroad Administration to take immediate steps to restore railroads and other transportation facilities to private control. The resolution states that the service rendered by transportation facilities under federal control is not up to the standard existing under private control and has not improved, since the cessation of hostilities, to the extent expected.

A decision sustaining the right of the government, under the federal control act, to increase intrastate rates has been handed down by Judge Dickson of the district court of Ramsey county, Minn., in the case of the state of Minnesota against the American Railway Express Company. This decision was made on a motion of the plaintiff for a temporary injunction restraining the express company from charging the increased rates that have been in effect since January 1, 1919.

Production of both anthracite and bituminous coal stands at a total of about 50 per cent of full time output according to reports furnished by the Geological Survey and announced by the United States Fuel Administration. Production has been at a low ebb ever since the signing of the armistice on November 11, and the demand for coal has been gradually falling off, because of the mild winter. Consumers have been using from stocks accumulated last summer and fall, and are still holding back their orders.

At the New York City freight stations of the Pennsylvania Railroad and the Old Dominion Steamship Line a rule has been adopted that inbound freight shall be delivered only to the wagons of the consignee, other wagons being refused permission to enter the piers. It appears that consignees of perishable freight have disposed of goods to retailers before arrival, and the wagons of these retailers have been sent for the freight; and the carriers now say that heavy losses have been sustained by merchandise being wrongfully taken.

There has been a marked decrease in freight traffic in the Central Western region during the past month as compared with the same period last year. The traffic in grain, coal and livestock shows decreases of 27.3 per cent, 38.3 per cent

and 18.3 per cent respectively. The roads in this region loaded 32,595 cars of grain during March this year as compared with 44,808 cars during the corresponding month last year; coal cars loaded, 70,791, as compared with 98,700 in 1918; carloads of livestock, 45,120, a decrease from 54,699 last year.

A hearing was held on April 2, before the Western Freight Traffic Committee on an appeal from the decision of the Chicago Eastern and Western District Traffic Committees that Central Freight Association class rates should apply on Illinois intrastate rates instead of the Illinois classification. This appeal has been made by Illinois shippers. R. B. Coapstick, traffic manager of the Indiana Chamber of Commerce, represented the Indiana interests, on whose complaint the decision of the district committees was made. R. W. Ropiequet, representing the Illinois District Traffic League, made the principal appeal for the Illinois shippers. Another hearing was held the following day before the district committees concerning the rates on commodities from and to Indiana points as compared with rates in Illinois. An effort was made by the Indiana Commission to withdraw from the case and let the Indiana Manufacturers' Association take its place as complainant, but inasmuch as the case had been formally heard with the Indiana Commission as complainant and as the case would die if this substitution were to be made, it was unsuccessful. The Indiana Chamber of Commerce includes in its membership individuals and associations interested primarily in this case.

### Traffic Through the Sault Ste. Marie Canals

The total freight traffic passing through the American and Canadian canals at Sault Ste. Marie, Michigan and Ontario during the season of 1918 totaled 85,680,327 tons. This is a decrease of 5 per cent, or 4,133,571 tons, as compared with the traffic for the season of 1917. All the items of freight show a decrease, with the exception of oil. The total number of passengers was 34,990, or a decrease of 3,349. The American canal took 85 per cent of the freight, 84 per cent of the net registered tonnage and 23 per cent of the total number of passengers.

### Export Traffic

The total number of carloads of export freight on hand at North Atlantic ports for the week ended April 1, was 36,023, compared with 36,250 for the week previous. With a total working capacity of 23,533,000 bushels, there were 20,315,000 bushels of grain in elevators at North Atlantic ports for the period mentioned. At South Atlantic and Gulf ports there were 11,651 carloads of export freight on hand, as against 11,420 cars on March 22.

### Great Lakes Commerce Association

This association was organized at Milwaukee, Wis., at a recent conference of representatives of cities located on the Great Lakes. More than 60 delegates representing 18 cities in this district were present. The needs of the Great Lakes for transportation facilities were discussed and a resolution was adopted urging Congress to take steps to provide the facilities needed. A special committee was instructed to confer with the director general of railroads. The officers of the association are W. G. Bruce, Milwaukee, Wis., president; George A. Schroeder, Milwaukee, vice-president; F. E. Williamson, Buffalo, N. Y., vice-president; Frank Barry, Milwaukee, secretary and treasurer.

### A Million for Advertising

The expenditure of \$1,000,000 for advertising calculated to stimulate passenger travel has been authorized by the Railroad Administration. This money will be expended entirely in newspaper and magazine advertising and informative booklets, and will be devoted entirely to the exploitation of localities and not to the service of individual roads. As the advertising is to be national in character and its management must be closely coordinated, the work will be done under the supervision of the three territorial passenger traffic committees who have been instructed to prepare recommendations as to the localities.

## Commission and Court News

### Interstate Commerce Commission

The Interstate Commerce Commission has discontinued its investigation, started on February 5, 1912, into the use of passes and free passenger service.

Hearings were held before Examiner Attorney G. U. Brown, of the Interstate Commerce Commission, this week, at Washington, in the railway mail pay case, which has been pending since 1916. The commission is to render a decision as to the rates and as to the merits of the space or weight basis, or both, for compensating the railroads for carrying the mails.

### New Classification for Freight Statistics

The Interstate Commerce Commission has called upon all railroads of class 1 and class 2 to report, beginning with January 1, 1919, in their annual reports, the weight of revenue freight transported divided into 59 classes, which will provide information in considerably greater detail than is now required. All commodities are to be stated in tons of 2,000 lb. each. Products of agriculture are divided into 20 classes; products of animals into 12 classes, products of mines into 10 classes, of forests into 2 classes and manufactures into 15 classes. Class 59, headed "Merchandise," is to include all less than carload freight. Under the head of manufactures empty packages are put in a class by themselves. Crude petroleum and salt will be reported under the head of products of mines.

## Court News

### North Dakota Acts Against Federal Freight Rates

The Supreme Court of North Dakota on April 2 issued a mandamus restraining the Northern Pacific and other roads from charging, within that state, the increased passenger and freight rates established last June by the director general. This action was taken on the application of the attorney general of the state, claiming that the act of Congress of March 21, 1918, did not confer on the president or the director general any authority to interfere with "lawful police regulations of any state." It is understood that the Railroad Administration will appeal the North Dakota decision to the Supreme Court of the United States.

## United States Supreme Court

### Compensation for "Transportation of Troops" Within Land-Grant Acts

The Supreme Court of the United States has affirmed the judgment of the Court of Claims (52 Ct. Cl. 226) granting recovery of the 50 per cent deduction made from the Union Pacific's compensation under the land-grant statutes for the transportation of persons alleged to be "troops of the United States." The following classes of passengers were held not to be within the act: Discharged soldiers; discharged military prisoners; rejected applicants for enlistment in the army; accepted applicants for enlistment in the army (being forwarded for final examination and enlistment); retired soldiers and furloughed soldiers. The furloughed soldier is, of course, a part of the army or troops of the United States; but his transportation back to the proper station is held not "transportation of troops" within the meaning of the land-grant acts. The furloughed soldier travels for his own purposes. The government merely advances to him the cost of transportation and subsistence while on furlough, and does this only if the soldier lacks funds to bear the expense himself.—United States vs. Union Pacific. Decided March 31, 1919.

## Equipment and Supplies

The Interstate Commerce Commission on Thursday issued a set of regulations prescribing the method of competitive bidding as provided in section 10 of the Clayton Law on all contracts with or purchases amounting to over \$50,000 from companies or persons with which there is an interlocking relationship. The carriers and the director general are given until May 15 to file objections. The law has been suspended, but became effective January.

### Steel Prices

At the request of Mr. Peek, a meeting was held between R. S. Lovett, Henry Walters and H. B. Spencer, representing the Railroad Administration, and a few of the members of the general committee of the American Iron and Steel Institute, in New York, on Wednesday of this week to discuss the subject of producing costs of certain lines of steel in which the railroads are especially interested. Nothing was given out as to the results of the discussion, but it was understood that the representatives of the Railroad Administration would report at once to Director General Hines.

### Locomotive Deliveries Week Ended March 29

The following new locomotives were shipped to railroads under federal control during the week ended March 29:

Works	Road	Number	Type
American	C. M. & P.	21	USRA Mikado.
	P. L. W.	11	USRA Santa Fe
	Erie R. R.	6	USRA Santa Fe
	C. N. W.	4	USRA 6W. Sw.

Large Purchases of Ties

The West Coast Lumbermen's Association announces at Seattle, that Oregon and Washington mills have sold to the United States Railroad Administration 175 million feet of Douglas fir ties to be sent by water to the Atlantic Coast; also that 40 million feet of ties have been ordered by French and English railroads. These figures mean about 4 1/3 million ties for American railroads, and one million for Europe.

chanical interlocking machine for an extension to an existing 52-lever machine at South Norfolk, Va. The extension will have 17 mechanical levers and 7 electrical units.

Delivery of Standard Cars to March 31

The Railroad Administration has compiled the following statement showing the delivery of U. S. R. A. standard cars as of March 31:

Signaling

THE CHESAPEAKE & OHIO has placed an order with the Federal Signal Company of Albany, N. Y., for an electro mechanical interlocking machine and other materials for installation at Kenova, W. Va. This machine will have 22 working mechanical levers and 18 electric levers.

THE NEW YORK CENTRAL has ordered from the Federal Signal Company of Albany, N. Y., a 68-lever frame style "A" mechanical interlocking machine with 51 working levers for Jordan, N. Y.

THE VIRGINIAN RAILWAY has placed an order with the Federal Signal Company of Albany, N. Y., for a 24-lever style "A" me-

HEAVY CONSTRUCTION.—James O. Heyworth, engineer and general contractor, Chicago, has issued a 64-page album of photographs and short descriptions of various large construction projects carried on by his firm. Among these are included several railway construction contracts.

PIPE THREADING MACHINERY.—An illustrated catalogue of pipe threading and cutting machines and pipe and nipple threading machines has been issued by the Landis Machine Company, Inc., Waynesboro, Pa. The catalogue contains a detailed discussion of all the machines, but aims principally to set forth the distinctive features of the Landis die and chaser as compared with other types. This is known as catalogue No. 25 and copies may be had upon request.

## Supply Trade News

The Standard Railway Equipment Company of New York, Chicago and St. Louis has moved its New York offices from the Singer building to the Equitable Trust building.

S. V. Sargent has been appointed district manager of sales of the Chicago Pneumatic Tool Company, Chicago, with headquarters at Boston, Mass., to succeed F. S. Eggleston, who has resigned.

The Pacific Car & Foundry Company, Seattle, Wash., has expended approximately \$400,000 in new buildings, tools and equipment in refitting their car building plants situated at Reuton, Wash., and Portland, Ore.

The name of the Aspromet Company or Asbestos Protected Metal Company of Pittsburgh, Pa., manufacturer of roofing, siding, ventilators and skylights, was changed to the H. H. Robertson Company, effective April 1.

The Interstate Iron & Steel Company at Chicago has opened a branch office at Detroit, Mich., with R. B. Dutch in charge of sales in that territory. Mr. Dutch has been identified with the iron and steel industry for several years.

C. M. Schramm, chief clerk to the general mechanical superintendent of the Chicago, Rock Island & Pacific, with headquarters at Chicago, has been appointed assistant to the vice-president of the Vapor Car Heating Company at Chicago.

The entire executive staff of the Okonite Company was transferred on April 1 from 501 Fifth avenue, New York, to the company's plant at Passaic, N. J., where the main office will hereafter be located. A sales office will be retained at 501 Fifth avenue, New York.

William K. Stamets, Pittsburgh, Pa., announces the opening of an office in Cleveland, Ohio, under the management of Wm. S. Dickson, formerly general manager of the Greaves Klusman Tool Co., Cincinnati, Ohio. The Stamets organization will represent exclusively the majority of machine tool manufacturers that it now represents in Pittsburgh.

Ensign Donald Walker, U. S. Naval Aviation Corps, died in the Naval Hospital at Key West, Florida, on Monday, April 7, as the result of a fall of an aeroplane, of which he was the pilot, at Miami, Florida, on April 1. He was the son of Edmund H. Walker, vice-president of the Standard Coupler Company and president of the Railway Supply Manufacturers' Association. Ensign Walker was a student at Yale University when he entered the aviation service last year. He was 21 years of age.

The Wetmore Reamer Company is the new name of the Wetmore Mechanical Laboratory Company, of Milwaukee. This company has completed all of its contracts with various munition makers of Canada and this country to whom it supplied Wetmore expanding reamers, hobs, taps, lathe and boring bar tools. Since the completion of this work it has resumed its former tool business, specializing in a type of expanding reamer for all grades of industrial reaming operations. More floor space has been added and the offices enlarged. P. H. Door, recently released from the government service, has joined the organization as secretary and sales manager.

E. I. du Pont de Nemours & Co., Inc., announces the organization of E. I. du Pont de Nemours Export Company, a subsidiary corporation, created for the purpose of handling foreign business, effective April 1, 1919. The officers of the new company are as follows: F. W. Pickard, president; W. S. Gavan, vice-president and director of sales; F. D. Brown, treasurer; Alexis I. du Pont, secretary. The same staff which has previously been associated with the du Pont export business will be continued with some additions made necessary by the broader scope of the new corporation. The main offices will be located at 120 Broadway, New York, with

branches in San Francisco, Mexico City, London and Rio de Janeiro.

H. H. Simmons, who has been connected with the Simmons-Boardman publications for the last 10 years, has severed his connection with that company to become associated with John H. Cross in the advertising service business under the firm name of Cross & Simmons, Inc., with offices in the Webster building, Chicago. Mr. Simmons was born at St. Joseph, Ill., on November 14, 1888. He attended the University of Illinois, graduating in civil engineering in 1909, and immediately joining the staff of the Simmons-Boardman Publishing Company. He was first employed as associate editor on news for the *Railway Age Gazette* in the Chicago office, later becoming assistant engineering editor. In May, 1915, he was appointed editor of the *Railway Signal Engineer*, and continued in active charge of the editorial work of that publication until November, 1917, when he was transferred to the business department of the Simmons-Boardman Publishing Company in the capacity of business manager of the *Railway Maintenance Engineer*, which position he held until his recent resignation.

D. P. Lamoreux, general manager of the Pratt & Letchworth Company, Ltd., Brantford, Ont., has been elected vice-president of the Canadian Car & Foundry Company, Ltd.

D. P. Lamoreux

Mr. Lamoreux has been connected with the Pratt & Letchworth Company since October, 1916. He was born in Mayville, Wis., December 12, 1873. He received his education at the University of Wisconsin, where he took a course in civil engineering as a member in the class of 1895. After leaving college he spent two years in the maintenance department of the Milwaukee Northern Railway, and the California Oregon Railway, and for the following three years was private secretary to the commissioner of the general land office at Washington, D. C. In 1900 he became associated with the Beaver Dam Malleable Iron Company and worked his way up through that organization until in 1913, when he left to take up another position, he was the company's general manager. During this period, also, he was on the executive and legislative committees of the Wisconsin Manufacturers' Association and for three years of this time, was also regent of the University of Wisconsin. In 1913 he entered the railway supply business in Chicago, and was connected with the Cleveland Steel Company and the Trumbull Steel Company. He became connected with the Pratt & Letchworth company in November, 1916, as general manager.

Lieutenant Commander H. J. Elson, U. S. Naval Reserve Force, has been released to inactive status and has resumed his civilian work as secretary and treasurer of the Walter A. Zelnicker Supply Company, St. Louis, with which company he was in charge of internal management and manufacturing operations. Lieutenant Commander Elson was graduated from the U. S. Naval Academy in 1898, and after service in Cuba, the Philippines and China, resigned from the navy in 1902 to become interested in the Zelnicker company. He was chief engineer of the Missouri Naval Militia, with which organization he was mobilized into federal service upon the declaration of war, April 6, 1917. His assignment was as Inspector of Machinery, 9th, 10th and 11th Naval Districts, with headquarters at Chicago, where he had charge of the design and conversion to salt water use of the machinery of great lakes vessels taken over by the Navy, among which were the City of South Haven, Virginia and Puritan, as well as the rehabilitation and design and

installation of new machinery in the ill-fated Eastland, now named U. S. S. Wilmette and called by her crew "The Queen Gun-Boat Cruiser of the Navy."

J. S. Hobson, western manager of the Union Switch and Signal Company at Swissvale, Pa., with office at Chicago, has been elected president of the Massey

Concrete Products Corporation of Chicago at the annual meeting of the board of directors, succeeding C. F. Massey, who has been elected chairman of the board. Mr. Hobson began his railway career as an engineer apprentice on the Great Southern & Western at Dublin, Ireland, in which capacity he was employed from 1884 to 1889. He came to this country in 1889 and entered the employ of the Chicago, Burlington & Quincy as locomotive machinist and draftsman. In 1892 he became associated with the Union Switch & Signal Company as a construction

foreman in Chicago and St. Louis, and in 1896 he was appointed a signal supervisor on the Michigan Central, with headquarters at Detroit, Mich. The following year he entered the employment of the Atchison, Topeka & Santa Fe as signal engineer, with headquarters at Topeka, Kan., which position he held until 1901, when he returned to the service of the Union Switch & Signal Company as assistant engineer at Swissvale, Pa. In 1904 he was appointed assistant general manager, in which capacity he served eight years until he was promoted to western manager at Chicago. In 1914 he was made general sales manager, and in 1915 general manager, which position he held until 1916, when he was again appointed western manager at Chicago, in which capacity he will continue to serve the Union Switch and Signal Company, combining the duties of that office with those of president of the Massey Concrete Products Corporation.

J. S. Hobson

### Federal Liquidating Association, Inc.

The Federal Liquidating Association has been formed to facilitate and hasten the liquidation of reduced, suspended, terminated or canceled war contracts, whether formal or informal.

Brig.-General Hugh S. Johnson will be president of the new association. General Johnson was largely responsible for the organization and administration of the draft and was also largely responsible for the reorganization of the Army supply system, and for the creation of the present system of purchase, storage and traffic. As author of the Army supply system, chairman of the War Department superior board of contract review and director of purchase, General Johnson naturally acquired great familiarity with the department's contracts.

Lieut.-Colonel R. H. Montgomery, of the accounting firm of Lybrand, Ross Bros. & Montgomery, who was a member of the War Department board of appraisal and of the War Industries Board price fixing committee, will have charge of the accounting for the association.

The officers of the Association for Manufacturers of War Material, whose efforts resulted in the passage of the war contracts validation bill, will share in the direction of the association. These are W. S. Symington, president of the Symington Chicago Corporation; C. J. Symington, president of the Symington Machine Corporation, and H. H. Dinneen.

The Washington headquarters of the association, Munsey building, Washington, D. C., will keep in close touch with the various governmental departments, presenting the contractors' point of view and attending to the expedition and presentation of all matters pending.

Local offices have been established at each of the following points selected because of their convenience to local boards of adjustment: New York, Boston, Philadelphia, Baltimore,

Rochester, Pittsburgh, Cleveland, Detroit, Bridgeport, Cincinnati, Chicago and St. Louis. Each local office has a business manager, an accounting and engineering department, a local counsel and a competent office personnel.

The plan of having accounting engineering and legal departments is not intended to restrict the use by contractors of their own experts in these lines.

## Trade Publications

**DUFF JACKS.**—The Duff Manufacturing Company, Pittsburgh, Pa., has issued a new 16-page catalogue listing the various types of bridge, track and car jacks and other equipment manufactured by that company. The jacks are catalogued in regular order with a small illustration, short description and table of capacities and limiting dimensions of each type.

**FROGS AND CROSSINGS.**—The Indianapolis Switch & Frog Company, Springfield, Ohio, has issued a 12-page leaflet of information on its products, with special reference to solid cast manganese frogs for turnouts and crossings and solid manganese crossings, including the Eymon continuous crossing and the Balkwill articulated cast manganese crossing.

**RECLAIMING RAILROAD FROGS.**—The Air Reduction Sales Corporation, New York, has issued a 24-page booklet illustrating and describing the process of reclaiming railroad frogs by the oxy-acetylene process. The process is described in detail, with diagrams and photographs. Considerable cost data and material and service records are also given.

**OVERHEAD CARRYING SYSTEMS.**—Catalogue 50, issued by the Coburn Trolley Track Manufacturing Company, Holyoke, Mass., manufacturers of overhead carrying systems for both "round trough" and I-beam, shows price lists, illustrations, plans and dimension drawings of overhead carriers and their details. The catalogue contains 56 pages, 8½ in. by 11 in. and illustrates a number of actual installations.

**PUMPING MACHINERY.**—The National Transit Company, Oil City, Pa., manufacturers of special machinery to meet the requirements of pipe line companies, has begun the manufacture of other machinery for general service, including pumping machinery, gas and oil engines, which together with old lines are illustrated and described in various bulletins. These have been bound in heavy manila covers in such a way that others may be added from time to time as they are issued.

**TWIST DRILLS, REAMERS, ETC.**—A machinists' supply catalogue, No. 91, listing carbon and high speed twist drills and reamers, screw and drop forged wrenches, spring cutters and keys, etc., has been issued by the Whitman & Barnes Manufacturing Company, Akron, Ohio. The catalogue contains 183 pages and a distinctive feature of it is a thumb index marked to show the products listed in the various sections, making it an easy matter to find desired information.

**SAW MILL MACHINERY.**—The American Saw Mill Machinery Company, New York, has issued an attractive 48-page booklet under the title "How Americans Helped to Win the War," which contains an illustrated account of the part that saws and wood-working machinery played in the war, both in the construction of camps, ships, hospitals, etc., on this side and abroad and in connection with American lumbering operations in the French forests. A large number of photographs show the uses of this equipment under a wide variety of conditions, while in the latter part of the book appear reproductions of letters of commendation by contractors and others who used the equipment.

**REPAIR OF THE GERMAN SHIPS.**—A booklet of 24 pages, telling of the remarkable work of repairing and reclaiming by Plastic-Arc welding 288,780 gross tons of interned German ships which had been damaged apparently beyond repair by their German crews, is being distributed by the Wilson Welder & Metals Company, New York, manufacturers of the Plastic-Arc welding apparatus. Included in the booklet is the report of this work by the Secretary of the Navy, a description of the Wilson system of welding, and an article reprinted from Iron Age, entitled The Part of Electric Welding in Repairing the Damaged Ships, by Captain E. P. Jessop, U. S. N., who recommended that the broken cylinders be repaired by welding. The text is well illustrated.

## Financial and Construction

### Railway Financial News

**BALTIMORE & OHIO.**—See Staten Island Rapid Transit Company.

**CHICAGO & NORTH WESTERN.**—At the annual stockholders' meeting, John V. Farwell, Edward M. Hyzer and Homer A. Miller declined re-election, and were succeeded by Childs Frick, James A. Stillman and Samuel A. Lynde. The other directors whose terms had expired, Chauncey M. Depew, Henry C. Frick and David P. Kimball, were re-elected. The stockholders ratified the directors' acceptance of the government contract.

**NEW YORK CENTRAL.**—R. S. Lovett and Carl R. Gray have been elected directors to succeed C. B. Seger, resigned, and W. H. Newman, deceased.

**NEW YORK, ONTARIO & WESTERN.**—The payment of dividends on the common stock has been deferred until compensation for 1918 is received from the Railroad Administration.

**NORFOLK & WESTERN.**—See editorial comment elsewhere in this issue.

**SOUTH CAROLINA & GEORGIA.**—J. P. Morgan & Co. have announced that arrangements have been made by the Southern Railway, with the consent of the director general of railroads, to offer to holders of \$2,250,000 South Carolina & Georgia first mortgage 5 per cent bonds, falling due May 1, the right to extend their holdings for ten years with interest at the rate of 5½ per cent. Holders of the maturing issue may at the same time receive a cash payment of 2¼ per cent, so that the extended bonds will net them 5.80 per cent. Holders who do not extend will be given par and interest for their bonds at maturity.

**SOUTHERN PACIFIC.**—Samuel Rea, president of the Pennsylvania Railroad, has been elected a director to succeed W. B. Scott, a federal manager in the Southwestern Region, and Paul Shoup, vice-president of the Southern Pacific, has been elected to succeed William Sproule, district director of the Central Western Region.

**SOUTHERN RAILWAY.**—See South Carolina & Georgia.

**STATEN ISLAND RAPID TRANSIT COMPANY.**—The New York Public Service Commission has adopted an order permitting this company to issue at not less than par and interest \$1,150,000, 4 per cent refunding bonds, due June 1, 1948, interest payable semi-annually. The bonds are redeemable at par and accrued interest on and after June 1, 1925. The issue is secured under the company's \$5,000,000 refunding mortgage, executed June 1, 1905, to the Guaranty Trust Company of New York, as trustee. The proceeds are to be applied for the discharge or refunding of an equal amount of the company's obligations to the Baltimore & Ohio Railroad, for the acquisition and improvement of its property. The application stated that the Staten Island Rapid Transit Company was indebted to the Baltimore & Ohio to the amount of \$1,625,000.

### Railway Construction

**LEHIGH VALLEY.**—This road has awarded a contract to the Roberts & Schaefer Company, Chicago, for the construction of a 750-ton capacity, four track, automatic electric, reinforced concrete locomotive coaling plant and a 750-ton storage reinforced concrete sand handling plant at Ashmore, Pa. The contract price is \$75,000 and installation will begin immediately.

**TEMISKAMING & NORTHERN ONTARIO.**—Separate bids are wanted for each section, April 15, by W. H. Maund, secretary-treasurer, Toronto, Ont., for the construction of the roadbed, except steel bridges, on the section between Swastika and Kirkland lake, 6 miles, and between Timmins and the Mattagami river, 2 miles. Separate bids for each section are also wanted for track laying, ballasting and fencing.

## Railway Officers

### Railroad Administration

#### Central

**Swagar Sherley**, who has been appointed director of the Division of Finance of the United States Railroad Administration, as was announced in our issue of March 14, page 596, was born on November 28, 1871, at Louisville, Ky., and graduated from the University of Virginia in 1891. He is a lawyer by profession, having begun practice in 1891, at Louisville. He has been a member of Congress since 1903, and for a number of years has been a member of the House Appropriations Committee. Mr. Sherley was chairman of that committee in the Sixty-Fifth Congress, and, effective about April 15, will enter upon his duties as director of the Division of Finance, to succeed John Skelton Williams, resigned.

Swagar Sherley

#### Regional

**Harry M. Adams**, whose appointment as traffic assistant to the regional director of the Southwestern region, with headquarters at St. Louis, Mo., was announced in the *Railway Age* of March 28 (page 860), was born at Camanche, Iowa, on January 3, 1867. He entered railway service in 1880 with the St. Louis-San Francisco as messenger at Cherryvale, Kan. He later held various positions on the Kansas City, Fort Scott & Gulf and the Southern Kansas and the Oregon Railway & Navigation Company. From 1889 to 1890 he was consecutively division baggage agent and advertising agent of the Union Pacific at Portland, Ore. After 3 years in other business and a year in South

H. M. Adams

America he entered the traffic department of the O. R. & N. in 1894. On May 15, 1902, he was promoted to assistant general freight agent, with headquarters at Portland, Ore., and on June 18, 1905, left the Oregon Railway & Navigation Company to become assistant traffic manager of the Great Northern, with headquarters at Seattle, Wash. From December 1, 1907, to June 30, 1910, he was general freight and passenger agent of the Spokane, Portland & Seattle, at Portland, and from the latter date until March, 1914, freight traffic manager of the Western Pacific. On August 1, 1913, he was appointed also freight and traffic manager of the Denver & Rio Grande. In March, 1914, he was also appointed general traffic manager of the Missouri Pacific and the St.

Louis, Iron Mountain and Southern, and in May, 1914, he resigned as freight traffic manager of the Denver & Rio Grande. In May, 1917, he was elected vice-president in charge of traffic of the Missouri Pacific system, with headquarters at St. Louis, Mo. In January, 1918, Mr. Adams was appointed director of inland transportation of the war department, with offices in Washington, D. C., in which capacity he served until his recent appointment.

### Federal and General Managers

**George B. Perkins**, who has been appointed assistant federal auditor of the St. Louis-San Francisco, with headquarters at St. Louis, Mo., was born in Cincinnati, Ohio, on August 5, 1865, and received his education in the Woodward High School of that city. He entered railway service in the maintenance department of the Pittsburgh, Cincinnati, Chicago & St. Louis in 1890, remaining with that road until 1892 and then entering the employment of the Cincinnati, New Orleans & Texas Pacific in the engineering department. The following seven years he was engaged in the commercial field in Cincinnati, Ohio, and Kansas City, Mo. He re-entered railway service in July, 1901, as a clerk in the accounting department of the Kansas City, Fort Scott & Memphis which position he held until the consolidation of that road with the St. Louis & San Francisco in September, 1901, when he was transferred to St. Louis, Mo. From that time to June, 1911, he was consecutively clerk, statistician and general bookkeeper for the St. Louis-San Francisco, resigning in the latter year to engage in agricultural work at Portland, Ore. One year later he entered the service of the Spokane, Portland & Seattle and in January, 1914, he was employed by the Interstate Commerce Commission as examiner of accounts, in which capacity he served until April, 1918, when he resigned to enter the employ of the St. Louis-San Francisco as special accountant. On August 1, 1918, Mr. Perkins was appointed assistant auditor, in which position he served until his recent appointment as above noted.

**J. A. Somerville**, whose resignation as general superintendent of transportation of the Missouri Pacific, the Memphis, Dallas & Gulf, the Arkansas Central and the Natchez &

J. A. Somerville

Southern was announced in the *Railway Age* of April 4 (page 923), has been appointed general manager of the Texas & Pacific, the Trans-Mississippi Terminal, the Weatherford, Mineral Wells & Northwestern, the Gulf, Texas & Western, the Denison & Pacific Suburban and the Fort Worth Belt, with headquarters at Dallas, Tex. He was born at Carthage, Ill., on November 25, 1867, and received his education in the public schools of that place. He entered railway service on November 17, 1887, and was employed up to 1897 in the local office and yard of the Chicago, Burlington & Quincy at Keokuk, Ia. From that time to 1899 he served as general agent at Hannibal, Mo., and the following year as local agent at St. Louis, Mo. From 1900 to 1902 he was contracting freight agent at St. Joseph, Mo., and the next year became chief clerk to the general freight agent at St. Louis. In 1903 he was promoted to general agent, with headquarters at Keokuk, which position he held until 1905, when he became superintendent of terminals of the same road, with headquarters at St. Louis. The next five years he held the position of superintendent of the terminal division of the Missouri Pacific, with office at Kansas City, Mo., after which time he was appointed superintendent of transportation of that road and the St. Louis, Iron Mountain & Southern, with headquarters at St. Louis.

Upon the resignation of E. F. Kearney in May, 1913, as general superintendent of transportation of the Missouri Pacific, the Memphis, Dallas & Gulf, the Arkansas Central, the Natchez & Southern and the Natchez & Louisiana, Mr. Somerville was promoted to that office. When the office of superintendent of transportation was abolished on January 15, 1917, he was promoted to general superintendent of transportation, with the same headquarters and in June, 1917, he was temporarily assigned to the commission on car service of the American Railway Association at Washington, D. C., in which capacity he served until January, 1919, when he resigned to return to his former position as general superintendent of transportation at St. Louis, in which position he remained until his recent appointment as general manager of the Texas & Pacific.

The jurisdiction of **G. L. Peck**, federal manager of the Pennsylvania Railroad, Western Lines, and associated lines, with headquarters at Pittsburgh, Pa., has been extended over the Wheeling Terminal Railroad, which line is released from the jurisdiction of **C. W. Galloway**, federal manager.

### Operating

**George Masten** has been appointed superintendent of the Norfolk & Portsmouth Belt Line Railroad, with office at Portsmouth, Va., vice **W. A. Gore**, transferred.

**L. R. Taylor** has been appointed superintendent of the New River division of the Virginian Railroad, with headquarters at Princeton, W. Va., vice **H. W. Sheridan**, deceased.

**J. B. McMann**, superintendent of the Bangor & Aroostook, with office at Houlton, Me., has been transferred to the Southern division, with office at Bangor; **J. P. Darling**, trainmaster, has been appointed superintendent of the Northern division, with office at Houlton, Me. **F. A. Andrews**, superintendent at Bangor, has been appointed trainmaster of the Southern division, with office at Millinocket, and **Joel H. Curtis**, trainmaster of the Southern division, has been transferred to the Northern division, with office at Houlton, Me.

**W. C. Ennis**, division superintendent of the Chicago, Milwaukee & St. Paul, with office at Miles City, Mont., has been appointed assistant superintendent of the Coast division of the Tacoma Eastern Railroad, and that part of the Columbia division west of Othello, with headquarters at Seattle, Wash. **W. S. Johnson**, trainmaster on the Coast division, has been appointed trainmaster of the Columbia division, vice **T. E. McFarlane**, who has been appointed assistant trainmaster and traveling engineer of the Idaho division, vice **H. R. Calehan**, assigned to other duties. The position of trainmaster on the Coast division has been abolished.

### Financial, Legal and Accounting

**L. S. Smith**, acting federal treasurer of the Texas & Pacific, with office at Dallas, Texas, has had his jurisdiction extended over the Fort Worth Belt.

**E. K. Scott** has been appointed federal auditor of the Kentucky & Indiana Terminal Railroad, with office at Louisville, Ky., vice **C. R. Arnold**, resigned.

The jurisdiction of the following Texas & Pacific officers has been extended over the Fort Worth Belt and the International & Great Northern (Spring to Fort Worth and Madisonville branch): **George Thompson**, general solicitor; **A. J. Biard**, federal auditor, and **W. L. Holder**, land and tax commissioner; all with headquarters at Dallas, Texas.

### Traffic

**E. A. deFuniak**, general freight agent of the Louisville & Nashville, with office at Montgomery, Ala., has been appointed general freight agent, with office at Louisville, Ky., vice **D. M. Goodwyn**, promoted, and **J. A. Ridgely** has been appointed general freight agent, with office at Montgomery, Ala., vice Mr. deFuniak.

**J. R. Wilson**, traffic manager of the Sacramento Northern, with headquarters at Sacramento, Cal., has resigned, effective April 30. Mr. Wilson entered the employ of the Northern Electric Railway as traffic manager in 1914, which, after its reorganization, adopted the name of the Sacramento North-

ern. Prior to his service with the Sacramento Northern he was employed in the general freight office of the Southern Pacific at San Francisco, Cal., and later acted in the capacity of commercial agent for the Illinois Central at San Francisco.

**J. B. Payne**, traffic manager of the Texas & Pacific, with office at Dallas, Texas, has had his jurisdiction extended over the Fort Worth Belt and the International & Great Northern (Spring to Fort Worth and Madisonville branch).

The titles of **W. G. Story**, assistant general freight agent, and **M. J. Powers**, assistant general passenger agent of the Delaware & Hudson and associated lines, with headquarters at Albany, N. Y., have been changed to general freight agent and general passenger agent, respectively.

### Engineering and Rolling Stock

**E. F. Mitchell**, chief engineer of the Texas & Pacific, with office at Dallas, Texas, has had his jurisdiction extended over the Fort Worth Belt and the International & Great Northern (Spring to Fort Worth and Madisonville branch).

### Purchasing

**R. L. Irwin**, purchasing agent of the Texas & Pacific, with office at Dallas, Texas, has had his jurisdiction extended over the Fort Worth Belt and the International & Great Northern (Spring to Fort Worth and Madisonville branch).

## Corporate

### Executive, Financial, Legal and Accounting

**William W. Tirrell** has been appointed general auditor of the Maine Central Railroad Company (Corporate), with office at Portland, Maine.

**Arthur B. Hoff**, formerly industrial commissioner of the Erie, with headquarters at New York, and later in the United States naval service, has returned to railway work as assistant to president of the Erie Railroad Corporation.

**Walter H. Ardley**, controller of the Grand Trunk, with headquarters at Montreal, Que., retired from active service on April 1, under the superannuation plans of the company. He was born on April 24, 1858, in London, Eng., and was educated in the City of London College. In 1883 he entered the service of the Grand Trunk in the general auditor's office, and was in the continuous service of that road for 36 years. In November, 1893, he became chief clerk and general bookkeeper. He was appointed auditor of disbursements in 1907, and in 1908 served as acting general auditor, until December 31 of that year. He was then appointed general auditor of the Grand Trunk and the Grand Trunk Pacific, and since August, 1914, served as controller of the same roads, with headquarters at Montreal, Que.

**Alexander R. Lawton**, general counsel of the Ocean Steamship Company of Savannah, has been elected president, with office at Savannah, Ga., in place of **William H. Pleasants**, deceased.

**Reginald H. M. Temple**, general solicitor of the Canadian National Railways at Toronto, Ont., has been transferred to Winnipeg, Man., and is now in charge of the legal department; **W. W. Evans** and **T. H. Gilmour**, solicitors at Winnipeg, have resigned, and the position of **O. H. Clarke**, western counsel, has been abolished.

## Traffic

**Bernard R. Marsales**, division freight agent of the Canadian National, with headquarters at Calgary, Alberta, has been transferred to Saskatoon, Sask.

**F. G. Frieser**, export freight agent of the Canadian Pacific, has been appointed general agent of the freight department of the Canadian Pacific Ocean Services, Limited, with office at New York City.

**M. S. Throne**, district freight agent of the Canadian Pacific, with office at Cleveland, Ohio, has been appointed general agent of the freight department, with office at New York, to succeed **R. E. Larmour**, promoted, and **G. S. Hiam** has been appointed district freight agent, with office at Cleveland, to succeed Mr. Throne.

### Engineering and Rolling Stock

**W. F. Connal** has been appointed mechanical engineer of the Canadian National Railways, with office at Toronto, Ont., vice **H. D. Cameron**, resigned to enter other service.

## Obituary

**Amos H. Watts**, who was master mechanic of the Cincinnati Northern, with office at Van Wert, Ohio, previous to July, 1912, died on March 30, at his home in Walnut Hill, Ohio, at the age of 72.

**Charles E. Henderson**, formerly second vice-president of the Philadelphia & Reading, with office at Philadelphia, Pa., died on April 10, at his home near Easton, Md. He was born on September 25, 1844, in Jefferson county, West Virginia, and began railway work on January 5, 1870, as a clerk at the Fort Scott station of the Missouri River, Fort Scott & Gulf, now part of the St. Louis-San Francisco. He subsequently held various positions on a number of roads in the Middle West until December, 1889, when he was appointed general manager of the Philadelphia Reading Coal & Iron Company, and from October, 1903, to May, 1908, was first vice-president of the same company. From November, 1896, to May, 1908, he served also as second vice-president of the Philadelphia & Reading Railway, in charge of freight traffic.

**Curtis Dougherty**, chief engineer maintenance of way and structures of the Southern System, lines west, with headquarters at Cincinnati, Ohio, died at his home in that city on March 30. He was born at Otterville, Ill., on July 30, 1863, and received his education at Washington University, St. Louis, Mo., graduating in 1885. He began his railway career in 1887 in the office of the chief engineer of the Wisconsin Central and the following year he was appointed engineer of the Chicago & Western Indiana, in which capacity he served until March 1, 1892, when he entered the employ of the Illinois Central as assistant engineer. From June 1, 1893, to June 1, 1902, he was roadmaster of the Chicago division and upon the latter date was appointed superintendent of the Springfield division of the same road. On January 15, 1907, he resigned his position with the Illinois Central to become assistant chief engineer of the Cincinnati, New Orleans & Texas Pacific and the Alabama Great Southern, which position he held until the consolidation of these lines with the Southern system, when he was appointed chief engineer maintenance of way and structures.

## Railway Age

# EDITORIAL

The Railroad Administration is inaugurating an advertising campaign in which it expects to spend about \$1,000,000 in

### Publicity Policy of the Railroad Administration

advertising intended to stimulate passenger traffic. This is a move in the right direction. Now that the war is over, there is just as much reason why advertising should be done under government operation to increase passenger traffic as there would be under private operation. The Administration also is increasing the number of really informing statements it is issuing to the public. For example, when the order regarding the advance in the wages of the train service employees was issued last week, it was accompanied by a statement from Director General Hines concerning the wage advances that have been made under government control which was very enlightening. In the future, there should be more publicity given to important labor cases while they are pending as well as after they are settled. With the railroads in the hands of the government, important questions arising on them are more decidedly public questions than ever; and the public has a right to be fully informed not only regarding important things that have been done, but also regarding important steps which are under consideration.

The service which the Latin-American Division of the Bureau of Foreign and Domestic Commerce has been rendering to

### The Railways of the Argentine

the railway supply field and others interested in export trade or investment abroad, by means of its circulars on railway development in Latin-American countries has been supplemented this week by another able report—this time on the railways of the Argentine. The report is of sufficient value to bring it to the attention of our readers in practically complete form, and on another page will be found the first two installments of it. The Argentine railways do not apparently offer to American exporters or investors comparable opportunities to those of Chile, Bolivia, Brazil or other Latin-American countries that might be mentioned. But the report will prove of especial value for the emphasis it cannot help but place on the important fact that "trade follows the investment." The railways of the Argentine have been developed to the greatest extent of those of perhaps any Latin-American country for the reason principally that they have not had to surmount the geographical barriers that exist in the other South American countries. They have been developed for the larger part by British capital, and were built primarily to bring to the seaports the raw materials that were needed by the industries of Great Britain. The result has been, as will be shown clearly in the figures of imports which are given in the latter part of the circular, that the larger share of the imports of railway material in the five-year period immediately preceding the war were from England. Germany supplied a fair quantity of locomotives and rails, but not as many as England; Belgium a fair quantity of freight cars, but Belgium made a very poor second to England, closely followed by Germany, while the United States and France together did not supply even one-half as much as Germany. There are few instances in the world where the advantages to the railway supply export companies of invest-

ment of capital abroad are so clearly shown. What the future holds out for this business is a question. The Argentine railways are working under many difficulties at present, but there is no doubt that a large additional development of transportation is a prime essential to as great and prosperous a country as the Argentine. And an equally important fact is that the Argentine railways have imported practically no railway material since the outbreak of the war and are greatly in need of supplies of all kinds.

The art of railroading in its various phases owes much to the inspiration and facts that have been developed by the different railroad associations, many of which have been managed and supported by individuals and have had little or no official recognition. Those who have followed the development of

### Getting the Most From Conventions

these organizations in recent years, have been more and more impressed with the far-reaching importance of their work. In an effort to more scientifically utilize these associations the *Railway Age* has, from time to time, suggested that the representatives of the various railroads should be instructed by their managements to report back in writing on those things that were brought to their attention at the meetings which might, in their opinion, be applied to advantage on their own roads. A small railroad having only one or two representatives present would, of course, find it necessary to give general instructions to its representatives as to the nature of the desired reports. On the other hand, a road which might have several representatives at the June mechanical conventions, for instance, should assign to each man certain features that he is specially well fitted to follow up and report upon. The reports and discussions at the meetings, the vast exhibit which promises to break all records this year, and the opportunity of meeting railroad officers and railway supply experts from all over this country and even from abroad, present marvelous opportunities for making an extensive investigation in a minimum of time and effort. The Railroad Administration is frankly doing all it can to make the June mechanical conventions the biggest possible success in all respects. It remains for the mechanical department officers and their subordinates to make the most of the opportunity, and to demonstrate beyond a doubt that the mechanical department is dominated by a breadth of vision and a determination that will give it the place in the railroad organization which so rightly belongs to it and which, generally speaking, it has never attained.

John Calder of the Business Training Corporation recently made a most significant statement in speaking before an industrial conference held under the direction of the New York Editorial Conference of the Associated Business Papers. He said, "The art of management and supervision has been well

### How About the Foremen?

worked out to date, so far as the chief executives are concerned, and it calls for an ever increasing and high order of ability. It has sometimes been inclined to belittle the

foreman and at other times to ignore him. Yet we have a fair supply of good managers today and are calling loudly not for them or for advisory engineers but for competent foremen, not merely to criticize but to supervise successfully and to 'deliver the goods' with the only kind of help now available, at a cost that makes good business and with due regard to the aspirations and interests of labor." The foremen deal directly with the men and are the vital points of contact between the management and its employees. And yet, comparatively little attention has been given to their selection or training. This is not because the way to do it has not been pointed out many times, but rather because of a real lack of vision on the part of the higher officers in not recognizing the importance of so doing. A striking example of this today in the railroad field is the delay in increasing the compensation of the foremen to a reasonable basis; true some roads have done so after long delays, but many have still neglected to pay these men on an adequate basis. The foremen in many cases are working under the most disappointing conditions because of the lack of proper recognition. As Mr. Calder said, "Liberal, forward-looking ownership and management inviting self-expression and self-determination on the part of the labor in its plants is everywhere handicapped today by the unenergized and unenlightened foremen and minor executives who make the intimate contacts with the workmen." What can be done to enlarge the vision and comprehension of those who are responsible for this condition?

Whatever opinions individuals may hold as to the merits or shortcomings of piece work and as to its efficiency compared to day work and other systems of wage payment, makes little difference so far as the railroads are concerned. Rightly or wrongly piece work has been thrown out and is, for

the time being at least, a thing of the past. Obviously, a shop, enginehouse, or repair yard, organized on a piece work basis, must be entirely reorganized in order to go back to a day work basis. The nature and the amount of the supervision, the shop equipment, the records and accounting, and many other things all have to be modified. It is rather surprising that in the face of so revolutionary a change so little has been done in pointing out the best solution to the difficulty, and of presenting constructive suggestions for making the change. Unfortunately, the most disappointing results have followed in many instances so far as the efficiency and output are concerned. This is possibly excusable because of the strenuous conditions under which the railroads have been operating since it became evident that piece work was doomed. There are shops in this country which have secured excellent results in operating on the day work basis. There are men in the mechanical department who can do much to help out in the present distressing situation by way of advice and suggestions based on practical experience. It would seem that an important part of the program of the June mechanical conventions could profitably be given over to the study and discussion of those things that should be done in order to secure the greatest possible efficiency on the part of the shop, enginehouse, and repair yard forces under the new order of things. As a suggestion, what part should the more general introduction of shop schedules play in this program? How about introducing intensive educational methods for the men now on the job, as well as the more general introduction of real apprentice systems? How about the necessity of giving more attention to the selection and training of foremen? What changes or modifications should be made in the supervising forces? What records should be used in order to afford the

best means of checking the efficiency of the shop? What changes or modifications should be made in the plant and equipment? These are only a few of the questions that might be discussed to advantage. An entire day could well be devoted to these questions and surely no more important problem confronts the mechanical department at this time!

## Deferred Maintenance and the Labor Supply

LIKE MANY IMPORTANT QUESTIONS which come before the public, the proposal recently advanced that immigration be restricted for a period of five years can be argued pro and con. Without entering into a discussion of the merits of the suggestion itself it is pertinent to consider its probable effect on the railroads. With few exceptions it seems to be agreed that conditions will return to approximately normal in this country within a few months at the outside. That is to say, it is confidently expected by the great majority that the period of uncertainty in which we are now living will soon come to an end. When this time arrives, the country is expected to enter upon a period of remarkable prosperity. If this is the correct view it may not be an unmixed blessing to the maintenance of way departments of the railroads.

Under normal conditions it is axiomatic that the volume of maintenance work varies directly with the prosperity of the country. The reason for this is plain. It is occasioned by the fact that the prosperity of the country goes hand in hand with that of the railroads. With good times obtaining on the railroads, it has been the experience of the past that their prosperity will be reflected in increased activities in nearly every line of endeavor. It has also been the experience of the past that this general picking up in business is accompanied by brisk competition between employers, for both skilled and unskilled labor, and a shortage of men is the likely result. In spite of this fact it is true that it is in these prosperous times that the bulk of maintenance work is done by the railroads for they then have the money and the work is urgent.

At the present time the railroads have a vast amount of deferred maintenance. One of the most important problems facing them is to catch up with this work, and it seems to be beyond doubt that it must be done in the prosperous times that we are just approaching. If it is to be done then, it seems also to be beyond doubt, that, by comparison, past labor shortages will pale into insignificance compared with the one we must expect to face.

The statistics of immigration support this view. In 1914 more than 1,200,000 immigrants came into this country, while the total for the next four years was nearly 200,000 less. By the beginning of 1918 immigration had so fallen off that the net increase to our population from this source during that year was only about 16,000. In the past we have recruited maintenance of way forces largely from the immigrants reaching our shores, but these figures indicate that for the present at least this source of supply is lost.

It has been estimated that a total of more than 12,000,000 men, in large part prospective immigrants, were either killed or totally incapacitated during the war. The loss of manpower among civilians during the war period has been at least equal to the military loss. Summed up, these losses in the countries concerned are greatly in excess of the probable loss from emigration during the same period if conditions had been normal. This, coupled with the fact that there must be a great demand for labor in repairing war damages, leads to the conclusion that emigration from European countries will be greatly below normal for some years to come.

Now if it is true that this country faces a period of prosperity and that employers may be expected to engage in keen

competition for the available labor with the principal source of supply greatly depleted, it follows that the railways, particularly in the maintenance of way department, are facing a very serious problem. Unless all signs fail, maintenance of way officers must embark in the near future on the biggest task which they have ever faced, that of overcoming the vast amount of deferred maintenance, and doing it shorthanded. With this prospect before them it is hardly possible that they can view with complacency the proposed legislation to prevent immigration for a period of five years.

## The Perplexing Dining Car Question

THE SHADES OF DIFFERENCES of opinion about the way dining cars ought to be run are infinite. A member of the *Railway Age* staff recently had occasion to take at least one meal a day on a dining car for a period of about two weeks, and by far the worst served and poorest meal was on the new a la carte service of a large railroad whose dining car service has aimed at a high standard, which simply goes to prove that no general conclusions can be drawn from single instances.

During the last few weeks, dining car service has been in a period of transition from table d'hote back to a la carte, and among men who have to spend a considerable part of their time traveling, there appears to be a general expression of satisfaction in the return to the a la carte meal. Yet the traveler cannot get as good a meal for \$2.25 under the a la carte system as he could for \$1.25 with the table d'hote. The able dining car steward under the table d'hote system could serve dinner to more than two complete cars full of diners without confusion, with the food well cooked and hot, table linen clean and waiters and cooks un-hurried. This is not possible, apparently, under the a la carte system.

It is perfectly true that where a traveler was compelled to take six or eight meals consecutively in dining cars, the standard lunch and dinner got to be very tiresome, but is it necessary to give up a right principle simply because in trying it out it did not prove entirely satisfactory to that class of travelers who, when they are not satisfied, know how to make their complaints heard? Would it not be far better to stick to the correct principle and to so modify details as to overcome the objections which were raised to the Railroad Administration's table d'hote meals?

The first criticism that suggests itself to anyone who studies the table d'hote system, introduced by the Railroad Administration, is in regard to the rigidity of the system. Some stewards were much more clever and diplomatic in carrying out their instruction than others. One, instead of inquiring more or less peremptorily whether the traveler wanted dinner at 5:30, 6:15 or 7 o'clock, made his inquiry sound more like an invitation to be present at a little affair given by the railroad company; but even a natural diplomat like this man could not vary from a set of hard and fast rules.

In some cases at least, one car served the same dinner and the same lunch each day for a week. In the shorter runs, such as that between New York and Boston, this would seem to be a mistake, since a man's chance of striking the same car, if he made a round trip to Boston, is pretty good. Furthermore, the variety as between different cars and different weeks of the standard meal was conspicuous by its absence. There are not simply two or three meats which can be served economically in a dining car; there are, as any hotel keeper knows, a great variety of entrees or roasts. The practice of giving the choice only between two meats at a meal was right, but the lack of imagination in varying the form of meats as between different days and different cars made for a monotony on an extended trip or on frequent trips that was bound to react disastrously against the table d'hote system.

Could not a table d'hote meal be supplemented with a very simple grill service that would not add greatly to the work in the kitchen, but yet permit the traveler who wanted a broiled steak or broiled chicken to take this instead of the table d'hote meal? This ought not to interfere at all with the service of meals at specified times—5:30, 6:15 and 7:00 o'clock—for dinner, since when the dining car steward inquires the time which the traveler desires to have his meal he could, at the same time, ask whether the table d'hote meal or a steak or chicken from the grill was desired.

With only a little less rigidity and more imagination and thought, the table d'hote service could, we believe, have been made a success.

## The Alaskan Government Railway

VERY LITTLE ATTENTION is being paid by most people in the United States to the fact that the government is engaged in the experiment of building a railway of some importance in Alaska. From the information available there is reason to believe that the conduct of this work has been a decided credit to those who have it in charge. Administered under the general supervision of Franklin K. Lane, one of the ablest members of President Wilson's cabinet, and directed by a high grade engineering commission, it is doubtful whether private hands could have prosecuted the construction of this particular railroad with greater skill or efficiency, except insofar as they would have been more free from the red tape incidental to all government undertakings. The fact that the line will ultimately cost more than the \$35,000,000 estimated before the war, is no reflection on the commission.

The conditions under which this project has been conducted are so entirely at variance with normal social and political conditions in the United States that it means little as a demonstration of the efficiency or inefficiency of government management under ordinary conditions. Rather, it is simply an instance of what may be done by government under political circumstances that permit of the unhampered application of business methods. In other words, it is a repetition in a minor way of what was done so admirably on the Panama canal. Except for small settlements near the two termini, the Alaskan Railway traverses an almost uninhabited region where there are no strong labor unions to deal with, no established financial, commercial or industrial interests that may seek to warp the plans of the commission to suit their own selfish ends, and no established communities with sufficient influence in national affairs to force unwarranted concessions in the way of extravagant service or lavish expenditures for passenger stations, etc. In other words, the commission has been able to proceed with its plans unhampered by the conditions usually surrounding public work in the United States.

The fact is, however, that the people of at least one community along the location of this road have voiced their disapproval of the manner in which the affairs of the railroad are being conducted. The Chamber of Commerce of Seward, Alaska, has recently objected because snow slides have obstructed the line during winter months and it has sent a despatch to Washington to "urge the Alaskan Engineering Commission be instructed to open its line at once for traffic . . . that sufficient funds be made available to put this division (from Seward to Anchorage) in position to operate." Any public work or utility is subject to demands for service and improvements which are entirely out of all relation to revenue. The only reason the government railway in Alaska has been able to proceed unhampered by such interference is that the possibility of the interference is present only to a limited degree.

## Railroad Administration and Government Price Fixing

**W**HEN DOCTORS DISAGREE, and nothing is done, the patient, if seriously ill, is fortunate if he does not succumb.

The railways need rail, and need it badly. They need several millions of tons, not merely to enable them to maintain their tracks this year, but to make up maintenance which has been deferred from past years. They also need coal, although not so badly.

The price of rail was greatly advanced during the war, owing to increased costs of manufacture and to other causes. These increased costs were due to advances in wages and in the prices of materials. There were also large increases in the prices of coal. These also were due chiefly to advances in wages. In the cases of both steel and coal, however, parts of the advances in prices were permitted in order to enlarge production by enabling mills and coal mines to operate which could not have operated if prices had been kept on a lower basis. The revenue laws were purposely so framed that if low-cost concerns made too large profits the greater part of the excess would be taken by the government in taxes.

It was not assumed that price-fixing by the government would be continued after the war ended. Certainly it would not have been assumed that if it was continued prices which had been fixed largely to stimulate maximum production would be continued after the war need for maximum production in certain special lines was past.

After the signing of the armistice, however, the government found itself confronted with some conditions which were unexpected. The war ended sooner than anybody anticipated. Organized labor demanded that the high wages which had resulted from war conditions should be made permanent, and the government supported it in this. Large business concerns took the position that if wages stayed up, prices must stay up. But many business men refused to continue to pay the war prices. The result was, that industrial activity began sharply to decrease and unemployment to increase.

The government, through the Department of Commerce, then created the Industrial Board, to bring about readjustments of prices in basic industries, such as coal and steel. That board decided upon certain prices which it believed the government departments should pay, and the producers agreed to sell for those prices.

The largest of the government departments in point of volume of purchases is the Railroad Administration. It is both the largest buyer of steel and the largest buyer of coal in the country. And it refuses to buy at the prices proposed by the Industrial Board. The Industrial Board says it has investigated the costs of production, and that the prices proposed are reasonable. Director General of Railroads Hines says that in his opinion the prices are too high, and therefore he will not pay them.

Who is right in this controversy? The *Railway Age* confesses that, although it has read the statements issued by both sides, it is unable to form an opinion. Since the Industrial Board has investigated the subject and is convinced that the prices are reasonable, it undoubtedly is right in insisting upon the Railroad Administration paying them. Since Director General Hines is solely responsible for the management of the railroads, and since he has investigated the subject and feels sure the prices are too high, he is undoubtedly within his rights, and even performing his duty in insisting that the prices shall be reduced.

But—while these two departments of the same government are thus disagreeing, no rails are being ordered for the railroads. Railway maintenance is getting farther and farther

behind; some of the steel mills are being closed down; others are working only part time; and men are being thrown out of employment. It is an old saying that two wrongs never made a right. Here, however, is apparently a case where two rights make a wrong.

This deadlock between two government departments, with its sinister consequences, is another development which will hardly be used by the advocates of government ownership in their arguments as an example of the advantages of government management. Mr. Hines says, in effect, that the producers of steel and coal are trying to "hold up" the railways because they are in the hands of the government and the taxpayers have to pay the bill. Chairman Peek of the Industrial Board says flatly that the Railroad Administration is trying to use the power of monopoly that its control of most of the railways gives it to force down prices unfairly. And both of them are acting in an official capacity for the government!

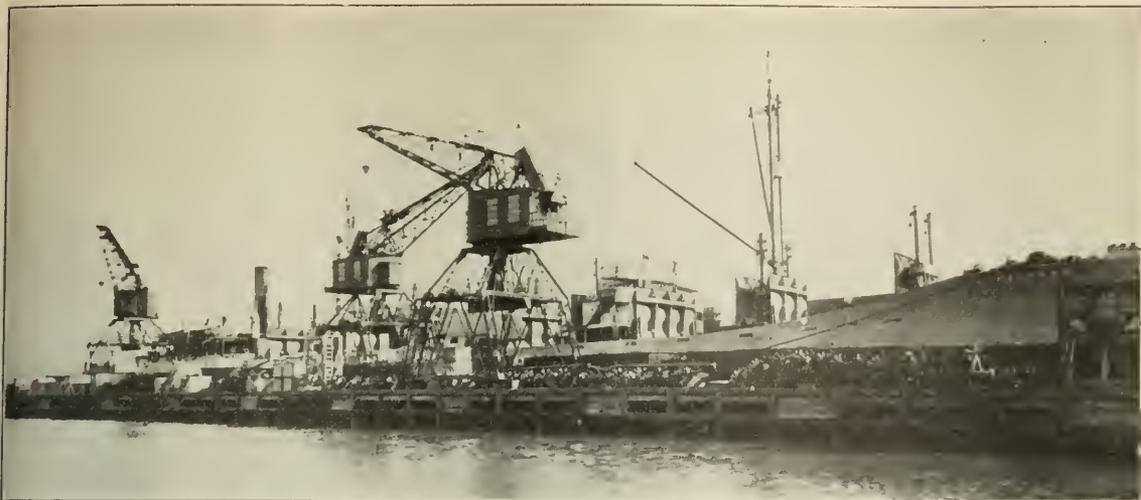

The public wants to see prices paid for rails and coal which will be sufficient to yield reasonable profits on the basis of existing wages to as many steel mills and coal mines as are needed in order to enable the United States to produce as much steel and coal as will be needed under normal conditions to supply our own demands and to do a substantial export business. The prices paid should not be based on the costs of either the highest cost or the lowest cost concerns, but on a mean between these extremes. The Railroad Administration should not use its monopoly power to force prices down unduly. If it does, wages will and must be reduced in consequence, thus defeating one of the principal policies of the administration. On the other hand, manufacturers (and precisely the same thing is true of labor) should not be allowed to hold up the railways merely because they are in the hands of the government. If the Railroad Administration was a little stiffer in dealing with labor, its consistency in dealing so stiffly with the manufacturers, who have labor problems of their own, would be less open to question.

And meantime, we repeat, the railways need millions of tons of rail and need them badly, and the business of the country is being injured and thousands of men are being thrown out of employment while the government departments at Washington continue to disagree. The government is hardly giving a perfect demonstration of the way the problems of reconstruction should be handled.

## New Books

*Proceedings of the American Railway Bridge and Building Association.* Edited by C. A. Lichty, secretary, 228 pages. Illustrated, 6 in. by 9 in. Bound in paper and cloth. Published by the Association, C. A. Lichty, secretary, 143 Waller Ave., Austin Station, Chicago. Price, \$1.

This volume contains the Proceedings of the twenty-eighth annual convention of the American Railway Bridge & Building Association, which was held in Chicago on October 15-17, 1918. The reports presented at this meeting were unusually practical in character and reflected the strenuous times through which maintenance of way men were passing last year. Among the reports of special value are those on the Repairing and Strengthening of Old Masonry; Sources of Railway Water Supply; Wooden Tanks, and Bridge Decks, and Guards. Several papers were also presented which were of unusual value. These papers included one on Essential Work, by C. A. Morse, assistant director of the Division of Operation of the United States Railroad Administration, and another on the subject of Carrying Bridges Over, by C. F. Loweth, chief engineer of the Chicago, Milwaukee & St. Paul.

Steamship Feltore Receiving Load of Locomotive Parts Direct From Pier

## Radical Departure in Loading Ocean Freighters

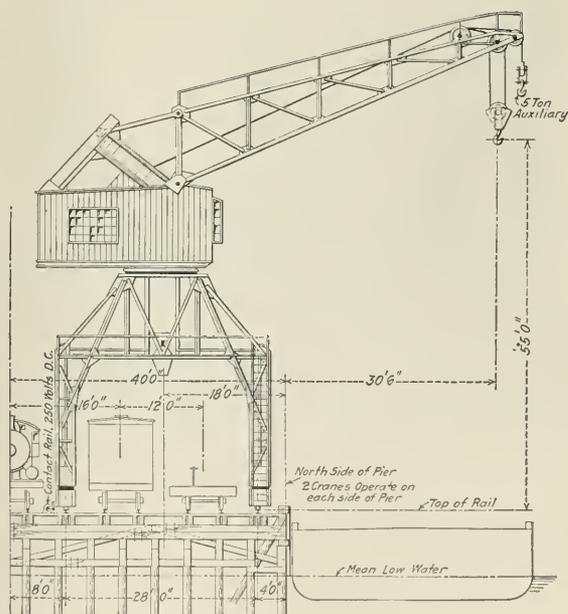

Erie Railroad Utilizes Existing Equipment in Handling 50 Locomotives Direct from Pier to Ship

THE SUCCESSFUL LOADING of a shipment of 50 locomotives into the hold of an ocean liner without the use of lighters, which was accomplished this week, marks a significant and important step in the development of New York harbor, being the first time the direct loading from pier to ship of freight of the character described had ever been attempted here. The work was done with the standard pier equipment and no special preparations were necessary for its accomplishment. It had never been attempted because of the well founded impression that damage to fixed equipment would result. This impression is based on the fact that in many ships the hatches do not have sufficient area to permit free passage to packages of large dimensions, with the result that forcing methods in loading have had to be resorted to. That is to say, large packages often become wedged in the hatchway and when pried loose would drop and shift quickly, setting up strains sufficient to break rigid equipment. When such freight is loaded from lighters and forcing methods are resorted to, the strains are greatly reduced because of the free movement of the lighter in the water.

The freighter Feltore is of the single deck type with hinged hatches extending across the ship for almost its full width. For this reason this ship is particularly adapted for such methods of loading. This shipment, and several thousand tons of pig iron, were loaded during the week direct from Erie Railroad pier H at Weehawken, N. J., and by eliminating the use of barges, tugs and lighters, commonly required for work of this character, the expense of loading was materially decreased. Most important of all, however, was the saving of time.

Following usual methods, the ship would have been anchored off shore and the cargo moved from the pier by cranes and loaded on to barges. Then from the barges the cargo would have been transferred to the hold of the vessel by the usual lighterage methods. As no more time is required to load the ships direct from the piers than to place the cargo on to barges, the economy of the direct loading is apparent. When it is considered that approximately 50 per

cent more time is required to transfer the cargo from the barges by the floating equipment than to load the barges by the pier equipment the importance of the new departure as an economic measure is still more evident, to say nothing of

Half End Elevation of Pier

the benefits and savings accruing from the release of the floating equipment, thus making it available for other service.

The 50 locomotives were delivered unassembled to the pier

in 200 cars. The car loads were made up of 20-ton locomotive boilers, 14-ton tender tanks, 12-ton locomotive frames, 4-ton cabs, 4-ton drivers and 3-ton cylinders.

During the first day 19 of the 20-ton boilers were loaded in seven hours, a cycle being completed in about 22 minutes. After the seven hours the loading of boilers had to be discontinued while smaller cargo, chiefly pig iron, was placed to prevent shifting of the larger units. The pig iron was loaded with ship's crane and did not interfere with the operation of the pier equipment, then engaged in loading tender tanks and other locomotive parts. From the time studies made it will apparently require four days to load the entire shipment of locomotives, the speed of loading being controlled by the capacity of the ship's facilities for handling the cargo delivered to it by the pier equipment.

As the cargo could not be loaded on to barges in less time than is required to load it into the ship the initial saving by the new method is four days. The time which would be required to transfer the load from barges to the ship would depend on the location of the ship in reference to the pier

The Box Contains a Tender Tank and Weighs 14 Tons. The Picture Shows the Box Suspended Over the Cars on the Pier Preparatory to Swinging It Over the Ship's Side

and cannot be arrived at definitely. As a comparison, however, it may be said that the estimated time for transferring a 20-ton locomotive boiler from a barge to a ship is about one hour as compared with the 22 minutes mentioned above. In other words, the time required to load from the pier to the ship is more than 50 per cent less than that required to load from the barge.

Pier H is of the open-type with timber construction. It is 80 ft. wide and 1,000 ft. long, providing space for five railroad tracks, which extend the full length of the pier, and have a combined capacity for 200 cars, and for two gantry tracks. The center line of railroad track No. 3 coincides with the center line of the pier. The two tracks on the south side of the pier and the two on the north side are spaced on 12 ft. centers. The distance from the center line of track No. 3 to the center line of adjoining tracks is 16 ft., and the distance from the centers of outside tracks to the edges of the

Type of Gantry Crane Used. Pier Is Equipped With Three Ten-Ton and One 20-Ton Cranes

pier is 12 ft. The gage of the gantry track is 28 feet., with the outside rail of each track 4 ft. from the edge of the pier.

The pier equipment comprises four electric traveling portal gantry cranes consisting of one 20-ton and one 10-ton crane operating on the south side of the pier, and two 10-ton cranes operating on the north side. The vertical clearance between the top of the gantry rails and the boom in its lowest position is 55 ft., an ample distance to clear the side of any vessel.

All of the cranes have a vertical or hook lift of 90 ft., ranging from 30 ft. below the level of the crane rails to 60 ft. above. They all have a rotating movement giving them a working radius of 48 ft. 6 in., permitting each crane to load or unload cars on any track and to reach 30 ft. 6 in. beyond the edges of the pier.

Three of the cranes have a maximum capacity of 10 net tons. These have a hoisting speed for loads up to five tons of 220 ft. per min., and for loads above five tons to ten tons of 110 ft. per min. The rotating speed is three revolutions per min. and the traversing speed is 150 ft. per min. The capacity of the main hoist of the fourth crane is 20 net tons and that of the auxiliary hoist 5 net tons. For loads up to 5 tons the hoisting speed is 220 ft. per min., and from 5-ton loads to 20 tons the speed is 55 ft. per min. This crane has a rotating speed of two revolutions per min. and

a traversing speed of 100 ft. per min. All of the cranes have a longitudinal movement for the entire length of the pier. Each crane is equipped with three electric motors, one each for traversing the crane; rotating the jib; raising and lowering the load and raising and lowering the jib. These motors

A 25-hp. fully enclosed motor located on the portal and connected through cut steel gears to one wheel at each portal provides an equal tractive effort for traversing the machine irrespective of the direction of the wind. The motor is equipped with a drum type controller located in the cab. Whenever the power circuit is opened, by accident or by the operator, a magnetic brake provided on the armature shaft of the motor automatically stops the traveler.

The operator's cab is so located on the crane that the operator may have a plain view of the operations at all times. The cab is heated electrically.

The hoist motor consists of an 81-hp. open mill type motor connected through cut steel gearing to a cast iron drum hoist. A magnetic brake on the armature shaft of the motor automatically acts to hold the load whenever the power circuit is open. In addition, an H. & P. standard brake and friction clutch is provided in the drive to disconnect the hoisting drum and hold it stationary while raising or lowering the jib. The combined brake and clutch is so constructed that the brake will be normally set and the clutch released. The clutch is set and the brake released by means of a solenoid.

The controller for the hoisting engine is of the magnetic contactor type and gives either power or dynamic braking, whichever may be necessary for lowering the empty hook without any shift of the controller handle. Limit switches automatically prevent overhoist of the load.

The crane jib is hinged and is raised or lowered by a heavy forged steel screw running in bronze nuts connected to the top chord of the jib through steel links. Limit switches limit the travel of the boom in each direction.

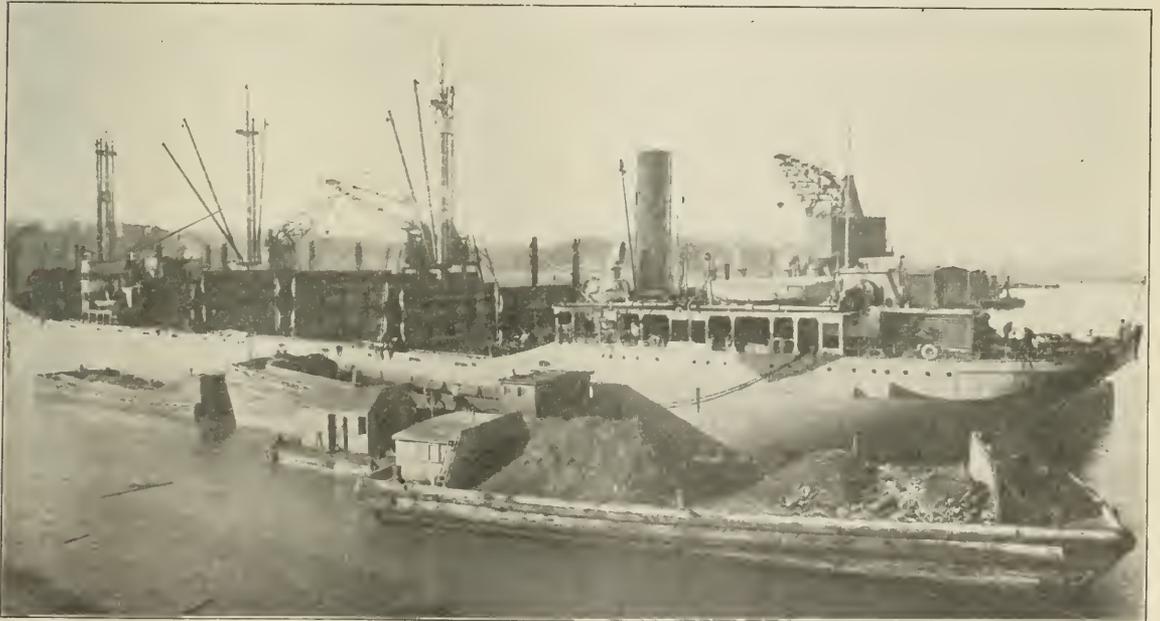

The rotary movement is effected by a 33-hp. crane type motor connected through steel gearing to a heavy steel gearing bolted to the top of the portal. The motor is equipped with a drum type controller located in the cab and a magnetic brake on the armature shaft of the motor automatically stops rotation whenever the power circuit is opened.

Box Containing Tender Tank Being Lowered Into the Ship's Hold. The Largest Parts Placed in This Manner Were the Boilers Which Weighed 20 Tons

are all 230-volt series wound direct current machines, and each one is protected by overload relays mounted on a panel in the crane cab.

The cranes are mounted on equalizing structural steel

This Type of Ship with a Single Deck and Large Hinged Hatches Is Particularly Well Adapted to This Method of Loading

trucks, one 2-wheel truck being provided under each of the four corners of the portal. The truck connection to the portal structure is flexible, thus equalizing the load on both wheels at each corner.

The control equipment for operating the crane consists of drum controllers for the travel, and the rotating motors and a master controller for the hoist motor. The latter is provided with an auxiliary interlock having three positions, (1)

providing for operating the hoist engine; (2) for raising the hook; and (3) for lowering the boom.

Electric power for the operation of the crane motors is brought to a sub-station located near the shore end of the pier on a two-phase, four-wire, 2,300-volt circuit. This power is transformed to six-phase, 163-volt alternating current by two 105-kva. transformers and a rotary converter is used to change this to 250-volt direct current power for the crane motors. The rotary converter is a General Electric type HCC, six-pole, 200-kw. machine, running at 1,200 r.p.m.

The maximum rated current capacity of the rotary con-

The Crane's Boom Was Not Long Enough to Reach the Off-Pier Side of the Ship and to Place the Boxes on this Side the Ship's Hoisting Apparatus Was Used to Pull Them to the Side as Shown in the Picture

verter is 800 amperes. Momentary loads put upon it by the crane motors are frequently as high as 1,600 amperes, but the converter takes care of these without difficulty. A duplicate machine, however, has been placed on the floor of the sub-station, which will be connected in a short time to take care of excessive loads and to provide for emergencies and repairs to the other machine. A third rail is provided for carrying the direct current power to the crane. The crane and electrical equipment on the pier were furnished by Heyl & Patterson, Inc., of Pittsburgh, Pa.

## Orders of Regional Directors

**WAR DEPARTMENT POSTERS.**—The regional director, Eastern region, in a circular dated April 9, authorizes the posting in station waiting rooms of advertisements of the War Department, not over 28 in. x 38 in., calling for volunteers, for service in the regular army, to relieve drafted men now in service in Europe.

**Pullman Passes for Ticket Sellers.**—The regional director, Eastern region, by circular dated April 9, notifies federal managers that requests of ticket office employees for Pullman car passes should be made through the same channel as requests for railroad transportation. This supersedes the former custom under which the Pullman Company granted such passes on requests from the ticket agent in charge of the office where the applicant was employed, granting the free transportation in consideration of the fact that the employee handled Pullman tickets without extra compensation.

**Repairs of Short Line Cars.**—The regional director, East-

ern region, by circular 500-14-5A669, announces that beginning with April 1 bills for repairs to cars and engines belonging to non-federal roads—the "short lines"—are to be made on the basis of actual cost of labor and materials, plus 15 per cent, with 10 per cent added to the total to cover superintendence and accounting. Material furnished by the road owning the car or locomotive is to be billed to the road making the repairs, which, in turn, should re-bill it at the same rate plus 15 per cent for handling. Proper credit is to be allowed for scrap at current prices.

**Reclamation of Scrap.**—The regional director, Eastern region, by circular 2900-99A-670 calls attention to carelessness in the gathering and sale of scrap material. Scrap material has been sold without assortment, and new articles, available for immediate use, have been sold as scrap. Federal managers are called upon to review the instructions and regulations now existing in order to make sure that the greatest possible care is exercised, and to take any action that may be found necessary to insure that the sorting, reclamation and sale of the scrap is being properly and economically handled.

**Rental Charges for Cars and Engines.**—The Southern regional director, answering a question, says that it is the intention that the schedule of rental charges shall apply to equipment loaned by federal controlled railroads to independently operated railroads, or to contractors or other outside parties, where, in the judgment of the federal manager, it is proper to lend such equipment.

**Tax on Telegrams.**—The regional director, Eastern region, by circular 2002-14A677, advises federal managers that on telegrams sent under a contract between a railroad company and a telegraph company, which provides for an interchange of services, for which no charges are made, there is no federal tax, provided the messages relate exclusively to the business of the railroad company. This is the substance of a decision by J. E. Walker, deputy commissioner of the treasury department.

**Victory Liberty Loan.**—The regional director, Eastern region, by circular 1500-1-7A679, announces, for the benefit of all railroad officers and employees, the terms of the Victory Liberty Loan notes.

**Requests for Statistical Data.**—The Eastern regional director, by circular 1801-118A678, advises federal managers what should and what should not be done in dealing with requests for statistical data presented by other branches of the government and by private parties. Such information should be given only where it is in the interest of the public to do so. The Geological Survey is to be furnished with statements of the number of cars of coal and other minerals shipped, and the Bureau of Standards may be told the designation and location of track scales, and the number of test cars owned by the railroads. As to a great variety of requests no exact rule can be laid down, but ordinarily any information which has been compiled by a railroad for its own purposes, or for the government, may be given out, if the federal manager deems it in the public interest.

**Grain Embargo.**—Supplement 22 to Circular 34 of the Northwestern regional director similar to Circular 197 of the Southwestern regional director (*Railway Age*, April 11, page 942).

**Army Appeal Posters.**—Supplement 3 to Circular 169 of the Central Western regional director authorizes the display of War Department posters calling for recruits for the regular army. The Southwestern regional director, in Circular 201, issues similar instructions.

**Marking of Cotton.**—Supplement 1 to Order 182 of the Southwestern regional director orders that unpressed cotton or cotton linters must not be accepted at way stations unless, in addition to the shipping marks, there is firmly attached to each bale a waterproof shipping tag showing the name of shipper, point of origin, consignee and destination.

# Train Employees Granted Wage Increase

Four Hundred Thousand Men are Affected; Total Increase Estimated About \$60,000,000

GENERAL INCREASES in wages for the train service employees, which, with orders issued this week giving increases to the dining car and sleeping car employees, are estimated by the Railroad Administration to amount to about \$67,500,000 a year, were ordered by Director General Hines on April 11, retroactive to January 1, 1919. This would make the increase for the train and engine employees somewhat over \$60,000,000 a year. It was announced that the order was issued in pursuance of proceedings begun in September, 1918, for the purpose of putting the wages of train and enginemen on a basis which will give them the benefit of the same principles that were established by the Railroad Administration during the war and that were applied to practically all other classes of railroad labor. These adjustments involve approximately

termed the war cycle of wage increases to railroad labor and recounting the procedure which the Railroad Administration has adopted throughout the war in dealing with its wage problems. The first increases were made in General Order No. 27 issued on May 25, 1918, by Director General McAdoo, and based on recommendations made by the Railroad Wage Commission. To take such supplemental action as might be necessary to complete the readjustment of wages, the Board of Railroad Wages and Working Conditions was created, consisting of three representatives of railroad managements and three representatives of railroad labor organizations. This board took up in turn the various classes of labor and its recommendations were considered by the directors of the Division of Operation and Labor and were then acted upon by the director general. As a result of this procedure practically all classes had received the necessary supplemental consideration and treatment at the time of the signing of the armistice, but the recommendation of the board as to the train and enginemen was not submitted until December 21.

When the report of the Board of Railroad Wages and Working Conditions on the readjustment for employees in train and engine service was made, the statement says, the director general was faced with the following alternatives:

(1) To refuse to make any readjustments whatever because of the present unsatisfactory condition of railroad revenues in spite of the fact that this class of employees had reason to expect readjustments because of readjustments which had already been made for other classes of employees.

(2) To establish relative justice between the various classes by cutting down the wages established for the other classes during the war.

(3) To make readjustments proportional with those which had been made for other employees.

Of these three possibilities the director general is satisfied that only the last was practicable and just and he therefore adopted it.

The statement continues in part as follows:

"Since the order now made as to train and enginemen and the orders about to be made as to dining car and sleeping car employees will establish in the opinion of the Railroad Administration a fair equalization on the basis of the standards adopted during the war by the Railroad Administration, it will of course be understood that the cycle of war adjustments is thus completed and that further wage questions will naturally be dealt with only in the light of conditions hereafter arising. While the foregoing deals with all classes of employees whose wages are part of railroad operating expenses, it is also true that the wages of express employees have not yet received final consideration and action.

"In this connection some points regarding wages of railroad employees in train and engine service should be remembered in view of the mistaken belief that they are unusually highly paid. In the report of the Lane wage commission, the following statement was made:

"It has been a somewhat popular impression that railroad employees were among the most highly paid workers. But figures gathered from the railroads disposed of this belief. Fifty-one per cent of all employees during December, 1917, received \$75 per month or less. And 80 per cent received \$100 per month or less. Even among the locomotive engineers, commonly spoken of as highly paid, a preponderating number receive less than \$170 per month, and this compensation they attained by the most compact and complete or-

The Star Boarder

400,000 men and are based on recommendations of the Board of Wages and Working Conditions. The orders allow time and one half for overtime after eight hours in yard service, while the question of time and one half for overtime in road service insisted on by the brotherhoods, together with collateral questions affecting the schedules, has been referred to Railway Board of Adjustment No. 1, made up of four representatives of the managements and four representatives of the brotherhoods. This was done on recommendation of the Board of Wages and Working Conditions. It was erroneously stated in last week's issue that this question had been referred to the latter board.

Director General Hines authorized a statement explaining that this step practically completes what can properly be

ganization, handled with a full appreciation of all strategic value. Between the grades receiving from \$150 to \$200 per month, there is included less than three per cent of all the employees (excluding officials) and these aggregate less than 60,000 men out of a grand total of 2,000,000.

The higher paid men in train and engine service reach their favorable position only after long years of service. They are men who through the operation of the seniority rule reach the higher grades and better paid positions and thereby attain the goal of a life's work in an honorable and exceeding onerous trade. To their care are entrusted the lives of men, women and children and the protection of valuable property. Their work is at all hours of the day and night and it is exposed to all sorts of weather.

Employees in engine and train service (except yard service) perform nearly all their work away from home, and a greater proportion of their individual living expense is incurred away from home, but no compensation for this item has ever been granted to this class of employees, and the expense ranging perhaps from \$30 to \$45 a month is paid out of the employees' wages.

The train and enginemen earnestly insist that they should be paid time and a half for overtime in road service (instead of prorata overtime) for any excess time due to a failure to maintain a speed of 20 miles per hour in passenger service and 12½ miles an hour in road service, claiming that this is strictly analogous to the allowance of punitive overtime after eight hours in work which is paid for exclusively by the hour. The railroad managements, however, strenuously insist that there is no such analogy, because they say that work on the road is in the nature of piece work, also that the higher speed in freight service is frequently not economic and hence the failure to make it ought not to be penalized, and also that the employees while on the road cannot be under strict supervision, and can largely influence the time consumed and the speed of their trains. The Board of Railroad Wages and Working Conditions recommended that this question be submitted to a bi-partisan board of eight, i. e., four representatives of the managements and four representatives of labor for a thorough study and report on this question. This course will be pursued, and the question will be submitted to Railway Board of Adjustment No. 1, which is made up of four representatives of the managements and four representatives of labor. Effective steps will be taken to secure the promptest possible action upon this matter.

The orders now issued allow time and a half after eight hours for overtime in yard service (which is strictly an hourly employment).

This action upon the wages of train and enginemen leaves only two relatively small classes of railroad employees yet to be dealt with in the completion of the war cycle of wage adjustments, these two classes being the dining car employees and the sleeping car employees.

It is estimated that if railroad labor throughout the war year 1918 had been paid the wages actually established by the end of December, 1918, (working the same hours and under the same conditions that they actually worked during the year) the wage increase in operating expenses for the year would have been \$754,811,000 in excess of what the wage increases have been if (and this is an impossible assumption) the work could have been performed throughout the year for the low wages prevailing on January 1, 1918. If in addition the train and enginemen had been paid throughout 1918 the wages now established and the dining car and sleeping car employees had been paid the wages which are about to be established (and the police forces had been paid throughout 1918 the wages recently established for them), the additional increases on these accounts would have been about \$67,500,000. Attempting thus to measure the matter by the labor actually performed during the calendar year 1918, the total increase in wages growing out of the war conditions

and the resulting policies firmly established during the war by the Railroad Administration (and including the wage increases now being and about to be made to complete the war cycle), would have been \$822,311,000, due however in substantial part to the excess hours and to the inexperienced labor which came about on account of the war. (The actual increase during the calendar year 1918 was only about \$583,000,000 because many of the supplemental increases did not take effect until the latter part of the year.) It is anticipated that through the elimination of overtime which will be unnecessary under peace conditions and through ability to regain experienced employees who were lost during the war, the total increase in wages would be substantially less on the same volume of business than the foregoing based on the calendar year 1918 would indicate, and of course the increase will be less if the volume of business is less.

As a result of the wage levels established and principles applied prior to the signing of the armistice to practically all other classes of labor, and as a result of the unusually thorough study of the rates of pay proposed for the train and enginemen, the present orders, known as Supplements Nos. 15 and 16 to General Order No. 27, have been issued.

A fair illustration of the substantial effect of these supplements is suggested by the following comparison, which compares the rates of pay in effect immediately prior to federal control with the new rates of pay, a large part of the indicated increases having been made, however, by General Order No. 27, which was issued in May, 1918:

COMPARISON OF RATES*				
Service	Occupations	1917 Average (Per month)	Now ordered Average (Per mo.)	Increase Average
Passenger...	Conductors...	\$135.00 to \$165.00	\$180.00	\$15.00 to \$45.00
	Baggagemen...	71.50 to 105.00	124.80	19.80 to 53.30
	Brakemen...	68.75 to 90.00	120.60	30.00 to 51.25
	Engineers...	(Per day) \$4.47	\$5.79	\$1.32
	Firemen...	2.98	4.31	1.33
Freight.....	Conductors...	4.09	5.40	1.31
	Brakemen...	2.73	4.08	1.35
	Engineers...	5.33	6.64	1.31
	Firemen.....	3.33	4.81	1.48
Yard.....	Conductors...	3.87	5.33	1.46
	Brakemen...	3.47	5.00	1.53
	Engineers...	4.20	5.72	1.52
	Firemen.....	2.72	4.25	1.53

\*Because of the wide variety of rates it is impossible to do other than show the increases on the average; ignoring both maximum and minimum rates.

In the East 60 per cent of the passenger conductors, brakemen and baggagemen are now receiving the higher rate and will get the less increase as shown above. In the West and South 80 per cent receive the higher rate and will get the less increase.

The comparisons given are between the new rates and the rates in effect immediately prior to federal control. A large part of the increases have already been made by General Order No. 27, issued in May, 1918."

**Order for Enginemen**

Supplement No. 15 to general order No. 27 provides as follows:

Effective January 1, 1919, except as otherwise provided herein, as to employees herein named, the following rates of pay and rules for overtime and working conditions upon railroads in federal operation are hereby ordered:

(b) In short turn-around passenger service, the earnings from mileage, overtime or other rules applicable, for each day service is performed, shall be not less than \$6.00 for engineers and \$4.25 for firemen.

(c) Engineers, firemen or helpers employed on electric locomotives in passenger service to be paid the rates shown in preceding table, based upon weight on drivers. In the application of the rates for various driver weights in electric locomotive service, the total weight on drivers of all units operated by one engine crew shall be the basis for establishing the rate.

(d) Electric car service, whether operated in multiple unit or single unit, to be paid minimum rate in preceding table.

(c) All motor cars used in passenger service operated under train rules by engineers, regardless of whether operated by gasoline, steam, electricity, or other motive power, to be paid minimum rate in preceding table.

(f) The term "helper" as used in this order will be under-

for firemen shall be added to the through freight rates, according to class of engine; miles over 100 to be paid for pro rata.

(c) The term "helper" as used in this order will be under-

PASSENGER SERVICE.

\*Oil differential not to apply on engines weighing over 215,000 lb. on drivers.

stood to mean the second man employed on electric locomotives or other than steam power.

ARTICLE II—Basic Day

One hundred miles or less (straight-away or turn-around) five hours or less, except as provided in Article III, Section (a), shall constitute a day's work; miles in excess of 100 will be paid for at the mileage rate provided, according to class of engine.

ARTICLE III—Overtime

(a) Engineers, firemen and helpers on short turn-around passenger runs, no single trip of which exceeds 80 miles, including suburban and branch line service shall be paid overtime for all time actually on duty, or held for duty, in excess of eight hours (computed on each run from the time required to report for duty to the end of that run) within 10 consecutive hours; and also for all time in excess of 10 consecutive hours computed continuously from the time first required to report to the final release at the end of the last run. Time shall be counted as continuous service in all cases where the interval of release from duty at any point does not exceed one hour. This rule applies regardless of mileage made. For calculating overtime under this rule the management may designate the initial trip.

(b) Engineers, firemen and helpers on other passenger runs shall be paid overtime on a speed basis of 20 miles per hour computed continuously from the time required to report for duty until released at the end of the last run.

Overtime shall be computed on the basis of actual overtime worked or held for duty, except that when the minimum day is paid for the service performed, overtime shall not accrue until the expiration of five hours from the time of first reporting for duty.

Where a more favorable overtime rule exists, such rule may be retained, in which event this section will not apply.

Where the provisions of this section for continuous time on turn-around runs of over 80 miles one way, change existing overtime rules, the effective date will be April 10, 1919; otherwise January 1, 1919.

(c) Overtime in all passenger service shall be paid for on the minute basis at a rate per hour of not less than one-eighth of the daily rate herein provided, according to class of engine.

FREIGHT SERVICE

ARTICLE IV—Rates of Pay

(a) Rates for engineers, firemen and helpers in through and irregular freight, pusher, helper, mine run or roustabout, belt line or transfer, work, wreck, construction, snow-plow, circus trains, trains established for the exclusive purpose of handling milk, and all other unclassified service shall be as follows:

(b) For local or way-freight service, 52 cents per 100 miles or less for engineers and 40 cents per 100 miles or less

stood to mean the second man employed on electric locomotives or other than steam power.

ARTICLE V

(a) Where rates below those for coal-burning locomotives are provided in this order for oil-burning locomotives, they shall apply only on the railroads where differentials have heretofore existed.

(b) If a type of locomotive is introduced on a railroad which formerly was not in use on that railroad, and the rates herein provided are less than those in effect on other roads in the territory the rates of the other roads shall be applied.

(c) Road engineers, firemen and helpers required to perform a combination of more than one class of road service during the same trip will be paid at the rate and according to the rules governing each class of service for the time or miles engaged in each, but will be paid for the entire trip not less than a minimum day at the highest rate applying for any class of service performed during such trip.

When two or more locomotives of different weights on drivers are used during a trip or day's work, the highest rate applicable to any engine used shall be paid for the entire day or trip.

ARTICLE VI

Wherever electric or other power is installed as a substitute for steam, or is now operated as a part of their system on any of the tracks operated or controlled by any of the railroads, the locomotive engineers shall have preference for positions as engineers or motormen, and locomotive firemen for the positions as firemen or helpers on electric locomotives; but these rights shall not operate to displace any men holding such positions on the date of issuance of this order.

ARTICLE VII—Basic Day and Overtime

(a) In all classes of service covered by Article IV (except where under mileage schedules a more favorable condition exists), 100 miles or less, eight hours or less (straight-away or turn-around) shall constitute a day's work; miles in excess of miles required for a minimum day will be paid at the mileage rates provided, according to class of engine or other power used.

(b) Where there is no existing agreement regarding overtime provisions more favorable to the employees, on runs of 100 miles or less overtime will begin at the expiration of eight hours; on runs of over 100 miles overtime will begin when the time on duty exceeds the miles run divided by 12½. Overtime shall be paid for on the minute basis, at not less per hour than one-eighth of the daily rate, according to class of engine or other power used.

ARTICLE VIII—Held Away from Home Terminal

Present rules in effect to be continued subject to provisions of Article XXIII; it being the intention that the propriety of a standard rule be considered by the board herein provided for.

ARTICLE IX—Monthly, Daily or Trip Basis

(a) All service which prior to the effective date of this order was paid on a monthly, daily or trip basis, shall be established upon the mileage basis and paid the rates according to class of service and operated under the rules herein provided.

(b) In branch line service where differentials now exist in either rates, overtime basis or other conditions of service, the main line rates shall be applied for the class of service performed. Miles in excess of the mileage constituting a day will be paid pro rata. If existing rates are higher than the revised main line rates they shall be preserved, but the excess in the rate over the main line rate may be applied against overtime. The passenger or freight overtime basis shall be applied according to the rate paid. Other existing conditions of service shall not be affected by the foregoing.

(c) On other than Class 1 roads, independently operated, the rates of this order shall be applied for the classes of service performed, but no change is required in the miles, hours or service for which the former rates compensated. Existing higher rates shall be preserved. This section does not apply to terminal and other roads where recognized standard rates and conditions are in effect.

(d) If this order in any case produces abnormally high earnings because of unavoidable long lay-overs such cases may be referred back to the director general for special disposition.

ARTICLE X—Arbitrarities and Special Allowances

The same rates shall apply to all arbitrarities and special allowances as are applicable to the service of which they are a part or upon which they are based, or if not related to any particular class of service, the increase applicable to through freight service shall apply, except that in no case shall they exceed the pro rata rate of the service upon which the increase is based. The minimum time or mileage allowances shall remain in effect.

ARTICLE XI—Beginning and Ending of Day

(a) In all classes of service engineers', firemen's and helpers' time will commence at the time they are required to report for duty, and shall continue until the time the engine is placed on the designated track or they are relieved at terminal.

(b) Engineers, firemen and helpers in pool or irregular freight service may be called to make short trips and turn arounds with the understanding that one or more turn-around trips may be started out of the same terminal and paid actual miles with a minimum of 100 miles for a day provided, (1) that the mileage of all the trips does not exceed 100 miles, (2) that the distance run from the terminal to the turning point does not exceed 25 miles, and (3) that engineers, firemen, or helpers shall not be required to begin work on a succeeding trip out of the initial terminal after having been on duty eight consecutive hours, except as a new day subject to the first in-first out rule or practice.

YARD SERVICE—Freight

ARTICLE XII—Rates of Pay

Weight on Drivers	Engineers, Per Day	Firemen, Steam, Per Day	Helpers, Electric, Per Day
Less than 140,000 lb.....	\$5.60	\$4.16	\$4.16
140,000 to 200,000 lb.....	5.76	4.28	4.16
200,000 to 300,000 lb.....	5.92	4.40	4.16
300,000 lb. and over.....	6.08	4.56	4.32
Mallets under 275,000 lb.....	6.68	5.28	....
Mallets 275,000 lb. and over.....	6.92	5.52	....

ARTICLE XIII—Basic Day

Eight hours or less shall constitute a day's work.

ARTICLE XIV—Overtime

Except when changing off where it is the practice to work alternately days and nights for certain periods, working through two shifts to change off; or where exercising seniority rights from one assignment to another; or when extra men are required by schedule rules to be used (any rules to the contrary to be changed accordingly) all time worked in excess of 8 hours continuous service in a 24-hour period shall be paid for as overtime, on the minute basis at one and

one-half times the hourly rate, according to class of engine.

This rule applies only to service paid on the hourly or daily basis and not to service paid on mileage or road basis.

This rule is effective April 10, 1919, but in calculating back pay from January 1, 1919, overtime accruing under former rules after eight (8) hours service shall be paid at one and one-half times the hourly rate.

ARTICLE XV—Assignments

Engineers, firemen and helpers shall be assigned for a fixed period of time which shall be for the same hours daily for all regular members of a crew. So far as is practicable assignments shall be restricted to eight hours work.

ARTICLE XVI—Starting Time

(a) Regularly assigned yard crews shall each have a fixed starting time and the starting time of a crew will not be changed without at least 48 hours' advance notice. Practices on individual roads as to handling of transfer crews are not affected by this section.

(b) Where three eight-hour shifts are worked in continuous service, the time for the first shift to begin work will be between 6:30 a. m. and 8:00 a. m.; the second 2:30 p. m. and 4:00 p. m.; and the third 10:30 p. m. and 12:00 midnight.

(c) Where two shifts are worked in continuous service the first shift may be started during any one of the periods named in Section (b).

(d) Where two shifts are worked not in continuous service the time for the first shift to begin work will be between the hours of 6:30 a. m. and 10:00 a. m. and the second not later than 10:30 p. m.

(e) Where an independent assignment is worked regularly the starting time will be during one of the periods provided in Section (b) or (d).

(f) At points where only one yard crew is regularly employed, they can be started at any time, subject to Section (a).

(g) Where mutually agreeable, on account of conditions produced by having two standards of time, starting time may be changed one hour from periods above provided.

ARTICLE XVII—Calculating Assignment and Meal Periods

The time for fixing the beginning of assignments or meal periods is to be calculated from the time fixed for the crew to begin work as a unit without regard to preparatory or individual duties.

ARTICLE XVIII—Point for Beginning and Ending Day

(a) Provisions of existing rules that there shall be a specified point for either going on or off duty, or both, are not affected by anything herein; but schedules having no such rules shall be modified to provide that yard crews shall have a designated point for going on duty and a designated point for going off duty.

(b) The point for going on and off duty will be governed by local conditions. In certain localities instructions will provide that engine crews will report at the hump, others report at yard office, others at engine houses or road tracks. It is not considered that the place to report will be confined to any definite number of feet, but the designation will indicate a definite and recognized location.

ARTICLE XIX—Lunch Time

(a) Yard crews will be allowed 20 minutes for lunch between 4½ and 6 hours after starting work without deduction in pay.

(b) Yard crews will not be required to work longer than 6 hours without being allowed 20 minutes for lunch, with no deduction in pay or time therefor.

(c) This article is effective April 10, 1919.

ARTICLE XX—Arbitrarities and Special Allowances

Where it has been the practice or rule to pay a yard engine crew or either member thereof arbitrarities or special allowances, or to allow another minimum day for extra or additional service performed during the course of or continuous after the end of the regularly assigned hours, such practice or rule is hereby eliminated, except where such allowances are for individual service not properly within the scope of yard service.

This article is effective April 10, 1919.

ARTICLE XXI—Hostlers and Hostler Helpers

	Rates of Pay	Per day
Inside Hostlers .....		\$4.16
Outside Hostlers .....		4.80
Helpers .....		3.60

The term "helper" applies to employees when used to assist outside hostlers.

Articles XIII and XIV of the yard rules shall apply to hostlers and hostler helpers.

ARTICLE XXII—Rules for Application of This Order

(a) Rules for overtime and working conditions which are in conflict with any of the provisions of this order, but no others, shall be changed to conform to the provisions hereof.

(b) Rates of pay in road, yard, or hosting service, which are not affected by Article IX, and which are higher than herein provided, shall not be reduced.

(c) Questions and answers on interpretations of certain articles of this order are listed below:

ARTICLE III

Question 1—Under certain conditions, crews operate round trip service in the morning and again late in the evening. Will it be permissible to pay for each of these services on the basis of a day subject to the rule, or will it be necessary to apply the rule regardless of whether the service is paid two days or more?

Answer—Pending the report and findings of board herein provided for, service is to be operated in accordance with present practice.

Question 2—Will it be permissible for the management to definitely assign crews on the basis of a minimum day in each direction?

Answer—Yes (in accordance with decisions of Commission of Eight and Arbitration Boards).

Question 3—May railroads which have a common overtime basis applicable to passenger service, as described in Sections (a) and (b) adopt Sections (a) and (b)?

Answer—Sections (a) and (b) of Article III apply to all passenger service.

ARTICLE XXIII

Question 1—A number of articles will unquestionably be subject to consideration by the board herein provided for. Pending conclusions by the Board and the final order by the director general, shall the existing bases be maintained or shall the bases provided for in this order be applied?

Answer—The bases provided for in this order shall be applied in the interim, except where such application causes a reduction in compensation, in which case, existing schedule rules and practices shall govern.

Question 2—In addition to the provisions of this order which are to be considered by a board, this article also provides for their consideration of "schedule rules and practices." What shall be the status of such schedule rules and practices during the interim?

Answer—They are to be applied in accordance with schedule agreements.

ARTICLE XXIII—Reclassification of Service. Arbitrarities and Special Allowances

The director general is advised that the Board of Railroad Wages and Working Conditions feels that punitive rates for overtime for employees in passenger and freight road service should be studied in connection with and including the modification of certain rules and numerous arbitrarities and special allowances which are intricate and important, and that it recommends the reference of this subject to a board made up of transportation wage schedule experts.

In order to dispose of this question as promptly as possible and to avoid the delay that must accompany the selecting and organizing of a new board specially equipped to deal with questions growing out of transportation wage schedules, the matter is hereby referred to Railway Board of Adjustment No. 1, which board shall begin at once the study of the practicability and the propriety of applying punitive overtime to road service at this time and of the further question of what abrogations or modifications of existing rules and practices which are affected thereby should be made in the event of the application of punitive overtime to road service, and shall at the earliest practicable date report its recommendations to the director general.

Following its report on the above subjects, the board shall also report as promptly as possible its recommendation upon the matters referred to it in Article VIII of this order.

ARTICLE XXIV—Interpretation of This Order

The rates of pay and rules herein established shall be incorporated into existing agreements and into agreements which may be reached in the future, on the several railroads; and should differences arise between the management and the employees of any of the railroads as to such incorporation, intent or application of this order, such questions of difference, when properly presented, shall be referred as

hereinafter provided to the director of the Division of Labor, who will transmit them to the proper board for decision or recommendation, subject always to review by the director general.

Where differences arise, a concrete joint signed statement shall be prepared in triplicate, setting forth first, the article of this order involved; second, facts; third, the position of the employees; and fourth, the position of the management thereon. Where supporting documentary evidence is used it shall be attached in the form of exhibits. Such presentations shall be transmitted to the director of the Division of Labor in the manner provided for the submission of appeals to boards of adjustment.

Order for Trainmen

Supplement No. 16 to General Order No. 27 provides:

Effective January 1, 1919, except as otherwise provided herein, as to employees herein named, the following rates of pay and rules for overtime and working conditions upon railroads in federal operation are hereby ordered:

PASSENGER SERVICE

ARTICLE I—Rates of Pay

(a) Rates for trainmen on trains propelled by steam or other motive power except as provided in Section (b).

Class	Per mile	Per day	Per month
Conductors .....	4.00c.	\$6.00	\$180.00
Asst. Conductors or Ticket Collectors .....	3.20c.	4.80	144.00
Baggagemen—Operating Dynamo .....	3.00c.	4.50	135.00
"Baggagemen Handling Express .....	3.00c.	4.50	135.00
Baggagemen .....	2.77c.	4.16	124.80
Flagmen and Brakemen .....	2.66c.	4.00	120.00

\*Rates specified for "Baggagemen handling express" apply to baggagemen in the employ of railroads who shall be paid exclusively by the railroads.

(b) The above rates apply on all roads except exclusively suburban roads doing passenger business only, upon which the following rates shall apply:

Class	Per mile	Per day	Per month
Conductors .....	3.00c.	\$4.50	\$135.00
Ticket Collectors .....	2.77c.	4.16	124.80
Guards performing duties of Brakemen or Flagmen .....	2.45c.	3.68	110.40

ARTICLE II—Basic Day

One hundred and fifty (150) miles or less (straight-away or turn-around) shall constitute a day's work. Miles in excess of 150 will be paid for at the mileage rates provided.

A passenger day begins at the time of reporting for duty for the initial trip. Daily rates obtain until the miles made at the mileage rates exceed the daily minimum.

ARTICLE III—Overtime

(a) Trainmen on short turn-around passenger runs, no single trip of which exceeds 80 miles, including suburban and branch line service, shall be paid overtime for all time actually on duty, or held for duty, in excess of eight hours (computed on each run from the time required to report for duty to the end of that run) within ten consecutive hours; and also for all time in excess of ten consecutive hours computed continuously from the time first required to report to the final release at the end of the last run. Time shall be counted as continuous service in all cases where the interval of release from duty at any point does not exceed one hour. This rule applies regardless of mileage made.

For calculating overtime under this rule, the management may designate the initial trip.

(b) Trainmen on other passenger runs shall be paid overtime on a speed basis of 20 miles per hour computed continuously from the time required to report for duty until released at the end of last run. Overtime shall be computed on the basis of actual overtime worked or held for duty, except that when the minimum day is paid for the service performed overtime shall not accrue until the expiration of seven (7) hours and thirty (30) minutes from time of first reporting for duty.

Where a more favorable overtime rule exists, such rule may be retained, in which event this section will not apply.

Where the provisions of this section for continuous time on turn-around runs of over 80 miles one way, change ex-

isting overtime rules, the effective date will be April 10, 1919; otherwise January 1, 1919.

(c) Overtime in all passenger service shall be paid for on the minute basis at a rate per hour of not less than one-eighth of the daily rate herein provided.

ARTICLE IV—Guarantees

(a) Regularly assigned passenger trainmen who are ready for service the entire month and who do not lay off of their own accord, shall receive the monthly guarantee provided for in Section a of Article I, exclusive of overtime, except that former higher monthly guarantees shall be preserved.

Extra service may be required sufficient to make up these guarantees, and may be made between regular trips; may be made on lay-off days; or may be made before or after completion of the trip. If extra service is made between trips, which go to make up a day's assignment, such extra service will be paid for on the basis of miles or hours, whichever is the greater, with a minimum of one hour. Extra service before or after the completion of a day's work will pay not less than the minimum day.

The basis of pay for extra service applies only in making up the guarantees. After guarantees are absorbed, schedule provisions for extra service apply.

(b) When a regularly assigned passenger man lays off of his own accord or is held out of service the extra man will receive the same compensation the regular man would have received, and the amount paid the extra man or men will be deducted from the amount the regular man would have received had he remained in service, the sum of the payments to the man, or men, who may be used on the run equaling the monthly guarantee.

(c) Reductions in crews or increases in mileage in passenger service from assignments in effect January 1, 1919, shall not be made for the purpose of off-setting these increases in wages, but nothing in this order is understood to prevent adjustment of runs in short turn-around and suburban service that are paid under minimum rules, for the purpose of avoiding payment of excess mileage, or overtime that would accrue under these rules without reducing the number of crews. Such runs may be rearranged, extended or have mileage changed by addition of new train service; separate pools or assignments may be segregated or divided; provided that crews are not taken off or reduced in number. Added mileage up to mileage equaling the mileage rate divided into the guaranteed daily rate does not change, take from or add to the minimum day's pay, and this added mileage is not to be construed as "increase in mileage" within the meaning of this article.

(d) For the purpose of avoiding payment of excess overtime on turn-around runs in passenger service when any part or leg thereof is over 80 miles, the railroads will be privileged to rearrange runs, combine pools or sets of runs, and may establish interdivisional runs excepting when this may be prohibited by provisions of existing agreements, such runs to be paid for in accordance with the mileage schedules of this order, but in no case less than the combination of trip rates in effect at the date of this order.

FREIGHT SERVICE

ARTICLE V—Rates of Pay

(a) For service paid the through freight rates under schedules in effect prior to January 1, 1919, the rates shall be as follows:

Class	Per mile	Per day
Conductors	5.40c.	\$5.40
Flagmen and Brakemen	4.08c.	4.08

(b) For service paid the local or way freight rates under schedules in effect prior to January 1, 1919, the rates shall be as follows:

Class	Per mile	Per day
Conductors	5.92c.	\$5.92
Flagmen and Brakemen	4.48c.	4.48

MILK, MIXED AND MISCELLANEOUS TRAIN SERVICE

(c) The same increases shall apply to milk, mixed and miscellaneous train service as are applied to the service in which they are now classified. Where there is a separate

rate for milk, mixed or miscellaneous classes of service, it shall be increased in the same amount, compared with the rates in effect December 31, 1917, as the through freight or passenger rate, according to the overtime basis on which it is calculated.

ARTICLE VI—Basic Day and Overtime

(a) In all road service, except passenger service and where under mileage schedules a more favorable condition exists, 100 miles or less, eight hours or less (straight-away or turn-around), shall constitute a day's work. Miles in excess of miles required for a minimum day will be paid for at the mileage rates provided.

(b) Where there is no existing agreement regarding overtime provisions more favorable to the employees, on runs of 100 miles or less overtime will begin at the expiration of eight hours; on runs of over 100 miles overtime will begin when the time on duty exceeds the miles run divided by 12½. Overtime shall be paid for on the minute basis, at not less per hour than one-eighth of the daily rate.

ARTICLE VII—Guarantees

(a) Regularly assigned way freight, wreck, work and construction trainmen who are ready for service the entire month and who do not lay off of their own accord, will be guaranteed not less than 100 miles or eight hours for each calendar working day, exclusive of overtime (this to include legal holidays). If, through act of Providence, it is impossible to perform regular service, guarantee does not apply.

(b) Crews may also be used in any other service to complete guarantee when for any reason regular assignment is discontinued, but such service shall be paid for at schedule rates unless earnings from such rates would be less per day than would have been earned in regular assignment.

ARTICLES VIII, IX and X—(Same as in Supplement 15)

ARTICLE XI—Beginning and Ending of Day

(a) In all classes of service trainmen's time will commence at the time they are required to report for duty, and shall continue until the time they are relieved from duty.

(b) Trainmen in pool or irregular freight service may be called to make short trips and turn-arounds with the understanding that one or more turn-around trips may be started out of the same terminal and paid actual miles with a minimum of 100 miles for a day, provided, (1) that the mileage of all the trips does not exceed 100 miles, (2) that the distance run from the terminal to the turning point does not exceed 25 miles, and (3) that trainmen shall not be required to begin work on a succeeding trip out of the initial terminal after having been on duty eight consecutive hours, except as a new day subject to the first in-first out rule or practice.

YARD SERVICE

ARTICLE XII—Rates of Pay

Class	Per day	
	Denver Differential Territory	Other Territories
Foremen	\$5.44	\$5.33
Helpers	5.11	5.00
Switchtenders	4.00	4.00

Where rules of existing schedule agreements provide that switchtenders are paid helpers' rates, such rules will be continued.

ARTICLES XIII to XXIII—(Contain Provisions Similar to Supplement 15)

INTERPRETATIONS

(c) Questions and answers on interpretations of certain articles of this order are listed below:

ARTICLE 1

Question 1—Do train auditors or ticket collectors who are not transportation employees and who have no status as such, come within the provisions for ticket collectors?

Answer—No.

Question 2—Shall baggagemen, flagmen or brakemen who assist conductors in collecting tickets and fares receive the rate provided for assistant conductors or ticket collectors?

Answer—Only where designated and classified as assistant conductors or ticket collectors.

Question 3—In view of different rates being provided for baggagemen handling express, and baggagemen not performing such work, how will

baggage handling express on certain days and not handling it on other days be compensated?

Answer—On any day where express is handled the combination rate will apply for that day; in such cases minimum monthly guarantee shall apply.

Question 4—Does the provision for higher rates for handling express cancel all existing understandings between the managements and the men in regard to bonuses or special compensation that they have heretofore received from either their road or the express company for handling express?

Answer—Yes; provided the new rates do not reduce previous combined earnings.

ARTICLE III

Question 1—Under certain conditions, crews operate round trip service in the morning and again late in the evening. Will it be permissible to pay for each of these services on the basis of a day subject to the rule, or will it be necessary to apply the rule regardless of whether the service is paid two days or more?

Answer—Pending the report and findings of board herein provided for, service is to be operated in accordance with present practice.

Question 2—Will it be permissible for the managements to definitely assign crews on the basis of a minimum day in each direction?

Answer—Yes (in accordance with decisions of Commission of Eight and Arbitration Boards).

Question 3—May railroads which have a common overtime basis applicable to passenger service, as described in Sections (a) and (b), adopt Sections (a) and (b)?

Answer—Sections (a) and (b) of Article III apply to all passenger service.

Increases for Express and Sleeping and Dining Car Employees

Supplement No. 17 to General Order No. 27 was issued on April 14, covering employees in sleeping and parlor car service of the railroads in Pullman Car Lines and Supplement No. 18 to General Order No. 27, covering employees in dining car departments.

The order covering employees in sleeping and parlor car service provides increases of \$25 per month above the basic minima in effect as of January 1, 1918. These basic minima are practically the rates then in effect. There were some variations in monthly rates at that time and the basic minima are established for the purpose of producing uniformity.

Approximately 50 per cent of these advances were given by General Order No. 27, issued May 25, 1918. Approximately 12,000 employees are affected by this order.

The order covering employees in dining car departments also provides approximate increase of \$25 per month above basic minima as of January 1, 1919. In this case also approximately 66 2/3 per cent of the increases were absorbed by General Order No. 27. Approximately 10,000 employees are affected by this order.

Both orders are effective May 1.

Supplement No. 19 to General Order No. 27 affecting employees of the American Railway Express Company, which is under federal control, was also issued on April 14.

The order provides an increase of \$25 per month above the rates in effect January 1, 1918, or an average of about \$15 per month per man over the rates now in effect. About 69,000 employees are covered by this order.

For sleeping and parlor car conductors basic minimum rates for a monthly mileage of 11,000 miles or less are established, ranging from \$115 to \$145 a month, according to length of service. Mileage in excess of 11,000 will be paid for at the rate of 1.1 cents per mile. For sleeping, parlor, buffet and club car porters, not required to perform kitchen service, a minimum rate of \$60 is established for 11,000 miles or less, excess mileage to be paid for at the rate of .55 cents per mile. Bonus payments in addition to established wages will be discontinued.

For dining car, buffet, cafe and club car employees minimum monthly rates are established ranging from \$115 to \$145 for stewards, \$115 for assistant stewards, \$100 to \$130 for chefs or first cooks, \$80 to \$95 for second cooks, \$55 to \$70 for third and fourth cooks, \$65 for waiters in charge without stewards and \$55 for waiters, with minimum rates for excess mileage. Another scale of rates is prescribed for restaurant employees, boarding car employees and camp employees.

In addition to the above, schedules are prescribed for both sleeping, dining and express employees for terminal time.

Accident Bulletin No. 68

THE INTERSTATE COMMERCE COMMISSION has issued quarterly accident bulletin No. 68, showing the number of railroad accidents occurring in the United States during the months of April, May and June, 1918. In train accidents 79 passengers, 110 employees, and 26 other persons were killed; and 1,318 passengers, 937 employees, and 134 other persons were injured; a total of 215 persons killed and 2,389 injured. Of the passengers killed 65 were victims of collisions and 14 of derailments.\* Other totals for the quarter are shown in the following comparisons with the quarter ending with June, 1917:

Passengers killed in train accidents.....	79	1917	1
Employees killed in train accidents.....	110	85	
Total persons killed in train accidents.....	215	128	
Total persons killed, all causes.....	2,043	2,264	
Total persons injured, all causes.....	15,535	15,698	
<i>Non-train accidents—</i>			
Industrial employees killed.....	103	100	
Industrial employees injured.....	27,722	31,147	
Other persons killed.....	24	26	
Other persons injured.....	462	597	

Of the 15,535 persons injured in this quarter the bulletin says that 165 have been reported by the railroads as dying more than 24 hours after the time the injuries were received.

The total number of collisions in the quarter was 2,216 and of derailments 3,296. These and other data are shown in tables No. 10 and No. 11, from which we take the following comparisons:

SUMMARY OF TRAIN ACCIDENTS, THREE MONTHS, WITH RATIOS TO MILEAGE

	1918	1917
Collisions, number.....	2,216	2,084
Number per million locomotive-miles.....	4.78	4.63
Damage to railway property.....	\$1,450,980	\$1,794,240
Deraillments, number.....	3,296	3,070
Number per million locomotive-miles.....	7.11	6.81
Damage to railway property.....	\$3,349,790	\$2,730,130
Locomotive boiler accidents, number.....	66	71
Number per million locomotive-miles.....	0.14	0.16
Damage to railway property.....	\$28,860	\$79,240
Other locomotive accidents, number.....	74	71
Number per million locomotive-miles.....	0.16	0.16
Damage to railway property.....	\$30,110	\$23,190
Miscellaneous train accidents, number.....	542	341
Number per million locomotive-miles.....	1.17	0.75
Damage to railway property.....	\$210,620	\$250,750
Total number of accidents.....	6,194	5,637
Number per million locomotive-miles.....	13.36	12.51
Damage to railway property.....	\$5,070,560	\$4,877,550
Number of locomotive-miles.....	463,693,866	450,561,714

Of the 2,216 collisions, 236 were rear and 94 were butting; and of the 119 non-trespassers killed in collisions, 99 are charged against these 330 collisions; but of the total damage ascribed in the report to collisions—\$1,450,980—more than 62 per cent is charged to the miscellaneous classes not included under the head of rear or butting.

From table 13, classifying accidents to shopmen, trackmen, etc., not connected with the movement of trains, we make the following extracts:

NON-TRAIN ACCIDENTS ON THE RAILROADS OF THE UNITED STATES: QUARTER ENDING JUNE 30, 1918

	Killed	Injured
1—Class 1 roads, industrial accidents.....	97	26,808
2—Shopmen (included in Item 1).....	32	16,188
3—Trackmen (included in Item 1).....	25	4,749
4—Class 1 roads, other non-train accidents.....	18	421
5—Class 1 roads, total.....	115	27,890
6—Roads of Class 2, Class 3 and Switching.....	12	895
7—Total non-train accidents.....	127	28,184
8—Millions of man-hours on Class 1 roads, shopmen.....		390.32
9—Millions of man-hours on Class 1 roads, trackmen.....		261.57
10—Casualties per million man-hours, shopmen.....		41.56
11—Casualties per million man-hours, trackmen.....		18.25

\*Among the notable collisions occurring in this quarter were those at Schoadak Landing, N. Y., May 13; Rittman, O., June 4; Burlington, Vt., June 5, and Ivanhoe, Ind., on June 22. In the last named collision 59 passengers were killed. Among the derailments reported is Columbia, S. C., May 10, in which nine passengers were killed. This derailment occurred on the tracks of the military reservation at Camp Jackson, and facts concerning the cause are now published for the first time. The inspector of the Interstate Commerce Commission finds that the derailment was due to a weak rail joint. The train was moving at only about ten miles an hour, but a wooden coach fell off a trestle and landed bottom side up. The track appears to have been insecure because of a lack of suitable angle bars, necessitating the use of spikes to hold the rails in line; and some of the spikes had worked loose. The collision at Rittman was caused by an operator making an error in copying a train order. This operator, about 3 a. m., received an order over the telephone giving an extra train the right from Silver Creek to Rittman; "he copied the order about ten times for practice, and in doing so erroneously inserted Sterling in place of Rittman." This operator was sixteen years old and had been employed about two months and a half; he had no book of rules, and had had very little instruction as to his duties.

The percentages shown in items 10 and 11 include both the killed and the injured, and the shopmen appear to have suffered much worse than did the trackmen; but taking the killed alone, the numbers per million man hours are: shopmen .08198; trackmen, .09557. In the bulletin for the preceding quarter, bulletin No. 67, the number of shopmen killed on class 1 roads is given as 62, or nearly twice as many as in bulletin 68. Trackmen killed by being struck or run over by trains (the number of which is not shown in this bulletin) would largely increase the ratio of killed in this class.

Sixteen pages of the present bulletin are filled with reports of the investigations of accidents made by the Bureau of Safety.

## Price Controversy Up to President

PRESIDENT WILSON has been called on to settle the controversy between the Railroad Administration and the Industrial Board of the Department of Commerce over the steel prices, which involves the entire price stabilizing policy of the board and which came to a head at a conference on April 10 when Director General Hines announced his final decision not to accept the steel and iron prices, proposed by the board, as being reasonable either for the present or for the future. Following the conference, which was attended by Mr. Hines and his advisers on purchasing matters, and George N. Peek, chairman of the Industrial Board, Mr. Peek declared that all the facts would be laid before the President by cable and announced his intention to maintain his contentions unless over-ruled by the President, although he stated that this would put a temporary check on the work of the board. Mr. Hines explained his position in a statement, saying in part:

"It has been perfectly clear to me throughout, and I think it is now generally understood, that no power was conferred on the Industrial Board to impose any prices upon the Railroad Administration, but that it retained the power and also was under a duty to exercise its own judgment in respect to this important matter. Throughout the discussion in the Industrial Board itself, Mr. Powell, the representative of the Railroad Administration, indicated that the final approval of any prices so far as the Railroad Administration was concerned rested with the director general himself. Mr. Powell objected that not only the prices on steel rail but the prices generally were unreasonably high, and before the committee announced its action he positively stated that the Railroad Administration would not agree to buy at the proposed prices."

Mr. Hines then recounted the various conferences which had been held on the subject. After the Industrial Board had announced the prices he took the matter under consideration with his advisers in purchasing matters, John Skelton Williams, R. S. Lovett and Henry Walters, members of the Advisory Committee on Purchases; T. C. Powell, director of the Division of Capital Expenditures, and Henry B. Spencer, director of the Division of Purchases, who, before taking action, consulted Chairman Culver of the Federal Trade Commission as to questions of cost of steel production, and expressed the unanimous opinion that the prices were too high.

Subsequently, the suggestion was made that a further conference take place between representatives of the Railroad Administration and the Industrial Board, and he arranged for Messrs. Lovett, Walters and Spencer to rediscuss the entire subject with the Industrial Board. He requested the Interstate Commerce Commission to delegate one of its members to attend this conference and Commissioner McChord was so designated. The result of prolonged discussion was

that all his advisers, including Mr. McChord, were confirmed in the opinion that the prices were too high. Afterwards, Mr. Peek raised the question whether it would be worth while to get the views of the representatives of the steel industries, and Messrs. Lovett, Walters and Spencer met with Mr. Peek and such representatives at New York on April 9. As a result of this discussion the railroad representatives were again confirmed in the opinion that the prices were too high.

"In view of these considerations," Mr. Hines said, "I cannot do otherwise than to announce definitely that I must decline to endorse these prices as being reasonable either for the present or for the future. To the extent that the Railroad Administration finds it necessary to make purchases it will continue to make them on the best terms obtainable by fair and just methods, with full recognition of the principle that a government agency with large purchasing power must be particularly careful not even to attempt action which could be regarded as oppressive.

"The object of the Railroad Administration throughout has been to obtain a fair and reasonable price level. It has never contemplated that it should get a lower price level than the general public. If the Industrial Board can assist in bringing about levels of prices at which the Railroad Administration will feel justified in buying its co-operation will be welcomed.

"In the newspaper discussions of this matter the suggestion has at times occurred that the principal thing is to establish some price which the government will endorse to the end that the public will begin buying at that price, and that the mere establishment of a price for this purpose is more important than the intrinsic reasonableness of the price itself. I cannot agree with this principle. I am keenly alive to the great desirability of stimulating business in every reasonable way, but I believe in the long run that the endorsement by a government purchasing agency of an excessive price level would be harmful to the public interest and would not bring about confidence, and that the end sought to be obtained will come only by reaching a price level which the public itself shall consider to be reasonable.

"I believe one of the greatest problems that confronts this country is that of getting prices back to a reasonable level and I believe progress in that direction will be seriously retarded by the approval by a governmental purchasing agency of prices which it deems excessive."

### Statement by Mr. Peek

After conference with Secretary Redfield of the Department of Commerce, Mr. Peek issued a statement charging in effect that the director general's reasons for refusing to accept the prices were based on opinion only and charging him with a purpose to exert a power of monopolistic buying.

"The public must be informed of the magnitude of the solemn responsibilities assumed by the director general in this important decision," he said. "The Industrial Board was formed to carry out a perfectly definite industrial policy to which the government, represented by the President, the cabinet and the director general, was fully committed. There is no ambiguity either in the record or in the minds of the people as to just what that policy is—it is to avoid industrial stagnation pending a return from war to peace prices, to start the wheels of industry, give employment to labor, to reduce the cost of living, to insure prosperity. Neither is there any ambiguity as to the methods to be employed. A scientific study of costs of production is to be made. Upon these studies prices are to be determined which shall be as low as cost of production will permit, which shall squeeze out all speculative or opportunist profit, and upon which industry can commence operations without fear of any considerable drop in the market. To the complete success of this plan, however, there was one absolute essential, that the govern-

mental departments should express the confidence of the government in the execution of this most important policy. Especially is this true in respect of steel rails, in the buying of which the government, through its control of the railroads, consumes a very large percentage of the output. At this late date this important essential to its success has been denied by the director general and by that denial the labor of the Industrial Board is set at naught and the government is exhibited as setting up an industrial policy with one hand and destroying it with the other."

Mr. Peek conceded the technical prerogative of the Railroad Administration to refuse to accept the prices, but said the board feels that the Railroad Administration is under a powerful obligation either to have the governmental policy abandoned by the same source that announced it and assume full responsibility for the inevitable effect of such a step, or to support the policy, or to demonstrate that the board has failed in its function and that the prices announced are not fair. He declared that, contrary to Mr. Hines' statement, the representative of the Railroad Administration on the board dissented only on the price of rails and that the figures representing costs of production had not been contested.

"In fairness to the Railroad Administration, it must be admitted," Mr. Peek said, "that by using the full effect of its power of monopolistic buying it might secure a price on rails somewhat lower than that announced by the Industrial Board. The figures stand to prove, however, beyond all question, that such a price would be lower than the production costs of any but one or two of the most highly organized, powerful and lowest cost producers. For example, the pre-war price of rails was \$30. The increase over pre-war costs of production for the United States Steel Corporation in direct labor alone, excluding labor in transportation, is reported by that corporation to be \$19.48 per ton. The price approved by the Industrial Board was \$47, or \$2.48 less than the increase of cost of labor alone would account for."

The inevitable result of the use of the buying power of the Railroad Administration to reduce any price, Mr. Peek said, would be either to increase prices to the public, throw all railroad business into a monopoly of powerful producers, or reduce wages, but these results are much less important than the frustration of the industrial policy of the government and the forced return to the period of commercial and industrial stagnation, which has continued since the signing of the armistice and which threatens to continue or grow worse in the absence of a strong governmental policy alleviating it. It is not the opinion of the board that governmental organization is such that important policies can be so lightly frustrated.

The facts were cabled to the President by both Mr. Hines and by Secretary Redfield. The President had not up to that time replied to any of the messages sent him in connection with the controversy.

#### Mr. Hines Replies to Mr. Peek

In reply to Mr. Peek's statement Mr. Hines said in part:

"The controlling point is that the director general has the personal responsibility of deciding whether he is justified in approving those prices or not, and being unable to escape the belief that the prices are excessive, he has not approved them.

"Mr. Peek says that the government has set up an industrial policy with one hand and torn it down with the other. The fact is, however, that the industrial policy which has been interfered with is one which was not set up by the government, but appears through some misconception to have been initiated by the Industrial Board itself. The policy authorized by the government was the policy of establishing a committee which would endeavor to bring government purchasing agencies, including the Railroad Administration, and producers of certain commodities together, by voluntary action, on reduced prices at which the government purchasing

agencies including the Railroad Administration would be justified in buying freely. Mr. Peek entered upon a very different policy of fixing prices with a virtual insistence that the Railroad Administration must buy at those prices regardless of its judgment. His committee even proposed the prices as being prices below which the general public ought not to expect to buy during the rest of this calendar year. His real cause of chagrin at the present time is that the policy thus set up without government authority is not supported by the Railroad Administration as to steel prices when the Railroad Administration is convinced that those prices are excessive.

"Mr. Peek also professes great alarm at the consequences that will result from the steel interests of the country being subjected to the monopolistic buying power of the Railroad Administration. If I am not mistaken, one of the gravest causes of concern to the people of this country for many years, has been the persistent suspicion that the country was subjected to the menace of a monopolistic selling power on the part of the steel interests and therefore I do not believe the country will share Mr. Peek's alarm that the Railroad Administration's purchasing power of steel will be prejudicial to the public interest. I believe the same considerations will keep the public from being alarmed by Mr. Peek's suggestion that all railroad purchases of steel will be thrown into a 'monopoly of powerful producers.' I have already made it clear that the Railroad Administration will make purchases on the best terms obtainable by fair and just methods, with full recognition of the principle that a government agency with large purchasing power must be particularly careful not even to attempt action which would be regarded as oppressive. The carrying out of this policy will not justify 'reductions in wages' as Mr. Peek indicates, nor 'increasing prices to the public.' On the contrary the public will greatly benefit by the Railroad Administration's refusal to approve these unreasonably high prices.

"It is important to emphasize that the interest of the Railroad Administration is not merely in the price of steel rail but in steel prices generally. This is true because the railroads purchase three or four times as much tonnage of other steel products as they purchase of steel rail. But further than this the Railroad Administration is vitally interested in prices on steel articles generally which will encourage a revival of industry. In the conferences Messrs. Lovett and Walters have constantly stressed the interest of the Railroad Administration in steel prices generally and emphasized the unreasonable differentials which have resulted in the prices of many steel articles of great importance both to the railroads and general industry being placed far too high in comparison with the price of billets proposed by the steel interests and adopted by the Industrial Board."

Secretary Redfield's cable asked the President to indicate whether the board should discontinue its efforts at once or whether it should continue until the President returns and a policy can be formulated. It was followed by a letter accompanied by the various documents. Fuel Administrator Garfield had previously cabled the President, supporting Mr. Peek's attitude. The cabinet officers generally, except Mr. Redfield, are supporting Mr. Hines.

The seventh annual meeting of the Chamber of Commerce of the United States is to be held at St. Louis, April 28 to May 1, and representatives of business from 48 states will express their views on policies and principles, and will advance detailed programs as to carrying them out. The subjects for discussion include the disposition and operation of the railroads and merchant marine; proposed revision of anti-trust legislation; the future of public utilities; foreign relations and foreign trade; agriculture; industrial production; waterways and highways; industrial relations; international commercial arbitration; finance and Victory Loan. Walter D. Hines is one of the speakers.

South Half of the Roundhouse with Office on the Left

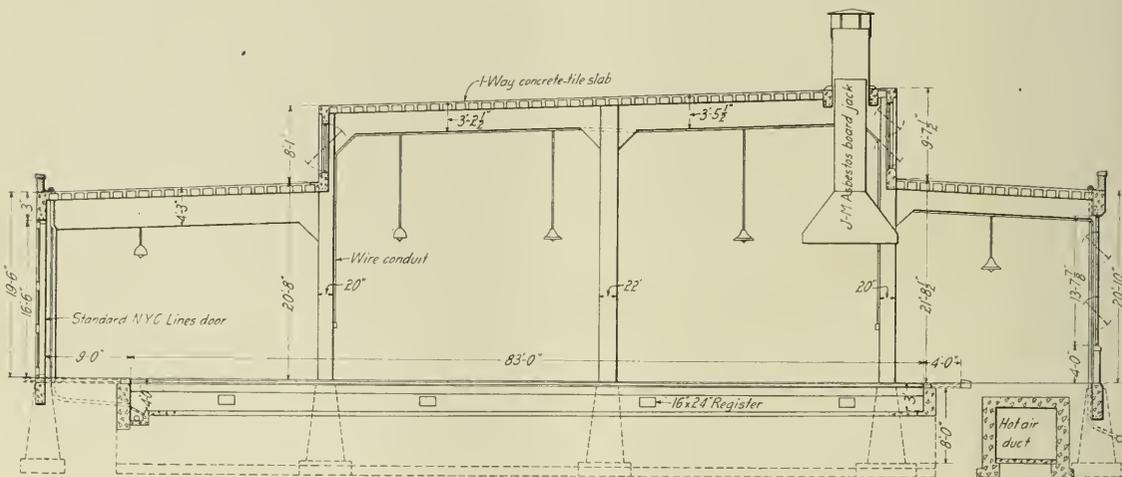

# A Complete Modern Engine Terminal Installation

Reinforced Concrete Roundhouse for the Toledo & Ohio Central  
Is an Example of Modern Construction

A NEW 20-STALL reinforced concrete roundhouse recently completed for the Toledo & Ohio Central at Columbus is one of a number of engine terminal projects undertaken since the advent of government operation of the railroads, and represents an interesting tendency of the present day in engine house design. It replaces a small engine terminal that has proven inadequate both as to the capacity

of the house and the area and arrangement of the approach

ceed without any interference with the existing engine terminal, yet providing for an arrangement of the approach tracks in such a way as to require but little change in the routing of engines to and from the terminal. In fact the new routing is similar to the old one, and while the length of the approach is somewhat greater, this increased distance is taken up largely in providing greater track capacity. The old terminal is located at the east end of the McKinley avenue

Longitudinal Section of a Stall

yard and auxiliary facilities. Three factors contributed to the successful completion of the project in spite of wartime difficulties—the completion of plans for the terminal in advance of the award of the contract, the entire avoidance of any interference between the construction of the new terminal and the operation of the old one, and the effectiveness of the contractor's organization.

The site of the terminal was particularly fortunate since adequate space was found available in close proximity to the freight terminal yard which permitted construction to pro-

ceed without any interference with the existing engine terminal, yet providing for an arrangement of the approach tracks in such a way as to require but little change in the routing of engines to and from the terminal. In fact the new routing is similar to the old one, and while the length of the approach is somewhat greater, this increased distance is taken up largely in providing greater track capacity. The old terminal is located at the east end of the McKinley avenue

freight yard while the new one is at the west end, at the corner of McKinley and Grand View avenues. The entire plant consists of a roundhouse, a shop building and power plant, a coal, oil and locker building, two cinder conveyors, a 70,000-gal. water tank and a coaling station.

The lead to the terminal consists of four tracks, two in-bound and two outbound, with the latter on the outside. These four tracks are independent all the way from the turnout to the table, it being the idea to provide a progressive movement in one direction on each track, with the engines receiv-

North Half of the Roundhouse

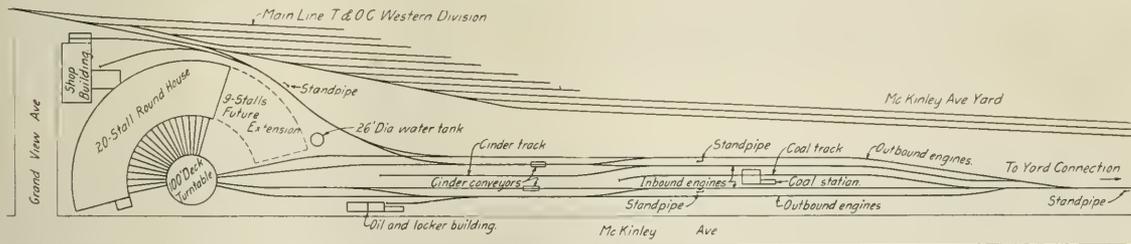

ing coal and water and dumping cinders while on the inbound movement and water only on the outbound movement. However, crossovers are provided between the inbound and outbound tracks of each pair so that engines may come in for coal and water or even to dump cinders and back out over the crossover onto the outbound track with a minimum of interference with the regular operation of the terminal. A track connecting with the north inbound and outbound tracks near the roundhouse affords a direct connection with the west end of the yard and serves also as a lead to the coal dock at the power plant.

The coaling station is a Roberts & Schaefer plant of 500-tons capacity with a complete sand drying plant in addition. The coal track for the station is located between the two inbound tracks and passes over a track hopper underneath the superstructure of the station. The cinder plant consists of two Robertson cinder conveyors, dumping into cars on a track between the two inbound leads. Provision has been made for installing two additional conveyors in case they are found necessary.

Water is delivered to the engines by four stand pipes. The

supported on a conical roller center with an extra-heavy electric tractor furnished by George P. Nichols & Bro., Chicago. As shown in the photograph the tractor is supplied with electric current from an overhead collector.

For the purpose of obtaining fire proof construction the roundhouse was built of reinforced concrete with brick curtain walls. As shown in the longitudinal section of the house, the framing consists of a subdivision of the house into four circumferential bays. The roof over the two interior bays is raised to about 9 ft. above the two outside bays to give a monitor construction, affording better illumination and ventilation through the use of the maximum amount of window area in the two sides of the monitor. The same treatment is used in the outer wall of the roundhouse in which all of the space between the columns from a height of four feet to the underside of the wall girder is used as window space. United steel sash are used for the outer wall windows as well as for the monitor windows, horizontal pivoted sections being introduced to afford ventilation. An interesting detail in connection with the outer wall is the arrangement of the brick work under the windows in three independent parts, sep-

Track Layout of the New Engine Terminal

water is stored in a 70,000-gal. redwood tank on a creosoted trestle frame. The new tank is supplied from the tank and treating plant located at the old terminal, but since the old tank is 10 ft. lower than the new one, the latter cannot be completely filled by gravity, so an automatic booster pump has been installed to supply the new tank. A further insurance against failure of supply is a direct connection with the city water supply.

#### Room for Future Extension

The roundhouse has been built for 20 stalls with provision for a future addition of 9 more. The stalls are 110 ft. deep with door posts 14 ft. center to center, while the width of the stalls at the rear is 25 ft. 11 in. The turntable is 100 ft. in diameter, designed for an equivalent of E-70 loading and

arated by vertical construction joints. In the event of an engine pushing out the rear of the house, the middle section of this wall would be carried away with little or no damage to the side portions.

An interesting adaptation of specialized reinforced concrete construction is the use of a one-way tile slab in the roof. The air spaces in these tiles are expected to affect a material reduction in the condensation from the underside of the roof in cold weather. The roof is covered with Barrett composition roofing.

In accordance with modern practice the roundhouse pits are of concrete 3 ft. 11 in. wide, by 3 ft. to 4 ft. deep and slope toward the door end where catch basins have been installed. Down spouts from the roof attached to the door posts drain into these catch basins which in turn empty into the

exterior drainage system consisting of a 12 in. sewer pipe leading to a settling basin in the yard. This was provided to remove sludge from the blowout water before allowing it to enter the sewers.

Stalls 17, 18 and 19 are intersected by a driver-removal pit, 7 ft. 6 in. wide by 6 ft. 10 in. deep, and stalls 18 and 19 by a truck wheel pit, 4 ft. wide by 4 ft. 9 in. deep. Each of these special pits is equipped with a 24-in. gage track for wheel trucks. An interesting detail has been worked out as shown in the drawing in connection with these special pits to facilitate the handling of the rail beams which carry the pit tracks over the special pits. The heavier of these girders weigh 690 lb. each, which is too great a load to be handled conveniently by hand. Accordingly T-bars have been provided to span across the pits as shown. The rail girder is pivoted on one side of the stall and the T-bar at the other side. When it is necessary to swing the girder out of the way, the T-bar is swung out across the pit and its upper surface serves as a support for the free end of the girder as it is swung across the pit. Rails are secured in place on the side walls of the pits by means of clip bolts fitted into slots imbedded in the concrete. The upper portions of the pit walls are broadened out to afford adequate space outside of the rails for the support of jacks.

**Carefully Planned Illumination**

Special attention was given to the lighting arrangement. Five lighting fixtures have been installed in the lines of columns between the stalls. As indicated on the longitudinal section of the house each fixture consists of a lamp socket attached to a section of pipe conduit and equipped with an enameled steel reflector. To light the passageways along the front and rear of the house every other lamp in the front row of lights is connected up in one circuit controlled by a master switch, while another switch controls the alternate lights in the outside row. The other four lamps in each row are controlled by local switches so that any stall may obtain additional light as needed. Supplementary to these lights there

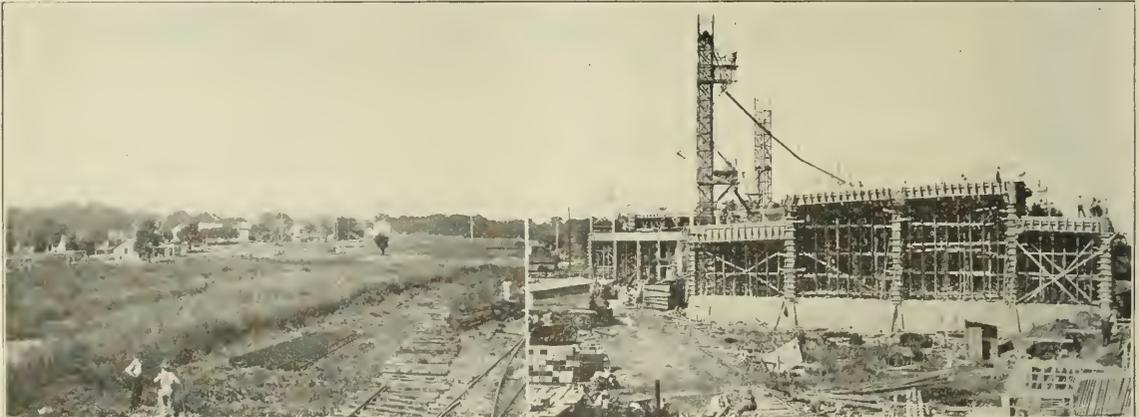

conducted from this heating plant through a system of conduits having a main duct leading along the rear of the house with branches between the stalls terminating in registers of 16 in. by 24 in. size in the engine pits, equipped with adjustable shutters.

The power house and shop building is a structure 60 ft. by 120 ft. connected to the roundhouse proper by a wing 40 ft. by 55 ft. It has a steel frame with brick curtain walls

Interior of the Roundhouse During Construction

and wooden roof construction following a standard design used by the contractor and for which he was able to supply the steel frame ready to erect. This building consists of a boiler room equipped with two 250-hp. Union Iron Works water tube boilers with Jones automatic stokers fed by hand. The coal is received from cars by dumping from a low trestle

Engine Terminal Site on June 28, 1918

Progress on the Roundhouse on September 15, 1918

are outlets on two posts between each pair of stalls for extension cord lamps. There is also a socket at the rear of every second stall for an electric welding circuit. Illumination of the engine terminal outside of the roundhouse has been provided by installing flood lights on the top of the coaling station.

**Hot Air Heating System**

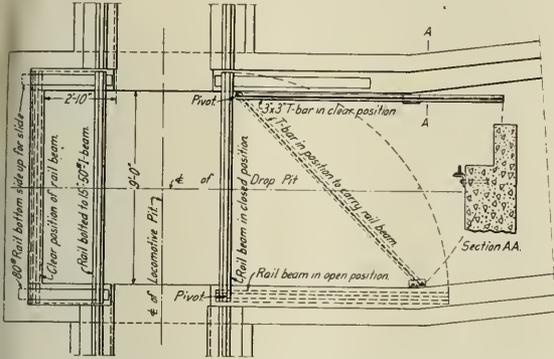

The roundhouse is heated by a hot air, forced draft system from a fan and heating coils in the power house. The air is

so that the hand work is limited to transferring the coal from the pit under the trestle to the stoker hoppers. Adjacent to the boiler room is an engine room containing a two-stage air compressor with a capacity of 1,250 cu. ft. of free air per min. to 110 lb. pressure. This air is used to supply the ash conveyors, sand plants and two miles of 1½-in. train charging line in the yard.

The heating plant consists of a Sturdevant fan blowing air through the coils, receiving exhaust steam from both the fan engine and the air compressor, although in cold weather

it will be necessary also to use live steam direct from the boilers. The fan and ducts are designed of adequate capacity to supply air to the nine additional stalls contemplated in the design of the engine terminal. The remaining space in the shop and power plant building is used as a machine shop, air brake room and store room, with a toilet for the roundhouse employees.

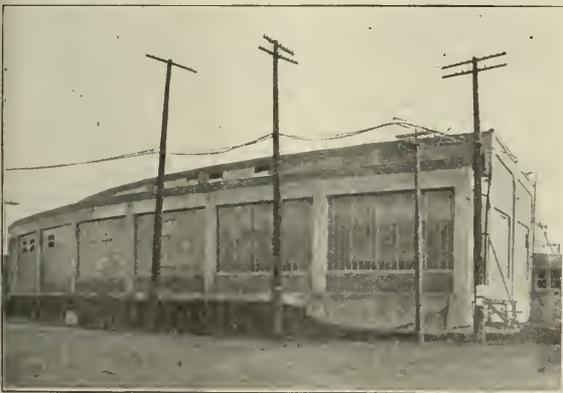

Another auxiliary facility of the terminal is an oil house and locker room for the enginemen. This consists of a building 76 ft. 4 in. long by 22 ft. wide, with a platform 40 ft. by 10 ft. 8 in. It is one-story high, with a basement,

Special Arrangement to Facilitate Handling of Rail Girders Over Drop Pits

and as it is located adjacent to McKinley avenue, and as the level of the engine terminal is considerably above that of the street, the structure is virtually two stories high on the street side.

One end of the first floor is used for a locker room for the enginemen, with a small space partitioned off for the engine dispatcher, while the other end is used for an oil room

Rear of the Roundhouse Showing the Large Expanse of Glass

and the basement underneath for oil storage tanks. Further tank space is provided under the platform, which is supported on concrete walls extending to the natural ground level. The oil is handled by a complete installation of Bowser pumps. The walls of this building are brick and the floors and roof are of reinforced concrete, except in the enginemen's room, where the floor is on cinder fill.

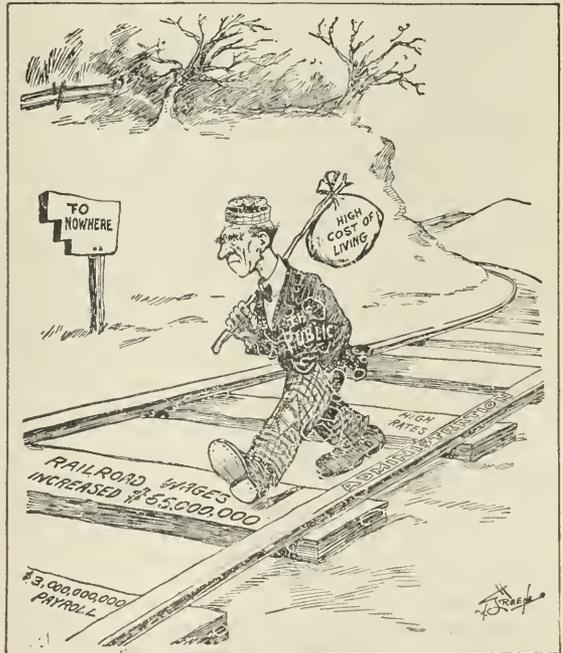

**Construction**

The level of the ground in the engine terminal is about 7 ft. above the natural ground surface of that of the adjoining

street and it was necessary to provide about 100,000 cu. yd. of filling material, about 50 per cent of which was granulated slag. Owing to this difference in elevation it was necessary to support the walls and columns of the roundhouse considerably above the original ground surface. To do this with any economy it was found desirable to support the walls on reinforced concrete girders spanning between pedestals. In the case of the roundhouse pits, however, the full section of the wall was extended to the foundation level but the floors of the pit were placed on back filled material. The excavation for the turntable pit was made with teams and slips, but that for the roundhouse pedestal foundation was done by hand.

Cement was delivered in cars but sand was brought to the work by motor trucks from the washing plant near by. Water was pumped from the Scioto river about 500 ft. away. The concrete for the roundhouse was poured from two concrete towers, one in the front and one in the rear of the house. In addition to these a third mixer was used for a part of the pits and the pedestals. The two towers are shown in the illustration on the preceding page. The tower on the inside of the house was used for concreting a large portion of the front of the building and about ten complete stalls on one end, whereas the tower in the rear was used for pouring the other 10 stalls of the superstructure and a considerable portion of the rear of the building.

The plans for this work were prepared by the engineering department of the Toledo & Ohio Central, at Columbus under the direction of J. A. Stocker, chief engineer and C. V. Bucher, assistant engineer, who were also responsible for the supervision of the construction. The Austin Company, Cleveland, Ohio, had the contract for the roundhouse and other building work with the exception of the coaling station and was later given a contract for the filling and the equipment work.

Nothing to Do but Walk

# Waterway Policy of the Railroad Administration

The Director General Outlines the Government's Intentions  
to a Number of Senators and Representatives

WALKER D. HINES, director general of railroads, has addressed a letter to Senators Duncan Fletcher, Joseph E. Ransdell, W. L. Jones, and Representatives John J. Esch, Samuel E. Winslow, J. Hampton Moore, John H. Small, and Charles A. Kennedy, in response to a letter addressed to him by them under date of March 12 containing a series of questions as to the waterways policy of the Railroad Administration. Mr. Hines says in part:

It is my conviction that water transportation lines, at least such as are financially and physically equipped to discharge the duties of common carriers, and to effect transfers of traffic on an economically sound basis, should be co-ordinated and correlated with the whole transportation system of the country. This necessarily implies that there should be no obstructions to an interchange of traffic between rail and water on terms substantially equal to those between rail carriers, and that through billing and through bills of lading should be adopted under such conditions between the rail carriers and responsible water carriers, but this, of course, would require that on such traffic the water carriers would be subject to the Act to Regulate Commerce. I have reference, of course, to waterways with permanent channels.

Each waterway and the service thereon presents a different problem; on some waterways there is no responsible organized transportation with which traffic could be interchanged by the rail carriers with any degree of regularity; on others the absence of transfer facilities would make the transfer of traffic between rail and water involve such a heavy labor cost as to render the rail and water traffic hopeless from an economic standpoint. On others, including the present government projects, joint through rates and billing have been or are in the process of being arranged to and from points which are reasonably tributary to the water lines, with the necessary divisions of the revenue applicable to each party carrier. I attach great importance to making a success of the present governmental experiments, because I believe success there will point the way to further developments of other waterways.

The attitude of the Railroad Administration with respect to the relation between water and rail competitive rates is that the rates should bear a relation to each other proportionate to the cost and desirability of the service by the respective routes and methods of transportation. There is no doubt that in the past the relations between the rail and water rates have not always been determined on this basis, and that application of this principle will necessitate modification of some existing rate adjustment. We have, however, to deal with an existing rate structure, which in most cases is many years old, as to the general relationship between rates, and to which, irrespective of whether the rate structure is altogether sound or not, the commercial and manufacturing interests have largely adjusted themselves, so that any general radical and quick remodelling of rate relationships would be exceedingly disturbing to business interests and to many communities. Furthermore, a change in the relationship between any two rates necessarily changes the relation of one or both of them to all of the other rates of the country, and the business of the country transacted at each business center is so interwoven with that transacted at others, that the effect of a change in rate relationship may be widespread and seriously affect the interests of communities not at all directly interested in the situation on account of which the original change in relationship is made.

For these reasons changes in the relationships between rates must be made with great care and after full consideration of the effects both direct and indirect. This, however, does not mean that no changes should be made, but merely that all those interested should be given an opportunity to be heard so that a decision may be reached on the basis of all the important facts, and that the decision when made should give fair consideration to all of the interests involved, many of which necessarily conflict with others. Experience has shown that the safest and fairest method of securing full information in such matters is to permit all those who are sufficiently interested to present their views of the facts in a public manner.

The above are the general principles on which the Railroad Administration intends to handle the difficult situation arising from disproportionate depression in the past of many rail rates on routes subject to water competition.

At present the principal district in which the question presents itself is the Mississippi valley. There is now being heard before the Interstate Commerce Commission a case originally involving rates between Memphis and points in southern Missouri, Arkansas, Oklahoma and Kansas, in which the issues have become extended until it involves the rates generally between points on the east bank of the southern Mississippi and points in the territory above described and between points in that territory, also the relationship of rates between the river towns and rates from points on the river to interior points. The issue as to the relationship between river point rates and interior rates has been brought into the case through the Interstate Commerce Commission having set down for hearing with this case numerous applications of the railroad corporations heretofore filed for permission to maintain rates between river points lower than rates to intermediate points. Under the provisions of the Interstate Commerce act such rate relationship has been maintained only by virtue of the pendency of these proceedings before the commission, or by virtue of permission of the commission heretofore granted in similar proceedings, which it has now set down for re-hearing in connection with the pending cases. The Railroad Administration is taking the position in this case that it does not urge the granting of permission by the Interstate Commerce Commission for the maintenance of this rate relationship, except as to certain rates which the rail carriers in the central section of the country from Chicago to the gulf are required to maintain on a lower basis than some intermediate rates in order to meet ocean competition from the Eastern seaboard. All the interested parties have a full opportunity to be heard before the commission, and the Railroad Administration will abide by the decision of the commission.

Along the New York Barge Canal route there is no present suggestion of any readjustment of the relationship of rail rates between points located on the canal route and rates between interior points.

On the Great Lakes the established common carrier water lines are operating under a differential rate basis approved by the Interstate Commerce Commission.

Along the Atlantic coast arrangements have been made for putting in rates via water and rail which will enable the water lines to participate in the traffic on a fair basis in competition with all rail. Such arrangements have for a long time been in effect on the Pacific coast, and no change has been made there by the Railroad Administration.

You recite that the Railroad Administration has authorized the construction of boats of various types for service on the lower Mississippi, the Warrior river and the New York State Barge Canal, and ask the future policy of the Railroad Administration with regard to these boat lines and the rates to be established with connecting rail carriers.

(a) A limited service on the lower Mississippi, with the maximum obtainable equipment, has been in operation since late in September, 1918. It provides one weekly sailing each from St. Louis and New Orleans. Joint rates and through bills of lading with rail carriers connecting at New Orleans and St. Louis, and covering a large territory in the Mississippi valley, and offering service at rates less than the cost of competing all-rail service, are in operation. The scope of these joint tariffs is being extended to cover other points available to waterways when the equipment is sufficient to give regular and continuous service and when requested by the communities concerned.

(b) Service on the Warrior river was delayed because of the difficulty in obtaining and equipping available craft. This service was inaugurated December last, chiefly for the transportation of coal. Joint through rates on coal, in connection with the rail carriers in that district, are being actively considered. The present service provides ample outlet for mines directly on the banks of the Warrior river and without rail connection. Equipment to make practicable the carriage of general merchandise by existing craft is now being designed. This will link the water service on the Warrior river with that on the lower Mississippi, and a comprehensive system of joint water, as well as water-and-rail rates between these two water projects is being developed.

(c) The New York State Barge Canal is a state owned waterway. The superintendent of public works of the state of New York has just announced that arrangements have been effected with the Railroad Administration whereby traffic will be interchanged between canal and railroad lines through all practicable water routes. The administration has agreed that, if the traffic justifies, it will establish joint rates between responsible independent canal lines and rail carriers under Federal control at connecting points on the canal.

For the lower Mississippi river operation approximately \$630,800 has been applied to the purchase of 2 steel towboats and 9 steel barges of 550 tons average capacity, and the equipping of leased vessels (3 steel towboats and 20 steel barges) and the strengthening of the hull of an acquired barge and installation of machinery thereon, to be used in transfer service at New Orleans. All of this equipment is in operation except the transfer barge, which is being equipped. Contracts have been awarded for the construction of 6 steel towboats of 1,800 horse power each, and 40 steel barges of 2,000 tons capacity each, at an aggregate cost of \$6,290,000, for use on the lower Mississippi river. It is expected that these towboats and barges will be completed and in service in mid-summer or early fall.

For the Warrior river \$698,241 has been expended for the purchase of 3 wooden towboats, 23 500-ton wooden coal barges, 3 harbor transfer coal barges and 6 self-propelled steel barges of an average capacity of 825 tons each. Contracts have been awarded for the construction of 4 self-propelled steel barges, with a capacity of 1,800 tons for coal loading, but equipped to load up to 400 tons each of merchandise provided the coal loading is correspondingly decreased. These barges are for service between Cordova and New Orleans.

Bids have been received and contracts are about to be let for 3 steel towboats for service between Cordova and Mobile.

Contracts have been let for 20 500-ton wooden coal barges for service between Cordova and Mobile. The aggregate contract price under these contracts for Warrior river equipment is \$1,508,300.

Most of the old equipment purchased as above stated, for use on the Warrior river, is now in operation.

The 4 self-propelled barges for which contract has been let are expected to be completed early in the fall. The 3 twin-screw towboats for which contracts are about to be let are expected to be completed about the same time. The 20 wooden barges will be completed between April 1 and June 1, and pending the completion of the towboats above referred to, towboats will be leased to propel these barges.

The total amount expended up to March 1, 1919, for the purchase of floating equipment, and to meet payments to contractors for new equipment for the Mississippi-Warrior river section, has been \$1,930,941.37.

For the New York canal section 5 tugs, from 85 to 150 horse power each, and 3 wooden barges of 550-ton capacity each, were purchased in 1918, at a total cost of \$110,860, including the repairs necessary to put the same in service.

Contracts have been let and the work is largely completed on 51 steel barges of 650-ton capacity, to cost about \$1,898,218, and 21 concrete barges of 600-ton capacity each, to cost about \$586,664.

Bids have been received and contracts are about to be let for the construction of 20 self-propelled steel barges of 550-ton capacity each, having 400 horse power. Each one of these towboats will tow 3 of the steel or concrete barges in addition to carrying cargo itself. The contract price for these self-propelled barges is \$1,726,200.

Of the 72 steel and concrete barges under construction, nearly all are expected to be delivered in time for the opening of navigation May 1, 1919, and the rest very shortly thereafter.

The 20 self-propelled barges which are also to act as towboats are expected to be delivered in August and September. Meanwhile additional towboats will be temporarily hired to tow the steel and concrete barges.

You will see that in all of the three principal operations of the Railroad Administration on the inland waterways; namely, the Mississippi river, Warrior river and New York Barge Canal, the policy was pursued of purchasing equipment for temporary use in order to begin operations as soon as possible, with a view to substitution, in whole or in part, of modern equipment, the construction of which was authorized.

As soon as the equipment under contract can be completed it is expected that the use of leased equipment will be altogether discontinued, as the Railroad Administration is planning to own sufficient equipment to transport the traffic.

In addition to the items expended for new equipment referred to above, the Railroad Administration had constructed under contract in 1918, 10 wooden barges for service on the Chesapeake & Ohio Canal, at a total cost of \$46,547.20. The differing arrangements under which these barges were operated last year and will be operated this year by a private corporation is stated below in response to your inquiry for details as to the Chesapeake & Ohio Canal.

The Delaware & Raritan Canal came under federal control as a part of the transportation system of the Pennsylvania Railroad, and after the establishment of federal control the maintenance of the canal and the operation of the locks was under the jurisdiction of the federal manager of the Pennsylvania Railroad until December, 1918, when it was transferred to the Division of Inland Waterways of the Railroad Administration, New York-New Jersey Canal Section. The Pennsylvania Railroad Company operated no boats on the canal, excepting tugs, prior to federal control, and had no through rates except on anthracite coal via Trenton to Philadelphia and nearby points. These through rates have been maintained under federal control, and during the season of 1918 the Railroad Administration operated some package freight service via the canal between New York and Philadelphia. My information is that independent compa-

nies propose to use the Delaware & Raritan Canal quite extensively during the season of 1919, and the Railroad Administration therefore does not contemplate placing any equipment on the canal, but will maintain the canal, operate the locks and provide towage as heretofore. The canal toll rates on vessels doing a common carrier business have been revised and placed on a basis of 15 per cent of the freight collected by the vessel from shippers, instead of the class rate basis of tolls heretofore in effect. The purpose of this change is largely to facilitate operation by simplification of the method of computing tolls, but it is estimated that it will also result in a reduction in toll charges, particularly on the higher classes of freight. Some of the towage rates have been increased, as they were considerably below the cost of operation.

The Chesapeake & Ohio Canal was never operated by the Railroad Administration. At the beginning of the season of 1918, on account of increase made by the canal trustees in toll rates and the increases in operating expenses, the Canal Towage Company, which was the only company operating boats on this canal, announced that it proposed to discontinue operations, as it could not pay operating expenses.

In order to avoid the loss of this means of transportation of coal to Washington and vicinity during the acute congestion which then existed on the railroads and the shortage of coal which then appeared imminent if war conditions continued, the director general of railroads at first made an arrangement whereby he assumed payment of the canal tolls on coal traffic on the Chesapeake & Ohio Canal. Later in the season, in connection with the increases made in rail freight rates on coal, this arrangement was revised so that for the balance of the season the director general of railroads assumed the actual deficit of the Canal Towage Company in operating its boats. This was substantially less per ton than the canal trustees charged for tolls, the Canal Towage Company under this arrangement paying such tolls.

For the same reasons which led it to pay part of the expense of operating the canal, the Railroad Administration constructed 10 new canal boats to increase the tonnage transported via this canal, these boats being leased to the Canal Towage Company for operation.

The Railroad Administration has made no arrangement with the Canal Towage Company to pay any part of its operating expenses for the present year. The same emergency does not exist as obtained last year. Arrangements, however, have been made for divisions between the railroad and the canal of the freight charges from the mines to destination which will make it possible for the Canal Towage Company to operate its boats on the canal during the coming season as heretofore, and the boats built by the Railroad Administration will be operated by the Canal Towage Company on a rental basis.

You request my views concerning disposition of the government owned vessels on inland waterways in the event the railroads are returned to private control. This is a broad question of governmental policy and involves, in a sense, a settlement of the entire inland waterways problem. I am a firm believer in the policy that the great inland waterways of the country can be made economically very useful and that means should be found for making them of more benefit to the nation than they have been in the past. For a number of years the government has been devoting a great deal of money and study to the improvement of these waterways, but no adequate utilization of them has ever been brought about. While we have had in existence some navigable inland waterways, we have never had the facilities for exchanging traffic between the railroads and the waterways.

Under the old form of private management railroads in this country had no substantial interest in acting as feeders to the waterways, and, of course, there was no other form of feeder available. It therefore seems to me that in any

permanent solution of the railroad problem which may be adopted, it will be necessary to bring about close co-operation between the railroads and waterways, and the first element in this situation must be the desire or interest of co-operation and the next facilities for transferring traffic from the inland waterways to the railroads and vice versa. Were the railroads to remain under government control for any considerable length of time this would be a comparatively simple matter, granting that sufficient appropriations were available, but if the railroads are to go back to private control the problem becomes a more difficult one.

One of the objects of the Railroad Administration has been to make a sympathetic test of economic co-operation between the rail carriers and the waterways, and some progress has been made in this direction, but of course it is impossible to bring about such changes in a brief time, and therefore I do not feel that a fair test of the possibilities in this direction has yet been completed.

If the rail carriers are to go back to private control and the government is to sell its interest in the boat equipment already provided and authorized on inland waterways to private interest, there is grave danger that old conditions will again obtain with the likely result that there will be no proper development of inland waterways. Taking for granted that the rail carriers are to go back to private control, the question remains as to whether the situation would be better for the water equipment to be placed under the control of some other governmental agency at the time the present Railroad Administration is disbanded. My present view is that this should be done, at least through an adequate experimental period. I deem it highly important to preserve and strengthen in the public interest the beginnings already made in demonstrating the utility of our inland waterways.

A Mixed Train at Corrientes

# The Railroad Development of the Argentine

The Largest Market for Railway Equipment in South America  
—Regulation, Labor and Taxation Big Problems

IN TWO PARTS.—PART I

THE LATIN-AMERICAN DIVISION of the Bureau of Foreign and Domestic Commerce has this week added to its reports on railway development in various countries in South America, Circular No. 55 dealing with the railways of the Argentine. The circular discusses the characteristics of the present railway development in that country, shows what difficulties the railways have been confronted with in the way of government regulation, labor and taxation, points out the possible trend of future development and concludes with detailed figures of imports of railway material and a discussion of the possible markets for such supplies. The Argentine railways, prior to the war, secured the greater part of their material and supplies from England owing to the fact that the larger portion of them were owned by British capital. Since the war cut off these imports, the Argentine railways have not been supplied and as a result "the equipment of all the roads has become very materially depleted."

Because of the length of the report it will be given in the *Railway Age* in two installments. The first follows:

At the outbreak of the war Argentina afforded the most inviting field in South America for railway investment and the largest market for railway equipment. With one-third the area of Brazil, Argentina had some 21,000 miles of railway in operation while Brazil had 16,000. This rapid development had been greatly facilitated by many factors, chief among them the absence of the coastal mountain barrier which had made railroad construction so difficult and so costly in the other republics.

Argentina may be divided into four sections, three of which are flat, fertile plains, and offer few difficulties to the engineer. The northernmost of the prairie sections, the Chaco, extending south to Cordoba and west to the foothills of the Andes, is a scantily populated territory with luxuriant vegetation and a warm, moist climate. The central division, the Pampas, stretches south from Cordoba to the Colorado River and west to the Andes. It is the real Argentina of to-day; its cities—Buenos Aires, Rosario, Bahia Blanca, Santa Fe,

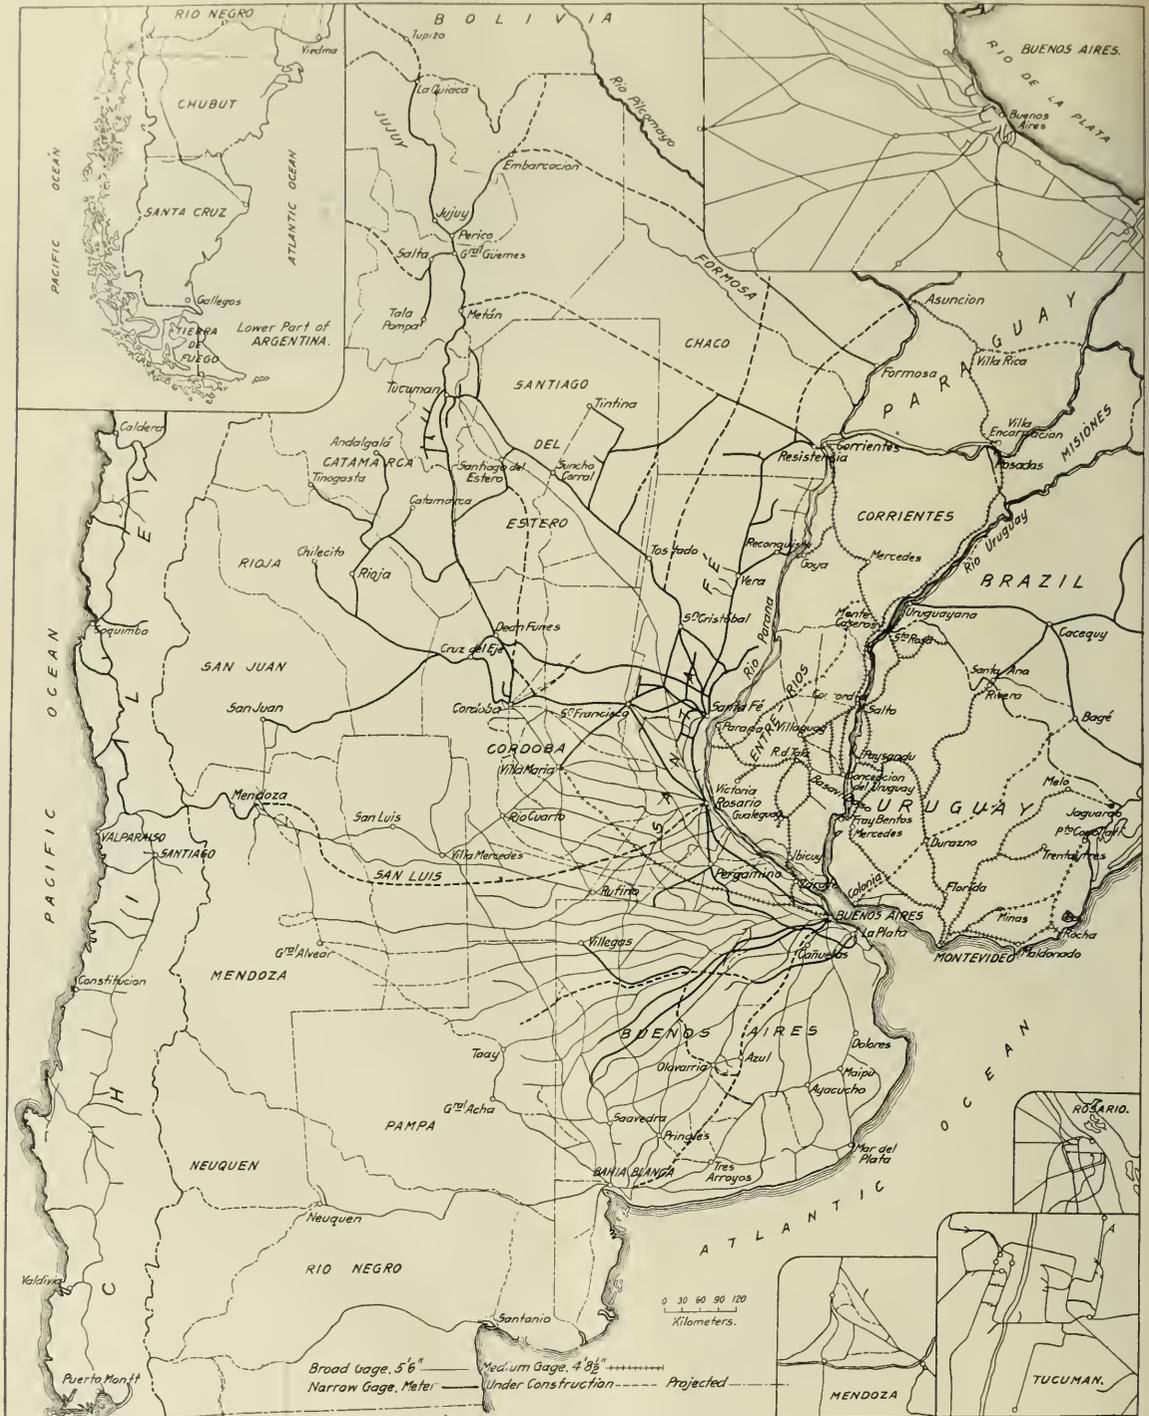

and La Plata—are the chief ports and industrial centers of the republic; its grassy plains produce the major part of the nation's wealth. The southern part, Patagonia, extends south from the Colorado River, west to the Andes, and is a cold, arid region which has only recently been explored. The fourth section of Argentina, the narrow Andean belt, forms the western frontier of the country, reaching from the extreme north to the extreme south. It is characterized by scarcity of rainfall, is rugged and uninviting in comparison with the Pampas, and has not been developed to any great extent.

## Other Factors in Development of Railways

Among the factors which have contributed to the growth of the railways should be noted the following: Argentina possesses a strong, stabilized central government, and this government offered every inducement to the investment of foreign capital. Also some means of rapid transportation between the ports and the interior became imperative because of the growth of the live-stock and agricultural industries in the Pampas.

Railway construction has, perforce, been suspended in all South American countries during the period of the war and imports of railway equipment have been curtailed. During this time new factors have entered the situation which may tend to reduce the relatively rapid development of Argentine railways in future. The meat packers of Argentina have worked overtime to feed the armies of the allies, the farmers have sold their grain at unheard of prices, and the railways have handled enormous quantities of grain and cattle at better rates. But these advantages have been overshadowed by the increased cost of fuel, suspension of traffic and damage to property occasioned by strikes, decrease of import freight, increased taxation, and advanced cost of labor, so that while the first two industries have benefited materially during the war, railway earnings have fallen off and the companies now find themselves confronted with problems which must be

solved before they can pursue their former prosperous courses. To-day, in spite of the fact that Rosario, Campana, La Plata, Bahía Blanca, and Zarate all compete for a share of the foreign trade freight, Buenos Aires handles nearly 85

Map Reproduced from Article on Argentine Railways by F. Lavis, Railway Age Gazette, March 27, 1914

Map of the Argentine Railways

per cent of the imports and 60 per cent of the exports. Moreover, it has become the largest and most important city not only in Argentina but in all South America.

In the early days of railway construction short lines were pushed out from Buenos Aires to distribute supplies throughout the Province of Buenos Aires, to collect grain and other products for export. To-day Buenos Aires is the focus of the Argentine railway system. From this point a network of lines radiates north, west, and south, reaching the Paraguayan boundary on the northeast, the Bolivian on the north,

(d) West through Mendoza to the Chilean border. Connections are made at Mendoza for Santiago and Valparaiso, Chile.

(e) Southwest to Toay.

(f) South to La Plata, Mar del Plata, and Bahia Blanca.

II. Patagonian railways listed from north to south.

The railways of the Pampas transport large quantities of grain and live stock, whereas oranges and semitropical fruits form an important part of the freight brought down from the northeast. Sugar is a leading item in the export freight of the Tucuman district and grapes and wine of the Men-

Name of railroad	Location	Length Miles	Gage Ft. In.	Remarks
Buenos Aires Central	Main line, Buenos Aires to Rojas. Branch to Zarate.	252	4 8½	First of 3 lines over which international trains are run from Buenos Aires to Asuncion.
Entre Rios	Main line, Ibicuy on Parana River north to Concordia. Branches from main line west throughout Province.	831	4 8½	Main line forms second section over which international trains to Asuncion are run.
Argentine Northeastern	Concordia to Posadas on Paraguayan border; Concordia south to Concepcion.	752	4 8½	Third link in international service to Asuncion. Runs through Libras, port on Rio Uruguay, opposite Uruguayana, southern terminus of main line south from Rio de Janeiro.
Province of Buenos Aires Gen-eral Railway	Buenos Aires to Rosario, with a branch to La Plata; Buenos Aires to Villegas and Salliquelo.	790	Meter	
Province of Santa Fe	Main line, Rosario north through Santa Fe to Corrientes. Branches throughout Province of Santa Fe.	1,188	Meter	
Formosa-Embarcacion	Northwest from Formosa, a port on the Rio Paraguay.	186	Meter	
Central Norte	Main line, Santa Fe through Tucuman and Jujuy to La Quiaca on Bolivian border. Branches to Embarcacion and Barranqueras.	*3,046	Meter	
Argentine del Norte	Main line, Lake Paiva, near Santa Fe, west to San Juan. Several branches, including one to Cordoba.	...	Meter	Connects with Central Norte at Lake Paiva. Connects with Cordoba Central at Dean Furnace.
Central Argentine	Main line, Buenos Aires north to Tucuman. Feeders in Provinces of Buenos Aires, Santa Fe, Santiago del Estero, Tucuman, and Cordoba.	3,305	5 6	
Cordoba Central	Original line, city of Cordoba to San Francisco on eastern boundary of Province.	1,205	Meter	Built by company. Connects with Santa Fe and with Cordoba-Rosario at San Francisco.
	Additional lines:			
	Cordoba to Rosario	...	...	Purchased from Cordoba & Rosario Ry. Co.
	Rosario to Buenos Aires	...	...	Purchased from Cordoba Central, Buenos Aires Extension (Ltd.).
	Cordoba north to Tucuman with branches to Chumbicha and Santiago del Estero.	...	...	Purchased from Central Northern Ry. Connects with Central Norte at Tucuman.
Buenos Aires & Pacific	Original line, Buenos Aires to Villa Mercedes with branches.	3,535	5 6	Built and owned by Buenos Aires & Pacific.
	Additional lines:			
	Villa Mercedes west to Mendoza	...	...	Leased from Argentine Great Western.
	Mendoza to Chilean boundary	...	...	Leased from Argentine Transandine.
	Toay (station on Argentine Western) to Bahia Blanca. Nueva Roma to Huinca Renanco with feeders and branches (links original line with Bahia Blanca to Toay section).	...	...	Leased from Bahia Blanca & Northwestern.
	Bahia Blanca south to Carmen de Patagonas at mouth of Rio Negro.	...	...	Built and owned by Buenos Aires & Pacific.
	Rufino, on main line, north to Villa Maria, station on Central Argentine.	...	...	Leased from Villa Maria & Rufino Ry. (lease expires 1920).
	Villa Mercedes north to Villa Dolores	...	...	Purchased from Andine Ry.
Buenos Aires Western	Buenos Aires west, spreading through Provinces of San Luis and La Pampa.	1,882	5 6	
La Plata & Meridiano Quinto	La Plata to Mira Pampa.	343	Meter	
Buenos Aires Midland	Suburb of Buenos Aires southwest to Carhue.	322	Meter	Operated by Great Southern and Buenos Aires Western jointly.
Buenos Aires Great Southern	Connects Buenos Aires with ports of Bahia Blanca, Mar del Plata, La Plata, Ingeniero White. Has network of short lines radiating south and southwest from Buenos Aires. Short lines radiate from Bahia Blanca. Branch from Bahia Blanca west across Patagonian Plains through Neuquin to Zapala.	3,792	5 6	90 per cent of mileage in Province of Buenos Aires.
Rosario-Puerto Belgrano	Rosario in southerly direction to Puerto Belgrano, port just east of Bahia Blanca.	493	5 6	Affords connection between lines radiating south-west and west.
Central Railway of Chubut	Port Madryn to Trelaw and Gaiman.	51	Meter	Serves Welsh colonies.
Patagonian State Railways	Port of San Antonio due west to Lake Nahuel Huapi.	281	5 6	
	Port of Comodoro Rivadavia to Lake Buenos Aires.	124	5 6	
	Puerto Descado to Colonia Sarmiento.	176	5 6	

\*Includes Argentine del Norte.

and the Chilean on the west. These main lines emanating from Buenos Aires are supplemented by short cross-country connections and by one railway—the Rosario-Puerto Belgrano—which describes an arc through them.

The railways conform in general to the following plan of location:

I. Lines radiating from Buenos Aires:

- (a) Northeast, the three links over which the international trains run from Buenos Aires to Asuncion, Paraguay.
- (b) North through Rosario, Corrientes, Tucuman, and Jujuy to La Quiaca, on the Bolivian border, and Embarcacion, near the Bolivian border.
- (c) Northwest to Cordoba and Tucuman.

doza section. Sheep and wool are the principal products of northern Patagonia and petroleum of the Comodor Rivadavia region. Quebracho and firewood of all kinds have formed profitable and important parts of the local and through freight handled since the war by the lines penetrating the northern provinces.

Location of Chief Railways, Mileage, Gage, Etc.

The foregoing table lists the important Argentine railway systems; gives the location, total mileage, and gage of each; the connections afforded between the various systems; and lists the companies which compose each one. Details of short or unimportant branches have been omitted, as the table is intended to present a picture of each system as a whole and

its position in the general scheme. As far as possible the lines have been listed in accordance with the foregoing plan of location.

**State and Private Ownership**

The relation between state and private ownership and operation is not so complicated in Argentina as in Brazil or Peru. Generally speaking, the private companies own their holdings in perpetuity and do not operate government-owned lines. The private companies are permitted to build short feeders, providing they observe certain conditions, without applying for government concessions, and to construct irrigation works adjacent to their holding for which they receive payment in government bonds. The provincial governments have the right to grant concessions for railway construction, to build and operate railways themselves.

Halsey estimates the value of the privately owned railways at 1,219,846,313 gold pesos, of which amount some 1,000,000,000 pesos consists of British investments. The following table lists the privately owned railways, classified by nationality of ownership, and gives the capitalization of each company. The figures are quoted in Argentine gold and are those given in the official 1917 reports of the companies.

	Gold pesos.

The few government railways have been built primarily to hasten the development of remote portions of the republic and are usually divided into two classes—Los Ferrocarriles del Estado and Los Ferrocarriles de Fomento. In the former

Quebracho Ties Along the Santa Fé Railway

class are included the Argentine del Norte and the Central Norte, with a total capitalization of 155,895,474 gold pesos. These railways afford an outlet for portions of the country which otherwise would be wholly isolated, and the system north from Tucuman affords an important link in the proposed international line into Bolivia. The roads are well equipped and administered, and exchange cars with the Argentine Central at Tucuman and Cordoba so that freight from Jujuy and Salta can be shipped directly to Buenos Aires. Los Ferrocarriles de Fomento, or State development

railways include the unfinished Formosa-Embarcacion line and the Diamante-Curuзу line, both situated in the Chaco, and the Patagonian State railways.

La Plata a Meridiano Quinto, owned and operated by the Province of Buenos Aires, is the only example of a railway entirely managed by a provincial government. It was constructed as part of a comprehensive system to compete with the proposed fusion of the Southern and Western.

**Interpretations of Mitre Law and Pension Bill**

The two much discussed railway bills which have been repeatedly presented to congress but which so far have failed to pass are the so-called explanatory law of the mitre law

In the Chaco Along the Santa Fé Railway

and the pension bill. During the past year, congress adjourned without passing even such necessary measures as the budget law. The recent special session has been little better but the minister of public works assures the railways that some definite action will be taken on both measures during the coming regular session.

In the early stages of railway development in Argentina most of the companies carried government guarantees of interest some of which were as high as 7 per cent. In 1895, these guarantees were relinquished by mutual consent and 4 per cent recission bonds issued to the railways in payment thereof. Freedom from customs duties and taxes in general was still granted. In 1907 the mitre law was passed, the terms of which were not compulsory, but were voluntarily accepted by most of the privately-owned lines. The Entre Rios still operates under the terms of its original concession.

Recently, a great deal of misunderstanding and trouble has arisen over article 8 of this law by which the railways agreed to pay a tax amounting to 3 per cent of their net receipts, based on 60 per cent working expenses, in lieu of customs duties, national and provincial duties until 1947. This sum was to be used to improve and construct roads and bridges to and from stations in the towns or districts served by the respective railways. The companies understood that this tax was to be the only one to which they were subject but the law has not been so interpreted by municipal authorities. The municipality of Cordoba sued the Central Argentine for recovery of street cleaning expenses claiming that they were rates, not taxes. The case was taken to the supreme court which rendered a decision in favor of the municipality with the result that many other municipalities are attempting to collect various sorts of assessments from the railway companies. In some cases the bills to be collected cover a period of 10 years and represent large sums.

The companies have resented the decision of the supreme court bitterly and have attempted repeatedly to obtain an exact explanation of the meaning of article 8 from the national congress. An explanatory measure was passed by the deputies, revised by the senate, and is now before the lower house.

The pension law of 1913 provides that 3 per cent be de-

ducted from the monthly salaries of employees and that a corresponding amount be paid to the pension fund by the companies, subject to certain exceptions—for instance, when the companies' profits fall below certain amounts. A new law was projected in 1915, but was satisfactory neither to the employers nor to the employees, and has never been passed. The railway companies have declared themselves willing to pay as much as 8 per cent of their wages sheet provided the workmen pay 5 per cent of their wages, the extra cost to the companies to be met by increased rates. The workmen are holding out for an increase in the amounts of the pensions to be received and for a reduction in the term of service necessary to procure a pension.

#### Labor Problem—Strikes

No Argentine industry has been free from the menace of strikes during the last 2 years, but the railways have suffered more than any other single class. Radical newspapers and trade journals have bitterly denounced the foreign capitalist; conservative periodicals have as hotly denounced the labor unions; and both classes of publications have denounced the inaction and the action of the government.

The railway employees have two organizations—La Fraternidad, composed of engine drivers, and Federacion Obrera Ferroviaria, made up of stokers, guards, and other employees. La Fraternidad has proved much more willing to arbitrate than La Federacion Obrera Ferroviaria. Both organizations are members of La Federacion Regional Argentina, reported to control 250 labor unions, and which in 1917 and again in January of the present year, has called general strikes.

Strikes on the more important English and French rail ways early in 1917 were succeeded by a general strike in the

fall which affected not only the privately owned lines but the state railways also. The general strike lasted for 24 days and was characterized by destruction of property and by acts of violence. As a result, on October 11, the president of the republic issued provisional railway working regulations, which were agreed to by both the companies and the labor unions. One of the conditions on which the strike was terminated was the granting of a 10 per cent increase in all salaries under 300 paper pesos a month; another was the exaction of an 8-hour day. It is estimated that the salary increase is costing the companies about 8,000,000 pesos per annum and the 8-hour day condition 12,000,000 pesos.

The length of the working day and the wage scale were not the only bones of contention, however, and the provisional regulations have not succeeded in bettering conditions materially. The year 1918 was characterized by a succession of disturbances which culminated in a general strike early in January, 1919. This strike lasted only a few days, but relations between capital and labor remain excessively strained and are punctuated by constant disturbances.

There is no law in Argentina to provide for arbitration of disputes between employers and employees and there seems little chance of one's being enacted in the near future. Some of the companies feel that their interests and property have not been sufficiently well protected during the recent disturbances, and are sending representatives to Argentina to put their cases before the government to determine the future attitude of the government toward foreign investors.

On the other hand, the laborers claim that the companies have lost nothing by their concessions, but rather have been fully compensated by the recent increase in tariffs allowed the railways.

## Doings of the United States Railroad Administration

### Director General Hines on Western Trip; Regional Mechanical Officers Oppose Shop Wage Increase

WASHINGTON, D. C.

**D**IRECTOR GENERAL HINES and members of his staff, including Edward Chambers, director of the Division of Traffic; Henry B. Spencer, director of the Division of Purchases; Max Thelen, director of the Division of Public Service, and Brice Clagett, assistant to the director general, left Washington on April 14 for a trip of inspection over the western railroads. Mr. Hines addressed the Lumber Congress at Chicago on Wednesday and the itinerary also includes St. Paul, Minneapolis, Spokane, Seattle, Portland, San Francisco, Los Angeles, Denver, Kansas City and St. Louis, where Mr. Hines will speak at the annual meeting of the Chamber of Commerce of the United States on April 30, returning to Washington about May 1. He will be accompanied on parts of the trip also by the regional directors of the lines traversed. On his recent trip to Pittsburgh, Chicago and Atlanta, Mr. Hines had an opportunity to confer with all the regional directors and with most of the federal managers.

#### May 1 Requirements to Be Met

The Railroad Administration has arranged to take care of the most pressing financial requirements of the railroad companies on May 1 by following the policy adopted with reference to the April 1 requirements, that is, by issuing certificates of indebtedness to the railroad companies for amounts due on account of rental and other transactions arising out of federal control which may be used as collateral

for loans from the War Finance Corporation or from banks. This was announced after a conference on April 11 between Director General Hines, Swagar Shirley, director of finance, and other members of the director general's staff, with members of the special committee of the Association of Railway Executives, of which Howard Elliott is chairman, a group of bankers from various parts of the country, and officers of the War Finance Corporation. At this conference the entire railroad financial situation was discussed, including the requirements up to about August 1, estimated at between \$400,000,000 and \$500,000,000. The May 1 requirements are estimated roughly at \$100,000,000 and the June 1 requirements at a similar amount, while a much larger sum will become due during July, the amount depending to some extent on the amount of capital expenditures, which is uncertain.

It is understood that the Railroad Administration was unwilling to make arrangements beyond May 1 at this time, in the hope that a special session of Congress will be called and that an appropriation will be available before it is necessary to meet the full requirements. For the May 1 requirements the Railroad Administration will issue approximately \$60,000,000 of certificates, which will take care of interest, dividends and other corporate expenses, and about \$40,000,000 is represented by maturities which it is believed can be extended. It was the opinion of those present that these requirements would be cared for through the co-operation of all parties concerned in the same manner that was successful in

regard to the April 1 requirements, which were met by the issuance of certificates, about half of which were used as collateral for loans from the War Finance Corporation and about half for loans through the banks.

#### Coal Purchases

In reply to a statement made at Pittsburgh by John L. Lewis, acting president of the United Mine Workers, charging the Railroad Administration with unfair practices in connection with the purchase of coal, Director General Hines telegraphed Mr. Lewis, asking him to give him the benefit of specific cases so that he might correct any instances where it may appear that there has been a failure to carry out his policy. Mr. Lewis said the miners' organizations would be obliged to take drastic action unless there was a change of policy. His principal objection seemed to be that railroads were making contracts for coal covering only the month of April. It was stated at the office of the Railroad Administration that every railroad contract for coal is open for inspection by representatives of miners or by contractors and every contract is made at the prevailing scale of wages. It was stated that the making of preliminary contracts for April was no departure from past practices. Mr. Hines also asked Mr. Lewis to meet him in Chicago on Wednesday.

#### Representatives of Regional Directors Oppose Wage Increase for Shop Crafts

C. E. Chambers, mechanical assistant to the regional director of the Allegheny region, testified before the Board of Wages and Working Conditions at Washington on April 15, as chairman of a committee representing the regional directors, and asked the board to deny the increases in wages and allowances asked by the federated shop crafts affiliated with the American Federation of Labor, on the ground that their wages are now higher than those paid generally by industrial concerns not under government control. The rates asked by the shop crafts include a basic rate of 85 cents an hour for experienced mechanics in place of the present rate of 68 cents, 60 cents for helpers, and also differentials for certain classes of employees, 30 days holiday a year and other concessions in time. These increases, Mr. Chambers said, amount to 25 per cent in the basic rate, 46 per cent for second class electrical workers now paid 58 cents, 35 per cent for car men now paid 63 cents and 46 per cent for those now paid 58 cents.

He presented a set of exhibits comparing the rates of wages paid to railroad shop crafts with minimum, maximum, going and average hourly rates paid to employees performing similar work in 1,293 industrial plants. Ship yards and similar plants were not included, he said, because of the emergency character of the work. The information was received in reply to questionnaires, all of which have not yet been answered, so that the information is not entirely complete. The exhibits showed average hourly rates in the outside industries as follows: Machinists, 56.2 cents; boiler-makers, 62.6 cents; blacksmiths, 58.4 cents; sheet metal workers, 54.7 cents; first class electrical workers, 55.8 cents; second class electrical workers, 46.3 cents; car men, 48.2 cents; molders, 60.6 cents, and helpers, 44.3 cents. The majority of the outside machinists receive rates of 50 cents and upward, while the prevailing rate for helpers is 45 cents. Mr. Chambers said that the pay rolls had also been increased by the classification of work made in Supplement No. 4 to General Order No. 27, because the first class rates are now paid in many instances for work formerly performed by helpers at a lower rate, as the craftsman rate is now paid for some of the work performed by men not fully qualified as craftsmen. Formerly a craftsman engaged in piece work made his helper do all he could, whereas now in the intervals between work assigned to the helpers, the helper frequently does nothing. Mr. Chambers also presented exhibits

showing the labor turn-over, which he said now is about 50 per cent less than it was during the first half of 1918; in other words, it has been reduced to about normal.

A. O. Wharton, vice-chairman of the board, questioned the completeness of the figures because they did not include many industries on the Pacific Coast where high rates have been established, or in the inter-mountain territory, where he said he knew that many mechanics were receiving a minimum of \$1 an hour. He also commented on the absence of figures from the Ford Motor Company, which he said had recently established a minimum of \$6 a day for mechanics. Mr. Chambers said that many of the questionnaires from the more remote points had not yet been received, and that the committee had been unable to obtain the figures from the Ford plant. He remarked that the \$6 minimum was 75 cents an hour.

The representatives of the employees testified before the board on March 12, 13 and 14.

#### Conditions in Allegheny Region

Railroads in the Allegheny region, according to a report from Regional Director Markham, continued to meet all the demands made upon them for the month of March. Due to the unusually mild winter weather, coal loadings decreased to a considerable extent. Permit restrictions on lumber and forest products were raised on April 1 and, with few exceptions, this region continued clear of embargoes on carload freight. The campaign for the prevention of loss and damage to freight is beginning to show results. In March the bureau operated in the Philadelphia district for bringing together astray freight and waybills on which freight was reported short amounting to \$170,000. A similar bureau started its operations at Baltimore on April 1, and another one will be opened at Pittsburgh at an early date. On account of export traffic reverting from munitions and supplies to commercial freight, the freight traffic committee at North Atlantic ports was disbanded on April 1. Traffic control managers, appointed for New York, Philadelphia, and Baltimore, will hereafter issue permits for export freight. During the existence of embargoes, these managers will also have charge of issuing permits covering domestic freight destined for ports under their jurisdiction.

#### Maintenance Budgets Being Prepared

Figures on which the 1919 budgets of maintenance of way and structures expenditures are to be based are now being compiled by the railroads to be submitted to Washington by May 1, in accordance with instructions issued by C. A. Morse, assistant director of the Division of Operation, some time ago, which are being somewhat modified in order to reduce the amount of clerical labor required in complying with them. The upkeep this year is to be measured by the amount necessary to make the average for 1918 and 1919 equal to the average during the test period, after equating for the increases in labor and material costs, so that maintenance work is not being delayed until the budgets are approved, because the general standard to be reached is known.

Circular No. 28, issued by the Division of Operation, calling for detailed information for the purpose of affording a comparison of the expenditures for maintenance of way and structures in 1918 and in the test period, which is necessary to comply with the contracts between the government and the railroads so that each property may be returned in substantially as good condition as when taken over, is to be cancelled because it has been found that it would require a duplication of the work which will be necessary to furnish similar information under circulars to be issued by the Division of Accounting, which it is planned to have in by about July 1.

Statistics received by the maintenance department of the Railroad Administration show that the tie situation has been rapidly improving since the signing of the armistice. Tie

production during March showed a marked increase, amounting to about 8,000,000, as compared with an average production during the five years prior to 1917 of about 90,000,000 a year, and since October the monthly production has nearly doubled. In some regions it has more than doubled. The present outlook is that there will be plenty of ties produced this year not only to meet the current requirements but to provide for the usual amount of carry-over into the next year. Arrangements have been made for treating ties made from the inferior grades of wood and also for the transportation of 5,000,000 Oregon fir ties to the Eastern region. Reports received since the close of the year show that 79,000,000 ties were inserted in 1918 for renewals alone, as compared with 81,000,000 in 1917 and 90,000,000 in 1916.

Rail renewals last year also compared less unfavorably with previous years than preliminary estimates indicated. For the calendar year they amounted to 1,097,000 tons, as compared with 1,233,000 in 1917, 1,450,000 in 1916 and an average of about 1,600,000 for ten years. In 1918 there were about 460,000 tons of rail carried over from the previous year and about 369,000 tons were carried over from 1918 into 1919.

### Contracts Executed

The Railroad Administration has executed compensation contracts as follows: Memphis, Dallas & Gulf, \$28,295; Nashville, Chattanooga & St. Louis, \$3,183,089; Abilene & Southern, \$78,375; Cumberland & Pennsylvania, \$255,692; Buffalo Creek, \$409,397; Detroit & Mackinac, \$310,664; Kansas City, Mexico & Orient, \$150,000; Port Huron Southern, \$11,025, and St. Paul Bridge & Terminal Railway, \$67,509; also co-operative contracts with the Waycross & Southern, Rockingham, Alabama & Northwestern and Virginia Blue Ridge.

### Reparation Claims on Special Dockets

The Division of Traffic has issued Circular No. 7 giving instructions as to the handling of reparation claims which may be dealt with on the special docket of the Interstate Commerce Commission (and of state commissions on intrastate passenger traffic handled prior to June 10, 1918, and intrastate freight traffic handled prior to June 25, 1918). It is intended to advise what claims may be made the subject of special docket proceedings, and in what manner.

Claims growing out of transactions subsequent to January 1, 1918, drawing in question the justness or reasonableness of any rate, fare, charge, classification, regulation or practice falling within the following classes, but not otherwise, should be considered and submitted:

(a) Where there was an error in publication.

(b) Where the claim is within the terms of section 3 hereof.

(c) Where, in special instances not covered by (a) or (b), a charge was exacted which was manifestly unjust and not fairly in contemplation. Each such claim will be considered on its merits.

Claims based upon the fact that through rates were charged which exceeded the aggregate of intermediate rates legally applicable at date of shipment via the route over which the shipment moved should be considered and submitted: *Provided, however*, That the total or through rate in effect upon the date of the application does not exceed the sum of the intermediate rates. It should be understood that rates which are restricted in their application to intrastate traffic can not be used as one of the factors of the combination applicable to an interstate shipment.

Except as to claims arising under paragraph (c), claims approved in accordance with the foregoing by a chief traffic officer of the initial or delivering carrier (other than the switching carrier) which is under federal control and which will participate in the refund, shall be submitted on special

docket application form. This application should be signed by such officer and should contain a full statement of all the facts which, in his judgment, make it improper, under the conditions and circumstances existing at the time of the transaction, to retain the charge which it is desired to refund. Such applications should contain the statement that "it is admitted that the rates or rules legally applicable at the time and over the route shipment moved were, under all the circumstances and conditions then existing, excessive and unreasonable," but should not contain any agreement or promise to maintain any rate, fare, charge, rule, or relationship for the future. Such application need not be signed by any traffic official of a carrier under federal control, except a chief traffic officer of the federal carrier submitting it. Where a carrier not under federal control will participate in the refund, such carrier must concur in the application by proper indorsement.

A concise statement of the facts in connection with the claims arising under paragraph (c) should first be submitted by the carriers to the director, Division of Traffic, who will instruct whether the application should be prepared and submitted on the special docket. If the director, Division of Traffic, finds that a claim falls within the provisions of (a) or (b) or that a claim falling within the provisions of (c) shows the exaction of a charge which was manifestly unjust and not fairly in contemplation, the director will promptly forward such claim, when it has been put in proper form, to the Interstate Commerce Commission (or to the state commission) for approval.

### Navy and War Departments Pay Bills to Administration Treasurer

The Navy and War departments are now paying direct to the treasurer of the Railroad Administration at Washington, all amounts due to federally operated railroads for the transportation of men and property covered by bills rendered by such railroads to the Navy and War departments. No such amounts will hereafter be paid to federal treasurers by the Navy or War departments whether covered by bills already presented or bills which will later be rendered.

When bills for transportation are audited by the Navy or War department and payment is made to the treasurer of the Railroad Administration, there will be issued by the auditor of the Railroad Administration to the federal auditor of the appropriate road a credit advice, which will show reference to the bill audited, the amount, and stating the month's accounts in which the amount shall be transferred to the account entitled "Administration Ledger Control Account." The federal auditor will thereupon transfer the amount from the asset account in which it is included to the administration ledger control account and include the amount in the analysis of that account as provided for that class of items.

The bills for the transportation of men and property are to be rendered by federally operated roads and charged to the Navy or War department as heretofore. All correspondence regarding the correctness of such bills will be conducted by the Navy or War department with each such road. Any adjustment made by the Navy or War department will be included in the advices furnished by the administration auditor, so that the accounts of the road presenting such bill may be corrected in accordance therewith.

For the present, at least, bills presented to other government departments will be settled as heretofore. As a result of this change in practice, it will be no longer necessary for settling carriers to withhold apportionment of interline passenger and freight revenues due from these departments. Such revenues are to be included in current months' reports and settlements will be accomplished in the same manner as for commercial traffic.

### Report of Safety Section

The Railroad Administration has issued a notice regarding a report of the Safety Section, stating that since the government took control of the transportation facilities its record is one of which both employers and employees should have cause to feel proud. The statement indicates however, that a similar pride is not felt in the activities of the railroad safety departments before that time. On January 1, 1919, there were 20,156 railroad men serving on railroad safety committees under the direct supervision of the Safety Section "actively working for safety on the railroads; whereas a year ago there were comparatively few men thus employed." It is also stated that on certain typical roads, where, in the month of January, 1918, there were in the aggregate 212 persons killed, and 3,118 were injured, the record for the same month in 1919 shows the number killed as 94, and of injured 363. Apparently it is not the province of the Safety Section to note any difference in operating conditions in the two months.

Concerning the campaign directed to cleaning up yards and rights of way, one of the big roads reports:

"One division has picked up between 675 and 700 carloads of scrap and debris; and 92 cars of scrap iron were gathered along rights of way in yards. On the divisions that were cleaned up through the efforts of the safety department a number of old link and pin couplers were picked up, a proof that no clean up had been made for a number of years." One of the circulars issued by the brotherhood lodges reads: "We feel the safety movement is of the utmost importance to all employees and your hearty co-operation and earnest support is requested, that accidents and personal injuries to our fellow employees may be reduced to the lowest minimum." The Safety Section is planning a "No Accident Month" for May in the Southwestern Region.

### Passenger Traffic Increasing

Passenger traffic during January increased by 11.5 per cent as compared with January, 1918, according to the monthly report of the Operating Statistics Section. The number of passengers carried one mile for the two months by regions and districts was as follows:

	January, 1919	January, 1918	Increase, per cent
Total, New England District	276,907,918	256,417,267	8.0
Total, Central District	488,561,079	416,278,740	16.6
Total, Ohio-Indiana District	73,782,065	66,542,908	10.8
Total, Eastern Region	835,251,062	739,238,915	13.1
Total, Allegheny Region	720,671,426	587,364,895	22.6
Total, Pocahontas Region	79,031,603	62,519,832	26.4
Total, Southern Region	519,221,957	477,846,209	8.7
Total, Northwestern Region	386,544,671	349,040,976	10.7
Total, Central Western Region	616,670,871	586,379,033	5.2
Total, Southwestern Region	300,219,314	299,654,824	0.2
Grand total, all regions	3,458,010,904	3,101,994,684	11.5

### Rates on Road-Building Materials Reduced

Director General Hines has decided, after consultation with the department of agriculture, commerce and labor, to reduce the present regularly published tariff rates upon specified road-building materials when for use in federal, state, county, parish, township or municipal government road work.

All railroads under federal control are authorized to apply rates on carload shipments of stone (broken, crushed and ground) slag, shells, chatts, cherts, sand and gravel, shipped during the period from May 1 to December 31, 1919, inclusive, when for use in road building or road maintenance, and when consigned to and the freight thereon paid by federal, state, county, parish, township or municipal government, 10 cents per net ton less than the regularly published tariff rates in effect for the transportation of these materials for commercial uses at the time shipments move; but with a minimum charge of 40 cents per net ton, except that where the regularly published commercial rate is less than 40 cents

per net ton then such regularly published rate shall apply. These reduced rates may be applied on shipments consigned as outlined above but in care of a contractor, provided the freight is paid by the government, and provided proper certification is made by the government through its properly accredited representative that the shipments are for the use of, and the reduction in the rate will accrue to the government.

The rates authorized are to be applied without publication in tariffs, but each railroad hauling such material is charged with the duty of seeing that the reduced rates are applied only on bona fide government material where the freight charges saved by the reduction will accrue to the government as indicated.

### Contingent Fee Covenant Modified

Director General Hines has announced that, with the approval of Attorney General A. Mitchell Palmer, he has consented to a modification of the covenant inserted in purchase contracts under the direction of the Department of Justice issued June 18, 1918, prohibiting the payment to agents of fees contingent upon the procuring of contracts with the government in so far as it relates to railroad contracts.

Since this order was promulgated by the attorney general, there has been a good deal of complaint from railway supply houses that its provisions were working a hardship upon them, and that the government itself was losing the benefits of a system which, previously, had proved both economical and satisfactory in every particular.

Hereafter, the attorney general's order will not affect contracts made between the Railroad Administration and supply houses which, previous to government control, carried on their business through bona fide selling agencies.

At the suggestion of John Barton Payne, general counsel for the Railroad Administration, the following clause will be inserted in appropriate cases in future railroad contracts:

"Provided, however, that this covenant shall not invalidate a contract obtained through a bona fide commercial representative employed under a general contract covering designated territory and shall not prohibit or penalize the employment of the same agencies, rates and methods of compensation in dealing with the United States heretofore customarily employed by the contractor in the regular course of his business in similar dealings with the railroad corporations."

### Financial Results in February

The financial results of the operation of Class I railroads (excluding terminal companies) by the Railroad Administration during the month of February, in comparison with those of February, 1918, are shown in a compilation by the Operating Statistics Section. As these figures cover the operation of 231,009 miles of Class I railroads under federal control and exclude switching and terminal companies, they do not exactly correspond with the figures published by the Interstate Commerce Commission for 233,045 miles of road, published last week.

#### REVENUES AND EXPENSES—CLASS I RAILROADS IN FEDERAL CONTROL

	February		Increase or decrease
	1919	1918	
Operating revenues	\$346,582,675	\$285,867,230	\$60,715,445
Operating expenses	318,693,877	256,495,399	62,198,478
Net operating revenue	27,888,798	29,371,831	D 1,483,033
Taxes, rents, etc.	15,965,925	15,337,911	628,014
Net operating income comparable to standard return guaranteed by government	11,922,873	14,033,920	D 2,111,047
1/12 of standard return	74,035,288	74,035,288	.....
Operating ratio	92.0	89.7	2.3

D—Decrease.

It is explained that operating expenses for February, 1919, included approximately \$2,573,000 of back pay applicable

to prior months. If this amount were excluded from the operating expenses, the result would be a net federal income of \$14,495,873, or an increase of \$461,953 over last year. The operating ratio would have been 91.2 or only 0.5 over last year.

### Mechanical Committee to Meet

The Committee on Standards for Cars and Locomotives will hold its next meeting at Washington on April 22.

## Rules for Competitive Bidding Under the Clayton Law

THE INTERSTATE COMMERCE COMMISSION, in an order issued on April 10, has prescribed a set of proposed regulations to govern the method of securing competitive bids, as required by Section 10 of the Clayton anti-trust Law, in connection with dealings in securities, supplies or other articles of commerce, contracts for construction or maintenance of any kind, to the amount of more than \$50,000 in the aggregate in a year, by a common carrier with another corporation, firm, partnership or association "when the common carrier shall have upon its board of directors or as its president, manager or purchasing or selling officer, or agent in the particular transaction, any person who is at the same time a director, manager or purchasing or selling officer of, or who has any substantial interest in such other corporation, firm, partnership or association."

This section of the law, which was twice extended by Congress, became effective on January 1, 1919, except as to corporations organized after January 8, 1918. It provides that such purchases, contracts, etc., shall not be made except from the most favorable bidder, to be ascertained by competitive bidding under regulations prescribed by the commission, and requires the carriers to file with the commission a full detailed statement of the transaction. If the commission, after investigation, shall have reason to believe that the law has been violated it shall transmit the papers and its views of findings regarding the transaction to the attorney general.

The following proposed regulations are served upon all common carriers subject to the act, including the director general of railroads, to show cause, by objections, if any, to be filed with the commission by May 15, why they should not be made effective:

When any carrier, subject to the act to regulate commerce, is required by Section 10 of the Clayton antitrust act to call for bids for securities, supplies, or other articles of commerce, or for the construction or maintenance of any kind or part of its carrier property, such carrier shall prepare specifications, form of proposals and contract, setting forth clearly and in detail a description or descriptions of the matters and things for which bids are requested, the terms, times and conditions of delivery and payment, the place or places where delivery or performance is to be made, the character, amount, and terms of securities offered or sought, and a full description of the supplies or other articles required or offered for sale, hypothecation, or purchase, and shall make and attach to such specifications such maps, drawings, and illustrations and state such other substantial facts or conditions as are or may be necessary to a full understanding of the premises and procedure by bidders. Such specifications, drawings and illustrations in each case shall be kept open at the principal office or offices of the carrier for full examination, free of charge, by persons desiring to examine the same with a view to bidding, and, upon request, such carrier shall furnish to any person or persons desiring the same true and accurate copies of such specifications, maps, drawings and illustrations; *provided* that the

carrier may make a charge for such copies so furnished, the charge not to exceed the reasonable cost of making and forwarding the copies requested.

The carrier shall publish in each case a request for bids in at least two daily newspapers of general circulation, at least two publications in each week for two weeks, the first publication to be at least two weeks immediately preceding the day when the bids are to be submitted; one such newspaper shall be published in the city or town where the principal operating office of the carrier is located and the other newspaper shall be published in one of the following cities nearest to the operating office of the carrier or the place where the contract is to be performed, namely: New York, N. Y.; Boston, Mass.; Chicago, Ill.; St. Louis, Mo.; Atlanta, Ga.; San Francisco, Cal., and Portland, Ore.; and a printed copy of the published notice in each case shall be posted in plain view, for two weeks immediately preceding the day on which bids are to be received, on a bulletin board, designated for that purpose, in a public and conspicuous place in the building where the principal operating office of the carrier is located. Such published notices shall describe in general but intelligible terms the proposed contract, giving its serial number, and the special matter or things for which bids are requested, and the date on or before which the bids must be submitted, and the person by whom and the office at which the bids submitted will be received and opened as herein provided. The carrier may in said notice reserve the right to reject any and all bids and may, at its option, require each bidder to tender a bond in a reasonable sum to be therein named, with sufficient surety or sureties conditioned upon the faithful and prompt performance of the terms of the contract.

Every bid to receive consideration shall be submitted at the place specified in the notice on or before noon of the day on which the bids are to be opened, and the bids shall be opened afternoon and before six o'clock, on the day and at the place and by the person or persons designated in the notice. Each bidder may attend in person or by duly authorized representative at the opening of the bids, and shall be afforded an opportunity to do so and to examine each bid. The bids shall forthwith be tabulated in conformity with the form of proposal prepared and a copy of such tabulation shall be promptly furnished to any bidder or his authorized representative upon application therefor.

When required by the notice, each bid shall be accompanied by tender of a bond in the amount specified in the notice, with sufficient surety or sureties conditioned upon the faithful and prompt performance of the proposed contract. A bond shall be required only in cases where the notice for bids expressly calls for a bond.

Each bid shall be enclosed with accompanying papers in a plain envelope securely sealed bearing no indication of the name of the bidder or the amount of the bid, and shall be marked "Bid under proposed contract No. . . . .," and shall be addressed to the officer of the carrier designated in the notice to receive the same.

Each bid shall state the name and address of the bidder and, if the bidder be a corporation, the names and addresses of the officers, directors and general manager thereof and of the purchasing or selling officer or agent in that transaction and, if the bidder is a firm, partnership or association, the bid shall give the names and addresses of each member thereof, and of the manager, purchasing or selling officer or agent in that transaction.

After receiving and opening bids as aforesaid, the carrier receiving the same shall within 10 days after the opening of the bids, accept the most favorable bid considering (1) the lowest price or prices for the supplies, equipment, and other articles of commerce, and for the construction or maintenance work, described in the advertisement, and the highest price or prices offered for any securities or property, so

described, for sale by the carrier, and (2) the ability and reliability of the bidder, financial and otherwise, to deliver the property or to perform the work or transaction, or to pay for the securities, described in the advertisement, giving due consideration to any bond or security tendered by the bidder. If the right be reserved in the notice all bids may be rejected and the carrier may readvertise for bids. The carrier shall notify the successful bidder of the acceptance of his or its bid, and the bidder shall within 10 days execute the required contract, and, if required by the notice, execute a good and sufficient bond for the faithful and prompt performance of the contract. In case the successful bidder shall neglect or fail within said time to execute the contract or bond as aforesaid the carrier may within five days award the contract to the next most favorable bidder, ascertained as herein provided for determining the most favorable bidder. If neither the most favorable bidder nor the next most favorable bidder shall execute a contract and qualify as aforesaid, the carrier shall readvertise for new bids.

Each carrier after having made and executed a contract as and in the manner above specified shall within 30 days after the execution of such contract file with the Interstate Commerce Commission a statement of the transaction giving (a) a copy of the published notice, (b) the names of all bidders, and, if the bidder be a corporation, the names and addresses of the officers, directors and general managers thereof and of the purchasing or selling officer or agent in that transaction, or if the bidder be a partnership or firm, the names and addresses of the members of the firm, the general manager and purchasing or selling agent thereof, and the total amount of each bid; (c) the name of the bidder to whom the contract was awarded together with a copy of the contract; and (d) if any other than the lowest or the highest bid, as the case may be, is accepted as being most favorable to the carrier, the reasons for such acceptance. The statement shall be made in typewriting, in pamphlet form on pages not less than 8 by 10½ inches in size nor greater than 9½ by 12 inches, in size, bound on the longer edge of the page, the paper to be of durable quality, fit for permanent record.

In the case of each bid so taken as aforesaid, the carrier shall preserve and keep open for examination by the Interstate Commerce Commission or any duly authorized examiner thereof, (a) a copy of the resolution or order of the board of directors, executive committee, or officers of the said common carrier specifying the purposes and terms of the contract for which the bids were invited; (b) a copy of the specifications, maps, drawings, and illustrations upon which bids were made; (c) copies of the notices published, sworn to by or on behalf of the publisher of each paper, respectively, giving the dates and times of publication; (d) the original bids received, designating the bid accepted and giving a statement of the reasons for accepting the same; (e) a copy of the contract entered into between the carrier and the accepted bidder, together with a copy of bond if any; (f) a statement showing any relationship, or business relation if any of the accepted bidder to any officer, director, general manager or agents of the carrier; (g) references by number of volume and page to the records of proceedings of the stockholders, directors, or executive committee of the carrier. The files in each transaction shall be securely fastened together and given the contract number and each document therein shall be numbered consecutively and, at the conclusion there shall be a sworn statement by the president or the general manager of the carrier, stating that the files in No. . . . . contain true and complete records and statements of all the negotiations had in connection with the contract therein set forth. Such files shall not be broken or any part destroyed by the carrier or any officer or agent of the carrier without written authorization from the Interstate Commerce Commission.

## Report on South Byron Collision

THE INTERSTATE COMMERCE COMMISSION has issued a report, dated March 4, and signed by W. P. Borland, chief of the Bureau of Safety, on the rear collision of passenger trains on the New York Central at South Byron, N. Y., on the morning of January 12, in which 22 persons were killed and 71 injured. The circumstances and causes of this collision have been quite fully reported in the *Railway Age*—see the issues of January 17, page 212, and February 28, pages 477 and 491.

Mr. Borland in his conclusion says:

"This accident was caused by the failure of Engineman Friedley of train No. 11 properly to observe and be governed by automatic block-signal indications. A contributing cause was the failure of Flagman Groves to go back a sufficient distance properly to protect his train, and to display lighted fuses as required by rule. Engineman Friedley was employed as a water boy in 1873, promoted to fireman in 1876, and in 1885 was promoted to engineman. In January, 1906, he was dismissed for using the main track without flag protection, being reinstated in November of the same year. Flagman Groves was employed as brakeman in 1891. In 1907, he was suspended for 15 days for not protecting his train by flag when it remained at a regular stopping point longer than usual. The evidence indicates that all of the signal appliances intended to prevent an accident of this character worked properly, its occurrence being due solely to human error.

"In answer to a question as to what he would suggest for the prevention of accidents of this character, W. H. Elliott, signal engineer of the road, said that the only remedy would be an automatic train-control system. In his 25 years' experience as signal engineer he had made tests of three different types of train control, starting in 1893. Eight years ago a former president of the New York Central appointed a committee of four signal engineers from that system to investigate such devices and recommend one for trial. If this could not be done they were to devise one themselves. Up to the present time the work of this committee is uncompleted. Mr. Elliott stated that one of the principal objections to the use of an automatic train-control device was the idea of taking away from the engineman the control of his train, the belief being that such a practice, under stormy weather conditions, for example, would cause the engineman to take chances and to depend upon the train-control device. If it should fail under such circumstances and an accident should result then the railroad company would be in a very undesirable position.

"The committee felt that an automatic train-control system was not intended for such dependence as would be placed upon it by enginemen, and that it would be better not to have it unless it could work with the same degree of reliability as the signal system. Another objection was the Expense. Mr. Elliott stated that after careful investigation it seemed to this committee that greater protection would be afforded by spending an equal amount of money in installing automatic signals on the parts of the road not so equipped than by putting a train-control device into use on lines already equipped with automatic block signals. Mr. Elliott said that a device of the mechanical trip type was in use in the tunnels and subways of New York City, and was giving good service, but its use in open country where it would be exposed to snow and ice and to gravel or stone which might be dumped along the roadway had not proved a success, the result being that often there would be no application of the brakes when there should have been, or else there would be many stops when none was called for. Difficulties were also presented to steam roads operated in the open on account of the different types of trains operated over them at greatly varying rates of speed. Mr. Elliott further stated

that with one possible exception no device has been developed in which the objections from an operating and engineering standpoint were sufficiently overcome to warrant going ahead with such devices. He said, however, that a device can be had; but that everyone had been dodging it on account of the expense."

Commenting on the argument that a railroad will more effectively promote safety by extending automatic block signals and interlocking and introducing other safeguards, than by installing an automatic train stop, the report says: "This in substance is merely an argument for utilizing available funds so as to secure immediate returns and results; it can not properly be considered an argument against the development and use of an automatic train-control system, although it may temporarily serve as an excuse or reason for indefinite postponement of the consideration of that subject and of the practical development of automatic train-control devices. \* \* \* While many of the problems of automatic train-control are serious, and the vision of the diffi-

culties to be encountered has been allowed to obstruct the constructive development of such devices by railroad companies, these difficulties are not considered insurmountable. In its fourth annual report, in 1911, the Block Signal and Train Control Board in a discussion of this matter held that had the railroads directed the same effort toward the development of automatic train-control apparatus that has been devoted to the development of interlocking and block-signaling apparatus, 'we should now have adequate installations of automatic train-control devices which would permit an engineman to handle his train without interference as long as he did it properly, but would intervene to stop his train if he disregarded a stop signal or ran at excessive speed where speed restriction was prescribed.'"

The report repeats the discussion which was issued in connection with the similar collision at Mount Union, Pa., on February 27, 1917, concerning the construction of steel passenger cars with a view to mitigating the results of collisions at high speeds.

## Railway Developments in Foreign Countries

### British Government Makes Compromise with Railwaymen Resulting in \$47,500,000 Increase-Wage Bill

**T**HE LABOR DIFFICULTIES on the British railways which have threatened on a number of occasions to result in a general railway strike were amicably settled after extended conference and discussion on March 28, when the conference of delegates of the National Union of Railwaymen agreed to accept the government's compromise offer.

The men's demands and the developments during the war were outlined in the *Railway Age* of March 12, page 612.

anted week, and all turns commencing on a Sunday shall be excluded from the operation of the guaranteed week. In the event of a strike affecting the work of any grade, either generally or in any district, the question of suspending the operation of this article shall be referred to the Joint Committee to be set up under Article 7 of this Memorandum.

#### GUARANTEED DAY

This to be further discussed.

#### OVERTIME,

*Demand*—Double time (National Union of Railwaymen). Time and a half (Associated Society of Locomotive Engineers and Firemen).

The Board of Trade Confers with the British Railwaymen—Sir Albert Stanley, President of the Board, Presiding

By way of showing to how great an extent these demands were met in the government's offer, the following comparison is given:

#### GUARANTEED WEEK

*Demand*—Eight-hour working day or 48-hour week.

*Offer*—The standard week's work to consist of 48 hours (as granted effective February 1). The standard week's wages, exclusive of any payment for overtime or Sunday duty, to be guaranteed to all employees who are available for duty throughout the week, but turns commencing on a Saturday and finishing on a Sunday shall form part of the guar-

*Offer*—All time worked on weekdays in excess of the standard hours to be paid for at the rate of time and a quarter, each day to stand by itself for overtime purposes.

#### SUNDAY DUTY

*Demand*—Double time.

*Offer*—12 o'clock midnight Saturday to 12 midnight, Sunday: Time and a half without addition to rate for overtime and/or night duty. The same to apply to Christmas Day and Good Friday. Hours worked on those days in excess of the standard number of hours shall not be computed as part of the hours of work of any other day.

## NIGHT DUTY

*Demand*—Time and a half for all time worked between 6 p. m. and 6 a. m.

*Offer*—Week days: (a) All ordinary time worked between 10 p. m. and 4 a. m. to be paid at the rate of time and a quarter; (b) all overtime worked between 10 p. m. and 4 a. m. to be paid at an inclusive rate of time and a half.

## REST

*Demand*—Not less than 12 hours between each turn.

*Offer*—In all regular duties a period of 12 hours' rest to be shown on the rosters at the home station, but in other cases a minimum of nine hours.

## HOLIDAYS OR VACATIONS

*Demand*—14 days with pay.

*Offer*—One week's holiday with pay after 12 months' service, to include the casual employees who are regularly employed, without prejudice to those men who already have a longer holiday under their existing conditions of service.

## MANAGEMENT

*Demand*—Equal representation on management.

*Offer*—The negotiating committees of the two unions (the National Union of Railwaymen and the Associated Society of Locomotive Engineers and Firemen) will be recognized as the medium for dealing with all questions affecting rates of pay and conditions of service while the present negotiations are proceeding.

A committee shall be appointed to consider and report:

(1) As to the setting up of a joint committee, consisting of representatives of the Railway Executive Committee and of the two unions, to deal with any questions that arise in regard to rates of pay and conditions of service of the men within the conciliation grades, as from the date when these negotiations are concluded, and the time until some final arrangement is arrived at in regard to the future position of railways.

(2) As to the continuance or discontinuance of the existing Conciliation Boards.

When the new Ministry of Ways and Communications is set up it is the intention of the Government to provide in the organization for, and to avail itself fully of, the advantage of assistance, co-operation and advice from the workers in the transportation industry.

## WAGES AND STANDARD RATES OF PAY

*Demand*—War wage of 33s. to be converted into permanent wages and rates of pay to be standardized on all railways (National Union of Railway Men).

Drivers, 20s. a day; firemen, 15s. a day; cleaners, 10s. a day (Associated Society of Locomotive Engineers and Firemen).

*Offer*—The present wages to be stabilized till December 31, 1919, and any reduction of the war wage under the agreement of November, 1918, to be waived.

As regards standardization of rates of pay and removal of present anomalies, this can only be dealt with in connection with a general revision of permanent wages, and, therefore, it is proposed that the present negotiations shall be continued for fixing new standard rates so as to insure that all men throughout the country shall receive the same payment for the same work under the same conditions.

This will involve a transfer of a part of the war wage to the permanent wage, but the Government agrees that up to December 31, 1919, no man shall receive less in weekly rate of wage, plus war wage than he is receiving at present, while anyone to whom the new war wage and new rate yield more than they are receiving at present, shall receive the advantage as soon as an arrangement is arrived at.

At the end of the year the whole situation will be reviewed. The war wage will have to be looked at in the light of the circumstances of the time generally and it will be open to the men to ask for a revision of the new standard rates if they think a case can be made for it. But the anomalies of varying pay for similar work under similar conditions will have been removed, and future negotiations will be rendered much easier through there being only one set of figures to work upon.

## OTHER ITEMS IN THE PROGRAMMES

These to be discussed at further meetings.

Discussion concerning these demands was postponed during the war, but began immediately after the signing of the armistice, and conditions became especially acute during the strike on the tubes and electric lines out of London in February. The discussion has been between the Railway Executive Committee and the Board of Trade on the one hand, and the National Union of Railwaymen and the Associated Society of Locomotive Engineers and Firemen on the other. Sir Albert Stanley, as president of the Board of Trade, presided at most of the conferences, and the railway men's case was presented by J. H. Thomas, general secretary of the N. U. R. The meetings were secret for the greater part of February and March, and but little account was given out concerning the decisions reached. In the meantime the so-called triple alliance was formed of the railwaymen, the miners and the transport workers, and fears were held for a time of a general sympathetic strike of all three classes of workers. Finally the Board of Trade made a compromise offer to the railwaymen, but this was promptly rejected and a strike resolution adopted. The final agreement came about

when another offer was made which differed only in minor details, and after a conference was held in Downing street, at which the entire matter was gone over in great detail before Bonar Law, and at which the latter brought out the government's position and outlined how far it was willing to go. Mr. Thomas then took the matter to his union and then secured a vote to rescind the strike resolution and a favorable vote of the conference of delegates. It is understood, however, that the vote in favor was a narrow one and that fears were expressed that there might be local disturbances.

At the conference before Bonar Law, Mr. Thomas, who conducted the railwaymen's case, explained the railwaymen's position and went into great detail concerning a number of points. One of these was the status of the shopmen. About 100,000 of the railway shopmen belong to his union, but many belong to the Amalgamated Society of Engineers, and other craft unions. The government felt it would become involved in a jurisdictional dispute if it came to terms with the N. U. R. alone, but Mr. Law finally agreed to negotiate with a committee from all the railroad shopcrafts together.

It is estimated that the concessions which have just been accepted will add about £10,000,000, or approximately \$47,500,000 annually to the railway wage bill, bringing the total increases in wages since before the war to about £85,000,000. This includes £60,000,000 in the form of war bonuses, now amounting to 33s. to all men over 18 years of age, £15,000,000 covering the introduction of the eight-hour day on February 1, 1919, and the £10,000,000 in the latest concessions. It is stated that the gross receipts of the railways before the war were only £139,000,000 annually, and the net revenue £50,000,000. In view of the fact that there have also been increases in the cost of materials amounting to some £25,000,000 yearly, it is evident that the cost of the new concessions will have to be borne either out of taxation or increased freight rates.

## Swiss Railways' Coal Bill

The Swiss Federal Railway accounts show that the deficit has increased from \$14,355,000 in 1917 to \$41,510,000 in 1918. This is due to the increased wages, pensions, and cost of all materials, but above all to the enormously increased price of coal in the last six months of the year.

## Railway Extensions in Peru

Hector F. Escardo, Minister of Finance and Commerce, recently made a statement in one of the leading newspapers of Lima, says Commerce Reports, to the effect that the first operations of the new Peruvian Railway Construction Co. (which company was created by a Government decree) will be directed toward the extension and improvement of existing railways. He states that with the revenues from the National Tobacco Monopoly they propose to finish the railway between Lima and Huacho, the latter being a small seaport town north of Ancon. The railway between these two points is at present managed by the Peruvian Corporation, a standard gage road existing between Lima and Ancon, and it is a narrow gage between Ancon and Huacho, which requires at present the transshipment of cargo and passengers at Ancon. In all probability this railway will be changed to standard gage throughout. He states that the next work of the company will be in connection with the extension of the existing railway from the port of Chimbote to the interior town of Racuay. This road will probably open up part of the Peruvian coal fields. One of the most important undertakings will be the extension of the Central Railway of Peru from Huancayo to Ayacucho. This extension was begun several years ago, but only about 20 kilometers have been finished. They expect work to begin this month (February, 1919). Another needed improvement in the development of railway facilities in the Republic will be the proposed con-

struction of the road from the port of Chimbote to Cajabamba. It is stated that this railway will pass through one of the richest mineral and agricultural sections of the country. The present indications are that this company will not undertake, for the present at least, the construction of new railways.

### British Government Makes Concession on Transport Bill

The bill providing for the establishment of a Ministry of Ways and Communications in Great Britain and Ireland, which, as noted in last week's issue, passed to its second reading on March 18, came before the standing committee of the House of Commons for the first time on April 1, and was also considered in connection with the Money Resolution in the House itself the same evening. At the latter, considerable objection was brought up against the broad powers of the bill as relates to finances, it being feared that the control of the House would not be sufficiently retained over the actions of the new ministry. As a result, Bonar Law, for the government, made the very important concession of agreeing that the government would provide for a competent representative of the Treasury to watch the financial aspect of the schemes worked out by the ministry and to report on

proximately \$6,000,000, of which \$500,000 is to be devoted to the purchase of rolling stock.

The mineral wealth of the region through which this railway will be laid is of considerable importance; productive iron-ore, manganese, nickel, and wolfram mines being located in its immediate vicinity. Over 56,000,000 tons of iron-ore alone have been mined in that district. The agricultural wealth of the region is of no less importance, consisting in large quantities of cereals, wines, olive oil, and cork bark. Cattle raising is also a factor of interest.

Zafra is connected by a railway with Seville and Huelva, and the terminus—at Villanueva del Fresno—with Lisbon, Portugal.

Walter Francis, a British engineer, has been commissioned by the British Government, through the British Commercial Office at Madrid, to construct this railway.

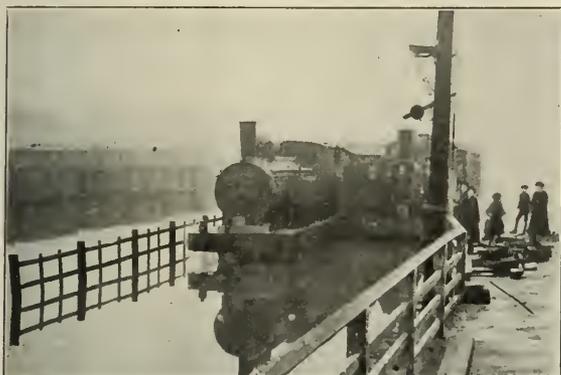

### Special Correspondence from China

PEKING, March 5.

In the recent tenders for 100 goods wagons upon the Peking Hankow line, firms representing American builders were the successful bidders.

The Peking Syndicate has so nearly concluded arrangements for a loan to the Taokow Chinghua railway, that it is advertising for tenders on 100 open wagons of 40 tons capacity each.

On February 26, a joint protest was lodged with the Ministry of Communications by the foreign diplomatic corps, concerning the discomfort caused to travellers by soldiers on the Peking-Hankow line, the use of goods wagons by soldiers to the deprivation of foreign interests needing the use of them, and the distribution of wagons so as to discriminate in favor of a mining company in which the Minister of Communications is personally interested. It is alleged that one-fifth of the entire equipment of this line is being devoted to the exclusive service of this mine.

From February 18 to 22 Floods in the Lea Valley, England, Resulted in Serious Operating Difficulties on the Great Eastern Railway. The Scene Shown Is at Tottenham Hale Station

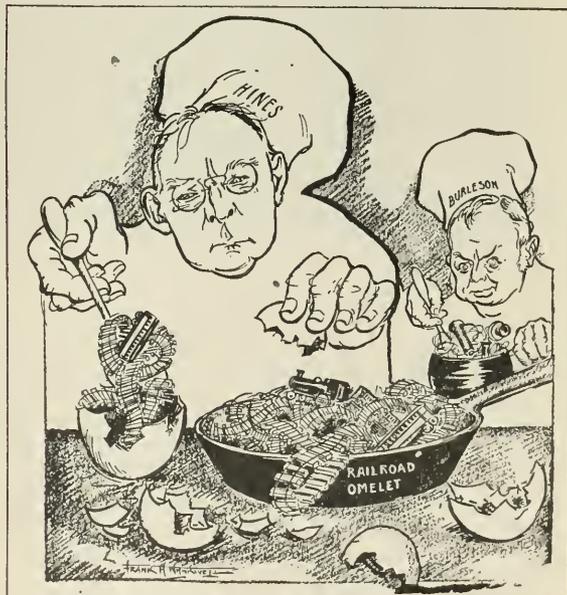

such matters not to the Minister of Ways but to the Chancellor of the Exchequer. He also stated that the government proposed in the case of every scheme which involved an expenditure of as much as £1,000,000, not in any particular year, but upon the scheme as a whole, it would before the scheme was undertaken submit it to the House of Commons in an estimate or in some other way.

Both at the session in question and before the standing committee, the government has reaffirmed its intention to fight in every way any proposed changes in the bill which will take away control over any of the facilities of transport which are now included.

### Proposed Railway in Andalusia, Spain

A railway from Zafra, Province of Huelva, to Villanueva del Fresno, Province of Badajoz, is about to be constructed, writes Consul Robert W. Harden, Seville, in Commerce Reports. Its importance will consist mainly in the means it will afford for transporting the agricultural and mineral wealth of the provinces of Huelva and Badajoz, and as a connecting line between the port of Huelva and the Portuguese frontier.

This railway is to be over 100 kilometers (62 miles) in length and the cost of its construction is estimated at ap-

## Unified Shop Record and Management Conditions

A COMMITTEE WAS recently appointed from several roads in the Eastern Region, assisted by a representative from the mechanical department of the United States Railroad Administration, to visit a number of representative shops, collect data, and make a report as to the various methods of shop operation, supervision and shop records. Copies of the recommendations of the committee have been sent out to the federal and general managers of the Eastern Region by the regional director with Circular 1801-129.A674, which states that while not mandatory, the recommendations if gradually adopted will secure uniformity in shop records and simplify many of the methods of procedure. The circular also suggests that, where no system is in use, the proposed plan may well be adopted. Reports are asked for as to what action is taken on the committee's recommendations.

The recommendations of the committee include the following:

### Supervision

The committee has paid particular attention to that supervision which comes in direct contact with the men, and invariably where the number of men assigned to one supervisor exceeded 30, a lack of activity was noticed.

It is generally conceded that shops on a day-work basis require more supervision than those on piece work, and after careful consideration it is recommended that the plan of assigning not more than 30 men to one foreman be adhered to as closely as practicable. The committee further recommends that this supervision be relieved of office clerical work during the work period; that shop staff and other meetings be held at other than the working period and that these supervisors be given the title of foremen rather than leaders.

### Checking In and Out

Your committee recommends a time clock system for checking men in and out; clock card should show employee's name, occupation and key number. Space should be provided on card for overtime as well as regular time. The same card should never be used beyond a payroll period and the one week card is preferable.

Clocks should be located convenient to the men's work and no clock should serve more than 125 employees. Unless existing agreements prohibit, clocks should be opened 15 minutes before starting time and closed promptly on whistle; opened promptly at quitting time and closed after all employees have checked out, with an attendant in charge of each clock during checking periods. This clock card should be used as a basis for payroll and checked against workmen's daily time cards.

### Routing of Locomotive Work

Experience shows that any system of despatching or scheduling of work through the shop must be predicated upon: (1) A predetermined route; (2) a predetermined time limit.

With the above in view the general outline of a routing system is hereby made. In order to properly carry out the following routing it is necessary to have a competent schedule man, with authority, to follow up the system. The locomotive should be thoroughly inspected prior to entering the shop and the schedule man furnished with a copy of the inspection report from which the shopping schedule is prepared.

Separate forms should be made out by the schedule man covering parts to be repaired in various departments and furnished each foreman. These forms should show the

locomotive number, class, date in and date scheduled out of shop and under the heading "Class of Work" the various units of the locomotive, condensed into not exceeding 30 items, to be listed in consecutive order in which the parts of the locomotive are dismantled and erected. Space should be provided opposite each of these items for the date the particular item is to be dismantled or repairs started, and the date the repairs are to be completed and erected. Space also should be provided opposite each of these items, for parts of the locomotive that it is necessary to send to the machine, smith or boiler shops, for the dates these parts should be received in the various shops and the dates they are to be completed. Space should also be provided opposite each item under the heading of "Remarks," for "Cause of delay," if any.

A "Daily Schedule Delay Report" should be furnished by the schedule man to the officers in charge, this form to cover all locomotives in shop on which any part is behind schedule. Opposite the individual engine numbers, space should be provided for the various units of repair, condensed into not exceeding 12 units of repair. Under the heading covering the units of repair space is to be provided for a check mark to show just what items are behind the schedule and delaying the work, together with the cause.

A blackboard should be provided in each department, located in a conspicuous place, for the observation of the workmen as well as the foremen. All locomotives in shop requiring work in this department are to be listed on this board. At the top of the board should be shown the units of repair with which the particular department is concerned. As the parts of the locomotive reach the department a check mark opposite the locomotive number and under the parts is made. When repairs to these parts are completed and ready for delivery to the erecting shop, another check mark is made. When they are moved from the department, the check marks are erased.

By the use of this board it is possible for any one concerned to readily ascertain in just what department the repairs to the locomotive are being delayed.

### Shop Order System

Shop or work orders should be issued to obtain the cost of manufacturing parts, repairing machines, cranes, etc., or, when desired, to determine the cost of a specific unit of locomotive repair.

After ascertaining that the necessary raw material is on hand, a shop order number should be assigned and a form issued giving the shop order number, requisition number, date issued, description, drawing number, pattern number and storehouse section. The accounting office should be notified so they may open the account.

The shop order clerk should then issue a card showing departments in which the work is to be performed and then enter in a book with duplicate stubs, kept for the purpose in the foreman's office, the work necessary in that department. After the department completes the work, the foreman will detach and return to the shop order clerk the duplicate slip. By this method it can readily be seen just what department has completed its share of the work.

When all slips have been returned, signifying the completion of the work, the accounting office is notified so it can close the account and compute the cost.

Where there is a sufficient amount of shop order work, it is recommended that a competent man be appointed, with authority, whose duty shall be to see that the work is promptly handled through to completion.

### Accounting

Of the 10 shops visited, eight have in use daily time slips (paper) and two, daily time cards (light cardboard). In all cases except one the daily time cards are made out by the

workmen and approved by the foremen. In the one case, the daily time card was also the clock card and the cards were filled out as to hours and distribution by shop time-keepers.

In all cases, locomotive numbers were shown and the number of hours spent on each, and distribution was drawn off to individual locomotives; arriving at a cost per locomotive as a unit.

The daily time cards in all but two cases provided space for description of work. In three of these cases some description was being shown and in the other seven none; but in no case were descriptions as shown considered specific and complete enough to form a basis of cost. Other than distribution to individual locomotives the only other information shown and the only other distributions made are those necessary to satisfy the requirements of the Interstate Commerce Commission classification of accounts.

### Recommendations

It is recommended that one daily time card—size preferably 4 in. x 9¼ in.—of light cardboard paper be used. The card should show name, place, date, key number, occupation, department of shop and rate and should provide sufficient space for locomotive or shop order numbers, etc., description of work and hours worked. Total hours as shown by the daily time card of each workman should be checked with total hours as indicated by registerings upon his clock time card.

After a careful consideration of this subject it is the opin-

## Storage Battery Cars for Mexican Railroad

**T**HE THREE CARS shown in the illustrations have just been delivered to the United Railway of Yucatan by the Railway Storage Battery Company. The cars are driven by motors geared to the axles and power is supplied to the motors by Edison storage batteries. The cars are designed to be operated singly or in multiple unit.

The schedule as laid out for service to be performed, covers the run from Merida to Progreso, a distance of 23.6 miles. There are six stops between terminals and the running time over the line is 45 minutes. The city of Merida has a population of 70,000, while that of Progreso is 8,000. The grade between the two cities is practically level and the total service per day is three round trips. The cars are fitted for passenger service and are able to draw a trailer carrying baggage and express matter.

### Construction

The car is constructed according to M. C. B. standards and the car body and its appliances are all steel with the exception of doors and inside fittings. The over-all length of car body is 56 ft., the extreme width is 8 ft. 6 in., and the extreme height is 12 ft. Reversible seats upholstered with rattan are used and the seating capacity of the car is 66 persons. Brill 69E trucks are used and the couplers, draft gears, and wheels conform to M. C. B. standards.

Three Storage Battery Cars Just Shipped to the United Railways of Yucatan

ion of the committee that it would be impracticable to endeavor to arrive at the cost of a smaller unit of locomotive repair, from description of work on daily time card, than the locomotive, as a whole, except by timing each individual workman, which practice the committee does not believe would be countenanced by the workmen. Therefore, it is suggested that when it becomes necessary or desirable to determine the cost of any specific unit of locomotive repair a shop order or work order be issued, to which all labor performed in connection with this specific unit of repair be charged and in this way determine its actual cost.

The American Railway Tool Foremen's Association will hold its ninth annual convention at the Hotel Sherman, Chicago, on August 27, 28 and 29, 1919.

The total weight of car without load is 28.3 tons; the batteries alone weigh 6.3 tons and the total weight of the motors and control equipment is about 3 tons. This makes a total weight per passenger of about 500 lb.

### Motor and Control Equipment

Each car is equipped with four General Electric, No. 261, 250-volt, direct current motors. There is one motor for each axle and each motor is connected to the axle with a single reduction gear. These motors were supplied to meet the requirements of supplying a single car with 88 mechanical horse-power during acceleration and 28 mechanical horse-power when running free and to supply a car and trailer with 166 mechanical horse-power during acceleration and with 39 mechanical horse-power when running free. The motors are protected by Condit instantaneous, automatic,

overload circuit breakers. Double end multiple unit control is used and the cars are connected with a seven-point cable when used in multiple units. The cars are equipped with General Electric straight and automatic air brakes.

### Battery

Each car is equipped with a battery of 252 Edison type A-12 cells; 240 of these cells are used for the power circuit

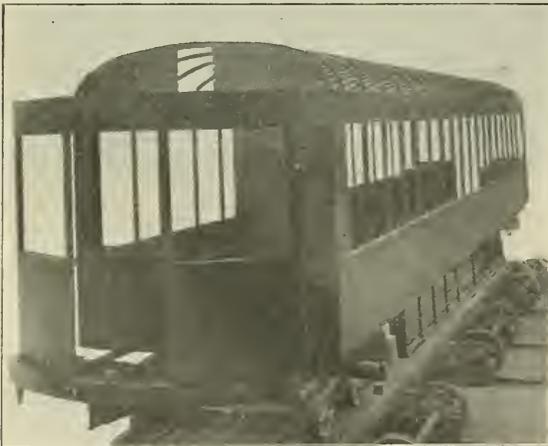

Interior of Car Showing Seating Arrangement

and eight for the lighting circuit. While the battery is being charged all of the cells are connected in series. A Sangamo ampere hour meter is installed in the charging circuit to insure the batteries the proper amount of charge.

### Performance

These cars are capable of developing a speed of 45 miles an hour on level tangent track. It is possible for them to

The Car Bodies and Their Appliances Are All Steel, Except for the Doors and Inside Finish

negotiate grades of from 8 to 10 per cent and to haul loads of from 30 to 35 tons at a fair maximum speed. They may also be used to sort and drill loads up to 150 tons. Under

ordinary service conditions their range of operation on one charge of the battery is about 120 miles.

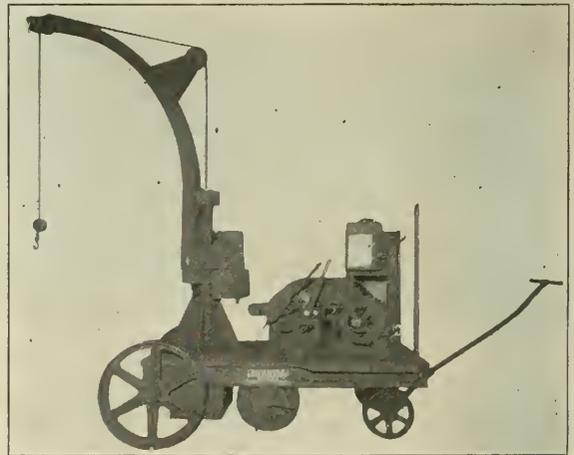

The particular advantage of this type of car as presented by the maker lies principally in the characteristic of the alkaline storage battery. As the battery is comparatively light in weight, the total weight of the car is not excessive and as the battery is strongly built and not affected by ordinary vibration and shock it lends itself particularly to this class of service. The only attention required for this class of storage battery is to keep it charged and filled with water.

A storage battery, of course, represents a loss of efficiency, but it does away with line losses and where 24-hour service is not required the cost of keeping power on the line with no cars running is eliminated. Furthermore, it is usually possible to charge batteries during an off-peak period and thereby obtain a lower charging rate.

Similar cars are in use on the Cambria & Indiana, the Lorain, Ashland & Southern, the Atlanta, Birmingham & Atlantic, the Chattahoochee Valley, the Long Island and the Pennsylvania. During the mechanical conventions to be held at Atlantic City next June a demonstration car of this type will be operated between Atlantic City and Ocean City.

### A Portable Electric Stacking Crane

**A**N ELECTRIC STACKING MACHINE designed for use in freight terminals and warehouses which can be wheeled from place to place and which is equipped with a conductor reel so that the conductor may be connected with plugs in the various parts of the house and the current thus carried to the motor on the crane is shown in the photograph. These cranes can be operated either by direct or alternating current and are made in capacities up to one ton. They are designed for high speed work, usually

The Crane Is Readily Moved from Place to Place

having a hoisting speed of from 150 to 200 ft. per minute except for short lifts, when the speed is lower.

The boom or tower can be made up to 25 ft. high and may be swung either by motor or by hand. In special installations the truck can be driven by motor and the boom may be hinged so as to permit passage through low doorways.

The principal installation of these cranes in this country is on the Boston terminal wharf. Installations have also been made at various points in Cuba. The cranes are manufactured by the Northern Engineering Works of Detroit, Mich

## New Type of Cinder Conveyor

AT THE CHASE YARDS of the Chicago & North Western at Milwaukee, Wis., a cinder pit conveyor of a new type has recently been installed. The conveyor, designed and built by the American Steam Conveyor Corporation, Chicago, carries the cinders from the ash pit to a car by the action of a steam jet. The conveyor consists of a line of pipe, into which the ashes and small cinders are fed and through which they are carried to the discharge point by current action. This current is created by the action of a jet of steam discharged at high velocity into the center of the pipe line in the direction of travel of the material. This steam discharge tends to create a vacuum behind it, which in turn creates a current of air through the intake at the end of the line.

The ash or cinder intake is conveniently located in the cinder pit at a point where the material can be raked or shoveled into the intake with the least effort. The suction pulls the ashes through the pipe line toward the steam unit fitting where the steam is introduced into the conveyor system. Here the force of the steam itself ejects the material through the discharge line. One man in a cinder pit using

Conveyor Which Discharges Cinders Through a Pipe Line by the Action of a Steam Jet

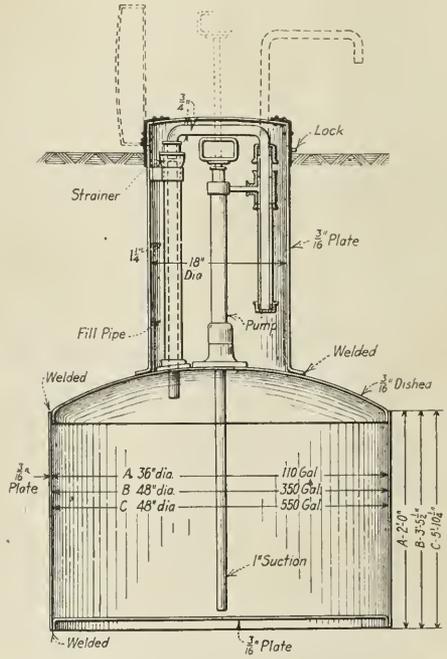

this conveyor can handle the ashes from locomotives as fast as they can be dumped, as his work is simply to shovel or rake the ashes into the intake. When all the ashes have been dumped from a locomotive, the ash handler turns on the valve which allows the steam to enter the steam unit and starts raking or shoveling steadily until the cinder pit is cleared.

One of the advantages of this system lies in its simplicity. It can be operated by the most ignorant type of labor as there are no complicated parts; the whole operation consists of turning the one valve and feeding the ashes into the hopper. So simple is the operation of these cinder pit conveyors that when male labor was scarce because of war conditions, women were placed in the pits and successfully kept them clear.

The system as installed in the Chase yards successfully handles the ashes from 45 to 60 locomotives each day, and effects a marked reduction in labor costs. Several men were previously employed in the two cinder pits in which the steam cinder conveyor has been installed and the saving in these two pits over hand operation is four men per shift. The amount of steam consumed per ton is surprisingly small, as it is used only when the conveyor is in actual operation. Steam for operating this conveyor may be secured from an adjacent power house, or it may be taken from the locomotive. The conveyor system is flexible in design and may be changed to suit the conditions at any cinder pit.

## Underground Gasoline Storage

THE STORAGE OF GASOLINE in a safe yet convenient manner is a problem arising whenever this fuel is used in appreciable quantities. On railroads it arises in connection with the operation of motor cars, water stations, coaling plants—in fact with all uses of gasoline outside of engine terminals equipped with a complete oil house. To meet this need a buried storage tank has been introduced by the Wm. Graver Tank Works, Chicago. As shown in the drawing it consists of a welded steel tank buried in the ground so that the top is covered to a depth of about 2½ ft., access being had by a steel shaft 18 in. in diameter

A Cross Section of the Tank

welded to the top of the tank and extending about 6 in. above the ground surface. This shaft contains all the equipment for filling and drawing off gasoline and is provided with a cover, so that the tank may be sealed against tampering.

The equipment consists of a 1¼-in. filling pipe, a pump and a ¾-in. discharge pipe. The latter is made to telescope into a 1½-in. pipe so that when it is to be used this discharge pipe may be drawn up out of the well and turned in a convenient position for filling a can or pail. This form of storage unit may be had in sizes varying from 110 to 1,000-gal. capacities.

The Red river division of the St. Louis-San Francisco has been abolished; the territory known as the Creek and Sherman sub-divisions, including the Sulphur branch, has been added to the Southwestern division, and the territory known as the Ardmore and the Arkinda sub-divisions, including the Platter branch, is added to the central division. The Ozark division will be abolished; the Memphis and Willow Springs sub-division, including branches, will be added to the Southern division, and the Clinton and Osceola sub-divisions will be added to the Eastern division. The office of the superintendent of the Southern division will be transferred from Birmingham to Memphis.

# General News Department

Railroad bills pending in Congress when it adjourned on March 4 have been abstracted by the Chamber of Commerce of the United States and published in a special bulletin. This bulletin also contains the more elaborate plans for dealing with the railroads which were presented at the Senate committee hearings in January and February.

An extension of 45 days in the time for filing complete tax returns, in the case of corporations, has been granted by D. C. Roper, Commissioner of Internal Revenue. In announcing this extension (to June 15) the commissioner calls attention to the fact that it is to the interest of corporations to file their returns at the earliest possible moment in order to avoid the interest charge of  $\frac{1}{2}$  of 1 per cent per month.

The Committee on Automatic Train Control of the Railroad Administration held a meeting at Washington on Tuesday of this week, and on Wednesday inspected the operation of the automatic stops between Gordonsville and Charlottesville, Va., on the Chesapeake & Ohio. This apparatus is that of the American Train Control Company, of Baltimore, Md., and it was described briefly in the *Railway Age* of March 28, page 846.

Passenger schedules between Washington and New York City have been changed during the past week, and the running time of some trains is shortened by 25 minutes; day coaches are added to certain trains now carrying only sleeping cars, and a new train with parlor cars and coaches was put in service by the Pennsylvania, leaving Washington at 12:45 p. m. Some adjustments were also made in the Washington-Baltimore service.

William J. Wilgus has been awarded a distinguished service medal, by order of General Pershing. Mr. Wilgus served throughout the greater perior of our participation in the war as deputy director general of transportation in France, with the title and rank of colonel. He was a member of the first commission sent abroad to study the transportation features of the preparations to be made for handling a large army and its supplies in France.

Abolition of the Railroad Commission and the establishment of a new Public Utilities Commission of three elective members is the object of a bill which has been introduced in the Michigan legislature. This bill is part of a scheme looking to a constitutional amendment reserving to cities and villages the sole power to regulate, control and fix rates of all public utilities within their boundaries, unless radical changes in statutes can be accomplished at this session.

One hundred and eleven miles an hour from Washington to New York, with 157 lb. of mail, is the latest American airplane record. This is reported by the Post Office Department as having been made on the regular mail-carrying trip on April 11. The flyer was Leon D. Smith. The time from Washington to Philadelphia, 128 miles, was one hour, eleven minutes; and from Philadelphia to Belmont Park, 90 miles, 47 minutes. There was a stop at Philadelphia, time not given.

## Railroad Y. M. C. A. Campaign

Arrangements for the "Continental Extension Movement" of the Railroad Y. M. C. A., which is to be inaugurated on May 18, have been completed and the slogan "Couple Up" has been adopted. It is significant that the 300 associations in this country will act as a unit in this extension movement. Another important factor is that the railroad men themselves are taking the leadership in the movement, and the secretaries are being utilized largely in an advisory capacity. While efforts will be concentrated at the opening of the campaign to increase the membership, this is only a small part of the extension program. The summer months will be uti-

lized for assimilating the new members and perfecting the general organization of the different branches and then early in the fall there will be a series of campaigns, each lasting one week, and each devoted to stirring up interest and developing plans for the year to cover the various phases of the work. For instance, there will be a religious week, a thrift week, a health and happiness week, educational week and Americanization week. It is expected that a very large number of new members will be drawn into the work and that active work will be carried on among employees who are not now served by the association.

## Highways Transport Committee

The Council of National Defense has announced a reorganization of its Highways Transport Committee. The work of the committee has been broadened to include direct representation from the office of public roads and rural engineering of the Department of Agriculture; the bureau of markets of the same department; the Post Office Department, and the Department of Commerce.

The committee as reorganized consists of the following: John S. Cravens, of the Council of National Defense, chairman; James I. Blakslee, Fourth Assistant Postmaster General; J. M. Goodell, Consulting Engineer, Office of Public Roads & Rural Engineering; James H. Collins, investigator in market survey, Bureau of Markets; R. S. MacElwee, second assistant chief, Bureau Foreign & Domestic Commerce; Charles W. Reid, executive secretary; Grosvenor B. Clarkson, director of the council, ex-officio. The committee will be assisted by the Highways Transport Committee Advisory Board, consisting of: William P. Eno, Prof. Arthur H. Blanchard, C. A. Musselman, Raymond Beck and John T. Stockton. It is the policy of the council to co-operate with all transportation agencies and to aid in the promotion of motor express lines through rural communities.

## Material-Handling Machinery

### Manufacturers' Association

The Engineering Committee of this association met at the association quarters, 35 West 39th street, New York City, on April 9. The members of the committee as at present constituted are: W. B. Clarke, Manning, Maxwell & Moore, Inc.; S. H. Libby, Sprague Electric Works; R. W. Scott, Otis Elevator Co.; D. V. Jenkins, Watson Elevator Co.; L. C. Brown, Elwell-Parker Electric Co.; A. F. Case, Wellman-Seaver-Morgan Co.; J. C. Walter, Alvey-Ferguson Co.; J. A. Shepard, Shepard Electric Crane & Hoist Co.

The committee will make studies of large industrial plants, and a special study, based on the selection of one of the new port terminal projects, for consideration of a complete installation of equipment for general cargo handling. As the committee is made up of representatives of the different divisions of material handling equipment, such as cranes, hoists, winches, conveyors, telfpers, elevators and elevating machinery, industrial trucks, tractors and trailers, mechanical bunkering equipments, chutes, etc., used in cargo and general and bulk material handling; these studies will include several lines of manufacturing plants and the special study will be made of a location and pier and warehouse development which would normally utilize all of this different equipment in the construction of one complete handling organization.

In taking up the requests presented by harbor commissions, manufacturing groups and chambers of commerce, the committee voted that for the present, in cases where manufacturers request recommendations and where terminal developments are in process, all the details will be secured

so far as possible and will be submitted to the members of the association for individual action. Plans will be made to develop a standard system of cost accounting for the handling of cargo. Zenas Carter, secretary and manager of the association, advises that interest in the association on the part of manufacturers and harbor commissions is daily increasing.

### American Lumber Congress

The program for the first American Lumber Congress, which is to be held at Chicago, April 14, 15 and 16, and of the annual convention of the National Lumber Manufacturers' Association which will also be at Chicago on April 16 and 17, includes the following topics: Trade Extension and Advertising; Lumber Merchandising Service; Standards of Wood Construction; Organization for Trade Extension; Retail Service; Governmental Relations, including an address on "The Railroad Problem," by Walker D. Hines, Director General of Railroads (Wednesday morning); American Industry in Relation to National Policy; Annual Banquet of National Lumber Manufacturers' Association; Traffic Problems; Annual Report of National Lumber Manufacturers' Association; Request of Bureau of Internal Revenue for Co-operation of Industry in Administration of Revenue Law; Progress Toward Uniformity in Cost Keeping; Price Stabilization Plan; Service of Bureau of Lumber Economics, and the Lumber Industry's Opportunity in National Affairs.

The annual banquet will be held on Wednesday evening.

### Report on Business Conditions

A report on general business conditions throughout the United States has been issued by the National Association of Manufacturers, based upon a canvass of 4,400 representative establishments in practically every line of industry. The report shows that business and industry are suffering from after-war uncertainty. Eleven obstacles tending to prevent general business activity are set forth, the fifth on the list stated being "continued government control, management and operation of railroads." The lack of railroad buying is also mentioned. An overwhelming percentage of manufacturers, the report states, recorded themselves as being in opposition to any form of government ownership of railroads or other public utilities and strongly in favor of returning the roads to their private owners. Furthermore, there is noted a demand for a more reasonable and limited form of government regulation than that which prevailed in the period prior to the taking over of the railroads by the government. Questionnaires were addressed to 22 principal groups of industries and with the exception of five of these groups, business activity was reported to be approximately between 25 and 50 per cent of normal. The five industries reporting a condition of prosperity include the producers of jewelry, silverware, musical instruments, automobiles, rubber and tobacco.

### A. F. L. Calls for Government Ownership

Now is the time to be active in pressing the argument for government ownership of railroads, says a circular issued to railroad employees by the officers of the Railway Employees' Department of the American Federation of Labor. The circular says:

"Pending the calling of a special session of Congress to enact legislation for the future control and operation of the railroads, it devolves upon the railroad employees, in whatever capacity they are employed, to use their utmost efforts in promoting sentiment favorable to a continuation of government control. Now is the time to be active; do not overlook any opportunity in pressing this argument, not only with your Senators and Congressmen, but with the public at large.

"The future of the railroads depends very largely on the employees. Government ownership and control is now on trial and public sentiment is being molded for or against it, according to the service rendered. The majority of the railroad officials are not in favor of either—government control or ownership. This is in most cases not in accordance with their own personal opinion, but they must be governed by instructions from the higher officials, and there is ample

evidence to show that they are not conducting matters with a view to promote sentiment favorable to government control.

"Many matters, no doubt, will come under your notice that are entirely at variance with what was formerly the practice under private control and which appear wasteful and deliberately extravagant. Report each case to your committee and urge them to take such matters up with the proper officials; and if the remedy is not applied we will be pleased to call the matter to the attention of the Railroad Administration."

### Western Tie Producers Object to Centralized Purchasing

The methods of the central and regional purchasing committees of the United States Railroad Administration in the purchase of ties are strenuously objected to by the tie producers of Oregon and Washington. At a meeting of several lumber and tie producing associations in Portland, Ore., on March 29, a resolution was passed protesting against the present centralized purchasing system. Represented at this meeting were the West Coast Lumbermen's Association, the Western Oregon Tie & Lumber Association, the Willamette Valley Lumbermen's Association and the Lewis River Tie & Lumber Mills Association.

Elimination of competitive buying, too rigid specifications and inspections and low returns, were the main things objected to. The tie makers now must deal with the one road on which their mills are located. Specific objections were raised against the methods used by the purchasing agent of the Southern Pacific. It is stated that it has become the practice to consider the prices published and advertised by the Railroad Administration no longer as fixed prices, but as the maximum, below which the purchasing agent may negotiate in making new contracts. In degrading ties that fail to conform to the requirements of a given grade, the inspectors are so exacting in their requirements that only a very small percentage of ties which fall slightly below the standard measurement are accepted. Returns have been so reduced that a number of associations of local producers have voted to close operations this month or as soon as individual mills have completed contracts.

These conditions have been laid before the legislature of Oregon and the legislature has memorialized the Congress of the United States as follows:

"Whereas, since (November, 1918,) poster prices have been withdrawn and many orders canceled and by order of the United States Railroad Administration, said mills can only accept orders from the purchasing agent of the Southern Pacific Company, and said agent is now offering orders only at \$3 less per thousand feet than said original poster prices, and said mills not being allowed to solicit or accept orders from other railroad companies must now accept said prices or close their mills; and

"Whereas, at a meeting on Saturday, February 15, 1919, at which were present over 60 owners of said tie mills representing a daily production of 1,500,000 ft. b. m. of ties, it was unanimously decided that under the present system it was impossible to operate without a loss. . . .

"Resolved, that the Congress of the United States be requested to take such action at once as will put an end to U. S. Government action that continually adds to our serious condition of unemployment and will provide some means by which the affairs of this nation may approach reconstruction without such disastrous results."

### Threatened New York Harbor Strike

The Marine Workers Affiliation, which is the union representing captains and crews of the tugboats in the service of the Railroad Administration, and certain other captains and crews of tugboats in the New York harbor, voted to declare a strike beginning Thursday, April 17, at 6 o'clock in the morning. The strike order, however, was postponed for 48 hours. The demand of the Marine Workers Affiliation is that tugboat captains and crews who had refused to tow coal and grain barges who thereupon became severed from the service of the Railroad Administration should be reinstated. A. H. Smith, regional director of the Eastern region, had notified the union that the men would be reinstated in service if they go back to work and perform the work which they had agreed to do under the award of J. L. Hughes. Mr. Hughes had acted as mediator in the previous strike

for higher wages and shorter hours, after V. Everitt Macy's award in this controversy had been rejected by the men. The private boat owners in New York harbor had not settled their controversy with the men that they employed at the time of the Hughes award, but the agreement under the award was that the tugboat captains and crews were to perform the same service, having been granted higher wages and shorter hours, as before the strike. Another union, also representing workers in New York harbor, principally longshoremen and workers on coal and grain barges, had recently come to an agreement with the private boat owners. The private boat owners, therefore, notified the Railroad Administration that their coal and grain barges were ready to be moved, but when the Railroad Administration ordered tugs to do this work, some of the captains and crews refused. A. H. Smith gave out the correspondence between T. L. Delahunty, president of the Marine Workers' Affiliation, and himself, and in one letter from Delahunty, the following appears:

We did agree that the Tidewater Boatmen be permitted to settle up with the individual boat owner at that time, but since then the situation has somewhat changed. John Brennan's and T. V. O'Connor's actions have brought about a change of heart among the Marine Workers' Affiliation through their strike-breaking proclivities and will not be permitted to continue this practice any longer.

The Marine Workers' Affiliation regret their inability to permit at this time the towing of coal barges by railroad towboats because of our lack of knowledge that there is an agreement in existence. We have only the statement of John Brennan for that, and as we have since learned Mr. Brennan and T. V. O'Connor have instructed to tow with either fair tugs or scabs.

We feel that it is essential for our own preservation at this time to demonstrate that neither of these two gentlemen will be permitted to sacrifice their fellow-workers without giving them the battle of their young lives.

I cannot see wherein we have violated the agreement with the United States Railroad Administration. I do not think we can prove an alibi on the grounds of misunderstanding in the issuance of orders. We do intend to carry out our contract with the United States Railroad Administration, March 15, 1919, but it is a debatable question as to a violation in refusing to tow private owned coal barges with non-union crews.

### Director General Hines at Chicago

Walker D. Hines, director general of railroads, in an address before the annual convention of the National Lumber Manufacturers' Association at Chicago, on Wednesday of this week, outlined his ideas of a permanent solution of the railroad problem and summarized the administration's views on prices of steel, purchases of materials, maintenance questions and other railroad topics. The solution for the railroad problem, he says, must rest upon a direct government guarantee at a moderate rate. He would preserve the benefit of private initiative. These two fundamental principles, said Mr. Hines, have not been recognized in any of the plans so far submitted to the Senate Committee. Private initiative can be preserved by participation of roads in profits in excess of a low government guarantee. Mr. Hines suggested government representation on railroad boards of directors, also representatives to be members of rate-regulating bodies, and the consolidation of the railroads into a few large competitive systems, each one taking in strong and weak mileage.

On the subject of steel prices the speaker outlined his negotiations with the Industrial Board. He said that his action regarding steel prices was taken because he did not feel justified in giving the Railroad Administration's sanction to the prices presented. Regarding purchases of materials and supplies he said that railroads will continue to make purchases as before. The administration has no desire to bring about prices for itself which are below the prices paid by other purchasers of commodities in similar volume. The maintenance program for this year is much greater than that would probably be carried out by the railroads under private management at the present time. The increased cost of maintenance work will make the programs much larger than in past years, measured in dollars. It is the policy of the administration to bring about a readjustment of operating costs down to a peace basis. It is clearly understood that wage levels are not to be revised; but every practice which has grown up during the war is subject to revision. In order to avoid unnecessary costs there will be a careful readjustment of hours so as to avoid the additional burden of punitive overtime.

Regarding the service rendered the public Mr. Hines said that it was the policy of the administration to attempt as far as possible to restore railroad service to the sort of service rendered before the war. He believes that the present government control is purely temporary in character, and therefore it is his duty to get the railroad service on the best possible footing. Any readjustment of the rate structure should be approached with the greatest care. To carry out a wise policy in this matter the Division of Public Service and Accounts was divided so that public service and rates could be viewed from the public standpoint.

In the evening Mr. Hines addressed the Union League Club, amplifying portions of his speech before the lumber men in the morning.

Mr. Hines and his party, composed of Max Thelen, director of the division of public service; Edward Chambers, director of the division of traffic; B. L. Winchell, regional director, Southern region; H. B. Spencer, director of the division of purchases; T. C. Powell, director of the division of capital expenditures; M. B. Clagett, assistant to the director general; R. H. Aishton, regional director, Northwestern region, and Hale Holden, regional director, Central Western region, left Chicago for the Pacific Coast immediately after the evening address.

Following Mr. Hines' address before the lumbermen his position toward steel prices and the Industrial Board was assailed by R. A. Long, a Kansas City lumberman, and J. H. Kirby, president of the National Lumber Manufacturers' Association, who requested that he reconsider his decision, and make purchases of steel so as to stabilize the industry.

### Exhibitors at the June Conventions

There has been a remarkable demand for exhibit space at the mechanical conventions which are to be held in Atlantic City, June 18-25. The Railway Supply Manufacturers' Association has furnished us with the following list of exhibitors to whom space has been assigned thus far. The president of the Railway Supply Manufacturers' Association is E. H. Walker, of the Standard Coupler Company, and the secretary is J. D. Conway, Oliver building, Pittsburgh, Pa.

Acme Machine Tool Co., Cincinnati, O.  
 A. G. A. Railway Light & Signal Co., Elizabeth, N. J.  
 Air Reduction Co., Inc., New York.  
 American Abrasive Metals Co., New York.  
 American Arch Co., New York.  
 American Automatic Connector Co., Cleveland, O.  
 American Brake Shoe & Foundry Co., New York.  
 American Flexible Bolt Co., Pittsburgh, Pa.  
 American Insulation Co., Philadelphia, Pa.  
 American Locomotive Co., New York.  
 American Malleable Castings Assn., Milwaukee, Wis.  
 American Mason Safety Tread Co., Boston, Mass.  
 American Rolling Mill Co., Middletown, O.  
 American Steam Gauge & Valve Mfg. Co., Boston, Mass.  
 American Steel Foundries, Chicago.  
 American Tool Works Co., Cincinnati, O.  
 Anchor Packing Co., Philadelphia, Pa.  
 Ashton Valve Co., Chicago.  
 Assn. of Mfrs. of Chilled Car Wheels, Chicago.  
 Atkins, E. C., & Co., Inc., Indianapolis, Ind.  
 Baker, R. & L., Co., Cleveland, O.  
 Barco Mfg. Co., Chicago.  
 Barrett Company, Philadelphia, Pa.  
 Besly, Chas. H., & Co., Chicago.  
 Bettendorf Co., Bettendorf, Iowa.  
 Bird-Archer Co., New York.  
 Blackall, Robert H., Pittsburgh, Pa.  
 Blevney Machine Co., Greenfield, Mass.  
 Boss Nut Co., Chicago.  
 Bowser & Co., S. F., Inc., Fort Wayne, Ind.  
 Bradford Draft Gear Co., Atlanta, Ga.  
 Buckeye Steel Castings Co., Columbus, O.  
 Buda Company, Chicago.  
 Buffalo Brake Beam Co., New York.  
 Bullard Machine Tool Co., Bridgeport, Conn.  
 Byers, A. M., Co., Pittsburgh, Pa.  
 Cambria Steel Company, Philadelphia, Pa.  
 Camel Company, Chicago.  
 Carbic Manufacturing Co., Duluth, Minn.

## Traffic News

The North Carolina Pine Association at its thirtieth annual meeting at Norfolk, Va., recently, passed resolutions advocating the immediate return of the railroads to private ownership.

The Eastern Steamship Line announces the re-establishment of the Metropolitan line of steamers between New York and Boston. These boats will start at 5 p. m. and will make the journey by way of the Cape Cod canal, in about 14 hours.

The Topeka (Kan.) Traffic Association complains of the methods of the Railroad Administration in handling freight and has asked Senators Capper and Curtis to aid in securing an improvement. The sailing day plan is the main point of attack. The association is unanimous in asking the return of the railroads to private ownership.

Betterment of shipping condition and cooperation in developing the foreign trade of the middle west, is the object of recent action of the Chicago Freight Forwarders' and Customs Brokers' Association. Committees have been appointed to investigate questions relating to export traffic by way of both Atlantic and Pacific ports. The officers of the association are: President, J. P. Collins, of the G. W. Sheldon Company; vice-president, Walter J. Riley, of the Judson Freight Forwarding Company; secretary, S. E. Boughton, of the Overseas Shipping Company.

On April 9 there were 33,619 carloads of export freight on hand at North Atlantic ports, compared with 36,023 for the same day of the preceding week. Exclusive of bulk grain, there were 10,390 carloads of export food on hand at these ports, compared with 10,589 carloads as of April 1. There were 21,306,515 bushels of grain in elevators at North Atlantic ports; received during the week, 5,910,992 bushels; cleared 6,024,250 bushels. Elevators at South Atlantic and Gulf ports held 4,009,408 bushels of grain. The situation is regarded as entirely satisfactory.

The transportation bureau of the Denver (Colo.) Civic and Commercial Association has filed a protest with the Railroad Administration against two proposed plans to change west-bound freight rates, one of which is for a zone or mileage system, which it is claimed would be unfair to Colorado's mountain railroads, and the other for a new tariff of rates compiled jointly by the San Francisco and Portland freight traffic committees. The bureau recommends that Denver rates be fixed on a percentage basis in relation to through rates between Mississippi river points and the Pacific coast.

A joint resolution criticising the action of the Railroad Administration in proposing the division of San Francisco, Oakland and Los Angeles into zones for switching purposes, has been adopted by the California Senate. It is claimed this plan will greatly increase switching charges at these points. The proposition has not been submitted either to the Interstate Commerce Commission or to the Railroad Commission of the state and no justification has been offered for the proposed readjustment. The resolution further requests Congress to investigate the proposed attempt of the Railroad Administration to increase charges without first submitting the proposition to the regulatory bodies having jurisdiction over these matters for approval.

The number of revenue freight cars loaded in the North-western region in March was slightly less than in March, 1918. The grain and grain products, livestock, coal and coke, lumber and forest products, ore and miscellaneous cars loaded totaled 471,702 this year, as compared with 490,419 during the same month last year. The number of revenue freight cars received from connections in this region remain practically stationary, 302,318 cars being received this year as compared with 310,390 during the same period last year. Corn and oats show a substantial decrease but the total number of grain cars loaded remains practically the same, due to a substantial increase in wheat and miscellaneous grain. Bituminous coal loaded shows a decrease, 22,924 cars as compared with 32,701.

## Commission and Court News

### Interstate Commerce Commission

The Interstate Commerce Commission has discontinued its investigation into the rates and practices of various carriers of oil and other commodities by pipe lines or partly by pipe lines and partly by railroad or partly by pipe lines and partly by water, which was begun seven years ago.

In a decision in the case of the Public Utilities Commission of the State of Colorado, et al., vs. Atchison, Topeka & Santa Fe Railway, et al., the Interstate Commerce Commission finds that the record is not convincing that the class freight rates in effect April 21, 1916, between Chicago, the Mississippi river and the Missouri river, on the one hand, and Colorado common points on the other, were, or that the rates initiated by the director general and made effective June 25, 1918, are unjust, unreasonable or unduly prejudicial, although certain of the commodity rates from Chicago and the rivers to Colorado common points appear to have been and to be relatively high by comparison with rates to Utah common points. The commission finds that no adequate basis for readjustment has been put into the record. Class rates made effective June 25 which carry the increase ordered by the director general between Denver and Pueblo and certain points in interior Kansas and Nebraska; between Denver and points grouped therewith, and Galveston, Texas, and intermediate points in Texas; from Denver and other points in Colorado to certain stations in New Mexico, Arizona and Texas; and from Denver and Denver rate points in Colorado to certain stations in Nebraska, South Dakota and Wyoming, are held to be unjust, unreasonable and unduly prejudicial to the extent that they exceed the scale of maxima prescribed in the order.

### Valuation Hearing

The Interstate Commerce Commission has assigned for oral argument at Washington on May 26 the valuation cases of the Texas Midland; Atlanta, Birmingham & Atlantic; Kansas City Southern; Winston-Salem Southbound, and Elgin, Joliet & Eastern, for the purpose of hearing such arguments as the parties may desire to present as to the final valuation which the commission should find and report; and as to the elements to be considered and the weight to be attributed thereto in finding the final valuation in any case.

### State Commissions

A hearing will be held on April 22, before the Railroad Commission of Texas on plans to restore all passenger trains to a pre-war basis on the Missouri, Kansas & Texas, the Texas & Pacific and the International & Great Northern.

### United States Supreme Court

The Supreme Court of the United States will be asked to make an early decision in the controversy between the Railroad Administration and various state governments as to the legality of increases in freight and passenger rates ordered by the director general, superseding rates made by state authority. The attorney general of the United States has filed appeals in the Supreme Court from the decrees of the North Dakota Supreme Court enjoining the railroads in that state from charging the increased rates and ordering them and the director general to show cause why the injunction should not be made permanent. Attorneys for the Railroad Administration filed motions asking the court to hear arguments at this term in the hope that a decision may be handed down before the summer adjournment.

In addition to above the American Locomotive Company shipped 26 miscellaneous domestic locomotives and completed 32 foreign locomotives; and the Baldwin Locomotive Works shipped 1 miscellaneous domestic locomotive and completed 96 foreign locomotives.

## Freight Cars

THE GREAT NORTHERN REFINING COMPANY, Chicago, is inquiring for 125 eight thousand gallon tank cars for lease for 90 days.

THE BROKEN HILL PROPRIETARY COMPANY, has ordered 6, 50-ton steel hopper cars from the American Car & Foundry Company.

THE SOUTHERN ALBERTA REFINERIES COMPANY, has ordered one 40-ton, 8,000-gal. tank car from the American Car & Foundry Company.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for 20 second-hand, 30 to 40 ton capacity flat cars.

THE CUBAN AMERICAN SUGAR COMPANY, New York, has ordered 100 narrow gage cane cars from the American Car & Foundry Company for export to Cuba.

## Supply Trade News

The Union Asbestos & Rubber Company of Chicago will remove its general offices from 112 West Adams street, Chicago, to 2834 South Loomis street, effective April 22.

Jasper A. Writer, secretary and treasurer of the Colorado Fuel & Iron Company, died in Denver on March 31. Mr. Writer had been connected with the company for over 37 years.

The Chicago Pneumatic Tool Company has moved its Milwaukee office from room 1305, Majestic building, to room 1418 in the same building, where more convenient quarters necessitated by the growing business of the company in this district have been obtained.

The Chicago branch of the General Asbestos & Rubber Company, Charleston, S. C., has recently moved into new quarters at 14 North Franklin street, Chicago, the rapid growth of the business in Garco asbestos products having made the old quarters at 106 West Lake street inadequate.

A. M. Mueller, manager of the St. Louis branch of Joseph T. Ryerson & Son Company of Chicago, has been promoted to general manager of sales, in which capacity he will have charge of all warehouse and mill products for all territory west of Pittsburgh. He was born at Plymouth, Ind., on July 30, 1874, and received his education in the public schools at that place. His business career dates back to 1899 when he first entered the employment of the Joseph T. Ryerson & Son as a clerk in the credit and cashier department. During this period he served successively as traveling salesman, Texas representative for three years and manager of the New York and Minneapolis offices until 1911, when he was appointed assistant manager of sales. Later he went to St. Louis, Mo., as manager of the Ryerson-Hagar plant, being recalled at the end of three years to handle the sales at the main plant at Chicago.

J. M. Borrowdale, formerly superintendent of the car department of the Illinois Central and for the past two years sales representative of the H. W. Johns-Manville Company at Milwaukee, Wis., has been appointed sales representative in the railroad department of the Liberty Steel Products Company, Inc., with offices in the McCormick building, Chicago.

Philip K. Condict, who has until recently been in government service, has been elected vice-president of the International Western Electric Company, Incorporated. In the summer of 1917, Mr. Condict gave up his work as foreign sales manager for the company to take charge of the New York office of the War Trade Board, after a short stay with the Department of Commerce. In December, 1917, he received a commission as major in the Quartermasters' Corps, U. S. A., serving in that capacity until July, 1918. He was then detailed to the Signal Corps with the same rank, and served in France until January.

Willis B. Clemmitt and George H. Ruppert have entered the employ of the Powdered Coal Engineering & Equipment Company of Chicago as advisory engineers. Mr. Clemmitt was formerly associated with the Central Iron & Steel Com-

pany at Harrisburg, Pa., and Mr. Ruppert, before his entry into the chemical branch of the government military service, had charge of the sodium-ferro-cyanide department of the Semet-Solvay Company.

William H. Basse has been appointed manager of the Detroit (Mich.) plant of the Joseph T. Ryerson & Son Company. Mr. Basse has been in the employ of this company since November, 1900, and for the past ten years has held various positions in the sales department at Chicago. In August, 1918, he was transferred to the Detroit office as acting manager of the Detroit plant, succeeding Ralph J. Stacyman, who left the company temporarily to fill a war vacancy existing at the Chicago office and who later resigned.

Captain C. A. Duntley, who recently received his honorable discharge from the army after serving as captain in the 27th Field Artillery, has been elected vice-president of the Duntley-Dayton Company, with headquarters in the Westminster building, Chicago. He was born in Chicago on October 21, 1892, and received his education in Armour Institute, Chicago and at Cornell University, from which latter school he graduated in 1914. Captain Duntley will have charge of the sales work of the pneumatic and electric tool department of the company.

Captain C. A. Duntley

F. J. Foley has been appointed general sales agent of Railway Steel-Spring Company, with headquarters at New York. Mr. Foley's connection with the company dates from its organization in 1902. For the past eight years he has occupied the position of general superintendent.

The Portland Cement Association announces the opening, effective April 1, of a new district office of the association at Des Moines, Iowa, room 404, Hubbell building, 9th and Walnut streets, with L. R. MacKenzie as district engineer in charge. Mr. MacKenzie recently held the rank of Captain and Engineer of Roads on the staff of the Commanding General of the Port of Embarkation at Newport News, Va., and has been identified with road work for 12 years in the middle west and on the Pacific coast, both as engineer and contractor.

F. V. Sargent, whose appointment as district manager of sales of the Chicago Pneumatic Tool Company, Chicago, with headquarters at Boston, Mass., was announced in the *Railway Age* of April 11 (page 973), was born in Belmont, Mass., on December 15, 1881. He began his business career in 1905 with the Bethlehem Ship Building Company as drafting clerk, and later in charge of the heat treatment department and physical laboratories. In 1914 he entered the sales department of that company, in which capacity he remained until 1918, when he resigned to accept the position as district sales manager of the Chicago Pneumatic Tool Company.

Captain L. R. MacKenzie, engineer of roads on the staff of the commanding general of the port of embarkation at Newport News, Va., and who for the past 12 years has been identified with highway work in the middle west and on the Pacific coast both as an engineer and as contractor, has been appointed district engineer of the Portland Cement Association of Chicago in charge of the new district office located in the Hubbell building, Des Moines, Iowa.

The Toledo Pipe Threading Machine Company, Toledo, Ohio, has organized a "Toledo Ten-Year Club," whose membership will be limited to owners of Toledo Pipe Threading machines that have been in service ten years. All applica-

A. M. Mueller

tions for membership must be in by July 1, 1919, and on that date the six members owning the six oldest "Toledos" will be notified and given their choice of a "Toledo" Ratchet Threader complete or a "Toledo," No. O, tool.

The William Graver Tank Works, East Chicago, Ind., has published the first issue of a new house organ for the benefit of its employees, of which **K. W. Bartlett**, assistant general manager of the company, is manager, and **C. B. Swanson**, editor. Two interrogation points appear at the head of each page of the first issue in place of a name. A prize of \$10 is offered to the employee suggesting the best title. For the present the paper will be published twice a month.

**Colonel Robert Andrews**, one of the pioneers in American railroad construction and a former president of the Safety Car Heating & Lighting Company, died at his home in East

Orange, N. J., on April 7, in his 85th year. Col. Andrews was born August 2, 1834, at Andrewsia, near Wilmington, Del. His early schooling was at the Episcopal academy, of Cheshire, Conn., where he graduated in 1849. He then entered Trinity college, Hartford, Conn., graduating in 1853, and in 1854 completed a course at the Polytechnic college, Philadelphia. He adopted civil engineering as a profession, beginning his career as assistant engineer, Union Canal & State Canals of Pennsylvania.

R. Andrews

His long career of railroad engineering began in 1857 as principal engineer of surveys and construction on the Sunbury & Erie. In 1859 he went to the South Pennsylvania Railroad as principal engineer of surveys until the outbreak of the Civil War, when he was made a major of the 2nd Regiment, Delaware Volunteers. He was advanced to the rank of colonel in 1863. At the close of the Civil War he was made principal engineer of the Saratoga & Hudson River Railroad from 1863 to 1865; division superintendent of the Toledo, Wabash & Western from 1865 to 1873; chief engineer of the same road from 1873 to 1875; and general superintendent and consulting engineer of the Wabash System from 1875 to 1884. Then for one year he was consulting engineer of the Wabash, St. Louis & Pacific, and in 1885 was made general superintendent and engineer of the Virginia Midland. In 1889 he left railroad service to take the position of vice-president of the Safety Car Heating & Lighting Company. In December, 1901, he was elected president of this company, and from May, 1907 to 1915, he was chairman of the board of directors.

The American Steam Conveyor Corporation, Chicago, announces the appointment of **Charles H. Florandin**, formerly of the National Electric Welding Company, New York, as general manager of the eastern territory, with headquarters at the New York office, 110 West 40th street. Mr. Florandin, who assumes charge of his new duties May 1, was born in France and received his technical education at the famous Lycee de Marseilles. He is an engineer by profession, and upon coming to the United States did important work with the Brooklyn City Railway in the early days when the road was being electrified. After five years' service with this company, he joined the C. & C. Electric Company, New York, where he held a responsible position with them for many years. After a brief connection with the Western Electric Company, he returned to the C. & C. Electric Company, and later organized the National Electric Welding Company. During the war Mr. Florandin was a member of the welding committee of the Emergency Fleet Corporation.

## Westinghouse Electric's European Interests

General Guy E. Tripp, chairman of the board of the Westinghouse Electric & Manufacturing Company, issued this statement recently concerning his trip abroad: "Subject to the successful accomplishment of certain legal details in Europe, which, however, may be waived by the Westinghouse Company if thought desirable, an agreement has been reached with certain important British interests under which the Westinghouse Company sells for cash its British holdings and enters into a commercial alliance looking to the development of export business.

"The commercial plan will be instituted immediately, upon the assumption that the whole deal will be consummated on one of the bases above indicated. No further details can be given out at this time."

## Railway Business Association

This association's committee on government purchasing policies was organized in New York City this week. The chairman of the committee is Knox Taylor, president of the Taylor-Wharton Iron & Steel Company, High Bridge, N. J.; and the other members are Samuel G. Allen, vice-chairman, Franklin Railway Supply Company, New York; G. S. Brown, president, Alpha Portland Cement Company, Easton, Pa.; Andrew Fletcher, president, American Locomotive Company, New York; Howard A. Gray, manager railroad sales, Joseph T. Ryerson & Son, Chicago; A. L. Humphrey, president, Union Switch & Signal Company, Swissvale, Pa.; A. H. Mulliken, president, Pettibone, Mulliken & Co., Chicago; L. G. Parker, assistant manager of sales, Cleveland Frog & Crossing Company, Cleveland, Ohio; W. H. Woodin, president, American Car & Foundry Company, New York.

## Trade Publications

**DRILLS AND REAMERS.**—The Clark Equipment Company, Buchanan, Mich., lists and briefly describes all of the standard tools comprising the Celfor line in catalogue No. 16. These include drilling and reaming tools of various kinds, drill chucks, drill sockets, lathe tool holders, tool bits, flue cutters and drill gages. In the back of the book are several pages of tables showing feeds and speeds for Celfor drills and decimal equivalents in inches of millimeters and fractions of an inch.

**PERFORATED METALS.**—The Hendrick Manufacturing Company, Carbondale, Pa., manufacturers of perforated metals, etc., has issued a catalogue of 127 pages which will be found useful for reference purposes to the user of perforated metals. Thirty-six pages are devoted to reproductions of standard perforated screen plates and 25 pages to illustrations of manufactured screens for various purposes in handling coal, cement, ore, etc., including strainers for locomotives and metal spark arresters for locomotive front ends. This company also manufactures elevator buckets, conveyor troughs and flights, stacks, tanks, hoppers, etc., which are also listed in this catalogue. Of special value should be found the tables showing the styles and sizes of perforations and the spaces between holes and maximum widths and gages in steel, according to the United States standard gage, and a number of tables of weights, measures, and gages for coal screens, decimal equivalents, metric conversion tables, etc.

**BALDWIN LOCOMOTIVES.**—In September, 1918, the Baldwin Locomotive Company completed the erection of its fifty-thousandth locomotive, which is the subject of Record No. 91. This locomotive is one of a group of 12 built for the Southern Railway Company and is of the Mallet articulated type with 2-8-8-2 wheel arrangement. The booklet gives some interesting facts regarding the Southern Railway System and a brief review and several illustrations of motive power built by the Baldwin Locomotive Works for this road, in addition to a description of the 12 Mallet locomotives represented by locomotive No. 50,000. It also contains interesting information regarding the growth of the locomotive industry and of the Baldwin Locomotive Company's plants, illustrations showing the shop in which the first Baldwin locomotives were constructed and the various plants in operation at the present time.

## Railway Financial News

**BOSTON & MAINE.**—Attorney James L. Doherty, of Springfield, Mass., has been elected chairman of the federal trustees of the New Haven stock interests in the Boston & Maine to succeed the late Marcus P. Knewlton. Mr. Doherty has been a trustee and is a New Haven director.

**CHICAGO, MILWAUKEE & ST. PAUL.**—The president has sent a letter to stock holders in part as follows:

On January 1, 1918, the United States government took over the possession, use and operation of the company's railway and system of transportation together with all balances due from agents and conductors, all cash on hand as working capital, and all materials and supplies, and has since continued to control and operate it. The rental for the Chicago, Milwaukee & St. Paul and its six subsidiary railways amounts to \$27,506,771.

The company filed with the government claims somewhat in excess of \$2,000,000 for extra compensation. The general policy adopted by the director general has been to deny all claims for extra compensation. However, due to the recent expenditures for the installation of the electrical operation of 440 miles of the company's railway between Harlowton, Mont., and Avery, Idaho, in February, he allowed the company as extra compensation of \$440,000 per annum, making the total annual compensation \$27,946,771.

For the purpose of acquainting you with the financial condition of the company the following statements of income, receipts, disbursements and obligations for the year ended December 31, 1918, are submitted:

Annual compensation due from the U. S. R. R. Administration for the year ended December 31, 1918.....	\$27,506,771.45
Extra compensation .....	440,000.00
Total compensation due from U. S. R. R. Administration.....	\$27,946,771.45
<b>Other Income:</b>	
Income from lease of road (Lake Minnetonka Line) .....	\$1,833.34
Rentals received—miscellaneous.....	234,213.71
Non-operating property income.....	751,240.03
Dividends on securities owned.....	170,344.00
Interest on securities owned.....	9,295.00
Miscellaneous interest on additions and betterments, and on advances to subsidiary companies .....	414,431.00
Income from sinking and ins. res. funds.....	34,801.30
Miscellaneous income .....	42,405.04
Revenue earned prior to January 1, 1918, credited in account by the U. S. R. R. Administration .....	1,143,676.31
	<u>2,302,239.73</u>
	\$30,249,011.18
<b>Income Deductions:</b>	
Interest on bonds.....	\$16,767,186.15
Corporate organization expenses.....	163,214.77
War taxes accrued.....	376,628.03
Miscellaneous rentals paid.....	27,520.32
Expense of separately operated properties.....	124,845.46
Interest on notes.....	663,084.31
Miscellaneous income charges.....	153,952.77
Income appropriated to sinking fund reserves .....	147,104.19
Expenses prior to January 1, 1918, charged in account by the U. S. R. R. Administration .....	5,583,965.45
	<u>24,007,501.45</u>
Net corporate income.....	\$6,241,509.73

While the amount of the annual compensation to be paid the company under the terms of the agreement with the director general is \$27,946,771, only a small part of this amount, viz., \$6,275,000, was paid by the United States Railroad Administration to the company during the year 1918. The company was, therefore, under the necessity of borrowing certain funds to meet interest payments and other corporate obligations, as follows:

Loan from the War Finance Corporation, Washington, D. C., to pay interest.....	\$8,500,000.00
Loans from New York banks, to pay interest.....	4,500,000.00
Loan from United States Railroad Administration, to pay interest.....	857,000.00
	<u>\$13,857,000.00</u>

Besides the above loans there is due the United States Railroad Administration, for open accounts, \$2,912,846, which will be deducted from the compensation for 1918.

In addition, the company was under the necessity of obtaining a loan from the War Finance Corporation to retire the trust certificates of the Puget Sound & Willapa Harbor, one of its six subsidiary railways, amounting to \$3,000,000, which matured June 1, 1918, the payment of which the company had guaranteed. The United States Railroad Administration also has a charge against the company of \$10,872,712, on account of expenditures made by it for additions and betterments to the company's property during the year 1918. Furthermore, the United States Railroad Administration has allocated to the company 100 heavy Mikado locomotives and 3,000 box cars (1,000 of which are to be built in the company's shop at Milwaukee), the cost of which the company is obliged to meet. These last three charges will be financed as soon as conditions will permit.

While your board is hopeful of better conditions, and more favorable results for the year 1919, the complications and uncertainties of the railroad situation in general render it impossible to make a definite forecast at this time. Meanwhile, the property of the company is being well maintained and with the return of normal conditions it is confidently expected that more favorable results will follow.

**DENVER & SALT LAKE.**—The bill for the acquisition of the Moffat road and the boring of the James Peak tunnel was signed by Governor Oliver H. Shoup on April 9.

**LOUISVILLE & NASHVILLE.**—This company is preparing to issue shortly \$7,323,000 series "B" equipment trust bonds, to bear interest at six per cent and mature in semi-annual installments over a period of fifteen years.

**MISSOURI, OKLAHOMA & GULF.**—Judge William C. Hook, of the United States Court of Appeals, sitting at Muskogee on April 5, rendered the final decree in the case of St. Louis Union Trust Company against the Missouri, Oklahoma & Gulf. He rendered judgment to the bondholders for approximately \$16,000,000 and appointed J. W. Seely, of Muskogee, as special commissioner to sell the railroad property at public auction at some date to be designated by him. John H. Atwood, of Kansas City, was appointed special referee to determine the status of and adjust all unsettled claims.

**NORFOLK & WESTERN.**—The stockholders have voted to increase the common capital stock of this company by \$100,000,000 to an aggregate of \$250,000,000, and have authorized the directors to create, issue and sell from time to time convertible bonds to an aggregate of \$108,431,000.

**WESTERN PACIFIC.**—The executive committee of this company has refused to accept as its standard return the average operating income for the three test years ended June 30, 1917, which was \$1,917,038. The company claims that its just compensation from the Railroad Administration should be \$4,557,195 and bases its claim on the following items:

Net railway operating income for year ended June 30, 1917.....	\$3,112,628
Est. net earnings from branch lines and other facilities not reflected 1917 .....	623,500
Decrease in hire of equipment on account of purchase of new equipment delivered in July, 1917.....	235,888
Six p. c. int. on new equipment contracted for prior to December 31, 1917, but delivered in June and October of 1918 at cost of \$4,120,000.....	247,200
Depreciation on equipment 2½ p. c on \$4,120,000.....	92,700
Yearly saving in water service.....	40,114
Six p. c. int. on \$523,287 capital expended completed in 1918 or work still in progress.....	35,176
Six p. c. int. on value of construction material above normal on December 31, 1917, amounting to \$308,206.....	18,492
Loss in excess earnings March 1 to June 30, 1917.....	26,097
Annual expenses of maintaining corporate organization.....	94,000

The railroad company will ask that the entire question of federal compensation be submitted to a board of referees which will be appointed by the Interstate Commerce Commission in accordance with the provisions of the federal control act.

The construction of a tunnel, for automobiles, beneath the Hudson river, between New York City and Jersey City, seems to be assured by the action of the legislature of New York, which has made an appropriation of \$1,000,000 for the beginning of the work. The governments of New York and New Jersey appear to be substantially agreed as to the general plans. The estimated cost of the tunnel is \$12,000,000, and the time necessary for the construction about two years.

# Railway Officers

## Railroad Administration

### Central

**R. Walton Moore**, assistant general counsel of the Railroad Administration and formerly commerce counsel for the Southern Railroad, has recently resigned to become a candidate for Congress.

### Federal and General Managers

**E. H. Utley**, general manager of the Bessemer & Lake Erie, with offices at Pittsburgh, Pa., has been appointed federal manager.

**A. M. Darlow**, general manager of the Buffalo & Susquehanna, with office at Wellsville, N. Y., has been appointed federal manager.

**A. G. Whittington**, general manager and **A. R. Howard**, acting federal treasurer of the International & Great Northern, the Galveston, Houston & Henderson and the Houston & Brazos Valley have had their jurisdiction extended over the International & Great Northern (Spring to Fort Worth and Madisonville branch) which line was placed under the authority of **J. L. Lancaster**, federal manager at Dallas, Tex., upon the reorganization of the Southwestern region on March 1.

**J. E. Callahan**, whose appointment as general manager of the St. Louis Southwestern, the St. Louis Southwestern of Texas, the Eastern Texas, the Dallas Terminal and Union Depot, the Southern Illinois and Missouri Bridge and the Louisiana & Arkansas, was announced in the *Railway Age* of March 7 (page 553), began his railway career with the Chicago, Milwaukee & St. Paul. He resigned from that road after three years' service to enter the employment of the St. Louis-Southwestern in 1893 as an operator and agent, since which he has been consecutively train despatcher, assistant chief despatcher, chief despatcher and superintendent until his recent appointment.

Effective April 1, the jurisdiction of the following officers of the Gulf, Colorado & Santa Fe, the Atchison, Topeka & Santa Fe (Pauls Valley, Lindsay and Sulphur districts only), the Fort Worth Union Passenger Station, the Union Terminal of Dallas, the Texas Midland and the Galveston Wharf Company is extended over the Beaumont, Sour Lake & Western, the Houston Belt & Terminal, the Iberia, St. Mary's & Eastern, the New Iberia & Northern, the New Orleans, Texas & Mexico, the Orange & Northwestern and the St. Louis, Brownsville & Mexico. **W. E. Maxson**, general manager; **J. S. Hershey**, freight traffic manager; **J. W. Terry**, general solicitor; **F. Merritt**, chief engineer; **D. W. McLeod**, federal auditor. **M. Eckert**, auditor, and **J. H. Lauderdale**, acting federal treasurer of the Houston Belt & Terminal have had their jurisdiction extended over the same roads, effective on the same date.

### Operating

**R. C. Reid**, trainmaster of the New Orleans & Northeastern, with office at Hattiesburg, Miss., has been appointed superintendent of the same road and the New Orleans Terminal, vice **A. A. Woods**, promoted.

**W. C. Bevington**, trainmaster on the Missouri Pacific, has been appointed superintendent of the Joplin division, with headquarters at Nevada, Mo., and **C. A. Clements**, trainmaster at Cornell, Kan., has been appointed superintendent of the Kansas City Terminals, with headquarters at Kansas City, Mo.

**A. A. Woods**, superintendent of the New Orleans & Northeastern, with office at Hattiesburg, Miss., has been appointed chief engineer maintenance of way and structures, of the

Southern Railroad lines and associated railroads, lines west, with office at Cincinnati, Ohio, vice **Curtis Dougherty**, deceased.

**Colfax B. Wildman**, whose appointment as general superintendent of the Eastern district of the Missouri Pacific, with headquarters at St. Louis, Mo., was announced in the

C. B. Wildman

*Railway Age* of April 4 (page 923), was born in Shipman, Ill., on May 23, 1869. He began his railway career in 1883 with the Chicago & Alton as an operator since which he has been consecutively, from 1884 to 1885, agent and operator on the C & H line; 1887 to 1889 despatcher and copy operator on the Atchison, Topeka & Santa Fe; 1889 to 1890 operator on the Northern Pacific, and from 1890 to 1893 despatcher and night chief despatcher on the same road. The following year he was engaged in private busi-

ness. He re-entered railway service in 1894 as a despatcher and chief despatcher on the Missouri, Kansas & Texas, in which capacity he served until 1898 when he entered the employ of the Chicago & Alton as chief despatcher. In 1904 he resigned from that road to enter the service of the Missouri Pacific as despatcher and chief despatcher, and from that date to 1916 he was consecutively with the same road as trainmaster, superintendent of the Central division and superintendent of the Eastern division, which position he held prior to his recent appointment.

**J. Cannon**, whose appointment as general superintendent of transportation of the Missouri Pacific, the Memphis, Dallas & Gulf, the Natchez & Southern, and the Arkansas Central,

with headquarters at St. Louis, Mo., was announced in the *Railway Age* of April 4 (page 923) was born at Cairo, Ill., on May 6, 1872. He entered railway service in 1886 as a laborer in the mechanical department of the Illinois Central. By May 1, 1892, he had been promoted several times and on that date was made chief clerk to the assistant superintendent of the Chicago division. He was soon promoted again and served successively as chief clerk to the superintendent of the Amboy and St. Louis divisions; chief clerk to the general

J. Cannon

superintendent of transportation; assistant trainmaster on the St. Louis division; chief clerk to the general manager and trainmaster on the Springfield and Chicago divisions. In October, 1905, he entered the employ of the Missouri Pacific-Iron Mountain system as superintendent of the Southern Kansas division, with headquarters at Coffeyville, Kan., since which he has been consecutively to date, division superintendent at Little Rock, Ark., and De Soto, Mo.; superintendent of the Missouri division of the Eastern district at Poplar Bluff, Mo.; superintendent of the Eastern division at Sedalia, Mo.; general superintendent of the Eastern district; acting general superintendent of transportation with headquarters at St. Louis, Mo.;

general superintendent of transportation and general superintendent of the Eastern district, which latter position he held prior to his recent promotion.

Fred C. Smith, whose appointment as assistant superintendent of the Salt Lake division of the Southern Pacific, lines south of Ashland, with headquarters at Ogden, Utah, was announced in the *Railway Age* of April 4 (page 923), received his honorable discharge from the army in the latter part of February. He entered military service in March, 1917, and served as a first lieutenant in the Engineers Corps, Russian Railway Service, returning to this country in July, 1918, when he was promoted to captain and assigned to an engineer unit in which capacity he served in France from September, 1918, until his return to this country in February, 1919.

### Financial, Legal and Accounting

J. J. McEwen has been appointed federal auditor of the Gulf, Mobile & Northern and the Meridian & Memphis, with office at Mobile, Ala., vice H. M. Hood, who has resigned to accept a position with the Railroad Administration at Washington.

E. M. Devereux, acting federal treasurer of the Baltimore & Ohio, has been appointed federal treasurer of the Baltimore & Ohio, Eastern Lines; the Coal & Coke; the Morgantown & Kingwood; the Western Maryland; the Cumberland Valley, and the Cumberland & Pennsylvania, with headquarters at Baltimore, Md.

### Traffic

R. H. Rolfe, passenger service agent of the Seaboard Air Line, with office at Jacksonville, Fla., has been appointed district passenger agent, with headquarters at Tampa, vice R. E. Camp, resigned.

A. Hilton, assistant traffic manager of the St. Louis-San Francisco, the Kansas City, Clinton & Springfield, the Paris & Great Northern Belt, the West Tulsa Belt and the Rock Island-Frisco Terminal, has been promoted to traffic manager of these roads and also of the St. Louis-San Francisco & Texas and the Fort Worth & Rio Grande, with headquarters at St. Louis, Mo. The office of assistant traffic manager has been abolished.

### Engineering and Rolling Stock

C. A. Sasse has been appointed divisional car foreman on the Pennsylvania division of the Delaware & Hudson, with headquarters at Carbondale, Pa., vice F. S. Ganley, assigned to other duties. Mr. Sasse will report to the master car builder.

W. J. Ormsby, general foreman in the locomotive department of the Illinois Central, with headquarters at Chicago, has been promoted to master mechanic of the Wisconsin division of the same road, with headquarters at Freeport, Ill., to succeed E. Lawless, deceased.

A. T. Hawk, architect of the Chicago, Rock Island & Pacific, with headquarters at Chicago, has been appointed engineer of buildings, with the same headquarters, and his former position has been abolished.

D. C. Fenstermaker, assistant engineer in charge of construction on the Chicago, Milwaukee & St. Paul, has been promoted to district engineer, with headquarters at Chicago, in charge of the Iowa, the Des Moines, the Kansas City, the Sioux City and Dakota and the Dubuque divisions, succeeding W. E. Wood, assigned to other duties.

E. W. Hammond, division engineer of the Buffalo, Rochester & Pittsburgh, with office at Du Bois, Pa., has been promoted to acting engineer maintenance of way, with headquarters at Rochester, N. Y., vice G. C. Cleaver, granted leave of absence, and J. B. Oatman, roadmaster, at Du Bois, has been promoted to acting division engineer, with headquarters at Du Bois.

## Corporate Operating

I. T. Williams has been appointed general manager of the London & North Western Railway of England, succeeding Sir Guy Calthrop, deceased. Mr. Williams entered the service of this road in 1876, and in 1902 he was made district goods manager at Warrington. He was transferred to London in 1907 as traffic superintendent of the metropolitan area, and later went to Euston Station as assistant to the general manager. In 1914 he was appointed chief goods manager, and in 1917 he became acting general manager, which position he held until his recent appointment as general manager of the same company.

Charles Harry Fox, who has been appointed division engineer on the Canadian Pacific, with headquarters at Regina, Sask., was born at Winnipeg, Man., on April 2, 1885. He began his railway career in May, 1902, with the Canadian Pacific, serving as clerk, rodman and transit man in the maintenance department until 1906 and the following three years as transit man in the construction department of the same road. From 1904 to 1910 Mr. Fox attended McGill University, Toronto, Ont., and upon his graduation was appointed resident engineer on the Canadian Pacific, in which capacity he had charge of the construction of terminal docks, elevators and coal handling facilities at Fort William, Ont. The following year he was appointed assistant division engineer on the Manitoba division, in which capacity he served for three years when he was appointed resident engineer of maintenance, with headquarters at Winnipeg. During 1918 he was engaged in military service and upon his release from the army he was appointed division engineer as noted above.

## Railway Officers in Military Service

Major George W. Berry, formerly general superintendent of the Illinois Central, with headquarters at Memphis, Tenn., has been made a Chevalier of the legion of honor by the French government. Major Berry has been in France since June, 1918, with the 31st Engineers (Railway), and is now in Paris consulting upon technical matters with the Peace Commission.

## Obituary

Willard Van Valkenburgh, general baggage and mail agent of the Long Island Railroad, with office at Long Island City, N. Y., died on April 10, at his home in Brooklyn at the age of 53.

Thomas B. Purves, formerly for many years in the service of the Boston & Albany, died in Springfield, Mass., on April 13, at the age of 61. On May 1, 1904, he resigned as superintendent of motive power and rolling stock of that road. From January, 1907, for about three years, he was superintendent of motive power and the car department on the Denver & Rio Grande, with office at Denver, Colo. In 1909 he entered the service of the Massachusetts Railroad Commission on valuation work, and later served in the same capacity for the Interstate Commerce Commission.

"Erection of the Sciotoville Bridge" of the Chesapeake & Ohio Northern across the Ohio river was the subject of a paper presented before the Western Society of Engineers on Monday, April 14, by Clyde B. Pyle, manager of erection, McClintic-Marshall Company, Pittsburgh, Pa. Because this remarkable structure consists of 1,550-ft. trusses continuous over three supports, the erection involved some unusual problems requiring the institution of special methods which were explained in an interesting manner with the help of some fine photographs. A general article describing this bridge and its construction appeared in the *Railway Age Gazette* of September 14, 1917, page 453.

# EDITORIAL

### Open Cincinnati Office

On Monday, April 28, the Simmons-Boardman Publishing Company, publishers of the *Railway Age*, will open an office in the First National Bank Building, Cincinnati, Ohio. It will be in charge of R. H. Smith, a member of the business staff formerly connected with our Chicago office, who will look after the interests of the Simmons-Boardman publications, including the *Railway Age*, *Railway Mechanical Engineer*, *Railway Maintenance Engineer*, *Railway Signal Engineer*, *Railway Electrical Engineer* and the *Locomotive and Car Builders' Dictionaries*.

Hereafter concerns selling supplies to the railways will be able to pay commissions, or, as they are technically called, "contingent fees," to bona fide agents

#### Contingent Fee Covenant Modified

employed under a general contract without invalidating their contracts with the railways. This is the result of an order recently made by Director General Hines. On June 18, 1918, the Department of Justice issued an order requiring that thereafter there should be inserted in every contract of purchase made by any government department a covenant stipulating that the concern from which the purchase was made would not pay a commission or fee to any agent as compensation for having made the sale to the government. This was not the exact language of the covenant, but was its substance and effect. The insertion of this covenant in all contracts between the railway equipment and supply companies and the railways, if permanently continued, would have forced many supply concerns radically to change business methods which had been used for years and would have driven not a few out of business. It had been a common practice for railway supply manufacturers to sell goods through agencies which were constituted regular representatives and whose compensation took the form entirely of commissions based upon the amount of goods they sold. The commission method of doing business would have had to be abandoned if the covenant drawn up by the Department of Justice had had to be inserted in all contracts. The result would have been that the equipment and supply companies would have had to make all sales through salaried agents. This would have increased their selling costs and either reduced their profits or rendered it necessary to charge the railways higher prices. The covenant was manifestly adapted to doing almost no good and much harm. It will continue to be inserted in contracts, but in appropriate cases there will be added a proviso to the effect that it "shall not invalidate a contract obtained through a bona fide commercial representative employed under a general contract covering designated territory and shall not prohibit or penalize the employment of the same agency methods and rates of compensation" which have heretofore been "customarily employed by the contractor in the regular course of his business in similar dealings with the railroad corporations." This seems to dispose of a matter which has caused much vexa-

tion of spirit and not a little expense to the railway supply companies. The negotiations which have led to this satisfactory outcome were conducted by the Railway Business Association which, as well as the director general of railroads, deserves credit for having secured a settlement on a common sense basis.

The effect upon the members of the New York Railroad Club of the moving pictures which have been used in the fuel conservation work on the Northern Pacific and which were shown by Fuel Supervisor M. A. Daly at the meeting of the club last week, was indeed remarkable. At first thought it is difficult to see how moving pictures can be used to show up the advantages and disadvantages of different methods of firing and the effects of wastefulness and carelessness in the operation of the locomotives and the handling of fuel. With the help of a skilful expert in the art of taking moving pictures, however, the Northern Pacific has developed a series of films that clearly show these effects and leave a deep and lasting impression on the mind which could hardly be produced in any other way. The moving pictures combined with the fuel instruction car which has been developed along lines which are unique and different from those used by any other road have, beyond question, been responsible for the splendid showing that the Northern Pacific has made in its fuel performance as compared with other roads operating under more or less similar conditions. The testimony of the fuel supervisors who took part in the discussion of Mr. Daly's address indicate a deep-seated belief in the fact that the average man takes a real pride in doing his work well; the difficulty in railroad service where the men are scattered and the problem of supervision is difficult, is to keep in sufficiently close touch with them to know that they understand exactly what is expected of them and just how their tasks should be performed. In no other field is the educational problem of greater importance than among the operating men on the road. Likewise the difficulty of reaching these men is equally great and exceptional methods must be taken if real results are to be obtained. The fuel instruction car on the Northern Pacific, with its simple and yet forceful lectures including practical experiments and demonstrations, taken in conjunction with the movies, should be studied by all those who are interested, not alone in fuel conservation but in educational work along other lines.

#### The Movies and Fuel Conservation

For months a dispute as to wages and length of working day has been dragging on between the workers in New York harbor and the owners of tugs and barges.

#### The Turning of the Tide

Two arbitrations failed to settle the matters in controversy, but, as a result of the second of these arbitrations, the Railroad Administration granted the eight-hour day to employees on its tugs and barges and the men agreed to return to work. The independent boat owners, however, refused to grant the eight-hour day but effected a settlement with one of the unions involved. The inde-

pendents are largely owners of barges—coal, wheat, etc. It appeared that through the agreement with the rival union the independents were in a fair way to win in the strike which had been declared by the Marine Workers' Affiliation (the union with which the Railroad Administration made its settlement). The barges of the independent owners depended largely upon the tugs of the Railroad Administration to move them about the harbor but when the Marine Workers' Affiliation saw how things were going, they ordered crews of the Railroad Administration tugs to refuse to handle independent boat owners' barges. This was the cause of the trouble which was ended by the men agreeing to go back to work for the independent boat owners with a ten-hour day. The wage question was left to future arbitration. This is, apparently, a defeat for the Marine Workers' Affiliation and is a successful outcome to the policy pursued by A. H. Smith, director of the Eastern region, in his handling of the dispute. It is true that the Railroad Administration granted the eight-hour day to its employees, whereas the success of the independent owners has demonstrated that a ten-hour day is not considered unreasonable by the men; but the encouraging feature about the strike is that it was handled, in regard to the administration's tugs in New York harbor, by the regional administration, not by the central administration in Washington, and that the regional administration stuck to its guns and won its point without making concessions. Needless to say, its case was perfectly clear-cut and the refusal of the Marine Workers' Affiliation to carry out the terms of an agreement so recently made left it without the power to greatly confuse the issue.

## Maintaining Wages and Reducing Prices

SINCE THE SIGNING of the armistice it has been the policy of the government to try to maintain wages in industry while securing reductions of prices. In attempting to carry out this policy it has been given the support in public utterances of many labor leaders, public men and business men. It cannot be said that as yet the policy has been notably successful. There have been some slight reductions in wages and some larger reductions of prices. On the other hand, there have been some advances in prices. Generally speaking, both wages and prices have been maintained. One of the principal results has been that in most lines of industry business men, hoping for larger reductions in prices, have refrained from entering upon large new projects and that the business of the country has slumped. There is no better barometer of general business conditions than the amount of freight being moved by the railways. The volume of freight traffic has greatly declined.

There is naturally much skepticism in some quarters as to whether the policy of trying to maintain wages and at the same time reduce prices will be successful. If it is not successful it will in the long run do more harm than good. As to the maintenance of wages this is desirable, if it can be done. But wages are a very large part of the cost of production in every industry. There are only two ways in which wages generally can be maintained and prices reduced. The first is for business concerns to forego part of their profits. The second is to secure greater efficiency in production. As to the first, business men naturally will not make large reductions in their profits if they can avoid doing so. As to the second, increased efficiency means a greater output in proportion to the amount of materials used and the number of men employed, and unless the co-operation of labor can be secured it is extremely difficult to get improved results from either the material or the human elements in production.

As a matter of fact, no really large reduction of prices can be obtained merely through reduction of the profits of industry. Large reductions in prices, if they are to be obtained while wages are maintained must be secured by means of increased efficiency in production. Unfortunately, present-day labor generally seems to be almost as strongly indisposed to co-operate in securing increased efficiency of production as to accept reductions of its wages. This is one of the greatest obstacles to general reductions of prices. It is also the one obstacle regarding which the governmental authorities who are urging the maintenance of wages, the reduction of prices and the practice of "Buy it now," are maintaining the deepest silence. In Great Britain, where labor conditions are far more unsatisfactory than in the United States, and the trade unions are stronger, the leading statesmen, with Lloyd George at their head, are constantly emphasizing in their public utterances the need and duty of labor to co-operate with the employers in maintaining and increasing efficiency of production. Our public men at Washington are showing the same want of statesmanship and courage in dealing with this phase of our reconstruction problem that they are showing in dealing with most other phases of it.

## Terms of the Victory Liberty Loan

ANNOUNCING THE DETAILS of the Victory Liberty Loan, Carter Glass, secretary of the treasury, stated that there will be no more popular subscription loans floated in the United States. War debts will continue to pile up as long as it is necessary to keep the army of occupation in the provinces along the Rhine, and until the troops already returned to this country are demobilized and the country takes up again the works of peace. But other means of financing will be found by the treasury department to meet these demands of the future. In outlining the purpose of the department in making this final appeal to the people for support, Mr. Glass said:

"In fixing the terms of the issue, the treasury has been guided largely by the desire to devise a security which will not only prove attractive to the people of the country in the first instance, but the terms of which will insure a good market for the notes after the campaign is over and identical prices for the two series, and should not affect seriously the market for the existing bonds of the Liberty Loans. This will be the last Liberty loan. Although as the remaining war bills are presented further borrowing must be done, I anticipate that the requirements of the government in excess of the amount of taxes and other income can, in view of the decreasing scale expenditure, be readily financed by the issue of treasury certificates from time to time as heretofore, which may ultimately be refunded by the issue of notes or bonds without the aid of another great popular campaign such as has characterized the Liberty Loans.

"I am sure that the people of America will subscribe to this Victory Loan in the same spirit of patriotism which they have shown in the past to the end that the notes may be distributed as widely as possible and that our great banking institutions may be left free to supply the credit necessary for the purpose of industry and commerce and the full employment of labor. Let the world see that the patriots of America out of their boundless resources, and with the same enthusiasm and devotion to country with which they prosecuted the war to a victorious conclusion, are determined to finish the job."

The *Railway Age* presents herewith details of the new Victory Loan, and terms of payment as outlined by the government. The amount of the loan was fixed at \$4,500,000,000, instead of \$6,000,000,000 as was anticipated in many

circles. The loan is in the form of two series of gold convertible notes, one bearing  $4\frac{3}{4}$  per cent interest, exempt from state and local taxes, except estate and inheritance taxes, and normal income taxes; and the other bearing  $3\frac{3}{4}$  per cent interest, exempt from all taxation except estate and inheritance taxes. The notes are for a term of four years, but may be taken up by the government at the end of three years by payment of the par value with accrued interest.

Either form of note is convertible into the other at the option of the holder. Interest is payable semi-annually on December 15 and June 15 after December 15, 1919. No over-subscription will be accepted, but all subscriptions up to \$10,000 will be allotted in full.

The government's terms of payment are 10 per cent with the subscription prior to May 10, when the campaign closes; 10 per cent, July 15; 20 per cent, August 12; 20 per cent, September 9; 20 per cent, October 7, and 20 per cent, November 11.

Although this is the last call of the government upon the people for a popular war loan, the raising of this money is just as important as were any of the Liberty Loans. The government needs the money for the payment of a myriad of war bills that accumulated during the last few months of the war, and to keep the finances of the country in such a condition that industry will not be crippled, and the chance at the world trade lost.

## Progress in Water Treatment

THE HISTORY of the introduction and development of water treatment on American railroads not only is a fascinating story filled with human interest, but it also constitutes a lesson regarding the need of proper appreciation and practical application of scientific discoveries, that may be applied with equal propriety to many other phases of railway operation. Water softening on railroads received its first real impetus about 20 years ago, through the enthusiastic zeal of a few energetic engineers and chemists who understood the wonderful possibilities in the simple chemical transformation involving the use of two cheap reagents, lime and soda ash. Through their efforts the practical value of treating locomotive water supplies was demonstrated beyond question, and during 1904, 1905 and 1906 current technical literature was replete with expositions of the value of water softening, fully demonstrated by records of savings in boiler repairs, flue and sheet renewals, fuel economies and reductions in engine failures.

Then followed a lull in the advancement of this improvement of railway water supply. The subject was less frequently discussed and the occasional references brought to light from time to time were as often derogatory as otherwise. There was also talk of treating plants that had been taken out of service here and there.

This was the state of affairs when in 1913 the Water Service committee of the American Railway Engineering Association was instructed to "report on water treatment and the results of study being made of water softening from the operating standpoint." In the ensuing investigation, the committee discovered that a few roads which had undertaken water treatment some years before were not only thoroughly convinced of the advantages accruing from these installations, but were obtaining increased benefits from year to year as the more intimate details of the subject were better understood. However, the most profitable phase of this investigation was the study of those cases where the use of water softeners had been discontinued or was being considered with disfavor. This disclosed the fact that the failure of these plants to produce the desired results, arose in nearly all cases from one essential defect—inadequate supervision, not only in the

operation and maintenance of the plants, but in making the installations in the first place.

The chemistry of water softening is simple. Nevertheless, the operation of a battery of plants treating a variety of waters, some of which change in composition from day to day, presents a problem of no mean proportions. It entails the exercise of both engineering and chemical knowledge, and like any other technical branches of railroading, it must be managed by one who knows his business and who is clothed with adequate authority to put his knowledge into effect. The particular importance of this in the case of water softeners arises from the fact that the successful treatment of water and the efficient use of the treated water in the locomotives requires co-operation on the part of all that have anything to do with the operation and maintenance of the plants and the operation of the locomotives. Consequently, the water treatment must be under the general supervision of a man who is able to inspire confidence in the system of water treatment he is handling, on the part of all those directly or indirectly concerned.

During the last four years water softening has received a renewed impetus, with the result that there have been repeated demonstrations of its economic value wherever the railroads have approached this subject with an adequate conception of the essentials for success. One of the best demonstrations of the results obtainable when it is prosecuted under a comprehensive plan with proper control will be found on another page of this issue where a report is given of the results secured on the Great Northern during the last seven or eight years. The special lesson of this report lies in the demonstrated value of close supervision of the minute details of plant operation. It also illustrates the advantage of water treatment covering a complete area, as compared to a "hit-or-miss" plan under which only the most objectionable waters are treated. The article will be found of interest alike to the student of water treatment and to the operating or mechanical officer who is concerned only with results.

## Senator Cummins on the Railroad Problem

THE VIEWS OF SENATOR CUMMINS of Iowa upon the railroad problem have become of great importance. He is now the ranking Republican member of the Senate Committee on Interstate Commerce and doubtless will be elected its chairman when Congress meets. Therefore, he will have a leading part in framing the important railway legislation which probably will be enacted this year. Senator Cummins recently delivered an address on the railroad problem before the General Assembly of Iowa, which we publish in this issue.

For some years the Iowa senator was a severe critic of the management of the railroads of the United States. He seemed inclined to favor government ownership. He is now, as his address shows, strongly opposed to government ownership—or, at least, to government management. He still believes that the system of management and government regulation existing before government control was adopted resulted in wastes and abuses; and he is in favor of returning to private operation under a different system.

The principal shortcomings of the old system of regulation were, first, the conflicts between state and federal regulation; second, the way in which it dealt with competition; third, the way in which it dealt with the return upon capital. Senator Cummins has come "slowly and reluctantly" to the conclusion "that in so far as the rates are concerned the national government must be the arbiter." He is in favor of competition between strong roads, but would have the railroads consolidated into not more than eighteen large

systems in order that the extremely unequal competition between the strong and weak roads which has rendered it impossible intelligently and fairly to regulate rates shall not be revived. Thus far most students of the subject who are in favor of private management will be able substantially to agree with him.

The most important feature of his plan, however, is that which relates to the regulation of the return to be earned by the railways. Regarding this part of it there will be sharp differences of opinion between those who favor and those who oppose government guarantees of net return. He would have a government corporation acquire all the railway properties or all the securities and substitute new obligations. After effecting the needed consolidations, he would turn the properties over to the ownership and operation of private companies. He would have the government guarantee a return of  $4\frac{1}{2}$  per cent upon the new securities, which would be based upon some kind of a valuation.

The execution of this plan would involve virtually a complete change in the ownership of all the railroads. The transaction would be the most enormous in history. The details to be worked out would be inconceivably intricate and numerous. Even if this part of the plan were practicable, it would seem that it would take years to carry it out. Meantime, the railroad situation would be wholly unsettled, and it is hard to see how any progress could be made in securing the improvement and expansion of railway facilities which is now needed.

Senator Cummins assumes, without conceding, that the value of the properties is \$17,000,000,000. He says that a government guarantee of  $4\frac{1}{2}$  per cent, or \$765,000,000 a year, on this would be "ample"—doubtless meaning it would be ample to keep the securities at par. He adds, "The people paid in 1917 a (railway) capital charge of a billion dollars. \* \* \* The principle I have proposed, if embodied in the law, will save the people of the country from \$250,000,000 to \$500,000,000 annually." Senator Cummins' reasoning at this point is open to destructive criticism. It is wholly improbable that the value of the railways would be found to be as small as \$17,000,000,000. Even if it were, and the government guaranteed  $4\frac{1}{2}$  per cent on it, the saving in capital charge would be nowhere near as large as he estimates. The year ended on June 30, 1916, is the last for which we have complete statistics of the Interstate Commerce Commission. By "capital charge" Senator Cummins must mean—in view of the figures he uses—the "operating income" which the railways have earned—in other words, the excess of earnings over operating expenses, taxes, etc. In 1916 the operating income was \$1,043,000,000; but this was not really the "capital charge." The total net dividends and interest paid by the railways in that year amounted to only \$834,600,000. This was but \$69,600,000 more than the \$765,000,000 a year which Senator Cummins estimates a guarantee of  $4\frac{1}{2}$  per cent would cost the government.

The difference between the operating income and the net interest and dividends paid was about \$202,000,000. Out of this amount the companies appropriated \$76,500,000 for investment in physical property. The rest was applied to sinking funds, used in extinguishing stock and bond discounts, carried to cash account, etc. Under any system, even government ownership, large investments would have to be made from earnings each year in unproductive improvements, sinking funds would have to be provided for, etc.

Furthermore it is not at all sure that, as Senator Cummins implies, a guarantee of  $4\frac{1}{2}$  per cent would be sufficient to enable railway securities to be sold at par. Government bonds which are subject to taxation are now selling on a 5 per cent basis. Besides, elsewhere in his address Senator Cummins indicates that while the government would guarantee  $4\frac{1}{2}$  per cent as a minimum this would not be the maxi-

mum which the more successful companies would be allowed to earn and pay. In this part of his address he favors "providing for a corporate ownership of the several systems into which the country could be divided, each corporation with a capitalization representing the actual value of the particular system and the establishment of rates which would produce not only the cost of maintenance and operation and the guaranteed return upon capital, but a reasonable sum in excess of the guarantee, the excess to be divided between the stockholders and the working men." But whatever excess over the government guarantee was allowed to be earned would make the "capital charge" more than  $4\frac{1}{2}$  per cent, thereby, of course, reducing the savings Senator Cummins estimates would be made.

There is another extremely important point to be considered. What effect would the guarantee of a minimum return to each company have upon the efficiency of operation? The operating expenses always have been and always will be several times as large as the capital charge under any system of ownership and management. Therefore, any system which will tend to stimulate efficiency of operation will be far more valuable as a means of keeping down the cost of transportation to the public than any system which will tend in equal or even greater degree to keep down the capital charge. Senator Cummins recognizes the need for affording an incentive to efficient management by suggesting that the companies be allowed to earn "a reasonable sum in excess of the guarantee." We fear, however, that if the government gave to each company a guarantee of at least  $4\frac{1}{2}$  per cent the tendency of the rate regulating authorities would be to so fix the rates that few, if any, companies would be able by efficient management to earn more than the guarantee, in which case the incentive to efficient management would be impaired if not destroyed.

Senator Cummins' address is a notable and statesmanlike document. The system he outlines would, on the whole, be an improvement from the standpoint of both many investors and the public over the system which prevailed before government operation was adopted. But he underestimates the time that would be consumed and the difficulties that would have to be overcome in carrying out his plan. He overestimates the saving in capital charges that it would make and underestimates the extent to which it would impair the incentive to efficient management. If private operation is to be made a success and adequate expansion of railway facilities is to be secured, a more definite assurance must be given to the railway companies that they will be afforded an opportunity to earn an adequate return; but a better method of affording this assurance than that proposed by Senator Cummins can be devised. Indeed, some better methods have been proposed.

## Present Prices and Railway Rates

IT HAS BECOME PLAIN that neither under government nor private operation can the railways, while paying present wages and receiving present rates, earn enough net operating income to pay anything approaching a reasonable return. When, however, it is proposed to make a further advance in freight rates, the objection is likely to be made that the rates have been advanced greatly within recent years, and that the traffic could not stand a further advance.

The rates which commodities can bear, however, are determined mainly by the value of the commodities; and any comparison of the advances in the prices of staple commodities with the advance of the freight rates upon them within recent years, quickly establishes the fact that the increase in freight rates has been nowhere near as large in proportion as the increase in prices. The greatest advances in freight rates have been in eastern territory. First, there were the

advances made in the so-called "Five Per Cent Case" in 1914; second, the 15 per cent increase, part of which was granted in 1917 and part in 1918; and finally, the 25 per cent advance made throughout the country later in 1918. The effect of these various advances of the rates upon various commodities moving in large quantities in eastern territory are shown in the following table. The advances which occurred in the same years in the selling prices of the same commodities also are shown:

ADVANCES IN FREIGHT RATES AND SELLING PRICES OF NINE REPRESENTATIVE COMMODITIES, 1914 COMPARED WITH 1919

	1914	1919	Per cent Increase
Wheat (Chicago to New York—994 miles):			
Freight rate N.....	\$3.20	\$4.90	53.1
Selling price N.....	36.47	79.33	117.6
Lumber (W. Va. to New York—490 miles):			
Freight rate N.....	3.40	4.70	38.2
Selling price N.....	9.09	19.96	119.6
Steel Rails (Pittsburgh to New York—516 miles):			
Freight rate G.....	2.60	4.00	53.8
Selling price G.....	30.02	57.00	89.9
Fresh Beef (Chicago to New York—994 miles):			
Freight rate N.....	9.00	13.80	53.3
Selling price N.....	260.00	488.00	87.7
Man'd Iron (Pittsburgh to New York—516 miles):			
Freight rate N.....	3.20	5.40	68.8
Selling price N.....	22.60	58.40	158.4
Cotton (Midling) (St. Louis to New York—1,105 miles):			
Freight rate N.....	9.10	13.40	47.3
Selling price N.....	222.60	535.00	140.3
Pig Iron (Pittsburgh to New York—516 miles):			
Freight rate G.....	2.45	4.30	75.5
Selling price G.....	14.78	33.60	127.3
Bituminous Coal (Fuel) (W. Va. to New York—489 miles):			
Freight rate N.....	1.80	2.40	33.3
Selling price N.....	1.02	2.50	145.6
Stone (Ballast) (M'ns'g to C-ville—172 miles):			
Freight rate N.....	1.00	1.40	40.0
Selling price N.....	.43	.89	107.2

Freight rate and selling price on ton basis.  
 N = Net ton. G = Gross ton.  
 Lumber—Average of chestnut, hemlock, white oak and yellow pine.  
 Manufactured Iron—Average of iron bars, steel bars, plates and shapes.  
 Prices paid at mine or quarry.

It will be noted that in the cases of all these commodities, the increases in prices have been much greater in proportion than the advances in rates. The advances in rates have varied from 33 to 69 per cent; the advances in prices, from 88 to 158 per cent. The rates now actually charged, therefore, in spite of the advances which have been made, are lower, and in most of these cases much lower, relatively to the value of the commodities than they were five years ago.

A more complete series of comparisons of the advances in rates in eastern territory with the advances in prices of commodities might not yield corresponding results; but that it would show that, on the whole, the increases in prices in that territory have been relatively greater than the advances in rates can not be seriously questioned.

But these comparisons are merely between the advances in rates and increases in prices which have occurred in eastern territory. Now, the increases in commodity prices have been approximately uniform throughout the country. On the other hand, while the advance in freight rates in eastern territory in the last five years probably have averaged 45 per cent, the advances in the southern and western territories have not averaged much over 25 per cent. Therefore, the disparity between the advances in rates and the increases in prices in other parts of the country has been much greater than it has been in eastern territory.

Since the freight rates which the commodities can bear are roughly in proportion to their market value it is clear that most commodities easily could bear much higher rates than are now being charged. As to the cost of the transportation service, it is now exceeding what is being paid for it, as the deficits of the Railroad Administration demonstrate. Therefore, whether measured by the cost of the service or the value of the service, freight rates, although much higher than a few years ago, are too low and should be advanced.

It is said that another advance in rates would cause further increases in commodity prices and, thereby, another increase in the cost of living. Perhaps that is true. But is

it not fairer that those who actually receive the transportation service and benefit by it should pay the entire cost of it, than that the taxpayers, whose taxes have no relationship to the amount of transportation they use, or the benefits they derive from it, should be required to pay part of the cost of it, as they are now being required to do?

## Pere Marquette

THE PERE MARQUETTE earned, under federal operation in 1918, the full rental which the government is to pay the company which owns the property. This was accomplished by holding down transportation expenses. The average train load in 1918 was 670 tons as against 582 tons in 1917. The property was operated in 1918 by F. H. Alfred as federal manager. Mr. Alfred had, prior to the reorganization, been one of the two receivers and, when the property was reorganized, had been elected president.

The government's rental amounts to \$3,748,000, and after paying war taxes and interest on bonds there was a surplus of \$1,894,000 or the equivalent of 5 per cent on the prior preference 5 per cent cumulative stock and 10.7 per cent on the \$12,429,000 preferred stock on which dividends are cumulative at 5 per cent after January 1, 1919.

The earnings of the property under federal operation amounted to \$28,955,000 in 1918 and after the payment of expenses and rentals there remained \$3,851,000 or something over the rental due the company. The operating revenues were greater in 1918 than in 1917 by \$5,447,000, due to an increase in the ton mileage of freight handled and to the increased freight rate received. Passenger business fell off but the increase in passenger rates permitted the Pere Marquette to just break even, as compared with the previous year, in its passenger earnings. The number of tons of revenue freight carried in 1918 was 14,242,000, or 7.3 per cent more than in 1917. The average haul was 5.5 per cent longer, being 196 miles in 1918, so that the ton mileage amounted to 2,796,000,000 in 1918, an increase of 13.3 per cent over 1917. The number of passengers carried, however, was 3,571,000 a decrease of 23.3 per cent. The average passenger journey was a little longer, but the decrease in passenger mileage was 20.5 per cent, the total in 1918 being 168,195,000. The passenger fare per passenger mile received by the company was 2.517 cents in 1918 as against 1.991 cents in 1917, an increase of 26.4 per cent.

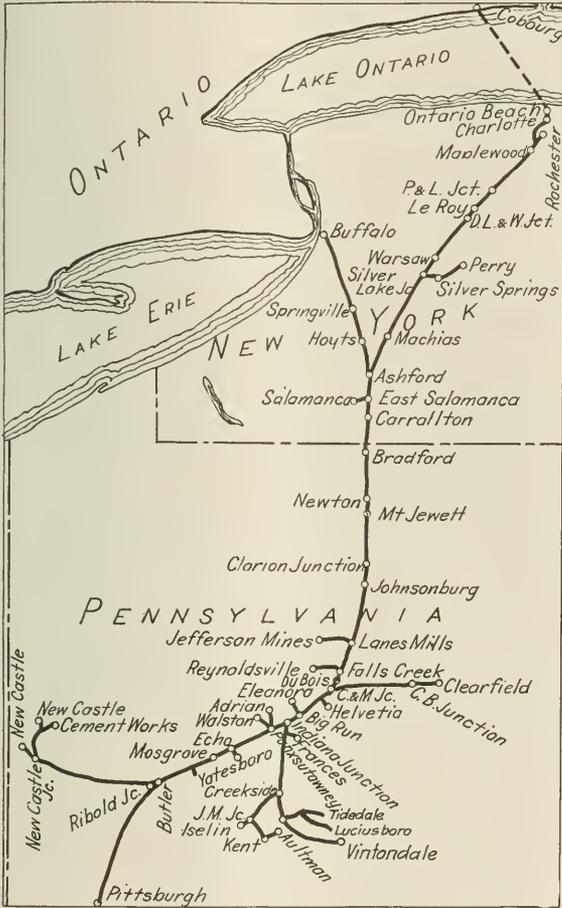

Notwithstanding the increase of over 13 per cent in freight, the freight locomotive mileage was 1.6 per cent less in 1918 than in 1917. Helper mileage, however, increased from 160,000 in 1917 to 194,000 in 1918, but this was much more than offset by a decrease of 8 per cent in switching locomotive mileage, 6.6 per cent in road train switching miles and 9.3 per cent in passenger locomotive switching miles. The reduction of over 20 per cent in passenger business was accompanied by a reduction of 12 per cent in passenger locomotive mileage.

The increase in train load is all the more notable because the traffic was apparently less well balanced in 1918 than in 1917. Loaded freight car miles totalled 104,562,000 in 1918, a decrease of 3.7 per cent as compared with the previous year, while empty freight car mileage totalled 38,153,000 in 1918, an increase of 12.8 per cent. A large increase in the tonnage of bituminous coal carried may have been a help in getting a larger average train load. Of the total 14,242,000 tons of freight carried in 1918, 30.09 per cent was bituminous coal, comparing with a bituminous coal tonnage in 1917 which was but 25.85 per cent of the total 13,270,000 tons carried in that year. As a commentary on general business conditions in the territory served by the Pere Marquette, it is interesting to note that the tonnage of automobiles carried in 1918 was 139,000, which was 103,000 less than in 1917.

roads, and to suffer from higher material costs. This latter fact possibly needs a word of explanation. A railroad running through the coal fields and into the Pittsburgh district is in times of industrial depression and low prices able to buy much more closely than a railroad in the west, for instance, but for this very reason when prices advance abnormally, as they have in the last two years, the spread or percentage of increase on a road like the Buffalo, Rochester & Pittsburgh is even greater than on roads not so intimately connected with the coal and industrial situation. Since the signing of the armistice coal production has dropped off to minimum but wage rates on all railroads have continued to go up and this has hit the Buffalo, Rochester & Pittsburgh doubly hard because it is a coal road.

When the Railroad Administration took over the actual

The Buffalo, Rochester & Pittsburgh

operation of the properties William T. Noonan, president of the Buffalo, Rochester & Pittsburgh, elected to remain with the corporation and T. F. Brennan, who had for a year been vice-president, and had for a number of years prior to that been general manager, was made federal manager. E. F. Robinson, who had been in charge of operation for a year prior to 1918 and chief engineer prior to that, became chief engineer under the Railroad Administration. With the exception of the executive, therefore, the same men were operating the property under the government as operated the property for the corporation.

Total operating revenues of the property (not the corporation in 1918) amounted to \$18,480,000 in 1918 and

to \$14,975,000 in 1917. Nearly the entire increase in revenue was due to higher rates. The ton mileage of freight handled amounted to 2,844,000,000 in 1918, as against 2,697,000,000 in 1917, and passenger mileage to 51,380,000 in 1918, as against 57,112,000 in 1917. There were no important changes in the character of the traffic carried, the increase in ton-mileage being accounted for by an increase of three miles in average length of haul, this figure being 173.6 in 1918, and an increase in the tonnage of bituminous coal, coke and iron ore.

Total operating expenses in 1918 amounted to \$17,577,000, an increase of \$5,699,000, or 48 per cent. Maintenance expenses increased even more than transportation expenses, but the increase in transportation expenses amounted to \$2,367,000, or 41 per cent. For years the Buffalo, Rochester & Pittsburgh has been able to offset the increasing unit costs of operation, with no increase in rates, through greater efficiency in operation, heavier train loading and the far-sighted but conservative adoption of heavier locomotives, with the attendant increase in weight of rail, strength of bridges, etc. In 1918 the largest stride in the history of the property was made in increased train loading. The average train load was 943 tons, comparing with 836 tons in 1917, 777 tons in 1916, 707 tons in 1915 and 694 tons in 1914. Never before in a single year had a hundred tons been added to the average train load. This showing is all the more remarkable in that traffic was not as well balanced in 1918 as in 1917. The Buffalo, Rochester & Pittsburgh is not a low grade road. On the contrary its profile shows a succession of fairly heavy grades against both north and southbound traffic, and to have attained an average train load of over 900 tons is a remarkable achievement.

The number of loaded cars per freight train was 23.24 in 1918 and 21.60 in 1917. The average number of empty cars per train was 18.01 in 1918 and 15.70 in 1917. The percentage of empty cars to total number of cars per train was 44 in 1918 and 43 in 1917. Steady progress had been made in years past in heavier loading of cars and this was maintained in 1918, and the remarkably high figure of 40.93 tons was reached for the average per loaded car last year, comparing with 38.69 tons per loaded car in 1917. When we take into consideration these evidences of good railroad operation, the increase in transportation expenses seems high, nor does an examination of the detailed figures for transportation expenses lead to the discovery of any peculiar circumstances, other than the general increase in the cost of labor and materials, which would explain the large increase in transportation expenses.

Maintenance of way expenses in 1918 amounted to \$2,824,000, an increase of \$1,369,000 over the previous year and the increase was due both to larger amounts spent for materials and larger amounts paid to labor. Thus, ties for renewals cost \$266,000 in 1918, as against \$154,000 in 1917, and labor for track laying and surfacing cost \$875,000 in 1918, as against \$455,000 in 1917. Repairs to shops and enginehouses amounted to \$247,000 in 1918, as against \$118,000 in 1917.

Maintenance of equipment in 1918 cost \$5,966,000, an increase of \$1,922,000. The increase in cost of repairs of locomotives alone accounted for more than half of this increase in total. Repairs of locomotives amounted to \$2,545,000 in 1918, or \$1,002,000 more than in 1917. The Administration charged a rate of 4½ per cent for depreciation of locomotives delivered in 1918 but continued the rate of 3 per cent on cars.

The Buffalo, Rochester & Pittsburgh equipment on January 1, 1918, was in as good or better shape than it had ever been in the history of the property. Great care and forethought have been spent on ordering the types of cars and locomotives best adapted to the particular requirements of the road. The company has been very liberal in times past in providing equipment, both because it was rightly con-

sidered economical to buy the best and because an ample supply of cars was a necessity in successfully meeting competition and providing for the future. So thorough were the repairs given to equipment in the Buffalo, Rochester & Pittsburgh shops that the cost of repairs per car per day on foreign lines due to owner's defects had been reduced to an average of five cents.

Under competitive conditions it had been possible to conserve for use on the Buffalo, Rochester & Pittsburgh itself, B. R. & P. equipment sufficient to handle by far the greater part of the traffic. In 1918, on the other hand, this equipment was scattered far and wide over the country and the traffic on the property itself was necessarily handled by a considerable proportion of foreign equipment. This was reflected in increased expenses not only of maintenance of equipment, but of maintenance of way and of conducting transportation. In mixing lighter and less well maintained cars with the company's own heavier coal and ore cars, not only was the lighter equipment damaged, but the danger of derailment and tearing up of track, etc., was increased. The equipment situation also necessitated considerably more switching work than would have been necessary had the company retained its own cars.

The following table shows the percentage of operating expenses to total operating revenues in 1918 and 1917:

	1918	1917
Maintenance of way.....	15.28	9.71
Maintenance of equipment.....	32.29	27.00
Traffic.....	1.02	1.28
Transportation.....	44.26	38.82
General.....	2.13	2.37
Total, including miscellaneous.....	95.12	79.32

During the year 1918 the property received 39 new freight locomotives and eight new passenger locomotives. These were orders placed by the corporation in 1917 and the cost was charged to the corporation's capital account. It is interesting to note that eight old locomotives were equipped with superheaters and 33 Duplex stokers were purchased. The Buffalo, Rochester & Pittsburgh has been exceptionally liberal in the provision of ample equipment. The purchase of heavier and heavier locomotives was in accordance with a well balanced plan of general improvement and the road now has in service 7 heavy Mallets (113,000 tractive power), 41 light Mallets (80,000 tractive power), 48 Mikados and 229 lighter freight and switching locomotives. The 39 freight locomotives received in 1918 included all seven of the heavy Mallets and 17 of the light Mallets mentioned above. The company placed its orders before the heavy rush of orders had driven prices up to their present level and got its heavy Mallets for \$92,500 apiece and its light Mallets for \$71,850.

The corporation spent \$1,948,000 for additions and betterments to road and structures, the two largest expenditures being on the terminal facilities at Elk Run Junction, Pa., and at East Salamanca, N. Y. Both of these terminal improvements, which involved extensive changes in and additions to facilities, have now been completed.

The table shows the principal figures for operation of the property. This is not the corporation income account.

	1918	1917
Mileage operated.....	590	585
Coal freight revenue.....	\$10,953,346	\$8,499,013
Coke freight revenue.....	565,584	401,257
Merchandise freight revenue.....	4,917,019	4,219,568
Passenger revenue.....	1,335,097	1,313,594
Total operating revenues.....	18,479,659	14,975,000
Maintenance of way and structures.....	2,823,761	1,454,770
Maintenance of equipment.....	5,966,244	4,043,988
Traffic expenses.....	187,924	191,523
Transportation expenses.....	8,179,286	5,813,030
General expenses.....	393,795	354,834
Total operating expenses.....	17,577,208	11,878,566
Taxes.....	294,580*	506,000
Operating income.....	607,528	2,590,075

#### CORPORATION INCOME ACCOUNT

	1918	1917
Gross income†	3,353,337	3,906,076
Net income.....	1,148,311	1,739,820
Appropriations.....	29,355	671,715
Income available for dividends.....	1,118,956	1,068,105
Dividends.....	885,600	990,000
Surplus.....	233,956	78,195

## Letters to the Editor

### Clifford Thorne on English Freight Rates

CHICAGO

TO THE EDITOR:

My attention has been called to a letter by W. M. Acworth of London, England, referring to my testimony before the Senate committee on Interstate Commerce, Mr. Acworth's letter being published in your magazine, volume 66, No. 11, page 573.

I did not quote Mr. Acworth in regard to any comparison of rates. I simply used Mr. Acworth's work, referred to specifically in my testimony, in order to secure a typical or representative list of commodities and hauls in England. The rates were brought down to date by a London authority.

In addition to these specific comparisons of rates I made certain comparisons of revenues, using estimated hauls and average revenues per ton, all traffic. An examination of the transcript of the proceedings before the Senate committee will confirm the accuracy of my statement.

CLIFFORD THORNE.

### Not an Unqualified Recommendation

CHICAGO

TO THE EDITOR:

Your report of the discussion of my paper on "Creosoting Wood Signal Trunking to Extend its Life," presented before the recent meeting of the Railway Signal Association as appearing in the *Daily Railway Age* of March 18, page 644, due to the partial publication of my reply to Mr. Dryden places me in the position of recommending without qualification, treatment with zinc chloride. This is, first, incorrect, and second, far from the fact. May I, therefore, ask you to now publish a corrected reference to that discussion? The official transcript records my remarks as follows:

"Mr. Barth: I don't see where there would be any objection to using zinc as long as it doesn't interfere with the operation of your apparatus. That is a question I cannot answer. You can use zinc providing, of course, that the zinc treated timber is employed in dry situations. It is not suitable where there is an average rainfall or a lot of moisture which will cause leaching of the salt solution.

"Zinc chloride is soluble in water. If you are in a dry territory where there is less danger, as for instance, in the West where zinc treated ties have given excellent service, I should say that the zinc treatment there would apply also in the case of trunking. However, the advantage of creosote over zinc is that creosote is insoluble.

"As far as procuring creosote goes—you will understand that I have recommended in these surface treatments, of which I am primarily speaking, an oil, meeting the specifications of the United States Railroad Administration (R-828-A), which can be obtained in reasonable quantities at the present time."

KURT C. BARTH,

The Barrett Company.

Alonzo Sargent, the engineman at fault in the collision at Ivanhoe, Ind., on June 22, was tried in court in Indiana last week, and the trial resulted in the disagreement of the jury. Acting on the instructions of the court, the jurymen considered the question whether Sargent was or was not guilty of involuntary manslaughter.

# Fuel Conservation on the Northern Pacific\*

## A Fuel Instruction Car and Moving Pictures Bring Big Results

By M. A. Daly

Fuel Supervisor, Northern Pacific

THE NORTHERN PACIFIC links together Wisconsin, Minnesota, North Dakota, Montana, Idaho, Washington, Oregon and Western Canada; yet, we don't feel that we are very far from the east. I suppose this is because every year we go to West Virginia and Pennsylvania to buy coal with which to supply a large percentage of our locomotives throughout the following year. Nevertheless, it is a long distance to haul coal. The average rail haul is about 200 miles from the eastern mines to the Lake Erie ports, where the coal is loaded into ships. It is a 900-mile boat haul from the Lake Erie ports to Duluth. At Duluth the coal is again loaded into cars and hauled by rail as far west as the Missouri river, a distance of 500 miles. By the time it reaches its destination the coal has become very expensive—and that is just the reason why our people have felt compelled to do everything they could to get the greatest possible amount of heat out of every ton of coal used.

The necessity developed a campaign of fuel economy, beginning about eight years ago, and we have kept right at it ever since. It has been largely an educational movement, designed to interest not only the men who handle coal, but the officers who supervise the operating performances.

### Fuel Instruction Car

To introduce the work a passenger coach was fitted up as a traveling lecture room†. Chemical and physical apparatus was installed to demonstrate the properties of coal and the chemistry of combustion. Stereopticon views and motion pictures were added from time to time, as needed.

In passing over the line, at suitable intervals, the instruction car was located at places convenient for the men at the various division points. Locomotive and power-plant engineers and firemen, interested roundhousemen, dispatchers, yardmasters, superintendents, trainmasters, master mechanics, road foremen and other local officers presented themselves for the various lectures. The responsibilities of individuals were reviewed, proper methods of handling coal were emphasized and fascinating possibilities were pointed out.

With all who are directly or indirectly concerned with fuel the plan has been to realize a common understanding of its great value, develop an appreciation of the actual losses in known wasteful practices, and to anticipate the enormous savings to be accomplished by concerted efforts, systematically and persistently applied.

It was made clear from the start that fuel saving was a non-departmental matter, that instead of being the work of one department it was a matter of interest for all departments. And it was easily shown that there was enough available glory to be obtained so that all departments could take some of the credit.

Beginning with the preparation of coal at the mines attention is given to all phases of distribution, consumption and accounting. But, since approximately 95 per cent of all railroad fuel is consumed on locomotives, it naturally follows that special attention is given to its use on locomotives. Just as some engines through improper condition may burn more

\*Abstract of an address before the New York Railroad Club, April 18, 1919.  
†A description of the car and an outline of the lectures which are given was published in the *Railway Age Gazette* of May 1, 1914, page 976.

coal than others (of the same class), so, some enginemen through improper operation may burn more than other enginemen, and some firemen through improper handling may burn more than other firemen.

According to observations on various railroads, one fireman may burn as much as three tons per trip more than other firemen in the same service, using the same engine, on a similar train, over the same piece of track, under identical conditions. Now, men in general take a natural pride in doing good work. Once show a man that he can give better service with less labor and you have confronted him with a double argument which is seldom wholly lost. Once convince a fireman that when coal is properly placed in the firebox it will make more steam and less clinkers, that the required steam pressure will be more uniform and more certain, that the trip will require less shoveling and less shaking, and you have a fireman who is on his way to open-minded appreciation of instructions.

About all that is required for good firing is a little care and attention, with proper intention. Any instructed fireman can supply the necessary care and attention, and become a good fireman.

### Talks in Instruction Car

Of the lectures in the instruction car, perhaps the things that most impressed our enginemen and firemen were the chemical experiments illustrating how combustion may take place. In one instance, a wide mouthed bottle was inverted over a lighted candle to prove that when the contained oxygen was consumed burning stopped. Hydrogen was prepared. With a proper supply of oxygen a lighted match could explode it. With no oxygen present, this highly inflammable gas would extinguish a lighted match. Thus, after a series of similar experiments, it was conclusively shown that to have burning, oxygen must touch the fuel. Accordingly it became clear to enginemen and firemen why it was necessary to have a draft bringing air through the grates into the firebox, and why air must constantly supply new oxygen to the pieces of coal throughout the burning firebed.

Considering then that since oxygen of the air is necessary for burning, and, since air cannot well pass through clinkers or banks in a firebed, it follows that clinkers and banks are not desirable things to have in a firebox. Following this line of thought it is but a step to consider that while gas is being driven from each piece of coal that lies in the firebox, this gas cannot be burned unless oxygen comes in contact with it. It then becomes obvious that the best firebox condition is possible only when air is coming through every square foot of grate surface.

In one of the demonstrations a pound of coal is put into a retort, heat is applied and the gases driven off. The coke remaining is weighed and computations made on a blackboard bringing out the fact that approximately one-half of the heat value of coal is in the gas. The gases themselves, having been collected in transparent jars, are then burned in various ways to illustrate proper and improper combustion. They can be burned with a clear, white flame, giving off intense heat, or may be burned with a dull, yellow, smoky flame, developing very little heat. One smoky flame and one white flame are placed under separate test tubes containing equal amounts of water. The white flame evaporated completely the water above it, using much less gas than the smoky flame. We had the smoky flame when the supply of oxygen was not sufficient to burn the flow of gas; that is, the smoky, imperfect, low-heat, extravagant combustion took place when the supply of gas was greater than could be burned by the available oxygen.

Here again was a direct comparison with the locomotive firebed. A fire that is fed at short intervals, with small quantities of coal, properly scattered over the surface of the

firebed, will give a dazzling white fire to be compared with the dull red fire that comes when a large quantity of coal is thrown in at one time. To the enginemen and firemen this latter "slugging" method begins to take on a new aspect; the greater the quantity of coal thrown in at one time the greater the quantity of gas which may be rapidly driven off. And of course, when the quantity of gas exceeds the proportionate flow of oxygen through the grates, the excess gas cannot be burned and will pass off as smoke, through the stack—wasted. Then they correctly conclude that since 50 per cent of the heat value of the coal is in the gas, their aim must be to burn as much of the gas as possible, and thus they are intellectually persuaded to lean toward light and frequent firing, which is clearly the more economical method, and at the same time much the easier.

Firemen were encouraged to experiment for themselves, and it was not long before enginemen and firemen were boasting of the fact that they were making trips on one or more tons of coal less than formerly.

Competition is encouraged by comparing different crews on similar runs, between certain points. Road foremen use tally counters to ascertain the number of scoops, while a pocket scales will tell the weight of an average scoop, allowing the determination of the approximate number of pounds of coal used on the trip.

This all becomes very interesting when facing the fact that our Mikado locomotives often leave terminals with \$125 worth of coal on their tenders, and each locomotive may take on an additional \$50 or \$60 worth of coal at some intermediate coal dock.

Our strong point with firemen has been that the more care exercised in placing the coal in a firebox the less coal will be required on the trip. This fact was taught not only verbally but by actual demonstration. So successfully has the plan worked out that we have men who actually fire our heaviest Mikados with one scoop to a fire. Now, single scoop firing is very particular work. Every fireman has not the patience to work it out, to master it. We do not advocate it, but we do point it out as an ideal to which firemen may aspire. Those who can approach it use less coal than formerly. Those who can master it use the least coal with the least labor. We do not ask our firemen to fire to a diagram.

### The Movies

The value of self-criticism has not been overlooked as a means of aiding enginemen and firemen to raise the character of their service. By the use of motion pictures they have been enabled to see themselves as others see them. The result has been very gratifying.

(Mr. Daly then showed several hundred feet of motion picture films which demonstrated in a most forceful way the advantages and disadvantages of proper and improper firing and the losses due to wastefulness and carelessness. For instance, with the moving picture camera mounted on the tender, pictures were shown of firing by the single scoop method as compared to the ordinary methods. Not only did the pictures clearly show the movements of the fireman but at intervals the camera was elevated so that a view was obtained over the top of the cab showing the results at the stack. Pictures were also taken from the roadside showing the trains in motion and the effect of the proper and improper methods of firing as reflected in the amount of smoke from the stack.

Moving pictures were also shown of the wastefulness of overloading tender tanks, of carelessness in unloading and cleaning out coal cars, and of the losses due to popping. In order to maintain interest on the part of the men, particularly during the period of the war, pictures were interposed showing the great need for fuel conservation in order to re-

duce to a minimum the number of cars required. Such pictures, for instance, might show the results of the freight congestion at the eastern seaboard, or the great trains of troops and munitions which it was necessary to transport, etc.

Typical individual pictures selected from the films are shown in the photographs, but, of course, they give no adequate idea of the forceful way in which poor or indifferent methods of firing can be contrasted by means of the movies.

**Results**

Mr. Daly did not include in his paper any figures as to results secured on the Northern Pacific, but during the discussion he was questioned as to this and as to the size of the locomotives on the Northern Pacific. His reply showed that the average tractive power of the freight locomotives in service was high. He was also able to furnish the following figures as to fuel consumption which are taken from reports recently issued by the Fuel Conservation Section of the United States Railroad Administration:

	FREIGHT SERVICE			
	Pounds of coal per locomotive mile		Pounds of coal per 1,000 gross ton mile	
	December, 1918	January, '19	December, '18	January, '19

—Editor.)

**Discussion by George M. Basford**

Let's get our heads out of the sand. Our nation must get out of the wasteful class. It must get over thinking that its resources are limitless. It must conserve many things, first of all coal. Coal comes in train loads. There are other train loads waiting to be moved and all hands on a railroad naturally feel that anything so easy to get is somewhat like dirt and therefore is cheap.

With wages up, probably to stay, and with coal costs doubled, the locomotive must be looked at in a new light. The present generation is to be held accountable for its stewardship. In a large sense it is to be tried on the charge of wasting coal.

Let us acknowledge and appreciate everything that the government and the railroads are doing to improve the firing of coal and the management of the coal itself. Great improvements are being made in this direction. However we must not overlook the fact that the best of coal and the best management of the fire may be nullified by the locomotive itself if the machine is not what it ought to be. This is being overlooked to-day in the case of thousands of old engines.

What is wanted is to put the locomotive in shape for its various parts to pull together to use the coal to best advantage. Boilers should not send wet steam to the cylinders. Fire-boxes should not send unburned and therefore unburned gases to the flues. Tender tanks should not send water to the boiler unheated by waste heat. There are a lot of other ways in which many old engines are working against themselves for lack of modern means for conserving their faculties and abilities. Even the best of firing of itself cannot insure the proper development of the heat of the coal or its use in producing power. The engine must have the means properly to make and use the power that is in the coal.

How about the 25,000 locomotives that as to power remain as they were built and are ten or more years old? Unless these engines are brought up to date they are antiquated, obsolete and an encumbrance as to power and as to the waste

of fuel. Many of these engines were ten or more years old when they were built. This was because of bridge or other weight limitations. To-day they are in the class of the old Rodman cast iron cannon whereas we have Hindenburg Lines to deal with to-day.

Think for a moment of the taking of the Hindenburg Line. No small factor in the achievement was the confidence the men had in their equipment. They knew that this country had not sent them out without the best of everything to fight with. The inspiration of this confidence was necessary to success. Now think of the men who are handling these old engines we are talking about. What coal saving effort can you expect of men who know that the machine you give them wastes coal faster than they can save it?

In six years the coal consumption of locomotives has gone down from 3.6 lb. per draw bar horse power to 2.25 lb., the figures being taken at the most efficient power of the engine. No parallel improvement has ever been made in six years in any other branch of engineering development.

This has been done by intelligent use of improved designs and by the employment of labor and fuel saving and capacity increasing factors which everybody knows about. These figures show what may be done and what is in everybody's mind to aim at with new engines, but why overlook the 25,000 old ones?

The fortunate feature of these improvements lies in the fact that they may be applied to all old engines that are in shape to run at all and they give these old engines increased power making them, weight for weight, equal to the biggest, newest engines of the latest and best designs and in many instances they will be better adapted for the work they are doing than new engines would be.

I mean that one big thing to do right now is to modernize those old engines—25,000 of them, applying to them the factors that make the modern locomotive take its place among the efficient power plants of the world. The way to do it is to make a survey of the old equipment in complete detail, to decide upon a modernizing program and determine the number of engines to be rejuvenated per month and then follow the program in spite of "hell and high water."

One of the roads that did this found that the improvements paid for themselves in seven months. Every \$100 of cost earned \$171.60 in the first year. This was 171 per cent investment. If the engines had but one year of life ahead of them it would have paid most handsomely. Did it pay? Is this one of the big economies? Does it not put in the shade all other locomotive economies that you can think of?

The steam locomotive of America is too big a factor in the success, stability and happiness of the nation to allow so large a proportion of antiquated equipment to be running hauling tons and hauling people at the high cost that these conditions entail. These old engines ought to be modernized or they ought to be scrapped, and that quickly.

The survey of the power on any railroad will reveal the merits of this question. It is my opinion that this survey is one of the most important immediate problems before the railroads. The best thing about it is that it can be done now and that it will point out the best business policy of the roads—no matter who owns them.

A small engine need not be an uneconomical engine just because it is small. You need lots of small engines and always will need them. They should be put into the efficient class and their lives prolonged. By the way, this policy will overcome the extravagance of the past in the purchase of new power, much of which was necessary merely because there was so much unmodernized power on the road.

Some of you are thinking—"That's all right but where is the money?" Let me tell you where the money is. It is blowing up the stack of every unmodernized engine. The en-

the first cost of modernizing is wasted in coal every seven to ten months on every one of these engines that is working. That's where the money is.

Did we back away from Germany because we didn't have the money for the war? We got the money!

You will find it easier to convince the hard headed businessmen, the shippers, that you ought to have freight rate increases after you have modernized these old engines. The shippers understand modernizing. That's why they succeed in business. That's why they have something to ship.

If you have had the inspiration of watching rival gun crews handling modern guns you will appreciate the fact that, to do the work of to-day, which is greater work than that of yesterday, the guns must be *right*. It is not sufficient that the handling only should be right. The results are up to the right guns handled *right*. The more worthy the gun the better it will be served and the more it will do. This is exactly true of the locomotive. Every scoop of coal well fired does the more work when the engine is modernized. Modernizing augments every other means of saving. Let's get our heads out of the sand.

### Other Discussion

H. C. Woodbridge, fuel supervisor, Allegheny region, spoke particularly of the part transportation officers have in the conservation of fuel, mentioning a number of things not generally done now which they could do to reduce fuel consumption. When business is heavy it is now a common practice to start trains out from terminals whenever enough cars are available to make up a train, without regard to conditions at either the despatching or receiving terminals. He advocated the despatching of trains according to a predetermined plan, based on a careful study of the expected amount of business for any particular season, in which consideration has been given to conditions at terminals and important intermediate points on the division. In this way temporary congestion at terminal yards and engine terminals may be avoided and the power received only as fast as it can be handled. Such a plan has a marked influence on coal consumption through the elimination of delays.

The maximum allowable tonnage should be maintained, and tonnage should be reduced promptly to meet extraordinary conditions of weather, partial engine failures, etc. Tonnage trains should be given assistance out of the initial terminal to prevent delays in movement during the time in which the train is getting warmed up. Through loads should be segregated and pick-up work confined to certain trains rather than being handled hap-hazard by every train over the division. Trick despatchers and tower men should be made to see clearly the effect on fuel consumption of slowing or stopping tonnage trains. Recommendations from trainmen as to the revision of schedules should be carefully considered; engines should be assigned and not pooled; the road foremen's time should not be taken up in conducting efficiency tests, etc., but devoted to supervising the operation of the locomotives on the road; the use of unnecessary lighting should be discouraged, and men should be disciplined for pulling apart air hose and allowing locomotives to waste steam at the pops. A close check should be kept on slow orders to eliminate their use or continuance except within absolutely necessary limits. The most efficient engines should be used and the inefficient ones scrapped or stored.

Robert Collett, fuel supervisor of the Eastern region, laid stress upon the fact that nothing saves so much coal as an all-around good job of railroad operation. Any practice or plan which tends to improve general operating conditions is bound to reduce the consumption of fuel. Mr. Collett said that his conception of the function of the Fuel Conservation Section lay more in passing on the good things already being done from one road to another, than in initiating absolutely

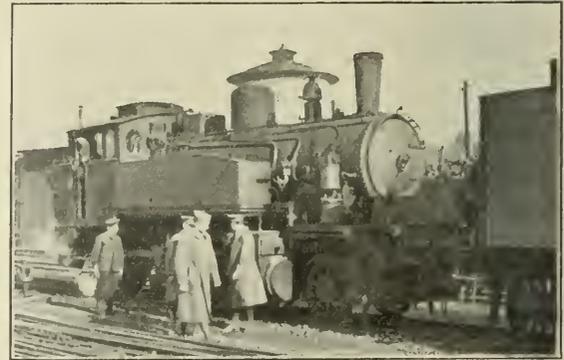

new practices. In dealing with the use of coal on the locomotive he suggested that more stress be placed on telling the men about their good performances than in continually criticising them for their failures. The business of a railroad is to move trains and engineers should not be criticised if they place more stress on keeping engines hot than upon the question of fuel economy, unless they have been thoroughly instructed in the best methods of firing and operating locomotives. As an evidence of the effect of operating conditions on fuel economy, he mentioned the fact that a 40 per cent difference in fuel used on the same passenger train on two succeeding days had been observed, where the difference in conditions lay in the necessity for stopping at block signals in one case, whereas a good run was made in the other.

Mr. Collett quoted from a comparative statement recently issued by the Fuel Conservation Section, which shows that the best results in reduction of fuel consumption on a gross-ton-mile and passenger car mile basis have been obtained in the Central District of the Eastern region. Comparing the last six months of 1918 with the last six months of 1917, thus eliminating the effect of the extraordinary weather conditions prevailing during the early months of 1918, the average reduction in freight unit consumption for this district was 9.2 per cent and in passenger train-unit consumption 7.1 per cent. As shown by the available statistics, the total reduction in all regions was 5.5 per cent in freight service and 3.2 per cent in passenger service.

H. B. Brown, superintendent fuel department, Lehigh Valley, referred to the fact that, next to labor, fuel is the largest single item in railroad operating expenses and that the coal bill of the railroads was \$150,000,000 greater in 1918 than in 1917, a fact which necessitates the redoubling of efforts to conserve coal from the standpoint of economy. He also referred to the necessity of fuel economy from the standpoint of the conservation of a natural resource which is not inexhaustible.

George L. Fowler called attention to the effect of proper firing methods on boiler repairs, stating that the opening and closing of the fire door produces a change in temperature of the firebox sheets reaching a maximum of 100 deg. F. in some parts of the firebox.

W. E. Symons referred to economies which could be effected in the 15 per cent of railroad fuel not burned in locomotives. By converting coal into producer gas for stationary power plant purposes, as high as \$1.80 per ton may be realized from the sulphate ammonia, which is a by-product of the gas producer process.

# A Statesman's View of the Railroad Problem\*

## Consolidations, Private Operation and Government Guarantees of Return Proposed

By Albert B. Cummins  
United States Senator from Iowa

**B**ARRING, POSSIBLY, the proposed League of Nations, the readjustment of the relation between the government and the railroads is by far the most important and most difficult of the many problems of reconstruction which the war has bequeathed to the United States. There can be no prosperity, no proper development, no enduring growth, unless our system of transportation, both internal and external, is adequate in its facilities and reasonable in the charge for the service rendered. The people of the country should turn their minds to the question in a serious, determined way. They must think of it fundamentally, and with intelligence adopt a policy which will not only be economically sound, but which will furnish sufficient transportation to meet the constantly increasing demands of business, and furnish it at the lowest possible cost consistent with fairness to the capital invested, and to the men whose brain and brawn conduct and operate railway properties. We ought to bear constantly in mind these two requisites as the basis of all our efforts toward regulation and control. I repeat them: First, adequacy of facilities; second, cost of maintenance and operation.

Dismissing for the moment the former, my greatest desire is to impress upon you and the country the fact, never to be forgotten for a single moment as we pass through this discussion, that the cost of transportation is composed of just two items: First, the charge for capital; and, second, the charge for maintenance and operation.

If we are to serve successfully the general welfare our labors must be directed toward reducing, if we can, the charge for capital, and toward securing the utmost efficiency and economy in maintaining and operating the railway properties compatible with fair compensation to those whose minds and hands are engaged in rendering the service we require.

### Looks Upon Transportation as Government Function

In order that there may be no misunderstanding as to my attitude, I desire to say in the beginning that I look upon transportation by railway as a governmental function. I believe it is just as much the duty of the government to provide the people with adequate transportation at the lowest cost as it is to provide them with adequate highways, adequate water supply, adequate courts of justice, or adequate police protection. Whether the government can best perform this function through the government ownership and operation of railroads, or through the instrumentalities of private corporations under public control is entirely a matter of sound judgment and wise discretion. Whatever course is pursued the test must be the same. It is our manifest duty to adopt the plan which will give to the people of the country the transportation which they require at the lowest cost.

It is clearly recognized by every country in the world that government ownership and operation of railroads is a proper governmental activity, and if a particular government selects some other agency through which to accomplish its purposes it is solely because the commerce of the country can be better served through such agency. I interpolate this thought simply because there are some men who seem to believe that

in government ownership and operation there is a dangerous approach toward socialism as it is generally understood. Nothing could be more erroneous than this view of the subject. I do not intend to enlarge upon this phase of the matter, and mention it only to quiet the fears which seem to disturb the composure of a great many good citizens.

I emphasize again the proposition already announced: The object which Congress must constantly bear in mind is the necessity for transportation, and the right of the people to have it upon reasonable terms. If they can secure better transportation and at lower rates through government ownership and operation that is the system which should be adopted. If, on the other hand, the object can be attained in a higher degree by employing private instrumentalities under public direction and control, it is obvious that we ought to pursue the latter course.

### Magnitude of the Subject

With these preliminary observations I beg to turn your thought, first, to the magnitude of the subject with which we must deal; and, second, to some historical facts which may be of value in determining what we ought to do.

The railways of the United States constitute about one-twelfth of all the property of the country. We have 260,000 miles of railway lines—more than one-third, nearly one-half of all the railways of the world. These railways of ours carry a yearly traffic so much greater than that of any other country that there is really no basis for comparison. Indeed, the traffic of any two nations may be combined and still it does not approach the commerce of America borne upon American railways.

The average capitalization of our railways is \$67,000 per mile, and while that may be greater than the cost of the properties, and I am quite convinced that it is, yet it is still true that it is considerably less than one-half the average capitalization of railways throughout the remainder of the world.

When we approach the radical readjustment of the system of control and regulation of such a property, appreciating its intimate relation with every other business activity, it is not difficult to understand the deep sense of responsibility which those who are engaged with the readjustment must feel; and the consciousness that the work must be done after the most complete inquiry, the most careful reflection, and the most intelligent comprehension of the subject in all its vast ramifications.

It is easy to demonstrate that these railways were not all built where they should have been built, and that the construction of hundreds of them was attended, not only with profound ignorance of the most fundamental principles of railroad building, but with a greed and graft which shocks the modern investigator; but which, happily, cannot be repeated in the future. Nevertheless, the railroads were built, communities have been developed which rely upon them, and it is idle to think even of dismantling any considerable number of them or of changing the channels of commerce which have now been established.

It is not my purpose to inquire into the iniquities of either the original construction of the railroads or into the dishonesty

\*An address delivered on March 27 before the General Assembly of Iowa. Senator Cummins is the ranking Republican member of the Senate Committee on Interstate Commerce, and undoubtedly will be re-elected its chairman when Congress meets again.

which accompanied the capitalization of the railway corporations. Much of the wrong-doing can never be punished, and much of the injustice can never be repaired. Nearly a generation has passed since most of these things were done, and the railways are in the hands of a new and better body of men, who, in my opinion, have in the main for a decade or more been faithfully endeavoring to comply with the law in the management and operation of their railroads; and it is unfair to inflict upon them all the penalties which their predecessors justly incurred.

In my service as a member of the Interstate Commerce Committee of the Senate I have been in close contact with most of the railway presidents and managers of the country, and I take this opportunity to say that, while I cannot accept in all respects their opinions with regard to the readjustment which everybody admits is imperative, I believe them to be thoroughly honest in their discussion of the subject; and that they have a sincere desire to help, rather than to hinder, Congress in finding the best solution of the intricate and important problem. It is natural that they should be biased, but it is a pleasure to know that all of them recognize that they are engaged in a public service and that the public interest is, and must always be, the paramount consideration.

Passing over the earlier history of the railroads without further remark, I bring your attention to the three years immediately preceding the war. The years 1915-1916 and 1917 were the most profitable years ever experienced in the operation of railroads. During these years the funded debt, and I use round numbers, amounted to eleven billions of dollars, and the capital stock, eliminating all duplication, to six billion five hundred millions of dollars. The property investment account, which was intended to show the actual cost of the railway property, but which in fact is inaccurate, as frequently declared by the Interstate Commerce Commission, aggregated something more than eighteen billions of dollars. This does not include all the assets of the corporations. The average net railway operating income for the three years was nine hundred and thirty millions of dollars.

### Unequal Earning Capacity of Railways

The average return upon the so-called property investment for the Eastern District was 5.21 per cent. For the Southern District 5.36 per cent, and for the Western District 5.15 per cent. After paying all fixed charges, including interest upon the funded debt, and taxes, the railways earned upon their capital stock all the way from nothing to more than one hundred per cent.

Limiting my inquiry now to what are known as Class 1 roads, being the railways which have a gross income of more than a million dollars annually, and still using the average of the pre-war period and the property investment account for comparisons, a startling situation is disclosed.

In the Eastern District there are 67 railroads: Three of them show a net operating income of more than 10 per cent upon the investment account. Two of them show more than 9 and less than 10. Three of them show more than 8 and less than 9. Four of them show more than 7 and less than 8. Five of them show more than 6 and less than 7. Twelve of them show more than 5 and less than 6. Fourteen of them show more than 4 and less than 5. Nine of them show more than 3 and less than 4. Seven of them show more than 2 and less than 3. Five of them show more than 1 and less than 2. Two of them show less than 1, and one of them was operated at a loss.

In the Southern District there are 32 railroads: I need not particularize so closely with respect to them, and it is sufficient to say that upon the property account four of them earned more than 7 per cent; fourteen of them earned less than 5 per cent, and seven of them earned less than 3 per cent.

In the Western District there are 63 railroads: Thirteen of them had a net operating income of more than 6 per cent. Twenty-five of them had a net operating income of less than 3 per cent; and twenty of them a net operating income of less than 2 per cent.

I am stating these facts for one purpose, and one purpose only. It is to fasten upon your minds the disparity in the earning capacity of the various railroads of the country. In my judgment, the railroads earned in the years to which I have referred, as a whole, more than they ought to have earned; but the varying conditions of the several properties present an insoluble problem under our former system of regulation and control.

It is, of course, well known that a very large proportion of the railroad revenues are earned under competitive rates, and no matter what the necessities of a particular railroad may be it must do business upon the rates that prevail among its competitors. I give you a concrete illustration in order to make this point perfectly clear.

You are all familiar with the Chicago & North Western and the Chicago Great Western railroads. They are wholly competitive. The average net operating income of the Chicago North Western for the period named was 6.13 per cent upon its property investment account, while the average net operating income of the Chicago Great Western for the same period was 1.77 per cent. The Chicago Great Western cannot survive upon rates which will enable the Chicago & North-western to pay its interest and 8 or 10 per cent upon its capital stock, and add every year to its surplus.

What is true of the Chicago Great Western is true in greater or less degree of the railroads which carry about 25 per cent of the traffic of the country. To increase rates so that the weak roads will become self-sustaining and able to finance themselves would give to the roads which do 75 per cent of the business a revenue which the commonest sense of justice forbids.

It was this situation which finally convinced every thoughtful man, even before the war turned the railroads over to the government, that there must be a radical change in the system gradually developed from 1887 to 1917. I beg that you will remember these conditions, for upon them is founded one principle which any readjustment must observe.

Two additional facts and I shall have finished the historical review. The funded debt of all the railroads was, at the beginning of the war, eleven billions of dollars, bearing an interest charge of four hundred and seventy-five millions of dollars, leaving substantially five hundred and fifty millions for either dividends, investment in property or surplus. In 1917 the revenue from operation was substantially four billions of dollars and the cost of maintenance and operation was substantially three billions.

### Results of Government Operation

In order to complete the basis for the comparisons I shall institute I pass to a very brief statement with respect to the year of government operation. The President took possession of the railroads on the 29th day of December, 1917. In March, 1918, Congress passed an act which authorized the government to pay for the use of the property a sum somewhat in excess of nine hundred millions of dollars annually. The volume of traffic in 1918 was slightly less than in 1917, but in the first half of the year the rates, both passenger and freight, were increased so that the revenues amounted to a trifle more than four billions nine hundred millions of dollars. That is the aggregate sum which the people of the country paid in the year in freight and passenger charges for their railroad transportation—something like eight hundred millions of dollars in excess of the amount paid in 1917.

The cost of maintenance and operation, however, grew to substantially four billion two hundred millions of dollars, to

which we must add nine hundred millions for compensation and a further large sum yet to be announced for the expense of the Central Railroad Administration.

The outcome is that it cost the government more than five billions one hundred millions of dollars to furnish transportation for the year, leaving a deficit of more than two hundred millions of dollars to be paid from the treasury of the United States.

While the former Director General expressed before our committee the belief, and in this opinion he was joined by the present Director General, that the year 1919 would exhibit more satisfactory results, it is my judgment that the deficit of 1919 will not be less, and may be more, than the deficit of 1918. I do not intend to enter upon an analysis of this deplorable showing of government operation further than to say that the increase in revenues is substantially as great as the increase in wages and the advanced cost of supplies, and the shortage must be largely accounted for by the inefficiency incident to government operation and the tremendous increase in the number of railroad employees—an increase which has always been observed in all countries as they have passed from private to public operation.

Moreover, the government during the year either paid or became responsible for extensions, additions and betterments chargeable to capital account, and which the railroads must repay if they are able, about eight hundred millions of dollars. It is this condition which makes it impossible for the government to return the railroads to their owners until there is far-reaching legislation which will protect both the public and the railroads from the disasters which would inevitably follow an immediate return. Without the necessary credit to finance themselves, and in view of the enormous demands which the war has made, and is making upon the resources of the people, it is clear to thinking men that a return of the railroads to the corporations which formerly operated them without suitable legislation would lead fifty per cent of the railway mileage of the United States into the hands of receivers within six months.

It is the first and highest duty of Congress to deal with this situation in a fundamental way, and to establish a permanent policy for the future maintenance, regulation and control of our transportation systems. No half-way or timid measures will suffice. We must meet the question squarely and boldly. It is no time for shrinking, compromising spirits. I am sure that I speak for every member of the Senate when I invite the best thought of the General Assembly of Iowa to aid in the solution of this exceedingly serious and overwhelmingly important problem immediately confronting us.

You will understand, of course, that the facts which I have recited merely outline the information with which the history of railroads, their development and operation, is crowded, and I assume that you will supplement what I have said with your own comprehensive knowledge of the subject. These facts are sufficient, however, in my judgment, to point the way to the reorganization of our transportation system, and to sustain the principles which must be embodied in any successful readjustment of the relation between the government and the railways.

### Some Fundamental Principles

Some time prior to the first of January of the present year, and in anticipation of the hearings which have been in progress before the Interstate Commerce Committee of the Senate for two months or more, I announced to the public a series of principles which, as it seemed to me, should be accepted in the enactment of any fundamental legislation. They are:

First. The return upon the capital invested in railways should be made certain through a government undertaking.

Second. The railways should be consolidated into com-

paratively few systems, and by few I mean not more than eighteen.

Third. The railways should be operated by private corporations organized under an Act of Congress.

Many complete plans of reorganization have been laid before the Senate Committee, brought forward by the most intelligent, thoughtful men of the country, some of whom are railway executives, some of whom represent security holders, some of whom are bankers, some of whom represent commercial and civic institutions, and some of whom are observers and students of economic life in all its varied phases.

It was intensely gratifying to me to discover as the hearing proceeded that all these plans, save one, adopted the substance of the principles which I had made public, although there are wide differences in the form of their application to the actual affairs of transportation.

Will you indulge me while I submit, with such brevity as I can command, the reasons which justify the principles to which I have called your attention?

The return upon the capital invested should be made certain by a government undertaking because:

First, it is highly desirable to remove for all time the demoralizing, corrupting struggle between the owners and representatives of railway property and the public, especially that part of the public directly interested in freight and passenger charges. For more than forty years this conflict has been going on in conventions, elections, legislatures, congresses and the courts. Sometimes the railways have won, sometimes the people have won, but the fight has been so intense that oftener than otherwise the justice of the matter has been ignored by both sides, and it is high time to bring the contest to an end.

Second, the honest investment in railway properties is entitled to protection, and the public is entitled to fair treatment. It is impossible to conceive of any revision of the law that will accomplish these two things without the elimination of the controversy relating to the return upon capital. The certainty of the return is also demanded because furnishing transportation is a public business, and abstractly considered there should be no speculative profit in the business.

Finally, and chiefly, the return should be made certain in order to reduce the charge for the capital invested in the railway properties. So long as the return is uncertain with respect to many railroads, every railroad will insist upon earning all it can.

Taken as a whole, the roads received in 1917 a net operating income of about a billion dollars, and they were contending earnestly for more. In 1918 Congress authorized the President to pay them as compensation during the government possession somewhat more than nine hundred millions of dollars per year, and this did not include many of the short line railways. If the government makes a certain return it can justly reduce the return to a rate of interest which a government obligation ought to bear.

Assuming, but not conceding, that the railways are worth in the aggregate seventeen billions of dollars, a return of four and a half per cent under a government guaranty would be ample. Under such a provision the annual charge for the properties as they now are would be seven hundred and sixty-five millions of dollars. The people paid in 1917 a capital charge of a billion dollars, and we are now paying under government operation a capital charge of more than nine hundred millions of dollars. The principle I have proposed, if embodied in the law, will save the people of the country from two hundred and fifty millions to five hundred millions of dollars annually, for it must be remembered that under the old system the capital charge was gradually increasing, and it is easy to believe that without reckoning any addition to the value of the property the capital charge would soon reach a billion two hundred millions of dollars.

Another vexatious element would be laid at rest. The unearned increment in public utility property is a constant menace. It ought to be understood, once for all, that a fair return upon the actual investment is all that capital can demand. I understand perfectly that many people will instinctively shrink from a guaranteed return, but their reluctance to adopt the principle will disappear upon reflection. There is no possibility of an additional burden; on the contrary, we shall save an immense sum of money every year and at the same time convert railway securities into a stable investment and contribute tremendously to the available credits of the country.

There are various methods in which the principle can be applied. It may take the form of a legislative assurance that the rates shall be sufficient to produce the sum required, but preferably it will be put in a positive guaranty. It may be worked out through the securities as they now exist, but the simpler plan would be for a government corporation to acquire all the properties or all the securities and issue or substitute new obligations.

It is to be understood that in any event there must be a valuation of railway properties, unless there can be an agreement between a government agency, such as the Interstate Commerce Commission, and the owners with respect to value. In my judgment, this principle extends the only hope of a reduction in rates, or of preventing still further increases.

#### Consolidation, Without Eliminating Competition

The second principle to which I have referred is that there must be a consolidation of the railroads into comparatively few systems. It is utterly impossible to maintain an efficient system of transportation with reasonable rates for service unless this be accomplished. In my statement of the earning capacity of the various roads it was made entirely clear that if the weaker roads are made self-sustaining so that they can continue to serve the communities through which they pass, the stronger roads will enjoy a revenue so excessively large that the people as a whole will be compelled to pay inordinately for their transportation. This is one proposition upon which all impartial students of the subject agree, no matter whether they come from railway life or from the general community. The weaker roads must be merged with the stronger ones into competitive systems which can endure upon substantially even terms. They must be merged, too, under a law that will require at proper times a common use of terminal facilities and a free interchange of equipment, and thus preserve the great advantages of unification, which is the one superiority in government operation.

I am not in favor of regional systems, for we must at all hazards perpetuate competition in service. The experts who have studiously examined the matter are of the opinion that all the railroads of the country could be consolidated into—say 18 systems, and that the competition in service in nearly every locality would be even more keen than when the government assumed control.

I cannot, within the time which I may properly consume, describe these systems, but I know that it is wholly practicable to do what I have suggested. When this is accomplished if any particular system earns enough as a whole to pay the capital charge and the cost of maintenance and operation the law will be satisfied, and all that will remain for the Interstate Commerce Commission to do will be to see that the rates as between communities and commodities are not discriminatory.

I would not have you think that it will be easy to bring about this situation. It will require very considerable time and a high order of intelligence, but it is largely administrative work, and in the hands of men who have devoted their lives to the subject it can be realized without danger to either the

financial, commercial or industrial structure of the nation.

Here again more than one method can be used to embody the principle. It is possible to take railway corporations already in existence and work out the plan with them. My own conviction, however, is that the safer and better method is to put each of these consolidated systems in the hands of a Federal corporation. It is gradually becoming clear that in so far as rates are concerned the national government must be the arbiter. I have come to this conclusion slowly and reluctantly, but it is folly to resist the inevitable conclusion. State made rates which either discriminate against interstate rates, or which do not raise their full share of the required revenue, impair the control over interstate commerce which the Constitution has conferred upon Congress and destroy the efficiency of Federal action. I sincerely hope that there will be found some feasible plan for co-operation in this matter between Federal and state authorities, but in the last resort the Federal agency is supreme.

It seems to me, therefore, that all railway common carriers should be organized under an Act of Congress, although I freely admit that the national government can exercise its full power through state corporations, but with some embarrassment and loss of efficiency.

#### Government Operation Is Undesirable

The third principle which I have mentioned is that the railways should be operated by private corporations rather than by the government. I want you to observe that I emphasize the distinction between government ownership and government operation. I realize fully that when the government undertakes that the return upon the capital invested shall be certain, or in other words guarantees the return, whether by legislative assurance or explicit obligation, it is the equivalent of government ownership, and in so far as I am concerned, I am quite ready for the undertaking. The truth is that we have government ownership now in its most undesirable form. The Interstate Commerce Commission, under the present law, determines the revenues which the railways shall receive. It thereby determines the expenses which they may incur, and when the technical owner of property loses the right to say how much he shall have for its use, and the right to say how he shall conduct the business of which it is a part, and the right to fix the cost of its operation, he has parted with the essential characteristics of private property.

I favor the private operation of railways under the strictest control for one reason, and one only. The government cannot operate the railroads either economically or efficiently. It is not my purpose to examine the experience of other countries. It is sufficient to say that to my mind that experience is not reassuring. But no matter how that may be I know that the government cannot take seventeen billions of railway property rendering a service which reaches every nook and corner of the land, employing in the service two millions of men or more, and indirectly affecting the fortunes of many other millions, and manage it with either economy or efficiency.

It costs the government more to do any given thing in a country like ours, where every man is a sovereign, than it costs anybody else to do the same thing. The history of every enterprise of a business character conducted by the government proves all and a great deal more than the statement I have just made. I disparage no one, and impugn no man's integrity. What I have said is not only the truth, but it is as natural as life itself.

I admit that the result of government operation during the year 1918—a year of war—is not altogether a fair criterion by which to test the capacity of the government to manage the business of transportation, and it is not my

desire to discredit the officials who have been responsible for what has happened. They have, however, demonstrated that the influences which surround the operation of a great commercial and industrial enterprise are too strong to be resisted.

It is unnecessary for me to enter into the details of this subject and I am content simply to record my opinion in favor of private operation, an opinion based solely upon the ground that the people of the country will get better transportation and at less cost in that way than through government operation; and that, as I view it, is the chief concern of those to whom the service is to be rendered.

### Must Afford Incentive to Efficiency

If then, private operation is the better plan, how is it to be accomplished, in view of the limited capital charge which I have already considered? I am fully aware that if private corporations are to operate the several systems which I have described there must be an incentive in the way of profit in order to secure the highest degree of fidelity and efficiency. There must be a reward for good management and honest work, and a penalty for bad management and dishonest work.

Happily, there are several methods through which this problem can be worked out. It can be done through a leasing system, with the rights of lessees carefully prescribed in suitable contracts, but a still better way may be found by providing for a corporate ownership of the several systems into which the country should be divided, each corporation with a capitalization representing the actual value of the particular system, and the establishment of rates which will produce not only the cost of maintenance and operation and the guaranteed return upon capital, but a reasonable sum in excess of the guaranty; the excess to be divided between the stockholders and the workmen. I am a profound believer in profit-sharing, and when the rule is properly applied it will solve many of the problems which now disturb the industrial world. The additional compensation to capital for efficient management, together with the sum distributed among employes as a reward for faithful labor, will be far less than the increased cost of government operation.

These suggestions could be extended almost indefinitely, but I forbear, knowing that I have sketched but the outline of a mighty field. If, however, I have turned your thought to the real questions which must be answered, and have induced you to give them the study of which you are capable, and thus forward the immediate task in which we are commonly engaged, I have fulfilled my mission, and will be content with your judgment upon my public service in this regard.

One word more and I will have finished what to me has seemed a duty and which I hope you will not look upon as an intrusion upon your valuable time. I intend to discuss this subject throughout the country within the next two months and I felt that I should first lay my views before the law-making body of my own state.

The Supreme Court of the United States on April 21 agreed to expedite consideration of test cases which are expected to determine the question of the authority of the federal government to prescribe intrastate rates for freight, passengers and telegrams. The court fixed May 5 as the date for hearing arguments in three cases involving this question, one of which is the appeal by the Railroad Administration from a decree of the North Dakota supreme court enjoining the Northern Pacific and other railroads in the state from increasing freight and passenger rates within the state as ordered by the director general last year. The other two concern telephone and telegraph rates. It is hoped that final decisions may be reached before the court adjourns for the summer.

## Return of Colonel McCrea

COLONEL JAMES A. M'CREA, formerly general manager of the Long Island Railroad, has returned from France and this week made a short address at a Victory Loan rally of Long Island employes at the Pennsylvania Station in New York. A part of the address is given below.

Colonel McCrea went over in the latter part of 1917, and served as general manager of the American railroads and deputy director general of transportation under Brig. Gen. W. W. Atterbury. He has received a distinguished service medal. General Pershing had recommended Colonel McCrea for promotion to brigadier general, but before the recommendation could be carried out the armistice was signed.

With Colonel McCrea at the meeting was Captain Charles E. McLaren, who was in charge of the Long Island Railroad's lighterage department prior to his enlistment early in 1917. Captain McLaren looked after the operation of ships at seven different ports in France, namely, La Rochelle, St. Nazaire, Nantes, LaPallies, Havre, Brest and Rochefort.

### Colonel McCrea's Address

There had never been such a thing as a railroad transportation department in the United States Army. It had its inception when four or five men went to France in July, 1917. These men made a complete survey of the situation, which resulted in the preparation of what is known as "Requisition Number Six," being a list of materials and supplies that called for an expenditure of something like \$400,000,000. And at the end of a year not a single item was found in that long list which wasn't needed and didn't have a distinctive part in the machinery of the transportation department.

We didn't build any separate railways in France, although many people here have been led to believe that we did. Our contribution was terminals, yards, and sidetracks, equal to a new line about 1,000 miles in length, with one important cutoff. With the exception of a few small branches, the French railroads are all double-tracked. There were plenty of French-built railroads, and we found them in pretty good physical condition, but there was a scarcity of men to operate them. The young men were doing their bit on the battlefields, but the men around middle age left in service did excellent work. The women of France also deserve great credit. They fired engines, did braking, and performed some of the hardest kind of manual labor in the shops.

By our arrangement with the French, we were to supply trainmen to move a tonnage equivalent to that which the American army would need. For every American serving in France we had to move an average of fifty pounds a day. This included coal, engineering materials, food, clothing and ammunition. We handled not only our own supplies, but also a great volume for the French as well. They reciprocated, moving American supplies over their lines to different sectors where our troops were fighting. There was magnificent co-operation on both sides.

The plans of the Allies required that by July, 1919, the United States should have three and a half million men in France, fully equipped and trained to do battle. For every hundred fighting men we had to have between 15 and 20 service-of-supply troops, to do other kinds of work. As many as 18,000 American troops landed at Brest in one day, and it was a gigantic problem to move these great hordes of men and their supplies, especially as we were continually handicapped with a comparatively small transportation force.

One of the fundamental reasons the American Expeditionary Forces did so remarkably well in France was their adaptability to almost any character of work, however

difficult. Of the transportation men few, if any, performed only the work which they came over to do.

There were many French railroad practices we did not fancy, I am frank to admit; but it would have been a tremendous mistake for us to go over there and insist upon introducing American methods. We had to adapt ourselves to conditions as we found them. We had trackage rights over all the French railways. On no two roads were the signal systems alike, and we had to prepare a book of rules whereby our men could run the trains. In this country the conductor is in charge of the train. In France the engineer has charge while the train is in motion, but when the train is not in motion a so-called "pilot" is the responsible head.

When the armistice was signed we were moving 40,000 tons of freight daily, and were planning to move a daily tonnage of 100,000. For about a week following the cessation of hostilities, everybody was celebrating the victory, but the transportation department's work could not be interrupted. Our job really had only just begun. Our hardest work was done between November 11 and the middle of January, when we had to get the Army of Occupation up to the Rhine. And even then we were not through. The Allied soldiers on the Rhine had to be fed, which meant that several trainloads of food had to be despatched every day and hospital trains had to be operated; and there was also the task of feeding the German population in the occupied territory.

## Orders of Regional Directors

**VICTORY LIBERTY LOAN.**—The Northwestern regional director in a telegram, file 52113 to Northwestern railroads states that where payments on account of the fourth Liberty Loan have not been completed, it will be permissible to defer deducting from the payrolls on account of the Victory Liberty Loan until payments on the previous loan are completed; but the deductions on account of the Victory Loan must begin not later than the payrolls for September, 1919. The Eastern regional director has issued a similar notice.

**Sale of Secondhand Rail to Industries.**—Circular 199, canceling Circular 8 of the Southwestern regional director states that it will be satisfactory for relay rail to be sold for the construction and repair of industry tracks at \$40 per gross ton.

**Brakes on U. S. R. A. Hopper and Gondola Cars.**—Order 194 of the Southwestern regional director requires inspectors to make a special inspection of all United States composite gondola standard and hopper cars, and that where these cars are found without sheave wheels on the brake shaft end of the hand brake rod to send these cars to shop, regardless of ownership, and have the brake arrangement changed to conform to the approved standard.

**Campaign Against Venereal Diseases.**—By circular 200 the Southwestern regional director permits state boards of health to post placards advertising the free government and state clinics for venereal diseases. These placards must not be placed in reading rooms or in cars.

**Use of Headlight Generators.**—Circular 203 of the Southwestern regional director reminds enginemen that by keeping water gages and shields clean or by slightly relocating the lamps of these water gages, it will not be necessary to run headlight generators during daylight as is now being done in many cases.

**Records of Shipments of Distilled Spirits.**—Supplement 1 to Order 88 of the Southwestern regional director states that records ordered kept by Order 88 of shipments of distilled spirits (no longer required) should be carefully retained and

be made accessible to revenue officers at points where such officers have not already inspected them. The Eastern regional director, by Circular 600-70A687, issuing the same instructions.

**Repairs of Short Line Cars.**—Supplement 2 to Circular 49 of the Northwestern regional director similar to Circular 500-14-5A669 of the Eastern regional director. (*Railway Age*, April 18, page 984).

**Revised Industry-Track Agreement.**—Supplement 9 to Circular 33 of the Northwestern regional director contains two forms covering standard track agreements which have been revised in accordance with the terms contained in Supplement 1 to General Order 15. This form of agreement is subject to modification by the federal manager in special cases.

**Reports of Air Brakes Cleaned.**—The Eastern regional director by Order 1801-131A691, calls for regular monthly reports, beginning with April, showing the number of freight car air brakes overhauled, with a statement showing the ratio of number cleaned to the number of freight cars owned.

**Rail and Lake Freight.**—The Eastern regional director, by Circular No. 600-4-121A688, advises federal managers of the arrangement for delivering freight to boats at Buffalo. During this season the Cleveland & Buffalo Transit Company and the Great Lakes Transit Corporation will load vessels at the New York Central dock at Ohio street; the Detroit & Cleveland Navigation Company will load at the Delaware, Lackawanna & Western dock; and the Lehigh Valley Transportation Company at the Lehigh Valley dock. Attention is called to the fact that freight which is sent over the roads making these direct connections will avoid additional switching; but shippers must be allowed the right to route their freight as they please. Freight is not to be forwarded by lake unless so ordered by the shipper.

**Passes for Brotherhood Chairman.**—The Eastern regional director, by Circular 2100-13A689, advises federal managers that they may apply to the director of operation, Washington, for annual passes over connecting roads for general chairmen of committees of employees' organizations where such passes are necessary to enable a chairman to make a short cut from one part to another of his own territory.

**Express Agents' Telegrams.**—The regional director, Eastern Region, by circular No. 304-11A693, advises federal managers that the agreement with the American Railway Express Company permitting agents of the express company to send telegrams free on the railroad wires, is intended to allow this privilege only between points on the same railroad.

**Passes for Representatives of Clerks.**—The regional director, Eastern Region, by circular No. 2100-13A694, quotes an order from the director of the Division of Operation authorizing the issuance of free transportation to the general chairmen of the Brotherhood of Railway Clerks on the same basis as to general chairman of other brotherhoods, regardless of whether there is or is not a contract between the clerks and the railroad on which these chairmen are employed.

**Passes for Brotherhood Conventions.**—The regional director, Eastern Region, by circular 2100-37A695 promulgates the order of the director of the Division of Operation, dated April 15, authorizing free transportation for members to annual conventions of the conductors, the trainmen and the firemen, to be held within the next two months. Transportation is to be granted as in the past, and it is suggested that the federal managers, to save time, send their applications direct to Washington. This privilege includes also the delegates to the Ladies' Auxiliaries.

*The New Retiro Station of the Central Argentine—the Largest in South America*

## The Railroad Development of the Argentine

The Largest Market for Railway Equipment in South America—  
Regulation, Labor, and Taxation Big Problems

IN TWO PARTS.—PART II

**S**UPPLIES OF ALL KINDS have increased tremendously in price since the beginning of the war and have been hard to obtain at any price, but the increase in price and scarcity of fuel has contributed more directly than any other factor in increasing the cost and difficulty of operating the railways. Coal has risen in price from £1 10s. before the war to something like £10 in 1918; in 1916-17 the average price was about £5 or £6 a ton. In normal times the Central Argentine consumes annually about 400,000 tons; the Great Southern, 380,000; the Pacific, 280,000; the Western, 190,000; and other companies in proportion to their mileage and traffic. Not only has coal increased in price but the supply has been so limited that the railways have been forced to burn large quantities of wood.

It is estimated that the Great Southern, the Buenos Aires & Pacific, the Buenos Aires Western, and the Central Argentine together use approximately 3,000,000 tons of wood annually under the present abnormal conditions. In addition, the industrial enterprises burn 8,000,000 tons, and all this fuel must be brought down from a restricted area in the northern part of the republic. The carrying capacities of the lines serving this region are wholly inadequate, with the result that the Southern and some of the other systems having no wooded districts of their own to draw from have been unable to obtain sufficient wood at any price.

In 1915 the railways were authorized to raise their tariffs 10 per cent and in 1917 22 per cent. They announced a

third increase of 10 per cent to take effect May, 1918, but were refused permission by the government to put this last into effect. According to the terms of the mitre law the government may not interfere in the rates which a company charges so long as its dividends do not reach 6.8 per cent on the recognized capital. The companies contend that since their dividends have not reached any such figure, and are unlikely to for a long time to come the government has overstepped the prescribed limits. They maintain further that this 10 per cent increase was promised them in compensation for the higher salaries granted their employees at the settlement of the strike in 1917 and the shorter working day which necessitated a larger working force. The government refused to allow the new rate on the grounds that the companies had failed to give the required four months' notice and that it would impose an unduly heavy burden on the producers of the nation, especially the wheat growers selling their crops to the allied governments at a contract price.

The various companies submitted detailed reports setting forth their reasons for asking this increase. All their expenses, especially wages, taxes, and cost of fuel, have been augmented during the last four years while their volume of traffic has not changed materially. The export freight has grown in volume but this has been counter-balanced by the falling off in import freight. The Southern claims in its report that the 22 per cent increase failed to add to the

gross receipts the 5,792,054 gold pesos estimated; that the proposed supplemental 10 per cent would only yield an additional 2,951,957 gold pesos; and that the working expenses were greater by 13,054,435 gold pesos. Hence, a rate 25 per cent higher instead of 10 per cent would be necessary to cover the deficit entirely.

### Improvement in Financial Outlook

While not disposed to underrate the seriousness of the present unsettled labor conditions, the uncertainty as to the character of the proposed railway legislation, and the probability of the continued high cost of supplies, recently published reports of many of the Argentine railways indicate the hopeful feeling with which the shareholders are looking forward to the coming year. The 1917-18 net returns have in general been a trifle better than those of 1916-17, due to the 22 per cent rate increase allowed November, 1917, and this has been reflected in a slight rise in recent quotations of stock. The grain crop on which the railways are chiefly dependent for their export freight was large in 1917-18 and promises to be almost as good for the present year. The ending of the war means the gradual easing of the shipping situation which will result in larger volume of import freight traffic for the railways.

The following quotations of railway stocks which are listed on the London Stock Exchange represent the high and low prices for 1913 and the opening and closing prices for

available. A recent issue of the Review of the River Plate states that the minister of finance has been authorized to transfer the sum of 12,000,000 paper pesos to the administrator of state railways. One-half of this amount is to be utilized in canceling the outstanding liabilities of the administration and the remainder in the acquisition of materials urgently required for the state lines. It is understood

Name of company	Gross receipts		Per cent consumed in working expenses		Dividends	
	1916-17	1917-18	1916-17	1917-18	1916-17 Per ct.	1917-18 Per ct.

\*Argentine paper pesos.

that the transfer will be effected at the rate of 100,000 pesos a day.

### Extensive Improvement Policy Halted by War

Argentina's railway mileage has only increased from 21,000 miles at the beginning of the war to 22,000 in 1919,

Railroad Station at Goya

1918. They show the very real depreciation in the selling price of these stocks since the war, but they show also that during the last year the movement has been appreciably upward. With a single exception, the closing price for 1918 is higher than the opening price.

Name of company	1913		1918	
	High	Low	Opening	Closing
Buenos Aires Great Southern, ord....	130	109	72½	72
Buenos Aires Western, ord.....	128	109	71	73½
Central Argentine, ord.....	112	100	59	66
Buenos Aires & Pacific, ord.....	92	64	39	58½
Central Cordoba, ord.....	54	39	11½	17½
Entre Rios, ord.....	78	54	22¾	41

The table in the next column gives the amount of gross revenue for the years 1916-17 and 1917-18, the percentage consumed in working expenses, and the dividends on ordinary stock, wherever it has been possible to obtain these details from published company reports.

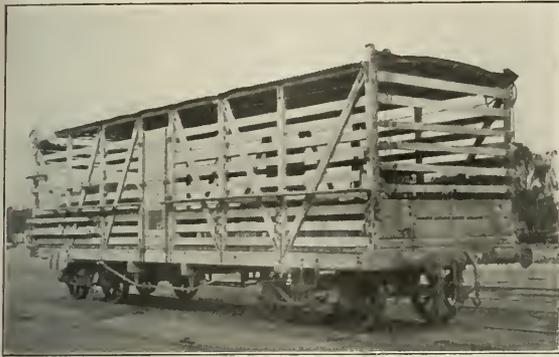

Los Ferrocarriles del Estado usually show an annual deficit, but in 1915 and again in 1916 they showed a slight profit on the capital investment. No later reports are now

and some of the companies have allowed their concessions for extensions to lapse entirely. However, considerable sums have been spent in the improvement of roadbeds, the double tracking of main lines, erection of new and larger stations, the electrifying of suburban lines radiating from Buenos Aires, and the improvement of port facilities and workshops. Some of the companies have been severely criticised by their stockholders for the elaborate scale on which they have pursued this policy of improvement, and it is impossible to predict whether or not the railways will resume their pre-war plans for expansion. In the case of the European companies it will depend on the price of money at home as well as on the form which the proposed railway legislation in Argentina will take and the solution of the present labor problem. Almost without exception the companies have increased their reserve funds, during the last four years, although they have been forced to pay very small or no dividends at all, and they are anxious to retain and expand their Argentine holdings, provided they are insured sufficient protection by the government, as well as a chance to make a reasonable profit on their capital investment.

**Electric Suburban System**

The Central Argentine opened its new passenger station in Buenos Aires in 1915 and inaugurated its electric suburban line to Tigre in 1916. The passenger terminal, the Retiro, holds the distinction of being the largest in South America and is said to handle 1,900 passenger trains weekly. The branch to Tigre is a third-rail line, modern in every respect, and is operated by power from the Central's own plant. This company began an elaborate plan of expansion, which has been temporarily suspended during the war.

The Buenos Aires Western has a large passenger terminal in Buenos Aires, the Once, and has electrified a portion of its suburban system. From the point of view of economy

**Cattle Wagon on the Transandine Railway**

the freight tunnel recently completed by this company is interesting. It connects the docks with the company's station in the heart of the city, nearly 3 miles distant, and cost about 5,000,000 paper pesos. The original plan was to use only electric locomotives, and an order had been placed with a German firm to supply these, but this order was canceled, and at present steam locomotives are being used. About 100 cars pass through the tunnel daily. The company has also built a tunnel which affords direct connection between its own passenger terminal and a station of the Anglo subway and has plans for the construction of several branches and feeders.

The Great Southern, a third company which serves suburban Buenos Aires, has not electrified any portion of its line yet, but had made plans to do so prior to the war. It has a large passenger terminal in Buenos Aires, La Plaza Constitucion, and the largest freight station in South America, La Sola (also in Buenos Aires), which has capacity for storing 230,000 bags of grain and 2,000 tons of other freight. An extension is projected from Zepala, where connection will be afforded with a line to be built by the Chilean State Railways, thus forming a transcontinental line with easy grades. A second extension is planned to run south from Darwin to the port of San Antonio, where it will connect with the Patagonian State railways. Important irrigation works are being carried out in the Neuquin and Rio Negro valleys.

**Plans for Further Expansion**

The Buenos Aires & Pacific pursued a more aggressive plan of expansion during the last few years prior to the war than any other line in the Argentine. The land along its so-called Patagonas Extension is being irrigated, and every effort is being made to attract colonists. At present the fixed charges of this system are relatively high, and its financial condition not quite so assured as that of the other large companies, but in general its prospects are considered good. Should there be an influx of immigrants from Europe within the next few years, as seems likely, this road will benefit materially.

The Argentine Northeastern has a large projected mileage and serves a rapidly developing section. A considerable portion of its present mileage was opened just prior to the war. The Entre Rios states in its latest report that it does not intend to undertake any construction work for some time.

The Central Norte and the Transandine are the only two railways in the Republic whose construction has been complicated by engineering difficulties. The Central Norte reaches an altitude of 12,000 feet at Abra Tres Cruces, the Transandine over 10,000 feet at the Chilean border.

This latter line has never fully accomplished its mission of forming a quick and easy means of carrying freight from ocean to ocean owing to the forced suspension of traffic during the stormy winter months and to the excessively high freight rates. Conditions have been considerably improved on the Argentine portion of the railway during the last few years. There has been some discussion as to the advisability of joining the Chilean and Argentine portions under a single management, but nothing has been done so far. The Central Norte serves a portion of the Chaco, little developed as yet and comparatively uninviting.

**Proposed Fusion with Government Lines—State Development Railways**

There has been some discussion recently of the fusion of the Central Cordoba with the government lines of the north or the purchase of the Central Cordoba by the government in order to obtain a means of access for these roads into Buenos Aires. This would result in competition of government with privately owned railroads, and would be a decided departure from the past policy in regard to railway ownership.

The state development railways include two in the Chaco and the three Patagonian State lines. The Formosa-Embarcacion system will be about 437 miles long when finished,

**The Train Shed of the New Retiro Station**

The shed is 787 ft. in length and the steel arches have a span of 160 ft. with a maximum height of 84 ft. above platform level. (Note the third rail and the multiple unit equipment on the left.)

and will exploit the little-developed territories of Chaco and Formosa. The Diamante to Curuzu Cuati road, as planned, will extend from Diamante on the Parana River in the Province of Entre Rios westward to Crespo (21 miles), from which point the Entre Rios will be used to Hasenkamp. From here the line will extend northwest to Curuzu-Cuati in the Province of Corrientes, a point on the Argentine Northeastern. About 106 miles have been completed, and eventually this road will open a rich and extensive territory for development.

The plans for the Patagonian State railways call for about 1,243 miles of track, 580 of which are now open for traffic

either full or provisional. When finished, this system will consist of two lines, the San Antonio and the Comodora Rivadavia, across Patagonia from east to west, and a third extending from Puerto Deseado in the Territory of Santa Cruz northwest across the Comodora Rivadavia to the western terminus of the Port San Antonio Railway. The San Antonio line, which now reaches the foothills of the Andes, may later be extended across the Andes to connect with the Chilean State railways at Osorno. The Comodora Rivadavia will eventually reach Lake Buenos Aires on the Chilean boundary.

The Central of Chubut is the only privately owned road which operates wholly in Patagonia. This company plans to extend its present short line across the republic to the Andean foothills. It owns an iron pier at Port Madryn in addition to the railway.

The bulletin of the Pan American Union for August, 1918, reports that Juan B. Lalucat & Co., of Buenos Aires, have petitioned the national government for a concession authorizing the construction of about 180 miles of railway to extend from Malabrigo, a point on the French railway of Santa Fe, to Anatuya, a junction of the State railway system in the Province of Santiago del Estero. The road, as planned, runs northwest through a quebracho zone.

**Argentina as a Market for Railroad Supplies**

The Argentine market for railway supplies of all kinds is varied and extensive. The electric suburban systems operated by the Central Argentine and the Western necessitate an entirely separate equipment, and the large freight terminals and the extensive docks at Buenos Aires require their own special equipment.

The following table shows the quantity of rolling stock owned by each of the large companies in 1913, the last pre-war year:

Railroads	Locomotives	Passenger cars	Freight and other cars	Total
Central Argentine	620	651	21,233	22,504
Buenos Aires Great Southern	627	786	15,200	16,613
Buenos Aires & Pacific	742	409	12,651	13,802
Buenos Aires Western	327	348	9,747	10,422
Cordoba Central	267	323	6,960	7,550
Central Norte	387	206	6,537	7,130
Province of Santa Fe	160	147	5,604	5,911
Province of Buenos Aires General Railroad	104	98	2,566	2,768
Entre Rios	84	94	2,168	2,346
Argentine del Norte	66	100	1,829	1,995
Argentine Northeastern	68	74	1,136	1,278
Rosario Puerto Belgrano	44	28	1,094	1,166
Buenos Aires Central	38	25	1,016	1,079
La Plata & Meridiano Quinto	21	25	923	969
Buenos Aires Midland	34	33	869	936
Central Railway of Chubut	6	7	86	99
State Development Railways	...	...	...	...
<b>Total</b>	<b>3,595</b>	<b>3,354</b>	<b>89,619</b>	<b>96,568</b>

It will be noted from this table that the Central Argentine, the Southern, and the Buenos Aires & Pacific normally require the largest amounts of rolling stock. These three companies maintain extensive shops in the Argentine where they not only do repair work but manufacture a considerable amount of rolling stock. The Central Argentine has large factories at Rosario and Perez, where it has been building cars for several years. The shops of the Southern are situated at Talleres, where, among other railroad equipment, a special type of postal car is made. The Buenos Aires & Pacific has been building a distinctive ventilated fruit car for fast service between San Juan, Mendoza, and Buenos Aires.

The administrative offices of the large English companies are, without exception, situated in Buenos Aires, but the executive officers are English and prefer to make their purchases in England when possible. This fact explains the predominant place occupied by England among the countries sending railway equipment to the Argentine during the five-year period (1909-1913) immediately preceding the war.

**Steady Decrease in Imports**

The following table gives the total amount of railway supplies imported during this period by country of origin. Since the tariff valuation is a fixed amount for each article, increase or decrease in these figures represents a difference in the amount of imports and not price fluctuations.

Countries of origin	Locomotives Number	Passenger cars Number	Freight cars Number	Rails, steel Metric tons	Rails, used Metric tons	Other material Gold pesos
United Kingdom	612	372	10,957	426,124	161	26,924,577
United States	50	160	2,616	198,830	...	1,075,661
Germany	525	26	1,576	289,889	1,340	2,657,117
Belgium	69	27	7,230	80,246	...	2,685,042
France	15	6	588	40,685	38	754,469
All other countries	16	8	72	37,903	41	236,609
<b>Total</b>	<b>1,287</b>	<b>599</b>	<b>22,439</b>	<b>1,073,677</b>	<b>1,580</b>	<b>34,333,475</b>

No detailed statistics for 1916, 1917, or 1918 are now available, but the following table compiled from the official Argentine statistics for 1913-1917 demonstrates the continued decrease in total import during successive war years:

Year	Locomotives Number	Passenger cars Number	Freight cars Number	Rails, steel Metric tons	Rails, used Metric tons	Other material Gold pesos
1913	234	98	5,370	156,592	29	5,411,415
1914	185	69	68	84,936	13	4,116,622
1915	29	28	...	13,391	21	1,690,786
1916	30	6	24	1,535	25	1,261,908
1917	2	5	28	640	14	822,065
<b>Total</b>	<b>484</b>	<b>206</b>	<b>5,490</b>	<b>257,094</b>	<b>102</b>	<b>12,932,796</b>

Since imports, not only of rolling stock, but of miscellaneous supplies of all kinds including raw materials have been so greatly restricted for the past four years, the equipment of all the roads has become very materially depleted. The Patagonian State railways are reported to be especially hampered by lack of equipment. The Entre Rios, according to the latest company report, is in the market for one or more new train ferries. The annual purchases of the government railways are said to amount to about 5,000,000 paper pesos. All the companies report that in view of high prices, difficulty of obtaining supplies, and unsettled conditions in the Argentine, purchases have been reduced to the minimum.

**War Cost of Railway Equipment**

FOR THE INFORMATION of the Liquidation Commission, the office of the chief of engineers has prepared an estimate of the costs of railroad equipment shipped to the A. E. F. computed on the basis of 1914 prices. The government actually paid from two to two and a half times the pre-war costs.

UNIT COST OF STANDARD GAGE RAILWAY EQUIPMENT COMPARED WITH PRE-WAR COST	Shipped to A. E. F.	Unit price		Actual cost in per cent of pre-war cost
		Pre-war	Actual	
<b>Locomotives—</b>				
Consolidation	1,306	\$17,500	\$42,966	245
Gasoline	10	9,350	22,000	235
Saddle tank	30	4,500	9,700	216
<b>Total</b>	<b>1,346</b>			<b>...</b>
<b>Cars—</b>				
Tank	675	\$1,367	\$3,397	248
Gondola, l. s.	3,429	1,090	2,340	215

<b>Total</b>	<b>13,303</b>			<b>...</b>

COST OF STANDARD GAGE RAILWAY EQUIPMENT COMPARED WITH PRE-WAR COST	Actual cost in per cent of pre-war cost		
	Pre-war cost	Actual cost	
Locomotives	\$3,083,500	\$56,524,870	245
Cars	22,346,745	48,822,100	214
<b>Total</b>	<b>\$45,430,245</b>	<b>\$104,446,970</b>	<b>230</b>

# Securing the Maximum Efficiency in Train Loading\*

High Ratio of Actual Tonnage Moved to Rating of Engines.  
Heavy Loading Promotes Fuel Economy

By T. H. Williams

Assistant General Manager, Southern Pacific

ONE OF THE FIRST FACTORS to be considered in the subject of train and engine loading is organization. Under the plan of organization effective on the Southern Pacific, the superintendent is practically the general manager of his division, and he is looked upon in this light by the executive officers. He is the responsible head and is the man who is looked to for results. The staff officers on a division of the Southern Pacific consist of the superintendent, one or two assistant superintendents (as the needs of the business justify), from one to three trainmasters, a chief dispatcher, a master mechanic, a master car repairer, a road foreman of engines, a division engineer, a signal supervisor, a bridge and building supervisor, roadmasters, and a division storekeeper.

In the movement of the business as it relates to train and engine loading, the officers who are principally concerned as an aid to the superintendent are the chief dispatcher and the master mechanic. The first is charged with the responsibility for the handling of the power, and the second with the responsibility for the power being in good repair. The assistant superintendent and trainmasters act as aids to the chief dispatcher in assisting in loading the engines to a point somewhere near their efficiency and seeing that the trains move promptly over the division. The usual practice is to charge the chief dispatcher with the responsibility of loading the train with such tonnage as will present a proper engine efficiency. The assistant superintendent and trainmaster should encourage every effort on the part of the chief dispatcher by aiding him in the support of this work. Good progress is usually measured by the amount of interest that the staff officers take in this or in any other subject, and when the chief dispatcher, who really carries this load, finds his superiors seeking every avenue in which to assist him, the results are always in favor of a division organization of this kind.

## Importance of Yard Organization

The chief dispatcher, in carrying out a program of train service, and in ordering the trains from each yard, has to rely upon the general yardmaster and his assistants. It is therefore necessary that the general yardmaster, the chief yard clerk and the entire yard clerical organization manifest some spirit of interest in the make-up of the trains with the tonnage as ordered by the chief dispatcher, and the despatching of these trains from the initial terminals on time is necessary. A poor start of any train is frequently met with a very poor ending. Initial delays to tonnage trains in terminals will not exist in a well organized yard, and are a handicap to the chief dispatcher's efforts.

Locomotives are rated to haul a given tonnage and this rating is arrived at by a series of tests, developing the number of tons that each engine can haul and maintain schedule time. The ratings of these engines vary, of course, as the business is moved over the various grades, but the ratings show the maximum capacity of the engine to haul a given tonnage over each freight district of a division, and the engine is given credit for a 100 per cent performance when hauling the tonnage for which it is rated.

To bring out graphically the saving that can be accomplished in train and engine mileage by reason of increasing train and engine loading, consider the actual figures as reflected in the statistics of the results accomplished on the Tucson division during the month of December, 1918, as compared to the same month of 1917. This division extends from Yuma, Arizona, to El Paso, Texas, with a main line mileage of 560 miles, and has a decided preponderance of eastward business. In the direction of the preponderance of business on the main line during the month of December, 1918, this division handled an average of 1,692 tons per locomotive against 1,463 tons during the same month of 1917, an increase of 229 tons per locomotive, or 15.7 per cent. By reason of this splendid increase in engine load the engine efficiency was increased from 86 per cent in December, 1917, to 94 per cent in December, 1918. During this same period, in the same direction the division handled 216,152,000 gross tons one mile as against 238,903,000 gross tons one mile during the same month of the previous year, a decrease of 22,751,000 gross tons, or 9.5 per cent. This amount of business was handled with 99,186 train miles as against 136,675 train miles in the same month of the previous year, a decrease of 37,489 train miles, or 27.4 per cent; and with 127,727 locomotive miles as against 163,258 locomotive miles, a decrease of 35,531 locomotive miles or 21.8 per cent. In other words, by reason of increasing the engine load 15.7 per cent, and the engine efficiency from 86 per cent to 94 per cent this division was able to handle a decrease of only 9.5 per cent in business with a decrease of 27.4 per cent in train miles and 21.8 per cent in locomotive miles.

## Waste of Power Due to Light Train Loading

This year, taking the business as a whole in the direction of the volume of traffic, every train moving over this 560 miles of main line during that month hauled 94 per cent of its full tonnage rating. In other words we lost only 6 per cent efficiency on the engine of each train run. In the same month of the previous year each engine hauled 86 per cent of the rated tonnage, or in other words the division failed in the full utilization of its power by 14 per cent. Let us say for argument that a division of any railroad is only obtaining 75 per cent efficiency in its engine load in the direction of the preponderance of its business. Here is a wastage of 25 per cent in the utilization of the power, and, considering the fact that a heavy type freight engine costs in the neighborhood of \$90,000, I leave to your own conclusion the waste of power on a machine that is utilized at 75 per cent of its efficiency.

It is not possible for a division that originates a large tonnage to compete in tons per engine and in engine efficiency, with a desert division that originates very little business. The large number of local freight trains run on each freight district of the division that originates considerable business, must be started each day with a train load that will permit them to pick up and set out cars at stations between terminals, and these trains when pooled with the through tonnage trains over this division, pull down the average train or engine load and detract just that much from engine efficiency. For example, our Coast di-

\* From a paper presented before the Pacific Railway Club on February 13, 1919.

vision in the year 1918 loaded 167,000 cars, or 4,000,000 tons of commercial freight. It is not hard to realize the large number of local freight trains necessary to assemble a business of this volume. A desert division originating little business on account of the character of the country has the opportunity of moving its trains intact with little change in their make-up en route, and enjoys the opportunity of obtaining a splendid engine load and engine efficiency.

### Heavy Engine Loading and Fuel Economy

Our monthly statistics show the amount of fuel oil saved or lost in freight service on a ton mileage basis as compared to the same period in the previous year, and while we always conduct a very intensive campaign of education among our enginemen on fuel conservation, the large part of any saving that is made can be directly charged to an increase in the average tons per locomotive. Contrary to the general impression that prevails that less fuel is consumed by running light trains at high speed, when fuel consumption is figured on a ton mile basis, which is the only fair way of showing this consumption, our statistics have proven conclusively that increasing the engine load is the biggest factor in railroad fuel conservation.

For example, consider the performance of the Tucson division in this respect for the month of December, 1918, as compared to the same month in 1917. Due largely to the increase of 229 tons in average tons per locomotive this division in December, 1918, consumed an average of only 15.38 gal. of oil per 1000 gross ton miles, as against 16.29 gal. per 1000 gross ton miles in December, 1917. This resulted in a saving of 1,024,554 gal. of oil on a ton mile basis as compared to the consumption during the same month of the previous year. At the current price of oil, this means a saving of \$36,128 on this one division alone. Of course, we must attribute some of this saving to mechanical improvements, such as the superheater; also to the campaign of education among the enginemen and the co-operation which we have received from these employees, but as stated before, the major portion of this saving has been effected by the splendid increase that has been made in the average tons per locomotive.

### Daily Records of Train Loading

Our company furnishes statistics as a guide to operation, and although these statistics are furnished with promptness, it is not necessary for the divisions to wait for the auditor's figures to keep abreast of their showing in train and engine loading. The divisions that are successfully handling a good engine load, are the ones that are tabulating in statement form from day to day the number of tons handled in the direction of the volume of business, taken from their train sheets, and the average tons per engine, showing how their performance today compares with their record on the same day of the previous year.

High speed freight trains means light loaded locomotives and detract from engine efficiency and increase the consumption of fuel. One of the discouraging features that operating officers are called upon to contend with is the burden placed upon them for fast freight train service. These demands are usually the result of an endeavor to meet some competitive feature of service, and while appreciating the necessity, from a competitive standpoint, for the establishment of such fast schedules, it must be understood that wherever conditions of this kind are met we throw away the opportunity of building up an engine load and engine efficiency that means increased net returns in the operation of the property. It is not my experience that the shipping public is unreasonable in its demands for service. A freight train schedule arranged with a view of giving to the shipper and receiver of freight a dependable service and at the same time framed by the railroad with a view of maintaining

the efficiency of its power, is a condition that can be covered to the satisfaction of both the shipper and the railroad. In other words a condition of this kind is possible, and where it is in effect works out to the mutual advantage of both parties.

### Division Secures 100 Per Cent Engine Efficiency

No better illustration of what can be accomplished in full train and engine loading could be given than the record obtained by the officers of our Los Angeles division during the second week of January. On the freight district from Indio, Cal., to Yuma, Arizona, a distance of 122 miles, this division hauled an average of 2321 tons per locomotive, as against 1845 tons per engine for the same week in 1918, an increase on each train run of 476 tons per locomotive, giving the division 100 per cent engine efficiency this year as against 86 per cent last year.

While this freight district is in desert territory and originates very little if any business and the conditions are ideal for obtaining splendid engine efficiency, these favorable conditions do not detract from the fact that this splendid increase in engine load was obtained only through the undivided attention and individual effort of the staff officers on that division. The division handled a large number of orange, perishable and high-class manifest trains, on which it is necessary that schedule time be closely observed, and it was only through system and method that the officers were able to load up their fast freight trains, together with drag freight trains, to the extent of finally obtaining 100 per cent efficiency on the tonnage hauled by each engine during this week. To illustrate further the efforts of the organization on this division, during this second week in January each engine run on the four freight districts of the division, in the direction of the volume of business, eastward, obtained 96 per cent efficiency in tons per engine, which was the best record made, or the highest percentage of efficiency of any division on the system.

"Cheer Up," Says Robin Redbreast

# Treating Water Reduces Boiler Troubles

Great Northern Has Found Installation on 1,100 Miles of Main Lines Yields Excellent Results

By C. Herschel Koyl

Engineer of Water Service, Great Northern, St. Paul Minn.,

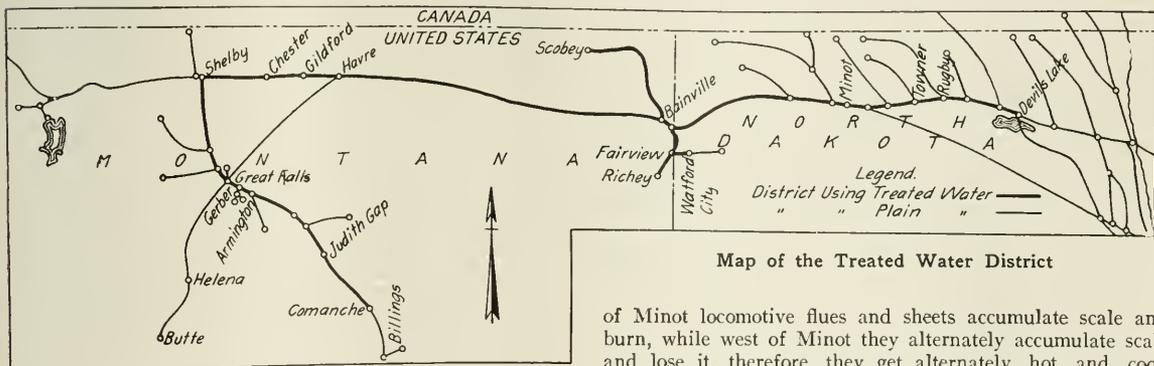

**D**URING THE PAST six years the Great Northern has been developing a system of water treating adapted to its needs. Of this the following is a brief description, with some account of the waters, treating plants, methods of inspection, and results.

The Great Northern crosses a strip of country 600 to 700 miles wide, just east of the Rocky mountains, which receives less than the average rainfall and the waters of which contain more than the average dissolved mineral water, particularly of the sodium salts. The trouble used to come not alone from the amount of matter dissolved in the water, but from its variety, because any boiler will leak and foam if it receives alternately hard water and alkaline water. The principal work of the water treating plants has been to reduce all of these waters to a common standard of hardness and alkalinity, and for this essential we have installed a plant at every water station on the treated water district.

Work was begun in 1912 and now, in 1919, we have more than 1,100 miles of exceedingly bad railroad water con-

cause deep waters are so laden with sodium salts as to be practically unusable.

The waters of the Great Plains of North Dakota and Montana are divided into two classes at a line running roughly north and south through Minot, S. D. East of this line the deep waters are charged mostly with sodium chloride (common salt); west of this line with sodium sulphate (Glauber's salt); and in each the charge is so heavy, several hundred grains per gallon, as to make them impossible as railroad waters. Of the surface and sub-surface waters, all contain calcium bicarbonate and nearly all magnesium bicarbonate; while east of the Minot line they contain also calcium and magnesium sulphate, but west of the Minot line sodium bicarbonate. At Minot these substances are so nearly balanced that in summer the Mouse river contains 3 grains per gallon of sodium carbonate and in winter 3 grains per gallon of magnesium sulphate. It is understood that this is a general classification, there being a few individual exceptions; but east

Map of the Treated Water District

verted into water satisfactory in all respects for its content of sodium sulphate. We have practically abolished scale, leaks due to water, and clogging of the injector and branch pipes. We have not altogether abolished foaming (due to the accumulation of soft sludge deposited in the boiler from the 3 grains per gallon of calcium carbonate unavoidably left in the water when treated cold), but we seldom hear about it. We have not abolished pitting and grooving (which are not produced by chemical action of the water), but we have had a set of tests running for some months from which we hope to be able shortly to add something to the present knowledge on this subject.

## The Waters

Many interesting and important problems are presented on a road having so many kinds of water. In Minnesota, surface water of fair quality is plentiful in rivers and lakes, and when these are not convenient to the railroad it is generally possible to get usable water in wells of moderate depth. West of Minnesota to the Rocky mountains, railroad water *must* be taken from the surface or near it be-

cause deep waters are so laden with sodium salts as to be practically unusable. In the case of Minot locomotive flues and sheets accumulate scale and burn, while west of Minot they alternately accumulate scale and lose it, therefore, they get alternately hot and cool, alternately expand tight in the flue sheet and contract from it, and therefore leak.

In each state there is also some excellent water flowing south in gravel beds from isolated mountain peaks—the Turtle mountains on the Canadian border of North Dakota and the Sweetgrass hills on the Canadian border of Montana. In Dakota, just below the surface soil, is clay of great depth, but lying in east and west waves so that the troughs of the waves run north and south. In the course of years, these troughs have been nearly filled with gravel and sand from the weather worn peaks of the Turtle mountains, and all year long these gravel veins carry excellent water from the mountains south through Dakota. I do not know the total number of these troughs nor their length, but I am sure of four which are 60 miles long each, and there are numerous shorter ones. In Montana somewhat similar conditions exist about the Sweetgrass hills.

Then we have a most interesting set of waters in shallow lakes which we use as reservoirs. These lakes are crowded with weeds and small fish. The water is supplied by melting snow and rain. In summer, weeds and fish are growing and the quality of the water is fair; but toward

winter organic decay sets in, of which the product is marsh gas, and in hard water eventually hydrogen sulphide. Before ice forms, this gas escapes to the air; but later the escape is cut off and great concentration takes place in the water, with results to the boilers which are very serious. Sweetwater Lake, so named by the Indians when the lake probably had a current, is our most striking example; and before we treated the water engines sometimes could not make the main line from the roundhouse, although now we use it with conspicuous success.

Nearly all of the surface waters are growing yearly harder because of the more extended plowing of nearby lands. Still, in springtime, most of them are fairly soft, though they grow gradually worse with the season until in late winter several of the reservoirs and at least one of the streams exceed 100 grains per gallon in hardness.

For locomotive purposes all these waters must be put into the same chemical condition, which is done except as to the varying content of sodium sulphate or chloride. It is the aim to maintain all treated waters, clear and colorless, at 3 grains per gallon hardness and one extra grain alkalinity due to sodium hydrate. The treating plants are of the "continuous" type with 40-min. mixing tanks fed from the bottom, the plants varying in working capacity from 20,000 gal. per hour at the principal stations to 5,000 on the branches. Each has an engine with two pumps controlled by clutches, the pumps operating simultaneously, with the raw water pump delivering to a water wheel which furnishes power for all the mixing devices and the treated water pump working at the same rate and delivering to the track tank.

The plant design has varied in detail from year to year as we have gained experience of railroad wayside conditions, but it has always retained the essential feature of a 40-min. mixing tank fed from the bottom—this for the reason that raw water and chemical reagents do not mingle by diffusion in any practicable time and that experience shows the necessity of a minimum of 25 min. mechanical stirring if the reactions are to be completed in the mixing tank and the precipitate deposited in the settling tank instead of in the track tank. The mixing tank is fed from the bottom so as to provide therein a mass of old precipitate for the cohesion of the microscopic and slow settling particles which are nascent during the last reactions when combining molecules are few. We do not use filters in any form, and for wayside work have discarded automatic regulating devices and feed the chemical boxes every hour. Each plant is housed and in winter is kept warm by a hot water system distributed about the lower walls.

We put a pumper at each plant; a water inspector in charge of each engine district, usually of 9 or 10 stations, and a general inspector in charge of 5 or 6 district inspectors.

### The Chemical Treatment

The character of the treatment varies from plant to plant with the character of the water, and may vary at any plant from day to day; but all cases are covered by the use in proper proportions of hydrated lime, soda ash (sodium monocarbonate) and sulphate of iron (ferrous sulphate).

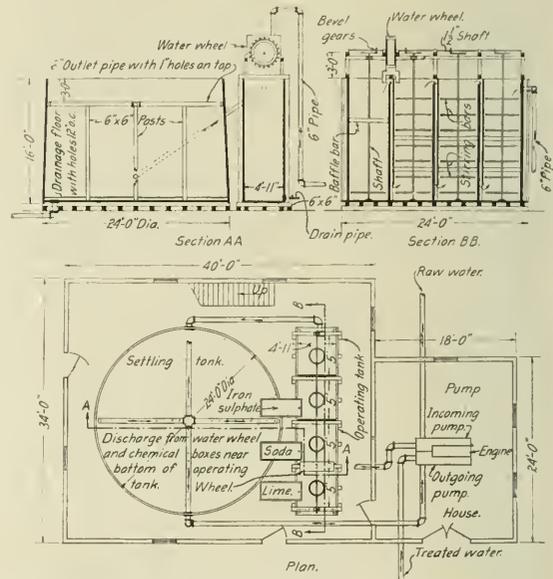

Hydrated lime is used to extract the carbonic acid, which brings about (1) the precipitation of the scale-making limestone carbonates (down to 3 grains per gallon or less), (2) the conversion of sodium bicarbonate into sodium hydrate, and (3) the weighting of the particles of light suspended mud and organic slimes. Soda ash is used to replace completely the scale-making limestone sulphate by non-scaling medium sulphate. Ferrous sulphate is used (1) for the treatment of the last 3 grains of calcium carbonate so that it will not clog the injector or branch pipe,

(2) for the conversion of caustic sodium hydrate into neutral sodium sulphate, and (3) for the further weighting and more rapid settling of particles of light suspended matter.

The treatment with lime was the gift to the world, in 1840, of Dr. Thomas Clark, professor of chemistry in Mareschal College, Aberdeen, Scotland; the treatment with soda ash was proposed by William Porter, an Englishman renowned for his advances in water softening, and the treatment with ferrous sulphate is my own device for preventing after-precipitation and particularly the clogging of the locomotive injector and branch pipe.

### The Results

The first treating plant in 1911 was for demonstration purposes on the three stationary boilers of the roundhouse at Minot, N. D. These boilers had been fed from the hard and dirty water of the Mouse river; had been washed, one each day; had received the exclusive service of one boiler maker; had been dismantled, thoroughly cleaned and the flues retipped or renewed each summer, and, even so, had consumed \$10,000 worth of coal per year and delivered about \$5,000 worth of steam. The demonstration treating plant consisted of an old wooden water car, partitioned, fitted with

Plan and Sections of a Water Treating Plant

stirring apparatus, set in the roundhouse, connected at one end with the track tank and at the other end with the stationary feed water heater. The river water varied from a colored, muddy, comparatively soft water in spring to a comparatively clean water of 40 grains per gallon hardness in late winter. The treated water was kept throughout the year colorless, clear and at a hardness of 3 grains per gallon (calcium carbonate) and at a total alkalinity of 5 grains per gallon, the extra 2 grains being sodium hydrate.

The results in the boilers were immediate. In 10 days the shells and lower flues were clean, and when the loosened masses of scale above were broken so that they could fall through between the flues the whole boiler interiors became clean. Thereafter for a year the flues were black and the master mechanic reported for the year "no scale, no leak and not a tool touched to a boiler." During this year, too, there was no lack of steam for any purpose and

there was a hitherto unknown "snap" to the tools operated by compressed air. We burned as much coal as before, but we made twice as much steam.

Before the year was out instructions had been given for equipping with treating plants the 10 water stations for locomotives on the engine district between Devils Lake and Minot, and this was accomplished during the summer of 1912. During the winter of 1911, with untreated water, the Minot roundhouse handled an average of 600 engines per month and maintained a certain force for boiler repairs and washing; during the winter of 1912, the Minot roundhouse handled an average of 900 engines per month, of which 600 were from the untreated water sections and 300 from the treated water district between Devils Lake and Minot, and during this winter the crews for boiler repairs and washing were the same as during the winter of 1911. This looks as though the treated water boilers cost nothing for washing or repairs, but the fact was that the other boilers all took treated water at Minot before going to their hard water work and the effect of this one tankful of treated water every two days was quite marked in their repair and washing bills. The flue renewals at Minot roundhouse in 1911 with raw water were 491; in 1912, with heavier traffic and raw water most of the year, were 676, and in 1913, with circumstances as stated above, the total renewals were only 183.

While the old scale was coming out of the boilers there was considerable foaming, but this gradually disappeared, and with freedom from leaks boiler operation became something of an exact science. The effect on the locomotives was such that since then the addition of treating plants has been continuous, until now there are 77 in use, protecting 1,156 miles of traffic through the wheat fields and the cattle country. They are attached to every water station except one from Devils Lake, N. D., west to Shelby, Mont., a distance of 652 miles; they run in the same manner from Shelby southeast to Comanche, near Billings, Mont., a distance of 295 miles; they protect two important branches of 209 miles, and there are 3 other plants where the division equipment is not yet complete.

The general benefits accruing to the railroad are the usual saving in coal and in boiler repairs, and the saving of time on the road, and the greatest of these is the saving of time on the road. It is not merely that boilers do not leak and fail; it is that the service is dependable, and that every officer can reckon on speeding up his department accordingly.

The following note, under date of January 20, 1919, from the general master mechanic of the Central district concerning the work on the Billings line, represents fairly the conditions and results along the road. "The treating plants were put into operation between Great Falls and Billings during October, November and December, 1917, and we were able to have passenger power use treated water as early as October. In December, 1916, we had 6 complete failures on the Billings district on account of flues leaking. In December, 1917, we had one partial failure, and since that date we have not had an engine failure on account of flues leaking nor have we heard of flues leaking between Great Falls and Billings.

"We used to bombard crown sheets on this district once a month to remove scale that adhered around crown bolts and stays. The stationary boilers at Judith Gap had to be washed once a week and crown sheets scraped in order to keep scale off sheets. The boilers now go 30 days and there is no scale.

"Before treated water was used our helper engines at Armington could not stay in service over 5 days on account of flues leaking, and the Neihart engine which laid over at Armington had to come in once a week. But since

Armington water has been treated the engines stay 30 days, at which time they are brought in for monthly inspection and washout.

"Gerber is the best illustration of what water treating has done. Our Sand Coulee engines use this water only, and a set of flues sometimes used to last six months, but never longer. Since Gerber water has been treated the scale has all come off from stays, crown bolts and flues; and with the aid of a little kerosene the flues and sheets in engine 1204 are as clean as the day she came out of the shop. This engine has now been in service on this one district 15 months as against a maximum life of 6 months with untreated water.

"I cannot say that treated water has reduced our boiler washing, because, on account of the concentration of sodium sulphate and the sludge in the mudring, we think it best not only to change water, but to wash every round trip, the same as before."

On the Montana division main line from Williston west to Cut Bank, a distance of 420 miles, treating plants were installed during the autumn of 1914. Improvement in locomotives and in service followed at once, and increase regularly was evident until in February, 1915, a comparison with the month of February, 1914, under practically the same weather conditions, gave the following results:

	1914		1915	
	Boiler repair and washing, hours per week...	2,000	1,000	1,000
Boiler failures on the road,.....		10		0
AVERAGE TONS PER TRAIN				
	1914	1915	Increase	
			Tons	Per cent
Williston to Glasgow (West) .	1,180	1,691	511	43½
Williston to Glasgow (East) .	1,602	2,152	550	34
Glasgow to Havre (West) . . . .	1,192	1,769	577	47½
Glasgow to Havre (East) . . . .	1,810	2,297	487	27
Havre to Cut Bank (West) . . . .	936	1,241	305	33
Havre to Cut Bank (East) . . . .	1,466	2,134	668	45½
Whole main line . . . . .	1,364	1,881	517	38

In February, 1919, operating conditions in Montana were quite different and most of those engines were working on other divisions. One remains, however, to prove not only that the loading exceeded that of February, 1915, but that the time was less.

Our boiler washing on treated water districts averages about half what it used to be. The roundhouse cost of handling an engine is much reduced. If we succeed in doing away with pitting and grooving, boiler repairs will be almost nil.

No one need expect to get perfect boiler service the first year after installing a set of treating plants, because there are many things other than water which will make a locomotive boiler leak. In the old hard water days, if a boiler leaked, it was easiest to blame it on the water and let it go. But in our case we found that, with treated water, boilers would go through a North Dakota or Montana winter without a sign of leak, and then the first warm day in spring there would be an epidemic; and it took a long time to trace this to a tendency of inexperienced firemen to imagine that a sun which was hot on the back raised outside air to the temperature of the firebox.

It will be found, too, that in hilly districts there is a constant tendency on the down grade to permit thin spots in the firebox and consequent local flue chilling, and there are other causes of unequal heating and of resultant flue leaking well known to boiler men. In bad water districts so much has been blamed on the water that these other matters have not received as much attention as they deserved; but with the advent of treated water and the co-operation of everyone connected with the boiler service in making a careful report of every case of leaking, we are gradually running down these causes and endeavoring to eliminate them.

This is a cold country for a short time every winter and water-treating plants must be carefully housed and heated.

The cost of the housing and the heating apparatus is more than the cost of the plant proper, but it is a necessity, for in winter the water is worst and must be most carefully treated; in winter engines require more water than in summer because of the heating and other extra work they do, in winter there are more engines for the same traffic because the trains are shorter, in winter much water is wasted at coach hydrants and other places to keep the pipes and hose from freezing, in winter the men are all under strain and a frozen pipe line or a failure at a treating plant might disarrange traffic very badly.

Not only are our plants costly in construction because of the climate and the service we aim to give, but also our operating expenses are heavy because of the constant patrol and inspection maintained. Improperly treated water is little better than water not treated at all; and the amount of treatment depends not alone on the kind of raw water (which itself may change 20 grains per gallon over night), but on the rate of pumping, which may be affected 10 per cent or more by an obstructed suction, a flaw in the pump packing, some derangement of the pumping engine, a drop in the voltage of an electric current, or other causes; and under our rule "Get there before it happens, not after," the inspector's duty is not only the regular and frequent examination of the character of the treated water, but the examination, as regular and frequent, of all the appliances which affect the operation of, or the rate of water flow to, the plant. For this reason, our wa-

ter inspectors are the trained and promoted pick of our pump repairers.

The sending of a weekly water sample to a chemist a couple of hundred miles away is good enough for record purposes; but how is the chemist to know why the treated water is not correct, or how is he to know that the pump will not be repaired by the time the pumper receives the data for the changed treatment? I have seen many abandoned water-treating plants on railroads and in other places, but never one which had been regularly inspected on the ground. The value of a properly run treating plant for locomotive service is so much greater than the cost of inspection, with interest and depreciation on its cost of construction, and the value of one improperly run is so small that I think there is no question of method. What is worth doing at all is worth doing well. I have never known a case of locomotive priming with properly treated water which I did not consider traceable to the accumulation of sludge from the last 3 grains per gallon of calcium carbonate which cannot be taken out while the water is cold, and I am confidently looking forward to the time when all boilers will have blow-offs in the front and back ends as well as in the throat sheet, *all operated from the cab*, or similarly operated blow-offs connected to properly perforated pipes inside the boiler bottom and the mud ring. Then 5 seconds' blowing would do more good than 60 seconds' blowing under present conditions, and there would be almost no necessity for boiler washing.

## Railway Developments in Foreign Countries

### New Corporation Organized in America to Finance Public and Private Enterprises in Foreign Countries

**A**N IMPORTANT DEVELOPMENT in export trade is contained in the announcement Monday of the incorporation under the laws of Delaware of the Foreign Bond & Share Corporation. The purpose of the corporation, according to the statement issued by the Guaranty Trust Company of New York, is to finance public and private enterprises in Central and South America, the Far East, Europe, and other parts of the world. It will also sell to American investors either the debentures of the corporation, which will be covered by the deposit of the securities of these foreign companies, or the foreign securities themselves. It is the intention of this corporation to reach all investors in the United States.

The Foreign Bond & Share Corporation has an authorized capital stock consisting of 100,000 shares of common stock, of the par value of \$100 each, and 3,000 shares, with no par value, known as "participating certificates," and a subscribed capital and surplus of \$3,000,000.

It is understood, the statement says, that the state department is particularly interested in the development of trade in the manner proposed by the Foreign Bond & Share Corporation.

The organizers of this corporation include private banking firms and some of the strongest financial institutions throughout the United States. Among them are Brown Brothers & Co., J. & W. Seligman & Co., Guaranty Trust Company, Chase Securities Corporation, Central Union Trust Company, Columbia Trust Company, Hayden, Stone & Co.—all of New York; First National Corporation of Boston; Hibernia Bank and Trust Company, New Orleans; First Trust & Savings Company, Cleveland; Anglo & London Paris National Bank, San Francisco; Mercantile Trust Company, Mississippi Valley Trust Company, and interests as-

sociated with National Bank of Commerce—all of St. Louis; and the Central Trust Company of Chicago. Other institutions which have expressed their desire to take part in the enterprise will be announced later.

The directors of the corporation are:

John Henry Hammond and Thatcher M. Brown, Brown Brothers & Co.; Frederick Strauss and William P. Phillips, J. & W. Seligman & Co.; Albert Bretton and Harold Stanley, Guaranty Trust Company of New York; E. V. R. Thayer and R. I. Barr, Chase Securities Corporation; James N. Wallace, Central Union Trust Company of New York; Howard Bayne, Columbia Trust Company; Charles Hayden, Hayden, Stone & Company; John Sherwin, First Trust & Savings Company; R. S. Hecht, Hibernia Bank & Trust Company; Herbert Fleishhacker, Anglo & London Paris National Bank; Adolfo Stahl of New York and Guatemala; J. Hugh Powers, Mercantile Trust Company; Breckinridge Jones, Mississippi Valley Trust Company; J. G. Lonsdale, National Bank of Commerce; Joseph E. Otis, Central Trust Company of Illinois; and Ernest Gregory, First National Corporation of Boston, and Maurice Hely Hutchinson.

A number of the subscribers of the Foreign Bond & Share Corporation are now actively identified with the Asia Banking Corporation, Mercantile Bank of the Americas, the American Foreign Banking Corporation, Banco Mercantile Americano del Cuba, the China & Japan Trading Company, and other American financial institutions which have branches in many parts of the world. The statement brings out the necessity of investment abroad for foreign trade.

"Latin-American, Asiatic, and other countries undeveloped economically, will buy merchandise from the nation which places capital at their disposal, it says. This has been the

history of undeveloped countries. It is in large the secret of the success of the British, German, and French trade in such countries in the past.

"As regards the European countries, they now owe the United States such enormous sums that the mere problem of exchange necessitates the taking of foreign securities by the American public in payment for our exports of merchandise to Europe, if such exports are to continue in anything like their present volume.

"In the past London has been the great international market for the securities of every government of the earth and of the industries that were among the principal sources of national wealth. British investors always have been large buyers of such securities. The new-found financial position of the United States should result in a similar appreciation on the part of American investors of this factor, which is vital to the future of our foreign commerce.

"Rates of investment return in Latin-American, Asiatic, and other countries needing development are higher than in the United States. There is no reason why, under careful supervision, the American investor should not be given the benefit of such attractive rates of investment return, and at the same time have the protection of good security.

"England, France, and Germany in the past have done most of the financing necessary for the development of foreign countries, and have reaped the benefits; but, as they are no longer in a position to supply the amount of capital needed for this purpose, Americans must furnish the larger part of it from now on."

#### Chilean Railways to Buy Equipment

Felix Nieto Del Rio, of the staff of the *Diario Ilustrado*, Santiago, in an article written for *The Sun* (New York), is authority for the statement that Chile hopes to borrow \$32,000,000, most of which will be spent during the next three years for railway equipment.

Industrial progress, together with agricultural development due to expanses of land recently irrigated, and the more extensive cultivation of the soil brought about by the increase of population and higher prices of the products, has threatened, he says, to make the Chilean railway system, of which the greater part belongs to the State, incapable of meeting the demand on it, and in this way is jeopardizing the coming prosperity if its deficiencies are not corrected in time.

The remainder of his article follows:

"The total number of ton kilometers transported through the South Central Lines of the Chilean State Railways was: Seventy-nine per cent greater in 1909 than in 1901, 87 per cent greater in 1910 than in 1902, 99 per cent greater in 1911 than in 1903, 105 per cent greater in 1912 than in 1904, and 106 per cent greater in 1913 than in 1905.

"A similar proportion in the increase of passenger traffic was found, the percentages above being replaced respectively by these figures 93 per cent, 92 per cent, 87 per cent, 107 per cent.

"The Chilean Government, due to the actual economic conditions of the country, expects that in the coming years the railway traffic will continue to increase in the same proportion, and has decided to place in the foreign markets the loan that it had been agreed upon to place in the year 1914, but which had been postponed on account of the war, increasing it to \$32,000,000. With this resolution the government initiated the policy that determined the law authorizing the loan, that is: To provide the Chilean State railways with the sufficient and adequate equipment necessary to maintain a correct and efficient service, and in the future increase this equipment systematically following the requirements of the production and commerce of the country.

"These investments, required periodically by the increase

of traffic, correspond really to an increase in capital. It is expected that these periodical loans, to be made after the \$32,000,000 loan, will amount to an average of \$3,000,000 yearly. The \$32,000,000 will be invested systematically between 1919 and 1925 and the greater amount of this sum will be disposed of during 1920, 1921 and 1922.

"The materials to be bought comply in general with the specifications in use in this country, and as it is of interest to the manufacturers here I insert a rough outline of the different items: Electric lines, feeders and sub-stations, \$2,300,000; electric locomotives, \$2,100,000, which materials will be used in the electrification of the railway between Valparaiso and Santiago; rolling stock, \$5,200,000; railroad shops, \$3,100,000; couplers and air brakes, \$1,640,000; electric signal system, \$1,500,000; reconstruction and reinforcing of bridges, \$1,200,000; sidings and double tracking, \$2,820,000; coal storages, \$800,000; ballast cars, \$364,000; buildings, warehouses, machine shops and platforms, \$3,600,000.

"Up to date about ten millions have been spent in purchasing equipment belonging to the different items above listed, nearly all of which has been bought in this country.

"It is natural to expect that the country where the loan is placed will get preference in the sale of materials when the offers are as advantageous as those from other sources. This makes the placing of the loan more interesting for American investors, as they will not only obtain the benefit of the interest, but also the benefits that indirectly come to them or their associates in the different branches of the industries when orders are placed."

#### Uruguay East Coast Railway

Latest advices are to the effect that the Senate of Uruguay has passed a bill without amendment authorizing the purchase by the state of the Uruguay East Coast Railway and the construction of a branch line from La Paloma to Rocha. The government was urged to proceed with the construction of the latter without delay, although it was estimated that it would cost \$40,000 per kilometre at the present time.

#### Germans Ousted From Chinese Railroad Loans

The Chinese Cabinet, says an Associated Press despatch, has agreed to a request by the British, American and French governments that German capital be dissociated from the four-Power railway loan agreement concluded by the Chinese government in 1911, under which each financial group contracted for the construction of assigned sections of the Hankow-Szechuan line. In deference to the wishes of the allied powers the German interests will not be assigned to any other nationality but will be divided among the Americans, British and French.

#### Special Correspondence from China

PEKING, March 5.

During the closing days of December, the managing director of the Peking Suiyuan line negotiated a loan with Japanese capitalists in the amount of Yen 4,000,000 (\$2,000,000), with the line as security. A further provision gives the same capitalists preference whenever foreign money is to be used for extensions to the line. The American firm of Siems-Carey under its opinion on the construction of 1,600 miles of line in China, has marked out a route branching from the further extremity of this line, but which was given up temporarily under a protest from Russian firm of Siems-Carey under its option on the construction of a loan by two years, it is not anticipated that the American firm will raise any opposition. American firms never have successfully resisted pressure from other nations in China. But the loan is particularly interesting as an indi-

cation of the difficulties of the Chinese government as to funds. This line has been operated at a profit from the very first. It has no funded debt. The purpose of the loan has not been given out. So the inference is that the funds will be loaned to the government for administrative purposes. Up to the present the Chinese have been proud of the fact that the Peking Suiyuan line was "all Chinese,"—built by Chinese engineers and with Chinese money, operated entirely by Chinese forces. That they should now mortgage it to Japanese is very significant.

### Exports of Locomotives in February

The exports of locomotives in February totaled 85 with a value of \$2,584,269, as compared with 87 in January, valued at \$3,076,543. The figures compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce show that nearly one-half the locomotives exported in February from the standpoint of value were shipped to France. The larger part of the remainder were divided among Italy, Cuba and Egypt.

The figures in detail follow:

Countries	Number	Dollars
France	33	1,126,380
Italy	21	962,650
Spain	2	25,800
England	1	1,250
Canada	1	15,000
Mexico	2	21,400
Trinidad and Tobago	1	9,800
Cuba	12	223,423
Chile	2	14,670
Peru	1	11,000
Japan	4	31,350
Philippine Islands	3	24,325
Egypt	2	117,221
<b>Total</b>	<b>85</b>	<b>2,584,269</b>

### Exports of Car Wheels and Axles

The exports of car wheels and axles in February, totaling \$541,630, were double those of January when exports of these commodities were made, valued at \$278,393. The figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce, show that nearly one-half the February total was consigned to "Japanese China," and about one-fifth to Canada.

The figures in detail follow:

Countries	Dollars
Denmark	16,700
Italy	33,465
England	18,985
Canada	111,589
Panama	307
Mexico	12,979
Cuba	7,952
Dominican Republic	1,281
Argentina	33,309
Brazil	25,354
Peru	4,647
Venezuela	129
Japanese China	238,945
Straits Settlements	5,500
Japan	22,839
Australia	7,128
New Zealand	67
British South Africa	454
<b>Total</b>	<b>541,630</b>

### Exports of Railway Track Material

Exports of railway track material in February showed a considerable increase over January, according to the figures compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce.

Exports of rails totaled 66,900 tons with a value of \$6,023,982, as compared with 65,024 tons valued at \$4,221,563 in January. Spikes exported in February reached a value of \$258,073, as compared with \$189,408 in January, while switches, frogs, etc., exported amounted to \$905,264 as against \$543,330 in January. Over half the total of all three were consigned to France. The figures in detail were as follows:

Countries	Railroad spikes		Rails of steel		Switches, frogs, etc.
	Pounds	Dollars	Tons	Dollars	Dollars
Belgium			422	24,260	8,094
France	2,252,960	165,222	49,400	4,847,312	467,701
Italy			3,476	298,135	88,402
Netherlands			383	18,307	695

### Exports of Cars in February

The Division of Statistics of the Bureau of Foreign and Domestic Commerce has added to its detailed compilations of exports of railway material which it began for January a similar compilation for exports of freight and passenger cars. The exports for February were in detail as follows:

Countries	Passenger		Freight and other	
	Number	Dollars	Number	Dollars
France	219	40,708	50	112,600
Canada			6	12,000
Mexico			47	110,180

Chile			1	1,225
Ecuador			1	110
Dutch East Indies			2	5,200
Russia in Asia			30	152,567
<b>Total</b>	<b>225</b>	<b>130,768</b>	<b>583</b>	<b>957,128</b>

### Americans Are Speeding Up Trans-Siberian Railway

Some improvement is noticeable in the operation of the Trans-Siberian Railway since the Inter-Allied Railway Mission began its work, representatives of the mission say, although the mission has done nothing beyond making a preliminary investigation, says a Canadian press despatch. The reason for the improvement is believed to be due to the fact that Allied officers have been visiting the various stations and jogging up the local officials.

The Trans-Baikal line is hampered seriously by the opera-

tions of General Semenoff, whose armored trains demand much needed rolling stock and whose levies on railway funds tend to disorganization.

Rumors of Bolshevik uprisings have caused the officials to use the greatest vigilance in operating the trains.

### A Three-Minute Railway Strike in France on May 1

Press despatches from Paris report that the role to be played by the railroad men in the May 1 demonstration has been decided by the General Federation of Labor to consist in the main feature of a three-minute stoppage of trains at or about 10 o'clock in the morning. The stoppage is to be entered in the train logs as "The manifestation of May 1, by order of the Federation." The central office and workshop staffs will lay off for 24 hours, while the depot staffs will stop work for periods of from 15 minutes to three hours, according to the nature of their service.

The union's instructions explicitly state that the stoppages must not in any way endanger the public, special gangs being assigned to make any urgent repairs necessary to the tracks, etc., and the union expressly disclaims all responsibility for individual acts done outside of its instructions.

This decision followed a meeting on April 15 at which the delegates of the unions of the railroad workers, miners, dock workers, metal workers, sailors and general transport workers decided to unite in efforts to obtain recognition of the demands of the workers, especially an eight-hour day and increased wages.

Delegates recognized that the demands of individual unions had been satisfied in many cases, but decided that the members of the unions should not work on May Day, in order to show the power of the organized working classes and the spirit of solidarity. They adopted a resolution, giving the results of the negotiations in detail. The first part, dealing with the railroad union said that definite engagements had been made regarding the eight-hour day and the scale of wages, and that two commissions are in session arranging details.

### London Business Interests Oppose British Transport Bill

Representatives of a number of business associations meeting in London recently brought out strong arguments against the proposed Ministry of Ways and Communications Bill and passed resolutions strongly opposing particularly the inclusion of the control over public docks and piers and any alteration in the existing control and management of the Port of London. It was declared that the work of the Port of London authority was complex and efficient and that it was better to let well enough alone.

The bill was perilously overweighted, the meeting declared, and there were other grave objections, the most striking of which was that arbitrary powers were conferred on the minister to override the statutory rights of the undertakings which he was to control. Another objection, greatly affecting London, was the inclusion of the docks in the general scheme. Before that was done some good argument for their inclusion should be brought forward.

The ground the minister took was that the docks were essential to the scheme because they were the great terminal points of the railways. That was not a correct expression so far as London was concerned, it was brought out, for 90 per cent of the produce imported into London docks did not pass on to the railway lines direct from the ship. Besides, vast quantities of goods came into London that never passed at all on to the railway lines, but were reshipped to the near continental or coastwise ports.

### Foreign Railway Notes

On February 20, by ministerial order, the managing director of the Peking-Suiyuan railway was created director of aerial navigation. Subsequent reports state that ten Handley-Page machines have been purchased through the Peking Syndicate for use between Kalgan and Urga. These machines are said to be capable of carrying 20 passengers or three tons of freight, and will make the complete trip in ten hours. At present by caravan the trip requires 30 days and by automobile from three to five days. During winter,—six months of the year—the route is closed by snow. An unconfirmed report gives that a loan of \$10,000,000 (Mex.) has been obtained from Japanese sources for the development of aerial navigation.

The Taokow Chinghua line is about to begin work upon a branch line of 37 miles from Chinghuachen to Menghsien. The latter point is on the Yellow river, which offers a means of distributing a considerable portion of the coal business arising some ten miles east of Chinghuachen. Due to the poor navigability of the river during a large portion of the year, it is not anticipated that any large tonnage will be diverted from the usual rail haul to the Peking-Hankow line. The funds are being supplied by the Peking Syndicate, owner of the mines in question.

The Peking-Suiyuan line is about to begin work upon a short branch line to an iron mine a little north of Kalgan. The principal stockholders in the mine are the managing director of the Peking-Suiyuan railway, the Minister of Communications, the former Minister to Japan, now head of the Japanese Exchange Bank of China, and other high officials in the present government. It is understood that ore will be shipped to the Hangyang Iron Works at Hangyang, about 1,000 miles to the south. The latter is under contract to sell its entire output to Japanese merchants.

On February 22, the Standing Committee of the Unification of Railway Accounts and Statistics finished its labors upon a standard set of forms with rules to govern to be used at all stations for accounting purposes. While ministerial sanction is necessary before the standardized system is in force, it is believed that this will be forthcoming. Six months' preparation will be required upon lines using the daily system of reports. All of the French lines come under this category. The committee will next attempt to standardize store accounts and construction accounts.

The through traffic administration has recently perfected plans for the interchange of rolling stock upon the basis of equivalent tonnage. That is, no obligation will rest with respect to the return of a particular car, but per diem charges will be calculated upon the difference in tonnage borrowed and tonnage lent. Settlements will be made through the Clearing House in the Ministry of Communications.

No subject has given rise to more heated discussion in Peking than the unofficial proposal to consolidate the foreign interests in Chinese railways. British and American policy is decidedly pro, Japanese influence is con, while French interests seem to have adopted a waiting attitude. Chinese opinion is distinctly divided. The Minister of Communications is opposed. Outside of his following, official and unofficial opinion is favorable.

### Disastrous Collision in France

By a collision between a passenger train and a standing train at Crisse, near LeMans, France, on the 17th of April, 16 American and 17 French soldiers were killed and 45 persons were injured.

# Doings of the United States Railroad Administration

## Tie Producers Urge Restoration of Competitive Buying—Number of Employees and Pay on Class I Roads

WASHINGTON, D. C.

THE RAILROAD ADMINISTRATION has executed compensation contracts with the Port Camden Ferry Company, providing for an annual payment of \$401,556, and the Baltimore, Chesapeake & Atlantic providing for an annual payment of \$86,647.

### Locomotives Returned to Home Roads

Practically all of the locomotives that have been used during the past year on railroads other than those of their owners, in accordance with the Railroad Administration's plan of pooling facilities, have now been returned to their home roads or are in repair shops on their way home. Instructions were issued about March 1 that when leased locomotives could be returned to their owning roads without inconvenience and without serious interruption to traffic it should be done as a large number of the roads at that time had locomotives of their own in storage. Nearly 800 locomotives at that time were being operated under lease by roads other than their owners. They have been repaired and put in good shape before return at the shops where the work could be most conveniently done. In many cases, particularly where locomotives were returned from eastern or southern roads to the western lines, it was necessary to use very roundabout routes because of insufficient clearance.

### Tie Producers Ask Restoration of Competitive Buying

President John W. Fristoe and a committee representing the National Association of Tie Producers called on officers of the Division of Purchases at Washington last week to urge changes in the methods of the Railroad Administration in the purchase of cross ties for the purpose of restoring competitive buying by the railroads. The committee presented a statement regarding conditions affecting the production and purchase of ties, together with a series of specific suggestions, which were taken under advisement for a definite reply when the director of purchases, Henry B. Spencer, returns from a western trip, but no encouragement was held out to the tie producers to think that the present plan, by which each railroad acts as the agent for the other railroads in the purchase of ties, would be done away with. They were urged to produce as many ties as possible with the assurance that there would be a market for all that meet the specifications.

The statement presented by the committee expressed appreciation and endorsement of the principle of standard specifications for cross ties as a step toward permanent improvement, but objection was made to the plan of fixed prices and limitations of markets. The specific suggestions were that roads on which ties are produced should continue to purchase at present prices such ties as are offered up to November 1; that any railroad may immediately enter into contracts with individual tie producers at prices not to exceed those now in effect at point of shipment up to November 1, provided the quantities and kinds of ties contracted for are approved by the Railroad Administration; that all cross ties should be inspected by regional inspectors at the point of shipment and that the purchase of cross ties for delivery after November 1 should be made in accordance with the following plan:

1. The railroad should register their annual cross tie requirements with the Division of Purchases and all ties

should be purchased in accordance with national standard specifications.

2. All ties should be inspected by regional inspectors in accordance with standard rules for application of the specifications.

3. Individual roads should enter into contracts for their tie requirements direct with responsible tie producers, filing copies of the contracts with the Railroad Administration.

4. All contracts should be awarded only after fair and open competition has developed the lowest price per tie obtainable from responsible tie producers.

The statement also included other detailed suggestions.

### Number and Compensation of Employees

The January, 1919, pay roll of the Class I railroads under federal control was \$230,800,589 for 1,848,774 employees, as compared with \$153,039,988 for 1,703,748 employees in December, 1917, according to a statement compiled by the Operating Statistics Section, which shows the effect of the wage increases during 1918 as between the different classes of railway employees, together with the numbers, the days and hours worked, the compensation per day and per hour, and the percentage of change in the unit compensation for each of the 68 classes prescribed by the Interstate Commerce Commission. The average increase in unit compensation was 48 per cent, the range being from a 20 per cent reduction for general officers receiving \$3,000 per annum and upwards, up to 98 per cent for structural iron workers and 99 per cent for "other yard employees."

The increase in the number of employees was 145,026 or 8.5 per cent and the average compensation per employee in January was about \$125, as compared with about \$90 in December, 1917. This would amount to an average of \$1,500 per year, as compared with an average for the year 1917 of \$1,004.

The increase in the number of employees was the greatest in the territory where the war traffic had been concentrated, notably in the Allegheny region, where the increase was 15.4 per cent. The number and percentage of increase in the total employees by regions and districts is as follows:

	January, 1919.	December, 1917.	Per cent Increase.
New England District.....	89,822	87,324	2.8
Central District.....	286,334	282,179	1.4
Ohio-Indiana District.....	50,634	49,373	2.5
Eastern Region.....	426,790	418,876	1.9
Allegheny Region.....	403,975	350,014	15.4
Pocahontas Region.....	58,028	51,390	12.9
Southern Region.....	257,314	229,320	12.2
Northwestern Region.....	240,110	217,307	10.5
Central Western Region.....	300,833	285,226	5.4
Southwestern Region.....	161,724	151,615	6.7

The number of days worked in January for those employees whose time is reported by days was 6,156,896, as compared with 5,819,461 in December, 1917, and the number of hours worked, for those reported on an hourly basis, was 391,444,564 as compared with 387,696,988. The 1,644,000 employees paid by the hour worked an average of 238 hours in January, 1919, whereas 1,507,000 in December, 1917, worked an average of 257 hours. The average daily compensation for those reported by the day increased from \$3.52 to \$4.83, and the average per hour from \$.342 to \$.514. The weighted average for the increase is 48 per cent.

The average daily compensation of general officers receiving over \$3,000 per annum shows a decrease of 20 per cent,

EMPLOYEES AND THEIR COMPENSATION

MONTH OF JANUARY, 1919, COMPARED WITH MONTH OF DECEMBER, 1917—CLASS I ROADS UNDER FEDERAL CONTROL

d—Decrease. a—Less than one-half of one per cent.

but the number of such officers shows an increase from 4,251 to 4,370, while the average for those paid less than \$3,000 has increased 17 per cent, and their number has decreased from 3,201 to 2,481. This shows the effect of the cutting off the operating pay roll or reducing the pay of the higher salaried officers, while the lower paid officers have had their compensation increased. The total number of general officers has been reduced from 7,452, who were paid a total of \$2,908,207, or an average of \$390, in December, 1917, to 6,851, paid \$2,493,908, or an average of \$364, in January, 1919, a saving of 601 in number and of \$414,299 in salaries.

The number of division officers paid \$3,000 a year and over also shows an increase, from 1,717 to 3,712, while the number receiving less than \$3,000 has been decreased from 9,419 to 8,762.

The number of employees for 1919 is as of January 16. The number for 1917 is as of a typical day of the week of December 16. The mileage covered for 1919 is 228,571 and for 1917, 228,914.

The largest increases in the number of employees are shown in the mechanical department. A considerable reduction is shown in the number of train employees, attributable to the decreased volume of traffic.

The details are given in the accompanying table.

### Modification of Shipping Day Plan

Director General Hines announces that as a result of conferences with representatives of the National Industrial Traffic League and some of the state railroad commissioners regarding the movement of less than carload freight, decision has been reached as follows:

"Shippers shall not be deprived of the right to route less carload freight over any line at the legal rates applicable or of delivering it at point of origin to such carrier on any week day except holidays during the established hours of service. Preferred routes will be established on the basis of convenience of patrons, economy, despatch and proper destination of railroads not under federal control and less carload freight will be routed accordingly except when routed by shipper at shipping points.

"Where it can mutually be arranged between representatives of the shipping public and the carriers schedules will

be arranged covering forwarding of less carload freight from such points in through cars or set out cars on specified days, it being understood that such cars be forwarded daily except Sunday and holidays, when tonnage is offered in sufficient amount.

"Peddlar cars are to be operated on all week days but holidays except when a less frequent service meets the requirements. The foregoing shall not be construed as requiring the establishment of additional train service."

This is in accordance with the report of a committee at the conference, which was published in our issue of April 11.

### Certificates of Indebtedness

Up to Thursday the Railroad Administration had issued and delivered certificates of indebtedness to equipment companies on account of amounts due for cars and locomotives to the amount of about \$14,000,000 and about \$2,000,000 certificates had been signed ready for delivery. The total indebtedness to equipment companies is now about \$60,000,000, and certificates will be issued on application which can be used as collateral either at banks or, if necessary, for loans from the War Finance Corporation. They are issued in denominations convenient for payment to specialty and material companies for their bills against equipment companies. The Administration has also begun the issuance of certificates to railroad companies to meet their May 1 requirements, and will issue for that purpose about \$70,000,000.

### Steel Controversy Reopened

President Wilson has declined to take sides in the controversy between the Industrial Board of the Department of Commerce and the Railroad Administration regarding steel prices but has sent a cablegram to Secretary Redfield, the effect of which is to direct the reopening of negotiations in another effort to reach common ground. Secretary Redfield had asked the President whether the board should be disbanded or remain quiescent until his return. Chairman Peek of the board immediately wrote to Mr. Hines, who is in the west, suggesting a new conference, and the board began to prepare for further conferences with other industries.

Director General Hines announced that in order to make effective the policy already announced as to publicity in connection with railroad fuel contracts it has been decided to post on all bulletin boards or in a record book open to the public at the headquarters of the purchasing agent of each railroad under government operation the following facts: The name of the coal company or coal operator to whom a contract for railroad coal has been allotted by the railroad in question, the price of the coal contained in the contract, the tonnage involved in the contract, the duration of the contract. Through this method the information will be made available not only to coal miners and coal operators, but, the public generally.

A conference between Mr. Peek and R. S. Lovett and Henry Walters of the Railroad Administration advisory committee on purchases was to have been held on Monday but was postponed because of the illness of Judge Lovett. There have been other cablegrams from the President to Mr. Hines and to Secretary Redfield but they have not been given out. It is reported that the members of the Industrial Board have prepared letters of resignation but that they have been withheld pending new developments.

#### Disputes Between Employees Organizations

Director General Hines has announced in supplement 22, General Order 27, that he will not become involved in juris-

## Side Lights on the Russian Railroad Situation

RUSSIA'S WAY of operating railroads is described in an entertaining fashion by Major Benjamin O. Johnson of the American Railway Mission to Russia in a letter to his father, Olaf Johnson of Worcester, Mass. Writing under the date of October 3 about conditions on the Russian railways as he found them Major Johnson says:

"I can not tell you what I am doing at the present time, so will proceed to tell you something of the Russian way of running a railroad. All the State railways of Russia are divided into small lines of about 1,500 miles in length. Each of the small lines has a complete general and supervisory organization; is actually about four times our force in the States. Office forces work from 9 to 3 with some 10 or 15 minutes for tea about noon. The real officers and heads of departments show up about 10 and leave about 2.

"When it is considered that the Russian officer in any line of work is the inventor of thoughtful, systematic, effective and perfected procrastination, and also in the noble art of 'passing the buck,' it is really most surprising that they are only four times as heavily officered as we are in America.

"Along the lines of organization, every railroad officer must be a graduate engineer. The common ruck never has a look-in. You have read stories and seen plays of comic

With the Czecho-Slovaks in Siberia—Taking Water from a Wayside Brook

dictional disputes between organizations of employees which in some instances have demanded removal of employees because of belief that classification of employees named in wage orders established rights to such demands and have claimed that wage orders have established jurisdiction for certain organizations over all employees of certain classes. No order or supplement has such intent, he says.

#### Contracts with 70 Roads

The Railroad Administration to April 17 had executed standard compensation contracts with 70 roads; 62 of these were Class I roads. There were 68 contracts with a total annual compensation of \$529,000,000, and two contracts with a lump sum of \$121,000.

opera South American armies with 50 generals and 10 soldiers. The Russian way of running a railroad is along the same lines, and the comedy of the situation never appeals to the Russian railway officers. When it comes to morals for this office-holding class there is no such animal. Honesty, ditto, ditto. So much for the officers and their staffs.

"The rank and file of the Russian railway workmen are as fine a bunch of workmen as are found in the world. They are about 75 per cent. as efficient as our men, but are steady, good-natured and very good workmen. Bolshevism is simply the misdirected expression of a class of workmen against the officer class.

"There is no middle class in Russia. Either you are to the purple born or you are a roughneck.

"Please don't understand that the Russian people average to Americans. They have many undesirable qualities, but they are honest. They don't know what they want. They don't know what liberty is, but they want it. They are coming out from their 'liberty jag' and are waking up. My sympathies are certainly with the Russian common people as against their so-called 'intelligentsia' class.

"I can give you one very good illustration of the difference. Along Lake Baikal, on the Siberian Railroad, are 41 tunnels. The cut stone and masonry, the brick work and, in fact, all the workmanship is something splendid. The engineering is a joke.

"To start with, the locating engineers could have avoided half these tunnels on the present alignment and, by leaving the lake, could have avoided this tunnel district entirely. In other words, the engineers fell down, but the workman did his share satisfactorily. This runs through all the engineering work I have seen.

"The old Russian governing class still believes in the divinity of the class. I heard a very highly educated Russian, who had been converted to the republican theory, express himself that he believed absolutely in the democratic form of government. Franchise was to be universal, excepting that the workingmen must not be permitted to vote as they had no idea of their own best interests. He was just as serious about this as he could be, and could not be convinced that what he was talking about was not a democratic form of government at all. Yes, the Russian 'intelligentsia' is impossible. In any event, every officer so conducts himself that you can never fasten anything on him.

"Physically speaking, the Russian railways are in very

rails and then ran a bunch of equipment into the open gaps at the far foot of the hill. We were only two hours getting a hole through and away we went again.

"Do you know that the movement of these 135 trains was made over the hills without accident of any kind? Of course, we had double track to operate on and opposing business was extremely light. Practically all enginemen handling the Czech trains were from the Ural district and mind you, no air, nothing but water and hand brakes. That is the kind of a workman the Russian workman is.

"I remember well my own sensations at the summit. We had about 40 cars—no air—and I went over to the head end and asked the engineer if he had ever been over here before, and he told me he had never been east of Omsk before. Going down this hill, not knowing what the bunch ahead was doing on the water and hand brakes on every car—to put it mildly, I was quite nervous.

"In reading over the above I note that I omitted the most important part which is that the mountain movement in question was made in 48 hours. It was wonderful."

## Chamber of Commerce Report on the Business Situation

A COMPREHENSIVE REPORT on the business situation issued by the Chamber of Commerce of the United States says: "The railroads are in serious condition. This seems chronic, and is due largely to the increase in salaries and wages, which is not offset by heavy increases

A Czecho-Slovak Armored Train at Chaljabinsk, on the Trans-Siberian

good shape. I venture the opinion today there is not one single American trans-continental line in the splendid physical condition of the trans-Siberian. Of course, the little organization they ever had is entirely gone, but the rank and file, through all the confusion, has gone ahead getting out ties, putting them in, raising joints and keeping the property up.

"During the big drive across Siberia we had considerable fighting at the divide between Lake Baikal and Pacific watersheds. To cross this summit is quite a bunch of 1.75 grade. When we got to the near side of the foot of the hill we were so close to the trail of the Magyars and Bolsheviki that they could not stop to blow up any bridges or fuss up any railroad until they could get a few miles ahead of us. So over this mountain we tore—the enemy ahead in some 75 trains and we behind in some 60. Our head end, which was our train, had to feel our way over. They took out some

in freight and passenger charges. To return the roads to their stockholders in their present condition would mean bankruptcy to the entire system. There must first be a thorough readjustment between expenses and revenues. Meanwhile the roads must naturally experience a decline in their volume of business at least for a time, because of withdrawal of Government transportation created by the war and the present smaller volume of domestic business." The report also comments on the effect on lumber business because the largest single consumers, the railroads, are slow in buying, and railroad buying of iron and steel products is light.

The American Association of Freight Agents will hold its annual meeting at Cleveland, Ohio, on June 17, 18, 19 and 20. E. L. Kemp, Union Stock Yards, Chicago, is president of the association, and R. O. Wells, Chicago, is secretary.

## The Canadian Government and the Grand Trunk Pacific

THE EVENTS which immediately preceded the appointment on March 8 of the Honorable J. D. Reid, Minister of Railways, Dominion of Canada, as receiver for the Grand Trunk Pacific Railway Company, because of their unusualness and unexpectedness, constitute an interesting chapter in the development of Canada's railways and their relation to the Dominion government, and throw some light on the present railway situation in Canada. This action, according to governmental announcements, was taken mainly because of the peremptory notice given by A. W. Smithers, chairman of the board of directors of the Grand Trunk Railway Company, that on March 10, one week after the information was given, operations on the entire Grand Trunk Pacific Lines west of Winnipeg would be discontinued.

The financial condition of this road for the past few years has been very serious and the Grand Trunk Railway Company, which originally took \$25,000,000 stock in the Grand Trunk Pacific, is now liable for about \$97,000,000, and the government, owing to the payments of deficits and guarantee of bonds is liable for approximately half of the estimated cost of the road or \$100,000,000. The actual correspondence

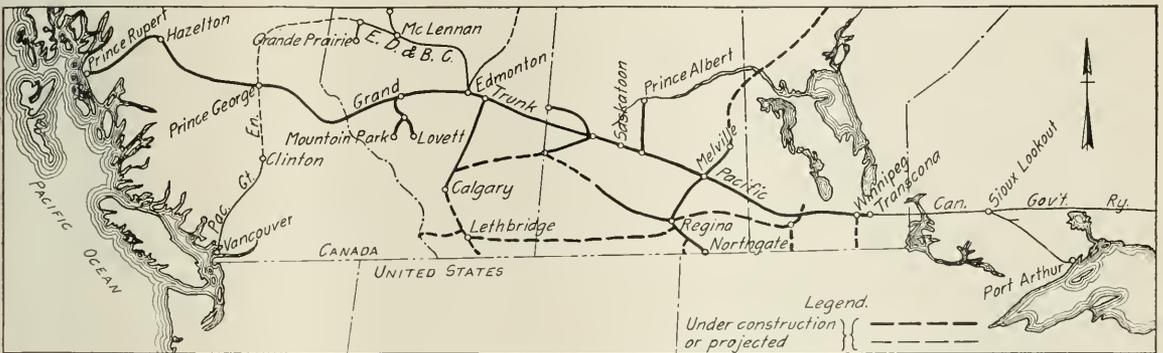

operating obligations.' The small balance of the vote amounting to about \$28,000 will, I understand, be required for the same purpose. There seems no doubt that the deficit in operation should have priority over all other charges.

"I have already informed Mr. Kelley, president of the company, and yourself, that it is not the intention of the government to ask Parliament to provide a further vote for the Grand Trunk Pacific while our negotiations with the Grand Trunk remain in their present unsatisfactory condition. It will be for the Grand Trunk directors to determine the question of their responsibility in respect of the interest maturing tomorrow upon securities guaranteed by their company."

The interest on the Grand Trunk Pacific debenture stock was, however, paid when due.

Following this letter came the sudden announcement by Frank Scott in a letter to Sir Thomas White, dated March 4, that "in view of the fact that the increased rates applicable to the Grand Trunk Pacific have not been sufficient to meet the increased operating expenses, it will not be possible for that company to continue its operations when the present funds have been exhausted, which will be about March 10." The governmental answer to this notice was an order passed in council appointing the Honorable J. D. Reid, receiver for the company.

Negotiations between the Grand Trunk and the government have been carried on for some time with a view to the

Occupation of the Western Canadian Provinces by the Grand Trunk Pacific

and negotiations which led up to the acquisition of the Grand Trunk Pacific by the government grew out of the decision of the Dominion government not to ask Parliament to provide further funds for the Grand Trunk Pacific while negotiations with the Grand Trunk, the parent company, were in an alleged unsatisfactory condition.

Frank Scott, vice-president and treasurer of the Grand Trunk Pacific on February 25, wrote Sir Thomas White, finance minister, and acting prime minister, in part, as follows:

"I am in receipt of a cable from Mr. Smithers stating that in the anticipation of receiving the balance of the appropriation of \$7,500,000, viz., \$951,911, to apply for interest on Grand Trunk Pacific debenture stock due March 1, payment was duly advertised. In consequence, however, of the remittance being coupled with the condition that it is to be used only for operating obligations, the company will be unable to meet the interest due on March 1, and a serious situation will result."

To this letter Sir Thomas White replied as follows:

"With reference to the balance of the appropriation of the vote of \$7,500,000 by parliament, \$923,311 was paid to your company on your certificate No. 10, dated January 28, 1918, approved by the acting Deputy Minister of Railways. This certificate expressly states that this sum is 'on account of cash deficit in the operations of the company from April 1 to November 30, 1918, inclusive,' and 'is required to enable the company to meet its

purchase of the Grand Trunk system by the government. The state of these negotiations is indicated in the following series of telegrams, the first from Mr. Smithers to Sir Thomas White, which reads in part as follows:

"I have received a cable containing an extract from your letter saying that it is not the intention of the government to ask Parliament to provide a further vote for the Grand Trunk Pacific while negotiations with the Grand Trunk remain in their present unsatisfactory condition. I beg to recall that when the ministers came over last summer, it was stated in Parliament that negotiations would be resumed in London. I accordingly saw the ministers with members of the board several times, and at last was told that the ministers could make no advance in their original offer without the consent of the full cabinet in Ottawa. In these circumstances progress in negotiations was impossible, but with a view to facilitating matters, just before the Prime Minister left for Canada, a committee of the board and myself saw him, with two of his colleagues, and made a fresh proposal, involving a very big reduction in our first offer. This offer was not accepted, but on November 5, the High Commissioner for Canada sent for me and said he had a message from the Prime Minister asking me if we wished to continue negotiations, and if so, he thought I should go to Canada. I told the High Commissioner that, looking to the fact that the government had given no sign of any intention of departing from their original offer, I thought it was useless going out unless I had some further explanation or assurance as to the

government's intentions. To this we have had no reply, and I really fail to see how the company can be held responsible for the unsatisfactory condition of our negotiations."

Sir Thomas White answered Mr. Smithers on March 8, as follows:

"The government considers that the unsatisfactory condition of negotiations is due to the Board of Directors of the Grand Trunk Railway Company entirely failing to appreciate its responsibilities to the Grand Trunk Pacific undertaking, and the bearing of its liabilities in respect thereto upon the question of the net earning power and value of the Grand Trunk Railway System. In November last the Prime Minister cabled to Sir George Perley to suggest to you that if your company desired further negotiations the government would be glad to see you in Canada as soon as convenient. He pointed out that it did not seem useful to continue discussion by correspondence. He also suggested that if you came you should be invested with ample powers to conclude an arrangement if one could be reached. Your attitude towards the reasonable suggestion contained in the Prime Minister's communication seemed clearly to indicate indifference towards the continuance of negotiations. Confirmatory of this is the peremptory notification on Thursday last to the government, without previous intimation or discussion, that the Grand Trunk Pacific would on March 10 discontinue operations entirely, regardless of consequences to Canada, through interruption of traffic over a system so extensive and important."

The official announcement of the receivership was made by Sir Thomas White on March 8, and the Minister of Railways commenced to act as receiver on March 10. W. P. Hinton, vice-president and general manager, and other company officials having signified their willingness to obey the order in council were retained in their respective positions and no changes of title have been announced. The Minister of Railways is acting as receiver in his individual capacity, as though appointed by the Exchequer Court, and not by the government. On March 10, Sir Thomas White outlined the case to the House of Commons and on March 20 moved that the House go into committee to consider a resolution that it was expedient to bring in a measure to ratify and confirm the order in council of March 7, appointing a receiver for this road. Following the introduction of this matter into the House of Commons there was considerable discussion as to the legality of applying the war measures act to this case, but the resolution was concurred in. A bill giving effect to the resolution was then introduced by Sir Thomas White, and read a first time.

The Canadian Government Railways, a public service corporation recently formed by the government, consisting of the old Canadian Northern, the National Trans-Continental and the Intercolonial line operated as one system, now comprises 11,540 miles of railway, and with the addition of 2,229 miles of the Grand Trunk Pacific the government will be operating 13,959 miles under one system. If the Grand Trunk system, including the old Grand Trunk and the Grand Trunk Pacific, eventually comes under government control there will be operated under one system a total of 17,511 miles exclusive of a number of smaller lines which would soon be forced by these conditions to come under the same direction. The effect of this possible amalgamation will be probably to place the government system in a position to compete effectively with the Canadian Pacific system, which now has a mileage of 12,823 miles, and is the one big successful private railway corporation in Canada.

A DISAPPOINTED MONOPOLIST.—F. G. Pettibone, federal manager of the Santa Fe and Gulf Coast lines, arrived in Houston Friday morning. He said that he had come to discuss plans for obtaining exclusive control of the transportation business of Houston for his lines and asked if there was any method by which this monopoly could be obtained. It was suggested that W. D. Hines or possibly Albert Sidney Burleson was the man to approach on a monopolistic proposition.

## Train Accidents in March<sup>1</sup>

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of March, 1919:

COLLISIONS						
Date	Road	Place	Kind of accident	Kind of train	Kil'd	Inj'd
41.	N. Y., N. H. & H.	Touisset, Mass.	bs	P. & F.	2	34
'6.	Pennsylvania	Heaton, Pa.	rc	F. & F.	5	2
13.	Pitts. & L. Erie	Newcastle	xc	F. & P.	0	4

DERAILMENTS						
Date	Road	Place	Cause of derailment	Kind of train	Kil'd	Inj'd
4.	Atlantic C.	Cairo, Ga.	b. rail	F.	0	0
10.	Waynesburg & W.	Vankirk	unx	P.	0	8
14.	Seaboard A. L.	Kress, Va.		P.	0	1
18.	Texas Mid.	Atlas	d. track	P.	0	0
21.	Del., L. & W.	Cresco	boiler	F.	3	0
27.	St. Louis S. W.	Pine Bluff	b. rail	P.	0	0

The trains in collision at Touisset, Mass., on the first of March were passenger train No. E23, consisting of a single car, and a work car. The passenger car, an electric motor, was crushed for a length of 15 ft. One passenger was killed and 25 passengers and nine employees were injured. The motorman of the work car was killed. The line is worked by the manual block system, and it appears that the passenger train entered the block section under a permissive signal; also that the flagman of the work train failed to flag the passenger train properly.

The trains in collision at Heaton, Pa., on the sixth, about 5:30 a. m., were eastbound freights. The leading train, consisting of a locomotive and 85 cars, was at a standstill, the locomotive taking water; and the other train, consisting of a locomotive and 76 cars ran into it at good speed, making a bad wreck. A westbound freight was passing on the track to the left; and there were standing freight cars on side tracks both north and south of the two main tracks. Flames burst from the wreckage, and, fanned by a strong wind, spread among the cars on all tracks and also to a bridge above the tracks. Fire companies were called from Lamont, Edge Hill, Bryn Athyn, McKinley, Jenkintown, Abington, Glenside, Willow Grove and Hatboro; but water had to be run in hose for about three-quarters of a mile and the flames were not subdued for 17 hours. Five trainmen were killed and one was injured. The bodies of four of the dead were burnt up. The collision occurred on a straight line, in clear weather. This line, the Trenton cutoff, is operated by the manual block system. This collision occurred in a block section six miles long, and the rear of the standing train was 2885 ft. east of the entrance to the block section. The following train was running under a permissive signal and responsibility for the collision is charged against both the engine-man of that train and the flagman of the standing train. The flagman had used neither torpedoes nor fuses. The engine-man is reported as saying that he was blinded by the glare of the headlight of the westbound train. Estimated loss \$200,000.

The trains involved in the collision on the Pittsburgh & Lake Erie at Newcastle, Pa., on the morning of the 13th, were eastbound passenger No. 506, and a switching engine of the Carnegie Steel Company's plant, which ran uncontrolled from a siding into the side of the passenger train. One combination passenger and baggage car was pushed off the track and into the Shenango River. Six trainmen were slightly injured. Most of the passengers were railroad employees going to their work; a few of these were slightly injured.

<sup>1</sup>Abbreviations and marks used in Accident List:

rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P. or Pass., Passenger train—F. or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

The train involved in the accident near Cairo, Ga., on the morning of the 4th, was a westbound freight. It was derailed by a broken rail and 19 loaded cars fell through the trestle over Ochlocknee River. The trestle for a length of 400 ft. was destroyed. Trains were detoured for three days.

The train derailed on the Waynesburg & Washington, at Vankirk, Pa., on the 10th, was southbound passenger No. 542. Three cars were overturned; but the train was moving slowly and was quickly stopped. Eight persons were injured. The cause of the derailment was not determined.

The train derailed at Kress, Va., on the 14th, was a southbound passenger. The engine and five cars were derailed and four sleeping cars fell down a bank. One employee was injured.

The train derailed near Atlas, Tex., on the evening of the 18th, was southbound passenger No. 1. Three cars left the rails, but reports indicate that no person was seriously injured. The derailment was due to insecure track on a curve in a cut, resulting from heavy rains.

The train involved in the accident near Cresco, Pa., on the 21st, was a westbound freight, drawn by three locomotives, two ahead and one pushing, moving at low speed up grade. The boiler of the leading locomotive exploded and was wrecked, and the engineman, fireman and one brakeman were killed. The train consisted of 72 cars, and two cars near the rear end were thrown off the track, obstructing the eastbound track. The explosion was due to low water in the boiler of the engine.

The train derailed at Pine Bluff, Ark., on the 27th, about 2 a. m., was southbound passenger No. 3. Two passenger cars were partly overturned, and five passengers were slightly injured. The derailment was due to a broken rail, 75-lb., found to be badly piped.

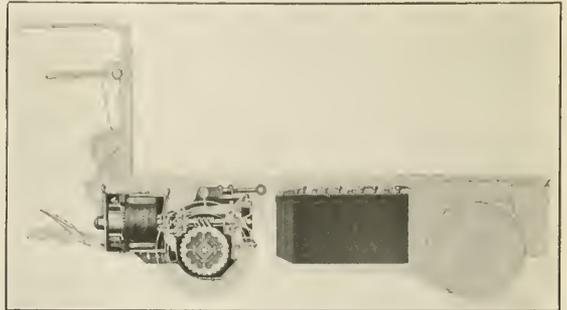

*Canada.* On the Canadian National Lines at Saskatoon, Sask., on the 24th of March a passenger train was derailed near an elevator, and the locomotive, knocking down a part of the wall of the building, caused the rupture of several grain bins; and the engine and first two cars were buried in an avalanche. The engineman, fireman and one other man were smothered to death.

## Industrial Trucks With Standardized Parts

**S**TANDARDIZATION OF PARTS whereby the essential details of various styles of industrial tractors and utility trucks are made interchangeable is a noteworthy feature of the equipment manufactured by the Baker R. & L. Company, Cleveland, Ohio. Some of the salient features of this system, under which 98 per cent of all vital parts are said to be identical, will be found of interest to those concerned with the installation and operation of industrial trucks for handling freight and baggage or supplies at shops and storehouses since the interchanging of parts from one machine to another greatly reduces the necessary supply of spare parts.

An adequate comprehension of the system necessitates a general knowledge of the make-up of these trucks of both the tractor and burden-carrying models. All of the standard trucks are of the four-wheel steering type, that is with all four wheels swiveled by the action of the steering lever, the arrangement being such that all wheels travel on arcs having a common center. Under this arrangement the load is applied from a structural steel platform through a spring pedestal to the top of the knuckle. The standardization idea is carried throughout this detail since the same steering knuckles, jaw parts, wheels and tires are used on the trailing and power axles of both the tractors and utility trucks. The tractors are either two-wheel or four-wheel drive but the trail-

ing axle is substantially the same as the power axle with its differential and driving parts omitted. The application of power and transmission is the same in all types, except that a 48-volt motor is used for the tractor instead of the 24-volt type used for the general utility truck. However, the worm drive, as shown in one of the photographs, with a single reduction direct to the driving axle is standard throughout all of the types. By extending the motor shaft to the other pair of wheels and replacing the trailer shaft by another drive

Phantom View of a Utility Truck Showing Details of the Power Unit

shaft, the truck is readily transformed from two-wheel to four-wheel drive.

The working conditions and purchaser's requirements determine the battery equipment. With a view to having battery trays for tractors and trucks made up of identical units the standard truck battery compartments provide for two trays of 6 lead cells or two trays of 11 to 12 Edison cells. In the case of the high platform utility trucks the battery compartment is underneath the platform between the wheels, whereas in the tractor and the elevating and low platform

A Tractor of the Four-Wheel Drive, Four-Wheel Steer Type

trucks, the battery compartment is on top of the platform.

Standardization of parts is also applied to the auxiliary equipment. The controller, which is of the continuous short-drum type in a cast metal housing, is the same on all the models. This is also true of the automatic switch operated by a foot lever so that the current is on only when the operator has his foot on the lever. This standardization between models has been made possible by the simultaneous development of all the basic units. It contributes materially in shortening the time that the trucks stand in the repair shop.

# General News Department

The War Department has announced that the 66th Company, Transportation Corps, had been assigned to early convoy for its return to this country.

The Waterloo, Cedar Falls & Northern reports a 100 per cent Victory loan subscription; 335 employees subscribed \$34,200. This was the first railroad to report a 100 per cent subscription to the new loan.

The Chamber of Commerce of the United States, at its annual meeting, at St. Louis (Statler Hotel), next week, will discuss a great variety of subjects, as heretofore announced. Group four—transportation—will meet on Tuesday afternoon. George A. Post is chairman of this group. Director General Hines and United States Senator Albert B. Cummins will speak on Wednesday evening.

## New York Public Service Commission Changed

The New York State Public Service Commission for the first district (New York City), consisting of five members, is to be changed, and, so far as the steam railroads are concerned, will hereafter consist of only one member. This results from a law which was passed by the 1919 legislature, just adjourned, and which, it is understood, is sure to receive the approval of the governor. Another law provides for a separate commissionership, of one member, to supervise the completion of the subway and elevated railroads now in course of construction in the city.

## Conference of Technical Societies

A conference of representatives of the technical societies of America was held at Chicago on Wednesday, Thursday and Friday of this week. This conference was called by Engineering Council (a joint organization of the four national engineering societies with the American Society for Testing Materials) to consider the advisability of advocating the creation of a national department of public works. Among the subjects which were considered were (a) what Federal bureaus or activities which should be included in a department of public works—(b) whether an effort should be made to secure an additional Cabinet office, or to make over one of the present departments by the redistribution of activities—(c) whether the present efforts shall be to reorganize the engineering bureaus completely or merely to bring these bureaus under a single head so that such rearrangement of functions as may be found desirable may be made gradually. Among other subjects which were presented for consideration were the creation of a department of transportation and the definition of the attitude of the conference with respect to engineering work on highways, rivers and harbors and railroads.

## American Bureau of Welding

At the meeting of this Bureau held on April 11, at the Engineering Societies building, 33 West 39th street, New York, the by-laws of the Bureau were adopted and the following officers were elected: Director, C. A. Adams; vice-director, H. M. Hobart; vice-director, A. S. Kinsey; treasurer, W. E. Symons; secretary, H. C. Forbes. Regular meetings of the Bureau are to be held on the third Friday of each month.

The Bureau voted to establish a research committee for the purpose of carrying out the plan of co-operation in conducting investigations in welding, and appointed 52 members. This membership will be increased from time to time.

The American Bureau of Welding was organized for the purpose of providing a means for co-operative research and standardization in welding. The nucleus of the bureau consists of the board of directors of the American Welding

Society, and that the bureau may fulfill its mission, the board invites engineering societies, associations and government departments, each to designate a representative for appointment as co-operating director; and appoints the representative so designated a director of the American Bureau of Welding with full powers.

## "Prevent a Claim a Day"

R. H. Aishton, Northwestern regional director, in an effort to minimize freight loss and damage, has started a campaign to "prevent a claim a day." The claim prevention departments of carriers in the Northwestern region, under the supervision of the regional bureau for the prevention of freight loss and damage, have dealt personally with the employees who handle freight, inculcating a feeling of individual responsibility. In a statement outlining this campaign, issued by Mr. Aishton's office, it is said that the claim payments of the past year amount to about 3 per cent of the freight earnings, which is a large increase. This increase is due in a large measure to inexperienced help, to the increased price of commodities (with the smallness of the increase in transportation rates) and to the inferiority of containers.

## Railroad Men Returning from France

Fifty officers and 1,316 men of the Sixteenth Engineers, one of the first of the railway constructing organizations to enter the war, arrived at New York city on April 22 on the transport "Panaman" and were sent to Camp Upton, whence they will be returned to Detroit, Mich., for demobilization. They are mostly Ohioans. The work of this regiment in France was the building of freight classification yards, putting up the great hospital at Nesves and building railroads. It was in March, 1918, when the British fighters were hard pressed, that these Americans threw down their picks and shovels and took up rifles to stem the mighty German drive.

The regiment was ordered on duty with the American Army on October 1, 1918, and began building light railways around Montfaucon. It was close to the front at the battle of the Meuse, at Verdun, Sedan and Stenay. Since the armistice these men have been laying light railways in the mining districts of Lorraine.

The 108th Company, Transportation Corps, commanded by Capt. F. R. Fitzpatrick, also came on the "Panaman." The company was originally the Nineteenth Engineers, made up chiefly of Pennsylvania Railroad men. They went across in May, 1917.

Companies C and D of the Eleventh Engineers also arrived in New York this week on the transport "Santa Teresa." The Eleventh left New York in July, 1917, and was the first American regiment to be received by the King of England. The regiment assisted in handling tanks in advance of the attack on Cambrai in November, 1917, and was in some severe fighting.

In March, 1918, while engaged in railroad yard construction, the regiment was hurriedly sent to the British front near Arras, and later near Bethune, where the men worked on intrenchments and were held in readiness to serve as combat troops in event of further German attacks. While here the regiment suffered further casualties and earned its second citation from the British.

In June the regiment was again sent back to railroad work, but in July, the first battalion was sent to serve with the first army of the American forces east of Paris, and Company E for a short time was in the Château Thierry salient. In September the entire regiment went with the First Army to the St. Mihiel front, where Lieutenant Charles T. Cusick was killed.

The rest of the Eleventh, with Colonel William Barclay Parsons, will probably reach New York this week.

REVENUES AND EXPENSES OF RAILWAYS

TWO MONTHS OF CALENDAR YEAR 1919

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Operating revenues (Total, (inc. misc.), Way and structures, Maintenance of way and equipment, Traffic, Trans-portion, General, Total, Net for railway operation, Operating income (accruals), Operating income (last year), Increase comp. with last year.

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Operating revenues (Total, Inc. misc., Freight, Passenger), Maintenance of way and structures, Equipment, Traffic, Transportation, General, Total, Operating ratio, Net railway operation, Railway tax accruals, Operating (on the basis of last year), In cases (on the basis of last year).

REVENUES AND EXPENSES OF RAILWAYS

TWO MONTHS OF CALENDAR YEAR 1919—CONTINUED

Table with columns: Name of road, Average mileage during period, Operating revenues (Freight, Passenger, Inc. misc.), Total, Maintenance of way and equipment, Operating expenses (Traffic, Fuel, etc.), Net operating ratio, Railway tax accruals, Operating income (with or without tax), Increase in income (with or without tax) last year.

### Increase in Rates in Germany

The new Minister of Prussian Railroads foresees the necessity of raising all freight rates 60 per cent (exception made in the case of potatoes and wheat, if necessary). He proposes besides an increase of passenger rates with the following percentages: 4th class, 20 per cent; 3rd class, 25 per cent; 2nd class, 35 per cent; 1st class, 100 per cent. If the financial results of exploitation improve, the increase will be reduced or even abolished. The new Minister of Railroads is an adversary of the four class system of passengers, and wishes to reduce it to two classes. However, he considers this reform actually impossible. He has been authorized to negotiate with the federated German governments on the question of unification of rates, but not to bind the Prussian government in this question.—*Vorwärts*.

### Chicago to New York in Six Hours, 50 Minutes

Captain E. F. White, an aviator of the United States army, flying in a DeLlaviand biplane, made the trip from Chicago to New York on Saturday, April 19, without a stop, in six hours, 50 minutes, beating all previous speed records for that distance. The airplane has a twelve-cylinder Liberty motor, and its gasoline tank holds 194 gallons. Captain White had with him a mechanic. He left Ashburn field, Chicago, at 9:50 a. m., and landed at Hazelhurst field, Mineola, N. Y., at 5:40 p. m. (4:40 p. m. Central time). Mineola is 20 miles east of the New York post office, and the distance through from Chicago is calculated at 727 miles, making the rate of speed 106.38 miles an hour. Captain White reported that the temperature, at the great altitude at which he flew, was not uncomfortably cold.

On Monday, April 21, Captain White flew from New York to Washington in one hour, 50 minutes, starting at 11:30 a. m., and arriving at 1:20 p. m.

The best regular passenger train time between New York and Chicago is 20 hours, and the best time which has ever been made between these cities by a special train is 16 hours, 30 minutes. Between New York and Washington the best regular schedule is five hours, and the best time on record is four hours, 18 minutes.

### Loans by War Finance Corporation to Railroads

The War Finance Corporation has announced the following list of loans made by it to railroads up to April 10:

Baltimore & Ohio.....	\$4,450,000
Baltimore & Ohio.....	1,000,000
Buffalo, Rochester & Pittsburgh.....	1,000,000
Central of Georgia.....	900,000
Chesapeake & Ohio.....	25,000
Chesapeake & Ohio.....	275,000
Chesapeake & Ohio.....	2,070,000
Chicago, Mil. & St. Paul.....	11,560,000
Chicago, Rock Island & Pacific.....	9,700,000
Chicago, Rock Island & Pacific.....	730,000
Illinois Central.....	1,500,000
Illinois Central.....	10,500,000
New York Central.....	13,500,000
New York Central.....	3,000,000
New York Central.....	4,000,000

## Traffic News

The New York State Barge Canal is to be opened on May 1. The United States Railroad Administration has announced that no action will be taken by the government toward regulating the rates for transportation except on the boats owned or controlled by the government.

C. D. Boyd, formerly general coal and coke agent of the Louisville & Nashville, has become traffic manager for the coal operators of eastern and southeastern Kentucky and Tennessee, members of the Southern Appalachian Coal Operators' Association, Harlan County Coal Operators' Association and Hazard Coal Operators' Exchange.

The Refractories Traffic Association of the St. Louis district was recently organized at St. Louis, Mo., by traffic agents of fire brick and clay products companies located in this district. The object of the association is to keep in touch with all matters pertaining to freight rates on the various commodities manufactured by the companies. Meetings will be held monthly.

The Railroad Commission of Texas has issued an address to the commercial and shipping interests of that state, calling for information concerning experience with the sailing-day plan, adopted at freight stations in that state, with a view to presenting a protest to the United States Railroad Administration. The Texas Commission believes the plan is inconvenient to the shipping public.

Freight rates by lake, this season, as approved by the United States Shipping Board, are published as follows: Grain, from Lake Superior and Lake Michigan ports to Lake Erie, in April, 3½ cents a bushel; in May, 3 cents a bushel. Ore, to Lake Erie, 80 cents a ton. Coal, from Lake Erie ports, 42½ cents a ton. Grain rates to Goderich, to Port Huron and to Collingwood, will be one-half cent a bushel less than to Lake Erie.

The Houston (Tex.) Traffic Club has adopted resolutions opposing government ownership or operation of railroads and outlining desirable legislation to accompany the return of the roads to private ownership. The Atchison (Kan.) Chamber of Commerce has taken similar action including also the telegraph and telephone lines. The resolutions ask that Congress take immediate steps to return the railroads to private ownership and to vest jurisdiction over the issuance of securities in the same national governmental agency by which freight and passenger rates are controlled.

The Fruit Growers' Express, Chicago, has been cited by the Federal Trade Commission on charges of making contracts with railroads to create a monopoly in the interstate transportation of fresh fruits and vegetables. The commission "has reason to believe that a complete monopoly already has been established over the Atlantic Coast Line, Seaboard Air Line, Florida East Coast, New York, Philadelphia & Norfolk, and other lines." The contracts complained of stipulate that the railroad shall use the car line's equipment exclusively in the movement of fruits and vegetables under refrigeration. Answer is called for by June 1.

Export freight on hand at North Atlantic ports for the week ended April 16 totaled 32,994 carloads, exclusive of bulk grain and coal, compared with 33,619 for the same day of the preceding week. For the same period there were 8,161 carloads of export food on hand at these ports, exclusive of bulk grain, which was a decrease of 2,219 cars, compared to the week previous. For the week ended April 16 there were 19,240,216 bushels of grain in elevators at North Atlantic ports; received during the week 6,099,116 bushels; cleared 7,288,986 bushels. At South Atlantic and Gulf ports there were 11,329 carloads of export freight on hand for the week mentioned, compared with 11,855 for the week previous; grain in elevators, 3,924,898 bushels.

## Court News

### Federal Control of Railroads—

#### Constitutionality of 1918 Statute

In an action in the New York Supreme Court, Erie County, against the Pennsylvania for the death of a brakeman, which happened while the railroad was being operated by the federal authorities, the chief question involved was the constitutionality of the Act of Congress of March 21, 1918, in so far as it authorized the maintenance of actions and the recovery of judgments against carriers for damages sustained by employees and others while the railroad is being operated by and under the direction of the federal authorities. The court holds that the act is unconstitutional in so far as it authorizes the recovery of judgments against carriers for the negligence or default of the government or its agents and the enforcement of such judgments against such property of the carriers as is not taken under federal control. It considers that this amounts to depriving the corporation of its property without due process of law. The court says that it may almost take judicial notice of the fact that railroad companies, or many of them, do own and possess other property than that employed in the transportation of property and freight, which latter alone was taken under government control. Many of the companies have large holdings of the stock and bonds of subsidiary companies. Many, if not all, in addition, owned considerable sums of money on hand and in bank as the result of their operations. The federal government took into its possession and control none of this class of property and all such property can be reached by judgment creditors in appropriate proceedings to satisfy valid judgments against the corporation.

The court cited in support of its opinion in the present case the recent decision of the federal district court for the Eastern District of South Carolina in *U. S. Railroad Administration v. Burch*, 254 Fed. 140 (November 30, 1918), where the United States Director of Railroads sought to enjoy a sale under execution, under a judgment obtained against the Atlantic Coast Line of certain lots owned by the company, and claimed not to have been taken over by the government. The court there held that the acts of Congress of August 29, 1916, did not authorize the Director General of Railroads to take possession of lands belonging to a railroad company which are not used in the business as a carrier, and that a sale of such lands under execution will be enjoined by the court.

The federal government, in the control and operation of the railroad properties taken over, is in no sense the agent or representative of the railroad companies to which the systems belong. By the 12th section of the act of 1918 the moneys and other property derived from the operation of the railroads during federal control are declared to be the property of the United States."

In view of the importance of the questions and the far-reaching effect of such a holding, the court considered they should be passed on by courts of review; and as the appellate courts have expressed the opinion that constitutional questions should be reserved by trial courts for their determination, it was held that the exceptions taken on the trial be ordered heard in the first instance at the Appellate Division of the Supreme Court, with a stay of entry of judgment on the verdict pending the hearing and disposition of the case in that court. *Schumacher v. Pennsylvania Railroad Company*. Decided March 26, 1919.

**Condition of the Roumanian Railroads.**—The condition of the Roumanian railroads, which before the war were prosperous, becomes more and more one of the chief difficulties in the return to economic life. There is only one train a day between the different parts of the country, instead of three to seven, which circulated in normal times. The wagons are partly useless.

# Equipment and Supplies

## Locomotives

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., wishes to purchase one, 40 to 50-ton, consolidation or 10-wheel locomotive, with a short rigid wheel-base, 36 to 44 in. wheel centers, and 180 to 200 lb. steam pressure; one 65-ton, 2-6-2 type locomotive, and one 4-4-0 type locomotive with 14 by 22 in. cylinders. This company also wants a second-hand, standard gage, four driver saddle tank locomotive, with 10 or 11 by 16 in. cylinders.

## Locomotive Deliveries

The following new locomotives were shipped to railroads under federal control during the week ended April 12:

Works	Road	Number	Type
American	C. M. & St. P.	13	USRA Mikado
	Cent. of Ga.	1	Mallet
	Erie R. R.	3	USRA Pacific
	C. & N. W.	3	USRA 6-w. Sw.
Baldwin	Norf. & W.	22	Mallet
	C. B. & O.	1	Mikado
	Phil. & R.	1	Consol.
	Penn. R. R.	1	Mikado
	C. B. & O.	4	USRA Mikado
	C. C. & O.	1	Mikado
	Gt. North.	2	8-w. Sw.
	A. T. & S. F.	1	Mikado
	C. C. & O.	1	Mallet
			13
Total		35	

## Passenger Cars

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for one gasoline motor car with baggage compartment, seating 25 to 30 people.

## Car Deliveries Week Ended April 5

Road	Number	Type	Manufacturer	Total accepted for given roads
Sou. Pac.	45	50 Ton S. S. Box	Am. Car & Fdy. Co.	100
C. C. & O.	48	50 Ton S. S. Box	Bettendorf Co.	276
Sou. Pac.	142	50 Ton S. S. Box	Haskell & Barker	331
Sou. Pac.	200	50 Ton S. S. Box	Pullman Car Co.	200
N. & W.	70	50 Ton S. S. Box	Pullman Car Co.	800
P. McK. & Y.	107	70 Ton L. S. Gond.	Pressed St. Car Co.	130
Total	612			

## Car Deliveries Week Ended April 12

New standard cars were accepted during the week ended April 12, as follows:

Road	Number	Type	Manufacturer	Total accepted for given roads
C. C. & O.	24	50-ton S. S. Box	Bettendorf Co.	300
Sou. Pac.	146	50-ton S. S. Box	Haskell & Barker	477
Sou. Pac.	200	50-ton S. S. Box	Pullman Car Co.	400
P. McK. & Y.	77	70-ton L. S. Box	Pressed St. Car Co.	207
Total	447			

## Freight Cars

W. W. HEDGEMAN, St. Paul, Minn., is in the market for one flat car.

THE COMMONWEALTH EDISON COMPANY, Chicago, is inquiring for one 66-ton concentrated-load well-car.

THE GOVERNMENT OF THE NETHERLANDS, COLONIAL DEPARTMENT, is inquiring for one motor inspection car for export.

THE NEW HOWARD COLLIERY COMPANY, Huntington, W. Va., has ordered 59 cars from the American Car & Foundry Company.

## Supply Trade News

J. S. Cullinan has recently been elected president of the Galena-Signal Oil Company, New York.

J. H. Deppeler of the Metal & Thermit Corporation, Jersey City, N. J., has been elected a director of the American Welding Society.

Briggs & Turvias, Inc., iron and steel, Chicago, have opened a New York office at 1805 Equitable Trust building, to be under the direction of the president of the company, Carl R. Briggs.

The United States Switch Company, Eau Claire, Wis., has let contracts for the erection of additions to its iron and steel foundry and machine shops and work is now under way on the new buildings.

The Illinois Manufacturers' Association, Chicago, is planning to open a New York office as a result of recommendations of its foreign trade committee. The committee states that particular attention will be paid to buyers from the Philippines and the Orient.

Charles Gilman, eastern manager at New York for the Massey Concrete Products Corporation, Chicago, has been elected vice-president, effective May 1. Mr. Gilman's headquarters will be in New York, and he will be in charge of sales in the eastern territory.

Geo. W. Hoover, formerly in charge of the procurement of railway material in the Construction Division of the army, has been appointed manager of the St. Louis office of the Buda Company, Chicago. The Buda Company opened a St. Louis office on April 1 at 2025 Railway Exchange building.

T. J. Hudson, of the Chicago Pneumatic Tool Company, has been appointed acting manager of the pneumatic tool sales division, effective April 15, succeeding F. H. Waldron, who returns to Minneapolis, Minn., as district manager of sales for the Minneapolis territory.

B. L. Swearingen, formerly assistant general freight agent on the Missouri Pacific, and for the past year supervisor of oil traffic for the Railroad Administration with headquarters at Kansas City, Mo., has been appointed traffic manager of the Sinclair Refining Company, Chicago, to succeed G. F. Rung, who has been assigned to other duties.

The Indian Refining Company, Lawrenceville, Ill., will commence work immediately on the construction of a car repair shop at Lawrenceville. The new shop will be of structural iron and brick construction, one story high and 85 ft. by 327 ft. The work will be done by the company's own forces. The approximate cost is \$75,000.

The American Railway Signals Company, Terre Haute, Ind., has been organized with a capitalization of \$200,000 by Harry W. Beggs, Thomas G. Beggs, John T. Beasley, John F. O'Brien and John H. Beasley. The new company will manufacture railroad signal devices and holds a license contract with the Julian-Beggs Signal Company giving it the sole right to manufacture, sell and install the Julian-Beggs Signal Company devices.

The Hess-Bright Manufacturing Company, the S K F Ball Bearing Company, the Atlas Ball Company and the Hubbard Machine Company have announced a combination effective May 1, under the name of S K F Industries, Inc., to sell the products of the above companies through one central organization. The new company will offer a comprehensive line of ball bearings, including the Hess-Bright deep-groove type, S K F self-aligning radial and thrust bearings and ball bearing pillow-blocks and shafting hangers. S K F Industries, Inc., is simply a holding, sales and engineering organization under the direction of B. G. Prytz, president; W. L. Batt, vice-president; J. P. Walsh, comptroller, and S. B. Taylor, sales manager. The principal office will be at 165 Broad-

way, New York, with branches at Boston, Philadelphia, Atlanta, Buffalo, Cleveland, Detroit, Cincinnati, Chicago and San Francisco.

### Advisory and Purchasing Engineers

Earl Wheeler, O. A. Mechlin and Frank Rhea announce their association in the firm of Wheeler, Mechlin & Rhea, as advisory and purchasing engineers with office at 90 West street, New York. Its purpose will be to conduct an advisory and purchasing engineering business, organized to furnish service to foreign and domestic clients purchasing machinery and engineering materials in the United States, to be used to construct, maintain and operate properties.

Earl Wheeler

By the term "machinery and engineering materials" is meant those classes of materials, equipment, apparatus and supplies which demand engineering specifications or plans as a fundamental basis of purchase, including general construction materials and plant; steam railway materials, equipment and supplies; electric railway materials, equipment and supplies; electric light and power apparatus and supplies; shop and factory equipment; harbor, wharf, dredging and freight handling equipment; highway, street, sanitation and water supply plant and materials; mining and smelting plant equipment, etc.

The firm in addition to acting as advisory and purchasing engineers will arrange co-ordinated production programs for shipments from one or several manufacturing plants, will follow production schedules at the factories by a follow up system of correspondence and personal visits, and supervise inspection, packing and shipments by rail and water. It will also follow through export bills of lading and co-ordinate shipments from different sources at ship's side and will combine inspection certificates of quality, quantity and packing with bills of lading and secure all possible discounts by applying the client's established credits.

The entire compensation of the firm will be derived from the clients served, in direct fees for advisory engineering and commissions on purchases made. No compensation will be received in the form of selling commissions, as the firm will conduct negotiations as the authorized agent of its client.

Earl Wheeler is a member of the American Institute of Electrical Engineers. He has served as director of the department of electrical and mechanical engineering, engineer school; Corps of Engineers, United States Army; as treasurer and general manager of the Electric Speedometer Company, Washington, D. C.; and as local manager of the General Electric Company at Washington, D. C. He had the rank of lieutenant colonel of engineers, United States Army, and

Frank Rhea

acted as chief of the machinery and engineering materials division, office of the Director of Purchase, General Staff, which was formerly the General Engineer Depot, the purchasing engineers for the Corps of Engineers during the participation of the United States in the world war.

O. A. Mechlin is an associate member of the American Society of Civil Engineers. He is a member of the firm of Mechlin & Starr, architectural engineers, Washington, D. C. He served as lieutenant-commander, Civil Engineer Corps, United States navy, and was the officer in charge of construction of the additions to the Naval Academy; the Navy and Munitions building, Washington, D. C. (the largest concrete-steel office building in the world); and was public works officer, Navy Yard, Philadelphia, Pa., in charge of construction of shops, buildings, wharves, power plant, dry-dock and ship building ways.

Frank Rhea is a member of the American Society of Civil Engineers, the American Railway Engineering Association, and the Railway Signal Association. He was at one time assistant supervisor and supervisor of track on the Norfolk & Western, and later served on the Pennsylvania as chief signal inspector, assistant engineer and division engineer, respectively. He was also at one time an apprentice with the Union Switch & Signal Company, superintendent of construction of the Clanond Telephone Company and commercial engineer in the railway engineering department of the General Electric Company. He later served as district engineer of the Eastern District, Division of Valuation, Interstate Commerce Commission; and as a commercial engineer of the Bureau of Foreign and Domestic Commerce made a study of the markets for railway materials in New Zealand, Australia, the Philippine Islands, China and Japan.

John T. Dickerson, general manager of the Strauss Bascule Bridge Company, Chicago, died April 14 at his home, Oak Park, Ill., at 40 years of age. Mr. Dickerson was a graduate civil engineer of Rose Polytechnic Institute of Terre Haute, Ind., class of 1902. He had been identified with the company for seven years. Prior to 1912 he was assistant engineer and general sales engineer with the Scherzer Rolling Lift Bridge Company of Chicago for a period of 5 or 6 years, and before that he was employed in the bridge departments of the Chicago, Burlington & Quincy and the Chicago, Rock Island & Pacific, and the American Bridge Company of St. Louis, Mo.

Carl H. Peterson, western representative of the Baldwin Locomotive Works, Philadelphia, Pa., and the Standard Steel Works Company, Philadelphia, with headquarters at Chicago, has resigned, effective May 1, to become president of the Iron Mountain Company, Chicago, and vice-president of the Jackson-Park Machine Company, Chicago. He was born in Chicago on November 9, 1872, and began his business career as an engineer and draftsman with Swift & Company, Chicago, in 1889. From this time until May, 1919, he has been consecutively engineer for the Railway Lighting & Manufacturing Company, Chicago; engineer and salesman for the Safety Car Heating & Lighting Company, Chicago; engineer and salesman for the Pressed Steel Car Company; assistant to the western representative of the Baldwin Locomotive Works and the Standard Steel Works; southwestern representative of the same firms, with headquarters at St. Louis, Mo., and western representative for the same firms, which position he has held prior to his recent election. Mr. Peterson will be succeeded by Arthur S. Globe, southwestern representative of the Baldwin Locomotive Works and the Standard Steel Works Company, with headquarters at St. Louis, who will have the title of manager of the Chicago office, the title of representative having been abolished. Paul G. Cheatham, assistant to the western representative, with headquarters at Chicago, will succeed Mr. Globe as manager of the St. Louis office.

### American Steel Foundries

The stockholders of the American Steel Foundries Company, Chicago, at a special meeting held in New York on April 22, voted unanimously in favor of the plan submitted by the board of directors to create a preferred stock issue of \$25,000,000 and to split the present capital of 178,140 shares or \$17,814,000 into 515,520 shares of par value of \$33½

per share. These latter shares will be exchanged, three for one, for the present stock.

This plan was formulated some time ago by the board of directors to provide capital for the acquisition of additional properties. President R. P. Lamont, in outlining the plan at the meeting, explained that only a part of the new preferred stock would be issued at this time and only in exchange for property that would earn the preferred dividend, leaving the balance of earnings for the common. The rise in the present shares on the New York Stock Exchange within the last few days from around 82 to 96 on April 22, is indicative that the preferred issue will not stand in the way of dividends on what will now be the common stock.

## Trade Publications

**SLOTING MACHINES.**—Latest information on three types of Newton slotting machines in a variety of sizes is given by the Newton Machine Tool Works, Inc., Philadelphia, Pa., in catalogue 49-A, which also contains photographs and brief information on upright generating planers, cold saw cutting off machines, locomotive link grinding machines, horizontal milling machines, vertical milling machines, rotary planers, keyseat milling machines and duplex locomotive rod boring machines.

**SHOP PRODUCTION.**—"The Missing Link" is the title of a 16-page booklet issued by the Gisholt Machine Company, Madison, Wis., explaining the principle of the Periodograph and the advantages to be secured from its installation. This machine was developed to make it possible to secure an accurate record of the time actually spent in producing and the loss of time lost by workmen waiting for materials, broken machines, lack of power, and other causes of delay. The booklet shows several cards which are used for registering the time lost, with the reasons, and a chart showing the record of a machine for an entire year.

**STEAM PUMPS.**—Several bulletins have been issued by the A. S. Cameron Steam Pump Works, New York, describing their pumps, which are bound together in a heavy manila folder. Included among these are bulletin 7204, which explains the general characteristics and operation of Cameron steam piston and plunger pumps; bulletin 7152, showing the construction of a single suction volute centrifugal pump, with tables of capacities, speeds and horsepower; bulletin No. 7251, covering two-stage motor driven and three-stage turbine driven centrifugal pumps and giving complete information regarding their operation, specifications and detail parts; and bulletin 7150, describing and illustrating the general design of a double suction volute centrifugal pump, including the results of tests made with this pump and useful information regarding the friction and pressure of water.

**HISTORY OF RAIL MANUFACTURE.**—Robert W. Hunt, president of Robert W. Hunt & Co., Chicago, has prepared a booklet on the occasion of his recent eightieth birthday outlining in detail the early development of Bessemer rail manufacture. The book contains a paper entitled "The History of the Bessemer Manufacture in America," which was presented by him at the American Institute of Mining Engineers at its centennial meeting held in Philadelphia on June 23, 1876, and one entitled "The Evolution of American Rolling Mills," which he presented as a presidential address before the American Society of Mechanical Engineers on November 16, 1891. These papers contain much information not commonly known regarding the early development of Bessemer rail manufacture.

**LOCOMOTIVE COALING PLANTS.**—A comprehensive book on locomotive coaling facilities, Rands gravity sand plants and cinder handling equipment for railroads, describing a large number of representative installations, has been published by the Roberts & Schaefer Company, Chicago. The catalogue contains 68 pages, 9 in. by 11½ in., is well illustrated and includes erection drawings of several of the plants. It also describes and illustrates some of the special features of Roberts & Schaefer equipment, including the Schraeder automatic measuring feeder and a patented elevating bucket. Some interesting data is also given showing in detail the cost of handling coal, taken from carefully compiled records of a large railway system which employs 10 different methods of handling coal, comparing the cost of operating plants designed by the Roberts & Schaefer Company with the others.

## Railway Construction

**DE QUEEN & EASTERN.**—This company is connecting a terminus of its road at the Arkansas-Oklahoma state line, about nine miles west of De Queen, Ark., with a line extended from the terminus of the Texas, Oklahoma & Eastern at Broken Bow, Okla., beginning at a point on the St. Louis-San Francisco at

Valliant, Okla., and extending east through Bismark and Broken Bow, in Okla., and De Queen, Lockesburg and Dierks, in Ark., a link of 76 miles will be built. There remains six miles of grading to be done and 15 miles of steel to lay. Many trestles and one 100-ft. steel span are to be built. The company's forces will carry out the trestle work and at a later date will contract for the steel span.

## ANNUAL REPORT

### Buffalo, Rochester & Pittsburgh—Thirty-fourth Annual Report

The Directors of the Buffalo, Rochester and Pittsburgh Railway Company submit to the Stockholders the following report for the year ending December 31, 1918.

As stated last year, the U. S. R. R. Administration formally assumed possession, control, operation and use of your property at 12 o'clock noon on December 28, 1917. The actual operation and accounting, however, became effective at midnight of December 31, 1917.

Under authority of a proclamation of the President, dated March 29, 1918, authorizing the Director General of Railroads to agree with the carriers respecting all the terms and conditions of the Federal Control Act, and in accordance with authority given by you at a meeting held July 10, 1918, a contract between the Director General of Railroads and your Company, dated October 25, 1918, was executed on December 19, 1918.

The annual compensation thereby guaranteed to your Company is \$3,276,410.42, payable quarterly in equal installments on the last days of March, June, September and December of each year, and was based entirely on the average annual operating income of your Company during the test period named in the Federal Control Act, being the three years ending June 30, 1917. A claim for additional compensation presented by your Company did not receive favorable consideration.

In assuming control of the property January 1, 1918, the Director General took over the following assets:

Cash .....	\$1,422,153.48
Agents and conductors balances.....	304,244.60
Material and supplies.....	2,932,330.71
<b>Total .....</b>	<b>\$4,658,728.79</b>

According to the agreement, out of the amounts received from the Company in cash collected or realized upon by him from current operating assets, he has paid the current operating liabilities of the Company and other claims arising prior to January 1, 1918, and is to account for the balance in the quarterly settlements. At the end of Federal control he is to return materials and supplies equal in quantity, quality and relative usefulness to that of the material and supplies which he received, or account for the same at prices prevailing at that time.

As definite settlements under this contract have not yet begun, the U. S. R. R. Administration advanced from time to time the necessary funds for immediate needs, as follows:

On account of annual compensation.....	\$860,000.00
Loans on notes.....	1,440,000.00
<b>Total .....</b>	<b>\$2,300,000.00</b>

For your information, and also to maintain the continuity of the statistics, full details of the operation under Federal control so far as available, are given in an appendix to this report.

ROAD			
(Operated by U. S. R. R. Administration)			
	1918.	1917	Inc.
Owned .....	368.31	367.07	1.24
Leased .....	90.31	89.91	.40
Trackage rights .....	131.11	127.67	3.44
<b>Total length of road operated .....</b>	<b>589.73</b>	<b>584.65</b>	<b>5.08</b>
Second track .....	212.61	210.61	2.00
Sidings .....	457.48	412.57	44.91
<b>Total miles of tracks, all steel rails .....</b>	<b>1,259.82</b>	<b>1,207.83</b>	<b>51.99</b>

The increase of road operated is due to an adjustment of 1.64 miles in line owned and leased, caused by remeasurement, and additional trackage rights of 1.24 miles over Pennsylvania Railroad in Pennsylvania, and 2.20 miles over New York Central Railroad at Clearfield, Pa.

The tracks were increased by 2.00 miles of second track, from remeasurement, and 44.91 miles of sidings, including 25.83 miles on lines used under trackage rights.

INCOME.			
	1918.	1917.	INCREASE OR DECREASE.
<b>OPERATING INCOME:</b>			
Revenues .....	\$14,975,000.30	\$14,975,000.30	—

Special appropriations .....	600.29	644,354.25
<b>Total appropriations .....</b>	<b>\$29,354.74</b>	<b>\$671,715.23</b>
<b>Surplus available for dividends .....</b>	<b>\$1,118,956.45</b>	<b>\$1,068,105.26</b>
<b>Return on capital stock.....</b>	<b>6.78%</b>	<b>6.47%</b>
		<b>.31%</b>

Under the agreement with the Director General only the taxes commonly called war taxes (estimated this year at \$150,000.00) are to be paid by your Company.

The increase of other items in non-operating income came principally from interest on balances due and adjustment in accounts with the Federal Administration.

A special appropriation of \$29,354.74 was made from Net Income, of which \$600.29 was applied to the purchase of new rolling stock, under provisions of the Sinking Fund of Equipment Agreement Series B, and the balance for the Pension and Insurance Funds.

DIVIDENDS.					
		1918	1917		
Dividends in cash were paid on:					
Preferred Stock .....	\$6,000,000	6%	\$360,000	6%	\$360,000
Common Stock .....	10,500,000	5%	\$25,000	6%	\$30,000
<b>Total .....</b>	<b>\$16,500,000</b>		<b>\$885,000</b>		<b>\$990,000</b>

Since the close of the fiscal year, your Board of Directors has declared semi-annual dividends of three dollars per share on the preferred stock and two dollars per share on the common stock, payable February 15, 1919.

### CAPITAL STOCK.

There has been no change during the year in this account. The total outstanding Capital Stock of the Company amounts to \$16,500,000 and consists of \$6,000,000 preferred stock and of \$10,500,000 common stock.

### FUNDED DEBT.

In accordance with the provisions of the Consolidated Mortgage of 1907, \$1,500,000 4½% bonds were received from the Trustee to apply on payments made for improvements and betterments, and the securities placed in the Treasury of the Company.

The Trustee also delivered to the Company \$147,000 Consolidated Mortgage 4½% bonds, representing 50% of a part of Equipment Bonds Series E and F retired during the year. The balance of the bonds due will be obtained next year.

These bonds, added to those in the Treasury of the Company, make a total of \$2,970,000 held in reserve.

Under the terms of the Sinking Funds for the redemption of Equipment Bonds, \$724,000 bonds were retired, as follows: \$25,000 Series A; \$50,000 Series B; \$50,000 Series C; \$117,000 Series D; \$116,000 Series E; \$185,000 Series F; and \$181,000 Series G.

Also the fourth annual installment of \$125,000 Series H bonds, and the first and second semi-annual installments of Series J bonds, amounting to \$100,000, were retired, as provided for in the agreements.

To provide for additional rolling stock, an issue of \$1,200,000 six per cent. Gold Bonds was authorized to be secured by new equipment costing \$1,573,600. These bonds were issued under an agreement, known as "Equipment Agreement Series K" dated August 1, 1918, and were sold during the year to the W. S. R. R. Administration. The Agreement provides that both principal and interest are payable without deduction for any tax or taxes (except any Federal Income Tax) under any present or future law. The bonds mature in semi-annual installments of \$40,000, beginning February 1, 1919, and ending August 1, 1933.

The net result is an increase of \$326,000 in the bonded debt of the Company, held by the public on December 31, 1918.

LOANS.

Pending a more favorable market for the sale of the Company's Consolidated Mortgage Gold Bonds, held in its Treasury, at a fair price, it was found advisable to issue its notes bearing interest at 6% to the amount of \$2,440,000.00 to obtain the necessary funds for corporate purposes.

Further loans of \$250,000.00 were made at 4½% and 4¼% to meet the purchase of a similar amount of the Fourth Liberty Loan Bonds, subscribed for by your Company.

Including the loans made in 1917, the short term indebtedness now amounts to \$3,699,600.00.

COST OF ROAD.

Capital account has been charged during the year with \$1,947,756.34 for investment in road, as follows:

Second track, Marion Center, Pa., to Home, Pa.	\$27,052.96
Passing Siding, etc., West Shore Junction, N. Y.	11,081.40
Passing Siding, etc., Warsaw, N. Y.	21,554.98
Passing Siding, etc., Beavers, N. Y.	52,607.72
Passing Siding, etc., Falls Creek, Pa.	31,493.06
Passing Siding, etc., Whistleton, Pa.	29,100.63
Passing Siding, etc., Juneau, Pa.	27,123.99
Interlocking plant, Riverside Jct., N. Y.	7,870.93
Interlocking plant, Brockwayville, Pa.	15,526.51
Interlocking plant, Falls Creek, Pa.	5,274.71
Interlocking plant, C. & M. Junction, Pa.	15,487.43
Terminal facilities, Buffalo Creek, N. Y.	31,441.10
Terminal facilities, East Salamanca, N. Y.	375,909.21
Terminal facilities, Clarion Junction, Pa.	26,781.29
Terminal facilities, Du Bois, Pa.	32,251.74
Terminal facilities, Elk Run Jct. and Cloe, Pa.	734,003.16
Remodeling freight station, Rochester, N. Y.	5,530.56
Remodeling freight station, Ganson St., Buffalo, N. Y.	14,794.00
New station, West Falls, N. Y.	8,289.57
Tie tamping machines and equipment	25,315.81
Shop and power plant machines	158,108.21
Improvement bridge, Johnsonburg, Pa.	19,803.98
Increased weight of rail, etc.	144,947.36
Stone and slag ballast	33,507.80
Additional yard extensions, sidings, etc.	92,898.26
<b>Total</b>	<b>\$1,947,756.34</b>

The program of new work authorized in 1917, including the extensive improvements and changes in the terminal facilities and buildings at East Salamanca, N. Y., and Elk Run Junction and Cloe, Pa., is virtually completed.

The only important work still in progress, to be completed in 1919, is the following:

Land for industrial tracks, Buffalo, N. Y. interlocking plants at Riverside Junction, N. Y., and Falls Creek, Pa. Yard tracks at Falls Creek, Pa.

No further new projects involving large expenditures are required or contemplated at this time.

COST OF EQUIPMENT.

Expenditures were made for additions to equipment as follows:

Thirty-nine new freight locomotives	\$2,427,777.40
Eight new passenger locomotives	351,006.85
Forty-four steel underframe gondola cars, built at company's shop	47,442.10
Fifteen new caboose cars	42,646.55
Eight locomotive superheaters	14,246.31
Twenty-five incandescent headlights	3,869.14
Thirty-three duplex locomotive stokers	75,279.27
Sundry other additions, including two flanger cars, three tractor plows, re-classification or transfer of ten freight cars to work equipment	33,295.32
	<b>\$2,995,562.94</b>

There was credited for equipment sold, transferred or destroyed, the following book values, of which the accrued depreciation to January 1, 1918, was charged to Accrued Depreciation Account, and the balance to the U. S. R. R.

Administration:	
Two freight locomotives	\$23,198.24
Two passenger locomotives	16,792.74
Two passenger train cars	5,494.75
One hundred thirty-seven freight train cars	89,151.94
Five work equipment cars	1,443.59
Eight miscellaneous equipment cars	5,289.70
	<b>141,370.96</b>

Making a net increase of \$2,854,191.98

The total tractive power of engines aggregates 16,025,362 pounds, an increase of 3,251,952 pounds during the past year.

The average tractive power of each engine increased 4,252 pounds, being 43,312 pounds as against 39,060 pounds on December 31, 1917.

The total carrying capacity of cars in freight service now amounts to 777,657 net tons, an increase of 40,330.

The average carrying capacity or efficiency of each freight car increased .57 ton, being 43.94 tons as against 43.37 tons.

Of the cars in passenger service 47.31 per cent are of all steel construction; and in the freight service 93.63 per cent of the cars are all steel or are equipped with steel underframes.

All rolling stock under contract was delivered during the year and is included in this report.

The approximate cost of \$2,253,600.00 for 800 fifty-five ton steel coal cars, allocated to your Company by the U. S. R. R. Administration and accepted from the builders by their inspectors, was not entered upon the books, pending a final determination of the whole question of the railroad equipment problem.

FIRE INSURANCE FUND.

The assets of this fund were increased \$12,294.11 and now amount to \$373,461.65 in interest bearing securities and cash.

PENSION FUND.

The assets of this fund, created July 1, 1903, were increased \$11,611.28, and now amount to \$243,998.69 in interest bearing securities and cash.

There were 68 pensioners upon the roll on December 31, 1918, a net increase of 4 during the year.

GENERAL REMARKS.

The Ontario Car Ferry Company, Limited, paid a dividend of 2½% for the six months ending December 31, 1917. The sum of \$6,250.00 received on the \$250,000 of this Company's stock was credited to non-operating income account.

The Interstate Commerce Commission began the valuation of your lines on July 1, 1917. About 95% of the field work, 75% of the office work and 45% of the profiles are completed. The amount expended to date on this account has reached \$95,166.76.

The officers and employees of your Company subscribed to the Liberty Loans of the Government as follows:

1st Liberty Loan	3,390 individuals	\$275,650.00
2nd " "	1,738 " "	128,250.00
3rd " "	5,544 " "	355,250.00
4th " "	7,567 " "	924,850.00
<b>Total</b>	<b>18,239 " "</b>	<b>\$1,684,000.00</b>

of which only \$144,442.34 remains to be paid for in the coming year.

During the war, two of the Directors and 850 employees joined the Nation's military and naval forces, of whom seven received commissions.

The acknowledgments of the Board are renewed to its officers and employees for their faithful and efficient service.

By order of the Board.

WILLIAM T. NOONAN,  
President.

Rochester, N. Y., March 6, 1919.

PROFIT AND LOSS ACCOUNT.

December 31, 1918.

CREDIT.

Balance Surplus December 31, 1917	\$4,395,242.15

## Railway Officers

### Railroad Administration

#### Central

G. W. Tomlinson, director of the Division of Inland Waterways, has been given leave of absence to become resident director at London for the American Shipbuilding Company.

E. Marvin Underwood, general solicitor of the Seaboard Air Line and formerly assistant attorney general of the United States, has been appointed general solicitor of the United States Railroad Administration, and R. V. Fletcher, general attorney of the Illinois Central, has been appointed assistant general counsel of the Railroad Administration, in charge of traffic matters, succeeding R. Walton Moore, resigned.

#### Operating

W. Stephenson, assistant superintendent on the St. Louis Southwestern with headquarters at Pine Bluff, Ark., has been promoted to superintendent, with headquarters at the same place, succeeding J. E. Callahan, promoted.

J. G. Fitzhugh, superintendent of safety and fire prevention of the Gulf, Colorado & Santa Fe and associated lines, with headquarters at Galveston, Texas, has had his authority extended over the Beaumont, Sour Lake & Western, the Houston Belt & Terminal, the Iberia St. Mary's & Eastern, the New Iberia and Northern, the New Orleans, Texas & Mexico, the Orange & Northwestern and the St. Louis, Brownsville & Mexico.

John P. Darling, who has been appointed superintendent of the Bangor & Aroostook, with headquarters at Houlton, Maine, as has already been announced in these columns, was born on January 25, 1866, at Port Jefferson, N. Y. He began railway work in May, 1883, with the New York, West Shore & Buffalo, now the West Shore, and served in different capacities until the summer of 1885, when he was appointed night operator at Utica, N. Y. In 1888 he served as copier to despatcher and later became trick despatcher. He subsequently served on the same road and the New York Central lines consecutively as despatcher, chief despatcher, examiner and trainmaster, until 1907, when he resigned from railway work on account of ill health. In October, 1909, he entered the service of the Bangor & Aroostook as examiner. The following year he was appointed yardmaster, and later in the same year became trainmaster, which position he held until his recent appointment as superintendent of the same road as above noted.

#### Financial, Legal and Accounting

Charles Elsey, acting federal treasurer of the Western Pacific, the Tidewater Southern and the Deep Creek, has been promoted to federal treasurer of these roads, with headquarters at San Francisco, Cal.

W. F. Ingram, acting federal treasurer of the Southern Pacific, with headquarters at San Francisco, Cal., has been promoted to federal treasurer of this road and the Arizona Eastern with the same headquarters.

J. Kennedy has been appointed auditor of disbursements of the Southern Pacific and the Arizona Eastern, with headquarters at San Francisco, Cal., vice F. L. McCaffery resigned to accept service with Southern Pacific Company.

James F. Wright, assistant general solicitor of the Seaboard Air Line, with office at Norfolk, Va., has been appointed general solicitor, vice E. Marvin Underwood, resigned to become general solicitor for the United States Railroad Administration.

C. H. Hueston, acting federal treasurer and paymaster of the Des Moines Union, the Iowa Transfer, the Des Moines

Western and the Des Moines Terminal has been appointed federal treasurer for these roads, with headquarters at Des Moines, Iowa.

#### Engineering and Rolling Stock

Philip Petri, until recently district engineer on the Baltimore & Ohio, Eastern Lines, with office at Pittsburgh, Pa., has been appointed division engineer, with headquarters at Cumberland, Md., vice W. T. Hughes, transferred.

#### Purchasing

R. L. Irwin, purchasing agent of the Gulf, Colorado & Santa Fe and associated lines, with headquarters at Dallas, Texas, has had his authority extended over the Beaumont, Sour Lake & Western, the Houston Belt & Terminal, the Iberia, St. Mary's & Eastern, the New Iberia and Northern, the New Orleans, Texas & Mexico, the Orange & Northwestern and the St. Louis, Brownsville & Mexico.

### Corporate

#### Traffic

M. O. Bicknell, assistant to the president of the Sacramento Northern, has been promoted to traffic manager, with headquarters at San Francisco, Cal., to succeed J. R. Wilson, who has resigned.

#### Executive, Financial, Legal and Accounting

Colonel Frederick W. Green, having retired from army service, has been reinstated to the office of assistant to the president of the St. Louis Southwestern Railway Company, with office at St. Louis, Mo.

### Railway Officers in Military Service

Major Edward W. Mason, 31st Engineers (Railway), American Expeditionary Force, who has been stationed at St. Nazaire, France, since May, 1918, has been promoted to Lieutenant-Colonel and appointed general superintendent of the 14th Grand Division, which extends from Gievres to St. Nazaire and La Rochelle, with headquarters at Nantes, France. Mr. Mason was formerly general superintendent of the Western Pacific, with headquarters at San Francisco, Cal. He entered the service of that road in 1909 and served continuously with the Western Pacific until his entry into the service of the United States Army.

### Obituary

Harry De Laney, formerly superintendent of motive power of the Chicago, Indianapolis & Louisville, at New Albany, Ind., and later for about six years, previous to 1912, eastern representative at New York for Brown & Company, Inc., manufacturers of iron and steel products, at Pittsburgh, Pa., died at his home in New York on March 30. Mr. De Laney retired from active work in 1912.

David M. Perine, special agent on the personal staff of the general superintendent of the New Jersey division of the Pennsylvania Railroad, with headquarters at New York, died on April 22, at Baltimore, Md., while on a business trip in that city. He was born on February 13, 1869, at Baltimore, Md., and entered the service of the Pennsylvania System in May, 1888, as an apprentice at the Mt. Vernon shops of the Northern Central. He subsequently served consecutively as assistant road foreman of engines, assistant master mechanic, assistant engineer of motive power, and master mechanic until April, 1906, when he was promoted to superintendent of motive power of the Northern Central and the Philadelphia & Erie. The following year he was transferred to Pittsburgh on the Western Pennsylvania division, and in January, 1912, was again transferred to the New Jersey division and the West Jersey & Seashore, remaining in that position until his promotion in June, 1917, as special agent on the personal staff of the general superintendent of the New Jersey division as above noted.

H. C. Woodbridge, supervisor of fuel conservation in the Allegheny region, directed attention at the New York Railroad

### Playing the Game

Club meeting week before last to the importance of the statistics which are being developed by the Fuel Conservation Section of the United States Railroad Administration. While there are,

of course, many reasons why the performance of one railroad cannot be directly compared with that of another road, yet in a general way such comparisons may prove of the greatest value in inspiring the managements of the different roads to look into the reasons for the differences and to try to improve their records. The matter of fuel conservation is of such vital importance that no stone should be left unturned in encouraging those who actually handle it to use it to the best possible advantage. This, however, involves the most careful and far reaching educational methods, which in conjunction with accurate performance records will encourage the men to emulate each other and will transform the work of the firemen and engineers into the spirit of playing a game. It is this spirit that is so necessary in getting the best results from men engaged in any kind of occupation or business. It kills the spirit of drudgery and adds a zest to a man's work that is reflected in an improvement in his physical and mental condition and development. The records that are being developed by the Fuel Conservation Section, which will undoubtedly improve in accuracy as the standard statistics developed under the direction of Professor W. J. Cunningham become better understood and appreciated, will encourage rivalry among the managements of the different roads. These same statistics which are being compiled for divisions and for individual performance will accomplish the same purpose among the various parts of each organization and among the individuals.

The rapidity with which the various stock arguments formerly advanced in favor of government management of

### Telephone Strike Under Govern- ment Operation

railways and other public utilities are being refuted by the results of actual government operation is as amusing as it is instructive. One of the principal of these arguments was that the govern-

ment would be a model employer, and that therefore under its management labor would be fairly dealt with and there would be no strikes. The Bell telephone system is now being operated, under government control, by the post office department. Recently the lines of the Bell system throughout New England were almost completely tied up by a strike of the operators and some other employees. The strikers attributed their break with the management to an unreasonable attitude assumed by Postmaster General Burleson regarding the method of settling their wage demands. Irrespective of the merits of the controversy, however, the fact that the strike took place under government operation is highly significant. We cannot now recall a single important claim which ever has been advanced in favor of government management which has not been refuted by actual experience in the operation by the government of the railroads and the tele-

graph and telephone systems; and some of the worst evils which appear sure to develop under long continued government management have not yet had time to come to full fruition. For example, the twin evils of politics and bureaucracy, although they already have made themselves felt, are still in their infancy, and the properties in the main are still operated, not by political appointees, or by the mediocre products of the civil service system, but by men trained under private management. In view of the great disparity which exists between the claims made in the past by advocates of government operation and the results that have already been produced, one wonders how wide the disparity would become after politics and bureaucracy had done their perfect work, and men of ability had been weeded out.

There were three short talks before the National Institute of Social Science in New York last Friday which, although

### Summing Up the Railroad Problem

they occupied less than an hour and a half in all, summed up the present railroad situation as clearly as it could be covered in weeks of discus-

sion. Theodore E. Burton, formerly United States senator from Ohio, sketched in outline the three phases through which, in his opinion, the railroads of the United States have passed; these were, encouragement of railroad building by gifts of land, etc., protection of the shipper which eventually amounted to persecution of the railroads, and exploitation of the employees. With this as a background, William Church Osborn showed in a lucid and entirely convincing address how, although the government had taken over control and operation of the physical properties of the railroads, it had not attempted to control the employees on these physical properties. As Mr. Osborn put it, control of the railroads without control of the organization to run them, means that the government has taken over less than 50 per cent of what constitutes the steam railroad transportation system of the country. It is a situation which nearly every railroad man realizes but it is one which is seldom fearlessly and frankly faced in the discussion of railroad matters in Congress or before congressional investigating committees. The solution that Mr. Osborn suggested, by implication at least, appeared to be a recognition that railroad labor as well as railroad capital was invested with a public interest to a degree which required it to be regulated. Employment in railroad work would then be an acceptance of conditions different from those in private industry and the right to strike—to quit work without warning—would be abrogated by acceptance of the position. George A. Post, chairman of the Railroad Committee of the Chamber of Commerce of the United States got down to the "brass tacks" of the situation when he summed up the discussion with the irrefutable fact that, discuss as much as you would the theoretical problems involved in the future of American railroads, what we have to do now is to "dig down into our jeans" as shippers and consumers of goods that are shipped by rail and pay the higher freight rate that is absolutely necessary to the continued solvency of the railroads.

## What Punitive Overtime in Train Service Would Mean

THE QUESTION of "punitive" overtime for employees in railway train service has been referred to the consideration of Board of Adjustment No. 1 of the Railroad Administration without attracting much attention. If the public knew just what this action means it would attract more attention. The granting of punitive overtime would involve another increase in wages of many millions of dollars a year which the public would have to pay and would not necessarily mean at the same time any change in the hours of work of the men affected.

Almost all railway employees have now been given the eight-hour basic day and changes are under way as a result of which practically all of them except those in train service soon will actually be working only eight hours a day. Work in train service, however, is peculiar, and the wages paid for it are on a peculiar basis. The number of hours a railway engineer, fireman, conductor or brakeman works in a day depends upon how far and how fast his train runs. If he is called for duty and works eight hours or less (five hours or less for passenger enginemen), or runs 100 miles or less (150 miles for passenger trainmen), he receives a day's pay. If he works eight hours or more, or runs 100 miles or more, he receives overtime at the regular hourly or mileage rate for the time in excess of eight hours or the miles in excess of 100 miles. To many people this arrangement does not seem reasonable. Admitting the soundness of the proposition that eight hours should constitute a day's work, the question naturally arises as to why a man who runs 150 miles in eight hours should be paid a half day's overtime for the extra 50 miles. The result of considering 100 miles a day's work is that thousands of men who run more than 100 miles in eight hours or less receive more than a day's pay for working eight hours or less.

Suppose, now, that the demand of the train employees for so-called "overtime" on a time and a half basis is granted. This would mean, first, that an employee in train service who worked ten hours in a day would receive time and a half for the extra two hours. That sounds reasonable enough. But as 100 miles is also considered a day's work, that is not all that is involved. If an employee should run 125 miles in eight hours he would be paid time and a half for the extra 25 miles. Why should a man be paid so-called "overtime," not merely at the regular rate, but at the rate of time and a half, when as a matter of fact his entire day's work is accomplished in eight hours, or even less than eight hours? The answer of the employee is that in train service 100 miles is a day's work. That is true. But ought it to be a day's work when it can be and actually is, run in less and even much less than eight hours? And if the theory that it is a day's work is still to be recognized, on what grounds can the proposition be defended that when more than 100 miles is run in eight hours or less the excess mileage should be paid for, not merely on a pro rata basis, but on the basis of 50 per cent more per mile than is paid for the first 100 miles.

Stated in terms of money, it was estimated on the occasion of the controversy which resulted in the passage of the Adamson law that the granting of time and a half for overtime would cost the railways about \$40,000,000 a year. The wages of the train service employees are now at least 50 per cent higher than they were then. Therefore, to grant their demands now would cost the railways about \$60,000,000 a year. This is upon the assumption that the terminals between which trains are run remain as they are now. Every study of the subject which has ever been made has indicated that it would cost more to change the terminals and shorten the runs than to leave them as they are.

It is clear that the train service employees should be required to make some very large and important concessions before the large additional burden which would result from granting them time and a half for overtime should be imposed upon the public.

## New Light on Present

### Railway Wages

THE EFFECTS OF THE CHANGES in salaries and wages and working conditions on the railways which have been made under government control are strikingly reflected by the statistics regarding the payroll for January, 1919, which were published in the *Railway Age* for April 25, page 1060. The last month of private control was December, 1917. In that month the railways handled practically the same traffic as in January, 1919. In January, 1919, however, they had 145,026 more employees than in December, 1917. This increase in employees was largely due to reduction in the average hours worked per employee per day. While the increase in the number of employees was 8½ per cent, the increase in the number of days worked by those reported on a daily basis was less than 6 per cent, and the increase in the hours worked by those reported on an hourly basis was less than 4 per cent.

It is clear, however, that the amount of traffic handled per employee, and in proportion to the average number of hours or days worked per employee, was smaller than in December, 1917, in spite of the vast advances in wages which have been made, and of the fact that December, 1917, was a month of extremely severe weather, while January, 1919, was a month of extremely mild weather. With the average wage per employee going up and the average amount of traffic handled per employee going down, it is easy to understand why the changes in wages and working conditions are having such unfavorable effects upon net earnings.

The table showing the increases and decreases made in salaries and wages per day or hour calls attention forcefully to the difference between the way in which the officers of the railways and the employees have been treated under government operation. The average salary of general officers receiving \$3,000 or more per year has been reduced 20 per cent. The average salary of division officers receiving \$3,000 or more per year has remained unchanged. The average salary of general officers receiving less than \$3,000 has been increased 17 per cent, and the average salary of division officers receiving less than \$3,000 has been increased 39 per cent. The average increase made to all officers and employees up to the end of January had been 48 per cent. Since then further advances have been made to employees in train service, etc., which will increase the average to considerably more than 50 per cent. In other words, the general and division officers receiving more than \$3,000 a year have seen their salaries standing still or being reduced, while they have seen the wages of railway labor advanced by more than half. If railway officers have not been altogether happy and enthusiastic about a regime which has had these relative effects upon their compensation and that of other persons in railroad service, it need occasion no surprise.

There is a marked difference between the changes which have taken place in the number of men employed in train service and the number employed in the shops. Owing to the reductions in passenger service, and to reductions in the number of freight trains due to increases in the average freight train load and to reductions in the freight traffic handled, there have been reductions in the number of almost all the classes of men employed in the train service. On the other hand, the statistics for January show a sharp increase in the number of men employed in the shops. In December,

1917, the number of machinists, blacksmiths, boilermakers, air brake men, painters and upholsterers, car inspectors, car repairers, machinists' helpers and apprentices, and gang and other maintenance of equipment foremen, was 278,188; while in January, 1919, it was 338,629, an increase of 60,500, or almost 22 per cent. Reductions in average hours worked per employee will account for some of this increase in the number of employees, but the total hours these employees were paid for on an hourly basis was much greater in January, 1919, than in December, 1917. The advances made in their hourly wages ranged from 41 to 85 per cent; and this, coupled with the large increase in the number of hours they were paid for, accounts for a large part of the increase in railway expenses. The Railroad Administration has adopted some radical measures in the shops, including the abolition of piece work. Most of these have been adopted contrary to the opinions of most leading railway men as to what ought to be done. How much have the new policies which have been favored by labor union leaders and adopted by the Railroad Administration, had to do with the manifest decrease in the efficiency of shop labor? The shop crafts are now before the Board of Railroad Wages and Working Conditions asking for another large advance in wages. They might pertinently be asked to work efficiently for the high wages they already are receiving before seeking for another advance.

Computations based upon the January pay roll indicate that in that month the wages being paid by the railways were running at a rate substantially in excess of \$900,000,000 a year more than they were when government control was adopted. Since then other advances amounting to about \$65,000,000 a year have been made. Roughly speaking, therefore, it must be concluded that, assuming that the same number of employees would be kept on the pay rolls as in January, 1919, and that they would continue to work the same number of hours or days per month as then, the advances in wages made under government control would amount to very close to \$1,000,000,000 a year. This fact is highly interesting and significant in view of what was said by the Railroad Wage Commission about a year ago in its report. That commission was created to consider the claims of all classes of employees. In its report it said that if all the advances in wages asked for were made they would cost about \$1,000,000,000 a year. It recommended advances amounting to about \$300,000,000 a year. Since then, however, sufficient advances have been made actually to raise the total granted to a sum equal to all that the railway employees originally asked for. The mere fact that in sum total the railway employees have been given all that they asked for would be enough to raise a question in the minds of thinking and fair-minded people as to whether in many cases the advances which have been made have not been very excessive.

The representatives of the railway employees have certainly done very well for their followers. As to those who have represented the public, and especially Mr. McAdoo, to whom the present wage scales are chiefly attributable, it may at least be said for them that they have succeeded in restraining themselves from giving the employees more than the employees asked for!

Counting the increases ordered by the director general during the past year as \$900,000,000, the total increase in three years has been \$1,250,000,000, as the railroad companies allowed increases amounting to \$350,000,000 in 1916 and 1917. This makes a total increase since 1916 of about \$600 per employee per year, or about 60 per cent; and since 1914, when the war began, the average increase has been about 80 per cent. For the trainmen the total increase in three years has been estimated at \$295,000,000 a year, including \$70,000,000 as a result of the Adamson law, \$160,000,000 from General Order No. 27 and \$65,000,000 from the recent supplemental orders. This would make

the average increase per man \$725 a year. The rise in railroad wages in recent years is shown in the following figures of average annual earnings per employee those for 1918 and 1919 being estimated:

	All employees	Train men	Employees not in train service
1910 .....	\$673	\$593	\$599
1914 .....	810	1,253	711
1917 .....	1,004	1,470	900
1918 .....	1,330	1,870	1,200
1919 .....	1,500	2,020	1,325

For want of a better unit, these calculations are necessarily expressed in terms of the somewhat enfeebled, but still, in a manner of speaking, almighty dollar, which will buy just as much fine gold as it formerly did and somewhat more of railroad securities, but less of almost everything else. The monetary unit in which wages are paid, however, is the same as that used to pay freight and passenger rates, which have not yet been advanced proportionately with wages.

## Shall Engineering Be a Profession or a Trade?

THE APPEARANCE of representatives of Engineering Council and of the American Association of Engineers before the Board of Railroad Wages and Working Conditions at Washington on March 31 and April 1 and 2, to appeal for higher wages for technical engineers in railway service, marks a new departure in the activities of engineering associations and one of much significance. Engineering work (civil, mechanical or electrical) requires a high degree of technical knowledge, in addition to practical experience; it requires the use of the brain rather than of the hand; it involves, in the main, the giving of directions, rather than the carrying of them out; in other words, it has the characteristics which differentiate a profession from a trade.

Because of their common professional interest, engineers have organized themselves into various technical societies. The national and local engineering societies have amply justified their organization by their valuable contributions to the knowledge of the profession of their members. In their concentration on technical activities they have given little attention to the promotion of their interests financially through these organizations, leaving this to the individual initiative and efforts of their members.

Meantime, workmen in the trades in railway service and elsewhere have combined for financial rather than technical or educational benefits, and through the power of their organizations have forced large concessions in wages and working conditions from their employers. This has reacted to the financial detriment of the engineers, particularly in railway service. It has led to a feeling among many members of the technical societies that these societies must give more attention to the promotion of the business interests of their members. It has also resulted in agitation for the formation of organizations of engineers fashioned after those of the trades whose principal object would be to promote the financial rather than the technical interests of their members.

The hearing at Washington brought into the foreground these two schools of engineering thought. Engineering Council is a joint organization of the four national engineering societies (civil, mechanical, electrical and mining) with the American Society for Testing Materials, formed to represent the engineering profession in matters of common interest. In general, the membership of its constituent societies includes the older and more experienced men of the profession. By its appearance at Washington it reflected the belief of the older and well established societies that the interests of the engineering profession, as represented in railway employ, made advisable the presentation of a united plea

for increased compensation for engineers. Its spokesmen pointed out the failure to recognize engineers adequately in the past and urged attention to the merits of their request.

The American Association of Engineers approached the problem from the other angle. It is intended solely as a business organization for engineers, and its membership is principally among the younger men in the field. It is patterned in many ways after the trades unions. It advocated collective bargaining, the standardization of positions, working conditions, and salaries, etc., and presented a standard wage scale for railway engineers to the Board.

There is no disagreement between these two schools of thought on the point that technical engineers in railway service are underpaid. This is evidenced by the appearance of representatives of both organizations to plead their cause. Where they differ is as to the methods which should be pursued to correct this situation. Shall they be those of a professional or a trades union organization?

Those advocating the latter course point to the lack of progress which the older national engineering societies have made in promoting the financial interests of their members, and argue from this that because these associations have not given attention to the business interests of their members in the past, they must necessarily continue this policy. But is this true? The policy of any organization is in the control of its members and it can be made to express their desires. The time may have come for these organizations to take up these new activities. That they recognize this fact is indicated by the participation of Engineering Council in the hearings at Washington. True, the beginning is small, but it is a beginning. There is nothing inconsistent or unprofessional in these technical societies taking such action along certain lines. The legal and medical associations have not considered it unprofessional to do so, and surely the engineering societies can do as much.

Those advocating the professional point of view believe that it will be unfortunate if engineers in railway service and elsewhere permit the present inequality between the compensation of professional engineers and workmen to lead them to take any steps which will change the standards of the former to those of a trade union. They maintain that no group of men can adopt the principles of standardization of positions and wages and collective bargaining without at the same time suffering other results—most important of all, the stifling of individual ability and initiative, which is the foundation of professional ambition and advancement. When the position becomes the measure of compensation to the exclusion of the kind of work done by the individual occupying the position, the work degenerates from that of a profession to a trade. Where the position of a man, whether he be rodman or chief engineer, carries a fixed salary without reference to his ability and efficiency, the incentive to the highest achievement is lost. This has been the case in the trades. The members of Engineering Council believe that engineers are underpaid today, but they also believe this can be and is being overcome by other than trade union tactics. Other professions have been able to do it, and the engineers can.

Perhaps it may become necessary ultimately for brain workers of all classes to organize themselves into unions and use trade union methods to get a compensation reasonable compared with that of hand workers. But iron-clad standardization of wages and working conditions in the trades tends to destroy individual skill and energy and to hinder industrial efficiency; and standardization of wages and working conditions in the professions could not fail to have a similar tendency.

Present conditions call for sober thinking on the part of all engineers in railway service or elsewhere. Shall engineering in the future be a profession or a trade? The attitude of railway men will largely decide.

## Administration Draft Gear Tests

THE PUBLIC DEMONSTRATIONS of the method of recording the action of draft gears under impact, which were carried out at the draft gear testing plant of the T. H. Symington Company at Rochester, N. Y., on April 10 and 11, opened up some very interesting possibilities in the graphic comparison of various types of gears. But aside from the graphic recording method shown, a description of which appears elsewhere in this issue, the outstanding features of the demonstrations are the evidence which they furnished as to the thoroughness with which the Inspection and Test Section of the Railroad Administration is studying the draft gear problem and the perfect fairness and good faith of the Section in the conduct of its investigations. Constructive criticism was invited with the utmost frankness and all suggestions offered were gladly received.

The testing of draft gears under conditions closely approaching those encountered in service is not entirely new. The method of graphically recording the action of the gears during the complete cycle of draft gear movement from the instant of first contact of the buffing faces to the instant of final separation, however, is unique. In some respects the apparatus is crude, but there appears to be no reason why the errors in the record may not be kept within limits which for practical comparisons are insignificant.

The study of the characteristics of new draft gears, however, is but one phase of the whole draft gear problem. The ultimate and decisive test is not in the possession of the characteristics of the ideal draft gear, but in the maintenance of characteristics nearest approaching the ideal throughout a reasonable period of service. To obtain reliable data on this phase of the subject requires a large amount of investigation and the essential element in such investigations is time. This phase of the subject is now being investigated by the draft gear committee of the Master Car Builders' Association, which is also co-operating with the Inspection and Test Section of the Railroad Administration. The prospects that ultimate results of the highest constructive value may be obtained through the joint efforts of these two agencies are bright.

## New Books

*Training for the Electric Railway Business.* By C. B. Fairchild, Jr., executive assistant, Philadelphia Rapid Transit Company. Written under the supervision of T. E. Mitten, chairman, executive committee, Philadelphia Rapid Transit Company. 155 pages, 9 illustrations, 5 in. x 7½ in. Published by the J. B. Lippincott Company, Philadelphia, Pa. Price \$1.50.

The function of this book is to present the demands and requirements of the electric railway business to the young man who is about to choose an industry. It outlines the organization of the business, names the officers required and explains the duties of each officer. The book is divided into five parts, as follows: Organization, the executive and transportation functions, the engineering functions, the administrative functions and miscellaneous functions. Each of these five phases of the business is laid out briefly and in order so that a single reading of the book will furnish a very complete and well defined picture of the subject. For example, in the section dealing with the executive and transportation functions, appear such subjects as the executive, the manager's duty, the morning mail, the day's work, transportation, public service and timetables, and the motormen and conductors. The book is written primarily for the young man looking forward, but as it outlines the entire field briefly, it furnishes the railway officer an opportunity to get a comprehensive view of his own work.

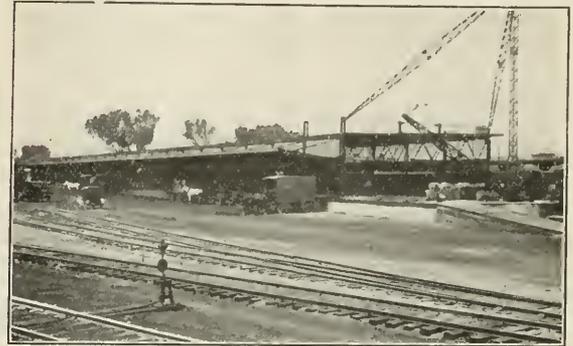

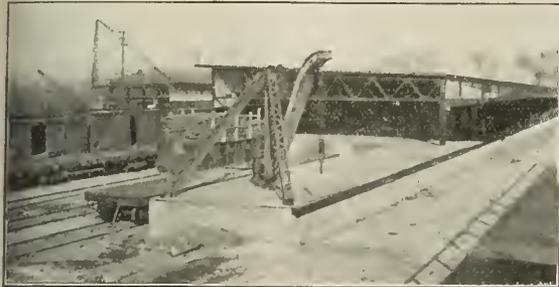

# Novel Features in New D. & R. G. Freight Terminal

The Facilities at Salt Lake City Include Two Houses,  
Transfer Platforms and a Team Yard

**B**ASCULE BRIDGES between trucking platforms and foot warmers for checkers are special features of new freight house facilities now being completed by the Denver & Rio Grande at Salt Lake City. Aside from these, the terminal represents an effective design based upon a simple layout and modern construction ideas. The development consists of separate houses for handling in and outbound business, together with appurtenant platforms, tracks

and four at the south end of the inbound house are used for end door loads. Four team tracks with a combined capacity of 45 cars are provided, and two additional tracks are contemplated. The tracks to be built are to be bridged by a 30-ton capacity transfer derrick located near Second South street.

It was originally planned to construct a head house facing Second South street and adjoining the north ends of both freight houses, but war-time economies compelled the temporary abandonment of this part of the program, and offices, lavatories, etc., were fitted up for the agent and clerical force in the north end of the inbound house. All driveways are to be paved with 3½ in. of asphalt topping laid

Inbound House and 20-Ton Derrick; Outbound House in the Background

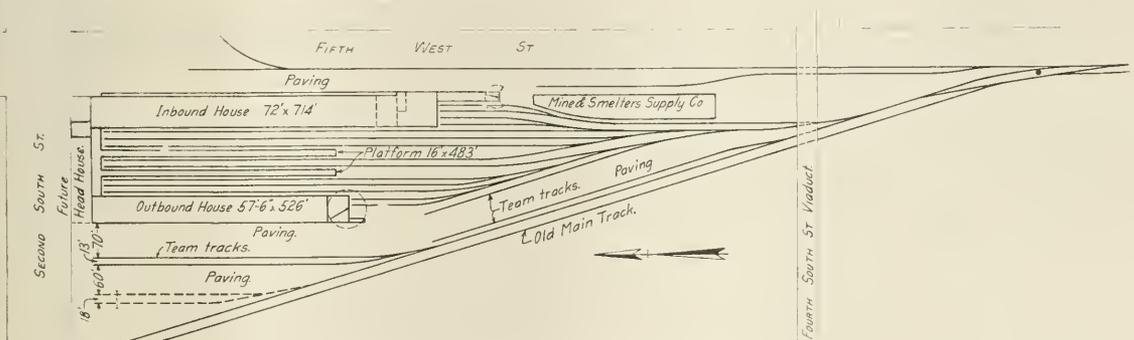

Outbound House from the Team Side

and a small team yard. The freight houses and platforms are located at the southwest corner of the intersection of Second South and Fifth West streets, and replaces an old installation which had become entirely inadequate to take care of rapidly growing needs.

In general, the new layout consists of parallel inbound and outbound houses with two 16-ft. transfer platforms between, all connected at the north end by a trucking platform 18 ft. wide. Another thoroughfare between houses and platforms is afforded by three pairs of hand-operated bascule bridges 14 ft. in width, located near the mid-length of the layout. They are protected by a continuous roof be-

on a 7-in. concrete base. The pavement on Fifth West street has been completed.

The outbound house is 57 ft. 6 in. wide by 526 ft. long. Of this length 399 ft. is inclosed, 84 ft. is covered platform, and 43 ft. is open platform. The latter is provided with a 5-ton electrically-operated, full-circle, swing steel derrick

Layout of the Freight Houses and Tracks

two houses built at a height to clear the bridges when in the upright position.

There are three tracks serving each house, with two additional tracks between the island platforms. These eight tracks have a capacity of 100 cars, set for loading. In addition, two spur tracks at the south end of the outbound house

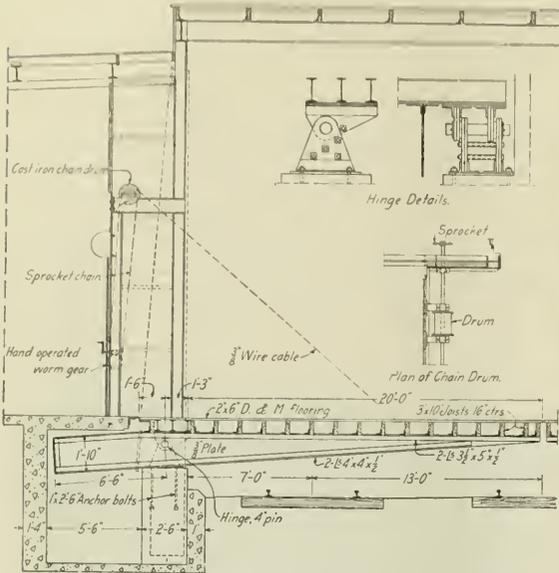

with 40-ft. boom. The inbound house is 714 ft. long, including 84 ft. of covered automobile platform at the south end. The inclosed portion is 66 ft. wide, exclusive of a 6-ft. loading platform on the team side. An open platform 19 ft. wide by 127 ft. long adjoins the covered platform and is provided with a 20-ton, stiff-leg derrick with a 23-ft.

boom. A concrete ramp affords easy access to the automobile platform from Fifth West street.

The houses are one story of concrete and steel construction, the details of which are common to both. The floors consist of 1½ in. of J-M asphalt mastic on a 5-in. concrete base which in turn is supported by a thoroughly-tamped sand and gravel fill between retaining walls. Cement top-

sheathing rests on 4-in. by 6-in. rafters spaced 4 ft., on centers, and spiked to lugs on the 10-in. 23½-lb. roof purlins. Steel canopies, 18 ft. wide, covered with corrugated iron, are suspended from brackets attached to the columns on the team side of both houses.

Two styles of doors are used. On the team side, Kinnear vertical sliding sectional steel doors, providing a clear opening of 9 ft. by 20 ft. were installed. On the track side horizontal sliding, tin-clad fire doors, each 9 ft. by 11 ft. were provided. The latter operate on double lines of continuous trolley tracks bracketed to the concrete lintels. The vertical sliding doors are counter-balanced by weights suspended inside the columns of the steel frame. Well diffused light is

Details of the Bascule Bridges Connecting Trucking Platforms

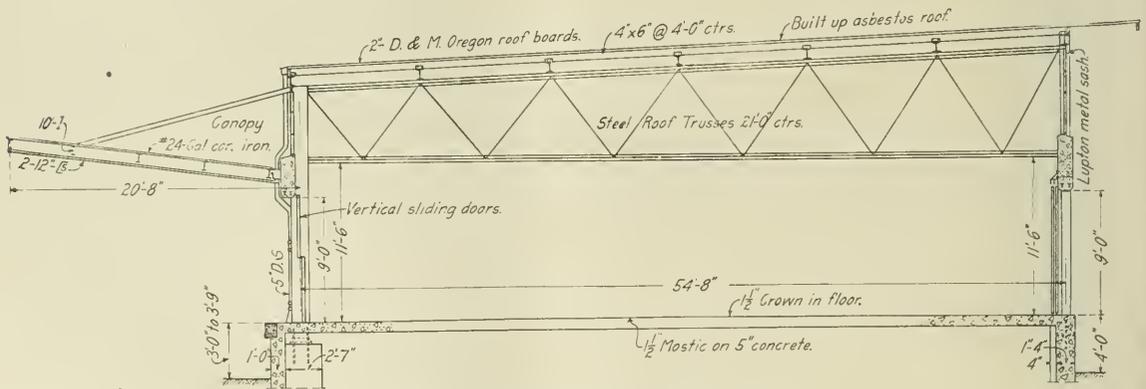

Interior of the Outbound House

obtained through ribbed glass set in metal sash above the concrete lintels.

A noteworthy feature of the design is the provision for the comfort of the checkers in cold weather in the shape of a heating system for foot warmers. A line of 3-ft. 6-in. horseshoe-shaped concrete conduits extends under the floors of each house. Heat is supplied in these conduits by steam pipes, and as the automatic dial scales are located directly over the conduits with a vent and floor register at each one, the checkers are afforded a warm place to stand. These "foot warmers" meet a long felt want and contribute to the efficiency of the checkers, while eliminating the obstruction to a general view of the interior introduced by the usual checker's house. The steam pipes have a gravity return to

ping, in place of the mastic, was used on the automobile and open platforms. Steel columns, spaced 21-ft. center to center on both track and team sides support the roof trusses, giving a clear span of 54 ft. 8 in. in the outbound and 64 ft. 8 in. in the inbound house. Above the doors there are reinforced concrete lintels on both track and team

Cross Section of the Outbound Freight House

sides for the full length of both houses at a clear height of 9 ft. above the floor, which are supported by brackets riveted to the columns.

The roofs are of two-inch tongue and grooved lumber, covered with "J-M" three-ply builtup asbestos roofing. They have an overhang of five feet on the track side. The

boiler located in the basement under the north end of the inbound house.

Separate rooms for oils and hides, invoice, bonded, and perishable freight are provided in the inbound house. Ample weighing facilities are afforded by 30 Fairbanks automatic dial scales, of two to five-ton capacity, 17 of

which are placed in the outbound house and 13 in the inbound house, together with one 5-ton wagon scale on the covered platform of each house.

The platform heights are variable on the team sides, ranging from 3 ft. 3 in. to 4 ft. at the inbound house and 3 ft. to 3 ft. 9 in. at the outbound house. For guards 10-in. by 12-in. timbers with exposed corners protected by angle irons are set in the concrete wall, the top being flush with the floor. The transfer platforms are each 483 ft. long by 16 ft. wide, with a butterfly-type roof supported by timber posts set in channel-iron pedestals which are spaced 21 ft. center to center, and bedded in concrete. The floors and roofs of the platforms are of the same composition as those of the houses.

The character of the bascule bridges, mentioned above, is indicated in the drawing. They are operated by worm gears attached to auxiliary columns set back of the door line of the

site cleared for the erection of the inbound house. The contract was let and work started in August, 1917, on the outbound house and one transfer platform, which were completed and occupied the following May, after which the old sheds were torn down and work was begun on the inbound house. All plans and specifications were drawn in the office of J. G. Gwyn, chief engineer of the Denver & Rio Grande, Denver, Colo.

## The Railroad Administration's New Advertising Campaign

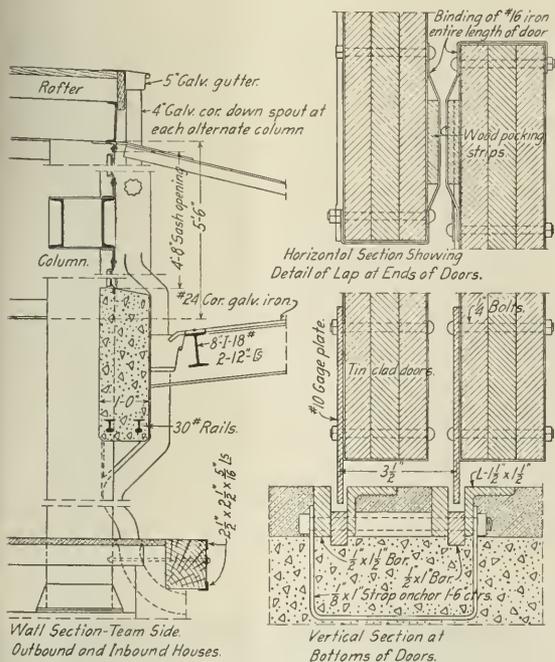

Now that the war is over and the necessity for restricting travel has passed, the Railroad Administration is spending approximately a million dollars in advertising campaigns. This attempt on the part of the Railroad Administration to restore the travelers' interest is developing into three campaigns. In fact, three distinct campaigns are being carried out at the present time, one to restore tourist travel to pre-war standards and the other two to again start the westward migration of homebuilders.

The first definite steps taken in this general campaign were toward the establishment of a Homeseekers' bureau last January as part of the Agricultural Section of the Railroad Administration. This bureau was placed under the jurisdiction of J. F. Jarrell, with the two-fold purpose of more closely co-ordinating the agricultural development work of the railroads under federal control with allied departments of the government and prosecuting the work with increased vigor. Its establishment was in a way due to the agitation for furnishing information to returned soldiers and war workers concerning available land in all parts of the country on which they might begin life anew. The advertising done under this bureau is not extensive, but this does not necessarily impair the efficiency of the service rendered by the bureau. At the present time classified ads are being placed in a number of farm daily and weekly papers throughout the United States, the inquiries received as result of these ads being sent to the railroads interested. The supervisor of agriculture of the roads to which the inquiries are sent gathers all available data, and after the prospective settler is furnished with this information in the form of pamphlets and booklets, he is placed in touch with reliable land men, whose duty it is to see that he is sold productive land. The new farmer is introduced to his future neighbors by the county agents, and is also put in touch with the state agricultural college, which will help solve his seed, crop and stock problems. In general it is the duty of these county agents to see that the man "starts right," and that he is an asset to the community.

Closely allied with the work being done by the Homeseekers' Bureau is the campaign instituted at a meeting of the agricultural supervisors of the Railroad Administration at Memphis, Tenn., early in April. At this meeting, which was presided over by J. L. Edwards, manager of the Agricultural Section of the Railroad Administration, a program was adopted which included four general propositions, as follows:

"1. To collect the latest information about opportunities for farming, stockraising, dairying, fruitgrowing, etc., in the several states having undeveloped resources, and furnish it free to those who wish to engage in such pursuits, special attention to be given to discharged soldiers, sailors and war workers.

"2. To co-operate with county farm agents and other government and state authorities in looking after the interests of newcomers through the dissemination of information regarding methods of soil preparation, seeding, cultivation,

Some Structural Details of the Freight Houses

houses, and near the edges of the platforms. Steel wire cables 3/8 in. in diameter are fastened to the outer ends of the bridges and wind up over the drums on a shaft connected to the hand gear by an endless chain.

Electric light is supplied by 100-watt lamps, one to each 21-ft. panel; two rows being used in the outbound house, three in the inbound house and a single row on each transfer platform. Detachable cords 35 ft. to 50 ft. in length with two and three 60-watt lamps on each provide light in the cars. Double service plugs for these cords are set in alternate posts of the platforms. When not in use, the cords are stored in cabinets fastened to the posts.

The Lynch Construction Company of Salt Lake City was awarded the general contracts for the foundations and superstructure, while the structural steel was fabricated and erected by the Omaha Structural Steel Works. In order to insure continuous operation, traffic being particularly heavy at the time construction was begun, it was necessary to build the plant in units; the outbound house being completed and put in operation before the old sheds could be wrecked and the

etc. in order that they may be successful in the localities in which they have settled.

"3. To improve marketing conditions by the widest circulation of information about where and when farm products will be ready for sale and where, and when there will be need of such products, thus enabling the farmer to send his stuff to markets which are not glutted, and to obtain for it a price that will mean a profit on his investment, rather than a loss.

"4. To conduct a campaign in co-operation with government and state authorities with the view of increasing the livestock output, not only because it is a profitable feature of the farming business, but also for the purpose of building up the soil."

It can clearly be seen from the propositions stated in this program that the work will, to a large extent, augment the work of the Homeseekers' Bureau. This bureau in the first three months of its existence awakened the interests of 12,000 prospective settlers, of whom 15 per cent were discharged soldiers, sailors and war workers. In many cases they may be led to the new fields, and it is the work of the agricultural supervisor under this plan to carry the service rendered these new farmers still further. The work being done by the agricultural section, aside from the campaigns carried on by the Homeseekers' Bureau, is partially illustrated in a statement made by C. L. Seagraves, supervisor of agriculture of the Atchison, Topeka & Santa Fe, and also chairman of the committee which is handling this matter for the north, west and east. The substance of the statement is contained in the following:

"One of the principal duties of the agricultural men at the present time is to see that the prospective settler has enough money to make the necessary payments on land, live stock, buildings, seed, etc. In this way it is almost impossible for him to fail if he takes advantage of the federal land banks and applies the information issued by the railroads and state agricultural colleges.

"Many of our states at the present time have unlimited undeveloped resources, and it is the duty of the agricultural departments to place these opportunities before industrial workers, discharged soldiers and sailors, and those desiring to change location.

"A great deal of attention at the present time is given to the improving of market conditions through the widest circulation of information in the way of market bulletins being issued by a number of railroads, containing information as to where and when products will be ready for sale, and where there will be a need for such products, thus enabling farmers now located along the line to send their products to markets which are not glutted, and receive a fair price for same, which means a profit on his labor and investment instead of a loss.

"Live stock, potatoes, and other products, are receiving a great deal of attention and the railroad agricultural departments are working hand in hand with the county agents and agricultural supervisors, so as to enable the farmer to grow more and better crops.

"Every railroad wants every farmer on its line to be an asset to the community in which he lives, and unless the farmer is able to conduct his business along profitable lines he will be a liability.

"The Agricultural Section of the Railroad Administration at the present time is issuing booklets on opportunities in the various States of the Union. These booklets are profusely illustrated and contain good concrete information as to temperature, rainfall, soil conditions, crops, stock, marketing, school advantages for the children, etc."

The third phase of the general advertising campaign carried on by the Railroad Administration concerns itself with a return practically to the pre-war practice of the railroads in advertising the national parks and monuments of the

west. This is the real "See America First" publicity campaign, with which it is hoped to stimulate passenger travel enough to justify the expenditure of the thousands of dollars which the Railroad Administration is planning. The only difference between the pre-war advertisements and those being used by the Railroad Administration is that in the latter advertisements there is no specific mention of routes or of the advantages of one point of interest over another. The fundamental principle behind all of the advertising is to induce the American public to travel, and the route which the traveling public selects to reach the advertised regions is immaterial.

This campaign has already been instituted in newspapers and magazines, and it is being furthered by the preparation and distribution of illustrated pamphlets and booklets describing the attractions of various sections of the country and especially the beauties of the national parks such as Yosemite Valley, Yellowstone Park, Glacier Park and the Grand Canyon.

The Railroad Administration has authorized the publication of low round trip summer tourist fares to practically all western resorts to which it has been customary to sell tickets in the past. In the majority of cases the sale date of these tourist fares will be from May 30 to September 30, inclusive, with the possible exception that 15-day tickets will be sold in the meantime. These reductions may be illustrated by those authorized for the Southern Pacific and Western Pacific. These roads have been notified that there will be two general classes of fares. For tickets limited to three months from date of the sale, the carriers will make a reduction of 20 per cent from double the one-way fare; and for the 15-day tickets sold on Friday and Saturday the reduction will be one-third. These reductions in general have been offered the public on practically every line over which the summer tourist travel has gone in the past and the passenger traffic officials of these roads have been making preparations for a heavier tourist traffic than ever before. To all appearances these reductions are practically the same as those made when the roads were under private control, but the fares are really proportionately higher, owing to the fact that the one-way fares on which the rates are based are very much higher than in the past.

Food and Clothing for the Aerial Freight Service to Belgium

# The National Foreign Trade Convention at Chicago

Meeting Attended by 1,800; Outline of the Ideas Presented;

Abstracts of Some of the Papers

THE SIXTH NATIONAL Foreign Trade Convention which met at the Congress Hotel, Chicago, April 24, 25 and 26, had as its theme "Foreign Trade Essential to American Industry," but the spirit evidenced by the 1,800 delegates showed that they needed no conversion to that idea; they were already converted and came prepared to consider the practical problems of carrying on and increasing the country's present great trade overseas. The convention took the form of four general sessions and eight group sessions as well as the banquet Friday evening. Alba B. Johnson, president of the Baldwin Locomotive Works, was elected president of the convention and presided at the general sessions. Some 50 papers were presented during the three-day meeting, not including the addresses at the banquet by Edward N. Hurley, chairman of the United States Shipping Board on The Future of Our Foreign Trade; by Frank O. Lowden, governor of Illinois on The Meaning of Foreign Trade to the Middle West, and by James A. Farrell, president of the United States Steel Corporation and president of the National Foreign Trade Council, who spoke on American Maritime Policy.

The scope of the convention is perhaps best shown by an outline of the topics taken up at the various sessions. The first general session on Thursday considered America's Need of Foreign Trade, papers being presented by Edward Prizer, president of the Vacuum Oil Company, on Export of Industrial Products; by Fred I. Kent, vice-president of the Bankers Trust Company, on America's Financial Equipment for Foreign Trade; by Tracy Lay of the Department of State, on Present Aspects of France, and by William Pigott, president of the Seattle Car & Foundry Company, on The Element of Cost in American Exports.

The second general session on Thursday considered a number of topics, papers being presented by Charles J. Brand, chief of the bureau of markets of the Department of Agriculture, on The Vital Concern of Agriculture in Foreign Trade; by John M. Parker, president of the Mississippi Valley Association, on The Mississippi Valley and Foreign Trade; by William S. Culbertson, of the United States Tariff Commission, on The Bargaining Tariff, and by J. W. Hook, president of the Allied Machinery Company, on The Stabilizing Effect on American Industry of a Definite Foreign Trade Policy.

Thursday evening was devoted to four group sessions, dealing respectively with Commercial Education for Foreign Trade; Foreign Trade Merchandising; Financing Foreign Trade, and Advertising for Foreign Trade.

The topic for the third general session on Friday morning was the American Merchant Marine. Homer L. Ferguson, president of the Newport News Shipbuilding and Drydock Company, presented an able paper on American Shipbuilding which discussed the status of shipbuilding during the war and treated to no small extent the fabricated ship as compared to the established methods of shipbuilding. Other papers presented were by W. S. Tower of the division of planning and statistics of the United States Shipping Board, on The World's Merchant Fleets Today; by Frederick J. Koster, president of the San Francisco Chamber of Commerce, on The Future of the American Marine on the Pacific; by Ernest E. Baldwin of the New York bar on the Relation of Law to the Development of Our Merchant Marine,

and by James E. Smith, president of the Mississippi Valley Waterways Association on The Relation of Inland Waterways to Foreign Trade.

Four group sessions on Friday afternoon dealt respectively with Foreign Credits and Credit Information; Direct Selling and Representation; Export Combination—the Webb Law in Operation, and Ocean Service.

At the closing session on Saturday, a paper was presented by Captain H. R. Moody, of the Quartermaster Corps on Packing for Export.

The tone of the convention expressed about as much as any other one thing the desire of those present to get back to a pre-war basis of unrestricted trade in private hands and with private initiative, every reference to that feature being greeted with loud applause and often with cheers. As one of the speakers put it, "the less the government interferes directly with export trade the better, confining itself to those functions which are clearly governmental, leaving to the exporter the handling of the business." Several references were made to the government control of the railroads, telegraph and cable lines, shipping, etc., and in every case the spirit in favor of their return to private control and private initiative was plainly shown.

On the other hand, it was felt that the government was not doing all that it should to help the exporter or the investor in the way of standing up for American rights in other lands. It was agreed that the consular service was efficient, but several appeals were made for additions and improvements to that service both for the purpose of a more adequate representation of American standing in foreign cities, and for the gathering of more information of a useful and practical character.

Great emphasis was placed on the necessity for investment of American capital abroad, it being pointed out on the one hand that trade would be expected where American capital was invested, and on the other that the country, if it desired to continue its export trade, would have to accept payments in securities because it could not secure goods for a long time to balance its exports to Europe.

Several of the speakers, touching upon the same point, showed the necessity for the limitation of imports by some of the countries of Europe and explained that with the exchange situation so adversely against them, they absolutely had to hold down their imports to a minimum until things are once more nearer normal. An appeal was made that American exporters should not complain at such restrictions, for the European countries were meeting an exceedingly difficult problem and themselves knew best how to work it out and what commodities they could for the time being best get along without.

The agreement of the delegates to the sentiments mentioned was apparent, and the desire to play fair and square with the European importer was much in evidence.

It is impossible to abstract any of the papers at length, but with a view to showing in more detail some of the important points that were brought out, a few are briefly abstracted as follows:

The Webb Pomerene bill was referred to by a number of speakers, among them Mr. Hurley, and was considered of sufficient importance to have a group session devoted to it, at which John Walsh, formerly general counsel of the Fed-

eral Trade Commission and other speakers considered its provisions in great detail.

## America's Financial Equipment for Foreign Trade

By Fred I. Kent

Vice-President, Bankers Trust Co.

The most extraordinary condition will face the United States in relation to its foreign trade upon the signing of the peace agreement. Before considering the financial equipment of the country which has been built up to meet our foreign trade problems it will first be necessary to analyze this condition.

The United States will stand as the one great country of the world with power to produce, manufacture and deliver to other nations all of the commodities vital to man's needs during times of peace, and covering as well those things required for his convenience and desired for his pleasure. On the other hand, the power to purchase our goods by those countries which are our natural customers has been seriously depleted. All of the belligerent nations of Europe have great financial problems facing them, which cannot be solved honorably and successfully unless their imports are confined largely to essentials until such time as their exports of commodities and service exceed in value their imports and other current foreign obligations.

The world trade situation which will face the United States upon the conclusion of peace is about as follows:

We will be called upon by our allies to supply them with the minimum amount of goods with which they can get along, whose maximum will undoubtedly be determined more by the amount of credit which this country can furnish to them through investments and otherwise than by the demands of such countries, for they can undoubtedly use effectively more of our raw material and manufactures than they can purchase without our help. Our allies will owe us interest, which they can only pay in foreign exchange that they can accumulate on balance, except as the United States reinvests such payments in the countries which make them.

The neutral countries of Europe should import from us more than they export to us.

Our trade with South America, while against this country, should not be so in such proportion as has been true in the past.

The same condition will probably prevail in our commerce with the Far East.

Under the federal reserve system and with the authority of our member banks to accept time bills drawn upon them, together with the foreign relationships which have been established by American banks and bankers doing a foreign exchange business, we have abundant capital and facilities to finance our foreign trade as it exists today. We will, however, require a very large development of our discount market for acceptances in order to make the banking facilities which we already have fully effective.

Admitting for the moment that our financial institutions and facilities are sufficient to take care of our foreign trade, in so far as it covers the actual operations necessary to finance such trade, another element has been introduced as a result of the war, which remains to be taken care of if we are to maintain and increase our export trade. The United States is to receive \$500,000,000 annually in interest from those countries to which it has made loans. Its own foreign interest payments have been reduced through the purchase of foreign held American securities to such an extent that it is reasonable to expect an annual net balance in favor of the United States, based upon normal foreign trade conditions,

of \$1,000,000,000. Unless this sum is absorbed in some manner through additional imports, increased services purchased abroad or foreign investment, our natural export trade cannot be maintained nor increased. The amount is so large that our financial institutions cannot and should not absorb the whole amount, or even such portion of the total as will probably be left after deducting possible increased imports. It is going to be necessary, therefore, if we would hold and increase our export trade, to import such high class foreign investments that the public will see fit to purchase them. To do this to the extent required, it may be necessary to organize companies in this country whose business it shall be to investigate and purchase foreign securities in all parts of the world, where they can be surrounded by proper safeguards, and to issue against such securities for sale to the public their debentures based upon them. A few such companies, with sufficient capital to act as proper margin, controlled by men carrying the confidence of the public both as to ability and integrity of purpose, could extend a great service to the United States. Such organizations would be in position to make such thorough investigation of foreign securities before their purchase that debentures issued against them should be the safest sort of investment, and one that the public at large should be most willing to absorb. It would undoubtedly require less education as to foreign investments on the part of the people to develop a market for such paper than would be true in the case of foreign securities purchased for direct distribution.

It is also going to be necessary, however, for our great foreign exchange banking institutions which have the facilities for investigating and purchasing foreign securities to build up a market in the United States which will absorb them.

Still another form of foreign investment will be most valuable and undoubtedly necessary if we would maintain our exports, and that is the purchase of interests in foreign industrial partnerships and corporations. Such investments carrying with them as they should a proper representation in the foreign companies, would help stimulate our exports, and under conditions of great security as to payment. They should also be of great benefit to the foreign countries in which they were made, as they would help to develop their resources.

When such undertakings are made by American export manufacturers in foreign organizations which absorb their own products, it will in a sense represent a direct investment of our exports, thus taking them entirely off the exchange market, with the exception of the income to be derived from them. This would help the continuation of our export trade while that of the other nations is being built up to the point where they can give us imports in exchange for our exports in such manner as to represent a great world exchange beneficial to all concerned.

Due to the high prices prevailing, neutral countries have largely stopped the importation of all classes of goods except those absolutely needed at the moment, and it can be expected that such a condition will continue until prices are readjusted or, which would seem more doubtful, stability of present prices is apparently assured for a period.

No financial equipment for trade or any other purpose can be successful unless based upon integrity. Such integrity, if existent, can only be maintained while the mass of the people is honest at heart or is controlled by those who are themselves honest. That it was safe to deal with Russian banking institutions before the establishment of Bolshevism is of no help to that nation now that its people have allowed such banks to be looted by those temporarily in power. If it was wrong for the former owners of property in Russia to hold it, there is even less excuse for those who have stolen it

to have the use of it. While the world is being flooded with theories which are intended to cover up this situation, the cold fact remains that Russia is being ruled by murder and loot, and entirely without principle, and that stolen money is being used throughout the world to purchase those whose souls are for sale to carry on their false propaganda.

We have before us the spectacle of a so-called agent of the Russian looters, who is supposed to have back of him some millions of the ill-gotten wealth of the Bolsheviks for the purchase of American goods from our manufacturers and exporters. It is inconceivable that any American manufacturer of integrity can be induced to sell his products for stolen property. Those who would sell their goods under such circumstances are in the same position as the man who would willingly and knowingly sell to a thief in exchange for money that he knew the thief had just stolen from his neighbor, and who is nothing more or less than a fence for stolen property. There is no more excuse nor right in dealing with wholesale crooks than with retail thieves, and if our country is going to stand for the principles which it professes, we will accept no market for our goods where payment is to be made from stolen wealth.

## The Government and Foreign Credits

By E. E. Pratt

Vice-President, Overseas Products Corporation

Mr. Pratt, in his paper presented before the group session on Foreign Credits, outlined a number of ways in which the various departments of the government could expand the assistance they are now giving the exporter. In conclusion, however, he asked for a stronger foreign trade policy on the part of the government and said:

The foreign policy of the United States has in recent years seen some extraordinary contrasts. In the case of Mexico, although American property and American lives were sacrificed in the mêlée of revolutions and counter revolutions, we have refused to interfere. We took the position that we could not possibly interfere in the internal affairs of that republic. The same point of view seems to characterize our attitude toward Russia, and will probably characterize our position in the near future toward Germany and Austria-Hungary. On the other hand we have interfered in the internal affairs of the Dominican Republic and the Republic of Haiti, where American lives and American property were endangered. We have not only interfered, but we have set up governments that are practically colonial administrations. We are superintending the finances of those countries. We are even policing them. Just exactly why we should interfere in the affairs of the Dominican Republic and Haiti, and just exactly why we should take over and supervise these governments, and why we should omit to do so in the case of other disturbed areas even on the American continent, is a question which our unannounced foreign policy does not comprehend.

Stop for a moment to examine the map of the world, and no one can fail to be impressed by the very large areas that are today in a disturbed and unstable condition. No one can fail to be impressed with the spread of such infectious disturbances. He is a brave exporter who today is willing to send his merchandise into Central Europe, unless he has first received payment. The same is true of all of Russia and Siberia. The same is true of Mexico. We hear constant rumors about revolutions and disturbances in other parts of the world, as for example in Italy and Argentina. This is the most important aspect of the credit situation which we must take into consideration at the present time. It is a situation in which our government can be of the greatest

assistance in selecting and in determining our credit risks. We must look to the government of the United States for a consistent policy with reference to the protection of American interests abroad.

But even more important, we must look to the government of the United States for a consistent foreign policy with reference to the establishment of stable government and the preservation of the existing economic system throughout the world. It is a question of very great importance whether the government of the United States at the present moment stands for stable government, or whether our government is at the moment an essentially disturbing element which tends rather to prevent the resumption of normal conditions.

## Shall American Business Enterprise Be Restricted?

By Edward N. Hurley

Chairman of the United States Shipping Board

Ships are the controlling factor in the development of foreign trade. Before the war only 9.7 per cent of our total exports was carried in American bottoms. It is our hope, if our program is completed, to have sufficient ships to move 50 per cent of our total commerce in American bottoms.

We want to put the best American initiative behind the operation of the fleet; we want to get rid of red tape and the possibility of stagnation when moving these ships to the ports where they will carry American trade.

We can't build up our foreign markets in a slipshod manner. We must specialize in trying to meet the different needs of different markets, and we must purchase raw materials and manufactured products from foreign countries as well as sell to them. We must take some chances in developing trade routes which are at present unprofitable, and a little of the pioneer spirit of the old days will not be out of place even in these modern times.

There is a feeling on the part of many business men that their competitors, at home as well as abroad, are not playing the game fairly. This is largely imaginary. Usually when you meet your competitor face to face you find that he is a pretty likable and human fellow. The same is true of our foreign competitors.

We hear a great deal these days about what is going to happen to American business when Great Britain and the other nations, supposed to have certain advantages over us, get into full swing. We have heard such doleful predictions many times long before the war.

After three months studying the situation in Europe I have not observed any outstanding advantage which they have over us, either from a production point of view, or a labor point of view, or from the character of products manufactured. This is true not merely of manufacturing, but with reference even to shipbuilding. Here we find some cloistered critics asserting we will never be able to compete with British shipping. Over in England you will hear English critics telling their government that Great Britain will never be able to compete with us.

We should not complain about Great Britain, France and Italy placing temporary restrictions on a number of commodities which they import. They are the best judges concerning what particular products they can do without during the present trying economic periods which they are going through.

We have many ships returning in ballast from France, Italy and Great Britain, and materials produced in those countries and needed here should be purchased now when tonnage is available. If our business men would take such

steps now, it would also be helpful in balancing our trade.

We needn't worry much about tank movements from our foreign competitors. They will compete fairly. They understand now, better than ever before, the evil of unfair competition. Germany's commercial system reached the point where it became top heavy. It was hard to distinguish between Germany's commercial enterprises and Germany's government, and it is my belief that combinations between governments and business are almost as dangerous as combinations between church and state.

If there were no obstacles to be overcome, half of the exhilaration of contest and competition would be gone. Neither foreign nor domestic trade will ever be handed to us on a silver platter. Gossip, rumors or criticisms as to whether we can do this, or whether we can do that, in competition with other nations, takes up a great deal of time, and serves no useful purpose. Let us try it out and see. As a nation, we have never been lacking in perseverance, energy, enterprise and skill. We have developed enormous purchasing power at home and compete keenly, yet fairly, with each other. There is no reason why we cannot do the same in the markets of the world.

Business should *not* get into the habit of relying upon the government to solve difficulties which can be overcome by ordinary business skill and honest methods.

### American Maritime Policy

By James A. Farrell

President, U. S. Steel Corporation, Chairman, National Foreign Trade Council

The temporary appearance as a military necessity of the government of the United States as a shipbuilder and shipowner on a colossal scale does not render it any less a fact that the future of the American merchant marine must depend on the attractions which it offers to the employment of private capital and the application of private enterprise. The steamship business is one requiring special and exceptional aptitudes. The men engaged in it have to match their wits against the keenest in the world; have to be prompt in decision, resourceful, expedient and expert in the calculation of probabilities. These are qualities which are not usually forthcoming when a government assumes the functions of private enterprise. As a commercial proposition, government owned ships in foreign trade could only result in disorganization of existing trade routes in which government ships might engage, while bringing about a complete paralysis of individual effort to obtain for private American ships a larger share of American sea-borne commerce. Thus, in the event of government ownership and operation of merchant vessels becoming a settled policy, the problem of the future of American shipping would solve itself by the extinction of private endeavor.

The Foreign Trade Council has already placed on record its conviction that American shipyards after the war will be able to produce tonnage at rates and under conditions that will compare favorably with those obtaining in foreign countries. There will be no return, for some time at least in any country, of so called pre-war prices of materials and labor. Shipbuilding materials and equipment are on a lower level in the United States, since the signing of the armistice, than in any other producing country; ship plates and structural material having declined \$12.00 per ton here with a corresponding reduction in collateral forms of iron and steel products.

Foreign ships in the past have worked their round of trade with profit because when they reached the regions of great production of bulky cargoes they found few or no

rivals. This will no longer be the case, because the foreign ship which goes in ballast from a coal station or South American port to the east coast of North America, must reckon with the competition of the tonnage of the United States. On the other hand, there is no escaping the fact that we start in the race with higher costs of operation.

If in other respects we are able to meet the competition of the world on equal terms, especially with types of ships built or to be built, comparable with those of our competitors, experienced in long voyage trades, the relatively high wages of American officers, engineers and seamen sufficient in numbers to operate economically with safety will not prove to be a serious handicap. Of course it is essential that laws requiring the employment of an excessive number of seamen or engineers, be repealed by the establishment of a definite policy.

One of the earliest requirements of the shipping situation is likely to be a general international agreement about the employment of the agencies of ocean transportation in the least wasteful and the most effective way.

The freedom of the seas, as a working formula of peaceful intercourse, should find a larger conception. It should stand for open ports and as free an interchange of commodities as the fiscal necessities of the nations will allow. To ourselves, with a merchant marine commensurate with the resources of our country, the lesson will come with new force, that to sell we must also buy.

### American Manufacturers' Export Association

In connection with the Foreign Trade Convention the American Manufacturers' Export Association held a luncheon on Friday at which Alba B. Johnson, president of the Baldwin Locomotive Works, presented a new idea as to the possible relation of the banks to foreign trade.

"The banking problem, the financing of our foreign trade, is one of the most important matters that now confronts us," said Mr. Johnson. "Goods cannot be sold unless satisfactory arrangements are made for payments. I feel that our bankers are confined in their dealings by the limitations of our banking methods, and that it is not realized that methods are in use elsewhere that are much more elastic.

"With reference to the plan I have in mind, you know that when you go to an insurance man and explain how you are going to ship goods he gives you a rate and assumes the entire risk, for that is his business. When you go to a banker he will extend you credit, provided you take the risk and do all the guaranteeing. Granted that the buyer is an individual whose responsibility can be ascertained, and that the man to whom you are talking knows the credit of this individual, isn't it reasonable to expect him to do the guaranteeing?"

"What would you think of an insurance man who would say, 'Yes, I will insure you, provided you will underwrite the risk yourself.'? When a bank is asked for the credit rating of an individual it gives its opinion. The seller takes the bank's word regarding this credit and assumes the risk. Is it folly for the seller to say to the banker, 'will you for a consideration guarantee this information?' Is it unreasonable for you to ask the bank to back up its opinion?"

The Kansas City, Clinton & Springfield and the St. Louis-San Francisco have been indicted by a Polk County (Mo.) grand jury under the state law requiring railroads to operate a passenger train each way each day. The railroad companies take the stand that the statute cannot apply as long as the roads are in the hands of the government.

# The Industrial Board of the Department of Commerce\*

## Work of Board Is Reviewed Particularly in Relation to the Controversy with the Director General

By George N. Peek, Chairman

THE RECORD OF THE CREATION, purpose, organization and procedure of the Industrial Board is perfectly clear.

The project was initiated in several preliminary conferences between W. M. Ritter and Secretaries Glass, Lane, Bursleson and Wilson. At a special meeting with members of the Cabinet on February 3, the plan upon which the board finally operated was thoroughly discussed and explained and it was agreed by the director general of railroads that an essential element of success was the co-operation of the Railroad Administration, which was then and there promised by Mr. Hines. The legality of the course proposed was discussed and approved by Mr. Hines. The plan was submitted by cable to the President and by him approved. The board was, to use the language of Secretary Glass in cabling the President: "To endeavor in voluntary co-operation with business interests, to arrive at a level of prices upon which business activities would be more actively resumed and the Railroad Administration and other spending agencies in the government would be justified in buying liberally."

Departmental purchasing was an incident to and not a condition of the plan and yet a factor upon which the success of the plan must depend.

The procedure was to conduct an investigation of the costs of producing and marketing basic materials, textiles and important food products. It was to announce the results in the form of prices which it considered fair and reasonable and which would continue present wage rates and agreements and prevent reductions of wages. This was all the board ever intended or attempted to do.

Since the Armistice the plan of the Industrial Board was the first concrete, forceful and effective step taken by the government toward an immediate and general reduction in prices of commodities and the cost of living. That plan had passed so far into execution as to render its effect certain. Greatly reduced steel prices had been determined on a study of costs and the theory of the board was proved by the fact that their mere announcement made them effective, and that the books of steel producers show beyond question that the tide of buying had begun and that the very results promised by the board were rapidly materializing.

The disagreement between the board and the Railroad Administration was the incident that stopped the operation of the board, but the ostensible issues of that controversy are relatively so insignificant that they can never be advanced as the real consideration for the overturning of a policy so vital.

The director general contended that the price on steel rails was too high by \$2 per ton. Throughout the discussion, the figures representing costs of production were constantly available to the Railroad Administration's representative, and the basis upon which conclusions have been reached has been repeatedly represented to the advisors of the director general and to Mr. Hines himself. Never have those figures been contested; never has additional or contradictory data been presented; never has the argument of the Railroad Administration been addressed to those figures nor to the conclusions drawn from them by the board. Repeatedly, all of these gentlemen have been urged to bring forward any facts which would assist the board in reaching a conclusion on prices

lower than those approved. The answer of the Railroad Administration has ever been, that the price at which the Railroad Administration will buy is within its own discretion and that in its opinion the prices approved by the board are too high.

In the opinion of the board, the prices arrived at were the lowest which the members believed they could recommend and which would, at the same time, permit the producers to maintain the existing scale of wages and preserve the existence of the average independent producer, without increasing prices to the public.

It is believed, therefore, that we must look further for the motive which prompted the director general of railroads to decline to accept the prices recommended. In a statement on April 5 he states: "I have therefore been unwilling to comply with the suggestion which has come from the National Coal Association, that the Railroad Administration withdraw requests for bids and instead undertake to buy its coal at uniform prices for the various districts fixed by some governmental agency."

On April 4, the director general placed himself on record in a long letter, which may be briefly summarized as follows:

- (a) That the Industrial Board has no power to impose prices upon the Railroad Administration against its judgment.
- (b) That if the Railroad Administration felt that the prices approved by the Industrial Board were such as would in themselves carry the suggestion that no lower prices were likely, it would accept them as a justification for buying liberally.
- (c) That such approved prices are not the lowest that may be expected, but that lower levels of prices will be reached if the activities of the Industrial Board are curtailed.
- (d) He suggests that the action of the board has resulted in an immunity to the iron and steel industries from the anti-trust laws.
- (e) He objects to the form of approval by the board of the iron and steel prices.
- (f) He expresses dissatisfaction of the fitness of the members of the board to sanction trade agreements as to prices, carrying the implication that governmental agencies must buy at those prices.

I concur with him fully that the board has no power to impose a price upon the Railroad Administration, against its judgment. I concur also that only the lowest fair prices immediately to be expected should be accepted by the Railroad Administration, or indeed, approved by the Industrial Board; but I can not agree that it is either fair or wise for the government to expect or attempt to force prices lower than the steel prices approved by the Industrial Board. These prices were approved only after a most exhaustive study of costs of production based upon figures in intimate detail furnished by other governmental agencies, and verified by experts in the service of the board. Upon these studies were determined the lowest prices that could be exacted without certainly producing one of the following highly undesirable effects: (a) Creating a market in which only the most powerful highly organized, and lowest cost producers of steel could survive. (b) Reducing the wages of labor throughout the iron, steel

\*Abstract of an address at the convention of the U. S. Chamber of Commerce, St. Louis, Mo., on April 29, 1919.

and subsidiary industries. (c) Increasing the prices to the public.

The director general feels, if I understand him, that had the board refrained from an attempt to consider prices from the aspects of labor and other costs, and had acted purely as a mediator to bring sellers and government buyers together, a lower price would have resulted. In this I think the director general is correct, and especially with regard to steel rails, because the Railroad Administration, by reason of its large percentage of consumption in this important commodity, could have practically controlled the market and the price. But such a beating down of prices would entail the very results which the Industrial Board was endeavoring to avoid. No one ever preceded the director general of railroads in supposing that governmental buying or action in aid of governmental buying, as a mediator or otherwise, was any part of the duty of the board. There is not the slightest need for such mediation and the creation of a new governmental agency for such a purpose would be extremely difficult to justify.

I think that in establishing the Industrial Board, a governmental policy was decided, viz: to avoid the chaos and possible panic incident to the fall of an abnormal market by an immediate determination of the lowest prices that can reasonably be expected; that low prices are not now to be secured by reductions in labor wages; that readjustment is to be made with the least possible disturbance to our social situation. I think that the studies and the course of conduct of the board were the only possible means to this end. If I am correct in this then I think that, while the board has no power to impose a price on the Railroad Administration or any other governmental purchasing agency, still it is the duty of the Railroad Administration and other governmental purchasing agencies to support the governmental policy, and, in the instant case, either to establish that a lower price could be had without producing the undesirable results I have recited, or to accept the price decided upon.

My conclusion is that it is not so much in the matter of price that he does not agree with me, as it is in the policy I have stated. Indeed, his apprehension concerning the course of the board in approving prices based on cost studies, rather than in calling sellers and government buyers together and permitting the best possible bargains by barter confirms me in this. The latter alternative overlooks entirely the circumstances that prices so forced to a lower level would, as is abundantly proved by the studies of the board, result in lowered labor wages, or the diversion of business to a few powerful producers, or increased prices to the public. My conclusion is that if the policy of scientific adjustment of prices is wrong, it ought to be abandoned; if it is right, then all departments of the government ought to support it.

The prices approved by the board were not agreed prices. Any producer is free to sell at either higher or lower prices. The action of the government itself in consulting an industry in an effort to obtain a price reduction (as distinguished from an increase) in the public interest can scarcely be denounced as a combination in restraint of trade. It is not a combination at all and even if it were, the result achieved is certainly a fit field for the application of the rule of reason. Whether the board was violating the Sherman law was the responsibility of the board and not of the Railroad Administration and had nothing to do with the question of fairness of the price announced by the board.

As to the form of price approval to which he objects, I have difficulty in following the objection, but the board has repeatedly indicated its willingness to agree to any change of announcement that will meet the wishes of the attorney general.

Successful accomplishment of readjustment problems can

be attained only by thorough and complete co-operation on the part of every agency of the government, or industry, and of labor, to reduce values to a stable level by first eliminating voluntarily on the part of industry everything in the way of profits not essential to the maintenance of the average operator, on a reasonable living basis, and thereby enlist the normal purchasing power of the government departments and of the public in making purchases, to the end that normal production may be had and unemployment of labor reduced to a minimum.

As the war called for the co-operation of all, so the adjustment to new peace conditions calls for the same unusual co-operation. To effect co-operation it is essential that there shall be concessions of the special and individual interests. Government departments and industry are called upon to make the first concessions.

The government permitted and required the abnormal conditions essential to the making of war. It must co-operate to restore. The government departments must temporarily yield something of their former customs and practices and the new departments of railroads and shipping, with their large power of purchase, must bend to the task even though pressed for sufficient revenue. At this time the railroads can only do better by immediately doing more to help industrial conditions and they, in turn, must be helped if that shall later be found essential to their well being.

The board recognizes that the purchasing value of the dollar has decreased approximately 40 per cent and that until this purchasing value of the dollar can be increased, compensation to labor should not be reduced; and that compensation to industry—with a normal volume of business—must somewhat exceed the compensation of periods during which the purchasing value of the dollar was not depreciated.

The more efficient or more servicable producers in any industry will receive more compensation and will support the government to a greater degree by the payment of greater taxes and still retain a fair reward for greater efficiency. Those less efficient than the average will pay little or no taxes and may have to sustain losses for a period or discontinue entirely. There is no other fair basis. If the most efficient reduce their prices to the utmost the others will be reduced to a point where they can not exist, and the entire purpose will be defeated and nothing stable will result.

The board believes that any impression upon the part of any one as to what constitutes a fair price or reduction of price at this time which is not based on an investigation of costs under existing conditions, with proper consideration for all, is not valid; that the lowest price obtainable under stress at this time from the most efficient is not a fair measure of what is right and is not in the interest of the nation. It believes further that no department of the government is entitled to a better price than the general public, except to the extent to which costs may be reduced by the quantity of purchase or the conditions of delivery, and at this time, in the national interest even this advantage might be waived.

With reference to the question sometimes asked as to whether or not the board is engaged in price-fixing, it may be said that inasmuch as it does no more than to announce what prices are fair and reasonable under all circumstances, and as low as may be expected for some time to come, it can not be regarded as fixing prices in any sense. Either this board or some other properly constituted body will have to promptly consider these matters, or in my opinion, the consequences to the country will be very grave.

A fire at the Atlantic Coast Line freight station in Bennettville, S. C., on April 21, destroyed the freight house and contents, 8 freight cars, and about 700 bales of cotton; estimated loss \$150,000.

# Expenses of the U. S. Railroad Administration

## Statement for Senate Committee on Interstate Commerce Gives Figures Not Hitherto Public

THE total expenses of the United States Railroad Administration for the year 1918 were \$3,647,143, according to a statement filed with the Senate Committee on Interstate Commerce by Director General Hines, and the total payroll for its organization for the month of December was \$280,600 for the central administration and \$252,500 for the regional administration, or at a yearly rate of \$6,390,000. This was for 1,193 officers and employees of the central administration at Washington and 227 officers and employees outside of Washington (including 106 central administration traveling representatives, supervisors and inspectors) and 1,079 officers and employees of the regional administration. This and a large amount of other interesting information not heretofore made public was furnished by Mr. Hines in reply to a series of questions addressed to him by the committee and has been made available by the publication of the concluding instalments of the record of the hearings held before the committee in January and February. The annual office rentals as of December 31 were \$74,993 for the central organization and \$24,872 for the regional organization. The office expenses exclusive of office rents, traveling expenses, expense for posters, and subscriptions to publications for the year, amounted to \$366,953.50 for the central organization and \$94,168.43 for the regional organization; traveling expenses were \$167,704.99 and \$40,134.40, and the expense of posters, and subscriptions to publications was \$9,402.36 and \$396.99. This was given in reply to a question as to the salaries, office and traveling expenses, and expenses for publications, posters, advertising and publicity.

### The Railroad Administration Payroll.

A complete list as of January 1, 1919, of all officers and employees of the central Railroad Administration, under the director general, and of the regional administration, under regional directors, other than those on the regular payrolls of the various railroad companies under federal control, together with their salaries, wages or compensation was furnished the committee. It includes only one "dollar-a-year-man," Theodore H. Price, actuary. The list shows the following:

DIRECTOR GENERAL—GENERAL OFFICE					
No.	Occupation	Annual salary	No.	Occupation	Annual salary
1	Assistant to director general	\$10,000	20	Telegraphers	\$1,500 to 2,000
1	Assistant to assistant to director general	3,000	6	Telephone operators	\$1,080 to 1,200
1	Private secretary to director general	6,000	67	Clerks	\$860 to 2,700
1	Office manager	5,000	2	Stenographer-clerks	\$1,800 to 2,000
1	Assistant private secretary to director general	3,000	13	Stenographers	\$900 to 1,500
2	Secretaries	2,500	2	Chauffeurs	\$960 to 1,000
1	Superintendent of telegraph	3,000	26	Laborers	\$300 to 840
			20	Messengers	\$600 to 1,200
			11	Charwomen	\$180 to 360
ASSISTANT DIRECTOR GENERAL					
1	Assistant director general	\$25,000	1	Secretary	3,000
1	Assistant to assistant director general	12,000	1	Accountant	5,000
1	Assistant to assistant director general	9,000	3	Clerks	\$1,200 to 2,000
1	Office assistant	5,000	1	Secretary	2,100
1	Secretary	4,000	5	Assistant secretaries	1,800
			4	Stenographers	\$1,400 to 1,500
			3	Messengers	\$600 to 720
FINANCE AND PURCHASES					
1	Assistant to director	9,000	1	Manager, forest product section	5,000
1	Assistant to director	4,000	1	Treasurer	10,000
1	Manager, fire loss and protection	8,400	1	Cashier	3,600
1	Manager, marine insurance	7,500	1	Accountant	3,600
			7	Inspectors	\$2,700 to 4,000

FINANCE AND PURCHASES					
1	Umlermain	2,700	1	Assistant secretary	1,680
30	Clerks	\$1,000 to 3,000	33	Stenographers	\$1,000 to 1,500
1	Secretary	2,100	2	Laborers	840
1	Secretary	2,000	7	Messengers	\$480 to 840
3	Assistant secretaries	1,800			

CAPITAL EXPENDITURES					
1	Director	\$25,000	2	Assistant engineers	4,200
1	Assistant director	15,000	1	Assistant engineer	3,500
1	Assistant to director	8,400	2	Assistant engineers	3,600
1	Accountant	3,900	18	Clerks	\$1,200 to 1,920
2	Accountants	3,000	4	Secretaries	1,800
1	Accountant	2,700	6	Stenographers	\$1,200 to 1,500
1	Secretary and assistant	4,000	2	Messengers	840
1	Chief clerk	4,000			

DIVISION OF OPERATION (PROPER)					
1	Director	\$25,000	1	Supervisor, troop routing	6,600
1	Assistant director	14,000	1	Inspector, coding	3,000
1	Assistant director	12,000	1	Assistant engineer	4,800
2	Assistant directors	10,000	1	Inspector of transportation	7,500
1	Assistant to director	7,500	6	Supervisors, fuel conservation	4,800
1	Manager, fuel conservation	9,000	1	Inspector of transportation	5,000
1	Manager, operating statistics	7,500	2	Assistant supervisors, fuel conservation	3,900
1	Manager, telegraph	7,500	1	Assistant supervisor, fuel conservation	3,600
1	Assistant manager, operating statistics	4,800	1	Inspector	2,400
1	Assistant manager, fuel conservation	7,200	1	Statistician	1,800
1	Assistant manager, safety	4,500	1	Statistician	4,200
1	Assistant to manager, fuel conservation	6,000	2	Secretaries	3,000
2	General supervisors, equipment	7,500	1	Secretary and assistant	3,900
1	General supervisor, car repairs	6,000	1	Secretary and assistant	3,000
7	Supervisors, equipment	4,800	1	Chief clerk	4,500
6	Assistant supervisors, equipment	3,900	1	Office engineer	4,200
7	Supervisors, safety	3,000	1	Chief clerk	3,600
12	Supervisors, car repairs	4,200	1	Assistant chief clerk	3,600
1	Supervisor, troop movement	3,600	67	Clerks	\$720 to 3,600
			1	Assistant secretary	2,400
			1	Secretary	2,100
			2	Secretaries	1,800
			2	Stenographers	\$960 to 1,500
			2	Laborers	840
			6	Messengers	\$480 to 600

DIVISION OF OPERATION (CAR SERVICE)					
1	Manager	\$10,000	13	Inspectors	2,400
5	Assistant managers	9,000	10	Inspectors	1,800
1	Assistant manager	7,500	2	Special representatives	4,000
1	Assistant manager	6,500	1	Secretary	3,300
1	District manager	5,400	1	Secretary	3,000
1	District manager	4,800	9	Office assistants	\$3,000 to 3,600
1	Assistant to manager	3,600	91	Clerks	\$720 to 3,000
1	Assistant	3,000	2	Secretaries	1,800
1	Special assistant	6,000	2	Secretaries	1,500
1	Chief inspector	3,300	66	Stenographers	\$900 to 1,500
1	Special inspector	3,000	8	Messengers	\$480 to 900

DIVISION OF TRAFFIC					
1	Director	\$25,000	1	Assistant, Navy Department	3,600
1	Assistant director	15,000	1	Assistant, Navy Department	3,000
1	Assistant director	12,500	3	Assistants, Fuel Administration	4,800
1	Manager, Food Administration	20,000	1	Assistant, Fuel Administration	4,200
1	Manager, War Industries Board	18,500	1	Assistant, Food Administration	5,000

			7	Messengers	\$480 to 780

PUBLIC SERVICE AND ACCOUNTING

Table listing positions and salaries for Public Service and Accounting, including Manager Accounting, Manager Short Line section, Auditor, Special rate expert, Traffic Assistant, Accountants, Clerks, Secretaries, Stenographers, and Messengers.

DIVISION OF LABOR

Table listing positions and salaries for Division of Labor, including Director, Assistants, Manager, Clerks, Secretaries, Stenographers, and Messengers.

DIVISION OF LAW

Table listing positions and salaries for Division of Law, including General counsel, Assistant general counsel, Assistant to general counsel, Assistant to general counsel, Managers, Attorneys, and Clerks.

ACTUARY TO RAILROAD ADMINISTRATION

Table listing positions and salaries for Actuary to Railroad Administration, including Actuary, Assistant actuary, Correspondent, and Messenger.

DIVISION OF INLAND WATERWAYS

Table listing positions and salaries for Division of Inland Waterways, including Director, Traffic manager, Secretary, and Inspectors.

BOARD OF RAILROAD WAGES AND WORKING CONDITIONS

Table listing positions and salaries for Board of Railroad Wages and Working Conditions, including Members of board, Secretary, Wage schedule experts, and Examiners.

EASTERN REGION

Table listing positions and salaries for Eastern Region, including Regional director, Assistant regional director, District director, Chairman budget committee, Traffic assistant, Mechanical assistant, Resident traffic assistant, Marine director, Assistant mail and express, Terminal manager, Staff assistant, Assistant to traffic assistant, Supervisor of stores, Transportation assistant, Operating assistant, Special agent, Executive assistant, Office assistant, Office assistant, Secretary, Special assistant, Assistants, Transportation inspector, and Transportation inspectors.

ALLEGHENY REGION

Table listing positions and salaries for Allegheny Region, including Regional director, Assistant regional director, Traffic assistant, Operating assistant, and Mechanical assistant.

ALLEGHENY REGION

Table listing positions and salaries for Allegheny Region, including Assistant terminal man, Assistant to terminal manager, Supervisor operating division, Supervisors operating division, Supervisor freight service, Freight supervisor, Supervisor car repairs, Supervisor locomotive repairs, Supervisor train movement, Chief of wage information, Inspector of yards, Inspector of piers, Regional director, Traffic assistant, Transportation assistant, Chairman regional purchasing committee, and Member regional purchasing committee.

POCAHONTAS REGION

Table listing positions and salaries for Pocahontas Region, including Regional director, Traffic assistant, Transportation assistant, Chairman regional purchasing committee, and Member regional purchasing committee.

SOUTHERN REGION

Table listing positions and salaries for Southern Region, including Regional director, Traffic assistant, Operating assistant, Staff officer, mechanical, Staff officer, engineering, Staff officer, traffic, Assistant to traffic assistant, Terminal managers, Terminal manager, Assistant to terminal manager, Staff officer, accounting, Accountant, Engineer, Terminal trainmaster, Traveling representative, and Traveling representative.

NORTHWESTERN REGION

Table listing positions and salaries for Northwestern Region, including Regional director, Assistant regional director, District director, Traffic assistant, Traffic assistant, Traffic supervisor, Operating assistant, Engineering assistant, District manager, Car service assistant, Terminal manager, Terminal manager, Terminal manager, Acting terminal manager, Assistant to terminal manager, Assistant to traffic assistant, Engineer, Engineer, Engineers, Assistant to district director, Joint export agent, Car agent, Field man, Inspectors, and Inspectors.

CENTRAL WESTERN REGION

Table listing positions and salaries for Central Western Region, including Regional director, Assistant regional director, District director, Traffic assistant, Engineering assistant, Transportation assistant, Mechanical assistant, Terminal manager, Labor representative, Routing assistant, Assistant to district director, Transportation efficiency, Assistant to traffic assistant, Engineers, and Supervisor of loss and damage.

Railroad Payroll Charges by Months

The total payroll for 1918, including charges to operating expenses and all other accounts for the Class I roads under federal control, was \$2,593,085,502, an increase over that for 1917 of \$874,339,367 or 50.9 per cent. The percentages of

This statement includes payroll charges for other purposes, e. g., for construction, as well as for operating expenses. The statement does not reflect the amount of increase in payrolls due to increases in the rates of pay, but has to include without segregation, all influences (e. g., number of employees, amount of overtime, state of experience of employees, etc.), making for a difference in total payroll in 1918 as compared with 1917.

Beginning with the month of April, figures for 1917 contain back pay retroactive to January 1, under the Adamson Act. From June to November, inclusive, figures for 1918 contain retroactive wage payments due to General Order No. 27 and its supplements.

Although changes were made during December, 1918, in the grouping of roads by regions, the December figures on this statement are made up on the basis of the same grouping as was in effect November 30.

Wage Increases Charged to Operating Expenses

The table below is an estimate of the increase in payroll charges to operating expenses for the year, due to advance in wage rates over those in effect December 31, 1917, as authorized by General Order No. 27, supplements thereto, and collateral increases made necessary thereby, (not including supplements 12 and 13 promulgated in December):

Supplement No. 4 was that giving a supplemental increase to the shop employees. Supplement 7 was for clerical forces and others, and Supplement 8 was for maintenance of way employees.

Increase in Number of Employees

Another statement filed with the committee gives the number of employees for the Class I roads under federal control by classes in October, 1917, December, 1917, October, 1918, and January, 1919. In October, 1917, the total was 1,733,115; in December, 1917, it had fallen to 1,703,684; in October, 1918, it had increased to 1,855,911, an increase of 122,796, or 7 per cent in a year, and in January, 1919, it had been reduced to 1,843,530, an increase of 139,846 or 8.3 per cent as compared with December, 1917. The figures regarding increases in wages and number of employees do not agree with those in a later statement compiled by the operat-

WAGE INCREASES CHARGED TO OPERATING EXPENSES

Operating expense account	Estimated payroll charges, excluding increases	Estimated increases charged to 1918 operating expenses				Per cent total increases over rates of Dec., 1917
		General Order No. 27 and Supplement 4	Supplements 7, 8 and 8	Collateral increases	Total estimated increase	
Maintenance of way and structures .....	\$321,791,000	\$53,634,000	\$30,072,000	\$12,584,000	\$96,288,000	29.9

ing statistics section and published in these columns last week, based on revised reports which showed the number of employees on January, 1919, as 1,848,774.

The information is also compiled by regions and by railroads.

In reply to a question by the committee as to whether any discretion is lodged with the regional directors and federal managers to employ men at current rates of pay in their respective territories, or whether all rates of pay are fixed by the director general, the following statement was made:

The rates of pay, generally speaking, are fixed in general orders by the director general.

As to personnel and salaries in the organization of regional directors, regional directors have authority to fix salaries up to but not including \$3,000 per annum and to select persons to fill these positions. All salaries of \$3,000 per annum or over are reported by the regional directors to the central administration at Washington.

*Draft Gear Test Plant of the T. H. Symington Company*

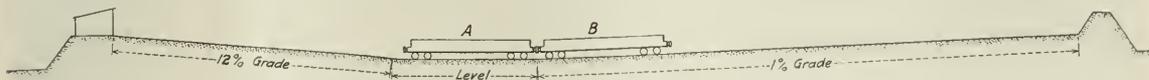

## Freight Car Draft Gear Test Demonstrations

Showing Methods to Be Followed by the Inspection and Test Section in Official Investigations

ON APRIL 10 AND 11 a series of public demonstrations were conducted by the Inspection and Test Section of the Division of Operation, United States Railroad Administration, at the draft gear testing plant of the T. H. Symington Company, Rochester, N. Y. The manufacturers of draft gears, the draft gear committee of the Mechanical Section of the American Railroad Association, the mechanical committee of the Railroad Administration and a number of railroad officers were present. The purpose of the demonstration was to disclose in advance of a series of official draft gear tests to be conducted at this plant, the methods of testing which will be followed, and particularly to demonstrate the operation of the devices which have been developed to graphically record the action of the draft gear

at the top of the 12 per cent grade, the cable from which is attached to a special puller car to which the test car is attached in such a way that the coupling may be tripped at any predetermined point on the grade; a motor driven capstan winch beside the track is used to spot the cars on the level track.

Both of the 50-ton gondola cars are loaded so that each has a gross weight of 143,000 lb. The adjoining ends are arranged so that they may be equipped with any draft gear of standard dimensions, or with solid buffers. The moving car, designated as the *A* car, is drawn up the inclined track and released at stations predetermined to produce whatever velocity of impact is desired. The stationary car, designated as the *B* car, is placed at a fixed point on the track so that

Profile of the Test Track

between two cars, one moving and the other standing at the instant of impact.

For a period of several months the Inspection and Test Section has been engaged in testing draft gears under the direction of B. W. Kadel, assistant engineer, the program including tests both with the static machine and under the drop, and the work to be done on the Symington plant covers the next series of tests in the draft gear programs, in all of which the draft gear committee of the Master Car Builders' Association is co-operating.

The test plant of the T. H. Symington Company was built to facilitate the testing of draft gears under as nearly as possible actual service conditions. It consists of a test track, one end of which is laid out on a 12 per cent grade for accelerating purposes, followed by a section of level track at the other end of which is a one per cent ascending grade. Two 50-ton steel frame gondola cars with wood floors and siding are used in the tests. The facilities for handling the cars consist of a motor driven drum hoist housed at

the performance of the cars during the period of impact is comparable for all tests. This position is chosen so that the *B* car stands fully on the one per cent decelerating grade when struck by the *A* car, while the latter moves upon level track during the period of impact and for a distance of approximately six feet before the instant at which the buffing faces of the two drawheads come in contact. The cars are equipped with flat face buffing stems instead of standard couplers, in order to produce a normal impact on the buffing coupler mechanism without coupling the cars.

The method of recording and comparing the action of various draft gears under impact between the two cars is a development recently worked out, and the apparatus built, jointly by the Inspection and Test Section and the engineers of the T. H. Symington Company.

The outstanding feature of the new recording apparatus is that a direct and continuous record is made of the movement of both cars during a period beginning before the instant of impact and continuing after the final separation

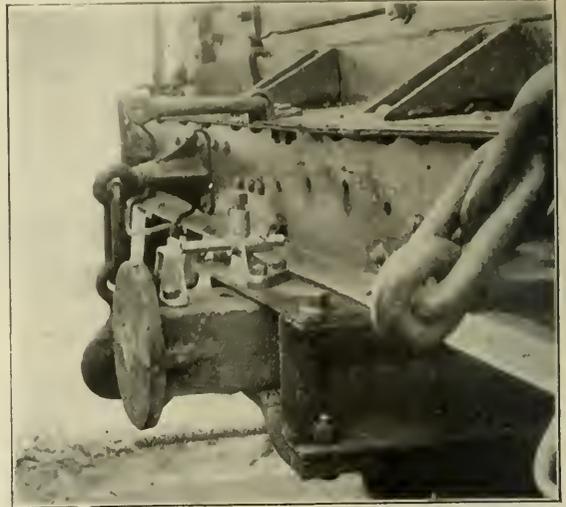

of the two cars. The records of the car movements are made by pencils traveling in a line parallel to the track and marking upon revolving drums, one for each car, both of which are mounted on a common shaft also parallel to the track. The drum shaft is worm driven by a 32-volt shunt-wound, direct-current motor, which receives its power from a storage battery. The paper speed of the drum is approximately 31 in. per second. The pencil holders for the two drums are mounted on guides parallel to the axis of the drums and are moved by bars which project out from the sides of the cars. Provision is made for horizontal movement of these bars at right angles to the longitudinal center line of the car. Guides attached to the instrument base engage a lever suitably attached to each bar to withdraw it from contact with the pencil holder before it can be moved beyond either end of the cylinder.

The line drawn upon the first or *A* drum shows the exact velocity of the *A* car at the moment of impact, denotes the exact point of impact, shows by the type of curve drawn the rate of retardation of this car and finally gives the velocity of the car after the two cars have parted. The line drawn upon the *B* drum shows the rate of acceleration of the *B* car and shows the final velocity of this car as the two cars part. Curves made in the same test upon the *A* and *B* drums are reproduced in Figs 1 and 2, respectively.

When a test is to be made the two cars are spotted with the buffing faces in contact and all slack is eliminated from the draft gears and attachments. With the drums standing the pencil carriages are given a slight movement along the guides to draw common reference lines, 3-3, Fig. 1, and 4-4, Fig. 2, by means of which the two cards later may be synchronized as to time. The pencils are then set on both drums in the positions which they will occupy against the bars projecting out from the sides of the cars at the instant the buffing faces between the two cars come in contact. With the pencils thus located the drums are rotated to draw the common datum line, 1-1, Fig. 1, and 2-2, Fig. 2, upon these drums. Line

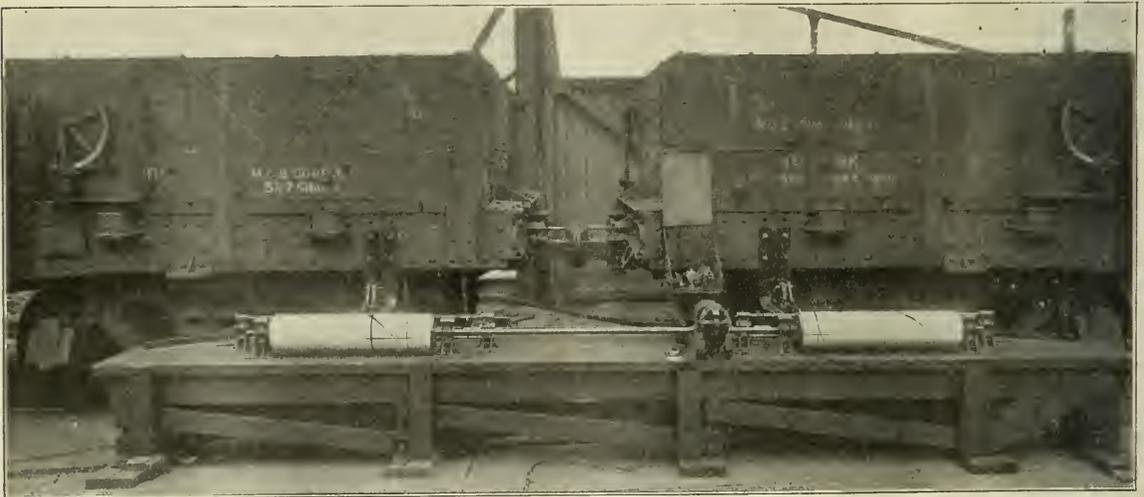

desired velocity of impact, the pencil on the *A* drum being moved back from its impact position so that a record of the velocity of the car as it approaches the point of impact may be obtained.

From the curves a study can be made of the car move-

The Flat Face Buffer and the Draft Gear Travel Gage

ments throughout the cycle of draft gear movement and the velocity of the *A* car at the moment of impact can be accurately determined, as well as the velocities of both cars beyond the point of separation. Thus on the card for the *A* car, Fig. 1, the angularity of the line below the datum line

Instrument for Recording the Movements of the *A* and *B* Cars on Time-Distance Coordinates

2-2 on the *B* drum indicates the standing position of the *B* car; line 1-1 on the *A* drum indicates the position of the *A* car at the first instant of contact with the *B* car. By means of these datum lines the cards can be matched as to their positions along the track.

The test is then run by hauling the *A* car up the 12 per cent grade, releasing it at the point required to produce the

denotes the exact velocity of the striking car, and the weight being known, its energy as a moving body can be accurately determined.

Referring again to Fig. 1, at point 5 it is known that the *A* car first met the *B* car, that the draft gears started to close and consequently that its velocity began to decrease. Assuming that the draft gear action is entirely smooth and that

the bombardments of static testing are not present in this service, it is possible to determine from the shape of the curved line denoting the decrease in velocity of this car, the approximate forces which must have been at work to produce the retardation shown between any two points on the time axis. From the final angularity of the approximately straight line beyond the point of separation of the two cars can be determined the velocity of the *A* car after the draft gears have parted and the number of foot pounds of energy still stored in this car. On cards made from certain draft gears the *A* car comes to rest as denoted in Fig. 1 before it has traveled beyond the limit of the pencil movement on the *A* drum.

Referring to Fig. 2, from the curve drawn by the *B* car can be determined the rate of acceleration of this car and its final velocity when the cars part. Knowing this velocity and the weight of the car it is possible to calculate the energy transferred from the *A* car to the *B* car. From Figs. 1 and 2 it is thus possible to determine the actual energy absorption which has taken place during the draft gear cycle.

The common datum and reference lines drawn on the two cards prior to the test makes it possible exactly to super-

impose one curve upon the other, thus producing a graphic record of the relationship of the cars to each other throughout the significant range of movement. This has been done in Fig. 3.

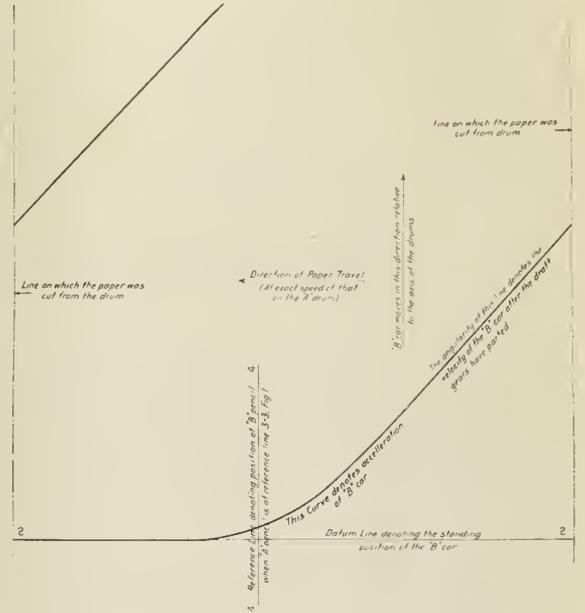

Fig. 1—The Card Made by the A Car

pose one curve upon the other, thus producing a graphic record of the relationship of the cars to each other throughout the significant range of movement. This has been done in Fig. 3.

From the superimposed cards it is possible to determine point 5 at which the draft gears begin to close, the point at which they closed to the maximum amount, point 6 at which they finally part, the distance the cars move along the track during any period of time within the range of the diagram, the time required for any phase of the gear movement cycle, and the amount of draft gear travel at any instant, this being indicated by the vertical distance between the two curves at that instant.

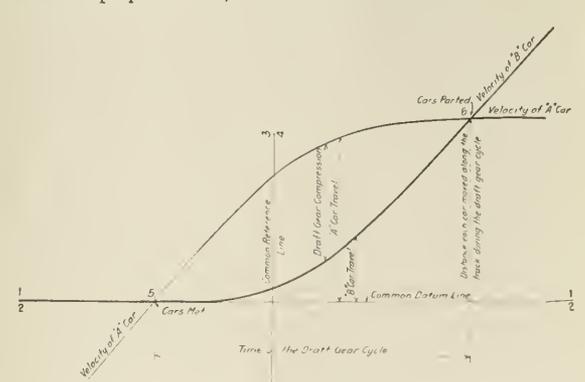

Fig. 2—The Card Made by the B Car

being arranged so that the pendulums swing in the opposite directions. The swing of the pendulums under the action of inertia carries with it a small marker mounted on a graduated segment, a friction spring in the marker causing it to remain in the position to which it is moved by the swing of the pendulum. These instruments are a part of the regular test equipment of the cars and the records obtained from them

Fig. 1—The Card Made by the A Car

impose one curve upon the other, thus producing a graphic record of the relationship of the cars to each other throughout the significant range of movement. This has been done in Fig. 3.

From the superimposed cards it is possible to determine point 5 at which the draft gears begin to close, the point at which they closed to the maximum amount, point 6 at which they finally part, the distance the cars move along the track during any period of time within the range of the diagram, the time required for any phase of the gear movement cycle, and the amount of draft gear travel at any instant, this being indicated by the vertical distance between the two curves at that instant.

In addition to the instrument with which these diagrams are obtained, the *B* car is also equipped with a small constant-speed motor driven recording drum, the pencil movement of which records the movement of the buffer stem on that car with relation to the car body, by means of an equalized piano wire connection to the top and bottom of the front follower. The card from this drum reflects the smoothness

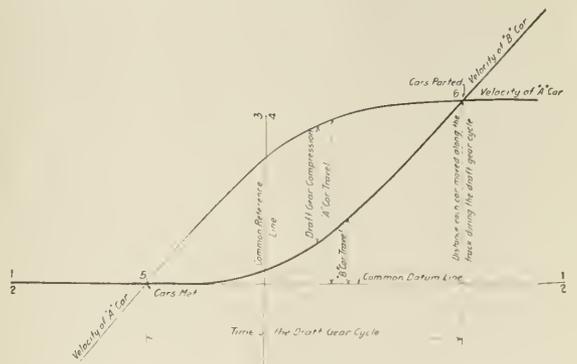

Fig. 3—Cards for the A and B Cars Superimposed

provide a means of comparison of the load shifting tendencies of the impact with various draft gears.

The demonstrations were entirely unofficial in character, no records or detail comparisons of commercial gears being taken. The curves here reproduced were obtained with M. C. B. spring draft gears in both cars.

## Orders of Regional Directors

**D**ERAILED CARS AND GASOLINE FIRES. The regional director, Eastern Region, by circular 602-31A701, calls to the attention of trainmasters and trainmen a recent bulletin issued by the Bureau of Explosives (Bulletin 176), setting forth the dangers incident to the presence of gasoline tank cars in freight trains, when cars are derailed, and pointing out the precautions which should be observed in such cases.

*Agitation of Piece-Work Question.*—The Southern regional director by Circular 1521-29-6, dated April 22, instructs federal managers not to allow the question of hour-rates versus piece work to be reopened. In this circular, he says:

"Referring to my telegram of January 2, regarding preference of shopmen throughout the country to be paid on hourly basis: Acting under the permission of the director general, of December 31, 1918, employees on many railroads have indicated their preference with respect to working upon an hourly instead of a piece work basis. Director Tyler, Division of Operation, Washington, writes me he is advised that at some shops, after a decision has been reached in this way, certain local officers or foremen are continuing to agitate the matter, urging upon the men that another vote be taken, with the result that in some cases two or three votes have already been taken upon the subject.

"This is taken as indicating a purpose on the part of these local officers to circumvent the wishes of the director general, so clearly expressed in his telegram of December 31. The effect is to keep the shop organizations at such points continually agitated with most certain detrimental effect upon the efficiency and morale of the organization.

"Will you please direct that, on railroads under your jurisdiction, where employees have once decided this matter by vote, it will be considered as definitely settled during the period of federal control."

*Sanitary Maintenance of Cars, Shops, Etc.*—The regional director, Eastern region, by circular 500-97A705 advises federal managers that a committee is at work standardizing the rules for practice in the maintenance of sanitary conditions in cars, shops, offices, etc. The committee wants copies of all such regulations now in effect.

*Payment of War Taxes.*—The regional director, Eastern region, by circular 2002-16A707, advises federal managers of instructions from the director of the division of finance, Washington, to the effect that payment by the railroads to the Treasury Department of taxes collected on transportation should not be made in any one month for more than a single month, where such double payment can be avoided. The usual practice has been to make payment ninety days after the close of the month in which the money is collected. The commissioner of internal revenue now desires to have payment made within thirty days; but this time will be extended, on request, where it is impracticable to file the statement within thirty days.

*Refrigerator Car Distribution.*—The Northwestern regional director in Freight Car Distribution Notice 11 refers to complaints of the misuse of refrigerator cars belonging to packers and directs that instructions be adhered to.

*Express Agents' Telegrams.*—Circular 205, canceling Circular 158, of the Southwestern regional director similar to

Circular 304-11A693 of the Eastern regional director. (*Railway Age*, April 25, page 1046).

*Shipping Day Plan.*—Circular 79 of the Northwestern regional director authorizes agents to accept less than car-load freight on any week day except holidays and regardless of any instructions heretofore issued as to routing.

*Passes for Brotherhood Chairman.*—Supplement 27 to Circular 29 of the Central Western regional director, similar to Circular 2100-13A689 of the Eastern regional director. (*Railway Age*, April 25, page 1046).

*Prohibition of Smoking in Mail Storage Cars.*—Supplement 15 to Circular 120 of the Central Western regional director, similar to Order 174 of the Southwestern regional director. (*Railway Age*, March 21, page 758.)

*Violations of Inspection and Safety Appliance Laws.*—The Central Western regional director in a letter dated April 19, states that, from the large number of reports which are being made by Interstate Commerce Commission Inspectors to the assistant director of the Division of Operation covering violations of federal inspection and safety appliance laws, it is evident that either the railroad inspectors are not adequately educated or they are careless. A systematic method of handling this matter is advised. Division master mechanics should keep a check upon whether or not the work reported by engineers is being done, and see that reports of violations of rules are followed by suitable discipline. Records should be kept of the violations at each terminal and of the employees responsible in each case.

*Preparation of Box Cars for Grain.*—The Central Western regional director in a letter dated April 17 calls for immediate attention to the preparation of box cars for grain, and the providing of well-adapted temporary grain doors where needed.

*Loss of Coal in Transit.*—The Central Western regional director in a letter dated April 14, reports complaints of loss of coal from open cars while in transit occasioned by train and yard employees throwing it off for the use of switchmen, crossing watchmen and others. Coal losses from this source must be reduced to a minimum.

*Furnishing Secondhand Rail to Industries and Dealers.*—Supplement 8 to Circular 33 of the Northwestern regional director states that hereafter it will not be necessary to secure authority of the regional director's office for the sale of secondhand rail to industries and dealers.

*Statistics for Census.*—The regional director, Eastern Region, by circular 1801-118A703, informs federal managers that all inquiries presented by the Census Bureau must be answered, the census law requiring all persons to answer inquiries propounded by the Bureau.

*Agreements with Brotherhoods Concerning Safety Measures.*—The Eastern regional director, by circular 1201-16A708, advises federal managers of the agreement made with the brotherhoods when they promised to refrain from presenting bills to state legislatures. Switch lights are to be maintained on all derail switches in tracks where trains are moved at night. Pusher engines must not push cabooses, except where the caboose has no platform or has steel center sills running through the length of the caboose and platform. Long back-up movements must not be made; if such movements are necessary as a regular thing, provision must be made for turning the engine, or to put pilots and head-lights on rear ends.

*Contracts Must Terminate with Federal Control.*—The Eastern regional director, by circular 304A709 calls attention to the order of April 11, stipulating that all contracts for materials and supplies must be made to terminate at the end of federal control, if they do not by their terms terminate sooner.

*Better Packing and Marking.*—The regional director,

Eastern region, by circular 600-159A710, advises federal managers of investigations which have been made to improve the efficiency of receiving clerks at freight houses. F. W. Smith, member of the Official Classification Committee, has visited and instructed the men at 257 freight stations. He had intelligent attention from the 6,897 employees to whom he talked, but many of them were found very poorly informed as to the rules for receiving freight. Intensive loading of way cars has resulted in some damage to freight. At some freight stations, receipts have been given, during the closing hour of the day, by men who have not seen the packages for which they signed. Railroads are found supplying shippers with tags (for merchandise) which would not

meet their own tariff requirements, being made of a poor quality of wood pulp. Waybill clerks working on the piece work basis are found to leave off part of the classification description, and this may result in making the rate too low.

*Cartmen's Custom House Bonds.*—The regional director, Eastern Region, by circular 600-68A699, informs federal managers that the director general, acting on behalf of all federal railroads, has executed, for the benefit of the Treasury Department, a blanket bond, such as is required by the custom house authorities, covering the liability of these railroads as carters and lighterers. Individual railroads, which perform cartage or lighterage service, and which have executed bonds to the government, need not renew such bonds.

## Development and Death of the "Sailing Day" Plan

### Shippers' Fight Against the New Method of Handling

#### 1. c. 1. Freight Is Successful

THE "SAILING DAY" plan is dead. Despite masses of figures, statistical reports and thousands of actual service cases marshalled in its support the plan for forwarding package freight less frequently than once a day, instituted just before the taking over of the railroads by the Government and supported by the Railroad Administration died on April 8, after having been viciously assailed for many weeks by shippers and their organizations in various parts of the country. A distinct innovation in operating methods, it lived but a short time before becoming merely an incident in the most turbulent period of railroad history. Its demise may be said to be due indirectly to the termination of the war; or, more directly, the reluctance of shippers to accept any service other than the very best. The complaints of the shippers were voiced unmistakably in resolutions passed by the National Industrial Traffic League at its spring meeting held in New Orleans, La., on March 11 and 12. These resolutions declare that the plan is a restriction upon commerce, that the carriers fail in their legal obligations of receiving and forwarding freight with all reasonable despatch; that this failure is a hardship on receivers of freight, lays a heavy burden of extra expense on the shipping public and causes undue discrimination between markets.

The discussion on these resolutions brought out the fact that the shippers believe there has been a lack of uniformity in the application of the plan. The most definite objections were based on the refusal of carriers to accept freight on other than the sailing days. In some of the larger cities shippers were permitted to deliver freight to the freight houses daily. But, whatever the detail reasons, the points raised in this discussion really explain the main reasons for the downfall of the sailing-day plan.

It was at Philadelphia, Pa., on September 4, 1917, that the sailing-day plan was inaugurated. Its apparent advantages, the condition of traffic at that time and the willingness of shippers to accept anything that promised better service made the first few months of the new system a success; and about March 1, 1918, the plan was extended to all of the Pennsylvania Railroad lines east of Pittsburgh and Erie, with the result that before long the records showed that 654 cars were being saved in this territory daily, and that 25 distributing freight trains were found unnecessary and were discontinued. By this time the new plan had reached a stage where it was possible to make definite claims concerning its superiority and shippers were told that by supporting it they would economize car space, would

enjoy more regular service, reduce the time in transit, lessen the number of loss and damage claims because of the elimination of rehandling at transfer stations and lessen the amount of freight going astray. Immediately following the extension of these economies over the Pennsylvania system the Car Service Section of the Railroad Administration threw its support behind the plan and it was quickly extended to all portions of the country.

But it was not long before clouds began to appear, and even before the Car Service Section gave its approval to the plan trouble was encountered at Philadelphia, at New York, in Massachusetts and in Rhode Island with the schedules first prepared. The plan, however, was not actually assailed until after the termination of hostilities on November 11, when the necessity for stringent economies in cars and service being ended, the shipper felt that he could express the objections, theretofore voluntarily repressed because of his desire not to do anything which might embarrass our government in its efforts to win the war. The first criticisms came from the smaller jobbing points. Smaller Iowa points first raised the cry which later was taken up by Missouri, Kansas, Nebraska and other central western states, terminating finally in the resolution passed by the National Industrial Traffic League representing the traffic interests of the entire country. The direct result of this resolution was the formation of a committee composed of National Industrial Traffic League members to lay the shippers' objections before the Railroad Administration and request the amendment or discontinuance of the plan. This was done at a meeting arranged by Max Thelen, director of the Division of Public Service which brought together traffic and operating men of the Railroad Administration, representatives of the shippers and state commissioners. The Railroad Administration at once acquiesced in the principles laid down by the objectors, a rather unexpected outcome in view of the steady backing that the plan had received from the Railroad Administration. The regional directors soon were ordered to accept less than carload freight on any week day except holidays, and regardless of any instructions previously issued as to routing. In other words, this order was the obituary of the sailing-day plan and the old sailing-day orders were made virtually inoperative. The action thus taken was epitomized in the formal announcement of the director general given in the *Railway Age* of April 11, page 942, which also virtually abolished the scheme for consolidating freight for a given destination over one of two or more competing lines.

Preferred routes were to be maintained only as they were accepted by patrons as "convenient." The proposal was for a "modification" of the plan; but with shippers' wishes so completely in the ascendant that the modification really meant abolition.

And so the sailing day, advocated as a war measure by the Railroad Administration, passed out of existence, a victim of the ill will of shippers and shipping organizations. It was natural that the first objections should come from the smaller jobbing centers. They complained of failure to receive and forward freight with reasonable despatch. Ordinarily this was as true of the larger cities as of the smaller. Legally, carriers must accept freight whenever it is offered during business hours and must transport it with all reasonable despatch. Obviously, the skipping of days to save cars often violated this legal obligation. The second point was that the sailing-day plan laid a heavy burden of extra expense on the shipping public. At the larger terminals where the tonnage is heavy this was not true, for the shipper was enabled by the fact of his heavy tonnage to deliver his freight to the roads on any day. But the jobber in the smaller town with only two or three sailing days in a week was compelled to store his freight on his own premises until the railroad was ready to receive it. But the small town jobber played his trump card in this third point; he said that the operation of this plan caused undue discrimination between markets. For example, competing shippers are located in Kansas City, Mo., and Atchison, Kan. Their products are substantially the same, their selling forces equal and their advertising equal; in short, they are typical rival companies. Yet when the sailing-day plan entered it gave an advantage to the jobber situated in the larger city, for he could ship freight on practically every day, whereas the shipper located in the smaller city was restricted in his shipping to the same point to two or three days of the week. The purchasers of the commodities produced by these companies, being in the main dealers in the smaller towns who as a rule do not place their orders for further stocks until the goods are actually needed, required the shipping of their orders with the least possible delay. The salesman of the Kansas City company could say definitely that the goods would be shipped immediately; the Atchison salesman usually would not dare to promise shipment in less than two or three days.

The discussion which followed the presentation of the resolutions before the National Industrial Traffic League brought out the interesting fact that the sailing-day plan had not been uniformly applied in the various sections of the country. For instance, in the east and northeast the objections to the plan were much less vigorous than those registered by shippers in the middle west, due probably to the careful manner in which schedules were arranged by the Eastern roads in order to avoid discrimination between markets. But on one objection shippers from all parts of the country seemed to agree, that against the carriers' refusal to accept freight, on other than the sailing days; although at some of the larger cities shippers were permitted to deliver freight to the freight houses daily.

These are the arguments presented by the shippers; the other side, the railroad men's side, has been backed by the compilation of important car savings effected, better service rendered and large expense saved. Certainly it is true that the sailing-day plan conserves cars. Undoubtedly the operation of the plan in the congestion so generally prevalent last year gave the shippers more regular and dependable service than would otherwise have been possible; but the question arises whether the shipper really wants a regular and dependable service or prefers an apparently better service with its faults and weaknesses concealed. In defense of

the objections which arose in the central west against the sailing-day plan railroad officers claim that many of these objections were made before the schedules had been properly arranged and revised to meet conditions of which their authors did not know when the schedules were prepared. In other words, railroad men believe that the shippers kicked against the sailing-day plan before it had been given a fair trial, and before the relations between the larger terminals and the smaller jobbing points could be satisfactorily adjusted to the individual needs of shippers. In many situations the sailing-day plan is the only really effective means of handling less than carload freight with true and mutual economy.

## The Facts in the Zone Rate Postage Controversy

**I**N a public and official statement given to the press on April 26, attacking the publishers, Postmaster General Burleson named Charles Johnson Post, director of the Publishers' Advisory Board, as the chief representative of "selfish publishers" and challenged him "to disclose all moneys raised by him to repeal this legislation (the Postal Zone Law) or in what manner it was spent."

Mr. Post immediately accepted the challenge to make public all the books and funds of his organization and to put himself under examination, under oath, as to the expenditure thereof.

The telegrams of Mr. Post and Mr. Burleson are given herewith:

### Post Replies to Burleson's Challenge

On April 26 Mr. Post wired the postmaster general as follows:

"I accept your challenge issued in your official statement published in today's papers, to publicly present all figures of moneys raised by the Publishers' Advisory Board, its expenditures and all details in connection with myself and this organization, before any representatives named by you and at any time or place at their convenience. I shall place myself entirely at their disposition as to examination under oath in connection with all these expenditures.

"In return I challenge you to similarly produce and make public your record of the moneys received by you and the profits made by you in connection with convict-labor on properties owned by you, a convict-labor system which competes with free American labor and in which whippings, brutality and ferocious punishments were the methods of extracting adequate labor from its victims.

### Burleson's Reply, Evading Acceptance

On the same date the postmaster general replied to Mr. Post thus:

"Answering your wire, the full facts in connection with the lease to the state of Texas of the plantation in which I was interested, upon which the state used its convict labor, and the terms of the contract in connection therewith have been placed before the Congress more than once and have long been a matter of public record.

"It would be quite interesting for you to publish now and later have laid before Congress the facts in the same detail about moneys raised and spent to secure the repeal of the zone postage rate law. Of course you know, as the New York World did when it published this falsehood, that I did not use convict labor on my plantation, but that the plantation was leased and cultivated by the state of Texas and the

convicts used thereon were at all times under the state's exclusive control and management."

### Post's Second Telegram to Burleson

Mr. Post replied to the above telegram on April 28 as follows:

"In reply to my prompt acceptance of your challenge you apparently seek to avoid any of the consequences of your challenge, for you clearly evade the issue in your simple, abstract and mild reference to it when you say: 'it would be interesting for you to publish now and later have laid before Congress the facts in detail about moneys raised and spent to secure the repeal of the zone postage rate law.'

"I met your previous challenge promptly and unequivocally; I accepted your challenge to produce publicly all records of moneys subscribed to this Publishers' Advisory Board and to submit myself, under oath, to examination as to all expenditures thereof before any body of representatives to be named by you as I stated to you in my telegram. I call upon you as a matter of good faith to the public to whom you appealed to come through on your own challenge—which I have absolutely and unqualifiedly accepted—or to stand repentantly self-confessed as a quitter along that line of sinister and disreputable suggestion.

"I, in return, challenged you to similarly produce to the public your record of moneys and profits received by you in connection with the abominable convict-labor system with its floggings to extract more work. In reply you admit that you have received moneys in connection with that convict-labor system, and in your own defense you merely plead that you, personally, were not directly in contact with the operation itself, but that your plantation was 'leased and cultivated by the state of Texas.'

"The public will thoroughly appreciate the unique qualities of such defense. It is as though a landlord were caught owning a house used for immoral purposes and immediately pleaded his own probity on the ground that he merely leased the premises, receiving the profits therefrom, but took no personal part in the orgies. Your defense—which is, I believe, what lawyers call a 'plea of confession and avoidance'—may well be left to the scrutiny of the American public.

"In your published official statement you continually endeavor to hide behind Woodrow Wilson's back and to make it appear that it is the enemies of the Administration who attack and martyrize you. Let me say in passing that behind Woodrow Wilson's back is pre-eminently the symbolic place for you; for it is you and your chief support in Congress that have been the Trojan horse of the Administration, hacking and ham-stringing the very principles and party you profess to serve.

"It is not the enemies of the Administration who effectively denounce you—it is your own record of postal incapacity and postal demoralization; it is your autocracy and Prussianized methods; your unswerving, imperialistic contempt and lack of understanding of what the ideals and hopes and rights of America today represent that make you out of harmony with the public and the functions you are supposed to serve. Among those is your contemptuous overturn of the sound postal principles established by President Lincoln that the postal service is an educational and social function of vast benefit to our entire nation; and that equal postage to all Americans everywhere within our nation is a basic postal principle. Your public utterances proclaim that all this means nothing to you. A revenge upon publishers—as you think it is—justifies in your eyes the revival of a discarded and condemned postal system of zones with increasing and unfair postal charges against the homes of this nation merely by reason of their accidental remoteness from any city in which a newspaper or periodical is published."

## Joint Engineering Meeting in Chicago

REPRESENTATIVES of approximately 75 engineering associations of the United States, representing an aggregate membership of 100,000 engineers, met in Chicago on April 23 to 25, inclusive, to consider the proposal to advocate the creation of a Department of Public Works. The meeting was called by Engineering Council and was presided over by M. O. Leighton, chairman of the National Service Committee of Engineering Council.

Among the question considered were (1) the federal bureaus or activities which should be included in such a department; (2) the advisability of endeavoring to secure an additional cabinet office or to make over one of the present departments by the redistribution of activities, and (3) the advisability of directing present efforts toward the complete reorganization of engineering bureaus or merely to bring these bureaus under a single head so that such a rearrangement may be made later as experience may show to be desirable.

After extended discussion extending for the greater part of three days, the consensus of opinion was incorporated in resolutions advocating, (1) the establishment of a National Department of Public Works by grouping those government bureaus, services, commissions and other activities whose functions are predominately of an engineering or architectural character in what is now the Department of the Interior and designating that department "The Department of Public Works"; (2) the transfer of any bureau, service or commission from any other department to the Department of Public Works should be accomplished without a change in personnel, compensation and general plan of organization, leaving the co-ordination of the several activities, and the establishment of additional bureaus to be effected as their need may become apparent from time to time; (3) in transferring river and harbor work and other work non-military in character but now in charge of the engineering corps of the United States Army, to a Department of Public Works, the relation of the army engineers to such work should not be changed so that there should be no relinquishment of non-military duty by the army engineers now on such duty, until such transfer of these engineers to military duty may be made without detriment to the public interest.

The conference decided that among the various activities which logically belong in a Department of Public Works were a Bureau of Public Roads; the United States Reclamation Service; the Alaskan Engineering Commission; the Construction Division of the United States Army; a Bureau of River, Harbor and Canal Work, including such functions as are now exercised by the Mississippi River Commission and the California Debris Commission; a Bureau of Architecture; a Bureau of Surveys, including the Coast and Geodetic Survey; a Bureau of Mines; the Geological Survey; the Forest Service (at least until it is divorced from the supervision of water powers and road building), and the Bureau of Standards.

It was believed that it would be unwise to determine at this time the extent to which the proposed Department of Public Works should control the engineering activities of the General Land Office, the National Park Service, the bureaus of Lighthouses and Indian affairs, and the Public Health Service, and of various commissions, such as those on buildings and grounds, and suggested that such questions be deferred for later consideration, preferably after the department had been organized. Three permanent committees were formed—(1) an executive committee, (2) a committee to draft the bill providing for the creation of a Department of Public Works, and (3) a committee to conduct the campaign for the passage of this bill. M. O. Leighton was made chairman of all three of these committees.

The session on Thursday morning was devoted to the dis-

cession of the creation of a Department of Transportation. Several speakers advocated such a department to take over the duties assigned to the Interstate Commerce Commission before the government took over the railroads, these same speakers advocating the handling of railway engineering and construction work through the proposed Department of Public Works. However, the conference passed no resolutions in this matter relative to the proposed Department of Transportation.

### Engineering Council and Other Societies

The concluding session of the conference on Friday afternoon was devoted to the consideration of the relation which Engineering Council should bear to national, state and local societies on matters concerning the council. In opening this discussion, J. Parke Channing, chairman of Engineering Council, outlined its development as a joint organization of the four national societies of civil, mechanical, electrical and mining engineers with which the American Society for Testing Materials has since become affiliated. Engineering Council handles problems of common interest to engineers and, only three years old, has made marked progress in developing its activities in spite of the handicaps of limited finances and war-time conditions. Among the accomplishments outlined by Mr. Channing are the creation of an employment bureau for engineers, the establishment of a National Service Committee at Washington and the creation of a war committee of technical societies in co-operation with the Naval Consulting Board. Committees of Engineering Council are also studying the problems of Americanization, the classification of compensation of engineers, curricula of engineering schools, the international affiliation of engineers, the licensing or registration of engineers, the patent situation and public affairs.

During the discussion need was expressed for more aggressive action on the part of the council to promote the business interests of the profession. The meeting adjourned without the adoption of any resolutions or the expression of opinion.

### Harmony and Safety\*

By T. J. O'Kelly

Brakeman, Atchison, Topeka and Santa Fe

**W**HEN I went to railroading I was only a boy. I wrote to my relatives in Missouri and told them of my new job. My brother and sister wrote and begged me to quit as it was so dangerous. I did not heed the advice. In less than a year my brother had his eye shot out by a blast and my brother-in-law had let his team run away and his ankle was broken, which made him a cripple for life. I wrote and told them they ought to quit farming as it was too dangerous. My observation is that a man's work is safe or dangerous just to the extent he makes it so. \* \* \*

A man working on the railroad has more to make him optimistic and happy than in any other occupation on earth. There is more to remind a railroad man of the good than in any other occupation. Every telegraph pole should remind him of the cross on which the Great Teacher was crucified because He taught the Truth. What is more sublime than to look along a freight train as she rounds a sharp curve going down a grade and think of that entire train being under the control of one man, the engineer, and *that* only by action of his mind, and all he uses to control it is the very air we are breathing. Think of the possibilities when we know all the truth about the wonderful earth and her resources.

\*Extract from a paper read at the Arizona division safety committee meeting at Needles, Cal., on February 10.

The engineman who is happy at his work is the most successful. \* \* \* So with conductors. With some conductors you can be sure that when the caller comes trouble begins. If the caller is five minutes ahead of time he gets bawled out, and if he is five minutes late he gets a cussing. The conductor gets on the caboose with a grouch, knows he is going to have a bad trip even before the train is made up. He catches the caboose and begins to complain to the rear brakeman about the head man, and when he gets to the head end he tells the head man the hind man is no good and everything is against him. He carries three kinds of trouble all the time: That which he had last trip, that which he is going to have this trip, and that which is coming after a while. But the man who is happy in his work is the man who will win.

Harmony among men and officers will make preventable accidents unknown. No train is safe when a brakeman doesn't like the conductor, or vice versa. I have actually known an instance where a brakeman let a conductor pass a meeting point because they were not on good terms. I am sure that most all these unfriendly feelings are the result of misunderstanding. Pardon me for quoting another passage from the old Book. The Great Teacher said: "The truth shall make you free." He also said if our brother had aught against us go first to him and talk it over. We can usually adjust all differences in the first conference, and if we have gone in the spirit of real brotherhood we shall have saved a friend. If it should happen that difference arises that cannot be settled at the time, suppose you say to him, "Now, let us not get mad, but when we get in we will go and ask Mr. Christie (superintendent) about it." I know that Mr. Christie will take both your hands and cement the friendship closer than ever.

A few seconds before nine o'clock each morning, if we are near a telegraph office, we hear the signal for time. If now in this room we were to compare watches we could easily tell who are carrying standard watches. The great master clock in Washington, D. C., is calling for the wire to send time. Everything is hushed, it reminds me of when I was small and father would call all the family together for morning prayers. As that clock beats off the seconds we stand with attentive ears to hear the time signal given. We then announce our differences—but they are not great if we have compared regularly. \* \* \*

Railroad Bridge, Near Ufa, Russia, Blown Up by the Bolsheviks. This Has Cut the Town Off from the Outside World

# What Does It Cost to Stop a Tonnage Train?

## A Study of the Value of Interlocking to Keep Traffic Moving at Grade Crossings, Draw Bridges, Etc.

By C. C. Anthony

Santa Rosa, Cal., Formerly Assistant Signal Engineer Pennsylvania Railroad

THE ECONOMY of signaling and interlocking is much more generally recognized now than it was 30 years ago; although the actual returns in dollars and cents are often so hidden among other varying operating factors that it is hard to prove or exhibit them so that they will make much impression. Even at the present day it is likely that many railroad officers view with gentle suspicion the estimates that have been prepared to show the operating economies effected by the installation of signals or interlocking, because of the favorable showing made, and besides there may be little hope that the predicted benefits can be detected after the work is done. Nevertheless, in many cases the benefits are real, however difficult it may be to show beyond question their money value.

The particular case considered here is that of the saving that may be effected by the use of interlocking where such an installation will assist in preventing the stopping of trains. Railroad grade crossings are prominent examples because, in the absence of interlocking, the stopping of trains before crossing is generally required by law. The same condition may exist at other points, such as drawbridges and junctions, depending upon the practice of each road or the laws and commission rulings in the various states. On several occasions in the past attention has been called to this phase of the benefit of interlocking, and some study has been given to the cost of stopping trains, on which the actual financial saving is mainly based.

As long ago as 1887 Wellington devoted a chapter to this subject in his book entitled *The Economic Theory of Railway Location* (Chapter XXV, edition of 1887). In his discussion Mr. Wellington is moved to strong language, which was undoubtedly justified at the time, and is, perhaps, to no small extent even now. After mentioning the practical absence of grade-crossings in England, he says:

"In America there are a great many grade-crossings, even on important lines; but the clumsy and costly precaution of a full stop of every train at every crossing is still the rule, although it can hardly be that such an absurd relic of barbarism will linger much longer, now that there is a considerable and increasing number of grade-crossings operated without a stop by the aid of interlocking apparatus, and always with perfect safety and success.

"In part, the slow progress in this matter is easily explained. The great loss and delay from grade-crossing stops goes on quietly and silently, sapping the life-blood of the company, as do the consequences of bad location, without interfering much with the routine of operation, and at points removed from the managing officers' immediate observation, whereas the difficulties at yards obtrude themselves on attention, and many of the most crowded yards have passed the limit of their capacity without some such mechanical aid. Nevertheless, from an economical point of view, abolishing the stops at grade-crossings is by far the most important, especially when, as is so frequently the case, they reduce the number of cars hauled below what it otherwise would be."

He rejects "the wild estimates which give the cost of a stop at anywhere from a dollar up," and, without going into details, takes from 30 to 60 cents as fair for the cost of a stop,

apart from all effect on length of trains. At 40 cents per stop, which he thinks not excessive for average trains on lines doing considerable through business, the cost per year of each train per day stopping at a crossing, becomes \$146. For an average of ten trains per day each way on each of two crossing roads, the total annual loss to both roads is then \$5,840. If these figures were reasonably near the truth, it is hardly necessary to go into the details of the cost of a small interlocking plant required at the crossing of two such roads, including the cost of operation, maintenance and depreciation, to be convinced that interlocking would be a profitable investment. Even at present rates and prices, which would greatly increase the interlocking costs, and at the same time increase the cost of stops materially, a good showing would undoubtedly be made.

To what extent the length of trains is affected at the present time by the stops required at non-interlocked crossings, the writer is unable to say. Mr. Wellington, however, asserts that there were many such cases at that time, and points out that the loss due to cutting down the length of train on account of the stops at a crossing, may be much more than that due to the direct cost of the stops themselves. It is evidently assumed that the train-load would be based on no stop at the particular crossing, if interlocking were provided, and that the trains occasionally stopped when the crossing was blocked by trains on the other road, would "double the hill" or be helped away by a yard engine.

In 1905 J. A. Peabody, signal engineer of the Chicago & Northwestern, prepared a paper on the cost of stopping trains, compared with the cost of maintenance, operation and inspection of interlocking plants, which was published in the proceedings of the Railway Signal Association, Vol. I, page 281. Mr. Peabody obtained from two railroad officers estimates of the costs of stopping trains (stopping, starting and accelerating to the speed from which the stops are made). These estimates varied from 35 cents for a six-car passenger train at 45 miles an hour to \$1 for an 80-car freight train of 2,000 tons at 35 miles an hour.

Mr. Peabody takes 45 cents as a conservative average cost for all trains and presents calculations of the savings to be effected in nine assumed cases (entrance to a yard, crossings and drawbridges) by eliminating stops through the installation of interlocking. It is assumed that additional men will have to be employed to operate the plants except at the drawbridges, for which calculations are made both with and without additional men. In each case the results for various numbers of trains are given. The annual saving, due to the cost of stopping trains, is equal to the annual charges against the interlockings (interest, depreciation, maintenance and operation) for from 16 to 19 trains per day, except at the drawbridges where no additional men are assumed, in which cases the balance exists for 7 and 8 trains. Except for one example net savings appear when the number of trains is 20 where additional men are assumed, and in the case of drawbridges requiring no additional men, when the number of trains is 10. At the crossings, of course, the number of trains is the total both ways on both roads. In one case, where 25 is the smallest number of trains for which there is any sav-

ing, the cost of the interlocking, and consequently the costs of interest, depreciation and maintenance, are assumed to be increased by the inclusion of two switches and a crossover located so near a crossing that they would have to be interlocked. In cases of this kind, however, although only from one point of view, the interlocking of adjacent switches is purely incidental and an unavoidable burden upon the protection of the crossing, it may still fairly be claimed that the resulting increased cost is more or less fully offset by a gain in safety at least.

In all of these examples, where additional men for operation are assumed, the cost of this item is \$1,320 per year. This amount is now much too small, of course; it should apparently be about three times as much under present conditions. On the other hand, it would seem that the entire pay of the levermen would rarely have to be charged up, for presumably in most cases where the traffic would warrant consideration of interlocking, signalmen are already employed, although the stopping of trains cannot be eliminated because approved interlocking has not been provided. Consequently the only thing usually to be considered is any increase of pay that may be necessary if interlocking is installed. No doubt the other items also have increased greatly since the estimates under consideration were made. But as against any increase in the total annual charges due to the interlockings, there must be charged an undoubted increase in the cost of stopping trains, especially in comparison with the average cost assumed, 45 cents, which seems to have been almost needlessly conservative in 1905. In view of the fact that freight trains are slightly more numerous than passenger, it seems that the average cost assumed should be a little greater than that estimated for the latter. At the same time there must have been a considerable increase in the actual costs, due to increases in prices, rates, and weights of trains. In practice, of course, after the costs of stopping average passenger and freight trains are separately calculated or estimated, it would be better to total them for the number of trains of each kind at a given point under consideration, than to use an average for all trains.

The annual charges against a proposed interlocking can be closely estimated, at least on the basis of conditions prevailing at the time. What changes the future may bring forth is, of course, a matter of speculation; although it should be rather immaterial in the long run, since variations due to changes in the general level of prices are likely to be nearly offset by similar variations in the cost of stopping trains. But this latter cost is not so easily determined. And yet it is the principal item in any estimates of benefits to be derived from the installation of interlocking in the cases here considered; in fact, it is about the only one on which attempts have been made to figure savings in dollars and cents, in these cases. For the most part the costs used have been based on pure estimates, or even on guesses—which, in some of the answers to Mr. Peabody's inquiries, ranged from five cents to five dollars. Whether the cost of stopping trains can ever be calculated with reasonable accuracy, even as closely as might be permitted by the use of statistical average amounts or costs for certain items, such as fuel and repairs per car and engine-mile, etc., is questionable. Very likely the best that can be done is to use careful and conservative estimates.

### Calculating Cost of Stopping Trains

In this connection it is interesting to refer to an ingenious method of calculating the "approximate cost of stopping a train," presented by "R. E. W." in the *Railway Age* of March 22, 1918, page 708. In this method the energy stored in the train, and dissipated in stopping, is calculated—taking a train of given weight moving at the speed from which the stop is assumed to be made. The amount is divided by the work

required to move the train a mile at the original speed. The quotient, "equivalent miles run," will represent the distance the train would have traveled due to its stored-up energy." The assumption is that "this quotient multiplied by the cost of coal, repairs and wages per train-mile, will give the total cost of the stop."

As worked out by this method the cost of stopping an eight-car passenger train weighing 623 tons, from a speed of 30 miles an hour, is 61.4 cents; and for a 50-car freight train weighing 3,943 tons, at the same speed, is 175.3 cents. In these examples wages of the train crews are not included, as they seem not to be a factor unless overtime is involved. So, too, certain negligibly small items are omitted. This method is attractive in that it is definite—free from estimates, and makes use of available, experimental and statistical data. If, for a given situation, an average passenger train, an average freight, and average speeds are taken, then for each kind of train the stored energy is obtained from the speed and weight of the train; the work required to move the train at the original speed is calculated from accepted values of train-resistance; and the cost of running the "equivalent miles" is determined from the average cost of fuel and repairs per car and engine-mile, as given in the road's reports. This cost, being for an average train and based on average costs per mile, should be fairly accurate. But is it the cost of the stop?

Apparently the principal items in the cost of stopping (and starting and accelerating) a train are: Extra wear and tear due to stopping and starting (wear of brake shoes, tires and wheel treads, and various other parts), represented by some addition to the average cost of car and engine repairs. Cost of extra fuel chargeable to the air compressor when replacing the air used in braking. In one set of estimates cited by Mr. Peabody this item was based upon tests, and amounted to about ten per cent of the total coal estimated. Cost of fuel used in starting and accelerating the train less the cost of fuel required to move the train, at its original speed, between the point where reduction of speed for the stop begins and the point where the original speed is regained.

Unfortunately it is not clear that the cost obtained by the method briefly described above has any necessary relation to the total of the items just enumerated. It might prove to be about equal if the amounts of these items could be found with reasonable accuracy. But it does not seem evident, on the face of things, that it would. As stated before, then, it may be necessary to depend upon careful and conservative estimates; although test runs with and without stops, over the distance covered by the stop and acceleration, should supply fairly accurate data of the extra fuel used for the air compressor and the acceleration together. One such test is reported by Mr. Peabody, and very likely others have been made.

### Cost of Stops Affected by the Delay of Other Trains

Impossible as it may be to determine the cost of stops with certainty, and difficult as it may be to see in the operating results the saving effected by eliminating certain stops, nevertheless this saving is real money. In addition to such direct financial saving there is the elimination of damage in starting heavy freight trains, and the general improvement in train movement due to cutting out the stopping of all trains at a certain point. The cost of the damage to trains may be included in the cost of the stops, but, even if it is, the indirect and sometimes quite far-reaching effects in the way of accumulating delay, both to the damaged and to other trains, may mean a considerable loss in the course of a year. So, too, with the general improvement in train movement. It is not merely a matter of saving so many minutes per train, lost in the stops. The few minutes lost by a freight train in stop-

ping at a crossing may mean a bad combination in meets and passes on all the rest of the run, resulting in many times the original delay before the terminal is reached; and other trains may suffer at the same time. If it is not always, or often, possible to show the money loss from such derangements of the movement, the elimination of one cause of them means, as everyone knows, real benefit thrown in for good measure above more definite money savings.

• Although there is no quick and easy way of showing beyond dispute just what saving will result from eliminating stops of trains by installing interlocking in a given case, the result can, with proper conservatism, be estimated convincingly. As interlocking costs and the cost of stopping trains have both risen, though probably not in just the same proportion, it is safe to say that the relation, as estimated years ago, is not now very far wrong, or at any rate is not too favorable to interlocking for general purposes.

## A Financier on the Railroad Problem\*

By Charles E. Mitchell

President, National City Company, New York

THE TIME HAS COME to solve the problem of the future for the railroads, and the longer the delay the more difficult the solution. The administration has suggested that government operation continue for a further period of five years, in order that it may be more thoroughly tested. This suggestion has met with marked opposition and apparently it has been dropped by its original advocates. While it is in the power of the administration to turn the railroads back at any time and immediate return has been threatened, assurances have been recently given that the railroads will not be returned in a way to bring disaster, which surely means that they cannot be abruptly returned. To fix a date, even that date provided in the law, namely twenty-one months after the declaration of the ratifications of the treaty of peace, as the date when the roads shall be returned, would seem the height of folly. The railroads should be, and probably will be, returned when a sane and sound plan for their return has been devised.

Suggestions for the return and subsequent method of operation and regulation have been many. Plans have been submitted by the railway executives, by the Associate of Railway Security Owners, by the Interstate Commerce Commission and the director general himself. Railroad presidents and bankers have expressed their views and the railroad brotherhoods have produced for consideration a most socialistic suggestion. Many of the views expressed in these plans are admirable, though for the most part, they involve the laying of the railroad structure upon the operating table and performing upon it major surgical operations that will result in making it little resemble that transportation system which has served so well our public in the past. They propose such physical and financial readjustments of the railroad situation as, in my opinion, would leave the patient weak and disfigured and unable to bear the burdens which American commerce must throw upon him without interruption.

Most of the plans provide for guaranteed minimum profits to the roads and a maximum profit return. I am personally opposed to the minimum guaranty suggestion, for I believe it to be a definite step toward government ownership, especially if private management fails to earn the income guaranteed. I believe it will take from private initiative a fear of failure, which is, in itself, a spur to achievement. I do believe, however, in a fair division of profits above a specified maximum, but I cannot believe in fixing a point in

profits above which all excess goes to others than the railroads. Rate making in itself must be largely determined by the expense of operation, not of one road but of all roads involved in the specific rate made. If operating on such a rate, the poorly located or poorly managed road is to be given a chance to live, the well located and highly efficiently operated road will find such rate extravagantly profitable. Such excessive profits should, I believe, be divided with the government and others as in the judgment of our Congress seems proper, but the spur to achievement in operation that results in high profits should never be taken away by placing a fixed maximum return on any road. In many of the plans suggested, an attempt is made to arrive at a method—a precise formula, as it were—for the establishment of equitable rates, and some definitely suggest a regional combination of roads. I cannot believe that this is the time to attempt to figure out theoretically a rate formula or what combinations of roads should in the ultimate be made. Given a properly constituted Interstate Commerce Commission of truly representative men with authority for the development of rates, as a result of a study, experimentation and adaptation, combined with legally delegated responsibility to see that such rates be commensurate with operating expenses, a federal commission having jurisdiction over intrastate as well as interstate commerce so far as the laws permit, but in any event working with greater harmony than heretofore with various states, through, perhaps, regional advisory boards, composed of State representatives, of shippers and of labor—then I feel that we have gone as far as we can along the lines of rate fixing.

Perhaps the thought that I would contribute to the discussion leading to the solution of the railroad problem may be of interest. It is based upon the conclusion that government ownership and operation is not practical; that private ownership and operation, freed from government regulation, has been shown by history to have its dangers and is not feasible; and that the situation must be worked out under private ownership and operation under fair and equitable regulation, the solution to be found with as little disturbance as possible of structures already existent.

Three things appear to me essential to be done before consideration is given to the return of railroad property to private operation: first, the reconstruction of the Interstate Commerce Commission, with rate-fixing authority and responsibility definitely established; second, an immediate rate increase sufficient to take up the burden of the wage increase granted during government operation; and third, the passage of such legislation as will provide for a division of profits above what shall be determined to be a reasonable return to invested capital. With these things accomplished, we should be ready for private operation. That complete severance from government responsibility for railroad credit should be immediate and for every road at the same hour, seems to me, however, a preposterous suggestion. The corner to be turned must not be a sharp one. The return must be gradual, both in method and point of time. I feel that the government should continue its guaranty of standard rental return as now established for such a period, probably two to three years, as will enable private managements to get back a firm hold upon their affairs. Under such continuance of guaranteed return, let the government turn back the properties with reasonable working assets to the private owners, leaving for gradual settlement and adjustment the counter claims inevitably to be made as between the government and the private owners for later but as early an adjustment as may be possible. Let private management reinstate itself, with the requirement upon each road to pay over to the government any excess over the government guaranteed rental return and with the right to call upon the government during the guaranty period for any deficit between its net operating revenue and such guaranteed rental. But let there be pro-

\*From an address delivered before the Canadian Club, Montreal, Canada, on April 21, 1919.

vision that at any time during this two to three-year period of continued government guaranty, any railroad company may, if it so elect, release the government from its guaranty and receive thereafter the full net return resulting from its operations, subject to a division of excessive earnings as heretofore suggested. I am of the belief that, under this plan, the owners of the majority of our large railroad companies would release the government from its guaranty within the first year, and that the roads continuing to work under the guaranty to the end of the period, which would naturally be the weakest of the companies, would be comparatively few. The financial condition of such remaining companies will doubtless be such that drastic reorganizations will be necessary at such time as the government guaranty ceases, and I would consider it more than likely that at such time the government would deem it wise to give its permission, present laws to the contrary notwithstanding, for absorption and consolidation of such roads in the stronger systems. Thus, would the roads return to private management under the same incentive to the development of efficient competitive service that has made the railroad system of the United States the model of the world. I recognize that this plan of adjustment involves many complexities which will demand co-operative effort and well considered legislation to solve, but I do feel that the plan subjects the problem to comparatively simple and effective treatment.

The railroad problem is only one of our great problems of the adjustment period through which we are now passing, but it is entwined with practically every other problem of the day—the problem of labor, of inflation, merchant marine, and even the problem of our export trade—for, as you know, the railroad item enters into the cost of goods delivered at seaboard for export to a greater extent than in any other country, with the possible exception of your own. It would be interesting indeed, were there time, to trace the windings of the knot which entwines other adjustment problems with this great railroad problem. The minds of American business men, however, are distinctly upon these many problems, and in that thought alone we may be optimistic that they will be solved aright.

Conditions in our country are, on the whole, exceptionally good. A uniformity of conditions and a uniformity of thinking, throughout the length and the breadth of the land, exists as I have never before seen it. Wages are everywhere high, and there is no marked degree of unemployment anywhere.

Bolshevism is being trampled down wherever it shows its head. Merchants are doing a large and profitable business. Our Victory Loan campaign gives promise of being a huge success. By and large, the fundamental conditions in the United States are sound. We have, to be sure, many questions for which we have yet to find the answer, and not the least of these is as to where we are to find a market for our goods. The development from a debtor to a creditor nation has brought its difficulties, as well as its responsibilities, and among those difficulties is the sharp advance in dollar exchange, which impedes the opening of foreign markets for our exports. The maze of the railroad situation would seem to preclude the possibility of the railroads becoming active purchasers in volume immediately, and as I have suggested before, the rate of railroad buying is usually a barometer of the prosperity of the times. On the other hand, agricultural conditions are so abnormally good with us that we hope the farming communities will enter our markets as exceptionally heavy buyers. Winter wheat was reported, on April 1, as in practically 100 per cent perfect condition comparing with 78.6 per cent a year ago and a ten-year average of 82.3 per cent. The ground condition is everywhere good, and a bumper year is expected. All things considered, the favorable conditions would appear to at least offset the unfavorable conditions with which we are confronted, and, while I will not predict a year of tremendous commercial activity, as compared with the years of the war, nevertheless, I feel that a year of at least moderate prosperity is assured.

One thing is certain—the immense wealth of the United States today and its unprecedentedly strong position as a creditor nation not only makes favorable the conditions for, but enforces the seeking of, foreign investments. In that way only, in my opinion, can inequalities of exchange such as exist between Canada and the United States today, be overcome, and I am satisfied that our people are only awaiting the opportunity to invest their capital on this side of the border. We hope to be of assistance to you in your development and of assistance to our own nation in the development of its commerce by bringing American dollars to your land for investment and thus adjusting the rate of exchange, to the end that there may be a free and easy movement across that imaginary line which separates commercially and politically your people and mine, who, after all, are one in blood, in method of thought and in purpose.

# Doings of the United States Railroad Administration

## Offer of Industrial Board to Bring Together Administration and Steel Producers Is Accepted

WASHINGTON, D. C.

ANOTHER EFFORT TO SETTLE the controversy over steel prices is to be made by calling the steel producers to Washington for a conference with the representatives of the Railroad Administration. Director General Hines telegraphed from Denver on April 28 accepting an offer made by the Industrial Board which had tendered its services to bring together the representatives of the Railroad Administration and the steel producers. It was stated that the board would "render all the mutual aid possible to bring about a satisfactory understanding between the Railroad Administration and the producers of steel, on the broad basis of the maintenance of the existing wage scale and the preservation of the average independent producer." The position taken by Mr. Hines throughout the controversy thus far would indicate that the success of the new conference depends upon whether the steel companies are willing to offer prices sufficiently lower than the scale approved by the board on April 21 to attract the Railroad Administration into the market, and that otherwise it will continue its policy of purchasing as little as possible.

It is understood that this represents the last effort to instill the breath of life into the price-stabilizing scheme. Following the failure of earlier conferences President Wilson cabled instructions that further efforts be made to harmonize the situation and on April 24 Robert S. Lovett, Henry Walters and George G. Yeomans of the Railroad Administration held a further conference with the Industrial Board without result. The railroad representatives reported to Mr. Hines and the Industrial Board to Secretary Redfield of the Department of Commerce, after which Chairman Peek wrote to Mr. Hines making the offer above referred to and saying in part:

"The previous recommendation of steel prices was made only after careful study of costs prepared by the Federal Trade Commission and the figures of the producers which were checked by experts in the service of the board.

"The prices arrived at were the lowest which the members of the board believed they could recommend and which would at the same time, permit the producers to maintain the existing scale of wages and preserve the average independent producer.

"The President has referred to our board 'as a court of mediation between buyer and seller.' We therefore, must decline to take a partisan attitude and in the absence of new information or data to urge the steel manufacturers to make a reduction in the offered prices, merely because the Railroad Administration requests it.

"If, however, you have any facts, figures or information showing that, on any ground whatsoever, the price recommended was too high, we shall be glad to approach the representatives of steel producers again and attempt to secure a modification of their offer in accordance therewith."

Secretary Redfield also telegraphed Mr. Hines as follows:

"Mr. Tumulty has informed me of the President's cablegram to you, requesting co-operation with myself and associates respecting prices. I regret that meeting of your advisers with Industrial Board Thursday, April 24, failed to advance matters, because they candidly stated they had no new facts and reserved their views respecting proper prices. I shall be more than glad, however, to take any possible further steps that will bring us into accord and relieve existing business tension. Am ready therefore to reconsider candidly all facts you or your representatives may care to present and to give same sympathetic attention.

"You are cordially requested to ask your representatives to confer anew with the Industrial Board, with the spirit on both sides of gentlemen engaged in a common service, seeking a mutual end, speaking without reserve and with entire absence of bargaining and without thought of maintaining previously expressed opinions, save so far only as facts may when fully developed justify. I assure you in advance that the Industrial Board will act in this spirit.

"Kindly advise if possible by telegraph whether you are prepared to act as above suggested. This is asked because you will appreciate that in the absence of action looking to definite results it will be necessary that the members of the Industrial Board resume their personal affairs."

Mr. Hines did not accept the idea of further conferences with the board but accepted the board's offer of mediation. In his statement he called attention to the fact that on April 24 Judge Robert S. Lovett and Henry Walters as representatives of the Railroad Administration had met with the Industrial Board "for the purpose of reaching common ground in a practical sense regardless of former conceptions on either side and had been prepared to offer compromise suggestions looking to an agreement as to prices but that the board declined at the meeting to act except according to its original conceptions which in the opinion of the director general were erroneous and that this attitude of the board practically closed the door to further discussion at that meeting."

The director general in view of the renewed suggestion for conference indicated a willingness to accept the offer made by the Industrial Board in a telegram sent by Chairman Peek on April 26 to bring together representatives of the Railroad Administration and the steel producers.

The resignations of members of the Industrial Board have been in the hands of Secretary Redfield since April 1, but he declined to make them effective until further efforts had been made.

### Cost of Train and Locomotive Service

The total cost of locomotive service per locomotive mile in February, 1919, was 120.7 cents as compared with 106.3 cents in February, 1918, an increase of 13.5 per cent, and the total cost of train service per train mile was 169.3 cents as compared with 155 cents, an increase of 9.2 per cent, according to a monthly report compiled by the Operating Statistics Section. The report shows in detail by roads and by regions the freight locomotive and freight train costs for the various items, all of which show an increase as compared with February, 1918, except the items of train men and enginemen. The total cost of train service per 1,000 gross ton miles was 126.5 cents in February, 1919. This is made up of 43.1 cents for locomotive repairs and enginehouse expense, 40.3 cents for locomotive fuel, 3.4 cents for other locomotive supplies, 34.8 cents for enginemen and train men and 4.8 cents for train supplies and expenses. No comparisons are made with last year on the gross ton mile basis. Per locomotive mile the cost of locomotive repairs was 40.2 cents in February, 1919, as compared with 31.5 in February, 1918; engine house repairs were 10.4 as compared with 7.4; train enginemen 18.8 as compared with 20.3; locomotive fuel 47.3 against 43.9, and other locomotive supplies 4 against 3.2 cents. The cost per train mile for locomotive repairs and engine house expenses was 57.7 against 45.2, locomotive fuel 54 against 51.1, other locomotive supplies 4.6 against 3.7, train

enginemmen 21.5 against 23.6, trainmen 25.1 against 26.6, train supplies and expenses 6.5 against 4.8. The highest cost for total train service per 1,000 gross ton miles is shown in the New England district, 197.7 cents. The lowest is in the Pocahontas region, 93.9 cents.

**Allocation of Equipment**

The Railroad Administration is making renewed efforts to get rid of some of the standard freight cars being built on its orders placed last year, which have been allocated to the various railroads, but which many of them have refused to accept. While something over one-third of the equipment has been built, the number of cars accepted by the railroads is between 10,000 and 15,000 less than those built and the balance are being held in storage without stencilling. During the week ended April 19 only 122 of the cars were accepted, although the number built has frequently been 800 or 900 a week. Swagar Shirley, director of the Division of Finance, held a conference at New York on Wednesday with members of the Association of Railway Executives to discuss the subject, but the only announcement after the meeting was that the executives would appoint a special committee to confer with Railroad Administration officials at Washington. One of the reasons for the failure of the railroad companies to accept the equipment is their inability to finance it. It is hoped that a practical plan for financing the equipment may be worked out. The equipment has been paid for by the Railroad Administration as it has been delivered, except that recently it has been necessary to make the payments in certificates of indebtedness and the cost is to be charged against the corporations to which the cars are allocated.

**Record Breaking Car Surplus Being Reduced**

All previous records as to the number of surplus freight cars in the country have recently been exceeded. On March 1 the total of idle freight cars of all kinds was considerably over 450,000, although it has since been decreased by an improvement in the volume of traffic, particularly in the grain movement to the elevators to meet the drafts made by exports, and by the opening of the lake coal and ore movement, and the surplus of freight cars of all kinds at the present time is somewhat over 300,000. On April 1 it was about 390,000. The largest surplus of freight cars previously recorded was in April, 1908, when the total was over 413,000, and the present surplus is probably greater than it has been at any time since 1908. In 1909 the net surplus was 332,513, and in 1915 it again reached about 330,000. The present surplus began in April, 1918, and it rose gradually until the peak was reached in March of this year. The greater part of the surplus on March 1 consisted of open-top coal cars, because the coal traffic has been at a low ebb since last fall. At the present time it is estimated that there is a surplus of 170,000 to 200,000 open-top cars and it is understood that approximately 125,000 of the total surplus represents box cars stored in western and southwestern regions in preparedness for the heavy loading of grain. On the other hand, there are some occasional shortages of box cars east of the Mississippi and north of the Ohio and since the opening of navigation the surplus of open cars is being absorbed by the lake movement.

The Railroad Administration inherited a shortage which had begun in the fall of 1916 and continued throughout 1917. On January 1, 1918, there was a net shortage of 90,000 and on March 1, 1918, a net shortage of 138,000, but on May 1 this had been changed to a net surplus of 12,000. There was a comfortable surplus for the rest of 1918, which jumped from 91,000 on November 1 to 157,000 on December 1 after the signing of the armistice, and which increased rapidly until March this year.

The regularly published statistics of car surpluses and shortages compiled by the American Railway Association since 1907 (with an interruption from October, 1914, to February 1, 1915), were discontinued by the Railroad Administration last April and the figures have not since been published, but a special study has recently been made by the Railroad Administration of the figures since January, 1918, which shows the following for the period up to February 1, 1919:

	Shortage		Surplus		Net surplus
	Open top	All cars	Open top	All cars	
January 1, 1918.....	110,332	.....	20,337	.....	*89,995
February 1, 1918.....	122,341	.....	24,297	.....	*98,044
March 1, 1918.....	159,992	.....	21,890	.....	*138,102
April 1, 1918.....	82,555	.....	7,770	.....	*74,785
May 1, 1918.....	14,160	45,886	14,988	57,921	12,035
June 1, 1918.....	4,861	15,058	11,044	86,282	71,224
July 1, 1918.....	8,248	20,757	11,256	83,563	62,806
August 1, 1918.....	15,311	35,905	8,267	92,339	56,434
September 1, 1918.....	10,137	28,870	11,447	64,792	35,922
October 1, 1918.....	4,380	21,248	14,866	66,988	45,740
November 1, 1918.....	3,112	13,788	32,565	105,479	91,691
December 1, 1918.....	2,025	10,350	82,130	167,177	156,827
January 1, 1919.....	96	833	96,744	270,177	269,344
February 1, 1919.....	52	1,036	134,910	355,488	354,452

\*Net shortage.

Since January 1, 1907, when the records of car surpluses and shortages were first kept there have been net shortages only in 1907, for a short period in 1909, in 1912, for a short period at the end of 1913 and in 1916, 1917 and the early part of 1918. Throughout the greater part of the time there have been net surpluses.

**Weekly Traffic Report**

According to a report of traffic conditions for the week ended April 23, the movement of freight throughout the country shows considerable improvement over the week previous. This is especially true with respect to shipments of grain and grain products from the Southwestern and Southern regions. Tidewater coal dumpings increased 37,933 tons in the Pocahontas region over the previous week.

In the Southwestern region the loading of miscellaneous commodities showed considerable increase, forest products increasing approximately 15 per cent over the week previous. A heavy movement of fat cattle from southwestern Texas continues.

A summary follows:

*Eastern Region:*—The increased movement of freight traffic did not materialize as was expected, but reports from the interior indicate that the general tone of the shipping public is optimistic and improvement is looked for. There is some decrease of furnaces in blast in Central territory as compared with last week's report. General reports indicate decrease in unemployed labor. Passenger reports are very satisfactory, the movement from out of town for the parade of the 26th Division at Boston, April 25, taxing facilities of Boston roads to their utmost.

*Allegheny Region:*—Freight operating conditions are about normal. Adjudication of labor difficulties in New York Harbor has resulted in a freer movement of traffic. Grain movement continues heavy and special efforts are being made to provide elevators in the Chicago district with sufficient cars to meet loading requirements. The movement of ore via the Lake was resumed April 18. Considerable decrease in the number of open top cars stored, and box car requirements were heavy, but supply ample. Regular passenger travel is normal, but tourist and excursion travel to the seashore resorts is showing heavy increases over corresponding period of 1918. The outlook is for an abnormally large seashore business during the coming season.

*Pocahontas Region:*—Tidewater coal dumped shows some increase over previous week, but last week's showing of cars loaded in region and received from connections was a disappointment. The present outlook is that April will show im-

provement over March. Total loads, other than coal and coke, decreased 119 cars. Compared with same period last year Tidewater coal dumped decreased 123,668 tons. General passenger travel is about normal as compared with past few weeks, earnings continuing to show increases over same period last year.

*Southern Region:*—Growers' organizations are being formed at various points for systematic handling of a bumper sweet potato crop; the indications are that an increased movement amounting to several hundred carloads will result. The general freight movement showed some decrease for the past week as compared to the previous week. The movement of crude oil from the eastern Kentucky districts continues to increase, 343 cars having been handled during the past week. Some improvement in the movement of grain and grain products has been noted and the demand continues good, a shortage of soft wheat, however, being claimed by some millers.

*Central Western Region:*—For the week ending April 22, as compared to same week last year, there was a decrease of approximately 12 per cent in number of cars of freight loaded, the greatest decrease being in coal loading. Live stock loading also decreased considerably, while grain loading shows some increase. The movement of grain products is increasing and the demand for equipment is heavy. On account of the relatively mild winter, reports indicate that the wool clip will be much better in quality this year than in previous recent years. Passenger travel continues heavier than for corresponding period last year.

*Southwestern Region:*—Loading of grain and grain products, live stock and miscellaneous commodities showed considerable increase, forest products increasing approximately 15 per cent over previous week. Lumber dealers, while complaining that building trade is not reviving, anticipate an early resumption of service. Heavy movement of fat cattle from southwestern Texas continues. . . .

**2,104 Persons in Washington Employed  
in Railroad Operation and Regulation**

The supervision of railroad operation and the regulation of the railroads together require the services of over two thousand people in Washington, according to a census just made by a commission which is engaged on a proposed reclassification of governmental salaries. The commission's report embodies an elaborate classification of the people employed in Washington in the various branches of government service, including 1,280 in the organization of the director general of railroads and 824 in that of the Interstate Commerce Commission, or 2,104 out of a total of 101,586 for all the governmental departments. These figures do not include the President and members of Congress and they take no account of either the labor leaders, the state commissioners or the shippers' representatives, many of whom are constantly on hand to offer assistance in one way or another in the processes both of operation and of regulation, nor do they include the large number of railway officers who are frequently called here for conferences, committee meetings, etc.

**Attachments Left Subject to Law**

The director general of railroads has issued an order effective May 15, rescinding General Order No. 43 made during the war, which provided that money in the possession of carriers under federal control shall not be subject to attachment, garnishment, or like process. This action does not make wages or other money subject to attachment or garnishment if they are not made subject to garnishment or attachment by the laws of the state as modified or affected by the

federal control act. It leaves the matter to be governed by the act of Congress and the state statutes where applicable, so that wages and other money in the possession of carriers under federal control will not be subject to garnishment or attachment unless the state law provides for it and the final construction by the courts of the federal control act of Congress permits it. The supreme court of Tennessee recently held that by reason of the federal control act, money in possession of the Railroad Administration is not subject to attachment or garnishment, and that this was the law regardless of General Order No. 43.

In view of this and other decisions, the director general concluded that it was wise to leave the matter to be determined by the law, rather than by any action of his.

**Net Operating Income in March  
Decreased 82 Per Cent**

The Railroad Administration again earned a deficit as compared with the standard return, according to preliminary reports of railroad earnings and expenses for the month of March. The net operating income amounted to \$10,522,620 for 178 Class I roads, operating 224,000 miles, a decrease of \$50,000,000 or 82.7 per cent as compared with March, 1918. The standard return for the Class I roads for March is about \$68,000,000 and for three months it is about \$170,000,000, so the net operating income for the three months' period is about \$128,000,000 short of the standard return. Gross earnings reports for April are also showing very little improvement. For March the operating revenues of the 178 roads amounted to \$357,699,961, an increase of 2.8 per cent. Operating expenses were \$339,044,348, an increase of 22 per cent. Taxes, \$14,536,629, decreased 1.1 per cent. The railroads in the eastern district had a deficit of \$1,283,939, a decrease of 107.8 per cent as compared with the net operating income of last year. The southern roads had a net operating income of \$4,485,303, a decrease of 72 per cent. The western roads had a net operating income of \$7,321,256, a decrease of 74 per cent.

**Excursion Rates**

The Railroad Administration is making a bid for passenger traffic in these days of reduced freight business by conducting special excursions similar to those formerly made by the railroads. A special Sunday rate of \$2.45 for the round trip between Washington and Philadelphia has been announced and also a similar round trip rate of \$3.00 between Washington and New York. The war tax is, of course, to be added to these rates. It has also been announced that a special rate of 2 cents a mile with a minimum rate of \$2.00 will be made for the round trip for the first convention of World War Veterans to be held at St. Louis May 8.

**Lake Line Established**

In an endeavor to restore as nearly as possible pre-war conditions, Director General Hines has issued instructions that a lake line be established from Buffalo to Chicago and Milwaukee. The proposed line will operate in connection with all trunk lines to and from Buffalo and the western trunk lines beyond Chicago and Milwaukee in addition to serving the Chicago and Milwaukee territories. To expedite the movement of freight and save excessive terminal work, one dock at Buffalo has been designated as point of interchange for all eastern roads. It is known as the Tift Farm terminal of the Lehigh Valley. Practically the same scale of differential rates under all rail, as were in effect in 1917, has been authorized.

# Railway Developments in Foreign Countries

## The Market for Railroad and Telegraph Supplies in Trinidad; Other Notes of Interest.

**T**HE POLISH DIET is considering bills for the construction of new railways, and it is hoped that construction can begin shortly in order to provide work for some of those whose lack of employment has made them the prey of agitators.

The railroad bridge over the Tornea Elf river in Finland is completed, according to report, and by the present is probably in use, thus establishing the long awaited through railroad communication between Scandinavia, Finland and Russia.

The National Exposition of Venezuela will open between the middle and the end of May. Manufacturers of motors, trucks, agricultural machinery, tools, implements, rolling stock, and farm railways will be permitted to exhibit their goods. It is expected that competition among the various countries interested in this market will be strong, as the farmers of Venezuela are unusually prosperous and in a buying mood.

### Italian Railwaymen's Claims

The executive committee of the Railwaymen's Union, including delegates from every important railroad center, recently met in Rome and passed a resolution urging the government to grant all demands made concerning the new scale of wages and an eight-hour working day.

### British Locomotives in France

In reply to a question in the House of Commons recently, Captain Guest, joint parliamentary secretary to the treasury, said that there were 423 locomotives owned by British railways still retained in France; 36 have been returned, and the remainder are being returned as they can be released, and as speedily as trans-channel facilities permit. There are in addition 786 locomotives in France which are the property of the war department.

### Lubricating Oil Desired by Bulgarian State Railroads

Chargé d'Affaires Charles F. Wilson has transmitted to Commerce Reports from Sofia, Bulgaria, a list of lubricating oils required by the Bulgarian State Railroads. The quantities are as follows (1 kilo equals 2.2 pounds): Engine oil, 1,300,000 kilos; cylinder oil, 500,000 kilos; superheated cylinder oil, 200,000 kilos; axle oil, 600,000 kilos; gas oil, 200,000 kilos; colza, 50,000 kilos; linseed oil, 30,000 kilos; kerosene, 40,000 cases; and benzine, 1,200 cases.

### Dutch East Indies

The continuing prosperity of the islands comprising the territory known as the Dutch East Indies is shown clearly by the extensive plans which the government is making for the extension of the already excellent railroad facilities of the islands. No fewer than seven new systems and extensions are planned, and work on eight lines will begin almost immediately. Sales were made recently in the United States of quantities of railway steel material. It is pertinent in this connection to note the discovery of extensive iron fields on the island of Celebes. The quantity of ore in the surface field on one deposit is estimated at at least 5,000,000 tons, with 155,000,000 tons of clay ore, which can be easily and cheaply mined. Plans for developing the fields, in which the government will have certain rights, are being outlined.

### British Officers of Railways of Argentina to Visit That Country

It is understood that a party of railway officials from England is about to visit the Argentine. Among the number are Sir Henry Bell, chairman of the Buenos Ayres Western, and a director of the Great Southern; Albert E. Bowen, chairman of the Great Southern, and a director of the Western; and Sir Harry Livesey, of a well-known firm of consulting engineers. Some of the directors have been accustomed to visit their Argentine railways annually, but this is the first visit since the outbreak of the war.

### Electrification on the Paris, Lyons & Mediterranean

The Paris, Lyons & Mediterranean Railway Company is proposing, subject to government sanction, to electrify the line between Clermont Ferrand and Nimes, via Alais. The distance is about 130 miles. The necessary power will be obtained by the construction, in the Department of the Lozere, of a barrage or dam near Florac, closing up a small valley, so as to form a fresh-water lake of six miles in circumference. The lake will contain 45,000,000 cubic metres and the water will fall a distance of 500 ft. The cost of constructing the lake and power station is estimated at about \$40,000,000.

### France and the Channel Tunnel

The Channel Tunnel Investigators' Committee, which was constituted by a ministerial decree dated September 3, 1918, and has already held several sittings, reassembled in Paris recently under the presidency of M. Claveille, minister of public works and transports, to consider definitely the conditions for the construction of the tunnel when an agreement has been come to between the British and French governments. It should be understood that while the British government recently announced that it was considering the project, it has as yet announced no definite decision as to whether the plan would be carried out or not.

### Electrification of Swedish Railways

The Swedish State Railway Administration has published a statement to the effect that after investigations regarding the electrification of the entire Swedish railway system, it has come to the conclusion that the plan can be carried out in 30 years at a cost of 192,000,000 kr. The advantages of electrification are that the whole of the power needed can be obtained from eight Swedish electric power stations, the traffic capacity will be considerably increased, and a great saving in staff costs will be effected. Sweden's enormous water power will, in the first place, be made available for this purpose.

### New Railway Laws in Venezuela

New railway laws have recently come into force in Venezuela, which materially affect future construction in that country. Hereafter, the government will no longer guarantee the interest on capital invested in the construction of railways, and all contractors are to be required to make a cash deposit proportionate to the length of the line and the width of the gage in accordance with the following scale: 0.610 metre, or 2 ft. gage, 600 bolivares per kilometre; 0.915 metre, or 3 ft. gage, 900 bolivares per kilometre; 1.08 metre-gage,

1,000 bolivares per kilometre; and 1.435 metre, 4 ft. 8½ in. gage, 1,400 bolivares per kilometre. (One bolivar equals 19.3 cents.) These deposits may be reduced by presidential decree by as much as 15 per cent. A reduction in rates is to be dependent upon the tonnage hauled beyond a certain amount.

### Standard Specifications in Spanish

Industrial Standards No. 29, giving in Spanish the standard specifications for cast-iron locomotive cylinders, as adopted by the American Society for Testing Materials, is the latest of the series of industrial standards to be issued by the Bureau of Foreign and Domestic Commerce. These booklets are designed primarily for distribution in Latin-American countries to assist in introducing American construction and engineering materials. Copies may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., at five cents each.

### Concrete Cars in the Netherlands

The construction of concrete rolling stock for railroads is under way in Holland. Only the wheels, axles, buffers and couplings are made of steel. The weight of cars of the new type is said to be no greater than that of steel cars, the construction is simpler and cheaper, and the upkeep light. This announcement, which is well authenticated, is of special interest in view of the establishment of large steel mills in Holland, and the proposed extensions of the railroads of the Dutch East Indies, a large part of whose material has been bought in the United States in the past, and for which additional orders have been expected.

### New Railway in Colombia

The Department of Bolivar, Colombia, according to Trade Commissioner P. L. Bell, has under consideration the building of a new railroad to connect Cartagena with the line now being constructed north from Medellin in the Department of Antioquia. A light, narrow gage road is to be built, the preference being for an electric line, using Diesel electric locomotives of light weight. The chamber of commerce has secured \$20,000 to defray expenses of the preliminary location and survey of the new line, and there is every evidence that the department will push the work as fast as possible. Although no definite specifications of requirements are available, they are being prepared now. [The name of the official to whom inquiries should be addressed may be obtained from the Bureau of Foreign and Domestic Commerce or its district and co-operative offices by reference to file No. 40197.]

### Mexico Has Lost 10,000 Freight Cars

According to Felipe Pescador, director general of the National Railways of Mexico, revolutionists and bandits have destroyed 10,000 freight cars and many passenger cars during the last eight years. There are now available approximately 16,000 freight cars for handling the traffic of the different divisions of the system which are in operation. The shops of the company are making repairs to damaged cars as rapidly as possible, there being at this time 3,000 of such cars in the yards awaiting shop. Mr. Pescador says that the plan of leasing American cars or permitting them to be employed in handling international traffic is not practicable at this time for the reason the National Railways is so short of locomotives that it is impossible to handle any more cars than are now available in Mexico. If engines could be obtained from the United States it would be a good idea to obtain the use of foreign cars, he thinks. The supply of locomotives for the National Railways is being gradually increased by repairing those that were damaged by internal troubles. At this time there are 380 locomotives in the shops

undergoing repairs. The company also has ordered 20 locomotives from the United States.

### Mexico Now Producing Rails

The iron and steel plants of the Monterey Iron & Steel Company will be running full blast in all of its departments within a few weeks, it is announced. It is now giving employment to about 1,200 men, and the number will be increased to about 2,500 when full operation is resumed. The orders for steel rails are not confined to the National Railways of Mexico, but embrace a number from mining companies and private industrial interests, it is stated. The demand for structural steel is constantly increasing. This comes from the larger cities of the country. The company is now obtaining its iron ore supply from its own ore beds, situated only about 60 miles from Monterey. Formerly its ore supply came chiefly from Iron Mountain, situated at Durango. The Monterey Iron & Steel Company is composed of Italians and the plant represents an initial investment of \$10,000,000 gold.

### Rumania's Need for Railway Equipment

Rumania, with a population of 7,500,000 before the war, was the richest of the Balkan countries, says a publication of the Guaranty Trust Company, New York. Enlarged by the inclusion of great areas formerly attached to Austria, and probably Russia, but inhabited, nevertheless by Rumanians, she will be, potentially, one of the powerful nations of Europe. There is little doubt, in the minds of most observers, that with direct water communication with the United States, via the Bosphorus to the port of Constanza, she will be a larger buyer in the United States, always provided that favorable terms can be arranged. So far, it is said, the Canadian Government has advanced \$25,000,000 for purchases in the Dominion, chiefly of agricultural products. Of 2,000 locomotives in Rumania before the war, the Germans took all but 15. Six hundred must be purchased shortly, and for this purchase approximately \$30,000,000 will be needed. Mechanical equipment of all sorts, clothing, and other supplies are necessary, and purchases probably will be made when the terms can be arranged.

### Priority Traffic in France

Under the terms of a decree published in February, which handed back the control of the French railways to their peace-time administrative control, special provision is made for certain forms of priority traffic, says a recent issue of the Railway Gazette (London). These include the conveyance of demobilized men and soldiers on leave; the evacuation of material; the handling of the food traffic, often for long distances, to meet the requirements not only of French and Allied troops, but also of the civilian population of reconquered and occupied territories; and the import traffic in such essential commodities as coal. It appears that this priority traffic is being conducted under conditions of great difficulty. In a statement to the Minister of Public Works, the president of the Committee of the Ceinture system has pointed out that the operating problems in the army zone are considerable, due to the enforced concentration of the traffic on a limited mileage as the result of destruction by the enemy. For instance, a single section of the Eastern Railway, via Toul and Nancy, is being called on to handle traffic for Alsace, the Rhine Provinces, part of the Ardennes and Belgium; while three lines on the Northern Railway are being simultaneously burdened with the task of assuring the food supplies and the demobilization of the British forces, the Pas-de-Calais coal field traffic, and communications with Belgium and the devastated regions of northern France. The operating difficulties of these two railways, the president

points out, recoil on the other French systems, and so far the employment of locomotives and rolling stock handed over by Germany under the terms of the armistice has not materially relieved matters, owing to the condition in which much of this stock has reached France.

### Railway Construction in Ecuador

The construction of a railway in Ecuador, from the capital (Quito) to Esmeraldas, has long been under consideration; many different contractors have been involved, while almost as many different groups of capitalists have been invited to participate, says the *Railway Gazette* (London). The project has its advocates and its detractors. The latter seem to predominate. But the government is determined to proceed with the building of the line, which has now found contractors who will see the thing through, perhaps. Plans have been prepared which show that the section to Ibarra will have a length of 167 km., and a 3.5 per cent grade. The construction work is estimated to cost between 8,000,000 and 8,500,000 sucres (about \$4,000,000), but the total will probably come out at about one-half as much again. The Ibarra Railway, it is resolved, shall be built in two sections. What is known as the Ibarra section—upon which work was commenced in August, 1917—has less than one-third of its length graded, but, on the other hand, it has completed 6 open and 87 covered culverts.

The Chimbacalle section has 24 kms. graded. The Sibambe to Cuenca Railway is divided into three sections, namely, Sibambe, Cuenca and Chunchi-to-Tambo sections. The Curaray Railway is now practically completed as far as Pelileo, and between 30 and 40 km. of the line are in operation.

### Trinidad Market for Railway and Telegraph Supplies

There is considerable agitation in Trinidad at present, says Consul Henry D. Baker, Trinidad, British West Indies, for better railway service, especially in regard to reliable time schedules and more up-to-date equipment. Cars still have old-fashioned hand brakes, although it is recognized that American air brakes must be substituted in the future. Owing to the high prices of materials and the difficulties in arranging prompt delivery of goods, the roads have been running with decreasing efficiency during the war.

Equipment, consisting of four large and three small locomotives, ironwork for 100 freight cars, and about \$80,000 worth of bridge material, recently ordered by the government railway from England is the first to be purchased in five years. An order consisting of 500 tons of 60-pound rails, English standard, 33 feet in length for relaying track has also been placed in the United States. The latter country would have been a more convenient market for the rolling stock mentioned above, but American manufacturers, on comparatively small orders of this sort, are unwilling to alter their patterns to conform to local specifications. For instance, locomotives here use brass tubes in their boilers and have copper fire boxes instead of steel. The government railway considers uniformity an important factor, as it desires to avoid carrying too great a variety of spare parts in stock, and it is found more convenient to follow British standard specifications.

### PROPOSED IMPROVEMENTS

The railway is arranging for all its locomotives to be equipped with oil burners, and the Legislative Council of Trinidad has just made an appropriation of \$8,640 to purchase two tank cars to carry oil on the government line. Besides having to provide for transportation of its own oil, the road has made contracts with several estates which it can not fulfill without additional cars. These two cars would be the Government's share of an order of ten cars to be

imported from the United States by a large oil-producing company on the island.

The railway is planning to improve the lighting facilities at its workshops and yards and will want two electric-light generators of either 110 or 220 volts, together with an oil engine for each generator of 50-kilowatt capacity. These will probably be purchased in the United States. All passenger trains on this line are illuminated by an American light system, the batteries being located in the brake van or baggage cars. This method of lighting is also to be installed shortly in all the stations of the railway, as it has been found to be more satisfactory and less expensive than the gas-lighting systems used heretofore.

### MILEAGE TO BE INCREASED—REVENUE

The Trinidad government railway has altogether 115½ miles of railway open for traffic. It also has three steamers, two of them used for traffic between Port of Spain and the small islands in the Gulf of Paria, and the other for traffic from San Fernando to Brighton, at the asphalt lake, and to the small towns on the Cedros Peninsula, at the extreme southwestern end of Trinidad, the railway not being extended along the coast south of San Fernando.

There is a public demand for an extension of the government railway to the east and north coasts of the islands. One branch line, which extends from Port of Spain to Sangre Grande, lacks about eight miles of reaching the east coast, and another branch, to Rio Claro, comes within 15 miles of the important cocoanut regions at Mayaro, also on the east coast. There the road will probably be extended, while another extension is planned to go to Salybia and Toco Bays, on the northeastern coast. This would make it possible to have a daily steamer communication between Port of Spain and the island of Tobago, reached now only by a coastal steamer making the trip once a week. While there have been no appropriations for such extensions, yet the Governor of Trinidad in his address opening the Legislative Council several weeks ago, said:

During the past year a committee appointed at your instance has been considering the questions of the improvements and extension of the communications of the colony and the development of its resources. The committee is making good progress in the task assigned to it, and I hope that before the session closes it will be able to lay before you a preliminary report containing recommendations regarding road and railway extensions and the improvement of the Tobago services.

The last report of the government railway, covering the year 1917, shows that the total revenue earned was \$756,652, of which \$717,289 was contributed by the railway proper and the balance by the railway steamers. The expenditures for the same period were \$644,294. The total number of passengers carried in 1917 was 1,701,665 and the freight amounted to 277,370 tons. The chief articles shipped over the line included sugar cane, sugar, molasses, rum, petroleum products, fruits (chiefly oranges and bananas for local use), cedar and other native timbers for export.

### PRIVATE LINES FOR SUGAR ESTATES

In addition to the Trinidad government railway the leading sugar estates of Trinidad also maintain private lines for the conveyance of sugar cane to their factories. The Usine Ste. Madeleine Sugar Co. has about 40 miles of railway through its sugar-cane farms; Waterloo Estate, 20 miles; Caroni Estate, about 15 miles; and the La Fortunee and Hermitage Estates, about 18 miles. Each one requires a certain amount of new rails every year for replacements and extensions, the average being about one-half mile each. The rails used are chiefly those rejected by American railway companies as defective, but as the sugar estates use their lines only for about three months a year, and very little traffic is carried over them, the defects do not matter. The rails weigh as much as 55 pounds a yard and the tracks are standard gage, 4 feet 8½ inches.

The locomotives used on these sugar-cane railways are

four-wheeled and have a 5-foot wheel base, with a maximum weight of 20 tons. They are equipped to use mineral-oil fuel and have no bogies or trailers. The distances are short, but there are often very sharp curves. The sugar-cane trucks or wagons are of 6 to 10 tons capacity, net weight of canes, and have side doors. The canes are loaded into the cars by means of derricks. The sleepers or ties are of local balata wood.

MEANS OF COMMUNICATION TO BE INCREASED

The telegraph department of the government railway has opened 138 miles of telegraph wire exclusive of duplicate wires, and also 116 miles of telephone wire. The total number of messages, public and railway, passing over the wires in 1917 was 114,120.

It is expected that orders will be placed in the United States very shortly for 30 miles of telegraph wire (No. 8 standard wire gage), and also for 35 miles of telephone cables, 10 miles of which will be two-wire cables, and 25 miles, four-wire cables. This will be used for the railway line between Port of Spain and San Fernando, and for communication beyond that to La Brea at the asphalt lake. About 25 new telephone instruments will also be ordered in the United States. The telegraph wire will all be used for replacements.

Comparison of Fuel Cost in 1917 and 1918

THE FUEL conservation section, division of operation, United States Railroad Administration, recently issued a statement showing the increase or decrease in the cost of locomotive fuel on the basis of the pounds used per thousand gross freight ton miles, and per passenger train car mile for the last five months of 1918 compared with the same period in 1917. The period referred to was taken as being reasonably comparable, from the standpoint of uniform weather conditions, absence of any general congested condition or other serious disturbing factor. The following summary of results based on the cost of coal, exclusive of the haul on users rails, is taken from this statement:

REGION	FREIGHT TRAIN SERVICE			PASSENGER TRAIN SERVICE		Estimated total saving for all roads, passenger and freight service	
	Roads for which complete information is available			Total savings	Per cent savings		
	Per cent of total mileage of all roads	Total savings	Per cent savings	Estimated total savings for all roads	Per cent savings		
Eastern—							
New England dist.	36	\$106,169	4.5	\$312,200	L \$278,783	L 6.1	\$33,447
Central dist.	37	1,328,364	11.2	2,297,000	564,338	8.6	2,861,338
Ohio-Indiana dist.	65	349,079	14.0	472,500	63,061	7.1	535,561
Total Eastern	54	1,783,612	10.0	3,061,700	348,646	2.9	3,430,346
Allegheny	66	1,260,053	9.3	1,856,000	101,227	1.4	1,957,227
Poconahontas*	15	.....	.....	.....	38,328	4.6	38,528
Southern	70	145,817	1.3	208,000	98,951	1.7	306,951
Northwestern	57	755,816	7.4	1,337,600	171,460	2.6	1,529,060
Central West-ern	98	1,574,578	6.8	1,597,000	437,130	5.6	2,034,130
South West-ern	97	343,734	3.5	352,000	33,866	0.8	385,866
Grand total all regions	97	\$5,863,610	7.0	\$8,452,300	\$1,229,808	2.8	\$9,682,108

L—Indicates loss.

\*Poconahontas region freight train service total omitted, since information on which to base estimate is inadequate.

In determining the estimated total saving in freight train service for all roads in each region, it has been assumed that the average per cent saving for the whole region is the same as the average per cent saving for the roads in that region for which complete information is available. The grand total saving for all regions has been taken as the sum of the regional totals.

The loss shown in passenger train service for the New England District of the Eastern Region is due to the extra-

ordinary increase in cost of coal used in 1918 compared with 1917. The pounds of coal per passenger train car mile were 6.8 per cent less in 1918, than in 1917. This statement does not include fuel used in mixed or special train service.

Beware of Detours!

GEORGE BRADSHAW, supervisor of safety of the Pere Marquette and associated lines, expands the idea of "safety first" to take in moral and economic questions, as well as matters of bodily safety, and in his latest bulletin (No. 13) addresses the wives of railroad men, reminding them of the importance of providing healthful meals and comfortable and quiet sleeping rooms; of always seeking domestic harmony and of keeping out of debt. On this last point (addressing the husbands as well as the wives) he says:

*Pay cash or go without.*—This is a good rule for every house. In many cases it is best to go without and save the cash. Ordinarily, there is only one justification for going into debt voluntarily, and that is to buy a home at a reasonable price and on reasonable terms.

The installment craze is a facing-point switch, where many a family train has been derailed. The installment method of buying is a detour from the better and safer road called

Copyright, 1919, by George Bradshaw.

Bad Company for a 31 Train Order

"Cash Drive." The firms doing business on the detour road have their tempting window displays and seductive advertisements to make you believe that the detour is not a detour, but the regular highway. Don't you believe it. That road is a detour. It may be the better road for you at certain times; but remember, it's a detour. Careful and experienced tourists are shy of it. There ought to be more happiness pushing a wheelbarrow than riding in a motor car with a mortgage. Can you save? Are you able to console yourself with the philosophy of going without when you want something you can't afford? Can you go without halting right by the show window with its luring diamonds, furs or other things your neighbors have and you want, and head straight for the savings bank in the next block? Can you do that every pay day till the bank cashier in his cage comes to have more attraction for you than the finest show window in the city? If you can, you have stood the acid test.

Major General Sir Henry Worth Thornton, K. B. E., general manager of the Great Eastern Railway of England, and inspector general of transportation in the British army in France, arrived in New York last week on the steamship "Aquitania." General Thornton is on a visit to his mother at Newtown, Pa.

## Proposed Solution of Railroad Problem

By Clinton D. Winant

Formerly Examiner for the Interstate Commerce Commission

THE GOVERNMENT has decided to regulate your business, Mr. Business Man, and this is the method hit upon. We will assume that you are engaged in the manufacture and sale of a great number of different commodities. A commission is appointed with power to determine reasonable rates for all commodities handled by you. This is interpreted to mean that each article sold by you shall yield only a certain fixed profit (say, for example, 6 per cent on the cost of producing the article). In cases coming before it, the commission is not concerned in the general question whether your investment shows a fair return as a whole. It limits its view to the particular case in hand. If the particular price asserted appears to yield a larger return than would be sanctioned on the investment as a whole, the price on that particular article will in all probability be cut. And you, Mr. Business Man, in continuing to talk about a fair return on "your investment as a whole" are simply out of order. You must learn to conduct your business on a basis that will keep the profits on every article the same.

Outside the hearing room Mr. Business Man might well say, "That each commodity sold or service rendered should by itself show a fixed profit is not important and often not possible of realization. In every business the vital thing is that the capital invested be rewarded. The success of any business depends upon the totality of revenue received and not upon the profits derived from any particular article."

But the system of railroad regulation now in vogue continually places upon the stand one single service (i. e., one single transportation unit purveyed by the carrier). If, compared with various other services, the charge appears to be somewhat high the chances are it will be cut. From the nature of the case the general condition of the carrier is lost sight of. After several hundred of such onslaughts what occurs? Under such a system but one result can occur. The road goes into the hands of a receiver.

Now what is the remedy for all this? It is obviously to permit the carrier whenever the *quantum* of a rate is challenged to come into court and say, "Here is my whole schedule of rates. While one single rate may appear high as compared with other rates over my line even under existing rates a fair return on the invested capital is not being earned. We are perfectly willing to alter the present schedule of rates as you see fit. All we seek is a fair return on our capital. But with our present return we do not think it fair for the regulating body to pick out one single rate which it may think high and order it reduced without indicating to us any way whereby the ensuing loss can be made good."

Under the procedure suggested all pending complaints against one carrier which affect merely the *quantum* of its rates could be disposed of by one investigation of the rates as a whole. This would save the enormous duplication of work which now occurs when these cases are considered separately.

The only bulwark which will protect the railroad investor is a law which will secure for him a fair return on his investment. How can this be realized? It is believed by providing that "*the power to reduce a rate or rates or deny an increase when the carrier shows it is not earning a fair return shall not be exercised without first indicating how a fair return can be obtained by some means other than that proposed by the carrier.*"

It would still appear to be the law that an investor in public securities is entitled to a fair return on all moneys invested in the public interest. The question is similar to the one which is at the heart of governmental regulation of the issue of securities. If a proposed expenditure will be in the

public interest, the railroad should be permitted to raise the needed money. Perhaps some governmental certificate to that effect will some day act as a sort of stimulus to the moribund credit of the railroads.

The amount of capital invested in American railroads upon which a fair return may be asked will not be known exactly until the so-called "physical valuation" of the roads is completed. Until such time what may be taken as a fair rate of interest on the invested capital?

Pending the completion of the "physical valuation" the compensation to the carriers provided for in the Federal Control act might well be used as affording a fair return on the capital invested. Of course, an increase in rates sufficient to provide for additional capital necessary for improvements should be allowed when the commission is of opinion that the proposed improvement is in the public interest.

It has been suggested that "the determination of what rate shall be paid should be taken" from the Interstate Commerce Commission while entrusting to it the accounting end of the railroad problem, the maintenance of parity between shippers and places and control over the issuance of securities. With this view, the writer cannot agree.

If it is true that "the commission has failed utterly in this commercial problem of fixing the necessary rate to enable the railroads to prosper and to obtain the needed capital to grow" it is simply because it was not given adequate power. It was given not too much responsibility but too little. It should be made responsible not only that the shipper obtains a reasonable rate but equally responsible that the investor obtains a reasonable return. This reasonable return should be made definite by law so that its power to control rates is affected thereby. Set a standard for the commission, for example, the average annual railway operating income for the three years ending June 30, 1917, as a fair return on each road's investment. If the returns of the roads fall below this standard the curtailment of the carrier's revenue by the condemnation of any rates assailed should not be allowed without the granting of a proper increase in other rates. The commission would then be in a position to deal with the situation effectively. It could order the reduction of one rate while at the same time finding the rates of the carrier generally too low.

The great percentage of cases brought before the commission present upon analysis merely questions of discrimination or undue preference. It would seem that much confusion would be avoided if cases involving the *quantum* of rates were placed upon a separate docket.

### Summary of Remedial Legislation

1. A repeal of the federal control act.
2. When a carrier shows that it is not earning a fair return, no rate should be reduced or increase denied by the commission without first indicating to the carrier how a fair return can be obtained by some other method than that proposed by the carrier.
3. Enactment of the standard set up in the federal control act for compensation to the carrier as the standard of a "fair return" pending the completion of the physical valuation.
4. A complete divorce on the commission's docket of cases involving the *quantum* of a rate as distinguished from cases involving undue preference (i. e., a relationship of rates).
5. The commission should be given power over the issuance of securities of interstate carriers.
6. The commission should have power over all rates of interstate carriers irrespective of whether traffic is interstate or intra-state.
7. The anti-trust laws and anti-pooling provisions of the Act to Regulate Commerce should be repealed in so far as they affect carriers by railroad.

# General News Department

The Committee on Automatic Train Control of the United States Railroad Administration left Chicago on April 28 for a trip of inspection of automatic train stops at Spokane, Wash., San Francisco, Cal., and Oroville, Cal.

The Associated General Contractors of America are preparing to establish a clearing house for workmen, an employment bureau for the service of members of the association. The work will be handled through the office of the secretary at 111 West Washington street, Chicago.

The Strike of 1894 figures in a suit now on trial in Chicago. After 25 years, the suit of the Yazoo & Mississippi Valley, now operated by the Illinois Central, against the city of Chicago for \$20,000 damages has been brought to trial before Judge S. T. Page in the United States Circuit court. The suit is for loss by the destruction of freight cars at the time of that noted strike when federal troops were called to guard property. Many of the witnesses called at the opening of the court were reported dead.

J. R. Holman, formerly (to September, 1915) chief engineer of the Oregon-Washington Railroad & Navigation Company, now colonel in command of the Eighteenth (railway) Engineers, at Bordeaux, France, has been awarded a Distinguished Service Medal. The order of General Pershing, dated March 27, commends Colonel Holman in connection with his supervision of construction in the vicinity of Bordeaux, for the display of "unusual judgment and great executive ability"; and in addition, "he rendered valuable services and advice to the other departments of Base Section No. 2."

The American Short Line Railroad Association announces that an important meeting of all short line railroads in the United States will be called to be held at Washington, D. C., about June 1, or as soon as President Wilson announces the date for the extra session of Congress. The special object to be considered is the legislation necessary to increase and protect transportation facilities, especially the short line railroads. It is planned to hold a three-day meeting about 10 days after Congress meets, and to have each session addressed by a prominent speaker interested in transportation problems. The proposers expect to have a very large attendance.

The Chicago section of the American Institute of Electrical Engineers and the electrical engineering section of the Western Society of Engineers held a joint meeting in Chicago on April 28. An interesting paper on "Wireless Telephony and Telegraphy in the War" was presented by A. A. Oswald of the Western Electric Company, New York. Mr. Oswald, during the war, was research engineer on the development of wireless telephony and telegraphy. He treated in a general way the apparatus which has been developed and its various uses in connection with military and naval warfare for land, air and water service. A number of slides were shown to illustrate the various types of apparatus in use and the diagrammatical charts of the sending and receiving stations in the fighting zones.

## Railway Projects in South Dakota

Reports from South Dakota show that organizations are being formed to advocate the building of railway extensions. In the southern part of the state west of the present terminal of the Chicago & North Western at Winner, S. Dak., there is a large section of the state which has been rapidly developing during the past four years and which is asking for better railroad facilities. A similar move is being made in Meade county, where the effort is to have either the Chicago, Milwaukee & St. Paul extend southwest from its present terminus at Faith or the Chicago & North Western to extend

from its present terminus at Newell east into that territory. Improvements on the Chicago, Milwaukee & St. Paul in this territory continue to be made and heavier rails have been laid between Aberdeen, S. Dak., and Mobridge. A cut off to save several miles has also been built near Mobridge.

## Certificates of Indebtedness

The Railroad Administration up to May 1 had issued its certificates of indebtedness to railroads on account of compensation to meet the April and May requirements, to the amount of about \$76,000,000. It had issued certificates of indebtedness to the equipment companies for cars and locomotives to the amount of about \$17,000,000. The exact total of certificates issued for these two purposes was \$94,267,733.

## American Railroad Association

### Moves Chicago Headquarters

The American Railroad Association has moved its Chicago offices from the Transportation building, 608 South Dearborn street, to the Manhattan building, 431 South Dearborn street, where the entire fourteenth floor has been secured for its offices and those of the railway associations which have been merged or affiliated with it. The office of the secretary of the Master Mechanics' and Master Car Builders' associations has been moved to the same building, and also that of the secretary of the American Railway Engineering Association, heretofore in the Karpen building.

## Large Safety-First Meeting at Cleveland

Officers and employees of the New York Central Lines, to the number of more than 400, attended an enthusiastic safety meeting at the Statler hotel, Cleveland, Ohio, on Friday, April 25, and enjoyed an elaborate program prepared by General Safety Agent M. A. Dow. Among the guests present were A. F. Duffy, manager of the safety section of the United States Railroad Administration, and other representatives of the government, and W. G. Lee, president of the Brotherhood of Railroad Trainmen. Addresses were given by Mr. Dow, Mr. Lee, and others. W. R. Rasmussen, representing the National Safety Council, said that that organization intended to open headquarters in Ohio or Indiana. Mr. Rasmussen said that he found the New York Central highly praised for its safety work in all parts of the country and in all industries. Mr. Duffy gave credit to the New York Central for the plan and standards which have been adopted by the Railroad Administration in the establishment of safety committees all over the country.

## Waterways Convention

The second annual convention of the Mississippi Valley Waterways Association was held at St. Louis, Mo., on April 18, at which resolutions were passed urging the Railroad Administration to extend the same service and operation of boats on tributaries of the Mississippi as exist on trunk lines and the extension of joint rail and river rates by the government. Other resolutions were passed urging that the jurisdiction of the Interstate Commerce Commission be extended to waterway problems, that Congress appropriate \$100,000,000 for the completion of improvements on the Mississippi river and its tributaries and the establishment of a fleet of four towboats and 24 barges for hauling freight on the upper Mississippi.

The projects already approved by Congress, but for which it has not as yet provided funds, include the completion of a 6 ft. channel on the Mississippi river from Minneapolis to St. Louis, a 9 ft. channel from St. Louis to New Orleans, a 6 ft. channel

from Kansas City, Mo., to St. Louis in the Missouri river and a 9 ft. channel in the Illinois river from Utica, Ill., to St. Louis; completion of the remaining three locks on the Ohio river, making that stream navigable from Pittsburgh, Pa., to Cairo, Ill., and the admission of the Tennessee river into membership in the eighth district of the association. James E. Smith, of St. Louis, was re-elected president of the association.

### A Transportation Corps in Northern Russia

According to the March 8 issue of "Rails and Sails," the publication of the Transportation corps with the American Expeditionary Force in France, 720 men of the Transportation corps have left France for Russia. This force is divided into two companies of 360 men each and has been designated as the North Russian Transportation Corps Expeditionary Force. These men are going to Russia by order of President Wilson in response to a request by the British for railroad troops to operate on the line of communication from the Murman Coast south to the Bolshevik front. In commenting on the organization of the new expeditionary force the "Rails and Sails" says that when the call was issued for volunteers five or six times as many men offered their services as were needed. The two companies sailed for England the latter part of March, and from there they sail to Russia. Major E. E. MacMorland, Coast Artillery corps, who has been on duty in the office of the Director of Military Affairs, has been placed in command of the expedition.

### Proposed State Purchase of the Denver & Salt Lake

Various reports of the contents of the Steele bill passed by the Colorado House of Representatives and Senate and providing for the acquisition and operation of the Denver & Salt Lake and the boring of the James Peak tunnel have been made. Yet few of the reports contain the true provisions included in this act. The first section of the bill calls for the appointment of a state railroad commission consisting of five members to be appointed by the governor with the consent of the Senate. The powers and duties of the commission so formed are specifically described in the bill. Provision is made for the condemnation of railroads operating wholly within the state, to empower this commission to institute proceedings in eminent domain and for the condemnation of the Denver & Salt Lake, to the end that the state may acquire and operate this road. The commission is also instructed to ascertain the approximate cost of purchase and such condemnation, to ascertain the approximate cost of construction and equipment for operation by electricity of the James Peak tunnel upon the line of the Denver & Salt Lake, to ascertain the approximate cost of extension, including equipment, of the Denver & Salt Lake from the present terminus at Craig, Colo., by the most feasible route to the western boundary line of the state and from its present line near McCoy, Colo., to a junction with the Denver & Rio Grande at Dotsero, Colo. When the approximate amount has been ascertained, there will be submitted to the voters of the state a constitutional amendment providing for the issuance of 30-year 4½ per cent bonds of the state sufficient in amount to pay for the condemnation, the construction of the James Peak tunnel and the extensions mentioned. Similar powers are given to the railroad commission to take action in regard to any railroad whose lines are entirely within the state of Colorado.

### New York Central Rally

In New York City on Tuesday afternoon, April 29, the New York Central held a grand rally which was a combination of a welcome home to seven hundred employees of the road who have been in the military or naval service, and have returned to the railroad, and a gathering for stimulating subscriptions to the Victory Loan. Of the thousands of employees of the railroad who served their country in the great war, over 1,000 have returned; but this gathering included only those in and near New York City. The announcement of this meeting says, by the way, that many of these returned soldiers are being employed in better positions than they had when they went away. This rally was

held out of doors, on Park avenue, north of the Grand Central Terminal. This avenue, about 150 ft. wide, is built on the roof of the Grand Central Terminal yard, and its broad open spaces have been beautified with elaborate decorations, including columns, flags and heroic figures. There is an immense pyramid, covered with 12,000 German helmets, and the street is temporarily named "Victory Way."

Many thousands of the employees, men and women, from the general offices and other departments, attended the rally, and two hundred young women from the offices mingled with the crowd selling Victory notes. From the windows of the ten-story army hospital immediately east of the "Victory Way" hundreds of wounded soldiers looked down on the scene.

The chairman of the meeting was Marcus A. Dow, chief of the New York Central Safety Department, and among the speakers, besides officers of the road, were William G. Sharp, former ambassador to France, and Colonel William Barclay Parsons, commander of the Eleventh Engineers, just returned from Europe.

### Telegraph and Telephone Systems to Be Returned

Postmaster General Burleson has ordered the return of the marine cable systems, the operation of which was assumed by the government on November 2, to their owners as of midnight, May 2, and has announced that the telegraph and telephone lines will be returned to the various companies as soon as legislation can be secured from Congress safeguarding the interests of their owners. This announcement was made after the postmaster general had been subjected to a great deal of criticism for his handling of the telegraph and telephone lines. In a public statement he said that at the time the government took over the control of the wires extraordinary and abnormal conditions existed, resulting in a constantly increasing and very high operating cost which has necessarily continued, and with the early coming of the armistice the accentuated cost of operation, diminishing revenues and the uncertainty in the period of government control, presented such a situation that those in charge for the government were able to accomplish but little by way of unification or to go forward with their policies of economy and consequently were soon brought face to face with a very serious problem. The only answer, he said, was an increase of rates, which was necessary and in no sense tends to refute the soundness of the contention that through government ownership savings would be effected that would result in a reduction of rates. The postmaster general reiterates his belief that a complete unification of the various wire systems should be brought about through government ownership and operation as a part of the postal establishment and declares that the present control affords no more a test of the virtues of government ownership than could be had through a temporary receivership in a court proceeding. The postmaster general has not changed his mind, he says, but as it is apparent that government ownership does not meet with the approbation of the new Congress there is but one course to pursue, which is to return the properties to their owners after urging proper legislation. It was announced that the President had approved of the proposed step.

### Victory Loan Subscriptions

The Railroad Administration had received up to Wednesday the following reports regarding the progress of the Victory Loan among railroad employees:

The Northwestern region reported for the first eight days, out of a total of 251,783 employees, 128,936 or 51.21 per cent subscribed \$12,244,650. As compared with the first eight days of the fourth liberty loan, this is a decrease of 53,894 subscribers and \$6,537,300.

The Southern region reported for the first six days, out of a total of 243,500 employees, 41,771 or 18.75 per cent had subscribed \$4,519,000, a decrease of \$2,800,250 as compared with the fourth liberty loan.

The Lawrenceville Branch Railroad had subscribed 100 per cent to the Victory Loan on April 23, and the Cincinnati, Burnside & Cumberland River had subscribed 100 per cent on April 25. The Southwestern region reported that up to and including

April 28, out of a total of 167,969 employees, 68,767 or 40.1 per cent had subscribed \$6,751,700.

The Pochontas region reported up to and including April 28, out of a total of 51,389 employees, 11,148 or 21.69 per cent had subscribed \$1,076,000.

The Central Western region reported for the first eight days, out of a total of 304,960 employees, 159,904 or 52 per cent had subscribed \$14,872,050, a decrease of \$3,498,290 as compared with the fourth loan.

The Allegheny region reported up to and including April 28, out of a total of 382,545 employees, 135,337 or 35.37 per cent had subscribed \$10,797,100.

The Eastern region reported up to and including April 28, out of a total of 334,995 employees, 151,320 or 43 per cent had subscribed \$14,474,750.

L. S. Taylor, federal manager of the Pullman Car Lines, reported that up to and including April 29, out of a total of 21,065 employees, 10,489 or 50 per cent had subscribed a total of \$848,100. H. S. Noble, federal manager of the New York-New Jersey Canal Sections, reported that the New York Canal Section had subscribed \$3,000, and that out of a total of 34 employees, 22 of them had subscribed. E. R. Richardson, of the Coastwise Steamship Lines in New York, reported that the employees of those lines had subscribed a total of \$83,600.

This makes a total of \$65,669,950 subscribed to the Victory Loan by employees of the Railroad Administration.

### Railway Regiments Return

The 13th Railway Engineers, recruited mainly from Chicago railroad men, arrived in New York on April 28, after service of a year and a half on French military railways. The history of the American Expeditionary Forces shows that this was the first American engineering regiment in France and the first American regiment of any kind to come under actual shell fire. Among the enviable records established by it in handling the strategic railways immediately behind the lines was the moving of 103 trainloads of men, ammunition, ordnance and supplies to the front lines during the Argonne drive within a period of 24 hours. Except for the men who died or were wounded in France and thirteen men who volunteered for service with the North Russian Transportation Corps Expeditionary Force and who are now on their way to Russia, the 13th Engineers returned complete. The regiment was in command of Colonel C. N. Whiting, formerly superintendent of the Chicago, Milwaukee & St. Paul at Butte, Mont. Colonel Whiting succeeded Colonel N. L. Howard, of Chicago, the son of E. A. Howard, vice-president of the Chicago, Burlington & Quincy and formerly division superintendent of the Chicago, Burlington & Quincy at Hannibal, Mo.

The 13th Engineers sailed for France on July 21, 1917, and spent 21 months and five days in service in the "zone of advance." The regiment was taken to France by Colonel William C. Lanfit, a regular army officer, who was succeeded soon after the regiment's arrival overseas by Colonel Kootz, who in turn was succeeded by Colonel Howard, who remained with the organization until after the signing of the armistice. All of the men, supplies, ammunition and ordnance supplied to the American troops in the St. Mihiel and Argonne drives were transported by the 13th Engineers, who in addition to their work in the Argonne drive built special spur tracks for the American naval guns which were used in that engagement.

Committees have been appointed from the Illinois Central, the Chicago & North Western, the Atchison, Topeka & Santa Fe, the Chicago, Rock Island & Pacific, the Chicago Great Western and the Chicago, Milwaukee & St. Paul—the six roads from which the 13th Engineers were recruited—to make plans for a great reception of the regiment at Chicago. These plans are in charge of W. L. Park, federal manager of the Chicago Great Western.

Plans are being made in St. Louis, Mo., for the reception of the 12th Regiment of Railway Engineers, recruited mainly in St. Louis and adjacent territory, which arrived in New York on April 26. The war department has given permission to the regiment to stop over in St. Louis on its way to Camp Funston, Kan., for demobilization. Colonel F. G. Jonah, chief

engineer of the Katy-Frisco lines, will meet the organization in New York and accompany it to St. Louis, as the representative of the St. Louis Railway Club. The entertainment and reception in St. Louis will be sponsored by the Engineers' Club of St. Louis, the Ladies Auxiliary of the 12th Regiment and the St. Louis Railway Club.

Soldiers of the 117th, and the 18th engineer regiments also arrived in New York on Monday of this week. The 117th regiment was recruited mostly in North and South Carolina. These men built bridges between Luneville and Sedan. Many of the officers and men have decorations. This regiment saw severe service and lost 237 men killed. The 13th regiment lost only 13 men.

### Exhibits at June Conventions

Secretary J. D. Conway, of the Railway Supply Manufacturers' Association, Oliver building, Pittsburgh, Pa., has advised us that by utilizing various odd spaces as well as the front porches on the Million Dollar Pier at Atlantic City, a total of 92,755 square feet of exhibit space has been obtained for the conventions of the Master Car Builders' and the Master Mechanics' Associations next June. This is 5,395 square feet in excess of the space assigned in 1913, that being the banner year for exhibits.

Through an error, two names were left off of the exhibit list which was published in the *Railway Age* of April 18: The Vapor Car Heating Company, Inc., Chicago, and Harry Vissering & Company, Inc., Chicago. Three changes should be made in the list as published. Gray & Davis, Inc., should be changed to Unit Railway Car Company, Boston; the Good-year Tire & Rubber Company has withdrawn as an exhibitor, and the Southern Foundry & Machine Company should be shown as Southwark Foundry & Machine Company, Philadelphia.

The following names should also be added to the list of exhibitors:

Beatty Machine & Mfg. Co., Hammond, Ind.  
 Brewster, William, Company, New York.  
 Crucible Steel Co. of America, Pittsburgh, Pa.  
 Electric Controller & Mfg. Co., Cleveland, O.  
 Electro Dynamic Co., Bayonne, N. J.  
 Graver, William, Tank Works, Chicago.  
 Hanna, The, Locomotive Stoker Co., Cincinnati, O.  
 Kerite, The, Insulated Wire & Cable Co., New York.  
 Keyoke Railway Equipment Co., Chicago.  
 Liberty Mfg. Co., Pittsburgh, Pa.  
 Pratt & Whitney Co., New York.  
 Railway Devices Co., St. Louis, Mo.  
 Rogers' Journal Packing Co., Chicago.  
 Standard Railway Equipment Co., New Kensington, Pa.  
 Swind Machinery Co., Philadelphia, Pa.  
 Wilson Welder & Metals Co., Inc., New York.

### June Signal Meeting

The next meeting of the Signal Division of the American Railroad Association (formerly the Railway Signal Association) will be held at "The Breakers," Atlantic City, N. J., on Thursday and Friday, June 26 and 27. The Journal of Proceedings, containing the reports of committees which will be dealt with at this meeting, is to be issued about June 7. Members are asked to make their reservations at the hotel at an early date. The rates at the hotel range from \$3.00 a day, European plan, for a room without private bath, occupied by one person, to rooms with private bath, occupied by two persons, at \$7 to \$14; and, on the American plan, from \$6 or \$7 a day for room without private bath, occupied by one person, to \$20 for a room with private bath occupied by two persons.

H. S. Balliet, secretary of the signal division, announces the removal of his headquarters, on May 15, from Bethlehem, Pa., to 75 Church street, New York City.

### St. Louis Railway Club

On Tuesday evening of this week the St. Louis Railway Club listened to a paper by Carl R. Gray, former director of the division of operation of the United States Railroad Administration, on the operation of the railroads by the government under war conditions, in which he dwelt particularly on his experiences in the early days of federal control. The paper was discussed by B. F. Bush, regional director, and others.

## Air Brake Association Convention

The 26th annual convention of the Air Brake Association will be held at the Hotel Sherman, Chicago, on May 6. The Railroad Administration has requested regional directors to send as many as possible of their air brake men to this meeting and the attendance is expected to be greater than at any previous convention.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

**AIR BRAKE ASSOCIATION**—F. M. Nellis, 165 Broadway, New York City. Next convention, May 6-8, 1919, Chicago.

**AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS**—F. A. Pantiou, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

**AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS**—E. H. Thayer, St. Louis-San Francisco R. R., St. Louis, Mo.

**AMERICAN ASSOCIATION OF FREIGHT AGENTS**—R. O. Wells, Illinois Central, Chicago. Next meeting, June 17-20, Cleveland, Ohio.

**AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS**—J. E. Quick, Port Huron, Mich.

**AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS**—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

**AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS**—J. Rothschild, Union Station, St. Louis, Mo.

**AMERICAN ELECTRIC RAILWAY ASSOCIATION**—E. B. Burritt, 8 W. 40th St., New York.

**AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION**—F. C. J. Dell, 50 E. 42nd St., New York.

**AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION**—Otto E. Schlinck, 185 W. 5th St., Peru, Ind. Next convention, June 2-5, Marquette Hotel, St. Louis, Mo.

**AMERICAN RAILROAD ASSOCIATION**—J. E. Fairbanks, 75 Church St., New York.

Operating Section (including former activities of Association of Railway Telegraph Superintendents and Railway Storekeepers' Association).

Engineering Section (including former activities of Railway Signal Association).

Mechanical Section (including former activities of Master Car Builders' and Master Mechanics' Association).

Traffic Section (including former activities of Freight Claim Association).

Transportation Section (including former activities of Association of Transportation and Car Accounting Officers).

**AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION**—C. A. Lichty, C. & N. W. Ry., 319 N. W. 1st Ave. Austin Station, Chicago. Next convention, October 21-23, 1919, Cleveland, O.

**AMERICAN RAILWAY ENGINEERING ASSOCIATION**—E. H. Fritch, 910 Michigan Ave., Chicago.

**AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION** (see American Railroad Association, Mechanical Section)—Acting Secretary, V. R. Hawthorne, 735 Transportation Bldg., Chicago. Next annual convention, June 23-25, 1919, Atlantic City, N. J.

**AMERICAN RAILWAY PERISHABLE FREIGHT ASSOCIATION**—E. F. McPike, 135 E. 11th Place, Chicago. Regular meetings, 2d Wednesday in March and September.

**AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION**—R. D. Fletcher, 6202 Greenwood Ave., Chicago. Next convention, August 27-29, Hotel Sherman, Chicago.

**AMERICAN SOCIETY FOR TESTING MATERIALS**—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Next meeting, June, 1919, Atlantic City, N. J.

**AMERICAN SOCIETY OF CIVIL ENGINEERS**—Charles W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York. Next annual convention, June 17-20, Hotel Radisson, Minneapolis, Minn.

**AMERICAN SOCIETY OF MECHANICAL ENGINEERS**—Calvin W. Rice, 29 W. 39th St., New York.

**AMERICAN SHORT LINE RAILROAD ASSOCIATION**—T. F. Whittelsey, 708 Union Trust Bldg., Washington, D. C.

**AMERICAN TRAIN DESPATCHERS' ASSOCIATION**—D. L. Darling, Northern Pacific Ry., Spokane, Wash. Next convention, June 17-20, Hotel La Salle, Chicago.

**AMERICAN WOOD PRESERVERS' ASSOCIATION**—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md.

**ASSOCIATION OF MANUFACTURERS OF CUTTED CAR WHEELS**—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.

**ASSOCIATION OF RAILWAY CLAIM AGENTS**—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J.

**ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS**—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Next meeting, October, 1919, Chicago.

**ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS** (see American Railroad Association, Operating Section)—W. L. Connelly, N. Y. C. R. R., Gibson, Ind.

**ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS** (see American Railroad Association, Transportation Section)—G. P. Conard, 75 Church St., New York.

**BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION**—M. J. Trece, Chicago, Bridge & Iron Company, Chicago. Next annual convention, October 21-23, 1919, Cleveland, O.

**CANADIAN RAILWAY CLUB**—James Powell, 46 Aberdeen Ave., St. Lambert (near Montreal), Que. Next meeting, 2d Tuesday in May, 1919, Windsor Hotel, Montreal, Que.

**CAR FOREMEN'S ASSOCIATION OF CHICAGO**—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

**CENTRAL RAILWAY CLUB**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November, and 2d Friday in February, March, May and September, Hotel Statler, Buffalo, N. Y.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION**—W. R. McMunn, New York Central, New York.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION**—D. B. Wright, Lehon Company, 45th and Oakley Sts., Chicago.

**EASTERN RAILROAD ASSOCIATION**—D. G. Stuart, Washington, D. C. Next annual meeting, May 8, 1919, Railroad Club, New York.

**FREIGHT CLAIM ASSOCIATION** (see American Railroad Association, Traffic Section)—Lewis Pilcher, R. F. & P., Richmond, Va.

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO**—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION**—A. L. Woodworth, B. & O., Lima, Ohio. Next convention, August 19-21, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION**—I. G. Crawford, 702 E. 51st St., Chicago. Next meeting, May 19-22, 1919, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION**—Wm. Hall, 1061 W. Wabasha Ave., Winona, Minn. Next convention September 2-5, 1919, Hotel Sherman, Chicago.

**MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION**—F. W. Hager, 1323 Huey Ave., Ft. Worth, Tex. Next annual convention, October 21-23, 1919, St. Louis, Mo.

**MASTER BOILER MAKERS' ASSOCIATION**—Harry D. Vought, 95 Liberty St., New York. Next meeting, May 26-29, 1919, Hotel Sherman, Chicago.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA**—A. P. Dane, B. & M., Reading, Mass. Next meeting, September, 1919, Chicago.

**MASTER CAR BUILDERS' ASSOCIATION** (see American Railroad Association, Mechanical Section)—Acting Secretary, V. R. Hawthorne, 746 Transportation Bldg., Chicago. Next annual meeting, June 18-21, Atlantic City, N. J.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES' COMMISSIONERS**—James B. Walker, 49 Lafayette St., New York City. Next annual convention, October 14, 1919, Indianapolis, Ind.

**NATIONAL FOREIGN TRADE COUNCIL**—O. K. Davis, 1 Hanover Square, New York.

**NATIONAL RAILWAY APPLIANCE ASSOCIATION**—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago.

**NEW ENGLAND RAILROAD CLUB**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

**NEW YORK RAILROAD CLUB**—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

**NIAGARA FRONTIER CAR MEN'S ASSOCIATION**—George A. J. Hochgrebe, 623 Erie Bldg., Buffalo, N. Y. Regular meetings, 3d Tuesday in each month, Tenison H., Buffalo, N. Y.

**PACIFIC RAILWAY CLUB**—W. S. Wollner, 64 Pine St., San Francisco, Cal. RAILWAY ACCOUNTING OFFICERS' ASSOCIATION—E. R. Woodson, 1116 Woodward Bldg., Washington, D. C. Next annual meeting, June 11, 1919, Hotel Commodore, New York.

**RAILWAY BUSINESS ASSOCIATION**—Frank W. Noxon, 30 Church St., New York.

**RAILWAY CLUB OF PITTSBURGH**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month except June, July and August, Colonial Annex Hotel, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION**—D. C. Welty, Missouri Pacific R. R., St. Louis, Mo.

**RAILWAY ELECTRIC SUPPLY MANUFACTURERS' ASSOCIATION**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION**—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

**RAILWAY PHOTOGRAPHERS' ASSOCIATION**—G. L. Ball, St. Louis-San Francisco Ry., St. Louis, Mo.

**RAILWAY REAL ESTATE ASSOCIATION**—James P. Nelson, President, C. & O., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION** (American Railroad Association, Engineering Section, Signal Division, H. S. Balliet, Bethlehem, Pa.: after May 15, 75 Church St., New York. Stated meeting, on Monday, before 3d Tuesday in March, Chicago.

**RAILWAY STOREKEEPERS' ASSOCIATION**—J. P. Murphy, N. Y. C. R. R., Box C, Collinwood, Ohio.

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION**—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Next annual meeting, June 18-25, 1919, Atlantic City, N. J.

**RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION**—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION**—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 16-18, 1919, Chicago.

**ST. LOUIS RAILWAY CLUB**—B. W. Fernald, Union Station St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION**—F. W. Edmunds, West Nyack, Rockland County, New York.

**SOCIETY OF RAILWAY FINANCIAL OFFICERS**—L. W. Cox, 127 Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND SOUTHWESTERN RAILWAY CLUB**—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS**—E. W. Sandwich, West-ern Ry. of Ala., Atlanta, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION**—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.

**TRACK SUPPLY ASSOCIATION**—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Next annual convention, September 16-18, 1919, Auditorium Hotel, Chicago.

**TRAVELING ENGINEERS' ASSOCIATION**—W. O. Thompson, N. Y. C. R. R., Cleveland, O. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

**WESTERN ASSOCIATION OF SHORT LINE RAILROADS**—Clarence M. Oddie, Mills Bldg., San Francisco.

**WESTERN RAILWAY CLUB**—A. F. Steubing, 750 Transportation Bldg., Chicago. Regular meetings 3d Monday in month, except June, July and August.

**WESTERN SOCIETY OF ENGINEERS**—Edear S. Nethercut, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except July and August.

## Traffic News

Grain loading on railroads under federal control up to April 19 this year has amounted to 330,800 car loads as compared with 342,964 in the corresponding period of last year.

F. M. Renshaw, assistant manager of the traffic department of the Cincinnati (Ohio) Chamber of Commerce, has been promoted to acting manager of the traffic department, to succeed Guy M. Freer, who recently resigned to take a position with the Central Coal Association.

A milling and grain division has been organized in the Traffic Club of Minneapolis to co-operate in the adjustment of traffic problems and to protect grain and milling interests. The officers of the division are: President, Otto Mortenson, Cargill Elevator Company; vice-president, E. C. Best, Washburn-Crosby Company; secretary-treasurer, J. H. Mashek, of the F. R. Milling Company.

The Farmers' Educational and Co-operative Union, at a recent convention held in Denver, Colo., passed resolutions asking Congress to grant a storage fee of two cents a bushel to farmers who store their own wheat and calling for the placing of an embargo on Oriental vegetable oil. Contrary to reports, no resolutions were passed at this convention concerning the solution of the present railroad problem.

The directors of the Texas Industrial Traffic League have announced their opposition to the efforts being made by New Orleans interests to obtain government ownership and private operation of all boats of the United States. They further declared themselves heartily in favor of the plan advocated by Chairman Hurley of the Shipping Board providing for private ownership and operation of the boats subject to the jurisdiction of the United States Shipping Board.

Producers of crude oil in Texas have formed the Texas Petroleum Refiners' Association for the purpose of obtaining favorable freight rates for the Texas industry. E. P. Byars, traffic manager of the Fort Worth (Tex.) Freight Bureau, is to be counsel of the new organization. A. J. Scrivner, assistant traffic manager of the Fort Worth Freight Bureau, will assist Mr. Byars as secretary-traffic manager of the new organization. M. A. Bundy, Wichita Falls, Tex., has been elected president and J. K. Gilgour, also of Wichita Falls, has been elected vice-president of the association.

In Arkansas the widespread use of automobiles has reduced the passenger traffic on some branch railroads by about fifty per cent. This statement was made by B. F. Bush, regional director, in a plea before the Texas State Railroad Commission against the proposed order to reinstate certain passenger trains on some of the railroads. He said that the automobile traffic has cut into the railroad passenger earnings severely. The traffic on the main lines as well as on branches has been seriously affected. While the figures for Texas have not yet been compiled, it is estimated that the showing will be fully as great as in Arkansas, so far as reduction of passenger traffic on branch lines is concerned. With the building of good highways and the restoration of business to normal the number of automobiles and the extent of their use for long distance travel will increase.

The New Orleans (La.) Joint Traffic Bureau, an organization of which the constituent bodies are the local Board of Trade, the Cotton Exchange, the Association of Commerce, the Board of Commissioners and the Public Belt Railway, has started a "campaign" against the recent action of the Chicago Passenger Traffic Committee, which eliminates optional routing by way of New Orleans on passenger traffic from Chicago, St. Louis, and Memphis, to points in California. The Bureau says that the route by way of New Orleans has been used extensively in the past, that the stop-over privilege has been of benefit to New Orleans, and that under the action proposed a trip by way of that city would cost \$18 more from Chicago and \$10 more when from Memphis. The Bureau further maintains that since the Railroad Administration did not see fit to eliminate this routing even during the war, there is no necessity to make the change now. Protests have been sent to Max Thelen, director of the Division of Public Service.

### Business Men's Association vs. Chamber of Commerce

The Shore Chamber of Commerce, Atlantic City, N. J., as reported in a Philadelphia paper, has "sounded the knell" of \$1 excursions from Philadelphia to Atlantic City the coming summer by declining to join in a movement started by the Fourth Ward Business Men's Association to get a reduction of the rate from \$1.25 and war tax. The Chamber of Commerce has issued a statement saying: "Considering the marked increase in the expense of operating railroads, we do not see on what grounds the increase of twenty-five cents was criticized. It was only by exerting influence from every angle that we were able to have it reduced last summer from the \$1.79 rate then prevailing. It would be beneficial to Atlantic City if the further reduction were possible, but we do not think the time is ripe to even ask for it."

## Commission and Court News

### Interstate Commerce Commission

The Commission has appointed a board of referees, in accordance with the provisions of the federal control law, to determine the just compensation of the Boston, Cape Cod & New York Canal Company, for the use of its canal under government control. The board will consist of J. B. Eastman, commissioner; J. J. Hickey, chief of the bureau of inquiry, and A. G. Hagarty, examiner attorney.

The Commission has received a petition from Director General Hines, asking that the "Michigan percentage cases" be reopened, as there are now pending against the director general complaints filed by various Indiana and Ohio cities attacking their percentage bases, resulting from the commission's decision in this case. It was held by the commission that rates between eastern trunk line territory and certain Michigan communities were so constructed as to give undue preference to cities in Ohio and Indiana, and to Detroit. Rates then put into effect have lately been declared to be discriminatory as against North Bend, Elkhart, Mishawaka, Goshen and Napanee, Ind. The only way to remove the discrimination resulting from the obedience of the carriers to the commission's order, Director General Hines states, is to change the bases now in effect, on which the rate structure in Michigan is built. He further avers that the South Bend case, the first to come up, is of greatest importance to the government in relation to its management of the railroads, in that a decision adverse to the government would be disastrous to the revenues and to the historical percentage structure of rates between eastern trunk line and Central Freight Association territory.

In *Natchez Chamber of Commerce v. Aransas Harbor Terminal Railway Company et al.*, the commission finds that: Class rates between Natchez, Miss., and Texas points are unreasonable and unduly prejudicial to the extent that they exceed rates between Shreveport, La., and Texas points. Class rates between Natchez and Houston-Galveston group are found unduly prejudicial in so far as they exceed rates between Shreveport and Texas points in common-point territory. Carload rates on cattle, horses, and mules from Texas points to Natchez are found unduly prejudicial to the extent that they exceed, for distances of 750 miles or less, the rates from Texas points to Shreveport, and, for distances greater than 750 miles, the rates from the same points to Shreveport by more than 6 cents per 100 lb. Carload rates on salt from Grand Saline, Tex., to Natchez, Miss., are found unduly prejudicial to the extent that they exceed rates from Grand Saline to Vicksburg and New Orleans. Carload rate of 23 cents on cement plaster from Acme and Plasterco, Tex., to Natchez found to be unduly prejudicial to the extent that it exceeds rates from the same points to New Orleans and Vicksburg, and unreasonable to the extent that it exceeded 18 cents per 100 lb. prior to June 25, 1918, and subsequent to that date to the extent that it exceeded and exceeds 20 cents per 100 lb. Portions of fourth-section applications of defendants are denied.

### Commission Prescribes Tap Line Divisions

By an order entered on July 29, 1914, the commission fixed the maxima of allowances or divisions out of the rates of interstate shipments of lumber and forest products that may be received by the tap lines involved in its investigation. The general rate advance ordered by the director general last June increased the rates on lumber and forest products 25 per cent, no increase to be more than 5 cents per 100 lb. The commission has now ordered that after June 1 the divisions which may be paid to tap lines shall not exceed the following amounts: for switching a distance of 1 mile or less from the junction, \$2.50 per car; over 1 mile and up to 3 miles from the junction, \$3.50 per car; on shipments from

points over 3 miles and not more than 6 miles from the junction, 2 cents per 100 lb.; over 6 miles and not more than 10 miles from the junction, 2½ cents per 100 lb.; over 10 miles and not more than 20 miles from the junction, 3 cents per 100 lb.; over 20 miles and not more than 30 miles from the junction, 3½ cents per 100 lb.; over 30 miles and not more than 40 miles from the junction, 4 cents per 100 lb.; over 40 miles from the junction, 4½ cents per 100 lb. These divisions are to be the net amounts that may be paid out of the trunk line rates from the junction, and when the rates from points on the tap lines are made by the addition of an arbitrary, the amount of such arbitrary shall accrue to the tap line.

### Valuation Order No. 3

The commission has issued a second revision of valuation order No. 3, containing the regulations and instructions to govern the recording and reporting of all extensions and improvements or other changes in physical property of common carriers, for the purpose of keeping its valuation records up to date in accordance with Section 19-a of the act to regulate commerce. The order is effective as of January 1, 1919.

### Report in Bill of Lading Case—New Forms Prescribed

The Interstate Commerce Commission has issued a report in the so-called bill of lading case, written by Commissioner Woolley. It deals comprehensively and generally with the entire subject and consists of three sections, one dealing with the general merchandise domestic bill, another with the export bill, and a third with the live stock bill; but the section on the live stock bill is reserved for disposition in a supplemental report. The report does not deal with the question of negotiability, that having been taken care of by the so-called Pomerene act. It discusses the fundamentals and history of the common law of the carrier's liability and exemptions tracing the development of the law in this country down to the time when Congress enacted legislation imposing certain specific duties upon carriers and making unlawful some of the exemptions and limitations of liability theretofore existing.

The commission holds that it has authority to enforce the provisions of the statutory law in respect to the issuance of bills of lading. It rules on the lawfulness and reasonableness of many of the time-honored terms and conditions, and interprets the Cummins amendment.

The long-standing provision that the measure of the carrier's liability shall be computed on the basis of the value of the property at time and place of shipment is in contravention of the Cummins amendment and is required to be stricken from the domestic bill, but the similar provision is retained in the export bill, the Cummins amendment being held not applicable to traffic destined to non-adjacent foreign countries.

The use of the new form is made compulsory in interstate and foreign commerce from August 8, next. The present order is dated April 14, and the case (No. 4844) originated on December 7, 1918; but the discussion covers various matters which have been before the Commission for seven years past.

### State Commissions

The New York State Public Service Commission, First District, holds that a railroad has no right to inconvenience its patrons by cutting off a service which it has contracted to give merely because that service no longer happens to be profitable. This is in an opinion by Commissioner F. J. H. Kracke, disallowing an application of the Long Island Railroad for permission to discontinue passenger service on its Bushwick branch. The railroad line referred to is single-track, and is largely used for freight service. The company desires to use the branch altogether for freight, and is willing to provide transfers to an adjacent street railway. This plan, however, was not acceptable to the Bushwick Branch passengers, who protested against the proposed discontinuance of service. It is held that merely because the passenger service was unprofitable and the company desired to use the

tracks for a more profitable form of traffic was not a good reason for depriving the passengers of service to which they were accustomed.

### Louisiana Commission Demands Service

The condition of the roadway, equipment and service of the Louisiana Railway & Navigation Company has resulted in the issuance of three orders by the Railroad Commission of Louisiana demanding a betterment of the existing conditions. The first of these orders requires the company thoroughly to repair its entire roadbed including cross ties, rails, bridges, switches, frogs and trestles and to provide a sufficient number of locomotives and other equipment to afford adequate freight and passenger service. The representatives of the carrier did not question the charges made but pleaded the weak financial condition of the company and inability to secure necessary materials. William Edenborn, president of the company, declared that during 1917 and 1918 the road was unable to obtain sufficient ties. Also the unprecedented labor shortage and the excessive rainfall contributed to the road's troubles. Mr. Edenborn said that repair work was being done on the roadbed as rapidly as possible and that conditions would soon again be normal. A second order requires the payment to the state of Louisiana of a fine of \$300 for violation of the commission's rule which requires that coaches be in a clean and sanitary condition. A third order imposes a fine of \$300 for violation of the rule relative to heating coaches.

## Court News

### Liability for Loss Under Cummins Amendment

The district court for the district of Minnesota holds that, under the Cummins Amendment, declaring that carriers shall be liable for the full actual loss caused by them notwithstanding any limitation of liability, a common carrier, where wheat was lost in transit, is liable for its value at the point of destination, notwithstanding the shipment was made under a uniform bill of lading, which was part of the public tariff filed with the Interstate Commerce Commission, and which provided that the loss should be computed on the value of the property at the time and place of shipment. Conceding, as has been suggested by the commission, that this conclusion will result in difficulties and confusion in existing rules and regulations and tariffs, and possibly hardship and injustice to the carriers, and possibly in some discrimination amongst shippers, the court said the remedy is to be found in facing the law squarely and revising and reconstructing those rules and regulations to meet it.—*McCauld-Dinsmore Co. v. C. M. & St. P.*, 252 Fed. 664. Decided August 23, 1918.

## United States Supreme Court

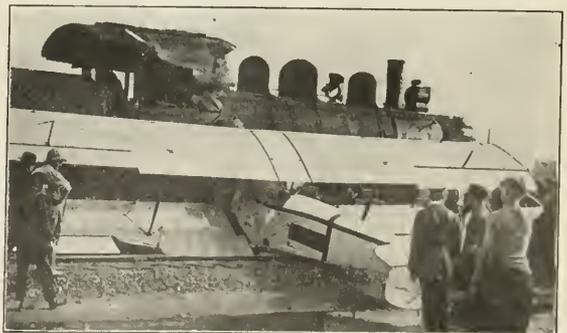

### Federal Employers' Liability and Locomotive Inspection Acts

A fireman on the New Orleans & N. E. was injured by being thrown down between the engine and the tender. The accident was caused by the uncoupling of engine and tender; and this was apparently due to the breaking of the king pin and the coupling chains. He brought suit in a state court of Mississippi, under the Federal Employers' Liability Act and the Boiler Inspection Act of 1911, and recovered judgment, which was affirmed by the Supreme Court of the state (115 Miss. 285). The railroad took the case to the United States Supreme Court, contending that the state Supreme Court erred in sustaining the action of the trial court, which charged the jury that the so-called "Prima Facie Act" of Mississippi applied, and that it relieved the plaintiff of the burden of proof to establish negligence. The plaintiff then conceded that that statute cannot be constitutionally applied to suits under the Federal Employers' Liability Act, since the United States Supreme Court has so decided in *N. O. & N. E. v. Harris*, 247 U. S. 367, and that the judgment must be reversed if the railroad's rights were prejudiced by this error. But he contended that the railroad was not prejudiced, because negligence on its part was not essential to recovery.

He insisted that the Boiler Inspection Act, as amended, imposes upon the railroad the absolute duty to have the locomotive and tender and all parts and appurtenances thereof in proper condition and safe to operate; that the mere breaking of the king pin and coupling chains showed conclusively that they were defective; that the evidence showed conclusively that this breakage was the proximate cause of the injury; and that the plaintiff was therefore entitled, under the Federal act to have the jury peremptorily instructed to render a verdict in his favor. This contention was apparently not considered by the State Supreme Court. The United States Supreme Court holds that the evidence did not establish as a matter of law that the king pin or the chains were defective. At most it presented a question for the jury. The court could not therefore say that the railroad was not prejudiced by the error of the trial court in instructing the jury that the "Prima Facie Act" was applicable, and it reversed the judgment.—*New Orleans v. Scarlet*. Decided April 21, 1919. A similar decision was made the same day in the case of *Yazoo & Mississippi Valley v. Mullins*.

### Cost of Industry Tracks

An order of the Minnesota Railroad and Warehouse Commission, requiring the Chicago & N. W. to alter and extend a side track leading from its main line to an adjacent brick making plant, made under a local statute, practically assigned two-thirds of the cost to the railroad and one-third to the owner of the plant. The railroad objected to bearing any part of the cost and the plant owner was not willing to bear all. The state Supreme Court sustained the order as reasonable. (135 Minn., 323.) The United States Supreme Court affirms the judgment, holding that the enforced discharge of the duty to provide the facility did not amount to a taking of property without compensation merely because it was attended with some expense, since the expenditure was for property which will belong to the company and be employed in its business. The court said in part: "Of course, the expense is an important element to be considered in determining whether the requirement is within the bounds of reasonable regulation or is essentially arbitrary, but it is not the only one. The nature and volume of the business to be affected, the revenue to be derived from it, the character of the facility required, the need for it and the advantage to be realized by shippers and the public are also to be considered. Tested by these criteria we think the order in question is not arbitrary, but reasonable." The yearly freight charge on the traffic of the existing side track to the plant had exceeded \$10,000, which the output over the new track would double. The estimated cost of the work was about \$2,300.—*Chicago & N. W. v. Ochs*. Decided April 14, 1919. A similar ruling was made the same day in the case of *Lake Erie & Western v. State Public Utilities Commission of Illinois*, regarding a side track in Illinois.

Airplane Forced to Descend Because of Dead Engine, Crashes Into Locomotive Near Seaside, Toronto

## Equipment and Supplies

### Locomotive Deliveries for Week Ended April 19

The following locomotives were shipped to roads under federal control during the week ended April 19:

Works	Road	Number	Type
American	C. M. & St. P.	12	USRA Mikado
	N. Y. N. H. & H.	6	USRA L. Mount
	Maine Central	2	USRA 6W. Sw.
	Penn. I. W.	6	USRA St. F.
	A. C. L.	3	USRA 6W. Sw.
		29	
Baldwin	Ill. Cent.	1	Mikado
	A. T. & S. F.	3	Mikado
	C. B. & O.	6	USRA Mikado
	C. B. & O.	1	Mikado
	L. V.	1	Pacific
	T. & P.	2	Mountain Pacific
		15	
Total		44	

### Cars Accepted Week Ended April 19

The following new standard cars were accepted during the week ended April 19:

Road	Number	Type	Manu- facturer	Total accepted for given roads
Sou. Pac.	23	50 Ton S. S. Box	Haskell & Barker	500
P. McK. & Y.	99	70 Ton L. S. Gon.	Pressed St. Car	306
Total	122			

## Freight Cars

THE BIDDLE PURCHASING COMPANY, Pittsburgh, Pa., is inquiring for one small lever hand car.

THE WENDNAGLE COMPANY, Chicago, is inquiring for one 80,000-lb. capacity 40 or 42-ft. flat car.

THE AIKEN GASOLINE COMPANY, Tulsa, Okla., has ordered 10 40-ton, 8,000-gal. tank cars from the American Car & Foundry Company.

THE LIBERTY STEEL PRODUCTS COMPANY, Inc., has recently placed orders for 200 flat cars and 200 tank cars to be shipped to France for private operators. These cars are to be made in accordance with the French State Railway and Paris & Orleans standards.

CAR WHEELS AND AXLES FOR NORWAY. Commerce reports in its issue of April 16 contains the following trade opportunity: 29,125—An officer of the department of public works in a city of Norway desires to purchase car wheels and axles complete, to be used in the construction of railway cars. Quotations should be given f. o. b. New York. Terms, payment against documents. Further information may be obtained from the Bureau of Foreign and Domestic Commerce or from any of its district and co-operative offices.

## Signaling

THE LEHIGH VALLEY has ordered from the General Railway Signal Company a 24-lever interlocking for Weatherly, Pa.

THE NEW YORK CENTRAL has ordered from the General Railway Signal Company a mechanical interlocking, twelve levers, for Military Road, Buffalo, N. Y.

CANADIAN PACIFIC.—This company plans this year to install automatic signals between Gault, Ont., and Woodstock, 30 miles; also to renew interlocking plants at Walkerton, Ont., and Saskatoon, Sask. A new copper telegraph wire is to be put up from Halifax, N. S., to Winnipeg, Man., and from Toronto, Ont., to Windsor.

## Supply Trade News

The Southern Railway Car Company has been organized at Wichita Falls, Texas, with James A. Jones as president, to make tank cars, railway cars, and street cars; also to operate repair shops.

The Booth-Hall Company, designers and builders of electric furnaces, has removed its executive and sales offices from 2307-15 Archer avenue, Chicago, to the Hearst building, 326 West Madison street.

John Walsh, counsel for the Federal Trade Commission since its organization, and its chief counsel for the past year and a half, has resigned and has opened an office in the Southern building, Washington, D. C., for the general practice of law.

Henry M. Sperry, publicity representative at New York of the Union Switch & Signal Company, the General Railway Signal Company, the Federal Signal Company and the Hall Switch & Signal Company, has removed his office from 120 Broadway to 347 Madison avenue.

Frank J. Tone has been elected president of the Carborundum Company, Niagara Falls, N. Y., in place of F. W. Haskell, deceased, and George R. Rayner, secretary, has been elected vice-president in place of R. B. Mellon of Pittsburgh. F. H. Manley retains the office of treasurer.

C. D. Barrett, who has just returned from France after 18 months' service as an officer in the Transportation Corps of the American Expeditionary Force, has been appointed district engineer of the Locomotive Stoker Company, with headquarters at New York. He was born in Fort Wayne, Indiana, and after graduation from Purdue University in 1901, he entered the service of the Pennsylvania Railroad as a special apprentice at Altoona. He remained with the Pennsylvania in the positions of motive power inspector, foreman, assistant master mechanic, assistant engineer of motive power and master mechanic until the summer of 1917. He then received a commission as major in the United States Army and went to France in command of the First Battalion of the Nineteenth Engineers. In France Major Barrett organized the St. Nazaire locomotive erecting shop, where all the locomotives used by the A. E. F. were erected. He remained in charge of this shop until July, 1918, when he was appointed assistant general superintendent of motive power in the Transportation Department.

C. D. Barrett

Frank J. Lepreau has been appointed sales manager of the railway signal division of the Macbeth-Evans Glass Company, Pittsburgh, Pa. Mr. Lepreau resigned on April 1 as vice-president and general sales manager of the primary battery division of Thomas A. Edison, Inc.

T. W. Holt, superintendent of shops of the Pressed Steel Car Company, Pittsburgh, Pa., who had entire charge of the munition work undertaken by that company, has resigned to accept the position of assistant general manager of the Curtin Supply Company, Chicago, succeeding the late R. S. Reynolds.

**G. E. Scott**, who for the past year and a half has been in the service of the American Red Cross as assistant general manager at Washington, D. C., and from September, 1918, as general manager, has received his honorable discharge and resumed his duties as first vice-president of the **American Steel Foundries**, Chicago.

**J. E. Mason** has been appointed manager of field sales of the **Blaw-Knox Company**, Pittsburgh, Pa., with offices at Pittsburgh. In this capacity, Mr. Mason will supervise the operation of a sales agency plan throughout the country. Mr. Mason is a graduate of Purdue University and for the past four years has been in the employ of the McGraw-Hill Publishing Company, Inc., New York.

The **Bailey Meter Company** removed its main office and works from Boston, Mass., to Cleveland, Ohio, on May 1. The Boston office, with H. D. Fisher as manager, is retained to handle sales and engineering service work in the New England district. For the present the New York and Philadelphia districts will be covered from Boston and all other districts will be covered from Cleveland.

**James Viles**, chairman of the board of directors of the **Buda Company**, Chicago, died Sunday evening, April 27, at the St. Lukes Hospital, Chicago. He was born in Boston,

J. Viles

Mass., on March 10, 1855, and received his education in the public schools of Cambridge, Mass., and a private school at Waltham, Mass. He began his business career in 1878 with the firm of Underwood & Company, packers, which was succeeded by the firm of Viles & Robbins, of which Mr. Viles was senior partner. Later he became president of the Omaha Packing Company, Omaha, Neb., from which position he retired in 1902 to engage in the railway supply business with the Buda Company. In

1907 he was elected president of the Buda Company, in which capacity he served until the early part of 1919, at which time he was elected chairman of the board of directors.

The **Chicago Pneumatic Tool Company** announces the election of **Allan E. Goodhue** as managing director of its English subsidiary, the **Consolidated Pneumatic Tool Company, Ltd.**, whose offices are at 170 Piccadilly, London, and whose plant is in Fraserburg, Scotland. Mr. Goodhue will also have charge of European sales for the Chicago Pneumatic Tool Company. He was for a number of years connected with the sales department of the Midvale Steel Company and Midvale Steel & Ordnance Company in Philadelphia, Chicago and Boston, leaving that company in March, 1918, to enter the service of the government. From that time until January 1, 1919, when he became connected with the Chicago Pneumatic Tool Company, he was assistant manager of the Steel and Raw Material Section, Production Division, of the Emergency Fleet Corporation. Mr. Goodhue will sail for England May 13 on the Mauretania.

**Lewis A. Nichols**, consulting engineer and president of the **Chicago Steel Tape Company**, Chicago, died on March 5, at his home in Chicago. He was born on August 26, 1851, in Florence, Italy, of American parents and came to this country in July, 1857, settling in Danvers, Mass. He was graduated from the Massachusetts Agricultural College at Amherst in 1871. Later during the same years he was engaged in laying out an addition to the city of Fall River, Mass., after which he was employed as leveler in a locating party on the Massachusetts Central. In the spring of 1872 he was given charge of the locating party finishing the construction of a division

of that railroad in the fall of 1873. In 1875 he was elected to the position of city engineer of Chelsea, Mass., from which position he resigned in 1877 to engage in railroad surveys and construction work in many parts of this country and Mexico. He gave up the active practice of his profession in 1908, except as a consulting engineer, and since then has devoted most of his time to the interests of the Chicago Steel Tape Company.

**Colorado Brake Shoe and Foundry Company**

The Colorado Brake Shoe & Foundry Company, Denver, Colo., was organized on January 1, 1919, by **James C. Dolan**, representative of a number of railway and mine equipment and supply firms at Denver, Colo. Mr. Dolan, in addition to assuming the presidency of the new company will retain his connection with the companies with whom he has been engaged for the past six years. Previous to this he was in the employ of the purchasing department of the Denver & Rio Grande for nine years.

J. C. Dolan

**F. T. Dickinson**, general manager of the new company was formerly superintendent of the Railway Material Company's plant at Toledo, Ohio, and later the plants at Phoenixville, Pa., and Stevens Point, Wis. Mr. Dickinson has been associated with the foundry business for the past 35 years, having received his early training in the general foundry business in Chicago. He first became

interested in the manufacture of reinforced brake shoes while working for the Union Iron & Steel Company of Chicago in 1905. Soon after Mr. Dickinson was employed by the American Brake Shoe & Foundry Company and here he was given opportunity to develop ideas on permanent iron molds for making brake shoes. After remaining with the American Brake Shoe & Foundry Company for two years he resigned to establish the Illinois Malleable Company, of Chicago, in the brake shoe business. In 1909 Mr. Dickinson resigned from this company to accept the superintendency of the Railway Material Company's plant at Toledo and later, while still in the employ of this company, started and operated its new plant at Phoenixville, and later at Stevens Point, retaining the latter position until his appointment as general manager of the Colorado Brake Shoe & Foundry Company. Mr. Dickinson is the inventor of numerous brake shoes and foundry devices pertaining to the manufacture of steel brake shoes.

F. T. Dickinson

The company has acquired a modern brake shoe foundry with a floor space of 150 ft. by 250 ft. and equipped with modern machinery. This foundry has a capacity of 50 tons a day, and its entire output is being devoted to reinforced brake shoes.

The company has acquired a modern brake shoe foundry with a floor space of 150 ft. by 250 ft. and equipped with modern machinery. This foundry has a capacity of 50 tons a day, and its entire output is being devoted to reinforced brake shoes.

## Trade Publications

**TRACK MATERIAL.**—The Illinois Steel Company, Chicago, has issued an attractive book of 48 pages of specifications, photographs and dimensions of track spikes, ordinary and open hearth oil-quenched track bolts and screw spikes. This book contains much data of use to those engaged in the ordering, handling and using of track materials.

**TIE PLATES.**—The Illinois Steel Company, Chicago, has issued an 80-page booklet showing the dimensions and designs of the standard sizes of tie plates rolled by that company. In addition to showing over 50 designs of tie plates, the book contains information concerning the widths of rail bases of various sections of rails and presents the information required with orders for tie plates.

**MOTOR DRIVE.**—A universal motor drive for any kind of double spindle shaper has recently been developed by the Oliver Machinery Company, Grand Rapids, Mich., and this company has now printed a bulletin fully describing and illustrating the device and showing its advantages. It also includes a drawing showing the floor plan of the motor drive operating in connection with the Oliver No. 483 high speed double spindle shaper.

**THE UNIT CAR.**—A steam propelled car, designed for railroad interurban and branch line service, known as the Unit car, is described in an attractive booklet containing 16 pages, issued by the manufacturer, the Unit Railway Car Company of Boston, Mass. As the name indicates, its power plant, passenger and baggage space is combined in one car and it has been operated successfully and demonstrated its adaptability for satisfactorily handling short line traffic. The text is illustrated with photographs of the car and drawings showing the side elevation, floor plan and front end.

**TEXACO LUBRICANTS.**—The series of advertisements of the Texas Company, New York, entitled "How Texas Jones Convinced the Railways," which has appeared in the *Railway Age*, has been reprinted in a booklet of 39 pages, 9 in. by 12 in., issued by the Texas Company. Thirty pages contain each a record in dialogue form, with illustrations, of imaginary meetings of a railroad purchasing board, showing the evidence brought by "Texas Jones" and others to convince the railways of the value of using Texaco lubricants. In addition, the book contains a new and valuable feature in the form of a list covering four pages, of railroad products made by the Texas Company.

**WELDING RODS AND WIRE.**—A small booklet of 60 pages has been published by the Page Steel & Wire Company, New York, which contains a large amount of useful information on welding and welding materials and describes the method of manufacturing Armo iron rods and wire for oxy-acetylene and electric welding, illustrated with microphotographs showing the structure of the material used. The booklet contains a large number of other illustrations and data in tabular form, including a table showing the diameter of rods to be used on various thicknesses of metals to be welded, temperature and metric conversion tables and data regarding the properties of elements and metal compositions, etc.

**MECHANISM OF COMBUSTION.**—The American Arch Company is issuing a series of bulletins dealing with the subject of combustion and the transfer of heat, of which the bulletin on The Mechanism of Combustion is the second. This bulletin, written by J. T. Anthony, vice-president of the company, presents in a very clear manner the various processes that take place in the combustion of coal. It explains the molecular construction of fuel and shows just what transformations occur in its combustion and why they occur. The illustrations serve as a great aid to the reader in visualizing the chemical processes of combustion. The pamphlet also shows where and how the heat is generated from fuel by the process of combustion. It discusses first the structure of atoms and molecules and explains the hydrocarbon molecules which are found in fuel. It explains the behavior of these atoms and molecules in the coal in both the quiescent and the active (when the coal is burning) state, and fully explains why and how the heat is obtained.

## Railway Construction

**BLACK MOUNTAIN RAILROAD.**—The line building from Hulen, Ky., to the head of Packetts Creek, 8 miles has been completed. The tracklaying was carried out by company forces. M. E. S. Posey, chief engineer, Path Fork, Ky.

**CANADIAN PACIFIC.**—This company has asked the Dominion government for permission to build various branch lines in the western provinces of Canada, as follows: From Duchesne, on the Bassano easterly branch in Alberta, in a general northerly direction; from Archive, on the Moose Jaw southwesterly branch, in a southwesterly and westerly direction to Wymark, on the Swift Current southeasterly branch in Saskatchewan; from a point on the Moose Jaw northwesterly branch at or near either Fortune or Rosetown, Saskatchewan, in a general southerly direction for 50 miles, then easterly for 30 miles in Saskatchewan; from a point on the Weyburn-Stirling branch in Saskatchewan in a southerly direction across two townships and thence in a westerly direction; from Lanigan, on the Pheasant Hills branch, in a northeasterly direction to a point between Carroll and Saskatchewan river and then to a point near Cumberland House, Saskatchewan; from Leader, on the Swift Current northwesterly branch, in a southwesterly direction 50 miles, and then easterly to a point on Big Stick lake in Saskatchewan; from a point on the Manitou lake branch to a point on the Whitford lake branch in Alberta.

**GREAT NORTHERN.**—This road will rebuild the bridge over the Whitefish river west of Whitefish, Mont., replacing the 341 ft. of timber trestle and 150 ft. Howe truss span with a new steel span. The material for this work is now on the ground. This road has also let a contract for the filling of the Beaver Bay trestle and the work will be completed this season.

**ILLINOIS CENTRAL.**—This road has received bids for the construction of a new passenger station, freight house and heating plant at Centralia, Ill. The passenger station will be 325 ft. by 36 ft., of which 85 ft. by 36 ft. will be two stories. The construction will be of reinforced concrete and brick with slate roofing. The freight house will be of concrete and brick construction with maple floors and a slate roof. The building will be 218 ft. by 40 ft., of which 110 by 40 ft. will be two stories. The heating plant will be 30 ft. by 34 ft., of brick and stone reinforced concrete construction with slab and composition roof. In conjunction with the new buildings considerable amount of new trackage, paving, sewerage, water lines and platforms will be constructed. The approximate cost of the entire construction will be \$250,000.

The Illinois Central has awarded a contract to the Railway Water & Coal Handling Company, Chicago, for the construction of a concrete dam across the Tradewater river at Dawson Springs, Ky., to supply water for a pumping station. The dam will be of concrete construction, 14 ft. high by 125 ft. long and 10 ft. thick, and will cost approximately \$6,000. Work has already been started on the project. This road has also awarded a contract to the same company for the construction of a pumping station 27 ft. by 27 ft. in area, one story in height, of brick with concrete foundation and slate roof. The machinery will consist of two 25 h.p. fuel-oil engines having belt connections with two 500 r.p.m. centrifugal pumps, discharging through 3,000 ft. of 10 in. cast iron main pipe into a 100,000 gallon tank. The approximate cost will be \$35,000.

**SOUTHERN RAILWAY.**—This road has given a contract to M. M. Elkins, Macon, Ga., for building a bridge at Gaffney, S. C. The bridge and retaining wall approach will be of reinforced concrete construction. The structure will consist of three spans, one of which will be 35 ft. long and the other two 26 ft. long. The cost of the work will be about \$30,000.

The Southern Railway is building, with its own forces, transfer sheds at the Atlanta (Ga.) transfer yard. The structures are to be one story high; one of the buildings will be 16 ft. wide and 760 ft. long, and another will be 30 ft. wide and 760 ft. long.

# Railway Officers

## Railroad Administration

### Central

G. B. Clifton has resigned as office manager of the Railroad Administration to become secretary and treasurer of the United Artists' Corporation, with office at New York. Mr. Clifton was office manager of the Railroads' War Board in Washington in 1917, and prior to that was special representative of Vice-President A. W. Thompson, of the Baltimore & Ohio.

### Federal and General Managers

The jurisdiction of G. L. Peck, federal manager of the Pennsylvania Railroad, Western Lines, and associated lines, has been extended over the Columbus Union Depot.

H. E. Whittenberger, general manager of the Grand Trunk, Western Lines, has been appointed federal manager of the same lines, with headquarters at Detroit, Mich., these lines having been released from the jurisdiction of F. H. Alfred, federal manager at Detroit, Mich.

E. F. Blomeyer, general manager of the Ann Arbor and the Manistique & Lake Superior, has been appointed federal manager of the Ann Arbor Railroad, with headquarters at Toledo, Ohio, which road has been released from the jurisdiction of F. H. Alfred, federal manager at Detroit, Mich.

B. C. Stevenson, general manager of the Toledo, St. Louis & Western, has been appointed federal manager of the same road and the Detroit & Toledo Shore Line, with headquarters at Toledo, Ohio. These roads have been released from the jurisdiction of J. E. Taussig, federal manager at St. Louis, Mo., and F. H. Alfred, federal manager at Detroit, Mich., respectively.

### Operating

R. D. Miller, trainmaster on the Chicago, Milwaukee & St. Paul, with office at Ottumwa, Iowa, has been appointed trainmaster of the Milwaukee terminals, with headquarters at Milwaukee, Wis., vice N. A. Meyer, promoted.

Lieutenant-Colonel Dwight S. Brigham, of Newton Centre, Mass., who went to France in July, 1917, with the 14th Engineers (Railway), has returned and been discharged from the United States service. He has resumed his duties as trainmaster on the Boston & Albany, with headquarters at Beacon Park, Boston, Mass.

Lewis Randolph Taylor, whose appointment as superintendent of the Virginian Railway, with headquarters at Princeton, W. Va., has already been announced in these columns, was born on September 22, 1871, at Charlottesville, Va. He began railway work on September 1, 1888, with the Richmond & Danville, now a part of the Southern Railroad, as a rodman, and was employed on surveys and construction work on that road, the Chesapeake & Ohio, the Chicago & Eastern Illinois, and the Ohio Southern for the next five years. From May, 1895, to May, 1897, he served in the maintenance of way department of the Baltimore & Ohio, Philadelphia and Baltimore divisions, and then to September, 1901, was assistant engineer, United States Engineering department, in charge of field work, coast defense and harbor improvement, Baltimore harbor. From September, 1901, to June, 1903, he was in the general contracting business in Baltimore, and then was engaged in making the reconnaissance for the Deepwater and Tidewater railways, which later became the Virginian Railway, until February, 1904. He then served consecutively as division engineer, principal assistant engineer and superintendent of construction on the Tidewater Railway, and from April, 1909, to March, 1918, as superintendent of the Third and Deepwater divisions of the Virginian Railway. Since March, 1918, he has been engaged in mining enterprises.

Robert Cornelius Reid, whose appointment as superintendent of the New Orleans & Northeastern and the New Orleans Terminal, with headquarters at Hattiesburg, Miss., has already been announced in these columns, was born on November 22, 1872, at Huntsville, Texas. He was educated in private and high schools and began railway work in 1890, with the Central of Georgia. He subsequently served as city ticket agent at Columbus, Ga.; then as agent at Sylacauga, Ala., on the same road and in 1893 entered the service of the Plant System as a rate clerk. In 1894, he was appointed train despatcher on the Southern Railway, at Columbus, Miss.; later in the same year he was appointed bill clerk at Anniston, Ala., and in 1895 served as operator at Atlanta, Ga., on the same road. From 1896 to 1899, he was an operator on the Central of Georgia and the following year was appointed despatcher on the Alabama Great Southern, becoming chief despatcher in 1906. In 1908 he was appointed chief despatcher on the Cincinnati, New Orleans & Texas Pacific, and two years later was appointed trainmaster of the Alabama Great Southern. In 1917 he became trainmaster on the New Orleans & Northeastern, which position he held until his recent appointment as superintendent of that road and the New Orleans Terminal, as above noted.

### Financial, Legal and Accounting

W. J. Stevenson has been appointed general solicitor of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, vice H. T. Ballard, resigned.

### Traffic

R. W. Farrell has been appointed general baggage and mail agent of the Long Island Railroad, with headquarters at Long Island City, vice W. Van Valkenburg, deceased.

C. H. Ryan, Jr., division freight agent on the Louisville & Nashville, with headquarters at Nashville, Tenn., has been transferred to Memphis, succeeding R. S. Willock, division freight agent of the Memphis line. Mr. Willock succeeds Mr. Ryan at Nashville.

A. Hilton, whose promotion to traffic manager of the St. Louis-San Francisco, the Fort Worth & Rio Grande, the St. Louis-San Francisco & Texas, the Kansas City, Clinton

& Springfield, the Paris & Great Northern Belt, the West Tulsa Belt and the Rock Island-Frisco Terminal, with headquarters at St. Louis, Mo., was announced in the *Railway Age* of April 18, was born at Hamilton, Ont. He entered railway service in 1878 as a clerk on the Great Western of Canada, now a part of the Grand Trunk. From 1880 to December, 1884, he was a clerk in the passenger department of the Chicago & Alton, and subsequently, until 1889, he was city passenger and ticket agent

on the same road at Kansas City, Mo. In 1887 he acted as Pacific Coast agent at San Francisco, Cal., and from 1889 to March 1, 1901, was general agent in the passenger department of the same road at Kansas City. On March 1, 1901, he was appointed assistant general passenger agent of the Kansas City, Fort Scott & Memphis, and the following August he was made general passenger agent of the St. Louis-San Francisco. In October, 1913, he was appointed passenger traffic manager of the same road. In 1918 he was promoted to assistant traffic manager of the St. Louis-San Francisco and the Missouri, Kansas & Texas, which position he held until March 1, 1919, the date of the regrouping of the Southwestern region lines. Incident to the regrouping

A. Hilton

he was appointed assistant traffic manager of the St. Louis-San Francisco, the Kansas City, Clinton & Springfield, the Paris & Great Northern, the West Tulsa Belt and the Rock Island Frisco Terminal, which position he held prior to his recent promotion.

### Engineering and Rolling Stock

I. O. Walker, division engineer of the Atlanta division of the Nashville, Chattanooga & St. Louis, with office at Atlanta, Ga., has retired after 33 years continuous service, 28 of which were spent with the Nashville, Chattanooga & St. Louis and leased Lines.

R. B. Robinson, engineer maintenance of way of the Oregon Short Line, with headquarters at Pocatello, Idaho, has been appointed engineer maintenance of way of the Union Pacific, with headquarters at Omaha, Neb., to succeed W. R. Armstrong, whose promotion to assistant chief engineer appears elsewhere in these columns.

H. L. Worman, master mechanic on the St. Louis-San Francisco, with office at Memphis, Tenn., has been appointed assistant superintendent of motive power, with headquarters at Springfield, Mo., and G. R. Wilcox, assistant master mechanic at Monett, Mo., has been appointed master mechanic of the Southern division, with headquarters at Memphis, vice Mr. Worman.

W. R. Armstrong, engineer maintenance of way of the Union Pacific and the St. Joseph & Grand Island, with headquarters at Omaha, Neb., has been promoted to assistant chief engineer of these roads, the Oregon Short Line and the Los Angeles & Salt Lake, with headquarters at Salt Lake City, Utah, to succeed Carl Stradley, deceased. Mr. Armstrong has had 25 years of railroad experience, both as an engineer in charge of construction and maintenance of way and as an operating official. Prior to his entering the employ of the Oregon Short Line in 1905, he was connected with various lines in the Middle West. During his first year with the Oregon Short Line he was employed on special engineering work, and in the following year was placed in charge of the construction of the Yellowstone Park branch and also in charge of the extension from Huntington, Ore., through the Snake river canyon, to Homestead. In 1908, Mr. Armstrong was made superintendent of the Montana division which position he held until 1913, when he was promoted to general manager and chief engineer of the Salt Lake & Utah, then under construction. On August 1, 1916, he was appointed engineer maintenance of way of the Union Pacific, which position he held until his recent promotion.

R. D. Moore, signal supervisor of the Los Angeles division of the Southern Pacific, Pacific System, with headquarters at San Francisco, Cal., has been promoted to assistant signal engineer, with the same headquarters, succeeding L. V. Parle, deceased. C. A. Veale, signal supervisor of the Tucson division, with headquarters at Tucson, Ariz., has been transferred to succeed Mr. Moore. H. M. Stone, principal assistant signal supervisor, with headquarters at Los Angeles, Cal., has been promoted to signal supervisor succeeding Mr. Veale. P. A. Bliss, who recently received his discharge from the United States Army, has been appointed signal supervisor of the Stockton division, with headquarters at Stockton, Cal.

H. H. Maxfield, formerly superintendent of motive power of the New Jersey division of the Pennsylvania Railroad,

with headquarters at New York, who was granted a furlough to enter military service, as an officer in the 9th Engineers, National Army, in July, 1917, has returned to the service of the Pennsylvania as acting works manager, with office at Altoona, Pa., in charge of the Altoona shops, comprising the Altoona machine shops, the Altoona car shops, the Juniata shops and the South Altoona foundries. This is a new position recently created on the Pennsylvania Railroad, Eastern Lines. Mr. Maxwell reports to the general superintendent of the Eastern Pennsylvania division and the superintendent of motive power of that division has been relieved of the jurisdiction over the above named plants. While in France Mr. Maxfield was superintendent of motive power of the Transportation Corps, American Expeditionary Force.

## Corporate

### Railway Officers in Military Service

Major C. E. Lester of Meadville, Pa., has been appointed general superintendent of the 19th Grand Division, Transportation Corps, of the American Expeditionary Force. He entered the National Guard, 13th Pennsylvania Infantry, in August, 1916, and was commissioned first lieutenant, infantry, in October of the same year. In August, 1917, he was transferred to the engineers. He was appointed captain, engineers, in the National Army in April, 1918, and commanding officer of the 50th Engineers, with which he went abroad in July, 1918. Upon his arrival in France he was appointed general foreman at the Nevers locomotive shops, operated entirely by United States soldiers. He subsequently served as assistant superintendent of the same shops and then as acting general superintendent of the 19th Grand Division until his appointment as general superintendent of the same division. Major Lester was formerly general foreman boiler maker on the Erie at Meadville, Pa., from April, 1906, to January, 1911, and was assistant master mechanic on the Baltimore & Ohio at Pittsburgh, Pa., until March, 1912, when he returned to the Erie as foreman boiler maker at Jersey City. From July, 1912, to July, 1914, he was assistant foreman in the tank shop of the American Locomotive Company at Dunkirk, and then was inspector with the Lima Locomotive Works at Lima, O., and from February, 1915, to August, 1916, was boiler maker foreman on the Lehigh Valley at Sayre, Pa.

## Obituary

W. P. Boger, general freight agent of the Florida East Coast Railroad, with headquarters at Jacksonville, Fla., died in the East Coast Hospital, at St. Augustine, Fla., on April 27.

William N. Noon, formerly superintendent of bridges and buildings of the Duluth South Shore & Atlantic, who retired in 1912, died on April 27, at his home in Miami, Fla. It is believed that Mr. Noon's death was due to a fall which he sustained while walking on a highway bridge soon after his retirement.

Frank May Souther, assistant treasurer of the National Railways of Mexico, with office at New York, died at his home in New York on April 26, after a short illness. Mr. Souther served on the Mexican Central Railway Company, Limited, for about 20 years (part of this time, from 1907 to 1909, as treasurer), previous to the merger of that road and the National Railway Company of Mexico, to form the National Railways of Mexico, and since that time he was assistant treasurer of the new company.

Charles H. Jacobi, assistant engineer with the Division of Capital Expenditures, United States Railroad Administration, died of pneumonia in Salt Lake City, Utah, on April 20, while on an inspection trip en route to the Pacific coast. Mr. Jacobi was born in Brooklyn, N. Y., on March 14, 1883, and was employed for a number of years as assistant engineer with the Lehigh Valley, and more recently as construction engineer with the Westinghouse, Church, Kerr Company, New York. He entered the service of the Railroad Administration on July 22, 1918.

## Railway Age

# EDITORIAL

The *Railway Age* does not care at this time, at least, to enter into a discussion of the political aspects of the recent decision of the Paris peace conference whereby the former German rights in the Chinese province of Shantung are to be transferred to Japan. It does believe, however, that the decision is of far-

### Japan's Rights in Shantung

reaching importance from many points of view. By the agreement made, to quote from the Associated Press despatch, "Japan voluntarily engages to hand back Shantung province in full sovereignty to China, retaining only the economic privileges granted Germany, and the right to establish a settlement at Tsingtao, south of Kiaochau." That the economic privileges mentioned are great is generally understood. That they will help Japan in its efforts to secure access to one of the greatest coal fields in the world is not so generally known. The *Railway Age*, therefore, feels itself somewhat fortunate in being able to present to its readers the article on another page by Frank Rhea, which clearly outlines the salient facts in the situation, from the railroad and transportation standpoint. In his article, Mr. Rhea has purposely omitted all reference to the controversial and speaks only from the point of view of an engineer who has visited the country in question and has studied it first hand.

The standard contract between the government and the railroads lays the burden of paying expenses accrued prior to the assumption of government control upon the railroad corporation. In like manner, when the roads are turned back to their owners, the accrued but unpaid expenses of the properties under the

### A Sometime Forgotten Item

Railroad Administration will have to be paid for by the government. These accrued expenses cannot be taken into the accounts until they are known. Practice among different roads has varied and the amount of liability for accrued expenses that have not gotten into the accounts is greater proportionally on some roads than on others. This amount cannot be reflected in the balance sheet. For instance, no liability is shown in the balance sheet for a claim for loss and damage until the amount of such claim has been determined. There is a total of such unaudited accounts much larger than most people realize. For instance, the income deductions account of the Chicago, Milwaukee & St. Paul, *Railway Age*, April 18, 1919, page 1026, shows that the expenses prior to January 1, 1918, credited in account with the Railroad Administration amounted to \$5,583,965. Ordinarily, of course, these expenses are simply carried into the next year's accounts and since each year bears corresponding expenses for the previous year, the accounts fairly correctly represent a 12 months' expenditure, but when the accounts are cut off, as they were as of January 1, 1918, there slowly come in items which the corporations have had to pay out of their own funds and it must be remembered that the government took over the cash as well as other working assets. These bills have had to be paid, therefore, either through borrowed money or from rental received from the government or from other corporate sources of income. There is, however, the reverse side to this situation. When the roads are turned back to their owners there will be a corresponding total of items coming in to the government to be paid by the government, which would not be

reflected in the balance sheet if one were to be drawn up today for the United States Railroad Administration. This is a factor which should not be forgotten in making an estimate of what funds are required for working capital, payment of rental, etc., by the Administration. Indeterminate as it is, it must be reckoned in some way in the cost of government operation and allowed for in Congress appropriations.

The "cost-plus" form of contract was in many ways a desirable instrument for the award of railway construction work under the uncertainties of war times.

### "Cost Plus" in Railway Construction

Inability to predict basic costs even a short time in advance made the unit price or lump sum contract undesirable, since the bidders had to make their tenders high enough to cover the maximum unfavorable conditions and the highest possible cost of materials and labor. Now, during the period of readjustment, conditions are subject to nearly as much uncertainty as during the war. Owing to the apparent failure of the price stabilizing plans and the fact that the prices of certain classes of labor are still subject to the laws of supply and demand, no one can predict with any accuracy what work will cost two months hence. Therefore, the form of agreement which will protect the contractor against rising costs, yet will allow the owner to take advantage of any reductions in the prices of materials and labor, would seem highly desirable from many aspects. The one basic objection to this arrangement lies in the lack of incentive for efficiency under the cost-plus contract. One contractor doing work on a unit price basis is now paying as low as 30 cents for common labor, thus obtaining a neat margin over a bid made last fall under much less favorable circumstances. The question arises whether he would have taken the trouble to secure labor at this low rate if it had not been to his pecuniary advantage to do so. However, even this objection would not seem to justify the use of the unit price or lump sum forms of contract under present conditions for any except the small jobs to be undertaken immediately and completed within a few weeks' time. Work of this kind does not involve the uncertainties inherent in the larger projects of railway construction.

### Savings Due to Interlocking Plants

A STUDY OF THE ECONOMIES effected by the installation of interlocking plants made in 1905 showed that 45 cents was a conservative figure for average cost of stopping a train. It was also found that when from 16 to 19 trains a day had to stop at a crossing the annual saving offset the annual charges (interest, depreciation, maintenance and operation) against interlockings of a certain size. At drawbridges, where it was assumed no additional men were needed, the same thing was true, with a daily traffic of 7 or 8 trains. If more trains were operated, interlocking at such points would more than offset the charges against it. The cost of materials has steadily climbed since this investigation was conducted, and while this would increase the cost of a plant, the cost of stopping trains has also undoubtedly increased in an equal or greater proportion, so that the above ratio should hold good at present.

When railroad traffic is heavy the officers have little or no

opportunity to plan or put into effect certain economies, but during periods when less active business prevails, an opportunity exists to carry on such studies. Where savings can be made those of an intangible nature are usually the last to be considered, even though they would in the aggregate amount to large sums yearly. An interlocking plant usually reduces the cost of operation, but the saving is to a large extent of an intangible nature. Not only do plants eliminate the cost of stopping trains, but their installation may permit of the hauling of heavier tonnage because of the elimination of stops. Other items to be considered are the prevention of damage in starting heavy trains, the increased safety of operation, the reduction of time on the road and the general improvement in train movement.

As an example, the studies made in 1905 by J. A. Peabody, signal engineer, Chicago & North Western, show a net saving of \$2,300 a year effected by the installation of an interlocking plant at a point where two single-track roads cross, with a total of 30 trains a day on both roads. The time required to pay for the installation from these net savings, neglecting all other factors, is three years. Twenty like places interlocked on a system meant a saving of \$46,000 per year at that time. A proportionate saving would result at the present time, as was brought out in an article by C. C. Anthony, published in the *Railway Age* last week. Railroad officers may well afford to have similar studies made at the present time covering points on their systems not now interlocked, such as grade crossings, drawbridges, entrances to yards, crossover locations, etc., looking to the construction of plants as soon as conditions warrant.

## Can Electrification Meet All Future Requirements?

THE RAILROAD MEN who are responsible for keeping the railroads operating on a sound basis are of a necessity hard-headed. They have had the advantages of electrification presented to them in such glowing colors for so long by enthusiastic promoters of electrification that they are not prone to recognize its merits when presented to them fairly. They know that general electrification would conserve a vast amount of the nation's coal, that electric locomotives are capable of high sustained drawbar pull at comparatively high speeds, that electrification increases track capacity and has numerous other advantages. They also know that the first cost of electrification is very large, that it requires more or less complicated overhead systems, that it means a necessary departure from established methods of operation and that existing conditions in a territory under consideration for electrification are the deciding factor for or against its adoption.

It is difficult to frame a convincing argument showing that electric operation improves service and reduces the cost per ton-mile of hauling freight. It can be done, however, and railroad men know that the amount of electric operation is bound to increase. For this reason they are interested in the specific problems involved. For example: Is there to be a continuous increase in the weight and length of trains as there has been in the past? What is to limit the capacity that can be hauled? Is it the length of the train, or the weight, or the power requirements or some other factor? What is the economic speed for passenger and for freight work? What requirements will be made of electric locomotives which are not inherent in their operation? Is it necessary to provide for moving fleets of freight trains or can they be scattered through the day to give a load factor on the line which can be handled without prohibitive expense? These are questions which vitally affect the economy of electrification. The inherent characteristics of steam and electric

locomotives will largely determine which shall be used to meet future problems, and for this reason the abstract in this issue of the paper presented by W. R. Potter and S. T. Dodd at a recent meeting of the Western Railway Club is of timely interest.

## Government Guarantees to Railroads

UPON MOST OF THE IMPORTANT QUESTIONS regarding the legislation under which the railways should be returned to private operation there is now substantial agreement among those who have given long and earnest study to the railroad problem, and who are in favor of a return to private operation. But the most important question involved is that of what means shall be adopted to restore and maintain the credit of the railway companies so that they shall become able adequately to develop their facilities; and upon this really vital question there is serious disagreement.

The difference of opinion is chiefly over whether the companies shall be given guarantees of net operating income by the government. Government guarantees are advocated by persons who have widely different reasons for doing so. They are advocated by Senator Cummins, who will be chairman of the Senate Committee on Interstate Commerce, on the ground that they would reduce the capital charge and thereby effect a saving in the cost of transportation. In an editorial in our issue for April 25, page 1031, we presented our reasons for believing that the effect of government guarantees to individual companies would be to increase rather than reduce the total cost of transportation.

Government guarantees are also being advocated by some of the leading financiers of the country, including Paul M. Warburg. Director General Hines also favors them. Most of the financiers who advocate them do so because they fear that in the absence of guarantees the regulating authorities can never be prevailed upon to make the net return earned by the railways large and sure enough to attract adequate capital.

Those who take this position have the strong argument of experience on their side. The system of regulation which prevailed during the 11 years before government control was adopted was a failure chiefly because the federal and state regulating authorities would not let the railways earn enough net return. The State authorities were the greatest offenders, but the Interstate Commerce Commission was far from guiltless. Most of those who favor guaranteeing the railway companies minimum returns also propose that those which earn more than the guarantee shall be allowed to retain part of the excess as an incentive to efficiency, the rest to go partly to the government and partly to labor.

The plan of giving guarantees to individual companies, whether upon the basis of valuation or any other basis, is opposed by most of the shippers of the country. It is opposed by many leading financiers, including Otto H. Kahn. It is also opposed by a majority of the railway executives, and especially by those who represent relatively prosperous roads. One very strong argument against it was presented by Samuel Rea, president of the Pennsylvania Railroad Company, in his address before the Chamber of Commerce of the United States last week, which is published elsewhere in this issue. The principal point made against government guarantees is that they would impair the incentive to efficient management. Another point is that if some of the railways failed to earn their guarantees and the government had to make them good from the public treasury, there would result controversy and agitation which probably would lead to government ownership.

The *Railway Age* has never had any doubt as to the general policy which would most effectively further the welfare of both the railways and the public, if it could be adopted. The

best policy would be, to let the railways make all consolidations and agreements which will not prevent competition in service and emulation in operating efficiency, and earn as a whole, a net return sufficient to attract adequate capital without guaranteeing a minimum to any individual road. Perhaps legislation and a system of administration can be secured under which this will be done. The principal shortcomings of the old policy of regulation were due to the following causes: First, the Interstate Commerce Act required the Interstate Commerce Commission to fix "reasonable" rates, but did not specifically make it the commission's duty to fix rates which would enable the railways to earn a return adequate to develop their facilities. Second, the commission as now constituted was created and its members were appointed at a time when the public believed that the sole function of regulation was to punish and control the railways and not to help them. Third, regulation by the Federal Government was constantly interfered with by that of the States. In consequence of these things, most of the members of the Interstate Commerce Commission during the last 13 years have regarded the railway companies with chronic suspicion and hostility, and even when the commission has shown a disposition to give the roads adequate rates its work has been interfered with by the State commissions and denounced in Congress. Bills have been introduced to abolish it, the real purpose of which was to prevent it from granting needed advances in rates.

It may be that regulation would be given a very different tone and tendency if the Interstate Commerce Commission were by express legislative enactment required, first, to prevent any interference by the States with Federal regulation of interstate commerce, and, second, to make rates not only reasonable in their relations to each other, but adequate to enable the railway companies to develop their facilities sufficiently. But whether this would be enough to solve the problem of regulation is very doubtful. Some members of the commission have within recent months publicly contended that it did let the railways earn an adequate return. Not much can be hoped from men who cannot see facts that are as plain as a pikestaff.

Many persons have criticised the plan of regulation put forward by the Association of Railway Executives because it proposes to transfer most of the administrative functions of the Interstate Commerce Commission to a Secretary of Transportation. But the railway executives do not ask for any government guarantees, and their proposal that a large part of the authority and duties of the commission shall be transferred to a Secretary of Transportation, is merely their way of saying that in the absence of guarantees they would fear to leave their case entirely in the hands of the commission. And they are amply justified in this position. It is clear that if private operation is to be made a success at all, either the railway companies must be given government guarantees, or the Interstate Commerce Commission must be so reconstituted as to render certain that the policy followed by it in regulating rates in future will be widely different from that followed in the past; or a large part of the administrative functions of the commission must be transferred to some other official or body. In the absence of guarantees, rate cases must in future be decided more promptly; intelligent cognizance must be taken not-merely of existing conditions, but of prevailing tendencies; and the rates allowed must be adapted not to restrict the railways to the so-called "fair return upon the fair value of their properties," but to provide them with revenues ample to enable them to give good service and to expand their facilities. It may be, as those who oppose specific guarantees contend, that the guarantee policy would soon land us in government ownership. But it is even more certain that if guarantees are not given and the policy of regulation of rates formerly followed is restored we shall soon be forced into government ownership.

## Delaware & Hudson

ONLY WHEN THE GOVERNMENT began to have to cast about for ways and means of raising the money to operate the railroads did any considerable number of people discuss the railroad problem, not as an effort to find ways of suppressing a predatory power, but as a question of how the transportation system of the country can be continued in its development and be best operated. When men like Samuel Rea, Daniel Willard, Frank Trumbull and Julius Kruttschnitt went to Washington and confessed frankly that they did not know where the money was to come from for the continued development of the roads, the great majority of the public was skeptical and somewhat amused. Had these gentlemen tried fully to express the acuteness of the fear with which they viewed the situation, it would have but laid them open to the ridicule of the Clifford Thorne's and the Hearst papers.

The railroad men and some of the bankers knew how affairs were actually shaping themselves. L. F. Loree, president of the Delaware & Hudson, and a close friend and associate of the late E. H. Harriman, made the remark, at the time of Mr. Harriman's death, that he, Harriman, saw as clearly as any pessimist of them all what the course of events was leading to, but that he differed from his associates in that he had such entire confidence in his own ability to meet the situation that he viewed it without apprehension. Whatever particular form the solution of the present railroad problem may take, the first essential in devising the solution is a thorough understanding of the problem itself. Thoughtful students of public affairs more and more often have been asking where the money is to come from to continue the development of American railroads.

The Interstate Commerce Commission tried in a theoretical bookkeepingish way to draw a hard and fast line between operating expenses and capital expenditures. The stronger railroad companies, with far-sighted and wise managements, at first protested the definition of expenses, and then frankly took the attitude that the commission could define expenses as it pleased; they, however, would continue to put into the property great sums of money over and above what the commission defined as maintenance and to issue securities against only a part of such so-called capital expenditures. Had earnings been sufficient to permit of such a course, the railroad managements which adopted it would have had a good prospect of success.

The factors involved in the development of an American railroad are different than the factors involved in the continued operation of railroads in Great Britain or in continental Europe. The Interstate Commerce Commission's theory of accounting might have been applicable to the Prussian State Railways. It was probably influenced by German practice, and nothing could demonstrate more clearly the fact that the commission had not the faintest comprehension of the fundamentals of the industry which it so confidently set out to regulate. That it was lack of comprehension and nothing politically immoral that swayed the commission goes without saying. There has never at any time been the slightest question of the integrity of the commission.

The development of an American railroad makes a tremendously interesting study. Concealed or revealed, dependent on the reader, in the masses of statistics reported to the commission and to stockholders, there is a wealth of incidents worthy of as much interest as the history of a country or the life of a great statesman. Seldom, if ever, has such a story been written in a language intelligible to the average reader. L. F. Loree, in his annual report to the stockholders of the Delaware & Hudson, has undertaken to do this very thing. The road is being operated by the government, and Mr. Loree, therefore, dismisses quite briefly the

year's operations and devotes himself instead to a discussion of the development of the property from 1907, when the new management took hold of it, to the time it was turned over to the government. This story of the Delaware & Hudson, rightly and fully comprehended, gives the essentials of the railroad problem. Could it have been read and understood by each interstate commerce commissioner, there would have been no need for long drawn-out rate cases. The Delaware & Hudson report is not easy reading, notwithstanding the fact that statistics are avoided and figures are used very sparingly. It is both tersely and intensively written; facts are stated often without comment; conclusions are arrived at by the writer only after they have become inevitable to the reader.

In Poor's Manual for 1872-73, in the description of the Delaware & Hudson Canal Company, which controlled the Delaware & Hudson canal and the Delaware & Hudson railroad, the following occurs: "The company derive their income mainly from the mining, transportation and sale of anthracite coal, conveyed to market over their own works. The incidental traffic is very limited, and brings no net profits into the treasury. For several years the company's stock has received dividends, February and August, each of 5 per cent." As a matter of fact, although the Delaware & Hudson, as Mr. Loree points out, is one of the oldest railroad companies in the United States, and "was the first to operate a steam locomotive on the American continent," it was formerly an adjunct to coal operations rather than a machine depending entirely on its earning power as a common carrier to reimburse its owners and creditors.

Prior to 1907, however, a considerable expansion of purely transportation facilities had taken place and the former management had gotten the company into a rather difficult situation, partly through the purchase of unprofitable electric lines and partly through lack of sufficient forethought and courage in the development of the railroad property and the financing thereof. When, therefore, the new management took hold in 1907 it had to deal with nearly all of the important elements of the problem which has faced American railroad men. The management has been eminently successful and turned over to the use of the government a thoroughly modern and up-to-date American railroad property. The success of the Delaware & Hudson has, we believe, been in part due to the strength which the coal department of the company lent to its credit and, in remaining part, to the skilful use of this credit by the management in the development of the machine as a transportation machine. Again and again, in Mr. Loree's story, we come across the evidences of the studied development of a plan as a whole, of which the purchase of Mallet locomotives, the building of the Oneonta yard, grade reduction, etc., are only parts, each carried out in co-ordination with other parts of the general plan. It is the extraordinary sureness and nicety of fit of the parts that has contributed so much to the success of the Delaware & Hudson.

The rental which the company should get under the standard contract is \$7,415,000, and after taking into its income account other corporate income and after the payment of war taxes, rentals and interest, the company had \$4,715,000 available for dividends, or an amount equal to 11.09 per cent on its stock. The Delaware & Hudson is paying dividends at the rate of 9 per cent annually.

Ordinarily, the annual report of the company includes details of operating expenses and statistics of operation, but this year these details are omitted, although the figures will later become available through reports to the Interstate Commerce Commission. It seemed best, therefore, to leave an analysis of the operation of the property, by the federal manager in the employ of the government, until next week, or such time as the detailed figures are available, and to confine these comments to the historical sketch of the de-

velopment of the property from 1907 to 1918, which is contained in the report to stockholders, and the greater part of which is reprinted elsewhere in this issue of the *Railway Age*. It is a document which is worthy of the most careful study by all those who are now engaged in discussing the future of the railroads. Different phases of history have, from time to time, brought out some supremely comprehensive and searching narrative and analysis of the events, and occasionally a phase of history, an economic development, or the career of a statesman, calls forth a classic in the shape of a history, an essay or a biography. This report of Mr. Loree's, confined as it is to the history of one railroad company, the Delaware & Hudson, is, nevertheless, such a classic dealing with the history of American railroads in the last decade.

## The Railroads—A Bankrupt Industry

THE DEFICIT INCURRED by the Railroad Administration not only continues to grow, but grows faster than even the most pessimistic have feared. It was \$58,000,000 in March. This made the total deficit for the first three months of the year approximately \$130,000,000, or almost one and a half million dollars a day. The government's guarantees of standard return to the companies, in these three months, based upon the net operating income which the companies had formerly earned in those months, were \$170,000,000. The net operating income actually made was only \$40,000,000, or but 23 per cent of the guarantees.

These startling figures ought to raise in the minds, not only of everybody directly concerned with railway operation, but also in the minds of public men and the public, the question of what is the matter with the railways?

The *Railway Age* has said repeatedly within recent weeks that if the wages now being paid are to be continued passenger and freight rates must be substantially advanced or the railways will be unable to earn the guaranteed standard return under Government operation or to earn sufficient net operating income under private operation to save the railway companies from general bankruptcy. Director General Hines, on his recent trip to the Pacific coast, made a number of addresses and public statements. He appears to have attributed the current bad showing of earnings and expenses chiefly to the heavy decline of traffic. He indicated that in his opinion the results will improve when industrial and transportation conditions become normal. He implied that until then no advance in rates will be made, and apparently left the impression that probably little or no advance in rates may be necessary.

Let us consider the director general's attitude in the light of the facts. It is true there has been a decline of traffic; and some refer to the business which has been handled thus far this year as abnormally small. It is smaller than that of 1918 or 1917; but conditions in 1917 and 1918 were not normal, and the traffic handled in those years showed a vast increase largely due to war conditions. Let us go back to the first three months of 1916. In that year the railways had the largest increase of traffic that ever occurred in any single year. They made the largest operating income ever made in one year. Every one remembers this. Doubtless, consequently, most people assume that because of the recent decline in traffic the business which has been moved thus far this year has been much less than in the remarkable year 1916. It is somewhat disconcerting, therefore, to find that in the first three months of 1919 the freight traffic of the railways was 85,000,000,000 ton-miles, while in the first three months of 1916 it was only 80,000,000,000 ton-miles, an increase in 1919 over 1916 of over 6 per cent. Furthermore, the traffic handled in the first three months of this year

was only 10 per cent less than that moved in the corresponding three months of 1917 and 1918. The railways moved less freight in February and March of this year than in the same months of 1917 and 1918, but they moved more in January than in either of those years.

Bearing in mind that the freight traffic moved in the first three months of the year was 6 per cent greater than in the same three months of 1916, let us compare the earnings made and the expenses incurred. The total earnings in these three months in 1916 were \$811,000,000, while in 1919 they were \$1,120,500,000, an increase of 38 per cent. The operating expenses in 1916 were \$560,000,000, while in 1919 they were \$1,037,000,000, an increase of 85 per cent. In the first three months of 1916 the ratio of operating expenses to total earnings was 69 per cent. In 1919, with passenger rates 50 per cent higher, and freight rates close to 35 per cent higher, the ratio of operating expenses to total earnings was 93 per cent. In the first three months of 1916 the railways, after paying their expenses and taxes, had left \$214,000,000 of operating income. In the first three months of 1919 they had operating income (which is slightly larger than *net* operating income) amounting to only \$44,000,000, a decline as compared with 1916 of 79½ per cent.

It is easy enough for anybody who carefully examines the foregoing figures to see what is the main trouble with the railroads. It is not the decline of traffic, but the increase of expenses. The increase of expenses seems especially startling when it is considered that the weather conditions for this period were abnormally favorable to economical operation.

Mr. Hines seems to look forward confidently to a revival of business which will stop the decline in traffic. Doubtless that will come. But that it will come soon enough or be large enough to prevent the loss of traffic during the year from being relatively as large throughout 1919 as it was during the first three months—that is 10 per cent—there seems no good reason for believing. If the loss of traffic throughout the year should be relatively as large as it was during the first three months, and railroad expenses should continue to be relatively as large, the railroad deficit for the year would be not far from three-fourths of a billion dollars.

Mr. Hines is also counting upon a substantial reduction of expenses. But the progress which had been made up to the end of March does not inspire hope. In January, when there was an increase of 10 per cent in the freight moved, the increase in operating expenses, compared with the same month of 1918 was 32 per cent. In February, when the decline in freight traffic was 13 per cent, the increase in expenses was 24 per cent. In March, when the decline of freight traffic was 23 per cent, the increase in expenses was 22 per cent. Whether the business moved increased or decreased, the large increase in expenses went on.

We can draw only one inference from these three months' statistics, or, for that matter, from the statistics regarding the six months of operation following the signing of the armistice. This is, that no increase of traffic, or increase in efficiency of operation, or increase in both, which there is the slightest possibility will occur, would leave the railways anything but a hopelessly bankrupt industry, if existing wages and existing rates were retained.

The fact cannot be too strongly emphasized that, from the standpoint of its earnings and expenses, the railroad system of the United States is today absolutely bankrupt. It is earning only 23 per cent as much net operating income as in the three years ended with June 30, 1917, in spite of the fact that its gross earnings are running about 50 per cent more than they averaged in those years. The rates must be advanced, and substantially advanced, if the railroads are ever to be converted from a bankrupt into a prosperous industry, and this whether government operation is continued or private operation is restored.

## Letters to the Editor

### The Lessons of the Past for Guidance in the Duties of the Present

ST. JOHNS, QUE.

TO THE EDITOR:

The educational value of your paper for young trainmasters and division superintendents is a fact often remarked in railroad circles and, of course, does not need to be proved by any specific declaration in your columns. Like the Washington monument on the banks of the Potomac, or the Statue of Liberty in New York harbor, it is as patent, to those who look, as is the monumental building in which you frame up your useful lessons for ambitious readers. But even those massive monuments are to most of us rather dim, because ordinarily we are too distant to take in all of their details; and the teachings of the Railway Age in like manner often suffer from our inability to focus attention on specific points. You will be pleased therefore, to hear of a definite item in this field of knowledge and of railroad science. In publishing your lucid and searching accounts of the shocking collision near Nashville, Tenn., last summer, you contributed toward the prevention of a similar catastrophe on another road. Two passenger trains were running in opposite directions toward each other and one of them was prevented from proceeding beyond the meeting point (through the forgetfulness of all hands) only by the presence of the trainmaster on the train, who called the negligent men to their senses.

Train No. 3 was proceeding westward, from a point which we will call Boston, toward "Chicago," which was the end of double track. Thence, on the single track line, the distance was 9 miles to Washington and thence 15 miles to Waterloo. About half a mile before reaching Chicago, the trainmaster observed that they were meeting train No. 2; No. 2 being superior to No. 3 by direction, and both first class passenger trains. He observed also that No. 2 displayed green signals, yet did not sound the whistle to call the signals to the attention of the men on No. 3. No. 3 had a car to set off at Chicago; so the trainmaster had some little conversation there with the engineman and fireman.

After the engine had backed on to the train and the conductor had shouted "All aboard" and it was plain that no thought had been given to the second section of No. 2, the trainmaster said to the engineman "Where are you going?" The engineman replied "Why, what's the matter?"

"What have you got on No. 2?" said the trainmaster. The engineman then replied that No. 2 had gone. On being told that it carried green signals he declared otherwise; and he said to his fireman, "Did No. 2 have signals?" The fireman replied that it did. Then the trainmaster, telling the engineman to remain at a standstill, went back and asked the conductor what he had on second No. 2. The conductor replied that he had nothing; and he did not know that No. 2 was carrying signals.

The point of this story is that the trainmaster, in relating the particulars to my informant, said that he had been reading about the Nashville collision; and he had the facts of that disaster in his mind. The engineman of first No. 2 failed to sound the whistle. The fireman of train No. 3 failed to speak to the engineman when he saw the green flags. The conductor of No. 3 failed to make any inquiry at the end of double track (there is no train register at this point). Thus four men "fell down"; and who knows whether the trainmaster would not also have fallen down if he had not been a regular reader of the Railway Age? K. & Q. C.

# Chamber of Commerce Discusses Railroad Situation

## Suggestions for Permanent Solution of the Problem a Feature of St. Louis Convention

WITH ONE OF THE SIX general sessions and a group meeting devoted exclusively to the railroad problem and its solution, discussion of the present transportation situation developed into one of the features of the seventh annual meeting of the Chamber of Commerce of the United States which was held at St. Louis, Mo., April 28 to May 1 inclusive. The feature of this convention of most interest to railway men was the general session, held on the evening of April 30, at which Walker D. Hines, director general of railroads, Senator Albert B. Cummins of Iowa and Samuel Rea, president of the Pennsylvania spoke in the order named. The preceding day a group meeting, presided over by George A. Post, chairman of the railroad committee of the Chamber of Commerce of the United States, was devoted to the subject of railroad transportation. At the same time the railroad problem and the relation of the present situation to the general state of business, entered into the discussion in several other group meetings, especially in one devoted to wholesale domestic distribution at which Luther M. Walter, counsel for the National Association of Owners of Railroad Securities delivered an address on "The Desirability of the Return of Railroads to Private Ownership" and M. J. Sanders, federal manager of the Mississippi-Warrior Waterways at New Orleans, La., spoke on "The Importance of Co-ordination of Rail and Inland Waterway Transportation."

An outstanding feature of the general session devoted to the discussion of the railroad problem, at which Director General Walker D. Hines, Senator Albert B. Cummins and Samuel Rea spoke, was the similarity of the solutions presented by Mr. Hines and Senator Cummins. The solution offered by the former was in substance the same as that outlined before the National Lumber Manufacturer's Association in convention at Chicago, an abstract of which was published in the *Railway Age* of April 18, with the exception that in this case Mr. Hines immediately delved into the solution of the present problem and went into detail as to the disadvantages of the present and past systems and the advantages of the solution he proposed. Senator Cummins in turn presented his solution, outlining practically step by step the same principles advocated by the director general. Senator Cummins' solution of this problem is essentially the same as that outlined in his address delivered on March 27, before the general assembly of Iowa which was reproduced in the *Railway Age* of April 25, page 1041.

### Address by Honorable W. D. Hines

Director General Hines said in part:

I want to tell you that my own judgment, based on a very careful study of this subject since the federal control began, is that the best interests of the country will be promoted, not through permanent government control of the railroads but through the return of the railroads to private management. It is also highly desirable to have a permanent solution at the earliest possible time, so that this return may take place without unreasonable delay, but so that it will not be necessary to take place until a permanent solution shall have been adopted. I think at times the disposition to want a very early return to private management has obscured the appreciation of the necessity for thoroughgoing legislative reform before that return takes place.

Viewing railroad regulation from the standpoint of the private management and the public standpoint, I have under-

taken to make a diagnosis of the trouble which seemed to manifest itself in the sort of regulation which we have had in the past. I think there is general agreement that the regulation was not satisfactory. It seemed to me as the years went by the regulation was increasingly unsatisfactory from the public standpoint, and that from time to time there was increasing unrest with the conclusions which were reached by the regulating bodies.

Undoubtedly the regulation was unsatisfactory from the standpoint of the capital invested in the railroads because the difficulty in attracting capital into the railroad business had become increasingly apparent. The condition had arisen for several years where it was almost impossible to sell railroad stocks, and the new money needed by the railroad had to be raised almost wholly by the creation of additional debt, so that the proportion of debt to total capitalization was rapidly increasing and the credit of the railroads was correspondingly diminished. Now based on my observation of this matter, first from the private management standpoint; secondly, from the public standpoint, I want to put before you my conception of the fundamental difficulties of the old form of regulations, because I think a clear appreciation of these difficulties will be the first step in arriving at a satisfactory remedy.

I would put first among the difficulties of the old form of regulations the fact that there was an entire absence of standards by which the regulation could be governed. There was a general concurrence of views that the railroads ought to have a fair return on the fair value of their property and no more, but nobody knew what the fair return ought to be; nobody knew what the fair value of the property ought to be, so it was unending debate all the time. We had a condition which in my opinion made successful regulation under the old conditions utterly impossible, and that is what I wish to mention as the second point in my catalog of fundamental difficulties with the old form of regulations. That second point is the wide disparity between the weak roads and the strong roads.

We had about 180 railroad companies in this country with revenue of a million dollars or more every year, and we had several hundred companies with operating revenues of less than a million dollars per year. That great number of companies presented every possible variation from a degree of exceptional prosperity to the degree of exceptional adversity, and yet every one of these railroads represented a necessary instrument of public service. Broadly speaking, the rates had to be the same for the weak roads as the strong; to a very large extent the scale of wages had to be the same regardless of the strength of the particular railroad because the cost of the supplies was practically the same for the weak and the strong. So we had a condition that whatever might be done through fixing the rates or through establishing a wage scale, the result was that some railroads would prosper while other railroads could not prosper at all, so that however any question of broad railroad importance was disposed the result led to discontent on the part of the public and to discontent on the part of the owners of the railroads.

There was another feature of regulation in the past which militated against a successful result; there was no point of contact in any effective sense between the government and the railroads. The government was permitting the railroads to exercise important public franchises, and the government was insisting very properly on the most thorough and far-

reaching regulation of what the railroads did, both as to the rates they charged and the service they rendered, and yet there was never any adequate provision for participation by the government in what the railroads did, and the regulating body that represented the government was absolutely separate in its method of procedure and in the conduct of its business from the private management which represented the owners of the capital invested in the railroads. The railroad business, therefore, was conducted by two factors, each of vital importance, and yet those two factors were entirely aloof from each other. Each operated without adequate understanding of the point of view of the other; neither was in position to explain in a timely way its ideas to the other. That absence of any connecting link, the inability to have a common understanding of the necessity of the situation, was another reason why the regulation did not tranquilize the situation, but generally any definite step that was taken was simply the starting point for new agitation and new discontent.

Another point which was of very great importance was the persistent suspicion which was entertained by a very substantial part of the public and which was almost unanimously entertained by labor, that the railroads, or some of them, were heavily over-capitalized. Any argument that was made on behalf of the owners of the railroads against the institution of any given level of rates, or in opposition to any proposed increase in the level of expenses was disregarded by a considerable part of the public and by labor almost altogether because of this persistent belief that the railroads were over-capitalized.

Then again, and connected with that thought of over-capitalization, the public very generally believed that since the railroad business was a public business and could be conducted only by the exercise of important public franchises and since in its nature it was practically a monopoly, no matter how much competition in service there might be, it was of great importance that the public and labor should not be exploited for the benefit of the private capital. Plausible cause might be made for increase of the rates, and yet there was the fear that if the increased rates produced more than was absolutely necessary, or if conditions became more prosperous, so that there would be additional profit, that profit would inure wholly to the benefit of the private capital. There was no way in which the public could participate in it, and this fear of the public being exploited for the benefit of private capital was always tending to prevent a confidential and liberal treatment of the railroad question.

I would list those five propositions as the five fundamental evils of the railroad situation: first, the absence of standards; second, the wide disparity between the weak and the strong roads; third, the absence of any point of contact between the regulating body and the private management; fourth, the suspicion as to over-capitalization; and fifth, the fear that the public would be exploited for the benefit of the private capital.

Those difficulties I have mentioned were obvious before the war. They are very much more serious, and much more obvious now. The railroad situation in the future is going to be far more difficult than it was in the past. The disparity between the weak and the strong roads is going to be more pronounced; there are going to be fewer roads which can survive on the basis of their individual earnings. So whatever may have been the necessity for a radical and effective solution of these difficulties in the past, that necessity is multiplied many times by the new conditions which will confront the railroads of this country, and which have been the outgrowth of this war.

Simply as an illustration further to emphasize the point I have made, and to serve as a basis for discussion, I want to put before you my personal view as to a solution, and in all

that I say I want to emphasize that I am speaking for myself alone.

This would be the solution which I personally believe ought to be adopted. I think there ought to be a compulsory consolidation of the railroads of this country into a few large competitive systems. I believe the American public wants competition in service, and I think that can be accomplished through the creation of a few large systems, say anywhere from 12 to 20. I believe in each of the three great sections of the country—the West, the East and the South—a few large railroad companies can be constituted each of which will be a strong system, and the several companies in each of these regions will give effective competition in service at practically every important point which now enjoys competition.

Each of these railroad systems can be made to combine the strong roads and the weak in such a way as to present a fair average in the general situation. In that way we will get entirely away from the insuperable difficulty in the past of trying to apply a single standard to railroads so different in their earning capacity that it was impossible for the same standard to work for all.

Since these railroad companies, reconstituted in this way, would have an official capitalization, that official capitalization would put an end for all times to come to this prevailing and persistent suspicion as to overcapitalization.

Having those railroad companies constituted in that way, with an official capitalization, I think the government ought to be business-like enough to save its own money and the money of the public by guaranteeing a moderate return on that capitalization, instead of by adopting a plan of giving an assurance which amounts to a sort of a moral guarantee, but yet is so uncertain as not to accomplish the result intended, either in attracting the new capital necessary, or in assuring an adequate public service. The government is morally bound, and as a practical matter it is bound, to keep the railroads in condition to render the public service, and if it cannot accomplish that in one way, it will have to accomplish it in another.

If you stopped there, you would wipe out the private initiative, which I think is of the utmost importance in order to get satisfactory public service, and in order to get a maximum of efficiency and economy, I would preserve that private initiative by giving private management a fair participation in the profits that might be earned in excess of this moderate guaranteed return. In that way the railroad management would get enough to stimulate private initiative just as effectively as it would be stimulated under any other system and at the same time the fact that there was a division of the profits, and perhaps, a rapidly ascending proportion of profits going to the government, or to the government and labor, would prevent the public and prevent labor from this suspicion and fear that it has always had that it would be seriously and detrimentally exploited for the benefit of private capital.

I believe that would result in removing the disposition toward illiberal treatment because I think that disposition has grown largely out of the fear, first of overcapitalization, and second, that there would be an unfortunate exploitation of the public for private benefit, if the rates were increased in a liberal manner, and I think this participation in the profits, along with the official classification, would guarantee that moderate return, and would get rid of all those difficulties.

I would go further than that. I would have the government represented on the boards of directors and I would have some of the government directors made members of the government regulating body, and in that way we would establish the necessary point of contact so that the private management in conducting this public business would do so with the advice and counsel of the representatives of the public, and so

that the regulating body, when it undertook to deal with this subject, would do so in the light of the knowledge acquired by members of its own body who were in daily contact with the management of the business.

### Senator Cummins' Plans

Senator Cummins, after stating the supposition that President Wilson will retain the possession and continue in the operation of the railroads until Congress has had a fair opportunity to enact a permanent policy for their regulation and control and that Congress will proceed with the task and bring it to a conclusion within the next 12 months, concurred in the belief of the Director General that there must be a series of consolidations which will merge the weak roads with the strong ones to the end that the resulting systems may do business upon substantially even terms. Under this plan Senator Cummins would have the railways consolidated into 18 or 20 systems under the initiative and direction of the government.

However, these systems would not be regional systems; on the contrary, they would preserve competition in every part of the country and in practically every community. The second principle of the solution presented by Senator Cummins is that the government guarantee in some form a return upon the capital invested in railroads. In backing up these two principles of his plan, Senator Cummins cited the disparity in the net operating income of railroads operating in practically the same districts and the amount of return on the railway bonds of the country. The third phase involved in his solution advocated the operation of the railroads by private corporations rather than by the government. All three of these principles are the same as underly Director General Hines' proposed solution outlined above and the making of this solution a reality was indicated in the closing statements of Senator Cummins when he said that he planned to introduce a measure embodying these principles for the solution of the railroad problem in the early days of the coming Congress.

The address of Samuel Rea, president of the Pennsylvania Railroad Company, is published elsewhere in this issue.

### Railroad Section Meeting

At the group meeting devoted to railroad transportation presided over by George A. Post, chairman of the railroad committee of the Chamber of Commerce of the United States there were presented the recommendations of that committee which were promulgated after four conferences with executives, financiers, legislators and labor leaders of the country. These recommendations will be presented to the various Chambers of Commerce throughout the United States for a referendum vote. These recommendations as presented were as follows:

1. Adherence to the policy of corporate ownership and operation of the railroads, under a comprehensive system of government regulation.

2. The return of the railroads to their owners as soon as remedial legislation can be enacted, and that no extension of the period of government operation should be made until Congress shall have found it impossible to enact the required legislation within the period possible under the Railroad Control Act.

3. That while adhering to the principle of railroad competition in service, the railroads be allowed, in the public interest, when so declared, and as approved by public authority, to consolidate to such extent and in such manner as may be necessary to enable the existing railroads to unite in a limited number of strong competing systems, so located that each of the principal traffic centers of the country shall, if possible, be served by more than one system.

4. That railroad companies engaging in interstate commerce shall be required to change from state to federal corporations, with suitable provisions in the Act of Congress providing there-

for, that the several states shall retain the power of taxation and police regulation of the properties of said railroads.

5. That the Interstate Commerce Commission be authorized to pass upon the public necessity for expenditures of capital (in excess of a stipulated amount) by carriers engaged in interstate commerce, and to determine the amount and to regulate the other conditions of the issuance of securities to obtain the funds required to cover authorized capital expenditures. That a railroad applying to the Interstate Commerce Commission for authority to make capital expenditures, or to issue securities, shall be required to file with the proper authorities of the states in which the railroad is located copies of the original petition; and that the Federal Commission be required to notify the said authorities of the hearings upon the petition in order that they may advise the Federal Commission as to actions they favor.

6. That the Interstate Commerce Commission be given authority by statute to regulate intra-state rates, when those rates affect interstate commerce.

7. The enactment of a statutory rule providing that railroad rates and fares fixed by the Interstate Commerce Commission shall be such as will yield the railroad companies, in each of such traffic sections as shall be designated by the Commission, aggregate revenues which will provide (after provision has been made for renewals and depreciation) a net return upon a fair value (determined by public authority) of the property devoted to the public use. This net return should be sufficient in amount to enable the carriers to furnish the public with adequate facilities and efficient and economical services.

8. The enactment of a statutory rule of profit-sharing, whereby the railroad systems, having a net corporate income in excess of an equitable minimum return upon a fair value (determined by public authority) of their property devoted to the public service, shall be required to turn over a stipulated share of their excess profits to a fund to be employed, as Congress may direct, to strengthen the credit of the railroads as a whole and to enable them to serve the public with greater efficiency.

9. That a Federal Transportation Board be created, whose general duty it shall be to promote the development of a national system of rail, water and highway transportation, and thus to make possible the articulation and economical use of all the facilities, including tracks, terminals and transfer facilities, of steam and electric roads, waterways, and hard-surface highways.

Not only were these recommendations presented to those interested in railroad transportation present at the group meeting but the committee's reason for arriving at each conclusion was also presented. George A. Post, the chairman of the committee, in addressing the group, said in part:

The query for discussion in this section today is: What Shall Be Done With the Railroads? There are several things of importance to be considered in giving the answer, but it appears that *two things* ought to be done, which take precedence in any general statement, viz.: return the railroads to their owners just as soon as the necessary remedial legislation can be enacted by Congress, as preliminary thereto, and in doing so provide them with adequate revenue without which performance our country's commerce and industry must languish.

Before taking up for consideration the financial policy that must be adopted before the railroads may safely be returned to their owners, it may be of interest at this point to make a survey of some other phases of the plan for necessary remedial legislation which will demand the attention of Congress, and which will be useful to it as indicative of public opinion as it seems to have already taken form.

Federal regulation of all issues of securities of corporations engaged in Interstate Commerce is now believed, with practical unanimity, to be necessary for the protection of the public, and legislation to accomplish this is desired.

The joint use of terminals and pooling of equipment in facilitating the movement of freight and passengers is now accepted as a public policy which needs only appropriate legislation to effectuate. This viewpoint has obtained, growing out of methods devised under federal control, and is a

feature of federal administration which cannot be too highly commended, it yet needs to be greatly expanded in the public interest.

There seems to be a marked trend of public opinion in the direction of providing for the consolidation of railroads into a limited number of strong competing systems, such consolidation to be permitted, advised, or even required by federal authority, when it is deemed in the public interest to do so.

That the state commission shall no longer attempt, in the interest of their particular state, to interfere with rates affecting interstate commerce is a view which I believe to be the opinion of a very large majority of the people of the United States. There is yet a desire to retain all the powers that they have heretofore exercised, and through able advocates they entreat the public to trust them with the further exercise of this power. They protest vigorously that they ought not be deprived of the power of rate regulation, but it would seem to be the public opinion now that the Interstate Commerce Commission must have or should have absolute sway in the matter of interstate rates. But if there shall be a disagreement, the rule of the Interstate Commerce Commission must be absolute.

The development of a national system of transportation is now conceded to be a crying necessity, necessitating the articulation and economical use of all facilities, including tracks, terminals and transfer facilities of steam and electric railways, water ways and hard surface highways, and was strenuously advocated by Director General McAdoo before his retirement, and by his successor, Mr. Hines.

There are already over four hundred million dollars worth of demand obligations of the railroads now outstanding, which are likely to be increased before the end of the federal control, which the railroads owe to the government as a consequence of the taking over of the railroads by the government as a war emergency. In common fairness to the railroads, and in order that they may not be rendered impotent when they are returned to their owners, the business judgment of the country would surely favor legislative action whereby such indebtedness by the railroads to the government would be funded by the issue to the government of the obligation of the debtor company maturing within a period of years, with interest, say, at five per cent per annum, and secured in such manner as may be required by the Secretary of the Treasury.

Most significant of all is the general recognition, both in and out of Congress, that the national prosperity requires a new element of policy in regulation of rates which shall aim to assure adequacy of railway service and development of facilities. Particularly has discussion concentrated upon the problem of giving sufficient revenue to meet the necessities of the people served by one road where the increase in rates would have to be needlessly imposed upon the people served by a more prosperous competitor taking the same rates. It is now declared by railway managers and financiers of the first rank that this part of the problem would be largely solved through combinations, if sanctioned. Thus a strong road would be permitted to take over a weak road and spread its income and credit over both. This does not mean the elimination of competition within geographical areas. One of the most unmistakable of recent tendencies in opinion is away from the proposal of regional monopoly toward retention of competition.

It is conceded that even after the process of consolidation has reduced the system to a score or so, there might still remain some strong and some weak roads, and a further adjustment now evidently accepted is that in some way the process of adjusting inequality of conditions should include the use of a part of the surplus income to form a contingent fund for diffusion wherever most needed. Underlying such

efforts as these in the direction of equalization is, of course, the assumption that revenue will be made sufficient for reasonable adequate service, facilities and development. Neglect of Congress to declare a policy designed to furnish revenue sufficient for operation and credit would, it is generally recognized, result in an experiment foreordained to failure, which would mean failure of private ownership or private operation.

### Resolutions

No resolutions were adopted on the railroad problem. This topic will be the subject of a national referendum among member organizations.

Among the resolutions passed by the convention and dealing indirectly with the railroad situation are:

Request of the President that he call Congress into immediate extra session upon his return to solve the problems of the readjustment period. The right of individualistic effort in business is declared in this connection, together with opposition to any governmental entrance to industry and commerce.

The extension of the foreign trade of the country is necessary to supply a market for greater production and banking and insurance interests are urged to accompany the manufacturer into the new field.

Immediate resumption of all construction, particularly by federal, state and municipal governments in public works is urged.

Immediate return of the telegraph and telephone lines to private operation is demanded, together with legislation that will permit their merger, if desired.

The immediate consummation of all congressional waterways projects, already approved, is urged, the construction of terminals by cities upon waterways advocated and the co-ordination of waterways with railways suggested as the subject of a special committee's effort to obtain needed legislation.

### Mr. Plumb Opens the Campaign

“THE ARRIVAL IN WASHINGTON of Mr. Glenn E. Plumb, author of the Plumb plan for the government ownership and operatives' management of railroads, marks the opening of a nation-wide campaign for the solution of the railroad problem along new and wholly original lines,” according to a notice sent to the press on May 3 signed “The Plumb Plan, by R. P. Risley, Manager,” containing an interview with Mr. Plumb, who is attorney for the four railroad brotherhoods and the ten railroad employees' organizations affiliated with the American Federation of Labor. The plan was outlined by Mr. Plumb in his recent testimony before the Senate Committee on Interstate Commerce. The press notice says it is to be incorporated in the form of necessary bills for legislative action which will be introduced at the approaching special session of Congress, and that copies of the plan will be sent on request and personal interviews will be arranged by special appointment.

“I am here to stay until the solution of the existing railroad problem is found in the enactment of legislation as endorsed by organized labor and civic and public bodies throughout the nation, with such reasonable modifications in non-essentials as may be deemed expedient in the preparation and framing of the proposed bills.” Mr. Plumb is quoted as saying in reply to inquiries on his arrival from Chicago.

“The coming session of Congress will, in my opinion, be only a preliminary skirmish—there is such division of sentiment among the parties in interest that I do not anticipate any railroad legislation of a definite character at the special session.

“The time will be necessarily short, and the session crowded with urgent measures bearing especially upon appropriations. The big issues will, however, be clearly defined, and next winter the fight will be on in earnest, accentuated

ated by the importance of a national campaign in the summer."

"You expect, then, that the railroad problem will develop into a Presidential campaign issue?" Mr. Plumb was asked by his press agent.

"Inevitably," he replied. "I do not see how that can be avoided. The railroads have always been in politics, and it requires politics to take them out. It is a political problem pure and simple, demanding a political solution. Personally, I think the whole question should be put up squarely to the people. In this I agree with Major-General Thornton, inspector general of England's railways, who in a recent interview at Philadelphia, is quoted as saying:

"Put it up to the people direct. Whether the government or private interests run the roads, the people have to pay, so let them decide. Why not vote on this?"

Steps are now being taken to obtain the sentiment of every candidate for a political office in this country having to deal with the problem, so that he must declare himself on this issue, the press notice states.

"The plan of government ownership which we advocate is so entirely different from any other proposition of the kind before the public that the usual arguments are answered before they are advanced against it," Mr. Plumb continued. "The question of government ownership can be debated, as it is being debated all over this country almost daily, with affirmative or negative decisions rendered, and still the essential features of our plan would not be touched upon. There is a very general misapprehension in the public mind respecting the difference between government ownership and government administration, to say nothing of the essential factor of the operatives' and the public participation in management which we introduce. It is beginning to be realized that war-control applied to over-capitalized corporations operated for private profit bears no more relationship to rational railroad functioning than does the moon to the proverbial green cheese.

"One of the numerous vital defects inherent in each of the half-a-dozen plans submitted by the railroad interests at the recent Senate hearing is the inevitable demand for a rate-increase or its equally inevitable alternative demand for a government subsidy. If these demands are not fully met, any deficiency must be made up by a wage reduction. These plans, furthermore, provide only for transferring the persistent drain upon the investing public, which must advance, as estimated by the late J. J. Hill, a billion of new funds needed for capital charges yearly, from the investing public to the taxpayers of the nation. They do not furnish the supply to meet the drain. They do not stabilize rates. They solve nothing. Our plan, on the other hand, meets every condition essential to sane financing and proper operation of our entire railroad system, trunk lines, 'weak sisters,' and short lines all included."

## Orders of Regional Directors

**DEMURRAGE DUE FROM U. S.**—The regional director, Eastern region, by circular 600-2-5-3A713, reminds federal managers that demurrage bills accruing on government freight must be collected strictly in accordance with the tariffs. A large amount of bills against the War Department remain uncollected, due in large measure to the difficulty in arranging for payment of the bills at points where the military officer responsible for the charge has to certify to the accuracy of the amount. Evidently the bills will have to be submitted in a special communication to the War Department.

**Interest on New Work During Construction.**—The Eastern regional director, by circular 2700A714, prescribes regulations for calculating interest during construction on addi-

tions and betterments to railroad property where payment is to be made out of federal funds. The rate is 6 per cent, and it applies on work done since December 31, 1917. On a job costing \$1,000 or less, or which is completed in one month, no interest is to be charged. A circular is to be issued containing further details.

**Employees' Passes for Conventions.**—A. H. Smith, regional director, Eastern region, by circular 2100-37A716 advises federal managers that employees regularly elected as delegates to conventions of their brotherhoods are to be granted free transportation both ways; and ordinarily these passes will be issued at Washington. Trip passes for side trips should be requested and secured through the usual channels.

**Quarantine Against Barberry Plants.**—The regional director, Eastern region, by circular 600-163A717 gives notice of a quarantine, issued by the Agricultural Department, against the shipment of barberry and certain other plants into the states of Nebraska, Iowa, Illinois, Indiana, Ohio, North Dakota, South Dakota, Minnesota, Montana, Wisconsin, Michigan, Wyoming and Colorado, because of the capacity of these plants for harboring the black stem rust, dangerous to wheat.

**Terminal Managers.**—C. H. Markham, regional director, Allegheny Region, announces that the offices of the terminal managers at Philadelphia and at Baltimore, were discontinued on April 30.

**Cartage and Lighterage Surety Bond.**—Order 198 of the Southwestern regional director similar to Circular 600-68A699 of the Eastern regional director (*Railway Age*, May 2, page 1101).

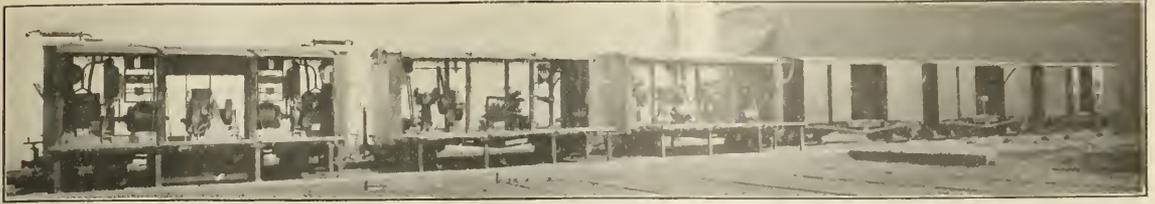

**Oiling Track Joints.**—Circular 206 of the Southwestern regional director states that a recent canvass in the Southwestern region discloses the fact that most of the larger roads apply crude petroleum or other cheap grades of oil to rail splices and bolts not only when first put in service, but also to those already in place. These are first, however, cleaned of rust and dirt. In view of the savings effected by this practice the regional director suggests that it be made uniform on all railroads. The oil should be applied at least twice a year.

**Repair of Short Line Cars.**—Order 197 canceling order 192 of the Southwestern regional director similar to Circular 500-14-5A699 of the Eastern regional director (*Railway Age*, April 18, page 984).

**Posters for Employment of Returned Soldiers.**—Supplement 4 to Circular 39 of the Northwestern regional director authorizes the placing in railroad stations of posters dealing with employment of returned soldiers and sailors. This arrangement may be made effective upon application of the local agents of the United States Employment Service or the Bureau for Returning Soldiers and Sailors. The Southwestern regional director in Supplement 4 to Circular 112 issues similar instructions.

**Industrial Sidings.**—Circular 208 of the Southwestern regional director suggests that, in order to expedite consideration of industrial sidings and in order to encourage new business these projects be handled by wire. Messages should give full information concerning the amount of money involved, how long it will take to lay the track and how soon the industry, will furnish the expected revenue.

**U. S. Employment Offices.**—The regional director, Eastern region, by circular 1500-80A719, asks federal managers to see that every useful advantage is taken of the United States Employment service. Complaint has been made that the railroads do not make full use of this service. Federal managers must, of course, exercise their own judgment in the selection of men, but they are requested to make use of the government employment offices so far as it is possible without harm to their own programs.

*Repair Shop Train in Working Order*

## Repair Shop Train Used on Narrow Gage in Flanders

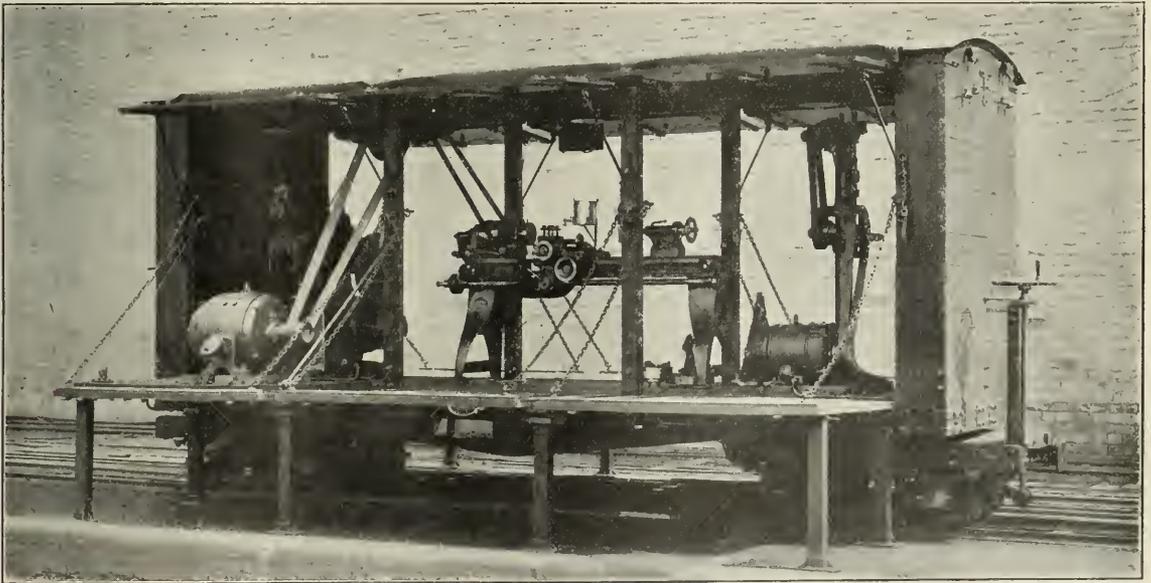

Portable Machine Shop Equipped With Electric Motor Driven  
Tools and Gasoline Generator Sets

By F. C. Coleman

ONE OF THE UNUSUAL FEATURES of transportation in the war zone was the system of a narrow gage military railway. The 16 cm. (1 ft. 11 $\frac{5}{8}$  in.) gage roads operated by the British in Flanders had some interesting equipment, of which none was more novel than the mobile workshop repair trains constructed by the Gloucester Railway Car & Wagon Company, Gloucester, England. Six of these trains, each consisting of six cars, were built to the requirements of the Director General of Light Railways and Roads

gasoline driven electric generator sets each with 15 to 20 hp. engines and 10 kw. generators. These sets weigh approximately three tons each. The gasoline is carried in tanks at each end of the car and water tanks are placed below the under frame, while the muffler is located on the roof. In the center of the car there is an air compressor driven by a 10 hp. motor and connected to an air reservoir slung from the roof. The total weight of this car is approximately 8 $\frac{1}{2}$  tons.

The machine shop car is furnished with a duplex wheel

Machine Shop Car Showing Motor Mounted on Hinged Side Panel

branch of the War Office and the Railway Material branch of the Ministry of Munitions for use on the lines serving the standard gage railway system. The train comprises a generating car, two machine shop cars, a tool car, a supply car and an officers' car. The over-all dimensions of each unit are the same, being as follows: length over body 17 ft. 8 $\frac{1}{2}$  in., width over body 5 ft. 4 $\frac{3}{4}$  in. and height from top of rail to top of body 9 ft. 1 in.

The generating cars are fitted with two direct connected

emery grinder, a 30-in. grindstone, a rapid hack saw, and a vertical drilling machine. The first two machines are connected to overhead shafting which is driven by a 3 hp. motor, while the other two are driven direct, each having a 2 hp. pipe ventilated motor. Electric lights are placed over each machine. The electrical connection between the cars is made by means of insulated cables which are plugged into special fittings on the end of the car. The total weight of this car is 5 tons. The second machine shop car con-

tains one 8 in. shaper driven by a 1½ hp. variable speed motor and a 6 in. lathe with a 21 in. chuck driven through a countershaft attached to the roof by a 2 hp. motor on the bottom portion of the falling side. There is also a small drilling machine in this car fitted with a chuck and driven by a 2 hp. motor. The weight of this vehicle is about 5¼ tons.

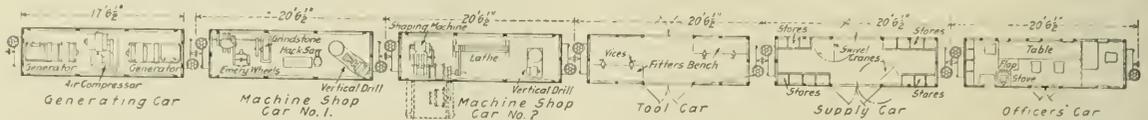

The tool car has two fitters' benches with four vises and is equipped with shelves for holding tools, etc. The supply car is provided with two swivel jib cranes, one on either side. Three rows of shelves are provided for storing material and there are also large bins below the shelves. The cranes swing out beyond the side of the car and the shelves are so arranged that they clear the crane when swung in and not in use. The floor space in this car may be used for portable articles such as forges, jacks, drills, etc. The weights of the tool van and store car are about 3¾ and 4¼ tons, respectively.

The officers' car is divided by means of a partition into two offices. The smaller of these, for the accommodation of the deputy assistant director of light railways, is 4 ft. 6

## Railway Storekeepers' Association Reorganized; Now Section 6, A. R. A.

THE EXECUTIVE COMMITTEE of the American Railroad Association has created an additional section, to be known as Section VI, to consider and report upon all questions affecting the purchasing, selling, storing and distribution of materials and supplies, and kindred subjects; and the section will include the former activities of the Railway Storekeepers' Association. In this section the representatives of the railroads will be officers of the purchasing and stores department.

J. E. Fairbanks, general secretary of the association, in circular No. 1949, has issued a tentative code of rules of order for the section, as approved by the executive committee. These rules, in principle and very largely in detail, are like those which have been adopted for the other sections of the association. (*Railway Age*, January 17, 1919, page 194; March 7, 1919, page 535.) The membership is divided into three classes, representative, affiliated and life. The life membership is for railroad officers and others "whose work

Plan of Shop Train for British Military Railways

in. by 4 ft. 11 in. and is heated by an electric radiator. The general office measures 12 ft. 8 in. by 4 ft. 11 in. and has a small coal stove for heating. The car is well equipped with electric fixtures, both stationary and portable.

From the illustrations it will be noted that the machine shop cars are provided with hinged side doors, the top half forming a canopy and the bottom half when lowered making a platform on which the men have room to work. The platform is supported by chains and wood posts reaching to the ground. During stormy weather use is made of tarpaulins, these being fastened to the canopy and thus completely screening the men from the weather. The underframes of the cars are constructed of wood strongly braced by angle trussing. The trucks are similarly wooden framed with the drawbars built in so that the pull is transmitted through the trucks instead of through the body of the cars, as is the usual practice on broad gage roads.

and interest have been beneficial to the section." The present honorary members of the Railway Storekeepers' Association are to be continued as life members of the section.

The section is to be managed by a general committee of 16 elected members, and, in addition, during the period of Federal control, of three representatives of the United States Railroad Administration, to be designated by the director of the Division of Purchases. The elected members must be divided equally between the purchasing departments and the stores departments; and during the period of Federal control there must be two from each Federal region, and two from Canadian railroads. The regular meeting of the section is to be held in May of each year, and at that meeting officers are to be elected. The time and place will be designated by the general committee three months in advance.

The first general committee, which has been appointed by the executive committee, will organize the section and will serve until a regular election is held. This committee consists of the following:

- H. S. Burr (Chairman), Superintendent of Stores, Erie Railroad.
- E. J. Roth, Manager, Stores Section, Division of Purchases, United States Railroad Administration.
- S. Porcher, Assistant Director, Division of Purchases, U. S. R. A.
- G. G. Yeomans, Assistant Director, Division of Purchases, U. S. R. A.
- A. W. Munster, Purchasing Agent, Boston & Maine.
- W. G. Phelps, Purchasing Agent, Pennsylvania Lines West of Pittsburgh.
- E. W. Thornley, Supervisor of Stores, Allegheny Region, U. S. R. A.
- B. T. Jellison, Purchasing Agent, Chesapeake & Ohio.
- J. P. Murphy, General Storekeeper, New York Central (West).
- H. C. Pearce, General Purchasing Agent, Seaboard Air Line.
- H. H. Laughton, Staff Officer, Materials & Supplies, Southern.
- G. E. Scott, Purchasing Agent, Missouri, Kansas & Texas.
- W. A. Hopkins, Supervisor of Stores, Southwestern Region, U. S. R. A.
- F. D. Reed, Purchasing Agent, Chicago, Rock Island & Pacific.
- H. E. Ray, General Storekeeper, Atchison, Topeka & Santa Fe.
- F. A. Bushnell, Purchasing Agent, Great Northern.
- J. E. Mahaney, Supervisor of Stores, Northwestern Region, U. S. R. A.
- E. N. Bender, General Purchasing Agent, Canadian Pacific.
- E. J. McVeigh, General Storekeeper, Grand Trunk.

Homeward Bound. Transferring Wounded Yankees from a Hospital Train to an Ambulance Bound for the Docks at St. Nazaire

The car shops of the Atchison, Topeka & Santa Fe, in Chicago, formerly known as the Empire Car Shops, were destroyed by fire on April 21. The fire was caused by crossed electric wires in the blacksmith shop. A planing mill, blacksmith shop and machine shop, including machinery, were totally destroyed; estimated loss \$65,000.

# Rate-Making Powers of the Director General

## Right of the Federal Government to Prescribe State Rates

### Argued by the Supreme Court

THE RATE-MAKING POWERS of the state authorities were compared with the "bleaching bones of the Hindenburg line" by John Barton Payne, general counsel for the Railroad Administration, in the argument before the United States Supreme Court on Monday in the test case appealed from the Supreme Court of North Dakota involving the question of the power of the director general of railroads acting for the President to prescribe rates for services wholly within a state. The case arose on a writ of error to review a judgment of the North Dakota supreme court directing the issuance of a peremptory writ of mandamus commanding the Northern Pacific Railway Company and Walker D. Hines, as director general of railroads, to desist from collecting for service wholly within the state any rates, fares or charges other than those on file in the office of the State Board of Railroad Commissioners. The rates involved are those put in effect by General Order No. 28 issued by Director General McAdoo on May 25, 1918, which were not filed with the North Dakota railroad commission except for purposes of information, and the laws of that state regulating the procedure to be followed by the common carriers in increasing rates, fares and charges were not absorbed. Arguments for the Railroad Administration were made by Judge Payne and Charles Donnelly, assistant general counsel, and for the state by Frank E. Packard and W. V. Tanner. A brief was also filed on behalf of the National Association of Railway and Utilities Commissioners as *amicus curiae*.

The brief of the Railroad Administration states that the court erred in holding that section 10 of the federal control act of March 21, 1918, does not confer on the President authority to initiate intrastate rates superseding pre-existing rates prescribed by state authority; also in holding that under section 15 of that act pre-existing intrastate rates remain in effect as lawful police regulations; also in holding that the term "police regulations" as used in section 10 embraces regulation of railroad rates and fares, and that the court erred in entering judgment in favor of the plaintiff. The argument of the Railroad Administration is summed up in the following points:

1. Congress was empowered by the Constitution to vest in the President or in the Interstate Commerce Commission control over intrastate rates and fares.

2. By the acts of August 29, 1916, and March 21, 1918, the President was given control over all traffic, state and interstate, and was empowered to initiate rates, fares and charges by filing them with the Interstate Commerce Commission.

3. Section 15 of the act of March 21, 1918, does not limit or qualify the power given by Section 10 to initiate rates.

4. Section 15, as construed by the court below, is repugnant not only to the specific provisions of Section 10, but as well to the whole spirit of the federal control act. It must be construed so as to harmonize with those provisions and with that spirit.

5. Any state regulation limiting the President's right to initiate rates and fares would affect the transportation of troops, war materials and government supplies.

6. Any doubt as to the meaning of the law will be resolved in favor of the Executive's practical construction of it. Some extracts from the brief are as follows:

So complete was the control given to the President "in

time of war" over systems of transportation by the act of August 29, 1916, that he was authorized to utilize them for the transportation of troops, war material, etc., "to the exclusion, as far as may be necessary, of all other traffic thereon." Possessing authority to exclude all other traffic, state or interstate, he could, of course, say what should be charged for moving it.

Again, section 10 of the act of March 21, 1918, gives the President express authority during federal control to initiate rates and fares by filing them with the Interstate Commerce Commission; and that commission upon complaint is empowered to enter upon a hearing concerning the justness and reasonableness of "said rates and fares." This authority covers all rates and fares. It is not limited to interstate rates or fares, nor can any reason be suggested why it should be so limited. Every consideration which could prompt the President to increase interstate rates must, of course, prompt him to increase those applying wholly within a state; indeed, discrimination must inevitably result if there were an increase of the one class without a corresponding increase of the other. Congress by section 10 did indisputably give him power to increase interstate rates and deprived the Interstate Commerce Commission of the power to suspend them; the state does not and cannot deny this. Yet its argument is that though the law was, as expressly declared in its last section, "emergency legislation" enacted by Congress in time of war, under its war powers, and designed to vest in the commander in chief authority commensurate with his duties and responsibilities, it yet left him a helpless petitioner before 48 separate and independent state tribunals for the permission necessary to make his action effective and lawful.

Moreover, the power thus given to the President by section 10 to initiate "rates, fares, charges, classifications, regulations and practices" must be considered in the light of the purpose for which he was to initiate them, and the manner in which the properties were to be operated, as shown by that section. It was recognized that to pay increased expenses, taxes and compensation to the companies he would probably be obliged to increase rates; and it was provided that if complaint should be made to the Interstate Commerce Commission regarding them consideration must be given to his certificate that he had in fact been obliged to do so. The properties, it was said, were to be operated "as a unit," and "under a unified and co-ordinated national control." How could they be so operated if subject to the regulation of the various states as to a considerable part of their traffic? And how was the President to proceed to get the needed additional revenue? Was he to make a segregation between interstate expenses and returns, and intrastate expenses and returns, along the lines pursued in the various rate cases with which the court is familiar? Such segregations, while theoretically possible, are essentially impracticable, and as this court must have come to realize are of little value when made. But if we accept the theory that it was the duty of the President to deal with each state as to the rates within the state, and to deal with the Interstate Commerce Commission only as to the interstate rates, such a view must proceed upon the idea that there is a practical basis for segregation. If this is true, it must follow that the President ought to have made a separate study of all the intrastate operations so as to decide how the increased burden should be divided. If the President had undertaken

to do this it would probably have been 1924 or 1925 before he could have reached a conclusion.

Surely it is not credible that Congress in providing a method to meet a *war emergency*, intended any such result.

It is said, however, that the very language of section 10 shows that it was never intended to apply to intrastate rates, because it authorizes the commission on complaint to make only "such findings and orders as are authorized by the federal act to regulate commerce," and to enforce them as provided in that act.

This argument utterly misconceives the scope and purpose of the language in question. That language authorizes the Commission to make "*such*" findings and orders as the act to regulate commerce authorizes. Now, what orders and findings does that act authorize? It authorizes findings as to whether rates under attack are unjust or unreasonable; as to whether they are unduly discriminatory or unduly preferential; as to what will be proper rates to substitute therefor; as to whether practices of the carriers are proper; as to whether a claimant has suffered damage and is entitled to reparation; and it authorizes orders giving effect to its findings and in certain cases—as where the order requires the payment of money—proceedings in court to enforce them. Congress might have enumerated specifically each of the findings and orders described in the act to regulate commerce which it was empowering the commission to make; but it wished to avoid circumlocution. It was enacting emergency legislation dealing with temporary conditions. The machinery already provided by the interstate commerce act was adequate to any case involving a complaint as to rates, and therefore it authorized the commission, in dealing with any case involving rates, whether state or interstate, to make findings and orders *such as* (i. e., *of the character of*) those authorized by that act.

Far from telling against the construction for which we contend, the language here in question tells distinctly in its favor. Had section 10 been concerned alone with interstate rates and fares, there would have been no point in giving to the commission authority, when such rates were attacked, to make such findings and orders as the interstate commerce act authorized. *The commission had that authority already.* The very purpose of the language was to give it like authority in cases of a character which it had not previously been authorized to consider.

The state contends that in preserving unimpaired its "lawful police regulations" Congress restricted to interstate commerce the authority given by section 10 to initiate rates; or, stated differently, that this language in section 15 proves that section 10 was not intended to have the broad effect now claimed for it. The argument is that laws relating to the regulation of rates and fares are "police regulations," and that these are not preserved unimpaired if the President is given authority to disregard them.

Taking the term "police power" in its broad sense, it is undoubtedly true that laws regulating rates and fares may properly be referred to that power; but in its broad sense almost every legislative enactment might be referred to it.

It is not in this broad sense that the term is commonly used. In its ordinary sense it is taken "to extend to the protection of the lives, health and property of the citizen and to the preservation of good order and the public morals."

Moreover, it is to be observed that it is not the "police power" of the states that section 15 preserves unimpaired, but only their "lawful police regulations."

It is said, however, that the history of section 15 in its passage through both houses proves that Congress intended by that section to preserve unimpaired the state's power of rate regulation. This argument rests upon the fact that the bills dealing with this subject which passed the Senate and House, while generally alike, had numerous points of difference in detail, and were therefore referred to a conference

committee. The House bill, as thus referred, provided, that "nothing in this act shall be construed to amend, repeal, impair, or affect the existing laws or powers of the states in relation to taxation, or the lawful police regulations of the several states, except wherein those regulations may affect the transportation of troops, war materials or government supplies, the regulation of rates, the expenditures of revenues, the addition to or improvement of properties, or the issue of stocks and bonds." The conference committee struck out the italicized words, and the remainder was reported with slight changes as the present section 15, and adopted with the rest of the bill. No explanation whatsoever was made by the conferees of their purpose in eliminating these phrases. The hearings before committees, and the observations of members in the course of the progress of the bill show that it was the purpose and aim of those who advocated the adoption of the provisions of section 10 to vest in the President primary control of *all* rates, state and interstate.

Again, if all state police regulations in the broad sense were to be observed, it is not alone in the matter of rate regulations that the President has been at fault. How about state laws forbidding consolidation of parallel and competing lines? These certainly are police regulations in the broad sense. He has disregarded them. Was he bound to observe them? He thought he was not, for he was told by the act that "a *unified* and co-ordinated *national* control" was provided for. Unification and co-ordination and nationalization of the railroads were the primary objects sought to be obtained; and can anything be more absurd than to suppose that Congress meant to undo its own work, and by its use of the term "police regulations" in section 15 to defeat the very purpose for which the law was enacted?

That it is opposed to the specific provisions of section 10 is apparent at once. That section tells the President that by filing them with the Interstate Commerce Commission he may initiate rates which the commission shall be powerless to suspend pending final determination; and this, as we have seen, within the principles of statutory construction which this court has laid down, means *all* rates, state as well as interstate. Section 15, on the other hand, as construed by the court below, directly negatives this and tells him that as to traffic moving locally within each of the 48 states, he may not initiate rates in this way, but must observe existing state regulations. But the language of section 10 is specific; it deals directly with the subject in hand, namely, rates, and tells the President how he may initiate them. The language of section 15, out of which the court below spells a prohibition against this, is general. It is not an express statement that he may not initiate those intrastate rates, which section 10 says he may. It is a mere general statement that those exceedingly vague things called "lawful police regulations" are to remain unimpaired.

Even if a state law regulating rates is a "lawful police regulation" within the meaning of section 15, the President, by the very terms of that section, was relieved from the necessity of observing it if its observance would affect the transportation of troops, war materials or government supplies. Is it certain that such a law would *not* have that effect; or, to put it on the lowest ground, is it *so* certain as to justify a court at this day, when the crisis is past, in undoing what the President then did? He was in charge of the transportation systems of the country. He had to operate them; and the consideration of the first importance was, of course, to utilize them in the movement of troops and war material. He could not in such an exigency allow their operation to cease through the disaffection or strikes of employees. This court knows judicially that on the very day when the director general issued Order No. 28, increasing railroad rates, he issued as well Order No. 27, increasing by several hundred millions of dollars annually the wages of railroad employees. The money to meet this added

charge must come from some source; it was proper that it should come from the shippers and passengers for whom, for the most part, it was incurred; and it was proper, indeed it was necessary, that in distributing the burden interstate shippers and passengers should not be discriminated against. Confronted with this situation the President might well have said: "These state laws which require me, at such a time, to observe all the formalities of a procedure adapted to times of peace, in order to get that financial assistance which to be effective must be obtained promptly, are a real hindrance to the effective prosecution of the war, and their observance would affect the movement of troops and war materials." And if in the exercise of his executive discretion he took this view, is it the function of a court now to say that he was wrong?

It is to be remembered that the action complained of was not that of a railroad corporation. They were increased by the President of the United States, in time of war, at a critical period in the history of the nation and of the world, and in the exercise of what *he believed* to be authority duly vested in him by Congress. No one questions or would dream of questioning his good faith; no one would think of suggesting that in what he did he or those through whom he acted had any ulterior or unworthy ends to serve. He acted with absolute impartiality. He imposed upon the commerce of North Dakota no burden not placed equally upon the commerce of every other part of the nation. His authority to do this was not then challenged. North Dakota, like every other state in the nation, acquiesced in and recognized it; and from the intrastate rates thus established and assented to many millions of dollars, as the answer shows have been collected and disbursed by the United States Government. We have, then, the disinterested, practical construction placed upon a law by those whose duty it was to administer it, and acquiesced in by the very parties who now challenge it. Unless that construction was clearly erroneous the courts will sustain it. Authorities in support of this proposition might be multiplied indefinitely.

Counsel for the state denied the contention of the Northern Pacific that because it no longer has possession and control of its property this suit as to it should be dismissed. They contended that the Northern Pacific is a necessary and proper party defendant, and that it is apparent that Congress intended to preserve the right to sue. The state also argued that the federal control act did not abrogate the laws of the state respecting the establishment and regulation of rates, and that it is the duty of the court to adopt the statutory construction that will reconcile the two statutes—the Interstate Commerce Commission act and the federal control law. Mr. Tanner argued that the states have no arbitrary powers which would interfere with the President's exercise of his control over the railroads, saying that the decision of the Interstate Commerce Commission in the 15 per cent rate advance case was immediately followed by the states. The contention was that while the President might initiate rates, the law contemplated that the Interstate Commerce Commission should review the interstate rates, and that the state commissions should review the state rates, and that their laws regulating the procedure to be followed were not inconsistent with the federal control act.

The state brief said in part:

The fact that the railroads are instrumentalities of interstate commerce does not preclude the exercise by the state of powers establishing regulations governing their internal commerce, and the fact that they are temporarily agents of the national government to execute national policies in war time does not exempt them from state regulation. The national power exercised for the enactment of national measures in war time emergencies is paramount, but the question here is not merely one of the existence of inherent power, either in the national government or in the states, but

the purpose manifested by Congress to exert its powers to the exclusion of that of the states.

In matters growing out of the war emergency, for which Congress deemed it necessary to prescribe regulations, there can be no question that the national powers are paramount and exclusive—whether these matters involve interstate commerce or the employment of other agencies for the execution of constitutional functions; but in so far as these instrumentalities are employed only in the purely local concerns of the state, regulatory power is reserved to the state authority.

We have shown that the mere fact that a railroad may be an agency of the Federal Government for military or other purposes, does not necessarily exempt such railroad from state authority.

It will hardly be contended that the act of August 29, 1916, operates to abrogate, repeal or suspend the provisions of law, federal and state, relating to the publication and establishment of rates, except as such laws may be affected by the utilization of the railroads "to the exclusion as far as may be necessary of all other traffic thereon, for the transfer or transportation of troops, war material and equipment, or for such other purposes connected with the emergency as may be needful or desirable."

Is the power here vested in the President to "initiate" rates inconsistent with the laws of the state relating to the filing and establishment of rates? Surely it is not. The use of the word "initiate" in defining the power of a public agency is new, but manifestly it is used in the sense of proposing a rate rather than in the sense of *fixing* or *establishing* the rate. The explanation of the use of this word is probably found in the fact that under the act of August 9, 1917 the carriers were required to first obtain the approval of the Interstate Commerce Commission before filing any increased rate or charge, and to the desire to remove this restriction during the period of federal control. Prior to this statute the carriers themselves, under federal laws and under the laws in force in most of the states, have always had the power to *initiate* rates. This power, however, has never been regarded as inconsistent with the *fixing* and *establishment* of rates by regulative commissions nor with the obligation to comply with provisions of law respecting the filing and publication of the rates so initiated.

Nor is an inconsistency created by the provision for the filing of the rates initiated by the President with the Interstate Commerce Commission. Prior to federal control rates initiated by the carriers were required to be filed with the state commissions and the interstate Commerce Commission, and, as pointed out, since the initiation of the rate is not the fixing of that rate, there is no inconsistency in permitting a rate to be initiated by filing it with the Interstate Commerce Commission and the concurrent requirement of compliance with state laws upon the subject. We believe this is the more apparent when regard is had to the provision forbidding the Interstate Commerce Commission from suspending rates initiated by the President pending final determination. In this provision Congress recognized the existence in the commission of a power to suspend rates initiated by the President and evidently felt it necessary to deprive the commission of that power during the period of federal control, showing that Congress did not regard the power to initiate rates by filing the same with the Interstate Commerce Commission as inconsistent with the power of the commission to review, regulate and fix the rates so initiated.

The provisions of section 10 of the federal control act modify to some extent the powers of the Interstate Commerce Commission in respect to the rules established for its guidance in the determination of questions affecting rates. It must proceed with due consideration to the fact that the railroads are being operated "under a unified and co-ordinated national control and not in competition."

The absence of an express provision in section 10 saving

in power of the states to act through the state commissions in cases involving intrastate rates is explained by the provision of section 15 saving the "police power" of the states. Having preserved to the state their right to make police regulations (with certain exceptions), it was wholly unnecessary to expressly save the jurisdiction of the state authorities as was done in the case of the Interstate Commerce Commission.

Certainly those provisions of the federal control act with relation to the exercise by the Interstate Commerce Commission of the powers *now possessed* by that body, although modified by the existence of federal control, cannot be held to be inconsistent to the point of conflict with the existence of state laws regulating the publication and fixing of "reasonable rates for its exclusively internal traffic."

It will undoubtedly be argued that the government, as the temporary proprietor of the property, has the right to *initiate and establish* rates. No one disputes the power of the government to initiate rates. Indeed, the law specifically provides the method of procedure with respect to interstate rates. The question is as to the power in the matter of purely intrastate rates. The government claims that the war emergency justified the exercise of the supreme power of the federal government. Assume that it did. This is no reason why the law should not have said so.

It was argued by counsel for the Railroad Administration in the state court that it would be "absurd and contrary to the general welfare" to permit the government to establish interstate rates for general commodities between points in different states and deny the right to fix the rates on the same commodities between points wholly within a state. Many will agree that the accident of state lines should have no controlling effect, but this condition is no more absurd in time of war than in time of peace, and it is just the condition that obtains in time of peace under the respective jurisdictions of the Interstate Commerce Commission and the authorized state commissions.

The matter of the charges for carrying passengers and freight between the various stations situated along the lines of the Northern Pacific in the state of North Dakota has no direct effect upon the transportation of troops, war materials, or government supplies. As stated before, it must be presumed that the established rates are reasonable. Such rates, governing as they do the transportation of property between individuals, have no more effect upon the conduct of the war than does any other purely local police regulation.

The President has not been vested with authority to set aside state laws, whenever he thinks it necessary to do so, for purposes connected with the war or for purposes connected only with the ordinary administration of railroad affairs. The act subordinates state laws to such orders as the President is validly authorized to make by the act of March 21, 1918, and the act of August 29, 1916. Any order not so authorized would be of no effect.

Under the act of March 21, 1918, the President is authorized to make only such orders as are necessary or proper to carry out the objects of federal control, *i. e.*, the use of the railroads for war and other purposes connected therewith.

No one would contend, for instance, that the President may make orders with respect to the method of recording documents affecting the title to the property of the carriers, the matter of establishing liens against their property, the liability of the carriers for damages in cases of personal injury or loss or destruction of property.

Clearly the state laws upon these subjects are not inconsistent with the act of Congress and cannot be abrogated or superseded by an order of the President. The laws governing the carriers in these matters have no relation to the conduct of the war. Similarly, if the obligation of the carriers to transport property at reasonable rates established by state law is not inconsistent with the provisions of the acts of

Congress, it is not within the power of the President to interfere with the force and effect of these laws.

We believe that when the federal control act is viewed in the light of the changes made in its text during the time it was under consideration by Congress, prior to its final passage, there can be but one opinion upon the question of the purpose of that body, that the states should retain their power to regulate rates applicable to their strictly domestic commerce.

When a proposed act as introduced in the legislature establishes one rule (*i. e.*, broadly empowers the President to fix rates) and during its progress through that body is changed so that, giving the words used their ordinary definite meaning, the act means something else (*i. e.*, intrastate rates to be fixed by local authorities), that fact is of the greatest importance in determining the intention of the legislature. The act should be examined in the light of the change; and we submit that when this is done, the conclusion is unavoidable that Congress intended, as it said, that nothing in the act should be construed "to repeal, impair or affect \* \* \* the lawful police regulations of the several states \* \* \*"

## The Economic Aspects of the Control of North China

By Frank Rhea

THE CONTROL of the future supplies of iron and fuel in the Far East is not only of great importance to the industrial development of that entire region, but it is bound to have a profound influence on the whole industrial world on account of the great volume of these resources in China with her unlimited supply of willing and capable labor.

There are undoubtedly large deposits of very good iron ores in China. The proved deposits of iron at the present time are largely in the provinces of Hupei and Anhui, all within reasonably short distances of that most unusual water route, the Yangtse river, the only great river of the world in the temperate zone navigable for 1,000 miles from its mouth running from west to east. All other great rivers, except the Amazon, run from north or south, as for example the Mississippi.

There are no doubt many great deposits of fuel in China, but few of these have been scientifically proved to date. It can be stated, however, and supported by good authority, that probably the greatest coal field in the world outside the United States is the general field in northern China, the central part of which lies in central and southwestern Shantung, all of northern Honan, all of southeastern Shansi and southern, western and northern Chihli. The known part of this field starts in northeastern Chihli at the Kaiping Basin, between Lanchow and Tongshan, and keeps inside the Great Wall and the Hunancho or Yellow river until Chichchow is reached, where it extends south of the Yellow river into southwestern Shantung—the limits of the field extending south of Honan and Kaifeng.

The Kaiping Basin, controlled and operated by the Kaiian Mining Administration (Sino-British\*) with the exception of the Fushan deposits in South Manchuria controlled and operated by the South Manchurian Railway (Japanese), is the only large deposit of coal in China which has been thoroughly and scientifically proved and comprehensively developed. The outlet of the Kaiping Basin operations to the sea is by the Pekin-Mukden Railway (Sino-British) through the port of Chinwantao with a rail haul of less than 100 miles. The port of Chinwantao has been developed and is largely controlled by the Pekin-Mukden Railway.

\*Chinese and British.

The Pekin-Hankow Railway (Sino-Franco-Belgian) for some two-thirds of its length either passes through or runs in close proximity to this great field, and there are now considerable developments on the northern end of this line. The Pekin-Suiyuan Railway, usually known as the Pekin-Kalgan (Chinese), by branches near Pekin, reaches deposits of this field, and there are a number of native workings on this line outside the Great Wall. The meter gage Cheng-Tai or Shansi Railway (Sino-Franco-Belgian) running from Chengting on the Pekin-Hankow to Taiyuanfu passes through one of the richest parts of this field. This is the only line not of 4 ft. 8½ in. gage in this part of China.

Tientsin-Pukow Line (Sino-British) reaches important deposits in southwestern Shantung which would also be tapped by the proposed line (Japanese) from Kiaochao to Hsuechow. The South Manchuria Railway (Japanese) taps the small but very good iron and coal fields at Penchihu in southeastern Manchuria, the important and completely developed and equipped Fushun coal mines and the indifferent Yentai coal deposits. Fuel from these three fields will be used at the new Anshan iron furnaces for smelting the indifferent ore found near the latter place. The rail haul from the Fushun mines to the ice free port of Dairen is less than 300 miles. What the coal and iron deposits are on the

The Railways of Northern China

The railways under the control of the Chinese Ministry of Communications are shown by open lines; the concessioned or Japanese railways by bold, full lines

The Taokow-Chinghua Railway (Sino-British) from Jaimeon to Taokow and the Pienolo Lines (Sino-Franco-Belgian) between Honan and Hsuechow both pass through extensive and excellent deposits of this great field. The Shantung Railway (now Japanese, formerly German) taps the indifferent iron and coal deposits near Poshan in northern Shantung, but the proposed extension of this line from Tsinanfu to Shunteh, where connections would be made with the Pekin-Hankow would give the Shantung Railway access to all this part of these great coal deposits and an outlet to the sea by way of the port of Tsingtao (Japanese). The

proposed railways (Japanese) in the region from Jehol to Chao Yang to Tao-nan-fu is not known, or, if known by anyone, the information was not obtainable by the writer.

The coast of China north of the Yangtse river, including that of south Manchuria, is singularly devoid of good harbors, particularly ones that can be kept open in the winter. The really good harbors are the well-known and excellently equipped ports of Dairen and Tsingtao, both at present under Japanese administration, and the port of Ching-wangtao, practically controlled by the Pekin-Mukden Railway (Sino-British). Hulutao claimed in connection with Japanese rail-

way concession is probably capable of being developed into a reasonably good port, which can be kept open during the long winters of this region. Port Arthur, located in the leased territory of Kwantung (Japanese), while valuable as a naval base, is of little value as a commercial port. New-chang in the mouth of the silt-carrying Liao River is unsatisfactory at the best, and is tightly closed during the long winters in this locality. Tientsin (Taku) is unsatisfactory, particularly for vessels of any size, and is also closed during the winter season. Chefoo is little more than open roadstead with poor land communications, and Weihaiwei has almost impossible land communications. Haichow and Kwanhokow are both undeveloped and neither is probably capable of satisfactory development. This very clearly indicates the strategic value of the control of the four practicable seaports of North China.

The railways controlled by the Chinese Ministry of Communications are shown by the open lines on the map. The concessioned railways are shown by the full lines. At present all these concessioned lines are under Japanese control and operation, except the Chinese Eastern. The lines in Corea are operated as part of the South Manchuria Railways. The black broken lines indicate the concessions claimed by the Japanese to build and operate additional railways in Shantung, Chihli, southern Manchuria and Inner Mongolia, and one of the special claims in this connection is the right to develop and operate the port of Hulutao, already mentioned. The open broken line indicates the general route of the so-called Kuhn-Loeb concession negotiated by the late Major Willard Straight for a line from Chinchow on the Pekin-Mukden Railway not far from Hulutao to Angin on the Amur river, crossing the Chinese Eastern Railway near Tsitsihar.

As already stated, the map and this brief description have been prepared to give the viewpoint of an engineer concerning the vast industrial and economic stakes which are at issue in the control of the transportation facilities of north China. These transportation facilities will completely dominate and control one of the world's greatest coal fields, combined with the great iron resources of China and also what was particularly impressive to the writer in several months' travel in this part of China, they will control the world's present greatest supply of willing, robust and capable labor.

## American Rails for Birmingham, Eng.

THE STEEL MANUFACTURERS of the United States are carrying their competition in foreign trade to the home of the British supply manufacturer, one mill having recently taken an order for 1,200 tons of rails for the tramways in Birmingham, England. The placing of the order excited no small amount of criticism on the part of British interests, with the result that the purchasers issued a statement as follows:

"The recent announcement that the Birmingham Corporation Tramways Committee had accepted a tender for steel rails from an American firm has given rise to considerable discussion. It now appears that the facts are as follows: During the war the tramway tracks had become so defective that it was necessary to reconstruct several routes at the earliest possible moment. The committee, accordingly, invited tenders for the supply of 1,200 tons of rails. Three replies were received. One, from an American firm, offered full delivery, April-May shipment, and quoted the lowest price of the three. A second, from an English firm, could only offer delivery of about 50 tons a week, commencing in three or four weeks. The firm stated, moreover, that they could not agree to a penalty clause, in view of labor conditions and of their difficulty in obtaining raw materials. The third offer was also from an English firm, who quoted a still higher price, and could not deliver under 20 weeks.

"Had the committee accepted either of the English tenders the work could not have been completed this summer. It could not be done during the winter months, and it would, therefore, have been delayed for a year. Such a responsibility the committee, having regard to public safety, were not prepared to take. They were, therefore, obliged to accept the American tender."

## The Modification of the Shipping Day Plan

OFFICIALS OF THE CAR SERVICE SECTION deny strenuously the statement made in the *Railway Age* last week, which has been made by some shippers and even some railroad men, that the "shipping day" plan (formerly called the "sailing day" plan) has been killed by the modifications that have been made in it to meet the objections of shippers and because the war emergency has passed. It is asserted, on the contrary, that the plan, originally adopted as a war emergency measure, has now received official sanction and that the shippers, through the National Industrial Traffic League committee, have pledged themselves to support its principle and to co-operate toward making it a success as a permanent measure now that concessions have been made to overcome the points of criticism that made the plan unpopular in some quarters. It is admitted that without the co-operation of shippers the complete object, which is principally to concentrate l.c.l. shipments in through cars over direct routes, thereby obtaining the advantages of full loading and avoiding the delays, losses and expense incident to transfer, cannot be obtained, but they believe that when the shippers are approached in the right way and their interests are properly protected the necessary measure of co-operation will be forthcoming. They point not only to the assurances of large numbers of shippers who have come to appreciate the advantages to themselves, but also to the successful results which have actually been obtained in the Eastern region, where, although it would seem that the difficulties were greater than in other parts of the country, the plan has been most successfully worked out.

The modifications in the plan as agreed to by representatives of the Railroad Administration and the shippers on April 8, with the concurrence of a committee of state commissioners that had, however, no power to bind the commissions generally, were published in the *Railway Age* of April 11, page 942, and a later announcement by Director General Hines was published in the issue of April 25, page 1062.

The opinions of those who feel that the plan has not been emasculated are based on the fact that it was agreed that the shipper shall not be deprived of the right to route his l.c.l. freight over any line, or of delivering it to the carrier on any day except holidays and that the schedules of specified shipping days should be published only after mutual arrangement between representatives of the shipping public and the carriers. It was agreed that peddler cars should be operated daily, except where more limited service is agreed upon, and Mr. Hines' announcement stated that peddler cars are to be operated daily on week days except holidays "except where a less frequent service meets the requirements" and that "the foregoing shall not be construed as requiring the establishment of additional train service."

It is admitted that if the shippers should withhold their co-operation by refusing to assent to a less frequent service or to route their shipments via the scheduled through car routes, little could be accomplished, but confidence is felt that by eliminating from the shipping day plan some of the more or less arbitrary applications of it that were sometimes made during the war, the manifest opportunities for im-

proved service in the handling of l.c.l. merchandise by concentrating it in through cars will operate to commend the plan. It is also felt that many of the evils charged against the plan arise not so much from the operation of the "staggered service" or "skip-stop" features of the plan itself as from the deficiencies of the l.c.l. service during war time and during the period of labor shortage. Much animosity was also aroused by the occasional arbitrary disregard of the shipper's legal right to send his freight to the freight house on any day, but where tact and care in meeting the shippers' requirements have been used in working out the schedules the reports indicate that the plan has been remarkably successful. For example in the Eastern region 33,000 tons of l.c.l. freight per week have been forwarded direct to destination which formerly would have had to be transferred from one to three times en route. There are something like 1,000 l.c.l. transfer points in the country, all of which present opportunities for freight to be delayed, go astray or be damaged in handling, and before the shipping day plan was adopted many of these points had become badly congested. At

Waverly transfer on the Pennsylvania near New York at one time 250 cars were held up for handling, whereas since the adoption of the plan the business at this point has been handled currently. At West Albany, N. Y., the number of shipments transferred has been reduced from 1,500 to 250 a day. The New York, New Haven & Hartford has been able to operate practically all of its local freight trains on a basis of service at each station every other day, with a weekly saving of about 15,000 train miles.

By way of illustration, the shipping day plan is compared with the skip-stop service plan adopted for the street car system in Washington and other cities in order to improve the running time during a period of congestion. While occasionally a would-be passenger is seen frantically gesticulating at a car that does not stop and "cussing" the motor-man or the company because he feels his rights were infringed when he was asked to go to the corners where the yellow signs are, the man who is already on the car appreciates the fact that he will get down-town sooner than if the car stopped at every crossing.

## What Railroad Plan Should the Country Adopt?

### Private Operation and Constructive Regulation Without Guarantees of Fixed Net Return Favored

By Samuel Rea

President of the Pennsylvania Railroad Company

WHAT IS THE SO-CALLED "RAILROAD PROBLEM"? We must be assured as to this before attempting to prescribe the remedy. It is now admitted by the vast majority of our thinking people that government ownership and operation of the railroads are undesirable, and that individual enterprise has given, and will give, the public the best and cheapest service. It is also admitted that it is in the public interest that the capital required for enlargement of transportation facilities should be voluntarily furnished by private investors under the attraction of a satisfactory rate of return and degree of safety.

It is admitted that there must be responsible and reasonable governmental regulation over rate structures, over capital issues, and over wages.

It is admitted that railroads, subject to public regulation as to charges and service, are not naturally subject to the state and federal "anti-trust" laws, and that in order to get full use out of facilities and avoid waste in service, they should be encouraged to consolidate and co-operate up to a certain point, and beyond that point they should be encouraged to compete in service.

Regarding the final objects to be attained there is no obscurity whatever. All that the regulating authority has to do is to see that hurtful discriminations in rates or service do not exist, and that the rates yield an adequate but not an excessive return to the railroads, so that they can obtain from the investor the new capital required for expansion and improvements.

Several years ago these railroads were assigned to the strictest public regulation, controlling revenues and the chief expenses, standards of equipment, wages, working conditions, and investigation of accidents, and subject to numerous bureaus. But have we been freed from controversy or complaints; has more new mileage been constructed or has the cost of transportation been decreased and is their financial

condition sound? The public can answer these questions. All the economies and the benefits of better equipment, heavier train loads, larger yards, stations, shops, etc., have been absorbed, and the return upon the property investment has, with few exceptions, been kept close to, and often below, the starvation line. The proportion of stock which the public would buy has been a minimum. The railroads have maintained and improved operating efficiency, but have been forced to restrict broad developments such as new mileage and electrification, and to finance the greater part of the railroads by the burden of additional debt, instead of through stock issues. In 1900 the total capital stock outstanding exceeded the funded debt by \$200,000,000, but in 1916 the situation was reversed and the total funded railroad debt exceeded the capital stock by about \$2,200,000,000. Even a conservative property like the Pennsylvania Railroad has found it impossible to sell stock for the last six years.

#### Railroads Not Allowed a Fair Return

The railroads were not in that period allowed a fair return, such as a business enterprise requires to live and expand. Banking rates of 6 per cent are legal, and public utilities are allowed rates to produce returns of 7 and 8 per cent, and higher, on their property investment, depending upon conditions and service. Railroad rates were regulated by charter and general laws, and later by competition, efficiency, and growth of the business, and ultimately by strict government regulation. Therefore, I feel that any return which a railroad can make under reasonable rates fixed by governmental action cannot be regarded as unfair, and should not be a matter of criticism when based upon an honest investment, and as a result of years of conservative financing, and able management.

We must consider the averages for a few years rather than for a single year. In the so-called Five Per Cent. Rate case,

which was decided in 1914, the Interstate Commerce Commission found that in the period from 1900 to 1913 the ratio of net operating income to the property investment in road and equipment, of the thirty-five railroad systems in the so-called Eastern district of the country had fluctuated between 5.19 per cent and 6.31 per cent, the yearly average having been 5.64 per cent. In the year preceding the Commission's decision, viz., 1913, this ratio had been 5.36 per cent. Having regard to these figures the commission held that in its opinion "the net operating income of these railroads in Official Classification Territory taken as a whole is smaller than is demanded in the interest of both the general public and the railroads." Experience demonstrated the soundness of that decision; yet in only five single years from 1900 to 1916 was a higher percentage earned by the railroads of the country. Taking three year periods, since 1900, only in that period ending with 1908 was an average return of 5.36 per cent exceeded in the 17-year period by the railroads of the country as a whole. But to avoid controversy as to the integrity of property investment let us take the Pennsylvania System whose property investment has never been questioned and is understated. In only one calendar year from 1910 to 1917 was the property investment return equal to 6 per cent. The return on property investment was 6.1 per cent in 1916, but in 1914 it fell as low as 3.92 per cent. All this proves conclusively to my mind that such returns were not sufficient for an expanding business. Is it any wonder that some railroads went into receivers' hands, or resorted to unsound financing? Appeals to the various state and federal regulators were long and costly, and even when the federal regulators were disposed to be reasonable, the states, or a state, deferred action.

The unsatisfactory plight of the railroad industry in America is due to the fact that while there was a general consensus that a policy of public regulation should prevail, we have had no definite national railroad policy, and no single authority responsible for the results of public regulation. The numerous regulating authorities have been governed largely by the great fear that the companies—or some of them—might make too much money from the rates. The seeds of distrust and timidity were sown in the minds of the investors by the continued hostile attitude of legislators and regulators to all railroads, and there was no foundation on which to expand. Consequently, speaking broadly, the rate of return allowed under regulation has been unattractive to the investor, and the industry has failed to regularly secure the new capital needed for its proper development. Briefly, I diagnose our real problem as weak railroad credit, which is directly attributable to the lack of responsible, constructive, regulation.

Finally, when confronted by war, the railroads were, as a war emergency measure, taken under federal control, with legislative restrictions removed. It was imagined that the word "unification" would cure all, that with a guaranteed rental the companies' financial strength would not be further weakened during federal control, and that the government could institute vast economies, and earn large profits. To this freedom from restrictions must be added the patriotic assistance of the public who were willing to endure any transportation inconveniences, and the services of experienced railroad men who devoted themselves to carry out the government policies, so as to assist in winning the war.

#### Government Operation Is Excessively Expensive

But a railroad problem still exists, notwithstanding the efforts of the Railroad Administration to prevent it. The result of federal control did not surprise experienced men in this country or abroad, but the cost was nothing compared to what it would have been under government ownership. I

cannot express the situation better than it was expressed by Senator Cummins recently before the Iowa state legislature:

"It costs the government more to do any given thing in a country like ours, where every man is a sovereign, than it costs anybody else to do the same thing. The history of every enterprise of a business character conducted by the government proves all and a great deal more than the statement I have just made. I disparage no one, and impugn no man's integrity. What I have said is not only the truth, but it is as natural as life itself."

These results do not peculiarly apply to our own country; they have been the experience of the world, wherever government ownership, government operation or government guarantee has been instituted, and when a policy is laid down for them to follow, subject to political exigencies.

#### Necessities of the Situation

How shall we approach the present situation to again make the railroad system the instrument of our future national progress? We must decide upon a national policy. Either government ownership, or responsible national regulation must be adopted. I believe it should be the latter. The essentials of the situation are adequate revenue to enable the companies not only to live, but to attract new capital for expansion, accompanied by constructive and responsible national legislation and regulation, committed to experienced men, assured of a long term of office to prevent the dread of reappointment, and paid sufficient compensation, and brought into state and local transportation necessities through regional commissions.

We have one system of National regulation from which we can take some comfort, i. e., the national banking system regulated through the Federal Reserve Board and the Regional Reserve Banks. That system permits and encourages prosperous banks, and we have confidence and pride in them. They stood the test of solvency in war time, and are the mainstay of the nation in its industries. Like the strong railroads a large part of their profits were made from rates that were reasonable, which profits, that might legally and morally have been paid as dividends, were invested in the expansion of business to serve the country. Yet banks have not been free from failures and bankruptcies in the past. In times of stress and depression our credit and currency system was often over-inflated and not helpful to industry, but we did not attempt to cure this solely by denunciation. Instead, we made the banks subject to one central reserve board to carry out a national policy through the federal reserve regional banks. The banks participate in the selection of the regulators comprising the boards of each federal reserve regional bank, but each individual bank, under the legal rate established, can earn as much as its individual management is able to earn. We recognize that their banking regulators must be men chosen from various walks of business life, beginning with the farm and ending with the bank itself. The banks are not forced to continuously take a small margin of profit, and therefore when confronted by weak conditions are not forced to bankruptcy. Compare bank dividends and profits with the railroads, and also compare the legislative treatment and regulation accorded to them with that accorded the railroads. Can it be possible that a dollar invested in bank stock, or placed on deposit, is a greater national trust than one invested in railroad securities?

The more that the business men and the public observe the success of banking regulation will they appreciate the principles for the rehabilitation of railroad credit recommended by the railroad executives. They will see the necessity for the railroads to have a separation of regulatory judicial questions from executive and administrative questions. They will see the effectiveness of a responsible national regulatory policy by putting the responsibility for executive questions and actions where it properly belongs. In the case of the railroads, it should be lodged either in a cabinet officer,

or in a board headed by a cabinet officer, or by an officer like a permanent assistant secretary of war, as in the case of railroad control during our Civil War. Congress could safeguard the situation against such an official suggesting, appointing, removing, or compensating any railroad officer or employee. They will see the necessity of rates reasonable and adequate to sustain railroad credit, and the wisdom of national regulation of securities and wages. They will also see the necessity of co-operation and consolidation between the railroads, and the freedom from those restrictive laws and inadequate profits that have separated and weakened them in the past. During federal control the government recognized most of these features were essential to carry out an active transportation business, but will our legislators and regulators have the faith and courage to put through some such reasonable program, and deal as constructively with the railroads as with the banks, and will the state governments co-operate?

Does the fear of allowing the railroads adequate rates still exist?

I would point out that in many of our strongest companies, and notably in the case of The Pennsylvania Railroad System, which consists of weak lines as well as strong lines, part of the surplus was continuously put back into betterments and improvements, and in aiding traffic-feeding lines, as a conservative measure of finance. The surplus of the Pennsylvania System did not arise from extortionate rates, but very largely from paying dividends to stockholders below the prevailing return in other companies for a series of years, and also from profits on long time investments, and through premiums on some of its capital stock issues. To be conservative and lay a foundation for continued growth, the stockholders were willing to relinquish a portion of the profits over a term of years, and in this way the Pennsylvania System in seventy-two years invested in its railroad property for public use about \$430,000,000 in excess of its capital issues held by the public. This undercapitalization explains why the parent company has been able to continue its 6 per cent dividends despite such low returns on the property investment. The increased cost of living has always been recognized for the employees and for the producer of materials of which the railroads are large consumers, but the railroad stockholder has often been neglected, and his conservatism has been used as a basis to keep rates down, instead of allowing them to be reasonable.

#### Rate Reductions Under Private Management

I would further point out that, under no system of government ownership, guarantee or control, have there been reductions in rates equal to those made by our company and others under private management and initiative and prior to the enforcement of punitive laws and regulations. In 1864 the average revenue per ton mile on the Pennsylvania Railroad was about 2.5 cents. Due to the traffic development and continued efficiency, the average revenue per ton mile was reduced from 2.5 cents in 1864 to 1.3 cents in 1874, and in 1884 it had been reduced to 8 mills per ton mile. By 1894, as a result of commercial depression and competition, it had been reduced to 5.85 mills per ton mile, and later, through ruinous competition between all the railroads, fell to a very unreasonable and unremunerative basis. Yet, notwithstanding greatly increasing labor and material costs, taxes and other expenses, the average ton mile revenue received in 1894 was not again permanently reached until 20 years later, in 1914. Compared with similar charges abroad we begin to see the moderate revenues for which our railroad service was rendered.

While the trend of public opinion is now unmistakably opposed to government ownership as a solution of the railroad problem, there is much discussion of the possibilities of a government guarantee of railroad income, and if the income is guaranteed in substance, the principal of bonds must be

paid at maturity, if not previously scaled down through government valuation. The railroad investor—so badly frightened by punitive laws and regulations and small profits—is willing to listen to any reasonable plan, whereby he can have a guarantee, hoping that he will have no more serious fluctuations in the price of his securities, and will be assured of a fixed income. He is not given the value to be placed on his individual investment on which the guarantee is to be based, nor the income to be guaranteed. He knows nothing of the division that is to be made between the various classes of securities of his railroad, nor the standing that is to be given to the various liens on his railroad property, and consequently does not know what is to be the final value of his securities, or whether he will finally get any return thereon at all. That knowledge, if it had to be conveyed beforehand, would be a serious eye-opener to the railroad investor. He should know it beforehand or he is taking a step in the dark.

#### Effects of a Government Guarantee

A governmental guarantee would plunge the country into a wholesale financial reorganization of the railroads extending over a period of years, and would ultimately mean government ownership. But to temporarily palliate the situation, the guarantee is to be coupled with private operation. What is to be the capitalization of these private operating corporations? Are they to be mere shells with no large financial stake in the properties they operate and administer? Is there any business man present who would recommend the government to guarantee returns on property having a value of about eighteen billion of dollars and turn it over to six, or even eighteen, private operating companies without demanding the power to thereafter define its financial and operating policy? Can any stock or bondholder imagine that our government will guarantee railroad stocks and bonds, and charge nothing for that guarantee? Should capital improvements thereafter be made according to the business necessities or on the political judgment of each administration? Would political favoritism as to new improvements, branches and extensions, and orders for supplies be inevitable in the government guarantee plan? Should we then employ officers and men who have political influence? Should we impose this guarantee plan on the country in the midst of the great struggle she must meet to reconstruct her industries and put national affairs and taxation on a peace basis? What period do you think it would take to work out the financial reconstruction of all the railroad systems of the country, and all their leaseholds, guarantees and other obligations, and what is to occur meanwhile?

These questions open up some of the problems of a guarantee. Why, even the Railroad Administration's federal control contracts, that deal only with the parent companies, and are based on the earnings for the three years ending June 30, 1917, remain in large part still unexecuted, and many vital questions and settlements thereunder are still untouched, although it is the ardent wish of the Administration to dispose of them.

Now, selfishly, the investor might take a 4½ per cent guarantee for his railroad security, and let the country take over his problem, but he must look further and realize that as a citizen and taxpayer he would be called upon to pay, in taxes and in the greater transportation costs upon production, his share of the extra cost of the government guarantee and administration, so that the net result to him of the guarantee plan would not better his condition.

What is the advantage of the guarantee plan to the private citizen who is not a railroad security holder? Those who support it admit that private ownership and initiative under equitable regulation produce the most efficient and economical operating results.

On top of that annual guarantee on about eighteen billions of dollars of existing railroad property, from six hundred million to one billion dollars more would be required annually for additions and betterments to the roadbed and equipment.

Now the chief advantage emphasized for the guarantee plan is that the government could raise new capital cheaper than private corporations, and that by various schemes of regional unification the weak roads could be tied to the strong, further economies effected, and some element of competition left. Now, we know that reasonable competition as to service and attracting traffic is the best method of keeping up the standards and accommodating the public and enforcing economies, but there must be some appealing force to assure such reasonable competition, and the guarantee plan on its face does not seem to possess that force. I agree that the government could probably raise new capital much cheaper for a time than the majority of the railroads, but the savings obtained in that way would be easily obliterated by extravagance and lack of concentrated and continued responsibility under the government guarantee plan with our form of government.

Under the federal control contracts the government allows 5 per cent on deferred rental payments, and 6 per cent on new capital expenditures. This, in substance, shows that the government financing can become just as costly as that of the conservative corporations. We have also seen the strongest nations selling bonds at rates as high as those allowed by private corporations. Even so able a man as Paul Warburg, in suggesting a very attractive guarantee plan, has this to say upon the subject as the result of his long experience, both in private and government finance:

"It has been argued that through the use of the Government's credit, railroads would procure the necessary funds at a lower rate of interest. As against that, we must remember that the excessive use of the government's credit tends to increase the rate at which a government borrows. With us it would not only affect the rate of the government bonds to be issued in refinancing the outstanding railroad securities, estimated at \$17,000,000,000, but it would add to the rate to be paid by our government when some of our liberty bonds in due course mature and come up for renewal. Moreover, the incessant use of government bonds, in order to finance the annual requirements for future railroad developments and improvements, would have a disastrous effect upon the price and standing of our government securities. Granting, however, that some economy could be secured by substituting the government borrowing power for that of the railroads, it would be insignificant when compared with the increase in cost of operation and waste and inefficiency that inevitably would follow government operation."

Shall we, in order to save some small difference between the rate which the railroads would pay and the rate the government would pay on new capital, incur the risks of a guarantee plan? Shall we try to effect a saving in that part of the railroad dollar used to pay interest and dividends that represents less than 20 per cent of the whole dollar and at the outset admit that expenses of operating and other expenses (already requiring 80 per cent of that railroad dollar) when subject to government dictation, would increase rapidly?

#### Guarantee Plan Means Government Ownership

Let us try to depict the situation in any year when the income earned was less than the guarantee. How would the deficit be made up? Congress would have to appropriate the money out of the public treasury and raise the funds by public taxation. If the deficiency ran through several years Congress would be obliged to make repeated appropriations from the public funds to the railroad companies. Instead of getting the railroads out of politics we would probably be making them the major issue in national politics. It is difficult now for the government Railroad Administration to get from Congress the funds needed to meet the government obligations to the roads when the government is in complete charge of operation and is collecting and disbursing the revenues. What would be the situation with eighteen railroad companies in full charge of the operations and the revenues, and the gov-

ernment called upon to make good their operating deficit? Bitter partisan attacks would be made on the corporate management for their failure to earn their minimum standard income, and demands in Congress for investigation of alleged extravagance and inefficient management and waste of the peoples' money given to the railroad bondholders and stockholders.

To my mind the guarantee of railroad income by the government would inevitably lead to government ownership—first of the weak lines, and later of all the lines. It might be argued that the government, instead of paying funds out of the treasury to the less prosperous companies, would advance the rates. But this again, it seems to me, would lead to the same sort of bitter political debate and attacks on the corporate management. It would probably be alleged that these weaker roads, knowing that their income would be provided by the government in any event, were purposely failing to do their best.

American industry has made its wonderful progress because the industries, and the men conducting them, have been rewarded for efficiency and penalized for inefficiency. It is the fear of failure as well as the hope of reward or commendation that incites men to do their best. A government guarantee on private capital invested in transportation would to a large extent remove the fear of failure, but would it be in the public welfare, or be helpful to our industries, which pay freight rates? If the government could keep rates at a level that would provide sufficient revenues for all roads to earn their guaranteed income and operating expenses, why can we not equally assume that the government will allow such adequate rates under a system of government regulation, stimulated to economy and efficiency by private ownership and initiative, and without the blight of a government guarantee?

The guarantee is not a solution of this great economic question, but a patch upon it.

#### Rehabilitation of Railroad Revenues

##### Should Begin at Once

Don't let us get frightened about the task of rehabilitating railroad credit or imagine that it is an impossible task. It is entirely possible if we approach it with the proper methods and with equitable legislation. We had a Civil War—its cost was heavy. Compared with the aggregate wealth and position of our country, each citizen had more national debt per capita than we now face. We met the cost and it was our pride to steadily reduce our national debt. Following the war period the railroads and the country expanded, and laid the foundation for the greatest progress the world ever saw. It had some pains and sacrifices, and we cannot escape similar experiences. It is the price of liberty and progress. We had weak railroads after the Civil War, but we had a fair chance to conduct the railroad business and other industries. The Pennsylvania Railroad had ton mile revenues of about 2½ cents, so that it could pay its taxes, expand its property, and lease or acquire weak roads even in the war period. It did this, and gradually reduced the rates as its business justified, and its solvency was assured. If the roads are allowed reasonable rates to properly support the railroad investment and service, and these rates are accompanied by constructive regulation, the credit of weak roads will, like that of so many weak roads in the past, be built up gradually by the growth of the country without taxing the public treasury or breaking down the few fairly strong roads. They will also be helped by ability to co-operate in the use of service and facilities with the strong roads, and adapt their capital and operating outlays to their necessities.

The root of our difficulty lies in weak railroad credit, and Congress must by legislation place the welfare of the public,

which is so intimately intertwined with the transportation systems, beyond the powers of any state or federal commission to disrupt the entire transportation system and investment. The way to do this is by a statutory rule that will insure adequate rates, and responsible regulation. Without such action there can be no railroad financial rehabilitation.

I suggest that the first step in the program of having the roads produce an adequate return upon the investment should be taken by the government itself which now has control of the railroads. There is no justification in throwing the railroad deficiencies on the backs of the taxpayers through a congressional appropriation, and if the government itself, in the control of the properties, has not sufficient courage to deal with the rate situation as it has dealt with wages and material costs, then from what source can we expect the requisite courage to deal with this great business and financial question? While wages and material costs are high, that adjustment of the rate structure to existing conditions should be the first constructive step in railroad financial rehabilitation, and constitutes a necessary preparation for the return of the railroads to their owners after appropriate legislation. The railroads of most countries face huge rate increases compared with the ante-war period, and our necessary increases being smaller than theirs will not place our industries at any dis-

advantage compared with those of other war-burdened countries.

**Conclusion**

I conclude that the immediate remedy for the railroad situation is

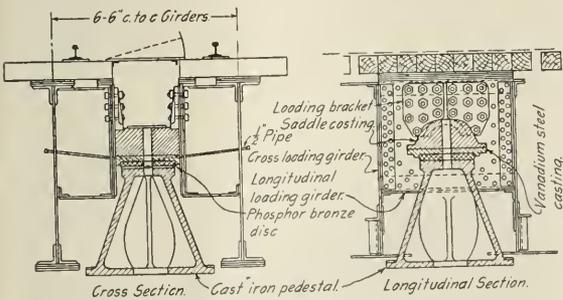

1. Adequate revenues on which the railroad credit may be strengthened and the new capital attracted;
2. Concentrated, responsible national regulation, separated as between its executive and administrative functions, and its judicial functions, and founded on equitable legislation, that will require our regulators to insure strong transportation systems, and not weak railroads;
3. All railroads under public regulation to be authorized to lease, acquire or consolidate with any other railroad corporations, and reasonable co-operation permitted in facilities, equipment, and train service;
4. Regulation of security issues;
5. Regulation of wages, with the employee, the employer and the consumer represented;
6. Funding of the capital debts incurred during government control.
7. Rehabilitation of revenues of the existing railroads, should begin immediately while they are under government control.

# New York Central Turntable Has Unique Features

## A Recent Design Has New Type of Disc Bearing Center and Heavy Wrought Steel End Trucks

**A** CENTER BEARING of the flat-disc type with a new form of rocker saddle and forged steel end trucks of heavy design are novel features embodied in a 100-ft. turntable recently developed by the New York Central Western Lines. Some of these features are an elaboration of ideas developed on a 90-ft. turntable which has had extended use at a number of engine terminals on this road. The table is exceptionally heavy, being adequate for a New York Central 0-8-8-0 Mallet locomotive weighing 480,000 lb., balanced over the table, or a Coopers E-70 loading for the

and therefore low operating cost. It has been the experience on this road that under present heavy loadings the roller centers used have been too highly stressed, causing rapid grinding and wear of both rollers and treads with the result that replacement has come too soon. It has also been found that the roller centers used have required more frequent and careful inspection and maintenance than they have received from the roundhouse forces, with the result that their operation was not satisfactory. While the roller centers unquestionably turn easier than the disc centers when new, it was found that poorly-maintained roller centers did not turn as easily. Tests made by this road on a number of its turntables several years ago and which are recorded in the Proceedings of the American Railway Engineering Association for 1916, page 141, confirmed this position. Briefly, with electric power costing 4 cents per kw. hr. and the roller center in first-class shape the cost for turning an engine weighing about 486,000 lb. is one-quarter of a cent, while if the center is in poor condition the cost might run as high as 0.6 cents. For the flat disc center 24 in. in diameter the cost is about 0.57 cents. On this basis the cost of turning 100 engines in 24 hr. would be \$0.57, while the cost per month would be a little more than \$17. In other words the cost of operating the turntable, even with a center affording increased resistance, is small compared with the cost of operating the engine terminal.

Arrangement for Applying the Loading to the Center

single spans. The circular wall is provided with a large inspection pit (6 ft. square by 6 ft. 9 in. high) and a jacking base is introduced on the circle wall footing directly in front of the inspection pit and also circumferentially opposite so that the table may be jacked up for a more thorough inspection or for the replacement of the end trucks.

Of particular interest are the reasons given for adopting the disc type of center. Briefly, continuous service and low maintenance cost are more important than ease of turning

In connection with the turntable, special attention has been given to the requirements of the tractor. It was felt that it is a serious mistake to provide a tractor of too limited capacity, for with it out of service 15 to 20 men may be required to turn the table. It is believed that with proper attention to this subject there is no more occasion for tractor failures on turntables than for failures of the motive power on movable bridges. The tractor required for these 100-ft. tables is specified to provide a tangential pull of 1,727 lb.,

this being the initial friction estimated for a total load on the center of 842,000 lb.

**The New Center**

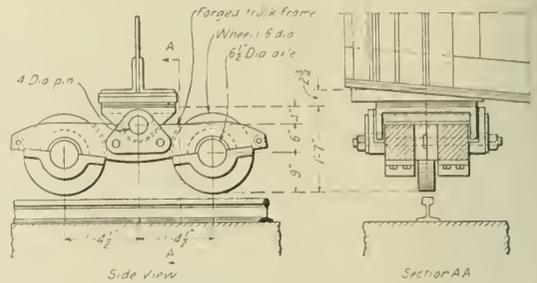

The disc of the center is flat and has only one rubbing surface. A vanadium steel bearing casting is attached to the under side of the turntable saddle and this bearing casting turns on a flat phosphor-bronze disc two feet in diameter which is attached to the center pedestal. The vanadium steel bearing is attached to the saddle casting by bolts while the disc is secured against turning on the pedestal by means of keys.

Special attention was given the manner of lubricating the contact between the vanadium steel and phosphor-bronze surfaces. Graphite grease is used for this purpose, being introduced into grooves cut in the surface of the vanadium steel through half-inch pipes leading from grease cups located outside the girders. Grease has been used because it was felt that for slow motions and heavy pressures a thick lubricant would be better than oil, since it has less tendency to be squeezed out of bearings.

The table is supported on the center through the use of a pin bearing. As seen in the drawing, the loading arrangement consists of two transverse loading girders connecting the two main girders, with two shorter longitudinal girders interposed between the two transverse loading girders. These two interior loading girders transmit the load of the turntable to the center through the aid of two brackets resting on trunnions forming a part of the saddle casting. As a consequence of this arrangement, the turntable may rock with

under side to fit over the pin, thus affording an effective rocker joint with a bearing 1 ft. 7 in. long. The wheels are of cast steel 1 ft. 6 in. in diameter and 4 in. thick with forged axles  $6\frac{1}{2}$  in. in diameter.

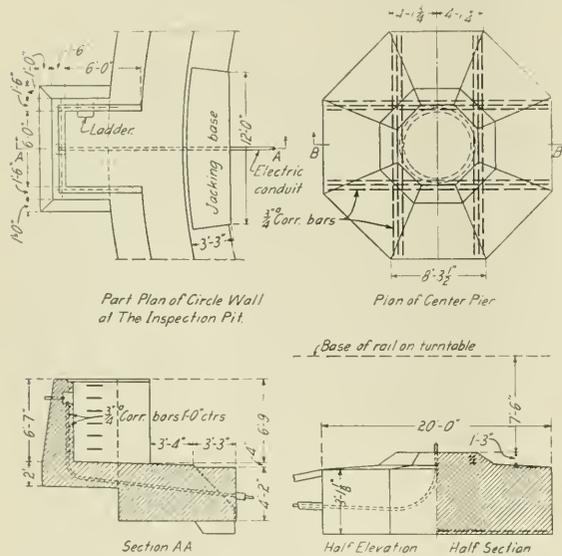

The table was designed for unit stresses not to exceed 12,000 lb. per. sq. in. in tension or compression with other stresses in proportion. For designing the end trucks and connecting parts the maximum end reaction was increased by two axle loads of 70,000 lb. each. When the table is

**The New End Truck**

moving the end trucks were considered as carrying an unbalanced load of 80,000 lb. on one end of the table. Provision was also made in the design for an end thrust of 20 per cent of the total live load on the table.

The total weight of the turntable is 171,927 lb., of which 145,720 is structural steel in the girders and cross frames, etc., and 26,207 lb. in the special castings, forgings, bolts, etc. The design of this table was developed under the direction of B. R. Leffler, engineer of bridges, New York Central Lines West of Buffalo, at Cleveland, Ohio.

**Details of the Masonry**

the passage of a locomotive over it without introducing any eccentric loading on the center.

The forged steel end carriage is another interesting detail, an important feature being the articulating arrangement whereby an even distribution of the load on the two wheels is obtained. The truck frame is of forged steel made in two parts so that it may be bolted around the wheels. The middle of the frame carries a four-inch pin which takes the load from the girder in direct bearing through a cast steel shoe bolted to a bevel plate on the bottom of the girder. The shoe has a groove of 4 in. in diameter bored in its

**The Black Tom disaster** in New York harbor, on July 30, 1916, is the subject of a lawsuit which is being tried in Jersey City, N. J., this week, wherein 200 witnesses have been called. The case is the suit of the Bethlehem Steel Company against the Lehigh Valley Railroad to recover \$2,900,000 for munitions destroyed in the explosion and fire. The suit is in the Supreme Court of New Jersey, in which court, a jury, in a similar suit a few weeks ago, awarded damages of \$413,390 to B. H. Howell Son & Co., sugar refiners, for sugar lost in the fire. The defense of the railroad company was that the fire started on property not owned by it.

# Hearing at Washington in Railway Mail Pay Case

## Revenues Steadily Decreased Under Space System—New Basis and Higher Rates Proposed

THE HEARING before Attorney-Examiner George N. Brown of the Interstate Commerce Commission in the railway mail pay case, which has been in progress at Washington since the first week in April, was concluded this week. The commission is to render a decision fixing reasonable rates for the transportation of mail by railway and prescribing the method or methods, by weight, or space, or both, for calculating the compensation of the railways for carrying the mail and the service connected therewith. If the decision of the commission shall be adverse to the space system now in effect, or if the rates established by it shall be greater or less than those now in effect, the postmaster general is required by law to readjust the compensation of the carriers from the date on which the present rates became effective, November 1, 1916.

Both the railways and the post office department have submitted voluminous testimony, and both have submitted plans representing their ideas as to the proper methods of compensation for the transportation of the mails, that of the department providing for a continuation of the present space system, with some modifications, and that of the carriers providing for a combination of the space and weight systems and greatly increased rates.

The case has its origin in the law passed by Congress at the instance of the post office department on July 28, 1916, which provided tentative rates for mail transportation, based on 21 cents per 60-foot car mile, subject to review by the commission, and authorized the postmaster general, pending the decision of the commission, to pay the carriers on the basis of the new rates by space, on such routes or systems as he should select for a test. Meanwhile the former method of paying on the weight basis was to remain in effect. The post office department, however, selected practically all of the routes for such "test" and put the space system in effect on November 1, 1916. Although for a short time the compensation of the railways under the new basis was increased at the rate of about \$2,000,000 a year, the department began reducing the amount of car space used in such a way as to reduce the annual railway mail pay from a maximum of \$62,750,551 in 1917, to \$53,502,591 in 1918, although the volume of mail was greatly increased. Although a few mail trains were taken off during the war, the railways saved very little in operated mileage, and it is not denied that the reduction in mail pay was the direct result of the reduction in the authorizations of space under the new system.

One of the ways by which space has been saved has been to reduce the amount of mail handling on the cars and to send it as storage mail, to be sorted at the terminal upon arrival, thereby gaining the advantage of the heavier loading in the storage car.

The post office department has always claimed that the method of paying for mail transportation on the basis of authorized space afforded a more equitable plan for measuring the service performed, while the railways opposed it both as to the railroads as a whole and as a means of distributing the compensation among the different railroads. They now contend that the roads which carry the greatest density of mail traffic have been penalized both in the rates and by the consolidation of a greater volume into the space used, with a consequent reduction in pay greater than the saving in expenses, while the roads of lighter traffic have been penalized because the car space necessarily run is not fully used and paid for by the department.

For the purpose of presenting the case to the commission the month of April, 1917, was selected as a test period, and on all the roads the service was measured both on the weight and the space basis. The basic statistics thus determined have been agreed upon by the carriers and the post office department; but different conclusions have been reached from them because the post office takes the position that it should not be charged with any space but that authorized, except in mixed cars, while the railroads take the position that all of the cars necessarily run in order to furnish the authorized space should be paid for by the mail service. For example, a 60-foot car is run from Chicago to Omaha. From Chicago to Creston, Ia., a unit of 60 feet of space is required and authorized, but from Creston to Omaha only a 30-foot unit is authorized, because some of the mail has been put off at Creston. The car is run through to Omaha and the railroads claim it is done necessarily and should be paid for, but the department claims that the movement of the empty 30 feet of space is "for the convenience of the railroad" or is incidental to the passenger, baggage or express traffic. Approximately 31 per cent of the car space which the railroads find it necessary to operate is not covered by authorizations; and the post office not only has not paid for it, but at the hearing objected to its inclusion in the cost studies, except as to mixed cars.

The railroads also contend that the space system lends itself to other one-sided interpretations of the law, such as holding the authorizations down to an unreasonable minimum and making frequent emergency authorizations; authorizing small units of space for mail to be divided among several routes at a junction point and thereby requiring the railroad to haul a car for each route; failure to pay adequately for empty return trips, etc. The law provides for authorizations of space in units of 3 feet, 7 feet, 15 feet, 30 feet or 60 feet, but in making emergency authorizations the department has adopted the practice of authorizing multiples or combinations of such units in such a way as to save a few feet, as by authorizing two 3-foot units instead of one 7-foot unit, or two 7-foot units instead of 15 feet, although the railroad may have to furnish the larger amount of space.

The roads also claim that the space system is theoretically unsound and does not compensate fairly for the service rendered. They say that under the present system mail is carried in storage or baggage cars on passenger trains for less than freight rates, and less than the railroad's proportion of express rates.

### Mail Rates Less Than Freight

Traffic men appearing as witnesses at the hearing produced elaborate detailed exhibits to show that to a great extent the railroads are being paid less for hauling storage mail in passenger trains than for merchandise freight in freight trains. It was testified that on the petition of the postmaster general the Interstate Commerce Commission had authorized a rating of first class for carload freight shipments of stamps and postal cards, but that since the establishment of the space basis the department has withdrawn such articles from the freight and is now sending them by mail in storage cars for less money.

For the purpose of comparing the revenue on parcel post traffic, a crate the size of a 3-foot unit of car space was taken to the plant of Sears, Roebuck & Co., Chicago, and filled with packages ready to mail. The crate held 874

pounds, or 146 packages averaging 6 pounds each. Assuming shipment for 17 large cities to various destinations approximately 50, 100, 225, 450 and 650 miles distant, and from Chicago to the 30 largest cities in the United States, it was shown in one of the exhibits that the average revenue when carried as closed pouch mail was \$7.79, and when carried in storage space \$5.11, but that if carried, under rates in effect in January, 1919, as one shipment of 874 lbs., the revenue would have been \$10.30 if carried as express, or \$9.12 if carried as freight.

The case for the railroads was prepared by the Railway Mail Pay Committee, Ralph Peters, New York, chairman, and was presented under the direction of its legal committee, F. H. Wood, of the Southern Pacific, chairman. Mr. Wood conducted the examination for the carriers with the assistance of other members of the legal committee, which includes Clyde Brown (N. Y. C.), New York; Kenneth F. Burgess (C. B. & Q.); H. W. Bikle (Pennsylvania); W. A. Cole (B. & M.); C. B. Northrup (Southern), and A. P. Russell (N. Y., N. H. & H.). The case for the post office department was directed by Joseph Stewart, special assistant to the Postmaster General.

The carriers' presentation was opened by testimony of traffic witnesses, D. M. Goodwyn (C. & N.), for the Southern carriers; P. C. Sprague (P. C. C. & St. L.), for the Eastern roads, and L. C. Mahoney (C. B. & Q.), for the Western lines, who presented voluminous statistics showing that present railway mail pay per gross ton-mile is far below first-class freight rates, as of April, 1917, when the freight rates were much less than at present.

Probably the most comprehensive statistics of passenger train operating costs and revenues ever put together are included in a series of exhibits presented in this case by L. E. Wettling, statistician for the railroad committee. Operating revenues and expenses for passenger train service were computed for 140 Class I roads on two different bases, for the separation of expenses common to both freight and passenger service, the basis used by the post office department and the basis of road locomotive ton-miles. On the first basis passenger train operating expenses were shown to be 26.58 per cent of the total operating expenses and on the second basis 27.79 per cent.

After reducing the service to equivalent 60-foot car miles the operating revenues and expenses per 60-foot car were shown on the two bases as follows (cents per mile):

	Basis No. 1	Basis No. 2
Total passenger train revenue.....	25.9	25.9
Total passenger train expenses.....	19.7	20.7
Passenger revenues.....	27.5	27.5
Passenger expenses.....	20.3	21.3
Express revenues.....	22.1	22.1
Express expenses.....	17.6	18.5
Mail revenues.....	17.8	17.8
Mail expenses.....	17.8	18.8

**Calculation of Reasonable Revenue**

For all roads in the United States the average passenger train revenue per passenger train car mile in 1917 was 29.29 cents. From this it was calculated that the mail revenue per annum necessary to make the mail earnings per used car mile equal to the average for the calendar year 1917 would be \$97,796,749, or 38.4 cents per authorized car mile. This was based on 252,195,309 car miles authorized as of March 27, 1917, plus .91 per cent of this amount for emergency authorization, a total of 254,490,286 car miles authorized; plus 31.2 per cent of the authorization to cover empty space, a total of 333,891,255 car miles. It was also figured that to pay expenses, taxes and a 7 per cent return on the investment devoted to the railway mail service in 1917, based on service and costs in April, 1917, would require an annual revenue of \$93,981,267, or 36.9 cents per authorized car mile, on the basis of post office letter of instructions No. 504; and \$98,895,819, or 38.9 cents, on the locomotive ton-mile basis. The mail investment, based on 9.1382 per cent of

the passenger train investment, according to the first basis of apportionment was \$443,629,626, and on the second basis it was \$463,824,955. For the calendar year 1918, based on the service in April, 1917, and on the costs in November, 1918, the mail revenue necessary to pay expenses, taxes and a 7 per cent return on the investment would have been \$121,675,988, or 47.8 cents per authorized car mile on the first basis and \$128,304,700, or 50.4 cents per car mile on the second. The average revenue, based on the authorization of March 27, 1917, was 7.32 cents per ton-mile and 23.69 per 60-foot car mile; and based on the authorization of June 30, 1918, it was 5.91 cents per ton-mile and 23.68 cents per car mile.

One of Mr. Wettling's exhibits showed that the compensation for initial and terminal service for 174 roads in April, 1918, was 18.55 per cent less than in November, 1916, for regular service, while for emergency service it had increased 55.84 per cent; and the total pay for both line haul and initial and terminal service had decreased 14.64 per cent. Another exhibit showed the distribution of passenger, express and mail revenues for April, 1917, for all roads in the case as follows: Passengers, \$55,401,359; excess baggage, \$551,039; sleeping cars, \$142,078; parlor and chair cars, \$80,490; other passenger train revenues, \$589,561; milk, \$1,209,824; express, \$8,315,260, and mail, \$4,467,027. Of this last amount \$4,397,040 was computed on the space basis and \$69,986 on the weight basis.

Mr. Wettling also presented exhibits showing the excess service performed by the carriers in carrying the mails over that authorized.

A special exhibit for the New England group of railroads showed the revenues and expenses per 60-foot car mile on the two bases of separating expenses as follows (cents):

	Basis No. 1	Basis No. 2
Total passenger train revenues.....	39	39
Total passenger train expenses.....	26.6	27.5
Passenger revenues.....	42	42
Passenger expenses.....	27	27.9
Express revenue.....	31.1	31.1
Express expenses.....	24.8	25.7
Mail revenue.....	20.8	20.8
Mail expenses.....	25.4	26.2

On both bases each of the New England roads was shown to be losing money on the railway mail service.

**Traffic Increases; Mail Pay Reduced**

An exhibit presented by W. A. Worthington, vice-president of the Southern Pacific Company, illustrates graphically the disparity in growth between railway mail pay and that in other sources of railway revenue since 1900, when the Wolcott-Loud commission reached the conclusion that railway mail pay was not then excessive, and also the effect of the space basis in actually reducing the compensation for mails, notwithstanding the fact that while the space basis has been in force the volume of mail has been the greatest on record, as stated in the annual reports of the Postmaster General. Under the old weight basis there was an automatic decrease in the ton-mileage rate as density of traffic increased, yet the mail pay was also subjected to several reductions after 1907.

From 1900 to 1917 the railway mail pay increased from \$37,315,725 to \$62,750,551, but in the calendar year 1918 it had fallen to \$53,502,591. Express revenue, however, was over four times as great in 1918 as in 1900, passenger and freight revenue were each over three times as great in 1918 as in 1900, and operating expenses in 1918 were over four times as great as in 1900. The operating ratio had increased from 64.65 to 81.25 and railway taxes were nearly five times as great.

In another exhibit Mr. Worthington showed that while the volume of mail as measured by total postal revenues had more than trebled, increasing from \$102,354,579 in 1900 to \$344,475,962 in the year ending June 30, 1918 (excluding \$44,500,000 due to increased postage rates) the payments to

railroads had increased only from \$37,315,724 to \$56,418,781, and the total postal expenses, excluding payments to railroads, had increased from \$70,424,543 to \$260,788,020. The percentage of postal revenues paid the railroads was only 56.46 in 1900, but this had been steadily decreased to 16.38 in 1918. Meanwhile the percentage of postal revenues absorbed by expenses other than payments to railroads had increased from 68.8 to 75.7.

Mr. Worthington also showed that while freight revenues per train mile had increased from \$1.65 in 1890 to \$4.60 in 1917, and passenger revenues per train mile had increased from \$1.08 to \$1.70, the operating expenses and taxes per train mile had increased from \$1 to \$2.48.

For the Class I roads mail revenue in 1918 under the space basis was 13 per cent less than in 1916 under the weight system, while express revenue was 40 per cent greater, passenger revenue 46 per cent greater, and freight revenue 35 per cent greater. While operating expenses had increased 70 per cent, the operating ratio had increased 24 per cent, and the net operating revenue had decreased 27 per cent.

Another exhibit illustrates the monthly fluctuations during 1916, 1917 and 1918, in revenues from express and mail, the former being directly responsive to increases in traffic, while the latter was not only not responsive but actually declined as traffic increased, because no additional pay was allowed to the carriers as the load in the car became greater.

As of March 27, 1917, the total mail pay on the space basis (excluding closed pouch service) was \$56,943,826, of which \$43,705,001 was for R. P. O. service and \$13,238,825 for mail storage car service, which represents over one-half of the mail ton-mileage. A total of 366,318,887 ton-miles of mail was handled in R. P. O. service and 411,317,318 in storage car service. The average tonnage per 60-foot car was 2 and per storage car 6.69, an average of 3.18 tons per car. The average pay on the space basis was 23.89 cents per 60-foot car and 11.93 cents per ton-mile for R. P. O. service and 21.54 cents per 60-foot car and 3.22 cents per ton-mile for storage car service. The average was 23.30 cents per car and 7.32 cents per ton-mile.

### Greatest Reduction on Heavy Traffic Routes

The annual railway mail pay on the basis of a weighing in April, 1917, would have been at the rate of \$69,546,909. The annual pay on the basis of the actual space pay as of April, 1917, was \$60,498,840, a decrease of 13 per cent. On some of the principal roads, carrying the bulk of the traffic, the percentage of decrease was much greater. For the Union Pacific the reduction on account of the introduction of the space system was \$1,192,277 per annum, or 40.2 per cent. For the Southern Pacific the reduction was 34.4 per cent. While the average space pay per ton-mile was 7.32 cents, it was as low as 3.82 in the Union Pacific, and it was 10.33 on the St. Louis-San Francisco.

An exhibit covering 17 of heavy traffic routes showed the average pay per ton-mile to be 4.09 cents, 9.03 cents for R. P. O. service and 2.8 cents for storage and closed pouch service. While these routes carry nearly one-half of the total mail traffic they received only 27 per cent of the total pay.

It was also brought out in connection with the exhibits that the increase in the ton-mileage of mail of 202.91 per cent since 1900, when the Wolcott-Loud commission held that the mail pay was not excessive, would have made the annual mail revenue for 1917 \$98,640,000 if the rate per ton-mile had fallen 5 per cent, the same as the fall in the average freight rate per ton-mile; that it would have been \$110,000,000 if the rate per ton-mile had risen 6 per cent with the average passenger rate; that it would have been \$141,440,000 if the mail pay rate had increased in the same ratio as express revenue, or \$126,960,000 if it had increased in proportion to the passenger revenue; or \$103,840,000 if there

had been no reduction in revenue per ton-mile after the commission had made its report showing the rates not to be excessive.

Mr. Worthington presented a statement, made up from the records of the Post Office Department, showing that in the fiscal year ended June 30, 1918, the periodicals shipped by the Post Office Department on freight trains amounted to 50,971,929 ton-miles. The average haul was 883 miles; average railway pay per ton-mile, 1.518 cents; average load per car, 17 tons, and average railway pay per 40-ft. car per mile 25.88 cents. This would be equal to 38.70 cents per 60-ft. car.

### The Carriers' Plan

Mr. Worthington also presented the carriers' plan for computing railway mail pay, under which about 40 per cent of the total compensation would be on the space basis and the remainder on the weight basis, and which it is estimated would produce an annual revenue of \$95,034,182. This plan has been approved by the Railway Mail Pay Committee, the Railroad Administration, and the American Short Line Railroad Association. The plan is based on the fact that railway mail transportation in part represents the furnishing of traveling post offices which cannot be adequately paid for on the basis of the weight of the mails, and in part the hauling of mail in storage cars, for which the carriers declare that the space basis is neither fair to the railroads as a whole nor to the individual roads, because it gives no consideration to the loading of cars. Therefore the space basis is proposed for that portion of R. P. O. and apartment cars that is made up of distributing facilities and in which the weight carried is practically negligible, and the weight basis is proposed for storage mail and that carried in R. P. O. or apartment cars outside of the space devoted to distributing facilities. Under the old plan about 10 per cent of the mail pay was computed on the space basis.

The proposed space rates for the distributing facilities are based upon passenger train revenues per car mile and are, therefore, flexible, in that they may be changed from time to time as passenger train car mile revenues materially increase or decrease, should the Interstate Commerce Commission determine a change to be necessary.

A rate of 5½ cents per ton-mile was proposed as a proper rate for weight, to apply to about 97 per cent of the total ton-mileage. But, on the ground that such a flat rate, while applicable to storage mail, was insufficient when applied to light tonnage in apartment cars, closed pouch service, etc., and would not compensate for differences in the length of haul, the carriers proposed an initial rate of 45 cents per ton-mile for the first 100 miles or less on a line of road. This would increase the rate per ton-mile on the routes of light traffic density, and for the short line roads and would compensate for shorter hauls. For closed pouch service, which is used especially on the short lines and involves a great deal of labor for handling and much unused space, an additional service rate of 3 cents per train mile was suggested. The percentage of increase proposed over the former weight basis, because of the increased cost of operation, is 36.6 per cent.

The proposed rate of 5½ cents per ton-mile as applied to storage mail, with an average load of 6.7 tons and a tare of 50 tons per car, produces a revenue of 36.8 cents per car mile or 6.5 mills per gross ton-mile for loaded movement and 5.7 mills after allowing 15 per cent empty haul. The post office department in the year ending June 30, 1918, paid for the transportation of periodicals shipped by freight 7 mills per gross ton-mile, or 25.88 cents per 40-foot car-mile.

Following Mr. Worthington's testimony a number of mail traffic managers testified as to the practical administration of the space basis by the post office department; and representatives of the New England roads presented a request for

special compensation due to higher operating costs. B. M. Robinson, president of the American Short Line Railroad Association, testified on behalf of the short lines.

The carriers' plea in detail is as follows:

The rates proposed herein are submitted as basic rates predicated on conditions prior to January 1, 1918, and should be increased 30 per cent to absorb subsequent increase in cost of operation.

The transportation of the mail to be paid for on the following basis:

#### RATES FOR WEIGHT CARRIED

The rates for all routes of all classes shall be as follows:

Forty-five cents per ton-mile for the first hundred ton-miles or less per mile of railroad per annum on each mail route, and 5½ cents for each additional ton-mile for each route

#### SERVICE RATE FOR CLOSED POUCH SERVICE

On short line railroads or branch trains of other railroads, and on other trains of other railroads not above designated, where there are no postal clerks on the train and the mails are carried in the baggage car handled exclusively by the baggageman, with record thereof at local stations, and the handling does not partake of the character of compact loading, as with storage mail for stowing in the baggage cars, an additional service rate of 3 cents per train mile shall be paid.

#### METHOD FOR WEIGHING

All weights to be taken for a period of 35 consecutive days, beginning with the second Tuesday in September of each year, or at such other representative period as may be prescribed, and a daily average for that period to be ascertained by the following method: readjustment of pay upon the rates prescribed to be made by the Postmaster General retroactively from July 1, of each year.

All weights to be taken at railroad stations by railroad employees where practicable; where their duties render it impracticable and the work of weighing shall require additional force, they shall be employed and paid by the railroad company after agreement has been reached between the Post Office Department and the railroad company as to the number of such employees necessary for that purpose.

The railroads to furnish trucks and scales at their expense.

The Post Office Department during the weighing shall have access to and supervision of the actual weighing under such regulations as may be prescribed by the Postmaster General.

The Postmaster General shall prescribe and furnish the forms upon which the weights shall be reported, and he shall make the necessary tabulations and computations and announce the average weights upon which payment shall be made.

The railroad companies may be furnished with duplicate reports by their employees, and shall be furnished with tabulated statements of the weights as computed by the Post Office Department.

#### RATES FOR DISTRIBUTING FACILITIES

The linear feet of distributing facilities in postal cars and apartment cars, as now constructed under Post Office Department standards, shall be paid for at the following rates:

35-37 ft. distributing facilities,	17.8c. per car mile, provided in 60-ft. car.
30 ft. distributing facilities,	15.3c. per car mile, provided in 60-ft. car.
25 ft. distributing facilities,	12.8c. per car mile, provided in 60-ft. car.
17 ft. distributing facilities,	10.7c. per car mile, provided in 30-ft. apartment car.
14 ft. distributing facilities,	8.8c. per car mile, provided in 25-ft. apartment car.
11 ft. distributing facilities,	6.9c. per car mile, provided in 20-ft. apartment car.
8 ft. distributing facilities,	5.6c. per car mile, provided in 15-ft. apartment car.

For existing 70 ft. R. P. O. cars (40 ft. to 42 ft. distributing facilities) the rate of pay will be 20.3 cents per car mile. Space for distributing facilities, according to the rate scale

prescribed, shall be paid for over the necessary operating run of car computed on a round trip basis, according to the maximum needed by the Post Office Department for distribution on such car run.

The foregoing rates are for railroad transportation service only, and do not include messenger or cartage service to and from post offices or to and from other railroad stations.

A differential of 3.3 1-3 per cent should be added for the New England lines, including Long Island, on account of higher operating cost.

#### Post Office Department Estimates

The Post Office Department introduced exhibits estimating the expenses of the principal roads for April, 1917, and after allowing a net income of 2.72 cents per car mile, as representing the rate which it said the railroads derive from express, arrived at a figure of \$54,415,778 as a fair estimate of the total railway mail pay for a year, or 21.57 cents per 60-foot car mile. Applying 21.5 cents (and proportionate rates for various units of space) to the authorizations of March 27, 1917, produced a total annual revenue of \$53,088,250.

The plan proposed by the Post Office Department for the continuance of the space basis contains certain modifications as compared with the present system, some of which were made during the course of the hearing as concessions to meet objections made by the railroads. The first witness for the department said that the space plan as at present operated was satisfactory, and he had only two changes to suggest, one to apply the system of using combinations or multiples of the space units to the regular authorizations as well as to emergency authorizations, and another to make separate contracts for side and terminal service. In the course of the rebuttal testimony the "improved" plan was submitted, eliminating the proposal for using multiple units. The proposed plan provides as follows:

#### Post Office Department's Plan

The space basis, as provided in the Act of July 28, 1916, shall be continued, subject to the following modifications:

##### REGULAR AUTHORIZATIONS

1. All regular authorizations for cars may be changed or discontinued at divisional points in accordance with the needs of the service; and for this purpose a divisional point is defined as one where the railroad company performs switching service in connection with passenger train service; but a change in an apartment car authorization may not be made at such point when the operating conditions of the train in question will not permit it.

##### EMERGENCY AUTHORIZATIONS

2. All units of space needed to supplement regular authorizations of space shall be units of 3, 7, 15 or 30 feet, without duplication or grouping, and such units shall be discontinued, increased or decreased at any point where a fluctuation in the volume of mail carried permits of a change from one unit to another.

3. Whenever a regularly authorized unit of storage or closed pouch space, combined with an emergency unit, necessitates the use of more than 30 feet of linear space in a baggage or storage car furnished exclusively for the use of the mail, a 60-foot car will be requested of the railroad company and paid for on the basis of the round trip, provided it is not used by the carrier in the opposite direction.

4. Whenever a regular authorization is exceeded on 60 per cent or more of the trips during a period of 30 consecutive days, the next higher unit shall be authorized. This rule will not be applied in the month of December.

##### UNDERSIZE CARS

5. Where a railway post office car or any apartment car is deficient in length, but otherwise standard, it will be paid

for pro rata. In computing the pay for such cars the major portion of a foot will be regarded as a full foot. One-half of a foot or less will be disregarded.

#### DEFICIENCY IN STORAGE SPACE

6. Where a railway post office car or apartment car is of standard length, but deficient in storage space, it will be paid for pro rata in the same manner as cars deficient in length.

#### OVERSIZE CARS

7. Whenever an oversize car is furnished, storage units may be authorized therein on the basis of actual measurement.

#### SIDE, TERMINAL AND TRANSFER CARS

8. Where the railroad companies are required by the Post Office Department to perform side, terminal or transfer service, they shall be compensated separately from the line rate for such service (other than that performed in or directly

contiguous to railway terminals and depots, unless otherwise provided for), in the amount paid therefor to contractors and for the value of the actual time of their employees while engaged in the carriage of the mails, including reasonable cost of vehicular service that may be necessary.

9. Where railroad companies contract for such service such contracts shall be let to the lowest responsible bidder upon advertisement.

10. Readjustment for such service shall be made annually and the companies shall furnish to the Postmaster General statements in detail showing the cost of the service rendered on such forms and in such manner as the Interstate Commerce Commission may prescribe.

#### MERGER OF RATES

11. The initial and terminal allowances shall be merged with the line rate.

## The Progress of Electric Locomotive Design\*

### Knowledge of Design Essential to Intelligent Consideration of Electric Operation Possibilities

By W. B. Potter and S. T. Dodd

Railway and Traction Engineering Department, General Electric Company

A COMPARISON OF AMERICAN electric locomotive development with European, and particularly Continental, shows a characteristic difference in the method of transmitting the power of the motor to the driving wheels. In America the success attained with the many heavy high-speed motor cars, and the utilization of these cars in many cases for hauling trains, naturally led to the building of similar equipment for locomotive purposes only. This type of locomotive is the most economical design, but as the tractive effort is transmitted through the truck center pin, this type is commonly limited to a weight of about 60 tons. For heavier locomotives of this type, weighing from 60 to 100 tons, the two trucks are usually connected and the tractive effort transmitted directly through the trucks instead of through the locomotive frame.

The Continental designers, having had little experience with heavy motor car equipment, were skeptical of gearing and the practice of mounting motors directly on the axle. Their efforts have been mainly directed toward substituting the electric motor for the steam locomotive cylinder, retaining all of the side rods and adding a few more. There is a difference, however, between driving side rods from a steam piston and from a motor-driven crank, which does not seem to have been fully appreciated. In a steam engine the maximum stresses end-pin pressures, so far as the driving power is concerned, may be predetermined from the piston area and steam pressure. In an electric locomotive, however, having a motor-driven crank and side rods, the maximum stresses are influenced by variations in the wheel centers and the wear of bearings. The mechanical design must be strong enough to withstand the driving torque at a 45 deg. angle from the center, and at as much less angle as may result from the variations. As an extreme illustration, with one side stripped and the other on dead center, the stresses would be in excess of any practicable design.

The Continental locomotives show many variations of the side rod drive, both with the jack cranks direct driven by

the motor through parallel rods or by means of gearing. Comparing only the most important trunk line electrifications in Europe and America, we find that out of nine European railroads operating 210 locomotives, there are represented 28 different types, while out of 14 American railroads operating 364 locomotives only 21 types are represented. The cause for this difference is to be found in the historical development which we have sketched above and in the fact that the American development has largely been determined by commercial reasons.

The design of American locomotives for slow-speed freight and passenger service has been influenced largely by the heavy motor car with motors geared directly to the driving axle. A gearless motor which could develop as tractive effort a proportion of the weight on the axle comparable to the geared motor would furnish a still simpler design. Recent developments along this line indicate the possibility of such a gearless slow-speed locomotive at a comparable price.

The design of electric locomotives for high-speed passenger service at 60 to 80 miles per hour is a more complicated problem. A substantial saving through the elimination of turn-tables and incident delays being obtained by designing the locomotive double ended and capable of running equally well in both directions, this desirable requirement involves features of design differing from that of a steam locomotive built for operation in one direction only. A feature in the design of a double-ended locomotive is to control the lateral oscillation and to minimize its effect on the track. This characteristic is more in evidence on tangent track where the flanges of the guiding wheels are free to move within the clearance, than on curves where the flanges of these wheels bear firmly against the outer rail. This characteristic also appears, though in a different form, in the single-ended steam locomotive, as the front and rear ends are not both subjected to the reactionary influence of two guiding trucks. In any event, the wheels at the front and rear ends of the locomotive must be relied upon to withstand the effect of these lateral oscillations.

In a double-ended locomotive, with guiding trucks at

\*Abstract of a paper presented before the Western Railway Club April 21.

each end, any lateral oscillation will deliver a thrust at the truck center plate both at the front and rear ends. The roll of the locomotive body has little tendency to transfer weight to the outside guiding wheels and, therefore, has but little effect in holding down the outer rail. The lateral movement of the locomotive, however, does increase the weight transferred to the outside guiding wheels in proportion to the height the center plate is raised above the rail head. The problem presented is to design a double-end locomotive with leading and trailing trucks, which shall have sufficient guiding force for the front end and with such characteristics as to minimize the cause and effect of lateral oscillations.

To minimize the cause of lateral oscillations the front and rear trucks should be restrained so far as possible from any individual movement, other than that essential to proper guiding of the locomotive. Experience has demonstrated that a two-axle truck with an articulated connection accomplishes this desired result much more effectually than either a two-axle bogie or pony truck. To minimize the effect of lateral oscillations the characteristics should be such that the truck will allow a time element during delivery of the thrust against the rail head and such that any lateral thrust at the center pin will produce a large vertical component at the outer guiding wheels. Raising the bearing point or center plate of guiding trucks to 60 in. or 70 in. above the rail head has shown by tests that these characteristics can be obtained in that manner. What we wish to do is to direct attention to the fact that a successful double-ended high-speed locomotive can only be obtained by a proper study of the front and rear trucks.

For high speed passenger service with speeds of the order of 60 to 80 m.p.h. if a locomotive is equipped with geared motors the gear reduction approaches a small ration, if the armature is to be kept within practical rotative speeds. This presents all the disadvantages of increased weight due to gears with their cost of maintenance without the compensating advantage of the increase in tractive effort usually gained by gear reduction. Consequently, it appears to us that for such speeds and for such service the gearless motor with the armature mounted directly on the axle presents the best solution. The bipolar gearless motors on the New York Central Railroad, which have been in service for twelve years, have shown very low maintenance costs.

#### Collection of Current

The trolley pole and wheel which has so well served the electric railway is not well adapted for the heavy service we have been considering, nor is it a convenient device for movement in both directions. The pantograph collector, which requires no attention on reverse movement, has long been used, but it is only within the past few years that its capacity as a collecting device has been fully demonstrated. Rolling and sliding contacts have both been tried, with results distinctly in favor of the sliding. The wear of the working conductor or trolley wire is due far more to the destruction by arcs at the point of contact than from the mechanical friction, hence it is most important that the wire be so supported as to eliminate any rigid spots which are the usual cause of this arcing. The wire should be lifted slightly and really supported by the collector rather than that the collector should run underneath a wire held in rigid relation to its support. Lubrication of the collecting surface not only reduces the wear but seems to slightly improve the contact, presumably because of less tendency to chatter than with bare metal. The amount of current that can be successfully collected seems limited only by the current capacity of the working conductor. Tests have shown no arcing at the contact with 3,000 amp. at 30 m. p. h., and 2,000 amp. has been collected with equal success at over 60 m. p. h. A copper conductor with copper wearing strips on the collector has been found to give the best results. Measurements taken on the St. Paul

railroad indicate the working conductor will have a life of over 100 years before it will have to be replaced because of wear.

#### Regeneration

Regeneration as used in this connection implies the use of electric braking and the utilization of the energy in the train as electric power, which is fed back into the distributing system. The train on a down grade drives the motors as generators, which is comparable to the action of falling water in a hydro-electric power station. Regeneration is of special advantage in the long grades encountered in mountain districts. Grades of 20 to 50 miles in continuous length are found on almost all the railway lines crossing the continental divide. It eliminates the surging in the train and the variations of speed which are encountered in holding the train by air brakes. In addition to this, the wear of brake shoes is eliminated and the delays which are often due to overheated brake shoes on long grades are also avoided. The electric braking takes place entirely at the front end of the train, taking up all slack and permits the air reservoirs to remain fully charged in reserve for emergency.

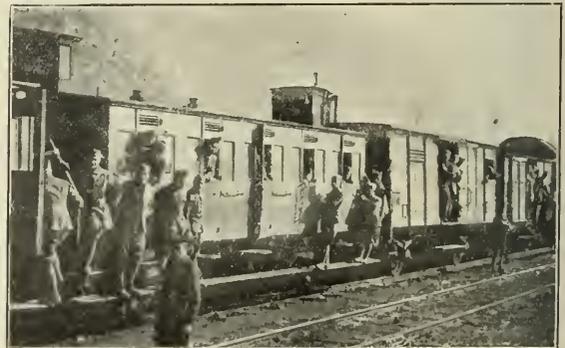

The amount of power returned to the trolley by regeneration varies with the amount of the grade and the type of train. On specific tests it has been shown that a train on a 2 per cent grade has regenerated 42 per cent of the power required to pull the same train up the grade. On a 1.66 per cent grade 23 per cent has been regenerated. The records for a particular month over the entire Rocky Mountain division of the C., M. & St. P. for both freight and passenger trains show that the regeneration was equivalent to 11.3 per cent of total power used.

#### Conclusion

On locomotives for freight and slow speed passenger service it seems probable that the use of geared motors mounted directly on the axle will be continued. On locomotives for high speed passenger work the motors will presumably have some type of gearing or preferably be of gearless design. The characteristics of the guiding trucks in their design and method of attachment are important for high speed running.

We find that incidental difficulties in connection with operation of heavy service electrically are being solved. The collection of any reasonable amount of current from an overhead conductor offers no difficulty; while regeneration solves in a practical manner the problem of braking on long grades and returning the available power to the power system instead of wasting it in brake shoes.

# Doings of the United States Railroad Administration

## Three Months' Deficit \$192,000,000; May Ask for Larger Appropriation; Rate Advance Deferred

WASHINGTON, D. C.

THE RAILROAD ADMINISTRATION is likely to ask Congress for an appropriation of \$1,000,000,000 instead of the \$750,000,000 which was lost in the filibuster of last session. The President has called Congress to meet in extra session on May 19 and its first work after organization will be to take up the necessary appropriation bills which failed of passage. While the Railroad Administration has not announced any change in its figure, it will be necessary to present its request anew and it is now engaged in a re-consideration of the various items that represent its needs for money and that will be shown in the new statement to Congress. As an additional deficit of \$192,000,000 has accumulated in the three months since the figures on which its first request was based were made up, and as the April reports are liable to increase this by another \$50,000,000 or so, while the revised returns for 1918 show the deficit for that year to have been \$226,000,000 instead of \$196,000,000 as estimated then, it is believed that a billion dollars is a conservative estimate, although the capital expenditures program has been curtailed by the lack of funds.

While there has been much discussion of the need for an advance in rates and most railroad men are inclined to the belief that such a step will be necessary, Mr. Hines has thus far deferred a decision on the matter until better information as to the probable results for the year as a whole is available. There is still hope that tonnage may be considerably increased later in the year and it might be a more propitious time to take up the rate question more definitely after an appropriation based on present and past conditions has been granted.

The passage of the appropriation bill will make it unnecessary to issue any more certificates of indebtedness after those applied for to take care of the present requirements have been issued unless the appropriation should be delayed.

The Railroad Administration has no other legislation to propose except the appropriation bill, but Congress is expected to take up at an early date the question of a permanent solution of the railroad problem and undoubtedly a large number of bills dealing with the subject will be introduced at the opening session.

### Mr. Hines Explains Financial Situation

The aggregate deficit of the Railroad Administration for the first three months of 1919, after allowing for the rental due the railroad companies, the expenses of the Railroad Administration, the operation of inland waterways and some incidental items, was \$192,000,000, according to a statement authorized by Director General Hines. This figure is reached, he explained, by comparison with three-twelfths of the standard return for a year, although the average net operating income during the three-year test period for January, February and March was less than that amount. Mr. Hines' statement did not give the figures for March, which show a net operating income for the Class 1 roads and the switching and terminal companies of \$10,924,000, or 82.5 per cent less than for March, 1918. The three-year average for March was \$68,251,000. For three months the net operating income was \$39,813,000, as compared with an average for the corresponding months of the test period of \$172,798,000, while three-twelfths of the standard return for a year for the roads under federal control would be about \$232,000,000.

Mr. Hines also stated that practically complete returns

for 1918 now show the deficit for the year to have been \$226,000,000 so that the total deficit up to April 1, since the government took over the roads is \$418,000,000.

The fact that his statement was somewhat less conservative than some previous financial statements of the Railroad Administration gave an impression that he might be preparing the public mind for an advance in rates, but he said it is now impossible to make any confident statement as to the results for the year as a whole and that his own judgment is that conditions are too abnormal to serve as a basis for any general change in the level of rates and that it is preferable to defer action on that subject until further information is available. The statement follows:

"I believe it is highly important to keep the public as fully informed as practicable as to the financial results of the Railroad Administration. Practically complete accounting for the calendar year 1918 has just been accomplished and tentative results for the months of January, February and March, 1919, have become available. I take advantage of the first opportunity after an extensive trip in the West to put a summary of these results before the public.

"The results for the calendar year 1918 show that at December 31, 1918, the deficit incurred by the Railroad Administration for that year after deducting the rental due the railroad companies amounted to \$226,000,000. This included the expenses of the central and regional administrations, and also included the operations of the inland waterways under control of the Railroad Administration as well as the incidental and miscellaneous items which must be taken into account in a complete statement. There remained comparatively small amounts of back pay for the calendar year 1918 which were not charged into the accounts for that year but which have largely been charged into the three months ending with March, 1919.

"For the months of January, February and March, 1919, the aggregate deficit incurred, after deducting the rental due the railroad companies, was approximately \$192,000,000. This figure includes not only the Class 1 railroads, but all other railroads under Federal control, the expenses of the central and regional administrations, the operation of inland waterways under control of the Railroad Administration as well as some incidental and miscellaneous items. In arriving at this figure there has been charged against each of these months one-twelfth of the annual rental for the railroads. Generally speaking, these three months have always earned much less than three-twelfths of the return for the year so that a substantially less charge of rental into these months would not be inappropriate. Still it seems preferable to charge a full one-twelfth of the rental into each of these months rather than to run the risk of an impression arising that there is any disposition to under-state the actual results. To a large extent the unfavorable results for January, February and March are due to the fact that business has fallen off and that expenses could not be correspondingly readjusted so that the loss largely arises in connection with the period of readjustment through which the country is going. Industrial enterprises generally have suffered embarrassment on account of the fact that business has been curtailed so much more rapidly than expenses could be curtailed. The railroad business is probably in its nature less elastic than any other business and shows more unfavorably the embarrassments of readjustment.

"Since the first of the year I have conferred repeatedly

with the regional directors and I have also conferred with nearly all the federal managers in the United States on the subject of costs. The entire railroad organization has been and is working most earnestly to readjust these costs to meet the present conditions, but the nature of the railroad business whether under private or public control is such that to a very large extent it is impossible to offset loss in business by a corresponding reduction in costs. On the other hand when there shall be a substantial increase in business the revenues therefrom will be largely reflected in the net because the costs will not be correspondingly increased. It is believed that this improvement will be considerably emphasized by reason of the fact that maintenance work has been carried forward during the favorable weather of January, February and March, on a liberal basis despite unfavorable business and this should be reflected in a saving in maintenance costs later in the year.

"While passenger business for the three months was only slightly less than last year, the loss in freight business was much more pronounced, as is shown by the following table:

	TOTAL NET TON MILES IN THOUSANDS (Revenue and Non-Revenue)		
	1919	1918	1917
January .....	30,383,169	27,619,867	32,652,616
February .....	25,681,943	29,678,260	28,386,351
March .....	28,952,925	37,706,100	31,674,619

"The figures for 1919 are strictly comparable with those for 1918, but the 1917 figures do not include all the large roads in federal operation. In order to put all three reports on a conveniently comparable basis, the net ton miles per mile of road per day are given in the following table:

	NET TON MILES PER MILE OF ROAD PER DAY (Revenue and Non-Revenue)		
	1919	1918	1917
January .....	4,275	3,878	4,770
February .....	4,002	4,591	4,511
March .....	4,059	5,273	5,192

"It is impossible on the basis of these three months to predict the results for the year as a whole, although it is believed the results will be very much less unfavorable if as seems to be generally anticipated there shall be an important resumption of business later in the year, especially if the great crops now in prospect shall be realized.

"On the trip in the West which I have just completed I have found the most pronounced optimism on the part of business and agricultural interests generally which gives a reasonable basis for hoping for an enlarged business that will be relatively profitable to the railroads since handling it should not correspondingly increase their costs. But while it is proper to mention these factors, it must be admitted that in the midst of the present period of post-war readjustment it is impossible to make any confident statement as to the results of railroad operations for the remainder of this calendar year.

"The present unfavorable results naturally lead to agitation of the question whether there ought to be an increase in rates. My own judgment is that the present conditions are too abnormal to serve as a basis for any general change in the level of rates and that it is preferable to defer action on that subject until there shall have been a fuller opportunity to get a more reliable, and possibly a more normal, measure of the conditions, meanwhile resorting to every practicable economy, studying the situation with the greatest care, and keeping the public fully informed as to developments.

"There has not been included in the months of January, February and March the sum of approximately \$6,000,000 per month for back pay on account of wage orders recently issued to put into effect recommendations of the Board of Railroad Wages and Working Conditions which were made upon proceedings pending before it during the war, such wage orders being necessary as heretofore explained to complete the war cycle of wages to which the government was necessarily committed during the war. These amounts of

back pay will appear in the next few months and of course will result in diminishing operating income for those months.

"One other item needs to be mentioned. Under the contract made between the government and the American Railway Express Company in the summer of 1918 the government undertook to assume any operating deficit which the express company might incur during government control. Such operating deficit for the first year will not be ascertainable or technically chargeable against the Railroad Administration until the end of 12 months from the effective date of the contract, i. e., July 1, 1918. The amount of this deficit, however, should be borne in mind. For the six months ending December 31, 1918, such deficit was approximately \$9,500,000 and for the months of January and February, 1919 (including allowance for back pay to be hereafter paid on account of those months) it is roughly estimated that such deficit will be approximately \$5,040,000, making the operating deficit now in sight for the first eight months of the year which will end June 30, 1919, approximately \$14,540,000. It can reasonably be assumed that this additional expenditure will have to be incurred by the Railroad Administration on account of the eight months in question, although it will not appear in the accounts until after June 30 next. No estimate can yet be made for the month of March.

"It is not anticipated that the conditions for April will be more favorable than the conditions for January, February and March. In many parts of the country the effects of business readjustment were more pronounced in April than in the earlier part of the year.

"It is my policy to give the public the facts and, where the inference to be drawn is doubtful, to resolve the doubt in such way as to avoid the risk of making a statement more favorable than the ultimate facts will justify."

As compared with the three-year average for March, the March deficit was \$57,327,000. In January the deficit was \$37,830,000 and in February it was \$37,828,000. Freight traffic declined very sharply in March, the net ton mileage being 23.2 per cent less than in March, 1918. The operating revenues were \$376,345,000, an increase of 2.9 per cent, while expenses were \$346,770,000, an increase of 22.2 per cent. Net operating revenues were \$29,574,000, a decrease of 63.9 per cent. The Eastern roads had a deficit of \$1,283,000, the Southern roads earned \$4,489,000 net operating income, and the Western roads \$7,719,000. For the first quarter of 1919 the operating revenues were \$1,125,078,000, an increase of 37 per cent over the test period average, and operating expenses were \$1,031,756, an increase of 81 per cent, while the net operating income \$39,814,000 was 77 per cent less than the three year average.

### Cash Transactions of the Central Administration

Director General Hines also authorized the following statement in connection with cash receipts and disbursements by the United States Railroad Administration treasurer at Washington, for the month of April:

The cash receipts from all sources, including payments of loans by the railroad companies, amounts transferred from railroad treasuries, collections from express companies, and payments on account of additions and betterments, aggregated \$35,643,175.

The cash disbursements, including loans to railroad companies, payments to railroad companies on account of compensation, advances to federal treasurers, and payments to waterways and canals, amounted to \$48,857,027.

Of the foregoing receipts, \$20,276,500 represented amounts transferred from railroad treasuries to the central administration treasury, while \$46,955,500 of the disbursements covered advances to federal managers. The net amount which it was necessary for the central administration to advance to federal treasurers for current requirements was, therefore, \$26,679,000.

The total amount loaned the railroad companies by the director general for the 16 months of federal control ended April 30, 1919, was \$232,349,459 and of this amount \$61,399,250 has been repaid. All of the balance, practically speaking, can be deducted in settlement of the compensation, so that these items, while termed loans, can be regarded substantially as payments on account of compensation. The total disbursements on account of compensation and loans substantially of that character, aggregated for the 16 month period \$494,913,615.

The total payments for standardized equipment during the 16 month period amounted to \$163,950,402.

The above relates to the cash receipts and disbursements of the central administration, and does not include the receipts and disbursements of the federal treasurers, in connection with the operation of the properties under federal control, as these figures are not yet available.

The director general issued to April 30, 1919, certificates of indebtedness aggregating \$148,883,234, of which \$131,257,800 were on account of compensation to enable the various carrier corporations to meet their cash requirements, such as interest, dividends, and other corporate charges, up to and including May 1, 1919; and \$17,625,434 were on account of amounts due the car and locomotive builders for equipment. These items are not included in the cash disbursements given above.

#### Demurrage Rates to Be Cut

The Division of Traffic of the Railroad Administration has advised the National Coal Association that the present demurrage rates will be changed at the earliest practicable date, and announcement of changes on the following basis is expected:

The rate will be \$2 per day for the first four chargeable days after the usual two days' free time; for all chargeable days thereafter the charge will be \$5 per day. The average agreement may apply on inbound loads separately and on outbound loads separately, but no credits will be allowed to be transposed from one operation to the other.

It is understood that the proposed recodification of the national car demurrage rules, in so far as it includes various changes, will be deferred until some future date, and that the rules now in effect will continue to be operative except as outlined above. The rules now in effect, and which are to be superseded by the new rates, provide that after the expiration of free time, the charges per car per day shall be \$3 for each of the first four days; \$6 for each of the next three days, and \$10 for each succeeding day.

#### Mechanical Officers Instructed to Report on June Conventions

Frank McManamy, assistant director of the Division of Operation, has addressed the following to the regional directors, asking that mechanical officers be instructed to make written reports regarding their observations at the June conventions:

"The convention of Section 3, Mechanical, American Railway Association, which is composed of the Master Car Builders' Association and American Railway Master Mechanics' Association, will be held at Atlantic City, June 18 to 25.

"It is desired that the representative members from the different railroads attend, as far as possible, and that other mechanical department officials who are members be permitted to attend, for at least a portion of the time, where they can be spared from their regular duties without adversely affecting the service. It is anticipated that there will be on exhibition the most complete collection of mechanical appliances that has ever been exhibited at one of these conventions, and a study of it will be of substantial value to the mechanical department officers who are in attendance.

"In order to obtain the greatest possible amount of benefit from this convention, it is desired that each member present below the rank of superintendent of motive power shall, on his return from the convention, make a written report to the superintendent of motive power, relative to the new devices which he inspected at the convention, or ideas which he obtained from the discussions which can be applied with profit to the work under his direction.

"The superintendent of motive power will make a digest of the various subjects presented in this way, so that those which can be profitably adopted may be given consideration, sending a copy of it to the assistant director, Division of Operation, in charge of the mechanical department, for the use of the Committee on Standards for locomotives and cars.

"Will you please issue the necessary instructions?"

#### Freight Traffic Movement for March

The volume of freight traffic in March decreased 23.2 per cent, measured in net ton mileage, as compared with March, 1918, according to the monthly report of freight traffic movement and car performance compiled by the Operating Statistics Section. Net ton miles of revenue and non-revenue freight were 28,952,925, as compared with 37,706,100 in March last year. In the Ohio-Indiana district the decrease was 39.4 per cent, while in the Southern region it was only 8.6 per cent, but all regions show a decrease. Net ton miles per mile of road per day were 4,059 as compared with 5,273. Train miles decreased 22.4 per cent and total car miles decreased 18.6 per cent, while the percentage of loaded to total car miles was 68.1 per cent, as compared with 71.4 per cent. Tons per train fell off 1.2 per cent, from 666 to 658, and tons per loaded car from 27.9 to 27.6, a decrease of 1.1 per cent. The average number of freight cars on line daily was 2,432,469, of which 2,295,617 were reported as serviceable. The percentage of unserviceable cars was 5.6 per cent as compared with 5.1 per cent in March, 1918. The average mileage per car per day was only 20.4 as compared with 24.9 in March, 1918, a decrease of 18.1 per cent, and the net ton miles per car day were 384 as compared with 496.

#### Executives' Committee to Confer on Car Allocation

Following a conference last week with Swagar Sherley, director of the Division of Finance of the Railroad Administration, the Association of Railway Executives has appointed a special committee to confer further with the Railroad Administration on the question of the allocation to the various railroad companies of the standard freight cars ordered by the Railroad Administration. According to a recent report about 92,000 of the cars had been allocated and 45,000 had been built, but only 27,000 had been accepted by the railroads, 18,000 being in storage without stencilling. Efforts will be made to work out a plan to assist the companies in financing the equipment. No date for the conference has been set. The committee consists of the following: Thomas DeWitt Cuyler, chairman; Alfred P. Thom, counsel; Howard Elliott, president, Northern Pacific; Julius Kruttschnitt, president, Southern Pacific; W. H. Finley, president, Chicago & North Western; E. E. Loomis, president, Lehigh Valley; Charles Hayden, president, Chicago, Rock Island & Pacific; Mark W. Potter, president, Carolina, Clinchfield & Ohio, and E. P. Ripley, president of the Atchison, Topeka & Santa Fe.

#### Conference of Steel Prices

Representatives of the purchasing department of the Railroad Administration were to hold a conference with a committee of iron and steel producers at New York on Thursday to discuss the much-controverted question of iron and steel prices. The conference was arranged by the Industrial Board of the Department of Commerce, which, having failed to obtain the endorsement of the Railroad Administration for the scale announced on March 21, offered its services as a

mediator. The board itself was not to take part in the conference. It was understood that the Railroad Administration was prepared to offer the steel interests a compromise price.

#### Interest to Be Paid on Claims

Accounting Circular No. 41-A says that P. S. & A. Circular No. 41, issued October 29, 1918, seems to be unfair as to claims presented previous to November 1, 1918, and is accordingly amended by striking out paragraph 2 of the original circular and inserting in lieu thereof the following:

"2. In case of claims presented prior to November 1, 1918, interest shall be paid from the date of presentation. If settlement has been made during federal control upon a different basis, the claim shall be readjusted upon the interest basis here prescribed. In the making of payment fractions of the month shall be disregarded as is provided in paragraph 1."

#### Small Under or Over Charges May Be Ignored

Accounting Circular No. 87 states that in the course of collecting freight charges from shippers or consignees and adjusting disputed items to a correct basis many small errors occur which in the aggregate are not substantial, but the correction of which are both costly and annoying to the railroad and some of its patrons. In order that these petty differences may quickly be disposed of, carriers federally operated may enter into agreements with shippers or receivers of freight to

## Kanawha & Michigan Uses Electric Tractors and Trailers

THE NEW FREIGHT HOUSE of the Kanawha & Michigan at Charleston, W. Va., has been equipped with electric tractors and trailers for economy in the handling of package freight, both inbound and outbound, as well as to accomplish a general speeding up of freight house operations. The photograph illustrates the character of the equipment which was supplied by the Lakewood Engineering Company, Cleveland, Ohio.

The tractors are of the four-wheel-steer, four-wheel-drive type, operated by a 48-volt, 45-ampere motor (continuous rating), supplied with current by storage batteries. The motor is mounted on a longitudinal shaft with a worm drive on both axles. Among the distinctive features of the equipment is the short turning radius of 5 ft. 1 in., measured to the outside edge of the platform at the forward corner, which is of great advantage in handling the tractors and trains in close quarter. Another feature is the double-end control. The control equipment is mounted in a centrally located stand flanked at either end of the car by battery boxes, each fitted with a driver's seat. Thus the driver has the controller, steering wheel and safety pedal in convenient position before him no matter which seat he occupies. This feature is of special value in handling the tractors in narrow passageways.

Tractors and Trailers Used in the Freight House at Charleston, W. Va.

ignore undercharges or overcharges of 10 cents or less on each shipment detected after freight bills therefor have been rendered. If patrons require the settlement of all undercharges or overcharges of 10 cents or less, all such differences must be settled with them. Care should be exercised to see that differences of this character are not intentionally created so as to result in an advantage to any interested person or concern. It is expected that the obvious benefits of the plan will commend it to all concerned, and that no difficulty will be experienced in making it effective.

#### Contracts Executed

The Railroad Administration has executed compensation contracts as follows: Chicago Great Western, \$2,953,449.94; Brooklyn Eastern District Terminal, \$306,259.63; New Orleans, Great Northern, \$575,951.79; and the Leavenworth Terminal Railway & Bridge Company, \$43,583; also co-operative short line contracts with the following: Cumberland & Manchester; Alabama Central; Bartlett Western; Glenmore & Western; Kosciusko & Southeastern; Nevada Copper Belt, and Pittsburgh & Susquehanna.

In connection with the steering and drive arrangement it is of interest to note that the power is transmitted from the axles to the wheels without the use of universal joints. Instead the transmission is accomplished by a train of bevel gears, using the vertical shaft which also serves to swing the wheel in steering. Power is applied to this shaft from a bevel gear on the axle and is transmitted from the shaft to the wheel by means of a second bevel gear of large radius mounted on the inner face of the wheel.

The trailers used at Charleston are of the caster type with main wheels 16 in. by 4 in. and caster wheels 8 in. by 4 in. and a weight of 720 lb. The carrying capacity is 5,000 lb. This type is particularly adapted to installations where it is desirable to do a certain amount of hand trucking. Another Lakewood type, the four-wheel-steer trailer tracks more accurately and has the further advantage that it may be hauled in either direction. Still other types of Lakewood trailers include a balanced type having a pair of 18-in. center wheels with two casters at each end, and a "fifth wheel" type for use on rough ground in cases where considerable hand hauling is done.

# Railway Developments in Foreign Countries

## Proposed Extensions in Peru; Suggestions for Trading With Greece; South African News

THE GOVERNOR of the state of Sao Paulo, Brazil, has temporarily authorized an automobile passenger and freight service along the route of the branch of the Campineiro Railway from Joaquim Egydio to Dr. Laciada, in place of the present steam railway service.

Exports of railway material through the port of New York in March, according to figures compiled by the National City Bank of that city, included car wheels to the value of \$197,573; steam locomotives valued at \$779,099; steel rails amounting to \$1,289,394, and steam railway cars valued at \$427,378.

### Discussion of Chinese Railway Unification Ceases

[Special Correspondence from Peking]

Public discussion of the proposed "unification" of the foreign interests in Chinese railways has ceased as suddenly as it began. In the meantime, the Japanese-controlled Chinese press contains almost daily articles dealing in innuendo against American motives in Korea, Siberia, and in world politics. The most pointed action has been the publishing of the Siems-Carey railway agreements simultaneously with a few of the more innocent Japanese secret agreements. The idea evidently has been to convey the impression that these American agreements were also "secret" when as a matter of fact they were given to the press two years ago.

### Standard Specifications in Spanish

A number of additional publications in the Industrial Standards Series of the Bureau of Foreign and Domestic Commerce are now available. These contain standard specifications of the American Society for Testing Materials in English and Spanish, and include No. 14, carbon steel car and tender axles; No. 29, cast-iron locomotive cylinders; No. 45, iron and steel chain; No. 30, extra-high-carbon steel splice bars; No. 47, cast-iron car wheels; No. 35, structural steel for cars; No. 48, malleable iron castings. Copies may be obtained from the Superintendent of Documents, Washington, D. C., at 5 cents each.

### Ambitious Japanese Electrification Project

Application has been made to the Japanese government, says an item in the Electric Railway Journal, for permission to construct a high-speed electric railway between Tokyo and Osaka, a distance of 287 miles. It is estimated that an expenditure of about \$100,000,000 will be necessary for the purpose. The proposed line is about 69 miles shorter than the existing steam railroad. Doubt is expressed in Japan as to the willingness of the government to permit the construction of an electric line competing with its own steam line, but the promoters are counting on the changed commercial, financial and transportation conditions brought about by the war to cause the government to consider the project favorably.

### Proposed Railway Extensions in Peru

A committee of civil engineers has been appointed to recommend to the Peruvian government the most feasible and desirable of the different surveys made for the construction of the Jatunhuasi Railway.

The Lima to Lurin railway, the construction of which was commenced under the administration of President Billinghurst, was completed and opened to traffic during the latter part of 1918. The road is 46 kilometers long.

The Peruvian Congress has authorized the executive power to build a branch railway from kilometer 76 on the Chimbote to Recuay line to Cajabamba.

Information has reached the State Department at Washington that the Peruvian Government has undertaken the construction of a railway line which will make possible transportation between the Pacific and Atlantic coasts across the widest part of South America. With the completion of the railroad goods can be shipped from Callao, on the Pacific, to ports on the Amazon River and transferred then to steamers bound for ports on the Atlantic. The new road starts at a point on the Cerro de Pasco Railroad, which runs from Lima to the Cerro de Pasco copper mines, which are owned by an American company. This firm was said to be interested in the construction of the new line, which will tap extensive virgin forests of valuable timber.

[Other references to new railway construction in Peru have appeared in this column in the issues of February 7, 1919, page 373; February 14, page 418; March 28, page 866 and April 18, page 1012. A map will be found in a more extensive article in the issue of March 7, 1919, page 533.]

### American Railway Supply Prospects in Greece

Consul General Alexander W. Webber, at Athens, in a letter to the *Railway Age* makes the suggestion that American railway companies should appoint representatives in Athens to submit bids on government contracts; and submits a list of business men who might be willing to consider agency proposals.

With the exception of a few small suburban railways, he says, all railways in Greece are operated by the government ministry of transports.

"There are two facts which it is thought advisable to point out, in this connection, to American manufacturers of railway equipment," he continues. "The first is that the British and French Armies at Salonica, which are being returned home from the Macedonian front, are disposing of large quantities of material of all kinds at very favorable terms. It is possible that the Greek Government will avail itself of the opportunity to purchase railroad material. And secondly, it is understood here that the Canadian Government has offered to the Greek Government railway material and equipment, in great quantities, at very low prices.

"Present conditions, however, are not normal, and there is every reason to believe that American railway equipment manufacturers can advantageously meet ordinary European competition.

"While the firms named on the list below are of good local repute, no responsibility can be assumed for them by this office. They can doubtless furnish references, while detailed information relative to their financial strength and credit standing could no doubt be obtained, through any New York bank, from the National Bank of Greece, Bank of Athens, Commercial Bank, or any other financial institution of this city."

The commercial representatives whose names are given are J. M. Schapira, 21 Colocotroni street, Athens; George Rozis & Co., 50 Hippocrates street, Athens; Nicolaidis, Papazoglou, Politis & Co., Philonos street, Piraeus; Stephen C. Stephanson, 11 Lycourgou street, Athens; E. A. Hill, 55 Eolou street, Athens; Rouso & Danon, Piraeus; A. Denaxas

& Co., Stadium street, Athens; Christos Stassinopulos, 35 Maouli avenue, Piraeus; Bernard Melissinos, Sophocles street, Athens; P. Vryonis, 1 Plouton street, Athens.

### The South African Railway Budget

[Special Correspondence from Johannesburg]

The exhaustive statement of the Minister of Railways and Harbors on the railway estimates throws further light on the circumstances which have necessitated the recent increases of rates. For the current year (1918-19) the department was faced with the prospect of a deficit of £1,169,000. Rates were consequently increased as from May 11 and thereafter revenue showed a remarkable expansion until the influenza epidemic. The original estimate of general revenue was £276,034 per week. During the seven weeks preceding the epidemic the weekly earnings averaged £301,385. By the end of September, half way through the financial year, the total traffic receipts were £397,915 in excess of the estimates. There was, however, a big decline as soon as the effects of the epidemic made themselves felt. For the week ending October 26 the receipts dropped to £186,933, the lowest figure since Union, with the exception of the strike period and the week ended September 26, 1914, just after the outbreak of the war. It is calculated that the epidemic occasioned a loss in railway revenues of something like £550,000. It was not until December that signs of recovery became apparent, but for that and the following months the earlier record was re-established and exceeded the total ending February 8, being £342,000. Meanwhile the second increase in rates had taken effect from the New Year and as the combined result of the traffic improvement and the higher charges there is now every reason to hope that the ordinary railway revenue for the year will be approximately £650,000 in excess of the original estimate. To this position passengers, parcels, and general goods traffic have all contributed, the first named, so far from having shown any falling off owing to the increased fares, having attained proportions with which the department has been hard pressed to cope, while passenger traffic for the year constitutes a record since Union. There has also been a record tonnage of goods and minerals other than coal. Coal traffic, on the other hand, has decreased owing to the diversion of shipping and decline in military requirements, though the falling off in respect of bunkering has been set off by a heavy expansion in export and the internal coal traffic has generally increased. A noteworthy feature of the period under review has been that the heavy decline in the traffic in imports, brought about by war conditions and the restrictions on ocean transport, has been counter balanced by a contemporaneous increase in the revenue from internal sources. In this respect the railways have reflected the growing industrial activity within the Union which is a healthy sign of the times. From the standpoint of railway revenue the replacement of traffic in imported overseas goods by that in South African products is the exchange of a lucrative for a less productive class of business, but from the point of view of general development it implies that South Africa has been more favorably situated than most countries during the war. The gross revenue from railways is now expected to exceed the estimates by £805,055.

### Expenditure

Turning to expenditure, the epidemic cost the department £77,000 in sick pay alone, while overtime and other sources of special outlay due to the same cause are estimated to have involved a further loss of £100,000. Apart from this exceptional visitation, however, there have been substantial causes of increased outlay, notably the war bonus, improvement in the pay of various sections of the staff and the increased cost of materials of all descriptions owing to the war. Under these circumstances the gross railway expenditure for 1918-19

is expected to exceed the estimates by £627,128 and the harbor expenditure by £67,525. The actual results of the year's working, however, are now expected to be considerably better than the original estimates implied and the net result has been a reduction of the estimated deficit on the current year, from £1,169,396 to £1,062,000. This deficit is being treated as estimated expenditure for the coming year.

### Drawbacks of the Past Few Years

Glancing back over the conditions of the past few years, the Minister recalls a remarkable sequence of serious drawbacks, comprising the general strike of 1913, the railway strike and other industrial troubles in January, 1914; the outbreak of war; the rebellion in 1915; the prolonged drought of 1916; the destructive floods and washaways of 1917, and the devastating epidemic of last year. Throughout the whole of this period the general overseas position, and the state of affairs in regard to shipping, created constant difficulties. The cost of all requirements has been subject to constant expansion. The pay of men on active service absorbing nearly £1,250,000 per annum. The war bonus for railwaymen in the current year amounts to over £1,300,000. The rate of interest on capital has advanced. Despite all this, the Minister points out, and the improvements made in the pay and conditions of the staff, the expenditure has been met out of revenue, and the normal working of the railways has been maintained comparatively unimpaired. In this connection he pays a high tribute to the devotion of the Staff, and makes acknowledgment of the way in which unavoidable inconveniences have been borne by the public.

### Financial Year 1919-20

For the financial year 1919-20 the estimated expenditures on railways and harbors is: Railways, £19,410,983; harbors, £913,087. Total, £20,324,070. There is an increase on railways as compared with the previous year, of £2,884,521 and on harbors of £79,498, a total of £2,964,019. The biggest contributory item towards this increase is the deficit of £1,062,000 from the current year.

### The Estimate of Revenue

The estimate of revenue for 1919-20 leaves an anticipated deficit at the end of that period of £877,500. The question of how to deal with this position, the Minister states, has been the subject of the most careful consideration.

Funds can only be provided in two ways—by reducing expenditure or raising more revenue, and the only way of raising more revenue is by the increase of rates. It is not considered likely that the estimate of revenue will be exceeded under existing conditions. It is frankly recognized that the drastic expedient of withholding or reducing contributions to the renewals fund cannot be repeated, the fund stands at about £5,832,000, but the great bulk of this has already been ear-marked, and the Minister makes significant revelations as to the far-reaching extent of present requirements for getting the railways into proper working condition. Under these circumstances there is no alternative but to carry the deficit forward and await developments. If it seems likely that the deficit will be substantially covered, no action will be taken. If, on the other hand, there is no immediate prospect of wiping it out, it will be necessary to reconsider the whole position from the standpoint, presumably, of determining whether there will not have to be some further raising of rates.

J. E. Johanson, a member of the St. Louis (Mo.) Western District Freight Traffic Committee, has been appointed chairman of that committee to succeed C. E. Perkins who has resigned. G. E. Rambach has been appointed a member of the committee in place of Mr. Johanson.

# Air Brake Association Holds Annual Convention

## Record Attendance; Air Consumption of Auxiliaries and Holding Trains on Grades Among Topics Discussed

THE LARGEST DELEGATION of air brake men in the history of the organization gathered at the Hotel Sherman, Chicago, on Tuesday for the opening meeting of the twenty-sixth annual convention of the Air Brake Association. The first session was devoted to addresses by Frank McManamy, assistant director division of operation, United States Railroad Administration; W. J. Bierd, Federal manager, Chicago & Alton; W. J. Patterson, bureau of safety, Interstate Commerce Commission, and F. J. Barry, president of the association.

### Address of President

President Barry in his address spoke of the past work of the association and mentioned its recognition by the Railroad Administration as showing the general recognition of the progress that had been achieved through the leadership of the organization. He urged that the association should continue its efforts to improve air brake service and to extend its sphere of activity, particularly by more active co-operation with the local air brake clubs, which offer an excellent opportunity for keeping in close touch with the problems arising in the maintenance and operation of air brakes. In closing he paid a glowing tribute to the genius of Walter V. Turner whose work was largely responsible for many of the most important recent advances in the art.

### Address of Frank McManamy

Mr. McManamy emphasized the necessity for promoting safety, efficiency and economy in the operation of the railroads under present conditions and pointed out how the Air Brake Association can help to secure these aims. He spoke of the need for a realization of the fact that the air brake is not merely a safety device, but is essential for proper operation with the heavy motive power and long trains now in use. He mentioned also the part that could be taken in reducing damage claims by the proper maintenance of the air brake.

Mr. McManamy stated that in his opinion the neglect of brake equipment was too common on roads with low grades and that steps should be taken to remedy the condition. He recommended increasing the forces employed on air brake work and installing proper facilities at repair points where the equipment is overhauled. As the first essential for proper operation he suggested that more attention should be given to stopping leakage in the air brake system and especially in brake cylinders and retainer valves. He spoke also of the co-ordination of the mechanical associations under the American Railroad Association and the benefit that the Air Brake Association could derive by having its recommendation referred to the Mechanical Section and issued as mandatory instructions.

### Address of W. J. Patterson

Mr. Patterson outlined the work of the Division of Safety as it affects air brake matters and spoke of the importance of improving general air brake conditions throughout the country. He advocated the universal use of the incoming brake test as a means of securing better conditions. He also referred to the fact that hand brakes are used to control

freight trains when descending heavy grades and said that it was the intention of the Division of Safety to require such practices to be discontinued.

### Air Consumption of Locomotive Auxiliary Devices\*

The committee submitted a report of progress, giving a resumé of the work which had been done. The purpose of the committee's investigation was, (1) to investigate the rate of air consumption of auxiliary devices as found in service on locomotives; (2) to investigate the relation of air consumption by auxiliary devices to compressor operation; (3) to determine if the amount of air used is sufficient to warrant a separation of auxiliary devices from the air brake system, with a separate compressor to furnish air for them; (4) to determine if it is satisfactory to have the auxiliary devices take their air supply from the air brake system, but necessary on this account to install an additional compressor; (5) to investigate the cost of compressed air for operating the auxiliary devices used, and (6) to make recommendations with respect to the maintenance of auxiliary devices.

### TESTS MADE AND RESULTS

While the data given here do not cover the subject completely, they will at least serve to give a conception as to what the use of air operated auxiliary devices on locomotives may mean in the ordinary practice of busy railroads. It is to be expected that this report will be regarded as a report of progress, and it is hoped that the work of the committee will be continued for the ensuing year.

The investigation covered in this report naturally divides itself into two parts, *viz.*, standing and running tests. The standing tests were made on locomotives in roundhouses, and consisted in measuring the amount of air used by the auxiliary devices operated while the locomotives were standing. The running tests were made on freight engines working over the road in service, and consisted of the continuous measurement of air used by the auxiliary devices in operation while the engine was running. The standing tests involved a total of 48 engines, and the running tests were made with six engines. A total of 489 individual tests were made, the results of which have been classified and arranged for the purposes of this report.

The locomotives used during these tests were not selected, nor were any locomotives inspected before the tests were made. It was desired to test the equipment just as it might happen to be available so that the data would be representative of average operating conditions. Furthermore, the standing tests were made at three division points and involved the equipment on four different divisions. The running tests were conducted on two road divisions.

*Standing Tests*—The standing tests involved measuring the amount of air used by the various auxiliary devices with the locomotive at rest. The form of apparatus for making this measurement is shown in Fig. 1. It consisted of two tanks connected as shown, the larger being designated as the measuring reservoir and the smaller as the pressure

\*The meaning of the term "air operated auxiliary devices on locomotives," as used in this report, can be defined as referring to all air operated devices on locomotives which are not a part of the air brake system, such as air operated fire doors, bell ringers, reverse gears, sanders, etc.

reservoir. The measurement of the air used by each auxiliary device was accomplished in the following manner:

The auxiliary device to be tested was disconnected from the main reservoir on the locomotive and reconnected to the measuring apparatus at globe valve No. 3. A connection was likewise made from the main reservoir on the locomotive

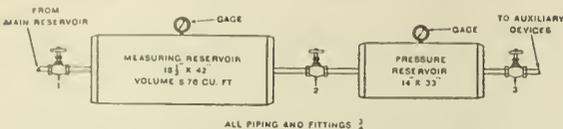

Fig. 1—Measuring Apparatus Used in Standing Tests of Air Operated Auxiliaries

to the measuring reservoir at globe valve No. 1. The air was measured by opening valve No. 3 and manipulating globe valves Nos. 1 and 2. The operator of valve No. 2 regulated that valve so that a constant pressure of 70 lb. was maintained in the pressure reservoir as the supply of air pressure to the auxiliary device under test. The operator of the main reservoir valve No. 1 opened this valve so as to charge the measuring reservoir up to the main reservoir pressure of the locomotive, usually 40 to 50 lb. higher than the constant pressure in the pressure reservoir. This operator

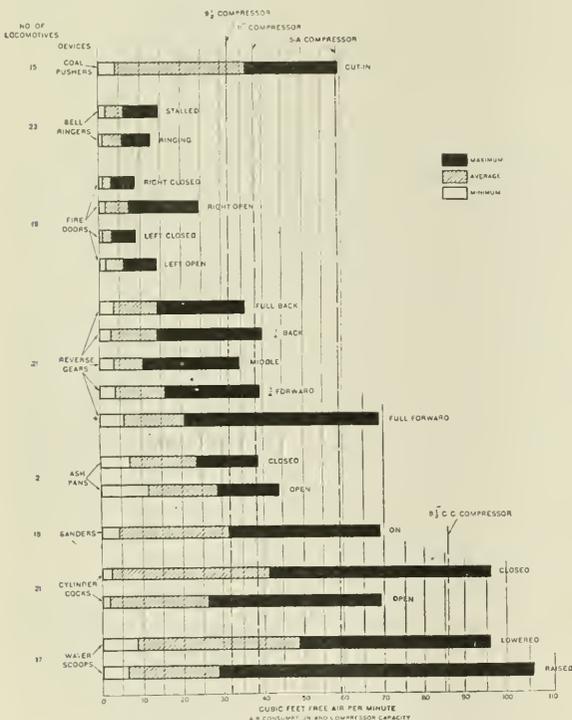

Fig. 2—Results of Standing Tests of Auxiliary Devices on All Locomotives

then closed valve No. 1 and noted the time required for the pressure in the measuring reservoir to drop any given amount during the time it was supplying air continuously to maintain the constant pressure in the pressure reservoir.

The air consumption was calculated as follows:  

$$\frac{20 \text{ (drop in measuring reservoir)}}{14.7 \text{ (atmospheric pressure)}} = 1.36 \text{ drop in measuring reservoir expressed in atmospheres.}$$

$1.36 \text{ atmospheres} \times 5.76 \text{ (volume of measuring reservoir)} = 7.83 \text{ cu. ft. of free air supplied during the test.}$

$\frac{7.83 \times 60 \text{ (No. of sec. in one min.)}}{78 \text{ (time of test in sec.)}} = 6.03 \text{ cu. ft. per minute.}$

The standing tests made on all auxiliary devices have been classified and arranged according to the type of locomotive upon which they were found, and the results are shown in graphic form in Fig. 2. Each figure on the chart shows the minimum, average and maximum rates of air consumption of all the auxiliary devices of the several types tested. The results for passenger locomotives are based on the standard passenger train reservoir pressure of 130 lb., although the actual tests were made at a constant pressure of 70 lb. In every case the data were converted from the 70 lb. basis to give the equivalent rate of air consumption at 130 lb. in the following manner:

$$\text{Rate of leakage, cu. ft. per min.} \times \frac{\text{Absolute press. on locomotive}}{\text{Absolute test pressure (84.7 lb.)}}$$

(144.7 lb.) equals rate of leakage on engine when main reservoir pressure is 130 lb. instead of 70 lb.; that is, the leakage is taken as proportional to the absolute pressures. The data for freight engines are based on 100 lb. main reservoir pressure, standard for freight service.

It will be noted that all charts have the capacity of air compressors indicated on them for convenient comparison with the rates of air consumption given. These values for compressor capacity are based on the rate of air delivery established by the Interstate Commerce Commission's compressor condemning tests, as shown in Table I.

Type of compressor	Delivery rate, cu. ft. free air per minute, 60 lb. pressure
9 1/2-in.	32
11-in.	37.5
3-A	59
8 1/2-in. C.C.	86

**Running Tests**—Running tests were made with the object of determining the rate and total amount of air used by the auxiliary devices while the locomotive was working in regu-

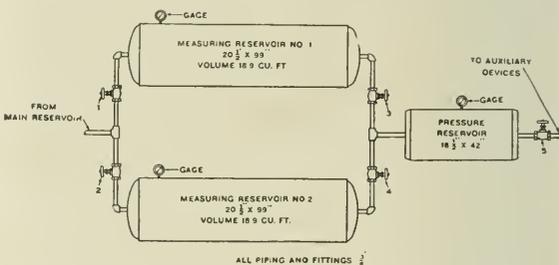

Fig. 3—Measuring Apparatus Used in Running Tests

lar service. An apparatus was devised for measuring continuously the rate and amount of air used, and is shown diagrammatically in Fig. 3. This apparatus is similar to that described above and shown in Fig. 1; the only difference being that two measuring reservoirs are used, with the object of permitting the measurement of air to go on continuously.

This apparatus was manipulated so that while the air was being measured by the dropping pressure in one reservoir, the other reservoir was allowed to charge from the main reservoir in order to be ready to start measuring the supply of air to the pressure reservoir as soon as the air pressure in the first measuring reservoir was exhausted.

The measuring apparatus was installed in a caboose which was run at the head end of the train next to the engine. The

pipng was so arranged that with either end of the caboose toward the engine, connections could be made to the main reservoir and the auxiliary devices on the locomotive under test.

The length of running tests covered in this report varied from 3½ to 8 hours, or the time required to make a fast freight movement over a division of 131 miles. The running tests made were six in number and can be divided into two classes, viz.: (a) Running tests in which the rate of air consumption was measured for the reverse gear only, and (b) running tests in which the rate of air consumption was measured for all auxiliary devices.

Three tests of each kind were made, and each test was made during a full trip of an engine in regular service on

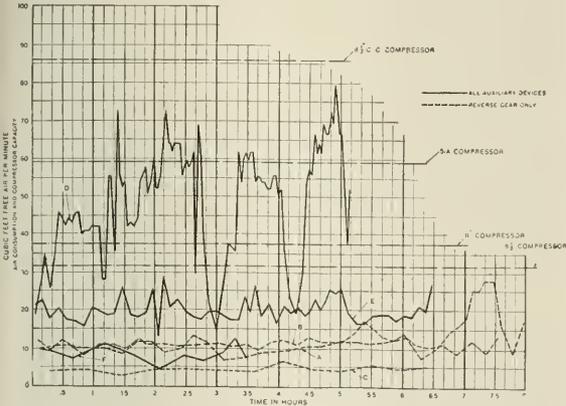

Fig. 4—Results of Freight Service Running Tests

fast freight. The running tests are, of course, of a great deal more importance than the standing tests, in that they show the rate of air consumption as it varies during the working time of the locomotive, and it is the judgment of the committee that more tests of this kind should be made.

The tests herewith presented do not provide sufficient data for basing definite conclusions, but they do show how the leakage of auxiliary devices will vary with running conditions on the road, and that cases do exist in which the air consumption is unreasonably high, if not actually dangerous, in the sense that it increases the possibility of an engine failure as the result of overworking the air compressor.

The running test, data are shown plotted in graphic form in Fig. 4. Each of the six tests is represented by a line which shows how the rate of air consumption varied throughout the trip. The three solid lines represent tests made on all auxiliary devices, and the three dotted lines represent the tests made in which the air consumption was measured for the reverse gear only. Additional lines are shown on the charts to indicate the capacity of different air compressors in order that comparisons between the compressor air capacity and the rate of air consumption can readily be made. All of the engines used in the six tests plotted on this chart were of the same class, and were equipped with two No. 5-A air compressors and the following air operated auxiliary devices: reverse gear, double fire doors, bell ringer, sander, water scoop, and cylinder cocks.

The tabulation below shows the total amount of free air used and the average rate of using during each of the six running tests shown in Fig. 4.

Locomotive designations	Auxiliary devices	Total cu. ft. free air used during trip	Cu. ft. free air used per min.
A	Rev. gear only.....	5,665.2	11.84
B	Rev. gear only.....	4,939.8	10.55
C	Rev. gear only.....	1,809.62	4.50
D	All devices.....	14,750	46.93
E	All devices.....	7,761.2	23.13
F	All devices.....	1,738.4	8.17

Cost Data—Fig. 5 has been made up from the running test data to show the relative cost of maintaining auxiliary devices at the minimum, maximum, and average conditions of leakage found during these tests. The first two figures of this chart show the minimum and average rates of air consumption for the three tests in which the reverse gear only was measured and the three tests in which all auxiliary devices were measured. These values were obtained from the test data by dividing the total amount of air used during the trip by the total time of the trip in minutes. The actual values used are shown in the last column of the preceding tabulation. The remaining figures in Fig. 5 give the relative minimum, maximum, and average cost for compressed air when using various types of air compressors. There are two figures for each type of compressor, one for the tests made with reverse gears only, and the other for the tests made with all auxiliary devices. These figures show the relative cost of supplying the compressed air required under the various conditions, based on the following assumptions: (1) That the average working time for locomotives is 6 hrs. per day, or 2190 hrs. per year; (2) That the rate of evaporation is 7 lb. of water per pound of coal; (3) That the price of coal on the tender is \$2.00 per ton, or \$1.00 per 1,000 lb.; (4) That the rate of steam consumption in pounds of steam used per 100 cu. ft. of free air compressed, is in accordance with

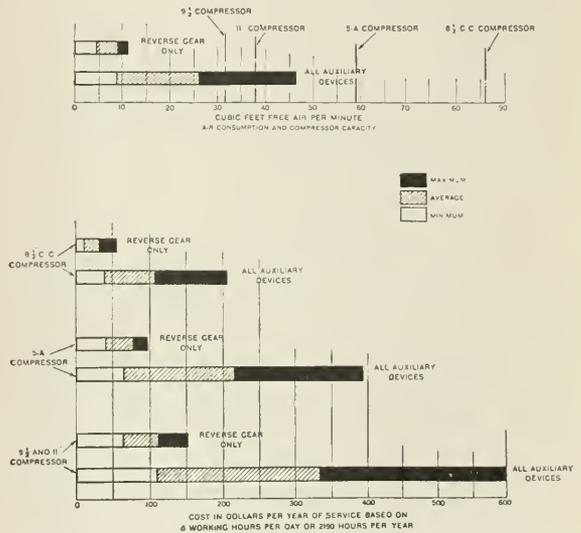

Fig. 5—Cost Data Based on Running Tests of Various Types of Air Compressors

the values given in Table II. These values have been determined from a series of steam consumption tests made on each of the types of air compressors indicated.

TABLE II—STEAM CONSUMPTION OF LOCOMOTIVE AIR COMPRESSORS  
 Lb. of steam, at 200 lb. pressure, per 100 cu. ft. free air compressed

Type of compressor	To 100 lb. main res. press. per 100 cu. ft. free air compressed	
	To 100 lb. main res. pressure	To 130 lb. main res. pressure
9 1/2 in. and 11-in. ....	68	76.25
5A .....	44.7	51
8 1/2-in. C. C. ....	24	25

The cost comparison figures are based upon the above assumptions only, no consideration being given to such factors as the cost of handling coal on engines, cost of water, depreciation of boiler plant and compressor plant, etc. These considerations have been omitted because the committee does not have sufficient data to accurately determine them. It is obvious that these factors would increase the costs shown, and

the chart figures can therefore be regarded as the minimum conservative values.

A detailed account of the results of the tests of individual appliances was given in the report. The theoretical or computed air consumption did not account for even the minimum consumption that was found during the standing test, proving that the greatest part of the air used was wasted through leakage due to improper maintenance of the devices. The committee believes that it would be worth while to continue the test with a view to establishing more complete data upon which performance standard and condemning tests could be made.

#### CONCLUSIONS

(1) Auxiliary devices under average conditions were found to use too much air.

(2) Conditions frequently exist where compressor capacity may be exceeded by the demands of the auxiliary devices.

(3) Some of the data justify the conclusion that auxiliary devices should be operated separately from the air brake system. On the other hand, some of the data show that with proper maintenance this conclusion might not be warranted.

(4) Under some of the conditions shown by these data, it would not be satisfactory to connect the auxiliary devices to the air brake system and increase the compressor capacity accordingly, unless the air brake main reservoir is protected from the consequences of excessive air requirement by the auxiliary devices.

(5) Cost basis data show that better maintenance would be profitable.

(6) Standards of performance, including maximum permissible leakage, should be established upon which to condemn devices unfit for service.

(7) Means should be devised for checking and testing the performance of auxiliary devices.

#### RECOMMENDATIONS

The committee recommended that its work be continued and this report be regarded only as a report of progress; that the data be made more complete by investigations on individual railroads, conducted as outlined in the report, such investigations to be reported to the chairman of this committee; that steps be taken to secure better maintenance of auxiliary devices; that further experiments be made with the object of devising satisfactory means for testing, and satisfactory standards of performance which can be applied to show whether the device is fit for service; and that consideration be given to the plan of operating the auxiliary devices at a pressure lower than that carried in the air brake system main reservoir. This plan would effect a large saving in air used, but would require a separate air supply reservoir with means provided for controlling the reduced pressure.

The report was signed by C. H. Weaver (N. Y. C.), chairman; C. B. Miles (Big Four), W. W. White (M. C.), and R. E. Miller (W. A. B. Co.).

#### Discussion

Great interest was shown in the results of the test and numerous opinions were advanced as to the cause of excessive leakage in auxiliaries and the method that should be used to overcome it. The practice of operating power reverse gears by steam when handling locomotives around the round-house was condemned by several speakers, who stated that steam destroyed the packing in the cylinders and caused excessive leakage. Some roads are now equipping metal disk power reverse systems with metal packing rings. T. F. Lyons (N. Y. C.) brought out the fact that leakage in the auxiliary devices might interfere with the proper operation of the brake even though it did not result in a large waste of air. The loss due to leaks in water scoop cylinders did not cause excessive air consumption because the cylinder is operated at infrequent intervals. However, in approaching

water tanks the scoop is usually dropped at the same time as the brakes are released and excessive leakage in the water-scoop cylinder might seriously interfere with the recharging of the auxiliary reservoir.

#### Air Leakage Due to Defective Hose Couplings

A paper on Air Leakage and Money Wasted Through Failure to Keep Hose Couplings in Standard Gage, submitted by the Manhattan Air Brake Club, was presented at the Wednesday session of the convention. The paper emphasized the fuel waste due to brake pipe leakage and stated that examination of 1,600 freight cars showed that 35 per cent of the leakage existed in the hose couplings. Further investigation developed that it was difficult to find couplings in service that would pass the M. C. B. standard coupling gage test. Employees often use makeshifts to secure tight joints and at least one road has adopted a special gasket to eliminate hose coupling leakage. Some special types of gaskets submitted to railroads for approval when tested have required from 1,000 to 1,300 lb. to pull the hose apart. Such excessive strains fracture the hose and cause the brake pipe to shift, resulting in leakage. The paper recommended that the universal practice of gaging air brake hose couplings be included when periodic attention to air brake equipment is being given freight cars in shops or on repair tracks.

#### M. C. B. Air Brake Defect Card

By Jas. Elder

General Air Brake Inspector, Chicago, Milwaukee & St. Paul

The United States Railroad Administration, Fuel Conservation Division, in Circular No. 13, of August 31, 1918, issued by Eugene McAuliffe, manager, presents 15 specific recommendations made by an Air Brake Association committee. Recommendation No. 9 is as follows: "A rule should be put into effect that trainmen must apply an M. C. B. standard air brake defect card in cases where defects develop en route or for brakes cut out by them; defect to be checked off on back of card."

The M. C. B. card shows careful thought, but the changed conditions since its last revisions demand certain alterations to meet present requirements. Some believe the brake defect card has outlived its usefulness, basing this on (a) the great difficulty in getting it applied where needed; (b) on incoming brake tests rendering it less necessary; (c) and some object because of the appearance occasional trains would present if all cars with defective brakes were carded. Assuredly the brake defect card should either be used to better advantage or discontinued.

If a defect card is yet needed and is practicable after having simplified the card, it will be very desirable to have mandatory instructions as to responsibility for its application. As this card is a detail of repairing, for which car men are responsible, *car men should be primarily responsible for its application*; that is, before a departing train is released from the blue signals, the inspectors should have either repaired or carded every defective brake. With this insured, it would be fair to insist that the departing train crew should card every defective brake delivered at the next terminal. However, as the incoming test should invariably be made, and as this would disclose to inspectors all defects except with cut-out brakes, it is submitted that if train men are required merely to card properly every brake brought in cut-out, all needs will be met, and the work of getting cards used by them will be lessened in a rational manner.

If one road cards all defective brakes not repaired and a connecting line does not, the former will be subjected to an unfair comparison; hence, that if real value is to be obtained from the defect card, its full and similar use must be obligatory on all roads in interchange traffic. If the defect card

is to be continued the following additional means for bettering the results obtained should be adopted. The card and its use should be simplified, and then action looking toward its obligatory and uniform use by all railways in interchange service should be taken. The stub should be omitted. If it were possible to get the stubs filled out and forwarded, they would merely burden the mails and the offices. The reasons warranting omission of the stub also justify dropping from the card all matter pertaining to its use after the defect has been repaired. The size proposed is 4 in. by 2 1/4 in.

With all-air trains, a defect which prevents placing a certain car between other air brake cars, puts it back of the caboose. This advertises the defect on arrival at the next terminal, and as it must not go farther until repaired, there is now no use for the second card, as there was when the present M. C. B. card was designed. Where an existing defect does not require air pressure to locate it, such as one

practices, and the further fact that many accidents from lack of the right practices occur on roads with grades too light to include them under the term mountain or steep grade roads, amply justify the Air Brake Association's careful consideration of this subject.

As before implied, probably the greater danger is due to laxness in the daily enforcement of rules and instructions on this subject. Observance of these requires more forethought and co-operation on the part of engine and trainmen to reduce the time and labor for compliance; and even then the latter will be greater than by the easier but more dangerous ways. Familiarity with steep grades, and the many deviations from safe practices that can occur so generally without an accident following, tend constantly toward habits which, unless checked regularly, will eventually result in disaster. One of the most common and dangerous of these is failure to release and recharge the train brakes promptly after stopping on a grade, which should invariably be done whether or not the engine in control is to be cut off.

A general superintendent of a large road with several long and steep grades, expressed this matter well by the statement that it was necessary about every six months to instruct each superintendent having a steep grade, to report how well safety precautions against runaways were being observed, but not to do so until he had the trainmaster and the traveling engineer make a special investigation and report. He said that without this, a serious accident invariably occurred in time, and that its investigation disclosed chronic laxness as the cause.

The following definite instructions and recommendations are submitted on the subject of this paper:

As soon as a train is stopped on a grade, brakes should be released and recharged at once. If the engine from which brakes are being operated remains attached, and keeps the train charged, as it then should, it may be held with the independent brakes; that is, by keeping the independent or the straight air brake valve in application position. An exception is where the engineer is to leave the engine. In this case enough hand brakes to alone hold the train should be applied. This should be proved by having all automatic and independent brakes off and, if the compressor may be kept running, then the independent brake should be re-applied and its brake valve handle left in application position.

If the engine from which the train brakes are being operated is to be cut off, enough hand brakes to alone hold the train, should be applied, but the trainmen should not commence to apply them until the automatic brakes are released. Where retaining valves are in use, none need be turned down, but no hand brakes should be applied until one minute after train brake release is begun.

Hand brakes used to hold cars or a train on a grade should be applied at the down-grade or lower end, thereby assuring against any car starting if uncoupled. All slack should be in, against the applied hand brakes, as well as all automatic brakes off (see previous exception about retaining valves) before cutting off an engine.

If, with the engine in control of the train cut off, another engine is to be detached, as a helper or pusher, its engineer should first cut in, release and recharge the train brakes, then release the independent brake so as to be certain the train will stand after the engine is cut off. While remaining with the train the independent brake should be kept applied on each of any such other engines.

With a descending train, the final reduction to bunch the slack, as the stop is being completed, should be followed, during the wait of one minute after release is begun before commencing to apply hand brakes (at the head end), by reversing and pushing the slack in as much more as possible, then holding the train with the independent brake while the hand brakes are being applied.

Suggested Revision of M. C. B. Air Brake Defect Card

with either the hand brake or the foundation brake, it is plainly undesirable to elaborate the card by specifying the various points where such defects commonly develop. The revised card submitted is here illustrated.

Discussion

Practically all who discussed the paper agreed that the defect card gave valuable information, but that considerable difficulty was found in getting train men to use them. There was a marked difference of opinion regarding the advisability of eliminating the stubs. The association adopted a motion recommending the adoption of the air brake defect card revised as suggested in the paper, the use of this card to be confined to train men and inspectors in departure yards.

Holding Standing Freight Trains and Cars on Grades

By R. J. Watters

Assistant Air Brake Inspector, Northern Pacific

While many, if not most roads with steep grades have recognized the possible great dangers incident to holding standing trains and cars on grades, and have generally issued rules or instructions to guard against such dangers, yet the fact that even on such roads there is a strong tendency, on the part of some officials as well as of the men in the train service, to gravitate toward easier and more dangerous

With an ascending train, that the slack is in before cutting off should be insured by allowing it to drop back gradually, with train brakes off, until the train will stand with no aid from the engine in control. It should be held by hand brakes applied at the rear, aided by the independent brake of each other engine in the train.

If a break-in-two, or burst hose occurs on a grade immediately apply more than enough hand brakes to alone hold the train until its brakes are again recharged. If it is a descending train, and a coupling is damaged that will take some time to repair, and if the portion of the train with the engine (ahead) can be backed so as to couple the detached hose, it should be done and the train kept recharged during any necessary wait while obtaining a repair part, as a knuckle or pin, or if a delay must ensue before putting the damaged car elsewhere, as where this occurs where the car may be switched out or to the rear end.

It should be noted that the air brakes are off before applying hand brakes on cars set out on a grade, and on level track as well, sufficient to hold them. It is not necessary to bleed the air from auxiliary reservoirs of cars so set out as long as the air brakes are off when the hand brakes are applied. In addition to the foregoing any rules regarding blocking cars should be complied with. Hand brakes applied when the car air brakes are set, may result in broken chains when the air brakes leak off, especially dangerous with one or two cars. Even where this exceptional failure does not occur, they will often be so difficult to release as to necessitate the delay and waste of air required to apply the air brakes to aid in releasing them.

### Instructions on Freight Car Brake Maintenance

A paper giving detailed instructions for the maintenance of freight brake equipment was presented by Mark Purcell (Northern Pacific). The need for clear and definite instructions in printed form was shown by the tests of cars shortly after cleaning, which demonstrated that 21.3 per cent of the brakes cleaned were ineffective within one month. Two years of special inspection and instruction work reduced the percentage to 8.8 which still left a big opportunity for improvement. The need for detailed instruction is particularly urgent at the present time because of the large number of inexperienced men in the air brake department.

To avoid unnecessary switching and loss of car service, work should be done well when the cars are sent to the repair track and every opportunity taken to ascertain the condition of the brakes when on the repair track, house track and transfer track. The installation of air lines at such points was advocated as a means of reducing the cost of brake maintenance, increasing car efficiency and expediting train movement.

This completes the report of the proceedings up to the time of going to press. The remainder will appear in next week's issue.

### Exhibitors at the Air Brake Convention

An organization of manufacturers of air brake and accessories, for supervising the exhibits in connection with conventions of air brake associations, was formed at a meeting held in the Hotel Sherman, Chicago, May 7. At this meeting a constitution and by-laws were adopted and the name, Air Brake Appliance Association, chosen. The following officers were elected: Chairman, J. J. Cizek, The Leslie Company; secretary-treasurer, F. W. Venton, Crane Company. Members of the executive committee for three years: J. F. Gettrust, Ashton Valve Company; J. C. Younglove, H. W. Johns-Manville Company; J. D. Wright, Westinghouse Air Brake Company. Members of the committee for two years: F. W. Venton, Crane Company; J. H. Dennis,

New York & New Jersey Lubricant Company; L. H. Snyder, Joseph Dixon Crucible Company. Members of the executive committee for one year: J. J. Cizek, The Leslie Company; M. S. Brewster, U. S. Metallic Packing Company; D. S. Prosser, U. S. Rubber Company.

The companies exhibiting devices at the Air Brake Association convention this year, together with a list of their representatives, are given below:

- Anchor Packing Company, Chicago.—Packing. Represented by John Landreth.
- Ashton Valve Company, Boston, Mass.—Gages, gage testers and safety valves, portable boiler test pump, inspectors' testing and proving outfit. Represented by J. W. Motherwell and J. F. Gettrust.
- Jarco Manufacturing Company, Chicago, Ill.—Metallic engine-tender air, steam and water connections, air reservoir joint connections, metallic car steam heat connections, smoke box blower fitting. Represented by F. N. Hard and C. L. Mellor.
- Broschart Threadless Pipe Coupling Company, Trenton, Mo.—Emergency train-line repair coupling.
- Chicago Railway Equipment Company, Chicago, Ill.—Brake beam supports. Represented by E. G. Busse and E. A. LeBeau.
- Detroit Lubricator Company, Detroit, Mich.—Lubricators and flange oiler. Represented by A. G. Machesney.
- Dixon Crucible Company, Joseph, Jersey City, N. J.—Graphite and graphite products for railroad service. Represented by L. H. Snyder and F. R. Brandon.
- Edna Brass Manufacturing Company, Cincinnati, Ohio.—Lubricators, injectors and boiler checks. Represented by E. O. Corey and H. A. Glenn.
- Garlock Packing Company, Palmyra, N. Y.—Air brake gaskets, air pump throttle, cab cock and reverse gear packing and spiral packing. Represented by W. G. Cook.
- Gould Coupler Company, New York City.—Gould universal automatic brake slack adjuster. Represented by William H. Sauvage, W. F. Richards, George R. Berger and William Garstang.
- Johns-Manville Company, H. W., New York.—Air pump, throttle and brake cylinder packing, expander rings and slack adjuster. Represented by J. E. Meek, C. E. Murphv, Fred Horne, G. Christenson, L. S. Wilbur, J. C. Younglove, D. L. Jennings, P. C. Jacobs, E. H. Willard and P. R. Austin.
- Leslie Company, The, Lyndhurst, N. J.—Steam heat regulators and removable injector coupling nuts. Represented by S. I. Leslie and J. J. Cizek.
- Nathan Manufacturing Company, New York.—Injectors, lubricators, boiler check, gage cocks, non-lifting coal sprinkler. Represented by Otto West, W. E. Brumble, J. G. Arn and Richard Welch.
- New York & New Jersey Lubricant Company, New York.—Non-fluid oil brake cylinder lubricant and N. F. O. triple valve lubricant. Represented by J. H. Bennis and F. J. Barnes.
- New York Belting & Packing Company, New York.—Air brake and air signal hose, air tool hose, car heating and tender hose, gaskets, air coupling, packing rings, rubber gaskets, air pump packing, rubber belting, etc. Represented by L. F. Partill.
- Ohio Injector Company, Chicago, Ill.—U. S. Standard injector, Chicago non-lifting injector, Ohio injector, Chicago lubricator, Chicago flange oiler, Chicago automatic drifting valve, Ohio water glass protector, Ohio boiler checks and Ohio feed hose strainer. Represented by A. C. Beckwith.
- Simmons-Boardman Publishing Company, New York.—Railway Age and Railway Mechanical Engineer. Represented by A. F. Stuebling and J. M. Rutherford.
- Traction Lubricating Company, Chicago, Ill.—Air brake lubricant. Represented by D. W. Kimball.
- U. S. Metallic Packing Company, Philadelphia, Pa.—King type air pump packing. Represented by M. B. Brewster and H. E. Hyslop.
- United States Rubber Company, New York.—Mechanical Goods Division. Air brake hose, pneumatic tool hose, gaskets and packings. Represented by C. S. Prosser.
- Westinghouse Air Brake Company, Pittsburgh, Pa.—M. C. B. hose coupling gages and hose coupling gasket gages, individual car testing device, air brake cleaning and testing tools and devices, triple valve test rack, brake pipe vent valve, automatic brake valve with collapsible equalizing piston, M. C. B. standard hose coupling packing ring gage, shipping caps for triple valves, auxiliary devices governor. Represented by J. B. Wright, F. H. Parke, A. L. Berghane, G. B. Pierce, F. M. Nellis, E. H. Dewson, H. H. Burns, F. B. Johnson, J. S. Y. Fraiche, E. Weaver, B. F. Key, G. A. Stenson, A. G. Houston, R. E. Miller, W. M. Sleeth, C. J. Olmstead, L. M. Carlton, L. Wilcox, C. H. Larimer, E. W. Davis, F. W. Nagle, T. L. Burton, A. B. Brown, C. E. Rowley, H. L. Cusic, G. W. Wildon, C. C. Farmer, F. B. Farmer, H. A. Wahlert, C. D. Foltz, V. Villette, J. D. Siegrist.

The director general had received up to May 3 the following reports regarding the progress of the Victory Loan among employees of federal operated railroads:

Region	Employees on roll	Employees subscribing	Amount of subscriptions	Per cent of employees subscribing
Northwestern	251,599	164,270	\$16,160,150	65.29
Southern	235,263	69,587	6,307,000	26.14
Southwestern	177,321	84,786	8,435,800	47.8
Peachontas	51,334	15,986	1,499,150	31.14
Central Western	305,057	180,800	6,708,900	59.3
Allegheny	382,434	184,939	14,878,100	48.37

<b>Total</b>	.....	.....	<b>\$85,872,900</b>	.....

# General News Department

William Howard Taft, speaking before the Hamilton Club, at Chicago, on Wednesday last, called on the Republican party to make a party issue of the return of the railroads to private ownership.

The Michigan East & West Railroad, which is now operated under a court injunction restraining its owners from dismantling the road, evidently will have to go before the Michigan State Railroad Commission to get leave to expire. The road was sold under foreclosure. Officers of the state, understanding it to have been sold as a "going concern" exercised their authority to prevent the buyer from taking up the rails. The line of road is 72 miles long from Manistee, eastward to Marion.

Governor Lowden, of Illinois, this week sent a message to the Legislature asking for the appointment of a joint committee to investigate charges that representatives of the Pullman Company had approached members of the state board of equalization on matters relating to assessments of the Pullman Company's property. M. H. Malone, president of the board of equalization had declared that members had been threatened with the loss of their positions if the Pullman Company's assessment should be increased. Resolutions in accordance with the governor's wish were passed by both Senate and House. Governor Lowden, formerly a director of the Pullman Company, resigned his directorship when elected governor.

## Western Railway Club

The annual meeting of this club will be held on May 19 at the Hotel Sherman, Chicago. The usual dinner preceding the meeting will be served in the Italian Room at 6:30. The meeting will be held in the Louis XVI Room at eight and there will be an address by R. A. White on international problems.

## Accounting Officers' Association

The Railway Accounting Officers' Association will hold its 31st annual meeting at the Commodore Hotel, New York City, on Wednesday, June 11. C. A. Prouty, director of the division of accounting, United States Railroad Administration, is expected to be present. Members should make their hotel reservations as far in advance as possible; \$2.50 to \$4 for single room with bath, and \$4 to \$6 per day for double rooms with bath.

## American Society for Testing Materials Convention

The American Society for Testing Materials will hold its twenty-second annual meeting at the Hotel Traymore, Atlantic City, N. J., on June 24, 25, 26 and 27. Among the features of special interest to railway men as outlined in the tentative program are a session on preservative coatings, lubricants and containers on Tuesday afternoon; a session on steel and wrought iron on Wednesday forenoon; one on Wednesday evening on corrosion and magnetic analysis, and one on concrete and gypsum, including the report of the committee on reinforced concrete, on Friday afternoon. The convention will close with a joint session on cement and concrete with the American Concrete Institute on Friday evening.

## Pacific Railway Club

At the annual meeting of the Pacific Railway Club, held at San Francisco, Cal., on March 13, the following officers were elected: president, C. E. Norton, chief despatcher of the Southern Pacific; first vice-president, Dennistoun Wood, assistant mechanical engineer, Southern Pacific; second vice-president, George H. Harris, general superintendent, San

Francisco-Oakland Terminal Company, and treasurer, G. H. Baker, Atchison, Topeka & Santa Fe.

O. S. Corbin, engineman on the Southern Pacific, addressed the meeting on the subject of "The Prevention of Accidents at Highway Grade Crossings," treating the matter from the standpoint of the engineman. Eugene H. Baker and Mr. Dembow also spoke on the same subject. Following a discussion on this subject the meeting was addressed by Chaplain John T. Kendall of the 44th Infantry.

## Reception for the Thirteenth Engineers

Arrangements have been completed for the reception at Chicago next week of the 13th (Railway) Engineers. This regiment was recruited in Chicago immediately after declaration of war from the Chicago Great Western, the Chicago, Milwaukee & St. Paul, the Chicago & North Western, the Chicago, Rock Island & Pacific, the Illinois Central and the Atchison, Topeka & Santa Fe. The regiment is expected to arrive in Chicago on Monday morning, May 11. Breakfast will be served the men at the Coliseum. At 11 o'clock they will parade through the loop district and then will have luncheon at one of the large hotels. At four o'clock in the afternoon the regiment is scheduled to leave for Camp Grant, Rockford, Ill., for demobilization. In the reviewing party will be the federal managers of the six roads having companies in the regiment and Major General Leonard Wood. Arrangements have been completed for giving railroad employees, so far as possible, a holiday in order to welcome the soldiers.

## Railroad Employees' Subscriptions for Victory Bonds

The director general has received up to May 7 the following reports regarding the progress of the Victory Loan among the men and women employed by the United States Railroad Administration:

Region	Em- ployees on roll	Employees subscribing	Amount sub- scribing	Per cent of employees subscribing
Northwestern	248,588	180,013	\$17,664,900	72.41
Southern	264,796	89,804	8,337,000	33.91
Southwestern	177,326	96,464	9,775,900	54.4
Poahontas	51,334	20,489	1,910,000	39.91
Central Western	307,699	197,676	18,899,250	64.2
Allegheny	382,780	214,894	17,431,500	56.14
Eastern	427,909	251,535	23,096,650	58.
Mississippi-Warrior (water lines)	.....	.....	9,600	...
Pullman Lines	21,061	16,355	1,308,450	78.
N. Y. Canals	34	33	4,850	98.
Coastwise S. S.	.....	1,918	126,850	.....
Central Adm'n.	1,242	1,242	500,050	100.
Total	.....	.....	\$99,065,000	.....

## Luncheon to Thornton and McCrea

Ralph Peters, president of the Long Island Railroad, New York city, on Wednesday of this week gave an informal luncheon in honor of Major General Sir Henry W. Thornton and Colonel J. A. McCrea, both lately returned from France. The list of guests included the following: William A. Nash, chairman of the board of directors of the Corn Exchange Bank; Walter E. Frew, president of the Corn Exchange Bank; George A. Gaston, of Gaston, Williams & Wigmore; Lewis L. Clarke, president of the American Exchange National Bank; Austin B. Fletcher; Colonel George T. Slade; John Markle; Colonel A. L. Whiting, 13th Engineers; Thomas DeWitt Cuyler, chairman of the board of directors of the Pennsylvania Railroad; Samuel Rea president Henry Tatnall vice-president and A. J. County vice-president, Pennsylvania Railroad; F. D. Underwood, president, Erie Railroad; W. H. Truesdale, president, Delaware, Lackawanna & Western; L. F. Loree, president, Delaware & Hudson Company; Howard Elliott, president, Northern Pacific; W. G. Besler, president, Central of New Jersey; H. F. Gunion, publisher of the Brooklyn Daily Eagle; W. A. Goodman, Jr.; A. R. Parsons, of Douglas L. Elliman & Co. and Lieut. Ralph Peters, Jr.

### May Day in Denver

Approximately 6,000 railroad shop employees held a mass meeting in Denver, Colorado, on May 1, and adopted resolutions protesting against the efforts of "certain moneyed interests to force private ownership" and favoring a nationwide strike in the event of their success. Resolutions were also passed disapproving of the imprisonment of Eugene V. Debs and extending cordial greetings to "our Russian fellow workers and wishing them Godspeed in their successful venture and epoch making revolution." Other resolutions adopted called for the immediate withdrawal of American troops from Russia, censured the "undemocratic methods being used by our national officers in connection with the new wage schedule," and protested against unemployment among railroad men.

The meeting was attended by employees of the shops of the Denver & Rio Grande, the Colorado & Southern, the Union Pacific, the Chicago, Burlington & Quincy and the Denver & Salt Lake. All of the shops of these roads were closed for the afternoon. A committee in each shop asked the foreman for a half holiday for the May day celebration and the holiday was granted in each case. The shop workers contended that the government had failed to make a satisfactory agreement with them, and declared that, in violation of its pledge to keep all railway shop hands working, 60 per cent of the employees in one shop had been laid off. Inquiries were made if the present Victory loan is to be used to wage war on Russia. The resolutions as adopted were ordered printed and distributed broadcast over the country.

### Record of the Engineer Corps

A resume of the work of the Engineer Corps of the American Expeditionary Forces has been issued by the office of the chief engineer of the A. E. F. and is included in Engineering Recruiting Circular No. 2 used by army recruiting officers in their campaign for volunteers. The circular states that there were 174,000 engineer troops in the service. Part of the work done by the railway engineering units in this force consisted of the construction of 947 miles of standard gage track and a six mile cut-off at Nevers requiring a bridge across the Loire river, 2,190 ft. long. This latter project had been described in the *Railway Age*.

Among the accomplishments of this force are listed many records in the construction and operation of military railroads. The light railways of the American Expeditionary Forces handled to February 1, 860,652 tons of freight, of which 166,202 tons was ammunition. In one week the ammunition moved amounted to 10,600 tons, and in five nights 23,135 soldiers were carried on these railways. The daily net tonnage handled in October, 1918, was 8,100 tons. In one week 10,700 tons of rations were handled. At the time of the signing of the armistice 2,240 kilometers (1,392 miles) of light railway were in operation, of which 1,740 kilometers had been taken from the Germans, the balance being newly constructed or rebuilt. On November 11, 165 locomotives and 1,695 cars were available for use. In five hours 135 men laid 14,200 ft. of light railway track. Among the shops erected were 10 buildings at Abainville, with a total floor area of 70,000 sq. ft. Over 2,300 cars have been erected and 140 locomotives have been repaired in these shops.

In a letter to Major General William C. Langfitt, chief engineer, General John J. Pershing, expressing his appreciation of the work of the engineer department, said:

"The various units attached to combat troops distinguished themselves at all times in the assistance which they rendered. The Division of Construction and Forestry, with limited resources at its disposal and under conditions of extreme severity, more than met the many demands made upon it. The Department of Light Railways and Roads furnished the indispensable link between the railheads and the front lines for the transportation of troops and supplies, and for the evacuation of sick and wounded. Its record in the construction and operation of light railways and roads has seldom been equalled. The many other services of the Engineer Department, connected with the acquisition and distribution of engineer supplies, particularly those needed for combat operations, were so conducted that our forces never lacked for any essential.

"The Engineer Department has made a proud record for itself, and it gives me pleasure to express to you my sincere thanks and admiration, and that of your comrades of the American Expeditionary Forces, for its splendid achievements."

### Fuel Association Convention

Following is the program for the annual convention of the International Railway Fuel Association, which will be held at the Hotel Sherman, Chicago, May 19-22:

#### MONDAY, MAY 19

Address by the president, L. R. Pyle, supervisor of fuel conservation, Central Western region, Railroad Administration.  
Report of Committee on Pulverized Fuel, chairman, W. J. Bohan, assistant mechanical superintendent, Northern Pacific.  
Teamwork of Engineers and Firemen, by M. A. Daly, fuel supervisor, Northern Pacific.  
Locomotive Fuel Losses at Terminals, by J. M. Nicholson, fuel supervisor, Atchison, Topeka & Santa Fe.

#### TUESDAY, MAY 20

Responsibility of a General Operating Officer and What He Can Do to Promote Fuel Economy, by F. H. Hamill, general superintendent, Union Pacific.  
Storage of Coal by Railroads During 1918, by Professor H. H. Stock, professor railway engineering, University of Illinois.  
Fuel Losses Due to Distorted Valve Gears, by J. W. Hardy, supervisor, Fuel Conservation Section, Railroad Administration.  
Dirt in Coal, by L. J. Joffray, general fuel inspector, Illinois Central.  
Tests of Locomotives on Russian Railways, by I. B. Lebedeff, assistant chief of locomotive department, Russian Mission of Ways of Communication.  
Burning Oil on Locomotives, by William L. Haek, district road foreman of engines, Southern Pacific.  
Equated Tonnage, by R. N. Begien, general manager, Baltimore & Ohio Western Lines.
