The rapid growth of the Association in the last two years has introduced no small problem for the Committee on

#### Problem of Committee Personnel

Personnel of Committees to provide for participation in the work by as large a proportion of the membership as possible. With only 23 regular committees and an association membership nearing 2,000, there are obviously not enough places on the committees as now organized to accommodate all who may wish to serve. Just how to overcome this difficulty is a problem for which various solutions have been suggested. One plan has been to increase the size of the committees and provide for greater independence of action by sub-committees. Another proposal is that made by President Safford in his address yesterday morning whereby members of the Association would be made "corresponding members" of certain committees, the idea being primarily to recruit the assistance of those members located in the more distant parts of the continent who are precluded from attendance at committee meetings. The idea of rotation in membership of committees is subject to the criticism that many of the members are peculiarly valuable to the committees on which they serve, because their long service has given them an intimate knowledge of the past work of the committees

and the problems which they have previously encountered. With committee memberships at a definite premium, one thing is certain—there is no room for dead wood. Such a thing as vested rights to committee membership solely on the ground of seniority or long tenure of service is not to be thought of. The new members of the Association must have an opportunity to serve.

Engineers are little concerned with orators or oratory. They seem to pride themselves on their ability to resist the wiles of honeyed speech or spirit-swaying declamations. Theirs is a vocation that deals in cold facts which call for quiet discussion around a conference table rather than eloquence from the rostrum. But is this not sometimes carried too far? Some A. R. E. A. members seem to forget that the annual convention is no longer a conference of a small group of engineers with kindred interests. Rather it approaches the proportions of a congress. In other words, the conversational tone of voice which suffices for speech before a small gathering simply will not "get by" before crowds the size of those attending the sessions in the Florentine room. Speak up!

It is unfortunate that the line is so clearly drawn between the engineering and the motive power departments.

#### The Track and the Locomotive

The track and the bridges are so intimately related to locomotive and car design that they should all be considered in a large way as a single problem, instead of being almost entirely separated. Why, for instance, should the mechanical department consider the design of the locomotive almost purely from the standpoint of operation and cost of maintenance of the locomotive, when a larger expenditure for its first cost and facilities for maintenance will be offset many times by decreased damage to the track and bridges? Is the engineer officer advising the mechanical department of the vital necessity for reducing the dynamic augment to a minimum by showing clearly the extent of the damage which is now being done because of excessive dynamic augment?

One feature of this year's convention is to be noted in the large number of new committee chairmen—ten in all—

#### New Committee Chairmen

only one of whom owes his appointment to the organization of a new committee, that of shops and locomotive terminals. This is a much greater change in committee heads than has been observed in any recent year. At the convention in 1920 only four regular committees had new chairmen; in 1919 there were six new chairmen; while of the six new chairmen in 1918 two headed newly formed committees. Whatever the motives responsible for the greater

change in committee chairmen this year it is believed that this is a trend in the right direction. Evidence of high grade leadership should be recognized and utilized to the fullest possible measure. At the same time a certain degree of rotation in chairmanship will serve to stimulate interest and effort on the part of the rank and file. This does not mean that it is at all desirable to place any arbitrary limits on the tenure of office of committee chairmen. The really important matter is to insure that each committee is under the direction of a leader who is qualified by experience, ability and temperament to accomplish the best results.

The fact that the American Railway Engineering Association received over 500 new members during the past year, a larger number than in any previous year, is an indication of the inherent strength of the Association in the trying times through which we are now passing. While this large increase was attained as the result of a systematic campaign for members, the fact that the members were secured testifies strongly to the high esteem in which railway engineers hold the Association. The American Railway Engineering Association is unique among technical organizations in the way in which it conducts its work, and in the solidarity of its work. The result of its 23 years of activity are condensed in the Manual of Recommended Practice, aggregating approximately 1,000 pages. With the Association now comprising nearly 2,000 members, its influence is increasing accordingly.

Attention has been called repeatedly to the exceedingly poor ventilation in the convention room. This condition was exhibited strikingly yesterday, when every available chair was filled throughout almost the entire day. The air was so foul that a number of members were constrained to leave the room. The effect of this condition was also strikingly evidenced by the unusually limited discussion. Owing to the oppressive conditions in the room a number of the reports were not received with the interest that their contents justified. Thus the report of the Track Committee, which contained a number of conclusions which were the occasion of spirited discussion and controversy within the committee, were received without comment by the Association, considerably to the surprise of the members of the committee. The convention room has many admirable advantages, prominent among which is its lack of outside exposure to the noise of the city. However, this condition makes even more necessary the installation of adequate ventilation, for it is not possible to secure relief by opening windows.

## Record Convention Attendance

THE ATTENDANCE AT THE CONVENTION of the American Railway Engineering Association yesterday was the largest in history and the discussion of committee reports was characterized by great earnestness. These facts indicate that the engineering and maintenance officers of the railways realize that present conditions demand the most profound study and the hardest kind of work if efficiency and economy of operation are ever to be restored. The present is an opportune time to emphasize the fact that the greatest efficiency and economy in operation cannot be obtained by the adoption of tem-

porary drastic expedients to meet emergencies, but only by thorough study and planning and by intensive efforts over a period of long years to carry out the plans made. The largest economies ever effected have been the result of vast capital expenditures made to reduce grades, strengthen tracks, lengthen passing tracks and enlarge yards to enable the railways to operate more powerful locomotives and larger trains and thus handle traffic in larger units and at lower labor costs per ton and per passenger carried. There is a natural tendency in periods of stress such as the present to cease working on plans which will require millions of investment and years of time to carry out and concentrate attention and effort on meeting immediate conditions, but in the long run the best results are obtained by steadily continuing the effort to carry out well-conceived plans, and to subordinate their execution to the use of immediate expedients only to such an extent as is absolutely necessary. A very large and important part of the scientific planning for future railway development and future increases in efficiency is entrusted to the higher engineering officers, and it is gratifying to find that even in an acute period such as the present they are disposed to take active part in the study and discussion of the fundamental problems. One of the main causes of the troubles of the railways today is that since this country entered the war in 1917 the making and carrying out of far-reaching plans of improvement has been seriously interfered with. If important increases in the efficiency and economy of operation are to be resumed, the making and carrying out of far-reaching plans of improvement must be resumed, and it is essential to the making of such plans that all the problems involved shall first be carefully studied and thoroughly discussed.

## Today's Program

The program for today's sessions of the American Railway Engineering Association is as follows:

Committee No. IX.	Signs, Fences and Crossings.....	Bulletin 232
Committee No. III.	Ties .....	Bulletin 232
Committee No. XV.	Iron and Steel Structures.....	Bulletin 232
Committee No. XI11.	Water Service.....	Bulletin 232
Committee No. XXII.	Economics of Railway Labor.....	Bulletin 231
Committee No. XXI.	Economics of Railway Operation .....	Bulletin 234
Committee No. XVI.	Economics of Railway Location .....	Bulletin 233
Committee No. XXIII.	Shops and Locomotive Terminals .....	Bulletin 233
Committee No. VI.	Buildings .....	Bulletin 235
Annual dinner at 6:30 p. m.		

## Changes in Engineering Organization on the New York Central Lines West

Newspaper reports concerning reductions in the official personnel of the New York Central have excited considerable interest among those attending the convention, but unfortunately these items were so incomplete as to give little real information concerning the actual changes. Inquiry has shown that these changes as regards the New York Central Lines West, in so far as they affect the higher officers of the engineering department are not nearly so drastic as might have been assumed from the newspaper accounts. These changes were as follows: R. O. Rote, assistant chief engineer, will take over the duties of H. B. Reinsagen, engineer maintenance of way, whose position has been abolished. Mr. Reinsagen has been

appointed principal assistant engineer, succeeding A. M. Currier, and Mr. Currier has been made engineer grade separation, succeeding C. F. Mayer, who has been assigned to other duties.

### Car Loadings Increase

WASHINGTON, D. C., March 15, 1921.

Evidences of increased traffic on the railways are afforded by the weekly car loading statement of the Car Service Division of the Interstate Commerce Commission, showing that the number of cars loaded with revenue freight for the week ending March 5 was 712,822, an increase of 54,000 as compared with the preceding week. This is the first week this year to show any considerable increase in car loading and the loadings for this week are larger than for the corresponding week during the business depression of 1919. The loading of grain and grain products, of merchandise and of miscellaneous freight was greater than for any previous week this year.

### Purdue Luncheon Today

Purdue University men will lunch today at the University Club, corner Michigan and Monroe, at 12:45 p. m. All Purdue men are urged to report at the University Club at that time.

### More Winslow Bill Payments

WASHINGTON, D. C., March 15, 1921.

The Interstate Commerce Commission has issued a certificate for partial payments on account of the guarantee to the Trans-Mississippi Terminal Railroad for \$110,000, the Chicago, Rock Island & Pacific for \$6,000,000, the Chicago Great Western for \$500,000, the Chicago, Indianapolis & Louisville \$400,000, the Chicago & Northwestern \$12,000,000, and Gulf, Mobile & Northern \$50,000. The commission has also issued a certificate in final settlement for its deficit during federal control to the Western Allegheny amounting to \$114,000. The returns to the Interstate Commerce Commission by 43 Class I railroads show a net operating deficit of \$3,120,000.

### Correction of an Error

In the story in the Daily of yesterday entitled "The Railroad Labor Board Subpoenas Railroad Officers" the statement was made that a subpoena was issued for W. T. Tyler, vice-president of the Northern Pacific. This was a mistake. The subpoena was issued for Thomas DeWitt Cuyler, chairman of the Association of Railway Executives. The other persons subpoenaed were W. W. Atterbury, vice-president of the Pennsylvania Railroad; C. R. Gray, president of the Union Pacific, and Robert S. Binkerd, assistant to the chairman of the Association of Railway Executives.

### B. & L. E. Supervisors at Coliseum

The Bessemer & Lake Erie arranged for all of its track supervisors to spend Monday at the Coliseum. The party left Pittsburgh Sunday morning, traveling by daylight to Chicago over the B. & O. and studying the standards of track maintenance of that road.

### The Bridge and Building

#### Executive Committee Meeting

The Executive Committee of the American Railway Bridge and Building Association and interested members will meet in the Congress hotel at 4:30 this afternoon to plan for the next convention, which will be held in New York in October.

### The A. W. P. A. Dinner

Over 50 members and friends of the American Wood Preservers' Association gathered at dinner at the Hotel Sherman last evening to discuss problems of interest to the wood preserving industry and to witness the presentation of the moving picture films which were taken on the recent trip of the members of that association to the Pacific coast to attend the convention at San Francisco in January.

### New Division Engineer on S. A. L.

W. D. Simpson has been appointed division engineer of the Florida division of the Seaboard Air Line at Tampa, Fla., succeeding B. Land, Jr., resigned.

### The Annual Dinner

W. A. Wallace, chairman of the sub-committee of the Arrangements Committee in charge of the annual dinner of the American Railway Engineering Association, urges those members planning to attend the dinner this evening to get their tickets promptly, for the reason that the Congress hotel management must be notified at noon. Tickets will be on sale in the lobby outside the convention hall. This dinner will be held in the Gold room at 6:30 p. m. The speakers will include John F. Wallace, consulting engineer, New York City, and formerly chief engineer and general manager of the Illinois Central and chief engineer of the Panama Canal; Dr. David Kinley, president of the University of Illinois, and the Honorable William Renwick Kiddell, Justice of the Supreme Court of Ontario, Can.

### Requisites of Train Control

The Joint Committee on Automatic Train Control has issued its circular No. 2 on the functions and requisites of train control systems so far as these have been developed to date.

### Signal Business Picking Up

The Missouri Pacific has reopened bids for the necessary material to construct a mechanical interlocking plant where its line crosses the St. Louis-San Francisco at Aurora, Mo. Bids were originally asked for a 40-lever frame mechanical machine at this point, but due to track changes made on the Frisco it was necessary to reopen the bid. Power signals will be used on the Frisco in connection with its automatic signal system.

### Burlington Officers Meet

The Permanent Way committee of the Chicago, Burlington & Quincy and the Roadmasters' committee of the same railroad held meetings at the general offices of the Burlington in the city yesterday and Monday to discuss problems of the maintenance of way department.

### Senate Fails to Confirm Appointment of J. J. Esch

WASHINGTON, D. C., March 15, 1921.

The Senate failed yesterday to confirm the appointment of J. J. Esch as a member of the Interstate Commerce Commission because of the insistence of Senator LaFollette on his right to file a minority report to the action of the Committee on Interstate Commerce Commission, recommending the confirmation. This action on the part of Senator LaFollette will delay the confirmation of Mr. Esch until the extra session of Congress which is called for April 11. The appointment of M. W. Potter as a member of the commission was confirmed on Saturday, as announced in yesterday morning's daily.

One of the familiar faces which is missing from the convention this year is that of A. R. Fugina, signal engineer of the Louisville & Nashville, who is detained at home recovering from a severe illness.

S. A. Jordan, engineer maintenance of way of the Baltimore & Ohio, Lines West, finds that there are some bright spots in railroading even when things look duller for because of that he has been able to attend the convention for the first time in two or three years.

Among the prominent railway supply men who are attending the exhibit of the National Railway Appliances Association for the first time is W. B. Lashar, president of the American Chain Company, Bridgeport, Conn. Mr. Lashar came to Chicago purposely to attend this exhibit.

The fact that Cuba possesses attractions as a winter resort for railway as well as railway supply men is shown by the fact that W. H. Hoyt, chief engineer of the Duluth, Missabe & Northern, is stopping over at the convention on his way home from a six weeks' trip to that island and Florida.

Herbert Deeming, formerly of the firm of Deeming and Endsley, who has been in the shipping business in New York City for over a year, has returned to Chicago and the railway supply business. Seen at the Coliseum yesterday, he expressed considerable pleasure at his return to the railway game.

The friends of M. J. Trees, vice-president of the Chicago Bridge & Iron Works, have watched with considerable envy the frequent business trips which Mr. Trees has made to Cuba during the past year. He has found it necessary to make no less than four such trips during 1920 and one trip since January 1.

Ralph T. Hatch, for the past 14 years connected with the National Malleable Castings Company, will join the forces of the American Chain Company when he will become general manager sales of the Reading Steel Casting Company, a subsidiary of the American Chain Company, with headquarters at Reading, Pa.

Edwin Gagel, chief engineer of the New York, New Haven & Hartford, was an interested attendant at the convention yesterday. This is the first time Mr. Gagel has attended a convention. Mr. Gagel is a new member of the Association, having joined during the past year. He is one of about 15 officers of the New Haven Railroad who are present.

H. T. Porter, chief engineer of the Bessemer & Lake Erie and an active worker on the Track Committee, was

present at the convention yesterday and participated in the presentation of the report of that committee. It was necessary for Mr. Porter to leave last evening for Washington to participate in negotiations incident to the settlement of claims rising out of federal control.

Colonel H. S. Crocker, acting secretary of the American Society of Civil Engineers, was an interested visitor at the convention yesterday morning. Colonel Crocker has been serving in this position for over a year pending the selection of a permanent secretary. He has recently asked to be relieved of these duties in order that he may resume his private practice. Colonel Crocker stopped only for the day while enroute to Denver to reopen his office.

E. B. Katte, chief engineer electric traction, New York Central, and a member of the Board of Directors of the A. R. E. A., is also chairman of the professional section on Railroads of the American Society of Mechanical Engineers. The spring meeting of the A. S. M. E. will be held in Chicago, May 23-26, and the Railway Section is arranging for a revision of the problems connected with the design and maintenance of large freight locomotives.

E. R. Lewis, editor of the Maintenance of Way Cyclopedias, and now office engineer of the Michigan Central, at Detroit, Mich., was a first day attendant at the convention. Mr. Lewis, on the completion of the cyclopedia, left for a trip to Panama and other points south, but we understand that he spent his entire vacation in Cuba, stating for his reason that he sprained his ankle and could go no further. It is not at all surprising that an American citizen would let his foot slip when in Cuba.

F. A. Poor, president of the P. & M. Company, returned on February 12 from a month's trip to England. He is a director in the P. & M. Company of England, Ltd., which handles the products of this company abroad. Mr. Poor reported that railway conditions abroad so far as he had opportunity to observe them are very bad. The railways of India, Australia and South America buy a large part of their equipment and supplies in England. The railway conditions in these countries, as indicated by the inquiries for equipment and supplies in London, are beginning to improve but still are very unsatisfactory. Sentiment abroad is that business conditions will not get good until the whole general financial condition has been cleared up and that it cannot be cleared up until a definite determination of reparation to be paid by Germany and the other central allies has been reached. Mr. Poor found that the competition of European manufacturers for railway equipment and supply business is becoming more energetic. This is especially true of the manufacturers of Germany and Belgium. The low rate of exchange and the prevailing low wages of labor, especially in Germany, are enabling Belgium and German manufacturers to produce iron and steel articles cheaper than they can be produced in the United States and other countries. He found that the prevailing wage in the iron and steel industry in Germany is about 300 marks a week which at the present rate of exchange is equivalent to about \$6 a week in American money. British manufacturers are not getting on their feet as rapidly as those of Germany because the iron and steel industry in Great Britain is so highly unionized that it has been impossible thus far for the manufacturers to get their costs down to a basis where they can meet the competition of the Germans.

The A. R. E. A. in Session Tuesday Afternoon

## American Railway Engineering Association Proceedings

Record Crowd at the Opening Session in the Florentine  
Room Yesterday Morning

ANY DOUBT AS TO the success of the twenty-second annual convention of the A. R. E. A. was definitely dispelled by the capacity of the crowd which was present at the opening session yesterday morning to hear the address of President H. R. Safford, assistant to the president of the Chicago, Burlington & Quincy. As the minutes of last year's meeting have been printed and distributed, their reading was dispensed with and the con-

vention passed immediately to the president's address. Following this the reports of the secretary and treasurer were presented, after which the Association began the consideration of the reports of committees.

Reports were presented by the committees on Signals and Interlocking, Ballast, Electricity, Stresses in Railroad Track, Track, and Rail. Reports on Standardization and Uniform General Contract Forms come up today.

### Address of President Safford

THIS ANNUAL MEETING MARKS the close of the twenty-second year of the life of the American Railway Engineering Association—practically a generation as human life is measured. In some ways, it would seem that we have just passed through a period which will mark a very definite generation in the history of railroads. This thought is suggested when we recall that at the end of the Association's twenty-first year we find the railroad industry, of which we are a part, at the threshold of a new era.

Many things point to this belief. The new Transportation act expresses a desire on the part of the public for private control with protective regulation, with expressed support of efficient and honest management and an earnest desire to restore confidence in the enterprise and credit to the structure.

The termination of federal control and the restoration of the properties to their owners coincident with the passage of the new Transportation Act seem to mark the close of a period when there was a noticeable and increasing tendency toward excessive and burdensome regulation, an increasing failure upon the part of the public fully to understand and appreciate the rail transportation structure and especially a failure to realize the interdependence and joint responsibility resting upon both the railroad and the user to create, support and maintain what the public most desires, namely, good transportation. A great change and I believe for the bet-

ter has taken place. New powers and responsibilities are assumed by lawfully created public bodies. A different attitude is observed on the part of the shipper and the traveller and new conditions also surround the details of operation affecting theories of development and expansion of existing properties and the promotion of new projects, which are vastly different from 21 years ago.

This Association in devoting its entire attention to railway construction, operation and maintenance will find its efforts and results measured by the same standards applied to the various phases of railway service and we must feel the same sense of responsibility in trying to perfect the studies of the service which are entrusted to us that is felt by the executive and financial heads if we are to do our part in making the business successful and of permanent existence as a private enterprise. Probably no industry felt as severely the impact and the continued stresses of the war. It seemed sometimes as if the structure would not survive the eccentric and unexpected strains for which it was not designed, but it has done so, and from the test will be developed new formulæ giving truer results in future study and the structure should be much more scientifically designed than ever before.

We are now passing through the severe and trying period of readjustment from the war strain and greater therefore is the need for intensive study of economic

problems and renewed efforts to direct controlling influences to a stabilization of the situation so that the industry may thrive and prosper as intended by the new legislation.

#### MEMBERSHIP INCREASES

A review of our own activities as an association for the past year seems quite in order and I turn first to the matter of membership. It has always been the policy to place a high premium upon quality of membership with the very definite goal of securing the highest degree of efficiency and the most finished product in the Manual. On the other hand the restrictions have not been pronounced in so far as departmental representation is concerned and encouragement has always been given to applications from officers in the transportation as well as from the construction and maintenance departments; this because the Association has endeavored to co-ordinate transportation, construction and maintenance of way in matters which jointly interested these several branches. I believe that this idea has done much to keep interest in the Association and accounts for the par excellence of its work.

The encouragement which has always been given by railway executives has made it attractive for members to join and work. We have probably inclined in the past too much toward the policy of allowing the individual to seek us and have made too little effort to interest the outsiders, and while it is possible always to go too far in adding members for numbers only, on the other hand we must not sit idly by and fail to keep apace with the natural growth in general railway organization and should not hesitate to show fully and aggressively to all interested in the business the benefit to come from membership.

There are a great many officers who are not, but should be, members and if the practical advantages are indicated to them they might become members. We have always disliked the idea of a spectacular and exciting campaign for membership, but last year a dignified but earnest effort was made to interest men, with the result that from January 27, 1920, to March 1, 1921, there were 514 additions to the membership.

There were also deaths of some members which are recorded with deep regret, men who gave a great deal of earnest effort to the work and whose counsel is missed:

O. W. Albee	J. W. Wilkinson
Sir James B. Ball	Paul L. Wolfel
W. A. Cattell	R. C. Sattley
P. S. Hildreth	E. S. Draper
A. S. Markley	W. H. Moore
John G. Shillinger	A. T. Tomlinson
T. H. Hickey	L. J. Putnam
William Travers	G. W. Vaughan
T. H. Sears	E. V. Smith

#### FINANCIAL

The report of the secretary and treasurer shows a very satisfactory situation for the year and reflects great credit upon these officers as well as the Board Committee in charge of Finance. In the face of continual increase in costs of printing especially, and perhaps to a less extent in other things, we have been able to carry on without any increase in dues and without drawing upon our reserves. It is hoped this may continue, although until prices become more nearly normal, it may not be expected that our assets will increase as rapidly as in past years.

It has been the policy not to try to build up a large investment, but to invest the surplus in such a manner as to be in position to meet any emergency which may re-

quire temporary assistance in meeting unusual demands. Our invested funds are assisting in meeting annual expenses from interest bearing securities. The time may come when some use may be made of these funds in their application to research work and this possibility should be kept in mind, as I believe that should be the ultimate desire.

It is proper here to allude to the several kinds of assistance from outside agencies in promoting research work. The splendid results which have come from these special lines of study speak for themselves and this assistance is appreciated. I refer particularly to the work of the Committee on Stresses in Track and the Committee on Rail. I would especially commend to the members the published result of the last two years from these committees. It is not a waste of time to read them and give this committee all the support possible by way of suggestion.

#### COMMITTEE PERSONNEL

The increasing membership offers new problems in arranging the personnel of committees to obtain broad representation and effective work. It obviously is impracticable to put all the members on committees all the time, but the desirable thing is to encourage all members to have some committee service. There are always differences in the degree of support which members will give to committee work and committees should always be composed of good workers.

During the past year the Committee of the Board on Personnel has made extraordinary efforts to work out the problem and has made progress in getting changes in personnel, but they need assistance from you as individuals both as to offers of service and suggestion of preferential service. My own idea is that members should desire to obtain a varied committee service and occasionally shift from committee to committee to broaden their experience and to prevent autocracy in committee policy. A varied committee service is a splendid opportunity for the young man to grow in his profession beyond the confines or limited activities of his own particular branch of the service.

Committees can be too large and fail to function well on that account, but they can be too small as well, and can be composed of too limited a representation geographically and can be so greatly spread as to fail to obtain good attendance. Committee organization is a very important matter, probably the most important of all, because that is the means by which our work is done.

I would urgently recommend the establishment of joint conference between the Committee of the Board on Personnel and the various committee chairmen, both at the beginning and end of the year, to perfect the committee organization. This seems to be the most effective way of developing the fitness of members for committee service and to co-ordinate the work of the several committees whose work is related.

To afford opportunities to a larger number of members to have a share in committee work, it has been proposed to establish what might be termed "Corresponding Members" of committees. Many members of the Association are so situated geographically, or for other reasons, as to make attendance at committee meetings impracticable. Such members could nevertheless contribute materially to the value of committee work by correspondence. The Board Committee on Personnel is giving the suggestion further thought.

#### COMMITTEE SERVICE

Here is an important phase of our work, two features of which I would specially mention: (1) Co-ordinat-

ing the work of different committees whose subjects are inter-related, and (2) character of Reports.

The first seems to become increasingly important as the subjects expand and one of the real difficult duties of the Board Committee on Outline of Work is to assign the subjects requiring co-ordination.

I believe one of the most effective means to assign this work is through a joint conference of the committee chairmen and the Board Committee on Outline of Work. This would systematize the work and obtain the benefits from conference in expression of views and will result in a clearer understanding as to what is wanted, and minimize duplication of effort.

The matter of character of reports is one which has caused concern to the Board on account of the rapidly increasing size of Committee Reports due to the natural expansion of the subjects and the increasing costs of reproduction. The thought I try to convey is to consider the material collected during the research period and see if there cannot be a curtailment of volume without sacrificing the value of the report.

I believe too we have come to the point of doing more experimental work by sub-committee organization and less dependence be placed upon personal viewpoint in majority expression without actual supporting data from organized demonstration or test. In this connection I want to suggest that we avoid too great a speed in trying to conclude research for the purpose of definite recommendation sometimes at a sacrifice of thoroughness. This is not said in criticism of past practice but to call attention to the increasing complication of the many questions before committee.

UNIVERSITY CO-OPERATION

During the year the Association was asked to send to the University of Illinois and Purdue University committees to look over their facilities and methods with the ultimate idea that we might give such assistance as we could in the further development of their courses. In accordance with that request such committees visited the universities and reported favorably upon their work and methods.

These invitations permit the opportunity I have anticipated for some time to offer the recommendation that the Association should make systematic effort to establish and extend contact with technical schools. This is desirable not only for the purposes which have brought about the relations with those with whom we have had co-operation in committee work, such as impact tests and stresses in track, but for the larger matters of university work in which we are interested as employers of engineers.

OFFER OF ASSISTANCE TO THE INTERSTATE COMMERCE COMMISSION IN ACCOUNTING MATTERS

Realizing the increasing need and importance of correlating engineering and accounting to the fullest degree in filling the requirements of the Interstate Commerce Commission, the Board of Direction has tendered to the commission the services of the Association in any manner or matter that may be within its power, which offer has

been most cordially and appreciatively received. The development of the federal valuation work has more prominently shown the interdependence of these departments in perfecting accounting accuracy and the securing of proper cost data for the engineer and operating man.

In particular the enforcement of Order No. 3 has advanced and emphasized this need and I am hopeful out of this offer of assistance may come some new and constructive service for our Association committees. Our work heretofore has been confined almost to a study of forms, but matters of joint interest to both departments are confronting us, not in trying to re-form the basic principle of accounting, but to make them of greater value to both the Railroad and the Government which under the new powers granted by Congress call for new data and measures.

The Interstate Commerce Commission has just asked us, by letter, to co-operate in the development of methods for charging depreciation and its application to existing accounting rules. I believe all concerned feel that in accounting classification we have drifted into a class of detail which has bedimmed the light and caused us to lose the greater and broader view and that out of the co-operative study contemplated by our offer we can all be benefited in simplifying but making more useful the records of such great importance. I would urge that the offer we have made be aggressively followed up.

CO-ORDINATION WITH OTHER COMMITTEES

Through the activities of the American Railway Association for whom we perform the work of the Engineering division a contact has been established with the Mechanical division and with the Purchases and Stores division. The work of correlating the study of roadway and track structure with motive power and equipment is of increasing interest and importance. The tendency of the past for these two

departments to work more and more independently has not been the ideal manner of procedure. Increasing wheel loads and the need for maximum clearances requires careful consideration of the demands upon track, roadway and structures. Likewise certain track and roadway details require consideration from the standpoint of equipment clearances.

Transportation conditions, changed as they are by new regulations as to hours of service, working conditions, the penalty from idle power, all call for new values to be ascribed to speeds, gradients, train loads, terminal delays, etc.—requiring greater co-ordination between the engineering, mechanical and operating divisions. This co-ordination is made easier by reason of the present organization of the American Railway Association and should be encouraged.

RELATIONS WITH OTHER ENGINEERING BODIES

During the year the Association became a member of Engineering Council, a federated body composed of the four founder societies and several other technical bodies, the purpose being to co-operate in matters affecting the welfare and progress of the profession and of interest to

H. R. Safford  
President

all engineers. The board felt that such affiliation was desirable and proper. In the interim, however, a body of different origin and character has been proposed to take the place of Engineering Council and has been organized. The majority of the members of Engineering Council have voted to become members of the new body and by such action the greater elements of support were taken away from Engineering Council, rendering it inoperative.

The American Railway Engineering Association was invited to become a charter member, but having agreed to support the Council your Board felt it inexpedient to do so because it felt it could not commit your Association to the financial burden at this time and because it felt the plan of organization to be objectionable and by such action also urged that the Engineering Council be continued. The opportunity to become a charter member was of limited duration but the way is still open for the Association to become a member and which action should be by a referendum vote if it appears desirable and financially possible to consider such connection.

#### NEW PROBLEMS CONFRONTING THE ASSOCIATION

I have briefly referred to new conditions surrounding the construction, maintenance and operation of railways as a result of the many changes of the past two or three years. It is not necessary to discuss causes, but the practical effects—and their influence upon our work.

The Association has already sensed the need of giving relatively more attention to economics and committee assignments for two or three years past embody prominent references thereto. This necessity has increased by reason of the existing wage schedules and working conditions—whereby different values are given to the various operations of railway service.

These changes affect all activities and call for new formulae—new values and new ideals. They include: Greater costs of equipment with greater loss from idleness, higher values for speed against tonnage performance, where overtime is excessive, increased per diem needing higher average daily car movement, the application of the shorter working day and the adverse and wasteful effect upon that class of work requiring the transportation of employees. These things all must be related to transportation economics and developed cooperatively.

I want to take this opportunity to express upon behalf of the Board the splendid work and loyal support which you have given in the conduct of the year's work. The year has been a difficult one in many ways. The change from federal control to private control meant a great deal of confusion in the reorganization of the railway service, particularly disturbing the work of the engineering department, and your Association work has been done under hardships, but you have done well and I commend that service to my successor with a feeling of deep personal gratitude.

#### Report of the Secretary

##### FINANCIAL STATEMENT

The detailed financial statement for the calendar year 1920 shows:

Receipts from all sources .....	\$37,631.37
Disbursements .....	38,386.55
Excess of Disbursements over Receipts .....	\$ 753.18
Investments and Cash Assets, January 1, 1921 .....	\$42,989.22

Ten numbers of the Bulletin and the annual volume of Proceedings were issued during the year. The Proceedings for 1920 contain 1,500 pages, exceeding the volume

of the preceding year by more than 500 pages of printed matter.

#### THE REVISED MANUAL

The republication of the Manual has been deferred until this year in order to include in the revision the important changes and additions submitted by the several committees for action at this convention. The Manual will be issued as promptly as practicable after the annual meeting.

The revised manual will contain the net results of the Association's work for the past 22 years. It is estimated the new volume will contain approximately one thousand pages.

#### MEMBERSHIP

The campaign for increasing the membership has resulted in the largest addition to the membership roll within a like period in the history of the Association. Since the inauguration of the campaign—January 27, 1920—521 applications have been received. A portion of this increase was included in the report made last year. The credit for this gratifying condition is due primarily to the earnest efforts of L. A. Downs, chairman of the Special Committee on Increase of Membership; and, secondly, to the hearty co-operation of the individual members of the several roads.

The following is a report on the present membership of the Association:

Membership at last annual meeting .....	1,638
Deceased members .....	18
Resignations and dropped .....	33
	— 51
Additions during the year .....	364
Net gain .....	313
Total membership March 1, 1921 .....	1,951

Your Association has continued to actively cooperate with other technical bodies in the study of problems of mutual interest. The extent and scope of such cooperation has been clearly and comprehensively set forth in the address of the president.

Respectfully submitted,

E. H. FRITCH, Secretary.

Treasurer.

## Report of Committee on Ballast

*In choice of ballast, gravel, where available, should receive careful consideration when it is properly screened, crushed and washed. Consensus of opinion is strongly against ballasting by contract in normal times and especially so on operated track. New and more complete specifications for stone ballast and washed gravel are submitted for inclusion in the Manual. Specifications have been made sufficiently flexible to meet conditions of available supplies for individual roads, while at the same time furnishing accurate comparisons with desired product. Requirements are well within limits of tolerance. Plans are submitted for tamping tools, etc.*

H. L. Ripley  
Chairman

*H. L. Ripley, who is completing his second years as chairman, has been a member of the committee for five years. He is the second valuation engineer to direct the work of this important committee, having succeeded H. E. Hale, group engineer of the President's Conference Committee on Valuation in 1919. As valuation engineer of the New York, New Haven & Hartford he has had occasion to study many of the problems under consideration by the committee from the standpoint of their influence on the cost of a railway proper. His effective direction of the work of the committee is indicated by the fact that its report was completed early.*

THE COMMITTEE RECOMMENDED that the revision and rearrangement of the subject-matter in the Manual as made in accordance with Appendix A be approved and the revised matter be substituted for the present recommendations in the Manual.

The committee recommended that the instructions to govern ballasting on an operated line, presented as a report of progress last year (*Railway Age*, March 18, page 917), be approved and printed in the Manual as recommended practice.

The committee recommended that Specifications for Stone Ballast Material, as presented in tentative form last year (*Railway Age*, March 18, page 918), be ap-

proved and printed in the Manual as recommended practice.

The committee recommended that Specifications for Washed Gravel Ballast, as outlined in Appendix D, be adopted and printed in the Manual as recommended practice.

The committee recommended that the standard ballast tamping bar, tamping pick, and ballast fork, as outlined in Appendix E, be printed in the Manual as recommended practice.

Committee: H. L. Ripley (N. Y. N. H. & H.), chairman; F. J. Stimson (Penna.), vice-chairman; C. W. Baldrige (A. T. & S. F.), O. F. Barnes (Erie), J. S. Bassett, W. J. Bergen

(N. Y. C. & St. L.), F. W. Bettle (T. & P.), Theo. Blocher, Jr. (B. & O.), H. E. Boardman (N. Y. C.), C. J. Coon (N. Y. C.), T. W. Fatherson (C. G. W.), H. E. Hale, Paul Hamilton (C. C. C. & St. L.), G. H. Harris (M. C.), A. G. Holt (C. M. & St. P.), F. A. Jones (M. P.), J. S. McBride (C. & E. I.), S. B. Rice (R. F. & P.), D. L. Sommerville (N. Y. C.), Paul Sterling (N. Y. N. H. & H.), W. W. Thrower (I. C.), R. C. White (M. P.), W. D. Williams (C. N.).

Appendix A—Revision of Manual

DEFINITIONS

GENERAL

**Ballast.**—Selected material placed on the roadbed for the purpose of holding the track in line and surface.

**Sub-Ballast.**—Any material of a character superior to that in the adjacent cuts, which is spread on the finished sub-grade of the railroad and below the top-ballast, to provide better

**Gumbo.**—A term commonly used for a peculiarly tenacious clay, containing no sand.

**Sand.**—Any hard, granular, comminuted rock which will pass through a No. 10 screen and be retained on a No. 50 screen.

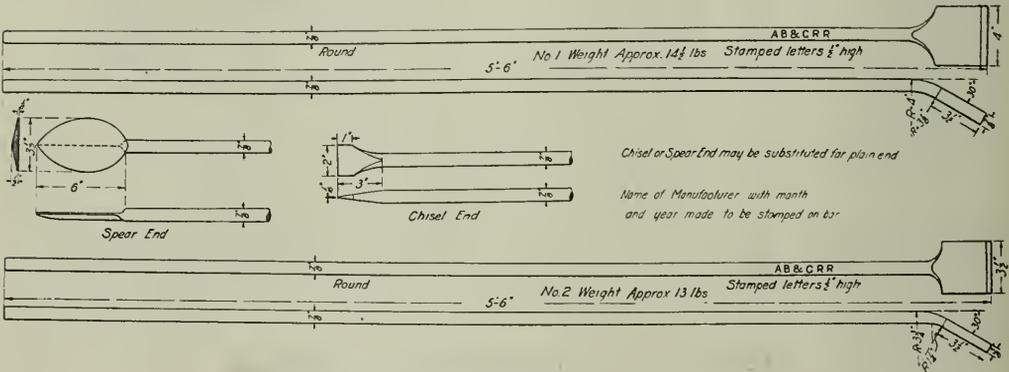

**Slag.**—The waste product, in a more or less vitrified form, of furnaces for the reduction of ore; usually the product of a blast furnace.

**Stone.**—Stone broken by artificial means into small fragments of specified sizes.

COMPARATIVE MERIT OF MATERIAL FOR BALLAST

The following sets forth the relative order of effectiveness of various kinds of ballast:

- (1) Stone
  - (a) Trap rock.
  - (b) Limestone.
  - (c) Sandstone.
- (2) Washed Gravel

Recommended Plan for Standardized Tamping Bars

drainage, prevent upheaval by frost, and better distribute the load over the roadbed.

**Top-Ballast.**—Any material of a superior character spread over a sub-ballast to support the track structure, distribute the load to the sub-ballast, and provide good initial drainage.

**Foul-Ballast.**—Ballast which has lost its porosity through the filling up of the voids by cinders, coal dust, dirt or other foreign matter.

**Dust.**—Fine particles of sand, clay, loam, or other earthy matter which will pass through a No. 50 screen.

**Shoulder.**—That portion of the ballast between the end of the tie and the toe of the ballast slope.

**Crib.**—That portion of the ballast between two adjacent ties.

**Depth.**—The distance from the bottom of the tie to the top of the sub-grade.

KIND

**Chats.**—Tailings from mills in which zinc, lead, silver, and other ores are separated from the rocks in which they occur.

**Chert.**—An impure flint or hornstone occurring in natural deposits.

**Cinders.**—The residue from the coal used in locomotives and other furnaces.

**Clay (Burnt).**—A clay or gumbo which has been burned into material for ballast.

**Granite (Disintegrated).**—A natural deposit of granite formation, which on removal from its bed by blasting or otherwise, breaks into particles of size suitable for ballast.

**Gravel.**

- (a) Pit Run.—Worn fragments of rock and sand occurring in natural deposits.
- (b) Screened.—Worn fragments of rock, occurring in natural deposits, that will pass through a 2 1/2-inch ring and be retained upon a No. 10 screen.
- (c) Washed Gravel.—A gravel from which foreign matter has been washed and the relative proportions of gravel and sand have been determined.

(3) Broken slag (not granulated)

- (a) Precious metal slag.
- (b) Open-hearth slag.
- (c) Blast furnace slag.

(4) Screened Gravel

(5) Pit Run Gravel

- (a) River or stream gravel.
- (b) Hill gravel (not cementing).
- (c) Hill gravel (cementing).

(6) Chats

- (a) Chats from zinc ore, which is coarse.
- (b) Chats from lead ore, which is fine.

(7) Burnt Clay or Gumbo

(8) Cinders

- (a) Hard coal cinders.
- (b) Volcanic cinders.
- (c) Soft coal cinders.

Natural ballast materials vary greatly in quality, and the choice must often be determined by availability and expediency under the particular existing circumstances. Financial conditions may control the choice or there may be only one suitable material readily available. Crushed stone is a manufactured article and, the process being under control, it is practicable to make the product conform to specifications. In the choice of ballast where gravel is available, it should receive careful consideration, as it has given excellent results, especially when properly screened, crushed and washed.

PROPER DEPTH OF BALLAST

(a) On a roadbed material such as clay, loam, etc., subject to deformation by the application of live load, the proper depth of ballast under the tie to produce approximately uniform pressure on the roadbed would be not less than the spacing center to center of the ties. For

Class A track, see ballast sections, adopted March, 1918.

(b) On material that approximates the character of good sub-ballast (which will not be deformed by the application of live load), the minimum depth of ballast under the bottom of the tie should be 12 in.

(c) These depths are required, under the conditions named, to support the track structure; to provide good initial drainage; to provide against upheaval by frost; to serve as a cushion for the track.

(d) A combination of a good sub-ballast 18 to 14 in. and top-ballast 6 to 10 in., making a total of approximately 24 in. under the tie in the aggregate, will produce nearly the same result as though the superior material was used for the full depth.

(e) Until sufficient tests are made under normal traffic conditions, the proper depth of ballast under the tie must rest on opinion, based on experience and supported by such tests as are available, notably the test made by Director Schubert of the German Railways and the "Altoona Test" made by the Pennsylvania Railroad.

(f) Proper drainage of the sub-grade is essential to success with any kind of ballast.

CHARACTERISTICS OF STONE BALLAST

(1) Stone ballast should be sufficiently durable not to disintegrate in the climate where used, hard enough to prevent pulverizing unduly under the action of tools or traffic, and should break with an angular fracture when crushed.

(2) It should be broken into pieces of such size that they will in any position pass through a 2½-in. ring and will not pass through a ¾-in. ring.

(3) It should be free from dirt, dust or rubbish.

(e) Toughness, maximum.

(f) Cementing value, minimum.

(g) Compression test, maximum.

The above physical tests are made uniformly and free of charge by the Department of Agriculture, U. S. Government, Washington, D. C. Much valuable information in regard to tests already made and tabulated can also be obtained from this department.

SPECIFICATIONS FOR PIT RUN GRAVEL BALLAST

For Class A Railways: Bank gravel, which contains more than 2 per cent dust or 40 per cent sand, should be washed or screened.

For Class B Railways: Bank gravel, which contains more than 3 per cent dust or 60 per cent sand, should be screened or washed. Screened gravel should not contain less than 25 per cent nor more than 50 per cent sand.

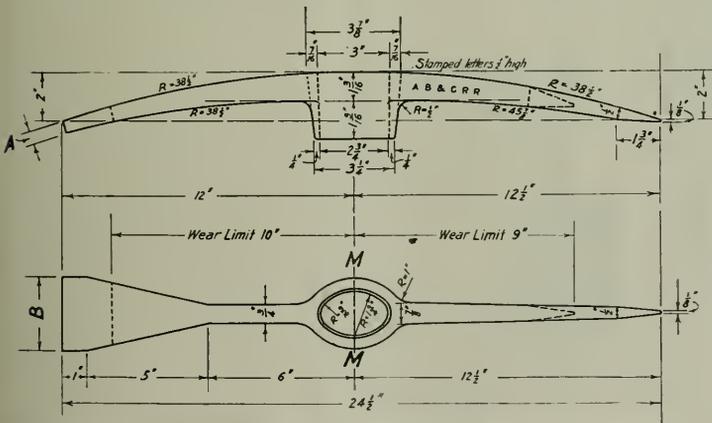

For Class C Railways: Any material which makes better track than the natural roadbed may be used economically.

METHOD OF TESTING QUALITY OF PIT RUN GRAVEL FOR BALLAST

(1) The size of the sample to be tested should be approximately 1 cubic foot.

(2) Five average samples of about one cubic foot each should be selected from various parts of the pit which is to be tested. The five samples should then be thoroughly mixed and about one cubic foot of the mixture selected for testing.

(3) To separate the gravel from the sand and dust, use a No. 10 screen, 10 meshes to the inch, made of No. 24 wire, B. & S. gage. To separate the sand from

Name of Manufacturer with month and year made to be stamped on pick

Recommended Plan for Standardized Tamping Picks

Attention is called to the physical test of stone for ballast given below, which is recommended as a guide in connection with the specifications, or where a quick test must be substituted for a more complete examination.

Other things being equal, the maximum or minimum results, as indicated, will govern in selecting stone for ballast:

(a) Weight per cubic foot, maximum.

(b) Water absorption in pounds per cubic foot, minimum.

(c) Per cent of wear, minimum.

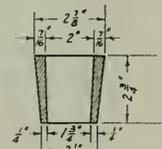

(d) Hardness, maximum.

the dust, use a No. 50 screen, 50 meshes to the inch, made of No. 31 wire, B. & S. gage.

(4) Measure the percentage of gravel, sand and dust taken from the sample by volume, giving the percentage of each ingredient compared to the volume of the sum of the ingredients, as follows:

$$\text{Per cent of sand} = \frac{S}{G + S + D}$$

Where S = Volume of sand  
G = Volume of gravel  
D = Volume of dust

SECTION M-M

SIZE	A	B	WEIGHT
1	½"	3"	7 ½ lb
2	⅝"	3"	7 ⅝ lb
3	¾"	2 ½"	7 ⅞ lb

(5) When sample is shipped for test it should be marked carefully and securely with the name and location of the pit from which it was taken.

### CINDER BALLAST

The use of cinder as ballast is recommended for branch lines with light traffic; on sidings and yard tracks near the point of production; as sub-ballast in wet, spongy places, on new work where embankments are settling, and at places where the track heaves from frost. It is recommended that provision be made for wetting down cinders immediately after being drawn. A sub-ballast blanket of cinders not less than 12 in. thick is effective in most cases in preventing mud and similar material working up into the top-ballast.

### SPECIFICATIONS FOR BURNT CLAY BALLAST

1. **Kind of Material.** Good ballast clay is heavy and plastic, free from sand, gypsum or other impurities. It must not crumble when exposed to air or when brought in contact with water.

2. **Location.** The pit should be located on level or moderately sloping ground, not subject to overflow. A water supply is desirable and it should be borne in mind that the sulphurous and carbonaceous gases liberated during the

3. **Size.** Burnt clay ballast should be crushed or broken, if necessary, so that the largest piece will pass through a 4-inch ring.

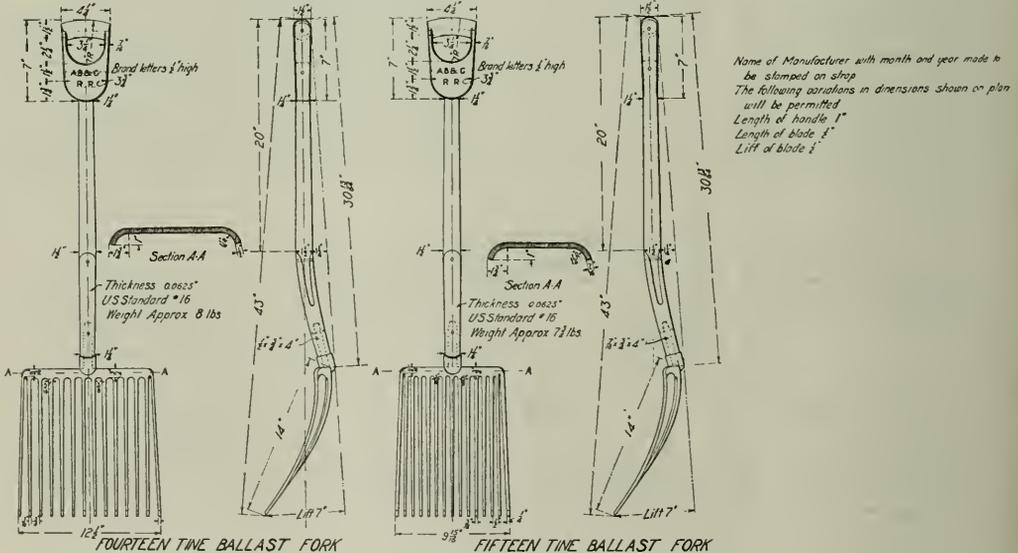

6. **Density.** The finished product should absorb not to exceed 15 per cent of moisture by weight.

### CLEANING FOUL BALLAST

Under usual conditions no ballast, except stone or hard slag, should be cleaned. Ballast should be cleaned when foul enough to prevent proper drainage. Clean with ballast forks or screens. Clean shoulder down to sub-grade. Clean crib to bottom of ties. Clean space between tracks to depth of 6 in. or more below the bottom of ties. Clean the berme to bottom of ballast, preferably not less than 12 in. below bottom of tie. Clean cross ditches between ties approximately every rail length, or 33 ft. Cross ditches should not be under rail joints. Return ballast when cleaned and apply sufficient new ballast to produce the standard section.

Tests, fully described in the report of the Committee on Ballast for 1914, indicate stone ballast can be cleaned by use of screens for approximately one-half cost of cleaning stone ballast with forks.

Stone ballast should be cleaned in terminals, at intervals of 1 to 3 years, under heavy traffic at intervals of 3

Recommended Plans for Standardized Ballast Forks

burning period, damage the surrounding vegetation and make habitation in the near vicinity very disagreeable.

3. **Test.** The location site should be thoroughly tested to determine quality of clay, depth and uniform consistency of deposit, and small quantities should be burned in test kilns to show the quality of ballast to be secured.

4. **Burning.** Fuel should be fresh, clean slack, and arrangements should be made to secure constant supply. One ton of slack coal is generally sufficient for the perfect burning of four cubic yards of acceptable ballast. From one to one and one-half-inch layer of slack is alternated with from ten to twelve-inch layer of clay, a new layer of slack and clay being applied to the fire every five or six days. Fires once started must be kept burning steadily and uniformly. To insure thorough and proper burning of the clay, the top and face of the fire should be frequently raked down, to avoid clinker or black spots, caused by too much or too little air. When fully burnt a proper ballast clay becomes red in color, when the clay contains iron; when under-burnt, the clay will show a yellow color.

to 5 years, under light traffic lines at intervals of 5 to 8 years. Per cent of new stone ballast to be applied, 15 to 25 per cent.

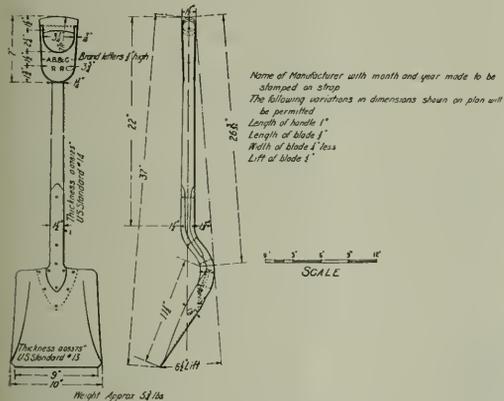

### USE AND LIMITATION OF MECHANICAL TOOLS

Mechanical devices used to save labor and expense and to expedite the work fall naturally into sequence from the pit, quarry or ballast pile to the finished track. Cars for transporting ballast should be chosen carefully with regard to the work to be done—whether it is to be on track already laid or for an additional parallel track. If for raising track, hopper cars should be used with the ballast plow or tie drag. If for parallel track, side dumps are to be preferred, especially when air operated. Convertible cars where the sides swing out and up, when used with the side plow and unloading engine-drum and

cable, are fairly satisfactory when dump cars are not available, which is usually the case when stone ballast is furnished from a private quarry. Anchoring the train and pulling the plow through the train by cable from the locomotive is a poor substitute for the unloading engine. It does beat unloading by hand.

The spreader car, especially when air-operated, is effective and should be in general use. With this car ballast for new second track work previously dumped alongside the running track from side dump cars or unloaded by side plows, can be spread out to a grade two inches below the bottom of tie and to the outside shoulder at a speed of eight miles per hour. When not in use on ballast work the spreader can be used on a grading dump and in wet clay or rock, will do the work of fifty men and remain idle most of the time at that.

The mechanical tamper has passed the stage where its usefulness under favorable circumstances needs further

Suggested Type of Ballast Shovel

defense. Around terminals and yards where there is a large amount of frog and switch work, so far as this committee knows there is no disposition to question the expediency of its use based on its merits alone, entirely apart from any question of scarcity of labor.

The consensus of opinion is strongly against ballasting by contract in normal times and especially so on operated track. Advocates of ballasting by contract do so largely as an emergency measure because of the greater flexibility of a contractor's organization in changing the rates of pay and so securing labor in times of stress.

Concrete slabs placed under the ballast on soft roadbed where traffic is heavy, and at times under other exceptional circumstances, indicate that a considerable degree of success may be expected from their use, and at reasonable expense.

**Appendix D—Specification for Washed Gravel Ballast**

1. Gravel for ballast shall be so prepared that dust, loam and dirt are removed, that all aggregates that will not in any position pass through a 2 1/2-in. ring are rejected; and that the sand contained in the ballast shall not, in volume, exceed 20 per cent nor be less than 15 per cent of the material as loaded for use.

**Test No. 1. Dust, Dirt or Loam**

2. A sample of the prepared ballast containing 1/8 cu. ft. shall be placed in a watertight receptacle having a capacity of not less than 1 cu. ft. Into this receptacle shall then be placed two quarts of clear water, after which the receptacle shall be agitated until the gravel is thoroughly washed. The water shall be drained off immediately and placed in a glass jar and allowed to settle. If the sediment deposited in the

bottom of the jar is more than 1/2 of 1 per cent of the volume of sample the output of the plant shall be rejected until the fault has been corrected.

**Test No. 2. Large Aggregate**

3. A sample weighing not less than 150 lb. shall be placed in or on a screen having round holes 2 3/4 in. in diameter. If a thorough agitation of the screen fails to pass through the screen 98 per cent of the material, as determined by weight, the output from the plant shall be rejected until the fault has been corrected.

**Test No. 3. Sand**

4. One cubic foot of the prepared ballast shall be thoroughly dried, placed in a screen having ten meshes to the inch and the screen agitated till all particles which will pass have passed the screen. If the material which passes through the screen exceeds 20 per cent or is less than 15 per cent in volume of the original sample the output shall be rejected until the fault has been corrected.

5. In case inspection develops the fact that the material which has been or is being loaded is not in accordance with these specifications, the inspector shall notify the manufacturer to stop further loading until the fault has been corrected, and to dispose of all defective material that had been loaded in cars, which shall be done at the expense of the contractor.

6. When ballast is being paid for by the ton, and it is impracticable to weigh each car, the weight per yard shall be obtained by weighing at frequent intervals not less than five cars loaded with ballast, the contents of which have been carefully measured. The weight per yard obtained by such a test shall be used in figuring the weight per car until another test is made.

7. When ballast is paid for by the yard, the amount shall be determined by weighing each car, where practicable, and applying the weight per yard as determined by frequent tests. When impracticable to weigh each car, the contents of each car will be carefully estimated by comparison with cars, the contents of which have been actually measured.

**Appendix E—Standardization of Ballast Tools**

The sub-committee submitted specifications and plans for tamping bars, tamping picks and ballast forks, which were recommended for insertion in the Manual.

The committee also submitted a plan for a standard ballast shovel which it requested be considered as a progress report.

**SPECIFICATIONS FOR BALLAST TOOLS**

**Scope**

1. These specifications cover tamping bars, ballast forks and tamping picks.

**Material**

2. These tools, other than straps, shall be high-grade tool steel made by the open-hearth or crucible process.

3. Straps for forks shall be of soft open-hearth steel or wrought-iron.

4. Handles shall be smooth and well seasoned, of the best grade straight grained ash or hickory, bent to shape.

**Chemical Properties**

5. The steel shall conform to the following chemical composition:

	Tamping Bars and Picks Per Cent	Forks Per Cent
Carbon .....	0.55 to 0.75	0.90 to 1.05
Manganese .....	0.40 to 0.60	Not more than 0.50
Phosphorus .....	Not more than 0.04	Not more than 0.04
Sulphur .....	Not more than 0.04	Not more than 0.04

**Design**

6. The dimensions of tools shall conform to the plans which are made a part of these specifications.

**Physical Properties**

7. All tools shall be free from defects and finished in a workmanlike manner.

8. Tools must be properly tempered to provide the maximum toughness and strength to perform the service for which they are intended.

9. Tamping bars, picks and tines, head and tongue of ballast forks shall be of one piece, no welding being permissible.

10. Tools shall be marked as shown on the plans.

**Inspection**

11. Inspection of tools shall ordinarily be made at the place of manufacture. The manufacturer shall notify

..... of the Railroad Company at least ..... days in advance when tools will be ready for shipment. However, when so directed, in regard to a particular shipment, the manufacturer shall make shipment on his own inspection, subject to requirements of Paragraph 15.

12. The manufacturer shall allow the railroad company's inspectors such access to the work as may be necessary to satisfy them that the provisions of these specifications are carried out.

13. The manufacturer shall furnish, without charge, all necessary facilities and assistance for making thorough inspection and tests at the works.

#### Rejection

14. Individual tools, defective in any respect, and lots of tools not meeting above requirements, shall be rejected.

15. All tools shipped on manufacturer's inspection, as provided in Paragraph 11, which on arrival at destination are found defective and all tools which develop flaws and defects in the usual and necessary service, shall be rejected and replaced at the entire expense of the manufacturer or seller.

#### Discussion

H. L. Ripley (Chairman): The work of the ballast committee for the past year has been largely in the nature of a review of the tentative report presented a year ago. It has been reviewed and corrected by the members of the committee.

C. W. Baldrige (A. T. & S. F.): The instructions to govern ballasting on an operated line were presented to the Association last year as information, with the statement that they would be presented this year for adoption for inclusion in the Manual. Some few changes have been made since that time by the committee. These instructions are intended as a guide to anyone who may care to look up something in regard to recommended practice on ballasting or reballasting of track.

Chairman Ripley: *I move the adoption of Appendix B, to be printed in the Manual as recommended practice.*

(*Motion carried.*)

Chairman Ripley: The next matter covered by the committee is Appendix C, on specifications for stone ballast material. In offering these, the committee realizes fully that it is not possible to write precise specifications for stone for ballast as can be done with specifications for steel, for instance, because the original material is not capable of the same treatment and one is compelled to use the raw material available. *I move the adoption of Appendix C for inclusion in the Manual.*

(After some discussion relating to details of wording the motion was carried.)

Chairman Ripley: Appendix D refers to a matter not directly referred to the committee, Specification for Washed Gravel Ballast. It seemed so closely allied to the subject that was specifically given to the committee for consideration and was a matter which some members of the committee themselves found they were very much interested in at this time that the committee has drafted this set of specifications, which does not do violence to the other set just read, and should go into the Manual.

J. E. Willoughby (A. C. L.): In connection with the first item of the specification I notice it is proposed that the sand for the washed gravel ballast shall not exceed 20 per cent. I believe it is the more general custom where washed gravel ballast is used that the sand may exceed 20 per cent. On the Atlantic Coast Line we use it up to 25 per cent and 33 per cent. We have a good deal of rain and do not have any trouble from the amount of sand causing the retention of the water. The soils on which the ballast is placed, however, are usually sandy soils. In our practice we remove all sand and remix the sand and gravel and the sand is that ordinarily found in our sand pits and will pass through a  $\frac{3}{8}$ -in. screen.

Chairman Ripley: Under the conditions found on the line of the Atlantic Coast Line that is perfectly permissi-

ble. This is recommended, not as a standard, but recommended practice to carry us under normal average conditions. The committee would not oppose making that 25 per cent if it seems good to the membership. The committee, however, is pretty thoroughly in accord, if not unanimous, in suggesting the percentages named here, and would be, frankly, more likely to reduce the 15 per cent than to add to the 20 per cent, based on the experience of two members of the committee who have used washed gravel very extensively and lately have had experience with it.

The Chairman: Did the committee take into consideration the fact that oftentimes a different specification might be required for washed gravel sand proportion, in the case of bank washed gravel, as compared with river-bed washed gravel, the difference being largely due to the fact that in the river bed material the larger particles are quite smooth and round, while with certain classes of bank gravel that are washed the aggregate is rough.

Chairman Ripley: Yes, that matter was considered by the committee. We put down a trial section of that track with ball-bearing gravel, as it is called, containing seven per cent sand, and it held its line, held its grade and there was no difficulty experienced. I have no objection to lowering the minimum 5 per cent or raising the maximum 5 per cent. I believe, however, as a guide under normal conditions the percentages named are better than would be the case if a change was made either lowering or raising the limit of tolerance. *I move Appendix D be adopted and included in the Manual as recommended practice.*

(*Motion carried.*)

Chairman Ripley: Appendix E, Standardization ballast tools. This matter has been before the convention for two years, and the report will be made by the chairman of the sub-committee, Mr. McBride.

(J. C. McBride (C. & E. I.) submitted Appendix E.)

Chairman Ripley: *I move the adoption of Appendix E, excepting ballast shovel specifications, be placed in the Manual as recommended practice.*

The Chairman: May I ask the committee whether in the designs of these tools there are any radical changes that will induce any manufacturing difficulties?

Chairman Ripley: I think we can say positively, no; although the manufacturers have not responded to our request for criticism; but these tools were the composite result of a questionnaire sent out by different carriers, and pretty well responded to.

(*The motion to adopt Appendix E was carried.*)

Chairman Ripley: The other matter is the revision of the Manual. We request permission to suggest to the committee editing the Manual that the matter be rearranged and worded as stated in Appendix A.

Mr. Willoughby: I take it that it was one of the duties of the committee to ascertain if the existing specifications on which no change is made fulfil what is now good practice, regardless of whether the convention have heretofore adopted the definition. In Appendix A there is a definition for sub-ballast: "Any material of a character superior to that in the adjacent cuts." Now, the material in the adjacent cuts is sometimes very good ballasting material. Sometimes it may be gravel, it is possibly stone and it is frequently sand, all of which may be good ballast, not only in sub-ballast, but in ballast. The purpose of the sub-ballast is to cover the roadbed. The sub-ballast material ought to be material which is better than the material underneath the roadbed.

Chairman Ripley: Mr. Willoughby, taking the condition that you have stated, isn't it an open question, whether it is ballast or not, or whether you would handle it as ballast? If you went through a cut with material of that

nature you would not take it out only to a certain depth. If the adjacent fill was made with that material, you would make it up to a certain depth. I wonder whether under such conditions material handled out of that cut below a final ballast would be considered and handled as ballast at all?

Mr. Willoughby: There is a condition in certain parts of the country, for instance, Florida, where the state is overlaid generally with a layer of sand that is sometimes 20 ft. or more in depth. In the cutting you will pass through sand, and sand would be in the adjacent cut. Sand will make good sub-ballast, but not good ballast, on account of its lightness in blowing away. Now, the cut may be sand itself and you would not be entitled under that classification to call the sand which you placed on the roadbed sub-ballast.

Chairman Ripley: I think your point is well taken. I wonder if that definition should not be made to read: "Any material of a superior character which is spread on the finished sub-grade of the roadbed and below the top-ballast, to provide better drainage, prevent upheaval by frost, and better distribute the load over the roadbed. Is that satisfactory to you, Mr. Willoughby?"

Mr. Willoughby: That is satisfactory to me.

H. Austill (M. & O.): In Appendix A, does the definition of screened gravel represent gravel in the pit that may be screened?

Chairman Ripley: The basic idea was to get a certain product, and that product is one that has no stone in it that is larger than  $2\frac{1}{4}$  in. in diameter, and has nothing smaller in it than will be held on a No. 10 screen.

Mr. Campbell: I would suggest that that be made to read: "Worn fragments of rock occurring in natural deposits that have been passed through a  $2\frac{1}{2}$ -in. ring and been retained on a No. 10 screen."

Mr. Ambrose: How would it be if you were to simply treat it as a noun and cut off the letters "ed" and leave it stand as it is? *I move that the "ed" be deleted.*

The Chairman: The motion is that the caption should read "screen gravel" instead of "screened gravel."

*(Motion carried.)*

J. M. R. Fairbairn (C. P. R.): In the figures we are passing on for the Manual, is there any special reason why in these diagrams the crown of the sub-grade has been left off? It seems to me it would be better to show the crown of the sub-grade as it is shown to the committee on roadway.

Chairman Ripley: I know of no reason why the bottom should not be made to conform, but it would require special action by the Association to do so.

Mr. Fairbairn: *I move that the sub-grade be shown with a crown in these diagrams similar to that used by the Roadway committee report.*

Mr. Frink: The committee on roadway this year is presenting some diagrams of roadway sections with the sub-grade crowned. It is my recollection our Manual now contains diagrams with the sub-grade at the level and therefore this presentation of the committee on roadway is a change in the Manual.

*(Motion carried.)*

(The committee was dismissed with the thanks of the Association.)

## Report of the Committee on Electricity

*The electrification of the Norfolk & Western is described in the report on water power. All phases of the work, including operating conditions, operating cost, classes of equipment, purchase of power, conservation of fuel and saving of wages are discussed. It is concluded that a saving of at least 12½ per cent of the total annual expense will be obtained by a system of electrification as compared with steam operation under similar condition. Specifications for wires and cables, underground conduit construction and tungsten lamp standards are presented for adoption in the Manual. Marked economies can be effected by the use of a restricted number of different lamps.*

Edwin B. Katte  
Chairman

*Edwin B. Katte has been associated with the work of the Committee on Electricity since 1911, and for the last four years he has been the chairman. No man has had a better training for the leadership of this important committee than Mr. Katte. Being associated with the electrification of the New York Central's Manhattan terminal since its very inception and occupying the position of chief engineer of electric traction, he has had an extended first hand contact with steam railway electrification from the viewpoint of both construction and operation. This experience is of great value to the committee when the subject of electrification is receiving so much attention.*

IN APPENDIX A OF THE REPORT the committee reported on the subject of electrolysis and its effect on reinforced concrete; in Appendix B, water power for electric railway operation; in Appendix C, railroad specifications for electric wires and cables.

In Appendix D the committee reported on the subject of electrical interference, and in Appendix E, railroad specifications for underground conduit construction for power cables for approval and printing in the Manual as recommended practice; also definitions of additional electrical terms for printing in the Manual.

### Conclusions

1. The committee recommended for inclusion in the Manual the additional electrical definitions enumerated in Appendix E.

2. The committee recommended that the report on electrolysis and insulation, being Appendix A, be accepted as information and published in the Proceedings.

3. The committee recommended that the report on water power, being Appendix B, be accepted as information and published in the Proceedings.

4. The committee recommended that the railroad specifications for wires and cables, being Appendix C, be approved and printed in the Manual as recommended practice.

5. The committee recommended that the report on electrical interference, being Appendix D, be accepted as information, published in the Proceedings.

6. The committee recommended that the railroad specifications for underground conduit construction for

power cables, being Appendix E, be approved and printed in the Manual as recommended practice.

7. The committee recommended that the report on the National Electrical Safety Code, being Appendix F, be accepted as information, published in the Proceedings and that the committee be authorized to continue its cooperation with the United States Bureau of Standards.

8. The committee recommended that the railroad specifications for incandescent lamps, being Appendix G, be approved and printed in the Manual as recommended practice.

Committee: Edwin B. Katte (N. Y. C.), chairman; D. J. Brumley (I. C.), vice-chairman; H. M. Bassett (N. Y. C.), R. D. Coombs (Cons. Engr.), Walt Dennis (Wabash), A. H. Hogeland (G. N.), C. E. Lindsay, W. L. Morse (N. Y. C.), R. S. Parsons (Erie), M. Schreiber (P. S. R. of N. J.), W. M. Vandersluis, R. Beeuwkes (C. M. & St. P.), J. C. Davidson (N. & W.), R. H. Ford (C. R. I. & P.), G. W. Kittredge (N. Y. C.), H. K. Lowry (C. R. I. & P.), A. E. Owens (C. R. R. of N. J.), J. R. Savage (L. I.), E. B. Temple (P. R. R.), S. Withington (N. Y. N. H. & H.).

### Appendix B—Water Power

The report on water power consists of a description of the Norfolk & Western's electrification, covering in the first part such subjects as operating features, types of locomotives, power house problems, etc. This project has been described on varying occasions in the *Railway Age*, the latest article being on page 101 of the January 7, 1921, issue. The last half of the report deals with the questions of purchasing power, operating costs, etc.

#### PURCHASING POWER

The question has been frequently asked why the company installed a steam-driven plant for power generation when hydro-electric power was available. At the time when plans for electrification were being perfected, this subject was studied in detail and the decision to generate by steam was arrived at after careful consideration. There were two main factors involved; first, the question of cost; second, continuity of supply. In 1913 and 1914, power station coal could be placed in the railway company's bunkers at less than one dollar per ton, and on this basis power could be produced more cheaply than it could be purchased. With the present high prices of this coal, the comparison is on an entirely different basis. As to continuity of power, hydro-electric concerns in the vicinity are affected materially by shortage of water at certain seasons of the year, and at the time electric operation was decided upon, very little steam reserve power was available. It was felt that it would be unwise for the railway to rely upon an outside source of power which was liable to interruption from shortage of water or other causes. Through the emergency connection with the Appalachian Power Company, the railway has frequently had to supply power to enable the hydro-electric company to maintain its service.

In 1916, a reciprocal agreement was effected between the railway company and the Appalachian Power Company whereby, in emergency, either company would supply the other with power. Under the terms of this agreement, the power company installed at its own cost in its plant at Switchback, a frequency changer with connections to the railway company's substation at Maybeury. The amount of power which can be transferred is, of course, limited by the capacity of the frequency changer, which is 10,000 kilowatts. All power exchanged is metered at the power company's side of the apparatus and consequently the railway stands all loss of transmission and conversion. As a partial compensation, the power company paid for power supplied 33 per cent more than

the railway company paid for power received. Payments originally were based on a flat rate per kilowatt hour.

Due to the great advance in cost of coal, a supplementary agreement was put into effect in 1918, whereby a sliding scale adjustment was applied to the price charged the power company to cover increase in cost of coal. No change was made in the price for hydro-electric power received from the power company, but provision was made that in the event of steam generated power being received from the power company from their steam reserve plants, the railway company would pay for this steam power on the same basis as the power company pays the railways. No adjustments have yet been made to cover increased cost of labor and material.

Under present conditions, the advantages of these emergency connections are slight insofar as the railway company is concerned. The amount of power available at any time is insufficient for traction purposes without keeping the railway company's Bluestone plant in complete operation. At times, it has been possible to use the power company's supply and shut down one machine. There is, however, a distinct advantage due to the fact that the operation of the frequency changer can be handled so as to improve the system power factor of the railway. The use of the frequency changer as a condenser increases the power factor by 10 to 15 per cent.

#### OPERATION COSTS

As the electric service now maintained is on an entirely different basis from the former steam service, it is impossible to give a direct comparison of cost. It has therefore been considered advisable to give the following comparison between steam and electric freight locomotive operation, using the records and figures compiled for use in the company's annual report. In this comparison, all costs entering into operation as well as interest and depreciation have been taken into account and while the figures are necessarily approximate it is believed they are sufficiently close to be representative:

COMPARATIVE COST PER MILLION TRACTIVE-MILES

Items	Steam	Electric
Interest and depreciation	\$ 4.36	\$12.16
Repairs	7.64	6.40
Fuel of elec. power at loc.	13.00	6.19
Lubricants and waste	.16	.05
Supplies	.16	.16
Engine house expenses	2.18	.56
Water	.51	.00
Wages	1.89	.70
Total per million tractive-miles	\$29.90	\$26.20
Per cent saving		12.5 per cent

Attention is called to the unit of comparison, "Tractive-Miles," which is the product of the maximum tractive power in pounds and total miles run. This affords a direct comparison.

In explanation of the table given above, it will be noted that the interest and depreciation figure for electric locomotives is much higher than that given for steam. This is because all of the electric cost has been charged against the number of engines in the service, i. e., each engine carries its share of power house transmission, distribution, etc. The actual electrification installation costs have been increased in this table over 100 per cent to adjust the values to those prevailing in 1919.

The cost of electric locomotive repairs has been reduced below the actual figures in order to eliminate charges which have been due to the development of a new design. In other words, the electric locomotives now in service have been experimental, and could they be replaced today by new equipment it is entirely reasonable to expect the figures shown for repairs would be representative. In this connection it is pointed out that the power house, substations and transmission lines gen-

erally are designed for considerably larger service than is now given.

#### CONSERVATION OF FUEL AND SAVING IN WAGES

An important question today in connection with the general movement towards conservation of fuel is how much actual fuel can be saved by electric operation, and in this connection the Norfolk & Western has found that with the modern Mallet, compound superheating steam locomotive, equipped with all improvements excepting feed-water heater, about 5.4 lb. of fuel are required per drawbar hp. hour, taking into account road conditions and allowing for standby losses. It should be noted that these figures assume the engine to be in thoroughly good operating condition. With electric operation, about 3.3 lb. of fuel are required per drawbar hp. hour in the present electric service, which gives a direct saving in the fuel bill of about 40 per cent. This amounts to a total saving for the present "Elkhorn Grade" electrification of about 60,000 tons of fuel coal per year. Applying the same ratio of saving to the entire Norfolk & Western system, it is estimated that with complete electric operation the net saving in amount of fuel used would be nearly one million tons per year.

In the case of crew wages, it will be noted that on the "tractive-mile" basis the saving in crew wages is over 60 per cent. A comparison on another basis can be made by comparing the round trip times. The average round trip time for an electric crew between Bluefield and the coalfield is somewhat under seven hours, whereas the best average time under steam conditions formerly was somewhat over 12 hours. Therefore, to make a direct comparison, the seven crew hours in electric operation should be compared with 14 hours in steam operation, taking into account punitive overtime. This in itself would show a saving of 50 per cent in the crew cost, but as there is of course a certain amount of overtime made by electric crews, the net saving is between 35 and 40 per cent.

One important point is that with the present facilities and volume of traffic, it is problematical whether the tonnage could be moved at all with steam. The only possible way to do so would be to increase the number of engines per train so that a schedule speed could be maintained equal to the present electric speeds. This would require probably four Mallet steam engines per train as compared with the two electrics on the heaviest grades, which would increase the operation costs much beyond those shown in the table, and if the percentage of engine failures were at all unusual, the service would be unreliable.

#### MILEAGE OF ELECTRIC LOCOMOTIVES, ETC.

The total electric locomotive mileage made for the six months ending June, 1920, was 224,974, or an average of 34,162 per month. The average number of locomotives in service per day is about eight, which establishes an average figure of 135 miles per locomotive per day. The company's records show that the kilowatt hours at the power house per locomotive mile are about 160, while the watt hours per trailing 1,000 ton-miles are about 165.

#### THE APPLICATION OF THE ELECTRIFICATION OF THE NORFOLK & WESTERN TO OTHER RAILWAYS

In a general way the following statements can be made regarding the utilization of electrical energy for the operation of other railways similarly situated:

(1) That 44,000-volts, single-phase, 25-cycle transmission of electric power with 11,000 volts, single phase on the trolley wire are practical and reliable voltages for electric train service for heavy grades and heavy tonnage.

(2) The average daily gross tonnage of freight east-bound over the electrified grade on the Norfolk & Western for 1918 was 47,500 tons as compared with 32,000 tons in 1912, an increase of over 50 per cent. The ultimate capacity based on the present installation is stated as 80 per cent over that of 1912.

(3) That such a system of electrification will probably effect a saving of at least 12½ per cent of the total annual expense as compared with steam operation on a railway with similar characteristics.

(4) That the introduction of electric locomotives with electric brakes (regenerative braking) has made possible higher speeds on heavy grades, with greater safety and reliability under all climatic conditions.

#### Appendix E—Underground Conduit Construction

The committee suggested three new electrical definitions as follows:

*Duct or Conduit:* A unit length of pipe suitable for use in the construction of runways for electric wires or cables.

*Manholes:* An opening in a splicing chamber through which a man may enter.

*Mandrel:* A tool used for aligning and cleaning ducts.

#### STONE CONDUITS

One of the large utility companies in the middle west has used for several years "stone conduit," and is now using stone conduit of their own manufacture, with very satisfactory results.

The specifications describe the processes of manufacture and method of installation of stone conduit.

1. **Materials.** Stone conduit shall be made of limestone screenings which will pass through a screen of ½-in. mesh and approved make of Portland cement in the proportion of 4¾ to 1 properly moistened with water and shall be formed by tamping in cylindrical moulds.

2. **Dimensions.** Conduit shall be made in lengths of 5 ft. with ⅝-in. walls and ¾ to 4½-in. round bore.

3. **Workmanship.** (a) Conduit shall be symmetrical throughout, straight, true, smooth, free from cracks, air holes, uneven surfaces or other imperfections which will injuriously affect it. The ends shall be perpendicular to the bore.

(b) Conduit shall be cured for not less than eight weeks after removal from the mould. For the first six weeks it shall be kept wet by sprinkling and then allowed to dry in the air for at least two weeks.

4. **Joints.** (a) Conduit when thoroughly cured shall be turned, for a distance of ¾ of an inch on each end, sufficient to secure an exact diameter concentric with the bore, but which shall not reduce the thickness of the wall given in Section 2 by more than one-sixteenth of an inch.

(b) With each conduit there shall be supplied a suitable metal sleeve which will fit tightly over the ends of adjacent conduits to hold them in place and to secure perfect alignment.

5. **Short Lengths.** Pieces of conduit less than the standard 5 ft. length will be accepted, not to exceed 10 per cent. of the total ordered, provided the ends are cut square, dressed and turned for metal sleeves, but no conduit will be accepted less than 2½ ft. long.

6. **Inspection.** (a) The railroad may inspect the conduit at any time during the process of manufacture and shall be furnished free of cost the necessary tools and appliances for making such tests as are necessary to determine if the requirements of these specifications have been met.

(b) Conduit offered for inspection shall be factory run from which no conduit of a superior quality has been removed.

(c) The railroad shall be given advance notice of completion of conduit to permit it to arrange for inspection.

7. **Tests.** Conduits shall permit the passage from end to end of a mandrel 3 ft. long and ⅝-in. less than the nominal diameter of the bore.

(b) Samples of 5 ft. lengths of conduit shall be selected at random and after immersion for 24 hours in air shall show an increase in weight of not more than 9/10 of one per cent.

(c) The presence of cracks shall be determined by sounding each piece with a steel hammer or its approved equivalent. Pieces which fail to give a clear metallic ring shall be considered defective.

(d) Conduit which fails to meet all of the requirements of these specifications shall be rejected.

8. Installation. (a) Conduit line shall be encased in concrete four inches thick on top, three inches on the side and a minimum thickness of four inches for the full width of the trench, except where ledge rock is encountered; in which case the concrete foundation may be omitted and the bottom of the trench leveled with cement mortar. Conduits shall be laid with a minimum separation of one inch both horizontally and vertically and the joints shall be staggered so that the joints of adjacent sections will be separated by at least three inches.

(b) In ending conduits only full lengths shall be used in the lower tier at the entrance to splicing chambers. Short lengths where necessary shall be inserted further out in the section.

(c) Where work is suspended leaving incomplected sections the open ends of the conduits shall be plugged with tapered wood, or other approved plug conforming accurately to the shape of the bore and so formed that it cannot be forced entirely within the opening.

(d) During construction work a mandrel three feet long and 1/8-in. less than the nominal bore shall be drawn through the conduits as they are laid.

(e) In other respects the methods of laying stone conduits shall correspond to the American Railway Engineering Association specifications for fiber conduits.

**Appendix G—Standards**

Many railroads carry in stock a long list of lamps of various kinds, which involves not only a large amount of storage space and storehouse expense, but likelihood of errors in the proper placing of lamps. The accompany-

purposes are not included in the report. More than 80 per cent of the lamps manufactured are rated at 110, 115 and 120 volts; and the intermediate voltages are being eliminated as rapidly as possible. With regard to train lighting circuits, the voltage is standardized at 32 and 64 volts. It should not be a difficult matter to so adjust the train circuits as to obtain an average of these potentials and eliminate all lamps of other voltages. Train lighting circuits of the 60-volt range are rapidly disappearing. With regard to the cab lighting, 33 volts appears to have been recommended by the American Railway Association as standard. The voltage has been standard at 34 volts, but the above recommendation of the A. R. A. will undoubtedly involve a change to 33 volts.

All lamps in the list can be obtained equally readily with clear bulbs, or with frosted or enameled bulbs. For "C" lamps of 100 watts or above, the bulbs, instead of being frosted, should be "bowl enameled." The "C" lamps are filled with an inert gas, such as nitrogen or argon, while in the "B" lamps the filament operates in a high vacuum. The diameter of the lamp bulb is measured in eighths of an inch, the shape is indicated by the following letters: S—straight side; G—round (globular), and P. S.—pear shape.

It is realized that the list is not complete, and that probably most railroads will have local requirements which are not met by the list. It is the thought, however, that if the demand can be concentrated on this comparatively small number of sizes and styles of lamps, deliveries will be facilitated, the labor of handling reduced, and manufacturing economies will before long be reflected in prices.

**Discussion**

E. B. Katte (Chairman): The first sub-committee report is that on electrolysis and insulation, presented as Appendix A.

(Chairman Katte briefly abstracted Appendix A.)

Chairman Katte: In the absence of G. W. Kittredge, chairman of the sub-committee on Water Power, the report will be presented by W. L. Morse, vice-chairman.

(Mr. Morse abstracted the report.)

Chairman Katte: In Appendix C is given Specifications for Insulated Wires and Cables. I have not had an opportunity to talk with Mr. Elliott. I think perhaps I might have made clear the intent of these specifications a little more fully. They were not written to supersede the signal specifications, and there is nothing in this specification which supersedes or takes the place of any of the signal specifications. We hope in the course of a few years, or maybe months, we will have one specification that is applicable to all the various users of electric insulated wire. There will undoubtedly be clauses added to this specification from time to time, in which will be included the special kind of insulation required by the signal department or any of the other departments. The committee which made the tests in connection with the Results of Analysis was made up of representatives of four or five railroads, the U. S. Navy, the U. S. War Department and four or five manufacturers, and after years of research they have finally agreed on a procedure which is fairly accurate. I move that the railroad specifications for electric wires and cables be approved and printed in the Manual for recommended practice.

(Motion carried.)

Chairman Katte: The next subject is "Underground Conduit Construction, Appendix E," and I will ask Mr. Brumley, chairman of the sub-committee, to present that matter.

(Mr. Brumley then abstracted Appendix E.)

Chairman Katte: The committee recommends for in-

Will be standardized to replace the type B lamp at a future time. "White" bulb may also be used.

ing list has been compiled from data obtained both from railroads and manufacturers, in an effort to obtain a list which should be as short as is consistent with efficiency of operation, taking into account both the illumination efficiency and the life of the lamps. Lamps for signal

clusion in the Manual the additional electrical definitions, "Duct or conduit, Manhole and Mandrel." *I present that as a motion.*

*(Motion carried.)*

Chairman Katte: I inadvertently passed Appendix D, on electrical interference. The committee recommends that the report be accepted for information, published in the proceedings and the subject continued.

*(Motion carried.)*

Chairman Katte: *I would move that the railroad speci-*

*fications for incandescent lamps in Appendix G be approved and printed in the Manual.*

*(Motion carried.)*

Chairman Katte: The committee now recommends that the railroad specification for underground conduit construction for power cables, Appendix E, be approved and printed in the Manual. *I so move.*

*(Motion carried.)*

*(The committee was dismissed with the thanks of the Association.)*

## Report on Signals and Interlocking

*An investigation of means whereby temporary protection may be provided for track workers or for dangerous track conditions in automatic signal territory is a matter occupying the attention of this committee. Arrangements may be made whereby protection of a temporary or of a permanent nature may be provided. Temporary protection is afforded by signalmen disconnecting signal circuits while permanent arrangements may be made by introducing knife switches or circuit controllers in the circuits. The committee also reported on automatic train control and on the proper time interval for the release of electrical and mechanical devices.*

W. J. Eck  
Chairman

*W. J. Eck is completing his first year as chairman of the committee, although he had been vice-chairman for the four years previous, prior to which time he has served as a member since 1911. He entered the signal department of the Chicago & North Western in 1902 and was assistant engineer from November of that year until July, 1907, when he went to the Southern as signal and electrical superintendent, in which capacity he is now engaged. Mr. Eck has taken an active part in the development of signal and electrical standards and practices, being one of the pioneers in the introduction of alternating current signals in this country.*

THE COMMITTEE SUBMITTED a number of revisions for the Manual in Appendix A. The recommendations cover the reprinting of certain parts and the elimination and substitution of other matter in connection with requisites of switch indicators, signal symbols, drawings and specifications, etc.

In Appendix B the committee submitted extracts as information from the report of the Automatic Train Control Committee of the United States Railroad Administration to the director general on November 29, 1919.

In Appendix C the committee submitted the results of its study on the subject of methods for the display of signals for the protection of track workers. Its recommendations are given under the heading of Conclusions.

In Appendix D the committee submitted the results of its study on the proper time interval for releases applied to signal or switch apparatus. Its recommendations are given under the heading of Conclusions.

### Conclusions

The committee recommended that the following action be taken on the reports submitted:

1. That the changes in the Manual in Appendix A be approved and the revised matter be substituted for the present recommendations in the Manual.

2. That the matter shown in Appendix B be accepted as information.

3. That the following be approved and published in the Manual on the subject of methods for display of signals for protection of track workers:

(1) If temporary protection by signal is desired for track workers or for dangerous track conditions it should be provided by disconnecting the signal circuits so that the proper indication will be displayed. Disconnections should be made by signal forces.

(2) If permanent arrangements are desired for protection, by signal, of track workers or for dangerous track conditions, this may be provided by:

- (a) Opening track relay through knife switch.
- (b) Opening circuit wires through circuit controllers.
- (c) Shunting track by circuit controller or knife switch.

(3) Information may be provided by means of indicators to advise track workers of the approach of trains.

Note.—On an emergency a shunt wire with clips to attach to bond wires may be used, provided prompt action is taken thereafter to arrange for proper disconnection as prescribed.

4. That the following be approved and published in the Manual on the subject of time releases applied to signal or switch apparatus:

For average conditions the proper time interval for the release of electrical and mechanical devices applied to signal and switch apparatus should be the time required for a train running 30 mi. per hr. to travel from a point 1,000 ft. before reaching the distant signal to a point 10 ft. beyond the home signal.

In interpreting and applying this recommendation, it should be distinctly understood that it is only a guide and that the particular local conditions must, in the final analysis, govern the determination of this time interval.

### Appendix C—Display of Signals for Protection of Track Workers

It is not recommended that temporary protection by signal shall be provided by means of short circuiting track circuits because of the unreliability of such protection. Even when substantial connections are provided, they are so easily torn loose that no absolute protection is afforded.

If temporary protection by signal for track workers or against some emergency trouble is desired, it should be provided by having the signal forces disconnect the

signal circuits so that the signal will display the desired indication. After the necessity for protection has ceased, the circuits should again be connected by signal forces.

Where it is desired to install permanent arrangements for providing protection for other than purely train operations, any of the following methods, which are now in use on several railroads, seem to take care of the situation:

- (a) Open track relay connections at the relay.
- (b) Open track relay connection by knife switch.
- (c) Open signal circuit wires by knife switch or provide convenient way to cut wires with pliers.
- (d) Shunt track by circuit controller operated by switch stand.
- (e) Double shunt and break track circuit by knife switch.
- (f) Shunt track circuit by circuit controller operated by hand.
- (g) Control line circuits by staff instruments operated by track or other maintenance of way forces.
- (h) Special indicators to give information of the approach of trains.

#### Appendix D—Time Releases Applied to Signal or Switch Apparatus

In considering this question, the important and determining factor is that of "Safety." All electric locking devices are applied to promote safety in operation and in considering any device for nullifying such features, safe operation must still remain the principal consideration.

It is obvious that with a given train, the proper time interval for the release of electric locking devices should be the time required for such a train to travel from the point of clear vision of the distant signal (or sighting distance) to a point just in advance of the track circuit controlling the derails or switches.

There is difficulty in formulating any one rule that will govern all the various classes of traffic operating over any one interlocking plant. As either the speed or weight or both of trains increases, the longer should be the sighting distance and the longer the distant signal block. The question then really resolves itself into determining the speed of traffic upon which the recommended rule should be based.

The committee does not recommend that this should be based upon the speed of the slowest train operating over the plant, for the reason that this train can stop in a lesser distance than other traffic.

For average conditions, it is recommended that a speed of 30 mi. per hr. and a sighting distance of 1,000 ft. be assumed.

Upon these assumptions the rule will take the following form:

"For average conditions the proper time interval for the release of electrical and mechanical devices applied to signal and switch apparatus should be the time required for a train running 30 mi. per hr. to travel from a point 1,000 ft. before reaching the distant signal to a point 10 ft. beyond the home signal."

In interpreting and applying this recommendation, it should be distinctly understood that it is only a guide and that the particular local conditions must, in the final analysis, nearly always govern the determination of this time interval.

Committee: W. J. Eck (Southern), chairman; W. M. Vandersluis (I. C.), vice-chairman; Azel Ames (Cons. Sig. Engr.), H. S. Balliet (N. Y. C.), A. M. Burt (N. P.), C. E. Denney (N. Y. C. & St. L.), F. L. Dodgson (G. R. S. Co.), W. H. Elliott (N. Y. C.), G. E. Ellis (A. R.), J. G. M. Leisenring (I. T. S.), H. K. Lowry (C. R. I. & P.), J. C. Mock (M. C.), F. P. Patenall (B. & O.), J. A. Peabody (C. & N. W.), A. H. Ridd (Penna.), A. G. Shaver (Cons. Sig. Eng.), T. S. Stevens

(A. T. & S. F.), B. Wheelwright (G. T.), E. E. Worthing (Sou. Pac. Atl. Sys.).

#### Discussion

W. J. Eck (chairman): The Committee on Signals and Interlocking is reporting on the revision of the Manual, on automatic train control, on methods of displaying signals for the protection of track workers, and on time releases applied to signal or switch apparatus. As to the revision of the Manual, *I move that the changes in the Manual, Appendix A, be approved and the revised matter be substituted for the present recommendation in the Manual.*

(Motion carried.)

Chairman Eck: In outlining the method of automatic train control, the committee submits certain data as Appendix B. *I move that the matter shown be received as information.*

(Motion carried.)

Chairman Eck: The committee submits a report for the display of signals for the protection of track workers, and recommends that the conclusions be approved and published in the Manual. *I make a motion that the same be adopted.*

(Motion carried.)

Chairman Eck: Under time releases, as applied to signal or switch apparatus, *I move that the conclusion be approved and published in the Manual.*

The Chairman: Is the last paragraph under Appendix D to be incorporated in the Manual?

Chairman Eck: Yes.

The Chairman: Do I understand that the entire text of Appendix D is to be incorporated in the Manual?

Chairman Eck: No, sir. I moved that the conclusion be approved.

G. A. Mountain (Kan. Ry. Com.): What regulates the speed of 30 miles?

Chairman Eck: It was taken as an average figure. For average conditions a rule or section of this sort must be carefully considered, as we bring out in the last paragraph.

(Motion carried.)

(The committee was dismissed with the thanks of the Association.)

Permanency and Harmony of Design Are Well Illustrated in the Lackawanna Tower at Montclair, N. J.

## Report of the Committee on Rail

The rail record forms have been revised and renumbered to divide them into groups relating to inspection and shipment, rail failures and rail wear. The relation of shattered steel in fissured rails to the mill end of the rail was discussed by M. H. Wickhorst, who concluded that this shattering developed in the cooling and seems to be shrinkage checks. Dr. P. H. Dudley presented data to show that the broad head of the 100-lb. and 105-lb. rail sections provides ample area to carry the wheel loads of present-day traffic without impairment of its initial ductility with rails made from sound, homogeneous metal. Elimination of brittleness would reduce failures.

G. J. Ray  
Chairman

G. J. Ray has been a member of the committee for five years and chairman for three years. He has also been active in other work in the Association, having served as chairman of the Track committee for several years and as a member of the Board of Direction from 1914 to 1917. He has been chief engineer of the Delaware, Lackawanna & Western for 12 years, during which time he has led in the development of an unusually permanent form of track construction employing treated ties, screw spikes and heavy ties plates and fastenings. He has long been a student of the rail problem and has had an important part in measures for improvement.

THE COMMITTEE GAVE CONSIDERABLE attention to the rail record forms in the Manual, and in Appendix A presented forms recommended for inclusion in the Manual to replace the present forms.

During the year special reports were presented by the Rail committee as follows:

No. 89. Fail Failure Statistics for 1918 Classified by Railroads, by M. H. Wickhorst.

No. 90. The Relation of Shattered Steel in Fissured Rails to the Mill End of the Rail, by M. H. Wickhorst.

No. 91. Fail Failure Statistics for 1919, by M. H. Wickhorst.

No. 92. Residual Ductility Tests in the Bearing Surface from Failed Rails in Service, by Dr. P. H. Dudley.

Report No. 90 is a continuation of the research work to discover the cause of interior rail shattering so a remedy can be provided. Previous reports by the Rail committee have announced the discovery of a shattered condition in the interior of the heads of rails that had failed from transverse fissures; that is, the interior steel contained numerous small cracks, some of which developed in service and some of these in turn finally breaking the rail. It has already been shown that in the body of the rail the shattering remains about one-half inch away from the exterior surface and this investigation shows that the shattered interior also terminates about one-half inch short of the end of the rail as hot-sawed at the mill. This indicates that the shattering was not in the hot rail bar as rolled, but developed in the cooling of the rail; that is, the small cracks are probably shrinkage checks.

Dr. Dudley's paper describes the results of drop tests of 65 rails which had failed in service. They were cut into short lengths and tested in the drop test with the head in tension, to determine their ductility. Most of the rails were lacking in ductility, but some showed good ductility. Failures of the coalescent type occurred mostly in the A rails, while failures of the intergranular type were more numerous in the B and C rails.

### Conclusion

The committee submitted the following resolution for adoption by the Association:

That the rail record forms submitted with this report (Appendix A) be adopted by the Association and included in the Manual to replace the present forms.

Committee: G. J. Ray (D. L. & W.), chairman; H. B. MacFarland (A. T. & S. F.), vice-chairman; E. E. Adams (U. P.), A. S. Baldwin (I. C.), W. C. Barnes (U. P.), W. C. Cushing (P. R. R.), G. M. Davidson (C. & N. W.), Dr. P. H. Dudley

(N. Y. C.), J. M. R. Fairbairn (C. P. R.), L. C. Fritch (C. R. I. & P.), J. H. Gibboey (N. & W.), A. W. Gibbs (P. R. R.), C. R. Harding (S. P.), John D. Isaacs (S. P.), H. D. Knecht (M. P.), Howard G. Kelley (G. T.), R. Montfort (L. & N.), A. W. Newton (C. B. & Q.), J. R. Onderdonk (B. & O.), F. S. Stevens (P. & R.), F. M. Waring (P. R. R.), M. H. Wickhorst, J. B. Young (P. & R.).

### The Relation of Shattered Steel in Fissured Rails

Rails that have failed in track due to interior transverse fissures contain "shattered" steel in the interior of the rail head, as disclosed by deep etching with strong hydrochloric acid of sections of the rail head, particularly horizontal longitudinal sections through the middle of the head. Etchings have shown the cracks to be deeply imbedded in the rail head, occurring not less than about one-half inch from an external surface. This suggested that the cracks are shrinkage cracks formed during or after the cooling after the rail bar has been fully formed. If so, then the end of the rail produced in the sawing of the hot bar also should be free from the cracks for about one-half inch or so from the end as hot sawed.

About 25 fissured rails were examined, and as a part of the investigation of the rails, longitudinal sections through the interior of the head, six inches long, were cut from each end of the rail and from near its middle. Most of the samples showed a defective condition in the interior of the head and about half the rails showed a condition of badly shattered steel, displaying numerous etching cracks. The samples which showed numerous etching cracks were suitable for observations as to whether the zone of shattered steel terminates before reaching the end of the rail and measurements were therefore made on these rails, of the distance from the end of the rail to the nearest crack displayed in the etched section. The numbers of the rails on which the measurements were made and the mill and service data concerning the rails were compiled. The results of the measurements showed that the shattered steel terminated from 0.33 to 0.62 inch from the end of the rail, with an average distance of 0.49 inch in the 19 rail ends measured. At any other place on the etched surface, including the end of the slab cut six inches from the mill end of the rail, a line drawn at right angles across the surface from side to side would be apt to cut through a crack or come close to it. This fact and the angular nature of the small cracks indicate that the shattering was not present in the hot bar as it left the finishing rolls, but developed in the cooling; that is, the cracks seem to be shrinkage checks. On the other hand, it has been sug-

gested that the freedom of the end of the rail from cracks is due to the densifying effects of the hot saw, and not to the relief of the end from strains.

### Residual Ductility Tests

For several years the New York Central Lines have conducted numerous drop tests on rails removed from service after having developed interior transverse fissures. These tests were conducted principally under an improvised drop testing machine, so constructed that the full residual ductility could not be developed. During July, 1920, a standard drop testing machine was used, so that each individual piece could be tested to destruction, and the full residual ductility developed. Rails were gathered from widely scattered locations, and represent failures in melts rolled in different years, as well as different months of the same year.

The tests were all made with the head in tension, supports 3-ft. centers, and the 2,000-lb. tup falling through a height of 15 ft. The object in testing all pieces of the old rails with head in tension was to determine the amount of residual ductility in the cold rolled bearing surface, and also to classify the type of head fracture as each piece was broken under successive drops.

Of the 305 pieces tested, 137 broke on the first blow without displaying ductility. One hundred and fifty-eight, or 52 per cent of the total tested, developed at least five per cent in two consecutive inches; the residual ductility on the various test pieces ranging all the way from 5 to 19 per cent, the latter amount being obtained in one inch of one test piece. This is a remarkable showing in view of the service records of these rails under severe traffic, speed and weather conditions, and substantiates the fact that the broad head of the 100 and 105-lb. rail sections provides ample area to carry the wheel loads of present-day traffic, without impairment of its initial ductility, when the rails are made from sound, homogeneous metal, both physically and chemically.

It should be noted that of the 137 test pieces failing under the first blow of the tup, 57 disclosed cores, or fissures of either the coalescent or intergranular type. Over half of the remaining 80 pieces were portions of high and low rails from curves. These contained the accumulated deformation and abrasive effect from the impingement of thousands of wheels, of which a great many were cast iron wheels with the M. C. B. contour. The chamfer of the cast iron wheels on the low rails does more than simply abrade the bearing surface. The action seems to exhaust the ductility in a faster ratio than the ordinary rolling abrasion. The metal in the low rails wears hollow, and in portions of the bearing surface the metal is frayed and ragged. It could hardly be expected under the 30,000 foot-pounds of the drop that this frayed metal would show as much ductility as on rails where only rolling abrasion has occurred.

It was exceedingly important to find the high residual ductility in such a large number of the test pieces from these rails after 5 years, or more, of service. The statement has often been made and inferred that the ductility is practically nil in all rail heads after relatively lighter traffic conditions and shorter lengths of service than was obtained on this lot of rails. This supposition will need revision from a study of the tests included in this report, for the evidence presented shows that a large amount of ductility still remains in many of the pieces of the old rails, with the full ductility due to the chemical composition, after a number of years' service.

### Discussion

(In the absence of both the chairman and the vice-chairman the report was presented by J. M. R. Fairbairn [C. P. R.] )

Chairman Fairbairn: Our chairman has written a letter in presentation of this report which I think it is in order to read, as I think it is the unanimous feeling of the committee on this subject. Mr. Ray says:

So far as the committee is aware no rail has been rolled under the new specification. This is not at all surprising considering the attitude of the manufacturers. On September 14, 1920, the rail committee met with the rail committee of the manufacturers. All phases of the specifications were freely discussed. The manufacturers, as represented by their rail committee, have stated that they will not agree to roll rail of any weight under a contract requiring full compliance with all features of the 1920 specifications. They have stated that they will roll rail up to 110 lb. per yd. under the 1920 specifications slightly modified so as to eliminate a few of the so-called objectionable paragraphs on manufacture or mill practice. This modified specification will take an extra price estimated at approximately \$13.00 per ton for a base price of \$57.00, or something in excess of \$9.00 on a base price of \$47.00. The manufacturers' committee have further stated that they will not meet the 1920 specifications at all for rail 111 lb. per yd. and over. The big extra demanded by the manufacturers has practically killed the new specification. Naturally, no railroad management will pay so large an extra for a standard specification until it has been proven beyond a doubt that rail manufactured under such specifications is sufficiently superior to warrant the extra price.

The rail committee is at present somewhat confused as to what to do under the prevailing conditions. Those reasonably well satisfied with the quality of rail now being received are opposed to changing the specifications if by so doing the price of rail will be increased. They are also opposed to two standard specifications, one for a higher quality of rail to require an extra price. Naturally they do not wish to be placed in the position of purchasing an inferior brand of rail. With the present attitude of the rail manufacturers there is little that can be done by the rail committee to improve the 1915 specifications without creating extra expense on the part of the purchaser.

It is a fact that many of the mills are rolling rail under modified specifications and the rail manufacturers freely admit that they are willing to roll rail for individual roads under specifications containing many of the objectionable features of the 1920 specifications. Some such specifications take a slight extra, in other cases no extra is charged. The rail committee has sought a reason from the manufacturers for their willingness to roll rail without extra charge under private specifications when they are not willing to have the special features of the private specifications included in the A. R. E. A. specifications. In answer the manufacturers give what appears to be a more or less reasonable explanation. Where the manufacturers and the individual road agree on a special specification, consideration is given to all features of the specification and the method of inspection together with the judgment and fairness of the inspector, or those responsible for the inspection. Where both the physical and chemical properties of the finished rail are limited as in the A. R. E. A. 1920 specifications, a strict compliance with the specifications as to chemistry might be the cause of discarding more or less perfectly good rail, but where the railroad officials are inclined to be fair and reasonable, some of the manufacturers are willing to try out the specifications, although such specifications may vary materially from the standard. They are not willing to take chances with inspectors at large and claim that the general use of such a specification as the A. R. E. A. 1920 would cost the manufacturers a

material amount of money, and in their opinion such refinement is not needed with the greater portion of the tonnage used throughout the country.

There is undoubtedly some merit to the manufacturer's contention that the purchaser should not specify the method of manufacture and also place a limit on both the chemical and physical requirements of the finished rail. On the other hand, the consumer is anxious to have sufficient control over the mill practice and to place such limits on the physical and chemical properties of the finished rail as to insure the elimination of both the dangerous and poor wearing rail.

The rail committee will endeavor to reach a conclusion during the coming year. First: Should the Association adopt two specifications, one to be the best possible without running into extra price; the other to be the 1920 specification, possibly revised, but requiring an extra price? Second: Should we have one specification without extra cost over the manufacturer's base price, the Association to be given a list of specific refinements in the order of their importance (considering the probable cost) so that roads requiring a higher grade of rail will have the benefit of the Association's judgment on the most valuable of such refinements?

Chairman Fairbairn: I think Mr. Ray has so thoroughly covered the ground in presenting the report, there is really nothing further to be said on the subject, except to proceed with the report itself. I will ask Mr. Newton, chairman of the sub-committee, to present the part of the report referring to Revision of the Manual.

A. W. Newton (C. B. & Q.): After a meeting of the committee the conclusion was reached that we should revise the forms in the Manual covering the production of rail and the records of rail failures and rail wear in track.

In order to ascertain the feeling of the railroads respecting the use of these forms, a circular letter was sent out and replies were received from 49 different roads, which showed that on the roads reporting only two of the forms are generally used. One was the failed rail report as it is commonly known, and the other is the summarization of those reports that is submitted annually to the rail committee.

Of the other, I think, 15 forms, out of 49 roads it appeared that about only 4 or 5 of the roads were using this or that or the other form. Only one or two roads made any attempt to use the number of the forms as provided.

One thing that the committee wishes brought to the attention of the convention is that probably much more valuable information would be available if all the roads interested would take a more active part in the compilation of data on this subject, not only the manufacture of rails, but of the results obtained from rails in the past. The changes made were such as would make it possible to give a little more detail in some respects and make it possible to apply the specifications of 1920 to record the results of any rail production under those specifications.

Chairman Fairbairn: *I move that the Association adopt these forms for inclusion in the Manual to replace the present form.*

C. E. Lindsay (N. Y. C.): In the report to be used by the section foreman the committee shows the gage side in plan or elevation, but do not provide for showing it in the section.

The Chairman: The committee states that that suggestion will be incorporated in the drawing.

C. W. Baldrige (A. T. & S. F.): In checking over the rail failure reports in the form Report of Rail Failure in Main Track I found that the term "Rail Section" gave the section foreman more trouble than most of the

other matters in it, and I prepared a form for our own road, some two or three years ago, in which we propose to overcome this by a little note to the foreman saying—"Show once on this line all letters and figures appearing in raised form on the rail."

Mr. Newton: That subject was considered, and I think it has been tried by other roads than your road. We tried it once, and when the report came in it happened that there were four sets of numbers on the rail that failed, and he started at one end and went clear to the other end, and we got all the figures. The committee in giving study to that, felt that the roadmaster who has to prepare these reports should certainly be conversant enough with the subject to have proper reports made by the section foreman.

Mr. Baldrige: I realize that a good many foremen, if you simply leave it to them to show the brand without any instructions, or the heat number without any instructions, would repeat it, but by putting the note—"show once all letters and figures appearing in raised form in the rail" I think he would get a pretty accurate brand.

I have this to say in regard to the checking up of these reports by the roadmasters—fully 50 per cent of these reports come in without the roadmaster seeing them. The clerk checks them up.

A. L. Davis (I. C.): On the Illinois Central we tried the same plan about two years ago, cutting out a lot of questions and substituting one line across the top of the form. We found it does not work out at all, but that by having the separate questions, as the committee has recommended, we get better results.

E. A. Frink (S. A. L.): It is obvious that this form is the most important form we have for our rail data, because upon it is based all the information we get as to the actual failure of the rail in the track. There is one class of failures which is unfortunately becoming more prevalent in our track and that is transverse fissures. I find that many of our section foremen (and I presume other roads have had the same experience) have not been educated to distinguish a transverse fissure, at any rate, not in all cases. I think this form would be improved if a note was inserted where rail failures are classified, bringing out the fact that a transverse fissure before it penetrates to the edge of the rail is always white, and after it reaches the outside air is almost invariably black or dark in color. If you bring that out more strongly a foreman will be more apt to report these breaks correctly.

J. L. Campbell (E. P. & S. W.): I believe a good plan in this connection would be if a railroad company would provide the foreman with a photograph of a typical transverse fissure, and that will give him a physical illustration of what it looks like. It is not difficult to photograph this particular form of failure so that it shows clearly, and that can be transferred to the blue print, where it can be shown clearly.

Chairman Fairbairn: On the Canadian Pacific we have inserted in our maintenance of way rule book a few pages on the subject of rail failures. They are really instructions to section foremen and roadmasters as to the use of these forms. They illustrate and elucidate what is required for each of these numbers. We give further, an illustration by photographs of what a transverse fissure is, and we try to educate the foreman to such an extent that he can intelligently fill in these forms, and I believe if that system of advising the trackmen was generally practiced the form as it now exists is in about as good shape as it can be put.

*(The motion was put to vote and carried.)*

Chairman Fairbairn: The next subject is a report on rail failures, comprising present statistics and conclusions

as to causes and including suggestions for improvements in rail steel.

Mr. Wickhorst will present that part of the report.

M. H. Wickhorst: I am asked to talk on the subjects, rail failures and investigations. I might just dispose of one of these, the subject of investigations, hurriedly, by calling your attention to the work, particularly along the line of transverse fissures—the work of the last few years, and which has been continued during the last year, has shown that fissures occur in steel that has been shattered interiorly, that is, the interior of the head contains numerous small cracks which are apparently in the rail at the time it is put into the track. At any rate there is a potential condition and a fissure is a development of some of the small cracks originally in the rail.

The paper on The Relation of Shattered Steel in Fissured Rails to the Mill End of the Rail, shows this, but I may say, first, that this shattered condition does not extend to the surface, either at the top or the side, but remains about a half inch away, and this particular investigation shows that that shattered condition does not extend clear to the end of the rail as it was not sawed. It terminates about a half inch away from the end, in other words, it is a purely interior condition.

Doctor Dudley has also presented the results of some of his work—tests of a great many rails that have failed from fissures, and tests particularly by means of drop testing, and we have some very interesting information. One is these fissures of the type that are called the coalescent type, that is, where there is a horizontal fissure extending lengthwise of the rail and horizontal, perhaps  $\frac{1}{2}$  to  $\frac{3}{4}$  in. That type of fissure occurs largely in the A-rail. Its point of origin or point of growth is from a streak in the interior, apparently in most cases a streak of slag, or some other non-metallic inclusions.

The type of transverse fissure—pure and simple transverse fissure—that has no longitudinal element to it, occurs mostly in the D and C rail. This zone includes perhaps 25 to 40 per cent of the ingots, which takes most of the fissures of that type. It is very interesting to know how that is caused, but we have not worked that out.

A study of rail failure records indicates that it is probable that a further reduction of perhaps 80 per cent can be made, and we have that to look to as a goal for the next eight or ten years perhaps.

Some years ago, when the thin base sections were used largely, there were a large number of failures of the base, but that type of break has been largely overcome by thickening of the base. I would suggest to those roads that are still using these thin bases, where the rails are in heavy service, would profit by adopting some sections with the heavy base.

The specifications should be so designed that the ductility of the metal in the rail can be retained. The mill practice, the methods of manufacture, should be such as to eliminate such matters as segregation in the ingot, inclusion of slag. That means good ingot practice.

The inspector has a very important part. The specifications generally permit the inspector to test the head with either base in tension or with the head in tension. Early work of the rail committee showed that the results when the rail is tested with the head in tension correlate pretty well with the interior condition of the ingot. Segregation of carbon and phosphorus or possibly large amounts of over-inclusion will show up in the analysis of the rail, or in etching tests. This same condition can be shown pretty well by testing the rail with the head in tension. With the base in tension, however, the correlation is not so good.

Tensile tests of rails made from special ingots showed much better than the ordinary type of ingot. But when they made break tests, and these tests were made with the head down, the ordinary type of ingot was quite as good or possibly even a little bit better.

C. W. Gennett, Jr. (C. W. Hunt & Co.): As one who is continually brought into very close contact with the rolling of steel rails, and frequently with their later use, I feel that some observations of the past year's work may be opportune. Production was low, one mill rolling no rails at all, four others contributing only a small tonnage, and the remaining eight of the United States and Canada rolling at a rate much reduced from normal. Such operations do not, in my judgment, speak for the best of quality, for slow operation generally means intermittent rolling, and may easily result in bad quality. As a rule, the best results may be expected when the mills are rolling steadily, with the various details running smoothly and with clocklike precision.

Perhaps the most curious fact apparent at the mills is their loathness to adopt any special means aiming towards the casting of sounder ingots. It is practically agreed that the segregated and physically unsound steel occurring in the top part of the ingots is the direct cause of virtually half of the troubles occurring with rails in service, for split, crushed, flowed and mashed heads are mostly confined to "A" or top rails from ingots. A number of "A" rails constitute, roughly, 15 per cent of all that are rolled and, while they all bear a mark of suspicion, still their price is the same as for the less doubtful rails.

Several mills have recently widened the distance between the supports in the cold straightening presses and as much as 60 in., instead of 42 in., is now being used. Needless to say, the results are favorable and it is to be hoped that the practice will be adopted at all the mills and the punishment of the rails in the damaging process of straightening thus reduced.

A continued source of difficulty at most mills is the inability to make every heat of open hearth steel analyze within the limits of the chemical composition specified for the particular order being worked. Frequently whole heats in the form of ingots or blooms have to be temporarily set aside to be later reheated and rolled on orders which their composition fits. Such cases invariably give rise to an increased number of flawed rails and the practice is manifestly unsatisfactory. Carbon is one of the chief causes of this trouble, and it would be extremely desirable to agree on a common standard to cover the carbon content of all rail steel.

It is difficult to say what specifications for rails are the most commonly used. Definite figures would probably show that the Manufacturers' Standard had been used on the largest tonnage, and following them would come the A. R. E. A. of 1915, often with modifications making it virtually that of the A. S. T. M. and, finally, several others of the individual railroads. Practically all of these specifications contain the clause governing ductility, which requires that the drop test pieces show at least five per cent elongation in two inches or six per cent in one inch.

The question of interior defects showing at the drop test is important. The rejections at one mill, due to interior defects, were approximately 10 times those at another. Such a diversity of results, of course, indicates a diversity of practice, and naturally raises again not only the question of making sound ingots, but also the desirability of treating each ingot as a unit and testing it accordingly, as was repeatedly done in war times with shell steel and is easily accomplished at the Canadian mills on rails for that country.

I venture the statement that good steel cast into sound ingots, of proper composition, followed by careful treatment in the soaking pits and rolling mills, may be expected to result in rails of such quality as to safely with-

stand, when laid on a roadbed of good ballast and ties, the heavy wheel loads of traffic for years to come.

(The committee was dismissed with the thanks of the Association.)

## Report of the Committee on Track

*Designs for 5/8 and 9/16-in. cut track spikes are presented. Specifications for switches, frogs, crossings and guard rails with data for laying out frogs are offered. New requisites for switch stands, including connecting rods, are presented. A number of typical plans for turnouts, crossovers, frogs and guard rails were submitted. A theoretical study of gages and flangeways for curved crossings was printed as information. The committee is working on plans and specifications for switch stands, switch lamps and switch locks and also on tie plates, deraillers and anti-creepers. Little track work was done by contract, except on a cost-plus plan, last year.*

W. P. Wiltsee  
Chairman

*W. P. Wiltsee has been chairman of the Track committee for three years and a member of the committee for two years more. He has also been active in the work of the Roadmasters' and Maintenance of Way Association, of which organization he is now president. In directing the work of the committee he has been particularly successful in enlisting the co-operation of the Manganese Track Society in the development of standard plans for special track work and in harmonizing conflicting opinions regarding these standards. Mr. Wiltsee is principal assistant engineer of the Norfolk & Western, in which capacity he has a wide range of duties.*

**I**N APPENDIX A THE COMMITTEE presented a large number of proposed changes in the Manual.

In Appendix B the committee reported on typical plans of turnouts, crossovers, slip switches, double crossovers and railroad crossings, and detail plans for such work, including necessary fixtures, etc., and its recommendations are given under the conclusions. In Appendices C, D, E and F the committee submitted progress reports on gages and flangeways for curved crossings; plans and specifications for switch stands, switch lamps and switch locks; plans and specifications for tie plates, deraillers and anti-creepers; specifications and piece work schedules for contracting track maintenance work.

The committee also reported progress on: Subject 3, "Reduction of taper of tread of wheel to 1 in 38, and on canting the rail inward"; on Subject 4 (a), "Report on tests of tie plates subject to brine drippings, and (b) on the effect of brine drippings on track appliances;" on Subject 5, "Plans and specifications for track tools," and on Subject 6, "Report on limit of wear on frogs, including rules for determining when frogs are sufficiently worn to warrant removal."

### Conclusions

1. The committee recommended the changes in the Manual as submitted in Appendix A be approved and the revised matter be substituted for the present subject matter in the Manual.

2. In Appendix B the committee submitted detail plans as per instructions, recommending certain of them for adoption and others to be received as information. These plans are the result of the study and co-operation of your committee and the Frog and Switch Manufacturers of the Manganese Track Society. Appendix B also covers a progress report on uncompleted work, and the committee recommended reassignment of the subject.

2a. In Appendix C a theoretical study was submitted on the subject of gages and flangeways for curved crossings, which the committee recommended be accepted as information, also that the subject be reassigned.

3. The committee reported progress and recommended that subjects Nos. 3, 4, 5 and 6 be reassigned. It also recommended that the progress reports in Appendices

D, E and F be accepted as information, and the subjects reassigned.

Committee: W. P. Wiltsee (N. & W.), chairman; J. V. Neubert (N. Y. C.), vice-chairman; L. B. Allen (C. & O.), V. Angerer (Wm. Wharton, Jr., & Co.), W. G. Arn (I. C.), J. D. Baker (P. R. R.), R. A. Baldwin (C. N. R.), G. H. Bremner (I. C. C.), H. G. Clark (C. R. I. & P.), E. A. Hadley (M. P.), G. W. Hegel (C. I.), E. T. Howson (Railway Age), T. T. Irving (G. T.), J. B. Jenkins (B. & O.), H. A. Lloyd (Erie), J. de N. Macomb (A. T. & S. F.), F. H. McGuigan, Jr. (V. S. R. A.), F. L. Nicholson (N. S.); R. M. Pearce (P. & L. E.), H. T. Porter (B. & L. E.), J. H. Reinholdt (M. & St. L.), G. J. Slibeck (Pettibone, Mulliken Co.), J. B. Strong (Ramapo Iron Works), J. R. Watt (L. & N.).

### Appendix A—Revision of Manual

The committee recommended that the following changes in the Manual be made:

#### CUT TRACK SPIKE

The committee recommended that the design of the cut track spike shown on page 22 of the 1918 supplement to the Manual be withdrawn, and the designs for 5/8-in. and 9/16-in. cut track spikes submitted be substituted therefor, as the present design in the Manual does not correctly show the slope of the underside of the head of the spike to agree with the slope of the top of the rail base. The design of 5/8-in. cut track spike is the same as that submitted last year and as published in Vol. 21, Bulletin 221, except the width at the toe end has been changed to 5/8 in. instead of 1/2 in., and the curve under the head has been changed for greater strength and better contact of the jaw of a claw bar.

Reports as to the practicability of this design for manufacture in automatic machines have been received from various steel companies and samples have been submitted to this committee.

It was recommended that pages 168 to 186, inclusive, in the Manual be omitted commencing with the article "Crossovers," and the following substituted:

#### Specifications for Switches, Frogs, Etc.

##### I. GENERAL INSTRUCTIONS

1. The purchaser will furnish the manufacturer specifications and drawings, giving rail sections, splice drilling, angles,

31. **Alinement and Surface.** The alinement and surface of all finished work shall be even and true and conform to the angles specified.
32. **Length.** Length of frogs and crossing arms shall not vary more than 1/4 in. from lengths specified. Switch-point rails and guard rails shall not vary more than 1/2 in. from length specified. Rail ends shall be cut square to the axis of the rail, unless otherwise required.
33. **Flangeways.** The width of flangeways shall not be less than nor more than 1/16 in. greater than the width specified, when measured on the level of gage line 3/4 in. below tread surface. Flangeways shall not be less than 1 1/4 in. deep measured from top of the tread surface, unless otherwise specified.
34. **Bending.** Bends shall be made accurately in arcs of circles and without injury to the material. It is desired that rails be bent cold. If heating of the rails is resorted to it must be done in a manner so as not to injure the metal.
35. **Planing.** All planing must be true and all abutting surfaces must fit accurately.
36. **Grinding.** Running surfaces of the manganese steel parts shall be ground to practically as good a surface as that of the rolled rail. Manganese steel portions fitting into rails or other parts shall be ground to a good fit.
37. **Drilling and Punching.** All holes in carbon steel rails must be drilled. In other parts all holes for turned pins or bolts and for tight fit of rough bolts must be drilled. Drilling to be done accurately, on bevel where necessary. Punching will be permitted only in wrought iron or mild steel parts for rivets, loose rough bolts and spikes, except when such holes come so close together or close to the edge of the piece that the metal between holes or between hole and edge is less in width than the thickness of the material, in which case holes must be drilled.
38. **Fit of Bolts.** Main or body bolts in frogs and crossings shall have a tight fit in straight true holes. Heads and nuts shall have a square bearing. Other bolts not requiring a tight fit, unless otherwise specified shall have a clearance of not more than 1/16 in. in drilled or punched holes and not more than 1/8 in. in cored holes. Threads must be U. S. Standard, accurately cut within tolerance of best practice for cut threads. Nuts must have a tight fit.
39. **Rivets.** Rivets shall be of full diameter called for on plans and rivet holes shall not be more than 1/16 in. greater in diameter. When not otherwise called for by plans or specifications, rivets shall have standard button or cone heads of uniform size for the same size rivet. The heads shall be concentric with the holes. Countersunk rivets shall be flush with the surface and fill the countersink.
40. **Fit of Fillers, Braces and Reinforcing Bars.** Fillers, except as otherwise called for or permitted by plans and specifications, shall fit closely into the fishing space of the rail and into the fillets of the web for not less than 1/2 in. below the head and above the base flange. When the raised brand of the rail interferes with fit of filler the brand shall be removed. Fillers shall be grooved or cut to clear rivet heads and bolt heads. Switch braces shall fit the fishing space of the rail when the brace is tight against the shoulder of the switch plate. Reinforcing bars shall fill the height of the fishing space of the rail.
41. **Plates and Bars.** All plates must be flat and true to surface. Bars must be straight and of the full size called for.
42. **Painting.** No paint, tar or other covering shall be used unless specified, and, in any case, shall not be applied before final inspection.
43. **Welding.** No welding shall be permitted on rails or on surfaces of other parts exposed to wheel wear. Welding in other portions may be permitted if in the judgment of the inspector the strength of the piece is not impaired.
44. **Marking.** The finished articles shall be plainly stamped with 3/4-in. figures and letters for identification. The manufacturer's name or initials, section and weight of rail and month and year of manufacture must be stamped on a rail portion of the structure not exposed to wheel wear and where marking can be plainly seen, or may be stamped on a separate rust-proof plate, riveted to the web of the rail, in which case smaller letters may be used. Frogs must be marked with the frog number. All loose parts or fixtures shall be similarly stamped with suitable size letters and figures, the stamping also to show the numbers of the parts appearing on the plan and detail number, where established. On cast parts all or part of the lettering may be cast on the piece. All heat-treated bolts shall be marked on the head with letter or symbol indicating the manufacturer.

IV. INSPECTION

45. Material and workmanship shall be at all times subject to inspection by a duly authorized representative of the pur-

chaser. The inspector shall have all reasonable facilities afforded to him by the manufacturer to examine the work during its progress, as well as the finished product, to satisfy himself that the work is manufactured and finished in accordance with these specifications.

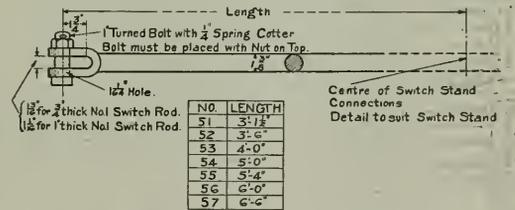

46. All inspection shall be made at the place of manufacture. Tests of material may be made at the expense of the manufacturer if the amount of any particular kind of material is 50 tons or more. If less than 50 tons, the manufacturer shall certify that it is furnished in accordance with this specification; however, if the purchaser desires that a test be made he shall bear the expense of same, unless the material fails to meet the specifications, in which case the manufacturer shall stand the expense of such test. For the rails used in the work the manufacturer, when requested, shall supply the purchaser with a certificate of inspection from the rail manufacturer.

47. The acceptance of any material by an inspector shall not prevent subsequent rejection if found defective after delivery, and such defective material shall be replaced by the manufacturer at his own expense.

Requisites for Switch Stands, Including Connecting Rods

The committee recommended that article "Requisites for Switch Stands" on page 168 be withdrawn, and the following substituted:

1. Provision shall be made for spiking or bolting switch stands to two head blocks.
2. Classification of switch stands according to heights. (Height of switch stands is measured from top of tie to bottom of taper of lamp tip):
  - A. High Switch Stands: Height greater than 14 ft.; standard height, 18 ft.
  - B. Intermediate Switch Stands: Height greater than 2 ft.; to and including 14 ft. Standard heights: (a) First intermediate, 7 ft. 9 in.; (b) second intermediate, 6 ft.; (c) third intermediate, 4 ft.
  - C. Low Switch Stands: Height greater than 1 ft.; to and including, 2 ft.
  - D. Extra Low Switch Stands: Height, 1 ft. or less.
3. The operating lever of extra low and low switch stands shall work parallel with the track.
4. The switch stand shall be so arranged that it can easily be inspected.
5. There shall be no lost motion in the bearings. The connections between the various points of the switch stand

Switch Stand Connecting Rods

- shall be such as to insure against movement of switch points without corresponding movement of the operating lever.
6. The connection between the connecting rod and the switch stand shall be by a turned bearing of not less than 1 1/2 in. diameter, and shall be so arranged that the separation cannot occur under operating conditions.
7. Provision shall be made for adjusting the throw of either or both switch points without moving the switch stand.
8. The throwing apparatus shall be so arranged that it will lock or latch in either extreme position without the use of the switch lock.
9. Lengths and details of connecting rods shall conform to plan No. 251, dated November 17th, 1920.
10. The target and lamp tip when used on a switch stand shall revolve through 90 deg. with the movement of the switch points, and indicate their position.
11. Shapes and sizes of targets shall conform to plan.....
12. Lamp tips shall conform to plan.....

On account of the variety in the detail of switch stands now on the market and the fact that many of the features are patented the committee recommended that it would

not be desirable to prepare plans nor complete specifications for switch stands, and in lieu thereof recommended the above. The requisites of switch stands have been drawn sufficiently broad to include the more efficient and complete switch stands now commercially available.

Appendix B—Typical Plans of Turnouts, Crossovers, Slip Switches, Double Crossovers and Railroad Crossings

The committee recommended the following plans for adoption:

- Plan 901—Layout No. 6 Turnout and Crossover.
Plan 902—Layout No. 7 Turnout and Crossover.
Plan 903—Layout No. 8 Turnout and Crossover with Rigid Frogs.
Plan 904—Layout No. 8 Turnout and Crossover with Spring Frogs.
Plan 905—Layout No. 10 Turnout and Crossover.
Plan 906—Layout No. 11 Turnout and Crossover.
Plan 907—Layout No. 16 Turnout and Crossover.
Plan 908—Layout No. 20 Turnout and Crossover.
Plan 190—Diagram Preferred Names for Split Switches with Uniform Risers.
Plan 191—Diagram Preferred Names for Split Switches with Graduated Risers.
Plan 390—Diagram Preferred Names for Bolted Rigid Frogs.
Plan 490—Diagram Preferred Names for Spring Rail Frogs.
Plan 590—Diagram Preferred Names for Guard Rails.
Plan 690—Diagram Preferred Names for Rail Bound Manganese Steel Frogs.
Plan 691—Diagram Preferred Names for Solid Manganese Steel Frogs.

The plans of turnouts and crossovers, Nos. 901 to 908, inclusive, are the result of study of several railroads. At-

Plan 502—Details of guard rail fixtures: Under notes, the second item, correct to read "For 16-ft. 6-in. guard rails and for congested traffic, with 11-ft. guard rails, use two clamps, applied in position C-2;" and note under alternate should be revised to read "For 16-ft. 6-in. guard rails and for congested traffic, with 11-ft. guard rails, use two adjustable guard rail braces applied in position B-2."

The committee also recommended that the following plans be accepted as information:

- Plan 309—No. 4 and No. 5 Bolted Rigid Frogs.
Plan 608—No. 4 and No. 5 Rail Bound Manganese Steel Frogs.
Plan 656—No. 4 and No. 5 Solid Manganese Steel Frogs.

The following plans for railroad crossings, dated November, 1920, were submitted as information and for criticism:

- Bolted Rail Crossings:
Plan 701—Angle 50 to 90 deg., Three Rail Crossings.
Plan 702—Angle 50 to 90 deg., Two Rail Crossings.
Plan 703—Angle 35 to 50 deg. minus, Three Rail Crossings.
Plan 704—Angle 35 to 50 deg. minus, Two Rail Crossings.
Plan 705—Angle 25 to 35 deg. minus, Two Rail Crossings with easers.
Plan 706—Angle 25 to 35 deg. minus, Two Rail Crossings without easers.
Manganese Steel Insert Crossings:
Plan 751—Designs and dimensions of manganese steel inserts for angles 45 deg. to 14 deg. 15 min., Details A.
Plan 752—Designs and dimensions of manganese steel inserts for angles 45 deg. to 14 deg. 15 min., Details B.
Plan 753—Designs and dimensions of manganese steel inserts for angles 14 deg. 15 min. to 8 deg. 10 min.
Plan 754—Typical crossings, angles 35 deg. to 45 deg., Details A, with continuous easers.

GAGES & FLANGEWAYS FOR CROSSINGS.

Table with columns for NAME OF RR OR MANUFR., TANG, 1", 2", 3", 4", 5", 6", 7", 8", 9", 10", 11", 12", 13", 14", 15", 16", 17", 18", 19", 20", 25", MAX. and rows for various railroads like B&O RR, ERIE RR, GRAND TRUNK, etc.

tention is called to using short ties in the crossovers to eliminate the heavy expense of longer ties, which are used as alternates. These plans were published as information in supplement to Bulletin 221, and in Vol. 21 of the Proceedings. As the changes from previous publication are of a minor nature only, principally in modifying some of the tie lengths, they were not reprinted.

The following changes were recommended on the plans adopted at the March convention, 1920:

Plan 501—Details of guard rails: Make the following changes in gage line diagram to show dimension line between gage line of frog point and guard line of guard rail, stating this distance must be maintained 4 ft. 6 3/4 in. instead of showing this distance as 4 ft. 5 in. between guard line of wing rail and guard line of guard rail.

- Plan 757—Typical crossings, angles 25 deg. to 35 deg., Details A, without easers.
Plan 762—Typical crossings, angles 35 deg. to 45 deg., Details B, with continuous easers.

Appendix C—Gages and Flangeways for Curved Crossings

The committee submitted a theoretical study of the subject as information, and for criticism and comparison with results obtained in practice. An analysis of the results lead to the following conclusions:

- (1) Practically all locomotives will operate on curves of 6 deg. or less laid to standard gage of 4 ft. 8 1/2 in. and standard width of flangeway of 1 3/4 in.
(2) Locomotives with not more than two pairs of flanged drivers will operate over all curves within the limits of the table on standard gage of 4 ft. 8 1/2 in. and 1 3/4 in. flangeway.

(3) The operation of locomotives with trucks is limited by the swing or lateral motion of the trucks and such locomotives will not take a sharper curve than the maximum swing, provided for thereon, permits.

(4) For locomotives with three or more pairs of flanged drivers "Free Gage" should preferably be used and practical width of flangeway made equal to F.G.—4 ft. 6¾ in. Exact figures call for slightly wider flangeway in numerous cases, but the usual side play of the axles will compensate for the difference. Minimum gage would call for a distance of less than 4 ft. 6¾ in. between gage line and opposite guard line, and should not be used through curved crossings. A practical minimum gage may be made equal to F. G.—½ (FG—MG) and flangeways made this practical minimum gage G—4 ft. 6¾ in.

(5) Gage and flangeway thus determined for the locomotive giving the greatest values will satisfactorily admit the operation of locomotives and trucks calling for lesser values.

In specifications for locomotive the degree of the sharp-est curve over which it is to operate is usually given and necessary provision is then made in side play, setting of wheels, lateral motion of trucks and sometimes special provision for floating axles are added if further required for the type under consideration.

Gages and flangeways for curved crossings should similarly be specified for the type of locomotive that is to be operated over the crossing and that requires the widest gage and flangeway, according to wheel base, number of flanged drivers and maximum degree of curve for which it is arranged. If such details are not available, but the types of locomotives operating over the crossing are known, the greatest value of gage and flangeway for such types and given curve may be used.

Where no definite information is available the rule for gage as per 1915 Manual with the flangeway made = G—4 ft. 6¾ in. will admit most of the general types of locomotives with less than 10 drivers up to a 20-deg. curve, except where swing of trucks is insufficient. In locations where the operation is restricted to certain types of locomotives, the rule may give a wider gage than would be necessary.

#### Discussion

W. P. Wiltsee (Chairman): Nine subjects were assigned to the track committee this year. They have reported on six subjects. The matter relating to the revision of the Manual is shown in Appendix A. *I move the adoption of this spike, both the 5/8 and the 9/16 spike, for printing in the Manual as recommended practice.*

A. W. Newton (C. B. & Q.): What has prompted such a change from the type that is used by all the railroads at this time, and being manufactured at all the mills? The explanation refers to the design of the head of the spike only, and I wondered why there was such a change in the general design, whether it was for economical distribution of metal or what.

Chairman Wiltsee: The proposed spike increases the metal in the neck of the spike more particularly than any other place. Otherwise it is practically the same as the spike adopted by the Association in 1918.

(*Mr. Wiltsee's motion was carried.*)

Chairman Wiltsee: The next item is specifications for switches, frogs, crossings and guard rails. *I move that these specifications be adopted as recommended practice and substituted for those now in the Manual.*

(*Motion carried.*)

Chairman Wiltsee: Considerable detail is given to show how the committee designed its frogs and switches. These take the place of the designs that are now in the Manual, and agree with the plans that we have already prepared. *I move their adoption as recommended practice and for printing in the Manual.*

(*Motion carried.*)

Chairman Wiltsee: The tables of turnout leads are simply a revision of those tables now in the Manual to agree with the different frog lengths that have been approved by the Association. *Therefore, I move their adoption.*

(*Motion carried.*)

(Typical plans of turn-outs, cross-overs and slip switches, and the plans showing diagrams of preferred names of parts were presented in turn for adoption and accepted.)

Chairman Wiltsee: In regard to Plan 501, as long as the standard frog has a flangeway of 1¾ in., this does not mean anything different, but provides in case of necessity for widening the flangeway, the committee thinks that the gage that should be maintained is from the back of the guard rail to the frog point.

(Mr. Wiltsee then read the matter relating to Plan 502.)

Chairman Wiltsee: These plans were not reprinted, as they were adopted last year, and the committee wish to make these two changes and *I therefore move their adoption.*

J. W. Ambrose (Tor. Term.): I will ask the committee how they arrive at the distance 4 ft. 6¾ in.; in other words, how do they justify the flangeway of 1¾ in.?

Chairman Wiltsee: The flangeway of 1¾ in. was adopted years ago as the flangeway required.

(*Motion carried.*)

C. W. F. Felt (A. T. & S. F.): I move that Plans 331 to 335 with the clamp frog be published in the Manual.

J. L. Campbell (E. P. & S. W.): I wish to compliment the committee on track on the very excellent designs of frogs which it has submitted from time to time to this Association and in which the design of the clamp frog is included. Speaking from an experience of 15 years with the clamp frog, I wish to say that I consider the design for the clamp frog submitted by this committee second to no design I have ever seen. I do not believe that it is the purpose of this Association to limit unnecessarily the recommended practice of the Association, and that if there is a choice between good articles, that the members of the Association ought to have the freedom of that choice. This committee is not recommending to the Association that you use this frog in preference to that frog, but rather that if you desire this type of frog it will be good practice for you to construct it according to this design.

(*Motion to adopt Plans 331 to 335 carried.*)

Chairman Wiltsee: The next matter is Gages and Flangeways for Curved Crossings, which will be presented by V. Angerer, chairman of the special committee.

V. Angerer: During the preparation of the plans for crossings, the question arose as to the proper gage and width of flangeways in curved crossings. Some roads have made investigations of their own on this subject, and the committee gathered information as to the number. The tabulation thereof was sufficient to show the great diversity in practice in the width of gages and flanges on curved crossings. The committee then decided to make a study as to how the different factors which affect the gage and width of flanges would work out theoretically. The factors, which are the determining points, are the wheel base, the number of flanged wheels, semi-rigid connection and diameter of the wheels. From these the committee has worked out some formulas and tables.

The swing given in these tabulations is the swing that would be necessary to allow the locomotive to take the

curve with the driver arrangement which it has, but is really in itself excessive in some cases. It is not practicable to give that much swing on the locomotive.

There are some factors which cannot be determined theoretically. One is the flexibility in the tender of the locomotive and its parts and also with regard to the flexibility of the tracks or the crossings, which, as we build them now, are not very flexible.

T. E. Rust (W. C. F. & N.): If I am not very much mistaken this Association adopted standard flangeways for both straight and curved track in 1917.

Chairman Wiltsee: I would like to know if this question is ever taken into consideration. Apparently it has been some years preceding. The question of curved crossings is certainly bad practice. Who would put in a curved crossing that could possibly be avoided? I have recommended to my Board a great many crossings of railroads, but I do not think I have ever passed one crossing on a curve. I do not think it is good practice.

W. M. Camp (Railway Review): Mr. Chairman, it is true that no one puts in curved crossings, but there are other arrangements that introduce similar conditions, for instance, a frog on a curve, a frog on the outside of a curve or on the inside of a curve introduces conditions which are essentially similar that you would have in a flangeway on a curved crossing.

C. J. Coon (N. Y. C.): In the Grand Central terminal we use a 4-ft. 9-in. gage. We have turnouts as high as 18 deg. constantly under regular traffic. The flangeway of the frogs is  $1\frac{7}{8}$  in. The distance the guard rail is set from the wing rail of the frog is 4 ft.  $4\frac{7}{8}$  in., and we have never had any derailment which was attributed to this gage or to the setting of these guard rails at these distances.

We operate multiple-unit electric equipment over 42-deg. 40-min. curves, with a 4-ft. 9-in. gage, and a flangeway in the frog of 2 in., without derailment.

The Chairman: The supplement to the Manual in 1918 provides for a flange  $1\frac{3}{4}$  in. wide, or with provision for an increase of  $1/16$  of an inch for every 2 deg. of curvature, and on that recommendation that is the practice now, reflected by the Manual.

Is there any further discussion of this, which, as I stated before, is merely received for information this year. If not, we will pass to the next subject.

Chairman Wiltsee: The next portion of the report is Appendix D. Mr. Macomb will present the report.

(J. de N. Macomb (A. T. & S. F.) read Appendix D, and also abstracted portion of Appendix D relating to switch stands.)

Chairman Wiltsee: *It is the recommendation of the Committee that this matter be adopted as recommended practice, and printed in the report. I therefore so move you.*

(Motion carried.)

Chairman Wiltsee: Plans and specifications for tie plates, derailleurs and anti-creepers in Appendix E is simply a progress report, and no conclusions have been reached. H. T. Porter, chairman of the sub-committee, will present the report.

(H. T. Porter (B. & L. E.) presented the report.)

The Chairman: This report, gentlemen, is offered as information, with the request for constructive criticism during the coming year.

Chairman Wiltsee: The next sub-division is Study and Report on Specifications and Piece Work Schedules for Contracting Track Maintenance Work. This part of the report will be presented by E. T. Howson.

E. T. Howson (Railway Age): Owing to the abnormal conditions with which we are all familiar which have prevailed during the past year in getting work done by contract or by any other means, it was very difficult for your committee to find any clean-cut examples of contract work. The standard track work system which had been in effect for several years on the B. & O. and for a shorter time on the Pennsylvania, prior to federal control, and which were abandoned during that control, have not yet been re-established. Therefore, the committee was unable to get any up-to-date information on which to base any report.

While a good many roads resorted to the cost-plus form of contract in one form or another last year, the committee did not consider that was the kind of contract the Board of Direction had in mind in assigning this subject, in most cases the cost-plus form of contract being little more than paying the contractor a percentage on the cost of his work for recruiting the force. Therefore the committee can only report progress.

(The committee was excused with the thanks of the Association.)

Simplicity Is the Keynote of the Lackawanna at Pocono Summit, Pa.

# Report of Committee on Stresses in Track

The work of the committee has resulted in the collection of a large amount of data relative to the stresses developed in curved and tangent track which will require considerable time for analysis and presentation in a final report. In securing this data field tests were made by methods similar to those employed in the preparation of last year's report. Work of a preliminary nature was performed to find the effect of flat spots on wheels upon the stress in the rail. The principal purpose of this year's tests was to find the effect of curvature upon the stresses in the rail caused by different types of locomotives as compared with the stresses developed in straight track.

A. N. Talbot  
Chairman

A. N. Talbot has been chairman of the committee since its creation seven years ago. He has also been active in other professional societies, having been president of the American Society of Civil Engineers in 1918. As professor of civil engineering at the University of Illinois he is brought into intimate daily contact with intricate problems of engineering research. His long experience in directing field investigations in the laboratory and field eminently fits him to guide the extensive and complicated investigations which constitute the basis for the work of the committee, while his connection with the university forms a valuable alliance for the committee.

IN CONTINUATION OF THE PROGRAM of the committee, field tests on railroad track were carried on during the summer season. The tests were conducted on the tracks of the Illinois Central in Illinois, the Delaware, Lackawanna & Western in New Jersey, and the Atchison, Topeka & Santa Fe in New Mexico and Iowa. The tests were made on tangent track and on curved track, several different curvatures being used. A principal purpose of the tests was to find the effect of curvature of track upon the stresses in the rail (including lateral bending stresses) caused by locomotives of different type run at different speeds, as compared with the stresses developed in straight track. Several types of locomotives were used—Pacific, Mountain, Santa Fe, Mikado, Ten-Wheeler, etc. Work of a preliminary nature was also done to find the effect of the flat spots of wheels upon the stress in the rail. All the tests were carried on in much the same way as were the tests described in the reports of the committee already presented to the Association. A large amount of data has been accumulated, and it will require several months to reduce these data and a further time to study the results. Preliminary work on the data indicates that the tests will give important information on stresses developed in curved track. The committee is also continuing work on other phases of the subject assigned to it.

Committee: A. N. Talbot (U. of Ill.), chairman; W. M. Dawley (Erie), vice-chairman; A. S. Baldwin (I. C.), G. H. Bremner (I. C. C.), John Brunner (Ill. Steel Co.), W. J. Burton (M. P.), Chas. S. Churchill (N. & W.), W. C. Cushing (Penna.), Dr. P. H. Dudley (N. Y. C.), H. E. Hale, Robt. W. Hunt, J. B. Jenkins (B. & O.), Geo. W. Kittredge

(N. Y. C.), Paul M. LaBach (C. R. I. & P.), C. G. E. Larsson (Am. Br. Co.), G. J. Ray (D. L. & W.), Albert Reichmann (Am. Br. Co.), H. R. Safford (C. B. & Q.), Earl Stimson (B. & O.), F. E. Turneaure (Univ. of Wis.), J. E. Willoughby (A. C. L.).

## Discussion

Prof. A. N. Talbot (Chairman): Since the report was written considerable progress has been made in reducing the data on curves. Attention may be called to the large bending stress in the inner rail over the third or fourth driver, according to the type of locomotive. The bending stress decreases in this inner rail with an increase of speed. For the outer rail there is considerable lateral bending over the front truck and first driver, and over the last driver and trailer, and this bending increases with increase of speed.

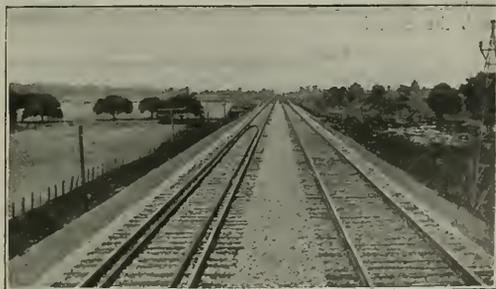

Measurements were made of the lateral bending of the rail section on itself (tilting) and also of the bending developed in the rail in a 6-ft. length, as would be produced as the engine passed at low speed. High stresses were found in the rail under wheels having flat spots. Tests in the laboratory are being carried on to learn how the splice bar and rails act at a joint and how the stresses are transmitted from rail to bar, as well as the amount of stress developed. It may be said that we have still a large amount of work to do before the results of data already secured will be ready for presentation, or even for discussion.

(The committee was dismissed with the thanks of the Association.)

(Adjourned.)

Crooked River Arch on the Oregon Trunk Line

A Typical Section of Track as Found on the Lehigh Valley

# National Railway Appliances Association Meeting

G. C. Isbester Elected President; Members Well Satisfied With This Year's Exhibit

THE NATIONAL RAILWAY APPLIANCES ASSOCIATION held its annual meeting in the restaurant of the Coliseum at 11 o'clock yesterday morning.

In reviewing the work of the year President J. B. Strong stated that "last year the space applications from old exhibitors exceeded that available by 20 per cent. This year, in adding the ballroom, we had 5,500 sq. ft., or about 17 per cent additional space to offer and were therefore able to take better care of our space applications though we still have applications for more space than available. At our last annual meeting the directors were asked to consider having a ladies' rest room for the next exhibit, and I am pleased to state we have now provided it in the southeast corner of the ballroom. We have also provided a lounging space and music in the gallery adjacent to the ballroom at the south end of the main building, which we trust is being found of convenience and interest to our visitors.

"The oak and wicker furniture provided this year is comfortable and of a unique design and a great improvement over that heretofore offered. It is all new, made especially for this exhibit at a considerable outlay in investment by the contractor, and has been furnished to our exhibitors at a reasonable rental.

"The added facilities and equipment have been provided without increasing our membership dues and with but a small increase in our space rental rates. It is too early to state just how our income and expenses will balance, but present estimates indicate a close balance with only a small deficit.

"I wish to take this opportunity of thanking the members of the board of directors, and especially our secretary-treasurer, Mr. Kelly, for their hearty co-operation throughout the past year by their attendance and interest in all meetings called, which has enabled this exhibit to be so successfully opened to railroad men."

## REPORT OF SECRETARY-TREASURER

Secretary-Treasurer C. W. Kelly reported that the exhibit will probably create a deficit of between \$1,800 and \$2,000. Last year our attendance on Monday was 2,084; this year at the same hour it was 3,566.

## OTHER BUSINESS

By a unanimous vote the transactions of the Board of Directors for the past year were approved.

A vote of thanks was extended to the retiring officers for the completeness of the furniture equipment of the booths. There was a general expression of satisfaction with the exhibit.

## ELECTION OF OFFICERS

The Nominating Committee, composed of P. C. Jacobs, Johns-Manville, Inc., chairman; L. B. Sherman, *Railway Age*; A. Anderson, Adams & Westlake Co.; E. E. Hudson, Waterbury Battery Co., and G. R. Lyman, William Wharton, Jr., Company, recommended the following officers for the coming year, and two directors to serve for three years, which recommendations were adopted:

President—George C. Isbester, American Chain Company, Chicago.

Vice-President—Thomas W. Aishton, National Malleable Castings Company, Chicago.

Directors for a three-year term—A. A. Taylor, Fair-

banks, Morse & Co., Chicago, and G. E. Geer, western manager, Wyoming Shovel Company, Chicago.

G. C. Isbester, who was elected president, is the district sales manager of the American Chain Company, Chicago. Mr. Isbester was connected with the mechanical department of the Great Northern at St. Paul, Minn., from 1897 to 1899, leaving the Great Northern at this time to go with the Sargent Steel Company, with headquarters at Chicago. He remained with this company until about 1902, when he went with the Q & C Company, with headquarters at Chicago, afterwards becoming vice-president of that company. In 1912 he went with the Rail Joint Company as district sales manager. During the war Mr. Isbester served in the United States Naval Reserve Forces as lieutenant commander, having been on active duty from April, 1917, until he was placed on the inactive list in May, 1919. He was recalled to active duty on July 28, 1919, to be sworn in as commander in the supply corps. He was selected for promotion from lieutenant commander to commander by the Board of Selection, and after receiving his promotion he was again detached from active duty. Commander Isbester also served with the Illinois Naval Militia for ten years. On his return from the navy Mr. Isbester again resumed his duties with the Rail Joint Company as district sales manager, which position he resigned on August 1, 1919, to enter the service of the American Chain Company, Inc., with headquarters at Chicago.

## American Railway Engineering Association Registration

THE REGISTRATION of members and guests of the American Railway Engineering Association yesterday totalled 593, as compared with a similar registration for the first day a year ago of 534. The crowded condition of the convention room yesterday reflected this large attendance.

Abbott, F. E., Insp. Engr., Lackawanna Steel Co., Buffalo, N. Y.  
Adams, L. L., Roadmaster, L. & N., Etowah, Tenn.  
Adamson, J. H., Asst. Engr., B. & O., Meyersdale Pa.

## An Innovation in Coal Handling Equipment

ON PAGE 607 of yesterday's Daily there appeared an article describing a new type of mechanical coal and cinder handling plant developed by the Roberts & Schaefer Company, Chicago. In this plant the coal or

RandS Coaling Station and Cinder Plant

cinders are handled by a clam shell bucket operated from a trolley moving on a runway supported by a structural steel frame, the idea being to afford a wide range of use for the equipment, which may be applied equally well for coaling locomotives direct from cars, for storing coal or for reclaiming it or for handling cinders. Through an error the cut provided to illustrate this article was interchanged with another, so that the wrong cut was shown. For this reason we are here presenting the correct cut of the equipment.

### A Correction

Owing to an error arising from the transposition of lines in the printshop the article describing the installation of Fenestra window sash in a Pere Marquette round house at Plymouth, Mich., which appeared on page 603 of the *Daily Railway Age* of March 15, failed to credit this work to the Detroit Steel Products Company, Detroit, Mich., manufacturers of the sash. While it was evident to a reader that an error had been made, the correct name of the maker was not so evident.

### Stresses in Track Meeting

There will be a meeting of the Committee on Stresses in Track in room 1102 in the Congress Hotel at 9 o'clock this morning.

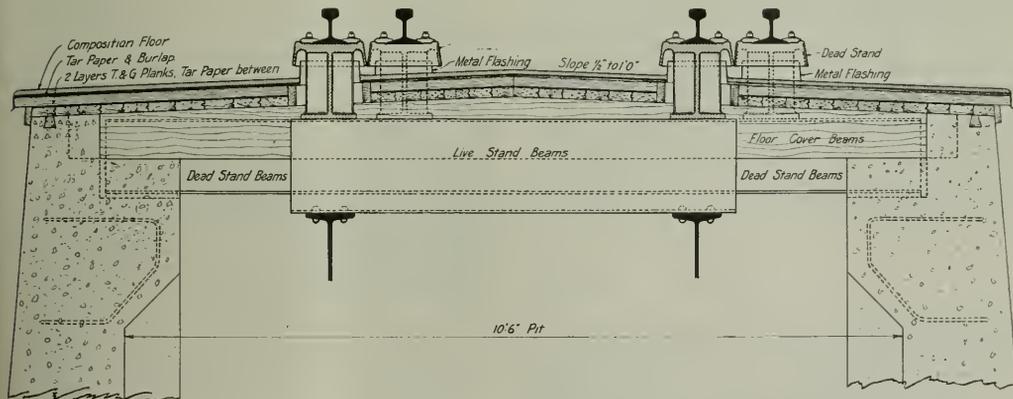

### A Weather Proof Track Scale Floor

**F**AIRBANKS, MORSE & Co., Chicago, has recently adopted a type of floor construction for its track scales which was developed by the Canadian Pacific recently. This design is a modified form of the earlier Fairbanks, Morse construction. It is of particular interest to railroads operating through regions similar to those

per, and covered with three layers of tar paper and burlap painted with asphalt mastic. This floor slopes away from the center on a slope of  $\frac{1}{2}$  in. to 1 ft. and is carried on timber joists which span the pit. This independent condition of the floor joists is said to simplify the work of shaping the joists over the earlier method of carrying both the joists and the dead rail chairs on the same l beams. The live rail and dead rail chairs in this construction, instead of being different design, as in the earlier type of floor, are alike. Each rail chair extends 5 in. about the track floor and has an umbrella top of such a size as to project a sufficient distance out from and down over the galvanized flashing provided around the floor openings as to avoid contact and prevent the entrance of water into the pit at these points. It is evident that with this form of floor construction there is little opportunity for any water to pass through the deck and enter the scale pit from above.

### Safety Railings for Motor Cars

**A**MONG THE DEVICES WHICH have recently been developed with special reference to the interest of safety, and whose range of application has been broadened, is a combined railing and end screen which Mudge & Co., Chicago, designed originally for use on motor cars of their construction, but which are now made to apply on any standard make of railroad section motor car or for push cars. In this construction two end frames supporting screens and connected at the top by a cross bar constitute the entire equipment, the frame work of which is made from heavy tubing bent to shape, connected by pipe fittings, and securely braced and bolted to the car body, while the screen is made of heavy woven wire held in place by iron strips bolted to the railings. The construction is substantial, adds but little weight to the car, and includes nothing capable of obstructing the free passage of the air, the screen purposely having a large mesh.

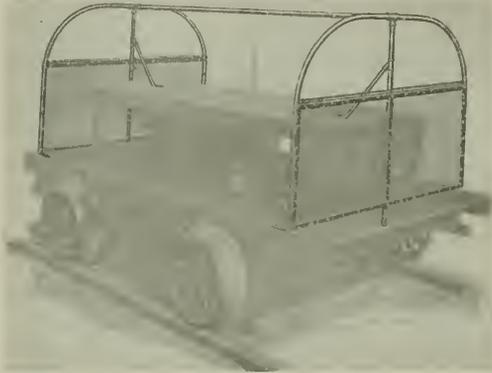

Cross Sectional Plan of Weatherproof Track Scale Floor

of northern United States and of Canada, where the trouble resulting from the leakage of water into scale pits is not only one of corrosion but of interference with the free and accurate movement of the scale parts by ice formed when melted snow drips through the floor and strikes the cold scale iron.

The floor as improved consists of a covering made up of two thickness of  $1\frac{1}{4}$ -in. tongue and groove planks extending crosswise to each other, separated by tar pa-

The screen prevents small tools from falling off the car and upon the track with resulting derailment, while it is also a guard against men being thrown off the cars or jumping off accidentally ahead of the car while in motion, and, in the case of push cars, of preventing passengers from riding with their feet suspended from the car. Aside from its function as a safety device it is said to be of value also in providing greater comfort for the men, in that men in a sitting posture can rest their backs against

the cross bar and that men, when standing (particularly the end men) are afforded a more substantial hold than that obtained by holding on each other or attempting to maintain a balance alone. Other points urged in favor of this device are that it affords an additional bracing to the car which tends to prolong its life; also that it makes for easier handling of the car by presenting a shoulder brace

Safety Railings on Motor Car

to the men lifting, that it makes the covering of the car with tarpaulin a more simple matter, and, finally, that it enables the men in starting the car to maintain practically an upright position while pushing.

### An Improved Locomotive Type Crane

THE LOCOMOTIVE CRANE COMPANY, Champaign, Ill., has recently made several improvements in its Model A Little Giant Crane. This crane is a ground machine, mounted on flat-faced wheels, 36 in. in diameter and 14 in. wide. On these wheels the crane is capable of traveling under its own power about 2 miles per hour and of turning in a 100-ft. circle. Both wheel gage and base are 10 ft., the boom 30 ft., the capacity of the clam-

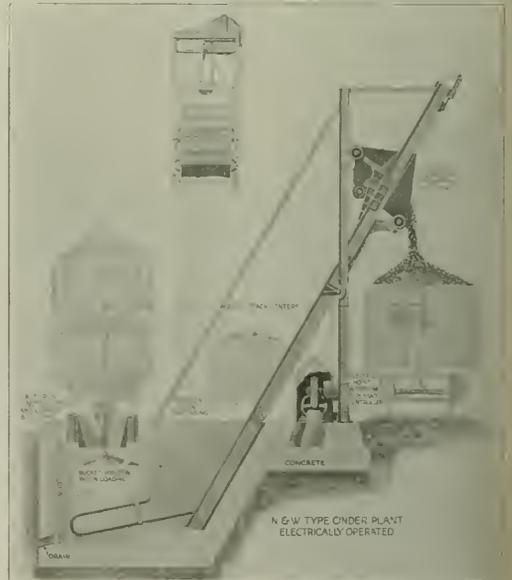

Model A Little Giant Crane Handling Coal

shell bucket  $\frac{3}{4}$  yd., and the approximate weight of the crane exclusive of the counter weight,  $12\frac{1}{2}$  tons. The crane is said to be capable of lifting 8,000 lb. with the radius of the boom at 10 ft., 6,000 lb. with the radius at 15 ft., 5,000 lb. with the radius at 20 ft., and 4,000 lb. with the radius at 25 ft. The most important feature of

the new model is the double cylinder, throttle reversing swinging engine, which is self contained, and is bolted to the frame in such a way as to permit its removal without dismantling. This engine is said to operate smoothly and to facilitate adequate rapidity in the crane's movements. Other features mentioned about the crane are the use of gears made of high grade steel and the absence of frictions, slip rings, and similar articles commonly used to overcome shock and strain on the swinging mechanism in the lack of flexibility in the steam engine's operation or proper gear reductions. It is also stated that the boom-hoisting mechanism is fitted with an adjustable cone maple block friction which is controlled from the operator's stand, and that the counter weight is made of heavy plate, cut to size for bolting to the frame.

### A Practical Electric Cinder Conveyor

COINCIDENT WITH ITS PORTABLE combination locomotive coaling and cinder handling plant, described in the columns of the *Daily Railway Age* of yesterday, the Roberts & Schaefer Company, Chicago, is introducing a new type of cinder plant for the use of railroads. This

New Type RandS Cinder Plant

plant is the product of several years of experimenting on the Norfolk & Western and the Nashville, Chattanooga & St. Louis, where installations of the plant as perfected are said to be operating very successfully.

In this plant, as shown in the illustration, ashes are dumped directly from the locomotive ash pans into a train bucket or cinder car located in the depressed pit below the track, this car, when filled, being hoisted up a structural steel incline to a point above an adjacent railway track and there automatically emptied of its contents. The distance required between the two tracks is 26 ft. The plant is operated electrically by means of a direct-connected hoist, by reason of which it is not subject to trouble from freezing in cold weather, and it involves no

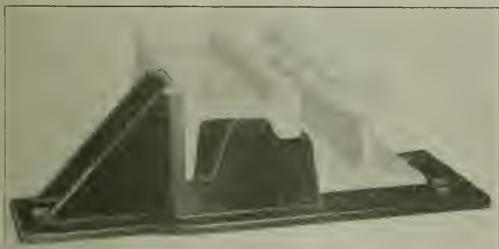

hand labor other than that required in operating the hoist. A heavy cast iron cinder hopper 8 ft. long is bolted to the track girders between the pit walls, providing the means of deflecting into the cinder car all ashes dropping from the ash pans. The cinder car itself has a capacity of 80 cu. ft. and travels at a speed of 150 ft. per min.

At many points a single installation of this type of plant is sufficient for all cinder handling requirements but where the conditions require it combinations of several such plants in various arrangements can readily be installed.

## A Girder Type Guard Rail

A NUMBER OF RAILROADS are now testing out a girder type of guard rail manufactured by the Positive Rail Anchor Company, Marion, Ind. This device consists of a section of stock rail bent through its depth and bolted in the sidewise position to the supporting guard rail braces and plates, each rail brace and plate being a one-piece malleable iron unit.

It is claimed for this type of guard rail that it is impos-

Sectional View of Girder Type Guard Rail

sible for it to overturn under traffic inasmuch as the plates to which the rail is bolted are held in place by the weight of the traffic and that the "I" beam or strongest section of the rail is utilized to resist the thrust instead of the unsupported head, as is the case with the ordinary rail guard rail. As an additional point in favor of this type of guard rail, it is stated that an old rail, either of

Installation of Girder Type Guard Rail

the same or of lighter section than the running rail, can be used for the guard rail, or when a road is adopting a heavier weight of rail, the old guard rail can be utilized, its preparation requiring only straightening, followed by bending through the "I" section. The fact that the rail when on its side presents a larger surface to abrasion than when upright, and that the head of the old rail, having been subject to cold rolling under traffic, is harder than a new rail are also presented in support of this device.

It is further claimed that the wide space obtaining under this type of guard rail, when installed, is a protection against clogging from snow and ice, this feature, together with the absence of parts likely to stretch or spread, and the absence of bolt connections with the running rail by means of which it might be pulled out of line by creeping movements, all contributing to reduce maintenance costs to a negligible point. Further points advanced in support of the guard rail are that the running rail can be removed without changing or disturbing the guard rail, that it can be assembled in the shop and shipped out as a one-piece guard rail, yet permitting broken parts to be replaced without scrapping the entire rail, and that a road need not alter its standards in order to employ the device inasmuch as plates may be made to fit these standards.

## Recent Developments in Movable Bridge Machinery

THE PERFECTING OF THE AUTOMOBILE and marine type of high-speed gasoline engines has led to their use in operating movable bridges. Owing to their compactness and reliability, these units are particularly adapted to serve as an auxiliary to an electric installation. The Deering bridge of the Chicago & North Western over the Chicago river (built in 1916) was the first bridge on which this type of engine was installed as the auxiliary drive and since then it has practically superseded the heavy stationary type of slow-speed engines in units ranging from 18

Fig. 1. Norwood-Nocnan Installation on Illinois Central

to 95 hp. Figure 1 shows a four-cylinder 60-hp. 900-r.p.m. auxiliary gas engine installed on the Illinois Central's bascule bridge over the south branch of the Chicago river, the longest bridge of its kind built so far. On the Baltimore & Ohio's bridge at South Chicago a six-cylinder 95-hp. 1,500-r.p.m. engine is provided to drive a dynamo that supplies current for an auxiliary electric motor located on the moving span.

Figure 2 shows a 22½-hp. gas engine with clutch and reversing gears all mounted on a single base to be used as the motive power on a swing bridge where electrical current is not available. It is unique in that it is a complete unit in itself, including gasoline tank and radiator. The engine is started with a crank, larger units being started with an electric motor. The gasoline tank holds 10 gal. of fuel and the radiator is large enough to permit of the engine being run for 30 min. under full load. The spark and gas levers are mounted on a stand located on

the operating floor near the brake and clutch levers. To open the bridge the operator releases the disc friction clutch, adjusts the spark and gas levers and cranks the engine. He then returns to the operating floor and throws the jaw clutch to "open." The end lift clutch on the next shaft reduction from the engine unit is then engaged and when the ends have been lowered this clutch is released

curves can be inserted in the conveyor track where necessary.

A further advantage claimed for the Godfrey system lies in its ability to dump the coal at more than one point, and, inasmuch as the conveyor bucket, when once over the coal pocket, is lowered before emptying, to deposit the coal without fall or chuting, thus by permitting uniform mixing of lumps and dust and reducing breakage to a low point, insuring the maintenance of the coal in the best condition for locomotive use.

The silo coal pocket and wooden pocket coaling stations shown in the illustrations are served equally well by the Godfrey conveyor. In either case it is possible to prolong the conveyor structure to serve more bins or to give open storage in connection with the hopper. The merit in the latter method lies in the possibility of providing a good-sized storage with a medium-sized conveyor

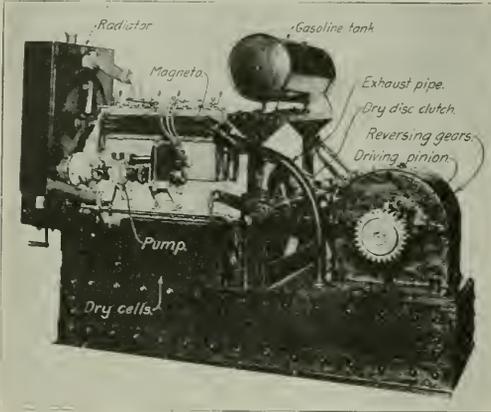

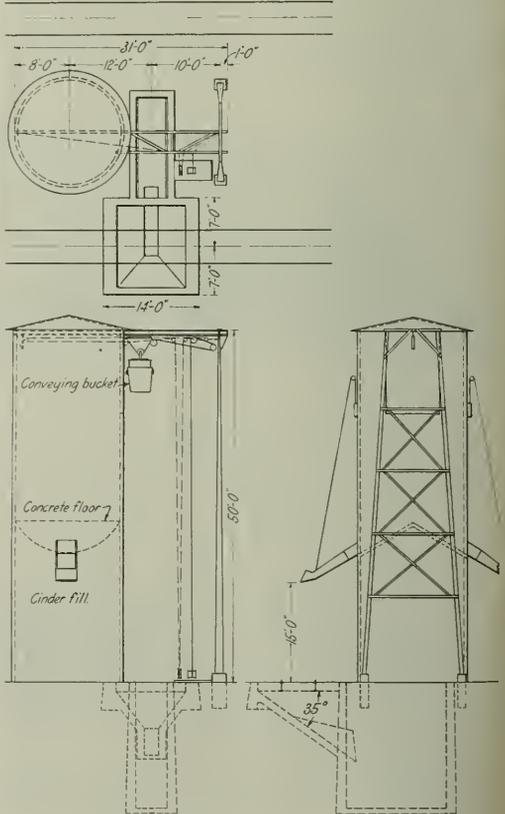

Fig. 2. A 22½ H. P. Norwood-Noonan Engine

and the swing clutch is engaged and the bridge opened. To close the bridge the cycle is reversed. This unit is to be installed on a draw span over the St. Joe river near Shatolet, Idaho, for the Oregon-Washington Railroad & Navigation Company and was designed and built by the Norwood-Noonan Company of Chicago.

## A New Type of Coal Handling Equipment

AS A RESULT OF EXPERIMENTS and investigations conducted during the last 18 months the Godfrey Conveyor Company, Elkhart, Ind., has introduced a type of coal handling equipment for locomotive coaling service, which comprises one or more coal pockets with locomotive coaling chutes erected alongside the coaling track and arranged to accommodate the operation of a special coal-handling bucket, this bucket being filled in a pit below the track, then hoisted to a point above the coal pocket, after which it is shifted along an overhead rail to the proper dumping position, lowered and then emptied. This system is adapted for use where the amount of coal to be handled ranges from 10 tons to 4 or 5 cars per day. It is stated that the Godfrey system requires the labor of but one or two men for a period of one to three hours in unloading a car of coal, and is reported that in many instances coal is being unloaded into hoppers at a labor and power cost of 5 or 6 cents per ton by means of these systems.

The system is obviously one which allows a large flexibility in arrangement and design, permitting the hopper to be built large enough to store several cars, as at points where a reserve supply should be provided during periods of free coal movement to warrant the presence of an adequate supply during periods of shortage, also readily adapting itself to the serving of any type of hopper. Furthermore, the conveyor can be installed to run parallel to the siding, or at right angles or other angles to it, and

Godfrey Coaling System—Silo Coal Pocket Plan

and a small hopper at points where the daily consumption is low and coal shipment irregular. In the construction of these systems the Godfrey Company recommends a pit large enough only to catch the drop from one coal car hopper, inasmuch as the time and labor consumed at small stations in pinching the car is a small item. It also calls attention to the advisability of reducing the pitch of the hopper floor to a minimum as a means of reducing first cost, although the size and angle of the track hopper is optional.

It is becoming more evident every day that railroading is becoming more scientific. Evidences of this are reflected in the report of the Committee on Economics of Railway Operation, which included progress reports on such important subjects as "Methods for Increasing the Traffic Capacity of a Railway," "The Effect of Speed of Trains on Cost of Operation" and "The Determination of the Traffic Capacity of Single and Multiple Track Railways."

In the early days of railway development in this country only a limited amount of attention was given to the consideration of operating economies. However, as the regulation of railway earnings has become increasingly strict, it has been necessary for them to reduce operating expenses in every manner possible. This has made necessary the more thorough study of many problems. At the present time, when the capacity of the railroads is so greatly taxed with each upward surge of traffic and when intensive improvement work is largely out of the question, studies of means of increasing the capacity of existing facilities are becoming of increased importance. Although organized only a couple of years ago, the committee has undertaken an ambitious program and has already made gratifying progress. It is to be hoped that

the American Railway Engineering Association will lead in the recognition of the value of the application of trained men to the analytical discussion of railway problems by the creation of other committees as occasion warrants. While continuing the consideration of those problems of a more particularly engineering nature, the Association can also contribute to the promotion of efficient railway operation by the consideration of these larger problems.

Engineering colleges generally have made considerable progress in recent years by broadening out their courses

### Human Element in Engineering

to include instruction in management and other matters concerning the human element and its relation to production. This is as it should be, and it is to be hoped that still greater progress will be made in this direction. The human machine is the most complicated piece of mechanism imaginable and it must be intelligently and scientifically supervised if the best results are to be obtained. Engineering societies generally have realized the importance of this and their programs in recent years have been giving more and more attention to matters relating to the handling of men in industry. It is of great importance that this be appreciated by railroad engineers because of the scattered forces on the railroads and the difficulty of providing adequate supervision.

In the article on "Humanizing Engineering Education," which appears in this issue, Professor A. A. Potter has pointed out clearly that the proportion of students graduating in engineering courses is far too small and that the educational system is at fault. The fact that only a small percentage graduate is only too well known, but it has usually been considered as an index to the standards of the school. Professor Potter now raises the question whether it is at all indicative of the standards of the institution or of the ability of the student. He believes that it is not and states that it is purely a matter of holding the student through stimulating his interest by introducing more engineering matter early in the curriculum. He further advocates, and for that matter is actually practicing at Purdue University, the study of the characteristics of men in order that the interest of the student may be continually sustained and his knowledge broadened. There is much to this. The students who drop out or change their course of study are by no means failures in their after work in life. In fact, a large proportion do achieve a success comparable with that of the graduate engineer. It has been chiefly a case in the past of following certain interests, modified more or less by natural though perhaps undefinable instincts. The successful business man of today has some understanding of engineering matters. On the other side, the successful engineer has, through either interest or necessity, acquired a knowledge of people, of business and of other matters. Thus, if we

### Why Not Broaden the Engineer at the Start

percentage graduate is only too well known, but it has usually been considered as an index to the standards of the school. Professor Potter now raises the question whether it is at all indicative of the standards of the institution or of the ability of the student. He believes that it is not and states that it is purely a matter of holding the student through stimulating his interest by introducing more engineering matter early in the curriculum. He further advocates, and for that matter is actually practicing at Purdue University, the study of the characteristics of men in order that the interest of the student may be continually sustained and his knowledge broadened. There is much to this. The students who drop out or change their course of study are by no means failures in their after work in life. In fact, a large proportion do achieve a success comparable with that of the graduate engineer. It has been chiefly a case in the past of following certain interests, modified more or less by natural though perhaps undefinable instincts. The successful business man of today has some understanding of engineering matters. On the other side, the successful engineer has, through either interest or necessity, acquired a knowledge of people, of business and of other matters. Thus, if we

can intelligently combine and sustain the interests and instincts of the students at the start of their education we will have laid the foundation for not only a larger number of graduates, but for a better and broader class of men. And the engineering profession will have been benefited thereby.

Because a man is a master workman is no reason why he will be successful in directing a gang or a force of men.

#### Training of Foremen

It takes years of practice to make a good craftsman, even in handling simple machines or materials. And yet because a man may be a good workman and appear to have a certain potential ability as a leader, he is often promoted and placed in charge of men with little, if any, instruction in handling them. What is the result? Sometimes he makes good, sometimes he just scrapes through, and often he fails and has to be set back. With an intensive course of instruction in the handling of men more of these foremen will make good in a decided fashion and at a very much smaller expense to the railroad—an expense which often is not apparent because it is reflected in friction, decreased production and lost motion. A great industrial organization has found it profitable to provide special courses of instruction in handling men for all of its foremen, old and new. Is there not a suggestion here by which the railroads can increase their efficiency?

One of the basic maintenance of way materials which is now undergoing a marked transition is the cross tie. The hardwood tie of a couple of decades ago has largely given way to that of the softer woods. Used originally as cut in the timber, they are now being treated with preservatives in increasing quantities. More attention is also being given each year to experimentation with substitute ties of steel, concrete and other materials. The Committee on Ties is performing a valuable service in presenting a report on the progress of these developments from year to year. Thus the report presented yesterday contains recommendations for methods of installing and keeping records on test sections to determine data as to the service life of cross ties of various materials and treatments. The annual presentation of information concerning the results which are developing currently in the experimental installations of substitute ties also constitutes a valuable record of importance which will be more fully appreciated as the cost of wooden ties continues to increase to the point where those of other materials are more practicable commercially.

#### Rendering a Valuable Service

No committee has a larger or more important field for investigation ahead of it than that on Economics of Railway Labor. The labor problem is now of paramount interest in all branches of railway service. Nowhere, however, are greater opportunities afforded for the promotion of efficiency, with a corresponding reduction in expenses, than in the consideration of maintenance of way labor. So many conditions have developed which have tended to drive the more efficient men from this work that the efficiency of the rank and file has deteriorated to a low level. In its report, the committee calls attention to one of the most serious defects in the handling of maintenance of way labor—the inefficient manner of hiring men for employment. Prior to federal control, the practice

prevailed of leaving the selection of men to labor agents, who most generally derived their compensation from boarding and commissary concessions. In spite of the evident viciousness of this system, the committee points out that this practice is again coming into vogue, following the return of the roads to private control. With the selection of men left to persons not directly in railway employment, and with no attempt to pick out the more capable or experienced, little improvement can be expected. The committee can perform no more important service than to develop a system by means of which some consideration can be given to the qualification of a man in hiring him for maintenance of way work.

Practice in making decisions as to old bridges covers a wide range of variation from an extremely empirical study based almost entirely on judgment and experience to a most exacting mathematical analysis. In view of the fund of information now available and the possibility of checking up stresses in indeterminate members with the extensometer, there is no excuse at the present time for relying on "educated guesswork" unless lack of time or a competent staff is an admissible alibi. This being the case, the real question at hand, as brought out in this discussion, relates to the method under which the true mathematical analysis applied under the rules adopted yesterday shall be applied.

Opinions were agreed on one point, the decision must be made by an officer who is thoroughly competent and, what is equally important, whose opinion will carry weight with the management. Since bridge engineering is so highly technical, requiring closer application than a chief engineer can give it, it would seem clear that this responsibility should rest primarily with the bridge engineer or one who is a bridge engineer by training if not by title. But on all but the smallest of roads, the bridge engineer can not himself make the detailed inspections and all computations required to carry out the complete investigation. He must delegate part of the work to others and herein lies a difficulty. In some cases the inspection and the mathematical analysis are completely segregated—the man who does the figuring rarely sees the structure. But while there are serious objections to this plan, it is sometimes difficult to work out any other feasible arrangement. On the larger roads it is a problem also to say to what degree the bridge engineer shall have a personal part in the investigation.

## The Classification of Old Bridges

These are problems of personnel and organization in the bridge engineer's office that are equally as important as the discussion of the rules presented at the session yesterday. Of particular moment is the need for impressing the management with the fact that this is highly exacting work requiring a thoroughly competent staff.

## The Railways and the Universities

A VERY LARGE PART OF THE TROUBLES of the world are due to ignorance. Most of the present troubles of the railroads of the United States undoubtedly are due to ignorance. Part of this ignorance is that of many railway officers concerning fundamental engineering and economic principles which must be applied to secure the greatest efficiency and economy of operation. Part of it is ignorance of railway employees, who do not understand the advantages they would gain from more efficient and economical operation and the disadvantages they suffer from every form of inefficiency and waste. Part of it is ignorance of the public and public men regarding the public policies in regulating the railways which must be followed if they are to be adequately developed and enabled to give good service at the lowest practical cost.

President Kinley of the University of Illinois in his address at the dinner last night discussed the subject of co-operation between the universities and the American Railway Engineering Association. There can be no doubt whatever that closer co-operation between the railways and educational institutions would, in the long run, reduce this ignorance and be of great benefit both to the railways and the public. The universities need in their work the practical point of view and knowledge of the working railway officer. If the university professors had more understanding of practical railway problems their pupils would go into active life better equipped to deal intelligently with railway problems, whether those of railway management or railway regulation. On the other hand, if there were more of the thorough scientific study of railway engineering, operating and economic problems which can be best done in the universities, and if railway managements were more disposed to use the results of such studies, the art of railroad transportation would be more rapidly advanced. The railroads could well afford to give more co-operation and support to university work along the lines of engineering economics and business administration. The greatest progress in every line of industrial endeavor depends upon a well-balanced combination of scientific investigation and practical administrative effort. In no other industry is this more needed than in the great railroad industry.

## Humanizing Engineering Education\*

IN CONNECTION with the question of engineering education, which is a most important one to the country and this Association, it is always believed that the best results are produced as far as instruction is concerned by the teaching of men and not subjects. That means we should pay greater attention to the testing and sorting of students before they are assigned to any particular course of study and that their progress must be carefully watched.

We should give more attention to the teaching of students, how to study and improve their personal efficiency, and that we should rate them not only on their academic performance, but certain personal traits. Every effort should be exerted to develop not only their memory, their knowledge of technique, but also to develop certain traits of personality such as initiative, judgment, leadership and other qualities which are so essential for success in engineering and industry.

The conditions which existed when most of you gentlemen were at school and which existed when I was at college was that the young high school graduate, as he

entered the university to study engineering, became immediately discouraged, because he found that instead of becoming acquainted with engineering problems he was made to devote all of his time during the first two or three years to certain abstract subjects. He could not see any connection between the subjects he was studying and the engineering profession for which he was preparing. Little attention was paid to the effect of failure, or the cause of failure, on the part of college students; in fact, I know in some cases university professors boasted of the fact that they had a high mortality among the students. In many cases certain institutions claim high standards because they start with 100 freshmen and graduate 25 or 30 seniors—that was taken as a criterion of high quality. If a factory superintendent would lose 25 per cent of his castings continuously day after day he would not hold his job very long.

We have not recognized the fact that failure on the part of the student to carry a certain subject may not be due entirely to his indifference, but may be due to poor teaching, and also to the fact that the student is not interested in the subjects which he is studying. In order to correct this a great many of the engineering schools at the present time are introducing in the larger courses certain subjects which are very closely related to engineering. At Purdue we are giving to every freshman a course in engineering problems, at the same time trying to acquaint him with certain problems of particular interest to his community, such as roads, water supply, sewage disposal, etc.

Another thing that I am personally interested in is to stimulate the college student in doing good work by giving recognition to his efforts and rewarding them. We are all familiar with the effect of publicity upon athletics. We all know the effect upon athletics by having space given to athletic events in the dailies, by having the pictures of the contestants appear in the paper. We know what a large stimulus that type of publicity gives. It would seem that if a student is relegated to the brain squad the results of his studies should be given some publicity. If a student excels in surveying or mathematics, or any other subject, we make it a point to send a little story about it to his home paper as well as to the college paper, and we find that that type of publicity is of great advantage in keeping the student interested in his work.

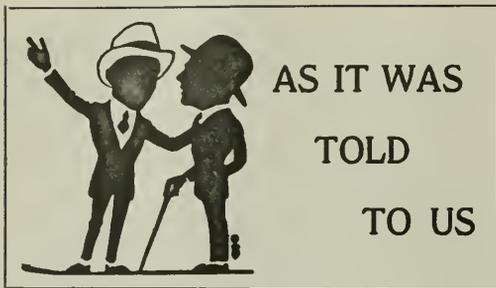

Another thing you may be interested in is that we are making a very careful study of the students' characteristics, and some of the qualities that pertain to the student's personality. We are also having the students graded on initiative and judgment, and other qualities, not only by his teachers, but by his chums, classmates and people in his home town, and we are using that information, to some extent, in advising the student concerning the selection of the course of studies.

## Today's Program

The program for the American Railway Engineering Association sessions today is as follows:

Committee VI.	Buildings .....	Bulletin 235
Committee VIII.	Masonry .....	Bulletin 233
Committee I.	Roadway .....	Bulletin 234
Committee XVII.	Wood Preservation .....	Bulletin 233
Committee VII.	Wooden Bridges and Trestles .....	Bulletin 233
Committee XIV.	Yards and Terminals .....	Bulletin 235
Committee XII.	Rules and Organization .....	Bulletin 234
Committee XI.	Records and Accounts .....	Bulletin 235
Committee XIX.	Conservation of Natural Resources .....	Bulletin 235
	New Business	
	Election and Installation of Officers	
	Adjournment.	

\*At the invitation of President Safford, Prof. A. A. Potter was given the privilege of the floor for a few minutes yesterday morning. This is an abstract of his talk.

H. B. MacFarland, a member of the Rail Committee and formerly engineer of tests of the Atchison, Topeka & Santa Fe, has just returned from a visit to England where he supervised the application of the Lewis draft appliance to a British locomotive.

\* \* \*

A. L. Grandy, assistant general manager of the Pere Marquette, with headquarters at Detroit, Mich., has been appointed chief engineer and the position of assistant general manager has been abolished. J. Tuttle, chief engineer, has been appointed assistant chief engineer.

\* \* \*

W. K. Hatt, who was professor of Purdue University at the time H. R. Safford and L. A. Downs were students, said that he always knew they would amount to something when they left Purdue because they had a habit of running things while they were there.

\* \* \*

Among those attending the convention this year for the first time is B. W. DeGeer, recently appointed engineer water service of the Great Northern. He is enjoying the convention keenly and expresses the opinion that the individuals who have had the opportunity to be present, likewise the railroads which they represent, cannot but greatly benefit from their experience here if in no other way than through the greater zeal with which they will return to their work at a time when this encouragement is greatly needed.

\* \* \*

After an absence of several years John B. Seymour is again present at the exhibit at the Coliseum, although in a new connection. Mr. Seymour was formerly manager of the Western territory for the National Lock Washer Company, resigning this position in 1917 to enter the officers' training camp at Ft. Sheridan, following which he was commissioned and spent considerable time in active service overseas. Mr. Seymour has recently returned to the railway supply industry as manager of sales of the Western territory of the Verona Tool Works, with office at Chicago.

\* \* \*

P. G. Lang, Jr., assistant bridge engineer of the Baltimore & Ohio at Pittsburgh, Pa., who is in attendance at the convention, was in direct charge of the design and construction of a new bridge over the Allegheny river at Pittsburgh, the last stage of which was completed yesterday with the opening of traffic over the eastbound track. This structure received considerable notice some time ago in connection with the completion of some exceedingly intricate erection operations involving the shifting and jacking of spans during a temporary interruption to traffic. With the completion of these changes on December 20 traffic was opened over the new structure on the west-

bound track. The work has now been completed on the east approach to this bridge so that traffic will be opened on the eastbound track, effective yesterday.

\* \* \*

Frank Rhea, trade commissioner, United States Department of Commerce, is the member of the A. R. E. A. who is perhaps the farthest away from the convention at this time. Mr. Rhea is at present in Peking, China, having left the United States last fall. Mr. Rhea spent some time in London and while there happened to meet another member of the Association, A. G. Shaver, who was in Europe studying the railroad situation at that time. In a letter recently received from Mr. Rhea, he states that he arrived at Shanghai on January 14 after a 42 day trip from London with only a two day stop at Singapore and less than one day stops at Gibraltar, Malta, Port Said, Aden, Colombo, Penang and Hongkong. As the ship usually arrived in these ports in the morning and left in the evening or night, Mr. Rhea stated that this did not give him much time to see these places, but that not much time was required for such places as Aden.

\* \* \*

Of the members of the American Railway Engineering Association who arrived Monday none has a more interesting railway career than S. B. Rice, engineer maintenance of way of the Richmond, Fredericksburg & Potomac, and a member of the Ballast Committee of the Association. Mr. Rice entered railway service in November, 1865, as a carpenter on the construction of the Jamestown river bridge of the Richmond & Petersburg Railroad at Richmond. He entered the service of the R., F. & P. in June, 1866, since which time he has been continuously in the service of this railroad with the exception of a few months in 1867 and 1868. Mr. Rice thus has a record of over a half century of continuous service with one railroad. He was made a foreman of carpenters in 1873 and was promoted to master carpenter on the death of his father in 1880. He was made roadmaster of the Richmond, Fredericksburg & Potomac and the Washington Southern in 1900 and was promoted to engineer maintenance of way in 1910.

At the time Mr. Rice entered the service of this road certain portions were still laid with "U" rails weighing about 46 lbs. per yard. Some old strap rail was also in use on sidings. In reviewing his experiences in his early days Mr. Rice states that "railroading at that time on the R. F. & P. was more a pleasure than labor. The responsibility was so light that you hardly felt it. If we were putting in any new work such as bridges, culverts, or laying rail, all we had to do was to let scheduled trains pass, then go to work, knowing that we had the track until the next scheduled train, never putting out a flag. If there was to be an extra at any time, we would have been notified the previous day by what was known as a "red letter." If there was to be an extra train, one of these red letters would be thrown off by the engineer, the train stopping at the man it was addressed to and the men would take out the order, sign on the back of the envelope and return to the conductor to be turned over to the superintendent. Another practice in those days was that engineers at night were required to throw off at section houses a cast disc about  $\frac{3}{4}$  in. thick and 4 in. in diameter, this to show the number of the train that had passed. This was after we had commenced to number trains. Section masters, carpenters, and all maintenance of way employees were required to find this disc before putting a car on the track or fouling the line. Sometime they would lose considerable time before finding same. The discs were bundled up and returned to the master mechanic at Richmond for further use."

D. L. & W. Station at Morristown, N. J.

# Railway Engineering Association Proceedings

## An Account of Wednesday Sessions Including Presentation of Ten Committee Reports With Discussions

THE SECOND DAY'S SESSION of the convention of the American Railway Engineering Association was called to order promptly at 10 o'clock yesterday morning by President Safford. The larger attendance at the convention was reflected in the fact that the room was completely filled throughout both the morning and afternoon sessions. Owing to inability to complete the entire program the reports of the committees on Standardiza-

tion and Uniform General Contract Forms were held over from the Tuesday morning session and were presented early Wednesday morning. These reports were followed by those scheduled for presentation on Wednesday and included: Signs, Fences and Crossings; Ties; Iron and Steel Structures; Water Service; Economics of Railway Labor; Economics of Railway Operation; Economics of Railway Location, and Shops and Locomotive Terminals.

### Report on Iron and Steel Structures

*This committee follows the policy of publishing certain criticisms of the specifications which it submits for approval with a view to eliciting more intelligent discussion on the floor of the convention. This practice has been carried out this year with respect to the Rules and Unit Stresses for Rating Existing Bridges. The Principles for Detailed Design of Flashing, Drainage, Reinforcement and Protection for Waterproofing Purposes cover the perfection of details which have been shown by experience to favor good workmanship and reduce the possibility of the chance fault that will cause a leakage at any point in the system.*

O. E. Selby  
Chairman

*O. E. Selby, chairman of the committee, has served in this capacity for the last four years, previous to which he was vice-chairman for five years. He has been a member of this committee for a total of ten years. Although Mr. Selby's present title is that of principal assistant engineer of the Cleveland, Cincinnati, Chicago & St. Louis, he carries the duties of bridge engineer and for a long time carried that title on that railway. As the head of the committee dealing with one of the most scientific subjects, it is to be expected that he is a man given to scientific study and investigation not only as to bridge work but to other railway matters as well.*

IN APPENDIX A ARE GIVEN the Rules and Unit Stresses for Rating Existing Bridges which were offered as a conclusion for printing in the Manual. A tentative draft of these rules was published in Bulletin 228 and the discussions received were considered in the revision. These discussions were presented by the committee in Appendix B. The Principles for Detailed Design of Ballast Floors, Flashing, Drainage and Reinforcement for Waterproofing Purposes, published in Bulletin 223 and submitted as information to the 1920 convention, have been revised and are offered as a conclusion in Appendix C.

#### Conclusions

1. The committee recommended that the Rules and Unit Stresses for Rating Existing Bridges as printed in

Appendix A be approved and published in the Manual.

2. The committee recommended that the Principles for the Detailed Design of Flashing, Drainage, Reinforcement and Protection for Waterproofing Purposes appearing in Appendix C be approved and published in the Manual.

Committee: O. E. Selby (C. C. C. & St. L.), chairman; F. E. Turneaure (U. of Wis.), vice-chairman; F. Auryansen (L. I.), J. A. Bohland (G. N.), W. S. Bouton (B. & O.), A. W. Carpenter (N. Y. C.), M. F. Clements (N. P.), J. E. Crawford (N. & W.), O. F. Dalstrom (C. & N. W.), F. O. Dufour (Stone & Webster), Thomas Earle, W. R. Edwards (I. C. C.), G. A. Haggander (C. B. & Q.), R. L. Huntley (U. P.), P. G. Lang, Jr. (B. & O.), B. R. Lefler (N. Y. C.), P. B. Motley (C. P. R.), C. D. Purdon (St. L. S. W.), Albert Reichmann (Am. Brg. Co.), A. F. Robinson (A. T. & S. F.), H. N. Rodenbaugh (F. E. C.), J. M. Salmon (L. & N.), I. L.

Simmons (C. R. I. & P.), I. F. Stern (Cons. Engr.), H. B. Stuart (G. T.), G. E. Tebbetts (Roberts & Schaefer), Dr. J. A. L. Waddell (Cons. Engr.), H. T. Welty (N. Y. C.), Paul Wolfel (deceased).

**Appendix A—Rules and Unit Stresses for Rating Existing Bridges**

(1) In fixing the carrying capacity of any bridge under traffic, its location, design, details, material, workmanship, behavior, and physical condition must be taken into account.

(2) Before recalculating an existing bridge, a careful inspection should be made to determine:

(a) Whether the actual sections and details conform to the drawings.

(b) The loss of metal due to corrosion and wear. This determination should be made by caliper measurements, after thorough removal of scale.

(c) The general physical condition. Defects such as loose rivets, worn pins, crooked or damaged members, cracked metal, etc., should be carefully noted.

Particular attention should be given to the position of the track with respect to center line of the bridge, and to undesirable details, such as forked ends of compression members, eccentricity in riveted joints and connections, unequal stress in tension members, etc.

(3) In recalculating bridges for increased loading, the equipment in actual use, or which it is proposed to use, shall be taken for determining the live load stresses. Where the design or details are such as to cause eccentric or secondary unusual stresses, these stresses shall be taken into account. It is recommended that stresses in members subject to marked secondary effects be determined by strain gage measurements.

(4) In spans exceeding 150 ft. in length, and in viaduct towers, the effect of lateral (or wind) force shall be taken into account. The lateral force shall consist of a moving load equal to 15 lb. per sq. ft. on the vertical projection of the structure on a plane parallel with its axis, and a moving load of 400 lb. per lin. ft. applied 8 ft. above the base of rail.

(5) On curves, the centrifugal force, based on actual speed of operation, and assumed to act 6 ft. above the base of rail, shall be taken into account.

(6) Where speeds may exceed 15 miles per hour, the dynamic increment of the live load shall be added to the maximum computed live load stresses and shall be determined by the formula.

$$I = S \frac{300}{300 + \frac{L^2}{100}}$$

I = impact or dynamic increment to be added to the live load stress.

S = computed maximum live load stress.

L = the length in feet of the portion of the span which is loaded to produce maximum stress in the member.

Where maximum live load stress is produced by heavy cars or electric locomotives, impact stresses shall be taken as one-half of those given by the formula above.

(7) If a bridge is so located that speeds are definitely limited, or where absolute control of speed can be secured, 50 per cent of the impact given by the above formula shall be used when the speed is between 10 and 15 miles per hour, and 25 per cent when the speed is less than 10 miles per hour. If the bridge is located where the locomotive must be started, the speed increased, or the brakes applied, full impact shall be used in the calculations.

(8) Impact shall be added to stresses produced by centrifugal force, but not to those produced by lateral forces.

(9) For bridges on curves, and at other places where tracks are off center, consideration shall be given to the increased load carried by any truss, girder, or floor member due to the eccentricity of the load.

(10) The limiting stresses resulting from the loads and forces mentioned in the preceding articles, in combination with the actual dead load, shall not exceed the following, in pounds per square inch:

	Open-Hearth Steel	Wrought Iron and Bessemer Steel
Axial tension (net section).....	26000	22000
Axial compression (gross section).....	24000- 80 $\frac{1}{r}$	21000- 70 $\frac{1}{r}$
but not to exceed.....	20000	17000

l = length of the member in inches.

r = least radius of gyration of the member in inches.

Tension in extreme fibers of rolled shapes (except rolled beams and channels), built sections and girders (net sections).....26000 22000

Tension in extreme fibers of rolled beams and channels (net section) .....24000 20000

Compression in flanges of plate girders and I-beams (gross section) .....26000-300  $\frac{1}{b}$  22000-250  $\frac{1}{b}$   
but not to exceed.....24000 21000

l = length of the unsupported flange, between lateral connections or knee braces in inches.

b = flange width in inches.

Tension in extreme fibers of pins (figured by assuming stresses concentrated at centers of bearings) .....50000 40000

If the members are packed closely on the pin, the bending stress need not be considered unless the tension in extreme fiber exceeds 60000 lb. per sq. in. for open-hearth steel, or 50000 lb. per sq. in. for wrought iron and Bessemer steel.

Shear in plate girder webs and rolled beams (gross section).....18000 15000  
Shear in rivets and pins.....22000 19000

Bearing on rivets, pins, outstanding legs of stiffener angles, and other steel parts in contact .....44000 38000

The above-mentioned values for shear and bearing shall be reduced 20 per cent for countersunk rivets, floor connection rivets, and turned bolts.

In members subject to stresses produced by a combination of dead load, live load, impact, centrifugal force, and eccentric application of dead and live load, with lateral forces or bending due to lateral action, unit stresses 25 per cent greater than those given in Article 10 may be allowed; but, in such cases, the unit stresses due wholly to dead load, live load, impact, centrifugal force, and eccentric application of dead and live load, shall not exceed those given therein.

(12) In hangers having an unequal distribution of load, and in hangers or hip verticals consisting of a single member, consideration should be given to the necessity for reducing the allowable unit stress to meet this condition.

(13) Stresses in plate girders shall be computed either by the moment of inertia of their net sections; or by assuming that the flanges are concentrated at their centers of gravity. In the latter case, one-eighth of the gross section of the web, if continuous or properly spliced, may be used as flange section. For girders having unusual sections, the moment of inertia method shall be used.

(14) When the stresses exceed the foregoing limits, or when the design or physical condition makes it necessary, the structure shall be strengthened or renewed.

When these limits are closely approached, or when the physical condition of the structure is not good, it shall be kept under close inspection as long as it is continued in service.

**Appendix C—Principles for Detailed Design of Flashing Drainage Reinforcement and Protection for Waterproofing Purposes**

GENERAL

1. The following applies only to membrane waterproofing, as the "integral method" is not recommended for waterproofing railroad bridge floors.

2. The structure should be designed so that it can be waterproofed and it should be adaptable to waterproofing by ordinary methods and materials.

3. Strength and stiffness are desirable features in a structure which is to be waterproofed.

4. The structure and its construction and expansion joints, drainage and waterproofing, should be designed together, considering their separate and combined functions, so that each will help to secure a waterproof structure.

5. Due regard should be had for the available methods and materials of construction.

6. All waterproofed surfaces should be easily accessible, and as simple and smooth as possible; hence features should be avoided which would increase the difficulty of securing waterproof construction, such as open spaces, joints, holes, seams or projections.

7. Concrete bridge floors should be of ample strength and thickness and of dense non-porous construction. Special attention should be given to providing the correct amount and disposition of the reinforcement, and to securing the proper amount of water used in mixing.

8. Where contraflexure would injure the waterproofing, special details should be provided, such as elastic joints.

9. Minimize the number of construction joints in the structure, provided an ample number of workable expansion joints can be introduced.

#### DRAINAGE

10. Adequate drainage should be provided by means of suitable grades which will shed water by the easiest or most direct route. One per cent is a minimum desirable grade, but the grades away from points which are difficult to waterproof, should be correspondingly increased. While sewer and gutter grades may be considerably less than one per cent bridge floors, especially if ballasted, are subject to clogging by ashes, cinders, etc., and hence require steeper slopes to secure satisfactory drainage.

11. Avoid pockets which cannot be easily drained. Water with only a slight head may find an outlet through the waterproofing, which otherwise might be tight. Standing water is undesirable on a waterproofed bridge floor, from its destructive effect, both as a solvent and also on account of frost action.

12. Where gutters or pipes are necessary, they should be of durable material, of ample size, easy of access to install and maintain, and protected against clogging or damage. The grades should be enough to secure quick and entire escape of the water. Corrugated metal pipes are satisfactory where exposed to alternate freezing and thawing. Where sudden considerable variations in temperature occur, it is not desirable to encase drain pipes in concrete. Cleanouts and manholes should be provided where pipes cannot otherwise be cleaned.

13. Provide free exits for the harmless escape of drainage. Such drainage should not be allowed to disfigure the structure nor to injure persons or property. Icicles may be prevented by a basket of rock salt inserted in the top of the drain pipe.

14. Avoid features which would induce or permit capillary action.

15. Where possible, locate edges and joints above the highest probable water level.

#### REINFORCEMENT

16. Reinforcement of the structure should be suitably disposed, and ample in strength to prevent cracks or distortion which would injure the waterproofing.

17. Cloths, felts or fibers should be capable of holding the waterproofing pitch where placed and should be durable, strong and flexible.

18. Wire mesh or sheet metal reinforcement for the membrane should be of durable material, flexible where

necessary, and intimately bonded or introduced so that the waterproofing and reinforcement act together.

19. Necessary breaks in the surface of waterproofing or flashing, such as for drain pipes, or at construction or expansion joints, should be reinforced with extra flashing material.

#### FLASHING

20. Metal flashing shall be of material which is non-corrosive, and shall be insulated or protected against electrolytic action at points of contact with steel members of the structure.

21. Flashing should be of material which can be applied readily, and should retain the position in which it is placed when subjected to actual conditions of service and temperature.

22. Flashing should be firmly attached in its proper position, so that it cannot easily be displaced or removed.

23. The edges of waterproofing and flashing should be protected against drip, percolation and capillary action.

24. Joints between concrete and other material should be grooved and filled with an elastic expansion joint cement.

#### PROTECTION

25. Waterproofing and flashing should be protected, as soon as possible after installation, against mechanical injury, excessive temperature, chemical action, and deterioration caused by exposure to light and air.

26. The protecting covering should be dense, hard, durable and easy to apply.

It is recommended to use on flat surfaces either: (a) Brick laid in cement mortar or served with hot pitch, (b) plain or reinforced cement mortar, (c) plain or reinforced concrete, (d) bituminous mastic.

For surfaces with considerable slope, mastic is not satisfactory, being difficult to apply and also to retain in place.

#### Discussion

O. E. Selby, Chairman (C. C. C. & St. L.): You will recognize the distinction between rating existing bridges and the classification. Rating is figuring the unit stresses and deciding the capacity of the bridge. The classification is the assembling of the bridges on a railroad or on a division, together with the classification of the locomotives to be operated, and putting the information in the hands of the Transportation department, so that it may be available in assigning locomotives to the division, and for operating locomotives and other loads in emergency.

*I move the adoption of Conclusion No. 1.*

John B. Hunley (C. C. C. & St. L.): To my mind this is really more important than the specification for designing. There are a good many good specifications for designing new structures in particular, but there seem to be varied ideas as to the rating of old structures.

It seems to me the steel stresses are quite high, considering that even with the best inspection we cannot always find out the condition of the bridge. We are permitting under this proposed rating stresses of 20,000-lb. for actual tension of net sections, that is, wrought iron or Bessemer steel. I think we are going pretty far in recommending such high stresses, particularly old bridges of wrought iron and Bessemer steel. It is to my mind practically impossible to determine all the defects of the bridge by any inspection which can be made.

Chairman Selby: I will answer Mr. Hunley's first point in which he called attention to the inconsistency between the stresses by saying that in this case the designing stress is the one that existed and the proposed rating stress is correct. I will have to admit that the designing stress in Article 48 of the Specification is too low and is unduly conservative.

E. A. Frink (S. A. L.): These values that the committee has put forward, as I read them, seem to me to be about right in line with practice of bridge engineers whom I have learned to look up to as the heads of their profession.

At first sight it looks as though a stress of 20,000 lb. on ordinary iron is too large, but there are a number of factors that come into play in figuring the safety or carrying capacity of an existing bridge, which we cannot put down on paper. In every structure that is at all well designed, every part will help out—almost every part will help out another part.

C. F. Loweth (C. M. & St. P.): I am quite in accord with the expressions of the first speaker in this discussion, and I have a great many things to take exception to in the remarks that have just been made. The older bridges that we have to deal with in many cases have been well designed, and in many other cases the material of which they are composed is more or less uncertain. The record as to the quality of the material in the old bridges is not as definitely known as in the newer bridges today.

In my own practice I have frequently been compelled to carry in service old structures whose unit stresses were fully as high as those that are recommended by this committee, and I have tried to work these things out in a way that seemed to me to be wise and prudent. We have inspected bridges and calculated the load they will carry, and we have restricted the type of locomotive that should operate over that particular bridge, and then the tendency was to go away and forget it and just assume that that bridge was all right. You know the interval which elapses between the time you decide that a bridge must be changed for a heavier structure and the time in which it actually is changed. So we find that we are carrying our bridge without proper regard to the narrow margin of safety that we had agreed on.

I realize that you wish to make it clear that these specifications were not to apply to bridges to be carried indefinitely in service, but it seems to me that we ought to place considerable emphasis on the fact that those bridges are really weak sisters, and that careful inspection be given to them from time to time and frequent times, and that bridges that are stressed as high as proposed in these specifications are bridges which it is the intention of the company to replace at an early date.

Chairman Selby: Mr. Chairman, it seems to me that Mr. Lewis has answered himself. With reference to Article 14, which I read, and which Mr. Lewis called attention to, I think that covers the case precisely. If it is admitted, as Mr. Loweth seems to admit, that these stresses are safe under close inspection and watching, I do not see why we should not say so and go on record.

Mr. Hunley: That is one of the points I have in mind. We have practically gone the limit on stresses and at the same time depend on each and every instruction here given will be followed out. We all know that is not always the case. I think we should allow a little leeway for some such oversight as that.

Mr. Loweth: Perhaps the committee would be willing to lower these unit stresses and change Paragraph 14, to say that for bridges which for various reasons must be carried in service, and cannot be replaced promptly and which can be frequently inspected and kept in touch with, that the unit stresses as specified may be increased. That would simply add to the safe consideration.

G. H. Tinker (N. Y. C. & St. L.): I think it would be a mistake to adopt a lower unit of the specifications and then remove that limit by a permissive clause. In that case we have no standard whatever. I think the correct procedure is to adopt the top limit beyond which

we shall not go and to limit the application of these units in particular cases to something less than that, rather than to adopt the limit beyond which we may go under certain conditions, and in line with that I feel this Paragraph 11 is a mistake and should be omitted. Let the unit stress be fixed at a limit beyond which we may not go, and omit all provisions for a permissive stretch of these limits which this paragraph evidently does.

John V. Hanna (K. C. Ter.): The suggestion of the last speaker is very good. I know that it would be helpful to some of us, who do not specialize in this bridge work, if there could be an ultimate limit beyond which we should not go in continuing an old bridge in service.

P. B. Motley (C. P. R.): The units mentioned by the committee I think are about correct, as a general practice, and as has been mentioned on other occasions this specification or any specification is not intended to take the place of a properly qualified engineer. We must use our common sense and also the extensometer in some cases. In fact, I am inclined to believe the suggestion of a French engineer some years ago has a great deal in it. He suggested that figures should be almost thrown to the wind and the extensometer rule with regard to every stress.

With regard to bridges on the Canadian Pacific, we have adopted such stresses as these certainly over twenty years ago and have had no reason to regret it. Of course, they are well inspected and frequently, and any members that have been deformed by physical injury are watched especially. I know it develops on the shoulders of one man eventually to call a halt and to make such a report to the management as will force the overloaded spans to be replaced and that item is very important. The personality of that man will have to be of the highest order, because always there are large sums of money involved and the managements, especially in these times, do not relish the idea of spending comparatively large sums.

O. B. Robbins (I. C. C.): I find myself in close agreement with the last speaker in regard to the matter of the extensometer in computing stresses. Some years ago when I was connected with the Great Northern Railway we tested the spans in the Columbia River bridge in the state of Washington. We found our computations on the test members check closely with the extensometer test, but there were other members where we found stresses far greater than we had anticipated. This illustrates the fact that the computations do not take into account within several thousand pounds to the square inch the stresses that may be developed.

Chairman Sibley: Article 7 provides for limiting the speed of trains (reads article).

Mr. Loweth: Is there any such thing as an absolute control of speed?

Chairman Sibley: The committee thinks there is in the sense used here. There are places where physical conditions as to site limit the speed and there are other conditions where an operating control that is practical certainly may be secured, but we do not want to go on record as advocating a reduction in impact in cases where the speed is not controlled by anything better than a slow order.

Mr. Loweth: One of the speakers a few minutes ago said he felt it was desirable to have a definite unit stress which would be safe because we were not all bridge engineers, and it would be desirable if he could tell just where they would have to draw the line. I think that is just where the danger comes in. We should not go right up to the danger point, and feel that beyond that there was an absolutely dangerous condition.

The tendency with a specification of this kind, as I see it, will be to put in the drawing room these stresses and

employ a man who can compute the stresses and determine the questions which will come up and then perhaps it will be perfunctorily settled by the bridge engineer that because it does not exceed the unit stresses that are stated here that the bridge is all right. That may not occur, that may only occasionally occur, but there will be a tendency that way.

Chairman Selby: If anyone puts these rules in the drafting room and leaves them there and without any other responsibility he is doing a very unwise thing and it is certainly not the intention of the committee that the rules should be so abused.

Mr. Motley calls attention to the fact that no set of rules can take the place of the personal responsibility of the engineer.

Article 1 certainly cannot be complied with in the drafting room. In fixing the carrying capacity of any bridge for traffic, its location, design, material, workmanship, behavior and physical condition must be taken into account. No one can tell in the drafting room what the behavior of the bridge is.

Prof. W. N. Wilson (U. of Ill.): The discussion of the rating of old bridges has centered, to a considerable extent, at least, in the written discussion, on the life of the bridge under these high stresses. We seem to be pretty much in accord that for a comparatively short time at least the steel structure can be subjected to stresses of 24,000 to 26,000 lb. without danger of bending, but the question in which we are interested is how long the bridge will continue in service under these excessive stresses. Our work on fatigue of metals, I think, has demonstrated that as far as the physical properties of the material itself is concerned, we have very little reason to fear that material will deteriorate. A stress of 24,000 to 26,000 lb. for steel intension is below the stress which will cause a large number of repetitions. Furthermore, I think it is our experience that where a bridge shows signs of weakening it is not because of the deterioration of the metal, but because of the working loose of the parts that are connected.

The testing work which has been done on the strength of riveted joints has demonstrated that as the stresses increase, the members that are connected slip relative to each other at a stress below the stress that was used in the design. This deformation is the slipping of one piece upon another and is not an elastic strain. We would naturally expect, then, that if this slip is repeated a large number of times that some wear will take place and the joint become loose, for, as we know, the joint holds not by virtue of the strength of the rivet in shear, but by virtue of the friction between the plates induced by the tension in the rivet.

With this idea in mind at the experiment station at the University of Illinois, we have undertaken a tentative program in which we have tried to determine the effect of repeated stresses upon riveted connections, and while we do not feel that these tests have been carried on far enough to prove anything definitely, I would like to present to the Association some of the indications of our tests.

We find that repeated stresses, in which the stress is only one-half as great as the A. R. E. A. specifications permit in design, that the rivets will work loose if the stress is repeated.

In the new specifications for new bridges it is proposed to increase the allowable stress on rivets approximately 80 per cent. The tests which we have made indicate that such a stress as that will loosen a rivet in a few hundred reversals, so that the passing of the trains for a period of 1 or 2 or 3 years will cause the rivets to work loose, and in the rating of the old bridges I think we should

focus our attention upon the effect of the overstresses upon the rivets rather than upon the material itself.

Albert Reichmann (Amer. Bridge Co.): There are several points which were brought out in the discussion on these specifications. Mr. Loweth thought that it was undesirable to fix an upper limit for refiguring old bridges. I do not agree with Mr. Loweth on that point. I think the best thing to do is to fix an upper limit and if the chief engineer or the bridge engineer of a larger system feels that he does not like to go to that upper limit, I think he could easily inaugurate a rule in his own office which would require his people to call his special attention to any bridge which came to that limit.

F. E. Schall (L. V.): I want to say something in support of Mr. Loweth's contention. If I remember correctly Mr. Loweth presented a similar table of unit stresses 5 or 6 years ago and they were about the same limit, I believe, and evidently Mr. Loweth has felt and experienced difficulties that made him change his mind.

I feel these stresses are higher than this organization should support as a general license, and say it is perfectly safe to use bridges to that extent. It is not always possible to find the weakest point in a bridge by the inspection made.

Chairman Selby: These rules are not intended to be put out for indiscriminate use by inexperienced men. They are intended only as a guide for an experienced bridge engineer to use in passing on the safety of the bridge, and the necessity for keeping it in service. If articles 1, 2 and 14 of the rules are not strong enough on that point, it might be well to make them stronger, but it should be kept in mind all the time that there is a great deal in passing on the capacity of the old bridge besides the figuring. The figures are only one of the means used to arrive at the capacity of the bridge. The other things are the physical condition, the design, details, material and the general knowledge and judgment of the bridge engineer.

B. R. Leffler (N. Y. C.): The criticism has been made that these unit stresses are too high. I think it might be well to call attention to the secondary stresses, which usually or quite often are included in the calculation of stresses in bridges. The committee in recommending these unit stresses had in mind that every legitimate of possible stress was to be calculated. I think that in the past many of the bridges have been rated as what is known as the axial stress, but in view of the fact that the committee has distinctly stated that all stresses of whatever character are to be included, it seems to me that the so-called high unit stresses are justifiable. I think we should remember that these recommendations here are not to be thrown into the drafting room and stresses calculated and a ruling given on that perfunctory operation. The specifications distinctly call for an exercise of judgment, and it is not intended that the bridge engineers will simply take these rules and pay no further attention to the structures. They are supposed to watch the structure in the light of what they have found in the field as well as in the office. I notice that while these stresses have been criticized as being too high, no one has suggested a lower stress.

Mr. Reichmann: These specifications are drafted for structures well designed, not poorly designed, and where the structures are poorly designed these factors should be considered in going over the details and in that way these stresses should be reduced. If they figure out the various details where they find defective design these stresses should be reduced, as these stresses are intended for well designed structures.

Mr. Leffler: I think it is utterly impossible to recommend limiting stresses for poor design. If a design is

so poor that the defective details cannot be calculated, for instance, eccentric connections, unsymmetrical spacing of rivets, you must rely on your judgment anyhow.

Mr. Tinker: I think these stresses should be laid on the interpretation of the specification and the physical construction of the structure, and its behavior under traffic should be considered of greater importance than the actual figures of stress which may be computed.

As to the matter of the repetition of stresses which has been mentioned, in the case where there is a reversal of stress the majority of members in the structure will not have reversal of stress, and if they have they have been designed with that fact in mind. But they will have stress in the one direction, and I believe it is true that it will require a great many more repetitions where the stress is in one direction, and that that stress may approach considerably closer to the elastic limit than in the case where there is a reversal.

I do not feel that the stresses given here are too high if they are taken in connection with the remaining paragraphs of the specification, which I believe are fully as important as the unit stresses. I wish to refer once more to paragraph 11 and ask the committee if they would not agree to remove the paragraph, because it does open the way for a large increase over the unit stresses in the table which are more or less indefinite, and it permits

a man who might forget his structure, to carry those stresses to a point to which he should not.

I. L. Simmons (C. R. I. & P.): In regard to paragraph 11, it would seem to me that should remain. It defines and limits us in our work in the establishment of the unit stresses. The latter part of the paragraph states that the unit stresses due to dead load, live load, impact and centrifugal force alone shall not exceed those given in the unit stresses. The only thing you are allowing a unit stress for is on account of the wind load. While it is possible, it is quite improbable, that you will get a maximum live load, dead load, impact, and centrifugal force, and the maximum wind load at the same time and the paragraph is written to avoid allowing anything except the wind load.

*(The motion for the adoption and insertion in the Manual of Appendix A, as a whole, was carried.)*

Chairman Selby: Referring to Appendix C, these principles were published a year ago, submitted as information, and are now without substantial change offered as conclusions.

On behalf of the committee, I move the adoption of conclusion No. 2.

*(Motion carried.)*

*The committee will be excused with the thanks of the Association.*

## Report of the Committee on Ties

*A review of the cross-tie specifications shows that a majority of roads submitting data are adhering closely to a common standard, though none are using the present specifications of the A. R. E. A. A new set of standard specifications for cross-ties and switch-ties, which is based on the U. S. Railroad Administration specifications, is presented for adoption in place of those now in the Manual. Installation of test sections forms best method to obtain accurate data on life of ties, the installation and records being under the supervision of an experienced technical man. Comparisons on economics of different classes of ties proves difficult.*

F. R. Layng  
Chairman

*F. R. Layng is rounding out his fourth year as chairman and his tenth year as a member of the committee. He served for two years as vice-chairman prior to his appointment as chairman. He also acted as chairman of the sub-committee on substitute ties for several years, a position for which he was particularly fitted because of his extensive use of metal ties. As chairman this year he has exerted a strong influence on the standard specification for ties which is presented for adoption this year. Mr. Layng is engineer of track on the Bessemer & Lake Erie, a railroad which has placed a large number of steel ties in its tracks.*

**I**N APPENDIX A THE COMMITTEE tabulated proposed changes in definitions (omitted) and submitted new specifications for cross-ties and switch-ties.

A report on the economics and the use of various classes of cross-ties and various kinds of preservative treatment was reported in Appendix C.

Appendix D contains a report on trials of substitute ties.

### Conclusions

1. The committee recommended that the changes in the Manual in Appendix A be approved and the revised matter be substituted for the present recommendations in the Manual.

2. The committee recommended that the reports in Appendices B, C and D, and the special report in Bulletin No. 227, be received as information.

Committee: F. R. Layng (B. & L. E.), chairman; W. A. Clark (D. & I. R.), vice-chairman; W. C. Baisinger (A. T. & S. F.), F. T. Beckett (C. R. I. & P.), M. S. Blaiklock (G. T.), F. Boardman (N. Y. C.), Carl Bucholtz (Erie), W. J. Bur-

ton (M. P.), S. B. Clement (T. & N. O.), E. L. Crugar (I. C.), L. A. Downs (C. of Ga.), John Foley (P. S.), O. H. Frick (C. M. & St. P.), G. F. Hand (N. Y. N. H. & H.), R. M. Leeds (L. & N.), A. F. Maischneider (C. C. C. & St. L.), A. J. Neafe (D. L. & W.), G. P. Palmer (B. & O.), George E. Rex (Nat. Lumber & Creosoting Co.), L. J. Riegler, Earl Sullivan (B. & O.).

### Appendix A—Specifications

The committee presented the following "Specification for Cross-Ties" and "Specification for Switch-Ties" and recommended that they be adopted and printed in the Manual in substitution for the specifications approved in 1916 and appearing on pages 243 to 246 of Volume 17 of the Proceedings of the Association.

#### SPECIFICATION FOR CROSS-TIES

##### MATERIAL

**Kinds of Wood**—1. Before manufacturing ties, producers shall ascertain which of the following kinds of wood suitable for cross-ties will be accepted: Ash, Beech, Birch, Catalpa, Cedar, Cherry, Chestnut, Cypress, Elm, Fir, Gum, Hack-

berry, Hemlock, Hickory, Larch, Locust, Maple, Mulberry, Oak, Pine, Poplar, Redwood, Sassafras, Spruce, Sycamore and Walnut. Others will not be accepted unless specially ordered.

PHYSICAL REQUIREMENTS

**General Quality**—All ties shall be free from any defects that may impair their strength or durability as cross-ties, such as decay, large splits, large shakes, large or numerous holes or knots, or grain with slant greater than one in fifteen.

**Resistance to Wear**—Ties from needle-leaved trees shall be of compact wood throughout the top fourth of the tie, where any inch of any radius from the pith shall have not less than one-third summerwood in six or more rings of annual growth, or not less than one-half summerwood in fewer rings. Ties of coarse wood having fewer rings or less summerwood will not be accepted unless specially ordered.

**Resistance to Decay**—Ties for use without preservative treatment shall not have sapwood wider than one-fourth the width of the top of the tie between 20 in. and 40 in. from the middle, and will be designated as "heart" ties. Those with more sapwood will be designated as "sap" ties.

DESIGN

**Dimensions**—2. Before manufacturing ties, producers shall ascertain which of the following lengths, shapes, or sizes will be accepted, and whether ties are to be hewed or sawed and in either case whether on the sides as well as on the top and the bottom.

All ties shall be eight feet, eight feet six inches, or nine feet long.

All ties shall measure as follows throughout both sections between 20 in. and 40 in. from the middle of the tie:

Grade	Sawed or Hewed Top, Bottom and Sides	Sawed or Hewed Top and Bottom
1	None accepted	6" thick x 6" wide on top
2	6" thick x 7" wide on top	6" thick x 7" wide on top
3	6" thick x 8" wide on top	6" thick x 8" wide on top
		7" thick x 7" wide on top
4	7" thick x 8" wide on top	7" thick x 8" wide on top
5	7" thick x 9" wide on top	7" thick x 9" wide on top
6	7" thick x 10" wide on top	7" thick x 10" wide on top

MANUFACTURE

All ties, except those of (Specify kind or kinds of wood) shall be made from trees which have been felled not longer than one month.

All ties shall be straight, well hewed or sawed, cut square at the ends, have bottom and top parallel, and have bark entirely removed.

INSPECTION

Ties will be inspected after delivery at suitable and convenient places satisfactory to the railroad, which reserves the right to inspect ties at points of shipment or at destination. Ties will be inspected at points other than the railroad's property whenever in the judgment of the railroad there is sufficient number to warrant it; but the shipper shall provide accommodations for the inspector while away from rail or steamer lines and transport him from or to a railroad station or steamer landing.

Inspectors will make a reasonably close examination of the top, bottom, sides, and ends of each tie. Each tie will be graded independently without regard for the grading of others in the same lot. Rafted or boomed ties too muddled for ready examination will be rejected. Ties handled over hoists will be turned over as inspected.

Ties will be rejected when decayed in the slightest degree, except that the following will be allowed: in cedar, "pipe or stump rot" up to 1/2 in. in diameter and 15 in. deep; in cypress, "peck" up to the limitations as to holes; and, in pine, "blue sap stain."

A large hole in woods other than cedar is one more than 1/2 in. in diameter and 3 in. deep within, or more than 1 in. in diameter and 3 in. deep outside the sections of the tie between 20 in. and 40 in. from its middle. Numerous holes are any number equalling a large hole in damaging effect. Such holes may result in manufacture or otherwise.

A large knot is one exceeding in width more than 1/4 of the width of the surface on which it appears; but such a knot may be allowed if it occurs outside the sections of the tie between 20 in. and 40 in. from its middle. Numerous knots are any number equalling a large knot in damaging effect.

A shake is a separation of one ring of annual growth from another. One which is not over 4 in. long or 1/4 in. wide will be allowed.

A split is a break across annual rings. One which is not

over 10 in. long will be allowed provided a satisfactory anti-splitting device has been properly applied.

A tie will be considered straight: (1) When a straight line along the top from the middle of one end to the middle of the other end is entirely within the tie; (2) when a straight line along a side from the middle of one end to the middle of the other is everywhere more than 2 in. from the top and the bottom of the tie.

A tie is not well hewed or sawed when its surfaces are cut into with scoremarks more than 1/2 in. deep or when its surfaces are not even.

The lengths, thicknesses and widths specified are minimum dimensions. Ties over 1 in. more in thickness, over 3 in. more in width, or over 2 in. more in length will be degraded or rejected.

The top and bottom of a tie will be considered parallel if the difference in the thickness at the two sides or ends does not exceed 1/2 in.; that is, one side may be 7/4 in. while the other is 6 3/4 in. wide; or one end may be 6 3/4 in. while the other is 7 1/4 in. thick.

All thicknesses and widths apply to the sections of the tie between 20 in. and 40 in. from the middle of the tie. All determinations of width will be made on the top of the tie, which is the narrower of the horizontal surfaces.

Ties which are oversize will be accepted as follows: 8 in. to 9 in. by 9 in. to 12 in., as Grade 4; 9 in. to 10 in. by 9 in. to 12 in., as Grade 3. Ties over 10 in. thick or over 12 in. wide on top will be rejected. Ties will be graded up by their smaller ends and graded down by their larger ends. The dimensions of the tie will not be averaged.

DELIVERY

All ties, except those of (Specify kind or kinds of wood) shall be delivered to the railroad within one month after being made.

Ties delivered on the premises of the railroad for inspection shall be stacked not less than 10 ft. from the nearest rail of any track at suitable and convenient places; but not at public crossings, nor where they will interfere with the view of trainmen or of people approaching the railroad. Ties shall be stacked in alternate layers of two and seven, the bottom layer to consist of two ties kept at least six inches above the ground. The second layer shall consist of seven ties laid crosswise of the first layer. When the ties are rectangular, the two outside ties of the layers of seven and the layers of two shall be laid on their sides. The ties in layers of two shall be laid at the extreme ends of the ties in the layers of seven. No stack may be more than 12 layers high, and there shall be five feet between stacks to facilitate inspection. Ties which have stood on their ends on the ground will be rejected.

Each stack shall have fastened to it a tag on which is written the owner's name and address, the date when stacked, and the number of ties of each kind of wood in the stack.

All ties are at the owner's risk until accepted. All rejected ties shall be removed within one month after inspection.

Ties shall be stacked as grouped below. Only the kinds of wood named in a group may be stacked together.

CLASS U—TIES WHICH MAY BE USED UNTREATED

SHIPMENT

Ties forwarded in cars or vessels shall be separated therein according to the above groups, and also according to the above sizes if inspected before loading.

SPECIFICATION FOR SWITCH-TIES

MATERIAL

**Kinds of Wood**—1. Before manufacturing ties, producers shall ascertain which of the following kinds of wood suitable for switch-ties will be acceptable: Ash, Beech, Birch, Cedar,

Cherry, Chestnut, Cypress, Fir, Gum, Hemlock, Larch, Locust, Maple, Oak, Pine and Redwood. Others will not be accepted unless specially ordered.

**PHYSICAL REQUIREMENTS**

**General Quality** [same as for cross-ties].

**Resistance to Wear** [same as for cross-ties].

**Resistance to Decay**—Ties for use without preservative treatment shall not have sapwood wider than one-fourth the width of the top between 12 in. from each end of the tie, and will be designated as "heart" ties. Those with more sapwood will be designated as "sap" ties.

**DESIGN**

**Dimensions**—2. Before manufacturing ties, producers shall ascertain what sizes of ties will be acceptable and whether ties are to be hewed or sawed and in either case whether on the sides as well as the top and the bottom.

All ties shall be 7 in. thick.

Ties sawed or hewed on top, bottom, and sides shall be not less than 9 in. wide on top throughout the section between 12 in. from each end of the tie. Ties sawed or hewed on top and bottom only shall be not less than 7 in. wide on top throughout the section between 12 in. from each end of the tie.

Each tie shall be of a length specified below:

(Bill of Material)

1. It is expected that each railroad will specify only the kind or kinds of wood it desires to use.

2. It is expected that each railroad will specify only the shape or shapes and size or sizes it desires to use.

**MANUFACTURE**

[Clause same as for cross-ties.]

**INSPECTION**

[All paragraphs same as for cross-ties except the one given below.]

A large knot is one exceeding in width more than one-quarter (¼) of the width of the surface on which it appears; but such a knot may be allowed if it occurs outside the section between twelve (12) inches from each end of the tie.

**DELIVERY**

All ties, except those of..... (Specify kind or kinds of wood)

shall be delivered to the railroad within one month after being made.

Ties delivered on the premises of the railroad shall be stacked not less than 10 ft. from the nearest rail of any track at suitable and convenient places; but not at public crossings, nor where they will interfere with the views of trainmen or of people approaching the railroad. Ties shall be stacked at least 6 in. above the ground. No tie shall be unsupported for more than 10 ft. of its length. The ties in each layer of 10 or more shall be not less than 1 in. apart, and such layers shall be separated by stacking strips at least 1 in. thick and not more than 4 in. wide. If ties are used to separate the layers of 10 or more, and they are rectangular, such strip ties shall be laid on their sides and the 2 outside ties as near as possible to the extreme ends of the ties in the layers of 10 or more. No ties shall be permitted to overhang more than 2 ft. No stack of ties shall be wider than 10 ft.

Each stack shall have fastened to it a tag on which is written the owner's name and address, the date when stacked, and the number of ties of each kind of wood in the stack.

All ties are at the owner's risk until accepted. All rejected ties shall be removed within one month after inspection.

Ties shall be stacked as grouped below. Only the kinds of wood named in a group may be stacked together.

**CLASS U—TIES WHICH MAY BE USED UNTREATED**

	"Sap" Redwood		

**SHIPMENT**

Ties forwarded in cars or vessels shall be separated therein according to the above groups, and also according to the above sets or lengths if inspected before loading.

**Appendix B—Methods of Installing and Keeping Records of Test Sections**

The Association has decided that the method of test sections is the best way to obtain the necessary data. The methods of installing the test sections and of collecting and reporting the data on different railroads are not uniform, although the work of the Forest Products Laboratory has tended toward uniform methods of reporting.

The principal criticism of the test section method of obtaining data on tie life has been that it often gave abnormal results. This criticism, if merited, is probably due to the fact that the ties are in most cases selected, the maintenance is above the standard, and the renewals are watched with unusual care. The main object of the tests is comparative data, however, and the test sections as usually installed give this comparison, but it is believed that the tests might be made more nearly representative if care were taken to keep the conditions as near as possible to average actual practice.

Of 40 railroads canvassed by this sub-committee, only five submitted data to show that a systematic record of test sections had been kept; namely, the Chicago, Burlington & Quincy, the Great Northern, the Baltimore & Ohio, the Pennsylvania and the Northern Pacific. Several other roads are keeping a more or less complete and comprehensive record of this kind.

**RECOMMENDATIONS**

**Installing Test Sections**—(1) In locating test sections, it is of first importance that a piece of track be selected that has no switches and is not likely to be disturbed by new construction or abnormal rail renewals. It is not essential but it is recommended that the test ties all be put in at once "out of face," as this accelerates the gathering of the information and without greatly increasing the ex-

Form for Report on the Condition of Each Tie

pense, as the good ties removed can be used elsewhere. All of the different kinds of ties in a test section should, so far as possible, be installed under the same conditions of curvature, grade and drainage. The committee recommends that not less than 100 ties of each kind under test be installed. If installed in multiples of 100, the percentages are readily obtained. If too few ties are put in, a few abnormal failures may make the test misleading. Each tie should be numbered and most roads think it necessary to mark each tie with its number, and in some cases with kind of timber and date of insertion. If a reliable record is kept in the office, however, it scarcely seems necessary to mark the tie with more than its number. The test sections should be marked by suitable monuments at each end.

**Inspection of Test Tracks**—(2) It is recommended that installation and records of the test sections be under the supervision of a technical man, experienced in that kind of work, who is qualified to make accurate observations and keep good records, so that the tests will be continuous and not affected by changes in the personnel. Regular inspection should be made of the test sections at least once a year. Ties should not be removed except in

emergencies without the approval of the official responsible for the record and should never be destroyed until inspected by him or his representative.

*Tie Record*—(3) The essentials of the record are covered by two forms: one being a report (Form No. 1) giving the location and principal data, such as traffic, weight of rail, kind of ballast, kind of tie, treatment, etc., and the other a record of the inspections (Form No. 2) showing the condition of each tie at each inspection. If many kinds of ties are under test in the test sections, a chart showing the location of the different kinds will be helpful and it is necessary to have a full record of the treatment of each different lot of ties under test.

In case the ties in the test sections are not put in "out of face," but the existing ties in the track are considered as test ties, the forms must be modified accordingly. Or if the test sections are to be built up by keeping a record of the ties used in renewals, still different forms are needed.

As renewal "out of face" is recommended in installing test sections, only the one set of forms is offered, though it is agreed that reliable records can be secured by any one of the three methods.

Appendix C—The Economics of the Use of Various Classes of Cross-Ties and Various Kinds of Preservative Treatment

An investigation of existing data indicates that not only is satisfactory tie life data far from plentiful, but also that much of it has been obtained, primarily for the purpose of justifying treatment and without very much regard to the question of size of tie or kind of wood. Some of the more recent tie data is one-sided, in that certain variables, especially the treatment details, are recorded with particularity out of proportion to the provisions for other equally important or even more important variables.

Some of the many variables which influence the life of ties are: Kind of wood, dimensions, preservative treatment, ballast, fastenings, climate and traffic. Wrong conclusions might easily be drawn if these variables are based on present data exclusively.

Having in mind this incomparability of much of the limited data existing, as well as to elicit discussion, the committee sent out a questionnaire dealing with the subject, and asking for opinion data where actual results were not available. It would seem from the returns that in some cases "conventional" ideas as to life of ties of certain kinds are reported, and it is also apparent that the variable of traffic, which is very difficult to handle, must receive much greater attention before proper comparisons or conclusions may be made.

A tabulation of the replies shows that, without taking

into account such variables as traffic and climate, conclusions, as, for instance, between ties seven inches thick compared with those six inches, are out of the question.

In view of the lack of data and the conflicting ideas, the committee desires to report progress on the subject, but to draw no conclusions this year. The information in the exhibits is presented as having value in considering the subject.

Discussion

F. R. Layng (B. & L. E.) (Chairman): The first subject to be presented will be the revision of the Manual, which will be given by Mr. Foley, the chairman of this sub-committee.

John Foley (Penna.): Appendix A comprises recommendations of the Committee in connection with the revision of the Manual. They are mostly additions with a few corrections and some omissions.

The Chairman: The chairman suggests that opportunity be given for discussion of that portion of Appendix A, down to the word "Specifications."

Chairman Layng: I move that that portion of the Revision of Manual, shown under Appendix A down to "Specifications," be adopted for printing in the Manual.

(Motion carried.)

Mr. Foley: The several tables following Appendix A is the summarized form of the material which was gathered by the committee in its consideration of a specification for cross-ties. The chairman calls attention to the fact that the committee was guided by the standard form adopted by the Board of Arbitration, which resulted in a slight rearrangement of this specification. The whole chapter on inspection is a development in the matter of specifications for cross ties, and brings to the manufacturer as well as to the railroad the standard practices which have developed in recent years.

In the ninth paragraph of the matter on Inspection, the committee has the following substitution to recommend: The lengths, thicknesses and widths specified are minimum dimensions. Ties over 1 in. and under 2 in. or more in thickness than the maximum specified will be accepted as one grade below the largest tie specified. Those 2 in. to 3 in. more in thickness than the maximum specified will be accepted as two grades below the largest tie specified. Those over 3 in. more in thickness or width of over 2 in. more in length than the maximum specified, will be rejected. Ties will be graded up by their smaller ends and graded down by their larger ends. The dimensions of the tie will not be averaged.

This does not alter the specification as you have it, but expresses it in a clearer form. It also makes it possible to apply the last paragraph to ties which may be ordered by a railroad that objects to purchasing grades larger than grade 3. As it is in the printed report, a railroad that stopped at grade 3 or grade 4 would not be able to apply this without certain alterations.

W. G. Arn (I. C.): In this paragraph on resistance to wear, what are we to do in the case where a railroad uses loblolly and woods of that kind quite extensively?

Mr. Foley: You will note that the specification does not bar the acceptance of a tie that any railroad might feel that it can accept.

Mr. Lewis: Under the head of "kinds of ties"—kinds of woods, rather—I wonder why the committee adopted that rather negative expression instead of saying: "Cross ties of the following kinds of woods will be accepted."

Mr. Foley: The committee figures that this is a general specification of ties which is going to be circulated. Some railroads which buy over a very large territory will not wish their specification to get into the hands of the manufacturer of ties, for he, without any consultation

with the railroad, might begin the manufacture of them, and end up by finding that some of the kinds of wood which he had in his timber land, and which he converted into ties, are not readily salable. We want it so that the manufacturer will find out from the railroad what it is they desire.

E. A. Frink (S. A. L.): Mr. Chairman, I would like to call the attention of the committee that we have this year presented to us three classifications for ties, this present one, two by the Committee on Wooden Bridges and Trestles, covering bridge ties and sawn ties and guard rails. It seems to me that these specifications should be made to harmonize before they are presented.

Chairman Layng: The committee felt it was certainly not the province of that committee to present specifications for either cross ties or switch ties. We feel that it is the duty of this committee to handle that, and if they have presented a specification we feel that they should withdraw it.

Mr. Foley: The committee felt that since switch ties were used as are cross ties, the specification should correspond as far as conditions would allow, and in that they followed the practice which was made standard in 1915, 1916 and 1917. Again, the specification follows the standard that is adopted by the Board of Direction.

(Mr. Foley gave the specification for switch ties.)

Chairman Layng: *I move the adoption of these specifications for cross ties and the specification for switch ties for printing in the Manual.*

(*Motion carried.*)

Chairman Layng: The next subject is shown in Appendix B, which will be presented by W. A. Clark, chairman of the sub-committee.

W. A. Clark (D. & I. R.): A year ago the Association approved of the test section method of collecting data on the life of cross ties. This committee was asked to report on methods of installing and keeping records of test sections. It developed from the information received by the committee that while many roads have installed test sections, there is no uniform method adopted for installing or keeping the records. With a view of promoting uniformity the committee had formulated the recommendations presented.

F. J. Angier (B. & O.): I suggest that in Form No. 1 the committee leave a line there for the average annual rainfall. It seems to me this is a factor that should be considered in any test tie section.

The Chairman: The committee say they will take that suggestion under consideration.

(Appendices C and D were next presented for the information of the Association, following which the committee was dismissed with the thanks of the Association.)

## Report on Signs, Fences and Crossings

*Revision of specifications for standard right-of-way fences is presented in order to make such fencing conform to the law in a large number of states. Old recommendations as to galvanizing are found impracticable when applied to manufacturing processes. Additional standards for signs for the use and information of railway employees are submitted for inclusion in the Manual. A valuation section sign is recommended on account of the valuation by the government and the probable continuation of reports by valuation sections. Regulations as to grade crossings already in effect in various states and Canada are presented. Wood plank is recommended for grade crossing construction.*

Arthur Crumpton  
Chairman

*Arthur Crumpton has been a member of the committee for eight years, and served as vice-chairman for three years prior to his appointment as chairman two years ago. Through his active participation in the work of this committee he has rendered an important service to the railways through the development of a series of standard signs to replace the innumerable designs now in use over the country. As valuation engineer of the Grand Trunk, which has been taken over recently by the Canadian Government, he is now in the anomalous position of working under the direction of the United States Division of Valuation, in so far as the mileage in this country is concerned.*

**I**N APPENDIX "A" are given proposed changes in the Manual, together with the reasons therefor, and its recommendations are given under the heading of Conclusions. In Appendix "B" the committee submits the results of its review of various signs. Its recommendations are given under the heading of Conclusions. In Appendix "C" the committee submits the results of its studies on highway crossing protection. This includes an abstract of laws on this subject in the United States and Canada (omitted).

### Conclusions

(1) The committee recommended that the changes in the Manual in Appendix "A" be approved.

(2) The committee recommended that the following paragraphs be approved and published in the Manual at the bottom of page 316 in lieu of its recommendation adopted at the last convention. The additional signs

covered are End of Block, Lack of Clearance, Corporation or Sub-division and Passing Siding.

### ROADWAY INFORMATION SIGNS

Signs for Dump Ashes, Blind Siding, Water Station, Fuel Station, Beginning of Double Track, End of Double Track, End of Block, Lack of Clearance, Corporation or Sub-division and Passing Siding to be similar to sketch shown on page 318, 1915 Manual, for Trespass Signs.

Length of sign plate to be changed, if necessary, on account of wording, and corners to be square on last two signs.

The committee recommended that the designs submitted of Mile Post, Section Sign, Sub-division and Section Sign, Property Post, Bridge Number, Curve and Elevation, Number and Valuation Section signs be approved and published in the Manual.

Committee: Arthur Crumpton (G. T.), chairman; Maro Johnson (I. C.), vice-chairman; Arthur Anderson (N. Y. C.),

F. W. Bailey (S. A. & A. P.), F. D. Batchelor (B. & O.), F. T. Darrow (C. B. & Q.), G. N. Edmondson (N. Y. C.), S. C. Jump (I. C.), L. C. Lawton (A. T. & S. F.), S. L. McClanahan, W. S. McFetridge (B. & L. E.), L. A. Mitchell (Un. Tr.), T. F. Rust (C. F. & N.), W. D. Warren (N. Y. N. H. & H.), K. G. Williams (Union), D. R. Young (D. L. & W.).

**Appendix A—Revision of Manual**

**SPECIFICATIONS FOR STANDARD RIGHT OF WAY FENCES**

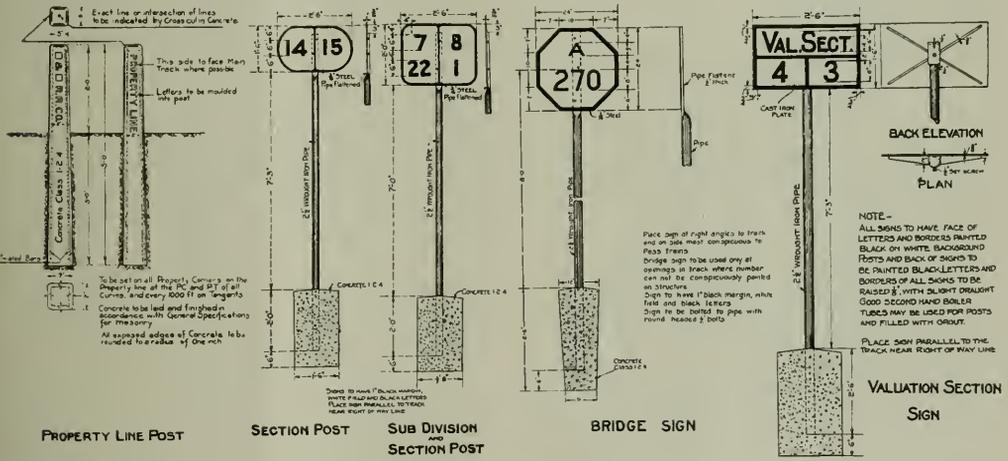

**Class A Fence.**—A fence 4 ft. 6 in. high is required by the laws of a great many states. The specifications for they now appear in the Manual provide that when this fence is used for hogs the bottom wire shall be not over 3 in. above the ground with a strand of barbed wire below. This would make the fence only 4 ft. 4 in. high, which would prevent its use in states requiring a 4 ft. 6 in. high fence. The sub-committee believes that the use of a barbed wire 2½ in. below the fencing will serve the purpose without lowering the woven wire.

**Class B Fence.**—A change from stays 18 in. apart to 12 in. apart is recommended because our largest makers of woven wire fencing do not fabricate this fence with

for line posts provide that they shall be 16½ ft. apart, without any reference to a short panel at the corners or ends. The sub-committee believes that a shorter panel should be used at these corners and ends and recommends 10 ft. If this panel is too long an unnecessarily heavy brace is required and if it is too short there is a tendency for the end post to lift out of the ground. Ten feet is thought to be about the right length. The change in the distance apart of other line posts to "not more than 20 ft." is to meet the practice of those roads which use 20-ft. centers, and, apparently, with good results.

**Stretching.**—The sub-committee is of the opinion that on curves it is desirable to have the fence on the outside of the curve from the posts so that the fence pulls against the posts instead of away from them. If this is not done it is thought that the staples would be likely to pull out when the wood in the post gets old and loses its holding power.

**Splicing.**—The sub-committee recommends the omission of the last two sentences advocating smooth wire, as it seems to us that while the use of smooth wire may be proper in some places it certainly is not desirable in

Recommended Designs for Inclusion in the Manual

18-in. stays. It is also our opinion that the use of 12-in. stays is fully warranted.

**Class C Fence.**—The Class C fence specified in the Manual is one that is only suitable under special conditions and in special locations. A fence 3 ft. 6 in. high is not suitable for general use, would be a legal stock fence in few, if any, states, and when used should be so placed as to suit the special conditions which caused its adoption. In its place the sub-committee has recommended a fence which is being used to some extent and which gives most of the advantages of the Class A fence at a considerably lower cost.

**Concrete Posts.**—The specifications for concrete posts, paragraphs 10, 11, 12 and 13 and the last sentence of paragraph 24, are obsolete, being largely amended by the conclusions adopted by the Association in 1918. Inferentially, also, they exclude the use of steel posts which have been adopted by several roads. The sub-committee thought it best, therefore, to omit all reference to concrete posts. Later on, if thought best, specifications of fence with concrete posts and with steel posts can be prepared by the committee.

**Intermediate or Line Posts.**—The present specifications

all places. On the western plains, for instance, smooth wire would scarcely be suitable for cattle fences.

**GALVANIZED WIRE FENCING**

The committee recommended that the two paragraphs on page 303 of the Manual headed Galvanized Wire Fencing be omitted.

**Appendix B—Signs**

The following is a resumé of the various signs, together with recommendations for their use. Signs should be divided between those serving the public and those serving employees, the latter of course being largely in the majority.

The first signs are those serving the public:

**Highway Crossing Signs.**—(a) At crossings. (b) Approach warning signs. The first sign, "at crossings," is covered in the 1915 Manual, page 317. The second sign, "approach warning signs," was adopted by the convention at its 1920 session.

**Trespass Signs.**—(a) Right-of-Way. (b) Bridge. (c) Crossing. These are covered on page 318 of the 1915 Manual.

**Private Crossing Sign.**—The committee does not believe a sign should be adopted by the Association to cover this, but considers it entirely a local matter as to their use.

the view is obscured or highway and rail traffic is heavy. Their use elsewhere is not ordinarily justified. Where a flagman is on duty bells should not be installed. There is a tendency for the flagman to depend on the bell.

Mechanically operated gates are simple and easy to maintain. The pneumatic gate is also satisfactory. Both types are subject to some trouble in the winter time. Pneumatic gates are adapted to situations where more than one pair of gates are operated from the same gate house. Such installations should be made where the gateman has a full view of both crossings. Electrically operated gates are more expensive in first cost, in maintenance and in operation. The use of automatic electric gates actuated by approaching trains through a track circuit is not desirable. It should be possible to operate gates on opposite sides of the track independently. It requires about 20 sec. to operate one pair of gates. The crossing should be closed about  $\frac{1}{2}$  min. in advance of the arrival of train. Striped gate arms are more easily seen than those painted in solid color.

Wigwags should be visible 500 ft. from the track. Bells should be loud enough to be heard above the noise of trains. Either device should be operated not less than  $\frac{1}{2}$  min. in advance of arrival of train. The length of track circuit will vary with the grade and with operating conditions. On double-track lines operation of warning devices is usually in the normal direction only.

Wigwags should be positive in action. The arrangement should be such that, when in working order, the disc will be concealed except when a train is approaching. When the device is out of order the disc should be in full view. Bells striking intermittently are more effective than those ringing continuously.

#### Discussion

Arthur Crumpton (G. T.), Chairman: In Appendix A the committee submit proposed changes in the Manual, together with the reasons therefor, and I will ask Mr. Rust, Chairman, to present the report.

T. E. Rust (W. C. F. & N.): Your committee, somewhat against its inclination, has recommended quite a number of changes in the Manual.

(Mr. Rust submitted Appendix A) and said:

"(3) The Sub-Committee recommends that the two paragraphs on page 303 of the Manual headed Galvanized Wire Fencing, be omitted."

In the first place they are rather conflicting. In one case they say that an electrically welded fence should be regalvanized after fabrication, and in the second place they say it should be galvanized after fabrication. The second paragraph also says that only wire of the specification of the Association should be used in the fences. That part of it, it seems to me, is entirely unnecessary. The adoption of the specification carries with it the recommendation that it should be used.

As to the regalvanizing of woven wire fencing, it is felt that this is impractical. In the first place, when the wire is to be coated with spelter, it is drawn through the bath and it will acquire the temperature of the spelter before it leaves the bath. If that is done, obviously the spelter which is first put on the wire will be melted off during its progress through the bath, and no more spelter will remain on the wire than remained after the first immersion. In the second place, wire metal which has been exposed to the atmosphere even for a few moments slightly oxidizes, and in order to be properly coated with zinc it is necessary that it should be chemically clean. There is no known method of chemically cleaning wire after it has been once zinc coated so that it will take a second zinc coat.

As to galvanizing after fabrication, I think that if the

members will consider what the result would be, even if such a process were practical, they would not desire to have a fence that had been regalvanized after fabrication. Large knots of spelter would unquestionably accumulate at the junction of the wires, and when the fence was unrolled for stretching, they would break off, and portions of the original metal would be exposed. At the present time there are no facilities in the United States for galvanizing woven wire fencing so far as this committee has been able to discover, and the principal manufacturers say that they have no machinery for doing it.

Chairman Crumpton: I may say in connection with this subject that the changes, which are rather drastic, are really for the elimination of some of the articles and parts of the specifications, to harmonize the parts so that they come in as a consistent whole. With that in view I will move the adoption of the committee's conclusions.

(Motion carried.)

Chairman Crumpton: The report of the sub-committee on Signs will be found in Appendix B.

(F. D. Batchelor (B. & O.) submitted Appendix B.)

Chairman Crumpton: This question of signs has been up for quite a number of years, and the committee from time to time has recommended individual signs. This year they attempted to cover the whole field of signs, and feel that the signs that have been spoken of this morning, together with those that have been recommended by this committee before, and also those that were recommended by the signal committee and adopted, will practically cover the field of signs. You probably will notice some signs are missing, but it was felt that these were of minor importance, and each road should do as it pleased.

The committee moves the adoption of its recommendation.

G. A. Mountain (Can. Ry. Com.): I would like to ask the committee why they omit the private crossing signs? My experience is that they are very important.

Chairman Crumpton: One of the reasons that sign was omitted is that we found the practice on the different roads in the country, both in United States and Canada, varied so much that we thought it was practically impossible to get anything that would meet the conditions.

W. A. Christian (M. & St. L.): I notice the size of the corporation signs is quite large.

Chairman Crumpton: That was obviously an error in the size.

Hadley Baldwin (C. C. C. & St. L.): I notice that the committee recommends a sign for the beginning and end of the double track similar to the sign for the end of a block. The signal is different, and I wonder why they recommend the same kind of sign. They should be distinct, it seems to me.

Chairman Crumpton: Some time ago the question of signs was brought up and divided into two classes, one for the guidance of the engineman which had to do with the operation of the road, and the other for the information of the employees. Those in connection with the operation of the road were dealt with by the Signal committee, which adopted very distinctive designs. This committee was of the opinion that these signs should be given great prominence, but that the balance of the signs, the right-of-way signs, should be as inconspicuous as possible, and one form of small sign was adopted for information purposes, and this sign was used as much as possible without any variation, the idea being to save expense.

John V. Hanna (K. C. Term.): As to the use of the  $2\frac{1}{2}$ -in. wrought iron rod provided in some of these signs, I ask whether the committee has tried to work out a concrete rod for that purpose, and, if so, what difficulties they found.

Chairman Crumpton: As to the question of the 2½-in. pipes, every railroad has many old boiler tubes, and, as a great many roads use these, the committee carried out that idea.

J. B. Hunley (C. C. & St. L.): I note that the valuation section sign is cast iron, and the section post and the subdivision section post, which are practically the same, are steel plates. I was wondering why that difference was made. Of course, the section posts will be moved more frequently than the valuation section signs, and may be considered as of a less permanent nature, but, on the other hand, when they are moved they will be used again, and used until they are worn out. A cast iron sign would be more expensive.

Mr. Batchellor: I have nothing special on that, other than that the chairman took into consideration that the valuation sign was more permanent and not so frequently used as a section sign.

Mr. Hunley: That is true, but on the other hand the section signs, even if they are moved, will undoubtedly be used until they are worn out. The only purpose I can see about it is that with the cast letters it is absolutely permanent and fixed. I wondered what the idea of the committee was in recommending this.

Chairman Crumpton: The chairman of the sub-committee is not here, and that is a detail I do not know about. I know that the committee felt these valuation signs were very permanent, and when put up were put up once for all, and that applied also to the section signs.

Hadley Baldwin (C. C. & St. L.): Is it part of the recommendation of the committee that mile posts carry the numbers in both directions?

Chairman Crumpton: The committee discussed that matter and got information as to how mile posts should be numbered, and this is given merely as an illustration. It seemed to the committee that question should be settled, that is, roads should number from one terminal right through, and omit the double number, and as a matter of fact since the question of valuation has come into prominence this double numbering is leading to trouble.

The committee worked over that matter, but as I say, as so many roads have different practices, it was practically dropped, so far as this report is concerned, and we put in the mile posts, following the ordinary practice.

E. A. Frink (S. A. L.): I ask if the committee has developed any way of permanently marking the concrete posts and concrete signs?

Chairman Crumpton: The letters are indented. (*Motion for the adoption of the recommendations carried.*)

Chairman Crumpton: The third assignment to the committee was "to make a final report, if practicable, on Grade Crossings, Crossing Gates, Crossing Signal Bells, and Warning Signals."

Maro Johnson (I. C.): These specifications are presented with the idea of bringing out the views of the members, and the committee would like suggestions on this subject.

The matter on warning signals is submitted as information.

C. E. Johnston (K. C. S.): It seems to me the part of the report relating to the interest of state authorities in co-operating with railroads in the matter of reducing the number of highway crossings, etc., is a very important one, and something on which the members of this association can accomplish a great deal if organized in some manner to investigate these new road projects and to ascertain in advance where grade crossings might be eliminated. In many cases the management of these

roads were advised of points where the roads might be changed, even with little cost to the railroads, it would mean saving to all the lines. As far as our lines are concerned, it has put an idea into my mind to canvass the entire territory to see where we can eliminate grade crossings.

G. A. Mountain (Can. Ry. Com.): Is it meant, in connection with the matter concerning warning signals and bells, that where a flagman is on duty bells should not be installed? Our experience is, where we have a fairly heavily traveled route, somewhat dangerous, more particularly traveled in the daytime, we have found it advantageous to put a watchman on and also install a bell. The bell is cut out during the daytime and it is cut in by the watchman for use at night, when the travel is not so heavy as in the daytime. It has worked all right in our case.

Mr. Johnson: I think that is the situation the committee has in mind. Mr. Mountain states the bell is cut out when the flagman is on duty, and that corresponds with our view of the matter, that the bell and the flagman should not be there at the same time.

Mr. Mountain: The wording says that the bell should not be installed.

Mr. Johnson: That conveys the wrong idea.

Mr. Mountain: In the report where it says: "On double track lines operation of warning devices is usually in the normal direction only." I would like to ask the committee if they will give consideration to that. Our view of it is that for wigwags and bells the bonding should be in both directions against the current of traffic, and there you are in a very dangerous position. You are operating a bell in the direction of traffic. When you are operating against the traffic there is no warning. It seems to me if anybody is injured under those circumstances, you are absolutely out of court.

Mr. Johnson: The committee found this was the practice on a number of railroads and followed that suggestion with the assumption that traffic in opposite directions is protected by a flag.

C. F. Loweth (C. M. & St. P.): I want to congratulate the committee on this report, especially that portion of it which deals with the present trend of legislation with relation to grade crossings, and especially that part of apportioning the cost between the municipalities and the railroads. I recently had occasion to read into the records at a committee of one of our state legislatures a portion of this report, showing especially the trend of recent legislation in respect to the apportionment of the cost of grade separation between the counties and towns and the railroads.

The chairman referred to the Wisconsin law, a recent law which the railroads are not very happy about, and that law provides that the State Commission may apportion to the railroad as much of the cost for the improvement of the highway as would represent the capitalization of the protection which the railroad has or should have at that crossing. Now, that works out very strangely sometimes and it has resulted in the railroad sometimes being assessed the entire cost of a highway improvement.

It seems this matter of the apportionment of cost between the parties interested, the state as well as the railroad, is one of very great importance and one that the railroads should be kept in very close touch with.

J. L. Campbell (E. P. & S. W.): In the matter of co-operation between the railroads and the community on the question of the costs of grade separation, as a rule the railway alone is not responsible by any means for the grade separation problem. It has been the rule in this

country that the communities have built up around the railways and the growth of the community itself, of which the railway is only a part, has created the problem.

I suggest that you can render a very important service for your companies and the properties with which you

are connected in connection with these grade separation issues by making the community understand its obligation and the mutual interest that it has.

(Committee was then excused with the thanks of the Association.)

## Report on Uniform General Contract Forms

Several revisions in the Manual are proposed, covering changes in the construction contract form and other agreements. A final report is presented for adoption on the form of lease agreement for industrial sites. The standardized form as submitted embodies the fundamental principles governing the preparation of this class of lease, and where not entirely adaptable because of peculiar or varying conditions, it can be modified or used as a guide. A form of license for wires, pipes, conduits and drains is also presented. Replies to a questionnaire on standardization of contract forms shows that a large amount of thought is being given to the question.

W. D. Faucette  
Chairman

W. D. Faucette is completing his first year as chairman and his fifth year as a member of the committee. As chief engineer of the Seaboard Air Line since December, 1912, he has had frequent opportunity to realize the value of standard forms for contracts, leases and similar documents. He has therefore been able to appreciate the importance of the work of this committee to an extent that men in less responsible positions would not and to direct the preparation of these standard forms with more enthusiasm. The report for this year testifies to the amount of attention which the committee has given to the work assigned to it.

IN ITS APPENDIX A, COVERING revision of the Manual, the committee recommended certain changes for adoption by the Association. In Appendix B is presented a tentative form of Wire Line Agreement, and in Appendix C there is presented for adoption by the Association a form of Lease Agreement for Industrial Site.

### Conclusions

(1) The committee recommends that the changes in the Manual be approved and that the revised matter be substituted for the present recommendations existing in the Manual or Supplements.

(2) The committee recommends that the form of license for wires, pipes, conduits and drains on railroad property set forth in Appendix B be received as information, and be assigned as part of the committee's work for the coming year.

(3) The committee recommends that the final report on Form of Lease Agreement for Industrial Site, Appendix C, be adopted and printed in the Manual.

In an Appendix D the committee presented a table of replies received to a questionnaire relating to the use of the standard forms adopted by the Association.

Committee: W. D. Faucette (S. A. L.), chairman; C. A. Wilson (Cons. Engr.), vice-chairman; C. F. Allen (M. I. T.), A. O. Cunningham (Wabash), G. L. Davenport (A. T. & S. F.), Clark Dillenbeck (P. & R.), C. E. Gifford (Br. Builders' Soc.), J. C. Irwin (B. & A.), E. H. Lee (C. & W. I.), O. K. Morgan (C. C. & O.), C. B. Niehaus (C. of Ga.), H. A. Palmer (G. T.), C. J. Parker (N. Y. C.), J. W. Pfau (N. Y. C.), A. C. Shields (C. R. I. & P.), E. L. Taylor (N. Y. N. H. & H.), Frank Taylor (C. P. R.).

### Appendix B—License for Wires, Pipes, Conduits and Drains on Railroad Property

(Tentative Form)

THIS AGREEMENT, made this.....day of..... 19.., by and between the..... hereinafter called the Company, and..... having a principal office or place of business in..... hereinafter called the Licensee,

WITNESSETH, THAT:

Whereas, the Licensee desires to construct, maintain and use..... upon the property of the Company, situated in..... and more definitely shown on the plan hereto attached, designated as..... and dated..... and made a part hereof:

It is mutually agreed as follows:

- The Company grants permission to the Licensee to construct, maintain, and use..... upon the property of the Company, in accordance with said plan and the specifications forming a part thereof, and subject to the requirements of the Company.
- In consideration of this license, the Licensee shall pay to the Company, in advance, the sum of..... per..... beginning.....
- Every cost and expense of construction, maintenance, use and removal resulting from this license shall be paid by the Licensee. The Company may perform without notice any work which it considers necessary to the safe operation of the railroad. The Licensee shall do no work under this license, which may interfere with the operation of the railroad without the written permission of the Company.
- Use of the property of the Company however long continued shall not affect any estate or easement in the Licensee or any rights other than license.
- The Licensee shall indemnify, protect, and save harmless, the Company from and against all claims, suits, costs, charges, and damages, made upon or incurred by the Company in connection with this license.
- This agreement may be terminated by either party by..... notice to the other party, or without notice on disuse by the Licensee for.....
- Any notice given by the Company to the Licensee shall be deemed to be properly served if the notice be delivered to the Licensee, or if left with any responsible agent of the Licensee, or if deposited in the postoffice, post paid, addressed to the Licensee at..... last known place of business.
- Upon termination hereof the Licensee shall forthwith remove all his constructions from the property of the Company, satisfactory to the Company. In case of the Licensee's failure so to do, the Company may at its option either retain such constructions or remove them at the cost of the Licensee.
- This agreement shall not be assigned or in any manner transferred, without the written consent of the..... of the Company.
- Until terminated as hereinbefore provided, this agreement shall inure to the benefit of and be binding upon the

legal representatives and successors of the parties respectively.

IN WITNESS WHEREOF, the parties hereto have executed this agreement on the day and year first above written.

Witness..... Company.
Witness..... By.....

Appendix C—Form of Lease Agreement for Industrial Site

Parties. (1) THIS LEASE, Made in..... this..... day of..... 19....., by and between..... a corporation, the Lessor, hereinafter called the Company, and..... having a principal office or place of business in..... in the..... and..... hereinafter called the Lessee, WITNESSETH:

That the Company in consideration of the agreement of the Lessee herein contained, hereby leases unto the Lessee, all those certain premises, situated in..... County of..... State of..... described as follows:

Description. (2)..... the location and dimensions of said premises being more definitely shown on the plan hereto attached, designated as..... and dated..... and hereby made a part hereof.

Term. (3) To have and to hold same from..... 19....., to..... 19....., unless sooner terminated, as hereinafter provided.

Termination. (4) Either party hereto may terminate this lease at any time, by giving to the other party..... days' written notice to that effect. Acceptance of rent in advance by the Company shall not act as a waiver of the right to terminate this lease.

Notice. (5) Any notice given by the Company to the Lessee shall be deemed to be properly served if the same be delivered to the Lessee, or if left with any of..... agents, or if posted on said premises, or if deposited in the postoffice, postpaid, addressed to the Lessee at..... last known place of business.

Rent. (6) The Lessee shall pay a rental of..... per....., payable..... in advance, beginning on..... for the use of said premises, payable to the..... of the Company, at.....

Refund. (7) Rent paid in advance for a period extending beyond the termination of this lease shall be repaid to the Lessee within thirty days after demand, unless such termination shall be on account of violation or non-fulfillment of any of the terms of this lease by the Lessee, or on account of the abandonment of said premises by the Lessee, in which case the amount paid as rental shall be retained by the Company.

Taxes. (8) The Lessee shall pay all taxes, licenses and other charges which may be assessed or levied upon said premises, improvements thereon, and upon the business of the Lessee upon said premises, or against the Company by reason of occupation or use of said premises by the Lessee.

Purpose. (9) The said premises shall be used for the following purposes:.....

Assignment. (10) This lease shall not be assigned or in any manner transferred nor said premises or any part thereof sublet, used or occupied by any party other than the Lessee, nor for any other purpose other than that specified herein, without the written consent of the Company.

Abandonment. (11) The failure of the Lessee to occupy or use said premises for the purpose herein mentioned for..... days at any one time shall be deemed an abandonment thereof. An abandonment of said premises by the Lessee, shall operate as an absolute and immediate termination of this lease without notice.

Improvement. (12) The Company hereby gives to the Lessee, subject to all of the conditions hereof, the privilege of erecting, maintaining and using on said premises, suitable buildings and other structures for the aforesaid purposes; provided that such buildings and other structures shall be first approved by..... of the Company, and thereafter maintained as to meet with the approval of the..... of the Company; that the Lessee shall, so long as this lease continues, keep all buildings and other structures on said premises in good repair, including painting, so as to present a good appearance, so far as required by such..... and that the Lessee shall install, rearrange and maintain such improvements as may reason-

ably be required by said Company for the reduction of fire hazard.

Clearance. (13) The Lessee shall neither erect nor place, nor permit to be erected or placed, upon said premises any structures or obstruction that will, in any way imperil the safety of trains, engines or cars upon such railroad tracks as are now or may hereafter be located on, or adjacent to said premises, or the safety of persons or property in, upon, or about such trains, engines or tracks. The minimum horizontal and vertical clearances from the tracks shall be prescribed by..... of the Company upon request.

Removal of Improvements. (14) Upon the termination of this lease in any manner, the Lessee, upon demand of the Company, without further notice, shall deliver up to the Company the possession of said premises, and shall if required, remove all the improvements placed thereon by the Lessee, and restore said premises to substantially their former state, and in case the Lessee shall fail, within..... days after the date of termination of this lease, to make such removal or restoration, then the Company may, at its election, either remove said improvements and restore said premises for the account and at the sole cost of the Lessee, or may take and hold the said improvements as its sole property.

Inflammables. (15) No goods of an explosive, dangerous or inflammable nature or character shall, in any case, be stored in or upon said premises without the written consent of the Company.

Condition of Premises. (16) The Lessee shall at all times keep said premises and the vicinity thereof, in a safe, clean and sanitary condition. The Lessee shall not mutilate, damage, misuse, alter or commit to suffer waste in premises.

Advertising. (17) No advertising shall be placed upon said premises or upon any structures thereon, except for the Lessee's own legitimate purposes, and all advertising so placed shall be to the satisfaction of the..... of the Company.

Laws and Regulations. (18) The Lessee shall in all respects abide by and comply with all laws, rules, regulations and ordinances affecting the said premises.

Miscellaneous Charges. (19) The Lessee shall pay all charges for water and lighting and for street or road sprinkling, sweeping and oiling, that may be levied or assessed against said premises, covering the period of occupancy.

Snow and Ice. (20) The Lessee shall at all times keep the sidewalks in front of said premises free and clear of snow and ice, and any expense to the Company by reason of the failure of the Lessee so to do shall be paid by the Lessee to the Company upon demand therefor; such expense to include all loss or damage of whatsoever character, either to persons or property.

Use of Tracks. (21) The Lessee shall not permit nor allow tracks belonging to others than the Company to be constructed upon said premises, and the Lessee will not permit nor allow trains or engines belonging to others than the Company to be used upon or given access to said premises, without the written consent of the Company.

Company's Right of Entry. (22) The Company shall have the right at all times to enter upon and to construct railroad tracks on said leased premises, and to maintain and operate, and to extend or change the location at any time, of such tracks as are then on said premises, upon..... days' written notice to the Lessee. If any structure on said premises shall obstruct or interfere with the construction of additional main or passing tracks of the Company, or if required for proper clearance of tracks, the Lessee at..... expense, shall promptly move such structure to another location, either on or beyond said premises as may be necessary, upon..... days' written notice to the Lessee.

Access to Premises. (23) In the event it is necessary for the Lessee or his agents, servants, workmen and customers to pass over other lands of the Company and railway tracks of the Company, to have access to and from said premises, all such persons shall make use only of the way indicated by the..... of the Company for that purpose, and the Lessee hereby expressly assumes all the risk of accident and injury to the person and property of all such agents, servants and workmen, and all others resorting to the leased premises in connection with the Lessee's business, whether the same be occasioned by the negligence of the Company's servants or in any other manner whatever, and the Lessee shall indemnify the Company from and against all claims, suits, costs and charges made upon or incurred by the Company by reason or in consequence of any such accident, loss and injury.

Liability. (24) (a) The Lessee assumes all responsibility for and agrees to indemnify the Company against loss or damage to property of the Lessee or of others upon said

premises, regardless of negligence of the Company, arising from fire caused by locomotives operated by the Company in serving the lessee upon said premises, or in the vicinity thereof, except to rolling stock belonging to the Company or to others, and to shipments in the course of transportation.

(b) The Lessee agrees to indemnify, protect and save harmless the Company for loss of, damage to, or destruction of property of the Lessee or of others upon said premises whether caused by fire or otherwise (except fire caused by locomotives as hereinbefore provided for), or for death or injury to, any person or persons, arising out of the construction, maintenance, use, or operation on said premises (except where such death or injury was due solely to negligence of the Company).

**Forfeiture.** (25) Any breach of any covenant, stipulation or condition herein contained to be kept and performed by the Lessee, shall after.....days' written notice, if continued, at once terminate this lease, and all rights of the Lessee hereunder. No further notice of such termination or declaration of forfeiture shall be required, and the Company may at once re-enter upon said premises and repossess itself thereof, and remove all persons therefrom, or may resort to an action of forcible entry and detainer, or any other action to recover the same.

**Right of Inspection.** (26) The said premises shall be open at all reasonable times to the inspection of the Company, its agents, and applicants for purchase or lease.

**Renewal.** (27) If the Lessee, with the consent of the Company, holds over and remains in possession of said premises after the expiration of said term, this lease shall be considered as extended, and shall continue in effect from.....to....., subject, however, to termination as herein provided, and upon the same terms and conditions as are herein contained. Until terminated as hereinbefore provided, this lease shall inure to the benefit of and be binding upon the parties hereto, their heirs, executors, administrators, successors and assigns.

IN WITNESS WHEREOF, the parties hereto have executed this lease on the day and year first above written.

.....  
Company.  
Witness:.....  
Witness:.....  
By.....

**Discussion**

(J. L. Campbell (Second Vice-President) in the Chair.)

G. H. Wilson (Vice-Chairman): Three subjects were assigned to the committee for attention this year. The first is "Make thorough examination of the subject matter in the Manual and submit definite recommendations for changes. This subject was handled by a sub-committee, of which Mr. Clark Dillenbeck is chairman.

Clark Dillenbeck (P. & R.): The committee has carefully gone over the Manual and made recommendations for certain changes as here shown. The first is "Construction Contract Forms." And we propose that this heading be changed to "Form of Construction Contract." In going over the Manual we noticed that the headings varied considerably and it was the thought of the committee that it would be well to make them uniform.

With reference to form of proposal, page 655, it is recommended that this be placed to precede "(A) Agreement." It appeared to the committee that this one page in the form is out of place and should be placed preceding the "(A) Agreement."

The next suggestion is Section 30, change the heading in the first paragraph. It is proposed to change the heading to read "Land of company, use of by Contractor." And there is a new proposed form under this heading. (Read proposed form.)

Section 32, page 662, has reference to the annulment of contract and the present reading of it is that the contractor shall be paid for the work annulled. We simply change the reading of the last line and say that "payments shall be made for work done on such portion so abandoned, as provided in Section 38 of this contract."

Section 34, page 663, it is simply suggested to omit the words "30 days" from the second and third lines. Under the present reading after a contract has been annulled,

the contractor would be permitted to continue the work for 30 days, and it is the thought of the committee that it is frequently the case when contracts are annulled that work must be stopped at once.

On page 666, change the heading "Bond" to "Form of Bond."

In the form, "Industrial track agreement," change the heading to read "Form of Industry Track Agreement."

The committee realizes the changes are necessary in the form and regrets that definite recommendations must be abandoned to a later date. The principal reason for this is that the matter was under consideration by the corporate engineers. I believe they had reported to the executives and their report has not been approved, and also the freight traffic department is expecting an order from the I. C. C. With these things staring us in the face we did not see that we could properly go ahead and correct this agreement.

In the agreement for interlocking plant, change the heading to read: "Form of Agreement for Interlocking Plant," and omit the whole Section 9, on wage rates.

Owing to the present rules of the Labor Board we thought that was not compatible with present practice.

In the form headed, Agreement for grade crossings, change the heading to read: "Forms of Agreement for Crossing of Railroad at Grade." The present heading simply reads: "Agreement for Grade Crossings," and grade crossings are generally spoken of as highway crossings and it was the thought of the committee we had better change it as noted. We also suggest omitting the first note which refers to Federal control, and change the words "Grade crossing" to "Railroad crossing at grade," wherever they occur.

The committee recommends that the above changes in the Manual be approved and that when the Manual is reprinted the changes be incorporated therein.

(Motion to accept the changes was carried.)

Vice-Chairman Wilson: The second subject is to be a report on forms of agreement embodying rules governing the construction of undercrossing of railways with electrical conductors, conduits, pipe lines, and drains, conferring with Committee on Roadway and Electricity."

This will be presented by Mr. J. C. Irwin.

J. C. Irwin (B. & A.): The sub-committee on the preparation of this form collected a large number of agreements used by American railroads and, of course, found a great diversity of practice in the majority of these cases. The specification formed part of the License for Wires, Pipes, Conduits and Drains on Railroad Property, but in some there are other forms of license which seem to apply better to this particular case, and the committee proceeded on that basis.

This suggested agreement is presented in tentative form. This is the first time it has been brought before the convention, and we believe it is approximately correct. It is submitted for discussion, merely as information, with the request that it be laid over until next year for final action.

(Mr. Irwin here abstracted Appendix B.)

Vice-Chairman Campbell: If there are no objections, this subject will be left with the committee for further study and report. The committee invites written criticism by the membership during the year on this proposed form.

(Vice-Chairman Wilson read Lease Agreement for Industrial Site, and "Conclusions" (3).)

Vice-Chairman Wilson: I move that this recommendation be adopted.

(Motion carried.)

(The committee was excused with the thanks of the Association.)

## Report of Committee on Water Service

Considerations of sanitation make it highly desirable that the supply of drinking water on railroads be under the direction of an officer with competent training in sanitary engineering. The incrustation of pipe lines results in great losses through reduced discharge and higher costs of pumping which can be overcome by mechanical processes for cleaning the pipes. The "after precipitation" in injector pipes can be overcome with the use of ferrous sulphate. Waste water at water stations results in loss of the water and increased cost of track work. Specifications for the substructures for steel and wooden water tanks are submitted in the report.

A. F. Dorley  
Chairman

A. F. Dorley has served as chairman of this committee for the past eight years, which is a well-earned record for continuous service as chairman. He was a member of the committee two years previous to his appointment as its leader. Mr. Dorley is now district engineer on the Missouri Pacific, with which road he was engaged for a number of years as engineer of water service. While occupied in this capacity the road made marked advances in water treatment and it is because of his connection with this and other developments in railway water service that his experience has been of particular value to the water service committee.

**A** PROGRESS REPORT on the Supply of Drinking Water on Trains and Premises of Railroads appears in Appendix A. Plans and Specifications for Typical Water Station Layouts are submitted in Appendix B. The Extent and Effect of Incrustation in Pipe Lines is reported in Appendix C and is followed by a monograph by C. H. Koyl.

A final report on the Disposal of Water Waste appears in Appendix D.

The Effect of Local Deposits on Pollution of Surface or Shallow Well Water Supplies is reported in Appendix E.

Specifications for Substructures of Wood and Steel for Water Tanks is covered in a final report in Appendix F for adoption and publication in the Manual.

### Conclusions

The committee requested the following action on its report:

(1) That the subject of examination of the subject-matter in the Manual be again referred to the committee for further study and report.

(2) That the report on progress of drinking water regulations be received as information and that the subject be reassigned to the committee for further study and report.

(3) That the report on typical water station layouts be received as information.

(4) That the report on extent and effect of incrustation in pipe lines and methods for cleaning be received as information.

(5) That the report on methods of disposing waste water at water stations be received as information.

(6) That the subject of specifications for contracting water service be reassigned to the committee for further study and report.

(7) That the progress report on effect of local deposits on the pollution of surface and shallow well water supplies be received as information and the subject be reassigned to the committee for further study and report.

(8) That report on specifications for substructures of wood and steel for water tanks be adopted and published in the Manual.

Committee: A. F. Dorley (M. P.), chairman; C. R. Knowles (I. C.), vice-chairman; R. C. Bardwell (M. P.), J. H. Davidson (M. K. & T.), G. B. Farlow (B. & O.), J. H. Gibboney (N. & W.), E. M. Grime (N. P.), W. C. Harvey (C. G. W.), R. L. Holmes (T. & P.), H. H. Johntz (M. K. & T.), C. H.

Koyl (C. M. & St. P.), P. M. LaBach (C. R. I. & P.), E. G. Lane (B. & O.), Thomas Lees (C. P. R.), M. E. McDonnell, W. M. Neptune (M. P.), W. A. Parker (U. P.), E. H. Olson (A. T. & S. F.); A. B. Pierce (Sou.), C. P. Richardson (C. R. I. & P.), F. D. Yeaton (C. M. & St. P.).

### Appendix A—Study Regulations of Federal or State Authorities Relating to Supply of Drinking Water on Trains or Premises of Railroads

At a meeting held by the sub-committee in the office of the Association on June 3 a representative from the office of the Surgeon-General was present and placed before the committee the following points outlining the position taken by the Public Health Service:

"First, it must be pointed out that the responsibility for furnishing or producing water safe for drinking purposes is a large and serious one, fully comparable with any of the other obligations or responsibilities of the common carriers. The railroads, therefore, must comply fully with accepted modern standards for the production and handling of water for drinking purposes.

"Second, the former and even the present methods of selecting and handling drinking water supplies by the railroads are in need of extensive improvements, which it is now imperative that the fullest consideration be given by the railways.

"Third, it is considered with adequate justification that satisfactory conditions in regard to railway water supplies can only be obtained by the responsible supervision over sanitary factors of the water supplies by a competent and qualified sanitary personnel of the railway organization, varying to be sure with the size of the system. In this connection, it has been noted with some concern that the recently adopted scheme of Water Service Organization contains no provision for the specific responsibility and supervision of the sanitary quality and safety of the drinking water supplies on railroads."

It was brought out in the discussion that the question of a pure drinking water was as much a question of safety as the standard mechanical safety appliances and should be so regarded. The chief objections raised appeared to be in the methods of handling of the water in and to containers on cars. A safe sanitary supply may be readily polluted by improper handling. One of the chief faults has been in lack of protection for the hose connection from hydrant to car reservoir.

It is the recommendation of the committee that the

detailed supervision of drinking water supplies on railroads should be under the authority of an officer with competent training in sanitary engineering, and such personnel should work in close co-operation with the recommended Water Service Organization as presented at the last convention.

### Appendix C—Extent and Effect of Incrustation in Pipe Lines

In pursuing the study of the subject a questionnaire was sent to different railroads, covering practically all the United States, covering the following headings: Incrustation, nature, extent, cause.

#### Method of cleaning.

Results obtained from cleaning.

Replies were received which show that stoppage of pipe lines by foreign materials is to be found in all territories. Some replies indicate that certain railroads do not know of its existence, but municipalities in the same area report trouble and measures for its removal. One road reports a 4-in. line in Maryland as practically showing no diminution in diameter after forty years' service. This was ascertained on removal.

#### GENERAL CAUSES AND CHARACTERISTICS

A large proportion of stoppages is due to corrosion, tubercles or roughening of interior surface. Where pipe is well coated, before laying, trouble of this nature is not generally to be expected in ordinary water for a number of years. While in itself it may not result in serious trouble, it usually forms the foundation for other deposits by roughening the interior of the pipe. The amount of deposit depends entirely on local conditions.

Mud or suspended matter (other than found as a result of water treatment) seldom forms a deposit unless the foundation has been already laid. The amount found depends largely upon the nature of the water and the velocity of the flow.

Snails and similar growths are frequently found in suction lines, but little information is to be found on the subject.

Iron, manganese or aluminum promote the growth of various forms of Crenothrix in pipes or reservoirs. When these substances are absent apparently no difficulty is found from this source.

The usual sequence is for the pipe to roughen through corrosion. The mud or slime is deposited which forms a culture bed for a variety of growths.

Incrustation due to water treatment is commonly found in treating plants of various types. This deposit is greatest when the water is undertreated or raw and treated water are mixed in the pipe lines. There is also difficulty due to water being used before the reactions are complete. There is no evidence that filters will entirely eliminate this trouble, as the reaction frequently takes place after the chemicals pass the filter. That a good filter will help there is no question.

The application of heat will deposit a scale largely composed of the carbonates of lime and magnesia. In treated water the changes in temperature will also cause a deposit. When the temperature rises in passing from the treating tank any excess of lime or magnesia will deposit. The reverse is true of soda. As any excess is generally carbonate of lime, the latter is usually the main source of deposit.

#### METHOD OF CLEANING

The cleaning of pipe by hand can only be done when the deposit is comparatively soft. It is sometimes possible in short pipes under special circumstances to clean them in place by using a scraper of some sort, but mechanical means are usually found more effective.

Mechanical means are most frequently used. The pipe line may be removed and a revolving cutting tool fixed on a shaft pushed through the section of pipe. This has been found to answer the purpose with an air motor and a special cutting tool on a 13-ft. shaft. Flue cleaners have also been used for the same purpose.

The latest method is to clean the pipe in place. This is done by opening the pipe line in two places and running a cable between them. This cable is used to drag a cutting tool behind it. One railroad has used a flue cleaner successfully. However, most of the work has been done by contract.

What may be accomplished by cleaning, irrespective of the method, is given in the following cases:

An 8-inch main, 11,575 ft. long, was cleaned September, 1909. Pressure required before cleaning 140 lb. for 400 gal. per min. After cleaning 49 lb. was required to deliver 450 gal.

A 6-inch main 7,200 ft. long. Former pressure at pumps 85 lb. New pressure 65 lb. Former capacity 180 gal. per min.; new capacity 220 gal. per min.

Valves, etc., around treating plants or where treated water is used are usually cleaned by the use of hydrochloric acid. The pipe lines can be cleaned by the same process, but the cost would generally be prohibitive unless the chemicals are recovered. This method is used at times, but the committee has not sufficient information as to its practicability.

#### PREVENTION

Flushing is generally nothing more than a mechanical method. It may be used if the local conditions are proper. It will prevent the formation of chemical deposits but rarely. Raw water used to flush lines which may carry uncombined chemicals will only aggravate the trouble.

Aeration before pumping will aid where the water contains iron. Adding to the aeration in intermittent treating plants is a preventive when the treatment is too short for completed reactions. The same may be said of any type of agitation.

The prevention of chemical reactions in the pipe lines will, as a rule, stop all incrustation. By the nature of the subject this is not possible. It may be said that the better and more complete the treatment the less the trouble will be. No method has been devised which will eliminate temperature changes and their resultant effect.

The specifications for cleaning by contract usually include a stipulation that the pipe line will be restored to within 5 per cent of the normal friction loss as taken from a standard set of tables. This seems to have been attained when the contractor agreed to operate without injury to the coating in the inside of the pipe.

#### CONCLUSIONS

Pipe cleaning will pay when the water horse power hour cost per year is reduced sufficiently to pay 7 per cent interest on the amount needed for the improvement.

Pipe line cleaning will pay if there is a shortage when the cost of cleaning is less than the cost of an additional pipe line needed for adequate service.

#### After-Precipitation from Treated Water—Its Cause and Prevention

By C. H. KOVL, Engineer Water Service, Chicago, Milwaukee & St. Paul

In the early days of water softening in this country—from 1898—it was noticed that after water had been through the softening process, completed by passing through some simple kind of filter like a packed 12-in. of wood excelsior or a thin bed of sand from which it

issued brilliantly clear, there was a deposition of flakes of carbonate of lime found on standing.

After studying this for some time it became evident that the chemical reactions had not been completed in the softening plant—that the last molecules of calcium oxide ( $\text{CaO}$ ) had not found the last molecules of carbon dioxide ( $\text{CO}_2$ ); and since chemical reaction is almost instantaneous when once the atoms or molecules are within combining distance it was evident that the lime had not been thoroughly mixed with the water.

I then made a series of tests to determine the amount of mechanical mixing necessary to effect a softening down to three grains per gallon, at which point the reactions in ordinary water are nearly complete, and found it to vary from 25 min. in clean well water at 60 deg. F. to 50 min. in river water at 45 deg. F. Thereafter I built a reaction (mixing) tank as part of every "continuous" water softening plant.

In those days the "intermittent" plants, whose tanks were filled with water, treated with the proper amounts of lime and soda, well stirred for 20 min. and then settled for three hours, were doing excellent work. But "continuous" plants had solutions of lime and soda in proper portion continuously added to the incoming stream of water and the combination run around a few baffle boards for mixing purposes, and the softened water from these plants all deposited flakes of calcium carbonate on standing; and if the water was passed through a sand filter or through a pipe while the deposition was taking place small particles attached themselves to the sand grains or the pipe walls, and the sand grains were said to "grow" and the pipe to be incrustated.

The addition of a 50-min. mixing chamber as a preliminary to the settling chamber of the "continuous" water softening plant did away with this "after precipitation" and I never saw enough of it from one of these plants to be noticeable. It was remarked, however, that if the water was undertreated in lime after disposition took place in spite of the 50-minute mixing, for undertreated water requires much longer mixing than that. It was still noted, too, that when the best of treated water was fed to locomotive boilers through injectors there was a sufficient deposition in the injector and branch pipe and on the check valve to interfere with the operation of the injector.

In the winter of 1915-16 there was a treating plant at every water station on the Great Northern on the line from Devils Lake, N. D., to Shelby, Mont., a distance of nearly 700 miles, all near the Canadian border; and while boiler leaking was unknown there was so much trouble from clogging of the injectors that its prevention became a serious study.

The material deposited in the injectors was calcium carbonate. It came from the water at a temperature not far above 212 deg. At this temperature the content of calcium carbonate can be reduced to about two grains per gallon, but calcium sulphate, if it were present, would not be affected. Therefore, I decided to try to convert at least part of the 3 grains of calcium carbonate in the cold water into calcium sulphate by adding three grains per gallon of ferrous sulphate to the water before it left the mixing tank of the treating plant. This would leave in the water a small amount of ferrous carbonate which would give the injector no trouble.

The first test was made at Minot, N. D., because the switch engines in the yard had been the subject of continuous complaint. The water was treated as above for one month and then a switch engine was taken to the round house and its injector, branch pipe and check valve were found as clean as the day they were made. Imme-

diately thereafter the treatment with ferrous sulphate began to be extended to all treating plants on the line and the results have been uniformly good. On this road, so far as water is concerned, the winter handling of locomotives is as simple as the summer's.

#### Appendix D—Methods of Disposing of Waste Water at Water Stations and Keeping Track Free of Ice

It is impracticable to have a very wide range of movement for water tank spouts and so it is imperative that locomotives be carefully spotted at points where water is received direct from a tank spout. Also on divisions where both high and low locomotive tenders are in use, it is desirable to have the manholes on the low tenders raised up to the same height as that of the high tenders.

Where a rigid spout is used a sleeve, hanging by chains from the end of the spout, serves in a measure to make it adjustable for high and low tenders, but it does not entirely eliminate waste. The telescopic type of water column has now been made standard on some railroads and where it is in use there is very little water waste.

At water tanks there is frequently more or less waste due to firemen raising the spout before the water has entirely cleared from it or due to slight leakage from the tank valve. The maintenance of tank valves is a matter which must receive close attention from the water service department, especially in the winter season.

One of the best plans for taking care of the situation at a water tank is to ballast the track in the immediate vicinity for a distance of 10 ft. each way from the spout with a heavy layer of crushed rock and provide a catch basin with a grating cover directly under the end of the outlet pipe with an inlet at the level of the subgrade.

For the northern latitudes, such catch basins should have a sewer connection at least eight feet below the surface so the water will be rapidly carried off before it has an opportunity to freeze. A catch basin of this type is giving excellent service in North Dakota.

Where a steam pumping plant is located not too far away from the tank, a steam pipe connection into the catch basin will be a big help in keeping the drainage channel clear and the expense will be nominal. Catch basins may also be used to advantage near water columns. Where there is no danger from frost, some saving may be made by building the catch basin as a part of the water column pit. In cold climates the catch basin drain should not connect direct with the standpipe pit, as cold air entering through the drain is liable to cause freezing at the standpipe.

#### Appendix E—Effect of Local Deposits on Pollution of Surface or Shallow Well Water Supplies

1. (a) Water obtained from rivers, lakes, wells and other sources of supply usually contain a considerable quantity of foreign matter in suspension and solution, not only as inert mineral substances, but also in the form of living organisms and waste products or organic origin.

(b) Recent observations and experiments have proven that water in its raw state from small streams, lakes and reservoirs may be rendered unfit for locomotives or industrial use by reason of surface pollution, the effect of sewage, mine, drainage, coal storage, industrial waste and decayed vegetation on locomotive and industrial water supplies is very detrimental.

##### EFFECT UPON SURFACE SUPPLY

2. (a) *Coal Mines and Storage.*—Cases are known where coal mine drainage modifies or completely changes the character of streams. The most objectionable property of water containing mine drainage is its corrosive-

ness. The iron sulphates and acid will actively attack metals. Ferric sulphate (a common constituent of mine drainage) once admitted into a boiler will induce serious pitting conditions. The ferric sulphate will dissolve sufficient iron to reduce itself into the ferrous condition, and being oxidized by the air admitted with fresh water will again attack the boiler, and by continuous repetitions of this process will accomplish its early ruin. Brass piping or acid proof bronze is not immune.

The storing of coal on reservoir sheds should never be permitted. Reservoir water has been made unusable by this practice.

(b) *Cinders*.—It is a fact that water station attendants waste their cinders in places most convenient to them and usually they are deposited adjacent to the water supply. Cinder deposits should not be permitted near a surface water supply nor upon the water shed of surface reservoirs. Sulphates in large quantities are found in cinder deposits and are a source of contamination.

(c) *Oil Wells*.—Waste water from oil wells have been found to be highly mineralized and has been known to render surface reservoir water unfit for both boiler and domestic uses. This source of pollution should be guarded against by carrying the injurious waters to another shed or beyond the catchment area of the reservoir.

(d) *Sewage and Industrial Waste*.—Surface reservoirs should not be located where they will be subject to the flow of sewage or industrial waste, especially those of relatively small capacities. Water in small reservoirs has been known to have increased three hundred per cent in total solids, consisting of sulphates, chlorides and organic matter, by reason of sewage and industrial waste.

(e) *Mud and Cultivation*.—The committee thus far is unable to determine the effect of mud upon a surface supply, except that it materially reduces the capacity of the reservoir, primarily caused by permitting cultivation too near the flood line.

Water from an extensively cultivated catchment area is more or less turbid and for this reason is at times objectionable.

Turbidity and suspended mineral matter may be greatly reduced by using rapid sand filters, allowing about 3 GPM per square foot filter area.

EFFECT ON SHALLOW WELLS

3. (a) *Storage Coal*.—Storing coal near or in a position where the drainage therefrom will flow near a shallow well supply should not be permitted.

(b) *Cinder Deposits*.—Cinder deposits adjacent to or near a shallow well supply will in time give serious trouble. The ground under and adjacent to cinder piles will become saturated with objectionable chemicals, which through seepage will render the water in its raw state unfit for locomotive or industrial use.

Appendix F—Specifications for Substructures of Wood and Steel for Water Tanks

*Number of Posts*.—There has been but little change in the type of construction of substructure or towers for wooden tanks having a capacity of 50,000 gal. or more, the common practice on American railroads being a 12-post structure of 12 by 12 timbers, braced according to height.

Steel frames for wooden tanks, and in a great many instances for flat-bottom steel tanks, have also been of the 12-post type. This Association found in 1910 that 82 per cent of the 50,000-gal. tanks were supported on 12-post towers, 10 per cent on 16 to 26-post towers and 8 per cent on 4-post towers. Of the 100,000-gal. tanks 100 per cent had 12-post towers, with one exception of a 4-post tower. The general practice of constructing

12-post towers is explained in the fact that it is possible to secure a better distribution of the load with a 12-post structure and to support every part of the tank bottom without an elaborate floor system. It also permits of a good distribution of the foundation load and represents the most economical type of construction.

*Height of Substructure*.—The Water Service Committee reports on this in specifications for wood and steel water tanks, Volume 11, Part 2, page 1148.

*Bracing*.—While the general practice followed in construction of posts and floor system appears to be fairly uniform, the practice as to bracing is divided between plank bracing and strut bracing. The superiority of the strut type of bracing is recognized, but many roads have adopted the plank bracing on account of the lower cost.

The earlier type of construction of steel or iron towers consisted largely of bolted or riveted round columns and in some cases box columns. This was followed by the so-called star post or a post built up from angles. The objection to a post of this type is that it provides spaces in which moisture may collect and causes deterioration through corrosion which cannot be prevented. The best and most economical type of construction appears to be with post constructed of 6 in. by 6 in. by 1/2 in. angles for the 50,000-gal. tank and 8 in. by 8 in. by 1/2 in. angles for the 100,000-gal. tank. Three in. by 3 in. by 1/4 in. bracing would be sufficient with a post of this kind, but on account of providing for possible corrosion it is considered advisable to use a 3 in. by 3 in. by 3/8 in. angle for bracing. The floor system consists of 10-in. 25-lb. I-beams for tying in the different bents, joists constructed of 7-in. 15-lb. I-beams and caps of 12-in. 31 1/2-lb. I-beams.

It is customary to include foundation bolts for steel towers, although they are seldom used on wooden towers. It would appear that there is little necessity for use of anchor bolts on tank towers 20 ft. or less in height.

It is the practice on some railroads to use steel floor joists instead of timber on wooden substructures, while a number of other roads advocate the use of second-hand steel rails for joists. The advantage claimed for the steel joists is that they will have a life equal to that of the tub, while untreated timber joists would have to be renewed at least once during the life of the tub. While this is perhaps true the same thing is true of all other parts of an untreated wooden substructure.

SPECIFICATIONS FOR STEEL SUBSTRUCTURES FOR WATER TANK OF 50,000 AND 100,000 GAL. CAPACITY

**General**.—1. The structure will consist of a 12-post steel tower, complete in all details, as shown on the attached plan, for supporting a wooden water tank of the specified size and capacity at the required elevation. The intent of the plans and specifications is to include all material required between the top of foundation and the bottom of tank.

**Material**.—2. Except as may be herein noted all metal in the structure will be made in accordance with specifications of the Association as given in Part Second, "Iron and Steel Structures," Manual of Recommended Practice (pages 494 to 499, 1915 edition).

**Workmanship**.—3. Except as may be herein noted workmanship on the structure will be performed in accordance with the requirements of the Association as given in Part Second, "Iron and Steel Structures," Manual of Recommended Practice (pages 499 to 503, 1915 edition).

**Painting**.—4. Steel work before leaving the shop shall be thoroughly cleaned and given one good coat of red lead ground in linseed oil or such paint as may be specified by the engineer. Except as herein noted, cleaning and painting shall be done in accordance with specifications of the Association as given in Part Second, "Iron and Steel Structures," Manual of Recommended Practice (pages 503 and 504, 1915 edition).

SPECIFICATIONS FOR TIMBER SUBSTRUCTURES FOR WATER TANKS OF 50,000 AND 100,000 GAL. CAPACITY

**General**.—1. The structure will consist of a 12-post timber tank tower complete in all details, as shown on the attached

plan, for supporting a wooden water tank of the specified size and capacity at the required elevation. The intent of the plans and specifications is to include all material required between the top of foundation and the bottom of tank.

**Timber.**—2. The timber shall be cypress, pine, fir, redwood, or such other timber as may be specified by the engineer, S. 4 S. and conforming to the specifications of this Association for No. 1 railroad bridge timber, as given in "Wooden Bridges and Trestles," Manual of Recommended Practice (pages 231 to 235, 1915 edition).

**Workmanship.**—3. All workmanship shall be in accordance with "Specifications for Workmanship for Pile and Frame Trestles to Be Built Under Contract," Manual of Recommended Practice (pages 238 to 241, 1915 edition).

**Metal Details.**—4. All metal details shall conform to the specifications of the Association as given in "Specifications for Metal Details Used in Wooden Bridges and Trestles," Manual of Recommended Practice (pages 236 to 238, 1915 edition).

**Painting.**—5. All exposed woodwork shall be painted with one priming and two finishing coats of such paints and colors as may be specified by the engineer.

**Treating.**—6. Where treated timber is used timber shall be treated with creosote oil in accordance with the requirements of Committee on Wood Preservation, Manual of Recommended Practice (pages 539 to 559, 1915 edition).

#### Discussion

A. F. Dorley (Chairman): The subject assigned to the committee for study and report are eight in number. The first subject is the revision of the Manual. Last year the committee recommended an entire rearrangement of the subject matter in the section of the Manual given over to water service. They also recommended certain changes in the recommended practice pertaining to water supply and water purification, and the committee has no additional changes to submit this year.

The supply of drinking water on trains and premises of railroads is a subject that has been in the hands of a special committee, of which R. C. Bardwell is chairman. The committee has kept in touch with the development of the regulations of the federal and state authorities, and the report of the sub-committee will be found in Appendix A. The work of this sub-committee is being closely followed by the health authorities at Washington, a representative of the office of the Surgeon General having attended one meeting of this sub-committee last June. The report on this subject is offered for information.

It is not an uncommon sight in railroad terminals today to see employees dragging the hose through which water is passed from the hydrant into car-containers along the ground and into the accumulation of filth that is generally around tracks or terminals, and it is not very hard to imagine that the chances of polluting an otherwise pure drinking water are very great by allowing a practice of this kind. One large mid-western railroad has made an effort to prevent pollution of this kind by using a protection for the hose which has only recently been devised and put into service and it is offered with the suggestion that other railroads try some such scheme.

The third subject is the making of a final report, if practicable, on plans and specifications for typical water station layouts. The committee feels that this subject should more properly come within the scope of the committee that has in hand the design of yard terminals, and that the work of the Water Service Committee be confined to devising facilities to supply water to locomotives, or to make it available.

The fourth subject is the extent and effect of incrustation in pipe lines and methods of cleaning.

The sub-committee that had this subject in hand, of which P. M. La Bach was chairman, offers the report given in Appendix C. This report is almost entirely the work of Mr. La Bach, and he reviews the subject, beginning with the causes leading up to incrustation, the operating costs affected, the methods for cleaning, pre-

vention suggestions that were offered for prevention, as well as the condition under which the cleaning of pipes is economical. Before I go to subject No. 5 I wish to call attention to a monograph by C. H. Koyl, on the subject of after-precipitation from treated water, its cause and prevention. This monograph is made part of the report on the incrustation of pipe lines.

The fifth subject is in the disposition of waste water at water stations, and on keeping tracks free from ice is covered by the report appearing in Appendix D. We believe the lesson to be drawn from this study is that railroads should as far as possible eliminate the waste water. There are several railroads, particularly the Illinois Central, that have had under way for several years a campaign to eliminate water waste, and the results in the saving of money have been astonishing. Water is only too frequently looked upon as free as air, and it may be as free as air while it is going by in the river, but it takes money to put the water into a tank or to put it under pressure in a pipe line. Railroad officials who sign vouchers in payment of water purchased from city or water companies, realize that waste of water means real money flowing into sewers or into drainage ditches.

The committee reports progress on the sixth subject, covering specifications for contracting water service work.

The seventh subject deals with the effect of local deposits on pollution of surface or shallow well-water supplies. The report on this subject will be found in Appendix E, the work of the sub-committee, of which R. L. Holmes is chairman. I would like to call particular attention to the section which makes reference to the pollution of well water and surface supplies from the storage of coal and cinder deposits. This source of pollution only recently attracted the attention of this committee. We will have more to say on this subject in the final report which we hope to make next year. In the meantime we would like to caution railroads against the very serious possibility of polluting reservoirs or wells by storing coal adjacent to the water supply.

This brings us up to the last subject, No. 8, covering specifications for sub-structures of wood and steel for water tanks. The final report on this subject will be found in Appendix F. The preparation of these specifications and the typical plans in the work of the sub-committee of which C. R. Knowles is chairman. There is so wide a variation in designing tank towers on American railroads that the committee feels that the adoption of these standards and specifications is very timely. Many of the details in use in tank towers all over the country are very uneconomical, and without actual justification. These specifications and typical plans are offered as a final report, with the recommendation that they be placed in the Manual, and I will ask Mr. Knowles to read that last subject. (Mr. Knowles abstracted Appendix F.)

Chairman Dorley: *I move that the specifications for steel sub-structures for water tanks; specifications for timber sub-structures for water tanks, and the typical plans be adopted and published in the Manual.*  
(Motion carried.)

Chairman Dorley: Before the committee is dismissed I would like to call attention to No. 5 of the suggested subjects for next year's study and report.

The pitting of boiler tubes is something that is becoming a very serious problem on American railroads, and the effect of this pitting represents one of the very large items in the expense of locomotive maintenance today. At first thought it might appear that the problem is one that the mechanical department should handle but the water service engineer is vitally interested in it, for the reason that pitting is generally ascribed to water condi-

tions. The most disquieting thing about the whole problem is that it is beginning to show up on districts where originally or years ago it did not appear, on districts where the water is either naturally good, or where the water is now being treated.

It is the recommendation of this committee that an arrangement be made to have a committee of the Mechanical

section of the A. R. A. and possibly a committee of the American Society of Testing Materials, co-operate with this committee in the handling of this subject. We think that it is about the most important problem that the water service engineer has confronting him at the present time.

(The committee was dismissed with the thanks of the Association.)

## Report on Economics of Railway Labor

*An investigation of methods of hiring maintenance of way labor shows a lack of systematic selection, and a tendency to return to labor agencies. Adverse effects of unsatisfactory housing conditions and intermittent employment are becoming more generally recognized. Engineering department is in charge of maintenance of way on most roads, with many men with engineering training coming into supervisors' position. Investigations on 52 principal railways indicates the estimated relative efficiency in September, 1920, only 67 per cent as compared with results obtained during the pre-war period from 1912 to 1916. Committee will continue investigations.*

C. E. Johnston  
Chairman

*C. E. Johnston, chairman of the committee, is completing his first year in this position and his third year as a member of the committee. He is representative of an increasing number of men who have risen through the engineering department to operating and executive positions in recent years. While chief engineer and for the last three years general manager of the Kansas City Southern, he has taken a keen interest in maintenance of way labor. Among his recent departures has been the organization of the foremen and higher maintenance officers on his road into a voluntary technical association, which meets monthly to discuss problems arising in their work.*

IN PREPARING THE SECTION of the report on plans and methods for obtaining labor for railways, a carefully prepared questionnaire was sent to 65 representative roads in Eastern, Western and Southern territory and to representative roads in Canada, in order to develop the existing practices throughout the country. This questionnaire developed that very little is being done by the railways in the way of specializing for the selection of their maintenance of way labor. The returns, when carefully analyzed, also show that for maintenance of way labor, at least, the railways have not availed themselves of the lessons which the experiences resulting from the war merely developed and intensified, and that no positive action has been taken to overcome the economic conditions which tend to create serious labor shortages at different seasons of the year.

Except for such labor as can be obtained locally, on approximately two-thirds of the roads throughout the country, the great army of excess workers required during the working season are, as a rule, recruited through labor agents, the majority of whom charge the men for securing the temporary job. There is no uniform practice as to the officer charged with responsibility for such matters, the tendency, however, seems to be to leave it, in a general way, under the engineer maintenance of way, where same exists. Where the services of these labor agents are utilized, it is the almost universal custom for the railways to obtain labor from various agencies, there being little tendency to accomplish this through a single source of supply.

As a general rule, railways do not pay bonuses or compensation to agencies for maintaining a stated supply of workers on their lines, but there are cases where this method has been followed, especially in times of labor stringency, the agency being responsible for maintaining the supply and being paid accordingly. Very few railways pay the agencies for securing their labor, it being customary for the labor agent to require the laborers to reimburse him for his efforts. This has resulted in a

great many abuses which are alike prejudicial to the interests of the worker and the railways.

The majority of the roads do not contract maintenance work, although there is a tendency in this direction on some of the more important items requiring extra gangs, or where special skill is required. Prior to the war, it was the practice for many roads to maintain labor agencies in the large labor centers, like Chicago, St. Louis, Kansas City, Omaha, etc. These were abolished during the war, but since the armistice was signed pre-war conditions have been restored and there has been a marked tendency to increase agencies, either wholly or partially supported by individual roads entering the larger labor centers.

Practically no limitation is placed on free transportation for transporting labor that cannot be obtained locally, and apparently no means has been found for protecting against the abuses resulting from the flagrant misuse of transportation furnished for the purpose of transporting this labor. In times of shortages, where labor cannot be supplied locally or obtained by labor contractors from territory tributary to the carriers, it is customary for most roads to pay fare for laborers recruited in off-line districts over other lines in order to bring them to their own road. It is not the practice of the roads to invoke statutory requirements against the misuse of transportation, as no method has yet been found whereby this may be effectively used. No effective means has so far been developed to protect against the worker who, having accepted free transportation, fails to accept service. When such worker leaves the service after a few days' (or hours') service, as is frequently the case, few roads make any attempt to retain part of his earnings as partial compensation for such free transportation.

The investigations of the committee, previously reported, have shown that the length of service for the casual worker is of exceedingly short duration, and the facility with which these transient workers may move from place to place is almost entirely responsible for

this condition. The questionnaire, however, developed that the majority of the roads appear not to feel that the abolition of free transportation for the casual workers would operate to stabilize labor. The replies reaching the committee indicated a general recognition of this widespread abuse in connection with the transportation of laborers, but few practical suggestions have so far reached the committee for its remedy. The popular one seems to be that some arrangement should be worked out by each road whereby laborers will be piloted from the source of employment to the particular job for which they are engaged. Where the services of boarding contractors are utilized to feed extra or floating labor, it is customary to afford free, reduced or limited transportation for their camp and food supplies, on approximately half of the roads reporting, the others assessing charges in some form or other thereon.

The replies indicate a decided effort is being made to furnish houses for regular section foremen at nominal rental, and some feeble efforts are being made to furnish better quarters than heretofore for common labor, but it is not general. The conditions in the Eastern section do not, as a rule, require this for its excess labor, whereas in the West it is necessary in some form on account of the long stretches of open country and the comparatively long distances between the towns. The majority of the roads furnish bunk houses for their laborers for which no rental is charged, but as a rule they consist of old car bodies. Some tendency for improvement in this direction is reported. It is the general practice for the railways to supply housing with wood or steel bunks for their floating, or semi-permanent labor, but the bedding, kitchen and other utensils are supplied by the boarding contractors, or the laborers themselves. It is also the general practice to supply cooks for track gangs, but no uniformity exists as to the number in proportion to the men employed. This applies to Bridge and Building Department and miscellaneous employees as well.

The majority of the roads reporting apparently contract with companies or individuals for feeding their common labor that is seasonably employed, the balance evidently believing that better results are secured where this is not done. There is almost an entire absence of trained supervision over food, sanitation or camp supplies for the workers. Where such supervision exists it is usually of a sporadic character and confined to local officers engaged in other duties. One large Eastern road, however, has assigned the feeding of its laborers to its dining car department and through it secures the benefit of the same sanitation and supervision of its food and camp equipment that is afforded to its patrons.

There is a marked difference between the practices of Eastern and Western roads in the matter of engaging and caring for labor. The general tendency of the Eastern lines is to so arrange their maintenance work that it shall be done with regular forces and minimize, as far as possible, the use of extra gangs, whereas, as a general rule, the Western roads depend on the extra gangs and casual labor to supplement the work of the sections, principally for relaying rail, ballasting and similar heavy work. There appears to be an almost universal appreciation by the roads of the serious effect that intermittent labor has on their organization and efficiency in maintaining the railways of the country. There is also a general feeling on the part of a majority of the roads that this can only be corrected, or at least minimized, by working out a more scientific method of arranging the maintenance of way program whereby large armies of

workers will not be made idle during a very considerable part of the year.

There is a universal feeling that before very much can be done by railways to stabilize labor, housing and living conditions must be more in conformity with the current practice of industrial and similar concerns, who seem very much in advance of the railways in this particular. Better sanitation, proper facilities for bathing and improved structures for housing the employee would appear to be the medium that will react powerfully to stabilize railway track labor. A better distribution of the forces so arranged as to give consideration to the comfort of the foremen and their families are a greater asset than is popularly supposed for increasing the efficiency, contentment and loyalty of the worker.

Changed working conditions have now served to intensify the importance of securing greater efficiency and a better selection of workers than ever before in the history of our railways. Section 15-A, of the Transportation Act, expressly stipulates that in determining the allowable return, expenditures for maintenance of way and structures and equipment must be so managed "as to secure honest, efficient and economic results." Manifestly if methods are employed which are wasteful or extravagant and as a result the principal item of railway maintenance (labor) is affected, the net return may also be affected. It would seem that it is well within the province of this Association to study the effect of poor methods in housing, transporting and otherwise caring for railway labor to the end that nothing of this kind may ever occur.

#### TRAINING AND EDUCATING EMPLOYEES

The committee has not completed its study of the subject-matter, consequently it is not in a position to make conclusive recommendations. Of the 60 roads reporting in answer to a questionnaire, 75 per cent have a divisional and 25 per cent a departmental organization.

Notwithstanding the large percentage for a divisional organization, approximately 72 per cent of the lines charge an engineer or the engineering department with the direct responsibility of maintenance of way. We also find approximately 65 per cent of the lines give preference to engineers, or men having engineering training, in selecting division officers in charge of maintenance of way. Fifty per cent of the total of roadmasters and track supervisors employed by the roads reporting have had engineering training. Our reference to roadmasters and track supervisors are those having charge of an average of 111 main track miles and 75 sidetrack miles.

Our investigations to date show approximately 99 per cent of track foremen are selected from common labor, the percentage of common labor being about as follows: Native white, 40 per cent; negro, 17 per cent; Mexican, 10 per cent; other foreign, 33 per cent.

The average length of track section in charge of a section foreman includes: 6.7 miles main tracks and 3.1 miles side track. Section motor cars are in use on approximately 69 per cent of the mileage reported. The investigation to date (September, 1920) indicated an estimated relative efficiency of only 67 per cent as compared with the results obtained during the pre-war period, or, say, 1812 to 1916.

Committee: C. E. Johnston (K. C. S.), chairman; C. H. Stein (C. R. R. of N. J.), vice-chairman; W. J. Backes (N. Y. N. H. & H.), A. F. Blaess (I. C.), B. M. Cheney (C. B. & Q.), C. C. Cook (B. & O.), W. R. Dawson (N. & W.), John Evans (M. C.), R. H. Ford (C. R. I. & P.), L. C. Hartley (C. & E. I.), W. R. Hillary (Penna.), C. B. Hoyt (N. Y. C. & St. L.), T. T. Irving (G. T.), R. E. Keough (C. P. R.), E. R. Lewis (M. C.), C. A. Paquette (C. C. & St. L.), W. H.

Penfield (C. M. & St. P.), J. R. Sexton (Erie), W. J. Towne (C. & N. W.).

### Discussion

C. E. Johnston (Chairman): The activities of the committee during the past year have been assembling information as a foundation upon which we might reach conclusions. The subjects assigned are, we think, so important, that we must go into all the details very carefully and endeavor to find some solution or arrive at some real honest-to-goodness recommendation in the handling of our maintenance labor, and what we have shown here in the report is to be taken as information. It is assembled with the idea of laying a foundation for our further study of the particular subject.

We have gathered considerable information with respect to maintenance of way labor, and I will admit it is hard to find a beginning point. We find that most lines have their own way of handling labor, and our questionnaires are giving us a very good line on the practices over the different parts of the country. In order to get the benefit of the views of the membership, we would like to invite discussion of these items, so first I will call upon Mr. Ford to read what we have said here with respect to the first subject.

R. H. Ford (C. R. I. & P.): I will take up some of the salient features on which the committee is very anxious to secure information. There are 3 or 4 things that have impressed us as being particularly important. One deals with the question of the misuse of transportation. Everybody recognizes this as a very flagrant evil, something that some united action will have to be taken to correct. No one was able to offer any real remedy.

The questionnaire has developed a great laxity of practice on methods of taking care of the men. We are paying so much for our track labor today, and the returns that we are getting must be measured by the ability of the laborer. Unless a man has good food and good housing conditions he will not deliver the work that he ought to do.

The Chairman: Are there any remarks or any suggestions to be offered the committee?

W. J. Backes (N. Y. N. H. & H.): The questionnaire would indicate that the majority of the railroads of the country have a divisional form of organization—that is, 75 per cent divisional and 25 per cent departmental. On the other hand, even though they have a divisional organization, the majority of the division engineers and roadmasters, or rather are engineers; that is, 75 per cent of the replies had engineers in charge of their maintenance of way departments; 65 per cent of the division engineers and 50 per cent of the roadmasters and track supervisors were men with an engineering training. Of course, in the east the tendency is to develop young engineers, and where the railroads take the time to give the men the training and establish a good line of promotion, we are able to attract some very promising young men into our service.

The territory covered by roadmasters and track supervisors generally averages about 11 mi. of main track and 75 mi. of side track. Possibly with the longer sections in the west, that average would be greater. The average age of roadmasters and track supervisors is 45 years. I think that on lines training young engineers you will find the average age probably nearer 35, between 35 and 40.

It has been very difficult to get young men to take positions as section foremen, although we have been able on some of the lines to get young men to take positions as general foremen, and those foremen have taken hold of the work very well.

The length of track sections under section foremen is 67 mi. of main track and 31 mi. of side track. That, I think, averages pretty well over the country, with the possible exception of where they have long motor car sections. Motor cars are now used on approximately 69 per cent of the mileage, and I believe there is a tendency for those who have had long motor car sections to shorten them.

I do not believe there is anything that we can do to strengthen our maintenance organization any more than to attract young men into our service who have had a good engineering education. That was the foundation of our work, and if we are going to develop the highest degree of efficiency we must have men who have the power to analyze the costs of their work and improve the methods of doing the work. Those railroads who have been doing experimental work, and using labor-saving devices are beginning to find out that material economies can be obtained through their use; it must be done intelligently. We cannot expect men to take these various mechanical devices without providing instruction and proper supervision in their use.

Chairman Johnston: We devote a great deal of thought and time and money to specifications for rails, ties and all other material, but we are overlooking to a considerable extent giving proper attention to labor and selecting the men who will develop into foremen and other supervising positions in the future. There seems to be a lack of uniformity all over the country—some do it one way, some do it another, some do not do it at all. Most of us do not do it at all, and I think that at the present time we are impressed with the importance of giving this entire subject a great deal more thought than we have in the past. We must get closer to the human side of labor. Personal contact probably will give us more results than anything else. Just how that can be brought about I am unable to say. We have a little organization on the line I am with called the Maintenance of Way Association. We have monthly meetings of our foremen and discuss things of interest—kind of a handshaking proposition—but at the same time we can notice a big improvement in feeling, in the fact that we are acquainted with the fellows. As Dean Potter said this morning, the engineering students think the time has come where they must be sorted and tested out. I think the time has come when our track laborer must be sorted and tested out if we are going to go along with the procession.

Earl Stimson (B. & O.): I hesitate to criticize the committee, because we assume that the committee represents the best thought on the subject that is in hand. In my opinion, the committee has the cart ahead of the horse.

The first thing to do when you undertake an enterprise is to establish what you are going to do and how you are going to do it, and then get together your supervising force that is going to handle the work, and train them. The last thing you do you get together your material and your men that are actually going to do the work and you are prepared to handle it. The committee get the men first, take care of them, keep them fed, and then educate them.

To my mind the first thing that should be undertaken is subject No. 3, "Study and report on standard methods for performing maintenance of way work, with the view of establishing units of measure of work performed." This elaborate preparation to get the men is more or less superficial and I think it is a mistake, as it applies to a very small percentage of the force which is employed regularly. We have men all the time. We do not have to organize a labor department, we do not have to build elaborate camps. We have plenty of men already to

start in and handle a piece of work in a well-organized way. On looking over the reports of the Committee on Economics of Railway Labor I find there has not been one single conclusion or one single recommendation that had been put forth, and this particular subject, which is the backbone of the whole thing, had been ignored. My suggestion to the committee is that it buckle down to work on subject No. 3 and arrive at a conclusion next year without indulging in the ancient and honorable American pastime of passing the buck. I suggest that the railroads take immediate individual action to improve the labor condition and to effect an organization to increase labor efficiency.

I think it is the duty of the committee to point the way and not leave it to the individual effort. The committee has been in existence four years and we have not gotten anywhere yet.

Chairman Johnston: It is all right to look at subject No. 3, with the view of establishing measure of weights of work performed, and say that is what we want. It is true, and we will get to it, and if there had been plenty of men during the past three or four years it would have been a comparatively easy matter to arrange for it. We have found it necessary to get men and show them what to do, and to measure what they are trying to do after we get them.

W. M. Camp (Railway Review): The trouble with the situation with regard to the maintenance force is that the men are not employed regularly all the year around. These men have families to support. The other classes of railway labor have work the year around. Under these circumstances you are not going to secure a class of men who will take pride in their work and who will expect to stay with that kind of work. I thoroughly believe that the point you have got to arrive at is to employ this labor regularly.

J. E. Willoughby (A. C. L.): On our road we have laid out our maintenance work so that the same number of men are employed throughout the year; that is, we do not increase or decrease the labor allowance on account of weather conditions. It is as much a part of the foreman's duty to see that his labor accomplishes sufficient work as any other thing of which he has charge. We hold the foreman responsible for the work accomplished. So far as the negro labor is concerned, the suggestion of the committee should be that the foreman be made responsible and measure the work of the foreman, and then require the foreman to see that the proper amount of work is done.

C. H. Stein (C. of N. J.): It was during 1916 and 1915 that this proposition of the equated track sections was considered, and we reached the conclusion that we could not do anything at that time, as the state of the art had not been advanced to a point where we could express conclusions in a mathematical form that would be substantial and effective in producing the results that this convention desired us to aim at at that time, and I want to say that we have been urged forward to make progress to stabilize the labor on American railroads. All of these subjects have been discussed and considered by previous committees and the labor situation was gradually becoming more satisfactory and the competency of labor was more nearly approaching a state of 100 per cent efficiency, but everybody knows what the experiences of 1917, 1918, 1919 and 1920 have been, and every man in this room knows but too well what the actuating forces have been which have been responsible for these restless conditions that have affected our general labor situation. The great factor in the problem is the human element, and I agree with one of the preceding speakers that this

has become not only a financial and economic problem, but it is becoming more and more as it was tending to do in '14, '15 and '16, a psychological problem. We have got to get nearer to the men. You must have approximately 100 per cent men in order to get any schedule or any program outlined or any method of equating track sections that will be productive of efficient and successful results.

R. G. Kenly (M. & St. L.): There are at least six months of the year in western Minnesota and the Dakotas when we operate with only a section foreman on a six-mile section. There is so little track work to be done that it would be difficult to arrive at any plan of dividing that work throughout the year so as to maintain our section force.

C. A. Morse (C. R. I. & P.): I have been in some labor meetings the last few months, where each railroad had an idea of its own, and no progress was made because there were as many ideas as individuals, and what we need to do is to give the committee the benefit of any suggestions we have for them to work on.

One of the subjects is in regard to trained men. On a railroad we have a lot of individual organizations; we have the water service gangs, the track gangs, building gangs, and signal gangs, etc., and it seems to me one of the things to do is to get the men in charge of these gangs into the habit of planning their work. The man who expends his money on track work or any other railroad work, hit or miss, cannot get the results that a man does who plans his work. We are up against the wage proposition, and in all these years of railroad in this country we have considered every man working on the section gang as a common laborer. The man who had been there 1 or 15 years got the same wages as a Mexican or Italian brought in who did not know the name of anything he had to work with. I think in this reconstruction period it would be a great thing if we could recognize the fact that there is such a thing as a skilled trackman, and part of our gang are skilled men, and I believe these men should be retained and the filling in part done with common labor. Probably one-third should be considered as skilled men and the rest put on as common labor.

J. L. Campbell (E. P. & S. W.): During the past 15 yr. we have been gradually improving the living conditions of our Mexican labor, and we are getting results every day. The tie shacks on our road in which the Mexicans lived at one time are being replaced at a reasonably steady rate with good buildings and improved labor conditions. We give prizes for flower gardens, and we do other work of that kind, which is producing good results.

Mott Sawyer (C. M. & St. P.): We do not need any system of standards to tell us that the men we are employing on the track do not come within hailing distance of doing a decent day's work and doing it in a proper manner, and something should be done to secure a better performance of duty by these men. Whether it will be by a system of bonus payment, or by some other system, possibly through welfare work, is difficult to say, but I do not see how you can stabilize section work throughout the year. But a means of improving the labor situation and giving us men enough to do our work efficiently and economically is a very serious matter, and I want to say that the committee in putting stress on means of recruiting and retaining labor is doing a very valuable work.

(The committee was dismissed with the thanks of the Association.)

## Report on Economics of Railway Operation

L. S. Rose  
Chairman

*L. S. Rose is completing his first year as chairman of the committee, of which he has been a member since its organization in 1918. His varied experience in railway service particularly fits him to direct the work of this committee. As division engineer of the Big Four for six years and later as signal engineer at a time when an extensive program of grade reduction and signal construction was under way, he was brought into contact with the economics of operation. More recently as valuation engineer and for the last two years as assistant to the general manager, he has of necessity continued these studies under the changing conditions of today.*

*The efficiency of the employees not regularly receiving comparative reports can be increased by furnishing them with reports and comparisons for their information and to create their interest. Data to be compared should be up-to-date, issued regularly and in the units of work or material with which the employee is most familiar. In order to increase the traffic capacity of a road detailed studies should be made embracing both road and terminal facilities, organizations and operating methods and covering such points as effective utilization of existing facilities, possible changes in operating methods and minor additions to secure immediate increases.*

THE COMMITTEE presented progress reports on the following subjects, none of which were recommended for insertion in the Manual, but offered solely as information: Subject (1) Methods for Increasing Efficiency of Employees by Furnishing Them with Reports and Comparisons, given in Appendix A; (2) Methods for Increasing Traffic Capacity, in Appendix B; and (4) Effect of Speed of Train Upon the Cost of Operation, in Appendix C.

Committee: L. S. Rose (C. C. C. & St. L.), chairman; G. D. Brooke (B. & O.), vice-chairman; J. B. Babcock, 3rd, L. W. Baldwin (I. C.), J. M. Brown (C. R. I. & P.), A. G. Boughner (M. K. & T.), J. W. Burt (C. C. C. & St. L.), Maurice Coburn (Penn.), F. W. Green (St. L.-S. W.), H. B. Grimshaw (S. A. L.), V. K. Hendricks, E. T. Howson (Railway Age), R. B. Jones (Penn.), E. E. Kimball, H. A. Osgood (Wabash), R. J. Parker (A. T. & S. F.), Dean Wm. G. Raymond (Univ. of Iowa), Mott Sawyer (C. M. & St. P.), J. E. Teal (B. & O.), C. C. Williams (Univ. of Kansas), Louis Yager (N. P.).

### Appendix A—Increasing Efficiency of Employees by Furnishing Reports and Comparisons

The term "employee" in this subject refers to those employed in minor positions on the railroad who do not see regularly the comparative reports sent out from time to time of various statistics. The methods suggested are that comparisons of the effective work of individuals or groups of individuals or employees be tabulated and published; these comparisons to be of subjects in which an employee is engaged. The purpose of these comparisons is to stimulate friendly rivalry which may be developed in practically every line of railroad work. These comparisons should be discussed with the employee, in groups of his fellow-workmen, for the purpose of securing their criticism and advice, recognizing their knowledge and insuring their interest. Men are interested in their own line of work; in fact, they are inclined to think all other lines are subordinate to theirs. This idea should not be discouraged.

While the final result to be secured is the cost, the units for comparison should be those in which the employee thinks; for instance, if a section foreman is asked about the number of ties he can put in, he will reply, so many per hour or per day; or a locomotive fireman will keep tally on the number of scoops of coal he uses on a run for his comparisons. The data collected should be published at least once per month, in some instances oftener. During the season when the subject under discussion is being actively engaged in, such as insertion

of ties, reports should be made every week. The reports should also be kept up to date, and if the data are not furnished by the employee promptly, inquiry should be made to ascertain the reason for the delay. If this is not done, the employee will think it has been forgotten, interest will die out, and soon there will be no records.

Methods for keeping the records should be published to prevent misunderstandings, and to insure uniformity. Some data are published by presenting a tabulated statement of facts, others by graphic charts. The range of territory covering the performances should not be too great, for people are more interested in the work of their neighbors than of those a thousand miles away, and the comparison of the work will probably be on a more equitable basis.

### Appendix B—Increasing the Traffic Capacity of a Railway

Two studies have been presented, the object of the first being to outline steps which will establish whatever weak points there may be in the organization of a railroad and the ways for improving operation so as to obtain increased capacity with the existing facilities or with slight modifications of them.

The second is a discussion of the physical elements which affect the traffic capacity. That is, it begins with the assumption that new facilities are required and a study is to be made to determine what these facilities shall consist of. This study was undertaken late in the year and is incomplete, due to lack of time to secure the data necessary to develop it to the point of determining where new facilities are required or to forecast what the benefits of the new improvements will be. It is proposed as a part of next years work to collect such data from actual operations on existing railroads and to use it in the continuation of this division of the subject.

In considering the means of increasing the traffic capacity of a railroad, the logical first step is an examination to ascertain

- (A) If the facilities as they exist are being utilized to the maximum capacity;
- (B) What changes, if any, in methods of operation will produce increases of capacity;
- (C) What minor additions or alterations to facilities can be quickly made which will produce increases of capacity.

For this examination the engine district—embracing two terminals and the one hundred miles more or less of line between them—is the most suitable unit. If the

problem should have to deal with more than one such district, each will have to be examined of itself and then with the results so obtained they must be studied together, each in its relation to the adjoining districts and to the line as a whole, and thus by progressive study the examination completed for the entire railroad.

The facilities of an engine district consist roughly of the main tracks, passing tracks and other sidings, yards, telegraph offices, signals, water stations, engine houses, ash pits, coal chutes, etc., the locomotives assigned to the district, the locomotive repair shops, and the special equipment.

The detailed studies should embrace both road and terminal facilities, organizations and operating methods or such portions of them as the preliminary investigation may determine is necessary. They should be made by consulting the train sheets and the various daily and periodic reports of operating performance and by making comparisons with the performance during previous periods, by suitable observations of actual work and by free discussion of the problems and conditions with the officers in charge of the operations.

The problem is peculiar for the reason that the results which might be expected from theoretical considerations of the factors involved are greatly in excess of the results which have been obtained in actual operation. On this account it has been difficult to obtain the best facilities when needed, largely because of the fact that the true conditions could not be set forth. The purpose of this discussion is to obtain a conception of the physical elements which determine the traffic capacity of a line and to show how operating results may be analyzed so

as to form the basis for comparing the costs of providing new facilities with the financial benefits to be gained therefrom. Such analyses will be of value in demonstrating the feasibility of proposed undertakings for increasing the traffic capacity of a given line.

### Discussion

L. S. Rose (Chairman): E. T. Howson will present Appendix A, "Method for Increasing Efficiency of Employees by Furnishing Them With Reports and Comparison to Inform and Interest All Concerned."

(Mr. Howson presented the report.)

Chairman Rose: G. D. Brooke will present Appendix B on "Methods for Increasing the Traffic Capacity of a Railway."

(Mr. Brooke presented the report.)

Chairman Rose: The Appendix of the report on the "Effect of Speed of Trains on Cost of Operation" will be presented by C. C. Williams.

(Mr. Williams presented the report.)

Chairman Rose: J. E. Teal will present that part of the report on "The Effect of Speed of Trains on the Cost of Operation."

(Mr. Teal presented the report.)

The Chairman: This report does not require action for adoption in the Manual, but is before you for discussion. I hope the good work which this committee has done will be appreciated by an active interest on the part of the members. It is a matter which is of great interest to nearly all of us.

(The committee was dismissed with the thanks of the Association.)

## Report on Economics of Railway Location

*Curves are presented for use in estimating freight and passenger train resistances at speeds ranging from 35 to 50 and 5 to 75 miles per hour, respectively, and temperatures of 35 deg. F. and upwards. In studying economy of electrification, conclusion is drawn that, taking into consideration the heavy fixed charges of investment, no general conclusion can be given at this time as to the relative economy of electric and steam operation. Each case must be considered by itself, taking into consideration all elements of cost and expense, both special and general, as well as operating conditions and the public comfort and safety.*

C. P. Howard  
Chairman

*C. P. Howard is rounding out his first year as chairman of the committee, although he was vice-chairman for seven preceding years and has been a member of the committee for ten years. He has taken a prominent part in guiding it through its more or less turbulent career. He has contributed a number of monographs on subjects allied with the work of the committee and wrote an extended review of the Manual, which was published in the October issue of the Bulletin. He has been identified with the federal valuation work for several years, being senior civil engineer in the Division of Valuation of the Interstate Commerce Commission at Chicago.*

**I**N APPENDIX A the committee submitted two proposed changes in the Manual to cover Sections 5 and 6. In Appendix B the committee presented a report on the resistance of trains between 35 and 75 miles per hour, with diagrams, tables and conclusions recommended for adoption and inclusion in the Manual. The committee submitted in Appendix C a report on economics of location as affected by electric locomotives with conclusions recommended for adoption and inclusion in the Manual.

Committee: C. P. Howard (I. C. C.), Chairman; A. S. Going (G. T.), vice-chairman; F. H. Alfred (P. M.), R. N. Begien (B. & O.), Willard Beahan (N. Y. C.), Edwin J. Beugler (West. Church Kerr), W. J. Cunningham, C. T. Delamere (C. P. R.), A. C. Dennis (Cons. Engr.), W. A. James (C. P. R.), Fred Lavis (Cons. Engr.), E. H. McHenry,

Edward C. Schmidt (U. S. A.), H. C. Searls, A. K. Shurtleff (Ass't Sec.), C. H. Splitstone (Erie), C. W. Stark (N. Y. N. J. Com.), M. F. Steinberger (B. & O.), John G. Sullivan (C. P. R.), Walter Loring Webb (Cons. Engr.), M. A. Zook (I. C. C.).

### Appendix B—Resistance of Trains Running Between 35 and 75 Miles per Hour

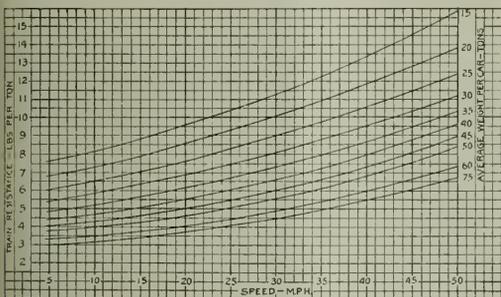

Throughout this report the terms "resistance" and "train resistance" mean the number of pounds of tractive effort required for each ton of the train in order to keep it in motion on straight and level track, at uniform speed. This resistance is only that of the train behind the locomotive tender—the resistance of the locomotive and tender, themselves, is not included.

The results here presented relate to trains running on good track and in moderate weather when the temperature is above 30 deg. F. and the wind velocity not over 20 miles per hour. Poor track, extremely low temperature, and high winds all increase train resistance; but there is not yet available enough information to enable the influence of any of these factors to be evaluated. The influence of low temperature is probably the most important, and some allowance should be made for it in attempting to predict resistance during extreme winter weather.

It should be emphasized that the resistance of both freight and passenger trains depends not only upon speed, but upon the average weight of the cars composing the train. In order to predict resistance at any speed, the average weight of the cars must be either known or assumed.

FREIGHT TRAIN RESISTANCE

The tests were made with a variety of trains in regular freight service upon well-constructed and well-maintained main-line track, 94 per cent of which was laid with 85-lb. rail, the remainder being laid with 75-lb. rail. The

The Relation Between Freight Train Resistance and Speed

track was ballasted with broken stone. The experiments were carried on during moderate weather when the minimum air temperature encountered was 34 deg. Fahr. and the wind velocities were less than 20 miles per hour.

The results are applicable to trains of all varieties of make-up to be met with in service. They may be applied, without incurring material error, to trains which are homogeneous and to those which are mixed as regards individual car weight.

The results are primarily applicable to trains which have been in motion for some time. When trains are first started from yards, or after stops on the road of more than about 20 minutes' duration, their resistance is likely to be appreciably greater than is indicated by the results here presented. In rating locomotives, no consideration need be given this matter except in determining "dead" ratings for low speeds, and then only when the ruling grade is located within six or seven miles of the starting point or of a regular road stop.

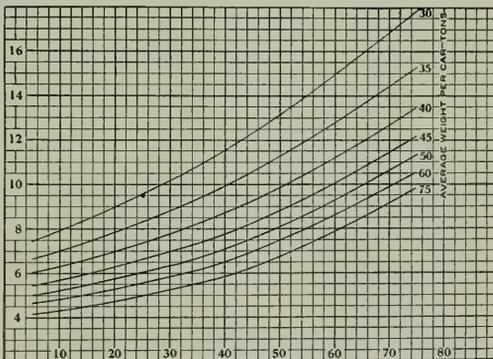

It is to be expected that some trains to be met with in service will have a resistance about 9 per cent in excess of that indicated by Fig. 1, due to variations in make-up or in external conditions within the limits to which the tests apply. If operating conditions make it essential to reduce to a minimum the risk of failure to haul the allotted tonnage, then this 9 per cent allowance should be made. This consideration, like the one preceding, is important only in rating locomotives for speeds under

15 miles per hour. At higher speeds, the occasional excess in the resistance of individual trains will result in nothing more serious than a slight increase in running time. It should be understood that this allowance, if made, is to be added to the resistance on level track—not to the gross resistance on grades. For all ordinary purposes, however, Fig. 1 may be used as it stands to estimate the resistance of freight trains running on straight and level track of good construction during moderate weather.

PASSENGER TRAIN RESISTANCE

The results are derived from tests of 28 passenger trains in "local" and "through" service. The average weight per car in these trains varied from 33 to 71 tons, and the number of cars from 4 to 12. The speeds ranged up to about 67 miles per hour. The tests were made upon well-constructed and well-maintained main-line track laid with 85-lb. and 90-lb. rail, and ballasted with broken stone. The experiments were carried on during moderate or warm weather, when the temperatures were above 40 deg. F. and the wind velocity generally less than 20 miles per hour.

Of the 240 cars composing these 28 test trains, 178 had six-wheel trucks and 62 had four-wheel trucks. All trains, except one, contained both four-wheel and six-wheel trucks, but in varying proportions. It was not possible under the conditions under which the tests were made to control the makeup of the trains. The tests had to be made in regular service and the trains had to be accepted with their usual makeup. This limitation has not defeated the main purpose of the tests, for they were undertaken, not to distinguish the resistance of

The Relation Between Passenger Train Resistance and Speed

four-wheel and six-wheel truck cars, but to measure the resistance of ordinary passenger trains of widely different average car weight; and wide variation in car weight carries with it, in American practice, a variation in truck construction similar to that encountered in the trains here discussed. Any train of 35 to 40 tons average car weight is sure to include in its makeup four-wheel truck cars—and in about the proportion which prevailed in these tests. Even the heaviest through trains are likely occasionally to include a car or two with four-wheel trucks.

A number of the trains tested developed resistance about 8 per cent greater than those found in Fig. 2, and it is to be expected that trains will occasionally be encountered which have a similar excess resistance, even

under conditions of air temperature and wind velocity such as prevailed during these experiments.

### Conclusions

(1) Fig. 1 may be used in estimating freight train resistance at speeds from 35 to 50 miles per hour for Class A rating and temperatures of 33 deg. Fahr. and upwards.

(2) Fig. 2 may be used in estimating passenger train resistance at speeds from 5 to 75 miles per hour and temperatures of 35 deg. Fahr. and upwards.

### Appendix C—Economics of Location as Affected by Introduction of Electric Locomotives

Railroad electrification, while most desirable from the point of view of the conservation of our fuel resources, is a matter than can not be undertaken wholesale, for several reasons. First, the capital outlay would be enormous; second, each individual railroad system or even subdivision is a problem in itself, to be judged on its own merits.

The modern steam locomotive by the use of brick arches, feed water heaters, superheater, stokers and trailer boosters has had its efficiency increased practically 50 per cent. At the same time its size and capacity have increased with this advance, and the question arises wherein the electric locomotive is superior. From an operating standpoint it has a number of minor advantages. It eliminates the turntable; cuts down standby losses; removes the delay at water tanks and coaling stations; its availability for service is very much greater, and its maintenance is considerably lower. Its capacity is increased with cold weather—the reverse of the steam engine. Its simplicity of control relieves the crew from many duties necessary on a steam engine, and permits closer observation of track and signals. When properly designed, it is much easier riding and can have a more uniform distribution of weights with less nosing and track pounding; all of which tend to lower track maintenance. In addition there is one great inherent advantage which the electric locomotive possesses, namely, the ability to concentrate large amounts of horse power under single control.

In steam railway operation each train has its own source of power, which has no relation to the propulsion of the other trains on the line. In electric railway operation every train draws its power from one or more centrally located power houses.

#### ADVANTAGES OF ELECTRIC OPERATION

The entire weight of the electric locomotive can be and frequently is on the drivers, while but 65 per cent to 75 per cent of the steam locomotive (except the switching type) is thus utilized. An electric locomotive allows an increase in tractive effort without a decrease in speed. A limiting factor of the horsepower output of a steam locomotive is the steaming capacity of the boiler, as well as the amount of coal per hour which the fireman can throw into the grate continuously throughout the shift. (The latter does not apply in the case of automatic stoker fired engines.) A comparison between the maximum weight of train permissible with the steam locomotive and the standard weight of train prescribed for electric locomotives shows there is an increase over steam operation of from 18 per cent to 25 per cent. The tractive effort and the motor capacity are far greater in the electric locomotives, due to the more effective application of power.

An advantage which is ascribed to electric operation is the benefit derived from the elimination of work at terminals necessary when steam locomotives are used. With

the same service to be handled there should be less electric locomotives necessary than steam locomotives, unless there are peculiarities in the service itself. It is maintained that under electric operation there is a saving in fuel of 50 per cent to 65 per cent. Assuming it is correct in stating that the power house consumes but one-half as much coal for the same number of ton miles, the cost of power would be more than one-half of the cost of coal. There are other factors entering powerhouse costs which do not appear in the cost of coal. The cost of other supplies than coal are the cost of power house labor, and the expense of maintaining the power house and its equipment, all of which are items of no mean importance. Another factor is the transmission loss between the power house and the locomotive. While engine house expenses of steam locomotives are important factors they are insignificant in electric operation. In freight service there is another factor tending to reduce further the cost under electric operation. Two or more electric engines coupled together may be operated by a single crew. This possibility of double heading without additional engine crews results in a considerable saving. Unit costs of electric operation decrease as the volume of traffic increases, whereas the unit costs in the case of steam operation remain comparatively constant.

#### DISADVANTAGES OF ELECTRIC OPERATION

As regards the disadvantages of electric operation, the most important objection is the enormous first cost and the heavy fixed charge which that involves.

Electric equipment is more costly than steam equipment. Electrification must not only bring about economy, but very large reduction in operating cost in order to prove itself economical. The electric locomotive is a piece of transforming apparatus which receives its power from an outside source, and is, therefore, subject to overloads. The steam locomotive is a self-contained mechanical unit and it is hardly possible to injuriously overload it.

There is additional danger to the lives of the employees and others. This is, of course, much more serious when the power is transmitted at higher voltage and where freight and switching service as well as passenger is operated by electric power. Another argument against electric operation is that which deals with the additional liability of train delays. In addition to equipment failures which occur on both steam and electric service, there are failures of the transmission lines.

With electric traction the territory protected with automatic block signals of the usual continuous current track circuit battery type will have to be replaced with alternating current track circuit apparatus, because the use of track circuits with propulsion currents in the rails requires selective apparatus to prevent false indications. Normal traffic cannot be exceeded for periods of long duration unless the system has been designed to take care of maximum traffic, which greatly adds to the capital charge.

Unless other load than the railway is carried on the generating stations on small systems a poor load factor is liable to be encountered which adds to the capital charge through maintenance of under-loaded equipment. It is more susceptible to the vagaries of the weather, as in addition to the snow, washouts, and other conditions that affect steam operation, lightning is apt to interrupt the electrical operation.

Steam locomotives are strictly interchangeable and can be moved from division to division, as the necessity for varying motive power capacity develops. Electric locomotives are limited in their field of operation strictly to

electrified track. Traffic must be handled as circumstances require. It cannot be spaced conveniently for power demands, but the terminal yards must be cleared as the cars accumulate.

#### GENERAL

As to the comparative efficiency of the two types of locomotives in the matter of failures, the electric locomotive seems to hold its own. There are certain factors, however, which within the last few years have made the steam locomotive a more formidable competitor of electrification. These are, particularly, the various outside valve gears, the superheater, the brick arch and the automatic stoker, which have increased the tractive power and sustained hauling power of an engine as well as resulting in greater economy of fuel and water.

From available data on the results of heavy electrification it would appear that the ton miles moved by six and one-half pounds of coal in a steam locomotive is approximately equal to that which can be moved by one kilowatt hour delivered from the power station, varying, of course, with the quality of coal. In a great majority of cases the profits from electrification must be realized indirectly rather than directly—increased track capacity, postponing second tracking or the like.

Steam railroads will generally consider electrification favorably when the reduction in operating expenses will pay the interest on the necessary investment, provided the capital requirements can be met, leaving the unevaluated advantages to be gained by electric operation as an additional asset. Also, when the traffic capacity is imperative and this can only be supplied by a large additional expenditure or by electrifying. Track maintenance will under present conditions be generally increased, not only by the additional charge for the maintenance of overhead or third rail contact and distributing systems, but also by the destructive effect upon rails and fastenings of the greater impacts, due to the imperfect cushioning of the heavy weights of the electric motors.

#### RISE AND FALL

The unit values of the several minor classifications under this head will be determined as before with modified factors of cost. Two new elements will be introduced and must be included in the final results, viz.: the time and temperature limitations of the electric motor and the possibilities of regeneration of power on descending grades. The cost of Rise and Fall will be reduced if advantage is taken of opportunities for the regeneration of power by trains on descending grades. The value of such regeneration is considerable under proper conditions. The actual percentage of power which can be utilized will depend upon the length and steepness of incline, total length of electrified section and the number and distribution of daily trains. Regenerative braking does not become economical except on long mountain grades.

The effects of rate of grade and of rise and fall are more closely inter-related in electric than in steam operation. Train tonnage ratings in steam service over lines of moderate grades are often determined by the average resistance of the division and the boiler horsepower of the engine rather than by the resistance of the maximum grades. If the inherent characteristics of the electric motor permit the development of higher speed and horsepower, within its nominal rating, then the resistance of the maximum grade may become the limiting factor, and its rate becomes economically important. In heavy service, and especially on mountain grades, the economic value of electric operation may be quite high, as it is possible to add engine units without adding engine crews.

Other differences affecting unit costs differ more in degree than in kind.

#### CONCLUSION

Taking into consideration the heavy fixed charges of investment, no general conclusion can be given at this time as to the relative economy of electric and steam operation. Each case must be considered by itself, taking into consideration all elements of cost and expense, both special and general, as well as operating conditions and the public comfort and safety.

#### Discussion

(C. P. Howard (Chairman) presented and outlined the report.)

A. S. Going (G. T.) presented the first subject, on "Make a Thorough Examination of the Subject Matter in the Manual, and Submit Definite Recommendations for Changes."

Chairman Howard: *I move the adoption and insertion in the Manual of the text under Appendix A.*

*(Motion carried.)*

Chairman Howard then read Appendix B—"Resistance of Trains Running Between 35 and 75 Miles Per Hour."

Chairman Howard: *I move that these conclusions be adopted.*

*(Motion carried.)*

Mr. Going: Referring to Appendix C, this information was taken from some of the data that is issued by the General Electric Company; in fact, most of the data that I have used in compiling this was information that we gleaned from different reports by Mr. Armstrong and other gentlemen that are with the General Electric Company.

C. F. Loweth (C. M. & St. P.): Many electric locomotives are built as two different units—they can be operated as independent units—but when you do that you are up against the enginemen's organization, and they want the double crew.

E. B. Katte (N. Y. C.): It did not occur to me that this report would take up operating features and comparison with steam locomotive operation, therefore, I have not read it. I find a great deal to criticize. The explanation from the chairman of the sub-committee that it is a compilation of information supplied by the General Electric and presumably other companies, perhaps manufacturers of steam locomotives, makes plain some of these statements, as for instance, this statement concerning insulators.

In fifteen years of operation on the New York Central we have broken many insulators, but we have never had the whole railroad tied up because one insulator was broken. It might cause a delay of four or five minutes to locate that particular insulator and isolate that feed-rail. No railroad built nowadays depends upon one feed-rail. I notice also a reference to electric operation being more apt to be interfered with by the vagaries of the weather, that lightning is apt to interrupt it. Lightning occasionally interrupts it, but very seldom, and other climatic conditions affect electric operation less than they do steam operation. The record of the New York Central on storms is far better than any of the adjacent steam companies. I hope that this report will be taken with a grain of salt.

May I suggest that when you write your next report you use the facilities of this Association and call upon the Committee on Electricity. I think this is more a report on electricity than on economics of railway location.

(The report was received as information and the committee excused.)

# Report on Shops and Locomotive Terminals

The design of car shops is influenced by the consideration of track centers, safe clearances for cars, material handling, headroom, lighting, heating, etc. In studying this subject the committee investigated a large number of structures in use on various roads and presented plans of a great many of them. Data concerning ash pits were gathered from practically all railways in the United States and Canada, covering such features as the number of locomotives handled, the estimated cost, and the advantages and disadvantages. Many types are employed and nearly every type in common use is highly favored by some roads and adversely criticized by others.

F. E. Morrow  
Chairman

F. E. Morrow is the first chairman of this new organization. As the attention of the committee is devoted largely to the subject of terminals it is fitting that it should be headed by a man occupying the position of chief engineer of a terminal railway, in which capacity a larger proportion of his time is devoted to terminal matters and terminal structures than would ordinarily be the case. Previous to his promotion to chief engineer he occupied the positions of principal assistant engineer and assistant chief engineer, in which capacities a large part of his time was occupied in matters of design which now serve him in good stead.

IN APPENDIX A THE COMMITTEE submitted certain studies for information on the design of car shops. It also reported progress on the subjects of (1) ashpits, (2) engine houses, power plants and shop extension, (3) storehouses, (5) design of coaling stations, and (6) typical layouts for storage and distribution of fuel oil, including fuel stations between terminals.

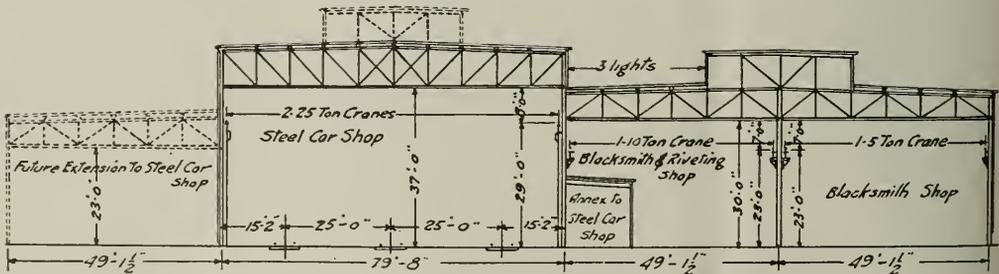

Committee: F. E. Morrow (C. & W. I.), chairman; A. T. Hawk (C. R. I. & P.), vice-chairman; C. N. Bainbridge (C. M. & St. P.), G. W. Burpee, Leland Clapper (D. & I. R.), C. G. Delo (C. G. W.), G. H. Gilbert (Sou.), Walter Goldstraw (G. T.), J. G. Gwyn (D. & R. G.), E. M. Haas (Austin Co.), R. J. Hammond (B. & M.), G. W. Harris (A. T. & S. F.), E. A. Harrison (A. T. & S. F.), J. L. Haugh (U. P.), L. P. Kimball (B. & O.), W. T. Krausch (C. B. & Q.), M. A. Long (B. & O.), J. B. Maddock, Adam Ritter (Sou.), L. K. Silcox (C. M. & St. P.), John Schofield (C. N. R.), E. M. Tucker, A. M. Turner (C. C. & St. L.).

### Appendix A—Design of Car Shops

Many railroad companies find it desirable to provide shops for handling repairs to freight cars either on account of climatic conditions, legal requirements, or the belief that the provision of such shops will result in a

degree of efficiency. Arguments advanced in favor of such shops are that their provision will insure a better grade of workmanship, a lower rate of labor turnover, and that cars repaired in a shop will give better service.

In order to facilitate the design of car shops where their construction may be necessary or desirable, the committee has collected a considerable amount of data to which it has devoted careful study, and as a result presented general drawings of several plants actually in service and several proposed for the future, as an outline of actual possibilities in construction as experienced at this time. It was noted that, in general, the layout of many plants had been governed by existing property and trackage limits, and this condition is one which will probably be encountered even more seriously in the future, except where very extensive plants in new localities are contemplated. In reviewing freight car repair layouts throughout the country, it was found that they divide themselves into two general classes: light repairs and heavy repairs. The first-named group consists of equipment receiving running repairs given in transportation yards with trains under blue flag protection, where the safety appliances, doors, brake equipment, lubrication, brasses and minor truck repairs receive attention. Further to this, light repairs are handled, but require switching of the cars out of trains. Under this heading, cars are spotted on improvised tracks, where wheels are changed, brake rigging repaired, draft rigging and couplers replaced, and cars ne-

Cross Section of a Steel Car Shop

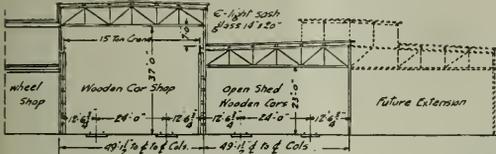

cessitating more extensive attention are temporarily strengthened and put in shape to meet safety appliance requirements, so as to be moved to heavy repair points having facilities and forces to do whatever is required.

Sheds or shops are not to be recommended as practicable at this time for the light repair work mentioned above, because of the frequent switching necessary and

Sheds or shops are not to be recommended as practicable at this time for the light repair work mentioned above, because of the frequent switching necessary and

the further fact that many hundreds of cars in this class are worked upon each day, depending upon the amount of business handled through any territory, and the number requiring repairs has little fixed relation to a road's ownership.

In the case of heavy repairs, however, shops may be desirable at certain points, especially when considered in conjunction with the power, tool and handling equipment necessary to intensive production. There are three subdivisions into which heavy repairs may be classed, namely: Medium repairs, consisting of moderate attention to trucks, underframes and superstructure with entire re-

Cross Section of a Wood Car Shop

painting; heavy repairs, occasioned by severe wreck damage or extreme deterioration; and rebuild, where cars are strengthened and made modern in construction through the application of steel underframes, ends, roof, etc. Where it is possible, most railroads prefer to do heavy repair work on their own cars, due to having suitable standard material, and the further fact that cars can be segregated by series and the work standardized. There are practical reasons requiring the rebuilding of foreign

named in section No. 1, it is desirable, considering present and future practice, to allow 60 ft. per car. Railroads using wider track centers, such as 30 ft. with material tracks, and 22 ft. without, usually only employ 50 ft. per car due to re-arrangement of work.

(3) **Supply Tracks:** Standard gage seems to be preferred throughout the country, due to the ease in handling wheels and the usual design of section push car upon which material can be carried. Further to this, erecting shops can be supplied with standard freight car loads of heavy material, such as underframes, sills, etc., which is not possible with narrow-gage tracks.

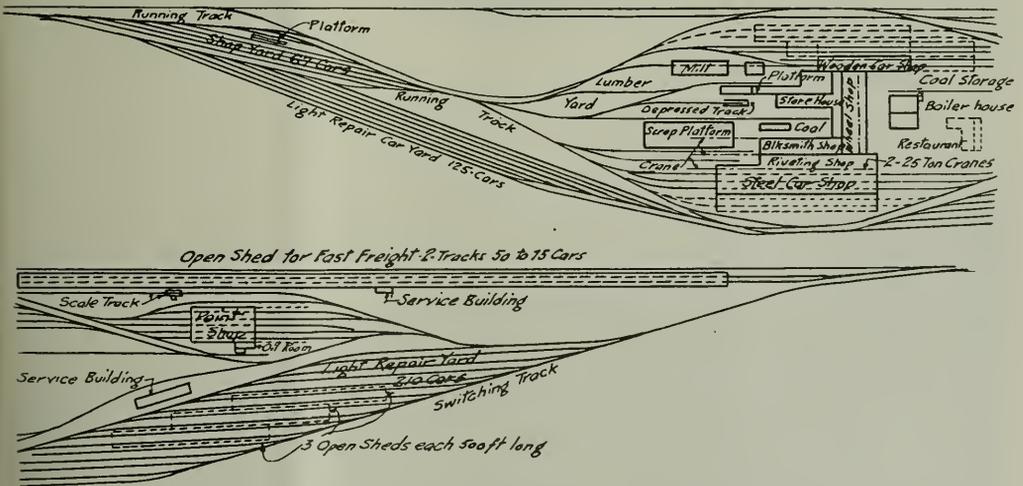

(4) **Clearances:** It is recommended that a minimum clearance of 10 ft. from center of track to face of pilasters and 12 ft. from center of track to face of wall.

(5) **Headroom:** Measuring from top of rail, overhead clearance in shops where cranes are not employed should be 20 ft. minimum, with 22 ft. desirable. Where cranes are used, clearance should be not less than 25 ft. unless careful study of local operating conditions should dictate a smaller dimension advisable. In mentioning clearance, it is the purpose to define it as the exact clearance possible either from the crane hook or crane cage or girder, whichever forms the limiting element and the farthest downward projection. Shops designed with cranes should be limited to include bays not to exceed four repair tracks.

(6) **Doors:** The minimum dimension for end doors in car shops should be 13 ft. wide and 17 ft. high, obtaining as large a door on supply tracks as clearance and general construction will permit.

(7) **Paint Shops:** Separate accommodation in line with the normal movement of cars through shops should be provided and installed in such a way so that equipment can be handled expeditiously and prevent blocking repair tracks.

(8) **Expected Increase:** Full consideration should be given to expected increases in demand and future extensions which can be foreseen. In cases where shops are constructed with traveling cranes, it was felt advisable to recommend that runways be advanced beyond the covered space which will provide for flexibility of operation and permit men to work either out-doors or in-doors as local conditions may govern;

Typical Layouts of Car Repair Facilities, Yards and Shop Buildings

cars occasioned by the handling lines' responsibility, but this only represents a small percentage of the total.

Where a railroad owns a sufficient number of steel cars to justify the expense, a special shop should be given consideration for this purpose. From what the committee could observe, based on experience throughout the country, it recommended the following:

(1) **Track Centers:** In cases where material tracks are employed, 24 ft. centers are recommended and in cases where material tracks are not used, 18 ft. centers as a minimum.

(2) **Space Allowance per Car:** With the track centers

also will assist in the handling of material and the adjustment of loads in cars.

(9) **Handling Material for Effective Service:** Every possible means should be provided for a prompt and economic handling of material through the application of necessary cranes, hoists, mono-rails, supply tracks, runways, and storage space, all located with the single purpose of concentrating work and materials into definite groups.

(10) **Lighting:** Ample lighting is essential. Construction of roof and walls should be such as to admit the maximum amount of natural light and ample artificial light should be provided, which, in a general way, should amount to just as much as is required in usual locomotive shop practice. In-

terior walls and ceilings should be painted and maintained as nearly white as possible.

(11) **Heating:** The question of proper heating should be carefully studied out so as to maintain a temperature of between 40 deg. and 50 deg. Fr. in the shop itself, whereas in adjacent machine sections and other points requiring operators remaining stationary at tools, etc., a temperature of 60 deg. to 70 deg. is preferable. The expense permissible in providing a heating plant will be governed largely by the form of construction to be employed. During cold weather it should be remembered that equipment has to be thawed out when brought into the shop in order to facilitate repairs, so that the heat should be delivered as near the floor line as practicable and well distributed so as to avoid drafts.

#### Discussion

Chairman Morrow: The committee has only had this year for the study of these subjects. It has been actively

engaged in collecting information as to prevailing practice on these subjects, but does not at this time present any definite conclusions as to recommended practice. This work is progressing, but has not yet reached the stage of compiling a report.

The Chairman: This is the first report of this newly-created committee, and I think they are to be congratulated for having brought together a great deal of good basic information which will be built on in coming months. It is a class of work on which I think we should place a great deal of importance, because it correlates the problem of the mechanical department with the engineering department.

(The committee was dismissed with the thanks of the Association.)

## Report of Special Committee on Standardization

*Standardization, considered solely in relation to railroad requirements, has been, because of its nature, scope and diversified application, the result of growth and will continue to be. Material benefits will accrue to the roads from standardizing such materials, tools, etc., as track spikes, track bolts, track jacks, switch lamps and track and ballast tools of all kinds. Work of standardization can be done by detailed handling of each article until a final design suitable to both producers and consumers is reached. A list of 43 different classes of articles is recommended for standardization by 10 different committees. Co-operation between committees is essential.*

E. A. Frink  
Chairman

*E. A. Frink is the chairman of this committee, which was organized two years ago and includes in its personnel the chairmen of all the regular committees. It is largely because of the interest which he took in this subject as a member of the Board of Direction that the committee was formed. It goes without saying that Mr. Frink is an enthusiast on the opportunities for good work by this committee, but in the absence of well defined policies on the part of the various interests involved it is to be expected that progress will be slow. Mr. Frink is one of the closest students of the committee reports, especially matter proposed for inclusion in the Manual.*

**S**TANDARDIZATION—CONSIDERED SOLELY in relation to railroad requirements—from its very nature, as well as its wide scope and diversified application, has been in the past and must continue to be the result of growth, but its natural growth can and should be advantageously accelerated by judicious assistance. Material benefits will accrue to the railroads from standardizing track spikes, track bolts, track jacks, track and ballast tools of all kinds, rail drilling, switch lamps, etc., and this Association should lead in the work. This can be done by detailed handling of each article until the final design, acceptable to both producers and consumers, is reported to this Association. Our experience would lead us to believe that a purchasers' market would expedite results.

The committee recommended that all standards adopted by the A. R. E. A. be known and designated as R. E. standards. In case of the adoption of standards originated by other bodies, due credit should be given to the originators. In accordance with instructions a list of recommendations was prepared for the Committee on Outline of Work and attached as Appendix A.

Committee: E. A. Frink (S. A. L.), chairman; J. R. W. Ambrose (Tol. Term.), vice-chairman; F. L. C. Bond (G. T.), A. Crumpton (G. T.), A. F. Dorley (M. P.), W. T. Dorrance (N. Y. N. H. & H.), W. J. Eck (Southern), J. M. R. Fairbairn (C. P. R.), W. H. Hoyt (D. M. & N.), Edwin B. Katte (N. Y. C.), F. R. Layng (B. & L. E.), B. H. Mann (M. P.), G. E. Ray (D. L. & W.), H. L. Ripley (N. Y. N. H. & H.), O. E. Selby (C. C. C. & St. L.), H. M. Stout (N. P.), C. M. Taylor (P. & R.), W. P. Wiltsee (N. & W.), J. J. Yates (C. R. R. of N. J.).

#### RECOMMENDED STUDIES ON STANDARDIZATION

The following list of articles was selected for studies on standardization and where other committees are to be consulted the name of the committee is shown in parentheses:

- Committee: **II—Ballast;** ballast tools (Track).
- IV—Rail;** rail sections, rail drilling, bolts (Track).
- V—Track;** track tools, except ballast, tie plates (Ties, Ballast, Rail), frogs, switches (Signals), switch stands, spikes, screw spikes, guard rails, rail braces (Signals), details (Signals).
- VI—Buildings;** glass sizes, hydrants, fire (Water Service), hose, nozzles, etc., baggage trucks, hand, scales, freight house and baggage, fire extinguishers.
- VIII—Masonry;** Portland cement, cement testing, metal reinforcement.
- IX—Signs, Fences and Crossings;** highway crossing signs.
- X—Signals;** R. S. A. standards, switch lamps (Track), bridge lamps (Iron and Steel), highway crossing signs (Signals).
- XIII—Water Service;** wood tank details, tank fittings, water columns, tank gages, float valves.
- XVII—Wood Preservation;** No. 1 Creosote, No. 2 Creosote No. 3 Creosote, coal tar—creosote solution.
- XVIII—Electricity;** incandescent lamps (Signals), insulators, insulated wires and cables (Signals), tile and other conduits, friction, rubber and other tapes (Signals), knife and snap switches.

#### Discussion

Chairman Frink: Your committee has no conclusions to report this year, and the report is presented simply as information, but your attention is called to Appendix A, which presents a list of various items which the committee has suggested to the Committee on Outline of Work as fit subjects for standardization by the appropriate committee.

The Chairman: The report is before you for discussion.

J. L. Campbell (E. P. & S. W.): I think it would be a good deal of assistance to the Committee on Outline of Work, and possibly also to the Board of Direction, if we heard some discussion from the committee itself as to what the work of the committee on standardization should be, and how it should be done.

J. J. Yates (C. R. R. of N. J.): I have in mind the necessity of standardizing some articles. I have principally in mind one subject that is coming up, that has been up before our Association, that is, membership in the American Engineering Standards Committee. It is very important for this society to be represented in it. There are innumerable questions coming up that will interest the railroads, and at the present time we have some voice in that committee, but we have not as an association, and our Standardization committee suggested that this association become a member so as to have a voice in the standardization of articles that would be of interest to the railroads.

J. M. R. Fairbairn (C. P. R.): I think one of the most important things before the Association today is the question as to whether we are to continue as we have in the past to recommend practice, or whether we are to establish standards. Unless we do establish standards, I doubt if we will ever get the railroads of America to adopt our recommended practice to the same extent that they would if we establish standards. Further than that, I believe that we should keep ahead of the railroads. If we do not keep ahead then we will have to follow some one railroad and adopt what it has adopted or what manufacturers have made for them.

E. B. Katte (N. Y. C.): I, too, would speak in behalf of this Association taking membership in the American Engineers Standards Committee. That committee is now formed of only four or five of the national societies, and it is very desirable that the railroad interests and the railroad engineers should be represented.

The matter was first brought to our board of direction a year ago, and met with some favor at that time, but we have not yet taken out a membership. A committee of three, I understand, will be appointed of the board to

look further into the matter, and I am quite sure that after they have familiarized themselves with the objects and aims of this National Standards Committee, that our Association will also be represented.

J. R. W. Ambrose (Tor. Term.): I am afraid I am that one. I do not agree with Mr. Katte at all. I think our Association is strong enough and able enough to stand upon its own feet. Surely at least we know as much or should know as much about railroad work as a standardization committee made up of various members from all branches of the technical world, and I think this Association should handle its own standards and look after its own standards. I now feel that the time has arrived when we should have standards, but it seems to me the fact that this Association prepares a standard does not mean it is to be used universally by the various roads, but if the Association could work in conjunction with the A. R. A., having the stamp of their approval on any standard we pass, it would seem then that it would be imperative that the standard be used, and we all know that the standardization of any article in railroad service spells economy and we also know that economy is the object we all want to attain.

Mr. Katte: Mr. Ambrose has done me the compliment to disagree with me, and perhaps I may be permitted to speak a little further. I think that the Committee on Standards, that is the American Committee on Standards, wants this Association to be with them, because this is the recognized authority on all railroad standards. I do not think that there would be any criticism of specifications of this Association for rails or track spikes, but there are other articles which we employ largely, yet which are employed to a greater extent by the members of other associations. I have, for instance, in mind the specification which we adopted yesterday on insulated wires and cables. The railroads of the country use a great many million dollars' worth of insulated wires and cables in a year, but that is only a very small part of the wires and cables used throughout the country. Now, if we can standardize on a number of cables the cost to the railroads and the other users will be materially reduced.

(The committee was excused with the thanks of the Association.)

A Bit of Picturesque Country Along the Boston & Albany

*At the American Railway Engineering Association Dinner Last Evening*

## The Dinner of the Engineering Association

Abstracts of the Addresses Presented at the Twenty-second Annual Banquet Held Last Evening

THE TWENTY-SECOND ANNUAL dinner of the American Railway Engineering Association was held in the Gold room of the Congress hotel last evening, President H. R. Safford presiding. After invocation by Dr. George L. Sherger, professor at Armour Institute of Technology, addresses were presented by Dr. David Kinley, president University of Illinois; the Honorable William Renwick Riddell, Justice of the Supreme Court of Ontario, and John Findley Wallace, chairman Chicago Railway Terminal Commission.

### The Association and the University

BY DR. DAVID KINLEY

President University of Illinois, Urbana, Ill.

I have been asked to say a few words about the common aims of the American Railway Engineering Association and the University, and possible points of contact and possible methods of co-operation between them. I gladly comply with such a request for several reasons. In the first place, even if I felt that the two organizations had nothing in common, I should still be appreciative of the request and thank you for the honor, sir, as did the old dinky who was unable to change the ten dollar bill. Moreover, the very presentation of such a request indicates a thought in the minds of those who make it of possible lines of usefulness on the part of academic men which a few years ago would have been scouted at. Still further, this request marks this Association as an unusual organization. Few even of the so-called learned societies have been able thus far to look out from their own confines and realize the possibility of co-operative work to the common advantage.

It is clear that the Railway Engineering Association and the University of Illinois have common interests in several respects. They are both interested in the education of the employees and officers of the railways from whose

organization your membership is drawn, and they are both interested in the two fields of research which you, the established officers of these railways, find it necessary or desirable to pursue—the economic and the technical.

Turning first to the field of education common to both organizations, it is evident that the University and the Association are both deeply interested in the curriculum of the College of Engineering, in which we are trying to train the future employees and officers of railways. The friendly advice which such an association as this could give the University through the faculty of the College of Engineering in the organization of such a curriculum and in the maintenance of proper educational standards would be of great value to us. I know that we are all human and that advisory committees which begin by being advisory not infrequently end by becoming dominating. It is easy to pass from advising what to do to telling what to do. That is a difficulty which the University has experienced occasionally in the past. Nevertheless, in spite of that danger and possible friction that comes from it, we would welcome a closer advisory relationship between organizations like this and the University for the purpose of helping us to solve our educational problems. This point of contact relates to the education and training of future employees and officers.

There is another field of educational contact. Occasionally members of the University staff have been asked by the officers of railways to give series of lectures at different points on the roads to their employees. In short, we have been asked to establish an extension service to present employees, giving lectures and conducting classes not only on technical aspects of the work they do, but on general educational subjects for the development of their morale and their general betterment. This particular field of inquiry, the best method of conducting such work, its organization, the subjects to be presented,

and the educational institutions that might be used in doing it, are all proper subjects of inquiry for your Association in co-operation with the University of Illinois or any similar institution. I have sometimes thought that the efforts of great corporations to maintain educational work of this kind might be more successful if, under a committee of some such association as yours, certain universities or colleges were enlisted in co-operation and the work left to them under your general direction. A University-Railway Association Education Committee might accomplish a good deal both for the railways and for the University.

You may think that such work is not within the scope of your Association, but it certainly is as much so as any other means for improving the morale of your employees or supply of labor or labor turnover, subjects on which one of your committees has already made a report.

But the main field in which co-operation between your Association and the University of Illinois is most promising is the field of research. Your committees are constantly making investigations into technical subjects which are also under constant study by the University Engineering Experiment Station and members of the staff. Co-operation with the Engineering Experiment Station in technical and scientific research is, therefore, the matter that deserves our largest consideration. A mere reading of the list of technical topics on which your committees report, side by side with those that form the subjects of report from our Engineering Experiment

vantage of the general public. The University cannot, therefore, enter into any arrangement whereby any discovery made in its laboratories which is evidently a matter of great public advantage and whose exploitation by the general public is economically feasible can be put at the service of any particular individual or particular organization. On the other hand, occasionally the University is in a position to conduct an experiment exclusively for the benefit of an organization when it is clear that the results are not a matter of public concern, but rather a matter pertaining to the welfare of the particular organization.

One great difficulty with all university research departments is the lack of sufficient funds to conduct their experiments, especially on a scale large enough to justify conclusions on an industrial or commercial basis. Co-operative investigations, therefore, must be financed by the interests especially related to them and most likely to benefit from them. But within this general limitation I can see a very large, indeed, a practically unlimited field of co-operation between your Association and the University of Illinois.

From remarks that I have already made it is evident also that many things of an economic or business character could be studied in common between the University and your Association. For many years it has been my ambition to see at the University of Illinois a Bureau of Economic Research corresponding in a way to the Engineering and Agricultural Experiment Stations. My suc-

David Kinley

Hon. William Renwick Riddell

John F. Wallace

Station, is enough to show that we are both at work along the same general lines. Electrolysis and its effect on reinforced concrete, electrical interference, maintenance of track, fatigue of metals, causes of rail failure, effect of speeding on track maintenance, elements influencing the strength of concrete, are subjects that might as well describe investigations in the laboratories of the engineering experiment station as in the libraries and laboratories of your committees. Undoubtedly some topics could be more advantageously investigated by us than you, and the opposite is also undoubtedly true. This fact suggests the possibility of a common committee for conference and advice as to the better agency to which to allocate a proposed investigation and a consideration of the ways and means of carrying it out.

I may say that the University of Illinois has on several occasions undertaken co-operative investigations with industrial and other organizations. The University work in research is designed, of course, to discover any scientific and technical truths, methods, processes for the ad-

cessor at the head of the Department of Economics and also my successor as the director in the courses of Business Administration have the same ambition, and I trust that it will soon be realized. If it is, I see no reason why co-operative investigation in the methods of doing business, business organization, cost analyses, labor matters which are scientific and not partisan, and many other matters may not be studied co-operatively.

Still a third possible mode of co-operation is in my mind. Some years ago I urged on the then state government the passage of a law establishing at the Engineering Experiment Station a State Bureau of Standards similar, in a general way, to the Bureau of Standards at Washington. That would be an organization at which tests of all kinds for commercial purposes could be conducted on payment of proper fees, and might well be a place where some of the problems of your Association could be sent. It may be that the University is not the best place for such a bureau, but there should be such a bureau somewhere in the State administration.

Aside from all these things, there is, of course, the large field of general educational improvement in which your Association and the University are alike interested. While this might not give a basis for continuous co-operation, yet it seems to me that there are large questions of educational public policy which an association like this might well study and on which they might well express themselves. For example, the question whether or not electric tramways, railways, and mines shall be publicly owned or privately owned is not a question for engineers or miners or electricians or economists or any other class of society as such. It is primarily a great question of public policy on which any fair-minded citizen is entitled to express an opinion, whose value will depend upon his knowledge of the subject and our estimate of his judgment. However, when it has been decided which policy is to be adopted by a given community or country, all questions relating to securing efficiency of operation and service to the public under the policy decided on are questions for experts.

### Canada

By HON. WILLIAM RENWICK RIDDELL  
Justice of the Supreme Court of Ontario

When we come to the United States we come not as strangers or as aliens, we come as one comes home. In all but the accident of political allegiance we are the same people. Aliens as we are by the strict and formal rules of international law, and standing apart by the evanescent and external form, by the great statutes of Heaven, in the essential and external, in all that is really worth while, Americans and Canadians are one.

What is it that so binds us in an indissoluble union? Race? Language? Religion? Oh, no. Race, language, religion, all are significant—immensely significant—but they are not everything—they are not even crucial.

The most potent and all-powerful force which binds us and unifies us is our common conception of human rights—individual rights—and the relative rights and the relative rights and duties of the State and the individual. We believe in democracy, real democracy, the rule of the people in whatever form.

In times of war we recognize the practical necessity for an autocracy more or less veiled—*inter arma silent leges*—but where such necessity does not exist we carry our love of liberty to great lengths. We follow Walt Whitman's advice, "Resist much, obey little." It is enough for us that a thing is "*verboten*" to make us wish to do it. The sign "keep off the grass" is taken as an implied invitation to trespass and the grass is promptly trodden down. Too often "we are content to believe that we cannot have both good government and liberty, and liberty we think the better of the two." This liberty necessarily means the right to govern ourselves, and that it is tyrannous for another to govern us—a concept unknown to the undeveloped or ill-developed races in some parts of the earth who claim the right to be governed, so that it is almost tyrannous to compel them to govern themselves. Such are they who could hear the head of their state boast, "There is but one will in this land and that is mine—him who opposes me I will crush," without rebelling or a universal outburst of derisive and inextinguishable laughter.

Self-government is democracy, whether the form be monarchical, republican or what you will. The vesture is naught, the soul is what counts, and here are seldom "the letter killeth but the spirit giveth life." What is called a republic may be a mere oligarchical tyranny. What are some of the so-called republics, even in modern times, of South and Central America?

Democracy is not a form, it is a vital principle man-

ifesting itself in many ways, under as divers shapes as life itself.

I am not one of those who believe, or pretend to believe, that democracy was born on the Fourth of July, 1776, and that her birthplace was upon this continent. I do not believe, nor do you believe, that liberty was unknown and non-existent before the Declaration of Independence.

The ultimate source lies far removed from the trodden path of civilization, not in Rome, not in Greece, still less in Babylon or Persia, but in the bleak, cold fens and the dense forests of northwestern Europe, where Angle and Saxon and Jute maintained their proud independence, and alone of all the nations refused to bend the knee to the Imperial Mistress of the world.

The English Bill of Rights in 1689 laid down principles of democracy in systematic form, and democracy was well advanced before George Washington was born.

The Revolution which sundered the British Empire was no cataclysm—it was not like the atheist and terrorist revolution in France which Goldwin Smith did not hesitate to call the "greatest of all calamities in history"—a complete breaking up of the foundations of society, of law, of government. There was nothing in the Revolution or in the conduct of it—though revolutions are neither made nor quelled with rose-water—which necessitated ill-feeling, once the new State had been established. Nor until driven by bitter necessity did the Fathers of the Revolution determine that America should sever her connection with the Empire.

It is a wicked libel to say that even before or during the Revolutionary war, England or the English were opposed to the aspirations of the American people. The best part of the public men of England or the English people were in favor, but their voice was overruled by the gross ignorance and foolish arrogance of the king and his chosen advisers.

The mass of the English people were always and are now not only friendly to the United States—they are proud of the United States. You may find here and there a relic of the dislike which the patrician class felt for republicanism. Prejudice dies hard, and the fool ye have always with you. I have seen as great, as unreasoning detestation of England and of modern Englishmen in Maine as I ever saw or heard of in England against Americans.

That Canada and the rest of the British Empire today are free is due largely to the example of American democracy in 1776. The embattled farmers who stood and fired the shot heard round the world, fought not only for themselves and the rest of those of the thirteen colonies and the great states that were to proceed from the thirteen colonies, not only for their descendants for generation after generation in these United States, but for Canada, too, for Australia and New Zealand, and South Africa, aye, for England herself, and all that makes the British Empire worth while.

With all these ties I do not fear that you need to im-bibe a more favorable knowledge of the Canadians and their character.

But I am not so sure that the nature and character of our government do not need to be more fully appreciated.

Not many weeks ago in this city, a man of eminence from New York was eloquently demanding that England should set Canada free—throwing in Australia for good measure. Not three weeks ago in this city, a person calling himself a Canadian was declaiming against the king and his pretensions over Canada. A well-known American author in a recently published book asks if England will, in the future, continue to rule Canada. Thousands of Americans insist that Canada must vote in the League

of Nations as Britain may wish, or British interests may indicate. I have myself been asked why does Canada not shake off the English yoke and elect a President for herself. These and a hundred other like facts indicate that there is a widespread misunderstanding of Canada's true position.

The "back number" who lives in the past has some ground for his ideas of Canada if he reads and thinks of the past only, for England did once rule Canada—as she once ruled America.

Let us speak of the present—for the Great War has forced a growth in the Constitution of Canada—greater than decades did previously. Before the awful Cataclysm, Canada had achieved with England's glad and proud consent, full control over her own territory, her own tariff, her own trade, her own people. Nay, she took part in Imperial Conferences in advising the general course of the Empire, and even succeeded in causing the denunciation of Imperial Treaties which stood in her way. She had negotiated treaties and formed an International Commission with the United States. She had repudiated the title "Colony."

Then came the War, *the War*, before which all other wars from the beginning of time pale their ineffectual fires.

When Germany made the assault on innocent Belgium, so long preparing, and at last thought certain of success, Canada did not delay a moment. The Atlantic cable carried the message: "The last man and the last dollar."

From the earliest days of Canada there has never been a stricken field where British troops fought but a Canadian was present—Waterloo, the charge of the Light Brigade at Balaklava, Kars, where the Canadian Williams held the foe at bay for months; these and many other fields of battle saw the Canadian fighting for his flag. But all these were volunteers, and while they were Canadians they were equipped and paid by Britain.

Now there was a change, Canada raised her own forces, equipped them, paid them, cared for them, and pays the pensions of the survivors, and widow and child of the honored dead. Sixty thousand Canadian dead and three times as many wounded prove how Canada acquitted herself. England could not call upon us for a soldier, a ship, an ounce of supplies, a cent of money; nor did we fight for England. We poured out our money like water, our men died in tens of thousands for a struggle which we call our own because we believed and believe it to be for humanity at large, and our chosen form of civilization.

May I venture the assertion that Canadians generally recognized that the war was the great Armageddon, the final and most terrible struggle for freedom the world has ever seen; and that the war was the crucial test of Democracy, sooner and more clearly than any other people, and Canada fought for herself, her own fight and not another's.

Her boys were dying in thousands, her mothers weeping the dead, her homes were desolate, and she thought that she should have some say in how the War should be carried on. Britain recognized that old things had passed away, and that the time had come frankly to acknowledge that Canada and the other Dominions had ceased to be in any sense dependent, but had become sister nations standing on an equality with her. The common effort and sacrifice in the war inevitably led to a recognition of an equality of status between the responsible governments of the Empire.

Accordingly in 1917, the prime minister of Great Britain called together the prime ministers of the self-governing Dominions for consultation on vital matters of policy relating to the prosecution of the war. They met as equals, as prime ministers of the nations of the Empire.

to discuss matters of common concern to the whole Empire.

The old forms remain like the old titles of the king—the spirit is new, the reality is transcendent.

In our British system, we build more stately mansions on the old foundations, we graft new and living buds on the old stock, without an outward change we renew, we quicken, we transform the spirit.

Some day, perhaps in a few months, there will be a conference of the statesmen of the Empire to frame a written constitution in some degree tying the theory to the reality, the letter to the spirit. Whatever be the result, we Canadians will remain steadfast; we cannot and will not give up our share of the old flag, or sever ourselves from the rest of the British world, but we will not revert to the status of a colony.

We are a free and self-governed people, an adjunct of no nation on earth, either on this side of the Atlantic or the other.

It is on these terms, and on no other or different, that we offer our friendship. We value beyond rubies the friendship of the United States, we offer our own, we yearn for yours. We will not beg for it—Canada can stand four square to the winds of Heaven, rely upon herself, her own industrial ability and resources, if she must, but she hungers for real brotherhood with the people of the United States.

Are we—have we shown ourselves to be—such as you desire for friends? Have our efforts and our sacrifices during the war shown us to be such as you would take up with? That is for the United States to answer.

A little broader is the real question upon which the future of the world depends. Are the English speaking peoples to stand together? If the answer be "Yes" civilization is safe, if "No," woe unutterable—one League of Nations must exist or all is lost. Let but the English speaking peoples be one in purpose and in determination and the future is secure.

When last I spoke to an American audience I ventured to say, and I repeat it here, "The world is to be made better, brighter, happier. It must be the task of the English speaking race to bring that about."

France, gallant, heroic France, must for generations watch the Rhine; two assaults she has experienced, a third might be fatal. Italy, worthy child of old Rome, relieved, indeed, of the spectre of evil omen scowling over the Alps, is cribbed, cabined, and confined by the necessity to overcome at home the effect of impoverishment of ages past. Germany, if she would, could not for generations do more than repair her shattered industrial and commercial life—and who would trust her in any case?

May the United States increase in wealth and prosper in every way—the more she does the more will the rest of the English speaking world rejoice.

### Reminiscences of John F. Wallace

It is very gratifying to me to appear before you tonight and particularly so at a time when the outgoing president and the incoming president are Bob Safford and Larry Downs, two of your presidents who commenced their career under my administration as chief engineer of the Illinois Central.

It was suggested by President Safford and some of the other members of the Association that the younger members, particularly, would like to hear something of the causes which led to the organization of the Association and the forming of its constitution, with its peculiar organization and peculiar outline of work and how this association came into existence.

In about 1898 there was a maintenance of way association in this country which was called the Roadmasters' Association. In that day the roadmaster had charge of about 100 or 120 miles of track, and held a position that on the larger systems today is called a supervisor. These men were practical men, mainly.

At the Denver convention of the Roadmasters' Association in 1898 there was a small group of men known as engineers of maintenance of way who desired to associate themselves with the Roadmasters' Association and learn what they could from these practical railroad roadmasters. They were treated with more or less of a cold shoulder and this small group of the technical engineers and engineers of maintenance of way came back from that meeting and felt that the time had come when, if that association could not be broadened and controlled and developed by the technical men who were gradually working into positions in charge of maintenance of structures, that it was time to form an association on a higher, larger, broader plane.

They took the matter up with some of their superiors, and later on, I think it was the latter part of 1898, a small group of men met in Chicago among whom was Mr. Torrey, the chief engineer of the Michigan Central, Mr. L. C. Fritch, who sits on my left, Mr. Curtis Dougherty, then engineer of maintenance of way of the Illinois Central, and a few other engineers. They formed a temporary organization of which Mr. Torrey was chairman and Mr. Fritch secretary. At that time they wanted to get the sanction of some of the larger roads which were building at that time or had built up scientific maintenance of way organizations under engineering supervision.

They appointed a committee consisting of myself as chairman, Thomas Rodd of the Pennsylvania, Walter Katte, chief engineer of the New York Central, Mr. Curtis of the Southern Pacific and Mr. Peterson, chief engineer of the Canadian Pacific. When that committee was appointed I was unaware of it, but a few days afterward, Mr. Torrey, whom I presume a few of the old members of this association knew, came into my office and told me about this organization work, and asked me to accept the chairmanship on permanent organization.

One of the members of the committee was in San Francisco, another in New York, another in Montreal and another in Pittsburgh, and all of us were busy men. We corresponded, and then we sent out a circular letter and got all sorts of replies. One man wanted to confine the association to chief engineers; another wanted to confine it to engineers of maintenance of way, etc. Finally it occurred to two of us—I will not mention any names on account of the memories of some of you gentlemen here—that we had to have something different from any other organization that was formed if we expected to do successful work. We felt that the ordinary scientific papers which were prepared without any direction or without any correlation of the different members was a waste of effort. We finally made up our minds that we must block out a line of investigation of work that would mean something.

Out of that idea grew this plan of forming constant standing committees that would cover every branch of railway engineering work, even to administration. I think we even included accounts at that time.

Then our next idea was to get the members to work. Then we made up our minds that we would have a series of standing committees, and we assigned every member of the organization to a place on a committee; that we would have these committees make annual reports; that we would have each member, on account of the wide membership of the railroads, have credentials that would enable the chairman to get information along the line of

the work of that committee from every railroad in the land.

The main object and purpose of this committee work was to eliminate peculiarities. One of the first things that occurred to us was our rails. Every railroad in this country had its own peculiar standard and section of rail. We thought if we could get a standard rail we might induce the rolling mills to keep rails in stock so that we could get them as we wanted them. We have not accomplished that yet.

Then we found a great many different ideas among the railway engineers all over the country, and in every case we hardly approached a fixed standard; for as you gentlemen know who were in the Association 22 years ago there was hardly a committee that did not find that every chief engineer had his own ideas, his own standard frogs, his own standard switch stands and all that sort of thing.

After we drew up the constitution as it originally was outlined, the original skeleton, we sent it around to the other members of the committee and told them that this was what seemed to be in the minds of the majority of the committee, and asked them to sign it, which they all did.

A meeting to form the permanent organization was arranged at Buffalo and I got a telegram from Mr. Torrey, who said: "The report of your committee has created a great deal of criticism among a great many members. You had better come on to Buffalo and present it in person to the permanent organization meeting." We had a meeting at a hotel there and after I read the constitution and commented on it Mr. Torrey put it to a vote and it was adopted unanimously, to my great surprise. Later on I was notified that they had elected me president.

### Roadway Committee Meeting

There will be a meeting of the Roadway Committee in Room 1102 of the Congress Hotel at 9 o'clock this morning.

### Invitation to Visit Underwriters' Laboratories

G. B. Muldaur, general agent of the Underwriters' Laboratories, 207 E. Ohio street, Chicago, extends an invitation to the members and other railway men attending the convention to visit the laboratories and observe the work under way in that institution. These laboratories are a non-commercial institution organized to test construction materials to promote safety from fire and accident. Tests are continually in progress on various building materials to determine their relative resistances to hazards of this character.

### Western Society of Engineers

The Western Society of Engineers, Railroad Section, will hold a meeting in the offices of the society on the 17th floor of the Monadnock block, at 7 o'clock, Thursday, March 17, at which C. F. Loweth, chief engineer of the Chicago, Milwaukee & St. Paul will present a paper on "The Classification and Maintenance of Old Railroad Bridges." A moving picture film showing the laying of rail on the Lehigh Valley by the use of locomotive cranes and the application of other labor saving equipment to auxiliary operations will also be shown. All members of the American Railway Engineering Association and other railway officers are cordially invited to attend this meeting and to participate in the discussion.

# The A. R. E. A. Elects New Officers

Results of Annual Election Announced Yesterday; Sketch  
of President-Elect L. A. Downs

**S**HORTLY BEFORE THE CLOSE of the afternoon session yesterday, Secretary Fritch announced the results of the balloting for officers for the ensuing year. The election resulted as follows:

President, L. A. Downs, vice-president and general manager, Central of Georgia, Savannah, Ga.

Vice-President, E. H. Lee, vice-president and general manager, Chicago & Western Indiana, Chicago.

Treasurer, G. H. Bremner, district engineer, Bureau of Valuation, Interstate Commerce Commission, Chicago. Secretary, E. H. Fritch, Chicago.

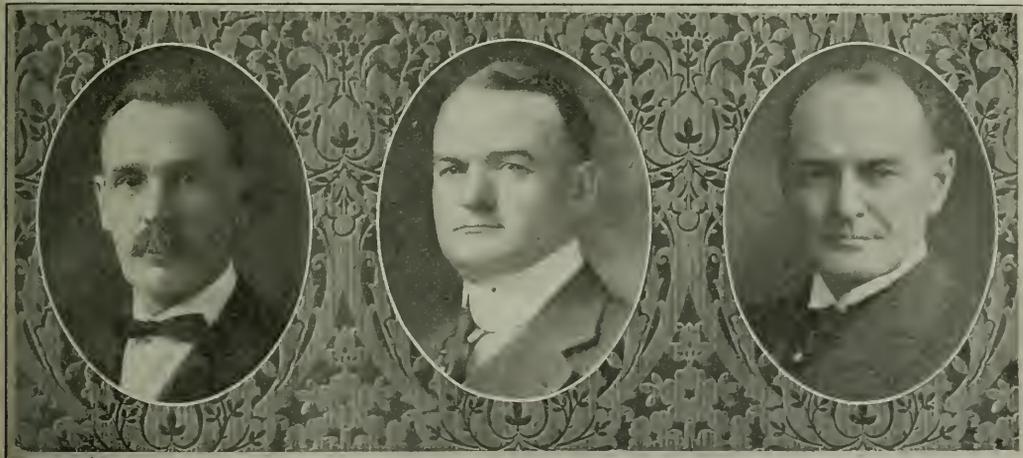

Directors: C. F. W. Felt, chief engineer, Atchison, Topeka & Santa Fe, Chicago; G. J. Ray, chief engineer, Delaware, Lackawanna & Western, Hoboken, N. J., and Colonel G. H. Webb, chief engineer, Michigan Central, Detroit, Mich.

Nominating Committee: J. R. W. Ambrose, chief engineer, Toronto Terminals, Toronto, Ont.; R. H. Ford, assistant chief engineer, Chicago, Rock Island & Pacific,

road which employs him. The case of Lawrence A. Downs is no exception to this rule. For many years he has had an active part in the affairs of the Association and as vice-president and general manager of the Central of Georgia, he occupies a position which permits of no question as to his ability as a railway officer.

In the affairs of the Association Mr. Downs has been identified primarily with the Committee on Ties because of his personal interest in this subject. He was an active member of this committee for many years and served for five years as its chairman. As a member of the Board of Direction he was the prime mover in the campaign for increased membership carried on during the last year, as a result of which 500 new members were added to the Association. Owing to the fact that it was deemed inadvisable to enlist the entire membership of the Association in this campaign, the results secured are largely the consequence of the personal work done by Mr. Downs.

In two respects the career of the new president and

J. L. Campbell  
First Vice-President

L. A. Downs  
President

E. H. Lee  
Second Vice-President

Chicago; E. A. Hadley, chief engineer, Missouri Pacific, St. Louis; J. V. Neubert, engineer of track, New York Central, New York City, and A. F. Robinson, bridge engineer, Atchison, Topeka & Santa Fe, Chicago.

**Lawrence A. Downs, President of the American Railway Engineering Association**

The presidents of the American Railway Engineering Association are selected through the agency of a nominating committee subject to the popular approval of the Association. Whatever the opinion of this indirect method of selection, it must be conceded that the results secured under this system have been excellent. A study of the nominations from year to year will indicate that the committee has been governed by two prime considerations: the value of the man to the Association as demonstrated by a whole-hearted interest and service in its behalf and evidence of intrinsic worth as shown by the confidence bestowed upon the candidate by the rail-

road that his predecessor bear a marked resemblance. Both are graduates of Purdue—Downs in the class of 1894 and Safford in the class of 1895. Both gained a large part of their railway experience on the Illinois Central. For a time they were roadmasters together. Whether this comparison may be carried any further without encountering sharp contrast in personal makeup, the friends of both decline to be placed on record. It suffices to say that the outgoing president has established a mark which bids fair to be continued throughout the term of his successor.

The new president is a strong man, yet one who is particularly endowed with truly human characteristics which have served to endear him in the hearts of his associates and those who have been so fortunate as to have been employed under his direction. The magnetism of his personality is by no means restricted to the close contact that comes with friendship or professional relations, but has manifested itself in his appearance before the Association convention. With a certain straightforwardness, frank-

ness and air of confidence in his bearing, he is quick to win the confidence and sympathy of his auditors. He has also had the happy faculty of being able to punctuate his remarks with a humor that has served to drive home his arguments. Those who attended the convention in 1916 will recall his well chosen comments on the futility of forestry as a railway undertaking.

As a man who has graduated from an engineering or maintenance of way position to that of an executive officer, his career is of particular interest to those whose ambition leads them in the same direction. He is a product of the maintenance of way department of the Illinois Central which has produced more than its share of leading railway officers and not a few presidents and directors of the A. R. E. A. Following his graduation from Purdue University, he entered the employ of the Vandalia, but joined the Illinois Central organization in 1896 and continued constantly in the employ of that property until March 1, 1920, when he was elected vice-president of the Central of Georgia, a subsidiary. His experience with the Illinois Central included service in engineering parties, nine years as a roadmaster and a period as assistant chief engineer of maintenance, until December, 1910, when he entered the operating department as a division superintendent. Subsequently, he was advanced to general superintendent and in January, 1919, to assistant general manager. Mr. Downs' election as president of the American Railway Engineering Association will accrue to the advantage of that society and be a source of inspiration to its members.

## A. R. E. A. Registration

THE REGISTRATION OF MEMBERS and guests of the American Railway Engineering Association yesterday aggregated 172, making a total registration for the two days of 765, as compared with 718 at the same period last year. Of the total registration this year 619 were members.

Abbott, W. P., Asst. Engr., B. & O., Cincinnati, Ohio.  
 Adams, L. L., Roadmaster, L. & N., Etowah, Tenn.  
 Anderson, Anton, Engr. M. W. C. I. & L., Lafayette, Ind.  
 Andrews, J. T., Asst. Engr., B. & O., Baltimore, Md.  
 Baird, R. C., Asst. Engr., C. R. I. & P., Chicago.  
 Baldwin, Springfield, Ch. Engr., G. & F., Augusta, Ga.  
 Barnhart, E. H., Asst. Engr., B. & O., Baltimore, Md.  
 Baxter, J. J., Div. Engr., Wabash, Peru, Ind.  
 Beckett, F. T., Engr. M. of W., C. R. I. & P., El Reno, Okla.  
 Belcher, R. S., Mgr. Treating Plants, A. T. & S. F., Topeka, Kan.  
 Bloecher, Theodore, Jr., Div. Engr., B. & O., Baltimore, Md.  
 Bradley, A. C., Div. Engr., C. R. I. & P., Colorado Springs, Colo.  
 Bratager, S. J., Prin. Asst. Engr., N. P., St. Paul, Minn.  
 Briggs, Z. M., Asst. Engr., Pennsylvania, Pittsburgh, Pa.  
 Brooke, G. D., Supt. Trans., B. & O. Western Lines, Cincinnati, Ohio.  
 Brooke, Richard, Div. Engr., B. & O., Weston, W. Va.  
 Brown, H. W., Div. Engr., Pennsylvania, Zanesville, Ohio.  
 Browne, H. L., Asst. Engr., C. B. & Q., St. Louis, Mo.  
 Burke, M. J., Asst. Engr., C. M. & St. P., Seattle, Wash.  
 Burrage, W. H., Pilot, Val. Dept., N. Y. C. & St. L., East Cleveland, Ohio.  
 Butterworth, A. S., Ch. Engr., G. F. & A., Pensacola, Fla.  
 Campbell, H. A., Chicago.  
 Cleveland, G. C., Ch. Engr., N. Y. C., West of Buffalo, Cleveland, Ohio.  
 Correll, E. J., Div. Engr., B. & O., New Castle, Pa.  
 Crable, Arthur, Engr. M. W., Hocking Valley, Columbus, Ohio.  
 Crites, G. S., Div. Engr., M. W. B. & O., Baltimore, Md.  
 Crowell, F. N., Div. Engr., Pennsylvania, Cincinnati, Ohio.  
 Crumpton, Arthur, Val. Engr., Grand Trunk, Montreal Canada.  
 Dansey, J. W., Asst. Engr., A. T. & S. F., Chicago.  
 Delo, C. G., Chief Engr., C. G. W., Chicago.  
 Dewees, A. R., Div. Engr., P. M., Saginaw, Mich.  
 Doyle, T. L., Div. Engr., Penna. Lines, Grand Rapids, Mich.  
 Edwards, W. R., Sen. St. Engr., I. C. C., Washington, D. C.  
 Ehrke, John, Asst. Supt., G. T., Battle Creek, Mich.  
 Elker, W. H., Dist. Engr., C. B. & Q., Lincoln, Neb.  
 Elliott, L. B., Engr. M. W., Big Four, Indianapolis, Ind.  
 Everham, A. C., West. Con. Man., Raymond Concrete Pile Co., Chicago.  
 Flora, G., Val. Dept., G. T., Durand, Mich.  
 Ford, R. H., Asst. Ch. Engr., C. R. I. & P., Chicago.  
 Freeman, J. E., Mgr. Street Bureau, Portland Cement Association, Chicago.  
 Freygang, A. H., Div. Engr., B. & O., Grafton, W. Va.  
 Frick, O. H., Dist. Engr., C. M. & St. P., Chicago.  
 Fritch, L. C. (Past-President), Vice-President in Charge of Construction, Maintenance and Capital Expenditures, C. R. I. & P., and Minneapolis & St. Louis, Chicago.  
 Fulks, E. B., Pres., Arkansas Preservation Co., 913 Carleton Bldg., St. Louis, Mo.  
 Gaines, R. H., E. M. Way, T. & P., Dallas, Tex.  
 Gaut, J. B., Supt. B. and B., G. T., Chicago.  
 Giles, W. H., Asst. Engr., M. P., St. Louis, Mo.  
 Gowdy, R. C., Ch. Engr. for Corp., C. & S., Denver, Colo.  
 Graves, W. F., Ch. Engr., Montreal Tramway Co., Montreal, Can.  
 Griggs, A. B., Val. Engr., A. T. & S. F., Eastern Lines, Topeka, Kan.  
 Griswold, H. C., Louisville, Ky.  
 Hallsted, R. H., Div. Engr., Mo. Pac., Wynne, Ark.  
 Hamilton, H. F., Res. Engr., G. N., St. Paul, Minn.  
 Hammond, E. W., Engr. M. W., B. & R. P., Rochester, N. Y.  
 Hanna, J. V., Ch. Engr., K. C. T., Kansas City, Mo.  
 Hansen, H. J., Office Engr., C. M. & St. P., Chicago.  
 Harman, H. H., Engr. Bridges, B. & L. E., Greenville, Pa.  
 Harsh, H. H., Div. Engr., B. & O., Pittsburgh, Pa.  
 Hartley, L. C., Chief Engr., Chicago & Eastern Illinois, Chicago.  
 Harvey, A. E., Ch. Engr., Metr. St. Ry. Co., Kansas City, Mo.  
 Hatch, H. A., Div. Engr., A. T. & S. F., Chanute, Kan.  
 Hawthorne, F. M., Div. Engr., Pennsylvania, Logansport, Ind.  
 Hayward, G. I., Asst. Dist. Engr., N. P., St. Paul, Minn.  
 Heidenthal, W. C., Engr. M. W., N. Y. O. & W., Middletown, N. Y.  
 Heritage, C. S., Bridge Engr., K. C. S., Kansas City, Mo.  
 Herth, C. E., Div. Engr., B. & O., Seymour, Ind.  
 Hewes, John, Jr., Div. Engr., B. & O., Florida, Ill.  
 Hillman, A. B., Asst. Engr., Belt, Chicago.  
 Hood, J. M., Supt., A. C. & Y., Akron, Ohio.  
 Hopkins, A. T., Asst. Val. Engr., M. C., Detroit, Mich.  
 Johnson, J. E., Saginaw, Mich.  
 Johnson, J. M., Con. Engr., I. C., Louisville, Ky.  
 Johnson, Noah, Val. Engr., Wabash, St. Louis, Mo.  
 Johnston, C. E., Gen. Man., K. C. S., Kansas City, Mo.  
 Johnston, D. B., Div. Engr., Pennsylvania, Louisville, Ky.  
 Jonah, F. G., Ch. Engr., St. L. S. F., St. Louis, Mo.  
 Kissell, J. E., Engr. M. of W., Big Four, Mt. Carmel, Ill.  
 Kulp, B. R., Div. Engr., C. & N. W., Madison, Wis.  
 Lane, E. G., Engr. M. W., B. & O., Eastern Lines, Baltimore, Md.  
 Lang, P. G., Jr., Asst. Engr. of Bridges, B. & O., Baltimore, Md.  
 Larsen, Albert, Div. Engr., Miami Con. Dist., Dayton, Ohio.  
 Lawton, L. C., Div. Engr., A. T. & S. F., Newton, Kan.  
 Layng, F. R., Engr. Track, B. & L. E., Greenville, Pa.  
 Leeds, R. M., Roadmaster, L. & N., Louisville, Ky.  
 Longwill, M. F., Div. Engr., Wabash, Montpelier, Ohio.  
 Mack, W. C., Draftman, C. R. I. & P., Chicago.  
 Maenner, L. T., Office Engr., M. P., St. Louis, Mo.  
 Mann, B. H., Sig. Engr., M. P., St. Louis, Mo.  
 McFetridge, W. S., Prin. Asst. Engr., B. & L. E., Greenville, Pa.  
 Miller, R. E., Engr. Br., St. L. S. F., St. Louis, Mo.  
 Mullen, Joseph, Gen. Mgr., Southern Acid & Sulphur Co., St. Louis, Mo.  
 Newhouse, C. E., Asst. Div. Engr., B. & O. S. W., Seymour, Ind.  
 O'Rourke, G. M., Roadmaster, I. C. M., Mattoon, Ill.  
 Petersen, W. H., Engr. M. W., C. R. I. & P., Des Moines, Ia.  
 Petri, Philip, Div. Engr., B. & O., Cumberland, Md.  
 Pfaffin, E. H., Ch. Engr., C. T. H. & S. E., Chicago.  
 Pfeifer, H. J., Ch. Engr., Term. R. Assn., St. Louis, Mo.  
 Phillips, H. C., Ch. West. Group Engr. Com., I. C. Val.  
 Pifer, C. W., U. S. R. A., Chicago.  
 Purdon, C. W., Consulting Engineer, St. L. S. W., St. Louis, Mo.  
 Radspinner, W. A., Spec. Engr., B. & O., Western Lines, Cincinnati, Ohio.  
 Ray, W. M., Asst. Engr., B. & O., Pittsburgh, Pa.  
 Raymond, W. G., Dean, Col. Appl. Sc., State Univ. Iowa, Iowa City, Ia.  
 Reagan, J. H., Supt. Track, G. T., Detroit, Mich.  
 Riegler, L. J., Asst. Engr., Pennsylvania, Pittsburgh, Pa.  
 Ringer, Frank, Ch. Engr., M. K. & T., St. Louis, Mo.  
 Rist, C. J., Div. Engr., P. M., Saginaw, Mich.  
 Roach, J. H., Val. Engr., N. Y. C., New York City.  
 Robbins, O. B., Senior Str. Engr., Bureau of Val., I. C. C., Chicago.  
 Rockefeller, R. P., Office Engr., C. M. & St. P., Chicago.  
 Rodenbaugh, H. N., Ch. Engr., F. E. C., St. Augustine, Fla.  
 Sawyer, Mott, Asst. Gen. Supt., C. M. & St. P., Minneapolis, Minn.

Scott, H. E., Asst. Engr., Wabash, Moberly, Mo.  
 Simmons, I. L., Bridge Engr., C. R. I. & P., Chicago.  
 Sisson, F. P., Div. Engr., G. T. W. L., Detroit, Mich.  
 Smith, H. R., Engr. Acct., P. M., Detroit, Mich.  
 Smith, R. M., Asst. Engr., M. P., Falls City, Neb.  
 Snyder, J. A., Roadmaster, M. C., Jackson, Mich.  
 Speiden, Theodore, Jr., Div. Engr., B. & O., Philadelphia, Pa.  
 Spencer, C. H., Dist. Engr., Bureau Val., I. C. C., Washington, D. C.  
 Sprague, Willson, Div. Engr., N. Y. C. & St. L., Conneaut, O.  
 Stevens, Thos. S., Signal Engr., Santa Fe System, Topeka, Kan.  
 Stimson, F. J., Ch. E. M., S. W. Region, Pennsylvania, St. Louis, Mo.  
 Stugs, R. M., Engr. Bridges, M. K. & T., St. Louis, Mo.  
 Sturdevant, C. F., Div. Engr., C. B. & Q., Lincoln, Neb.  
 Teal, J. E., Asst. Engr., B. & O., Baltimore, Md.  
 Vent, F. G., Asst. Engr., I. C., Chicago.  
 Wait, B. A., Div. Engr., C. R. I. & P., Cedar Rapids, Ia.  
 Washburn, R. H., Asst. Engr., M. C., C. & A., Springfield, Ill.  
 Weatherly, E. P., Contracting Engineer, Kansas City, Mo.  
 White, H. H., Asst. Engr., M. P., Little Rock, Ark.  
 Whiting, C. L., Supt. Term., C. M. & St. P., Milwaukee, Wis.  
 Williams, C. C., Prof. C. E., University of Kansas, Lawrence, Kan.  
 Williams, H. W., Spec. Rep. to Supt. M. P., C. M. & St. P., Chicago.  
 Williams, W. D., Engr. M. Way, C. C. C. & St. L., Van Wert, Ohio.  
 Woerner, A. H., Div. Engr., B. & O., Wheeling, W. Va.  
 Wonson, S. L., Bridge Engr., M. P., St. Louis, Mo.  
 Woodbury, W. H., Val. Engr., D. & I. R. and D. M. & N., Duluth, Minn.  
 Young, R. C., Ch. Engr., L. S. & I. and Munising Rys., Marquette, Mich.  
 Ziegweid, A. B., Sen. Civ. Engr., I. C. C. Valuation, Hinsdale, Ill.  
 Zook, M. A., Res. Engr., Bureau of Val., I. C. C., Washington, D. C.

 Willson, O. G., Bldg. Pilot Engr., B. & O., Baltimore, Md.

### Purdue Alumni Luncheon

THE CHICAGO ALUMNI ASSOCIATION of Purdue University held its second annual luncheon at the University Club yesterday noon for alumni attending the annual convention of the American Railway Engineering Association. It was voted at the luncheon held in 1920 to make this an annual affair, the dinner to be on Wednesday of the week of the annual meeting. The object of the dinner is to get the Purdue men engaged in the railway field better acquainted with each other

#### Guests

Barrett, P. T., Office Engr., C. & W. I., Chicago.  
 Beahan, R. J., Chief Engr., C. L. S. & S. B., Michigan City, Ind.  
 Bochtelheimer, A. E., Gen. Bridge Insp., C. & N. W., Chicago.  
 Bloom, J. G., Div. Supt., C. R. I. & P., Eldorado, Ark.  
 Bennett, W. R., Track Supvr., Wabash, Montpelier, Ohio.  
 Buchanan, E. G., Roadmaster, A. T. & S. F., Independence, Kan.  
 Chipman, Paul, Val. Engr., P. M., Detroit, Mich.  
 Cummings, A. E., Raymond Concrete Pile Co., Chicago.  
 Davis, H. E., Grasselli Chemical Co., Cleveland, Ohio.

The Cards of Presentation to Mr. Safford

and with the work being accomplished by the alumni in other fields of industry. Thirty-five men were in attendance yesterday as compared to 59 a year ago. The fact that fewer men were in attendance this year was due, to a certain extent, to the March stated meeting of the Signal Section of the American Railway Association being called off this year. Among those present at the luncheon yesterday were: H. R. Safford, retiring president of the A. R. E. A., and L. Downs, the president-elect, who are of the classes of '95 and '94. Others present included: G. W. Hand, assistant to the president, Chicago & North Western; W. K. Hatt, head of the School of Civil Engineering, Purdue University; C. C. Albright of Purdue University; and A. A. Potter, dean of engineering, Purdue University.

Short addresses were made by Messrs. Safford, Downs, Hatt, Potter and Albright. Mr. Safford emphasized the benefits which the young college graduate entering railroad service can derive from becoming a member of the A. R. E. A. By becoming a member, the younger man is in reality continuing his schooling in the practical lines of work he has adopted for his life work. Endless opportunities for co-operative relationship exist between the A. R. E. A. and the various technical universities and Mr. Safford emphasized the necessity of cultivating these opportunities.

Mr. Downs emphasized the fact that the older men can help the younger men by looking them up and getting acquainted with them and their problems. He stated that the younger men are not making themselves known to the older men who are alumni of their universities and who are engaged in the same line of work. Mr. Albright stated that the university is compiling a list of Purdue men who are engaged in various branches of railroad service.

A feature of the dinner last evening was the presentation to Mr. Safford of a badge by his fellow alumni who are also members of the A. R. E. A. In making the presentation Dean Potter spoke in part as follows:

"President Safford, the Purdue members of the A. R. E. A. have asked me to present to you in their name this badge as a mark of their esteem and as a recognition of your lively interest in the welfare of the younger men who are in the rank and file of the technical organization of our railroads. These alumni of Purdue University desire also to express their appreciation of your continued interest in your Alma Mater and your vision of the mutually serviceable relations that should prevail between the colleges and the railroads. The visiting committees which you appointed to advise with the faculties of Illinois and Purdue will prove most helpful to us and we hope will result in interesting an increasing number of our best students in the profession for which the A. R. E. A. stands. Your energies have found outlet not only in the technical and professional phases, but also in the improvement of human relation."

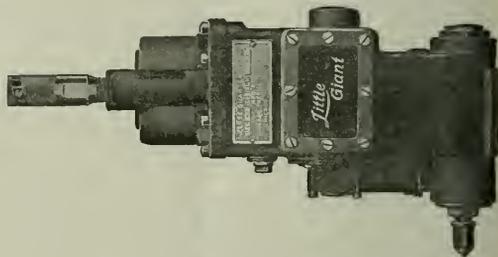

## A Throttle-Reversing Close Quarter Air Drill

IT IS INTERESTING TO NOTE that the Chicago Pneumatic Tool Company, New York, has recently remodeled its Little Giant Close Quarter Air Drill so that it is now available in reversing types and that the reversing is accomplished at the throttle. By reason of these features the machine is said to be greatly improved for tapping in close quarters operations and is proving highly useful both for drilling and reaming holes at rail joints, and as a wrench in connection with track repair and construction work. Below are given various figures relating to the

size and performance of the two models of the new machine.

Description	Capacity		Speed Light	Air Consumption Cubic Feet per Minute	Total Length Including Throttle	Length from Spindle to End of Screw When Run In	Distance from Side to Center of Spindle	Net Weight, Lbs.
	Drilling	Reaming						
No. 81-R.....	1 1/4"	1"	240	35	24"	1 1/2"	1 1/2"	36
No. 91-R.....	1 1/2"	1 3/8"	120	35	24 1/2"	1 3/4"	1 3/8"	40

Similar to the non-reversible drills of this type, drilling can be performed within 1 7/16 in. of an end wall or corner. In them the power is transmitted to the drilling spindle by means of a compact train of gears which are

Little Giant Reversible Close Quarters Air Drill

said to insure smooth uninterrupted rotation, and give an increased drilling speed over the earlier ratchet types. The gears themselves are of the stub-tooth design, it being held that in this design the roots of the teeth are relatively much stronger than in gears of the involute type.

## A Rail Failure Chart

HOW TO DETECT a defective rail before it breaks is one of the most difficult problems imposed on the section foreman. This becomes well-nigh impossible in many cases of transverse fissures, but owing to the serious consequences which follow the ultimate failure of rail containing a fissure, it is extremely important that these fissures be detected whenever any external evidence is shown. Information as to the nature of these troublesome flaws in rail steel is also of considerable importance to the foreman in order that he may report the rail failures accurately.

As a means for clearing up some of the misunderstandings concerning the transverse fissure and to assist in their detection, Robert W. Hunt & Co., Chicago, has issued a chart or card of instructions to section foremen illustrating three types of transverse fissures by a group of eight photographs. The card also contains an explanation of the nature of these fissures and details the various external manifestations by means of which some of them may be detected.

## Roadmasters' Dinner

Over 50 members of the Roadmasters & Maintenance of Way Association met at dinner at the Auditorium hotel last evening to discuss the work of the Association and means of promoting a successful convention, scheduled to be held at the Auditorium hotel in Chicago next September.

In many respects the Sao Paulo Railway, which is described in some detail by J. P. Risque in an article appearing elsewhere in this issue, is one of the most remarkable steam roads in the world.

### The Sao Paulo Railway

Although only 134 miles in length, it represents the investment of a great amount of capital because of the exceptional nature of the physical barriers it has had to overcome. Its earnings, too, which are derived largely from the profitable coffee traffic, are very great. It is chiefly, however, the unique engineering problems which were encountered in the construction of this line and the equally unique manner in which they were solved that make the Sao Paulo a really remarkable railway. About 11 miles from the seaport of Santos there is a sharp ascent to a high plateau. This obstacle has been overcome by an elaborate system of inclines over which the cars are operated by means of cables. The Sao Paulo road, in common with a great many others in Brazil, is British throughout and does not, therefore, offer a very promising market for American railway supplies. There are, however, many opportunities elsewhere in that vast country for establishing a market for American equipment and these will be discussed in another article by Mr. Risque which will appear in the *Railway Age* at an early date.

There is agitation in some quarters for a reduction of freight rates, the argument being that if freight rates are reduced shipping of commodities would thereby be encouraged. While it may be conceded that the present level of freight rates is made higher than would otherwise be advisable if it were not for the high wage scales of many classes of railway employees, we cannot but feel that the argument behind the present agitation for reduced rates rests upon an economic fallacy. It does not presume adequate realization of what constitutes a business depression. Prices of most commodities have fallen greatly during the past few months without bringing about buying on the part of the public on other than a bare hand to mouth basis. What justification is there then for the assumption of some that a reduction in rates would occasion heavier traffic to the railroads? It is the very nature of a depression that funds are not available for extensive buying and those who do have the funds are wary until they see signs of stability in business. Lower rates would, of course, decrease to some extent the cost of the commodities ordered when the present supplies are exhausted, and would be desirable if a large reduction of railway operating costs could be obtained. They would be of no assistance in helping the merchants to clear their shelves of present supplies. They would not, in other words, bring about an increase in buying and a revival of business. The problem now is to restore the earning power of the roads, which cannot be done without a reduction of operation costs and an increase of traffic. When that is done there will be a stabilizing of one of the greatest businesses in the country and an increasing confidence on the part of the public will follow. This increasing confidence would naturally tend to increase buying on the

### Reduced Rates Not a Solution

part of the public and bring about eventually the revival of business for which the entire country is looking. A decrease in rates at this time could be expected to bring no such results.

The railroad news of the present month consists almost entirely of developments in the railroad wage question and the effect of the present wage scale on net earnings. The same observation applies also to the news that one reads in the financial columns of the daily press. The buyers of railway securities at the present time are following the reports of net earnings of the carriers as never before, and naturally the paucity of such net earnings has been reflected in decreased stock quotations and sharp declines in the market. The investing public, the speculators and the operators have quickly realized that one of the most important reasons for low net earnings has been the wages paid to railway employees. The announcements of the railroads requesting conferences with their employees and the fear of the delay that would occur in carrying matters to the Railroad Labor Board have thus been given their due importance and have accelerated the decline. The *Railway Age* does not often refer in its columns to the market quotations of railroad stocks, but when the attitude of the investor is so clearly shown as has been evidenced in this case it cannot properly omit reference to it. Conditions have been such as to point out that the business revival which all of us have been looking for this past several months depends more upon what the railroads and the Railroad Labor Board are going to do in this matter of wages than upon almost any other factor. There are many reasons why the matter should be settled in a short time, and the attitude of the buyers of railway securities is not the least of them.

### The Stock Market

An official bulletin of the French Commission in the United States gives some very interesting figures showing the extent to which the French railways have been restored to normal since the signing of the armistice. It appears that of some 1,440 miles of double-track line destroyed during the war, all have been completely reconstructed. This work has involved not only the rebuilding of the tracks themselves, but of signal towers, stations and bridges also. Of the 1,665 miles of single-track line destroyed, 1,080 have been restored to service. Work on the remaining 585 miles is progressing more slowly, it is said, because they are being double-tracked. From the signing of the armistice until the end of 1920, 3,892 locomotives were placed in service, bringing the total up to 18,429. The amount of rolling stock and the efficiency of the shops can be said to have increased in like proportion during the period. In addition to the activities in reconstruction, the French railways are undertaking a vast program of electrification. The Midi company already has 90 miles of electrified line and the work of electrifying an additional 1,800 miles is in actual progress. In addition to this the Orleans and the Paris, Lyons & Mediterranean will

### Progress of the French Railways

each electrify 1,800 miles of their lines. It is estimated that the saving in coal resulting from this electrification will more than pay the interest on the necessary loans. The reconstruction of the destroyed lines alone presented to the French railways a problem of staggering proportions. The way they have solved it and are now undertaking to carry out other plans, comparable in size and importance to the reconstruction of the destroyed lines, merits the admiration of everyone.

The statement was made at the March meeting of the Canadian Railway Club that open-top steel freight cars deteriorate so rapidly from corrosion in some sections of the country that they become candidates for the scrap heap after 10 or 12 years of service. J. J. Tatum, superintendent of the car department of the Baltimore & Ohio, advocated strongly that steps be taken to develop a steel for such use which will contain less impurities and be less liable to damage from moisture and acids. He referred to the iron box cars which were introduced on the Baltimore & Ohio in 1862. A few of the bodies of these cars are still in existence and show little if any damage from corrosion. An analysis of the iron shows a low percentage of impurities and a small amount of copper. The American Railway Association could well afford to make a thorough and painstaking study of the action in service of the steel plates and members of open-top steel cars, the insides of which it is impossible to protect with paint or other coatings because of the abrasive action in loading and unloading coal and other commodities. The whole problem is one of dollars and cents. If better steel is required it can undoubtedly be produced by the makers. If the increased cost of this better steel is so great as to more than offset the advantages of increased life of the cars and reduced maintenance expense, then it will be useless to follow the matter further. Mr. Tatum's suggestion should be looked into thoroughly. Meanwhile, it is important to keep ever in mind the statement which was made by Samuel Lynn, master car builder of the Pittsburgh & Lake Erie, at the conclusion of the paper on "Maintenance of Steel Freight Cars" which he read at the above mentioned meeting—if the railroad provides adequate facilities and a maintenance program "and an honest effort is made to maintain the cars in accordance with that program, the steel cars in the country will give the owners a better return for the money invested, in the way of better service and in increased life of the cars."

### Non-Corrosive Steel for Freight Cars

adopted by the House under Mr. Esch's leadership, Mr. Esch, in co-operation with members of the Interstate Commerce Commission, had more to do with the bulk of the provisions in the act which rounded out the previously existing law. Mr. Potter, as a lawyer who has had some experience as a railroad executive, fulfils the demand which has been voiced for several years for a railroad man on the commission, and has already served for several months as a member of two of its divisions which have been intrusted with some of the most critical problems that have come before the commission. As a member of Division 5 Mr. Potter was closely identified with the commission's work in relation to car service last summer and fall and as a member of Division 4 he has been active in the work of administering the loan fund and in connection with the supervision of security issues.

It was like coming up out of a dark, damp, stuffy mine to the clear, bright air at the top of the shaft, with a stiff, refreshing breeze blowing. But it was not out-of-doors. It was in a large shop in which railway equipment was being repaired—quite evidently not a railroad shop where national agreements and McAdoo standardized wages hold full sway. The contrast from a previous visit to a railroad shop was as striking as the above simile. Men worked with a vim and as if playing a game. Exhausting themselves? No! Their good red blood was circulating freely and they seemed to get real enjoyment out of the game. After all work is no harder, and sometimes not nearly as exhausting as "soldiering" or loafing. The active, red-blooded man is the one who really enjoys living. After the closing whistle it was a delight to watch the faces of the men as they passed out of the shop gates. Slaves? No! Suffering? Not on your life! Happy? Most of them surely looked it! Exhausted after a strenuous day's work? Judging not, from appearances! What was the secret of this lively, red-blooded bunch? Each one of them had done a good, honest day's work. He was proud of it—and he was well paid on the basis of his individual output.

### A Refreshing Breeze

An encouraging sign of improvement of the desperate railroad situation was afforded this week by the publication of the Car Service Division of the American Railway Association for the week ending March 5, showing a larger number of cars of revenue freight loaded than for any previous week this year and almost the first increase since the latter part of October. The total, 712,822, represents an increase of 54,000 cars as compared with the previous week, which, however, included a holiday, and an increase of 17,000 cars over the week before that. It is nearly 100,000 cars less than for the corresponding week of 1920, but it is larger than the figure for the corresponding week of 1919 for almost the first time this year. The car loading is now, however, only about 70 per cent of what it was during the fall. The peak week of 1920 was the third week in October, when 1,010,961 cars were loaded with revenue freight. Since then there has been a steady falling off of almost unprecedented proportions. An increase in traffic is, of course, to be expected at this time of the year but the recent depression has been so serious that the apparent turning of the tide is particularly welcome. The railroads, of course, need much more than an increase in traffic to put them in a healthy condition and their experience of last September and October when even the present high rates were insufficient to produce a fair return

### Freight Car Loading Shows Increase

President Harding has made an excellent beginning toward commanding the respect of those interested in transportation by his first appointments of members of the Interstate Commerce Commission to fill two of the four vacancies. The importance of the commission was greatly increased by the passage of the Transportation Act and the many critical situations which have been and still are arising in the railroad world as incidents to the readjustment from the conditions resulting from the war and federal control demand ability of the highest type in its personnel. It is difficult to see how two better appointments could have been made than those of John J. Esch and Mark W. Potter. In addition to being a man whose personal character and integrity have won recognition, Mr. Esch has been a close student of transportation problems for many years and has probably been more closely identified with railroad legislation than any other single man. While those parts of the new law which have attracted the most attention had their origin in the Senate bill rather than that

with the heaviest volume of traffic ever known proves that a large reduction in the level of expenses, which the railroads are trying to accomplish by a reduction of the war-time scale of wages, is imperatively necessary.

The lading of approximately 1,700 cars is transferred monthly in the Chicago terminal district, at a cost of labor and material amounting to \$24,000.

**A Penalty  
of Bad Car  
Conditions**

This includes neither the cost of the extra switching involved nor of the inevitable crop of damage claims resulting from the transfers, which may

be of even greater importance than the actual cost of the unloading and reloading. This is a fair sample of one of the penalties paid by the railroads of the United States at every point where traffic is transferred in any quantity, for the chronically run down condition of freight cars. Any improvement in these uneconomic conditions undoubtedly will cost money at the outset. In the case of motive power, there are probably few railroad officers who would be willing to maintain that the expenditure in inspection and maintenance necessary to eliminate every preventable engine failure was not justified by the saving thereby effected. But is this not essentially as true with respect to cars? A failure of car equipment while moving in trains results in much the same character of delays to traffic as those caused by engine failures. The cost of these delays constitutes a direct loss in itself and here, as well as in the transfer of loads, the direct loss may be less important than the loss and damage to commodities, the claims for which the road must pay and the adjustment of which is a constant source of friction between the roads and the shipping public. The establishment of billing prices for labor and material expended in interchange repairs high enough to afford an average profit of 10 or 15 per cent, at the outset undoubtedly would cause an increase in the total cost of car maintenance. But without the incentive of such prices there is little possibility of ever establishing a standard of car maintenance comparable with that generally pertaining with respect to locomotives. Such a standard of maintenance would go far toward saving the present losses in transfers and damages due to bad car conditions. Furthermore, if experience with locomotives may be considered as a criterion, a high standard of up-keep, once established, may be maintained with less expenditure than is constantly required in the struggle to keep bad conditions from getting worse.

Readers of the *Railway Age*, and particularly those readers interested in foreign trade, are familiar with the work that

**The  
Department  
of Commerce**

has been done during the past few years by the Bureau of Foreign and Domestic Commerce of the Department of Commerce. This paper has printed

in abstract form and has discussed editorially the reports of Trade Commissioner Frank Rhea on markets for railway supplies in Australia, and in the Far East. The *Railway Age* also publishes monthly the instructive statistics compiled and issued by the Bureau's Division of Statistics. The new Secretary of Commerce, Herbert Hoover, has already announced in the few weeks, or rather days, that he has been in his new office, various ideas that he has in mind as to the improvement and enlargement of the work of the Department of Commerce. It is apparent that he does not desire to expand its work in a more or less haphazard way but that he desires rather to make its work such that it will be of most value to the business community. The administration of the Bureau of Foreign and Domestic Commerce in the recent past has been

of a high standard and there is little question but that it has kept up with the demands upon it due to our increased export trade. The consular information service in particular, while not perfect, is the envy of our competitors overseas. Nevertheless, there is room for some criticism in that the information supplied by the Bureau is sometimes not sufficiently practical to be of greatest service to the business man. Export trade at present is not what it was a year ago. The Bureau of Foreign Commerce, or whatever it may be called under the new order of things, has before it the task of rebuilding that trade to a more stable level. It is our opinion further that the Bureau should pay particular attention to exports of railway supplies. To do this it will have to give the business world information as to the advisability of investments in foreign railway securities, for it is well known that export business goes to that country that supplies the capital for improvements or new lines. The work to be done by the Bureau and by the Department of Commerce is of great importance. It is indeed fortunate that a man of Mr. Hoover's calibre and standing has been placed in charge of it.

In considering the possibility of obtaining more efficient and economical railroad shop operation, the important part played

**Training  
Shop  
Mechanics**

by foremen and gang leaders has been strongly emphasized in several recent editorials. It is true that a satisfactory shop output can never be obtained with inefficient, untrained foremen but

careless, incompetent workmen have an almost equally serious effect and some means should be provided to train them and change their point of view. It is perhaps most natural to consider apprentice schools as the source of trained mechanics and too much cannot be said in favor of giving more time and attention to railroad shop apprentices. The possibilities in this direction are indicated by the fact that one important western road is now benefiting by the services of 1,506 graduates of its apprenticeship courses. The subject of apprenticeship is too big to be considered in a short discussion, but a few words may be said regarding the possibility of training unskilled or inexperienced shop men to qualify for positions requiring more skill. Why cannot the foreman, by instruction and encouragement, help these men to become better mechanics and, therefore, of more value to themselves and to the railroads? The reason is that a good foreman is not necessarily a good teacher. Experience has shown that hardly one foreman in twenty is qualified to perform the duties of instructor. The establishment of training departments in industrial plants has been accomplished at small expense and with most desirable results. In a particular case during the war 65 per cent of the employees of a certain plant were in the first draft but new, trained workers were obtained through the training department at such a rate that the production of the plant was actually increased and it was claimed that the quality of the work was improved. It seems probable that a system, or at least certain features of a system, which has given such good results in industrial plants could be advantageously incorporated in railroad shops. It would be a distinct step in advance if all ambitious shop men could come under the supervision of shop foremen or apprentice instructors who have shown particular ability as instructors. Promising helpers could be encouraged to qualify as mechanics and low rate mechanics could be helped to fit themselves for positions requiring more skill. The result would be that in the future when pressure is once more brought to bear on railroad shops to repair the maximum number of cars and locomotives and get them ready for service, there would be no lack of skilled help to bring shop output up to the required point.

## Wanted—A New Baptism of Courage

ONE OF THE VERY GREATEST needs of the railroads today is more courage on the part of their higher officers. They especially need more courage in defending themselves. Within recent months they have been publicly and repeatedly charged with doing things which, if the charges were true, would justify the removal in disgrace of every one of them from his position.

The Plumb Plan League has circulated among railway employees all over the country literature implying that many high railway officers own stock in companies from which the roads make purchases, and get graft at the expense of their railroads by paying to these outside concerns excessive prices for the things the railroads buy. This persistent and insidious propaganda is undermining the confidence of hundreds of thousands of railway employees in the integrity of their superior officers.

The spokesmen of the labor unions before the Railroad Labor Board have secured publicity throughout the country for allegations that railway officers last year gave locomotive and car repair contracts at excessive prices to outside companies in which they were financially interested. These charges have been circulated and not adequately met with the facts until millions of people believe them.

A fine example of the kind of charges which are being made against railway officers appeared in the Chicago Herald and Examiner and other Hearst newspapers on March 12 under the signature of Arthur Brisbane. Mr. Brisbane said: "The recent government management amounted to this: It took over the railroads temporarily. Permanent public ownership was feared by the owners. The government stupidly left in charge the hired servants of the private owners. Those private servants were instructed to make government management an absolute failure, and they did all possible to make it a failure."

Government control was adopted as a war measure. It was the patriotic duty of every railway officer who accepted service in the Railroad Administration to do his best to promote efficiency of operation. Any railway officer who had done, what Brisbane in effect charges that all of them did, would have been a crook and a traitor. Who are these men that Brisbane and Hearst in effect charge are crooks and traitors? They include C. R. Gray, president of the Union Pacific, and W. T. Tyler, vice-president of the Northern Pacific, who served successively as directors of operation. They include Edward Chambers, vice-president of the Santa Fe, who was director of traffic, and A. H. Smith, president of the New York Central; Charles H. Markham, president of the Illinois Central; Hale Holden, president of the Burlington; N. D. Maher, president of the Norfolk & Western; B. F. Bush, president of the Northern Pacific; B. L. Winchell, formerly president of the Frisco; and R. H. Aishton, president of the American Railway Association, all of whom served as regional directors. They include every railway officer who served as a federal manager. Brisbane says, and is paid by Hearst for saying, in substance, that all these men were traitors to their country in its time of greatest need. Up to the present, however, we have not heard of a single one of the men thus accused having sued Brisbane and Hearst for libel, or having even publicly denied and refuted the charges made against them.

The men who ought to answer these charges are those against whom they are made. It is their personal honor which is attacked, and no man should rely on anybody else to defend his personal honor. If they do not promptly strike back at those who thus attack them the public in due course is sure to conclude either that the charges are true or that the men attacked are too cowardly to defend themselves. But the effect of allowing people like Brisbane to "get by" with such charges is not confined to the men attacked. It brings under

suspicion the entire management of the railroads, and the planting in the public mind of the suspicion that the railroads are being managed by men who were traitors to their country during the war, and who have been grafting at the expense of the railroads since, is bound to have the most harmful effects upon the railroads themselves.

Senator Cummins has announced that a Congressional investigation of the management of the railroads will be held soon after the special session of Congress begins. Railway officers do, and should, welcome this investigation. They should demand that it shall be so conducted that either the charges which have been made regarding the conduct of railway officers during and since government control shall be substantiated, or that those who have made them will be proven liars and slanderers. They should especially insist that Brisbane and Hearst be put on the witness stand to substantiate under oath and in detail the charge they have repeatedly published broadcast that the higher officers of the railways were traitors during the war. They should demand that every spokesman of the labor unions who has been making wholesale charges of incompetency and crookedness shall be compelled to appear and give under oath such evidence as he has to support his charges. Railway officers themselves should also demand the right to be heard fully in vindication of their entire conduct.

The *Railway Age* believes it knows enough about the conduct of railway officers within recent years, and the way the railways have been managed, to express the utmost confidence that when all the charges against railway officers which have been made have been fully ventilated practically all of them will be shown to be villainous fabrications. Meantime, however, every fresh charge which is made against them should be met promptly and publicly with flat denial and disproof; and we suggest that it is about time the railways and their higher officers seriously considered whether it is not their duty to themselves and to the railroads to begin invoking in their defense the laws against slander and libel. At any rate, the officers should cease to take "lying down" such charges as are being made against them. Their personal honor, the rights of their security owners, and the public welfare demand that they shall individually and collectively meet squarely and vindicate themselves from these wholesale charges that they are traitors and crooks.

## Railway Wages and the Cost of Living

IT IS EVIDENT that the question of what wages the railways shall be required to pay to all their employees in future will soon be before the Railroad Labor Board. Most railways already have arranged for conferences with their unskilled employees regarding reductions and some have asked for similar conferences with certain classes of their skilled employees.

The large advances in wages that have been made within recent years, and especially since 1917, have been based mainly upon the cost of living. The cost of living is also the most important factor which the Railroad Labor Board is required to consider in fixing reasonable wages. There is a general impression that for some years the cost of living increased more than the average wages of railway employees. There is also a general impression that the advances in wages finally caught up with and passed the increases in the cost of living, and that for some time the wages of railway employees have been relatively much higher than the cost of living.

Statistics regarding the average annual wage of the employees and the cost of living during the last six years show that these general impressions regarding the tendencies of wages in railway service and the cost of living are sub-

stantially correct. Studies of the cost of living have been made both by the Bureau of Labor Statistics of the United States Department of Labor and the National Industrial Conference Board. Those of the Bureau of Labor show the changes in the cost of living from 1913 to December, 1920. We have recalculated the Bureau's statistics to make them cover the period from 1914 to December, 1920, the last month for which they are available. Comparison of these statistics with the average annual wage per railway employee since 1914 gives the following percentages of increase in the average wage of railway labor and in the average cost of living in the United States:

INCREASE IN AVERAGE RAILWAY WAGES AND IN COST OF LIVING AS SHOWN BY BUREAU OF LABOR STATISTICS

Year	Average railway wage	Per cent increase in average wage over 1914	Per cent increase in cost of living over 1914
1914	\$816	.....	.....
1915	831	1.83	2 (Dec., 1914)
1916	892	9.31	15 (Dec., 1916)
1917	1,004	23.04	38.2 (Dec., 1917)
1918	1,419	73.89	69.3 (Dec., 1918)
1919	1,483	81.74	93.5 (Dec., 1919)
1920 (before wage award)	1,806	121.32	113 (June, 1920)
1920 (after wage award)	1,910	134.07	94.5 (Dec., 1920)

It will be seen from the foregoing table that according to the Bureau of Labor statistics the increase in the cost of living outstripped the advances in the average railway wage until 1918, when average railway wages showed a total increase of 73.89 per cent and the cost of living 69.3 per cent. In 1919 the increase in the average wage had again fallen behind the increase in the cost of living, but in 1920 it again caught up with and passed it before the Railroad Labor Board's wage award was made last July. At the time that award was made the average railway wage was running 121 per cent more than in 1914, and the cost of living was only 113 per cent higher. The wage award made by the Railroad Labor Board caused the average annual wage of railway employees at the end of 1920 to be 134 per cent more than in 1914, while the cost of living, owing to declines in prices, had become only 94.5 per cent more.

The following table gives the percentages of increase in the average railway wage since 1915, and also the percentages of increase in the cost of living as estimated by the National Industrial Board:

INCREASE IN AVERAGE RAILWAY WAGES AND IN COST OF LIVING SHOWN BY THE NATIONAL INDUSTRIAL CONFERENCE BOARD

Year	Average railway wage	Per cent increase in average wage over 1915	Per cent increase in cost of living over 1915
1915	\$831	.....	.....
1916	892	7.3	8.7
1917	1,004	20.9	31.3
1918	1,419	52.2	71
1919	1,483	71	72.2
1920 (before wage award)	1,806	117.6	104.5
1920 (November)	1,910	130	93
1920 (December)	1,910	130	90
1921 (January)	1,910	130	81.2

It will be seen that the statistics of the National Industrial Conference Board indicate that the increases in the cost of living exceeded the increases in the average wage of railway labor until 1919. From that time on, according to its estimates, the average wage of railway labor exceeded relatively the cost of living, while in January, 1921, the average wage of railway labor was 130 per cent more than in 1915 and the average cost of living was only 81 per cent more.

This use of the increase in the average wage of railway labor as the measure of increases in wages during this period is more than fair to certain classes of employees, while it is less than fair to certain other classes of employees. For example, the increases in wages of certain employees in the shops, especially car inspectors and car repairers, have very greatly exceeded the increases in the cost of living, being as much as 200 per cent, while the advances of the wages of the employees in the train service never have equalled the increases in the cost of living. Furthermore, there have been very large increases in the number of employees in the shops,

while there have been no increases in the number of employees in train service. These facts show how unfairly the readjustments of wages have been made since government control was adopted, and seem to demand that any reductions in wages which are now to be made shall not be flat percentage reductions but shall be relatively much smaller for some classes of employees than for others.

But after all it is the increase in the average wage as well as in the number of employees that has caused the enormous increase in the railroad payroll, and since the statistics of both the Bureau of Labor and the National Industrial Conference Board show that compared with the cost of living the average wage is much higher now than it was in 1914 or than it was last July when the award fixing the present wages was made, it is plainly fair that consideration should be given at once to a general readjustment of railway wages.

It should not be overlooked in this connection that while the cost of living is now not over 80 per cent more than it was in 1915, and while the average railway wage is 130 per cent more, most of the employees who are receiving this higher average wage also have benefited by substantial reductions in their hours of work.

## Getting Together

FREQUENT REFERENCE is made to the advantages which may accrue from co-operation between the manufacturers and the railroads in the study of many railway problems and without doubt much advance has been made in this direction in recent years. Failure to realize to the fullest extent the possibilities of joint work may be ascribed largely to the difference in the points of view of the railway man and the supply man. There are some officers in the employ of railroads who view with suspicion or even actual distrust any statement made by a manufacturer's representative. However, the vast majority of railway officers take no such position. They are willing to be shown.

The principal difficulty, as stated above, is in the point of view. In the eyes of the salesman his product is supreme while to the engineer all things are comparative. As an illustration—some years ago a manufacturer of a structural material published an account of some laboratory tests, each one of which was concluded with some mishap to the testing apparatus which prevented ultimate failure of the material. In other words, there was a misguided effort to create the impression that the material was too strong to be broken and that it would be a tactical error to admit that there was a limit to its strength, but to the engineer this obvious effort to avoid a statement as to the true ultimate strength could instill only a feeling of suspicion. As another illustration in point, an engineering officer, who was required recently to study the problem of painting some bridges subject to a particular exposure, endeavored to obtain some information from certain paint manufacturers which would help him in selecting those materials most suitable for the conditions and which would also enable him to determine a most economical painting program with reference to the number of coats to be applied at one time and the intervals between paintings. Unfortunately a considerable portion of the replies dealt in generalities and superlatives of little value to him.

A purchaser should not expect the impossible. While he may realize that some materials are better than others he knows that in most cases these differences are relative. He should, in consequence, be willing to give a trial to any material that is represented to him in terms that bear the stamp of sincerity, and reasonableness and indicate a thorough knowledge of the product and of the conditions under which it must be used. To obtain the greatest good from co-operation, each party must appreciate the other's point of view and endeavor to meet it.

## Letters to the Editor

### Systematizing Work in Shops and Engine Houses

DECATUR, III.

TO THE EDITOR:

I have read with interest your article in the issue of January 7, entitled, "Railways and Labor in 1921." Co-operation is certainly the right thing, if it can be established, but that "IF" seems to be a big factor.

I believe railways will have to undergo a complete change in their methods of handling repairs to locomotives and cars at repair shops and roundhouses. Repair shops and roundhouses are working and handling work practically the same way they did when I started serving my apprenticeship, or the largest per cent of them are. Railways will have to manufacture instead of repair.

The greatest expense in a repair shop is caused by fitting with calipers by the "cut and try" method. Every part will have to have a new size, scrap size and intermediate sizes. For example, why should cylinders just be trued? They should be bored in  $\frac{1}{8}$ -in. sizes or some standard size. Then piston heads and packing could be drawn from the store department. Why should a cross head pin-hole be just trued up? Why not ream it to the next standard size and draw a pin to fit? In this manner large pins could be reclaimed very handily. This could apply to the link motion and all through the engine in the same manner.

Much time has been saved on engines by having extra back ends for fireboxes. This would help the schedule—the same number of engines repaired each week and the same amount out every day. By doing this the weak department can easily be located and the necessary help be given.

Large roundhouses, to be more successful, will have to adopt repair shop methods of departments and gangs. The most important foreman would be the one that gets the engineer's report as soon as it is posted on the book. He will then schedule the engine in a certain department or gang, then each could be apportioned light as well as heavy jobs. Roundhouses should be made more convenient in regard to tool room and machine shop layout. These should be made so as to make the shortest possible routes for the work and workmen. There are plenty of good foremen that see these things but they have not the time or authority to remedy these matters. It should be the business of a special department. Did you ever stand in a large roundhouse or repair shop and see everyone going some place and wonder who is doing the work? I often wished I knew how much actual time was actually worked and how much lost calipering, to fit and try.

I have never seen a repair shop successfully worked unless the machine department was at least ten days ahead of the erecting department. This is done in a few well-balanced shops. If the plan to repair the engine out of the store department is adopted, the erecting department will always have material and the machine department will be ahead with the stock. What a great improvement could be made in the blacksmith shop by forging machines and plenty of good dies for them, also other labor-saving machines and tools!

I think the greatest showing in the many departments of a railroad can be made in the smithshop by machinery and good tools, but it seems this is left to the foreman, principally. In the number of blacksmith shops I have visited, I remember just two good ones, and the thought strikes me.

How much could be accomplished if these men were given assistance by standard manufacturing, good machines and tools!

Railroad companies do not buy enough new machines and tools. Machines never grow old to them, and if they build a new shop they do not always have new machinery. If they do get some new tools, the old ones are sent to another shop on the system for a high priced mechanic to run. Shop walls never repaired an engine or car. It is only a place to house machinery. It takes convenient layout and machinery. A job should never back track. Manufacturers figure the cost of doing a job by hand or by machinery. When a job is done, it is either by hand labor or machine labor. Instead of paying out labor, buy a machine with the saving of labor; when the machine is paid for the profit starts. I believe railroads will have to consider manufacturing, more and better machinery, tools and re-arrangement of shops, etc., so as to balance them. They will then make a big step towards reducing repair costs.

W. M. F. CANAVAN.

### The Increase in Freight Claims

CHICAGO.

TO THE EDITOR:

The Bureau of Railway Economics has prepared a statement of loss and damage payments which discloses the fact that the amount paid out for the years 1918 and 1919 increased 168.1 per cent over the four-year period from 1914 to 1917. Aside from the heavy burden which this unnecessary leakage imposes upon the carriers, a most serious phase of the freight loss and damage question is presented in the great economic loss sustained by the consuming public. The sum of \$106,000,000 paid out in freight claims during the year 1919, tremendous as it is, by no means represents the real value of the commodities destroyed. Claims are usually settled on an invoice price basis and represent largely the value of the raw products. Thus a claim payment of one dollar on grain lost or damaged means an actual loss of four dollars' worth of bread. But the drain on our economic resources occasioned by the loss of the commodities themselves is not the only waste. It is evident that the labor required to produce these goods is also a total loss. In the final analysis, the cost of producing a commodity is borne by the consumer whether the product serves its legitimate purpose, or is damaged or destroyed.

In considering the immensity of this burden on the carriers and the corresponding waste of the nation's goods, we are likely to overlook the direct hardship which freight losses impose on the shipper or receiver. A wholesale dry goods house might be considered a typical case. Such a concern depends largely for its patronage on its ability to serve its retail customers satisfactorily. One of the details that counts largely in this service is the promptness with which the house can place its merchandise in its customers' hands in good condition. If there are two or more wholesale houses competing for the business of one firm, and this is usually the case, and if one of these is located on a railroad which handles freight carelessly, it will soon lose the customer, for the latter will discover that he can obtain his goods with less delay and in better condition from the other house whose carrier is furnishing service which is continuously satisfactory.

The case of the small retailer who is the principal receiver of freight in the country towns, furnishes another illustration. He buys goods with the expectation of receiving them within a short time after the order is placed. As a general rule his orders are for small quantities. If a shipment is delayed or damaged in transit, he is very likely to run out of his stock in certain lines with the result that his customers

will go to some other store where they can purchase the commodity, and thus perhaps are lost to him permanently. Obviously no mere payment of his claim can make good any loss of his customers.

The duty of the carrier, therefore, does not rest merely with the prompt payment of claims. The railroad should make every reasonable effort to handle its freight so carefully at all times and under all conditions that it will reach the consignee in the same good condition in which it was delivered to the carrier.

F. E. WINBURN,

Special Representative, Freight Claim Prevention, American Railway Association.

## Car Supply and Mine Production

WASHINGTON, D. C.

TO THE EDITOR:

A. G. Gutheim, manager, Public Relations Section, of the American Railway Association, called my attention some time ago to a passage on page 48 of the "Buy Now and Ship Now" issue of the *Railway Age* of January 7, 1921. The statement reads "Studies made in the bituminous coal mining industry show that when the car supply is 75 per cent of the normal requirements, the cost of production is 16 per cent greater than when all demands for cars are met. If the car supply is one-half normal, the cost of coal is increased 40 per cent."

This statement is apparently based upon a diagram shown at the bottom of page 34, and numbered Figure IV. That diagram drives home a very important fact in bituminous coal mining, namely, that any long interruption to normal operation greatly increases the cost per ton. As Mr. Gutheim points out (in a letter to the editor published in the issue of February 4, 1921, page 314), however, the diagram may be misunderstood.

In the first place, I am informed by R. V. Norris, engineer in the Fuel Administration, by whom the original diagram from which the one shown by the *Railway Age* was reproduced, was constructed, that the figures in the vertical scale entitled "Percentage increase in cost," should read 20 per cent, 40 per cent, 60 per cent, 80 per cent, 100 per cent, 120 per cent, and so on, and not .20 per cent, .40 per cent, .60 per cent, .80 per cent, 1.20 per cent, and so on, as they are printed.

In the second place, the increase in cost is due to the fact of interruptions to regular operation, not to the particular cause of the interruptions. In other words, any cause preventing operation, such as a strike, mine disability, or lack of market, would tend to increase costs in the same ratio as the failure of the car supply. Furthermore, there is so much loose talk about "car shortage" that the diagram can be used as an indicator of increased costs only when the figure of car shortage is an accurate measure of the loss of mine-working time caused by lack of cars. It is my understanding that the committee of engineers that made the study on which the diagram is based was careful to consider the actual running time of the mine rather than any theoretical figure of car shortage based on the established rating and the cars placed; and furthermore, that the committee figured the decrease in car supply not from a full-time supply but from the normal, ordinarily enjoyed at these properties. That being so, the diagram ought to indicate the increase in costs accompanying each increase in working time below the normal. As Mr. Gutheim very justly points out, however, it may give an erroneous and exaggerated idea of the increased costs if the "car shortage" is calculated on a rating inflated far above the capacity of the mine to actually load coal.

F. G. TRYON,

In charge of Coal and Coke Statistics, United States Geological Survey, Department of the Interior.

## Automatic Signals and Train Operation

CHICAGO

TO THE EDITOR:

I have read carefully and with much pleasure your very interesting number of January 7, and would like to call your attention to the article on page 39, "What Additions to Physical Property Are Necessary?" Under various captions you specify certain types of improvements and end up with "Other Classes of Improvements." Under no head do you make any mention of automatic block signals.

I do not believe that there is any improvement which railroads can make today which will give as large and direct a return for the money in the speeding up of train movements as automatic block signals. I know of one subdivision of less than 120 mi. where automatic block signals were installed where a careful record was kept by the chief dispatcher for a year which showed that the average freight train movement after the automatic block signals were installed was more than an hour less per trip than it had been before. If this increase of efficiency does not represent a large economy I give up.

The whole trouble with the automatic block signal problem today is that the vast majority of the higher officers on railroads are men who learned railroading before the day of automatic block signals, and entirely too many of them still look on the installation of these devices as an expensive luxury, and not a necessity. They look principally on the safety feature of the signals and not on their increased efficiency and are loath to spend high-priced money for what they consider an unnecessary refinement.

Anyone who will ride on a passenger train over a railroad equipped with single track A. P. B. automatics and will give his attention to watching the actions of the crews on trains which have taken sidings to let the train he is on pass, will see the value of signaling. In almost every case, as he passes a freight train, he will see the head brakeman start towards the main track switch as soon as the rear of his train passes, knowing that in a minute or two the starting signal will clear up so that his train may pull out. In the old days, under manual block or with time limit rules, a train crew knew they had 10 or 15 min. to wait before the block would be clear, and that then it would be necessary to spend some time calling up the block operator on the phone; consequently nobody was in a hurry. The action of the men now is snappy where it used to be decidedly lazy.

I have many times heard the engineman of a train waiting on a siding for a meet, sound his whistle as soon as the starting signal went to the stop position (indicating that the train he was to meet had passed the limits of the next station ahead), so as to call in the brakemen, who may have been over in a cornfield chasing a rabbit, and the conductor who was taking a nap in the shade of a tree. In the old days, when there was no way for the trainmen to get advance information of the approach of the train they were to meet, this assembly would not be sounded until the opposing train had actually passed the siding and a considerable time would elapse before the train on the siding would get in motion; now, however, the train is ready to move as soon as the block ahead is clear.

The automatic block signal ought to be advertised much more than it is from the standpoint of efficiency. It is a big money saver as an operating proposition, aside from its use in preventing collisions.

JAMES B. LATIMER,

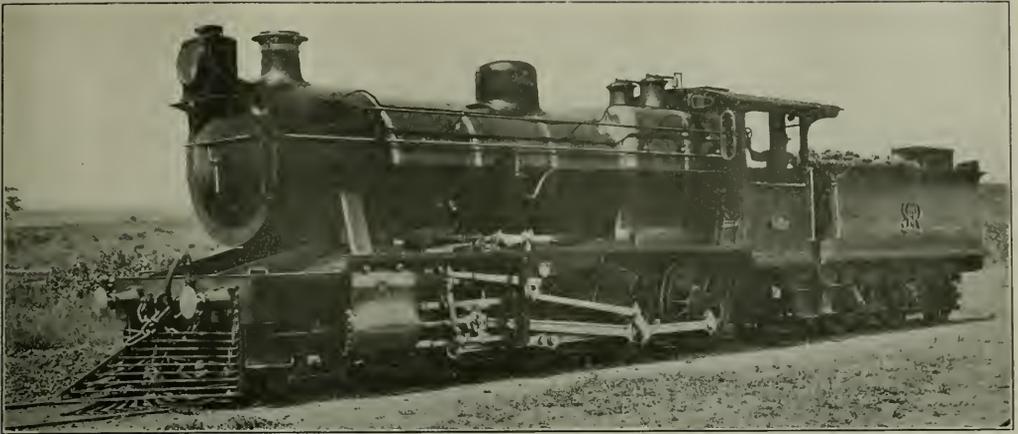

Signal Engineer, Chicago, Burlington & Quincy.

THE UNITED STATES CIVIL SERVICE COMMISSION has announced open competitive examinations for accounting and statistical clerks to fill vacancies in the Interstate Commerce Commission at \$1,500 to \$2,100 a year.

## Engineering Marks Sao Paulo as Novel Railway

Method of Overcoming Heavy Grades Unique—Virtual Monopoly of Coffee Traffic Gives Financial Strength

**B**RAZIL IS DIVIDED into 20 states, one territory and one federal district. This great country embraces 45 per cent of the area of the whole South American continent. The state of Sao Paulo lies to the west and south of Rio de Janeiro on the south coast of the country. The important seaport of the state is Santos and the city of Sao Paulo lies 50 miles inland from that place.

Lying mostly within this state but overlapping somewhat into the neighboring states of Rio de Janeiro, Minas Geraes and Espirito Santo is the irregular bottle shaped area which is said to supply 75 per cent of the world's coffee. The upturned bottom of this bottle can be said to lie somewhere around the northeastern boundary of the state of Sao Paulo; the mouth of the bottle is Santos, on the coast; the line of the Sao Paulo Railway from Jundiaby to Santos is the neck of the bottle through which this coffee flows from the hinterland traversed by the Paulista and other lines. Of the 1,400,000,000 coffee trees in the republic, 750,000,000, or 53½ per cent, are said to be within the borders of this state.

In 1915 the Sao Paulo Railway carried 13,444,756 sacks of coffee of 132 lb. each, or more than \$87,000 tons, from the coffee district to the port of Santos, this amount representing the entire production of the state of Sao Paulo and large quantities from the neighboring states. The Brazilian coffee crop of 1916-1917 was estimated at 13,500,000 sacks; that of the rest of the world at only 4,500,000. In 1916 the United States purchased 692,736,924 lbs. of the Sao Paulo crop, representing a value of \$65,176,310. A further expenditure for coffee from other districts, amounting to \$8,176,005 in that same year, brought Uncle Sam's Brazilian coffee purchases to the sum of \$73,541,315.

The presentation of these instructive figures is made in order to show that the Sao Paulo Railway, an English owned line, with its 134 miles of track is an important factor in the coffee trade of Brazil and to explain some figures on the earnings of that line in comparison with those of less fortunately located roads. In 1918 the Sao Paulo Railway

earned a gross income per mile of track operated which was more than 13 times the average amount per mile earned by 14 other lines. The amount in cold figures reached \$54,640; the average of the 14 other lines was only \$3,800 per mile. The highest earnings per kilometer of any other Brazilian road was \$7,700, which was the average for the Paulista Railway, a tributary to the Sao Paulo road and an important contributor of coffee tonnage to it. The next highest road in earnings per mile was the Central of Brazil, also somewhat of a coffee carrier from the states of Minas Geraes, Espirito Santo and Rio de Janeiro. The average earnings of this road reached \$10,500 per mile.

From the foregoing it is scarcely remarkable that travelers are wont to tell exaggerated tales of the "wonderful" Sao Paulo Railway which is alleged to "have so much money that the surplus is spent in painting the scenery along the right of way!"

This 5 ft. 3 in. gage line was constructed in 1867 in spite of baffling engineering problems, one of which involved finding an economic method of hauling traffic over 10 per cent grades which were encountered a few miles inland from Santos. These 10 per cent grades extended a distance of six miles and the method of hauling traffic over them which was finally adopted was the construction of a cable system with four stations. Over this line trains were hauled from sea level at the foot of the ascent to an elevation of 2,600 feet with comparative satisfaction. This route was successfully used for about 28 years when it was decided to lay a new line. In 1895, therefore, the relocation of the entire line was commenced, and finished in 1901, the latter construction superseding the former entirely insofar as the hauling of traffic is concerned.

The new line lies considerably above the level of the old one and provides an easier grade—8 per cent instead of the former 10—but its construction necessitated the boring of a string of 13 tunnels varying from 171 ft. to 853 ft. in length, a total of 4,428 ft. for all the tunnels combined, as well as the construction of 16 viaducts, the longest of which

is 620 ft. From Santos, on the bay, the new line follows the route of the old to the foot of the mountain, or Serra as it is called, and comprises the first section of the line, all of which is practically level.

The second, or Serra, section commences here and the details of the construction and operation of this section covering an ascent of 2,600 ft. mark it as one of the most interesting climbs in South America. The slope, or the entire section, is laid off in five equal inclines, at the base of each of which is a graded level of sufficient length and width to accommodate an arrangement of passing tracks. Below each of these passing tracks, at a suitable location, is a power-house for each incline. The tracks on each incline, except at the passing points mentioned, have three rails, the middle one of which is used in common by both ascending and descending trains. At the passing tracks the center rail divides into two, thus forming the inside rails of two separate tracks. Each line has its individual cable system driven by a distinctly separate set of rope driving engines. Thus, although operated independently the whole system is run as a single unit.

Unity of operation is facilitated by telegraph and telephone communication between the operators' towers on each incline. Each power-house has four coal burning boilers of the English type known as "Lancashire." These boilers are equipped with mechanical stokers and feedwater heaters. The two hauling engines in each power-house are of 1,000 h. p. each and drive two sets of drums upon which are mounted the driving cables, the two drums being connected through separate grooved pulleys of large diameter with 16 coils of hemp rope. The driving cable, entering the engine-room from the ascending line, makes four turns around the rope drums or wheels and then passes over a fixed return wheel 14 ft. in diameter at the back of the power-house and from there out and over the descending line.

At the base of each incline there is a special mechanism called a tension slide, which arrangement is designed to keep the driving cable taut at all times. The driving cable is

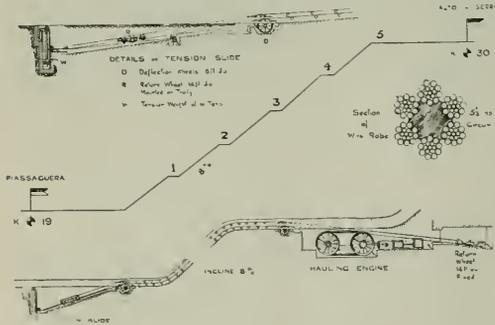

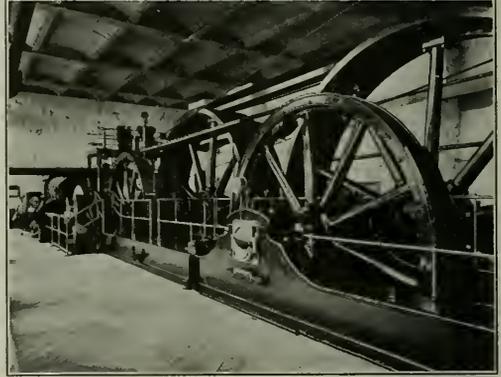

Diagram Showing Tension Slide, the Five Inclines, a Section of the Cable and Details for One Incline

made up of six strands of steel wire on a hempen core and is calculated to have a resistance to breaking of over 100 tons when new and of about 70 tons when worn. As the maximum working load on the rope from all sources is known to be not in excess of 18 tons, the factor of safety varies from 6 to 4. One train always ascends one incline while another descends the next higher incline and conversely. This makes for little delay at meeting points.

The maximum weight of each train, including the special locomotive built for this job, is 145 tons. Deducting the locomotive's weight of 31 tons and allowing an average weight for the cars it appears that the net paying load is

approximately 78 tons. A train will ascend the entire division or section of five inclines in 40 minutes; with five of them running, this is equivalent to a movement of 585 tons an hour.

The special locomotive built for and assigned to work on this interesting hill is an 0-4-0 affair entirely enclosed in a steel housing and would remind old timers of the steam "dummies" that were put to work in the cities of this country before the electric cars were introduced. The Sao Paulo officers call them "locomotive brakes," probably on account of the fact that they are far more efficient "brakes" than they are locomotives, their only use in the latter capacity

Interior of Power House Showing Cable Drive

being in light switching around the yard or on the level spaces at the foot of the inclines. They are equipped with a special clutching mechanism for gripping the cable and two sets of specially designed, mechanically operated, rail gripping, jaws for seizing the rails on both sides in the event of a failure of the vacuum brakes with which all the trains are equipped.

Extreme precaution is exercised in the operation of the inclines and aside from the fact that the car tips at one end, due to the steep grade, the passengers may feel perfectly at home. The "painting of the scenery," mentioned previously, is the only explanation the laymen has ever been able to make of the elaborate painted abutments that have been built along the right of way to forestall the extremely damaging effects of the slightest movement of earth which so frequently precipitates a slide of damaging consequences. The "painted scenery" which so highly amused the admirer of this perfectly equipped little road was the coating of tar which had been applied to the white faces of the solid concrete retaining walls in order to show up plainly a sudden crack. Thus has the road's engineering department been accused of extravagance when in reality the artistic setting which the passenger thought was prepared for his special edification was an evidence of engineering thought of the highest order! The trick has served its purpose well and has helped the line's inspectors to locate trouble in time to prevent a catastrophe. As the general manager of this railway seemed to be quite disturbed over his road's reputation because of the "painting" story, he asked that the truth be told; it is hoped that the facts as herein set forth are sufficiently clear and that the true explanation thus told will aid in the dissemination of correct information.

From the summit of the slope, called Alto da Serra ("top of the hill"), the line runs in a northwesterly direction to Sao Paulo which is 50 miles from the coast terminal at Santos. Here the railway intersects with the government

owned Central Railway of Brazil, which runs northeast in the direction of Rio de Janeiro, and the Sorocabana Railway, which is a meter and 5 ft. 6 in. gage line of 864 miles in length and which runs to the southwest. The Sao Paulo Railway uses the terminal in Sao Paulo known as Luz station. The through tracks at this terminal are below the level of the street, and four foot bridges are being used on the level with the station floor to convey passengers across these tracks to up and down trains respectively.

Sao Paulo is a typical town of modern Brazil. It covers about 14 square miles and its population is approximately half a million. Its manufacturing output is said to reach a value of \$20,000,000 annually and is made up of cotton, wool and jute goods, shoes, hats, beer, pharmaceutical goods and perfumery, matches and a number of other commodities. On the other hand, Sao Paulo is said to have imported more automobiles to date than any other city in Brazil. Remarks on the steamers from Buenos Ayres would seem to indicate that Sao Paulo is the business town of the republic and is fast outstripping in many ways the more attractive Rio de Janeiro. The same remarks likewise draw attention to the rumor that when a Brazilian has accumulated enough money in Sao Paulo he goes to "Rio" to spend it—which is in itself an advertisement for both cities.

Hurried railroaders—and others—should find time while in Sao Paulo to visit the "Instituto Serumtherapico," which

A British 4-6-0 at Alto da Serra

in plain unvarnished English means Snake Bite Farm. Here, in order to vary the monotony of rails, stations, engines and cars, he can look upon a collection of live snakes the like of which he never saw before and most likely will never have a chance to see again. This institution contributes its bit to the welfare of the prospector and railroad builder in the country in providing antitoxins for protection against the bites of the venomous snakes which infest the Brazilian jungles. The institution was founded by an eminent Brazilian physician, Dr. Vital Brazil, who originated the idea of preparing serums in that manner.

The Sao Paulo Railway continues on to Jundiaby, 84 miles northwest of Sao Paulo, where it meets the southern end of the Paulista Railway. A section of this line between Jundiaby and Campinas is now being electrified. The electrified division will be 28 miles long and double tracked. Power at 88,000 volts, 60 cycles, will be furnished by the Sao Paulo Light & Power Company and the initial motive power will be 8 freight and 4 passenger locomotives. The cost of the electrification is expected to be approximately \$2,000,000 and the work is being done by the International General Electric Company. The system to be used will be similar to that of the electrified divisions of the Chicago, Milwaukee & St. Paul, with a 3,000 volt overhead line and the locomotives are similar to those used by the Butte, Anaconda & Pacific Railway with the addition of regenerative braking apparatus. The eyes of Brazil are on this job and

none are going to watch its progress with more earnestness than the Paulista's affluent neighbor in the "neck of the bottle," the Sao Paulo Railway.

The road bed, like everything else on the Sao Paulo line, is excellent. Rails weigh 93 lb. per yard and are supported on rail chairs on each crosstie, such as is the custom in England. The motive power on the level stretches of the line consists mainly of the conventional designs of British locomotives similar to those referred to in the previous articles on the railways of South America which have appeared in the *Railway Age*.

Those who have watched the Britishers' way with locomotives have recognized their disposition to prefer side-tank designs. This tendency has been carried out, perhaps to a fault, in many instances in South America, where the distances to be traversed would seem to call for locomotives of extra liberal tender capacities. It is not a novelty to witness one of these otherwise excellent machines almost anywhere in South America hauling a flat car loaded with wood or coal, as the case may be, in lieu of the tender. A hole cut in the rear of the abbreviated coal bin on the rear of the frame behind the cab admits of passing coal or wood to the fireman. One of these engines is shown in an accompanying photograph. There are some handsome Consolidations and ten-wheelers in service as well. Cars, like a majority of those in South America, are of wood, well built and similar to our own designs, rather light and are mounted on two four-wheel trucks.

The next, and final, article of this series will deal briefly with several other Brazilian railways and will discuss in some detail the prospects of developing an extensive market in that country for American railway supplies. This article will appear in an early issue of the *Railway Age*.

## Department of Transportation Proposed

WASHINGTON, D. C.

CREATION OF A NEW GOVERNMENT department of transportation with a cabinet officer at its head, to coordinate the government's relations with rail and water transportation, including inland waterways and possibly motor truck transportation, and to take over the administrative as distinguished from the judicial functions of the Interstate Commerce Commission and the Shipping Board, is now under consideration by the Harding administration. The question is particularly under the consideration of a joint Congressional committee appointed by the last Congress to study and recommend a reorganization of the functions of the executive departments and a department of public works and a department of public welfare are also being discussed. As an alternative to the separate department of transportation another plan being studied contemplates making the present Department of Commerce, of which Herbert Hoover is now the head, into a department of industry and transportation. Mr. Hoover is anxious to develop largely the scope of the Department of Commerce for the purpose of making it in the widest sense a department of service to the commerce and industry of the country and some of the tentative plans which he is understood to have considered for the reorganization of his department were briefly outlined in the *Railway Age* last week. One feature of the plan understood to be considered was the establishment of a bureau of transportation in that department, but Mr. Hoover's plans are to a considerable extent contingent upon the results of the work of the joint Congressional committee. It is necessary to find out what departments are to be established before much can be done in the way of reallocating the functions of the various bureaus and commissions now in existence.

Secretary Hoover has discussed some of the phases of the proposed reorganization in his conferences with newspaper

men and on March 10 authorized a statement in which he discussed some of the general phases of the subject in part as follows:

In order to do service to the greatest advantage I wish to establish a wider and better organized co-operation with the trade and commercial associations, and will in a short time present some plans to this end. I want to see our efforts to push our foreign commerce more closely related to our industries. This sort of enlarged activity is within the original purpose of the department, and requires neither legislation nor burden upon taxpayers. This is no time to ask for appropriations to undertake new work. It is the time to search for economy and reorganization, for effective expenditure on essentials, the reduction of less essentials, and the elimination of duplication.

Outside of voluntary measures, the only immediate extension of service lies in securing greater internal efficiency in which I am certain all the bureaus join. The future of the department in its abilities to meet the needs of our industries and trade must await the thorough reorganization of the whole executive machinery, now being vigorously undertaken by Congress. The need of it, both in economy and to secure more definite purpose in government departments, does not need demonstration.

The great economic difficulties that we inherit from the war are obvious enough and they emphasize the necessity of better governmental machinery to assist in their solution. In the long run, we may as well realize that we must face a lower standard of living in Europe many years ahead. The production costs of her people will in consequence be lower than even before the war. If we meet this competition and still maintain our high standards of living we will have to work harder; we will have to eliminate waste; we will need to still further improve our processes, our labor relationship and business methods. If we would so improve our national efficiency and our foreign trade we must consider our transportation, both railway, water and marine, as one system directed to serve the nation as a whole. The development of certain trade routes through our mercantile marine as the real extension of our inland transportation; the improvement of great waterways; the opening of the Great Lakes to ocean-going vessels; the development of great electrification of our power necessities; and the handling of our labor readjustment by moderate men on both sides are all problems that have a fundamental bearing on the recovery in commerce and on our ability to compete.

If I were outlining one of the most essential directions for expansion of governmental activity, it would be in the constructive study and ventilation of the whole gamut of these possible improvements and of elimination of our great wastes in labor, in material, in power and a host of other directions.

There are some economic difficulties arising from the war that will no doubt solve themselves with time, but an infinite amount of misery could be saved if we had the same spirit of spontaneous co-operation in every community for reconstruction that we had in war. Government departments can at least try to do something to inspire such renewed co-operation. For instance, we have three or four million idle men walking the streets, and at the same time we are short more than a million homes; our railways are far below their need in equipment; our power plants, waterways and highways are all far behind our national needs in normal commerce. To apply this idle labor to our capital equipment is one of the first problems of the country.

Another outstanding economic trouble is that our farmers and our manufacturers are overloaded with food, raw material and goods that we cannot market abroad, and at the same time great masses of people overseas are cold and hungry. These people can only purchase on credit pending their own economic recuperation, and our own recuperation depends greatly upon theirs. We are thus not facing over-production, but a breakdown of credit links between us and the areas of under-consumption. Congress has provided the way for creation of foreign credits by banking co-operation under the Edge Act, and the logical and economic thing in the whole national interest is for our bankers to work something out. Foreign credits are better than rotten food.

There are some new forces in the world's commerce that must cause concern. There is a tendency in European nations to definitely mobilize the export, and in some cases the import, trades for militant commercial invasion. In some instances this is being done under government direction and organization, and often even with government finance; in others, it is being carried out by government leadership and suggestion. Such formal or informal combinations may render the position of our merchants and exporters precarious

indeed. Beyond this, where these controls are instituted over their own imports of cotton, food and other agricultural products, they seriously dominate the prices of our own farmers, and where they are instituted to secure control of the world's natural resources in minerals, oils, etc., they may dominate our future supply of these vital raw materials. Our competitors are within their rights in these matters, but we must protect ourselves. Our commercial community has the right in law and has been encouraged by Congress to combine for business outside our frontiers, precisely for the purpose of meeting such contingencies as this. But it all requires that our trades co-operate in an enlightened sense of national service as well as immediate interest.

All together, more economic taxation, tariff, large economy in government through internal bureaus, reorganization and agreements on disarmament and systematic government co-operation, will all contribute to help us out of the ditch. We will get out—yet when all is done the rapidity with which we get out will have depended upon the degree to which we pull together.

## Stoker Fired Locomotive Makes Continuous Run Over Three Divisions

**T**O DEMONSTRATE that a trip for a locomotive need not necessarily be limited to one division of approximately 100 miles as has been generally the fixed practice on railroads for many years past, the Erie Railroad recently planned a test run by which one of its through New York-Chicago passenger trains would be hauled over three divisions, by one engine alone instead of using three engines for the three divisions as is the practice at the present time.

This test was based on the belief that the superior firing service of the modern mechanical stoker on heavy locomotives and long runs would render fire cleaning unnecessary at the end of each division. Continuous operation over the three divisions would be advantageous as it would eliminate the costs of terminal handling, such as changing engines, cleaning fires, coaling, turn table and roundhouse service, time consumed, etc. It was believed these charges could be divided by three.

Accordingly on February 24, heavy Pacific type engine No. 2926 equipped with a Duplex stoker attached to Erie train No. 3, consisting of one mail car, one express car, two coaches, two Pullman cars and one dining car left Jersey City at 12:18 p. m. for a continuous trip over the New York, Delaware and Susquehanna divisions, a total distance of 332.3 miles. The train arrived at Hornell, the final terminal, at 11:28 p. m. on time, having covered this distance without incident in 9 hours and 13 minutes.

On the return trip, February 25, the same engine left Hornell at 10:57 a. m., one hour and one minute late, with train No. 4, consisting of one mail car, one express car, two coaches, two Pullman cars and one dining car, arriving at Jersey City at 7:00 p. m. on time. There was no hand firing done nor was the rake used during the round trip of 664.6 miles.

The fire was clean on arrival at Jersey City terminal, the ash pan being reasonably free from ash and not in any way clogged; and insofar as the condition of the engine was concerned, it could have been placed on another train and returned to Susquehanna over two divisions, a distance of 192 miles. This trip demonstrated decisively the practicability of one engine covering three divisions, and this was only made possible by this high speed Pacific type engine being mechanically fired.

THE WESTERN RAILWAY CLUB at the Hotel Sherman, Chicago, on March 21, will listen to a paper by J. Gardner, electrical engineer of the Chicago, Burlington & Quincy, the subject of which is "Electrical Development and Standards in the Power and Lighting Field."

# Railroads Hold Conferences on Wage Reductions

## Disagreement Marks Conferences with Unskilled Laborers— Reductions for Other Employees Announced

**D**ECREASES IN WAGE RATES for many classes of employees have been announced by several important railroads during the past week. In the meantime conferences will be held with these employees in the attempt to arrive at an agreement. Several roads have during the week held conferences with unskilled labor and the general disinclination of these employees to accept reductions would seem to indicate that the Labor Board will have to decide on the merits of many of these controversies.

The Erie has withdrawn all its wage reductions in conformity with the decision of the Labor Board, summarized in the *Railway Age* of last week, which ruled that these reductions were put into effect contrary to the rulings of the Transportation Act. The road will now reduce forces in practically every department in order to make the necessary reductions in operating expenses until such a time as the adoption of lower wage scales will permit of an increase in the number of employees.

A reduction in operating expenses was absolutely necessary, according to the management, in order to avoid a receivership and the most equitable way to meet it was to effect the necessary economies by throwing as few men as possible out of work and distributing the enforced hardship over a large number of officers and employees from the president on down. Since this method of meeting the situation was not permitted the company had no recourse but a drastic reduction in the number of employees. The failure of income to meet expenses has brought about a situation, the management says, which calls for immediate action and it will not be possible to await a reduction in wages which may be some time in coming.

### Erie Calls Conferences

The company, in restoring wages to their previous levels, assumed the same position before the Labor Board as any of the other carriers seeking reductions in rates of wages of their employees and is now in a position to seek reductions in wage rates in the same manner as the other roads. Consequently conferences were called at Hornell, N. Y., for March 17 and 18 with the shop crafts employees, the maintenance of way and signal men, the clerical forces, telephone and telegraph operators, train dispatchers and several other minor classifications of employees whose wages it is proposed to reduce. In the event of an agreement regarding these wage reductions they will be put into effect on April 15. Otherwise the road will appeal to the Labor Board to establish a wage scale in keeping with the reduced cost of living and the financial position of the road.

### New York Central Unskilled Laborers

#### Refuse to Accept Reduction

The New York Central held a conference on March 15 with representatives of unskilled laborers on its lines in regard to a proposal to reduce the wages of this class of labor 5½ to 14 cents an hour. The result of the conference was unsatisfactory. The employees refused to accept the reduction and the company has announced that it will appeal to the Labor Board to put in effect the reductions it asks.

The management pointed out following the meeting that not only did the representatives of the workers decline to accept a reduction in pay but that they also refused to "join the railroad in submitting the question" to the Labor Board. In reply to this latter statement, A. Spair, president of the

New York district of the Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers said, "The railroads wish the pay reduced. The grievance is theirs and therefore it is up to them to take the case before the Labor Board. . . . Our attitude does not in any way mean that we are not willing to have the case go to the Railroad Labor Board."

In addition to the decreases in wage rates asked for unskilled laborers the New York Central has announced reductions in the pay of the shop crafts employees, maintenance department workers, clerical forces and several other classifications. These reductions are to take effect on April 16. In the meantime the company will hold conferences with representatives of the employees effected in the effort to get them to agree to the proposed reductions. In the event of a disagreement an appeal will be had to the Labor Board. The date and place of the conference with the employees has not yet been decided upon.

In announcing the reduction a statement was issued at the general offices of the company which said in part:

This move is on behalf of the rate-paying public and of general industry just as much as of the railroad. The wage rates imposed upon the railroads by war-time government operation, aside from the absurd restrictions, inequalities and abuses brought about by the national agreements, are entirely out of line with the standards of today in all other branches of industry. The railroads have been compelled by law to maintain artificial standards and unbusinesslike practices in the management of their forces. The Transportation Act, however, expressly provides that the railroads shall be economically managed, so this action is in strict conformity with the letter and the spirit of the law.

The New York Central Railroad, throughout the years preceding federal control, successfully maintained harmonious and satisfactory relations with a loyal and efficient force of high class workers in all branches of the railroad organization. It now proposes to eliminate the gross evils which have been imposed upon it through the unprecedented events of the past few years, and to get back to management that is in harmony with correct business practices, on behalf of giving the traveling and shipping public the utmost of good railroad service at the lowest possible price.

Chief among the evils which the public rightfully should demand to be eliminated in wage waste, involving the payment of vast sums for services not rendered and a loss of normal efficiency amounting in many departments to upward of fifty per cent. The public is entitled when it pays a dollar to receive a dollar's worth of service from a railroad the same as from any other business institution. Artificial and unwarranted high wage scales upon the railroads are detrimental to industry generally, as well as a direct burden upon the railroads themselves which the public must pay in high rates, with the more serious alternative of suffering the deterioration or break-down of the transportation machine upon which the prosperity of our whole population depends.

On behalf of the public, the railroads are combating the so-called national agreements and rules which have produced grotesque injustices and almost insurmountable handicaps to efficient management, before the Labor Board, now sitting in Chicago. Before this tribunal the railroads are presenting volumes of evidence upon this subject and a decision will be reached in due time. The Transportation Act and the rulings of the Labor Board provide that the railroad management shall confer with their own employees in advance of any revision of wages in an effort to arrive at agreement. The New York Central is conforming strictly to these rulings and the first of these conferences, covering its unskilled labor, was held last Tuesday, with further similar meetings to be held as the task of rehabilitation of the working personnel proceeds.

It is a noteworthy fact that up to date, the representatives of labor have entered no denial whatever to the statement frankly presented to them by the managers that existing railroad wages are decidedly out of line with those prevailing in other industries. The New York Central has in progress a comprehensive study of the going rates of compensation being paid for all branches of the

labor which it requires, so that its position with respect to fair treatment of its valued employees and essential business prudence may be correct and entirely justifiable.

The New York Central, following the refusal of its unskilled laborers to accept a decrease, asked the Labor Board to put a temporary decrease in effect on April 1 and to make the permanent decrease finally decided upon retroactive to April 1.

#### Pennsylvania to Confer with Employees

The Pennsylvania, which announced general reductions in wages and salaries in a statement which appeared in full in the *Railway Age* of last week, has announced the dates of the conferences with its employees to consider reductions. These conferences will be held at Pittsburgh as follows:

March 31, maintenance of way and other unskilled employees; April 2, signal department employees except signal foremen, assistant signal foremen and signal inspectors; April 4, shop employees, except supervisory forces; April 6, telegraphers, telephone men, levermen, etc.; April 8, stationary engine and boiler room forces; April 9, clerical and station employees; April 11, engine service employees; April 13, train service employees; April 15, train dispatchers, yard masters and assistant yard masters; April 16, shop supervisory forces, signal foremen, assistant signal foremen and signal inspectors.

The amount of the proposed reduction in each classification has not been announced. The reductions are announced to take effect April 20.

#### New Haven Seeks Reductions

The New York, New Haven & Hartford has announced that on April 15 certain reductions will be put into effect in the rates of pay of the following classifications of employees: Store department employees, clerical forces, station employees, operators of office appliances, office and messenger boys, skilled and unskilled employees, and foremen in the bridge and building departments, draw-bridge tenders and pumpers, supervisory forces and mechanical craft-men in the mechanical department, stationery enginemen and boiler room employees, employees and foremen in the signal and electrical departments, dining car and restaurant employees and all other employees whose rates of pay were adjusted under decision No. 2 of the Labor Board effective May 1, 1920.

A conference was held with the unskilled laborers on March 11. No decision was reached at that time. The employees now have the matter under consideration. No conferences have been held as yet with the skilled workers and supervisory forces. In the event that the management and the employees cannot reach an agreement by April 15 the matter will be referred to the Labor Board for adjudication.

#### Other Roads Announce Conferences

Representatives of unskilled labor on the Philadelphia & Reading at a conference with the management held at Philadelphia on March 15 refused to accept the proposed decreases of from 15 to 25 per cent. Another conference will be held on March 29 at which time the representatives of the employees have agreed either to take final action on the company's proposal or to submit a counter proposal.

On March 15 an announcement of a reduction in wages of employees other than unskilled labor was issued by the Cleveland, Cincinnati, Chicago & St. Louis to take effect on April 16. The announcement invited conferences with the employees to decide their attitude on the question. The matter of a reduction in the rates of pay of unskilled labor has already been taken up by the company.

The Chicago, Indianapolis & Louisville has announced reductions in the rates of pay of practically all classes of employees with the exception of trainmen and engine

service employees, train dispatchers and telegraph operators.

The Delaware, Lackawanna & Western announced on March 15 that the rates of unskilled labor on its lines would be reduced, effective April 16, and that a conference would be held with the employees on March 23 to consider the reductions.

The railroads entering New York have announced that the wages of their marine workers in New York harbor will be reduced to substantially the same level as that which obtained on April 30 last, before the present wage scale was put into effect.

At the end of a four day conference with the management of the Gulf Coast lines at Houston, Tex., representatives of unskilled labor of that company on March 16 asked for several days in which to take up the proposed decreases in pay with the employees themselves. The decreases are scheduled to go into effect on April 6.

The Central of New Jersey has held conferences with representatives of unskilled labor on its lines relative to reductions in pay and will hold a final conference with these employees on March 24.

The Lehigh Valley held a conference on March 11 with representatives of its unskilled labor with the view of reaching an agreement to some reductions in the rates of pay. The representatives of the employees have asked until March 22 to submit a final decision. The reductions are scheduled to go into effect on April 4. The company has announced reductions in the rates of certain classes of skilled employees also, to take effect April 16. Conferences with these workers will be arranged later.

#### Cuyler Confers with "Big Four"

Warren S. Stone of the Brotherhood of Locomotive Engineers, L. F. Sheppard of the Order of Railway Conductors, W. S. Carter of the Brotherhood of Locomotive Firemen and Enginemen and J. E. Doak of the Brotherhood of Railway Trainmen conferred in Philadelphia on March 14 with T. DeWitt Cuyler, chairman of the Association of Railway Executives, on the proposal of the brotherhoods that "regional" boards be set for the settlement of disputes between employees and the managements of the carriers in each region.

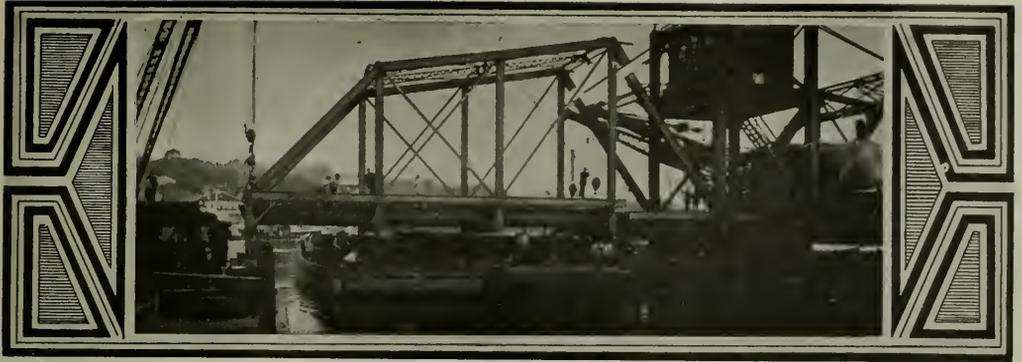

The proposal of the unions some months ago that "national" adjustment boards be set up to deal with these differences was rejected by the Association on the ground that rules and working conditions could not be equitably determined for the nation as a whole. The proposal for regional boards may be looked upon as a compromise between the idea of adjustments on a national basis and that of having a local adjustment board for each individual road. Definite action on the proposal of the unions has not been taken as yet.

#### Atlanta, Birmingham & Atlantic Strike Continues

The Atlanta, Birmingham & Atlantic has resumed business on a small scale, on parts of its lines, having hired a few new men and taken back a few former employees who returned voluntarily. Receiver B. L. Bugg refused to enter into proceedings with Messrs. Chambers and Klutz, the government mediators, and they returned to Washington on March 12. Receiver Bugg said: "No matter what conclusion might be reached by arbitration, I could not pay any more money than the road earns, for the obvious reason that I would have no means with which to pay. The proposition is not susceptible to compromise."

At the beginning of this week a train was running (apparently on every other day) between Atlanta and Cordele, 171 miles, and one between Birmingham and Lineville, 104 miles. At the Birmingham end of the road some freight was moved.

The Railway Mail Service used automobile trucks to carry mail to some of the towns deprived of railway mail cars.

*Lifting Out One Leaf of the Old Draw Span*

## Bridge Renewal Marked by Interesting Methods

The Replacement of the Mystic River Draw Span Involves an Interesting Erection Program

THE RENEWAL of a double-track swing span on the Shore line of the New York, New Haven & Hartford involved the construction of an interesting type of false-work. It also entailed the use of a temporary lift span operated by two stiff-leg derricks set up on each side of the track

usual reason, namely—increased weight of traffic, had to be replaced by a stronger structure—a double-track, through, riveted truss draw span 181 ft. center to center of bearings. This is of the center or pivot-bearing type with wedges under the trusses at the center pier and is electrically operated.

As the old end piers were in very poor condition, it was necessary to replace them. This was done by cutting off the ends of each pier and building two concrete towers—one at each end—resting on piles. The end bearings of the new draw were later to be carried by a cross girder made up of heavy I-beams spanning transversely between these towers.

General View of the Bridge

that were also employed for a portion of the erection and dismantling operations. The work was hampered by both railway and water traffic and had to be carried on with a minimum of interference with each.

The Shore line of the New York, New Haven & Hartford crosses the Mystic river in the outskirts of the town of Mystic, Conn., and at a point where the river empties into one of the many indentations in the Connecticut coast line. As the river is navigable, any bridge over it must care for both river and railroad traffic. The old structure was a double-track, through, pin-connected draw span of the rim-bearing type 178 ft. center to center of end bearings, and steam operated. The approach on either side consists of a pile trestle and an earth fill protected by retaining walls and rip rap. The old draw span was built in 1892 and for the

A Partial View of the New Superstructure

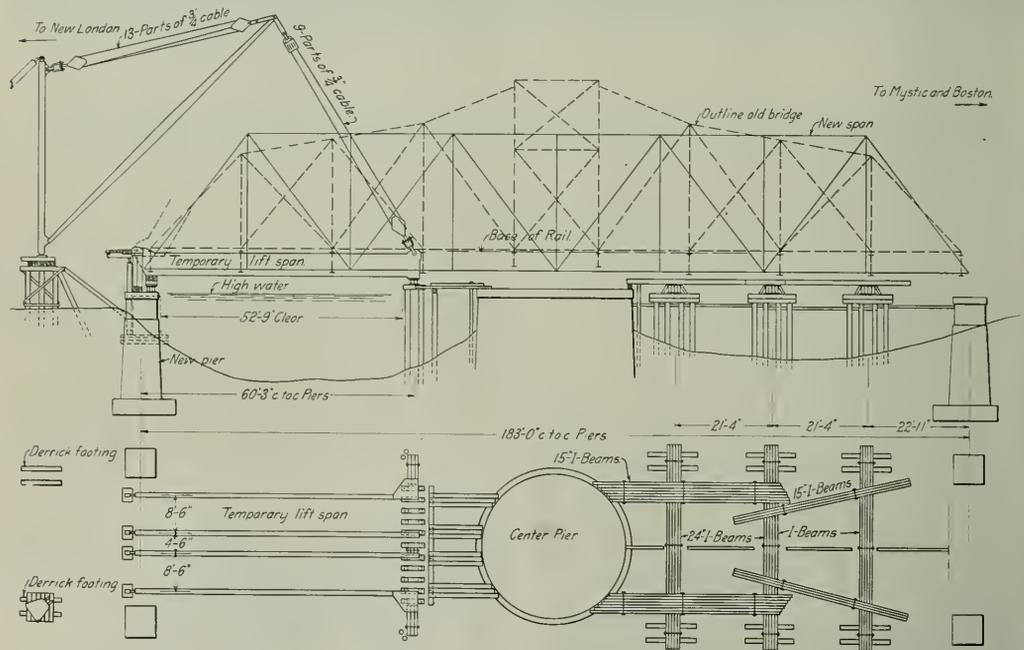

During the building of the towers, the ends of the old span were carried by temporary pile and I-beam supports.

The removal of the old span and the erection of the new bridge had to be carried on so as to interfere as little as possible with either the railroad or river traffic. The water at the bridge is shallow except for the channel dredged for navigation under the west arm of the bridge. The rail level across the bridge is low, so that there is but little headroom under the bridge. There is a total of about 12.26 ft. from base

of rail to mean low water. Because of these conditions the floating of the old or the new bridge intact would have been greatly hampered by the surrounding shallow water while a trestle run-around for traffic would have been very expensive. A further complication arose from the fact that the center pier also required considerable work done upon it before receiving the new bridge. All of these considerations made it advisable to erect the new bridge in the permanent position and at the same time maintain railroad service and river navigation. The latter consisted mostly of the passage of many fishing vessels, an occasional schooner and tugs with barges, the passage of which could be interrupted, when absolutely necessary, for a period of 36 hours.

In brief, the general erection scheme was to place falsework in the east channel, and at a predetermined time suspend navigation, block the east arm upon falsework, float

The hinge lift span in the west channel consisted of two single-track, deck plate girder spans braced together at the ends and at intermediate points, and with top and with bottom laterals. At the inboard end, the girders were connected to hinge shoes with the connecting pins at the elevation of the top of the rail. These shoes were carried upon a timber bent which rested upon timber beams spanning transversely between the concrete towers, and in addition, were blocked upon the old pier. When the span was in a closed position for carrying traffic, the bottom flanges of the girders at this end were also supported on the I-beams of the permanent cross girder. At the outboard end, the girders were supported on 15-in. I-beams which were carried by a double pile bent driven in the channel west of the center pier. These girders were obtained by cutting in half the two girders of a 120 ft. draw span which had been removed from another

Falsework Plan and Elevation, Showing the Position of the Temporary Lift Span

out the west arm, and place in the west channel a temporary hinged lift span. Following this it was required to erect as much as possible of the new bridge with all necessary machinery for turning and later suspend navigation again for 36 hours and remove the temporary lift span and erect the west arm.

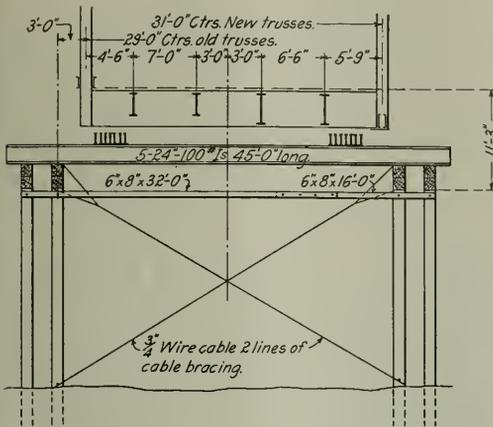

The falsework in the east channel consisted of 12 pile bents driven outside of the trusses, and arranged in pairs to receive the ends of 24-in. I-beams placed transversely of the bridge. Upon these I-beams, longitudinal 15-in. I-beams were inserted, upon which the old floor beams were later blocked up. As the caps were located close to the water, it was impossible to place any effective timber cross bracing, either transversely or longitudinally. However, submarine cross bracing of wire cable was placed transversely and the bents were shored longitudinally to the piers. The position of the piles outside of the bridge made it possible to drive them from a floating driver with little interference with the railroad traffic.

bridge, and were adapted to the work by the addition of bracing and suitable details at the ends.

To provide for the placing of the temporary lift bridge as well as for its operation, and any other necessary work, two 30-ton steel derricks with 70-ft. booms and two-drum hoisting engines were located on pile supports, one on either side of the trestle approach and near the west end of the bridge. The booms of the two derricks were set in a fixed position of about 45 deg., with the load falls secured to the outer ends of the lift spans, which were raised and lowered by operating the hoisting engines in unison.

A 60-ton locomotive crane was provided for handling the erection. This was supplemented on occasions by another from a nearby operation. As traffic was heavy, a 30-ton steel derrick with a 90-ft. boom was erected on piling to the south of the bridge to take material from a storage space on piles at the east end of the bridge and carry on some of the erection or dismantling when the locomotive crane was not permitted out on the main line.

After all falsework in both channels had been completed and the derricks erected, the temporary I-beam supports carrying the west end of the old structure were replaced by the permanent pier girder. Later all navigation was suspended for 36 hours beginning at 5:00 a. m., and ending at 5:00 p. m. the next day. The east arm and the first panel

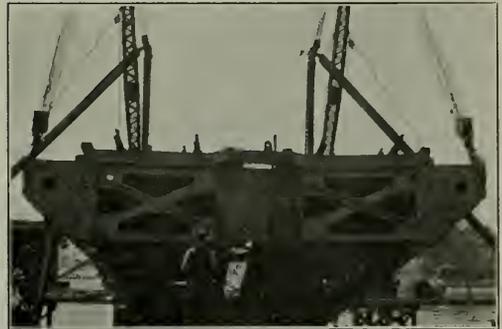

A Cross-Section of the Falsework

of the west arm to the west of the center pier, were blocked upon the falsework, and two deck barges with blocking were floated under the west arm. Rail traffic was suspended at about 6:50 a. m. and the two locomotive cranes were run out on the bridge over the center pier and hooked onto the first floor beam west of the pivot pier. The load falls of the two derricks for operating the lift span were hooked onto

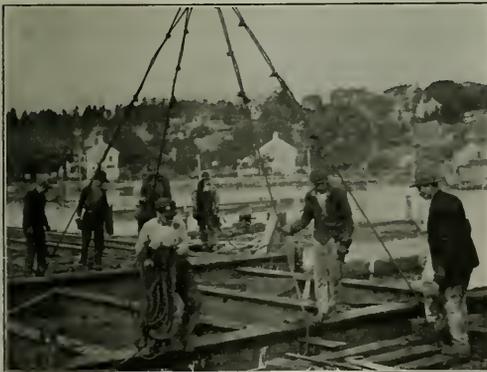

in pairs with their bracing and ties. One pair was then brought out on the trestle by the work-train, and the two derricks picked up the girders and set them to place in the west channel. Rail was laid on these; the second pair of girders brought out on cars on this track, and set to place by the derricks. The first track was ready by 10:53 a. m. and the first train crossed at 12:01. The second track was ready by 12:16 p. m.

On the following day the old west arm was dismantled on the boats lying in the west channel by all three derricks, and the various parts loaded on cars or set off in shallow water. The connections for the load falls were placed on the outboard ends of the girders, and these falls connected. By 5 p. m. of the second day the channel was clear and the temporary lift span ready to open for navigation, which was awaiting this moment.

The crane and the derrick then removed the remaining portions of the old structure and erected new material in the east arm and the first panel of the new west arm. This was riveted up, the operator's house built, and all machinery and electrical equipment installed, ready to operate the bridge as soon as the west arm was completed. In the meantime the changes were completed in the old pivot pier, and trans-

The Temporary Lift Span Partially Open

Lifting Out the Last Panel of the Floor System in the Old East Arm

the west end floor beam. The trusses and bracing were cut through with acetylene torches on the east side of the first panel point west of the pivot pier. The cranes and derricks then lowered the three panels of the west arm to the boats and they were floated a short distance away. In the meantime the bent for supporting the hinge shoes of the lift span was placed, and various other details were perfected at the west pier.

Previously the girders for the lift span had been assembled

verse I-beams placed for distributing the load from the wedges under the trusses over the pier.

For the purpose of completing the erection across the channel navigation was again closed for 36 hours, beginning at 6:30 a. m., when the temporary lift was put out of commission. The remaining three panels in the trusses of the west arm and one panel of top bracing were then erected, using the locomotive crane and the derricks which had operated the lift span. At 6:34 a. m. on the following day railroad service over the bridge was stopped, and the west derricks removed the two pairs of lift span girders and loaded them to be carried away. All temporary material was cleared from the west pier, the pier girder shifted to permanent position and the floor system filled in and the portal placed. By 12:02 p. m. one track was ready and the first train moved across, and by 12:30 the second track was ready for traffic. The remaining top and bottom laterals were placed; also all shafting and machinery which had not been previously bolted in place on the bottom chords in the yard, and at 5:22 p. m. a partial opening was made to permit boats to pass through.

After this there remained the riveting of the west arm and any final adjustment of the wedges, the removal of the falsework and whatever old structure had been temporarily placed in the water, the removal of the derricks and a general cleaning up.

While the general sequence of the erection was not that

which is usually employed, the alinement and the deflections of the two arms of the bridge worked out satisfactorily.

The design and the construction of this bridge were under the direction of Edward Gagel, chief engineer of the New Haven; W. H. Moore, engineer of structures; I. D. Waterman, engineer of construction, and P. B. Spencer, resident engineer. The bridge was fabricated and erected by the American Bridge Company of New York, under the direction of J. B. Gemberling, manager eastern division, erecting department; H. H. Starr, assistant engineer, and E. R. Collins, foreman.

## Benefits Derived from Apprentice Training\*\*

By John H. Linn

Assistant Supervisor of Apprentices, A. T. & S. F.

WHEN THE WORK of apprentice training was first begun on the Santa Fe thirteen and a half years ago, we were told the object was not to make mechanical engineers, but skilled mechanics for our shops and round-houses, men trained and educated Santa Fe way. This we have done.

During this period we have graduated 1,528 of the best mechanics that can be found anywhere in the country; at least we think them the best. Certainly no others would be so well suited to our particular needs. During the next six months we will graduate about a hundred more, and so on.

Just as a manufacturing plant finds in the development of its primary product that certain by-products can be produced with but very little extra effort or expense, so we have found in training and developing mechanics, a number of other good results have been obtained, a few of which I wish to call to your attention.

First, I would mention the output in work performed by the apprentices. We do not like to speak about this, for we have always insisted that the ultimate output in skilled mechanics for our future needs is more important than the immediate output in work done by those being trained, but our more than 1,700 apprentices, under the supervision of competent shop instructors, have performed a surprising amount of work. But if you stop to think about it, it is not surprising. We not only teach our boys correct and up-to-date methods, but impress upon them that time is just as important as materials. Moreover, a young man can excel an older man in any contest requiring quickness of mind or of muscle. So it is not to be wondered at, that when you give him competent instruction, he can turn out a great amount of work, often excelling the older mechanic.

But to do this you will have to have a number of competent shop instructors, skilled mechanics themselves, to give him the instruction he needs in the shop. There is a by-product from the work of these shop instructors. They greatly assist the foremen, are able to relieve the foremen during the latter's temporary absence, and are particularly good material for selection to permanent positions as foremen or supervising officers. The salary of a shop instructor should not be considered as an expense but as an asset or investment. There is also a by-product in the work of the school instructor. In addition to instruction in the school room, he looks after all shop drawing, and sketching, and blueprints. He is frequently the only technical man around the plant. As such he is a very valuable assistant to the master mechanic or superintendent of shops.

The instruction of apprentices also has a very wholesome

effect upon the other men in the shop. They are more anxious to use up-to-date methods in a vain effort to keep these younger boys from surpassing them.

But perhaps the greatest by-product outside the making of skilled mechanics is the value to the company of the promoted graduate. Mr. Basford has told you what railways need is not new blood, but to circulate the blood we have. Many men would make good if given the chance. You do not always know what they can do until you try them. It has long been a policy on the Santa Fe to promote from within our own ranks. As evidence of this policy and of the fitness of our apprentice graduates, we have 220 of our graduates filling positions above the ranks, many of them positions of great responsibility. In fact the last three master mechanics appointed were selected from our roster of apprentice graduates. Remember, these are all young men who have been graduated in a little more than a decade. We shall have a great many more in another ten years. To what heights may not some of them climb?

Someone has said that the greatest good one individual can do for another is to help that individual become an independent self-sustaining member of society. We are doing this for our young men; we are teaching them the best way to help themselves is to co-operate with the management; that their own success and prosperity is dependent upon and closely linked with the success and prosperity of the corporation as a whole. We are endeavoring, too, to make them young men of upright moral character, good citizens, loyal to the corporation which they serve.

Commenting further on Mr. Basford's paper, I would like to emphasize what he said about labor turn-over. Did you ever stop to think how many men must be hired to maintain our normal forces; what this costs in mere clerical labor involved, what the cost due to breakage of machinery, due to work spoiled by newly hired help; what the loss to the company due to the time machinery is idle from time one man leaves until his successor actually gets on the job, what the cost due to increase in frequency and severity of personal injuries of ignorant and inexperienced employees, what the cost of training these new men to take the places of the men who quit, what the effect upon the older, more contented employees of this continuous influx of the boomer element, most of whom are generally disgruntled and dissatisfied? I think if railway managements could realize how greatly these factors enter into and affect the balance sheet and the cost of production and operation, greater attention would be paid to selecting, training, and placing men. There is no better way than by adopting and carrying out some system of definite training for the employees in the various departments. There is no time like the present for doing this. It is well known that when times are dull, building operations and extensive repairs to equipment may be carried on more economically and more successfully and with less interference with regular business routine than when business is at flood tide. Men and materials are both more plentiful and can be more carefully selected and tested. For these and similar reasons, times of depression are most fitting for the training of employees and for sifting out and building up the man power which, like buildings and equipment, will be so badly needed for the good times which are bound to return.

EIGHT MILLION DOLLARS is the total amount of the losses sustained by the American Railway Express Company, because of thefts of merchandise in transit, during the period of Government control, according to a statement made by W. A. Benson, assistant vice-president of the company, in the Federal Court at Macon, Ga., on March 15, in connection with the trial of 54 men indicted on charges of conspiracy to rob the company of more than \$1,000,000 worth of goods.

\*From the discussion of the paper on foremen by George M. Basford at the February meeting of the Western Railway Club.

## Two Interstate Commerce Commissioners Appointed

WASHINGTON, D. C.

PRESIDENT HARDING on March 11 sent to the Senate the nominations of John J. Esch, who has been chairman of the House committee on interstate and foreign commerce, and Mark W. Potter, who has been serving on the commission under a recess appointment by President Wilson which expired on March 4, as members of the Interstate Commerce Commission. Mr. Esch was appointed for the full term of seven years, succeeding Robert W. Woolley, whose term expired on December 31, and Mr. Potter for a term ending December 31, 1923. This leaves two vacancies upon the commission, one to succeed James S. Harlan, whose term expired on December 31, 1918, and one for one of the new positions created by the Transportation Act when the membership of the commission was increased from nine to eleven, for the term expiring December 31, 1924. Henry J. Ford, who has been serving under a recess appointment since last summer, was appointed to succeed Mr. Harlan, and James Duncan, first vice-president of the American Federation of Labor, was appointed for the other vacancy, but never accepted the appointment. The Senate committee on interstate commerce at once held a meeting and voted a favorable report on confirmation of the appointments by the Senate, but it was announced that Senator La Follette of Wisconsin, intended to oppose the appointment of Mr. Esch. Mr. Potter's nomination was confirmed by the Senate on March 12, but that of Mr. Esch was held over until the next session to allow Senator La Follette to file a minority report.

A photograph and sketch of Mark Winslow Potter were published in the *Railway Age* of May 14, 1920, at the time of his original appointment by President Wilson. Mr. Potter was a member of the law firm of Hornblower, Miller, Garrison & Potter, of New York, and has been connected with the Carolina, Clinchfield & Ohio, of which he became counsel in 1905, chairman of the board in 1907, and president in 1911. He has been very active in the work of the commission, serving during the summer and fall on Division No. 5, which had charge of car service matters, and recently as a member of Division 4, which has particular charge of the financial matters within the commission's jurisdiction, such as the administration of the loan fund and supervision of the issuance of railroad securities.

John Jacob Esch has been in Congress since 1899, has been a member of the committee on interstate and foreign commerce for about 18 years, and has been chairman of that committee since 1919. He has manifested a special interest in railroad and transportation affairs in Congress and has played a very active part in the framing of railroad legislation. He was one of the authors of the Esch-Townsend bill, which was largely the basis for the Hepburn law of 1906,

and as chairman of the committee he had much to do with the framing of the transportation act of 1920. Mr. Esch was born at Norwalk, Wis.; on March 20, 1861, graduated from the University of Wisconsin in 1882 and received the degree of LL.B. in 1887. He was admitted to the bar in 1887 and engaged in the practice of law at La Crosse, Wis., as a member of the law firm of Winter & Esch.

## New York Commission and Automatic Stops

THE NEW YORK STATE Public Service Commission, Second District, has been asked by the New York Central to defer action looking to experiments with an automatic train-stop, and apparently intends to make no order in the premises until after a further hearing. Counsel for the road, at the hearing held by the Commission in Albany on March 10, objected to the issuance of an order requiring the road to install apparatus, asserting that the Federal Government having taken action, in Section 26 of the Transportation Act of 1920, the New York Commission had no jurisdiction in a matter of this kind. By that Act, Congress clothed the Interstate Commerce Commission with mandatory power to order the installation of safety appliances. It was claimed also that the proposed installation and tests would cost probably \$200,000. The counsel of the railroad company was accompanied by E. B. Katte, chief engineer of electric traction, who also is a member of the A. R. A. committee on automatic train control.

It appears that the request of the A. R. A. Committee that the Sprague automatic train control be tried on the New York Central has been favorably received by the road; but with the suggestion, or condition that as the proposed test would be made for the purpose of general information and not for the benefit of the New York Central alone, the American Railway Association ought to bear the expense of the test.

Frank J. Sprague, who was present at the hearing, asked the Commission to consider that the expense of automatic stops would be offset by the savings from loss of life and property, and by possible increases in efficiency of operation and capacity of tracks. He suggested further that on sections of road made specially safe by automatic stops there might be an increase in passenger fares, on the same basis that passengers pay an additional sum for the better protection afforded by limited trains. He had already suggested to the Interstate Commerce Commission that the Federal Government provide funds for the promotion of automatic train control.

The Commission, whose report on automatic train control was abstracted in the *Railway Age* of March 4, page 497,

J. J. Esch

examined a number of devices besides those which were mentioned in that abstract.

The following five companies, responding to inquiries from the Commission, declared themselves ready to contract for an installation on the New York Central and to guarantee its adaptability to the conditions on that road: General Railway Signal Company, Rochester, N. Y.; National Safety Appliance Company, San Francisco, Calif.; Schwyer Electric & Manufacturing Company, Easton, Pa.; Sprague Safety Control & Signal Corporation, New York City; Union Switch & Signal Company, Swissvale, Pa.

The Commission finds the present status of the devices examined to be as follows:

General Railway Signal Company: Now being developed in the laboratory with intentions to make a further test on a short piece of track with one locomotive. Mechanical parts practically completely developed.

Union Switch & Signal Company: Complete laboratory demonstration developed, with all parts mechanically complete. Ready for track installation test.

Schwyer Electric & Manufacturing Company: This device has been subjected to test on a branch of an eastern railroad. Mechanically should be further developed. This is in process. Ready for track test after a few modifications.

Sprague Safety Control & Signal Corporation: Complete laboratory and mechanical development. Ready for immediate track test.

National Safety Appliance Company: Has been tried on a railroad in California, but has since been modified. Apparently ready for test within reasonable time.

New York Air Brake Company: Device has been developed and is installed on a locomotive in the yard of the company.

Regan Safety Devices Company, Inc.: Induction portion of apparatus not yet fully developed. Remainder of device in manufacturing stage, and on trial under operating conditions on 20 miles of double track railroad.

G. P. Finnigan: A test of the fundamentals of this device has been made on two railroads. Apparently the design of parts now recommended has not been developed beyond the making of drawings.

Pittsburgh Train Control Company: At present in the laboratory development stage.

Automatic Train Control Developing Company, Inc.: In the laboratory stage. Test on track could be made in a reasonable time.

The snow flangers used on the New York Central extend the full width between the gage lines of the track and extend downward  $3\frac{1}{2}$  in. below the plane of the tops of the rails. The Commission says that these flangers would have to be changed so as to leave free a space in the center of the track 20 inches wide; for it would not be practicable to require the flanger to be raised at all of the points where track magnets, etc., would have to be installed. The Commission, in its report, intimated also that certain proposed devices designed to amplify electric current induced in receiving elements might need further development, as they have not yet been tried in signal work.

## State Rate Case Argued in Supreme Court

WASHINGTON, D. C.

**O**RAL ARGUMENTS before the Supreme Court in the Wisconsin intrastate rate case, in which 43 states are contesting the order of the Interstate Commerce Commission increasing rates within the state by the amount of the interstate increases, were begun on March 11 and concluded on March 15. The state of Wisconsin was represented by M. B. Olbrich, the railroads by Alfred P. Thom and Bruce Scott, and the Interstate Commerce Commission by P. J. Farrell, while John E. Benton presented the argument for the state commissions generally. Mr. Olbrich did not contest the constitutionality of the Transportation Act, but contended that the federal commission had exceeded the

authority conferred upon it by the act. Mr. Benton contested the constitutionality of the 6 per cent rate-making rule of the act and also declared that if the order of the commission is upheld the states would be deprived of all rate-making powers. Both of the state representatives tried so hard to give the impression that the commission had merely ordered the rates increased for the purpose of increasing revenues without finding discrimination that Mr. Scott devoted a large part of his argument to the facts in the case and the commission's findings of discrimination. The chief justice at one time remarked that the principal argument seemed to be on the question of fact as to what the commission had found rather than on the question of its power because the state representatives, he said, seemed to concede that the Interstate Commerce Commission had power to correct discrimination.

### Brief of I. C. C. Counsel

Extracts from the briefs in the case were published in our issue of two weeks ago. Chief Counsel Farrell of the Interstate Commerce Commission said in part in his brief:

We have shown that in making and issuing the order involved in this suit the commission did not exceed the authority conferred upon it by the interstate commerce act as amended by the transportation act, 1920, and in doing so we called attention to the provisions of law under which the commission operated. We think an examination of these provisions will be entirely sufficient to demonstrate that in making them Congress did not manifest any intention to interfere, or to authorize the commission to interfere, with rates, fares, or charges for transportation of passengers or property in commerce which is purely intrastate. The appellants contend that Congress did so interfere, and we understand this to be, in substance, the only claim advanced by them in support of their contention that the action of Congress referred to is unconstitutional.

We thus see that the power of Congress over interstate and foreign commerce is full and complete; that where it extends it dominates; that it was vested in Congress to secure uniformity of regulation against conflicting and discriminating state legislation and to protect the national interest by securing the freedom of interstate commercial intercourse from local control; that such power enables Congress to enact all appropriate legislation for the protection and development of interstate and foreign commerce; that this power necessarily embraces the right to control the operations of interstate carriers in all matters having such a close and substantial relation to interstate traffic that the control is essential or appropriate to the security of that traffic, to the efficiency of the interstate service, and to the maintenance of conditions under which interstate commerce may be conducted upon fair terms and without molestation or hindrance, and that, wherever the interstate and intrastate transactions of carriers are so related that the government of the one involves the control of the other, it is Congress, and not the state, that is entitled to prescribe the final and dominant rule.

That the constitutional power of Congress over interstate and foreign commerce, as that power is defined in the above-mentioned decisions, and in a large number of other decisions, of this court, which might be referred to, was not exceeded in enacting the provisions of law here involved is so clearly apparent, when the definitions are compared with the powers exercised, that, in our opinion, further argument in this connection is unnecessary.

In paragraph (4) of section 13 of the interstate commerce act, above quoted, it will be seen that all Congress did was to authorize the Interstate Commerce Commission to make orders which would remove and prevent any undue or unreasonable advantage, preference, or prejudice as between persons or localities in intrastate commerce on the one hand and interstate or foreign commerce on the other hand, and any undue, unreasonable, or unjust discrimination against interstate or foreign commerce; and that by paragraphs (2) and (3) of section 15a Congress simply authorized and required the commission to initiate, modify, establish and adjust rates so that carriers as a whole, or as a whole in each rate group or territory which the commission may from time to time designate, may earn an aggregate annual net railway operating income equal, as nearly as may be, to fair return upon the aggregate value of the railway property of such carriers held for and used in the service of transportation.

It is true, that by said paragraph (3) Congress fixed, for two years beginning March 1, 1920, the annual net railway operating income at  $5\frac{1}{2}$  per centum of said aggregate value, except that it authorized the commission, in its discretion, to increase said percentage to 6. In this connection, however, we do not apprehend

that an effort will be made by the appellants to show that this action of Congress is in excess of its constitutional power.

At the time matters covered by the transportation act were being discussed, Congress was confronted with the necessity of preserving and strengthening the interstate common carriers of the country, and making them efficient and serviceable agencies for the transportation of interstate and foreign commerce, and also for the transportation of intrastate commerce. Under these circumstances we think it is obvious that the most important matter presented for consideration was the means by which the

necessary railway operating revenues might be secured. After several months of discussion, deliberation and reflection, Congress perfected and put into operation the plan now under consideration, and our understanding of a large number of decisions heretofore rendered by this Court convinces us that in taking this action, Congress did not exceed its power under the Constitution of the United States.

A brief was also filed by the National Association of Owners of Railroad Securities.

## Shipping Board Asks Re-establishment of Rates

### Shipping Board Asks Re-establishment of Export and Import Rail Rates Through Pacific Coast Ports

WASHINGTON, D. C.

CHAIRMAN W. S. BENSON of the Shipping Board has recently asked the Interstate Commerce Commission to institute a proceeding of inquiry and investigation with a view to bringing about the re-establishment of export and import rail rates to and from points east of Chicago through Pacific coast ports in relation to the corresponding domestic rates on the basis which existed prior to the rate advance order of the director general of railroads in 1918, and the recent decision of the Interstate Commerce Commission in Ex Parte 74. In a letter to Chairman Clark of the Interstate Commerce Commission, Chairman Benson complained of the attitude of the eastern lines in failing to carry out promptly what he refers to as a promise made by the carriers at the time of the hearing in Ex Parte 74. Reviewing the situation, he says that for many years prior to the war, it was the practice of railways to maintain export and import rail rates through Pacific Coast ports on a basis lower than the domestic rates. This rate adjustment permitted the movement through the ports of traffic originating in or destined to territory both east and west of the Mississippi river. The exigencies of the war made it advisable for the director general to discontinue this practice temporarily and he accordingly on May 25, 1918, issued General Order 28, effective June 25, 1918, which cancelled all export and import rates and provided that domestic rates should apply to and from the ports. Early in 1919, requests were made to the Railroad Administration by the Gulf, South Atlantic and Pacific ports for restoration of the former relationship so that the ports might be placed in position to secure a reasonable share of the import and export traffic.

After a careful analysis the Railroad Administration made effective export and import rates lower than domestic rates via Pacific Coast ports to and from territory north of the Ohio river and east of the Mississippi river. Thereafter the Railroad Administration made effective export and import rates to and from the same eastern territory via South Atlantic and Gulf ports, using the same basis to determine the through rate as was used to determine the through rates via the Pacific Coast ports.

When the application for a percentage increase in rates was sought by all of the railroads in the United States in Ex Parte 74, Chairman Benson says, it was recognized that if the increases were allowed as applied for on a horizontal percentage basis, it would throw out of line the import and export rates via Pacific Coast ports, and attention was called to the fact that this would result at the time of the hearing on the applications.

Thereupon the Interstate Commerce Commission requested the petitioners to furnish for the record and for the information of the commission and the parties concerned, certain information. In response to questions propounded by the commission, the carriers through their counsel filed on June

8, 1920, their joint and several answer, which was designated Exhibit 1. The answer to the inquiry relating to export and import rates via Pacific Coast ports is quoted as follows:

*"Export and Import Rates via Pacific Coast. Rates made to equalize the rail and ocean rates via the North Atlantic ports to be advanced the same amounts in cents per hundred pounds as the base point rate to and from North Atlantic ports is advanced."*

"The questions propounded, including No. 11 as above set out," Chairman Benson says in the letter, "were presented to the carriers as a whole and not to any one carrier or any one group of carriers, and it was answered and filed in the record on the behalf of all carriers without reservation. No doubt the Interstate Commerce Commission in common with shippers and carriers relied upon the answer as one made by all the carriers without reservation, and it was regarded by all interested parties as a definite promise on the part of the carriers to expedite the readjustment and restoration of export and import rates via the Pacific Coast ports on the basis stated—a relationship and basis that was thoroughly understood by all concerned.

"Thereafter the interested transcontinental lines prepared a tariff on the basis as stated. The eastern lines refused to concur in the adjustment proposed by the transcontinental lines, giving as a reason that they could not afford to make the reductions that would result from the establishment of rates on the basis stated. This condition of affairs having come to the attention of the Shipping Board and having in mind the fact that several months had elapsed since the order in Ex Parte 74 was made and entered, it requested the executives of certain of the eastern roads to attend a conference or send representatives to confer on the subject of export and import rates at a meeting to be held in the office of the Shipping Board in Washington on February 4, 1921. The conference was held, on which occasion representatives were present on behalf of the following roads: Pennsylvania Railroad; New York Central Lines; Baltimore & Ohio; Erie; New York, New Haven & Hartford. There were also present Commissioner McChord of the Interstate Commerce Commission, Director of Traffic Hardie, and members of the Shipping Board.

"At said meeting it developed that after the order had been issued in Ex Parte 74, there had been a number of conferences between the representatives of Transcontinental lines and said Eastern lines, and that the proposition of the Transcontinental lines in respect to the establishment of export and import rates via Pacific Coast ports was rejected by the Eastern lines as they did not consider the proposition fair to them. Without further detail, the result of the conference was an agreement on the part of the chairman of the Shipping Board to call a joint meeting of the representatives

of the Transcontinental and Eastern lines in New York at an early date."

Following this conference, telegrams were exchanged between George H. Ingalls, vice-president of the New York Central, and the chairman of the Board, including the following:

WASHINGTON, Feb. 17.

G. H. Ingalls, Vice-President, New York Central Lines, New York City. Your wire 12th advising conference has been held. Shipping Board greatly interested and would view failure to agree on fair basis as placing serious handicap on development American merchant marine. Particularly call your attention to answer submitted Interstate Commerce Commission Ex Parte 74 by Attorney Wood for all carriers in response to commission's direct question as to how export and import rates via Pacific Coast were to be adjusted. Rates made to equalize the rail and ocean rates via the North Atlantic Ports to be advanced the same amount in cents per hundred pounds as the base point rate to and from North Atlantic Coast Ports is advanced. All parties concerned expecting rail carriers promptly carry out this adjustment. In view of long time this matter has been under consideration board feels it should have your answer not later than Saturday, February 19.

BENSON, Chairman,

NEW YORK, Feb. 18.

W. S. Benson, Chairman, U. S. Shipping Board, Washington, D. C. Yours 17th. Would respectfully advise there are other considerations not outlined in statement before commission in Ex Parte 74 that Eastern lines consider part of any concurrence on their side in statement made by Mr. Wood. I beg to assure you that this question involves large revenues and is being dealt with by the lines in Eastern territory with as much dispatch as is commensurate with importance of subject.

G. H. INGALLS.

"The answer of Mr. George H. Ingalls is considered by this Board entirely unsatisfactory," Chairman Benson says in the letter, "and in view of the statement made in Ex Parte 74 heretofore referred to, meetings that have been held since by the interested parties, the failure to arrive at agreement and the time that has elapsed, the Board has concluded that there is no likelihood of an adjustment of said rates by the interested carriers within a reasonable time.

"The Shipping Board views the question involved as one of great importance and urgency. The Interstate Commerce Commission is aware of the export and import rates applying through Canadian ports to points on Canadian rail lines, and that said rates affect not only movement through the American ports and to Canadian territory but to points in the United States as well. The maintenance of these rates by the Canadian lines, and the failure to establish such rates by the American lines directly affects the business and operation of vessels of the United States Shipping Board and other operators, as well as the business of the Pacific Coast ports. The traffic of American rail carriers is also reduced. The failure and refusal by the American rail lines to establish export and import rates from the territory referred to through Pacific Coast ports is opposed to the expressed policy of Congress with respect to the upbuilding of an American merchant marine, and the use of the various ports of the United States as we understand the law and policy declared therein. After having exhausted every effort to bring about an amicable adjustment of this matter, the Shipping Board believes it to be its duty to do all possible to enforce and maintain the law and the policy with respect to the subject matter of this communication as declared by Congress.

"The policy of placing Pacific Coast ports as well as the Gulf and South Atlantic ports on an equality with North Atlantic ports as to through rates on export and import traffic in the large producing and consuming territory east of the Mississippi river and north of the Ohio river has long been recognized as a helpful one in enabling the operation of regular lines of ships to and from the ports on the different seaboard.

"The division of the country's import and export traffic to a reasonable extent among all ports places the different sections of the country in position to get minimum rates to foreign countries for local production, which production by itself would not support a regular line.

"The policy outlined above is generally accepted as being wise and in the best interests of the country as a whole, not only in connection with the particular matter involved herein, but in preventing congestion and securing a better use of the

ports and in tending to build up an American merchant marine of the greatest use and service. It is the opinion of the board that in both the Transportation Act and Merchant Marine Act, 1920, the policy herein above stated is recognized and approved.

"The board, therefore, appeals to and requests the Interstate Commerce Commission to institute a proceeding of inquiry and investigation into this matter at as early a date as possible, with a view to issuing such order against the interested carrier as it may find necessary and just, to correct the rate adjustment against which complaint is made, and to bring about the re-establishment of export and import rates to and from eastern territory through the Pacific Coast ports in relation to corresponding domestic rates on the basis which existed prior to General Order 28 of the director general, and the decision of the commission in Ex Parte 74."

## Additional Payments Being Made on Railroad Guaranty

WASHINGTON, D. C.

ADDITIONAL CERTIFICATES for partial payments to railroads on account of their guaranty for the six months following the termination of federal control have been issued by the Interstate Commerce Commission and the Treasury Department in most cases paying the certificates within a day or so of their issuance. The following certificates have been announced by the commission since those published in last week's issue, which brings the total of certificates since the passage of the Winslow bill up to \$49,777,990:

		Previously advanced
Chicago Great Western.....	\$1,335,000	\$1,700,000
Texas & Pacific.....	1,000,000	.....
Ulster & Delaware.....	218,800	.....
Tennessee Central.....	115,000	.....
Gulf, Mobile & Northern.....	200,000	528,000
Philadelphia & Reading.....	2,000,000	2,500,000
Raritan River.....	60,000	.....
Chicago, Milwaukee & St. Paul.....	2,500,000	14,934,892
Chicago & Northwestern.....	12,000,000	.....
Chicago, Rock Island & Pacific.....	6,000,000	.....
Chicago, Indianapolis & Louisville..	400,000	500,000

The Treasury Department has also announced the payment of additional loans from the revolving fund, which had been approved by the Interstate Commerce Commission, to the Hocking Valley for \$1,053,000; New Orleans, Texas & Mexico, \$234,000; Indiana Harbor Belt, \$579,000; Western Maryland, \$1,500,000.

The Interstate Commerce Commission has also issued a final certificate for \$114,414.91 to the Western Allegheny under Section 204 in settlement of its deficit for the period of federal control, after deducting \$527.05 owed to the Railroad Administration for traffic balances and other indebtedness.

# Training and Developing the Railroad Worker\*

Individual Must Be Studied Critically and Special Instruction  
Given to Suit His Needs

By J. C. Clark

Assistant to General Manager, Oregon Short Line

THESE ARE TWO METHODS of training men. One is to provide instruction in the form of lectures, libraries, literature, etc. This does not contemplate rating or grading the individual, but simply provides the instruction

individual employee according to his value to the service, determine what his weak points are, and see that he gets the instruction best fitted to his needs.

A common method of providing instruction for employees is to fit up an instruction car and send it over the road in charge of a competent instructor. No doubt a great deal of good has been accomplished in this way and there is still room for good work along these lines.

One of the best means of offering instructions is the moving picture. This has not yet been developed as it should be, and it offers a field of wonderful possibilities. Films can be made showing the operation of the air brake, that will illustrate the action of the air pump, the manner in which the air flows from the main reservoir through the brake valve, the train pipe, the action of the triple valve, and all other parts of air brake equipment. This will be of immense value, because it will show the air actually flowing through pipes and valves, and the action of every part of the apparatus. This same idea could be followed out with the injector, superheater, valve motion, circulation in a boiler, combustion and any other subject that it is desired to illustrate.

The moving picture could also be used to give all classes of employees a larger outlook on their work. For example, a piece of freight could be followed from the time it is unloaded from the truck onto the receiving platform until it is delivered to the consignee, showing the proper manner of making up every form incident to the movement and the importance of keeping the proper record. It could show what happens if the proper record is not made, and if the piece of freight is damaged through rough handling or improper packing it could also be shown what procedure is necessary when the claim is made for damage. Too many railway employees do their work because someone has told them what to do, but do not understand the relation the part which they perform bears to the whole operation. Any instruction designed to broaden this outlook will unquestionably create more interest in the work and improve the morale. This suggests only a few things that can be done with the moving picture; the possibilities in this direction are enormous, and deserve immediate attention on the part of railroad managements.

## Concentrate on the Individual

Instructing men in groups has accomplished good results in some cases, and as outlined in the last paragraph it can be developed along new lines that will be extremely beneficial. In order to accomplish the best results, however, it will be necessary to rate each employee according to his value to the service. Where a considerable number of employees are doing exactly the same work under exactly the same conditions, their value to the organization they serve can be measured by their output or production; these conditions, however, are seldom or never found in railroad work. In the railroad game a large number of men may be doing the same class of work, but it is always under varied conditions. It is therefore necessary to find some other means of rating employees. Psychologists have devised a means for doing this which they call the "method of limited impressions."

To illustrate the application of this method to railroad

and leaves it optional with the man whether or not he will take advantage of it. The second method is to rate each

\*This is the third of a series of articles on personnel problems. The first one, "Labor Turnover—Not a Disease, but a Symptom," was published in the *Railway Age* of December 31, 1920, page 1157. The second, "The Functions of a Railway Employment Service," was published in the issue of February 4, page 329.

sider how this method of rating could be used in the best manner. When this system has been thoroughly established, a list should be made of all employees in a given class and an average percentage rating obtained for the entire class. We will suppose, for example, that the average for an entire class of employees was 75. Any employee whose rating fell below 75 would be called in by the supervising officer and informed that his rating was not up to the average of his class. He would be shown his rating card, which would indicate the qualifications in which he was deficient. He would be given the necessary instruction to improve his service and he would be told that his performance would be watched very carefully and every aid possible afforded him to improve his service and make good. Every supervising officer who had contact with this employee would be notified to help him in every way possible, by individual instruction, furnishing literature or other information that would be of aid, and in fact exert every effort to make the man see that he must improve his service or become a failure. Every employee who raises his individual average under this treatment would tend gradually to raise the average for the entire class, so that eventually a much higher average could be attained.

This system of rating could be applied to practically all classes of railroad employees, particularly in the higher crafts, the only thing necessary being to choose the most important qualifications applying to each class of work. The same methods of handling men who fall below the average could be followed and the same results obtained.

This method also provides a basis for the selection of employees for promotion, which is a most important feature. With information available that would show the rating of every man in all classes of employment, it would only be necessary to review the record of about 10 men with the highest rating from the class in which the promotion was to be made, and give each of these 10 men special study to determine which one was best fitted for the new position. If this policy were adopted and followed religiously, all employees would soon come to know that their promotion depended entirely upon their individual qualifications and this fact alone would have a wonderful effect, improving the morale, creating more interest in the work, more loyalty, more initiative, and increased safety and efficiency, resulting in better service and greater safety for the public.

## A Test to Determine the Cost of Pneumatic Tie Tamping

A TEST WAS RECENTLY CONDUCTED by the Delaware, Lackawanna & Western, in conjunction with the Ingersoll-Rand Company of New York, for the purpose of establishing some basic cost data on pneumatic tie tamping. The test was made on a stretch of main line track between Bonton, N. J., and Lincoln Park, the railroad furnishing the equipment and men to do the work. The plant consisted of an Ingersoll-Rand four tool compressor with hose and tampers. The work was done by a contractor who paid his men 55 cents an hour, but the data on the test have been compiled in such a way that the cost for any other rate of pay may be readily ascertained.

The Lackawanna required that only such time and other costs be charged as actually applied to the machine and its operation in the performance of its duty of tamping ties, and on that basis the following methods were used. For instance, the machine being a four-tool outfit, four men were used on the "guns" or tampers and their time was charged only when actually employed tamping. The foreman's time was charged only during the period that the machine was in actual operation, while the operator's time was charged for the full day whether or not the machine was in actual use.

This was done in view of the fact that it was deemed good policy to have the operator go over his machine carefully and thoroughly when not in operation.

The gang consisted of 40 to 50 men. However, only those actually working with the machine were charged to tamping. Such work as jacking up the track, cleaning the ballast, replacing ballast, putting in new ties equipped with tie plates and screw spikes, was conducted by the remainder of the gang. The ballast consisted of crushed stone of 2½-in. mesh, with 105-lb. rail laid on crossties with tie plates and screw spikes, all of the Lackawanna standard specifications.

The man compiling the data was in no way connected with the operation of the machine nor did he make any repairs and, with the exception of selecting a capable operator and instructing him originally in its operation, etc., he had nothing to do with the machine. The operator was not a mechanic and although he was fairly familiar with automobiles, he possessed no particular qualifications with reference to the machine or its operation. The men used on the tampers were all picked at random and were changed about every three or four days so that no specially trained men were used in connection with the operation of the machine or the tampers. In determining the number of ties and the lineal feet of track tamped, owing to the fact that the track was raised as high as 6 in. in many instances, run-offs were necessary and such ties as were tamped in the run-off as well as the lineal feet covered were counted in on the total for the day.

Throughout the duration of the entire test, which covered eight consecutive weeks, the tamping outfit was out of service 2½ hr., of which 1 hr. was due to the battery being exhausted and time consumed in waiting for a renewal, while the remaining 1½ hr. was due to dirt and water, making it necessary to remove and clean the carburetor and feed pipe. All the time so consumed was charged against the machine.

The summary of the results shows that for the eight weeks' run the average cost for tamping, including all items, was 11.3 cents per tie or 6.2 cents per lineal foot of track.

To determine a fair comparison or equation it is necessary to separate the average total cost into its component parts and to then reduce each part into its determining factors. These factors consist of a constant which, multiplied by the wage scale, will give the cost per tie for that particular item of the total cost. In reducing the total cost of \$1,155.92 for tamping 10,226 ties or 18,358 lineal feet of track, it will be found that this is made up as follows:

Items	Cost	Per cent	Cost per tie	Constant
Foreman .....	\$169.06	14.62	1.65	0.024 × wage
Operator .....	238.50	22.36	2.53	0.046 × wage
Labor .....	565.40	48.90	5.52	0.103 × wage
Gasoline .....	148.06	12.82	1.45	0.053 × price
Oil .....	9.38	0.81	0.10	.....
Grease .....	2.04	0.18	0.02	.....
Repairs .....	3.48	0.31	0.05	.....
Total .....	\$1,155.92	100.00	11.13 cents	.....

The constant as shown in the right-hand column consists of the figure which, multiplied by the wage scale of the man or men doing the work of tamping, will give the cost per tie for tamping by compressed air. For example, with a foreman receiving \$5.27 per day, or 66 cents per hr., with labor at 46.4 cents per hr. and gasoline at 27½ cents per gal. the proportionate cost per tie would be 0.024 times 66 or 1.58 cents; 0.046 times 46.4 or 2.12 cents; 0.103 times 46.4 or 4.78 cents, and 0.053 times 27.5 or 1.45 cents. This adds up to 9.93 cents to which should be added 0.15 cents for oil, grease and repairs, this cost remaining practically the same with the machine in good order. The result is a total cost of 10.08 cents per tie for tamping pneumatically or on a basis of 20 ties per rail length a cost of 6.11 cents per lineal foot. Other wage scales may be substituted in the manner outlined and the basic cost for any particular piece of work derived.

## Standard Locomotives for the Argentine State Railways

THE NEW ARGENTINE RAILWAY ADMINISTRATION is exerting its greatest efforts towards the unifying of locomotive and rolling stock types and the standardization of its equipment, so that the efficiency of the state railways may be brought to the high level of the best operated railways in South America. With the addition of 25 Mikado type locomotives recently completed by the Baldwin Locomotive Works, the state railways will possess 125 freight locomotives, duplicate in all their parts.

The Argentine railways during the world war deferred the placing of even the most essential orders for additions to their motive power because of the difficulty of securing deliveries. Since the signing of the armistice, however, a number of contracts have been placed with American and British locomotive manufacturers and negotiations are under way with German locomotive builders. Previous to the war most of the locomotives and cars were supplied by British manufacturers. This was due mainly to the fact that most of the private railroad corporations are British owned and

erected in the Laguna Paiva shops of the company. Detailed specifications are listed below:

*General Data:*

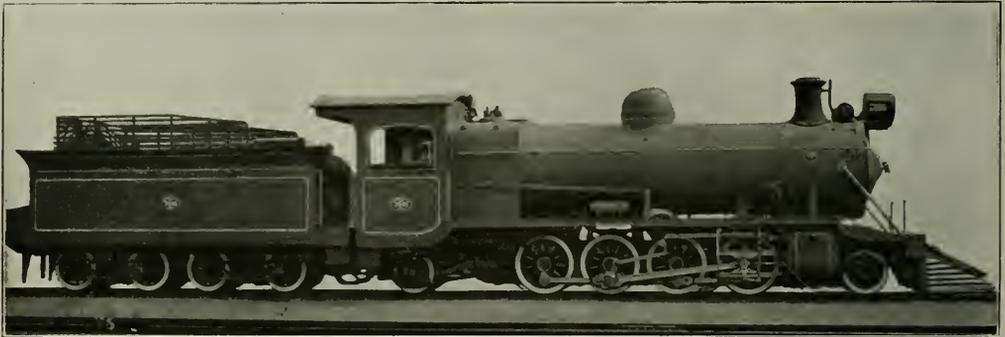

Gage	.....	1 meter.
Fuel	.....	Wood or coal.
Cylinders	.....	457 mm. by 560 mm.
Weight in working order	.....	59,550 kg.
Weight on drivers	.....	45,500 kg.
Weight on leading truck	.....	6,750 kg.
Weight on trailing truck	.....	7,300 kg.
Weight of engine and tender in working order	.....	97,550 kg.
Wheel base, driving	.....	3,600 mm.
Wheel base, total	.....	7,975 mm.
Wheel base, engine and tender	.....	14,625 mm.

*Wheels:*

Driving, diameter over tire	.....	1,067 mm.
Driving, thickness of tires	.....	80 mm.
Driving, journals, diameter and length	.....	184 mm. by 205 mm.
Engine truck wheels, diameter	.....	780 mm.
Engine truck journals, diameter and length	.....	127 mm. by 203 mm.
Trailing truck, wheels, diameter	.....	780 mm.
Trailing truck, journals, diameter and length	.....	127 mm. by 203 mm.

*Boiler:*

Style	.....	Straight top
Working pressure	.....	12.7 kg. per sq. cm.
Diameter	.....	1,500 mm.
Firebox, length and width	.....	1,806 mm. by 1,412 mm.
Tubes, number and outside diameter	.....	140—51 mm.
Flues, number and outside diameter	.....	21—137 mm.
Tubes and flues, length	.....	4,300 mm.
Heating surface, tubes and flues	.....	137.9 sq. m.
Heating surface, firebox	.....	10.2 sq. m.

One of the New Mikados on the Argentine State Railways

operated and also to the fact that a great number of the railway officers of the state railways have been taught railroading under British supervision and are accustomed to British equipment.

In order to assist the state railway engineers in standardizing their motive power, the Baldwin Locomotive Works guaranteed to construct these 25 locomotives to all of the railway requirements. The working drawings with dimension according to the metric system were completed in April, 1920—two months after the order for these engines was placed. To make the earliest delivery possible, the Baldwin company transported large quantities of materials by motor trucks, thus avoiding delay due to railway congestion and the steel strike which occurred at that time. The locomotives were completed between July 3 and September 15, 1920, and the first shipment made direct from the Eddystone Works to Santa Fe, Argentina.

These locomotives are of the most up-to-date type, and have open bar frames of cast steel. They are equipped with the Superheater Company's superheaters having an area of 40.6 square meters each and are provided with a modern automatic damper arrangement. Westinghouse air brakes are included in the equipment. Outside bearings are used on the trailing trucks, which are of the Hodges design.

These locomotives are also equipped with electric headlights operated by a turbo-generator set which supplies a current for electric lights at the steam, air and water gages in the cab. The last two of these engines are now being

Heating surface, total	.....	148.1 sq. m.
Superheating surface	.....	40.6 sq. m.
Grate area	.....	2.55 sq. m.

*Tender:*

Water capacity	.....	3,300 imp. gal.
Fuel capacity	.....	5.9 gross tons.

# Railway Executives Summoned by Labor Board

## Employees Expect to Prove Workability of National Agreements by Cross-Examining Witnesses

ON THE INSISTENT demand of Frank P. Walsh and B. M. Jewell, respectively counsel and spokesman for organized railroad labor, Robert S. Binkerd, assistant to the chairman of the Association of Railway Executives; General W. W. Atterbury, vice-president of the Pennsylvania, and chairman of the association's disbanded labor committee; Carl R. Gray, president of the Union Pacific, and a member of the labor committee before its abolishment, and Thomas DeWitt Cuyler, chairman of the association, have been summoned by the Railroad Labor Board to appear before it on March 18 as witnesses in the hearings on the demand of the employees for continuation of their national agreements.

In addition, the following, all members of either the old labor committee or the Conference Committee of Managers of the Association, have been notified to hold themselves in readiness for a similar call: Hale Holden, president of the Chicago, Burlington & Quincy; C. H. Markham, president of the Illinois Central; H. E. Byram, president of the Chicago, Milwaukee & St. Paul; W. G. Besler, president of the Central Railroad of New Jersey; E. E. Loomis, president of the Lehigh Valley; J. H. Young, president of the Norfolk & Southern; J. H. Hustis, president of the Boston & Maine; N. D. Maher, president of the Norfolk & Southern; W. R. Scott, president of the Southern Pacific, Texas and Louisiana Lines; J. W. Higgins, executive secretary of the Association of Western Railways; C. P. Neill, manager of the Bureau of Information of Southeastern Railways; A. W. Trenholm, vice-president of the Chicago, St. Paul, Minneapolis & Omaha, and J. G. Walber, secretary of the Bureau of Information of Eastern Railways.

Mr. Binkerd has been requested to bring with him the minutes, letters, recommendations and other records having to do with the proceedings of the association and its labor committee with reference to the dispute now before the Board.

These developments were brought about by the adoption of resolutions by the board on March 14 after Mr. Walsh and Mr. Jewell had maneuvered for additional delay and again declined to meet the issue, namely, the justice and reasonableness of the national agreement now in effect. The board's order, however, states specifically that these witnesses are called "to give testimony on the reasonableness or unreasonableness of the so-called national agreements."

After a delay of two weeks, granted by the Board to Mr. Jewell to prepare his rebuttal statement to the presentation which had already been made on behalf of the carriers, Mr. Walsh and Mr. Jewell appeared before the board on March 14, stating in substance that "it will be impossible for us to proceed with the presentation of our case until the witnesses we have called for have been subpoenaed and have presented themselves for examination." Mr. Walsh specifically requested that Mr. Binkerd be subpoenaed first to present the minutes of the meetings of the labor committee of the association. Following the presentation of this material, Mr. Walsh said General Atterbury and Mr. Cuyler would be cross-examined by the representatives of the employees in the order named. Then, Mr. Walsh stated, the other members of the labor committee will be called to the stand, followed by the financiers, as requested in their original subpoena demand, which has been reported in the *Railway Age* of February 11 (page 367).

During the course of Mr. Walsh's opening remarks it developed that in reply to the employees' request for subpoenas, the Board, before taking action, had requested them to state what

they expected to prove from the testimony of these witnesses. In reply to this Mr. Walsh stated that the employees expected to establish:

(1) What led to the carriers' decision to have national agreements abrogated; (2) why the carriers have refused to meet representatives of the employees on this subject; (3) whether the executives are fundamentally interested in doing away with the waste and extravagance chargeable to the national agreement; and (4), whether these executives really believe that national agreements are unworkable, unjust and unreasonable.

The absence of the executives from the hearing on March 14 indicated, Mr. Walsh charged, that the carriers were not acting in good faith in this case, inasmuch as the expressed desire of the employees to question these men had been widely circulated.

At the suggestion of Henry T. Hunt, acting chairman in Judge R. M. Barton's absence, the board then adjourned to consider the employees' request. Mr. Hunt's remarks indicated that many members of the Board were heartily opposed to bringing these witnesses before the Board. However, a portion of Mr. Walsh's remarks also indicated that he was aware of this feeling. In requesting again the subpoenaing of the men, he addressed his remarks first to the Board as a whole, then to "any group or to any individual on the board which recognizes our fundamental rights." The provisions of the Transportation Act give the Board, as a whole or each individual thereon, full power to subpoena any witnesses which the board or the individual deem necessary to complete the evidence in any case.

In addressing the Board on March 14, Mr. Walsh said in part:

"My clients are in no sense responsible for the delays in these proceedings, nor will they remain silent under any such imputation. We have been ready from the outset to go forward in an orderly way to a speedy determination of the issues involved in this controversy, and we submit that the whole matter could have been disposed of weeks if not months ago, if we had been granted the conferences which we asked of the railroad executives, or if this board had taken steps to bring about such conferences.

"The delay has been both disturbing and costly to the general public. It has contributed largely to the uneasiness and uncertainty in all business and in all industry which have prevented that return to normal activity and productivity in which we are all so vitally concerned. It has recruited thousands upon thousands to the army of the unemployed. I, for one, am apprehensive of the economic and political consequences that may ensue when we have a horde of hungry men, women and children in this country."

Referring to the present controversy over wages and hours of work in the packing industry, Mr. Walsh said:

"It means that the packers are backing up the railroad owners and the Morgans and the Gays of the steel industry in a concerted drive to break down all labor organizations and to turn back the clock that has registered all the progress that has been made in the relations between those who work and those who employ them. We are not deceived as to what is transpiring. When it comes to consider wage schedules, the railroad owners will argue that wages of railroad workers should be reduced because the wages of the packing house employees have been lowered and their hours of labor increased. And whatever tribunal is interposed

between the parties to the controversy in the packing industry will be told by the packers that wages in that industry must be reduced because wages of railway workers are about to be reduced. Then, in the next great struggle over the shorter workday they hope to be able to say that the eight-hour day is a failure and to offer as proof of that a return to longer hours in the packing industry.

"That is the vicious circle of which labor complains. That is the way the plan has been set up, and that is the way it will be played through by the financial interests unless they are restrained."

### Shippers Demand Part in National

#### Agreements Controversy

As a representative of the public which pays railway expenses, the National Industrial Traffic League, on March 15, filed a petition of intervention in the case involving national agreements. It charged that many freight rates are now so high that they are destroying business; and that the high rates are chiefly due to excessive pay rolls. It maintained that the Board was created to represent the public as well as the railways and their employees, and that therefore the public has a right to be heard. The Illinois Manufacturers' Association and other state organizations of manufacturers joined with the National Industrial Traffic League in its petition.

After showing that the League is composed of industrial and commercial organizations and representative shipping concerns throughout the United States which pay many millions of dollars in freight, the petition of the League said in part:

"Many of our members find that the increased freight rates are prohibitive and are destroying the business of those who produce and deal in such commodities. It is not possible to increase revenues of the carriers by horizontal increases in freight and passenger rates, as further increases will restrict the volume of business and thus reduce instead of increase the aggregate revenues of the carriers. Therefore, we allege that in order to give the carriers the return provided for in the Transportation Act, there must be a curtailment of operating expenses. We allege that a very substantial part of the necessary reduction in operating expenses may be brought about by the establishment of reasonable rules and working conditions without change in rates of pay, as the present rules and working conditions are unjust and wasteful. The failure to establish just and reasonable rules and working conditions adds to the operating expenses of the carriers which must be paid by our members and others similarly situated."

In defining the reasons for this stand, the League's petition pointed out the increases in the number of men employed and in the pay roll of the classes of employees which now operate under National Agreements, adding, "We believe that these large increases in the number of employees and wages result in large part from the establishment of so-called national agreements and the rules and working conditions now in effect."

The petition also calls upon the Board to request the Interstate Commerce Commission to transmit data pertinent to the determination of whether the present rules and working conditions are just and reasonable, and what would constitute just and reasonable working conditions. The factors on which data could be obtained in this matter, the petition points out, includes

(a) The efficiency with which labor is now being performed on the various railways,

(b) The effect of present rules and working conditions upon the efficiency of labor.

(c) The number of employees and the amount paid by the carriers to such employees by classes for the years 1914 to 1920 inclusive.

(d) The effect of increases in freight rates effective August 26, 1920, upon the volume of freight.

(e) The possibility of increasing revenues of the carriers by further increases in freight and passenger rates.

(f) Facts showing, or tending to show, whether the present rules and working conditions of the various crafts are just and reasonable.

(g) The probable operating expenses and revenues of the carriers for the calendar year 1921.

To the seven relevant factors, outlined in the Transportation Act as a basis upon which the Board should determine the justness and reasonableness of wages, rules and working conditions, the League asks that, in addition, the Board "consider as a 'relevant' factor the ability of the railroad company to pay wages and to maintain rules and working conditions."

"Whatever rules and working conditions," the petition added, "are prescribed by this Board for the various classes of employees affected thereby will materially affect rules and working conditions of similar classes of labor in various industries other than transportation. Therefore, we are vitally interested in having just and reasonable rules and working conditions established on the railroads."

In closing its petition, the League said: "Farmers, manufacturers, merchants and dealers and practically all other industries are now suffering from lessened volume of business and excessive cost of operation, the cost of transportation being not the least important. The highly inflated cost of material, capital and labor existing during the war time period must be brought to reasonable levels at as early a moment as is possible."

When the official report of the Board's proceedings on March 15, at which time Luther M. Walter presented an intervening petition of the National Industrial Traffic League, was completed this portion of the hearing was censored by order of the Board. There is grave doubt, therefore, that the Board will permit presentation of further evidence by a body representing the shipping public. However, this will be decided later by the board in executive session.

### Labor Board Again Enters A. B. & A. Controversy

In the opinion of the Board the Atlanta, Birmingham & Atlantic is still within its jurisdiction even though it is in the receiver's hands and the wages of its employees have been reduced by a federal court order. It has accordingly set March 21 as the date for a hearing to determine whether or not either the carrier or its employees have violated the Board's award of last July. The progress of this controversy has been reported in previous issues of the *Railway Age* from the time the carrier issued notice to its employees that their wages would be reduced below the rates fixed by Decision No. 2 to the time that the employees walked out after the federal court had reduced their wages to the rates asked of and denied by the Labor Board.

The Board in calling representatives of both the carrier and its employees to the hearing on March 21, said in part:

"This Board has reason to believe that Decision No. 2 has been violated by the receiver of the Atlanta, Birmingham & Atlantic and by its employees in the following respect, to wit, by the receiver: (1) that effective March 1, 1921, the receiver reduced the wages of track men and other common or unskilled labor determined to be just and reasonable by Decision No. 2, to such wages as may be made necessary by the conditions prevailing in the various communities of the carrier in which it is necessary to employ such common or unskilled labor; (2) by reducing the wages found to be just and reasonable as to other classes of employees to the wages and salaries prevailing on December 31, 1917, plus one-half the increases effective since December 31, 1917; and by the employees in authorizing and directing the cessation of work in concert by the membership of the organiza-

tions involved, on or about March 1, 1921, without reference to this Board of the dispute."

In issuing this order the Board referred in two places to "the legal duty" of the carrier to pay the wages fixed in Decision No. 2 and of the employees to exert every reasonable effort to avoid any interruption to the operation of this carrier. This is the first use of terms of this character by the Board and is taken by many to indicate that the Board intends to establish its legal status by means of this case.

Reports from the territory served by the Atlanta, Birmingham & Atlantic indicate that service on that line is gradually being restored with the aid of new employees.

The presentation of rebuttal statements on behalf of the employees continued during the past week. The first part of these presentations was outlined in the *Railway Age* of March 4 (page 519), and of March 11 (page 550), and they were concluded on March 11.

#### D. W. Helt Defends Signalmen's Agreement

D. W. Helt, grand president of the Brotherhood of Railroad Signalmen of America, based his arguments in support of the signalmen's national agreement on the responsibility of the signalmen and the absolute necessity, from the point of view of safety of the traveling public, of maintaining this national agreement which he claimed has greatly increased the signalmen's morale. The signalmen's agreement, he said, has made it possible to operate the railroads without serious interruption to traffic through critical periods and it has actually saved the railroads millions of dollars inasmuch as the signalmen have been willing, under it, to accept wages which they felt were below those paid in other and less important industries.

To support the contention that the employees' morale had been increased Mr. Helt cited the fact that they are demanding that the Brotherhood aid them in educating themselves in signal work because "the national agreement has given our men this sense of security; they now feel there is some incentive to increase their skill and efficiency." Regarding Mr. Whiter's contention that the national agreements result in inefficiency, Mr. Helt cited voluminous statistics to show that the percentage of signal failures on various carriers have decreased since the national agreement was placed in effect. He further attempted to prove this point by citing the increases in the efficiency of operation which took place the first six months after federal control. These increases in operating efficiency he maintained were due largely to the increased efficiency of the signalmen.

Regarding the continuation of this efficiency, Mr. Helt said: "The managements, in recently making such drastic reductions of signal forces have sown the seeds of a dangerous decrease in efficiency. In a few months, even in a few weeks possibly, the railroads will be able to show an inefficiency of signals due solely to the drastic reduction in the number of signalmen employed but in no wise due to a drop in efficiency of individual signalmen. Signal forces today are reduced far below the number required to insure proper safety."

Mr. Helt took up the various paragraphs of Mr. Whiter's presentation, basing his rebuttal statement contending that similar rules have been in effect on certain carriers prior to the formation of the national agreement, that these rules were brought about by sharp and evasive practices by the carriers and that their effect is the protection of the workers and bolstering up their morale.

Regarding Mr. Whiter's objection to paying men for work not performed, Mr. Helt said, "It is a function of efficient and economical management to so arrange the work of the employees that they can get their work done without being on duty for an excessive amount of time when they are not doing actual work."

In summarizing his presentation, Mr. Helt outlined the

development of signaling and the increasing intricateness of the apparatus which the signal men are called upon to maintain. He said in part, "The signalmen's national agreement in its salient features must be retained for the safety of the traveling public and the welfare of the railroads as well as the employees. Without the signalmen's agreement, the present railroad problem would not be decreased, but would be tremendously added to."

#### Maintenance of Way Union

##### Revives "Conspiracy" Charges

J. C. Smock, grand vice-president of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers, devoted the first part of his testimony in support of the maintenance of way agreement to a capital-labor harangue. He contended that in their stand for reasonable working conditions and a living wage, they have to contend not only against the railway managements, but against organized capital. Evidence, he said, that there is a concerted movement on foot in this country on the part of organized capital and employers is found in the clamor that is being made before Congress for amendment to the immigration laws. Furthermore, he charged that thousands of Mexicans, in direct violation of law, have been brought into United States within the past year and placed in direct competition with former employees of the railroads. This has been done, he said, for the purpose of lowering the level of the railway employees to the standard that exists in the country from which they came.

In support of a national agreement, he stated, "an agreement applicable to all railroads establishing a uniform working condition will have a tendency to encourage the employees to become steady workers, thus being an agency in preventing the fluctuation of labor, which is authoritatively considered to be a waste of energy and a genuine loss to the country as a whole."

Regarding Mr. Whiter's statement that representatives of the individual railroad companies are willing to negotiate agreements individually with their employees, Mr. Smock cited instances dating back as far as 1902 to show that the railroad companies have refused to meet the men in conference to arrange schedules of working conditions. The majority of the instances cited took place prior to 1915.

Following this Mr. Smock took up the seven specific objections to the proposed maintenance of way agreement, flatly denying in the majority of cases Mr. Whiter's statements.

Mr. Smock's specific objections to Mr. Whiter's presentation followed in general the objections which have been rendered by the other organizations, namely, that they serve as a protection to the worker thus creating contentment and efficiency, and that without them the carriers would begin indulging again in alleged sharp and evasive practices.

The rebuttal testimony which has been given so far has been more in support of the carriers' contentions than it has been in support of the employees' demands. The fact that this hearing is over the question of national agreements, and that the carriers have definitely stated that they do not oppose agreements between the individual road and its own employees has been largely ignored in the testimony on behalf of these organizations. The major part of the presentations made since March 1 outline the necessity for having agreements as to working conditions, the protection they afford to the workers, their beneficial results in as far as the worker's frame of mind is concerned, etc., but comparatively little has been said to justify making these agreements national in character. It is true that several of the organizations have touched on this point in their summaries, the clerks, for instance, stating that clerical work was the same on all railroads, several of the others stating that the formation of national rules would prevent excessive labor turnover, but

in general, that they have ignored the basis of Mr. Whiter's testimony, i. e., that the national application of rules which do not take into consideration varying local conditions results only in inefficiency and waste.

The presentation on behalf of the International Association of Railroad Supervisors of Mechanics was made by W. V. O'Neil, president. This presentation followed, in general, the preceding presentations.

Mr. O'Neil was followed on the stand by Timothy Healy, president of the International Brotherhood of Stationary Firemen and Oilers, who cited as evidence in support of that organization's demand for continuation of their national agreement many schedules and agreements now in existence between members of the Brotherhood in other industries and their employers. Practically all of these agreements, however, are local either to a district or city. This evidence, Mr. Healy said, proves the "workability" of national agreements.

E. J. Manion, president of the Order of Railroad Telegraphers, in making a rebuttal statement for that organization contended that its only request of the Board was a ruling on time and one-half for Sunday and holiday work. Mr. Whiter, he said, has offered no direct testimony on this matter. His presentation took practically two days and relied in detail to Mr. Whiter's testimony, however, little new material was injected into record.

In response to the suggestion of the Board that those carriers which feel that they are not parties to the present hearings on the national agreements present their reasons therefor several smaller Class I roads have appeared before the Board seeking a release. B. A. Worthington, president of the Cincinnati, Indianapolis and Western, was the first to appear, stating that his carrier wished to withdraw because it did not want to be obligated if an adverse decision is rendered and that it could negotiate its own agreement.

H. T. Brady, Jr., general counsel of the Mississippi Central, likewise held that his road was not properly before the Board because no conferences on subject of working conditions have been held and no dispute has therefore arisen. R. E. Faulkner, general manager of the Mississippi Central, also presented similar testimony. Ben L. Cain, assistant to the president of the American Short Line Railroad Association, testifying on behalf of the Abilene & Southern, the Georgia, Florida & Alabama, the Nevada Northern and the San Diego & Arizona, presented similar arguments on behalf of these carriers.

#### A Correction

In describing the progress of the controversy between the Missouri & North Arkansas and its employees in the *Railway Age* of March 11 (page 349), C. A. Phelan, general manager was quoted as saying that that carrier would hereafter be operated as an "open shop" road. This statement has since been denied by Mr. Phelan.

### Report on Piedmont Collision

THE INTERSTATE COMMERCE COMMISSION has issued a report, dated January 15, 1921, and signed by W. P. Borland, chief of the Bureau of Safety, of its investigation of the disastrous collision on the Chicago, Milwaukee & St. Paul at Piedmont, Mont., on September 30, 1920, when one employee and seven trespassers were killed and one employee and two trespassers were injured. The employee was Engineman Mutz, who was off duty and who had tried to move the standing train in order to avert the collision. Who the trespassers were or how they happened to be killed, is not explained.

This collision was briefly reported in the *Railway Age* of October 8, 1920, page 623, and October 13, page 669.

The collision occurred a few minutes after midnight. East-bound freight Extra 10215, consisting of 50 cars and two electric motors, No. 10215 at the head and No. 10209 about the middle of the train, was standing at or near Piedmont station. Information had just been given by the operator that a runaway was approaching, and efforts were being made to clear the main track, but these were not successful. The collision was the result of 55 cars breaking away from west-bound extra No. 10203 at Vendome, about five miles west of Piedmont. These cars had run from Vendome at high speed, uncontrolled, the grade, descending, being nearly or quite two per cent for more than half the way.

The westbound train (10203) consisted of 96 cars with a helper motor, No. 10227, in the train behind the 34th car, the custom on this grade being to put helping engines at or near the middle of the train. While on the siding at Vendome a coupler was pulled out of the eighth car behind this helper and, very soon after, the 55 cars and caboose ran back down the mountain. Two cabooses and 42 cars were wrecked and a portion of the wreckage was destroyed by fire. The rear brakeman of 10203, who had been ordered to set 10 or 12 hand brakes, was injured in the accident and could not be questioned; but it appears that he had released some of the brakes to facilitate backing the train a short distance to clear the main track for an eastbound passenger train. However, the air brakes appear to have been in such poor condition that it was estimated that the air would not hold the cars more than 15 minutes. The evidence is not very definite and the only conclusion of the report as to cause is that the accident "is believed to have been caused by inoperative or inefficient brake equipment on extra 10203." The conductor and engineman of this train had both been habitually neglectful of rules requiring careful inspection of air brakes, and officers of the division are said to have been lax in their supervision; some of them stated that they did not consider the observance of the strict rules for mountain grades to be necessary at Piedmont, where the brakes of this train ought to have been examined with special care.

Following the investigation, inspectors of the commission arranged to ride on a westbound freight train on the night of October 9. This train, with 100 empty cars was to leave Three Forks, 35 miles east of Piedmont, at 11 p. m. The making up of the train took about two hours and then the air brake inspection took nearly five hours more, and the train did not get away until 5:57 a. m. The first brake-pipe reduction disclosed two cars with short piston travel, three with excessive piston travel, two with air brakes cut out and 18 on which the brakes did not apply. Eleven cars were then set out, but a second test disclosed further defects, and a third one still others. Going up the grade tests were made at ten-minute intervals for the first 55 miles and showed brake-pipe pressure about 9 lb. higher on the motor than on the caboose.

Later and after a helping motor was cut in behind the 35th car and the governor on the motor was set at 80 lb. the other pressures were increased to about 70 lb. Inquiries made by the inspectors showed that air brake rules had been much neglected. The use of cards on cars to indicate that air brakes were cut out, required by the rule, had been habitually neglected. One conductor said that the only time that he had known of a train being delayed on account of an air brake test was when some government inspectors were present. In conclusion the report says:

"It is a matter of surprise that such dangerous practices should have been allowed to continue until finally they resulted in the occurrence of a disastrous accident, causing the loss of many lives. The responsible operating officials of this railway should take prompt and efficient measures to improve air-brake conditions on this line and to insure the strict enforcement of their rules. \* \* \*"

# Progress Report on the Superpower Survey

## Cost of Electrifying Railroads Within the Zone Estimated at \$40,000 Per Mile

WASHINGTON, D. C.

ONE-THIRD OF THE MILEAGE of Class I railroads in the Boston-Washington industrial region apparently can be economically electrified, at a cost of approximately \$800,000,000, which with salvage would be reduced to \$650,000,000, effecting a saving equal to approximately 14 per cent on the investment, says a progress report on the work of the Superpower Survey just submitted to the President by John Barton Payne, Secretary of the Interior.

The Congress, in appropriating for the Geological Survey, June 5, 1920, provided for the survey of power production and distribution in the United States, including the study of methods for the further utilization of water power and the special investigation of the possible economy of fuel, labor, and materials resulting from the use in the Boston-Washington industrial region of a comprehensive system for the generation and distribution of electricity to transportation lines and industries.

An organization was effected under the Geological Survey with offices for the engineering staff in New York City. The engineering staff includes: William S. Murray as chairman; Nathan C. Grover, the chief hydraulic engineer of the United States Geological Survey; Ozni P. Hood, chief mechanical engineer of the Bureau of Mines; Lorin E. Inlay, division engineer for the subjects of power and transmission; Henry W. Butler, division engineer for industries, and Cary T. Hutchinson, division engineer for railroads, with Henry Flood, Jr., engineer-secretary. The engineering staff has been aided by the hearty co-operation of an advisory board of business and professional men, who accepted appointments for this special service. Of this board Prof. Lester P. Breckenridge of Yale is chairman, and the various interests connected with this investigation are represented as follows: Magnus W. Alexander of Boston, representing the National Industrial Conference Board; Edward G. Buckland, vice-president, New York, New Haven & Hartford Railroad; Charles L. Edgar, of the Boston Edison Company, representing the National Electric Light Association; Abraham T. Hardin, vice-president, New York Central Railroad; Herbert Hoover, representing the mining industry; William Kelley, lieutenant colonel, U. S. A.; Elisha Lee, vice-president, Pennsylvania Railroad; Dr. Arthur D. Little of Boston, representing the electro-chemical and by-products industries; James H. McGraw, president, McGraw-Hill Company, Incorporated, representing the technical press; John H. Pardee, of New York, representing the American Electric Railway Association; Henry Cleveland Perkins of Washington, representing the mining industry; and Matthew S. Sloan, of the Brooklyn Edison Company, representing the National Electric Light Association.

The progress thus far made, Secretary Payne says, warrants the belief that the report will be completed by June 30, 1921.

Having in mind the object of the Superpower Survey, viz.: (1) allocation and amount of waste in labor, coal, and other materials, due to the improper form of power generation and distribution within the Boston-Washington zone, and (2) recommendations regarding a regional power system by means of which these wastes may be eliminated, the report naturally divides itself into three divisions: (1) Physical, (2) Legal, and (3) Financial.

With regard to the physical aspect, the investigation has been concerned with the power necessary to (a) railroads, (b) industries, (c) utilities, and (d) a system of centralized

electric generation and transmission to supply their power requirements up to and including 1930.

### Railroad Electrification

Regarding railroad electrification, the report says:

We find that there are 20 Class I railways included in the Superpower zone. These are divided as follows:

First track 14,500 miles.

Second track 6,500 miles.

Total trackage (including yards and sidings) 36,000 miles.

There are a total of 10,000 steam locomotives, of which 44 per cent are freight, 29 per cent passenger, and 27 per cent switching.

The total annual railroad coal consumption for 1919 was 19 million tons.

Apparently one-third of this mileage can be economically electrified, including the greater part of double track mileage. Due to lack of traffic density upon the branch lines these can not be profitably electrified.

The above 33 per cent of mileage will carry more than 50 per cent of the traffic and by preferential arrangement of routes probably 60 per cent of the total traffic could be put over this mileage.

Through the electrification of the above mileage a fuel saving of 6,000,000 tons, or \$40,000,000 per annum would be effected. Added to this saving will be \$50,000,000 annually as a difference in favor of electric versus steam engine repairs and maintenance.

The total unit cost of electrification will be approximately \$40,000 per mile of main line track, which with 12,600 miles to be electrified would cost \$500,000,000. In addition, yard and siding trackage would call for \$300,000,000 or a total of \$800,000,000. This sum will cover the necessary construction and equipment for the railroads beginning with the electric substations and with the driving wheel of their electric motive power.

The electrification above outlined will displace approximately 7,000 steam locomotives, which at salvage value of \$22,500 each will credit the electrification estimate with approximately \$150,000,000, leaving a net investment of \$650,000,000, which taken in connection with the afore-mentioned savings of \$90,000,000 per annum would return approximately 14 per cent on the investment.

Regarding other phases of the subject, the report says, in part:

There are approximately 50,000 industrial plants in the zone which either purchase or generate power. The Bureau of the Census is at present compiling the statistics of the 1919 Census of Manufacturers. As soon as the tabulations are completed by the Bureau of the Census, we, in conjunction with experts in the various industries, will analyze and ascertain what possible fuel savings could have been made by the Superpower System in 1919. From the data at hand, a saving of between six and eight millions of tons of coal is indicated. In the anthracite coal mines of Pennsylvania, by means of electrification and the supply of superpower, a conservative estimate based on actual tests shows a saving of 6,500,000 gross tons of anthracite. We are at present preparing estimates on the cost of completely electrifying the anthracite mines.

The data required of the Industrial Division will be ready by May 1, for assembly in its final form.

A large saving of coal can be effected through the more efficient generation of power by the new superpower stations. We find that the average rate of coal consumption for present central station output is 234 pounds per kilowatt-hour. Power can be produced in the superpower system at an average rate of 134 pounds per kilowatt-hour. The present central station output of coal-generated power within the zone is 8,000,000 kilowatt-hours. Therefore, 1 pound saved per kilowatt-hour will conserve 4,000,000 tons of coal annually.

The location of the large superpower stations and their attendant transmission lines is related to the establishment of load centers throughout the superpower zone to which power will be transmitted from them at minimum distance. To date it is indicated that some 20 load centers will be established. By March 1, sufficient data will be at hand to establish these load centers, after which the location of new superpower stations and their interlinking transmission systems can be promptly determined.

The development of power outside of but for transmission

to the zone is being most carefully considered having relation to the St. Lawrence River, other hydroelectric powers and the bituminous coal mines.

A conference with the coal authorities indicates that a fair figure to take for the average price of coal during the period 1919, was \$2.90 per ton at the mine, and that during the period from that date to 1930, \$3.50 per ton.

With regard to water power for the zone, a summation of the possible outputs from the Potomac, Susquehanna, Delaware, St. Lawrence (American rights), Raquette and the Adirondack powers indicate that for an average year there will be available 12,000,000 kilowatt-hours, and for a minimum year 8,360,000 kilowatt-hours; the plant capacity being 2,300,000 kilowatts to furnish this amount of energy. It is of interest at this point to state that in 1930, the total power requirement in the superpower zone indicated by projected growth curves will be 48,000,000 kilowatt-hours, of which amount the superpower system could supply 36,000,000 kilowatt-hours. This, therefore, indicates that the water power supply can be but from 20 to 25 per cent of the total.

I am pleased to be able to say that through the unusual co-operation of the public utilities, the railways, and the industries, the completion of the work will be, after May 1, substantially a matter of computation and tabulation.

Concerning legislative and financial status, the following paragraphs represent the general expression of opinion at the Washington meeting of the advisory board February 18.

### Needed Legislation

Legislation should take the form of an act permitting the formation of a corporation authorized to take by eminent domain lands or interests therein necessary or appropriate to the construction, maintenance and operation of lines for the transmission of electric energy. Such legislation may be by a separate act or by an amendment to the Federal Power Commission Law.

As a condition precedent to the formation of such a corporation the proposed incorporators should be required to apply to the Federal Power Commission for a certificate that the project is desirable and is justified in the public interest. This application should be followed by a hearing after due notice to the governors of the states through which condemnation rights are asked. If the certificate is granted the incorporators should be permitted to form a corporation with the usual powers and in addition thereto (subject to the approval of the utility commission of the state where the power is to be exercised), the right to construct, maintain and operate power plants and transmission lines, the right to purchase electrical energy from and sell it to electrical power producing and distributing companies. All of these rights should be subject to the exercise by each state of its full police and taxing power.

### Financing

The plan of financing which has been suggested is based on the supposition that the superpower system is in its very nature an extension of present power supply systems, whereby, combining several large plants with present relatively small plants, economy in generation and conservation of natural resources can be secured over that at present attained. Therefore, the vested rights of existing public utility power generating and distributing companies should be protected.

Dependence must be placed on the incentive of private initiative to lower costs and on some form of public regulation of prices to the consumer. The power generated and distributed by the superpower system will finally be distributed to the public by means of existing companies and the economies to the public utility companies which will result must ultimately be reflected in prices to the consumer through the action of present state regulating bodies.

The financial plan in bare outline provides for a superpower company with non-par stock as its only class of security. The public utilities within the Boston-Washington zone to be entitled to subscribe for this stock pro rata, based upon capacity demand and load factor. Stock not taken by these customers of the superpower system to be offered to public subscription.

A contract between the superpower company and a local public service company would be a selling contract or a buying contract, while in many cases both buying and selling of current would be involved. These contracts on which the state regulatory bodies would pass to be adjusted from time to time to meet the progress of the art and changing conditions, whether favorable or unfavorable to costs of operation.

Returns upon the stock of the superpower company should be limited by specific provision to a fair division of the benefits derived from its operation between the investing public and the consumers that will make it possible for the superpower company to come into existence, and at the same time be able to serve

the public adequately. New capital is the keystone of the project, but the public demand is its foundation. This division of benefits would be attained by a rule under which the customer companies shall participate equally with the stockholders in any distribution at stated intervals, of net earnings in excess of a specified rate of return, which itself should be more liberal than is commonly contained in the idea of public regulation. Thus efficiency in management would be rewarded and the public interest directly served. To secure the participation of the ultimate consumer in this division of benefits, provision should be made that the superpower stock held by any public service company be regarded as representing an extension to its existing station capacity rather than an outside investment security.

Absolute publicity of the superpower company's operations will be an essential condition. Freedom of action should, however, be also sought for this company in order to promote the free flow of capital to this enterprise whose requirements will be large and continually increasing.

The prime object of the superpower plan is a larger supply of cheaper power. The superpower survey looks to the full utilization of all resources and conservation of the country's fuel can not be attained except with the aid of large capital investment. Neither the nation, by coal conservation, nor the individual consumer, by lower rates, can profit by the project, however sound in its engineering and economic phases, unless the conditions of financing are sufficiently attractive to warrant the use of the country's financial resources.

## Employees and Their Compensation Under New Wage Scales

WASHINGTON, D. C.

THE FIRST OFFICIAL STATISTICS showing the effect of the wage award of the Railroad Labor Board of July 20, 1920, on the compensation of railway employees have just been issued by the Interstate Commerce Commission in its quarterly report on employees, service and compensation for the three months ending September 30, 1920, which does not include any back pay retroactively attributable to the months of May and June. The report shows an average number of employees for the quarter of 2,157,989, as compared with 2,004,760 for the second quarter of 1920 and 1,993,524 for the first quarter. The average for July was 2,111,280, for August 2,187,824 and for September 2,164,880. The total compensation for the quarter was \$1,052,109,451, as compared with \$801,063,938 for the second quarter and \$795,616,330 for the first quarter. The increase in the third quarter over the second quarter is about 31 per cent, but there was an increase in the number of employees. As the operating revenues for the third quarter of 1920 were \$1,699,000,000 the payroll represents 61.9 per cent of the revenues. The operating expenses as reported for the same quarter were \$1,691,000,000, of which the payroll represents 62.2 per cent, but the expenses as reported included a considerable amount of back wages. The report gives the total compensation for each class of employees, the compensation per day or hour and the average number of days or hours.

THE TRANSPORTATION CLUB of Flint, Mich., has adopted resolutions declaring that, whereas "the betterment of transportation services requiring purchase of needed equipment and additional facilities, is an important necessity in speeding economic readjustments; and whereas, the present schedule of rates as prescribed in EX Parte 74 is not producing for the railroads the financial returns contemplated by the act of 1920, thus proving that high rates are of no value unless traffic moves under them; and whereas, the railroads in southern Michigan by reason of excessive rates on sand, gravel, and other road building material, are depriving themselves of millions of dollars in revenue and the respective communities of very badly needed improved highways; be it resolved that the Michigan railroads be urged to give serious consideration to voluntary rate reductions on these commodities in line with the thoughts recently expressed by the Interstate Commerce Commission."

# The Lamont Six-Wheel Truck for Freight Cars

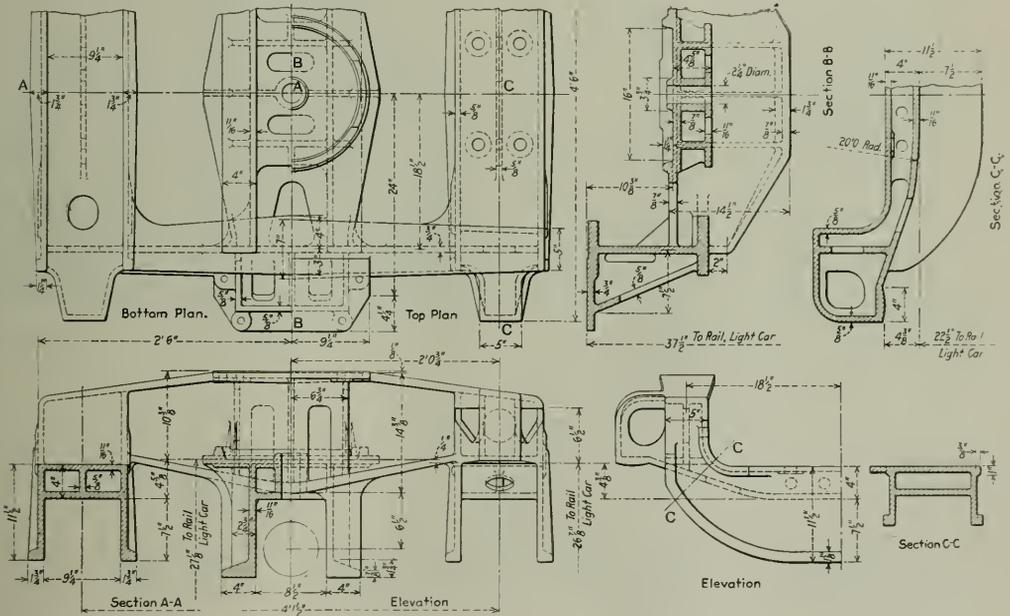

Side Frames Are Continuous Over Three Journals—New Design of Equalizing System Used

A NUMBER OF designs of equalizing six-wheel trucks have been developed for freight cars varying in capacity from 90 tons to 120 tons. The Lamont truck, the most recently developed of this type, has been brought out by the American Steel Foundries, Chicago, and has received its first installation under several of the new 120-ton coal cars built for the Virginian.

This truck differs from other six-wheel trucks for freight cars in bolster construction, the method of equalizing and the arrangement of the springs. The feature of the bolster design is its three-part construction, which provides for

the center of the cross bolster and nominally take one-quarter of the center plate load at each end. The bearing surfaces of these end portions of the equalizing bolster are curved to a radius of 20 ft. This permits a rocking movement of the equalizing bolster on the cross bolsters, and also provides for a limited amount of upward or downward movement of the ends of the cross bolsters as the wheels pass over inequalities in the surface of the track.

Under average track conditions this insures an equal distribution of the center plate load over the four points of delivery to the equalizing system. When a combination of

Details of the Equalizing Bolster

cross equalization of the load distribution to the four points of delivery to the longitudinal equalizing mechanism. The equalizing mechanism permits a symmetrical location of the bolster ends between the wheels, thus making possible a short wheel base and a simple arrangement of the brake rigging. The springs are placed directly over the journal boxes and coil springs are used throughout.

The bolster consists of three parts: two cross bolsters and one equalizing bolster. The ends of the cross bolsters rest on the equalizing levers, and the equalizing bolster, which carries the center plate and truck side bearings, bears at the center of the cross bolsters with a clearance of  $\frac{1}{4}$  in. at the side bearings when the car is riding level. The construction of the equalizing bolster is shown in one of the drawings, from which it will be seen that the center plate load is delivered to the side members of the equalizing bolster and through these to end portions which, taken separately, are inverted U-shaped bolsters designed to bear at

vertical movement of the end of a cross bolster and side motion of the car brings a side bearing of the equalizing bolster and cross bolster together, the additional load at this point is distributed through the equalizers on that side of the truck and, if the end of the other cross bolster is free, it may be partially carried back across the truck to the other equalizing system.

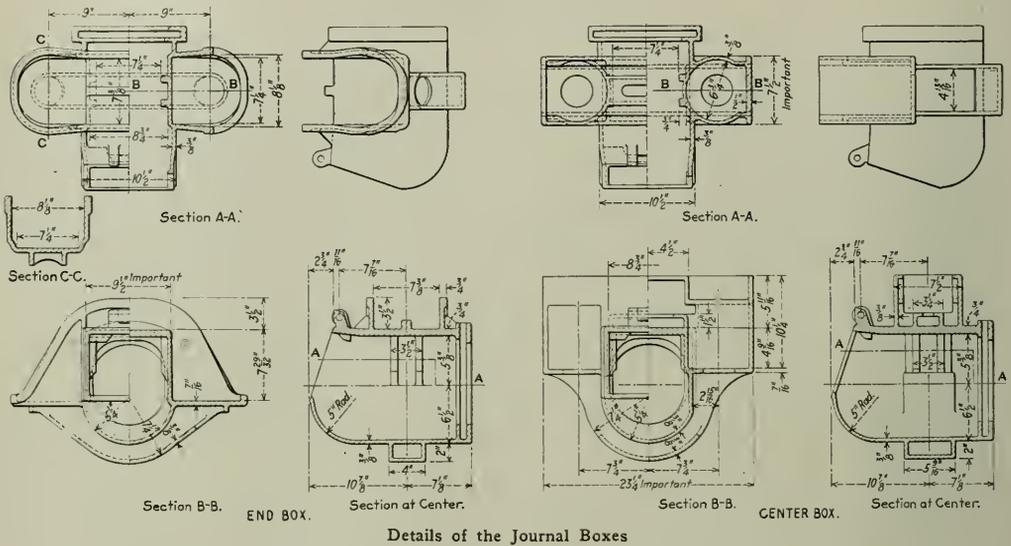

Because of the clearance provided between the side bearings of the equalizing bolster and the cross bolster, very little clearance, if any, is necessary between the car body side bearings and the roller side bearings attached to the equalizing bolster.

The equalizing mechanism on each side of the truck consists of two equalizing levers, two lever hangers and an equalizing beam. The mid point of the equalizing beam bears on the middle of a spring cap which spans the two coil springs of the middle journal box. The location and relationship of the parts are clearly shown in the general

drawing of the truck. The load delivered to either end of an equalizing bolster is taken up by an equalizing lever and delivered in the ratio of two to one, to the end and middle journals, respectively—to the end journal indirectly through

up shocks from the individual wheels without passing them on to the equalizing system.

Double coil springs are used on the end journal boxes and single coils on the middle journal boxes. The inner coils used

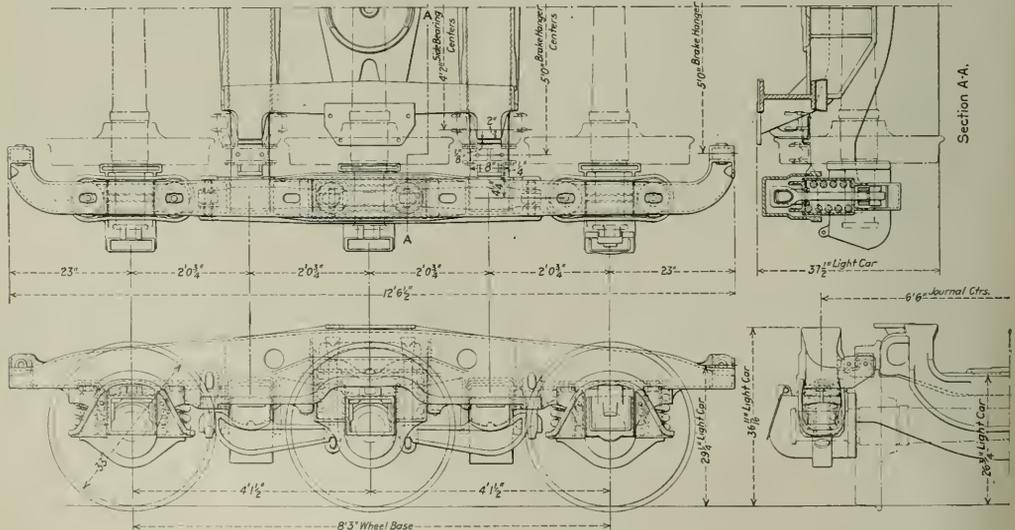

Details of the Journal Boxes

the side frame, springs and journal box and to the middle journal through the lever hanger, equalizing beam, springs and journal box.

on the end journal boxes have a free height 2 1/4 in. greater than the heavy outside coils. They are compressed to the height of the outer coils under the light weight of the car, and with this compression exert a force on each of the end journals

The journal boxes are of special design in which pockets

Lamont Six-Wheel Truck for Clasp Brakes

have been provided on either side to receive the coil springs. Thus located, the springs support the maximum amount of dead load, they are protected through the equalizing mechanism against overloads and are in the best position to take

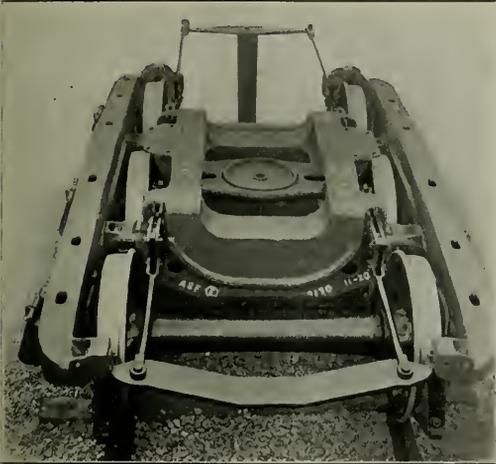

of approximately 1,750 lb. The heavy coils are the same on both the end and middle boxes and are necessarily of high capacity, compressing only about 1/8 in. under the light weight of the car. Because of this comparative lack of

resiliency under the weight of the empty car the inner coils have been provided at the end journals as a protection against possible derailment. The middle wheels being free to act through the flexible equalizing mechanism, do not require the protection of the inner coil springs, and only the heavy coils are used.

The middle journal boxes are guided by the side frames on their ends only. Clearance is provided between the upper portion of the boxes and the side walls of the frames to permit freedom of lateral movement of the middle pair of wheels on curves. When the middle journal boxes move

which, with the three-part bolster construction and clasp brakes, is 36,300 lb. per car. All parts of the truck are designed to carry a center plate load of 140,000 lb. and a 50 per cent overload on the side bearings without exceeding a fibre stress of 12,000 lb. per sq. in. All surfaces of contact between the journal boxes and the side frames are protected against wear by 3/16-in. hard steel liners. On the end journal boxes these liners are shaped to fit the top and sides of the boxes as well as the vertical flanges. For the middle journal boxes the liners are attached to the frame surfaces.

The truck has been designed for either clasp or single brakes. The trucks furnished for single brakes differ from those designed for the clasp brake rigging only in the shape of the side frames. For the single brake rigging the frames terminate at the outside spring pockets for the end journal boxes.

A Top View of the Truck, Showing Arrangement of Bolsters and Brake Rigging

laterally, an inverted pendulum motion takes place in the equalizing lever hangers, suitable provisions for this movement being made in the bearing surfaces of the hangers, keys and connecting parts.

This truck has a wheel base 8 ft. 3 in., which is the shortest of any six-wheel truck yet developed. This has been an important factor in keeping down the weight of the trucks

## Freight Car Loading Shows Increase

WASHINGTON, D. C.

THE FREIGHT CAR LOADING reports compiled by the Car Service Division of the American Railway Association for the week ending March 5 indicate that the tide of business depression has turned and railroad freight traffic is beginning to increase after an almost continuous weekly reduction since the latter part of October. The number of cars of revenue freight loaded during the week was 712,822, which is the highest figure recorded this year. It represents an increase of 54,000 cars as compared with the preceding week, but as that included the holiday of February 22 it is more significant that it represents an increase of 17,000 cars over the week of February 19. The loading was considerably less than for the corresponding week of 1920, when it was 811,106, but it was greater than for the corresponding week of 1919 when it was only 675,276. The weekly figures since the first of the year have heretofore generally been lower even than for the corresponding weeks during the depression of 1919.

The loading of grain and grain products was 41,936 cars, which was greater than for any preceding week this year. Most of the gain was shown, however, in the loading of merchandise and miscellaneous freight, the combined total for which was 431,000 cars, or 21,000 more than for any

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—ALL DISTRICTS: COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO, FOR WEEK ENDED SATURDAY, MARCH 5, 1921

February 12	1921	32,879	27,456	151,786	9,026	53,882	8,094	184,892	213,612	681,627	786,633	687,128	488,983	610,231	837,109
February 5	1921	36,875	31,277	155,917	10,381	54,066	8,501	182,221	217,759	696,097	762,680	692,614	495,860	599,454	551,312

previous week this year. This indicates an increase in manufacturing activity.

In spite of the increased loading, the number of surplus freight cars for the week ending March 8 showed an increase over the previous week. The total was 422,207. For the week ending March 1 the number was 413,450, but this represented a decrease of 10,000 as compared with the week ending February 23, which thus far represents the peak since the car shortage gave way to a surplus last fall. For the week ending March 8 there was a surplus of 191,012 coal cars and 164,005 box cars.

The semi-monthly summary of general car conditions issued by the Car Service Division as of March 11 says that the demand for grain cars is increasing in the west. The refrigerator car supply is said to be adequate in all sections, but there seems to be some tightening up. The railroads are asked to give special attention to the repair of refrigerator cars, as undoubtedly the demand will be quite active in the near future. There has been no noticeable increase in the demand for open top cars during the past few weeks but within a few weeks the usual spring demand for open top cars to transport road and building construction material will be upon us.

## Flood Lights With Crossed Beams for Engine House Lighting

By F. B. Freeman  
Chief Engineer, Boston & Albany

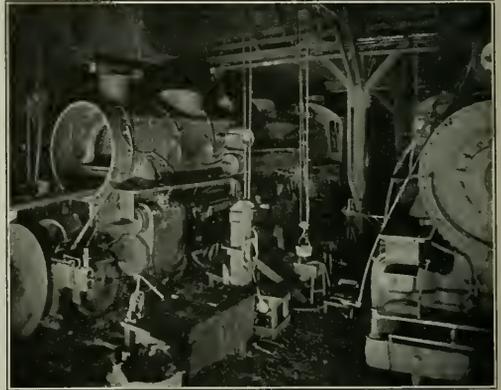

**T**HE ENGINEERING DEPARTMENT of the Boston & Albany has been working for some time on the possibilities of a more economical and efficient lighting system for engine houses, old methods proving so unsatisfactory and costly. It believes that it has now developed a system which is a distinct advance.

The new system consists of abolishing the old high over-

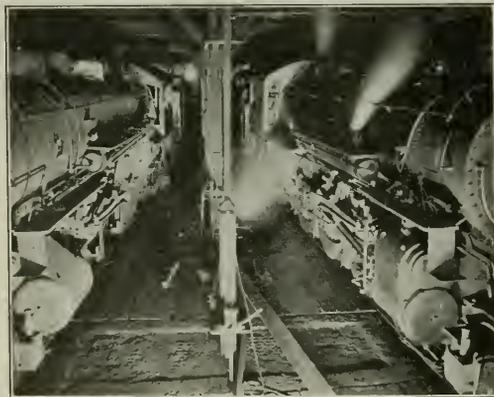

removes the conduits and wires out of the hot gases in the engine house which were found very destructive to interior wiring.

The flood lights adopted are of the Davis type, the case being all of heavy cast iron and the reflector of silvered glass with a plain glass front.

One of the greatest troubles with the old form of lighting was the rapid accumulation of a black coating on the exposed lamp due to the damp, dirty atmosphere and the heat generated in the lamp itself. This rapidly lowered the amount of light emitted and due to the height above the floor cleaning of the lamps was much neglected. The lamps being so high

The Angle of the Light on the Back Wall Is Great Enough to Furnish Light for an Open Front End

The Crossed Beams Provide Light on the Sides of the Locomotives in the Stalls

head lighting and wiring and substituting therefor two flood lights to each stall, placed on the rear wall of the house, ten feet above the floor surface and seven and one-half feet each side of the center line of the pit tracks. The conduit for carrying the wires is run on the outside of the house under the eaves, and branches run down outside to the location of the flood lights and then through the wall. This

up the rising steam and vapor which hung against the roof also diminished the amount of light. With the new arrangement the lamp is not exposed to the damp atmosphere and so cannot get a deposit of dust on it. The plain glass front on the flood light being only ten feet from the floor is easy gotten at with a hand ladder and can be readily kept clean. The lamps used in the flood lights are 1-100-watt type C Mazda as against the 400-watt lamps which were found necessary with the old overhead arrangement, so that the saving in current is considerable. It is also found that the new lights being so low the steam accumulating in the house is usually above the line of lights.

It was thought at first that trouble might be experienced with men running engines into the house due to the glare but this has not developed. The beams of light from the two flood lights crossing each other break up glare and diffuse the light very satisfactorily over the stall and light up all the moving parts of the engine very well indeed. The first installation was made in the Beacon Park house, Boston, and it has proved so satisfactory to everybody that all the houses on the road are now being equipped with the new system as rapidly as possible.

COMMENDED FOR SAVING THREE SECONDS.—Quick action on the part of Flagman M. H. Allred prevented a probable loss of life at Asheboro, N. C., recently, when a party in a large automobile started across the tracks in front of train No. 141, which was backing into the station. The motor of the automobile stopped when the automobile was on the track. Flagman Allred immediately applied air and brought the train to a stop within two feet of the stalled machine. Superintendent J. W. Fletcher has commended Mr. Allred for his presence of mind.—*Southern Railway Bulletin.*

# General News Department

The **Official Guide** has resumed the publication of its quarterly supplement entitled "The Official List of Interline Ticket Agents and Passenger Traffic Officers" of the United States, Canada and Mexico. The February issue is No. 1, Volume 6.

The **Western Railway Club** will meet at the Sherman House, Chicago, on March 21. J. E. Gardner, electrical engineer, Chicago, Burlington & Quincy, will read a paper entitled "Electrical Development and Standards in the Power and Lighting Field."

At the annual meeting of the Chamber of Commerce of the United States at Atlantic City on April 27 to 29 the Transportation Group will consider a report by the chamber's railroad committee, the present financial situation of the railroads in relation to plans for consolidation, and the shippers' part in rate-making.

The **Interstate Commerce Commission** and the **Railroad Labor Board** will hold a joint hearing at Washington on March 30 for the purpose of hearing objections or amendments to a proposed plan for revising the rules for reporting information to the commission regarding the work and compensation of employees.

**President Harding** is understood to be planning a trip to Alaska this summer to make a personal study of conditions, including the Alaska government railroad. A plan has been under consideration for completing the railroad as rapidly as possible and for the operation by the government of a steamship line between Alaska and various ports on the Pacific Coast.

**Senator La Follette's** speech in the Senate on February 21 and 22 in opposition to the passage of the Winslow bill has just been published in the Congressional Record, and, with the appendices, takes 64 pages, mainly in small type. The appendices consist largely of charts showing interlocking directorates and various statements presented by the labor leaders to the Railroad Labor Board at Chicago in connection with their charges that railroads have paid extravagant prices for car and locomotive repairs in outside shops.

## Inspection of Railway Stationary Boilers in Canada

The Board of Railway Commissioners for Canada has ordered that the railway companies subject to its jurisdiction put in force not later than June 1, 1921, regulations promulgated by the board for the inspection of railway steam boilers other than locomotive boilers. The orders cover the design and construction of the boiler and appurtenances and provide for periodical inspection.

## Wrong Use of \$28,000

The Interstate Commerce Commission has issued a notice quoting a letter which it has received from the auditor of a railroad which is less than 120 miles in length and which operates one train on alternate days, stating that the company had paid out \$28,935 in attorney's fees in connection with the collection of its claim under Section 204 of the transportation act. The letter stated that this amount, if taken into the operating expense for 1921, would seriously distort them; and permission was asked to put the item in profit and loss account. The commission says in its notice that there was nothing about this application for reimbursement which could not have been adjusted by correspondence. Applications under Section 204 and 209 of the transportation

act ordinarily require nothing on the part of the applicant except compliance with the commission's request for information.

## Fuel Conservation Campaign Shows Results

A saving of 15,875 net tons of coal in December, 1920, over the same month in 1919 in freight service was effected by the Philadelphia & Reading through its fuel conservation campaign. In December, 1920, the consumption of coal per 1,000 gross ton miles of freight was 254.6 lb., a reduction of 9 per cent as compared with December, 1919, when the consumption was 280 lb. per 1,000 gross ton miles.

## Preliminary Returns Show Deficit for January

Preliminary compilations of railway returns to the Interstate Commerce Commission for the month of January reveal a situation even worse than that in December. One hundred and sixty-six Class I roads, operating 200,000 miles of line, show a deficit of \$1,289,291 for the month. The same roads in January, 1920, had a net operating income of \$52,971,220. Total operating revenues show a reduction of 5.8 per cent, while total operating expenses increased 6.9 per cent. Freight revenues of the 166 roads increased 4.6 per cent and the passenger revenues increased 15.7 per cent as compared with January, 1920. The fact that total revenues show a decrease is probably attributable to the fact that in January last year an estimate of \$500,000,000 for back mail pay was taken into the accounts. These figures do not take into account lap-over items growing out of settlements with the Railroad Administration.

## Discipline and the Golden Rule

Discipline in the railroad business is as essential as it is in the army. We are responsible for the lives of our fellow men. Discipline may not always be easy to apply. It may seem easier to follow the lines of least resistance and let little things go, than to apply firm, impartial discipline, but in this we deceive ourselves. When we follow the "let alone" policy we make it harder in the end. Just discipline is a necessity, and to apply it, the officer charged with the responsibility must study conditions thoroughly and his conclusions must be based upon understanding, reason and justice. The Golden Rule is the best basis for discipline: that means treating the other man as you yourself would like to be treated. It is always good policy when discipline is necessary to take some time to think it over. Sleep on it. Be sure you are right and then go ahead. Frequently we find that the merits or demerits of a case present themselves in a different light after we have had an opportunity to reflect on them. If an employee is permitted to continue doing the things he should not do and is not disciplined, he becomes careless and irresponsible, a result that reflects not only upon himself, but upon his superior officer.—E. E. Nash, Minneapolis & St. Louis.

## Railway Fire Protection Association

W. F. Hickey, New Haven, Conn., president of the Railway Fire Protection Association, has issued "News Letter No. 2," dated March 10. The executive committee of the Association has appointed seven committees to prepare reports for the next annual meeting on the following subjects, the chairman of the committee being named after each subject: Protection of Shop Plants, J. R. Peters (Penn.); Statistics, G. R. Hurd (I. C.); Locomotive Hazards, E. M. Floyd (C. C. & St. L.); Telephone and Telegraph Hazards, E. Richards (S. P.); Coaling Plants, W. E. Cathcart (Penn.); Hand Book on Merchandise in Transit, E. B. Berry (South-

ern); Gasoline and Electric Motor Trucks in Freight Houses, E. J. Reilly (Erie).

The executive committee proposes that a half day be given at the meeting to a "question box" for the purpose of discussing inspectors' problems.

The Pacific Coast sectional meeting of the association, which will be in charge of W. S. Wollner (N. W. P.), will be held in San Francisco on June 16 or 17.

### No Exhibits at June Conventions

The Railway Supply Manufacturers' Association at a meeting of its executive committee at Pittsburgh, Pa., as briefly noted in last week's issue, voted against having an exhibit at the convention of the American Railway Association, Division V—Mechanical—in June.

Further details relative to this decision are given in a letter sent to members of the association, dated March 10 and signed by J. D. Conway, secretary, and J. F. Schurch, president. The letter follows:

After a thorough canvass and study of the entire situation, both among the manufacturers composing this organization and the railroad executives, your executive committee has unanimously decided that the part of wisdom and good business judgment to postpone the June, 1921, R. S. M. A. exhibit at Atlantic City for the following reasons:

1. We are all familiar with the present depression in railroad and general business and the attendant desire and demand to curtail expenditures in every possible direction to strengthen the existing financial situation with the prime motive of developing greater economy and efficiency in operation.
2. In the opinion of men of mature judgment in the manufacturing as well as the railroad fields we are confronted today with the serious situation of not knowing with any degree of certainty as to just when business conditions will improve. Many manufacturing concerns engaged in the production of railroad devices and specialties are either shut down or running at an unusually low rate of operation.

While we realize this action is drastic, we feel that present conditions demand it. We are confident, however, that it will meet with the full approval of the business interests of the country, and we further believe that the future will warrant our resuming plans at a later date for the 1922 exhibit as in former years.

The executive committee also decided that it would not be necessary, in view of the cancellation of the exhibit and the annual meeting, to send representatives to such meetings of the Railroad, Mechanical and Purchases and Stores divisions, A. R. A., as may be held. The wisdom of cancelling hotel reservations was also suggested.

### Proposed Senatorial Investigation of Railroad Situation

WASHINGTON, D. C.

Senator Cummins is actively engaged in preparing for the proposed general investigation of railroad conditions, for which he will introduce a resolution at the opening of the special session of Congress on April 11, and is gathering a large amount of data. He has been conferring for some time with members of the Interstate Commerce Commission and others on the subject and Thomas DeWitt Cuyler, chairman, and Alfred P. Thom, counsel, for the Association of Railway Executives, have conferred with him, assuring him that the railroads welcome this opportunity for a thorough airing of the situation. Senator Cummins has denied public statements which have indicated that one object of his proposed investigation is to consider the desirability of the government taking over the railroads and has made it clear that he is opposed to government ownership. He has also indicated that one of the primary purposes is to give an opportunity for making public some of the facts about the railroad situation which he has learned but which are not generally understood. It is reported that S. Davies Warfield, president of the National Association of Owners of Railroad Securities, is planning to lay before the committee a plan to carry out an idea which Senator Cummins has advocated for bringing about a greater centralization of railroad purchases. It is also understood that a strong effort will be made by the railroad labor organizations affiliated with the American Federation of Labor to take this occasion for strongly urging legislation to prevent the Railroad Labor Board from acting on the reductions in wages which the railroads have proposed by establishing some substitute organization along the lines of their boards of adjustment which they have heretofore advocated.

## Traffic News

Charles J. Sprague, for the last six years freight claim investigator for the New York Central, with headquarters at Buffalo, N. Y., has been appointed traffic manager for O. H. Willson at Lockport, N. Y.

The Interstate Commerce Commission has reopened the railway mail pay case to allow of consideration of the recent petition of the New England roads for a further increase in their rates for the transportation of mail and a readjustment for the period since September 11, 1920.

The Mallory Steamship Line announces that, beginning April 9, freight rates will be made from New York through to Birmingham, Ala., in connection with the barge lines on the Warrior River, and that the first-class rate will be \$1.75. This is 43 cents less than the all-rail rate from New York to Birmingham.

The Interstate Commerce Commission on March 3 vacated, as of March 6, its Service Order No. 17, which was issued on September 16, 1920, restricting the supply of cars to coal mines which are unable to load open-top cars within 24 hours. The Commission says the emergency which caused the issuance of the order has in general been measurably relieved.

The Transportation Club of Feoria, at its annual meeting on February 25, elected the following officers: President, H. D. Page; vice-presidents, G. I. Sweney and N. M. Love; secretary-treasurer, O. B. Eddy; directors, E. F. Stock, A. T. McMaster, E. E. Kester, G. H. McHugh, O. T. Arnold, W. J. Gorman, S. M. Russell, W. D. Upton, R. I. Colvin, A. H. Harwood.

The American Railway Express Company reports that from December, 1919, to November, 1920, 1,858,130 claims for loss and damage were filed against the company. The Express Company is conducting a "Right Way" campaign and is calling special attention to the importance of packing shipments properly so that unnecessary wastage in transit can be avoided.

The Pennsylvania has begun loading the lake coal boats tied up for the winter at Cleveland, Erie, Ashtabula and Sandusky, and expects to enable the boats to move cargoes aggregating about 200,000 tons as soon as the lake is open. Of the 28,000,000 tons of coal delivered by the railroads at the lake ports during the shipping season the Pennsylvania carries approximately 20 per cent.

The Spokane Transportation Club, at its tenth annual banquet held in the club rooms on February 18, elected the following officers: President, W. H. Ude, general agent, Northern Pacific; first vice-president, A. S. Cobb, manager wholesale department, Sherman Clay Music Company; second vice-president, T. W. Emerson, manager, Emerson Fuel Company; secretary-treasurer, George A. King, assistant general freight and passenger agent, Spokane International.

The production of soft coal, which had been declining steadily since mid-December, recovered slightly during the first week of March, according to the weekly bulletin of the Geological Survey, but whether the recovery was due to unfilled orders carried over from the week of Washington's birthday or whether this signifies that the bottom of the present depression has been reached cannot yet be stated, the bulletin says. The total output is estimated at 7,406,000 tons.

The Stark County Traffic Club was organized at Canton, Ohio, on February 28 and the following officers were elected: President, A. J. Burns, traffic manager, the Bonnot Company, Canton; vice-president, C. H. McCowen, traffic manager, Transue-Williams Steel Forging Corporation, Alliance; secretary, M. L. Underwood, traffic manager, Buckeye Cereal Company, Massillon; treasurer, B. T. Braucher, traffic manager, the Hoover Suction Sweeper Company, Canton. The Board of Governors consists

of D. J. Morris (W. & L. E.), W. A. Bell, A. O. Ellis (W. & L. E.), T. B. Ray and J. B. Mertes (W. & L. E.).

The "Shippers' Conference Committee of Greater New York," at its annual meeting, held in the Woolworth Building on March 8, elected as chairman for the ensuing year W. J. L. Banham of the Otis Elevator Company; P. W. Moore, Queensboro Chamler of Commerce, is secretary. This association, organized a year ago, now has 196 members. In connection with the annual meeting there was shown a motion picture illustrating right and wrong ways of handling freight. This picture, provided by the American Railway Express Company, is entitled "The Lost Millions." A report was received from a committee dealing with proposals to revise charges for cartage of export freight in the neighborhood of New York City.

A readjustment of rates on lumber from the Pacific northwest to eastern points was arranged for at a conference of traffic officials of the transcontinental lines with the Interstate Commerce Commission on March 16 under which the rates via Omaha will be equalized with those via St. Paul. The Omaha rate of 73½ cents will be reduced to the St. Paul rate of 66½ cents, which will also be applied to the lower river crossings with the usual differentials. The effect will be to reduce the Chicago rate from 80 to 73 cents. It is stated that the reduction will give a considerable degree of relief to the western lumber shippers. The commission authorized the new rates being made effective on five days' notice.

### Virginia Apples

The total movement of Virginia-grown apples from stations on the Harrisonburg-Manassas branch of the Southern Railway during the 1920 season amounted to 221,560 barrels, or about 1,390 carloads, distributed as follows: To eastern cities, 67,167 barrels; to Virginia and West Virginia, 48,112 barrels; to Ohio and Mississippi River crossings, 7,098 barrels; to southeastern and Carolina cities, 33,482 barrels; export, 33,482 barrels; to Charlottesville, Broadway, Winchester and Front Royal, for cold storage, 31,737 barrels. Total, 221,560 barrels.

### Abuse of the Order-Bill Form

The National Industrial Traffic League has sent out the following circular in its campaign against the misuse of the order bill of lading and also to limit its use:

The use of the order bill of lading covering carloads should be confined to those shipments where the consignee is required to pay for the goods before obtaining them from the carriers, or expressed in a different way, where goods are sold sight or arrival draft with bill of lading attached. Some shippers use the order bill of lading for the purpose of retaining control of the goods until they are ready for delivery to the consignee or to the notify party. Again shippers will consign goods to their own order at destination and endorse the bill of lading to a consignee who fails to notify the carrier, that upon the arrival the car should be delivered to him; such cars are unnecessarily delayed at destination. If a shipper desires to retain title to the goods it is not necessary for him to consign them to his order, but merely to consign them to himself in care of the consignee to whom he wishes them delivered. If, for any reason, he does not wish to show the consignee in the bill of lading, he should merely consign the goods to himself and promptly notify the consignee how the car is billed, and send him the bill of lading.

The practice of consigning goods to order, even where there is no banking transaction, is an old one and a great many shippers are following the custom which has prevailed for years without knowing why, or having any good reason for doing so. In many cases, the shipping clerk is merely following precedent without knowing why. This practice should be discontinued and shipments should be consigned to the order of the shipper only in cases where it is the intention to use the bill of lading as collateral or for collection purposes.

The carriers should be assisted by the shippers in getting rid of improper practices, particularly where such assistance will not only result in less car delay, but in better service to the shippers, and league members are urged to look into this matter and endeavor not only to regulate their own shippers in the present, but to urge them to do so. It is suggested that the league can induce non-members to discontinue the use of the order bill of lading except in those cases where it is to be used as the basis of a banking transaction, for it must be obvious that any unnecessary delay in the delivery cars should be avoided in the interest of better service as well as car supply.

Member-roads of the Association of Railway Executives, working in co-operation with the League, have been instructed to send to the office of the chairman concrete examples of the misuse of such orders and to advise as to whether there has been any such misuse upon their lines.

The campaign against the misuse of the order bill of lading was started by the National Association of Credit Men, who brought the subject to the attention of the League.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until July 14 certain proposed cancellations of rates on grain c. l., from points on the Chicago, Burlington & Quincy in Colorado, Idaho, New Mexico, Utah and Wyoming to Texas and Louisiana Gulf ports when routed via Denver and the Colorado & Southern.

The commission has reopened the Indiana intrastate rate case for further consideration of rates on coal applicable to intrastate shipments in Indiana for distances of less than 30 miles, including their relation to rates for distances of 30 miles and more, and their relation to interstate rates. The commission's order in this case did not apply to intrastate coal rates for distances of less than 30 miles, but it appears that the rates as now in force complicate the relations between mine groups in which some of the mines are a little more than 30 miles from the markets.

### Personnel of Commissions

The usual change in the chairmanship of the Interstate Commerce Commission will not take place in March this year, but at the end of June. When Commissioner Clark was elected chairman of the commission a year ago the commission adopted a change in its practice by which Chairman Clark will serve for the balance of the fiscal year ending June 30 and the chairman will hereafter be elected for the fiscal year. This makes the change come at what is ordinarily the dull season of the year rather than at a period of greatest activity.

### A New Commission in New Jersey

Governor Edwards, of New Jersey, has appointed a new public utilities commission, the court having sustained the governor in his action in dismissing the former commissioners last October. Acting under a new law, passed by the legislature—vetoed by the governor and then passed over the veto—the governor has appointed the following three: Joseph A. Hammill, of Hudson County, former Assemblyman and Congressman for twelve years; Joseph S. Hoff, of Mercer County, former Civil Service Commissioner; and Harry Bachrach, of Atlantic City, twice Mayor of Atlantic City. Two of the men named are Democrats and the other a Republican. The term of Commissioner Hammill will be for six years, Commissioner Hoff for four years and Commissioner Bachrach for two years.

## State Commissions

### Twenty-four Station Agencies Cut Out

New Hampshire Public Service Commission has authorized the Boston & Maine to discontinue twenty-four station agencies. The commission's report says:

"This move on the part of the railroad is in the interest of economy. The company finds its financial condition such that it is only by the strictest economy that it can continue serving the public. After paying operating expenses and fixed charges, including interest and rental of leased lines, the following deficits are shown:

September, 1920 .....	\$588,520
October, 1920 .....	1,082,704
November, 1920 .....	1,773,031
Total .....	\$3,444,255

"In all cases under consideration the company proposes to place a caretaker in charge of the stations. No tickets will be sold and no freight billed out. Passengers must pay their

fare to the conductors after boarding the train and have the baggage master on the train check their baggage. So far as the passengers are concerned, the inconvenience will not be great.

"In regard to freight, however, the inconvenience is considerable. Nothing but prepaid freight will be carried to these stations. In the case of l. c. l. freight, it will be at owner's risk after delivery on the platform or in the warehouse, which will be unlocked. There will be no one representing the railroad to take charge of the freight upon its arrival. If a shipper wishes a car set he must arrange for it at the nearest station from two to four miles away."

### Court News

#### Not Liable for Death of Wrecking Foreman

The Texas Court of Civil Appeals holds that a railroad furnishing a wrecking crew with chains of various and ample strength is not liable under the federal Employers' Liability Act for the death of an experienced foreman due to the breaking of a chain of insufficient strength selected by him to raise a wrecked car.—*Robert v. Houston & Texas-Central (Tex.)*, 220 S. W. 790.

#### Flowers of Rhetoric, Director-General

##### Hines and Georgia Justice

In affirming a verdict for the defendant in a personal injury case by a passenger against a railroad, the Georgia Court of Appeals, dealing with the complaint of strong language used by the trial court in cautioning the jury to do "exact justice between the lady on one side and the defendant on the other," approved the trial judge's opinion in overruling a motion for a new trial, in which he said: "Reference to the evidence shows that the case was between a lady with a sprained ankle and a soulless corporation that sees as much beauty in a crowbar as in a pretty foot. The case afforded a field where the flowers of rhetoric grew wild. The plaintiff not only had a sprained ankle with all of its horrors, but she 'couldn't get a cook last summer, and had neighbors to come in and see about the children.' Doubtless the plaintiff suffered very much from not having a cook in Savannah in the summer, but that suffering, bodily or mental, could hardly be ascribed to Mr. Hines, the Director General of Railroads. Seriously, cases should be tried under the rules of law and evidence and without appeals to prejudice. No higher duty rests upon a judge than to see that a recovery is based on exact justice."—*Green v. Hines (Ga.)*, 102 S. E. 899.

### United States Supreme Court

#### Freight Rates for Government Property

The Supreme Court of the United States has affirmed the decisions of the Court of Claims holding that the Oregon-Washington Railroad & Navigation Company and the Western Pacific are not entitled to recover the difference between the amounts paid the roads by the government for the transportation of the effects of army officers changing stations—being the rates for such transportation over land-grant roads fixed in the land-grant equalization agreements—and the usual commercial rates. Under these agreements such freight was accepted by the carriers without prepayment of the charges therefor upon the basis of the commercial or tariff rates with appropriate deductions on account of land-grant distance as provided in the Railroad Land-grant Act. The court bases its decision upon the railroad's non-action during a long course of years notwithstanding an explicit and contrary assertion by the government of the validity of the lower rate. It was also pointed out that section 22 of the Interstate Commerce Act permits reduced rates to the United States and that by conference ruling of the Interstate Commerce Commission No. 33 of February 3, 1908, section 22 is made applicable to property transported for the United States.—*Oregon-Washington R.R. & Nav. Co. v. United States; Western Pacific v. United States*. Decided March 7, 1921. Opinions by Justice McKenna.

## Foreign Railway News

### Car Exports in January

The exports of passenger cars in January were more than twice as heavy as during any month in 1920. The total was 64, valued at \$520,293, and the largest shipments were to Cuba. The exports of freight cars—1,452, valued at \$2,535,887—mark a considerable decline from December's totals. By far the largest shipments of these cars, too, were destined for Cuba. The totals by countries as compiled by the Bureau of Foreign and Domestic Commerce follow:

Countries	Passenger		Freight and other		Parts of cars, Dollars
	Number	Dollars	Number	Dollars	
Belgium	.....	.....	.....	.....	375

### Exports of Locomotives in January

In the exports of steam locomotives January showed a slight decline over December. The totals are 149, valued at \$4,248,147. Cuba, with 66, was the destination of the greatest number of these engines, while Brazil, with 23, comes next. The detailed figures by countries, as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Number	Dollars
Russia in Europe	2	25,000
Canada	2	16,488
Nicaragua	1	17,000
Mexico	6	51,275
Cuba	66	2,064,030
French West Indies	2	34,660
Dominican Republic	5	86,614
Argentina	2	28,460
Brazil	23	637,841
Colombia	3	102,700
Dutch Guiana	4	28,080
Peru	2	18,525
Venezuela	1	13,425
Chosen	12	692,340
Dutch East Indies	3	42,825
Japan	2	40,300
French Africa	1	3,104
Australia	1	17,000
Philippine Islands	6	60,650
Egypt	6	250,934
Total	149	4,248,147

# Equipment and Supplies

## Cars and Locomotives Delivered in January

The number of freight cars delivered in January by the car building companies reporting to the Railway Car Manufacturers' Association totaled 7,008 for domestic service and 819 for export. The passenger cars delivered totaled 43 for domestic service. On January 31 the companies had on order and undelivered orders for 32,874 freight and 786 passenger cars for domestic service and 2,903 freight and 42 passenger cars for export.

The figures for the month are as follows:

NEW CARS DELIVERED			
	Domestic	Foreign	
Freight .....	7,008	819	
Passenger .....	43	...	
ON ORDER AND UNDELIVERED			
	Domestic	Foreign	Total
Freight .....	32,874	2,903	35,777
Passenger .....	786	42	828
CAR REPAIRS			
Delivered—January .....			4,229
On order and undelivered January 31.....			21,469

The members of the association co-operating in this report are as follows:

- American Car & Foundry Company, New York.
- Bethlehem Shipbuilding Corporation, Wilmington, Del.
- Bettendorf Company, Bettendorf, Iowa.
- Osgood Bradley Car Company, Worcester, Mass.
- J. G. Brill Company, Philadelphia, Pa.
- Cambria Steel Company, Philadelphia, Pa.
- Cincinnati Car Company, Winton Place, Ohio.
- Greenville Steel Car Co., Greenville, Pa.
- Haskell & Barker Car Company, Chicago.
- Keith Car & Manufacturing Company, Sagamore, Mass.
- Keith Railway Equipment Company, Chicago.
- Laconia Car Company, Laconia, N. H.
- Liberty Car & Equipment Company, Chicago Heights, Ill.
- Magor Car Corporation, New York.
- McGuire-Cummings Manufacturing Company, Chicago.
- Mt. Vernon Car Manufacturing Company, Mt. Vernon, Ill.
- Pacific Car & Foundry Company, Seattle, Wash.
- Pressed Steel Car Company, New York.
- Pullman Company, Chicago.
- Ralston Steel Car Company, Columbus, O.
- Ryan Car Company, Chicago.
- St. Louis Car Company, St. Louis, Mo.
- Standard Steel Car Company, Pittsburgh, Pa.
- Manufacturers not members of the association co-operating in this report are as follows:
- Chicago Steel Car Company, Harvey, Ill.
- Pennsylvania Tank Car Company, Sharon, Pa.

## Locomotives

THE LOUISVILLE & NASHVILLE, reported in the *Railway Age* of November 19, as inquiring for locomotives, will build 34 locomotives, including 16 Mikado type locomotives, in its own shops.

## Freight Cars

THE ST. LOUIS, TROY & EASTERN is inquiring for from 50 to 100 cars.

THE BALDWIN LOCOMOTIVE WORKS is asking for prices on 100 tank cars for export.

THE LEOPOLDINA RAILWAY (Brazil) is asking for prices through the car builders on 60 flat cars.

THE UNITED FRUIT COMPANY, New York, is inquiring for 50 all steel ballast cars for the Truxillo Railroad, Honduras.

THE HURON PORTLAND CEMENT COMPANY, Detroit, Michigan, is inquiring for 20 steel ore cars of from 40 to 50 tons capacity.

THE ATCHISON, TOPEKA & SANTA FE is inquiring for 300, 50-ton gondola cars, in addition to those noted in the *Railway Age* of February 25 (page 483).

## Signaling

THE PENNSYLVANIA has ordered from the Union Switch & Signal Company for proposed alternating current signal installations between Atglen, Pa., and Downingtown, a total of 227 Vane type a. c. relays; 40 d. c. relays; 60 position-light dwarf signals, and 60 "A-1" electro-pneumatic switch and lock movements, complete, with Style "C" cut-off valves. This material is for revisions to three electro-pneumatic interlockings now in service between Atglen and Downingtown.

## Railway Construction

ANN ARBOR.—This company will replace its woodworking shop at Owosso, Mich., recently destroyed by fire, with a steel fabricated building.

CENTRAL OF GEORGIA.—The Interstate Commerce Commission has issued a certificate authorizing the construction of a branch line in Jefferson County, Ala., from McCombs, which is 12.6 miles east of Birmingham, in a southwesterly direction for a distance of 5.8 miles with a spur line of 3 miles.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—This road is contemplating realignment and grade revision in the vicinity of Terre Haute, Ind.

NORTHERN PACIFIC.—This company will erect temporary structures to replace the machine shop, wood working mill, car repair shop and minor buildings which were destroyed by fire at Tiburon, Cal., as definite decision has not been made as to whether a modern shop will be constructed at that point, or some more advantageous location along the line.

PHILADELPHIA, NEWTON & NEW YORK.—The Interstate Commerce Commission has rendered a decision that the proposed relocation of the main line in the city of Philadelphia, by which the company proposes to abandon a short piece of line and construct a new line about 1,150 feet in length across privately owned property, is not within the scope of Paragraph 18 of Section 1 of the interstate commerce act and that a certificate of public convenience and necessity is not required.

WISCONSIN-NORTH WESTERN.—This company has applied to the Interstate Commerce Commission for authority to abandon its line of 11½ miles in Marinette County, Wis., which was built to serve a logging traffic which, the petition says, is now adequately handled by other lines.

## Supply Trade News

The **Simmen Automatic Railway Signal Company** has moved its offices from Buffalo, N. Y., to Eden, N. Y.

The **Regan Safety Devices Company, Inc.**, has moved its New York City office from 140 West Forty-second street to 522 Fifth avenue.

The **H. K. Ferguson Company**, southern department, has removed its offices to Room 218, Healey building, Atlanta, Ga. **Richard W. Alger** is the manager.

The **Hegeman-Castle Corporation**, Chicago, has taken over the activities of Holden & White, Incorporated, and moved its offices from the McCormick building to 343 South Dearborn street.

**Manning, Maxwell & Moore, Inc.**, New York, on May 1, will take over the merchandise and goodwill of Patterson, Gottfried & Hunter, 211 Center street, New York. This firm handles mill and factory supplies.

**Ralph T. Hatch**, for the past 14 years with the National Malleable Castings Company, Cleveland, Ohio, has been appointed general manager of sales for the **Reading Steel Castings Company**, a subsidiary of the American Chain Company, with headquarters at Reading, Pa., effective April 1.

**F. E. Whitcomb**, special representative of the Federal Signal Company, Albany, N. Y., has left that company to become vice-president and sales manager of the **Consolidated Equipment Company, Ltd.** This firm handles railway, marine and signal supplies, with headquarters at Montreal, Quebec.

The **American Mason Safety Tread Company**, 480 Lexington avenue, New York, on March 1 consolidated its general sales office for New England, New York State and New Jersey with the local New York City office, under the supervision of **J. W. Scott. L. H. Devoe** will continue to serve the trade in this territory as in the past, with headquarters at New York.

**A. M. Castle & Co.**, of Washington, dealers in steel and hardware, have recently purchased a large portion of the real estate and buildings owned by the Skinner & Eddy Shipbuilding Corporation at Seattle, Wash. The purchase covers 250 ft. fronting on Railroad avenue and 560 ft. fronting on Connecticut avenue. A building 100 ft. by 500 ft. is located on this property, also a brick office building with two stories and basement 50 ft. by 120 ft. With the present purchase, the company now has three buildings, having approximately 100,000 sq. ft. of area, with an additional seven acres for building expansion.

The **Equitable Equipment Company**, 411 Whitney Central building, New Orleans, La., has just completed its organization for the purpose of handling locomotives, cars, railroad equipment, rails and rail accessories, machinery of all kinds, contractors' equipment and second hand machinery and equipment. This new company is taking over the equipment, rail and machinery business of **A. Marx & Sons**, Southern Scrap Material Company and the Ship Supply Company. The new firm will be under the direct management of **O. D. Cleveland**, who has been the manager of the New Orleans branch of the General Equipment Company.

### American Steel Foundries

The gross earnings of the American Steel Foundries for the year 1920 (including the Griffin Wheel Company) reached the largest total in the history of the company—\$59,481,563.58. The annual report, signed by **R. C. Lamont**, president of the company, says: "During the first three-quarters of the year the net earnings ran at the rate of about 10 per cent on the above figures, or approximately \$6,000,000; but,

of course, we could not hope to escape the very serious decline in business which became marked during the latter part of the year; our business began to shrink rapidly in the fourth quarter." In continuing his report, Mr. Lamont stated: "At the first sign of this shrinkage we stopped all purchases and by the end of the year had reduced our supplies and raw materials to the lowest point in many years; such materials as we had on hand, however, were written down to market prices, necessitating a reduction in profits of approximately \$1,500,000. In addition to this we took a loss on Liberty Bonds and Victory Notes of about \$320,000. In spite of this heavy write-off we were able to carry forward to surplus the very satisfactory sum of \$4,496,442.16. We have a total profits and income of \$6,670,994.13. From this must be subtracted \$924,951.97 for interest charges, losses on securities sold, earnings of subsidiary company belonging to outstanding minority stockholdings, also \$1,249,600 reserved for excess profits and income taxes, leaving net profits as above stated—4,496,442.60. Cash dividends of 7 per cent on the preferred stock and \$3 a share on the common stock were declared during the year; in addition, stock dividends aggregating \$6 a share on the common stock was paid out of appropriated surplus. The balance in this account is now \$2,869,263.85. The unappropriated surplus is \$11,144,730.71, as compared with \$9,274,166.52 last year." Mr. Lamont states that "the very high figure of \$13,219,235.34 of accounts receivable shown on the balance sheet is largely the result of the decision of the Comptroller of the Treasury that he cannot make payments on accounts to the railroads of the sums due from the federal government. The bill recently passed by Congress," he continues, "authorizing the Treasury to make payments should bring speedy relief and enable us to pay our bank loans."

The consolidated balance sheet follows:

ASSETS	
Real Estate, etc. (less depreciation reserve).....	\$32,946,233.19
Preferred Stock Sinking Fund (in Bank).....	84,813.00
Current Assets.....	27,024,791.77
Deferred Charges to Operations.....	148,955.53
	\$60,204,793.49
LIABILITIES	
Capital Stock.....	\$28,882,300.00
Capital Stocks (par value) of subsidiary company net held by American Steel Foundries and surplus appertaining thereto	4,955,458.61
Four Per Cent Debentures.....	684,860.00
Current Liabilities.....	11,048,830.99
Sundry Operating Reserves.....	619,209.33
Unappropriated Surplus (deducting stock dividends).....	2,869,363.85
Unappropriated Surplus.....	11,144,730.71
	\$60,204,793.49

# Railway Financial News

**ALABAMA, FLORIDA & GULF.**—*Asks authority to issue bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$150,000 of 7 per cent, first mortgage sinking fund gold bonds to finance additions and extensions.

**BOSTON & MAINE.**—*Consolidation of Subsidiaries Bill.*—In a bill passed by the House of Representatives of Vermont on March 10 this road is permitted to consolidate all its subsidiary lines in Vermont into a single corporation. The measure gives the Public Service Commission jurisdiction over consolidations of railroad companies in certain cases, and while the merger provisions apply generally to railroads in the state which parent organizations may decide to take over, it was stated that it resolved down in practicable application to the Boston & Maine. In 1915 a similar bill passed by the Senate was killed in the House. No opposition was offered the measure this year.

**CHESAPEAKE & OHIO.**—*Asks Authority to Pledge Bonds.*—This company has applied to the Interstate Commerce Commission for authority to pledge \$487,000 of its general mortgage 4½ per cent gold bonds of 1892 from time to time as security for short term notes.

**CHICAGO & ILLINOIS WESTERN.**—*Asks Authority to Increase Capital Stock.*—This company has applied to the Interstate Commerce Commission for authority to increase its capital stock by the issuance of 6,000 shares of 7 per cent non-cumulative preferred stock.

**CHICAGO & NORTH WESTERN.**—*Authorized to Issue Bonds.*—This company has been authorized by the Interstate Commerce Commission to issue and hold in its treasury \$1,440,000 of its general mortgage gold bonds of 1887 and \$416,000 of first and re-tunding mortgage gold bonds.

**CHICAGO & NORTH WESTERN.**—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has issued an order authorizing the issuance of \$15,000,000 of 15-year, 6½ per cent, secured gold bonds, maturing March 1, 1936, which had been sold to Kuhn, Loeb & Co., subject to the Commission's approval, at 95.40. Authority was also granted for the issuance of \$15,000,000 of general mortgage gold bonds of 1987, at 5 per cent, and for their pledge, together with \$3,000,000 of such bonds heretofore issued, as security for the 6½ per cent bonds.

**CHICAGO JUNCTION RAILWAY.**—*Annual Report.*—A comparative statement of the annual gross and net earnings of the Union Stock Yard & Transit Company, the Chicago Junction Railway Company and the New Jersey Company for the years ended December 31, 1918, to December 31, 1920, is as follows:

Year	Gross	Taxes, interest and operating expenses	Net
1920	\$10,231,200.82	\$9,128,452.45	\$1,102,748.37
1919	6,237,411.83	4,744,955.03	1,492,456.20
1918	5,644,627.41	4,130,862.27	1,513,765.14

The following is a comparative statement of live stock and car receipts for the two years ended, respectively, December 31, 1919, and December 31, 1920:

	1920	1919
Cattle	3,107,696	3,502,400
Calves	742,405	751,008
Hogs	7,536,120	8,672,476
Sheep	4,005,237	5,243,957
Horses	43,020	45,762
Cars	207,955	303,948

President Frederick H. Prince, in his report, said:

The live stock receipts for 1920 show a decrease in all classes of animals, as well as cars. These decreases were largely due to a general depression which prevailed in the live stock business and to the railway strike, which seriously interfered with shipments during the greater part of the year. The Chicago Junction Railway was operated under government guarantees up to September 1, but for the last four months of the year suffered from heavy increased expenses, the general decrease of business, and particularly from entirely inadequate switching rates, which were not increased until December 20, 1920. These factors all contribute to produce the decrease in combined earnings shown.

During the last year approximately 50 new industries were located in the district and on the Chicago Junction Railway and the Chicago River & Indiana in territory adjacent to the district. This is, by far, the largest number of new concerns locating in the district in any one year since its

inception. Many well known and important concerns are included in this list.

**CHICAGO, ROCK ISLAND & PACIFIC.**—*Asks Authority to Guarantee Bonds.*—This company has applied to the Interstate Commerce Commission for authority to guarantee \$619,000 of first mortgage bonds issued by the St. Paul & Kansas City Short Line, and \$227,000 first mortgage bonds issued by the Rock Island, Arkansas & Louisiana.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$1,052,000 of 6 per cent refunding and improvement bonds, dated January 1, 1921, and maturing January 1, 1941, for the purchase or payment and retirement of prior lien bonded debt.

**DENVER & RIO GRANDE.**—*To Raise \$100,000.*—The stockholders' protective committee has appealed to stockholders for a contribution equal to \$1.25 per share of stock for the \$100,000 necessary to show evidence of desire to purchase the road by March 25. There are approximately \$88,000,000 worth of stock outstanding and letters containing the appeal have been sent to 5,000 stockholders.

**HARTWELL RAILWAY.**—*Asks Authority to Issue Stock.*—This company has applied to the Interstate Commerce Commission for authority to issue \$20,000 of common stock.

**INDIANA HARBOR BELT.**—*Equipment Trust Agreement Authorized.*—This company has been authorized by the Interstate Commerce Commission to enter into an equipment trust agreement with the Guaranty Trust Company of New York for the issuance of \$354,000 of equipment trust certificates.

**LAKE ERIE, FRANKLIN & CLARION.**—*Application for Loan.*—This company has applied to the Interstate Commerce Commission for a loan of \$51,250 from the revolving fund, to be applied on the purchase of one freight locomotive.

**LEHIGH VALLEY.**—*Bonds Paid.*—The \$500,000 4 per cent collateral trust bonds which matured on February 1 were paid off on that date.

**LOUISIANA & ARKANSAS.**—*Asks authority to issue equipment notes.*—This company has applied to the Interstate Commerce Commission for authority to issue \$66,000 of equipment trust notes at 6 per cent to purchase 25 coal cars.

**LOUISVILLE & NASHVILLE.**—*Authorized to Pledge Securities.*—This company has been authorized by the Interstate Commerce Commission to pledge from time to time as security for short-term notes, which may be issued without authorization, certain bonds and stocks nominally issued and now held in its treasury.

**MAINE CENTRAL.**—*Bonds Paid.*—The \$400,000 Knox & Lincoln Railway 5 per cent mortgage bonds, series "A," which matured February 1, 1921, were paid at the First National Bank, Boston. The company obtained a government loan of \$320,305 to help it in meeting this maturity.

**MISSOURI-ILLINOIS.**—*Asks Authority to Issue Securities.*—This company has applied to the Interstate Commerce Commission for authority to issue \$1,800,000 of capital stock, and \$300,000 of bonds, for the purpose of taking over the Illinois Southern, which it has acquired in reorganization.

**MISSOURI-ILLINOIS.**—*Granted certificate of public convenience.*—The Interstate Commerce Commission has issued a certificate authorizing the acquisition and operation by this company of the railroad formerly owned and operated by the Illinois Southern.

**MISSOURI-PACIFIC.**—*New Directors.*—William C. Potter, Carl A. De Gersdorff, C. C. Hughtit and H. L. Utter have been elected directors to succeed Nicholas A. Brady, A. H. Wiggin, J. H. McClement, resigned, and A. J. Hemphill, deceased. Matthew C. Brush, Bertram Cutler, W. C. Potter and J. G. Drew have been elected members of the executive committee.

**MONONGAHELA CONNECTING.**—*Bonds Paid.*—The \$685,000 first mortgage 5 per cent bonds, due February 12, 1921, were paid off on that date.

**NASHVILLE, CHATTANOOGA & ST. LOUIS.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Com-

merce Commission for authority to issue and sell or hypothecate \$1,000,000 of its first consolidated mortgage 5 per cent gold bonds of April 2, 1988.

**NEW ORLEANS, TEXAS & MEXICO.**—*Loan from Revolving Fund Approved.*—The Interstate Commerce Commission has approved a loan of \$926,000 to the National Railway Service Corporation for the purpose of enabling the New Orleans, Texas & Mexico to provide itself with equipment at a total estimated cost of \$2,315,000.

**NEW YORK, CHICAGO & ST. LOUIS.**—*Asks Authority to Pledge Bonds.*—This company has applied to the Interstate Commerce Commission for authority to pledge \$1,036,000 of its second and improvement mortgage bonds from time to time as collateral security for short term notes.

**NEW YORK CONNECTING.**—*Asks authority to issue notes.*—This company has applied to the Interstate Commerce Commission for authority to issue two demand notes, for \$270,000 each, to cover advances made by the New York Central and the Pennsylvania to enable the company to pay the February interest on its 4½ per cent bonds.

**NEW YORK, NEW HAVEN & HARTFORD.**—*Receivership Advocated.*—Edgar J. Rich, counsel for the Associated Industries of Massachusetts, testifying before the governor's committee of New England, which is investigating the conditions at Boston, on March 15, made the statement in his testimony that he doubted if anything could save the New Haven from a receivership, and it was not to be deplored.

"Increased labor costs and a decrease in traffic due to higher rates, coupled with the fact that lines are in the hands of transportation men rather than traffic experts," Mr. Rich said, "were responsible for the present transportation crisis in this section. The cost of a receivership for all of the New England roads," he added, "would not be more than 3 per cent of the proposed increase in rates.

"It is highly important that the credit of the railroads be restored," he said. "The New Haven ought to be reorganized and this opportunity ought not to be lost. One of the essential reasons for a receivership for the New Haven is the millions sunk and investments impaired in outside properties."

James H. Hustis, president of the Boston & Maine, who testified before the committee on the following day, admitted also that the New Haven was the weakest spot in the New England railroad system. Further details of the hearing will be given in next week's issue of the *Railway Age*.

**NORWOOD & ST. LOUIS.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue and sell \$199,000 of first mortgage 5 per cent bonds, dated April 1, 1902, to discharge or refund existing obligations.

**PORT WENTWORTH TERMINAL CORPORATION.**—*Receivership.*—Thomas B. Felder and C. E. Gay, Jr., were appointed receivers by Judge Evans in the Federal Court at Savannah, Ga., on March 9. The Savannah & Atlanta Railway, which was placed in the hands of receivers on March 4, owns the entire \$1,500,000 capital stock of the terminal corporation.

**RARITAN RIVER.**—*Authorized to Issue Promissory Notes.*—This company has been authorized by the Interstate Commerce Commission to issue \$100,000 of promissory notes, with interest at 6 per cent.

**READING.**—*New Plan from Common Stockholders.*—The Prosser common stockholders' committee has filed an amended and supplemental petition with the Federal District Court at Philadelphia, in which it asks the court to adopt an alternative plan in case the court cannot require the Reading Company to reduce the par amount of its stock, as requested in the committee's first application. The alternative plan would confine the subscription for stock of the coal company to the common stockholders and require them to purchase the same for about \$7 per share of Reading common, subject to correction on bringing the Reading Company's balance sheet down to date. The petition states that this alternative modification of the plan would accomplish the requirements of the Supreme Court decree and still preserve the equities between the holders of the several classes of Reading stock in accordance with the contract between them.

The committee asks that the following be substituted for the section of the plan giving the three classes of stock equal subscription rights, in case the court refuses to order a reduction in the par value of the stock:

Such no par value stock will be sold to the holders of the common stock of the Reading Company for an aggregate sum equal to the amount by which the book value of the stock and debt of the Coal Company of which the Reading Company must be divested, after deducting the aforesaid \$10,000,000 in cash or current assets and \$25,000,000 in bonds of the Coal Company, exceeds the existing surplus of the Reading Company, for illustration:

Value of Coal Company's stock and debt as carried on books of Reading Company, December 31, 1919.....	\$77,919,770
Deduct cash or current assets and bonds to be received from Coal Company .....	35,000,000
Net book value of distribution to be made.....	\$42,919,770
Surplus of Reading Company (to be brought up to date).....	33,201,149

Amount to be paid by common stockholders to restore capital, or about \$7 a share of Reading Company common stock (based on surplus shown in December 31, 1919 statement)... \$9,718,629

**Petition Against Plan.**—The Continental Insurance Company and the Fidelity-Phenix Fire Insurance Company of New York have asked the court for a modification of the proposed plan. This action is taken independently of the Prosser common stockholders' committee, although the changes asked are substantially the same. Objection is made to that part of the plan which provides that the preferred stocks shall share in any distribution of the accumulated surplus, and also to the payment of a bonus of \$10 for \$1,000 bond to holders of Reading general mortgage 4s.

The Continental Insurance Company is the owner and holder of 4,200 shares of Reading common and the Fidelity-Phenix likewise owns 4,200 shares. Referring to the general 4s, the petition says:

Your petitioners aver that a segregation of the coal and railway properties of the Reading Company, pursuant to the decree of mandate entered herein, can be effected by permitting the general mortgage to remain undisturbed and by providing for the making of such agreements with trustee under said general mortgage as will render impossible any common control of the coal and railway properties, and that such plan can be effected without requiring the release of any property from the lien of said general mortgage.

**SEABOARD AIR LINE.**—*Abandonment of Line Authorized.*—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of a branch line in Nassau County, Fla., a distance of 1.39 miles, which was built to serve a beach resort, now abandoned.

**WESTERN MARYLAND.**—*Loan from Revolving Fund Approved.*—The Interstate Commerce Commission has approved a loan to this company of \$1,500,000 to aid the carrier in providing itself with freight locomotives at a total estimated cost of \$3,000,000. The carrier itself is required to finance \$1,500,000 to meet the loan of the government.

**WEST JERSEY & SEASHORE.**—*Defers Dividend.*—The directors have decided to defer for the present action on the semi-annual dividend of 2½ per cent upon the stock until business and financial conditions for the year can be definitely ascertained. The West Jersey & Seashore has been paying dividends since 1896, most of the time at 5 per cent. In 1906 the rate was increased to 6 per cent, but in 1908 reduced to 4 per cent. Since 1910 it has been 5 per cent. The total stock issue is \$11,586,250, of which the Pennsylvania Railroad owns \$6,747,900.

## Dividends Declared

Beech Creek.—½ of 1 per cent, quarterly, payable April 1 to holders of record March 16.  
 Cleveland, Cincinnati, Chicago & St. Louis.—Preferred, 1¼ per cent, quarterly, payable April 20 to holders of record April 1.  
 Green Bay & Western.—5 per cent, payable March 21 to holders of record March 19.  
 Joliet & Chicago.—1¾ per cent, quarterly, payable April 4 to holders of record March 23.  
 New York Central.—1¼ per cent, quarterly, payable May 2 to holders of record April 1.  
 New York, Lackawanna & Western.—1¼ per cent, quarterly, payable April 1 to holders of record March 14.  
 Pittsburgh, Bessemer & Lake Erie.—Common, 1½ per cent semi-annually, payable April 1 to holders of record March 15.  
 Southern Railway.—Mobile & Ohio stock transfer certificates, 2 per cent quarterly, payable April 1 to holders of record March 15.  
 Wisconsin Central.—Preferred, 2 per cent, payable April 1 to holders of record March 21.

# Railway Officers

## Executive

**J. L. Wilkes**, whose election as president of the Jacksonville Terminal was announced in the *Railway Age* of March 5 (page 534), was born at Columbia, Maury county, Illinois, on October 3, 1880. He began railroad work in 1896 as a telegraph operator on the Nashville division of the Louisville & Nashville and was later promoted to despatcher. In 1905 he entered the service of the Illinois Central as a despatcher and subsequently served as chief despatcher of the Louisville division of the same road. In 1917 he left railroad service for a brief period during which time he was general manager of the Bell-Union Coal & Mining Company, Union county, Kentucky. He returned to railroad service as assistant superintendent of the Atlanta division of the Nashville, Chattanooga & St. Louis, with headquarters at Atlanta, Ga. On August 1, 1918, he became supervisor of the operating division of the Railroad Administration reporting to the regional director of the Allegheny region. In February of the following year he became superintendent of the Washington Terminal at Washington, D. C. On March 1, 1920, he went to Jacksonville, Fla., as general manager of the Jacksonville Terminal and was holding that position at the time of his election as president. Mr. Wilkes will continue as general manager in addition to his new duties.

## Financial, Legal and Accounting

**H. T. Newcomb** has been appointed general solicitor of the Delaware & Hudson with headquarters at New York, effective February 1.

**C. E. Coomes**, whose appointment as auditor of the Florida East Coast was announced in the *Railway Age* of March 4 (page 534), was born at St. Marys, Ky., on November 3, 1880.

He attended high school in Davies County, Ky., and was graduated in 1898. In 1901 he entered the service of the Illinois Central as clerk to the road supervisor at Cecilia, Ky. The following year he entered the office of the division superintendent and served in various capacities in that office until August, 1905, when he was appointed chief accountant of the Kentucky division. He resigned that position in 1914 to go with the Valuation Division of the Interstate Commerce Commission as

an accountant. In 1917 he entered the service of the Florida East Coast as special accountant. The following year he was appointed chief clerk to the comptroller and was holding that position at the time of his recent promotion.

**G. C. Gahan** has been appointed general auditor of the Canadian Pacific with headquarters at Montreal, succeeding F. E. Shrimpton, deceased.

**George W. Lamb**, assistant comptroller on the Louisville & Nashville, with headquarters at Louisville, Ky., has been appointed general auditor for the Association of Railway Executives, with headquarters at New York City, effective March 1.

## Operating

**William H. Page**, trainmaster on the Seattle division on the Northern Pacific, returned to his former position as conductor on January 18. **Belger H. Hammer**, trainmaster on the Fargo division, was returned to position as conductor on January 7.

**H. W. Purvis**, general superintendent of the Seaboard Air Line, with headquarters at Savannah, Ga., has been transferred temporarily to the staff of the general manager with headquarters at Norfolk, Va., effective March 3. **P. G. Walton**, general superintendent at Hamlet, N. C., has had his jurisdiction extended to include the entire system.

## Traffic

**John A. Dolan** has been appointed general agent on the Erie, with headquarters at Cincinnati, Ohio, succeeding **John H. Webster**, who has been transferred.

**C. J. Acost**, traffic manager of the Macon, Dublin & Savannah, with headquarters at Macon, Ga., has had his jurisdiction extended to include the duties of auditor.

**J. D. McCartney**, whose appointment as assistant general passenger agent of the Central of Georgia was announced in the *Railway Age* of March 4 (page 534), was born at Linton, Ohio, on September 18, 1881. He was educated in the public schools of Denver, Colo. In 1899 he entered Northwestern University and continued his education at the University of Georgia, from which institution he was graduated in 1902 with the degree of bachelor of science.

J. D. McCartney

Upon leaving college he became editor of the Thomasville (Georgia) Times-Enterprise. In 1908 he went to Rome, Ga., as managing editor of the Tribune-Herald. He remained in that position until his recent appointment

with the Central of Georgia. In his new position, Mr. McCartney will have charge of the new department of public relations which has just been established by the company.

**Arthur F. Long** has been appointed commercial agent on the Chesapeake & Ohio, with headquarters at Minneapolis, Minnesota, succeeding **F. J. Vanderblue**, who has been promoted.

**T. F. Harding**, traveling agent on the Chicago & North Western, has been appointed traffic manager of the Utah-Idaho Central, with headquarters at Ogden, Utah, effective March 15, succeeding **J. W. Ellington**, who has been appointed to the position of traffic manager of the Amalgamated Sugar Company.

**A. C. Hilton**, whose appointment as general eastern passenger agent of the Erie, with headquarters at New York, was announced in the *Railway Age* of March 5 (page 534), was born at Altamont, N. Y., on October 15, 1872. He entered railroad service in 1892 with the Erie. In 1901 he was transferred to the general offices of the company in New York, and was subsequently appointed Pacific Coast agent for the company, with headquarters at San Francisco, Cal. In 1907 he became general agent, passenger department, with headquarters at Cincinnati, O. The following year he went to Buffalo, N. Y., in the same capacity, and continued to hold that position until the time of his recent promotion.

C. E. Coomes

### Mechanical

**E. E. Chapman** has been appointed engineer of tests of the Atchison, Topeka & Santa Fe with headquarters at Topeka, Kans., succeeding H. B. McFarland, resigned. The headquarters of this office were formerly at Chicago.

### Engineering, Maintenance of Way and Signaling

**W. E. Fitzsimmons** has been appointed roadmaster of the Dakota division of the Northern Pacific with headquarters at Carrington, N. D.

**G. M. de Lambert** has been appointed roadmaster of the Lake Superior division of the Northern Pacific with headquarters at Duluth, Minn.

**W. D. Simpson** has been appointed division engineer of the Florida division of the Seaboard Air Line, effective March 1, succeeding B. Land, Jr., resigned.

**G. W. Abbott**, division engineer of the Boston division of the Boston & Albany, has been appointed principal assistant engineer, with headquarters at Boston, Mass., succeeding E. S. Draper, deceased. **W. B. Knight**, division engineer of the Albany division, has succeeded Mr. Abbott as division engineer of the Boston division. **E. K. Mentzer**, supervisor of track of sub-division 1, has been appointed division engineer of the Albany division with headquarters at Springfield, Mass. **F. A. Jones**, office engineer with headquarters at Boston, has succeeded Mr. Mentzer, and **E. G. Hartford**, assistant engineer, has succeeded Mr. Jones.

### Special

**M. L. Bishoff** has been appointed assistant chief surgeon of the Atchison, Topeka & Santa Fe Hospital Association.

### General

The New York Central, Lines East of Buffalo, has announced that, effective March 16, the following offices have been abolished:

#### Operating

- General superintendent, New York Terminal, First and Second districts.
- Superintendent, Little Falls and Dolgeville division.
- Assistant general superintendent, New York Terminal district.
- Assistant manager, Marine department.
- Assistant superintendent, Electric subdivision, West Shore Railroad.
- Assistant superintendent on all divisions.

#### Mechanical

- Superintendent, fuel and locomotive performance.
- Assistant superintendent, fuel and locomotive performance.
- Fuel instructor.
- Supervisor of fuel and locomotive performance, First and Second districts.
- Superintendent, rolling stock.
- Assistant to superintendent, rolling stock.

#### Engineering, Maintenance of Way and Signaling

Engineer, maintenance of signals.

The following offices have been abolished on the Lines West of Buffalo:

#### Operating

- General superintendent, Third and Fourth districts.

#### Mechanical

- Superintendent, rolling stock, at Cleveland.
- Assistant district master car builders at Collinwood and Englewood.
- Assistant superintendent, motive power, at Cleveland.
- Master mechanics at Collinwood and Elkhart.

#### Engineering, Maintenance of Way and Signaling

- Assistant signal engineer at Cleveland.
- Engineer, maintenance of way.

### Purchasing and Stores

Assistant general storekeeper at Collinwood.  
Assistant district storekeeper at Elkhart.  
Traveling storekeepers at Englewood.

## Obituary

**Oscar A. Constans**, freight traffic manager of the Baltimore & Ohio, Western lines, died in Chicago on March 8. Mr. Constans was born November 23, 1862. He was educated in the grammar and high schools at Columbus,

O. A. Constans

Ohio, and entered the service of the Baltimore & Ohio in 1883 as a clerk. In 1884 he became secretary to the assistant general freight agent and remained in that capacity until 1887, when he became secretary to the general freight agent at Pittsburgh, Pa. He was later appointed chief clerk in the general freight office at Pittsburgh and held that position until 1895, when he became division freight agent at Pittsburgh. Two years later he was transferred

in a similar capacity to Columbus, O., where he remained until 1907, when he was transferred to Cleveland. In April, 1910, he was appointed western freight traffic manager at Chicago. In 1916 he was appointed freight traffic manager, Western lines, which position he held at the time of his death.

**Edmund D. Brigham**, assistant freight traffic manager of the Chicago & North Western, died suddenly at the Union League Club, Chicago, on Saturday, March 5, following an attack of heart trouble.

E. D. Brigham

Mr. Brigham was 65 years old, and had been in railroad service for 48 years. He entered railroad work in October, 1873, as a telegraph operator on the Chicago & North Western at Ishpeming, Mich., but went with the Chicago, Milwaukee & St. Paul in December of that year as a night telegraph operator at Western Junction, Wis. From May 29, to November 2, 1874, he served as a night telegraph operator in the dispatcher's office on the St. Paul at Racine, Wis., but on the latter

date he returned to the Chicago & North Western, being made cashier, with headquarters at Ishpeming, Mich. In March, 1879, he was made agent at Peshtigo, Wis.; he was transferred to Ishpeming, Mich., in February, 1880, and in January, 1882, he was promoted to traveling freight agent, with headquarters at Fond du Lac, Wis. Mr. Brigham came to Chicago in March, 1885, having been appointed chief clerk in the general freight department. In October, 1888, he was promoted to division freight agent, with jurisdiction over the Wisconsin, Galena, Madison and Peninsular divisions and in January, 1893, he was promoted to assistant general freight agent. He was made general freight agent in February, 1900, and assistant freight traffic manager in 1910.

Among the important subjects presented by the Committee on Wooden Bridges and Trestles yesterday morning were the specifications, classifications and grading rules for timber and lumber for use in maintenance work. These specifications strike at a condition which has long prevailed on

### The Specifications for Timber

the railways and which has been complained of by the manufacturers of lumber. It is unfortunately true that there is much merit to the criticism often voiced by lumber manufacturers that there has been no uniformity of specifications, grades or sizes of timbers required by the railroads, each road being a law unto itself in this respect. This wide variation in opinion has made it difficult for lumber manufacturers to proceed with the cutting of timber in advance of definite orders, for there was no assurance that these orders would include timbers of the sizes on hand. However, the position of the lumbermen has also been open to criticism in that they have endeavored to induce the railways to accept their stock sizes rather than those actually required by the roads. These conflicting viewpoints have tended to create a controversy in which the advantage has been first on one side and then the other. In revising the specifications for maintenance of way timber the committee has endeavored to present standards which all of the roads can adopt. If the roads will adopt these specifications and standards the criticisms of the manufacturers will have been removed in large measure and they will be able to proceed with the production of their materials,

knowing that they will comply with the requirements of many railroads. Once these specifications come into general use it becomes the duty of the lumber manufacturers so to cut their products as to meet the requirements of the railroads, since the railways, as purchasers, should be best qualified to pass upon the sizes and other conditions necessary to fill their requirements.

One of the tendencies which has been developing in the convention during recent years and which was particularly pronounced this year has been the lack of interest in the discussion of many of the reports. This may be due in part to a feeling among the members that the conclusions of a committee have been so thoroughly considered that further discussion is unnecessary. It may be due in even greater measure to a natural hesitation on the part of many members to speak before a large audience, or to take issue with the committee. Regardless of the case it is an unfortunate tendency which should be corrected. Few committees contain within their membership all of the sources of knowledge on a particular subject. There are few reports on which further discussion and information will not contribute to the value and possibly lead to a modification of the recommendations and conclusions of the committee. The object of the Association is pointed towards the development of the best practices. Any member of the Association who withholds information which might add to the knowledge of a subject is depriving the entire railway industry of this help. Since the most accurate conclusions can only be drawn by incorporating all of the information available it is important that this information be drawn out in the discussion if it is not contained in the report itself. This entails an individual responsibility to the Association which every member assumes when he joins it.

### Every Member Responsible for Discussion

The report of the Committee on Masonry contains a valuable suggestion for advancing the usefulness of the A. R. E. A. to the roads through the more intensive dissemination of information developed by the committees in the course of their work. The suggestion made by the Masonry committee relates to its own work, completed last year, namely, the Specifications for Concrete and Reinforced Concrete, but the same thought will apply to the work of other committees. It is proposed that these specifications be issued in pamphlet form in the same manner that the Specifications for Iron and Steel Structures have been published in various editions since they were first promulgated in 1906. The suggestion of the Masonry committee, however, goes further than this. In addition to the specifications *per se*, it is suggested that the pamphlet include a general fund of useful information on the subject of good practice in workmanship and material. In other words, it is proposed to prepare a fund

### A Field for Further Service

of data to support the requirements of the specifications couched in language that will appeal to the foremen and the inspector—the men who must be depended upon to secure the results. As pointed out by Mr. Robinson in his discussion, the real need is for simple statements of facts that the foreman can understand readily and put into use. Others may feel that a more comprehensive treatment would be preferable. Although there is thus an opportunity for a difference of opinion as to the character of information which should be included in such a pamphlet, it is believed that its publication will be an effective measure for the advancement in concrete practice on the railroads.

The reports of two committees presented yesterday bring out one of the most knotty problems now before the structural engineer. With all the

#### A Fair Presentation of the Facts

scientific effort being directed at the perfection of concrete technology and for the improvement of timber treating practice, the use of both concrete and treated timber in sea water is attended with all too frequent failures. In neither case can the problem be said to have been solved satisfactorily. In each case there is a vast fund of conflicting data in which the results of imperfect practice are confused with conditions that indicate bona fide limitations of the present state of the art. Good results and long service records mingle with inexplicable cases of exceedingly short ones. The reports of these two committees presented yesterday were exceedingly frank in pointing out the limitations in the present use of the materials, one in the presentation of rules calling for very conservative use of concrete and the other in pointing out the shortcomings in the service secured from the creosoted piles exposed to the attacks of borers. In view of the fact that the constructor is practically limited to concrete and timber in his selection of materials for railroad works built at tidewater terminals, the presentation of the unvarnished facts concerning both of them is of inestimable value to the user and surely will accrue also to the ultimate advantage of those who supply the materials.

In its report presented yesterday morning the Committee on Wood Preservation called attention to the severity

#### The Ravages of Marine Borers

of the recent attacks of marine borers on exposed piling in coastal waters and described various means of arresting these attacks in their entirety or in part. While this subject has received considerable attention for a number of years because of the known attacks along the Atlantic Seaboard and the Gulf Coast, the recent unusually severe invasions in San Francisco Bay and along Puget Sound have directed increased attention to this subject. The depredations within the confines of San Francisco Bay alone are estimated to have caused damage exceeding \$15,000,000 within the last two years. In view of the decreased first cost of timber construction, it is important that means be discovered to overcome this trouble at the earliest possible date. The Committee on Wood Preservation has no more important work before it than to bring these investigations to a successful conclusion, for unless the proper precautions are discovered, the use of timber will of necessity be abandoned where marine borers exist. The present conclusions of the committee that the timber should receive a thorough treatment with creosote oil and that at points of particularly severe attack it should also be given mechanical protection as well,

should receive the serious consideration of all engineers charged with responsibility for the construction of docks and other structures in sea water.

### Plan for the Future Now

THE MEASURE OF SUCCESS OR FAILURE achieved in business concerns, as in the lives of individual men, is mainly determined by whether they do or do not make thorough and intelligent plans for the future, and resolutely endeavor to carry them out regardless of the difficulties they meet. Often after plans are made it is necessary to modify them or carry them out less rapidly than was hoped, but it remains true that large success is almost universally the result of sound and thorough planning and of resolute endeavor regardless of obstacles.

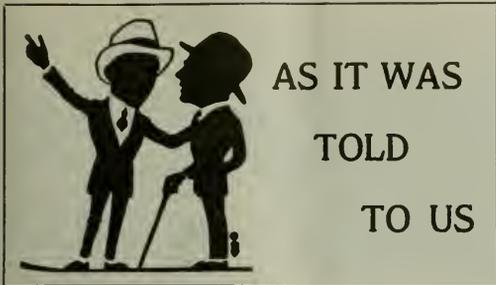

There never were any concerns for whose future development and successful operation careful planning was more needed than it is now needed for the railways of the United States. Conditions of almost all kinds in the railroad field have undergone violent changes within the last four years. Furthermore, most plans for the development of the railways which were made prior to four years ago have had to be kept largely in abeyance since then. Consequently, there are few railways which would not benefit greatly by having a complete survey made of their present and probable future needs and definite plans made for their future development.

The present needs of most railroads are different from what they were a few years ago. This statement applies to their position both from the standpoint of their physical condition and their organizations. Never was there a time when the development of the railways and their organizations along lines which would enable them to reduce operating expenses and give better service was so imperatively required as at present.

In the making of any survey of a railway to determine its needs and the means which should be adopted to meet them, the engineering department necessarily will play an important part. The engineering officers should make every effort to equip themselves to do their part in solving the great problem presented and they should not hesitate to direct the attention of their superior officers to the necessity for beginning to plan now. The time to make plans is when business is bad. There is less time and opportunity to make them when business is good.

Of course, every suggestion for improvements which is offered will be met with the answer that the railway has not and cannot raise the needed capital, but every railway under anything like normal conditions has some money to invest, and the smaller the amount the more necessary it is to spend it where it will do the most good. Only by careful study and planning can every available dollar be invested at the time and in the place where it will contribute the most toward the improvements which will increase the net return required to enable larger improvements to be made.

The present is a time of severe retrenchment. This retrenchment is being carried out on most railways in a desperate effort to effect the greatest possible economies and largely regardless of future consequences. With so many railway companies threatened with disaster it is difficult to find fault with any immediate saving that may be made, however effected, but the very existence of present conditions is the strongest argument for careful planning for the future. It is a notable fact that in general the railways on which the most careful planning has been done in the past and the greatest efforts made year by year to carry out the plans made are those on which today the smallest number of the costly maintenance-deferring retrenchments are now necessary.

AS IT WAS  
TOLD  
TO US

S. L. Flien and F. Y. Hie, two representatives of the Chinese government sent to this country to study telephone apparatus, were visitors at the Coliseum Tuesday evening, taking special interest in the railway telephone equipment exhibits.

\* \* \*

Judging from the frequency with which railway supply men are making trips to Cuba, the railways in that country must be in the market for tremendous quantities of material. Among those who have recently returned from business (?) trips to that island is F. L. Dodgson, consulting engineer of the General Railway Signal Company. Mr. Dodgson reports that the railway situation in Cuba looks very good.

\* \* \*

W. P. Borland, chief, Bureau of Safety, Interstate Commerce Commission, came in on Tuesday to attend a meeting of the Joint Committee on Automatic Train Control. Mr. Borland left the following day with a subcommittee of the joint committee of the American Railway Association to make an inspection of the National Safety Appliance Company's intermittent induction type of train control which is in service on a short stretch of track on the Western Pacific.

\* \* \*

One of the established customs of the convention is the assignment of Past President William McNabb to secure a prominent Canadian speaker at the annual dinner of the Association. The favor with which these speakers have been received by the Association is indicated by the fact that he has been requested to perform this duty year after year. Through his efforts the Association has been permitted to hear many of the most prominent men of Canada.

\* \* \*

One of the interested visitors at the convention Wednesday was A. A. Potter, dean of engineering, Purdue University. Professor Potter is returning from a meeting of the Committee on Prime Movers of the National Electric Light Association, which committee has just completed an elaborate investigation, the results of which are contained in a 1,500-page report. Dean Potter has taken an unusual interest in the American Railway Engineering Association this year since the retiring president and the president-elect are both graduates of the College of Engineering at Purdue.

\* \* \*

The memory of the late H. C. Cartlidge has recently been refreshed in the minds of many members of the American Railway Engineering Association through the receipt of copies of a bulletin of the International Railway Congress containing a review of the American railway practice in the use of concrete which Mr. Cartlidge prepared in 1914, but which was not published until again recently owing to the advent of the world war. A reading of this posthumous paper will impress one with the thorough grasp which this writer possessed in this branch

of engineering in which he had played so important a part. This fact was recently driven home to G. A. Haggander, Mr. Cartlidge's successor as bridge engineer of the Chicago, Burlington & Quincy. Mr. Haggander has had occasion to study the paper published by the International Railway Congress very carefully owing to the fact that the congress requested him to prepare an addendum to Mr. Cartlidge's report with a view to bringing the subject up to date. Mr. Haggander has just transmitted this to the congress.

The Latest Ford Story

Railway men were interested some months ago to learn that the man who put the "tow" in auto and who has since endeavored to remake many of our established institutions had also taken unto himself a railroad for the purpose of showing railway men how railroads should be run. We have learned in the course of the last two days that this successful American citizen is determined to reform the traffic and operating departments of the railroad. Indeed, he has even decided to show something to construction and maintenance of way. Recently while riding his pet hobby (in a physical sense) he inquired of the officer who accompanied him why the right-of-way was so wide and after this had been explained to him he inquired what was the minimum width that would suffice for operation. On being advised that 20 ft. could be made to serve the purpose he said: "Fine, we will use the rest of it for factories." But this is not all. He has also shown the bridge engineers a thing or two. Recently when designs were submitted to him in connection with a proposed bridge renewal, it was found impossible to convince him that any of the designs would serve his purpose. He did not want a swing span, but the bascule design submitted to him contained too many superfluous features. The counterweights particularly met with his severe disapproval with the result that he insisted on a design in which the span is lifted with a beautifully simple device consisting of two stiff leg derricks with fall lines of sufficient capacity to lift up the ends without the aid of any of those superfluous features such as were embodied in the designs which ordinary mortals had prepared.

Dr. Gunsaulus Dies

Those who were present at the annual dinner Wednesday evening and noted the absence of Dr. Frank W. Gunsaulus who was on the program to deliver the invocation, were shocked to learn yesterday morning that he had died suddenly at his home during the night previous. In addition to being pastor of one of the largest churches in Chicago for a number of years, he had been president of Armour Institute of Technology, Chicago, since its creation over 20 years ago. Dr. Gunsaulus was known internationally as an engineering educator. He resigned his pastorate in 1919 in order that he might give his entire time to the development of an enlarged institute of technology.

Statistics on Employees and Compensation

WASHINGTON, D. C., March 17, 1921.

The Interstate Commerce Commission has issued its quarterly report of statistics on employees and compensation for the third quarter of 1920. These are the first statistics showing the effect of the wage award of the Railroad Labor Board last July. It reveals a total payroll for that quarter of \$1,052,000,000 as compared with \$801,000,000 for the previous quarter, an increase of 31 per cent. This pay roll consumed 62 per cent of the total earnings of employees. The number of employees averaged 2,158,000. The total payroll for the three quarters of 1920 aggregated \$2,648,000,000.

An Interesting Type of a Double-Track Deck Girder Bridge on Steel Bents

## Railway Engineering Association Proceedings

The Last Day's Session Included the Presentation of Reports by Nine Committees

IT WAS NOT UNTIL 4:30 yesterday afternoon that the twenty-second annual convention of the American Railway Engineering Association drew to a close with the installation of the officers elect for the coming year. Usually the discussion of the reports of the regular standing committees is completed by noon of the third day,

but owing to the fact that the report of one committee was held over from the preceding day and discussion of some of the reports proved somewhat more lengthy than usual, the convention occupied nearly the entire afternoon. Abstracts of the reports and the discussions which followed are given below.

### Report of Committee on Masonry

*A final report on disintegration of concrete in sea water reviews the available data on this subject and presents recommendations covering the preparation of concrete for use in sea water which will be effective in preventing or minimizing the disintegrating tendencies. The effects of age and condition of storage on the strength of concrete are outlined in seven conclusions. Similarly the effect of low temperature on concrete is stated, giving references to leading authorities. The slump test and the float table, two means for testing the plasticity of concrete, are also presented as affording new measures for obtaining a better quality of concrete.*

J. J. Yates  
Chairman

*J. J. Yates, chairman of the committee, is completing his second year in this capacity and has been a member of the committee since 1912. During this long period of service he has played an important part in the work, having served as the representative of the Association on a Joint Committee on Cement Specifications and is now vice-chairman of the New Joint Committee on Concrete and Reinforced Concrete. His position as bridge engineer of the Central Railroad of New Jersey makes him particularly valuable to the committee, owing to his experience with important concrete structures in the salt water of New York harbor.*

THE WORK OF THE COMMITTEE has been largely confined to joint committee on standard specifications on concrete and reinforced concrete, on which a report is expected in 1921. In Appendix A the committee presented a report on the disintegration of concrete and corrosion of reinforcing materials in connection with the use of concrete in sea water. In Appendix B it submitted its report on the effect upon the strength and durability of concrete not having a sufficiency of moisture present throughout the period of hardening as compared with concrete fully supplied with moisture.

#### Conclusions

The committee recommended the following action be taken on its report:

That conclusions 1, 2, 3, 4, 5 and 6 as given in Appendix A be approved and substituted in the Manual for conclusions 1, 2, 3 and 4 as they appear on page 294 of the 1915 Manual under Disintegration of Concrete and Corrosion of Reinforcing Metal.

That the report as given in Appendix B be accepted and printed in the Proceedings as information.

Committee: J. J. Yates (C. R. R. of N. J.), chairman; Job Tuthill (P. M.), vice-chairman; J. T. Andrews (B. & O.), R. Armour (G. T.), G. E. Boyd (D. L. & W.), T. L. Condon (Cons. Engr.), L. N. Edwards (Bur. of Pub. Roads), J. E. Freeman, T. L. D. Hadwen, Geo. T. Hand (L. V.), W. K. Hatt (Purdue Univ.), L. J. Hotchkiss (Foundation Co.), S. C. Hollister, R. L. Humphrey (Cons. Engr.), Noah Johnson (Wabash), M. S. Ketchum (Univ. of Colo.), W. S. Lacher (Railway Age), A. E. Owen (C. R. R. of N. J.), W. M. Ray (B. & O.), F. E. Schall (L. V.), Z. H. Sikes (N. Y. C.), F. P.

Sisson (G. T.), L. L. Tallyn (D. L. & W.), C. C. Westfall (I. C.).

**Appendix A—Disintegration of Concrete and Corrosion of Reinforcing Material**

A great deal of attention has been given in the past to this subject, not only in America, but also in Europe and other countries. Many of the investigations published, however, are based upon laboratory tests, which, while very interesting and valuable, do not furnish all the facts as to the action of sea water on concrete. Concrete placed in sea water is not only subject to a chemical action taking place in the transformation of some of the elements composing the concrete, but more particularly to the mechanical attacks due to the action of the tides, waves, ice, drift or accident, the variation of temperature, especially in the colder latitudes, all tending to injure the film of the exposed surface. When this film is once pierced or abraded, the aggregates and binding material offering less resistance, are exposed to these attacks, causing the more or less rapid destruction and failure of the concrete.

Engineering publications in the past record many failures of concrete placed in sea water; the causes are variously ascribed to the chemical effect of sea water on concrete, to the mechanical action of the tides and waves (largely aggravated in Northern latitudes by alternate freezing and thawing between high and low water level), poor selection of aggregates or lack of proper workmanship, etc.

Whether such failures were due to any one of the causes mentioned or to their combined action cannot be answered directly. It is known, however, that in the development of the various methods of proportioning, mixing and depositing of concrete during the past few years, much has been accomplished to make a concrete that will better serve the general requirements of good concrete construction. With proper study of all the conditions encountered in a particular piece of work, and with first-class material and workmanship, it is thought possible that concrete may be made that will withstand the action of sea water in warm climates, if guarded against abrasion, and by providing special face protection against the action of frost or floating objects, between low and high water, concrete may also withstand sea water in the colder climates.

**PLAIN CONCRETE IN SEA WATER**

For concrete structures in sea water particular attention is to be given to designing, to the avoidance of all sharp corners, offsets or pockets tending to obstruct the flow or gliding of waves and floating objects past the structure. The cement used in this class of work to be Portland cement, which must meet the requirements of the current specifications of the American Railway Engineering Association.

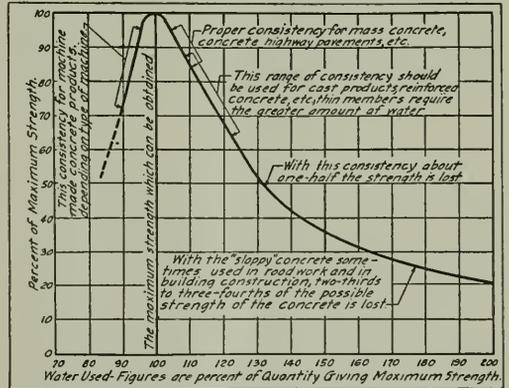

In the proportioning of fine and coarse aggregates, it is most important that a highly dense, impervious product be obtained. It is recommended that thorough tests be made to establish that mix which will result, with the aggregates used, in securing the greatest density of the concrete, and to continue these tests to maintain the proper mix at all times, until the completion of the work. Allowance should be made for the loss of cement when concrete is deposited into sea water. Special attention must be given to exposed surfaces to secure a hard, even and non-porous face of concrete. For pre-cast concrete blocks, piles, etc., placed in sea water, the foregoing requirements are equally important. Better results have generally been obtained heretofore with pre-cast blocks than with concrete deposited into sea water, but the

blocks must be well seasoned before being placed in position.

The sand must be free from clay or other foreign matter; clean, well-graded fine to coarse sand will produce the best results. The coarse aggregate should be carefully selected. It must be uniformly hard and durable. Non-porous, screened washed gravel is preferable for sea water work, especially in colder climates, although sound, hard, crushed stone may be used. Gravel affords better mixing and it settles more easily into place. Bank-run gravel, however, should not be used, since generally its quality is not uniform. Sea water has been used in the gaging of concrete, and it was found that the strength of the concrete is affected only to a small extent. Fresh water should be used when such can be obtained without unreasonable expense.

The gaging of the concrete is of great importance; the consistency should neither be too dry nor too wet. If deposited in air, a consistency that permits of light tamping and packing to bring water to the surface without much effort will generally be best; rodding, to secure greater density, may be employed to good advantage.

The time of mixing of the concrete for sea water construction must receive special attention, and should be tested out with the particular mix used, so that all par-

**Effect of Quantity of Mixing Water on the Strength of Concrete**

ticles of the fine and coarse aggregates are thoroughly coated and the full strength of the cement used obtained. It is an established fact that the strength of the concrete increases, according to the time allowed for mixing, up to a certain point, and full advantage should be taken of this element; two minutes is considered a minimum.

In depositing concrete into sea water, continuous operations must be employed and the greatest care exercised if failure is to be avoided, either using a well-designed watertight tremie or a bottom drop bucket. It is important that the concrete be deposited systematically. If a charge is used, it must be kept filled at all times; when a charge is lost, the tremie must be withdrawn and refilled. If a drop bucket is used, the concrete is to be discharged from the bucket alongside the last previously placed; the whole of the surface should be kept as level as possible. In all cases, enclosed cofferdams should be used to prevent washing. In case of unavoidable interruption of the work, it is most important that the top surface be thoroughly cleaned of laitance after the stoppage of work before additional concrete is placed. The concrete above the low water line should be tamped and

compacted as it is placed and thoroughly worked next to the forms, to obtain a dense, smooth, non-porous surface.

If the foregoing is followed, a good and lasting plain concrete should be obtained, but this is only possible by constant vigilance, rigid supervision and care, in every detail of the process of construction. The least infraction on the established proportions or laxity in thorough workmanship may lead to failure.

#### REINFORCED CONCRETE IN SEA WATER

The protection of reinforcing steel in concrete placed in sea water is dependent upon the density, impermeability and lasting qualities of the concrete in which it is embedded, and the distance of the reinforcing steel from the surface of the concrete. When the surface film of the concrete is once abraded by mechanical or other action, the reinforcement may be reached by the sea water either through capillary attraction or exposure of the metal. The steel will then rust, causing its destruction, and also the spalling of the concrete by reason of the enlargement of the rusted steel. It is, therefore, imperative to construct a dense, impermeable concrete when steel reinforcement is employed.

Where possible, mass construction should be adopted for such part of concrete structures as will come in contact with sea water, between high and low water, and even for the parts above the high water line, steel reinforcement should be so placed that there is at least three inches dense concrete between the surface of concrete and the face of the steel to prevent moisture from the salt air penetrating to the metal.

#### CONCLUSIONS

1. Concrete for sea water work should be mixed in the proportions of one part Portland cement to not more than six parts of fine and coarse aggregates, measured separately and combined in such proportions as will produce a concrete of maximum density and impermeability. Only enough water should be added to secure plastic workability. The concrete shall be mixed in a batch mixer for not less than two minutes after all the materials are in the drum. Where concrete is deposited into sea water, the above proportions should be reduced to one part of cement to not more than five parts of separately measured aggregates. Tests should be made from time to time during the progress of the work to maintain the proper proportions of the aggregates throughout construction.

2. Concrete should be deposited in the air wherever practicable. When necessary to deposit concrete in water, it should be protected from currents by cofferdams or similar means.

3. The concrete, where practicable, should be deposited in a continuous operation to a point five feet above high water. In case of unavoidable stoppage of the work, the previously cast concrete should be thoroughly cleaned of all laitance.

4. From two feet below low water to two feet above high water, or from a plane below to a plane above wave action, the face of the concrete should be adequately protected against mechanical abrasion and frost action. Construction or other joints should in every case be avoided within this zone. Sharp corners and projections should also be avoided, but where necessary they should be rounded to reduce abrasion to a minimum.

5. If reinforcement is used in concrete in sea water, special attention should be given in the design to the position of the reinforcement. In no case should the steel be nearer than three inches to any plain or curved sur-

face, and not less than four inches from any two adjacent surfaces.

6. The most rigid rules in regard to workmanship and inspection should be established and constantly enforced on all sea water work.

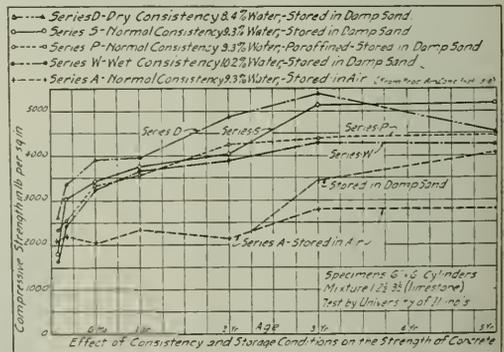

#### Appendix B—The Effect Upon the Strength and Durability of Concrete

A series of tests have been made at the University of Illinois supplemented by investigations made by the Chicago, Burlington & Quincy to determine the effect of age and condition of storage upon the strength of concrete. The results of the tests have been summarized as follows:

"1. The strength of the concrete which was stored in contact with moisture increased rapidly up to an age of one year; the increase in strength at ages greater than one year, although considerable, took place at a much less rapid rate.

2. The air-stored concrete attained nearly its final strength at a comparatively early age and gained little strength with the lapse of time.

3. The concrete which had been stored in air for a considerable time increased in strength greatly after it

Effect of Age on Compressive Strength of Concrete

had been stored in contact with moisture, so that further hydration of the cement could take place; the strength of the specimens stored in damp sand two years and eight months after they were two years and four months old was 1.46 times the strength of the specimens which remained stored in air for five years.

4. The strength of the concrete at an age of seven days for both damp sand storage and air storage was about 70 per cent of the strength at 28 days; at an age of one year the strength of the concrete stored in damp sand was about twice as strong as at 28 days and the air-stored concrete was only 10 per cent stronger than at 28 days. At an age of five years the strength of the concrete stored in damp sand was about 2.5 times the strength at 28 days and the strength of the air-stored concrete about 1.3 times the strength at 28 days.

5. At ages of three and five years the strength of the concrete stored in damp sand was about 1.9 times the strength of the air-stored concrete.

6. For the specimens stored in air the strength at an age of eight years was slightly more than that at six months.

7. The strength of the specimens stored in water for 10 months after they were seven years old was 1.3 times

the strength of the specimens which remained stored in air for eight years.

It seems apparent that concrete in structures exposed to air which is not damp will gain little strength beyond that attained at the earlier ages, in the portions where loss of moisture takes place, while concrete in contact with moisture or dampness will continue to gain in strength for some years."

#### Discussion

J. J. Yates (Chairman): The work of the Masonry committee this year has been largely confined to the work of the Joint Committee on Specifications on Concrete and Reinforced Concrete, and many of its reports are deferred pending the results of the final specification that is to be issued by that committee. I am pleased to announce that in accordance with the instructions of the joint committee, it is proposed to issue a tentative specification to the societies represented on the joint committee about May of this year, and I understand it will probably be published in July in our Bulletin. Under the rules of organization that discussion is to be open one year, and then it goes back to the joint committee for further consideration and preparation of the final specification.

The committee reports on two subjects, one a progress report, and one for insertion in the Manual. The first report for insertion in the Manual is report on disintegration of concrete and corrosion of reinforcing materials in connection with the use of concrete in sea water. This subject has been before the committee for several years and there have been several progress reports made. I will ask Mr. Schall, chairman of the sub-committee, to present the report.

F. E. Schall (L. V.): In presenting this report of sub-committee 2 of the Masonry committee it is well to state that we have found it difficult to find a common ground on account of the diversity of results obtained in using concrete in sea water. Ordinary concrete today used in sea water will not perform its duty. It requires the most careful attention in preparing the aggregates, grading them to the proper sizes, the mixing of the concrete, the placing of the concrete and working it in place, so as to obtain a dense impermeable product. The report has been published so there is no reason to go any further in regard to this matter, but I will read the conclusions.

(Mr. Schall read the conclusions.)

(*Moved that they be adopted by the Association and published in the Manual, and the motion was carried.*)

Chairman Yates: The next subject we want to present as information and we would like to have discussion. It is a very important subject, that is, the amount of consistency of concrete, and I am going to ask Mr. Freeman to discuss this.

J. E. Freeman (Port. Cement Assn.): The effect of the quantity of mixing water upon the strength and other properties of the concrete is a matter which has been brought out most forcibly by recent investigations. A chart shown illustrates the effect upon the strength, showing how, as the quantity of water increases, so the strength of the concrete that is produced decreases. In many cases in ordinary construction, the quantity of water that is used today is probably anywhere from 30 to 50 per cent in excess of the quantity needed for maximum strength. Now, of course, it is true that a concrete giving the maximum strength indicated on the chart would be rather too stiff to work readily in placing the concrete in structures, but at the same time a great deal can be done towards decreasing the quantity of water, and still have a plastic workable mixture that can be placed in forms without extra effort. By cutting down on the amount of water, which would bring up the

strength along the curve to a point between 110 and say 125, the strength of the concrete can be realized, which will be 70 to 90 per cent of that possible. The use of an excess quantity of water is bad from two standpoints. In one case it means waste of good material, and in another case it means a reduced factor of safety in the concrete that goes into the work. The excess water also means that other properties of the concrete are reduced in somewhat like proportion.

However, it is possible to control the quantity of water by means of a simple test which has been developed, called the slump test. The slump test can be used as a means of determining the slump of concrete that is produced with a given consistency, which has been selected on the basis of the mixture selected for work and the aggregates that are used as being the proper consistency for that particular class of work. This, then, can be transferred to the job and used as a control test for the maximum slump permissible. It is not necessarily an exact test. At the same time it is a good check to see that the consistency which has been selected for that particular job is not being exceeded by the use of more water than is really necessary.

A report which was presented in connection with the Masonry committee report for 1919 showed the results of some tests on the effect of moisture applied to the concrete while hardening and upon the compressive strength and the resistance to compression. Some of the tests now presented with this report as information carry this on further, covering a period from one year to seven years.

A. F. Robinson (A. T. & S. F.): I am one of the unfortunates who is not willing to accept the so-called slump test. It may be all right, and it doubtless is, but it is like some of those peculiar things which we can make mean almost anything. I feel a good deal as though the investigations thus far made, and while they were made on proper lines, have at the present time resulted in clouding the results. It does not seem to me that we ought to arrange our rules for making concrete in such a way that we have got to have a so-called concrete expert on every division of the road. We ought to be able to make our rules so that they are very clear and simple, and so that we can put them into the hands of any intelligent gang foreman and have the work carried out properly and get fine results.

I feel further that insufficient attention has been given to the question of the time the mixer is running. There is another very important feature, which does not seem to me the committee has even touched on, and that is the care of the concrete after it is placed. In this section of the country and east of here, there is usually a sufficient amount of moisture in the atmosphere to cure the concrete, but when you go west, we will say north and south of the line through Dodge City, every 10 miles you go west the quantity of moisture in the atmosphere is reduced, and I doubt if more than 70 per cent of the concrete that is built west of that line is anywhere near so good as it ought to be. This feature is one of the troublesome ones that I have to contend with. I am trying to find a method by which when concrete has been placed and the forms removed, we can coat it with something that is going to hold all of the moisture that has been put in the concrete in the mixing, and permit a complete hydration of the cement.

I have had several unfortunate cases in hand where we had failures of reinforced concrete girders. We have cut out pieces of the concrete that would break like a piece of half-dried clay. Afterwards these samples were put into water and left there for a week and we got a

fine ring to the pieces. In other words, the hydration of the cement was again started, even after it had stopped for several years.

Please do not understand from my remarks that I am attempting to ridicule or belittle this slump test and the test submitted by the Bureau of Standards. That is not my purpose. I am with you heart and soul in every kind of an investigation that can produce better concrete.

Chairman Yates: As to the mixing time, there has been considerable investigation on that point. I agree with Mr. Robinson there is a good deal of trouble now,

and we hope to join with the Concrete Institute this coming year in investigations of mixers. We do not know enough about mixers.

As for the care of concrete after seasoning, we had some reports last year but they were not satisfactory. We are not satisfied with the information we have for the Joint committee, and if any of the members have information with regard to failures of concrete and will send a written discussion on the subject, we will be only too pleased to put it before the committee.

(The committee was excused with thanks.)

## Report of Committee on Buildings

*A report on the classification of buildings for purposes of ascertaining the approximate cost of new construction shows that while detailed estimates are the most satisfactory, the amount of work entailed is too great where a number of structures are involved. Pricing curves are established by plotting known costs of actual building construction, using total cubical contents and the cost per cubic foot of a number of structures of one type. Sixteen separate classifications are submitted for the proposed final specifications of buildings. Results of studies presented in proposed specifications covering the first eight classifications.*

W. T. Dorrance  
Chairman

*W. T. Dorrance, who is completing his first year as chairman, has been a member of the committee since 1915 and in this connection has participated in the extensive and constructive work which it has done in this period. The studies of this committee have done much to promote standardization of design and construction of the smaller railway buildings and have contributed thereby to economy of operation. The report this year is an important contribution to the knowledge of building classification. Mr. Dorrance is designing engineer of the New York, New Haven & Hartford and as such is brought into intimate contact with intensive maintenance problems.*

**I**N APPENDIX A THE COMMITTEE submitted their report on the classification of buildings. In regard to specifications for buildings, specifications and methods in use were secured from various railroads covering various sections of this country and Canada. Careful study of the subject was made and decision reached that it was advisable to prepare separate specifications on the loose-leaf principle covering each class of work entering into railroad buildings. This would enable selecting the specifications required for any building desired and binding together to form a specification for that building. The subjects for these separate specifications are covered by the following list:

- (1) General conditions (to be attached to all specifications);
- (2) excavation, filling and back fill; (3) sewers and drains;
- (4) concrete; (5) brick work; (6) carpentry and millwork; (7) lathing and plastering; (8) hardware; (9) painting and glazing;
- (10) roofing; (11) plumbing; (12) lighting; (13) heating (steam); (14) heating (hot water); (15) heating (hot air);
- (16) scope of the work—In addition to the above specifications for the various trades, a specification should be drawn for each job defining definitely the scope of the work.

Eight of these were completed and presented as Appendix B.

The committee felt that it was practically impossible to write a specification that could be used without change by every railroad, but that the specifications submitted could be used as a guide, each road making slight modifications to fit local conditions.

Committee: W. T. Dorrance (N. Y. N. H. & H.), chairman; J. W. Orrock (C. P. R.), vice-chairman; F. L. Beal (St. L.-S. W.); G. A. Belden (C. of G.); Eli Christiansen; D. R. Collin (architect); W. H. Cookman (Penna.); A. Crable (H. V.); W. L. Darden (S. A. L.); K. B. Duncan (A. T. & S. F.); J. B. Gaut (G. T.); A. M. Griffin (A. C. L.); F. F. Harrington (Vir.); F. R. Judd (I. C.); G. A. Mitchell (G. T.); R. V. Reimer (C. R. R. of N. J.); C. W. Richey (Penna.); G. A. Rodman (N. Y. N. H. & H.).

### Appendix A—Classification of Buildings and Methods for Ascertaining Approximate Cost

The subject assigned to the committee indicates that only a method be outlined and that no attempt be made to establish costs due to varying prices of labor and material, and differences in types of construction. The report included three different methods for estimating as follows: (A) Bill of particulars method; (B) square foot method, and (C) cubic foot method.

#### THE BILL OF PARTICULARS METHOD

The "Bill of Particulars" method calls for simply a detailed estimate as is now the common practice of engineers and contractors for arriving at cost of construction. This is the most accurate and is perhaps the most satisfactory method which can be devised where only one or a very few buildings are to be estimated. Where there are a number of structures similar in type the burden of making so many detailed estimates would be large and it is advisable to use some short cut of reasonable accuracy.

#### THE SQUARE FOOT METHOD

The "Square Foot" method necessitates first making up a series of bill of material estimates or applying known costs of existing buildings on the various types of buildings selected, and plotting these estimates and costs so that curves can be drawn establishing a square foot price. The application of it is very approximate due to the fact that buildings of the same type will vary in height and other particulars, but the "Square Foot" method is satisfactory for approximate estimates.

#### THE CUBIC FOOT METHOD

The "Cubic Foot" method must also be built up by first making bill of material estimates or plotting known costs

and establishing a price per cubic foot in the same way for the various types of buildings selected. The application of this method is more accurate, as it takes into account the different heights of buildings, varying cubage of roof construction, etc. The following method, which is based on specification type, is by no means perfect and is not the only one that can be used, but it has been used satisfactorily on a number of railroads in connection with government valuation with various modifications. Briefly the method is as follows:

First, set up certain types of buildings, based on specifications, separating the different types of construction and different utilities, giving for each type a specification sheet showing briefly the principal details of construction. It is advantageous to make as few types as possible, consistent with local conditions. Each type may cover the complete structure, including normal foundation, plumbing, heating and lighting, but for accurate results it is recommended that the building type cover only the shell, setting up the foundation as a separate type and adding plumbing, heating and lighting at a cost per unit.

Following this latter scheme, there would first be set up type standards to cover the following foundations—the type description to show the depth, general dimensions, class of masonry, etc., as follows:

- (1) Timber post, 8 in. x 8 in.—5 ft. C-C, 7 ft. long.
- (2) Masonry pier, 12 in. x 12 in., brick on concrete footings.
- (3) Trench walls, 20 in., rubble or concrete walls.
- (4) Trench walls, 30 in., rubble or concrete walls.
- (5) Cellar, 20 in., rubble or concrete walls, with 12 in. x 30 in. footing concrete floor; 1 flight plank stairs; coal bin—windows with aces and gratings.

The following types for superstructure are suggested and will probably answer the purpose on most roads:

Frame passenger station.....	3	types
Brick passenger station.....	3	types
Stone passenger station.....	1	type
Concrete passenger station.....	1	type
Frame freight house.....	3	types
Brick freight house.....	3	types
Concrete freight house.....	1	type
Frame shop, 1 and 2 story.....	2	types
Brick shop, 1 and 2 story.....	2	types
Frame engine house.....	1	type
Brick engine house.....	1	type
Concrete engine house.....	1	type
Frame section house.....	2	types
Frame yard buildings.....	3	types
Signal towers.....	4	types
Dwellings.....	5	types
Office buildings.....	3	types

The above schedule of types is suggested for use in connection with valuation of existing buildings. For new work it would probably be advisable for any one road to limit the number of types to a minimum.

Each superstructure type should show the kind and style of framing, size of principal members, description of flooring, wall covering ceiling, outside covering, roof, over-hang chimneys, and other building items, as per specimen type sheet as follows:

**Specification for Building of Type No. 1**

**FRAME PASSENGER STATION—Type No. 1**

- Frame:** Spruce sills, 6x8 in. Floor joist, 3x10—16 in. C-C. Posts, 4x6 in. Studs, 2x6 in. C-C. Plate, 4x6 in. Rafters, 2x10—20 in. C-C.
- Framing:** Full mortise and tenon.
- Exterior Walls:** Sheathed and clapboarded with paper between (or covered with wood shingles or tin shingles).
- Exterior Trim:** Cypress, corner boards, water table, belt course, fascia and cornice.
- Interior Walls:** No. 1 planed, matched and beaded Nor. Car. pine sheathing with wainscot 3 ft. 6 in. high.
- Ceiling:** No. 1 planed, matched and beaded Nor. Car. pine (or 2 coats plaster).
- Floors:** 1 in. Rift hd. pine on 1 in. under floor.
- Interior Trim:** Cypress, all stock shapes.
- Roof:** 1 in. boarding with building paper, tin, wood or asphalt shingles.
- Gutter:** Wood or galvanized iron.
- Conduction and Flashings:** Galvanized iron.

**Overhang:** 6 ft. wide on four sides, sheathed underneath, with brackets.

**Doors and Windows:** All stock shapes and sizes.

**Hardware:** Iron, bronzed finish or brass.

**Painting:** 3 coats lead and oil. Inside filled and varnished.

**Interior Fittings:** 1 ticket shelf, 1 telegraph shelf, 200 ft. b.m. of pine shelving; iron wire grill in ticket window.

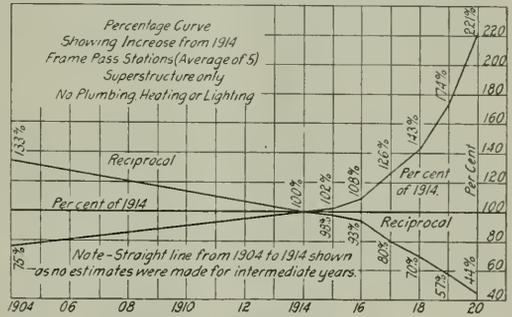

**Chimney:** Two 4 in. brick walls, 8x12 in. flue lining.

Additions should be made for slate or tile roof, concrete or terrazzo floor, special sizes and shapes of doors and windows, fireplace or mantel of elaborate design.

**Plumbing:** Various types should be set up to cover the principal classes of fixtures used by the carrier, and a price per fixture estimated for each type. This price is to include the proportional part of the total cost of such items as sewer and water connections, meters, soil pipe, etc. The following types for plumbing fixtures will answer most purposes:

- Closet with wood stall complete.
- Closet with slate stall complete.
- Urinal, flat back.
- Urinal, with slate stall.
- Urinal, full porcelain stall.
- Wash bowl.
- Sink, 18 in. x 30 in., cast iron with back, legs and fittings.

**Heating:** The best method of typing and pricing heating systems is on the basis of cubic foot of space heated—the

**Trend Curve for Building Costs**

system to be complete in itself, including boiler, radiators, and piping. Type to be set up to cover the following units:

- Hot air furnace.
- Steam—One- or two-pipe system. Cast iron radiators.
- Steam—One- or two-pipe systems. Pipe coils.
- Hot water—Two-pipe system. Cast iron radiators.
- Hot water—Two-pipe system. Pipe coils.

**Lighting:** This can be computed on either a cubic foot basis or price per fixture, but from experience we believe that the price per fixture is most accurate and easiest to apply. The price per fixture to include connection with city lines, meters, switches, and all wiring and fixtures inside the buildings, throwing everything into a type with the exception of very elaborate or expensive fixtures which should be priced separately. The following types are suggested:

- Electric lights with wall brackets—plug or drop.
- Electric light with chandelier, 2 to 4 lights.
- Gas—wall brackets.
- Gas—chandelier, 2 to 4 lights.

**Furniture:** The furniture in a building usually varies considerably even in buildings of the same general type, and we believe that a better method is to make a complete inventory and price each article separately, although such buildings as section houses and small railroad stations can be handled by assigning a typical outfit and putting one lump sum price on the whole outfit.

After setting up these various types, pricing curves should be plotted to cover foundation and superstructure, using the left-hand margin for the actual cubic contents of the building and the top and bottom margins for the price per cubic foot.

In order to establish the curve for any particular date, several structures conforming to the type are selected—taking the largest, the smallest and several intermediate sizes—a complete bill of material estimated and priced, and from this is computed the total estimated cost of the shell, and the cost per cubic foot. These points are plot-

ted on the sheet and in addition all available contract costs and costs of structures built by company forces, which conform to this type, also plotted. With these various points an average curve is drawn. These curves can be used for either pricing buildings for valuation purposes or for estimating the cost of new work, as of the one given date. Due to the rapidly changing labor and material prices, some method must be devised for modifying cost figures so that comparison can be made between similar types built at different dates. This can be done by a curve showing the cost of construction from 1904 to 1920, taking 1914 as normal and plotting the average for each year.

It is found that the pricing curves for the various types of buildings all follow the safe general shape and after establishing the form of the curve it is only necessary to figure about three buildings of any one type in order to give the curve the proper location on the pricing sheet. The method of applying this scheme in practice is to figure the cubic contents of the building—pick up the price per cubic foot from the curve sheet, and apply it to the cubage. In the same way figure the cost of foundation, then add the number of units of plumbing, heating and lighting at the type price, add such items as furniture, grading, outside drainage, platforms, etc.

#### Discussion

W. T. Dorrance (Chairman): The subjects assigned to the Committee on Buildings this year were five. (Read subjects.) A study of the Manual was made and the committee has no recommendations to make involving the subject matter; the conclusion on this subject merely refers to the editing and rearrangement of the subject matter now published.

Chairman Dorrance: Subject No. 2 on the Classifi-

cation of Buildings was given considerable study, and the committee presents as information the matter contained in Appendix A.

Chairman Dorrance: Subject No. 5 is to report on specifications for buildings for railroad purposes. The committee secured specifications from various railroads and made a careful study and analysis of the ones they were able to secure and from the data and information collected felt that the proper form for a general specification of this sort was in what might be termed the loose leaf form, whereby each general subject was given a specification by itself, so as to make possible the combining of any number of these into one specification for such buildings as might be under discussion. We selected 16 different subjects and were able to prepare specifications for 8 of these. The committee would like to have the approval of the Association for this general method of the work and would like to submit the 8 specifications which we have prepared for discussion, expecting them to lay over for a year before they are offered as final conclusions for insertion in the Manual.

O. E. Selby (C. C. C. & St. L.): I notice that carpentry and millwork are associated together. I have found that the practice in actual work is to separate these two subjects distinctly, the millwork is sublet usually and is a distinct classification. The carpentry work includes rough lumber and the placing of the mill work. The mill work includes all work that is dressed or framed in the mill before going to the site, and I think it will facilitate letting mill contracts if these two subjects are specified separately, and it can then be shown distinctly in the case of each building just what is included in the term mill work.

(The committee was excused with the thanks of the Association.)

## Report of the Committee on Roadway

*Some subsidence occurs under all embankments built on any ground except rock, the percentage being greater under small fills than under large ones. No fixed rule is possible for estimating the amount. Tests show that an average allowance of 10 per cent will cover shrinkage on earth removed from excavation. Local conditions must be studied in ascertaining subsidence or swell in rock. More consideration should be given drainage conditions when contemplating construction of long cuts on flat grades. Where such cuts are unavoidable good, wide, deep side ditches should be provided. If impracticable, sub-drainage should be provided.*

J. R. W. Ambrose  
Chairman

*J. R. W. Ambrose has served as chairman for two years and as a member of the committee for eleven years. He has given much time to the work of the committee and has studied at length the problem of determining unit pressures allowable on roadbeds of different materials. He served as chairman of a sub-committee investigating this subject at one time, working in co-operation with the Committee on Stresses in Railroad Track. He is chief engineer of the Toronto Terminal Railway Co., a joint organization of the Canadian Pacific and the Canadian National which has under way the reconstruction of the terminals in Toronto.*

THE COMMITTEE submitted (1) a few proposed changes and revisions of the definitions in the Manual. It also presented its findings and recommendations in regard to subjects (2-3) subsidence and shrinkage, in Appendix B; (4) metal culverts, in Appendix C; (5) sealing of cracks by cement gun, in Appendix D; and (7) drainage of long cuts. Progress reports were made on (5) sealing of cracks by cement gun and (6) standing water in borrow pits.

#### Conclusions

The committee recommended that the findings and conclusions on subjects 1, 2, 3 and 7 be adopted and

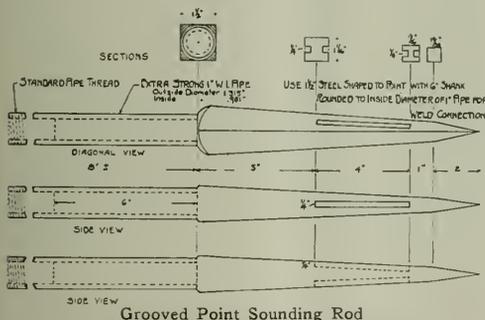

placed in the Manual and those on 4, 5 and 6 be accepted as information only and incorporated in the proceedings.

Committee: J. R. W. Ambrose (Tor. Term.), chairman; J. A. Spielmann (B. & O.), vice-chairman; E. J. Bayer (C. C. & St. L.), C. W. Brown (L. & N. E.), H. W. Brown (Penna.), C. C. Cunningham (C. R. I. & P.), W. C. Curd (Cons. Engr.), W. M. Dawley (Erie), Paul Didier (B. & O.), S. B. Fisher (M. K. & T.), R. D. Garner (S. N. E.), J. A. Lahmer (M. P.), J. G. Little (Railway Age), H. W. McLeod (C. P. R.), C. M. McVay (K. & M.), W. H. Penfield (C. M. & St. P.), P. Petri (B. & O.), J. W. Pfau (N. Y. C.), Frank Ringer (M. K. & T.), R. E. Robinson (U. P.), R. A. Rutledge (A. T. & S. F.), H. E. Tyrrell (Sou.), C. E. Weaver (L. I.), W. H. Woodbury (D. M. & N.).

**Appendix B—Subsidence and Shrinkage of Embankments**

Subsidence occurs principally and to the greatest extent in marshes, swamps, bogs and wet lands, the reason obviously being that the natural ground will not sustain the combined embankment, track and loads. In many cases the yardage below the original natural surface of the ground was found to be several times the quantity of that above it. In preliminary work there is no fixed rule for determining what amount of subsidence will occur. The engineer locating a new or additional line through bogs, swamps, marshes, etc., would do well to make allowance for considerable subsidence. In some cases, before building, soundings have been taken with a view to locating the hard surface under swamps, bogs, etc., and allowance made for the fill to subside to that level. This is not always possible, however, and it sometimes happens that this hard surface will break under the weight and subsidence continue indefinitely.

It was found that subsidence to some extent will invariably occur under embankments built through ordinary grazing or agricultural land. This applies to the greater percentage of embankments, as most of the land in the country comes under this class. This is due to the loose formation of the upper crust of the ground, which has not

**Grooved Point Sounding Rod**

the bond, weight or density of the lower beds due to the roots of grass and other vegetation, plowing and the action of frost keeping the bond continually broken up. The percentage of subsidence will be much greater on the small fills by reason of the smaller area of the base and the tamping action of trains. On the larger and higher fills the base is spread over a much greater area and the tamping action is not so pronounced at the base, consequently the subsidence is proportionately less.

The committee called attention to the good results secured in determining the extent of subsidence on small fills by means of a slotted and pointed bar, which, when driven to the bottom of a fill and turned leaves in the slot a specimen of the material at that point. For convenience of handling an extension may be put on the bar. This method, however, would not be practical on fills of over 10 ft. Great care should be taken in recording the measurements of the different depths.

Trenching is the most accurate method of determining subsidence. It is not, however, always practicable or possible to trench, in which case the boring methods must be used. Wash borings are more or less inaccurate and should be used with care. Several roads report they are unable to get any real results from their use, the holes filling with soupy, muddy water and the dividing lines of the strata impossible to determine. Dry borings protected by casing, if necessary, have given good results when proper care has been taken in making and record-

ing same. In determining the extent of subsidence, care should also be taken in locating the line of the natural surface at the toe of the embankment. On account of the earth often sliding or washing down and spreading out at the toe, a very gentle slope is left, which can easily be mistaken for the natural surface.

Subsidence occurs in two distinct ways. By compression and by displacement. On ordinary land the upper strata of earth being weakly bonded will tamp and compress, permitting the fill to subside. This will also occur in shallow swamps, such as muskeg, or where water standing on the ground will lessen its bearing power. Subsidence from this cause, as a rule, is not serious from an operating standpoint, as it will cease after the strata of soft material immediately under the fill is sufficiently compressed or tamped. Great and serious subsidence is caused by displacement. In deep, bottomless bogs and swamps, the embankment often continues to subside, displacing large quantities at the sides and requiring constant attention to prevent the interruption of traffic. In some such cases embankments have been known to reach a state of equilibrium without having reached a solid bottom, but this has taken a considerable time. Others are still subsiding after many remedies have been tried, and it seems probable will continue to do so indefinitely.

The effect of subsidence is to lower the base of the fill, causing a corresponding shrinkage of the track structure, involving heavy maintenance charges, and in some cases so large as to justify the abandonment and relocation of the line.

**CONCLUSIONS**

Some subsidence occurs under all embankments built on any ground except rock. It is very light in sand and gravel. The percentage of subsidence is greater under small fills than under larger ones.

Subsidence is due to compression or displacement of the strata of earth under the embankment.

Subsidence must always be anticipated in swamps, marshes and bogs, and any land on which there is standing water.

Serious subsidence is local and it is impossible to fix any rule as a guide in estimating or anticipating same.

The question has been raised as to whether shrinkage actually exists. It is felt by the committee that the existence of shrinkage is proved by every ditch or sewer line and every post hole. The Chicago, Burlington & Quincy, Duluth, Missabe & Northern and Duluth & Iron Range have made shrinkage tests by the density method, which may be briefly described as follows: Samples are taken from various points in embankments with an iron or steel cylinder of known cubical capacity, care being taken to neither compress nor expand the material. The same thing was done in adjacent excavation when it was quite certain that the embankment was built from this excavation. These samples were taken to the laboratory, where they were weighed and placed in a dry, warm or hot place. When samples were quite dry they were again weighed. The differences in weight is taken as measurement of change in volume. This method was described in detail on page 1573 of the June 4, 1920, issue of the *Railway Age*.

The results obtained indicate that the experiments should be carried on more extensively. Some remarkable ideas are developed, such as that the shrinkage of material is proportional to its weight, and weight depends on the depth in the natural bed. These subjects are capable of great and interesting development. From the results as obtained by this method it would seem the net shrinkage (making no allowance for subsidence) of common earth, would average close to 9.5 per cent and as 10 per cent is the commonly used allowance this would show it to be

away from the actual material and convey the water away as rapidly as possible; and, if then tile drains are still necessary, they should still be placed at satisfactory depth, and the cut ditches should still be kept open at all times; it being, of course, obvious that all ditches or drains must be kept open, as otherwise they defeat their own purpose. In hauling out cleanings from ditches or opening up new ditches, the material, if wasted, should be so placed that it cannot be washed back into the drain ditches or pipes in case of heavy storm.

Each year Drainage Districts are organized in territory adjoining railroads and where borrow pits exist are assessed exorbitant amounts for benefits assumed to accrue to embankments through drainage of the pits.

The report of the committee should be of value to the railroad by showing the effect of standing water, how best to overcome it, and whether or not drainage ditches will benefit track. If we should go on record with a report based upon replies received to date, which are to the effect that borrow pit drainage will relieve unstable track, we feel that the Association Proceedings will be in evidence at the trial of every Drainage District case and that the railroad companies will be further burdened by higher assessments.

The committee wishes to finally dispose of the subject, but it cannot do so without assistance. In view of its importance, we feel it would be unfortunate indeed if we had to recommend to the Association that the subject be withdrawn from further consideration.

There are very few railroads having no borrow pits, and it should be a comparatively easy matter to secure data as to their effect upon embankments under varying conditions. From many of the replies to our circular letter, it would appear that the effect of water in borrow pits is confused with that of water pockets.

The committee does not wish to prescribe any specific form of investigation that should be carried out, but rather that you follow your own ideas. What we are after is reliable data from which a conclusion may be reached.

### Discussion

J. R. W. Ambrose (Chairman): This is one of the committees that believes in standardization, and where there are two or more ways of doing things, we believe that the A. R. E. A. way is the way it should be done.

In the absence of J. G. Little, the chairman of the sub-committee on the revision of the Manual, I will present that part of the report. We wish, in the first place, to standardize the spelling of the word "berm," at least for this Association. There is considerable difference in the pronunciation of the text word Subsidence. We propose the accent be placed in the "si."

The definition for shrinkage was criticized somewhat by Mr. Wendt last year, and through the efforts of Mr. McVay's committee on subsidence and shrinkage, this new definition was formulated. The definition for settlement is entirely new, and we wish to delete the table on page 28 of the Manual in connection with the allowance for shrinkage, as it differs somewhat from Mr. McVay's report which will follow. *I move that this part of the report be approved.*

(After extended discussion of the definition for "shrinkage" the motion was put and carried.)

Chairman Ambrose: The second subject is "Subsidence and Shrinkage of Embankments." That is handled by Mr. McVay.

C. M. McVay (K. & M.): The sub-committee and the committee in general has put in considerable time in going over the information that was received, and submits the conclusions given in its Appendix B.

Chairman Ambrose: *I move that the conclusions be approved and incorporated in the Manual.*

G. A. Mountain (Can. Ry. Com.): I would like to ask how the conclusion was reached of figuring a shrinkage of 10 per cent on earth moved from excavation to embankment?

Mr. McVay: We had cases cited where the shrinkage would run as high as 40 to 60 per cent, other cases were given where the shrinkage was 2 and 3 per cent. Practically the only comparison that could be made was the quantity in the excavation and the same quantity in the embankment. Quite a lot of the information that is available does not carry that out far enough to give much information, but we found that 10 per cent was what would be used generally all over the country in ordinary earth excavation by practically all engineers in anticipating shrinkage, and we also found that the average of figure taken after the jobs were completed, where the figure was prepared in a usable shape, was very close to 10 per cent. I am free to say that that appears to be the general practice. Almost every railroad replying stated that 10 per cent shrinkage was allowed.

J. B. Jenkins (B. & O.): I will ask the committee if it will accept an amendment to Conclusion 1, inserting "of quantities measured in excavation" after "per cent," making it read: "Figure a shrinkage of 10 per cent on earth removed from excavation to embankment."

The reason I suggest this is that the I. C. C., where it has been applying a shrinkage of 10 per cent has been adding 10 per cent to the shrunken embankment quantities in order to ascertain the quantity of excavation, which results in a shrinkage of 9 per cent instead of 10.

Chairman Ambrose: There has been, as I understand, some dissension about the way this is to be applied, as to whether this yardage is from the source or in the opposite way. We found that in some cases it was applied one way, and in others in another way in different cases that were brought to our attention, but we did not feel like saying that it must be applied from the source or that it must be applied from the final location. The percentage, I believe, runs about 9.1 one way and approximately 11 the other way. The way it is written here it implies excavation, and that is, I think, the way that it is generally applied by the chief engineers of the roads from whom we got replies.

Mr. Jenkins: *I move that the words "measured in excavation" be inserted after "per cent."*

(Motion carried.)

The Chairman: That places the submission of these questions before you in an amended form.

E. A. Frink (S. A. L.): *I move to amend Conclusion No. 1 in Appendix 8 by including the words "in general" after the word "is," so the last sentence will read: "The percentage of subsidence is greater under small fills than under larger ones."*

The Chairman: The committee will accept that suggestion.

(Motion carried.)

Chairman Ambrose: The next subject is "Corrugated Metal Culverts." Mr. W. H. Penfield (C. M. & St. P.), chairman of that sub-committee, was called away suddenly last night. The committee collected considerable data regarding the use of corrugated metal culverts. It does not recommend the use of them as a permanent proposition, but only as a temporary one.

Chairman Ambrose: "Sealing Bad Cracks in Rock Cuts with Cement Gun." The committee has received considerable information on this subject from a number of roads, but the work is not far enough along yet to furnish any definite conclusions.

Chairman Ambrose: Standing water in borrow pits is the next subject. This subject was handled by Mr. W. C. Curd, chairman of the sub-committee, who will present the report.

W. C. Curd (Consult. Engr.): There seems to be a confusion existing between the effect of standing water in borrow pits and the water remaining on the track, and we have not been successful in getting specific locations from which we could report anything definite.

Chairman Ambrose: "Drainage of Larger Cuts," which was the last subject, will be presented by Mr. Robinson. Chairman of that sub-committee.

R. B. Robinson (U. P.): The sub-committee on this

subject has thought that because of the drainage requirements, long soft cuts offered a condition that should be avoided in any reasonable way possible in the first place in not laying the line into such soft locations if it is reasonably possible to avoid it. After it may have been found necessary to lay a line into a condition of that kind, various methods have been used to carry off the water.

We are not attempting to say that any one method would solve every local condition that could arise.

Chairman Ambrose: *1 move that these conclusions 1, 2 and 3 be adopted.*

*(Motion carried.)*

*(The committee was excused with thanks.)*

## Report on Wooden Bridges and Trestles

*Various types of wooden trestles have been studied with a view toward standardization. An analysis of designs shows a wide variation in stresses from those adopted by the A. R. E. A. A revision of allowable stresses is recommended in order to take advantage of the increased knowledge regarding different woods. Cooper's E65 is considered the maximum loading for wooden trestles built with the timber now generally available, while the E-55 loading is considered sufficient at the present time. Complete specifications for lumber and timber to be used in the construction and maintenance of way departments are presented for adoption.*

W. H. Hoyt  
Chairman

*W. H. Hoyt is rounding out his third year as chairman of the committee, after serving for four years as vice-chairman. He was first appointed a member of the committee in 1914. He is an active worker in association activities, having been prominent in the work of the Duluth Engineers' Club, the Federated Engineering Societies of Minnesota and the American Society of Civil Engineers. He has been connected with the railways on the Iron Range of Minnesota since their inception. As assistant chief engineer of the Duluth, Missabe & Northern for 19 years and chief engineer for the past year he has had charge of ore dock development.*

THE COMMITTEE PRESENTED a number of revisions of the Manual covering changes in definitions and minor changes in the text of the sections on guard rails and guard timbers, lag screws and specifications of workmanship. In Appendix A the committee submitted a progress study of the various types of wooden trestles with a view to recommending two or three standards adaptable for general railway use. In Appendix B the committee presented its specifications, classification and grading rules for timber and lumber for railroad purposes.

### Conclusions

The committee recommended the adoption of the suggested revisions of the Manual and the adoption and publication in the Manual of its report on specifications, classification and grading rules for timber and lumber as given in Appendix B.

Committee: W. H. Hoyt (D. M. & N.), chairman; A. O. Ridgway (D. & R. G.), vice-chairman; H. Austill (M. & O.), F. C. Baluss (D. M. & N.), C. H. Blackman (L. & N.), M. I. Connerton (Sou.), H. J. Hansen, H. T. Hazen (C. N. R.), C. S. Heritage (Wash. Term.), E. M. Lewis (C. G. W.), J. B. Maddock (C. of G.), L. A. Murr (S. A. L.), D. W. Smith (H. V.), L. L. Sparrow (A. C. L.), G. C. Tuthill (M. C.), A. M. Van Auker, S. L. Wanson (M. P.).

### Appendix A—Study of Various Types of Wooden Trestles

Forestry Bureau places supply of old lumber, not once cut over, as follows:

Southern yellow pine.....	139 billion ft. b.m.
Douglas fir .....	560 billion ft. b.m.

The National Lumber Manufacturers' Association reports as follows:

Douglas fir .....	595 billion ft. b.m.
Southern yellow pine.....	258 billion ft. b.m.
Oak .....	157 billion ft. b.m.
Cypress .....	23 billion ft. b.m.

Advices from southern mills are that there will be no difficulty in securing sixteen-inch timber as long as yellow pine is sawed commercially, and that prices will continue to be fixed by the market price of commercial lumber into which it can be sawed.

The sub-committee was unable to agree upon loading classification of trestles and the matter was referred to the main committee, which approved the following:

Light loading .....	Cooper's E-45
Medium loading .....	Cooper's E-55
Heavy loading .....	Cooper's E-65

Another question leading to much discussion was that of allowable stress. The stresses shown in the table in the Manual were excellent when adopted, but with the more concise definitions of timber and the increased knowledge of its strength, it should be possible to improve it.

The table of comparisons of stringer designs for wooden trestles was made from the data furnished by the table compiled from the answers to the questionnaire sent to the various railroads. These designs display American railway practice quite completely. No data was available relative to the maximum engine loading allowed on these structures by the railroads using them.

Column No. 4 is a coefficient which when multiplied by the individual wheel load will give the maximum moment for the span. Coefficient is calculated on the assumption that axles are spaced five feet apart and positions chosen to give the maximum moment. Simple beam action for one span only is considered. Partial

continuity due to beams being two span lengths adds to the factor of safety where this construction is used. Column 5 is the similar coefficient for maximum shear.

Column 10 gives the total width of the timber and for any given cap dimension will indicate the relative end bearing stresses between the cap and stringers. Column 11 gives the total cross-section area, useful in comparing end shearing stresses under like loading.

Column 14 gives ratios of actual bearing width to span length. The larger values indicate the more favorable stresses between the cap and the stringers. This ratio is only useful in comparing stresses from uniform loads. With concentrated loads the end stresses vary with the position of the loads.

Column 15 gives ratio of cross-section to the span length. The larger values indicate the more favorable stresses of shear at end sections. This ratio serves for comparisons only for uniform loads. With concentrated loads the end shear stresses vary with the position of the loads.

Column 16 gives ratio of section modulus to span length. The larger values indicate more favorable bending stresses. This ratio is only accurate for comparison under uniform loading.

Column 17 gives the values of the cube of the span length divided by the product of the width and cube of the depth of the stringers. All formula for deflection have this factor in combination with a factor of distri-

signs than columns 16 and 15, because in a wooden trestle live loads are more important than uniform dead loads in determining the stresses.

Columns under fiber stresses give values based on 40,000, 50,000 and 60,000-lb. axle loadings on five-foot spacings with no impact or dead load of deck stresses added. As the basic data does not indicate the limits of loadings put on the various railroad trestles by the railroads using them, it was thought best to display the effect of all three classes of loadings on each of the three determining points of design. Doubtless many of these structures were never designed to carry E-50 and E-60 loadings and may now be protected by limitation of engines allowed to pass over them.

The question of proper impact percentage to be added to the live load for these short spans of timber construction is still believed to be unsettled. However, any value used will materially increase the unit stresses above those shown in the tabulation.

Columns 23, 27 and 31 give the equivalent Cooper's rating assuming the stresses be limited to the amounts given in the table of "Working Unit Stresses for Structural Timber" in the Manual. These ratings were computed with dead loads of actual decks deducted from total carrying capacity.

In the recommended standards for loading, your committee finds that in many cases the maximum on any one span of trestle will occur when two 70-ton coal cars,

COMPARISONS OF STRINGER DESIGNS FOR WOODEN TRESTLES

Table with columns: SPAN, DESIGN OF CHORD OF STRINGERS, RATIOS FOR COMPARISONS, FIBER STRESSES AND EQUIVALENT RATINGS. Includes sub-headers for BENDING, LONGITUDINAL SHEAR, and COMPRESSION ACROSS GRAIN.

bution of loading, weight of loading and the structure of elasticity. Assuming these and other factors constant, the factor — serves to show the relative deflections and hence the smaller values indicate small deflections and hence the more rigid chord.

Column 18 gives the ratio of the maximum moment coefficient for the span length to the section modulus of the chord used. The larger values indicate greater fiber stresses in bending. While the moment coefficients were calculated on wheel spacings of five feet, because modern locomotives rarely have spacings closer than five feet, this assumption will serve for the comparisons of spans up to include 16 feet.

Column 19 gives the ratio of maximum shear coefficient for the span length to the cross-section area. The larger values indicate greater shear unit stresses in both vertical and horizontal shear.

Columns 18 and 19 are better for comparisons of de-

fully loaded, and coupled, pass over the structure. Theoretically, this approximates Cooper's E-50 loading, but is thought to be no more severe on the structure than an engine of the E-45 class. It is believed E-55 will be sufficient for the present needs of nearly all the roads, as that load is exceeded as to its effect on trestles, by comparatively few engines now in service. In E-65, there is found the maximum load for which a practicable wooden trestle can be designed with the woods generally available for trestle construction.

As to the advisable length of panel, the committee agreed upon 12 ft. Yellow pine manufacturers have assured the committee that 16-in. stringers will be available without undue cost, as long as yellow pine lasts, but evaded promising an 18-in. stringer. Also, the 16-in. stringer is in general use at this time. With a 16-in. stringer agreed upon, the 12-ft. panel is very nearly a corollary.

Having fixed upon the panel length and loading, we proceed to the remaining factors of design. First comes the pile.

We will not discuss varieties of timber, believing the engineer will use the best available, and make up for any lack of structural strength by increasing the size. It is also thought a 14-in. butt will be the minimum size used. It was assumed that piles should, if possible, be so driven as to be safe for a load of 15 tons plus impact.

Class	Rating	Load on Bent of Piles	No. on Pile	Load on Pile	Load Per Sq. In. Area Cap on Pile
Light	E45	56 tons	4	14 tons	210 lb.
Medium	E55	68 tons	5	13.6 tons	177 lb.
Heavy	E65	80 tons	6	13.3 tons	173 lb.

In the event it becomes necessary to strengthen E-45 to carry E-55 load, or E-55 to carry E-65 load, the weight would be 17 tons and 16 tons respectively on the piles, which would be permissible.

So many varieties of woods are used for caps that only a general rule applying to pine, cypress and fir can be used. It is recommended that the following be used:

Light	.....	12 in. x 14 in. x 14 ft.
Medium	.....	14 in. x 14 in. x 14 ft.
Heavy	.....	14 in. x 14 in. x 14 ft.

While more than 13 ft. in length may be unnecessary, since we must pay for even feet there is no cogent reason against using such length. Caps should be surfaced on one or two sides and not dapped over the pile. Dapping is expensive and weakens the cap.

Sway bracing should ordinarily be used on all bents over 10 ft. from surface of ground to base of rail. When this distance exceeds 18 ft. there should be two or more sash braces and corresponding sway braces. Bracing should be on both sides of the pile. The aim should be to so attach the braces as to enable them to give the bent the maximum strength. The bank bent should be the same as the intermediate bent, save that no bracing is required and that in the E-65 design only five piles are recommended for the bank bent.

For frame bents the committee's recommendations are:

Class	Cap	Posts	Sill
Light	.....12x12x14	4-12x12	12x12
Medium	.....14x14x14	5-12x12	12x12
Heavy	.....14x14x14	6-12x12	12x12

The committee asked further time for consideration of design of multiple story bents and their bracing. The batter to be used for piles and posts in trestle construction has been given consideration, but no recommendations are made at this time. No conclusion has been reached relative to details of fastenings to be used in securing the posts to sills or caps to posts. Sway bracing in single story bents should be the same size as in pile bents and similarly attached. In considering stringers, it was recognized that the two lighter types should be readily strengthened for the next higher loading and in our plans this can be accomplished by inserting an additional stringer under each rail. It is recommended:

Class	Size of Stringers	Fiber Stress, Lb. Per Sq. In.	Long Shear, Lb. Per Sq. In.	Compression on Cap, Lb. Per Sq. In.
Light	6-7x16	1422 lb.	168 lb.	221 lb.
Medium	6-8x16	1346 lb.	180 lb.	200 lb.
Heavy	8-8x16	1257 lb.	178 lb.	178 lb.

It will be noted that in longitudinal shear the stresses much exceed those given in either of the tables before referred to.

Ties should be 8 in. x 8 in. x 10 in. surfaced on one side, not dapped, 12-in. centers and attached to stringers in accordance with recommended practice of the A. R. E. A. Guard timbers should be 4 in. x 8 in. attached to ties according to recommended practice of the A. R. E. A.

### Discussion

W. H. Hoyt (Chairman): The first subject, the revision of the Manual, was in charge of Mr. Ridgway, but in his absence Mr. Austill will present the matter.

(Mr. H. Austill (M. & O.)) presented the matter under "Revision of Manual."

Chairman Hoyt: *I move that the recommended changes of the committee be adopted and incorporated in the Manual.*

G. A. Mountain (Can. Ry. Com.): There is a term used by the committee under "Use of guard rails and guard timbers for wooden bridges and trestles." It is recommended that the inner guard rail, when used, shall be so spaced, etc. I think it is common practice to use an inner guard rail, and this expression would seem to convey the idea that the committee does not recommend it entirely.

Chairman Hoyt: That is in the present Manual, and the question is optional with the designing engineer as to whether to use guard timber or not. I am informed that that matter was up at a previous meeting, and a motion to make it standard practice to use an inner guard rail was not approved, and that is the reason that the committee left that clause "when used" in there. Of course, it is possible to bring the matter up at the present time to decide whether it shall remain or not.

Mr. Mountain: In our practice in Canada it is standard.

Chairman Hoyt: The practice is nearly so in the United States, but there may be a number of cases where it does not apply.

*Motion carried.*

Chairman Hoyt: The second subject assigned was "Specifications and Classification and Grading Rules for Lumber and Timber to Be Used in the Construction and Maintenance of Way Departments of Railroads." This subject has been before the committee for the past three years. It has again been gone over this year; a number of revisions and improvements made as we see it and it is now submitted with a view to final approval for printed as recommended practice.

The President: On the question of ties, something was said yesterday about the correlation between the recommendations of various committees as to ties and those of the Tie committee.

Chairman Hoyt: As we have taken up the question of ties, we only make recommendations for ties for wooden bridges and trestles. We do not deal with track ties as such.

The question arises as to switch ties, sawed. It was intended that this clause would apply only to structural oak for bridge purposes. If there seems to be any conflict with the report of the Tie committee, that particular paragraph can be omitted, but I see no reason why it should be.

F. R. Layng (B. & L. E.): I think that should be done. These specifications cover wooden bridges and trestles, and should not conflict with the specifications of the tie committee. I suggest the Board has been a little liberal in its assignment to this particular committee.

The President: I think that is true, it is a matter to be handled by the Board. This suggestion is noted and the committee on outline of work will take that out.

Chairman Hoyt: *I move the adoption of the specifications in the Manual as recommended practice.*

(A recess was taken for lunch.)

Chairman Hoyt: I want to bring up the matter of uniform sizes, which was one of our hard nuts to crack. This received endorsement of the largest number of consumers that have ever got together in a particular matter. They held a meeting in Chicago last year representing practically all of the retail lumber dealers of the country. This question was thoroughly gone over, and they favored and approved standard uniform sizes. To make anything of that kind effective it requires the backing of the consumers everywhere, and that is the

reason that we inserted and are in favor of definite uniform sizes for lumber.

(The pending motion carried.)

Chairman Hoyt: There is one other report that this committee offers for a progress report. This sub-committee's report is submitted in Appendix A. I would ask Mr. Van Auken to explain the features of the report as far as the work has progressed up to the present time.

A. M. Van Auken (Monon): Our report as you will see is only a progress report. There were five members on our sub-committee, and there were five opinions on nearly every subject that came up. We have tried to work out some of the bigger questions in this problem, and we put the results before you.

(Mr. Van Auken abstracted Appendix A), and said:

We corresponded with the mills and the Forestry Bureau about sizes. A good many of them did not give us very much of an answer, but the Forestry Bureau sent us a pamphlet and gave the sizes of standing timber in yellow pine which indicates that 26-ft. stringers, 16-in. in the largest dimension, could be sawed out of a very considerable portion of the standing yellow pine.

I made a rough estimate of the amount of wooden trestles on roads, and replying found that a very considerable majority still use yellow pine stringers; consequently it was necessary that we should not adopt a set of standard plans, that would eliminate the larger portion of the railroads.

The principal reason for adopting E-45 as the lightest loading was the fact that practically every road is liable to haul over it two heavy coal cars coupled, and that is practically an E-50 load; but due to conditions we all understand, the committee adopted E-45. With a 16-in. stringer we could not carry these loads on a longer

span than 12 ft. The recommendations agree with that.

E. A. Frink (S. A. L.): Some of you may remember that I objected very strongly last year to the loading adopted, and I think there is much more justification for the loading on trestles than there would be on bridges, because the margin of overstrain is not nearly as large. It does not seem to me, however, that we ought to use standard loading of E-45, 55 and 65 for timber trestles used in the same track with steel bridges, with a standard of E-60. It seems to me as though the loading of the trestle ought to correspond with the bridge that has to carry the same load. I think the committee would do well to revise those loadings and agree to load with steel bridge specifications.

I question the statement of the committee about paying for even feet, for stringers are universally ordered in double panel lengths, so that there is no objection to buying panel lengths in even feet. I do not say I advocate that. I am suggesting it for the consideration of the committee.

I also question the statement of the committee about the use of 16-in. stringers instead of perhaps 14. While it is perfectly possible to get 16-in. stringers from our southern mills, yet it has been my experience that you pay more per thousand feet for 16-in. than you do for 14-in., and more for 14-in. than you do for 12-in. Therefore, I think some method should be allowed to have the road use whatever size of stringers which best suits their practice. The road I represent has used 14-in. stringers for years and is using them now.

Chairman Hoyt: The discussion that has been brought out by Mr. Frink is just exactly what we want. The more data and the more information of that sort that we can get, the better we will be satisfied.

(Committee was excused with thanks.)

## Report of Committee on Wood Preservation

*Inspection of ties treated with water gas tar shows that good results may be obtained with this preservative. Tests on toxicity of sodium fluoride indicate it to be about double that of zinc chloride. To date it has only been used for experimental purposes. It is recommended that test sections of track be installed for the further study of this preservative. Attacks of marine borers on exposed piling are of late more extensive and severe than formerly. Creosoting, when properly carried out, will protect piling from attacks of teredo on the Atlantic coast, but on the Gulf coast it is often inadequate. Creosote has not been found to stop the attacks of linnoria.*

C. Marshall Taylor  
Chairman

*C. Marshall Taylor, the chairman of this committee for the last three years, is now also the president of the American Wood Preservers' Association and, like a considerable number of others interested in that special branch of engineering, he has consistently divided his time and efforts between the Wood Preservers' Association and the committee on that subject in the A. R. E. A., of which he has been a member for 11 years. Mr. Taylor is the superintendent of the Port Reading Creosoting Plant of the Philadelphia & Reading and the Central Railroad of New Jersey, but has also had an opportunity to view timber treatment's commercial side.*

IN APPENDIX A THE COMMITTEE submitted service test records covering two kinds of work, one on the service of ties in experimental tracks, which are covered by reports from the Baltimore & Ohio, St. Louis-San Francisco, Chicago, Indianapolis & Louisville, the Santa Fe, and the Chicago, Rock Island & Pacific, and the second class is by reports of the Cleveland, Cincinnati, Chicago & St. Louis, showing the total number of ties they have put in track and taken out from the year 1905 until 1919, inclusive.

In Appendix B the committee reported on the subject

of water gas tar as a preservative. The use of sodium fluoride as a preservative for cross-ties is covered by the report of committee as given in Appendix C, while in Appendix D the committee reported on the protection of piles in water infested by marine borers.

### Conclusions

1. The committee recommended that further reports on indicators for determining burnetting of ties and timbers be eliminated, as this matter seems to have been covered fully in previous reports.

2. The committee recommended that the question of the comparative values of Grades 1, 2 and 3 creosote oil and creosote coal-tar solution is one that is not definable in any way so that conclusions can be considered for adoption as recommended practice.

3. The committee recommended that no further consideration be given to the proposition of trying to develop comparative values of Grades 1, 2 and 3 creosote oil and creosote coal-tar solution.

#### Appendix A—Service Test Records

The reports submitted by the Chicago, Rock Island & Pacific, the St. Louis-San Francisco, the Baltimore & Ohio, the Santa Fe System and the Chicago, Indianapolis & Louisville, are made up from test sections. In adopting this method much more reliable data is obtained, for the reason that a record of each particular tie in these sections is kept, and, furthermore, a close supervision is kept over these sections enabling those responsible of keeping a close supervision, both in tie renewals and tie removals. It is a distinct advantage to keep each class of wood used in these sections separately in reporting, as by so doing the average life of each kind of wood may be easily determined.

While it is possible that the form used might be improved upon, it is suggested that the next committee be instructed to follow up this question with the view of having this form, or one similar, adopted by all roads as standard, which would result in making the reports of more value to all concerned.

#### Appendix B—Merits of Water-Gas-Tar as a Preservative

The report of the committee in 1917 contained an account of the ties treated by the United Gas Improvement Company of Philadelphia and placed in the track of the Public Service Company of New Jersey. They were treated in 1911 with the full-cell treatment of 10 lb. per cubic foot. The manner in which these ties were treated, together with the analysis of the oil used and their location, was given in detail in that report. On December 1, 1919, the ties were again inspected and were apparently in excellent condition, none having been removed on account of decay. They are mostly Florida pine 6x8 in. by 8 ft. and have now given approximately 9 years' life.

In November, 1914, the Baltimore & Ohio placed 600 red oak ties in a test track at Herring Run, Md. They were treated by the United Gas Improvement Company at Philadelphia with water-gas-tar. An inspection of these ties was made on September 16, 1920, with the result that after six years no signs of decay were found, while 63 per cent of the untreated red oak ties placed in the same track have been removed account of decay. Two of the ties were taken out of this track for test. Each tie was sawed in two and one-half of each sent to the Baltimore & Ohio laboratory at Baltimore; half of one tie to the laboratory of the Port Reading Creosoting Plant at Port Reading, N. J., and half of one tie to the laboratory of the United Gas Improvement Company at Philadelphia. The oil was extracted and analyzed with the following results:

	Tie No. 1805 B. & O. Analysis	Tie No. 1960 B. & O. Analysis
Specific gravity, 38°/15° C. ....	1.085	1.108
Distilling below 205° C. ....	.6	4.2
205° to 235° C. ....	2.6	...
235° to 245° C. ....	2.8	3.1
245° to 275° C. ....	7.4	4.1
275° to 315° C. ....	7.4	14.7
315° to 330° C. ....	9.7	10.6
Residue .....	69.1	63.2
Loss .....	.4	.1

The ties appeared to be in good condition, although in several sections rails had been respiked and the old spike

holes were not plugged. No treated ties have been removed except those for the purpose of test. In view of the good results so far obtained in the treatment of cross-ties with water-gas-tar, it is suggested that other railroads install test tracks, and keep a careful record of the comparative life of cross-ties treated with water-gas-tar alone, or combined with coal-tar-creosote, zinc chloride, or other preservatives.

#### Appendix C—Availability and Use of Sodium Fluoride as a Preservative

Sodium fluoride has been used only in very small amounts for the preservation of ties, and that only for experimental purposes, and comparatively little is available for the preservation of ties at this time. Lack of a demand and an immediate shortage of high-grade fluor spar has deterred manufacturers in increasing their facilities for its preparation. Its recovery as a by-product from the manufacture of phosphate fertilizer is not being carried out because of the high initial outlay in plant construction under present conditions of labor and material shortages.

Tests on the toxicity of sodium fluoride as made by the Forest Products Laboratory, Madison, Wis., indicate it to be about double that of zinc chloride. Service tests on ties treated with this salt have not been carried on over a period sufficiently long to determine if this same ratio holds true in practice. Until this information is at hand, it appears that no railroad going into the extensive use of sodium fluoride for the treatment of ties would be warranted at this time, in using an amount much less than is customary when treating with zinc chloride, i. e., ½ lb. per cu. ft. of wood. Under the circumstances, the comparative prices of zinc chloride and sodium fluoride will determine whether or not the former will be supplanted by the latter, wholly or in part.

Recent developments indicate that there is a possibility that sodium fluoride will be obtainable at a price very nearly that of zinc chloride. This situation, therefore, causes the committee to suggest that any railroad maintaining experimental tracks should arrange to install a sufficient number of ties treated with sodium fluoride to obtain test records from which definite conclusions may be drawn.

#### Appendix D—Protection of Piles in Water Infested by Marine Borers

There are many varieties of borers present in the coast waters bordering the United States, but as far as protecting against them is concerned there are only two that need be considered, viz., the mollusk, represented by the various species of teredo, and the crustacean, represented by the limnoria and to some extent the sphaeroma. Protection that is effective against these is also effective against any others so far encountered. The borers breed faster and their attack is more severe in warm than in cold water, in clean water than dirty water, and in salty than brackish water. The action of limnoria is affected by the velocity of the current so that each location presents a problem in protection by itself, and a method that is effective in one location may be ineffective in another.

The activity of these borers is as a rule affected by the same conditions; however, their simultaneous presence is not always the rule nor is their activity necessarily the same, although found in the same location; as an example, the teredo is active in Norfolk harbor, but there are very few, if any, limnoria. The range of action of the teredo is from a point above low water mark to a depth of 25 to 30 ft., or to mud line. The attack of the limnoria is most severe between high and low water, but extends down to about the same depth as that of the teredo. In

Charleston harbor, where limnoria is particularly active, there are creosoted piles which are badly eaten at low water mark, but which have been attacked only to a slight extent in patches below low water. Untreated piles in these waters are quickly attacked by the limnoria at all depths to the mud line.

Creosoting has been relied upon to a great extent for protection against the attacks of marine borers and experience has shown that where properly carried out, from the selection of the timber to the driving in the structure, creosoting will generally stop the teredo at points on the Atlantic coast north of Florida, but that at points on the Gulf and Pacific coasts where the teredo is more active creosote treatment is often inadequate.

On the Atlantic and Gulf coasts the piling treated for marine use is usually pine and on the Pacific coast Douglas fir. The piling should be free from knots or other imperfections that will interfere with the creosoting. The inner bark should be completely removed and as much creosote oil should be injected as the wood is capable of taking up. After treatment the piles should be handled in such a manner as to avoid tearing the wood or abrading it in any way that will weaken or break through the treated area, and they should not be cut or bored below high water mark, the idea being to present to the teredo a perfect and impervious armor of creosoted material without holes or weak spots. As it is impossible to secure perfect material, perfect treatment and perfect handling the creosoting process as ordinarily applied can be considered as effective only in greatly retarding the action of the teredo.

Creosote so far has not been found to stop the attacks of limnoria. On the most carefully treated specimens of pile south of Norfolk on the Atlantic coast, the Gulf coast and on the Pacific coast their action is noticed after three to six years, probably as soon as the creosote has lost some of its toxic properties through leaching, and when once started their action progresses rapidly. In view of this experience, at points where the borers are very active, it is the practice of many who desire to insure a greater permanence of protection to piles in important structures to apply mechanical protection to the piles in addition to creosoting. Piles that receive mechanical protection are creosoted in addition in order to prevent decay above the water and also retard the attacks of borers until repairs can be made in case the mechanical protection becomes damaged.

#### CAST IRON CASES

These cases are made in halves so that they can be placed in position after the piles have been driven and capped. As the castings are bolted together the casing is lowered to the mud line and forced down into the mud. The space between the case and pile is usually filled with sand and capped with cement mortar to prevent the sand being washed out by the waves. This protection is entirely efficient as long as the jacket remains intact. Cast iron corrodes very slowly in sea water and if made thick enough will resist corrosion a great many years. Some of these cases at points on the Gulf have been in position about 30 years. Care must be observed that the cases go far enough into the mud so that the piles will not be uncovered by the washing away of the mud, or by dredging operation. In this event the sand escapes and the entire pile is exposed to a current of sea water and then to attack by the borers.

#### VITRIFIED PIPE CASES

In locations not exposed to wave action and the pounding of drift, vitrified pipe can be substituted for cast iron. It does not corrode, but is easily broken. The pipe sec-

tions are preferably in one piece and placed over the pile before it is capped. The sections are cemented together, lowered to the bottom and forced into the mud. The space between the case and the pile is filled with sand and capped with cement mortar.

This protection has been much used along the Gulf and Pacific coast, where full length protection is necessary, and is entirely efficient as long as it remains intact. Any defects in the case below the water will be shown by the escaping sand and any broken pipe sections can be easily replaced. It is the custom in maintaining these cases to make inspections and repairs about once a year. For protecting piles after they have been capped, or for making renewals, the pipe sections are made in halves and are joined together with some form of lock or copper wire, or treated wooden plugs.

#### REINFORCED CONCRETE CASES

Cases less fragile than vitrified pipe and less expensive than cast iron can be made of reinforced concrete.

The sections can be made in one piece for placing before the pile is capped, or in halves for placing afterward. One design provides for a lock by leaving some of the reinforcing wires projecting so that they can be twisted together and covered with cement mortar after the halves have been joined. For these cases the concrete casing over the reinforcement is rather thin, and there is some question whether the reinforcement will corrode and the cases go to pieces under the action of sea water. Service tests are needed to develop this point.

#### CONCRETE JACKETS CAST IN PLACE

Considerable protection work has been done of late in Charleston, S. C., waters by casting concrete jackets in place about the piles. In these waters the teredo is less active than at points on the gulf, and is successfully controlled by careful creosoting. The limnoria is very active and will finally cut off creosoted piles at about low water mark. It does not seem to work progressively on treated piles at depth greater than two feet below low water mark, although piles that have been pulled show traces of attack in isolated patches all the way to the mud line. Under these conditions, protection for a length of about 10 ft., extending from about three feet below low water to about two feet above high water, is efficient. Some of these jackets are plain concrete and some are reinforced.

Casting the concrete jacket in place has the advantage of restoring in a measure the strength of the pile, even though its section may have been reduced materially. On a protecting job now going on in Charleston jackets of plain concrete are being used. These are about 3 in. thick and the concrete is 1-2-4 mix with fine aggregate. The forms are No. 24 gage galvanized iron, the sheet being wide enough to form a complete section. The two edges are nailed to wooden strips about 2½ in. square, one of which has a tongue and the other a groove. The sheets are placed around the pile and the wooden strips clamped together. A tight, smooth concrete form is obtained. By using forms made in this way concrete jackets have been carried as much as 12 ft. below low water, and good results obtained.

#### NAILS, SHEET METAL, TAR, ETC.

The oldest method of protection of which we have knowledge is studding the exposed surface with nail heads. Its virtue does not seem to lie entirely in covering the exposed surface with nail heads, but is still effective when not more than one-fourth the surface is covered by the heads. Several plain piles studded with nails were driven about 2½ years ago in Charleston harbor. The nails have heads about ¼ in. in diameter and were driven

$\frac{1}{2}$  in. to  $\frac{3}{4}$  in. apart. The piles are entirely free from attacks by borers, whereas a plain pile without the nails driven at the same time has been reduced at low water line by the action of the limnoria from about 10 in. to about 5 in. in diameter.

Sheets of copper and zinc have been used with success in many places for protection against marine borers. This protection is entirely efficient as long as it remains intact. However, full length protection must be applied before the pile is driven and it is likely to be broken in handling. Copper is not affected by salt water, but zinc soon corrodes. It is stated that some of the brands of rust-resisting sheet iron will withstand the action of sea water for several years, and it is possible that that material could be used to advantage under some conditions rather than copper, which is too expensive. Many attempts have been made to provide a durable protection by applying coatings of tar or asphalt either alone or combined with some fabrics. These coatings are efficient as long as they can be kept intact, but they are likely to be broken by handling, or by the pounding of drift, and they have in general proved unreliable. Bark left on piles will protect against marine borers, therefore, when plain piles are used in infested waters their life can generally be strengthened by leaving the bark on.

#### Discussion

C. M. Taylor (P. & R.): Chairman. The report on wood preservation this year is full of information without any definite recommendations for the Manual. A part of the report that should appeal to each and every maintenance engineer is given in Appendix A on service test records. These records have resulted from experimental track in most cases on the Rock Island, the St. Louis-San Francisco, the Baltimore & Ohio, the Santa Fe, and Monon and the Big Four. In all cases except the Big Four their result is obtained through the insertion of experimental track sections. The first report will be the results obtained on the Rock Island, which will be presented to you by Mr. Ford.

(C. F. Ford (C. R. I. & P.) presented his report.)

Chairman Taylor: Are there any comments to be made on the result of the tests on the Rock Island? You will note that they cover three different treatments, and are giving very satisfactory records.

Mr. O. C. Steinmayer (St. L.-S. F.) is not present, but I would call your attention to the report of the Frisco. It is very interesting to note that the white oak, the basis for comparison in most tie work, does not show up as well as a great many people think it should.

F. J. Angier (B. & O.): The tests on the Baltimore & Ohio are in test tracks. We are not trying to keep a record of ties. We have 8 or 10 test tracks, the most important is the one that is just east of Baltimore—Herring Run. We put in 3,300 red oak ties in this test track. They all were put in under the same ballast conditions with screw spikes and tie plates and treated in 10 different ways. Three hundred ties were put in untreated. The others were treated with zinc chloride, with sodium fluoride, water gas tar, coal tar, creosote, mixtures of coal tar, creosote and zinc chloride.

The statement of the report is a little misleading. It shows the percentage of ties removed from all causes, and in this particular test track at Herring Run it shows that 300 ties treated with zinc chloride, 42 per cent have been removed, but not a single tie has been removed for decay. Those ties were removed on account of putting in a switch, and on account of a derailment on this track. It seems to me that it would be better if we could use two columns, one showing the number of ties taken out on account of decay, and the other for other causes.

Chairman Taylor: The result of the A. T. & S. F. test will be given by Mr. R. S. Belcher.

R. S. Belcher (A. T. & S. F.): The only difference between the test sections and the ordinary sections is that an individual record of each tie is kept. We have one or two special tests where ties were put in out of place, and possibly our oldest test of this kind and the most remarkable is the one made on the "Ottawa Cut-off." This represents about 24,000 ties that were put in in 1906, ordinary hewn Lobolly pine, which our reports show were treated with creosote, and although these ties have been in more than 14 years, only 357 have been taken out to date, and none because of decay. The principal reason for removing the 357 ties is derailments and breakage.

Chairman Taylor: The next report will be that of the Big Four, which is along entirely different lines. It is a history of their treated tie work from the time they started until the end of 1919. In other words, it is the whole story, and I will ask Dr. von Schrenk to explain the report.

Dr. Von Schrenk (Cons. Timber Engr.): Without going into the details of the interesting phases which have developed through a recent study of the tie record, the point I wish to call particular attention to is that these figures represent as nearly as possible an actual count of every tie, both treated and untreated, inserted on the Big Four System since 1905. The Big Four adopted the practice of putting a date nail into both treated and untreated ties. As careful a record as possible has been kept of all removals by years. You will note that the tie insertions have dropped from 369 ties to the mile to 201 in 1919, or a reduction of 168 ties in the mile. This record shows in a striking way that the probable life that we are attaining from these early ties give every indication that every tie in the railroad should be a treated tie.

Chairman Taylor: The next portion of the report is shown in Appendix B, Merits of Water-Gas as a Preservative. This portion of the report will be presented by Mr. Angier.

(Mr. Angier then presented Appendix B.)

Chairman Taylor: The next subject reported on is Availability and Use of Sodium Fluoride as a Preservative for Cross-ties. Sodium fluoride has certain apparent advantages in the treatment of cross-ties, and the committee suggests that any railroad maintaining experimental tracks should install a certain number of ties treated with sodium fluoride and maintain records from which conclusions may be drawn.

On Subject 8, Comparative Values of Grades 1, 2 and 3 Creosote Oil and Creosote Coal-Tar Solution, the committee feels that the report as given last year covers the situation as well as it is able to put it in writing, and in connection with Subject 9, Accelerated Tests of Grades 1, 2 and 3 Creosote Oil and Creosote Coal-Tar Solution, the committee has unfortunately not been able to develop reliable methods for making any such accelerated tests.

With reference to Conclusion 2, the committee felt that the data it has in hand at the present time does not enable it to give you something you can put in the Manual. The committee does feel, however, as time goes on that it may have something on the comparative values of Grades 1, 2 and 3, but it also wishes to say it is not something that can be decided immediately, because it is interwoven with so many other problems in connection with the committee work. It is difficult for the committee to formulate any definite conclusion that it would dare ask to be put in the Manual. The committee feels that this subject is one that all future committees should

consider, and if at some time they are able to give you something that is worthy of insertion in the Manual, they feel that such will be done.

With reference to Conclusion 3, Chairman Taylor said: It was the thought of the Committee of Direction that this committee could develop something that would determine this matter very quickly, and they suggested ac-

celerating tests to show this differentiation in values. The committee is very frank in saying that it is an absolute impossibility, and for that reason it recommends that no further consideration be given to the subject. It is one of those things which cannot be done quickly.

(The committee was then excused with the thanks of the Association.)

## Report on Rules and Organization

*In the manual of instructions for the guidance of engineering field parties the committee submitted an abstract of H. H. Edgerton's monograph. The subject matter, revised, is submitted for inclusion in the Manual. The chief work submitted is a manual of rules for the guidance of maintenance of way employees. While presented for inclusion in the Manual, it is recommended that it be considered as a live document to which additions or changes can be made as railway practices change. Safety rules affecting the different classes of employees are incorporated as a part of the regular rules governing employees working on or about the track.*

W. C. Barrett  
Chairman

*W. C. Barrett is now completing his first year as chairman of the committee and his third year as a member. He has been able, through his experience first as division engineer on the Lehigh Valley and more recently as trainmaster, to learn and appreciate the importance of well-thought-out practical rules for the guidance of those employees concerned with engineering and maintenance of way and also with the operating departments as well. Mr. Barrett is a conscientious and interested student in the fundamental problems of railroad organization and operation which are so pressing today, and in any development that will help solve these problems.*

THE COMMITTEE, IN APPENDIX A, presented its report on instructions for the guidance of engineering field parties; in Appendix B its rules for the guidance of employees of the maintenance of way department and in Appendix C its report on the science of organization.

In Appendix B the committee endeavored to make the rules general rather than special, and to so frame them that any road could use the work as a foundation for a book of rules and insert special rules as desired. The "General Notice" covers rules found in the standard code under the same heading. Under "General Rules" the committee placed rules applicable to all employees, so as to avoid, as far as possible, repetitions under each class. Under "Operating Rules" the committee placed those rules taken from the standard code and a few special rules which it is thought necessary and desirable for maintenance of way employees to know. Under "Rules for the Government of Employees Working on or about the Track" was placed what are usually called "Safety Rules." The committee also included "Rules for the Operation of Motor, Hand, Velocipede and Push Cars."

Under "Divisional Maintenance Officers" it was the endeavor to cover the positions common to most railroads and the usual duties of each. Individual roads may not have all the positions mentioned, or may have others not mentioned, or may not use the same titles for the positions. Under "Conduct of Work" the committee submitted "Rules for the Conduct of Track Work," or work to be performed by the forces under the supervisors of track only. The committee requested that it be permitted to submit "Rules for the Conduct of Bridge and Building, Signal and Telegraph and Telephone Work" next year.

The committee asked that the Association consider the "Manual of Rules for the Guidance of Employees of the Maintenance of Way Department" as a live document to be added to or changed in some details each year, as new methods or practices are developed, or present methods or practices become obsolete and better ones replace them.

### Conclusions

(1) The committee recommended the adoption of the "Manual of Instructions for the Guidance of Engineering

Field Parties" and the "Manual of Rules for the Guidance of Employees of the Maintenance of Way Department" and that these be substituted for all of the matter now appearing in the Association Manual under "Rules and Organization."

(2) The committee recommended that the "Manual of Instructions for the Guidance of Engineering Field Parties," as submitted in Appendix A, be approved for publication in the Manual.

(3) The committee recommended that the "Manual of Rules for the Guidance of Employees of the Maintenance of Way Department," as submitted in Appendix B, be approved for publication in the Manual.

(4) The committee recommended that the report on "The Science of Organization," as submitted in Appendix C, be approved for publication in the Manual.

Committee: W. C. Barrett (L. V.), chairman; H. H. Edgerton (C. G. W.), vice-chairman; F. D. Anthony (D. & H.); E. H. Barnhart (B. & O.); H. L. Browne (C. B. & O.); J. B. Carothers (B. & O.); S. E. Coombs (N. Y. C.); R. H. Gaines (T. & P.); R. H. Hallsted, H. H. Marsh (B. & O.); B. Herman (Sou.); F. D. Lakin (Erie); E. L. Martin (M. K. & T.); Jos. Mullen, W. H. Rupp, P. T. Simons, H. E. Stansbury (E. P. & S. W.); R. E. Warden (M. P.); A. A. Woods (Sou.)

### Appendix C—The Science of Organization

Up to the present, organization has developed as an art rather than a science and has brought out two general types, viz., the *line* type and the *staff* type. Line type is exemplified in the army, in which there is a direct connection from the head through each subordinate to the next lower until the worker, if we may so call him, is reached. The staff type is exemplified in manufacturing concerns, where there are specialists who may direct the worker in any part of his work that may be of a nature to be covered by the specialist's knowledge or authority.

The fundamentals of organization are as follows:

1. An organization must have its object clearly defined.
2. In its simplest form organization consists of head and working force.
3. Subdivisions, combinations, extensions and modifications of this form may be made to any extent and may be

- most readily shown and understood by means of charts.
4. The head or executive must (a) understand his objective; (b) plan and direct all activities; (c) select and educate working force; and (d) receive results.
  5. Executive must have complete authority over working force.
  6. Executive may subdivide or delegate his authority, in which case each sub-head must know exactly his duties and responsibilities and there must be an invariable sequence without any conflict in, nor division of, authority and responsibility.
  7. There must be harmony in all relations of different sub-heads.
  8. There must be interchange of ideas and information between all types of executives.
  9. Working force consists of equipment, tools and men, and the economic relations between these must be balanced.
  10. Correct discipline is an essential feature of organization.
  11. Compensation must follow the human effort in just proportion.
  12. Not only physical force is available in any human organization but proper results from item 10, 11 and 4 should develop in such a body an esprit de corps.
  13. Co-ordination and correlation of work as to time, place and materials must not only be planned by executive, but he must know that it is accomplished.
  14. Sub-heads in the smaller spheres must apply all principles used by the higher executives.
  15. Standardization of methods and means must be intelligently applied.
  16. Organization charts give the simplest and most readily comprehended means of expressing the system in use.

### Discussion

W. C. Barrett (Chairman): The committee was given four subjects on which to make a study and report.

Inasmuch as the action to be taken on subjects 2 and 3 will determine what action will be taken on subject 1, they will be presented first. Mr. Harsh will outline the matter under subject 2.

(H. H. Harsh (B. & O.) presented the report on instructions for the guidance of engineering field parties.)

Chairman Barrett: *I move the adoption of conclusion 2.*

*(Motion carried.)*

Chairman Barrett: While I believe this is the first time subject No. 3 has been presented formally to the Association for approval, it has been before the committee and the Association for a number of years, so that in presenting the Manual of rules for the guidance of employees of the Maintenance of Way Department, the committee is not presenting an entirely new subject. Mr. Barnhart will present this part of the report.

E. H. Barnhart (B. & O.): I will abstract Appendix B.

Chairman Barrett: *I move the adoption of conclusion 3.*

C. W. Baldrige (A. T. & S. F.): I believe I will have to take exception to rule No. 1 to start with. I do not believe it should be the duty of any employee to provide himself with a book of rules. The rules should be altered to read that the employing officer shall provide each new employee with a book of rules and that the employee then should familiarize himself with the rules.

I also notice in reading over the report of this committee, in a great many cases it duplicates the work of other committees already in the Manual and in a few cases conflicts with such work, and I move that *this portion be referred back to the committee, with instructions to co-ordinate the matter on the conduct of work with the work of the other committees, and that the report be brought in next year.*

H. L. Ripley (N. Y. C.): I second the motion and endorse what Mr. Baldrige has said without any intent to criticize the work of the committee. As he has already pointed out, there is conflict in this section on conduct of work with the work of the Ballast committee.

Chairman Barrett: The committee went very carefully over everything that was in the Manual, and so far as we could ascertain, there was no conflict with any other committee's report.

Maurice Coburn (Penna.): I agree with Mr. Baldrige's motion, and there are one or two other portions which should have some consideration. The instructions about "line and surface" seem to be misleading. Under "joint bars" it is said "Rail joints should be as simple and of as few parts as possible to be effective." These instructions, as I understand it, are for the trackmen with relation to the actual operation and are not for such items as that.

A. S. Baldwin (I. C.): I think it would be a mistake to refer these rules back to the committee. A great deal of excellent work has been done on them and what they are intended for is to be used as a general compendium of rules for the maintenance of way department. It would not be possible for this committee to get up a set of rules that would agree with everything that might be done in the convention after they came in. These rules will be adapted to the special conditions of every railroad, and it will be understood that they are for general use and will be very useful.

I believe it should be the duty of the superior officer to supply the men with a copy of the rules, but the employee should not be able to offer an excuse that he did not carry out the rules because he had not been supplied with a copy, and I think it should be one of his very first duties to supply himself with a copy and then leave it to his superior officer to do likewise.

J. B. Carothers (B. & O.): On behalf of the committee I wish to say that the first question was brought up about the employee providing himself with a book of rules, that is not our thought, we copied that from the American Railway Association standard code. They have been practicing that for a good many years. I do not believe it is necessary to raise that question at this particular time.

C. F. Loweth (C. M. & St. P.): These rules seem to contain a good many duplications. There are five or six rules for bridge and building foremen, mason foremen, painter foremen, that are almost identically the same rules, perhaps in one or two cases there is a change of a word. On many roads the foremen have to do with bridge and building work, and water station work, and are also painter foremen, and plumber foremen, and I am wondering if these rules would not be more effective if they were more simple. Say if we had the various rules I have referred to combined together, and then a paragraph for the particular duties of the particular foreman.

Chairman Barrett: The committee was cognizant of the fact that in preparing rules for these different foremen they would be more or less the same in their reading. We thought it proper to make the rules correspond to one another so that they would be in somewhat the same form, and while there is, perhaps, as indicated, some repetitions, these rules were intended as the groundwork for perhaps very much more extended rules that particular railroads would want, and we thought each one should be complete in itself.

Mr. Baldrige: I will call attention to Rule 274 with reference to broken rails. The rule is very good as far as it goes but it does not go quite far enough, in that a broken rail under present-day conditions should be removed from the track as soon as possible. The committee has finished this rule by saying, "The broken ends of the rail should be connected by joint bars, the rail drilled, and the joint bars full bolted, after which the resumption of traffic may be permitted," but they do not go on to say that the rail should be taken out of the track at the earliest moment. I think we should add a little more

to that rule, and provide that a broken rail must not be left in the track longer than is necessary.

Chairman Barrett: The committee accepts the criticism and will ask permission to add to that paragraph to make it read like this—"After which the resumption of traffic may be permitted with reduced speed. The rail should be removed from the track as quickly as possible."

Mr. Coburn: Will the committee be willing to omit Rule 275?

Chairman Barrett: We will eliminate Rule 275.

The President: If there is no further discussion, a motion to adopt this section of the report as amended, is in order.

Chairman Barrett: *I move the adoption of the report as amended.*

*(Motion carried.)*

Mr. Carothers: The revision of the Manual has been taken care of by the adoption of the other portions of the report, and we have nothing further to offer.

*I move the adoption of conclusion number 1.*

Chairman Barrett: Subject No. 4 is covered in Appendix C.

(R. H. Gaines (T. & P.) presented an abstract of the report.)

(The committee was excused with the thanks of the Association.)

## Report on Records and Accounts

*In addition to a number of definitions, Form 501, or monthly track material report, was revised and is presented for inclusion in the Manual. The revised form is the result of a study of forms used on a number of different roads. It is to be 11 in. by 16 in. so as to fold letter size with a one-inch margin for binding. In accordance with Valuation Order No. 3, second revised issue, three additional forms covering estimate sheets, register of authority for expenditure and equipment completion report are submitted for adoption. They are primarily for the carriers, but the requirements of the Interstate Commerce Commission have been kept in mind.*

H. M. Stout  
Chairman

*H. M. Stout is rounding out his first year as chairman and is completing his seventh year as a member of the committee. He is record engineer of the Northern Pacific at St. Paul. He is therefore in intimate daily contact with the work under consideration by the committee and in a particularly favorable position to direct its studies along practical lines. The need for complete and accurate records is being realized more fully now than ever before as the valuation work and the more detailed information required by regulating authorities are extending. The committee is in a position to render a real service to the roads in developing standards to meet these demands.*

**I**N APPENDIX A THE COMMITTEE submitted a number of proposed changes in the Manual.

Three additional forms for recording data for keeping up-to-date valuation of property of railways as required by Valuation Order No. 3, second revised issue, were presented in Appendix B.

### Conclusions

1. The committee recommended that the changes in the Manual as given in Appendix A be approved and the revised matter be substituted for the present recommendations in the Manual.

2. The committee recommended that the three additional forms shown in Appendix B, for keeping up records under Valuation Order No. 3, second revised issue, be approved and published in the Manual.

3. The committee recommended that subject (3) in Appendix B be continued as a part of next year's work.

4. The committee recommended that the reports relating to subjects 2, 4 and 5 be received as information and the subjects continued.

Committee: H. M. Stout (N. P.), chairman; Henry Lehn (N. Y. C.), vice-chairman; A. M. Blanchard (G. T.), H. Bortin (Con. Engr.), W. A. Christian (I. C. C.), R. A. Cook (C. & A.), W. F. Cronican (I. C. C.), E. B. Fithian (M. P.), L. B. Lincoln (B. & A.), J. H. Milburn (B. & O.), A. W. Neel, H. J. Sargent (Wabash). \*R. C. Sattley (C. R. I. & St. P.), C. W. Simpson (D. L. & W.), T. H. Strate (C. M. & St. P.), V. R. Walling (C. & W. I.), W. D. Wiggins (Penna.).

### Appendix A—Revision of Manual

The committee recommended changes in the Manual shown below. Under definitions the new or added letters

and words are underscored and the old or omitted letters and words are enclosed in parentheses.

### DEFINITIONS, PAGE 339

**Account(s).**—A statement(s) required to enable payment(s) to be made for labor performed and material furnished, or to establish the detail, total and comparative cost of work and various classes of expenses.

**Conventional sign(s).**—A symbol(s), such as a mark, character, abbreviation or letter, selected or sanctioned by general agreement or common use (and) to indicate upon a map or plan certain forms, conditions (and) or objects, both natural and structural.

**Ledger accounts (for individual pieces of work).**—Statements kept in ledger form in order to establish the detail, total and comparative cost of (any particular) individual pieces of work or classes of expenses.

**Progress profile.**—A graphical record (of the progress) showing status of work (prepared) at stated periods.

**Record(s).**—Authenticated information or data in graphical, tabular or statement form relating to physical characteristics, conditions, cost and such other information as may seem desirable for (record) preservation.

**Report(s).**—The medium through which information is transmitted (from one to another official) and from which records and accounts are prepared or compiled (in the filing office).

**Right-of-way map.**—A plat representing the actual location and dimensions of the property, (right or) franchises or other rights (that are) owned or controlled by a railway company.

**Track chart.**—A diagram showing the physical characteristics (of track and roadbed) roadway and track.

**Track map.**—A (map used primarily for) plat showing existing physical (conditions) plant, including tracks, bridges, buildings, water service and mains, leases, station facilities

\*Died December 31, 1920.

and all (of the) other physical and operating (features) property.

#### FORM 501, MONTHLY TRACK MATERIAL REPORT

The forms in use on the 23 railroads have been examined to determine what, if any, changes should be made in the form as published in the Manual. Eleven of these reports were bound in book form, in some cases being combined with time books and tool reports. The principal features in which these forms differ from the form in the Manual are as follows:

Four roads use separate forms for recording ties, rail, and miscellaneous track material; three roads divide the columns showing material received from track into fit and scrap; the Norfolk Southern and Bessemer & Lake Erie have a simplified form using only five columns. Some roads use an alphabetical arrangement of the material in the left-hand column, and one road prints the material in columns reversing the use of the lines and columns. Pittsburgh & Lake Erie prints a list of 232 items on four sheets, and furnishes a blank sheet for additional items; the Pennsylvania has a form with 40 columns. The form in the Manual is followed closely by the Chicago & Western Indiana, the Chicago, Rock Island & Pacific, the Missouri, Oklahoma & Gulf, and the Minnesota, Dakota & Western railroads.

The list of materials in the left-hand column will vary on different railroads and should be omitted entirely, and left to be filled in by printing or in pencil, according to requirements of individual railroads. The headings of the columns on Form 501 in the Manual seem to meet the requirements of a form of this kind, except that we suggest dividing column five (5), showing material received from track, into two columns, showing main tracks and side tracks; changing columns 10 and 11 to three columns, in order to itemize material used on different construction jobs, and divide column 12 into three columns in order to report material shipped to various divisions or destinations.

On the back of Form 501 are instructions, daily record of material received and shipped, and switch tie data. The instructions should be printed on the face of the form. The daily record of material received and shipped does not seem to be necessarily a part of this blank. The switch ties might be included in the items on the face of the sheet, with details in a separate table, if desired. It was recommended that the form be revised to be made 11 by 16 in., so as to fold once to lettersize with a one-inch margin for binding. The form to be printed in black with horizontal lines, 6 per inch. Instructions to be printed at the bottom of the sheet as shown.

#### Discussion

(Chairman Stout read the subjects assigned to the committee), and said:

The form in Appendix A, which is being proposed now to be substituted for that previously submitted and published in the Manual follows the practice which we have adopted of having forms as far as possible printed on one side only. Any descriptive matter or instructions to be shown on the face of the form.

*I move the approval of the committee's recommendations for changes in the form and that the matter submitted in Appendix A be substituted for similar matter now in the Manual.*

(Motion Carried.)

Chairman Stout: With reference to subject No. 2, as stated, the sub-committee which has been handling this subject has continued their work, but do not have the matter in shape for presentation at this time, so that no conclusions are offered.

We will pass to subject No. 3. Last year you will recall there were some four or five blanks submitted,

some of them directly bearing upon the order itself, and some of them requiring supporting data. This year we are submitting three additional forms.

H. L. Ripley (N. Y. H. & H.): Since the first days of December I have been spending much of my time in connection with this matter, which has to do with the I. C. C. Order No. 3. It may be the intention of the committee to present these forms and collect certain data, but I believe there will be a circular issued soon by the I. C. C. to cover that subject. It may not be known to the committee that new forms have been prepared illustrating what is required under that order of the Commission. The joint standing committee composed of three representatives of the carriers and two or three representatives of the Bureau of Valuation have been appointed to consider this matter, and I would question the expediency and perhaps the propriety at this time of adopting this Appendix B for inclusion in the Manual.

O. E. Selby (C. C. & St. L.): I want to call attention to the Register of Authorities for Expenditure. It carries under the third column a D. C. E. reference. That refers to the period of federal control and is not necessary now.

Chairman Stout: The column carrying the D. C. E. reference is only inserted there to continue matters which are not yet closed out, some of which were initiated under government control, and it is not the intention to perpetuate that. As soon as we entirely get away from that period the D. C. E. reference will automatically drop out.

In answer to Mr. Ripley's suggestion, we recognized at the time that Order No. 3 may be in a somewhat tentative condition, still it does to some extent become fixed, and we felt that these forms were so nearly like those prescribed in Order No. 3, and since these particular forms were not specified by the I. C. C. Bureau of Valuation, that considerable leeway was given for additional information. They specify only the minimum amount of information required, and we thought we were justified in presenting the forms at this time.

Mr. Ripley: I really feel I would be embarrassed rather than helped by the adoption of this Appendix B as it is presented, still what the chairman has said is true. There was prepared and handled by the secretary of the President's Conference Committee a new series of forms arranged in considerable detail and differing substantially from the old forms, and I may say if it had not been for the intervention of the carrier's committee, these forms would probably be before you in mandatory form. We ask for an opportunity to suggest modifications in these forms. I do not know how much consideration the committee has given to it, but we spent weeks on this thing and these forms do not go far enough and I would like to make the suggestion that this Appendix B be received for information, rather than for adoption and printing in the Manual.

The President: The committee desires to change its recommendation that this subject be continued and that neutralizes the motion made for adoption. The motion for adoption has been withdrawn by the mover.

Chairman Stout: Subject No. 4 is under consideration and no conclusions are presented at this time. Subject No. 5 is also under consideration and definite conclusions have not been prepared. In Appendix C in connection with that study will be found a very valuable bibliography covering the subject assigned. This has been prepared in large part by the Bureau of Railway Economics, and we feel we are fortunate in getting their assistance in this manner.

Mr. President, this matter is presented for information. (The committee was excused with the thanks of the Association.)

## Report on Conservation of Natural Resources

The results of the reclamation of scrap and material on the Wabash, the Santa Fe and the Baltimore & Ohio are presented with the idea that the information will be not only of value, but that it will stimulate still further interest and thus effect greater economies. The Wabash shows a saving by reclamation of approximately \$17,000 in about one year. Railways should encourage every method to maintain and increase forest growth, as they are directly benefitted by the increased revenue as carriers of timber and by the increased supply for their own needs. The roads should plant trees along the right-of-way to eliminate snow fences, and promote tree planting.

W. F. Ogle  
Chairman

W. F. Ogle is completing his first year as chairman and his third year as a member of the committee. In directing the work of this committee, it is necessary for the chairman to differentiate between the theoretical or intangible and that of immediate practical application. In these days of intensive search for the elimination of waste of every character as opportunity is offered for constructive work by this committee. Mr. Ogle is a relatively recent member of the Association. He is chief draftsman in the office of the chief engineer of the Chicago, Rock Island & Pacific at Chicago.

IN APPENDIX A THE COMMITTEE submitted its report on the reclamation of materials. In Appendix B the committee submitted its study of the subject of tree planting and reforestation. It is the judgment of the committee that greater interest should be manifested by both state and federal governments in this subject, by enacting more lenient tax laws on growing timbers, and making appropriations for acquiring denuded lands, unsuitable for agricultural purposes, which should be reforested. A report on the conservation of human life and energy was presented in Appendix C.

Committee: W. Forrest Ogle (C. R. I. & P.), chairman; E. E. King (Univ. of Ill.), vice-chairman; F. T. Beckett (C. R. I. & P.), C. M. Buck (A. T. & S. F.), Moses Burpee (B. & A.), J. R. Caswell (C. P.), O. P. Chamberlain (C. & I. W.), J. B. Dawson (S. P.), W. A. Duff (Can. Nat.), C. H. Fisk, F. A. Gaby, R. H. Howard (Wabash), William McNab (G. T.), J. B. Myers (B. & O.), J. L. Pickles (D. W. & P.), S. N. Williams (Cornell College), R. C. Young (L. & N.).

### Appendix A—Reclamation of Material

On the Wabash, during a period from August 19, 1919, to July, 1920, inclusive, new material costing \$24,702.73 was reclaimed at an expense of \$7,396.45, effecting a saving of \$17,306.28.

These figures cover such track material as clawbars, lining bars, pinch bars, track chisels, track spikes, guard rail clamps, head rods, connecting rods, switch stands and targets, derails, etc.

The following is an illustration as to the accounting procedure:

- (1) All material delivered to reclamation plant is accepted as miscellaneous scrap, whether it be tools, couplers, bolsters, switch stands, etc.
- (2) Material in some cases is worked over into other items from its originality or it is repaired, or rebuilt by applying to new parts, etc.
- (3) The cost of labor in repairing and assembling is charged direct to the particular item or material that has been handled.
- (4) To the cost of labor is added the price of miscellaneous scrap used.
- (5) To the cost of labor, new material and scrap also a pro rata charge is applied to the various items on percentage basis. This pro rata represents overhead charges, i. e., supervision, oil, power, light, telephone, and water. In other words, covering such expenses that cannot be accurately charged direct to any one item of material.
- (6) Recapitulations of all charges are brought forward, which makes the total cost of reclaiming, we being allowed

either current or contract prices for all material or, in other words, new value.

(7) The total cost of reclaiming any one item is deducted from the new value, which leaves the net saving as compared with new value.

On the Santa Fe if a switch stand can be repaired credit is allowed to the division from which it came at the price of the new stand, giving the stand a symbol, and when it arrives on the dock after going through the shop it has been charged with the time of each man's work and with the material used; then the office charges the division from which the stand comes with the actual cost of repairs, and by this method the division receives credit for the true value of the stand. All materials received are handled in this manner. If a frog is received that is good for nothing more than scrap, credit is allowed for any parts that are serviceable, such as clamps, fillers and rods. Clamps at \$3 each, cast fillers at \$1.50, steel fillers at \$3, and 25 cents each for the rods. The Santa Fe has repaired:

31 box stands at a cost of.....	\$4.13 each.	Total,	\$128.19.
6 low star stands at a cost of....	\$3.31 each.	Total,	\$19.87.
1 high star stand at a cost of....	\$6.84 each.		
32 switch stands at a cost of.....	\$3.05 each.	Total,	\$97.95.

### RECLAIMING REPAIR RAIL BY RESAWING

It has been the policy of the Baltimore & Ohio to lay new rail out of face on important high speed passenger divisions and those carrying heavy traffic, renewing the worn rail, which is often of lighter weight, and relay the repair rail on branch lines where the passenger movement is less frequent and speed considerably lower, or on such branch lines where the traffic consists almost entirely of slow heavy freight trains. Therefore, in the relaying of these four different weights and sections, each has been assigned to some one branch line, consideration being given to the traffic over that line. In relaying this sawed-end rail on branch lines, it is laid with new bolts and bars. In resawing the rail, 15 inches is cut off each end of the rail. After the rail is sawed it is 30 ft. 6 in. long and is redrilled. When this sawed-end rail is laid on branch lines, as above detailed, the bad features of worn surface and line bent at ends and worn angle bars, which were always objectionable features to relaying rail, are entirely eliminated.

When relay rail arrives at the plant it is unloaded on skids, where it is handled by a stiff leg derrick, with the assistance of four laborers, to the saw table. The rail is

then sawed by friction saw, one end at a time. After both ends are sawed it is moved on rollers by hand to the double drill presses, where it is drilled. In drilling, the ends of four rails are drilled at one operation. The burrs are knocked off by the men handling the rail on its way from the saw to the drill presses and at the drill presses.

During the calendar year reported on there has been sawed a total of 499,137 ft. of the four different sections, representing the total number of feet of rail after it is sawed and drilled equivalent to a tonnage of 7,192. In the sawing of the rail there was about 8 per cent lost which will be sold as scrap. The average cost of sawing this rail during the year was \$1.27 per ton. This cost includes all labor for unloading the rail at the saw; the labor and other direct costs incident to the actual operation of sawing the rail, and the labor cost of loading the rail into cars. This cost does not include the labor costs of loading the rail for shipment to the saw or the unloading of the sawed-end rail on the ground for laying. The loss on account of sawing off the ends of the rail or its credit when sold as scrap is not considered in the average cost previously given.

#### Appendix B—Tree Planting from Railway Standpoint

But few roads own land on which to carry out any experiments in this line, but many roads traverse tracts of country which are not productive of any crop, and which, even where soil is unfit for agriculture, might support a fair forest growth.

Railways are not only vitally interested in the timber supply for their own maintenance, but also in a very great degree in the amount of traffic which timber furnishes to them as carriers. It is fitting, therefore, that they should encourage and originate all possible means to maintain or increase forest growth. In the majority of cases, however, railway companies have no authority in forestry matters. It is time, and we are glad to know it, that the owners of wood lands are becoming more careful and more enlightened as to conservation of their properties, yet the problem of reforestation is scarcely getting the attention it deserves.

The railways, together with state and federal governments, should urge farmers and other land owners to utilize their waste, burnt over and cut over lands by planting trees. Co-operation in this way would furnish a large part of the timber required for buildings and roadway maintenance, for car construction and repairs, for paper used in various forms, and will materially aid in solving the fuel supply. Since they are such extensive users of forest products, the railways could well afford to have a sufficient forestry staff to help in carrying out a comprehensive planting program. The different states through their forestry officers could be called upon to assist in this work. By a series of demonstration lectures, newspaper articles and other publications, the land owners could be shown the benefits of such an undertaking, and could be taught the best methods of planting, growing and cutting timber and of protecting it against fire, insects and diseases.

Rough lands where the timber has been removed are being denuded of their soil by rainfall and their productivity is being decreased. This is of vital interest to the railways, for most of them derive their incomes from the products along their lines. Many of the excessive floods that have brought much damage to railway property in recent years were aggravated by the lack of growing timber. Most of the trees that formerly grew along the streams and that checked the flow of water before it

reached the streams and prevented much of it from getting to them at all, have been cut away. Wherever possible, these lands should be reforested to save the soil, to conserve the rainfall and to eliminate some of the damage from the floods.

The railways should plant trees along the right-of-way where there is difficulty with drifting snow, to eliminate snow fences. They should encourage land owners to plant trees for shelter belts where it is apparently not possible to get other plantings started at the present time. This would demonstrate what could be done in raising timber and would furnish for them a fuel supply.

#### Discussion

W. F. Ogle (Chairman): The committee had no recommendations to make in regard to what had previously been published in the Manual. Under Appendix A we have shown a few examples of how reclamation of materials could be practiced. I think it is needless to say that most engineers today realize that there is great saving to be made through reclamation of materials, and the field is so large that it is really up to the individual to practice it as he can do best on his own lines.

Tree planting and reforestation is an old subject. It has been gone over and over, and there is little left to be said. I think the thing that we should do is to encourage proper legislation to regulate tree planting and reforestation.

In Appendix C we have attempted to show under several headings a few of the methods which should be followed in the conservation of human life and energy. That also is quite a large field. Under Appendix D we have shown some of the progress in reforestation and conservation in Canada, which is very similar to conditions in this country.

(After brief discussion the committee was dismissed with the thanks of the Association.)

A Notable Bridge on the Bessemer & Lake Erie

## Report on Yards and Terminals

Typical plans for tracks and ladders leading to stub-end and through passenger stations are submitted for inclusion in the Manual. In transfer of lading of bad-order cars, hand labor is without real justification. Locomotive cranes can generally be used with economy. Intensified use of property is secured by multiple story freight houses. Two-track level freight house design is attracting increased attention. For the mechanical handling of freight in freight house work the most extensive and successful development has been that of small tractors and trailers. Automatic elevators have been applied with success at railway, commercial and army warehouses.

B. H. Mann  
Chairman

B. H. Mann has been chairman of the committee for three years. Prior to that time he was vice-chairman for four years. He has therefore held a position of responsibility for 7 of the 11 years he has been a member. The fact that he is signal engineer of the Missouri Pacific system is an indication of the increasingly close relation which signal engineering bears to the solution of operating problems. The experience which he has gained in his regular work is of particular value to the committee which has for its goal the development of the principles of economical terminal operation and the presentation of plans and methods for this object.

IN APPENDIX A THE COMMITTEE submitted the results of its study of the subject of handling of freight on two-track level freight houses and team tracks, including multiple-storied freight houses and handling of freight by mechanical means. In Appendix B the committee reported its continued study of the subject of typical and actual situation plans for passenger stations and methods of their operation showing plans and photographs of the St. Paul Union Station at St. Paul, Minn., and the passenger terminal at Richmond, Va. It also reported on the subject of economic transfer of lading of bad-order cars in large terminals by the introduction of mechanical means or otherwise. Progress was reported on the study of subject (2) Unit operation of railroad terminals in large cities; on subject (5) Classification yards, including methods of switching; on subject (6) Advantages of small sorting yards and gravity switching for switching trains into station order and in Appendix C, the compiling of specifications for passenger, freight house and grain weighing scales.

### Conclusions

1. The committee recommended that the following plans, taken from the Proceedings and revised, be approved for publication in the Manual:

Typical and actual situation plans for passenger stations and methods of their operation:

- (a) Plan showing a typical track layout at a dead-end passenger terminal station.
- (b) Plan showing a typical track layout at a through passenger terminal station.
- (c) Plans Nos. 20 to 26, showing types of ladders for passenger stations.

2. The committee recommended the following for approval and publication in the Manual:

Methods of economic transfer of lading of bad-order cars in large terminals by the introduction of mechanical means or otherwise:

- (a) Hand labor for transferring freight from cars in most cases is slow and expensive and without real justification.
- (b) The employment of a locomotive crane is generally justified in any case where the transfer of freight from open-top cars otherwise requires the equivalent of the constant daily service of six or more men, or the intermittent service of six men where the machine may be economically employed in the interim.
- (c) A study of each situation may develop extensive means of economy out of all proportion to the cost and such study is justified in each case.

3. The committee recommended that its report on the

subject of handling freight in two-track level freight houses and team tracks be received as information.

Committee: B. H. Mann (M. P.), chairman; A. Montzheimer (E. J. & E.), vice-chairman; J. E. Armstrong (C. P. R.), Hadley Baldwin (C. C. C. & St. L.), C. A. Briggs, J. H. Brinkerhoff, Miles Bronson (N. Y. C.), A. E. Clift (I. C.), L. G. Curtis (B. & O.), H. T. Douglas, Jr. (C. & A.), A. W. Epright, E. M. Hastings (R. F. & P.), Reuben Hayes (Sou.), L. J. F. Hughes, J. B. Hunley, (C. C. C. & St. L.), D. B. Johnston (P. L. W.), H. A. Lane (B. & O.), R. J. Middleton (C. M. & St. P.), O. Maxey (C. R. I. & P.), F. E. Morrow (C. & W. I.), H. J. Pfeifer (T. R. R. of St. L.), S. S. Roberts, C. H. Spencer (I. C. C.), E. B. Temple (Penna.), E. E. R. Tratman (Engr. News), J. G. Wishart (C. R. I. & P.).

### Appendix A—Multiple-Storied Freight Houses

The subject of multiple-storied freight houses divides itself into four parts:

- (1) Two-track-level freight houses as compared with single-level freight houses.
- (2) Two-track-level team tracks.
- (3) Multiple-storied freight houses, or the operation of storage warehouses in connection with freight houses.
- (4) Handling freight by mechanical means.

The committee has been unable to find any installations of two-track-level freight stations. Assuming that a two-level design is adopted, one of the first considerations is adequate provision for handling freight between the two levels. Elevators are the principal means employed, handling both freight packages and freight trucks, although inclined conveyors or escalators have been proposed in some cases.

As to the general plan, the almost universal arrangement is to have both tracks and driveways run longitudinally with the building, with the platforms on the upper level directly above those on the lower level. In a design made in 1912 by the Pennsylvania for a large freight terminal at Chicago the freight house was to cover an entire block and to have transverse driveways connecting the two streets on the longer sides, thus increasing the length of frontage for teams. This project was abandoned, however, in favor of the present terminal with longitudinal driveways.

### TWO-TRACK-LEVEL FREIGHT HOUSES

Double-deck freight house design is attracting increased attention in connection with railway terminal facilities in large cities, especially where separation of grades of tracks and streets involve steep grade approaches for single story freight houses. The floor area of many single-

level freight stations is inadequate for their business, but expansion is either impossible or is practicable only at great expense for additional land. In such cases the introduction of the two-level type of station may furnish a satisfactory solution of the problem, also being adapted to separation of grades, reducing congestion of vehicles, avoiding steep driveways and shortening trucking distance, the latter being one of the principal factors in the expense of freight house operation.

Two-level stations have been and are being built under governing conditions such as are imposed by topography, grade separation or the necessity of intensified use resulting from restricted area or high value of land. Where conditions permit of choice between single or multiple level designs, selection should be based upon these considerations: (1) Value of land; (2) construction costs; (3) present and future business; (4) operating costs, and (5) operating capacity.

#### MULTIPLE-STORIED FREIGHT HOUSES

This subject relates to the provision of upper stories for holding of inbound freight until delivered or for warehouse purposes. Some railway officers do not favor going into the warehouse business; the committee held, however, that where the freight house occupies land of high value it is desirable to develop revenue from the area occupied, increase traffic, and offer economy to shipper, providing that this can be done without interfering with the normal business of the railway.

One objection that has been made is the possible confusion between teams for freight house and warehouse business, and confusion in the elevator service handling both kinds of business. In this connection reference may be made to the combined freight station and warehouse of the Central Manufacturing Company at Thirty-ninth and Robey streets, Chicago. The tracks are at the first-floor level, and two outside tracks along one side are for the carload business of the warehouse. Along the other side is a double deck driveway, the lower deck serving the freight house platform and the upper deck serving the warehouse. Access to the upper deck is by two large elevators for wagons and motor trucks. Some of the interior elevators serve the warehouse floors only, and others serve both the warehouse and the freight station.

The new five-story freight terminal of the Pennsylvania at Chicago has tracks at the basement level and team driveways on the first floor, with the three upper stories designed for warehouse purposes. The new Chicago freight stations of the Chicago & Alton and Chicago, Burlington & Quincy will have a similar arrangement, the Chicago & Alton having one warehouse floor, the Chicago, Burlington & Quincy four. The Orange Street freight station of the New York Central Lines at Cleveland, Ohio, is of the single-floor type with provision for future upper floors for warehouse purposes.

#### MECHANICAL HANDLING OF FREIGHT

Two difficult conditions are involved in attempts to simplify the operation and to introduce mechanical methods of handling. In the first place, there is the network of movements. Outbound freight from each doorway must go to a scale and checker's desk and then to any one of the cars which stand alongside the house. In the second place, the freight to be handled is of bewildering variety in material, size and weight.

Hand trucking has met the requirement of flexibility of movement fairly well, but it is slow and expensive, and involves considerable confusion, with liability of numerous errors. Overhead cranes, trolley hoists and conveyor equipment has been used very little in freight house work. In fact, it has been difficult to adapt such appliances to

this work, since their operations are limited to fixed routes and directions and cannot generally be adapted to the irregular and changing directions of movements on a freight house floor. In warehouse work, however, such mechanical equipment finds numerous applications.

For the mechanical handling of freight in freight house work the most extensive and successful development has been the introduction of small tractors to haul trucks or trailers in trains. The tractor taking a train of loaded trucks drops them at their destined cars and collects empty trucks for delivery to loading points.

This system is in operation at a number of freight houses and also at warehouses. To enable the truck trains to cross the tracks between station platforms, light bascule bridges are employed in the Orange Street freight house of the New York Central Lines at Cleveland, Ohio. In settling cars on the house tracks they are spotted to clear these bridges. In the U. S. Army warehouse at Brooklyn, N. Y., the truck and tractor system is operated in combination with an automatic elevator service.

Automatic elevator service is a development of elevator equipment which has been applied with marked success in some of the busiest railway, commercial and army warehouses. It requires no operators on the elevator cars, in ordinary railway installations the elevators being operated by the freight handlers by means of push buttons at the elevator doors. As applied at the Brooklyn Army warehouse, however, one dispatcher at a desk equipped with a battery of signal lights controls all movements and has before him the record of movements and location of all elevator cars. In any case the operation of the doors and the leveling of the cars at the landings are effected automatically. The Pennsylvania freight station at Chicago has 16 of these automatic elevators of three to five tons capacity, and the new Chicago & Alton station at Chicago will have 17 five-ton and two ten-ton automatic elevators.

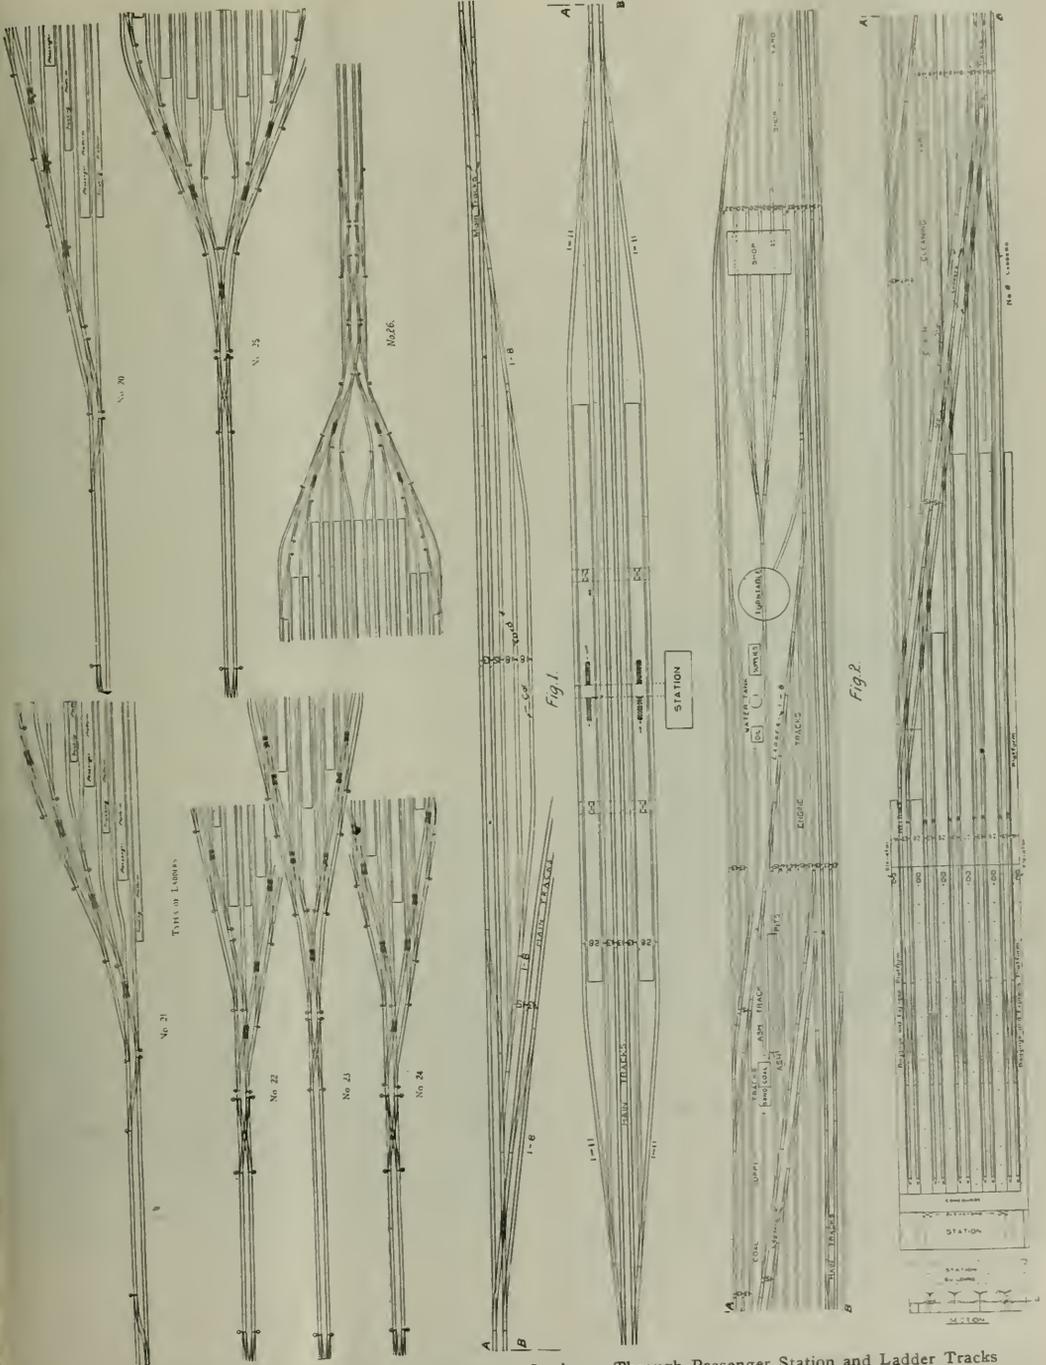

#### Discussion

B. H. Mann (Chairman): We will take up the report as shown under conclusions. The first two conclusions call for action by the Association. The rest are presented as information. Conclusion (1) will be handled by Mr. Hastings, chairman of the sub-committee.

E. M. Hastings (R. F. & P.): We were charged with the making of a final report, if practicable, on typical situation plans for passenger stations and the methods of their operation. The committee, however, feels that it was not advisable to make a final report, as this is a subject which covers a large field and a work which is consequently in the process of development, consequently it followed out the idea of reporting passenger terminals of interest that have been recently constructed.

We present as information the plans of the union passenger terminal at St. Paul, built by the St. Paul Union Depot Company, and also the plans and photographs of the Richmond, Va., terminal, which has been in operation about two years. We ask you to study these two situations, as they present some very unique ideas.

We present to the Association for approval and publication in the Manual a typical track layout of a dead-end passenger station, which was published in the proceedings of the Association in 1911. This has been slightly revised. Also a typical track layout for a through passenger station, published some time ago. These two plans, slightly revised, are now presented to the Association for adoption and inclusion in the Manual, as are also the types of ladders particularly applicable to passenger stations, which were originally prepared by Mr. Roberts, presented to the Association and printed as in-

Typical Track Layouts for a Dead-End Passenger Station, a Through Passenger Station and Ladder Tracks

formation in 1917. These types of ladders have been slightly revised.

Chairman Mann: *I move that these situation plans be adopted and approved for publication in the Manual.*

(*Motion carried.*)

Chairman Mann: Conclusion 2 covers subject 8. *I move the adoption of the conclusions for insertion in the Manual.*

(*Motion carried.*)

Chairman Mann: Subject 3 will be presented by H. T. Douglas, chairman of the sub-committee.

(H. T. Douglas, Jr., (C. & A.) presented Appendix A.)

Chairman Mann: The next subject, on scales, will be presented by Mr. J. B. Hunley.

(J. B. Hunley (Big Four) abstracted the report), and said:

We decided first that grain-weighing scales could not be considered along with the others. At that time we started to adopt a specification for a portable type of scales, of the self-contained and of the built-in type, and the motor truck scales. We found a good many complications. In the first place, the manufacturers, while they manufacture railroad scales and many other classes of scales, find that the railroads are small consumers. We realize that it would be better, if possible, to recommend certain sizes and capacity of scales which will meet practically all conditions, and accordingly a questionnaire was sent to all the railroads. We found that they were using various sizes and capacities of scales, and while we could have adopted certain of these sizes and capacities which the manufacturers were making at that time, we realized that the situation might bring out different classes of scales, and the manufacturer naturally objected to scrapping the old patterns and designs. We found there was but little information as to the weight of motor trucks. However, a great deal of information was collected, and afterward we could not always agree with the manufacturers, and many times the committee could not agree. We hope to have a tentative specification to submit at the next convention. I understand that the A. R. A. has adopted a specification for grain-weighing scales recently.

Chairman Mann: We had hoped to submit a completed report of subject 2, but it has not been possible to do that. Mr. Montzheimer will give details.

A. Montzheimer (E. J. & E.): Last year this committee made a progress report on the unit operation of railway terminals in large cities. It was hoped that we could make a final report on that subject this year, as well as revise the catechism on the operation of terminals as a statement of principles. On account of the change from government operation to private operation it was impossible for us to make a final report on this subject, and we would like to have the matter carried over another year with the hope that we can make the final report at that time.

(The committee was then excused with the thanks of the Association.)

### Closing Business

The Chairman: I will ask Mr. Morse and Mr. Baldwin if they will be good enough to escort the incoming chairman to the platform.

(President-elect L. A. Downs was escorted to the platform.)

The Chairman: Mr. Downs, you have been unanimously elected president by this Association for the coming year. You may take that to be a recognition of good service. You may take it also to be an expression of

confidence in your ability to direct the work of this body in a successful manner, about which there could be no doubt. It is a pleasure to me to turn over to you the symbol of your office, and in doing so I want to say to you that your success is going to depend a great deal upon your own efforts, true, but it depends a great deal upon the support of your associates, and I can assure you from an experience of one year that that support is always to be had, and it has been helpful in this, the most successful meeting we have ever had. I am glad to present you with the symbol of your office and to say that I am at your service at any time.

President Downs: I appreciate more than I can tell you the honor conferred upon me in electing me president of this Association. I cannot let the opportunity go by without mentioning how closely Mr. Safford's and my life has been associated. We were born in the same state, less than a hundred miles apart, less than two years apart. We were college boys together, we were roadmen together; transit men together; assistant engineers together. We were roadmasters together for a number of years on the same railroad, and neither one of us thought we would ever get away from it. We finally got to the head of the maintenance of way department on the Illinois Central. I say "we." Mr. Safford was chief engineer and I was top sergeant. We then separated in 1910, and for four years now we have both been directors of this Association.

I mention all these things from the fact that now we have passed through the best year the Association has ever had, with the peak reached in attendance. I feel that during the coming year, with the inspiration of the long history behind the Association, I will do nearly as well as my predecessor. I assure you that I will serve you to the best of my ability.

If there is no further business the 22nd annual meeting of the American Railway Engineering Association has now come to a close.

### A. R. E. A. Registration

THE REGISTRATION at the closing session of the convention yesterday totaled 31 members and 19 guests, making a total registration for the three days of the convention of 650 members and 165 guests, or a combined total of 815. This total of 815 members and guests compares more than favorably with the attendance of 759 of last year.

**A New Material Handling Device for Warehouse Use**

**R**AILROADS ACCUSTOMED TO RECEIVE for shipment, transfer or company use, large quantities of roll materials such as newsprint, felt, book paper, sacked wool, baled waste and cotton, barrels of oil, and similar packages which, because of their bulkiness and weight are often hazardous and expensive to handle without special equipment, will be interested in a truck recently developed with special reference to this work. This machine is a combination tractor and truck which is mounted

Karry Lode Truck Handling Print Paper

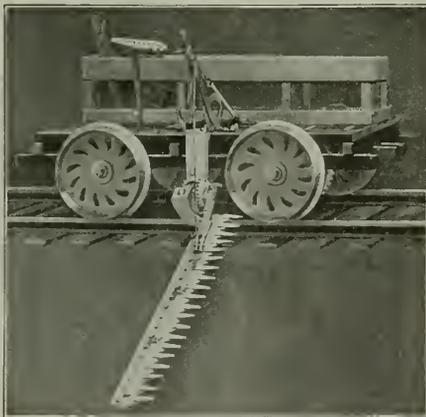

on rubber tired wheels and arranged so that one man, without leaving the platform on the rear of the machine, can load, transport, unload, and even stack such packages. In the case of print paper it is said that the operator can pick up one 72-in. roll or two 36-in. rolls from a prostrate position on the floor of a warehouse or freight car, revolve the load into an upright position, transport them

to another section of the warehouse, the tail board of a wagon, or into a freight car, and deposit them on end or side. It is said that the truck will pick up two 36-in. rolls from a horizontal position and stack them vertically, two rolls high, at the rate of 80 per hour.

In this machine the hoisting of the packages is accomplished by means of a single cable from a separate motor-driven hoist, the operator's hook providing the means of holding the material in place during the operation. For purposes of safety such devices are incorporated in the design as will prevent the truck from being started until the operator is on the platform and as will stop the machine immediately upon his stepping off. No fuses are used on the truck, the motor absorbing all the power which the battery is capable of delivering, and accommodation is provided for sufficient battery to carry the machine through the day. The machine is a product of the Elwell-Parker Electric Company, Cleveland, Ohio.

**A Track Mower Attachment for Motor Cars**

**A**MONG THE DEVICES now on the market for removing obnoxious vegetation from the vicinity of railway tracks is a mower attachment for motor cars, which has recently been installed on certain large roads. Being a mower, the machine is designed for use particularly in those sections of the country where dense

Motor Car With Mower Attached

growths of rapidly growing weeds are encountered, presenting one means of handling what is generally recognized to be an annoying and frequently quite an expensive problem.

The Rawls Trackmower, as it is called, consists of a meadow-mower type of sickle, attached to and extending directly out from one side of the car, and arranged so that it can be raised or lowered between the bank slopes and a vertical position by means of a hand lever on the floor of the car. The sickle is driven from a gear on one of the car axles, this gear being thrown in or out of engagement by means of a clutch operated by a foot control below the operator's seat, and the ratio of the gears being such that the mower will cut grass, it is said, with the car traveling at speeds as high as 7 or 8 miles per hour. The sickles can be furnished in 5, 6, or 7 ft. lengths, as desired, and are provided with an

automatic feature capable of protecting the blades from damage should they strike an obstruction. The entire outfit weighs about 300 lb. and can be fitted to any hand, push, or motor car. Its mechanism is simple, is said to be very substantial, and is arranged so that the sickle can be detached or replaced quickly. All movable shafts are fitted with renewable brass bushings, and all like parts are made interchangeable.

It is claimed that with no more equipment than the attachment itself, a convenient means is afforded of keeping the track clean throughout the season without requiring the services of extra labor or, where the mower can be operated while the car is making its regular trips over the section, without even diverting the attention of the regular force from other work. It is further claimed that the machine will not only do the weed cutting work far more rapidly than can be done by hand, but will do it more thoroughly. The machine is manufactured by S. E. Rawls of Chicago.

### A New Type of Small Pocket Calculator

A NEW POCKET CALCULATOR intended primarily to be used in performing the calculations ordinarily done on a slide rule has been placed on the market by Small, Small & Co., Waltham, Mass. The device consists essentially of a six-inch logarithmic slide rule, bent in a circle so as to be compact and easily operated. The instrument is made up of a base plate carrying a continuous scale on its periphery and upper face; a movable top plate or rotor arranged to turn on the hub of the first member and carrying a similar scale on its periphery and upper face; a slotted hub nut to keep the rotor in place and adjust the friction, and a runner with a cross hair and pointer for reading the scales.

The scales give the function of the angles as well as the logarithmic reciprocals and square roots.

These scales are continuous, insuring that the results are always ready, and never off the scale, as often occurs with a straight slide rule. The graduations on the continuous six-inch rim scales are 20 per cent larger than on the double five-inch scales generally used in the ten-inch slide rule. The accuracy is equivalent to a three-place logarithmic table giving three significant figures. The device is made in two models, No. 1 having the ordinary slide rule scales, and No. 2, intended for architects and structural designers, with scales for determining the strength of steel and wooden beams. The scale on the periphery may be used as a map measure for straight or curved lines.

The instrument is made chiefly of hard non-corrosive metals, the runner being oxidized German silver. The main bearing is tapered slightly with a spring washer to take up the end shake and insure uniform friction. It is claimed that the mechanical construction is such that the

The "Small" Pocket Calculator

changes in temperature and humidity will not affect its operation.

### A New Fire Alarm

A NEW DEPARTURE IN FIRE ALARMS has been placed on the market under the name "Fireklok," which is designed to offer a solution for a number of fire alarm problems. The device is automatic in its operation and consists of a bell with a self-contained system of clock-work, controlled by a fusible link.

The principle of its operation is that of a clanging of the bell, once the mechanism is released by the melting of the fusible link at a temperature of 160 deg. F., the idea being to have the device spread the alarm while the fire is in its incipency and before it has progressed beyond control by hand extinguishers. Once the alarm starts it rings incessantly for five minutes, after which it may be made ready for use again by inserting a new fusible link and winding up the mechanism.

These alarms occupy a space only five inches in diameter and are intended to be placed in locations where a fire is liable to occur, as in freight rooms, warehouses, paint and oil rooms, etc. This alarm is manufactured by the Pyrene Manufacturing Company, Chicago.

Fireklok Fire Alarm

### A New Rivet Set

COINCIDENT WITH THE DEVELOPMENT of a reversing type of close quarters drill described in the *Daily Railway Age* of yesterday, the Chicago Pneumatic Tool Company, New York, has introduced a new rivet set for pneumatic hammers. This set, the Boyer name, is said to be a successful culmination of efforts directed for some time by the company to the manufacture of a tool capable of affording a more uniform and greater resistance to the stress of riveting service than had been obtained in its earlier types. Those recognizing the influence which the rivet set has upon the character and quantity of work and even on the lasting qualities of the hammer, and familiar with the trouble which often attends the use of low grade sets will be interested in the new device, particularly for the possibilities it presents of withstanding service conditions. In this connection it is said that in a series of recent tests, different sets were

Boyer Rivet Set

found to permit the driving of from 12,000 to 20,000 rivets before requiring renewal, all of them displaying great uniformity in performance. Aside from using raw materials subject to rigid specifications, the secret of the success in the manufacture of these tools appears to lie in an accurate control of the forging and subsequent heat-treating processes.

## Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

"An engineman going forty miles an hour can attend to and understand one signal when he might be confused by two."

### Potential Danger Points

This statement, although made on October 17, 1866, by Ashbel Welch, general president and chief engineer of the United Companies of New Jersey, is equally true today. With this

thought in mind it would be well for railway managements to require a survey to be made to determine just how many potential danger points may exist where there is a possibility of a clear signal of one type being confused with a stop signal of another type located in line with or near the first. For example, many places exist where a train order signal is in line with a home signal at an interlocking plant, or an automatic signal governing in the same direction as the home signal is located in advance of the home signal a short distance beyond the crossing or junction point at an interlocking plant. Locations such as these are potential danger points and steps should be taken to correct them. This may be accomplished by interlocking the train order signal with the home signal or making other provision to remove the possibility of its light being mistaken for the home signal indication. When an automatic signal is located a short distance in advance of a home interlocking signal it would appear advisable to have the automatic signal indicate stop at all times when the home signal governing across the plant indicates stop. While it may never be known definitely that the train order signal at Porter, Ind., contributed to the accident it was a potential danger point that existed and still exists, not only there but at many other places.

The Pennsylvania Railroad has begun publishing a bulletin, entitled "Pennsylvania Standard," which is being circulated among its employees, telling the facts about the railroad situation in general and that of the Pennsylvania in particular. One of the main reasons for the strained relations now existing between most railroads and their employees is that for years large quantities of literature mis-stating the facts about private railroad management and the railroad situation have been circulated among employees. The Pennsylvania and other railroads which are beginning to send out literature of their own, telling the employees the real facts and giving them the point of view of the managements, are acting wisely. The loyalty and morale of railway employees will never be fully restored until they have been given opportunity to know the true policies of the managements and the reasons for them. They must be given the truth regarding the actual earnings of the companies, the amounts paid out in wages and in interest and dividends, the effects of working rules that destroy efficiency, and all those other matters regarding which the Plumb Plan League and other organizations are making persistent and successful efforts to mislead the employees. The employees will soon detect a wide discrepancy between the statements of their officers and those of the Plumb Plan League, for example. The more intelligent of them will be sure to investigate and find out who is telling the truth. When every railway company makes the same effort to educate and win the loyalty of its employees that

### Telling Employees the Facts

other organizations are making to mislead them and destroy their loyalty, the relations between the companies and their men will speedily begin to improve.

With the present high labor costs and the necessity of rigid economy in every department the matter of increasing the efficiency of railroad offices is one of great importance. The constant difficulty in improving conditions is the determination of just what methods in the office are susceptible of profitable change and whether proposed changes in methods or equipment will effect economies sufficient to justify the innovations. The problem is one of securing authoritative information concerning (1) the effectiveness of the system in use, (2) the performance which can be expected of changed methods or the introduction of new devices, and (3) the cost of the change. To assist in obtaining this information the New York Central has appointed an investigating committee of officers who have had long experience in office management. This committee is empowered to make whatever investigations it may desire in any office and to report its findings. With this full authoritative information at hand the probable effect of proposed modifications in method or appliances can be accurately estimated. After the several months of its existence the committee, whose activities are described in more detail elsewhere in this issue, has already given valuable service in determining the savings to be effected by the installation of dictating machines in the accounting offices of the company at Grand Central station. Greater economies are of pressing necessity to the railroads today and it may be expected that the activities of this committee in bringing about increased efficiency, which is measurable before the changes are made, will be followed with considerable interest.

### Investigating Office Efficiency

What is the average time between heavy repairs or rebuilding of freight cars on your road? Suppose it is seven years for wooden cars. Then 14.3 per cent of these cars should be put through the shops for such repairs each year. If a lesser number is repaired some cars must lie idle, or if temporarily patched up so as to get over the road without falling apart, they are "living on their vitals"; this in the last analysis is a mighty expensive proposition and one which cannot possibly be justified in these days when every cent must be made to count. Unfortunately, even railroads which had a well-defined, business-like policy of maintenance of their freight cars before this country entered the war, found it necessary to depart from such programs to a greater or less extent. This means that the programs for the next few years must be speeded up—possibly to the extent of making heavy repairs to 28 per cent of the cars each year instead of 14 per cent in the example noted above. What will happen if the roads generally do not do this? Considering the small number of new cars which are being added this year, the deferred maintenance which has already accumulated and the intensive use which has been made of the cars, it would appear that real disaster lies ahead unless some such policy

Car Repairs  
on a  
Business Basis

775

as that above suggested is adopted promptly. Figure it out in your own case. Can you afford not to have such a policy put into immediate effect?

Glenn E. Plumb is using a characteristic argument in his effort to demonstrate that high wages are not responsible for the high freight rates. In a speech before the conference of shippers at Chicago recently—and he has used the same fallacious reasoning elsewhere—he said that the railroads have nullified the effect of the wage increase of last summer by laying off 30 per cent of their employees, thus reducing the payroll by more than the wage advance, but that they are still collecting the “rates” raised in part to meet the wage advance. Mr. Plumb’s figure of 30 per cent for the number of men laid off seems rather high but at any rate there is no dispute about the fact that the shippers have “laid off” over 30 per cent of their shipments and that the revenues produced by the rates have, therefore, been reduced by more than 30 per cent. The rates of wages have not been reduced, although less men are receiving them, any more than the rates for transportation have been reduced, because they are paid on a smaller volume of traffic.

Railroad executives are exceedingly busy men. Their time and energy should be conserved wherever possible and yet

#### A Graphic Portrayal

they must have always in mind an accurate and vivid picture of exact conditions and tendencies in their departments or on their properties. Graphic charts have come into more and more extensive use in recent years for interpreting at a glance facts which would require pages and pages of figures and explanations. Still greater use, however, can be made of graphics. Subordinate officers can oftentimes get their arguments over and make their cases clear if instead of voluminous reports of words and figures—not always logically assembled—they will present the facts in the form of charts or diagrams. Sometimes, indeed, if they tried to do this they would decide not to go ahead with their recommendations. Waste, lost motion and useless expense must be eliminated from railroad operations. Officers and foremen must think straight and their decisions must be based upon facts as to actual conditions. Masses of undigested figures and data mean nothing, or less than nothing. Why not apply common sense and science to the problem of digesting them so that they will talk for themselves? Possibly some of our readers would like to send in examples of applications of graphics which have been helpful to them.

“In developing a new practice or a new design on our road it is first submitted to one searching question—Will it make money, directly or indirectly, for our company? If it will not, it is immediately dropped.” Thus spoke a mechanical department officer of a large road—a man, by the way, who has

made good in no small degree. He has a keen analytical mind, is a good engineer, and deals in facts. Such a man must of necessity have a good imagination in order to look ahead and get out of the rut which is often so deeply worn in railroad work. When it comes to applying the above test, it is not done in a guesswork or haphazard manner. Rather, the facts are marshaled in such a way as to present the results naked and free from any fads or fancies. If a new practice or design can fully justify itself it is adopted; it

is not dismissed from mind, however, when adopted, but checks are made from time to time to be sure that it justifies itself on the larger scale. If the so-called improvement is not reflected in the financial balance sheets somebody has made a mistake. After all, this is the acid test to which every railroad department and operation should be subjected. It eliminates the useless tinsel and furbelows. It gets work out of many deeply worn ruts—often so deeply worn as greatly to hamper and restrict progress.

The incentives which induce men to labor in railroad shops, or any branch of railroad or industrial service, may

#### Incentives for Greater Shop Production

be summed up as wages, opportunity for training and advancement, and confidence in the security of their positions. Under present conditions, the third of these factors has little effect on the personal efficiency and output of workmen, since it is practically impossible to discharge a man as long as he reports for work and does not absolutely refuse to obey orders. The first two incentives mentioned, however, may or may not provide increased shop production, depending upon conditions. It is only human to expect a special reward for unusual endeavor, and production managers throughout the country have found the installation of bonus or piecework systems, whereby wages are proportional to the work done, an effective method of increasing the personal efficiency and output of workmen. While there is no pressing need at present for greater railroad shop output, it is undoubtedly true that within a few months at the most the railroads will once more be working to capacity, and will want to install every possible capacity and efficiency-increasing method in railroad shops. One of the strongest arguments against the continuance of the national agreements is the fact that they prohibit piecework and eliminate the incentive for greater individual output. Ordinarily, the opportunity for securing training and advancement impels ambitious workmen to strive for higher positions, but railroad shop managers are denied the benefit of this incentive also, since, under the national agreements, promotion must be made in accordance with seniority rules and length of service. It is time that the capacity decreasing rules and regulations, promulgated by the national agreements, be revoked and railroad shops brought up to the same standard of efficient, economical operation as other industrial plants.

There never was a better example of men being “hoist with their own petar” than has been afforded within the last few days before the Railroad Labor Board at Chicago. The labor leaders got the Labor Board to subpoena

#### “Hoist with Their Own Petar”

Thomas DeWitt Cuyler, chairman of the Association of Railway Executives; C. R. Gray, president of the Union Pacific; General W. W. Atterbury, vice-president of the Pennsylvania Railroad, and Robert S. Binker, assistant to the chairman of the Association of Railway Executives. Their purpose was to try to give the Labor Board and the public, through the testimony of these railway officers, the impression that a majority of the railway executives originally favored the national agreements. The records of the association and the testimony of the witnesses proved beyond question that while a minority of the executives at one time, as a matter of expediency, favored acting with the labor unions in establishing national boards of adjustment, they have throughout unanimously opposed continuing the national agreements, with their effect of establishing the same rules and working conditions for employees on all railroads. Mr. Gray had been among those who favored national boards of adjustment,

but his testimony, based upon his experience as director of operation of the Railroad Administration, and also as a railway executive having charge at different times of railroads in almost every part of the country, was one of the most crushing attacks ever made upon national agreements. There can be no defense for the policy of delay after delay which has prevailed in the hearings on national agreements. The labor leaders have had ample opportunity to present their case, and they ought to be required briefly to make their rebuttal to the evidence and arguments offered on behalf of the railroads and quit. In calling the railway officers mentioned, however, the labor leaders certainly gained nothing but delay. They did not strengthen, but greatly weakened, their case.

Increased activity on the part of the railroad clubs has been most noticeable during the present season. This is probably largely due to the fact that they have quite generally broadened their programs. For some reason, most of these clubs formerly devoted the greater part of their attention to highly technical subjects, largely mechanical. The tendency during recent years has been to present better balanced programs, either for single meetings or for all of the meetings of the season, those appealing to larger groups. The educational value has thus been greatly increased. Instead of a handful of men at a meeting most of the clubs now have average attendances of 300 or more. Grant Hall, vice-president of the Canadian Pacific, at a recent meeting of the Canadian Railway Club, emphasized the value of this tendency and spoke for the presentation of subjects which would be of general interest and would help the members to get a better idea of railroad operation as a whole. It has been suggested also from several quarters that the clubs should give more attention to drawing out the younger men. Not a few instances can be cited of men who are now at the head of the railroad and railroad supply professions who got their first real start upward because of the attention which they attracted to themselves in reading papers before railroad clubs or taking part in the discussions. It is the younger members also who will profit most by the broadening out of the programs, since it will give them a better idea of the work of the other departments and as to how the various departments should co-operate and work together for the only purpose for which the railroads exist (although some departments and employees do not always seem to realize it)—to furnish transportation.

## The Panama Canal Again a Factor

IN THE maze of labor, financial and other problems confronting the railroads, a development of another character is now taking place concerning which few railway men are informed, but which would attract marked attention in normal times. This is the increasing tendency of traffic between the eastern and western coasts of the United States to move through the Panama Canal. Particular interest is attached to this tendency because of the recent experimental shipment of citrus fruit by this route, a boat arriving in Philadelphia on February 2 with 800 cases of oranges and 1,200 cases of lemons from Los Angeles. This shipment required 21 days and the fruit is reported to have shown a considerably smaller loss than is normally experienced in rail movement. In view of the marked reduction in transportation cost by this route and the demonstration of ability to deliver this fruit at distant ports in a comparatively favorable condition, the experiment is of great interest to railway men. Already a number of the large boat owners are planning to enter into

an aggressive campaign for this business and they have promised to cut their schedule to as low as 17 to 19 days between southern California and north Atlantic coast points, as compared with a minimum of 10 to 12 days by rail schedule.

At the time when the Panama Canal was completed, much attention was given to the possibility of the movement of a large part of the coast-to-coast freight by water. Boat lines were established and rates were so adjusted that freight from points as far removed from the Atlantic seaboard as Wisconsin, the Ohio valley and the Pittsburgh district was moving by rail to the Atlantic seaboard and then through the canal to Los Angeles, San Francisco and Puget Sound ports. This traffic was developing rapidly when this country entered the war, and it became necessary to take the boats out of this service. The boats are only now returning, and railway men may therefore expect to see the full effects of water competition as they have not before observed them.

That the stake is a large one is indicated by the fact that the citrus fruit movement from southern California alone aggregates over 50,000 cars annually. This fruit is delivered to the roads in large quantities so that it is handled in train load lots. It carries a high rate and demands expedited movement. It is long-haul traffic, practically all of it moving to points east of the Missouri river and much of it to the Atlantic seaboard. It and similar traffic from the west coast and the corresponding merchandise movement westbound constitute a large part of the business which the railways haul across the long mileage of intervening desert. With the increased freight rates now in effect, the competition has become all the more difficult for the railways to meet, for the cost of transportation by water has not risen to the same extent as by rail.

## The Public's Representation on the Labor Board

THE AMERICAN public may well soon begin to question whether it has adequate and competent representation upon the Railroad Labor Board. The railway companies have three representatives on the board and the employees three. The other three members were appointed to represent the public, and they hold the balance of power.

The board's handling of the question of national agreements thus far has afforded a striking contrast to the way it handled the wage case a little over a year ago. When it was appointed on April 13, 1920, demands of the employees for advances of \$1,000,000,000 a year in wages were pending. It commenced hearings on April 19 and closed them on June 4. The board was new to its task and the amount of money involved was enormous. Nevertheless, on July 13, exactly three months after it was appointed, the labor brotherhoods got President Wilson to send it a telegram saying an emergency existed, and urging it to make an early decision. That emergency was created by the fact that the labor leaders were threatening the country with strikes unless an award was quickly made. The board on July 20, just three months after it began hearings, awarded the largest advance in wages ever given to one class of workmen at one time in the history of the world.

In its wage award on July 20, 1920, the Labor Board took jurisdiction of the subject of national agreements. In announcing on December 18 that hearings regarding national agreements would be resumed on January 10, it notified the labor leaders of its understanding that they had presented their case in favor of national agreements in the wage hearings. They had had five months to get ready any additional evidence they might want to introduce. On January 10 the labor leaders, after making a general and indiscriminate attack upon railway management, said they rested

their case. The railways took less than a month to present their case against national agreements. Over a month has now elapsed since they finished, and the labor leaders have not even begun to present their rebuttal regarding the shop crafts agreement, the most important one under consideration.

Last week the labor leaders had four railway officers called as witnesses in an attempt to show, not that national agreements are reasonable or desirable, but that the railway executives had differed regarding their desirability—a point not remotely germane to the matters in issue. They completely failed in this. The testimony of the railway officers showed that the railway executives had differed upon the expediency of establishing national boards of adjustment, but always had been unanimously opposed to national agreements.

The labor leaders having failed to find in their fishing expedition among the files of the Association of Railway Executives the evidence for which they were looking, it is high time to ask when the Railroad Labor Board intends to require them to introduce any evidence they have in defense of the shop crafts agreement. They have not yet introduced a scintilla of evidence actually bearing on that subject. The game they are playing has long been perfectly plain to others. It must now be plain to the Labor Board. They are trying to add delay to delay, because every day's delay means another day in which the national agreements are kept in effect, and because apparently they hope that something ultimately will turn up which will save them the necessity of squarely meeting the issue presented in the controversy.

It took the Railroad Labor Board only three months to hold hearings and reach a decision awarding an advance in wages which statistics of the Interstate Commerce Commission now show amounted in July to \$59,946,608, or at the annual rate, not of \$625,000,000, as originally estimated, but as we have said, of almost \$712,000,000. Since it took only three months to ascertain it was reasonable to add \$712,000,000 a year to what the public must pay in freight and passenger rates, why should it take any longer to settle the question of national agreements, which, important as it is, does not directly involve anywhere near as much as did the advance in wages? If, however, the Labor Board continues to permit the labor leaders to carry out their policy of adding delay to delay, it will take not merely three months, but twice or three times three months, to settle the question of national agreements.

Settlement of the wage question was expedited because an emergency existed. A much greater emergency exists now. The entire railroad system of the United States is threatened with bankruptcy because of grossly excessive operating expenses. The Railroad Labor Board, by its control over wages and working conditions, controls 65 per cent of all railroad expenses. It must determine the question of solvency or bankruptcy for many railroads. The national agreements alone may mean the difference between solvency and ruin to many. Bankruptcy of a large number of railroads would not only bring disaster to many thousands of individual railroad security owners, but would pull down many life insurance companies, trust companies and banks, with disastrous effects to the holders of life insurance policies, to investors and depositors in the trust companies and banks, and to the entire public.

The public has a direct and vital interest in the work of the Railroad Labor Board. It has a right to expect and demand that the public members of the board will energetically and faithfully represent, protect and promote its interests. In the hearings upon national agreements, however, the public members, or a majority of them, have yielded to almost every demand of the labor leaders, however un-

reasonable. They have agreed to almost every delay the labor leaders have asked, and, with the railway situation the most critical ever known, have allowed them to take weeks of time loading up the record with testimony having no bearing whatever on the reasonableness of national agreements. More time has elapsed since the hearings were resumed on January 10 than the entire time taken in the wage hearings.

Spokesmen for the railways have claimed that the national agreements are causing inefficiency and waste, that they add approximately \$300,000,000 a year to railway operating expenses, or over \$820,000 a day. No wonder the labor leaders desire to protract the hearings! They would be glad to have them continue forever. The public, which, directly or indirectly, is paying the bill, has not the same reason for desiring them to be protracted indefinitely.

The determination of whether the indefensible delays shall be stopped and a reasonable decision speedily reached is entirely in the hands of the public members of the board; and the time has arrived when the public may well ask whether the public members feel the same solicitude for its interests which they displayed for the interests of labor when eight months ago they expedited the decision granting advances in wages.

## Standardize the Classification of Old Bridges

ANY RESTRICTION placed on the use of a railroad bridge is a matter of serious import to the traffic, operating and maintenance of way departments. The responsibility for such restriction rests with the engineering department, or, more correctly, with the bridge engineer. Apparently few people outside of the offices of the latter appreciate the complex nature of the calculations necessary to determine what stresses are set up in a bridge structure by a given locomotive or car. There is no satisfactory short cut by which approximate results may be obtained on the spur of the moment. By the same token a mere statement of the weight of the locomotive and maximum axle concentration do not provide the bridge engineer with the information he requires to make his decision. This is particularly true in those critical cases where the capacity of the bridge is being extended to the limit and it becomes a close question whether or not the load may be allowed on the structure. Another complication imposed in the work of the bridge engineer arises from the fact that he is frequently called upon to pass judgment on bridge loadings on very short notice, when it becomes, as a consequence, almost physically impossible to complete the necessary computations in the time available for the work.

Because of these considerations it seems highly desirable that some plan be promulgated, whereby the load-carrying capacity of all bridges and the bridge-stressing effects of all equipment could be reduced to some common standard and simple comparisons could be made which would give the bridge engineer immediately all the information he requires in passing judgment on the handling of a given piece of equipment over a bridge. Fortunately, such a standard measure of bridge stressing effect is available in the hypothetical Cooper "Class E" locomotive and train loadings. While these have been applied almost universally for the last 20 years or more in the design of railroad bridges, they have had but limited application in the investigation of old structures. Certain roads, however, have had this system in effect for some time and the manner of its use is described in a paper by C. F. Loweth, chief engineer of the Chicago, Milwaukee & St. Paul, an abstract of which appears elsewhere in this issue. This system is now under consideration by

the Committee on Iron and Steel Structures of the American Railway Engineering Association and it is expected that the next report of this committee will have something to offer with respect to its application.

As already stated, the question is of importance to many departments of a railroad. It has a particular bearing on the interchange of equipment between roads such as arises in the dead-heading of new locomotives on their delivery from the manufacturer, the detouring of foreign trains in the case of wrecks or washouts or the handling of heavy machinery, War department ordnance or other unusual loading. It is to be hoped that the steel structures committee will be able to formulate a plan whereby some such common standard of bridge classification may be adopted.

## The New England Situation

THE SITUATION confronting the New England railroads has been given so much publicity of late that there is probably no student of railway affairs who does not realize that these carriers are in a most precarious position. They are meeting all the difficulties resulting from the 26 months of federal control and the aftermath thereof. They are equally subjected to the inequitable rules of the national agreements and to the handicaps resulting from the present high wages of railway employees. Besides, they have some severe problems of their own. These several matters have been brought out in the hearings in the case on rate divisions. They are now again being brought to the fore in the hearings before the governors' committee of the New England states at Boston.

Briefly, the problems confronting the New England roads, which are additional to those confronting all the railroads, may be said to lie in the facts that the New England roads are terminal carriers and that they have to pay very high prices for fuel. Because of the nature of their territory they render a service very much in the nature of a switching service. As terminal roads they are subjected to large payments in the form of per diem and it is generally accepted that terminal labor costs have risen out of proportion to other increases in labor costs. The prices they have been paying for coal have increased 164 per cent over the test period. The Maine Central, whose annual report is reviewed elsewhere in these columns, has been subjected to an increase of 238 per cent in its fuel costs; coal which cost about \$3.60 a ton at Portland, Me., before federal control cost during 1920, \$10.00 or more a ton.

The New England roads have sought in the divisions case to secure what they believe to be more equitable divisions on through traffic exchanged with the trunk lines, and this case is now pending. In the meantime they have also sought to secure from the trunk lines cash payments to compensate for the too low divisions of the past. The sum of \$25,000,000 was suggested at first, but with the falling off in business another agreement has been suggested on the basis of \$15,000,000 annually to February 28, 1922, to be prorated among the carriers west of the Hudson. Even this part of the program seems to have met a snag, and it seems to be making little progress. The latest proposal for relief has been put in the form of a suggested 10 per cent increase in freight rates and passenger fares to continue in effect concurrently with the payment to be made by the trunk lines, or until February 28, 1922. This increase is to apply on local traffic and on the New England proportion in the case of through traffic. Coal and coke are excepted because of being raw materials, and export and import traffic is also not included where it comes in competition with other ports. It is hoped that this increase may permit increased revenues of \$23,000,-

000 yearly for the New England roads as a group; \$9,000,000 from passenger revenues, \$8,000,000 from freight within New England and \$6,000,000 on freight crossing the Hudson river.

The governors of New England have turned this proposal over to an advisory committee which is to investigate and to report back to the governors for action. This committee of 30 members has been in session at Boston and it has already developed some interesting facts. The most important of these is that the shippers of New England are up in arms. Their spokesmen have pointed out that New England industry cannot stand this increase; they show that even the present high rates are driving traffic to the motor trucks which are now in a position to compete at many points, even on the basis of rates and cost of service. At the same time there has been evidenced a rather derogatory attitude towards the most important carrier, the New Haven. Edgar J. Rich, counsel for the Associated Industries of Massachusetts, has gone so far as to say that he doubted if anything could save the New Haven from receivership and that a receivership would not be deplored. William H. Chandler, transportation expert of the Boston Chamber of Commerce who incidentally is also president of the National Industrial Traffic League, has similarly criticised the New Haven. He has complained that the New England roads are not efficiently managed and he declares that the case should go to the Interstate Commerce Commission for the purpose of a thorough investigation of operation. His remarks about the lack of co-operation on the part of the New York, New Haven & Hartford were especially caustic, although he did speak well of the other New England carriers.

Mr. Rich, who was formerly counsel for the Boston & Maine, is a man who speaks with authority, but we are not among those who agree with him that a receivership is necessary for the New Haven. As far as Mr. Chandler is concerned, the comment might be made that it is most unfortunate that the New Haven should not have the regard of the shippers in New England in greater degree than it has. No one can deny that the larger share of reforming the present difficult situation in New England is in the hands of the shippers and people in general of New England. It is true that under the old Mellen regime, the New Haven was not noted as worrying particularly about the regard in which the railroad was held by the shippers around Boston. Mr. Pearson, the present president of the New Haven, has worked some revolutionary changes in the operation of the New Haven. Presumably Mr. Chandler realizes this fact; he should also realize that the organization of a railroad is so large and complex that it cannot be changed completely in but four or five years.

As far as the charge that the New England roads are inefficiently operated is concerned, an investigation would without doubt show the opposite of what the shippers have in mind. The New England roads are naturally not as efficiently operated possibly as the Lackawanna or the Illinois Central. The improvements that have been made in the operations of the Boston & Maine under President Hustis and in those of the New Haven under Mr. Pearson are, however, noteworthy and there is no question but what their efficiency in management has increased markedly in the past several years.

Those who read these comments may contend that they but touch on the edge of this big question. That is all they are intended to do. The condition in which the New England carriers find themselves is a serious one and it is not yet near solution—and it needs the proper solution because on the welfare of the New England carriers depends the welfare of one of the leading centers of industry and population of the nation.

## Maine Central

IN THE OLD DAYS, prior to the time that Wilhelm Hohenzollern announced his intention of trying to run the whole world, it used to be one of the features of government ownership and operation of the Prussian State Railways that these lines returned a large profit which was applied toward the expenses of the state. It may surprise some of our readers to learn that a condition somewhat similar—though, of course, in different degree—exists in one of the states of our own United States. That state is Maine and the railroad system is the Maine Central. In the year 1920 this railroad returned to the state an income of no less than \$795,907 in the form of an excise tax based on  $5\frac{1}{2}$  per cent of the gross transportation receipts within the state. This is a handicap which the company has to meet besides those other difficulties attendant upon the aftermath of federal control and those characteristic of the recent railway developments in the New England section.

The total amount paid in taxes by the Maine Central in 1920 was \$1,163,289, of which \$795,907 was for the excise tax mentioned; \$101,767 for city and town taxes; \$201,194 for federal taxes, etc. The total mentioned was in excess of the \$1,014,423 paid as interest on funded debt, in excess of the \$905,591 paid as rent for leased roads or of the \$653,166

ever, well wooded and watered and the soil is well adapted to agricultural development. Products of forests constitute over one-fourth the total tonnage carried. The total tons of all traffic moved in 1919 were 8,753,065. The largest single item was pulpwood, 1,269,963 tons, with lumber second, 1,216,352 tons. Other commodities carried in volume included bituminous coal, 907,741 tons; paper, 710,972 tons; potatoes, 602,606 tons.

The Maine Central, up to the period of federal control, was considered the only prosperous road in New England. It was conservatively capitalized and well managed and it had paid regular dividends of 6 per cent or more without fail. The road is still conservatively capitalized and its management has not changed, but the conditions accompanying the return of the roads to private control have prevented the continuance of this enviable dividend record. Three quarterly dividends were declared in 1920 on both the common and the preferred, but the directors did not feel that the operations subsequent to the guaranty period ending August 31, 1920, warranted further payment of dividends so neither dividend was declared. The Maine Central is, therefore, properly one of the roads that were parties in the New England divisions case and the reports of its operations are properly included as exhibits in the hearings before the governors' committee which is now investigating the feasibility of a 10 per cent increase in rates in New England.

The operations of the road in 1920, including the two months of federal control, the six months of the guaranty period and the four months subsequent thereto, showed an operating deficit for the year of \$2,340,030 as compared with a similar deficit in 1919 of \$1,231,426. The corporate income account in 1919 showed a surplus income balance of \$185,884 after the payment of \$1,050,888 in dividends. In 1920 the dividends totaled only \$653,166 and there was a deficit of \$367,871.

The Maine Central is confronted with the same handicaps which are presented to the other New England lines. Its operating expenses in 1920 were nearly three times as great as during the test period and since 1917 its wage bill has increased nearly \$9,000,000 yearly. Coal for the Maine Central is received principally at Portland, Me., by water from Port Richmond and Curtis Bay. Coal which formerly cost \$3.60 per ton, in 1920 cost nearly \$10.00 a ton. The total tonnage used is about 432,000 tons yearly so that the increase in cost since 1916 has been nearly \$3,000,000.

The total freight revenue of the Maine Central in 1920 was \$14,312,998 as compared with \$11,268,063 in 1919. The ton-mileage was 948,186,188, an increase of 51,535,770 over 1919. The average haul was 108 miles and the average revenue per ton per mile 1.51 cents. The passenger revenue totaled \$5,360,708 in 1920 as compared with \$4,906,039 in 1919. The number of passengers carried in 1920 totaled 4,099,701; the average journey was 41 miles and the average revenue per passenger per mile was 3.188 cents.

The figures of operation as between 1920 and 1919 are as follows:

	1920	1919
Mileage operated.....	1,215	1,215
Freight revenue.....	\$14,312,999	\$11,268,063
Passenger revenue.....	5,360,708	4,906,039
Total operating revenue.....	21,353,708	17,375,178
Maintenance of way and structures.....	4,040,659	3,086,323
Maintenance of equipment.....	5,053,469	4,143,196
Traffic expenses.....	173,783	146,411
Transportation expenses.....	12,626,609	9,571,955
General expenses.....	611,651	525,880
Total operating expenses.....	22,675,123	17,611,806
Taxes.....	1,163,289	1,098,313
Net railway operating income.....	Def. 2,485,331	Def. 1,185,835

The following gives in brief the corporate income account:

	1920	1919
Gross income.....	\$2,766,924	\$3,222,968
Total deductions from gross income.....	2,462,291	2,136,997
Net income.....	304,633	1,085,971
Dividends.....	653,166	870,888
Income balance.....	Def. 367,871	Sur. 185,884

The Maine Central

paid in dividends on the common and preferred stocks. It would be difficult to find a tax of any kind that would work more inequitably under the conditions of railroad operation which existed in 1920 than an excise tax on gross receipts. The year just past has been characterized by great increases in gross income and decreases in net. The excise tax by expanding with the gross, increases to that extent the decrease in net income. In the case of the Maine Central the result was that despite the fact that the property was operated at a deficit for the year, the amount paid under the excise tax was considerably greater than in 1919; it was nearly 50 per cent greater than in 1917. Conditions in 1921 will probably present no improvement. The legislature of Maine has been asked to grant relief to the extent that for the years 1921, 1922 and 1923 the state excise tax should not exceed that assessed in 1917. Hearings were held in February, but the railroad's proposals were rejected.

The Maine Central operates 1,215 miles of line, the greater part of which is in Maine. Of this line, it owns 654 miles, including the main lines from Portland to Bangor and Waterville; it leases 546 miles and operates 15 under trackage rights. It is an independent property and is owned principally in Maine. On January 25, 1921, of its 2,247 common stockholders, 1,644 were residents of that state and owned 80,415 of the total of 120,069 shares. Of the 30,000 shares of preferred stock, 27,362 shares were held in Maine.

The territory served by the Maine Central is rather sparsely settled and lacking in density of traffic. It is, how-

# The Safety of Passengers in Steel Railway Cars\*

## A Discussion of the Action of Cars in Accidents and Methods of Avoiding Telescoping

By Frank M. Brinckerhoff

THE GENERAL ADOPTION of steel in place of wood in the construction of passenger train cars some 15 years ago marked a distinct advance in the art of car building. Various problems arose during the change, and many have been successfully met. The two most important problems to be solved were and still are: safety of passengers and weight of complete car.

That some steel passenger cars are heavier than the wooden ones which they displace in service, seems to be indicated by the significant fact that the adoption of steel pass-

To successfully defend the passenger space against invasion in side wiping collisions and derailments, strong sideposts must extend from side sill to roof and all the side frame members must be co-ordinated to ward off the colliding body.

enger train cars was frequently accompanied or closely followed by the purchase of heavier locomotives to handle the new passenger equipment.

It is not the intention at this time to discuss the economic consequences of the increased weight of steel passenger train cars, though that aspect is, of course, very important.

With regard to the problem of safety of passengers, I wish to present in a condensed form the results of an extended investigation of the behavior of passenger train cars when derailed or in collision and to point out, that, while the steel structure affords much greater safety to passengers than did wooden car bodies, modifications can be made in the superstructures of steel cars which will greatly increase their ability to resist destructive shock.

The data and some of the illustrations from which this paper is compiled can be found in the printed reports of accidents investigated by the Bureau of Safety, Interstate Commerce Commission, which are available to all; other illustrations are from photographs taken by various pictorial news bureaus and have appeared in the daily press, a few are from our office files.

In making our collection many hundred prints were examined and only these were selected which are of interest

\*From a paper presented before the New York Railroad Club, March 28, 1921.

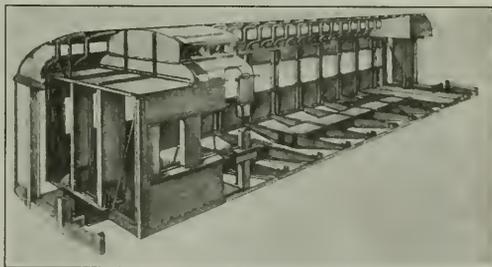

to car designers. It is greatly to be regretted that frequently the only available photographs of a wreck were taken as general views of the accident. Many valuable photographic studies of structural failures could have been made by an expert on the spot.

It was natural that the early designs of steel car structures should follow conventional lines and that the evolution from the all-wood car to the all-steel car should be gradual. It is now possible, however, to examine the photographic records of typical accidents to passenger trains and profit by past experience when designing and building new equipment.

For the purpose of analysis the illustrations have been divided into two groups: derailments and collisions. The records of the Bureau of Safety show that by far the greater number of accidents are in the derailment class though the loss of life and injury to passengers and equipment is greatest in the collisions.

### Derailments

Examining first the large derailment class it is found that a considerable portion of the momentum of the train is gradually expended in plowing up the roadbed and in tossing about the car bodies, therefore the violence of impact between the individual derailed cars is not comparable to the shock experienced in a rear end collision between a moving and a standing train wherein the momentum of the combined units

Framework of Passenger Car

Showing collision diaphragm and bulkhead with high-girder side walls.

of the moving mass, led by the locomotive, is concentrated in an impact upon the rear units of the standing train. This reduction in the degree of violence of impact is, however, somewhat offset by the fact that when cars are derailed the heavy underframe of one car is frequently projected against the relatively weak superstructure of an adjoining car with more or less disastrous results. Furthermore in derailments the cars are sometimes overturned or fall upon a neighboring car; in such cases the superstructure of the car is subjected to extremely severe stresses.

Examination of many illustrations of accidents of the derailment and side wiping class, led us to the conclusion that distribution of metal which would strengthen the superstructure of the car as compared to the strength of the underframe was highly desirable. During the last 10 years or more, 315 cars have been built according to a system evolved, with the purpose constantly in mind, to produce a car body

structure of great strength, but still of a weight not in excess of wooden car bodies of similar size and equipment. I wish to introduce at this point a short description of this system which affords unusual protection to the passenger space when cars are derailed or side wiped.

### A Car Body Structure of Greater Strength

The sideframe members of these cars are organized in the form of a girder extending from the side sill to the side plate at the roof line, a height of 7 ft. 6 in. or more. The underframe of this system includes centersills adequate to sustain the shocks of collision, draft, etc., but instead of being of the fish belly type, designed to be self-supporting between truck centers, as is the usual custom, the centersills of this system are uniform in section throughout their length and are supported approximately every six feet by heavy cross bearers between the high girder side frames. The centersills, being thus supported, have no measurable deflection and are, therefore, superior in capacity to resist end shock to those of much greater weight and depth which are self-supporting between bolsters. By this co-operation between side frames and centersills a great reduction in weight per car is accomplished and yet a much stronger body structure results.

The ends of the bodies of these cars are reinforced against the stresses of impact to an extent considered appropriate to the service in which the cars are employed, some of these cars being electrically operated in tunnel service, others in suburban steam and suburban electric service, others in through line steam service at high speeds and in heavy trains. The system of end reinforcement is, of course, carried to the greatest extent in the cars in the latter service where the greatest momentum is to be dealt with in case of accident.

This system of reinforcement of the ends of the car body co-ordinates the body end walls with the members of the high girder side frame and roof in the form of a rectangular tube with ends barred to prevent penetration by an impacting body. This is accomplished in the through line cars by the introduction of two new members:

1. An anti-telescoping tie plate extending across the car from side plate to side plate and lengthwise of the car for about six feet forming a flat ceiling for the lavatory, passageway and saloon and being securely riveted to the plate of the high girder side frame.

2. Special deep piers forming the posts for the door in the end of the car body. These piers are approximately 21 in. deep and as in some classes of accident they may be subjected to tension, the web plates of these piers pass through the upper tie plate and also through to the underframe and are, together with their flanges, securely riveted to each of these members. The corner posts and the adjacent side posts of the car body are also specially designed to withstand the shock of cornering collision.

The car structure thus formed is illustrated in the perspective drawing shown, from examination of which it will be seen that the compression member of the high girder side frame effectively braces this reinforced body end at the roof line.

The extent to which the high girder side frame and body end reinforcement of passenger car bodies will protect the passenger space when in collision or derailment can be somewhat gaged by examination of the damage to steel baggage cars after being involved in accidents of these classes. Baggage cars, because of the typical arrangement of their side doors, windows, etc., have in effect high side frames, with the elements of plate girders, extending from side sills to roof line at the car body ends. The high girder side frame and body end reinforcement of passenger cars, above described, co-ordinates all the strength elements of the car structure even more effectively than does the form of plate girder side walls of the usual baggage car, and in addition the body of the passenger car will be protected to a certain degree by the

wreckage of its vestibule which, when in collision, will be forced back against the reinforced body end. Comparatively little damage results to baggage cars with high side walls when colliding with coaches of the usual low frame construction, thus demonstrating the advantage of the high structure when subjected to end shock.

### Rear Collisions

Considering next the illustrations of typical rear collisions, it is interesting to note that, where cars with steel underframes are involved, the penetration by the locomotive into the rear car seldom exceeds the depth of the vestibule and that the greatest damage occurs where one car overrides another. The pilot of the locomotive usually underruns the rear car until

First Stage of Telescoping of Steel Cars

The body of the chair car has overridden the buffer sill of the coach.

the buffer sills of the car come in contact with the heavy frame of the locomotive, where further progress is arrested and the penetration of the vestibule structure by the locomotive boiler or smoke box ceases.

When one car overrides another the penetration is in some instances complete, the entire length of the invaded car being practically destroyed. Careful analysis of typical photographic records of railway wrecks will lead to the following conclusions:

1. The underframe of the modern steel passenger car is adequate to withstand the shock of the most violent collision.
2. The underframe of the invading car overrides the underframe of the invaded car and wedges its side walls apart, the

point of impact being a foot or more above the floor according to the upward angle assumed by the overriding underframe.

3. The superstructures of steel cars fail to protect the passenger space, when overridden in collision by a car having a steel underframe, because of the relative weakness of the invaded superstructure as compared with the heavy underframe of the invading body.

4. The joints connecting the side walls, hood and roof are subjected to tension because the invading body having penetrated between the side walls, exerts a bursting stress on the invaded structure. The members composing the roof are always light in section and the joints connecting them to the

The essence of this problem is the element of *time*. The structure best adapted to solve the problem must contain members which will act to resist penetration at the vestibule end and interpose a rapidly increasing resistance to the progress of the invading car.

The essential characteristics of a member best suited to accomplish the above ends are: *Flexibility* to avoid shearing; *elasticity* to avoid abrupt stressing; *high ultimate strength* in tension to resist the bursting stress exerted by an invading car.

**Use of Wire Cable Proposed as Remedy**

Manifestly the material best adapted to meet the above requirements is *wire cable*. The manner of introducing the wire cable in a car structure may vary considerably. One form may be described as follows:

A wire cable anchored to the underframe of the car, passing through the vestibule buffer sill, up through the vestibule corner post, across the hood, down the opposite corner post, through the buffer sill to the anchorage point at the underframe.

The loop is thus distended in such a manner that the vestibule end of an invading car will penetrate within the loop. The initial shock of collision will be met as now by the vestibule end posts. When the resistance of these end posts is overcome and as the invading body progresses, the cable loop, together with the members of the invaded vestibule will be

**End View of Coach Shown in Previous Illustration**

The chair car has commenced to exert a bursting stress upon the body of the coach.

side walls equally inadequate to resist the heavy tension stress of collision.

5. The structure of the invading car is subjected to compression, and as the joints connecting its members are better able to resist compression, than the invaded car structure is to resist tension, the invading car body is seldom seriously damaged.

Accurate computation of the force expended in a collision between trains is practically impossible. Two reactions, however, occur in all rear end collisions, which can be used to roughly gage the violence of the shock, namely:

1. Depth of penetration by the invading car, and

2. The distance the standing train is driven ahead by the force of the collision.

These reactions are complements of each other and roughly indicate the energy expended.

With these reactions in mind it seems highly desirable that the invading car be restrained from penetration by some device which will cushion the impact shock and impart motion to the standing train, thus diverting the force from the work of destruction to the work of moving the mass.

It is obvious that in a train collision the points of impact will be more or less damaged. It is impossible to build a car structure that will successfully resist all damage by an overriding car. The problem is to provide means to arrest the progress of an invading car before it penetrates deep into the invaded structure, meantime transmitting the force of the collision to the standing train to set it in motion.

**The Second Stage of Telescoping**

When telescoping has reached this stage the structure can offer but little resistance to further penetration by the invading body.

drawn in and down against the vestibule of the invading body crushing both within the confines of the loop.

The more resistant the structures thus crushed, the greater will be the energy absorbed and the greater will be the pull exerted by the cable, through its anchorage in the underframe, to impart motion to the mass.

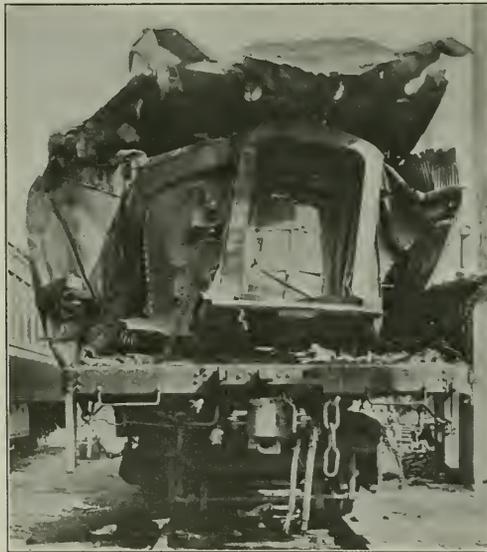

The design further provides for a second group of cables, imbedded in the body corner posts and body end frame, to act as a second line of defence against the invading car. Should the force of the collision be not completely dissipated through the resistance of the vestibule end posts and the cable in the vestibule end, the invading car body will next encounter the

high resistance of the body end wall, and the second group of cables will come into action upon being encountered by the invader. The second group of cables being also anchored to the underframe and distended in loop form will also draw the structure of the invaded car down and in upon the invader and similarly impart motion to the mass. This second group of cables will also act to draw downward and inward the roof and sides of the invader.

The size and number of the cables and the number of groups or lines of defence can be increased until all reasonable doubt of their collective ability to arrest an invading car disappears.

In the absence of the wire cables, a corresponding collision would result in wedging apart the invaded structure with comparatively little dissipation of energy and imparting but little motion to the standing cars, because the energy expended in wedging aside the members of the structure is exerted at almost right angles to the direction of the invading body and consequently, results in but little forward thrust.

The arrangement of the cables is purposely such that it is impossible to bring an abrupt stress on them. They are distended in an approximately rectangular loop by members which, when subjected to collision shock, are bent and distorted by the cable which is of superior strength to any member with which it is associated except only the centersill to which it is anchored. For example the combined tensile strength of the cable loops shown in the illustration is 2,000,-

End View of the Car Shown in the Last Illustration

000 lb., and therefore equivalent to the ultimate strength of centersills having a cross section of approximately 50 sq. in. Consequently when a car body protected by cables is invaded, the vestibule of the invader will be crushed down and the zone of destruction in the invaded car will be limited to the area enclosed by the cable loops engaged.

#### Length of Path of Resistance

Thrust will be imparted to the centersills of the car in which the cables are incorporated, from the moment of impact upon the vestibule end and in a gradually increasing degree until all the cable loops are drawn in and down to a position of rest against the crumpled structure of the invading car.

This prolonged and steep path of resistance is of the utmost importance.

In the illustration the cable loops are shown in combination with a high girder side frame and body end reinforcement as first described. This we consider the strongest form of car body construction in use today. When completely equipped with cable loops, this design provides the following path of resistance to penetration by an invading body:

1. A rigid vestibule end wall having as high initial resistance as practicable.
2. Cable loop, enclosing the vestibule end wall and acting to retain the structural members in the path of the invading

The Final Stage of Telescoping

The complete separation of the side walls of the invaded car indicates the desirability of incorporating strong tension members in the superstructure.

body, upon the failure of the initial resistance of the vestibule end wall.

3. A rigid body end wall including the strong piers at the doorway and the deep body end reinforcing plate, collectively over five times the section of the vestibule end.
4. The second group of cables which will act to prevent disruption of the body end wall structure and any further penetration.

The resistance effected by the cable loops is accumulative and the ultimate resistance will not be reached until the wreckage of both vestibules is compressed in a tangled mass within the confines of the loops engaged. The crumpling of the structural members within the cable loops will act to cushion the shock. The resistance will increase rapidly in a series of steps beginning with the resistance afforded by the rigid vestibule end posts and reaching a peak equal to the accumulated resistance of the four stages in the path of resistance above described. The body end structure being of much greater strength than the vestibule end structure will insure that the vestibule structure must be practically destroyed before the initial resistance of the body end structure is overcome, and the second group of cables called upon to resist further penetration. I believe that only in cases of the utmost violence will the body end of the invaded car be crushed in and the ultimate resistance of the main cables be developed. For example in some of the complete telescoping cases illustrated the initial resistance offered by the vestibule and the body end construction of the invaded car was inadequate to prevent penetration. The secondary resistance offered by the roof structure and the interior fittings was negligible as compared to that which would have been afforded by wire cables of 2,000,000 lb. (1000 tons) capacity which would have checked the invader at or near the point of entrance. It is my opinion, that in cases of extreme violence, and before the vestibule structures have been completely compressed, the

thrust transmitted to the underframe of the invaded car, through the medium of the cables, will be sufficient to impart motion to the standing train and thus dissipate a large portion of the energy of the collision.

We are all familiar with shock absorbers in daily use, such as rubber heels, pneumatic tires, truck springs, buffing devices, draft gear, etc. All these devices introduce a time element, or path of resistance, commencing at the instant of impact and increasing in resistance until the shock is absorbed or the device becomes solid. The introduction of the strong cable loops in the car structure, produces a collision shock absorber which may be compared to a buffing device in which the maximum length of path of resistance, or travel, is only limited to the confines of the loops engaged instead of limited to a few inches travel. Time will not permit of entering into details of the method of incorporating the cable loops in the car structure. It is the intention, however, that all the structural members be retained by the cable loops within the path of the invading body to make resistance to penetration as great as possible.

In the foregoing description of a car adapted to resist the shocks experienced in sidwiping, derailments and collisions

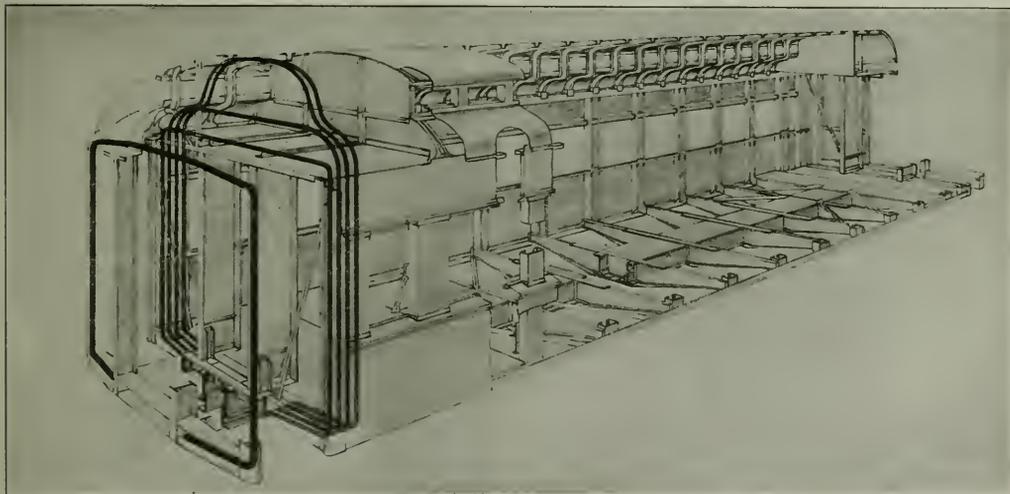

## Senator Cummins Discusses Railroad Conditions

WASHINGTON, D. C.

SOME OF THE REASONS for the proposed Congressional investigation into the operation of the railroads since they were returned to private operation a year ago are set forth in "The Nation's Business" by Senator Albert B. Cummins. Senator Cummins plans to ask the new Congress to authorize this inquiry.

"Present operating expenses are too high," declares Senator Cummins, "and both Congress and the public are interested in knowing the reason. Giving all the weight which can be given to the diminished traffic, it will not account for the negligible net income which the year will show. Neither will it suffice to say that critical comparison of the railway performance for the year just closing, with the railway performance under Federal control, is exceedingly favorable to private management. That comparison, however satisfactory to those who believe in private ownership under public control, does not solve the problem.

"Obviously the conclusion to be deduced is that it is costing

Reinforced Body End with Cable Loops

we have naturally illustrated and described the design of car which we have ourselves evolved while guided by a close study of the collection of photographic records of accidents which we have been accumulating for a number of years. Manifestly the cable system of reinforcement can be incorporated in any adequate design of vestibule end and body end construction. I, however, believe that a car embodying the strong superstructure, with strong vestibule and body end construction as outlined above is particularly well protected against damage in accidents of the derailment and sidwiping class and further that such a car fitted with the limiting loop of wire cables as described will be as safe against invasion by a telescoping body as now seems possible.

THE ATLANTA PASSENGER TRAFFIC CLUB, the activities of which were suspended during Government operation of the railroads, was reorganized at a meeting in the Healy building, Atlanta, on Tuesday evening, March 15, with a membership of 144. Joseph P. Billups, general passenger agent of the Atlanta & West Point, was elected president of the club.

the railroads too much to earn the money which they are earning. This may be due, of course, to mismanagement, or to inefficiency, or it may be due to the excessive cost of material and supplies, or to unreasonable compensation paid to those, from President down, whose labor operates these railroads.

"If the railroads are to survive and render the service which the people of the country must have, the question I have proposed must be answered. It must be answered speedily, wisely and justly. It will be found, I think, that the answer does not lie in the main with additional legislation, but in the prompt and fair administration of existing law. However that may be, the people have a right to know all the facts and make up their own minds after an intelligent consideration of the entire subject. To that end the investigation I have suggested ought to be made, and, so far as I can influence the matter, it will be made."

Senator Cummins points out that "notwithstanding the increase of something like 35 per cent in railroad rates, which became effective about the first of last September, the rail-

roads, as a whole, show a very small net operating income, while many of them have not earned the cost of maintenance and operation.

"There seems to be a widespread misapprehension with regard to the causes for this lamentable result; or, if not misapprehension, at least a failure to understand a situation which threatens the solvency of many of the best railways of the country. I find among those who have given some study to the prevailing conditions radical differences of opinion, both as to the cause and the remedy. This conflict of opinion arises, in my judgment, from a misunderstanding of the facts which have transpired in the last year, and it seems to me that there ought to be an immediate inquiry, attended with the utmost publicity, into the operation and management of the railroads since they were returned to their owners. With this in view, I intend at the opening of the next session of Congress to submit to the Senate a resolution proposing the broadest sort of investigation into the subject. The people want to know just what has happened during the past year; why existing railroad rates have not accomplished the purpose of the act which returned the roads to their owners, and especially why the cost of maintenance and operation has not been reduced.

"It is obvious that rates should not be increased, if for no other reason than that another general advance in rates would probably diminish rather than enlarge the net railway income. There are, therefore, but two ways in which the net income can be advanced:

"First, by an increase in the volume of traffic without a corresponding increase in the cost of maintenance and operation.

"Second, by a reduction in the cost of maintenance and operation.

"In considering the statistics which I am about to present, it must be remembered that they do not embrace and have no reference to expenditures for construction or equipment chargeable to capital account. Under the system of railway reporting required by the Interstate Commerce Commission the net railway operating income of any given railroad is the amount which remains after payment of the cost of maintenance, operation and taxes, with the proper adjustment of equipment and joint facility rents. In other words, it is the amount which the railway company may use for the payment of interest upon its obligations, dividends, upon its capital stock, for adding to its surplus, or investment in any lawful way as capital is invested.

"It is generally believed that during the latter part of the year 1920 the volume of traffic was materially less than for corresponding periods in former years, and, if this be true, it would tend to explain the decrease in net operating income, for the cost of maintenance and operation does not diminish in the exact proportion of a lessening traffic.

"The aggregate net ton-miles carried from March 1, 1920, to December 31, 1920, was 381,482,259,000. For the same period in 1919 the aggregate was 340,425,083,000. The number of passenger-miles during the same time in 1920 was 39,959,099,000, while for 1919 it was 39,528,264,000. Measured by this standard the volume of traffic upon all the railroads of the country was greater in 1920 than in 1919. In round numbers, figures for the entire year 1918 are 360,000,000,000 and for 1917, 350,000,000,000, with passenger-miles for those two years 35,000,000,000 and 34,000,000,000, respectively.

"Toward the latter part of the year and continuing up to this time, there was, and still is, a remarkable decrease in the number of cars of revenue freight loaded. The (ton-mile) reports for January of this year are not compiled, and the reports for February have not been made, but I have advance information upon one point, namely, the number of cars of

revenue freight loaded. The following table discloses that information and the comparison with 1920.

		Cars of Revenue Freight Loaded.	
		1920	1921
January	1	745,446	598,905
January	8	830,673	706,413
January	15	840,524	709,888
January	22	804,866	703,115
January	29	803,332	699,936
February	5	762,680	696,997
February	12	786,633	681,627
February	19	772,102	695,506

"Another indication of a condition which began in November, 1920, and which has progressed steadily up to the present time, is a surplus of freight cars; that is to say, the number of cars for which there is no present use. On December 21, 1920, the number of such cars was 204,608. The number rose during January, 1921, and at the close of that month was 324,186, and the last report, on February 14, 1921, the number was 290,550.

"These statistics very clearly show that while the volume of traffic for the last 10 months of 1920, taken as a whole, was greater than during the same period in 1919, or indeed at any former similar period, yet beginning as early as November and proceeding rapidly to the present moment, there has been a tremendous diminution in traffic. These statistics accord with our observation with respect to the decline in business during the latter part of 1920 and the early part of 1921.

"I direct attention now to the operating revenues and operating expenses from March 1, 1920, to December 31, 1920. The operating revenues of all class roads amounted to \$5,299,654,454. Operating expenses, including taxes and the adjustment of equipment and joint facility rents, amounted to \$5,289,348,937, leaving a net operating income for these 10 months of \$10,305,517, and if we assume that the remaining two months of the year, from March 1, 1920, to March 1, 1921, show no better results, then for the whole period the net operating income will amount to no more than one-fiftieth of 1 per cent of the value of the railroads as estimated by the Interstate Commerce Commission.

"It is interesting and instructive to know that the net operating income for March, 1920, was \$14,320,571. In April there was a net deficit of \$29,604,417, in May of \$13,455,871, in June of \$16,284,900, in July of \$10,427,989 and in August of \$155,227,617. The great deficit of August is probably accounted for by the back compensation ordered paid to the employees by the Railroad Labor Board in July, 1920.

"In September, that being the first month under the increased rates which were established by the Interstate Commerce Commission, there was a net operating income of \$75,310,311, in October a net operating income of \$86,455,487, in November of \$54,343,793, and in December of \$10,225,583. The decreasing net income in November and December seems coincident with the decreasing volume of traffic which began in November and which is still in progress.

"It may be helpful to institute a comparison here and there. For January, 1915, considering only Class I roads, railway operating expenses were \$163,654,452. In December, 1915, these expenses were \$184,510,067; in January, 1916, \$183,702,959, and in December of that year, \$209,615,966; in January, 1917, \$215,496,356, and in December of that year \$251,302,146; in January, 1918, \$271,521,592, and in December of that year \$396,468,865; in January, 1919, \$360,465,815, and in December of that year \$414,615,756.

"The expenses I have just given do not include taxes or the adjustment of equipment and joint facility rents. In March, 1920, these expenses had arisen to \$421,713,184, in July to \$511,773,300, in August to \$678,728,682, and in December, 1920, they had fallen to \$523,206,889."

# Present Wages and Rules Ruining Canadian Railways

## Reflex of "McAdoo Award" and Other Changes in United States Disastrous in Dominion—Chairman of Railway Com- mission Speaks Out Frankly

By J. L. Payne

Former Comptroller of Statistics, Departments of Railways and Cars, Ottawa, Can.

THE PEOPLE OF CANADA are awakening to the importance of the railway issue. After years of indifference on the part of the vast majority, and a settled attitude of hostility to all corporate interests on the part of a small but articulate minority, the truth is being generally accepted that a vital relationship exists between transportation and the life-giving commerce of the country. If the service which the railways are providing is crippled, a steadily swelling number of reading and thinking men are realizing that the whole community must suffer too, and suffer directly and acutely. If the railways should break down there would be universal stagnation. The actual conditions today suggest that as a possibility.

There has never been a time when all the leading newspapers were giving up so much space to carefully digested articles on the railway situation. Heretofore, references to transportation problems were incidental and spasmodic. They were not always based on accurate information. Today such references are frequent, and represent studious attention to fundamental conditions. Slowly, but nevertheless surely, the truth is being accepted that (1) the railways are in very grave trouble, (2) that this trouble has its foundation in the rising ratio of operating cost to gross earnings, (3) that higher operating cost is due in large measure to the scale of pay to railway employees, (4) that that scale is unreasonably high, and (5) that wages might be reduced to the rates paid to other skilled and unskilled workers without injustice to railway men.

Here, for example, is a paragraph from an editorial in the Ottawa Journal, one of the prominent newspapers of the Dominion, of March 17:

"The Chairman of the Railway Commission finds the salient cause of high operating cost to be the present scale and conditions of pay to employees, in which respect he gives direct corroboration to the judgment of the Deputy Minister of Railways. He declares the scale to be unreasonable, and backs up his statement by an array of facts showing that men in the railway service are receiving wages far above those paid to other workers. In support of Mr. Carvell's contention, here are a few specimen payments for a recent month by one of our leading Canadian roads:—Train conductor, \$434.23; locomotive engineer, \$425.33; telegraph operator, \$268.64; station agent and operator, \$254.34; yardman, \$237.84; train dispatcher, \$257; blacksmith, \$227.69; coach painter, \$208.12; machinist, \$220.71. These sums are purely typical of many, and were earned under a scale which Mr. Carvell refers to as 'ingenious.' He said: 'The straight pay looks reasonable and moderate, but the 'conditions' enable an employee to get time and a half while loafing.'"

Among the influences which have contributed to public enlightenment on this important subject have been the recent public addresses of Hon. F. B. Carvell, chairman of the Dominion Board of Railway Commissioners. It is unusual for one occupying such a high position to speak at all in public on matters associated with his judicial functions. All British traditions are more or less against it. That intense conservatism which clings to judges under the British system

has made for reserve. For that very reason, therefore, everybody in Canada understands that only the most extraordinary circumstances, only the utmost gravity of the case, could justify the chairman of a lofty tribunal like the Railway Commission in breaking the traditional bonds which hold him in large degree to silence off the bench.

Hon. Mr. Carvell has not only broken away from the reserve which has characterized him thus far, as well as that of his predecessors, but he has spoken with the utmost frankness on at least two occasions. The first was at Montreal on January 30 last, when he addressed the Canadian Railway Club. In that address, he referred in forceful language to the great part which the railways had played in developing the Dominion, especially the vast prairie provinces of the west. To the agreeable surprise of his audience he stepped aside from the beaten path usually followed on such occasions, when pleasant generalities are uttered rather than anything of real public interest, and "spoke his mind," as men would say. He said:

"During the past two years I have had much reason to change my ideas regarding our railways. Without the railways Canada cannot progress. These railways must go on no matter what happens."

### Commission Chairman Denounces "McAdoo Award"

With that start off the common road of men in places of responsibility, he plunged into the question of rates. In that relation he said:

"Whether a railway is owned by a corporation or by government I consider that it should be granted rates sufficient to allow it, if efficiently and honestly administered, to pay maintenance, interest on investment, and something besides that. Whether it is a government or privately owned road the rates should be sufficient to meet cost of administration and pay interest on investment; and so long as I occupy my present position I shall hold to that idea as my guiding principle in dealing with all questions as to rates.

"Wages is a matter which does not particularly concern the Commission, but when the present rates expire a year and a half hence the public and the employees must realize that an adjustment will be necessary.

"I am not discussing wages but a bigger question, that of the service employees are giving their employers on the railways. It has been stated that the Canadian people are receiving the cheapest railway service in the world, but if we are paying too much for that service there is cause for complaint. I believe that in some classes of railway work we have not been getting the returns we should for the wages paid."

He made an appeal to the employees on government lines to give as efficient and loyal service as, for example, the employees of the Canadian Pacific gave to that road; and in this there was a clear implication of something wrong along that line. Naturally these observations, terse and broad as they were, were given considerable publicity, and Mr. Carvell seems to have thought it necessary to be more specific. Hence, when he spoke to the Rotary Club of Ottawa on March 14 he threw all reserve to the winds. He said:

"Canada cannot continue with the railway situation as it

is. There must be an early conference of representatives of industry, business, the railways, labor and the government to discuss developments and bring about a change. If business keeps dropping off as it has during the past two months, I am afraid that the Canadian Pacific will not be able to pay dividends this year. It would be a calamity if that took place, because the Canadian Pacific has been one of the bulwarks of Canada and has grown to be an institution of the country.

"There is need for a new relation between labor and capital. The thought has been inculcated in the minds of laboring men that they are not to give service for money received. The working man has been advised to give the least that is in him. I do not want to see wages go back to the scale of 1914, but I want a man to give value for pay received. I believe a plan can be worked out to get railways back to normal.

"Railway employees are good citizens, and I consider that they are the aristocrats of the labor world in Canada. They are not crooks and should not be blamed for the cause of present conditions. The McAdoo award is more directly responsible. That award was not based on good judgment, on railway economics, nor on good business principles. It was merely offered and adopted as a vote catcher.

"The McAdoo award is one of the most iniquitous pieces of legislation ever foisted on the United States.

#### High Labor Costs Cause High Rates

"Proof that it was not a proper measure is found in the fact that it was followed by many amendments, adjustments and changes. It affected the Canadian railway situation because the railway employees of Canada threatened a general strike unless they benefited to the same extent as did railway men in the United States. The first McAdoo award meant an increase in wages to the extent of \$8,000,000 for employees of the Canadian National Railways alone, and this was followed by another increase amounting to \$13,000,000. Last July wages to railway employees in Canada were increased about \$50,000,000, the Canadian Pacific being called upon to pay \$21,000,000 more. The fact that the increases were made retroactive to May, 1920, meant a difference of \$20,000,000 in back pay which was not earned.

"That is the reason you are paying higher freight rates."

Hon. Mr. Carvell gave a few instances of high earnings by railway employees. Among them were payments of upwards of \$120 per week to conductors, and one extraordinary instance of a woman station agent who drew down \$202 every two weeks. This arose from a strict legal interpretation of the classification and regulations attaching thereto, under which the woman was paid an enormous allowance for overtime. How she spent the overtime does not appear to have been a factor. She was technically on duty, and, as the post was occupied by a woman, it is obvious that it was of minor importance. Probably her wages exceeded the total receipts of the station.

I had a talk with Mr. Carvell and asked him if he cared to add anything for the *Railway Age* to what he had said either at Montreal or at Ottawa, and his answer was in the negative. His reasons were good. "I have already exposed myself," he said "to criticism for having spoken at all. My motive may be misunderstood by many; but I have been so deeply impressed by the importance of the railway situation as it has developed during recent years, and the apparent apathy of the public, that I took the risk of departing from what might be regarded as a strictly proper attitude on the part of one in my position to sound a note of warning. I have gone as far as I could, and perhaps further than some will be disposed to approve. I regard the railway problem, however, as it exists today as the most serious thing which has happened in the whole history of the Dominion, and I simply could not be silent."

#### Losses of Government Railways

The allusion of Hon. Mr. Carvell to the serious results on the Canadian National system brought about by the McAdoo award is corroborated by an important report just made by Major Graham A. Bell, Deputy Minister of Railways. He deals elaborately with the facts of the case, and most convincingly, too. It is the first report of that nature ever published by the department, and emphasizes the serious view that is taken in official circles of the present scale of wages in its relation to the whole problem of rising operating cost. After announcing a deficit for the year ended December 31, 1919, of upward of \$50,000,000, including a considerable volume of fixed charges, he says:

"The great single factor contributing to the exceptional increase in expenditure during the year, and in fact during the past several years, has been the heavy increase in the wages of railway workers without commensurate increase in the rates or volume of business. These increases for the Canadian National are shown in the following table of wages paid:

1917-18 .....	\$40,606,170
1918-19 .....	57,252,095
1919-20 .....	73,567,036

"Out of every dollar earned in 1917-18, 59 cents were paid in wages. In 1918-19 the proportion was 67 cents, and in 1919-20 it had grown to 76 cents."

In continuing Major Bell points out that during the past year \$16,314,941 was absorbed by wages out of an increase of \$20,220,432 in operating expenses, or 80 per cent. The increases in wages during the past three years was 82.29 per cent of the increase in operating cost and 125 per cent of the increase in operating revenue. Bearing in mind the relationship of wages to this matter, the situation on the government system is further accentuated by the fact that operating expenses increased on the Canadian Northern unit from \$4,662 in 1918-19 per mile of line to \$6,230 in 1919-20. Per train mile for the same road the advance was from \$1.98 in 1917-18 to \$3.36 in 1919-20. Railway operators need not be told of the frightful significance of these figures, and they are due almost wholly to the McAdoo award and the succeeding increases.

D. B. Hanna, president of the Canadian National Railways, puts the case even more directly in a report incorporated with that of the Deputy Minister. He says, in alluding to the Canadian Northern unit:

"The increase of \$15,971,074 in operating expenses is nearly all due to higher wages. The general large increases in rates of pay granted during 1918 under the McAdoo series of advances, which were reflected only in part in the operating expenses for the year ended December 31, 1918, show their full effect in this year's figures, and the total is increased by the effect of additional supplements issued during 1919 by the United States Railroad Administration and which, under arrangement between the Canadian Railway War Board and the Dominion government, have been applied to the wages of railway employees in Canada.

"Under these conditions, and with less than one per cent increase in train service, the net result for the past two years has been to convert net earnings of \$789.08 per mile of line in 1917, and \$343.53 in 1918, to a deficit of \$671.63 per mile for the year ended December 31, 1919."

It is characteristic of President Hanna that he is not overwhelmed by his own picture of disaster, but ends his report with a fine show of optimism. He is sure all these obstacles to satisfactory progress will be removed, that the sun will shine again, and that all will go smoothly toward a day of ultimate triumph. This is somewhat exceptional for a Scotchman; but Mr. Hanna claims to have seen worse days.

What of the people? Upon them falls this heavy burden of deposit; for the Dominion treasury must pay it. It would

be hard to say at this moment what is the state of public feeling. A few warning voices were heard in Parliament and in the press during recent years, but they did not appear to touch the public conscience; and, of course, during the progress of the war everything was pushed aside for the supreme issue. Now, as was said at the outset, there are signs of an aroused interest in the troubles of the railways, and people are commencing definitely to realize that those troubles are also theirs. With over 52 per cent of all railway mileage in the Dominion owned and operated by government, they see, or are commencing to see, that a very large proportion of the railway losses must be paid out of their pockets. This irritating fact has at the same time brought them into contact with the international jurisdiction of the railway brotherhoods, and with the further startling fact that when General Director McAdoo was fastening a ruinous scale of wages on American railways he was automatically fastening that same scale on Canadian roads.

If Hon. Mr. Carvell has in mind a government commission, composed of representatives of the classes he specifies, he may find that the people have lost the robust confidence which they at one time reposed in the dignity and usefulness of such inquisitorial boards. It has almost come to be an axiom in Canada that if you want to smother any matter as to which inquiry has been provoked, all you have to do is to get it referred to a royal commission. There must be in the public archives a fine collection of still-born reports from such august bodies—and excellent reports some of them were. But if the people should become really aroused, that would be an entirely different matter. And that is precisely what is likely to happen. Those who have pushed up railway wages did not have to contend against public opinion, and if public opinion decides that wages are unreasonably high they will come down. That looks like the one thing that would start the railways back to solvency and safety. But it will be a momentous struggle.

# Getting the Maximum Service Out of Old Bridges\*

## Systematic Classification of Structures Insures Accurate Capacity Rating in Shortest Time

By C. F. Loweth

Chief Engineer, Chicago, Milwaukee & St. Paul, Chicago

THE TERM CLASSIFICATION of bridge, is here used to describe the systematic investigation of old bridges with a view of determining the maximum loads which they can safely carry. In order to conduct a systematic investigation of the carrying capacity of bridges, it is necessary to adopt a standard measure. Most any assumed train load might be used for this purpose, but on account of the universal use of Cooper's class E loading, the Chicago, Milwaukee & St. Paul has adopted this loading as the standard unit of comparison.

In order to obtain direct comparison between the structure and the power to be operated, it is, of course, also necessary to obtain the effect of the various locomotives and train loadings in actual use, on the various members and details of each structure in terms of the same standard as that used for rating the bridges.

The present practice on the Chicago, Milwaukee & St. Paul is to make an investigation or "classification" of all bridges subject to loadings much in excess of those for which they were designed. The carrying capacity is determined in terms of the standard series of train loadings. New engine and car loadings that come up for consideration are classified in that same series of standard loadings, and it is then a matter of direct comparison to tell whether or not such proposed loadings can be handled safely over the various bridges.

### Unit Stresses

The classification is based upon maximum unit stresses which are considered proper for the various materials as used in the structures under consideration; these unit stresses are nearer the limit of useful strength of the material than in those used in designs. The maximum unit stresses permissible in old structures cannot be arbitrarily determined for universal application. There is perhaps no greater responsibility placed on a bridge engineer than in determining the safe rating of an old bridge; the work

involves far more than the mere calculation of stresses and the arbitrary assumption of safe unit stresses. In order to decide intelligently upon the limiting unit stresses, the following should be given full and careful consideration:

The design—whether the details are well proportioned and direct in action, the degree of ambiguity or uncertainty as to distribution of stresses and of secondary stresses.

The character of workmanship and material entering into the structure as indicated by the reputation of the shop at which the bridge was built and the thoroughness of the inspection as disclosed by inspection reports of material and shop manufacture.

Deterioration and wear.

Action under load, such as rigidity and freedom from excessive vibration.

The speeds likely to obtain over the structure and confidence as to the observance of such speed restrictions as may be imposed.

The certainty as to the assumed loading being the maximum to which the bridge will be subjected.

Importance of the traffic and the hardship which might result from temporary disablement of the structure.

The reliability of the data upon which the investigation of the structure is based.

In general the exercise of good judgment and experience based upon all of the factors surrounding the bridge, its location, service and condition.

Coming now to unit stresses: Axial stresses in tension per square inch may generally be taken as follows:

	Wrought iron	Steel
In flanges, beams and girders.....	20,000 lb.	24,000 lb.
In truss members.....	18,000 lb.	22,000 lb.

Stresses of other kinds should generally be proportional to these, the same as in the design of new structures.

To the designer of new structures these unit stresses seem large; in the case of old bridges they frequently seem small, especially in the case of the structure subject within regular service to stresses of such intensity and at the same time indicating little or no evidence of distress.

There may be at times conditions which may require, and at the same time justify increasing the limiting axial tension stresses to a maximum of 22,000 lb. for wrought iron and 26,000 for steel. It does not seem wise, however, to permit these higher stresses except in the case of structures which

\*Abstracted from a paper and discussion presented before the Western Society of Engineers at Chicago on March 17.

are to be removed or strengthened at an early date, or where the traffic over them is relatively unimportant. It sometimes happens that a bridge must be kept in service longer than would otherwise be necessary because of pending improvements, such as double tracking, revision of grades or alignment, etc., which delay its replacement. The higher unit stresses may be necessary to meet emergencies of this or other nature.

It is desired to call attention again to the fact that the stresses mentioned are not to be applied indiscriminately. There may be cases where the limiting stresses should be less than those mentioned, and the writer has had cases in his own practice where the stresses have been even higher. It is obvious that the higher the stresses, the more care and discrimination necessary for intelligent and safe application. It must not be overlooked that increasing the loading with consequent increase in unit stresses will materially increase the vibration of the structure and the wear and tear on the details of connections, will lower the margin of safety, will materially shorten the useful life of the structure, and will render it more liable to injury.

There are some details of construction in which it appears that the limiting stresses might safely be increased at a larger ratio over the axial stresses heretofore indicated.

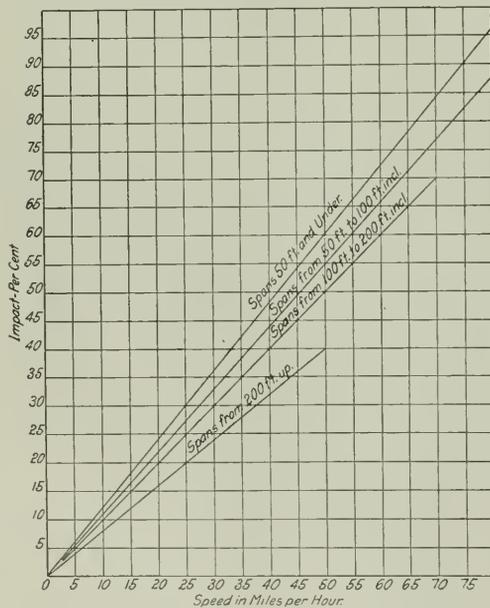

Fig. 1—Percentage of Impact for Various Speeds and Span Lengths

This, for instance, is true of stresses on the flange rivets in plate girders, stringers and floor beams. The failure of a girder in the flange riveting could not take place before ample warning of distress would be evident in the way of loose rivets, in this case the riveting could be strengthened before further failure could occur. It is, however, very seldom that flange rivets show signs of overstress, in fact. I am unable to recall a single instance where our bridge inspectors have reported loose flange rivets. I see no reason, however, for changing the general practice in designing new girders on this account.

## Impact

The impact for designing new bridges is taken as the maximum obtainable at unrestricted and very often at a very high speed, not usually obtained under ordinary conditions. In rating old bridges as to their maximum capacity, the impact allowance should be based on the probable maximum speed obtained. The speed is frequently known, and it can be restricted arbitrarily or it may be restricted due to the conditions surrounding the location of the bridges or the character of the traffic. It is desirable, therefore, for the purpose of rating old bridges, to determine not the impact for maximum speeds, but for such restricted speeds as the

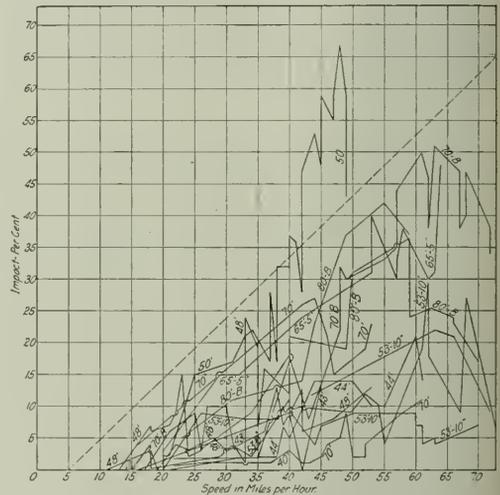

Fig. 2—Composite Chart of the Results of Impact Tests on Deck Plate Girders

structure may be subject to, either by reason of arbitrary ruling or speed limitations brought about by the location of the structure as to proximity of stations, ruling gradients, etc.

The impact per cent for various speeds and for spans of different lengths are shown in Fig. 1. This compact diagram has been evolved from several diagrams upon which have been plotted the results of the impact tests made by the A. R. E. A., classified as to speed of train and length of structures. One of these diagrams, Fig. 2, shows the impact observed for various speeds on deck plate girders from 43 to 80 ft. in length. This diagram includes a total of 14 spans, all of which have open timber floors except three.

These diagrams indicate that for all practical purposes the impact is directly proportional to the speed. The similar diagrams for truss spans show a similar condition, and on the basis of this practical information, the curves in Fig. 1 were drawn to cover the probable maximum impact for various speeds and different span lengths represented by the curves.

## General Methods

In general, the investigation for any part of a bridge would be as follows:

1. The maximum allowable stress is determined which, in the simpler cases, is the cross sectional area of the member times the limiting unit stress allowed.
2. Deduct from this the stress due to "dead load" and

"wind load." The remainder gives the allowable stress for the "live load" effect.

3. Divide this by the stress for unit "live load" (Class E-1), which gives the classification for allowed "live load," if at rest.

4. Divide this classification by the term which takes into account the extra effect of the "live load," due to impact and centrifugal force, the result being the classification of the allowed "live load" at full speed.

As an illustration of this general method, the example of the hip vertical member known as U-L1 of a truss. Assume that this consists of two steel bars, 4 in. wide by 1 in. thick, giving 8 sq. in. of cross section. If we assume that in this case the circumstances warrant the limiting unit stress of 24,000 lb. per sq. in., the total allowed stress is 192,000 lb. Assume that the dead load stress is 17,000 lb. and that the wind load is so small that it may be neglected. The total allowed stress available for live load is then 192,000 lb. - 17,000 lb. = 175,000 lb. The live load stress in the member for Class "E1" loading as determined by the usual methods of computing stresses in bridges, is 1,890 lb. The total allowed live load classification, if at rest, is therefore,  $\frac{175,000}{1,890} = E\ 92.1$ . Impact if taken by the ordinary formula  $\frac{300 + L}{300} = \frac{300}{300 + 50} = 0.865$  of the live load. Considering the bridge on straight track, the centrifugal force stress is zero. Therefore, if LL represents the net live load at full speed  $LL + 0.856 LL = E\ 92.1$

$$LL + 0.856 LL = E\ 92.1$$

$$\frac{LL}{1.865} = E\ 52.2$$

which represents the "Classification" of the member at the assumed unit stress. That is: An engine with wheels spaced as in the Cooper loading having 55,200 lb. on the driving axles and the other axle loads in proportion, will produce the assumed stress of 24,000 lb. per sq. in. if taken in connection with the other forces which are assumed to be acting.

**Classification of Loadings**

It is surprising to observe the extent to which it is generally assumed that the effect of various train loadings on

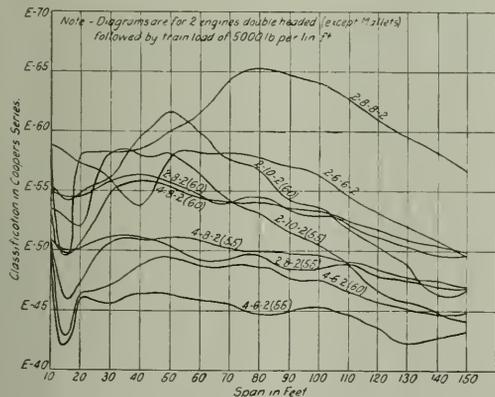

Fig. 3—Diagram Showing the Comparative Bridge Stressing Effect of 10 U. S. R. A. Standard Locomotives on the Basis of Bending Moments

bridges is in direct proportion to the aggregate weight of the locomotives and cars. This, of course, is far from the truth and no approximation by such a method should be used to determine the safety of any bridge.

The Fig. 3 shows the classification of several types of United States Railroad Administration standard locomotives for various span lengths compared with the standard Cooper's Class E loading. The diagram shows for each of the loco-

motives the relation between the effect of the given engines on bridges as compared with the standard Cooper's loadings, which are used as a basis for the classification of bridges. The locomotives classified in Fig. 3 are listed in the following table:

LOADING CHARACTERISTICS OF SOME U. S. R. A. LOCOMOTIVES

Type	Weight		Wheel Base			
	On Axle	Total Engine	Engine and Tender	Driving Engine	Engine	Engine and Tender
Pacific (4-6-2).....	55,000	270,000	414,000	13' 0"	34' 9"	67' 6 1/2"
Pacific.....	60,000	300,000	444,000	14' 0"	36' 2"	70' 8 1/2"
Mountain (4-8-2).....	55,000	320,000	492,000	18' 3"	40' 0"	75' 8 1/2"
Mountain.....	60,000	350,000	522,000	18' 3"	40' 0"	75' 8 1/2"
Mikado (2-8-2).....	55,000	290,000	466,000	16' 9"	36' 1"	71' 5 1/2"
Mikado.....	60,000	325,000	497,000	16' 9"	36' 1"	71' 9 1/2"
Santa Fe (2-10-2).....	55,000	360,000	532,000	21' 0"	40' 4"	76' 0 1/2"
Santa Fe.....	60,000	390,000	596,000	22' 4"	42' 2"	82' 10 1/2"
Mallet (2-6-6-2).....	60,000	440,000	646,000	10' 4"	50' 2"	88' 10"
Mallet (2-8-8-2).....	60,000	540,000	746,000	15' 5"	57' 4"	93' 3"

**Points of Low Classification**

In old structures, it is generally found that the floor systems are comparatively lighter than the girders in plate girder bridges and chord members of truss bridges. The point of low classification in stringer, floor beam and plate girder flanges is generally found at the point of maximum moment, except that where cover plates are used the low classification in the flanges may be found at a point where a cover plate terminates. The flange riveting near the ends of these members very often falls below that required by modern practice. The webs at the point of maximum shear and web splices near the ends of plate girders and the connection of floor beams to the gusset plates, frequently requires strengthening in order to produce a structure of uniform strength.

Members of low classification in truss bridges may be looked for in posts and diagonals near the center. The hip verticals very often are out of proportion to other members of the bridge. The end posts and top chords generally show up poorly on account of eccentricity with respect to pins. If the pins of a truss bridge should be calculated according to the accepted practice for designing truss pins, these pins would, almost without exception, show an extremely low rating.

In addition to the weak points in the design, the top flanges of stringers, deck girders and floor beams very often suffer from corrosion due to brine dripping and in bridges where the ties are supported on shelves, the shelf angles frequently are considerably weakened from corrosion. Overhead bridges are subject to excessive corrosion, due to smoke and gases, and this condition is further aggravated where these structures are covered with a solid floor, which prevents the smoke and gases from escaping, and also prevents the steel from drying out quickly; in cases of scant clearance, metal bridges may show excessive deterioration from the sand-blasting effects of cinders. This is especially the case where overhead bridges are located on an ascending gradient.

**The Economics of Reinforcing**

With the maintenance of old bridges, the question arises whether it is more economical to strengthen the structure than to renew it. This to a great extent depends on whether the old structure can be used to advantage on a branch line or is relegated to the scrap pile. On most large railroads there are branch lines carrying lighter traffic and requiring much lighter locomotives than on main lines; this condition makes it possible to remove bridges too light for main lines and use them on branch lines. Frequently the bridge will be quite suitable for branch line service without strengthening, although it will at times be found desirable to strengthen the bridge before it is re-erected in its new location, when this can be done more economically than while in service. Bridges which are too light for branch line service or which

for other reasons cannot be so disposed of, can frequently be used in highway overhead structures.

As a general proposition, the yearly amount of money that it would be permissible to spend for strengthening would be equal to the interest on the investment in a new bridge less the cost of additional maintenance required by the old bridge on account of the greater attention it receives.

For illustration, consider a few lengths of through spans designed for E-55 loading, replacing similar spans designed in the early nineties, the new steel work being taken at 5 cents per pound erected, falsework at \$10 per lineal foot, removal of the old structure at \$10 per ton, salvage on old span at 2½ cents per pound, additional cost of maintenance of the old span on account of additional inspection, classification and supervision required, \$1 per foot of span per year. The last column of the following table shows the amount which we could afford to spend per year in strengthening old spans rather than to renew them. The costs shown in this table are for illustration only. As they fluctuate from time to time, the resulting economies will vary accordingly.

#### RELATIVE ECONOMY OF REPLACEMENT AND STRENGTHENING

Span	New Steel		Salvage	Net Cost	Interest on Net Cost at 5 per cent	Available for strengthening each year
	Weight Pounds	Cost Erected				
50 ft. ...	60,000	\$4,330	\$1,130	\$3,200	\$160.00	\$110.00
100 ft. ...	218,000	13,390	3,700	9,690	480.00	380.00
200 ft. ...	830,000	46,800	12,500	34,300	1,715.00	1,515.00
300 ft. ...	1,600,000	92,200	25,000	67,200	3,360.00	3,060.00

With old and light bridges a limit is reached beyond which it is not economical to strengthen them, and replacement then becomes necessary. It must be recognized, of course, that a newly designed and heavy structure is preferable to a lighter one. It is possibly true that in case of a train accident on a bridge, a lighter structure might be destroyed while a heavy new structure might withstand the same treatment without being seriously disabled. Such considerations must be taken into account in shaping the general policy of keeping lighter bridges in service. Acknowledgment is made of valuable assistance in the preparation of this paper to H. J. Hansen, office engineer, Chicago, Milwaukee & St. Paul.

#### Discussion

O. E. Selby (C., C. & St. L.) said that the views expressed by Mr. Loweth in his paper indicated that the latter was much nearer in accord with the views of the committee on iron and steel structures of the American Railway Engineering Association than was presumed to be the case from Mr. Loweth's discussion before the A. R. E. A. convention of the committee's rules for the investigation of old bridges. Mr. Selby was particularly impressed by Fig. 2, accompanying Mr. Loweth's paper, which presented impact effects in an entirely different light. The plotting of the results of tests on individual bridges had seemed to indicate that there was a critical speed for each structure for which the impact effect was the greatest, but when all the results are assembled in one chart, as in Fig. 2, a direct relation between speed and impact seems to be brought out. The classification of bridges according to the Cooper-E loading bears directly on the work of the iron and steel structures committee for the coming year, and this will unquestionably be the basis of recommendations made by the committee before the next convention. A number of roads are now following this same system.

G. A. Haggander (C., B. & Q.) stated that his department on the Burlington did not classify the bridges for the Cooper-E loading direct, but by means of a comparison between the effects of the various locomotives on that system it was found possible to use the results of calculations made for the effect of one locomotive when it was necessary to consider other power.

W. S. Lacher (*Railway Age*) raised the question as to the relative amount of time and labor required to investigate a bridge in accordance to the Cooper classification as compared with that required to determine the effect of some individual locomotive direct. It was his opinion, based on conversations with a considerable number of bridge engineers on various railroads that very few of them had carried out the classification according to the Cooper loading in anywhere near as complete a form as that described by Mr. Loweth. Obviously, any ruling by the bridge engineer on the effect of some particular piece of equipment could be made very quickly if all the bridges had been previously classified according to the Cooper loading. The question arises as to when the bridge engineer and his staff would find time to do this in the face of more urgent work. It would seem that the most workable plan would be to carry out the classification of the bridge according to the Cooper loadings each time that a call was made on the bridge engineer concerning some particular structure, and that by keeping up this practice systematically, eventually the record would be complete for all the structures on that particular line.

C. N. Bainbridge (C., M. & St. P.) emphasized the importance of permitting the office man who carries out the classification calculations to inspect the bridge so that he may have a definite knowledge of the condition of those portions of the structure which prove critical under the investigation. In his experience the inspector cannot relay this information to the office man with sufficient accuracy. Based on his experience with the investigation of a large number of old bridges, it was his opinion that much more balanced designs would be obtained if the new bridges were designed for limiting loadings and limiting stresses. With structures designed for prevailing loadings and ordinary unit stresses, the heavier loadings too often result in greatly overloading a few members, which are disproportionately weak under these heavy loadings, as compared with the rest of the structure.

Mr. Bainbridge also called attention to the one important advantage of a uniform system of classifying both bridges and locomotives through the facility this would give for the exchange of information between roads when it became desirable to detour trains or to haul foreign locomotives over the line. There is a prevailing lack of appreciation of the character of information which the bridge engineer must have if he is to pass on the loading effect of a locomotive or some other equipment. The officers of some railroads seem to think that a statement as to the total weight of the engine and maximum axle load is all that is necessary, but this will not suffice.

C. F. W. Felt (A., T. & S. F.) said that the practice of re-erecting old bridges on branch lines of light traffic did not always work out economically, owing to the fact that it was found desirable to use heavier power on these branch lines sooner than had been expected. The presence of these light capacity bridges on the branch lines is often found objectionable in the case of temporary shortages of power, making it desirable to use the heavy locomotives on branch lines temporarily, while changes in traffic routes sometimes result in greatly increasing the train movement over what had been considered a light traffic line.

THE COLORADO SUPREME COURT on March 14, ordered the Denver, Boulder & Western to resume operation. The court decision held that the order of the Colorado Utilities Commission, which led to the scrapping of the equipment of this road, was unwarranted, as the road had performed a necessary service and must resume operation in the interest of public policy. The line extends from Boulder, Colo., to Eldora, and from Sunset, Colo., to Ward; total length operated. 53 miles.

# Railroad Plan Proposed by S. Davies Warfield

## National Railway Service Organization Suggested in Modification of Plans Presented to Congress in 1919

WASHINGTON, D. C.

vice Corporation will serve as the Finance and Administrative Division of the National Railway Service Board.)

**A** PLAN OF RAILROAD ADMINISTRATION described in a statement to the press as one which "will produce far-reaching results, will ensure annual savings of millions of dollars, increase facilities and service, and lower railroad fares and rates," has been filed with Senator A. B. Cummins, chairman of the Senate Committee on Interstate Commerce, by S. Davies Warfield, president of the National Association of Owners of Railroad Securities, accompanied by numerous exhibits, including a bill to carry out the proposed plan. In a separate letter to Senator Cummins, Mr. Warfield says that "unless intensive economical methods in railroad administration are adopted there is no alternative but government operation, followed by government ownership, although the country has given overwhelming evidence of being opposed to it." Representatives of the association will later appear before the Senate committee to formally present the plan in further detail in connection with the proposed investigation into the causes of the unsatisfactory condition of the railroads.

The plan is a modification of that advocated by the association before the committees of Congress in 1919. It provides that the existing machinery of transportation, as far as practicable, shall be co-ordinated through the organization, by act of Congress, of the National Railway Service; as an agency, first, to purchase cars and other equipment to be furnished to the railroads on an economical basis, without profit; and, second, to afford the means for co-ordinating facilities and service.

The plan as briefly summarized in the press statement provides:

(a) The Interstate Commerce Commission to select five from among its members to constitute the Service Division. This division to have supervision and initiatory and regulatory powers to be exercised through the board or staff of the National Railway Service.

(b) A board of 40 members subdivided into two divisions—Finance and Administrative, and Railroad officials, 20 members each. A chairman, four vice-chairmen, treasurer, secretary and other officials. An executive committee of 11 members.

(c) Four group railway boards each organized and selected from and by each group of railroads as now constituted by the commission in each of the four rate territories into which the commission has divided the country. Four boards in all, each to consist of seven members, five selected by the railroads of each group and two from the shippers located in each group territory. (The 20 officials forming these four boards will serve as the Railway Officials Division of the National Railway Service Board.)

(d) Ten committees of five members each to co-operate with each of the four group boards, and selected from the railroads of each group. This means four group railway boards, and 40 committees in all. These committees will cover a large range of investigation and report.

(Included in which are: Normal equipment requirements of each railroad; additional equipment to be leased from the National Railway Service; standardization of equipment; useless expenditures incident to wasteful competition; a study of joint use of terminals, yards and shop facilities; surplus property not required in legitimate transportation—cost of carrying; purchases of fuel and supplies; application of a standard of efficiency in railroad operations; working conditions—wages, etc.)

(e) The National Railway Service Corporation, recently organized by the association of security owners to furnish equipment to the carriers by conditional sale or lease, is superseded by the National Railway Service with extended powers for financing and leasing equipment under plans it is said will save many million dollars in preventing duplication of equipment by the carriers, now necessary when each carrier is required to buy its maximum equipment requirements. (The 20 trustees of the Ser-

### Railroads Already Divided in Groups

It is pointed out that the commission has already divided the country into four territories within which the respective railroads are grouped, and that rates are adjusted to meet the varying conditions of the respective territories. These and other conditions obtaining in each territory and the vast area covered are declared to necessitate the organization of the carriers constituting each group under a Group Railway Board to effectively dispose of matters affecting the roads of each group. These four group railway organizations would be made obligatory by act of Congress, with power to organize committees from each group to bring about the co-ordination and economies in facilities and service now or hereafter considered necessary and essential to the public welfare.

The National Railway Service Corporation (superseded by the National Railway Service), which was organized by the association of security owners under state laws, has sold trust certificates, and with the assistance of loans made to the corporation by the government, is supplying equipment to certain railroads. It is proposed that the excess earnings created under the transportation act shall be used in connection with the sale of trust certificates of the National Railway Service to provide for the purchase of equipment for the railroads. Equipment would be leased by the service to the roads to meet seasonal requirements, and thus be used at different times on different railroads. "The savings in this method of handling equipment would be very great," says the statement, "the rental cost to the railroads would be gradually cut down and railroad rates correspondingly lowered."

Congress is asked to provide that in the event of default by a carrier purchasing equipment, the receiver be required to carry out the contract made by the defaulting carrier and continue payments as a first charge against operations. It is stated that "this will place the equipment obligations of the National Railway Service on an investment basis of pronounced safety and assure the securing of money on especially favorable terms."

### Great Problem of American Transportation

"The great problem of American transportation," the statement continues, "has been to find the means to co-ordinate the natural advantages of individual railroad management and operation without destroying initiative and incentive." Certain consolidations of railroads are necessary, it is stated, but an emergency now exists and the public is entitled to more immediate and substantial benefits than can be derived from the great physical consolidations of railroad properties, by immediate provision for the co-ordination as far as practicable of the facilities and service of the existing railroads and systems.

### Present Methods That Are Available

"Before a decision is reached in respect to the suggestion herein contained," the statement continues, "which means the solution of the greatest remaining transportation problem yet unsolved, it becomes necessary for the Congress to consider the conditions under which the transportation system is now required to function, as a whole—what have been

and are at present the methods employed. Two methods have thus far been available":

(1) The voluntary action of an association composed of railroad executives, each representing distinctly conflicting interests, which has been tried; the results speak for themselves. In the nature of things voluntary action must fail in the effort to deal with the inherent complexity and difficulties of transportation in its national aspect. Prior consideration has been and must necessarily, under voluntary action, continue to be given to the interests of the individual railroads by those who represent them, and individual points of view which are not consistent with the broader interests of the public have always controlled and must continue to control.

(2) The other method is through the enlargement or extension of the regulatory powers of the Interstate Commerce Commission—the government authority—into those of operations, now properly employed as emergency powers. This extension of these powers, made permanent, would mean government operation.

The latter method is declared to be inconsistent with the continuance of initiative and eventually of private operation because it throws upon the commission an already over-taxed regulatory body, the responsibilities of railroad operation; the statement also says that the commission would likely rather not be thus burdened but would prefer that its duties continue to be regulatory and confined to the supervision of the organization or agency suggested.

The first named method is therefore asserted to be the only present means at command to bring about economies by the co-ordination of facilities and service essential in the public interest.

#### Shall Government Regulation Extend to Operation

"The question now to be decided—and its decision is of most vital concern," the statement continues, "is whether the powers necessary to the co-ordination of facilities and service do not extend beyond those of *regulation* and into the field of railroad *operation*; and whether these powers shall be performed by the governmental *regulatory* agency alone, or whether Congress shall enable and *compel* the railroads themselves to bring about such co-ordination of facilities and service, under the *supervision* of the commission. This is essential if incentive and initiative are to be preserved and private ownership survive."

"We have always favored extended regulatory powers being given the commission," says Mr. Warfield, "but should government regulation be extended to the point of operation with the tremendous indebtedness of approximately \$1,300,000,000 of the carriers to the government with their great financial necessities, the distance from private to government ownership of the railroads is indeed narrow.

#### Railroad Men and Public Service

"The suggestions herein are based on the belief that only under private operation fully regulated by the commission can transportation facilities and service be supplied adequate to the full development of agricultural and business pursuits, and that the railroads have among them able and competent men of large experience who should be subject to call to perform service of public concern in addition to their duties on the particular railroads by which they are employed. This would give a staff, free from political influences, to aid and co-operate with the commission in carrying out such instructions as Congress, by act, may deem necessary.

#### Inherent Weakness of Present System

"These statements of fact are not in criticism, but disclose a weakness inherent in the prevailing voluntary system which Congress must consider in deciding the necessity for the establishment of a comprehensive means to ensure economy in railroad operation which the public asks and later will demand. The employees are concerned, for

economical methods of railroad operation are essential to steady employment at fair wages."

Insurmountable difficulties are said to prevent the bringing about of the readjustment, which is now indispensable, by the voluntary action of an association of executives of railroads, which "necessarily represents the views of a small controlling group. Continued evidence is given of these difficulties," the statement says, "in the hasty and ill-considered action as expressed in the recent application before the Railroad Labor Board at Chicago to annul the so-called national agreements with employees during federal control, which left no alternative to the board, but to dismiss the demands as presented.

"The methods adopted have unnecessarily arrayed the employees against the railroads, and deferred the rehabilitation of the properties which depend upon the re-establishment of their credit and the good will of the men identified with them. That adjustments are essential in respect to working conditions and amounts paid many of the employees of railroads is generally recognized, but it should be made plain that these adjustments are a part of a general system of economies which must be instituted if adequate transportation is to be supplied at reasonable rates. The transportation act is definite in requiring orderly procedure for the adjustment of wages, which was not followed.

#### An Underlying Difficulty

"There are two distinct departments in the conduct of the affairs of a railroad, each requiring talents widely differing; one, administration, the other, operation. Questions of business and public policy have often been decided by those whose training has not been along those lines. This has been the underlying difficulty and has led to the positions taken by some of the controlling factors in the railroad world which have caused unfortunate results.

"The prohibitive features of the Clayton act now in effect make this situation more acute. The act requires that officials of financial and other institutions shall resign as directors of railroads with which their institution may have relations. This deprives the roads of the advice and service only obtainable from men of broad and varied experience acquired from the environment that now disqualifies them. Railroad directorates will be composed largely of men with little or no business experience or financial interest in the properties they manage, or of what are known as 'dummy directors' or of both. The proposed bill provides safeguards in respect to railroad directorates to protect the public and the roads, while providing a broad and effective management.

#### A Crisis Exists

"A crisis exists, culminating from a combination of conditions. The railroads were not returned to their owners in the condition required by Congress under the federal control act. The act called for the return of each railroad '*in substantially as good repair and in substantially as complete equipment as it was in at the beginning of federal control.*' The service of the carriers had become demoralized and their business and organizations disrupted. No cash was turned back upon their return.

"An increase in rates of 25 per cent only was made during federal control by the director general of railroads. This it has been estimated yielded approximately \$1,113,000,000 to pay \$2,750,000,000 (estimated) increase in operations. Had rates been advanced proportionately as expenses were increased, they would have been absorbed in general business activities and profits of the war period and not appreciably felt. This was not done, and the commission was faced with the necessity of meeting these extraordinary and unprecedented conditions.

"The commission, basing its calculations on a normal

increase in the gross revenues of the railroads, adjusted rates to yield the return called for by the transportation act. Then rapidly came violent after-war readjustment. The gross revenues of the railroads, instead of increasing, declined 21 per cent from the average of the period, March 1 to September 1, 1920, and a falling off of 31 per cent from what had reasonably been expected. The selling prices of commodities—such as cotton, grain, lumber, general merchandise, perishable fruits, vegetables, etc.—have fallen with such unprecedented rapidity that freight rates necessarily show a disproportionate ratio to the selling price of the products transported. Low prices for commodities have slowed down shipments, causing the equally unprecedented drop in railroad revenue, and the expected return has not materialized, which would have resulted under normal conditions.

**Conclusion**

“The questions involved require prompt decision. The railroads must recognize that only drastic measures on their part will save them from being swallowed up in the demoralization that government operation and after-war readjustment has brought upon them. It may be that a different result could not be expected. There is a point beyond which

rates and fares cannot be advanced because of the conditions the war has forced upon the country, although more revenue is necessary because of the conditions government operation has forced upon the railroads.

“This situation may well be seriously considered by the executives of the railroads. The questions now at issue are not how much authority can continue to be exercised by a railroad executive; not how far a railroad can hold on to the single use of a terminal or other facility that by joint use would institute a saving and fix a policy to save all, but whether the railroads will recognize that the crisis has been reached which will decide the fate of private ownership and operation and that all must submit to a readjustment of methods which perhaps few would desire could it be avoided. This is the situation we face, it cannot be ignored. The employees should bear their part in meeting the present emergency, the railroads should bear theirs through advanced methods of economy.

“Whatever is stated seemingly of criticism is not so intended; it is a system that is under discussion. American transportation has outgrown it; facts are necessary, the Congress cannot be expected to deal with the serious problems it is now called upon to solve unless in possession of every phase of transportation having a bearing thereon.”

# Railway Employees and Their Compensation

## Interstate Commerce Commission Issues Report Showing Payroll and Average Earnings Under Wage Award Now in Effect

WASHINGTON, D. C.

**A**S BRIEFLY REPORTED in last week's issue, the Interstate Commerce Commission has issued its quarterly statistical report on employees, their compensation and service for the third quarter of 1920, giving the first official statistics showing the effect of the wage award of the Railroad Labor Board of July 20, 1920.

In this and the reports for the first and second quarters of the year the number of employees of Class I roads by months is shown as follows:

January .....	2,000,105	June .....	2,056,381
February .....	1,970,525	July .....	2,111,286
March .....	2,609,948	August .....	2,197,824
April .....	1,932,446	September .....	2,164,889
May .....	2,005,483		

The average number of employees for each quarter and the total payroll as shown in the reports, with the average compensation per employee per month deductible therefrom, are as follows:

	Number employees	Total compensation	Average per month
First quarter.....	1,993,525	\$795,616,330	\$133
Second quarter.....	2,004,760	801,063,938	133
Third quarter.....	2,157,989	1,052,109,451	162

The commission has also issued another report compiled by its Bureau of Statistics on the increase in compensation resulting from the wage board award. The compilation relates to the single month of July, 1920, and as switching and terminal companies are not included, the number of employees reported as in the service at the middle of the month, 2,080,687, is somewhat below the corresponding figure shown in the quarterly report. The number reported as receiving additional pay from the wage decision is 1,987,658. The payroll basis immediately prior to the wage decision is given as \$285,778,515, and the increase resulting from the award as \$59,946,608 for the month, but because employees whose names appeared in the payroll had not all remained in the service, the amount of the increase

reported as payable is given as \$58,855,968. The report includes a table giving the total increase in compensation for each class of employees and the percentage of increase. This table has been combined herewith with some of the tables of the quarterly report referred to, but the percentages of increase are based on the total compensation for the employees of the class and not upon the average compensation per day or hour, which is given in another column.

It will be noted that the increases in compensation are those resulting from Decision No. 2, regardless of whether or not they were specifically covered thereby. Some persons, for example, classed as general officers or their assistants, received advances in salary to maintain a relation between their salaries and those of other employees.

The average number of employees and their total and average compensation and average hours or days per month during the quarter are shown in the table on the following page, with comparisons with the average compensation during the preceding quarter before the wage advance.

The average monthly compensation paid during the quarter, as computed from the above table, for some of the principal classes of employees was as follows:

Section foremen .....	\$169.10
Section men .....	112.52
Other unskilled laborers .....	118.14
Clerks below \$900 per annum, averaging 2,703 persons per month.....	68.73
Clerks \$900 per. and upwards averaging 244,854 persons per month .....	146.37
Messengers and attendants .....	90.96
Nachinists .....	195.11
Boiler makers .....	202.02
Blacksmiths .....	186.10
Masons and bricklayers .....	161.70
Structural iron workers .....	174.78
Carpenters .....	168.95
Electricians .....	184.44
Car inspectors .....	233.25
Car repairers .....	183.74
Other skilled laborers .....	185.20
Mechanics' helpers and apprentices .....	139.06
Train dispatchers and directors .....	266.10
Telegraph and telephoners and block men .....	153.46
Levermen (non telegraphers) .....	152.79
Yard engineers and motormen .....	237.56
Yard firemen and helpers .....	181.30

Yard conductors (or foremen) .....	228.85	Road pass. eng. and motormen .....	238.61
Yard switchtenders .....	157.37	Road pass. firemen and helpers .....	218.59
Hostlers .....	182.02	Road pass. conductors .....	261.42
Road freight firemen and helpers .....	219.27	Road pass. brakemen and flagmen .....	186.52
Road freight engineers and motormen .....	303.80	Crossing flagmen and gatemen .....	97.05
Road freight conductors .....	266.20	Drawbridge operators .....	122.19
Road freight brakemen and flagmen .....	209.82	Policemen and watchmen .....	154.13

SUMMARY OF EMPLOYEES, SERVICE AND COMPENSATION: CLASS I ROADS (INCLUDING SWITCHING AND TERMINAL COMPANIES), QUARTER ENDED SEPTEMBER 30, 1920

(CLASS I ROADS ARE THOSE HAVING ANNUAL OPERATING REVENUES ABOVE \$1,000,000)

Class of employees	Average number of employees in service	Total compensation	Average compensation per day or hour	Average number of hours or days per month per employee	Average compensation per day or hour in previous quarter	Increase in compensation resulting from wage award	Per cent of increase
General officers, \$3,000 p. a. and upwards.....	7,237	\$11,614,393	\$19.113	*26.0	*\$18.987	\$11,733	3.41
General officers, below \$3,000 per annum.....	1,809	1,033,369	7.088	*7.4	6.734	40,703	17.9
Division officers, \$3,000 p. a. and upwards.....	1,935	7,986,870	*11.502	*29.2	*10.771	232,842	11.51
Division officers, below \$3,000 per annum.....	5,892	3,970,850	*7.683	*29.2	*7.005	191,843	13.85
Clerks, \$900 p. a. and upwards.....	244,854	107,749,643	697	210.	573	6,515,205	22.25
Clerks, below \$900 per annum.....	2,703	1,557,647	353	192.	325	31,782	23.86
Messengers and attendants.....	11,735	3,206,341	*3.332	*27.3	*2.750	190,209	21.73
Assistant engineers and draftsmen.....	11,000	6,105,510	*6.958	*26.6	*5.980	283,985	16.94
M. W. and S. foremen.....	8,784	5,419,246	*7.385	*27.8	*6.130	304,937	19.89
Section foremen.....	43,776	2,586,777	*5.837	*25.8	*4.537	1,632,873	33.33
General foremen—M. E. department.....	1,930	1,674,099	*9.941	*29.1	*8.556	73,109	14.47
General foremen—M. E. department.....	25,909	18,765,269	*8.249	*28.6	*7.167	889,165	16.86
Machinists.....	65,364	38,290,703	895	212.	764	1,968,495	18.13
Boiler makers.....	20,888	12,657,241	910	212.	776	644,549	17.92
Blacksmiths.....	11,241	6,283,327	808	211.	682	347,759	20.31
Masons and bricklayers.....	1,253	608,391	736	214.	627	37,710	22.67
Structural ironworkers.....	791	415,364	861	203.	711	17,235	18.38
Carpenters.....	55,727	28,255,362	775	218.	643	1,671,717	21.61
Painters and upholsterers.....	15,572	8,458,629	808	219.	704	276,849	19.79
Air-brake men.....	15,469	8,865,241	*7.094	*26.09	*6.068	449,749	18.51
Car inspectors.....	8,160	4,668,978	852	224.	724	250,756	19.13
Car repairers.....	27,041	16,510,906	858	238.	722	892,618	19.23
Other skilled laborers.....	93,478	51,457,672	839	219.	719	3,648,759	21.70
Mechanics' helpers and apprentices.....	61,850	34,314,995	834	211.	712	1,827,085	19.10
Section men.....	138,153	57,589,979	635	219.	511	3,924,457	25.97
Other unskilled laborers.....	341,560	115,548,100	425	232.	360	6,723,809	21.66
Foremen of const. gangs and work trains.....	129,093	45,720,991	537	230.	450	2,563,835	20.63
Other men in const. gangs and work trains.....	1,934	1,132,459	770	255.	622	54,390	24.39
Traveling agents and solicitors.....	32,184	11,976,037	518	239.	430	625,704	20.31
Employees in outside agencies.....	3,865	2,557,651	*8.096	*27.2	*7.224	86,174	11.83
Other traffic employees.....	1,272	700,331	*7.193	*25.5	*6.047	30,273	16.09
Train dispatchers and directors.....	2,483	27,383	*11.811	*26.8	*7.235	11,901	13.91
Telegraphers, telephoners and block operators.....	6,256	4,988,827	1,162	229.	1,031	192,503	13.16
Telegraphers and telephoners operating interlockers.....	22,380	10,447,267	673	231.	579	531,687	17.84
Levermen (non-telegraphers).....	8,264	4,019,119	683	237.	585	200,797	17.63

SCHEDULE B—SERVICE AND COMPENSATION OF ENGINEMEN AND TRAINMEN\*

Class of employees	Number of hours en duty	Number of miles actually run	Total compensation	Average compensation per mile run
Road freight engineers and motormen.....	26,313,914	212,933,767	\$30,736,013	\$0.144
Road freight firemen and helpers.....	26,528,212	214,653,823	23,658,391	.110
Road freight conductors.....	22,907,734	188,495,553	21,989,968	.117
Road freight brakemen and flagmen.....	55,130,489	466,665,413	42,962,283	.097
Road passenger engineers and motormen.....	8,648,485	150,880,441	11,580,815	.076
Road passenger firemen and helpers.....	8,179,682	146,542,177	8,466,498	.058
Road passenger conductors.....	7,729,039	148,212,464	8,668,356	.058
Road passenger baggage-men.....	4,820,963	80,648,541	3,420,963	.043
Road passenger brakemen and flagmen.....	11,031,110	212,226,148	11,343,345	.043
Other road train employees.....	2,398,885	44,079,580	1,578,159	.036

\*Represents average computed on a daily basis.

†The number of hours and compensation shown in Schedule B do not agree with the corresponding items in Schedule A for the reason that carriers were instructed to omit from Schedule B the time and compensation against which no mileage was recorded.

Note—This statement is on the new basis of wages resulting from Decision No. 2 of U. S. Railroad Labor Board, and does not include any back pay retroactively attributable to the months of May and June.

Dictating Machines in Use in the Office of the Auditor of Revenue

# Securing Increased Efficiency in Railway Offices

New York Central Adopts Investigating Committee Plan—  
Findings in Case of Dictating Machines

AS THE FIRST STEP in its program of increasing efficiency in its offices the management of the New York Central realized that a thorough investigation of the methods and appliances in use in the office in question was the first essential. This matter involved seeking out wastes of time, effort and space. The next step to be taken was the adoption of a means of conducting this investigation,

the company's accounting departments and reporting in full on its findings.

The managers of each such department have been acquainted with the company's policy in this matter and have been requested that, should their department be selected for investigation, they permit perfect freedom to the committee in its work and co-operate fully with it. In other words, the

which would, in the first place, secure accurate information concerning actual conditions in the office and, in the second place, interfere as little as possible with the detail work going on in the office.

To secure a report on the performance of an office which would be known to be accurate and inclusive of all details, it was decided that the investigation should be conducted not by one man but by a committee of two or three officers who by their long experience in railroad office work were eminently qualified to undertake the task at hand. Such a committee was accordingly appointed some months ago and charged with the duty of making investigations in any of

committee has been given a free hand in its work and has the right to examine the employees in their work, to ask any questions deemed necessary, to study all the office records and, in short, to do everything necessary in order to secure accurate information concerning the functioning of the office from a standpoint of economy and efficiency.

Already this committee, working with the department managers, has rendered valuable service, particularly in solving problems in connection with the employment of office appliances which save time and money in certain departments, the work of which is adaptable to the use of these appliances. Under the present plan the company, before

making any changes in methods, systems or appliances, conduct an investigation which will give authoritative information concerning the probable savings to be effected by such changes. The element of chance ordinarily involved in such changes, due either to indifference or the lack of exact knowledge, is thus entirely eliminated.

The committee has recently conducted an investigation

performance report on a form shown herewith in chart No. 1. These reports were summarized for the month on chart No. 2. A similar report was compiled in offices already equipped with dictating machines, and the two were summarized side by side on a study form, as shown in chart No. 3. The hours were reduced to clerks where necessary by dividing the total hours worked by the number of hours assigned to an average employee. The other calculations shown in the chart are self-explanatory.

The lowest stenographic production in any office was 56 lines per hour and the highest was 83 lines per hour. The performance of the dictating machines on the New York Central was compared with similar records of certain other companies and the figure of 137 lines per hour was decided upon as being a reasonable production per operator when these machines were used. This estimated production was used in determining the force of operators required to care for the correspondence of the offices to be equipped.

It was found that the best results were obtained by equipping each office with the number of machines required to care for the entire correspondence of the office. All the stenographers were temporarily retained and each supplied with a machine. In this manner all the stenographers were given instruction concerning the operation of the machines at the same time, and no correspondence was delayed. At the end of about thirty days the employees who showed the greatest proficiency in their work were retained and the

relative to the use of dictating machines in the accounting department offices at Grand Central Terminal which has resulted in demonstrating that an investment of \$5,400 in these machines would save approximately \$20,000 per annum in the payroll in addition to a saving of 560 sq. ft. of office

space, 14 desks, 14 chairs and 14 typewriters, all of which were thus made available for productive use elsewhere. It was learned that 17 girls could perform the services which before the introduction of these machines required 31 stenographers. With proper usage the life of the machines is at least seven years, and during this period the company

remainder were either dismissed or assigned to other duties where vacancies permitted.

Experience in installing these machines leads to certain conclusions concerning them. In the first place, it is well to bear in mind that the value of the dictator's time ranges from two cents to ten cents a minute, while a dictating

	Hours	Number	No. Oper-ators	Amount	Type-writers	Desks	Chairs		

Chart 3.—Right Hand Half

estimates its savings at \$134,600 (the annual saving for seven years, less the cost of the machines).

In arriving at this conclusion the committee first caused a record of stenographic performances to be kept in each of the offices of the accounting department during the entire month of November, 1920. Each stenographer made a daily

machine will cost about ten cents a day, including interest and depreciation. The number of machines required is determined with regard to the organization and methods of conducting correspondence, which differ in the various offices. In some offices the practice is to have all correspondence handled by correspondence clerks. In other cases, each clerk

dictates his own correspondence. In the case of the former, it is advisable to assign a sufficient number of machines to the correspondence clerks so that dictating machines are always available and thereby cause no delay in handling correspondence. In the latter case, where clerks have only a comparatively small amount of dictating to do, one machine might take care of the correspondence of several, but this must be determined by careful study of the actual requirements. An important factor in efficient management is to have

The Transcribing Department in the Office of the Auditor of Freight Accounts

machines available always for the convenience of those who used them and at the required time, so that matters in hand can be disposed of without delay. Perhaps the greatest advantage of complete equipment is that it enables the dictator to attend to his correspondence at first reading instead of the usual procedure of reading his papers, piling them on his desk, and then rereading them when the machine is available.

The saving in the dictator's time, while important, is not

Dictating Machines at Work in the Office of the Auditor of Passenger Accounts

so easily measured as the pay roll saving effected by reducing by a half the time required for transcribing. The machine operators are segregated from the clerical force and placed together, where freedom from interruption and the force of example make for the highest production.

It is best to locate the machine for shaving the records in a well-lighted place, so that the boy in charge of the work may see that each record gets a perfect surface. The same boy, or boys, also acts as a messenger, making regular trips throughout the office to deliver clean records to the dictator.

taking the dictated records to the transcribing bureau and returning the finished letters to the dictators. The transcribing bureau should be on the same floor as the dictators where this is possible.

From the experience of the New York Central, it would appear that the installation of these machines has effected real economies. The committee will continue its work in investigating other time-saving appliances which it is proposed to install, and in a similar manner some authoritative information upon the saving to be effected can be secured before money is expended for new devices.

## Freight Car Loading

**F**REIGHT CAR LOADING during the week ended March 12 failed to maintain the gain shown during the preceding week and fell again to 702,068 cars, as compared with 712,822 during the preceding week. This, however, represented a gain over any week of this year since January 22 and for the last two weeks the loading has been in excess of that for the corresponding weeks during the business depression in the early part of 1919, following the armistice. The loading, however, has been very much below that for the corresponding weeks of last year, or 1918. For 1920 it was 819,329 cars, for 1919 it was 701,266 cars, and for 1918, 850,701 cars, for the weeks corresponding with that of March 12 this year.

The loading of grain and grain products was 4,000 cars less than for the week before and the coal loading was not only 7,000 cars less but was less than for any week this year, but the combined merchandise and miscellaneous loading was slightly greater than for the preceding week.

The volume of freight traffic during February, 1921, as measured by the cars loaded with revenue freight, was at a lower ebb than for any month since the combined car loading figures for all the railroads have been recorded, that is, since January, 1918, according to a compilation of the car loading by months made by the Car Service Division of the American Railway Association. In February only 2,732,352 cars were loaded, as compared with 3,108,680 in February, 1920, 2,747,363 in 1919 and 3,012,286 in 1918. Of course, February is a short month and includes a holiday on Washington's birthday but the lowest previous month was February, 1919. The highest total car loading for a month as shown by the report was October, 1920, when 4,975,477 cars were loaded, as compared with 4,824,375 in 1919 and 4,671,254 in 1918. In January, 1921, the loading was 3,418,257.

The freight car surplus continues to increase. For the week ending March 15 it was 424,409, as compared with 422,207 the week before. Of the total 158,110 were box cars and 202,267 were coal cars. The increase in the surplus is entirely due to the reduction in coal loading.

The number of bad order cars has increased rapidly during the winter. On March 1, 67 per cent of the freight cars were on home roads, as compared with 21.9 per cent a year before, but 10.7 per cent, or 243,586 were in bad order. Of these 167,909 were awaiting heavy repairs.

**ECONOMY OF FUEL OIL** is the subject of an efficiency campaign on the Southern Pacific, began on March 16. Employees have been notified that prizes will be awarded for the best efforts. The engineman and fireman on each division who operate their locomotive with the least consumption of fuel oil will be rewarded with a trip to Chicago as the company's representatives at the annual convention of the International Railway Fuel Association, with all expenses paid, including pay for working time lost. The division making the best showing in fuel economy will receive a banner.

## Wible L. Mapother

**W**IBLE L. MAPOTHER, first vice-president of the Louisville & Nashville since 1905, was elected president of the road at a meeting of the directors in New York on March 17, succeeding the late Milton H. Smith. For some time Mr. Mapother, as chief executive officer, had been relieving Mr. Smith of most of his duties, and in consequence his election as president was expected. Although he is well known among railroad executives, he has always avoided publicity, and his desire to escape it was illustrated by his recent wish that an editorial recently prepared for a Louisville newspaper, and paying him tribute, should not be published.

As president of the Louisville & Nashville, Mr. Mapother becomes notable at once as a veteran in point of years of service on his own railroad, and as one of the younger generation of presidents of great transportation systems. He has been in the service of the Louisville & Nashville continuously for 33 years, his entire railroad career having been with that company. His story is that of success achieved through ability and indefatigable industry and application. His loyalty to the Louisville & Nashville and to Mr. Smith, his former chief, is well known. A year ago, in fact, Mr. Smith wished to resign so as to permit Mr. Mapother to succeed him as president in name, as well as in fact. Mr. Mapother, however, used his influence to prevent this step, and stated at the time that he intended to do all in his power to induce Mr. Smith to remain as president as long as he lived, although the latter's resignation would have meant his own immediate advancement. Such traits of character have won for him the confidence of the owners of the property and the unswerving loyalty of his organization.

It is interesting to note that not only has Mr. Mapother been in the employ of the Louisville & Nashville Railroad throughout his business career, but he is a native son of Louisville. He was born in that city on September 28, 1872. At the age of 16, after a grade school education, he entered the service of the company which he now heads as an errand boy and file clerk in the office of the secretary. He early exhibited keen interest in his work and from the start set out to fill his mind with facts and figures pertaining to the Louisville & Nashville system.

In August, 1889, less than a year after he had started to work, his unusual talents attracted the attention of Mr. Smith, who was then vice-president, and who at once transferred him to the clerical force in the executive department. This step marked the beginning of a long and intimate association which ended only with Mr. Smith's death. The closeness of their friendship is well illustrated by the fact that Mr. Smith, in one of his last requests, asked that Mr. Mapother direct the continuance of service on all Louisville & Nashville lines and in all departmental offices of

the road without a moment's interruption in any detail.

In November, 1891, he was advanced to assistant clerk, and in May, 1902, he was made chief clerk in the executive offices. His next promotion, on July 16, 1904, made him assistant to the president. In this capacity his thorough knowledge of the affairs of the road, and his ability to lift burdens of administration from the shoulders of the president were so outstanding that on February 16, 1905, he was elected first vice-president. He was elected a director of the Louisville & Nashville on October 7, 1914. In November, 1915, he also became vice-president of the Lexington & Eastern, a road which had been acquired by the Louisville & Nashville in 1912.

These positions he was holding when federal control was adopted and, in June, 1918, he was appointed federal manager of the Louisville & Nashville and the Louisville, Henderson & St. Louis. A week later his jurisdiction was extended over the Nashville, Chattanooga & St. Louis, and the Tennessee Central, and in August of the same year he was appointed federal manager of a fifth subsidiary, the Birmingham & Northwestern. In this work Mr. Mapother made a fine record, becoming more widely known than formerly, and doing his full share not only toward conserving the property for the time when it would be returned to the owners, but in giving his first attention to the war needs of the government.

On February 28, 1920, when the Louisville & Nashville system was turned back to private control, Mr. Mapother resumed his position as first vice-president. As chief executive officer, he relieved Mr. Smith of many of his duties.

As aid to Mr. Smith, who has been ranked as among the greatest railroad builders and managers of his time, Mr. Mapother has witnessed and played an important part in the development of the Louisville & Nashville from a small, poorly equipped

property, to a great railway system. That his efforts toward building up the railroad are appreciated by the public it serves is evidenced by the editorial comment called forth by his election as president.

"It is especially gratifying to Louisville," says one newspaper published in that city, "to know that this great railroad property, upon whose proper management the prosperity of our city and state so largely depends, will be managed in the future by a man who has grown up in Louisville, who knows the interests of this state and who may be relied upon to advance the interest of this railroad property by helping to build up the state and section it serves."

THE CHAMBER OF COMMERCE of the United States has established a Department of Transportation and Communication the manager of which will be J. R. Bibbins, late with the Arnold Company, Chicago. Mr. Bibbins is a man of long experience. He has studied terminal problems in New York, Chicago, Baltimore, New Orleans and other cities.

W. L. Mapother

# Hearings by New England Governors' Committee

Shippers' Interests Desire to Appeal to Congress—Comprehensive

Review by President J. H. Hustis

THE COMMITTEE of thirty representative citizens, appointed by the governors of the six New England states to inquire into the railroad situation and to consider the request of the railroads for approval of their proposed general increase in rates, held hearings in Boston on Tuesday and Wednesday of last week; and the committee members of the different states are holding hearings in various cities this week.

Mercantile interests appear to have quite generally come to appreciate the importance of the question of employees' wages and it was proposed to the committee that if the United States Railroad Labor Board should not settle this matter very soon, it should be laid before Congress at Washington. William F. Garcelon, representing the textile interests, presented a statement at the first hearing. He said that the textile interests had in the past consented to freight rate increases, but that the limit had been reached. The textile interests would consent to a temporary increase if there could be adequate assurance that when the emergency was passed the rates would come down to earth again. One danger in advancing freight rates is that it would encourage the Labor Board to defer action concerning wages.

A. H. Ferguson, representing the New England Traffic League, presented a statement accusing the New England railroads of inefficient management. They have been too slow in readjusting wages. An increase in freight or passenger rates would not yield additional revenue.

William H. Chandler, speaking for the Boston Chamber of Commerce, declared that the railroads are not efficiently managed and that the whole case should go before the Interstate Commerce Commission. The Commission has in past years investigated the financial condition of the roads, but not until 1920 did it have authority to investigate operation. An advance in rates is a serious matter and should be made with extreme care. If the railroads have one foot in the grave and the other on the banana peel, it would be better to let them slip into the grave and start over again. The Boston & Albany is operated efficiently and there is no kicking about the service on that road, but on the New Haven road it is different; there is no co-operation among the officers. Criticisms of the Boston & Maine are comparatively mild. It is doubtful whether, with present wages, present prices of coal and present freight rates the roads can continue to operate, even with good management.

Several speakers emphasized the point that to increase rates would drive freight to motor trucks, which would, of course, further injure the railroads; but many merchants and manufacturers who are using motor trucks would gladly go back to the railroads if they could have efficient service. On Wednesday forenoon the committee listened to one spokesman for railroad labor, who declared that a reduction in wages could not be accepted; and to arguments for and against forcing the New York, New Haven & Hartford and the Boston & Maine into receiverships. The committee sought to get information also from the larger labor groups but were notified that the labor representatives would not appear. Only one witness spoke for labor, and he appeared in behalf of the unskilled labor in the maintenance of way department.

## The Railroad's Problems

James H. Hustis, president of the Boston & Maine, on Wednesday presented a statement outlining the financial condition of his company and reviewing the general situation.

Omitting details referring to the Boston & Maine's financial affairs and omitting also references to the doings of the Railroad Labor Board, with which the reader is already familiar, the substance of the address was as follows:

"The public has received all that has been possible both in rates and service, to the limit of the capacity of the railroad. The employees have also been recognized to the limit. The stockholders whose money has been invested should be recognized. All that we are now asking is an amount sufficient to bridge us over until more normal conditions return. Increased passenger fares and freight rates do not offer a permanent solution of the New England railroad question. These are already high and the tendency of a further increase may be to turn additional local freight traffic over to the motor trucks, and to some extent, to restrict travel. When conditions justify such action, some existing freight rates should be reduced and there should be a horizontal reduction in the present standard passenger fares. On the other hand there are freight rates in New England that do not yield the railroads the out of pocket cost of handling.

"It has always been the policy of the New England roads, to the greatest extent possible, to place the New England manufacturers on a parity in the common markets of the country with their competitors west of the Hudson river. There is no disposition to make a permanent change in this policy.

"In agreeing that the New England roads should be included in the Eastern group in the recent application to the Interstate Commerce Commission for increased freight rates, and in subsequently pressing the divisions case, the New England roads had this policy in mind and relieved their shippers of such portion of the burden of increased rates as is represented by the proposed settlement of that case. It was recognized that an average rate increase which would meet the needs of the Eastern group as a whole would not be adequate for us, but it was felt that it was desirable to keep New England in the Eastern group and not be forced to establish a separate New England rate group with a much higher scale of rates.

"It was expected that the disproportionate needs of the Boston & Maine would be equalized to a considerable extent by a revision of the division of through rates, but this has not yet been accomplished. The conditions which have developed since the presentation of the rate case was begun early in 1920 have tended to increase further the disproportionate needs of the Boston & Maine, and it is apparent that any settlement of the divisions case which can be reached within a reasonable time will not fully meet these disproportionate needs.

"The decision that the temporary increase in rates should include those between New England and territory west of the Hudson river has been reached with reluctance and is proposed because it seems to be the only way to meet the emergency. It is important to New England industries to be able to meet their competitors on equal terms, if the railroads can live under such rates, but it is equally important that their transportation machine should not be impaired.

"We are losing short-haul traffic to the motor truck, and there has been no compensating saving in our operating costs. Within certain limits, the natural operations of economic law will result in permanently turning over to the trucks a large amount of short-haul traffic which the railroads have handled in the past; but it is undeniably true that the rates

charged by the motor trucks are not yet on a proper basis. The trucks enjoy unlimited use of the highways and the rapidly mounting cost of maintaining these highways is borne largely by the taxpayers. Before motors came into general use the average maintenance cost of 700 miles of state highway was about \$100 per mile per year but in 1918, on sections much used by trucks, the cost was averaging \$1,500 per mile. Resurfacing was costing between \$20,000 and \$25,000 per mile on an eighteen foot road. State authorities then declared that heavy truck traffic was undoubtedly going to require city pavements on what were formerly county roads, and that this would easily double the expense compared to old times before the truck came.

"\* \* \* Making due allowance for any falling off in freight or passenger traffic, we believe that the proposed temporary rates, together with what benefit may accrue as a result of the divisions case, will yield the Boston & Maine an amount sufficient to at least meet its fixed charges. That there should be a readjustment of both wages and working conditions has been recognized by the railroad managers from the beginning, and they have taken every possible and proper course to bring about such changes within the limitations placed upon them by law.

"The Boston & Maine system consists of 2,484 miles of road. During the past ten years \$52,000,000 has been placed on the property for improvements and additions of traffic. The company has put into its track 20,000 tons of new—and much of it heavier—rail each year, which constitutes the renewal of only about 5 per cent a year. The renewals should be even larger. During the ten years charges to capital account for rails have amounted to \$1,200,000.

"The charges to capital account for equipment renewals have amounted to \$21,800,000, and during this same period the equipment retirements have amounted to \$7,500,000, leaving a net additional capital charge for equipment during that period of \$14,300,000. Of the passenger-train cars on the Boston & Maine, one-fifth are more than 30 and one-half more than 20 years old. The Interstate Commerce Commission has again recommended the substitution of steel for wooden cars. To replace wooden with steel cars would mean at present prices a capital expenditure of approximately \$50,000,000, and the substitution of steel for wooden cars carries with it collateral expenses for heavier locomotives to haul the heavier cars, and for yard and shop facilities for taking care of such equipment, all running into large capital investment. Bridges must be renewed from time to time to carry the heavier equipment. Capital expenditures during the past ten years chargeable to the bridge account have amounted to about \$5,000,000 and there is no reason to expect that this expenditure will be materially reduced. It should rather be increased.

"\* \* \* One recent requirement of the Interstate Commerce Commission substituting electric headlights on locomotives required a capital expenditure of \$300,000, and an annual increased operating cost of about \$30,000. Improvements in signalling and interlocking, looking toward safety in operation, are being adopted and extended generally as funds are available, and large sums annually should be spent in the installation of these devices, although the Boston & Maine, so far as road signalling is concerned, has maintained a high standard in this respect.

"In the test period, or three-year period prior to federal control, the Boston & Maine's average surplus over and above fixed charges was \$2,074,034. At that time fixed charges included approximately \$2,500,000 of guaranteed rentals on leased lines, which have since been converted into dividends on first preferred stock which are paid only when earned. On the basis of the present financial structure, therefore, the average surplus for the test period would have been over \$4,500,000. \* \* \* In 1920, if there had been no

Government guarantee during the first eight months, the deficit for the year would have exceeded \$17,000,000.

"In order to instal a normal amount of ties during the coming year at present prices, a further expense of about \$1,000,000 will be required which has not been reflected in the estimate. Even allowing for the fact that the past few months may have been somewhat abnormal, the present deficit is more nearly at the rate of \$10,000,000 per year than \$6,700,000.

"The war affected the labor situation on the railroads more adversely than in outside industry largely because the railroads, with their transportation charges fixed, were unable to compete with outside industry in wage scales. And before the government took over the railroads, an increase of wages in one department on the Boston & Maine after a strike in 1917, followed by an arbitration in which officers appointed by the Federal Government participated, added to the annual cost of operation about \$500,000 at a time when the railroad was unable to meet fixed charges. It resulted in a wage scale not only higher than was paid by any other railroad in New England, but generally higher than on other railroads in eastern territory.

"There are evidences of impatience on the part of the public everywhere as to the action or non-action on the part of the railroads in reducing wages as promptly as is being done in industry. \* \* \* Let us inquire who or what organized railroad labor is. Here in New England its membership is composed of men who are known to many of you. They are citizens in the communities in which we live, many of them holding offices in the town government and in the social and fraternal organizations which abound throughout the New England States; their families likewise participate in the community life, and their children attend the public schools and many of them the higher educational institutions. In dealing with organized labor, therefore, we are not dealing with some intangible, far-off thing, but with individuals who with their families form an integral part of our citizenship. I have talked with many of them, as most of you have talked with them, and you know their views on this subject of organized labor, and the extent to which many of them sympathize or do not sympathize with the extremists on the subject. They know, most of them, that readjustments must take place; but all experience indicates that when the call of their leaders comes, most of them will respond.

"In fairness we should not forget the other side of the picture, and that when the outlaw strikes on the railroads were so prevalent throughout the country a year ago, the New England railroads were practically free of interruption. Those of us familiar with the situation know of the great difficulties of the leaders of organized labor in preventing the spread of the strikes at that time \* \* \*"

Edward G. Buckland, vice president of the New York, New Haven & Hartford, at a hearing in Boston on March 23, told the committee that the movement for the increase was the result of a study of conditions by all the roads of this section. Referring to a statement that the Boston & Maine could rub along without increasing freight rates, he quoted figures to show that it was no more necessary for the New Haven to get increased rates than for any of the New England companies. The New Haven could "get along" if it could reduce wages covering the period of financial difficulties; a reduction of 15 per cent would give that road \$11,000,000 annually. Presenting a list of securities of the road's leased lines aggregating approximately \$30,000,000, he said that he was endeavoring to borrow money from New York bankers to help the road in its present situation with these securities as collateral, but the bankers were unwilling to lend on the security offered, because it did not represent an investment which was making money. He had been able to borrow \$2,000,000 from Boston bankers, however.

# Cross Examination on National Agreements Fails

## Testimony of Railway Executives Before Labor Board Proves Boomerang to Employees

THE WIDELY-HERALDED plan of labor leaders, headed by Frank P. Walsh, their counsel, and B. M. Jewell, president of the railway employees' department of the American Federation of Labor, to develop startling facts pertinent to their demand for perpetuation of National Agreements from the cross examination of railway executives has so far fallen flat. Thomas DeWitt Cuyler, chairman; Robert S. Binkerd, assistant to the chairman, of the Association; Carl R. Gray, president of the Union Pacific and formerly chairman of the Association's labor committee, and General W. W. Atterbury, vice-president of the Pennsylvania and chairman of the labor committee before its recent abolition, have all been on the stand during the past week, and their testimony under questioning by Mr. Walsh has served only to bring out more clearly than ever before the executives' united stand for their abrogation in the interests of economical and efficient operation.

By the testimony of these witnesses Mr. Walsh attempted to prove:

1—That national boards of adjustment and National Agreements are inseparable.

2—That railway executives are divided on the question of national boards of adjustment and therefore on National Agreements.

3—That Mr. Cuyler and General Atterbury, alleged representatives of capital, have exerted a powerful influence in opposition to National Agreements as part of a general attack upon labor organizations.

4—That the carriers are organized nationally to treat labor and other problems and they therefore should treat with the employees nationally.

5—That the basic principles of the National Agreements are just and reasonable even when applied nationally.

6—That the railroads are unfairly moulding public opinion to influence the Labor Board.

7—That the labor policy of the railroads is dictated by a handful of executives.

8—That the Association of Railway Executives and its officers wield more than an advisory power.

In every instance the attempt has failed. On the other hand, the cross examination has developed anew that the universal application of rules regarding working conditions is impossible without a loss of economy and efficiency. Every tack taken by Mr. Walsh in his examination of the witnesses regarding rules and working conditions was finally reduced to a lowest common denominator—the only agreements which are practicable are those made between the men who work under them and the men who are responsible for the management of the railroads.

The witnesses named above appeared before the Board in response to its summons outlined in the *Railway Age* of March 18 (page 723). From Mr. Binkerd, Mr. Walsh elicited information regarding the history, purposes, organization and powers of the Association of Railway Executives and detailed information regarding the files of that organization which he presented in accord with the order of the Board. From Mr. Cuyler, Mr. Walsh obtained information regarding his position and influence in the Association and the extent to which publicity work has been carried and by whom. Mr. Gray proved a distinct disappointment to the labor leaders, for he outlined in unmistakable terms the opposition of the executives toward continuation of National Agreements, and met every attack on their position with opinion and evidence gained through many years of railroad

experience in every part of the country. Mr. Walsh retired from the examination after a short time, leaving the interrogation of Mr. Gray to counsel for the carriers.

General Atterbury completed the wreck of the hypothetical case as envisioned by Mr. Walsh. He was not only not content to take the defensive, but at times took a hand in the questioning and backed up his contentions with definite proof.

As a result of these developments the case which has been before the Labor Board practically since its inception, and upon which hearings have been held since January 10, has assumed the importance in the public mind which it deserves. The awakening of the public is expected to lead to a demand for an expeditious settlement of the controversy, which would be exactly contrary to the plans of the labor leaders, who, since the beginning of the present case, have been more interested in prolonging than in settling the dispute.

### B. M. Jewell Presents a "Bill of Rights"

When this part of the hearings opened on March 18, Mr. Jewell read a "bill of rights," outlining the basic principles upon which he said the National Agreements are founded and for which the employees' representatives are fighting. This statement outlined in general the plan of attack later followed by Mr. Walsh in his examination of the various witnesses.

After stating that representatives of the employees have repeatedly attempted to have this controversy remanded to joint conferences and that "an aggressive and misguided minority of railroad executives has seized upon the question of National Agreements as the means of misrepresentation of the railway employees before the public and as the occasion for an attack on labor organizations," Mr. Jewell said:

"The fundamentals which are the basis of the National Agreement are as follows:

Eight hours as the recognized measure of the standard work day with an adequate hourly wage.

Payment for time worked in excess of the regular eight hours at proper over-time rates for the various characters of service required.

The beginning and ending of working shifts to be so arranged as to permit of reasonable living arrangements by employees and their families.

Reasonable rules for the protection of health and safety of employees.

Clear and concise definition of the work of each craft to be performed by mechanics and helpers.

The formulation of apprenticeship rules so as to develop sufficient, competent and efficient mechanics.

Applicants for employment as mechanics to be required to show that they have served an apprenticeship of four years or performed mechanics' work for a similar period and they not to be denied employment, when their services are needed, for any reason other than their inability to perform the work for which they are making application for employment.

The right of majority in each craft to determine what organization shall represent them. This organization to have the right to make an agreement which shall apply to all workers in each craft.

The right of the majority of each craft on each railroad to select a committee or representatives who shall handle all grievances which may arise affecting all employees of the craft in accordance with the provisions of the agreement.

Craft, point seniority, limiting seniority to the local shops or points and not permitting interchange of seniority with other shops, crafts, or departments of railroads.

The right to organize and the protection of employees against discrimination because of membership in labor organizations or for any other reason.

"These fundamentals constitute the irreducible minimum in labor's bill of rights," he continued. "If machinery is to

be successfully established for the peaceable settlement of the disputes between management and employees on the railroads these fundamental principles are an absolutely necessary preliminary."

As a result of the carriers' recognition of these principles, Mr. Jewell said that "well rounded and smooth running machinery would now be in operation and peace on railroads and good-will between management and employees would prevail where now exists, growing distrust, dissension, dissatisfaction, and increasing rumblings of a fast approaching, costly and vicious conflict, such as existed in the railroad industry prior to December 31, 1917.

"If it is proper, and we admit it is," he continued, "for railroad management of all railroads to have a national union of management, then, by the same line of reasoning, it must be admitted that the employees are entitled to the same. Railroad management is willingly accepting all the benefits of the Transportation Act, and just as willingly and determinedly it is endeavoring to escape its burdens. The law itself is not being given the fair test which it should be given.

"The facts are, there is at present and for years past there has been, no individual and independent railroad management with which the employees could bargain collectively. Railroad managements' labor policy is practically dictated by and through a small committee. Railroad managements' policy thus dictated is then sought to be imposed upon a local railroad craft organization of employees by and through the national union of railroad management. Railroad labor's organizations and policy are formulated in order that it may hope to successfully cope with the compactly and nationally organized union of railroad management."

Attacking "the tendencies of railroad management" as "deplorable," Mr. Jewell said, "the effort to misrepresent the employees to the public, and hold up faithful and efficient railroad employees as inefficient has steadily gone forward, until now, in their desperation, representatives of management are holding out to the public as a danger signal. 'Labor's policy of centralization and nationalization dictated by a few at the top in order that the few may retain and extend their control of the railroad industry.' This last desperate effort is a gross misrepresentation."

In support of this contention, Mr. Jewell said that the Board is deluged by inspired resolutions from railroad managements through commercial organizations and others who do not understand the National Agreements, the railroad industry and the present deplorable situation and have not taken time, nor do not care to investigate the facts."

Mr. Jewell closed his statement with the charge that the appearance of General Atterbury before the Board on January 31 indicated that "the railroad executives were doubtful as to the justness and reasonableness of their request for abrogation of the National Agreements." "When Mr. Atterbury failed so completely in his effort to stampede the Board into accepting as just and reasonable the never-to-be-remembered conditions of 1917, they then directed their efforts towards trying to secure the elimination of as many rules of the National Agreements as possible," he added.

#### Further Cross Examination

Following the presentation of this statement, Mr. Walsh called Mr. Binkerd to the stand. After interrogating the latter as to the organization, history, functions, etc., of the Association of Railway Executives, Mr. Walsh started to develop facts regarding the extent of the executives' opposition to the perpetuation of National Agreements and the extent to which E. T. Whiter, chairman of the Conference Committee of Managers, has voiced this opposition in his presentation. To this Mr. Binkerd laconically replied that "the executives are unanimous in their opposition to National Agreements and Mr. Whiter's presentation speaks for itself." Shifting his attack, Mr. Walsh then attempted to prove by

Mr. Binkerd that if the Association has but advisory powers, Mr. Whiter and his committee were in reality unauthorized to represent the carriers before the Board. In answer to this, Mr. Binkerd showed that this committee was acting for a short time under the general policy which had already been adopted by the roads which constitute the Association and that specific authorization was made as soon as possible thereafter. After answering numerous questions regarding the files of the Association which had been submitted to the Board, Mr. Binkerd was excused.

Mr. Cuyler was called next and both he and Mr. Binkerd asked to identify numerous papers and reports taken from the files. Among these were the majority report of the labor committee of the Association, submitted to the member-roads by Mr. Gray and the minority report submitted by General Atterbury. The majority report recommended that negotiations be held with the labor organizations and that national boards of adjustment be established as a result of these negotiations. The minority report of General Atterbury, on the other hand, strongly recommended that the proposition of national boards of adjustment be definitely turned down. At a subsequent meeting of the member roads of the Association General Atterbury's minority report was adopted and immediately thereafter Mr. Gray resigned and the former was appointed chairman of the Labor Committee by Mr. Cuyler.

Turning again to Mr. Binkerd, Mr. Walsh endeavored by a series of questions to bring out the relation in time between the presentation of the majority and minority reports, Mr. Gray's resignation and Mr. Atterbury's appointment, in a fruitless effort to establish the fact that undue influence was exerted to bring about this action. Upon questioning, Mr. Cuyler stated that Mr. Gray had resigned because General Atterbury's minority report had been adopted, and he felt it would accordingly be better to step aside. When Mr. Cuyler stated that he had appointed General Atterbury chairman of the Labor Committee, Mr. Walsh began a new line of examination to develop the position and influence of Mr. Cuyler in the Association and its labor committee.

Several statements and publicity matter accredited to Mr. Cuyler were then introduced by Mr. Walsh, whose questions thereon elicited the fact that several of these statements were not written by Mr. Cuyler but by the Association's publicity organization. Mr. Cuyler, however, pointed out that nothing had been sent out in his name which had not first received his careful analysis and approval. These statements led to a direct attack upon the competency of the Association's publicity organization. This attack was directed particularly at Ivy L. Lee, publicity adviser in the East, Mr. Walsh establishing by testimony his connection with other large industries. In addition, Mr. Walsh charged that these publicity statements were sent out in Mr. Cuyler's name because of his connection with several large banking organizations, the names of which, he said, would carry great weight with commercial organizations, etc., the voice of which was taken by many to be that of the public.

The same line of attack was followed when the examination continued on March 19, with Mr. Cuyler still on the stand and Mr. Walsh attempting to prove that the information regarding National Agreements being circulated by the railway executives is unfair and inaccurate. Mr. Lee was again attacked by Mr. Walsh in the latter's examination of Mr. Cuyler. As an example of the alleged unfairness of this publicity work, Mr. Jewell produced a copy of "Railroad Information," issued by the Association of Railway Executives. This bulletin cited that \$52 punitive overtime had been paid to each of five machinists on the Norfolk & Western under Rule 12 of the Shop Crafts agreement. Mr. Jewell's contention was that these payments were not made in accordance with Rule 12 and this contention was upheld by Messrs. Forrester, Hunt and Wharton of the Board on the assump-

tion that the rule quoted is in reality a rule in the so-called "southeastern agreement" and would still be in effect even if the National Agreements were abrogated. As another instance of this alleged unfairness and inaccuracy, Mr. Jewell read affidavits of employees which refuted a case outlined in Mr. Whiter's presentation and used in a press statement.

Throughout the examination so far there was an admitted effort on the part of Mr. Walsh to make National Agreements and national boards of adjustment inseparable. In support of this, the contention of General Atterbury as expressed in his minority report—that the establishment of national boards of adjustment means the continuation of National Agreements—was cited. This opinion, Mr. Walsh endeavored to establish, was known to the members of the labor committee when they adopted the majority report recommending negotiations toward the establishment of such boards.

Subsequently Mr. Walsh shifted his attack and endeavored to bring out in Mr. Cuyler's answers the fact that the outcome of the vote of member roads on the minority and majority reports—the latter was adopted by a vote of 60 to 41—was controlled largely by the votes of the New York Central and Pennsylvania. These two systems, Mr. Walsh showed, combined had a voting power of 15 and that if they had voted for Mr. Gray's report the entire situation would have been changed.

After thus pointing out the manner in which the railroads have organized to deal with matters common to all the carriers, Mr. Walsh asked Mr. Cuyler if he could consistently object to negotiating National Agreements with the representatives of national labor organizations. To this Mr. Cuyler replied that in his opinion the employees are much better protected by agreements between individual roads and their own employees.

Just prior to the end of this session Mr. Cuyler attempted to show the interest of shareholders in the question of National Agreements. This produced an avalanche of threats from Mr. Walsh, warnings from Judge R. M. Barton, chairman of the Board, and explanations from J. M. Shean, counsel of the Conference Committee of Managers. It was finally agreed to expunge Mr. Cuyler's statement from the records, although Mr. Walsh announced his intention of going into financial matters later.

Mr. Gray took the witness stand at the beginning of the afternoon session on March 1, and after outlining his experience in railroad work and in the Association's activities, the history and organization of the labor committee and its functions, and the developments leading up to the majority and minority reports, Mr. Gray nullified the attack which it was assumed Mr. Walsh would make by stating that, in his opinion, the establishment of national boards of adjustment does not mean necessarily that these boards would consider only disputes arising from the application of National Agreements. Mr. Gray further pointed out that both he, personally, and the majority report recommended conferences with the employees and not the establishment of any particular form of adjustment boards. He termed his majority report a "call to a conference."

It had been confidently expected by the labor leaders that, through the testimony of Mr. Gray, it would be possible to establish the existence of a difference of opinion among railway executives as to the justness and reasonableness of National Agreements, and thus materially weaken the carriers' case. However, the dispatch with which Mr. Gray killed this plan led Mr. Walsh, after a short time, to retire from the examination. Counsel for the railroads, however, asked Mr. Gray to present testimony as to the reasonableness or unreasonableness of National Agreements. To this Mr. Gray stated that the varied conditions existing in different parts of the country makes it practically impossible to devise rules which

can be applied justly and reasonably over the whole country.

"My conclusions are reached," Mr. Gray said, "as a result of my experience as an operating officer on various railroads and as an operating officer of the Railroad Administration. I have operated railroads in many different parts of the country and I am, therefore, in a position to state that the universal application of even 'fair' rules would, in some parts of the country, produce unfair results."

The "bill of rights," previously presented to the board by Mr. Jewell, was then brought to Mr. Gray's attention, and the manner in which these rules worked out in actual practice when applied universally, was quickly pointed out.

### Cross Examination of General Atterbury

On March 21 General Atterbury took the witness stand, and, in response to questioning, outlined his connection with the Pennsylvania, the Association, its Labor Committee and other railroad organizations. This led Mr. Walsh to submit a long list of organizations of executives and subordinate officials, which, he maintained, treated railroad problems nationally, and from this inferred that it was only fair that questions in which the employees as a whole were interested be treated on the same scale.

In answer to a question regarding the importance of the abrogation of National Agreements, General Atterbury said: "The abrogation of National Agreements is the most important thing before the country today."

During the progress of the examination, Mr. Walsh attempted to point out a difference in the positions taken by General Atterbury and Mr. Whiter's committee. This effort, however, failed, inasmuch as General Atterbury reiterated that he was not, and had not been, opposed to agreements negotiated between the men who are to work under them and the officers who are responsible for their application, and this, he pointed out, was a fundamental principle in Mr. Whiter's presentation.

In reply to Mr. Walsh's request that he add something to Mr. Whiter's presentation, General Atterbury read a statement which said in part:

"No more serious question (National Agreements) confronts the American people today. We have come to a parting of the ways. One road leads to government ownership, nationalization, Plumb Plan-ism, and Syndicalism,—the other road, to industrial peace, and the continuation of that individual initiative, energy and responsibility which is peculiarly American. The issue is in your hands. The sign board on one road is: National Agreements. The sign board on the other is: Negotiate directly with your own employees.

"The following quotations from the Official Circular No. 107 of the Railway Employees Department of the American Federation of Labor, which circular as an interesting coincidence, is headed 'Years for Government Ownership of Railroads'—are illuminating.

We are the first class of railway employees to force the understanding that the Railway Administration would negotiate and sign a National Agreement.

\* \* \* it was up to him, the Director General, to settle with us and further \* \* \* the entire proposition would be submitted to our membership at once for a strike vote.

"The other road I have indicated leads to industrial peace. I can quote no better testimony advocating following the sign board—'Negotiate with your own employees' than the following, taken from the Report of Industrial Conference called by the President, of which William B. Wilson, Secretary of Labor, was chairman, and Herbert Hoover, vice-chairman.

The right relationship between employer and employee can be best promoted by the deliberate organization of that relationship. That organization should begin with the plaintiff itself. \* \* \*

Industrial problems vary not only with each industry, but in each establishment. Therefore, the strategic place to begin battle with misunderstanding is within the industrial plant itself. Primarily the settlement must come from the bottom, not from the top.

"My views as to what the employee should not do, are as follows: (1) undermine discipline; (2) limit production; (3) demand pay for which there is no equivalent production; and (4) force the 'closed union shop.'

"I have no fight with organized labor as such. I have every desire to see its existence healthy and normal. Within reason-

able limits, it is a healthy spur to bring about fair conditions as between employer and employee.

"My views as to what the employee has the right to expect and the employer should provide, are as follows: (1) as steady employment as possible; (2) a good wage; (3) time for recreation; (4) opportunity to elevate himself in his employment; (5) a voice in determining the rules and regulations under which he should work; and (6) the right to be, or not to be, a union man. But to apply these principles, the 'dog collar' of National Agreements must be removed.

"An agreement to be properly binding must be equitable, and entered into freely by both parties; and in order that it may be intelligible and properly carried out, it is necessary that there be a common understanding. But a common understanding can only come from free discussion and negotiation.

"The so-called National Agreements were put in force on the Pennsylvania by order of the Director General. No discussion whatever was held between the employees who would work under these agreements, and the officers who necessarily would have to administer them. Nor have the employees who work under these agreements been permitted by their leaders to discuss them with their own railroad officers, or modify them as a result of such discussion."

After calling attention to the hurried effort on the part of the leaders of the shop crafts to make the question of National Agreements an issue before the Board, General Atterbury continued: "Confusion, misunderstanding and bitterness between the officers and the employees were bound to, and did follow, and are bound to continue until the so-called National Agreements are wiped out, and the officers and employees now working under them on the Pennsylvania sit down together and work out their own set of working rules to meet their own conditions. You may fairly ask what justification I may have for this statement I have just made. Your Board some time ago very wisely decided that it had no jurisdiction over the question of national boards of adjustment. That decision took that 'dog collar' off. What followed on the Pennsylvania with our men in train and engine service is typical and convinces me of the possibilities in this direction with all classes of employees. There are no cases before the Labor Board from our men in train and engine service involving grievances as a result of the train and engine service rules and working conditions on the Pennsylvania. Our men and our officers are settling them between themselves. Understand that there were in existence seven separate schedules, covering different parts of the system and you must recognize that we have varying conditions incident to serving a territory with agricultural, industrial, and climatic differences, that stretches from the straits of Mackinaw to the Chesapeake Bay, and from the Atlantic Ocean to the Mississippi river and the waters of Lake Michigan.

"Each railroad negotiating its schedules with its own employees is the road to industrial peace."

There followed an interesting controversy between General Atterbury and Mr. Walsh as to the formation of the various National Agreements. General Atterbury vigorously maintained that these agreements were obtained from the Director General by coercion and stated, in support of this contention, that Director General Hines "took strike threats too seriously; his experience in handling labor matters had been too limited." This brought forth another interesting but irrelevant discussion as to whether or not the agreements in effect prior to Federal control had been obtained by coercion, a charge which General Atterbury would not make despite attempts to lead the discussion to that end.

The next move in the examination was openly announced by Mr. Walsh when he said: "I will now try to prove that some universal rules are necessary." Following this he introduced considerable evidence regarding the legislation designed to safeguard railroad workers, various uniform rules promulgated by the Interstate Commerce Commission, etc. He then took up the rules contained in the National Agreements, and immediately found that, instead of examining the witness and directing the trend of the testimony, he was in turn being examined, and that the trend of testimony was being directed by General Atterbury. The first rule of the Shop Crafts Agreement was presented for General Atterbury's approval. Instead of approval, however, it brought forth the vigorous reply:

"The eight-hour day is a perfect farce. It is merely a means for getting more money. The rule typifies the whole

business. Why doesn't the rule say 'eight hours' work shall constitute a day,' instead of 'eight hours shall constitute a day's work.'"

General Atterbury then continued to bring out defects in the universal application of rules, stating again and again in discussing the applicability of the eight-hour day to railroad service that "the length of the working day should be gaged by the character of the service rendered." The remainder of the morning session was devoted to efforts on the part of Mr. Walsh and Mr. Wharton of the board to get General Atterbury to commit himself against the basic eight-hour day, but these efforts were without avail.

The discussion over the eight-hour day continued during the afternoon session with practically no change in the character of the evidence presented. General Atterbury reiterated his assertion that the character of the service should determine the length of the working day, and all efforts to dislodge him from this position were fruitless. Again in discussing other rules of National Agreements, General Atterbury took and consistently maintained the position that "no rule is a good rule unless it is agreed to by the officers who apply it and men who work under it."

Inadvertently, perhaps, Mr. Walsh then mentioned the relative merits of piecework as compared with the hourly wage system. This led to vigorous defence of piecework by General Atterbury, who said: "The abolition of piecework has been made a bone of contention by men who would level all good Americans." Once more Mr. Walsh found himself losing control of the situation and listening to a vigorous denunciation of the policy of the employees' representatives in carrying on this fight for the perpetuation of war-time rules.

General Atterbury said: "I would negotiate agreements with our men right now if their leaders would let go." To this Mr. Walsh replied that he, General Atterbury, could legally negotiate agreements with his own men at the present time. The latter was evidently waiting for this opportunity, for he immediately produced two communications from the Railway Employees' Department of the American Federation of Labor to members of the shop crafts, telling them, in substance, not to negotiate any agreements except the complete National Agreement. Furthermore, General Atterbury took this opportunity to substantiate his term for the National Agreement—"dog collars." This expression, he said, originated in a cartoon contained in a bulletin issued by the Railway Employees' Department of the American Federation of Labor, portraying labor handling railroad management a small dog collar labeled "National Agreement." Railroad management is saying, "It won't fit." Labor is replying, "We'll make it fit." How the "dog collar" was made to fit was explained by General Atterbury by reading portions of the communication below the cartoon.

The result was both serious and amusing. Mr. Walsh, aided by Mr. Wharton, attempted to draw different conclusions from labor's statement, "We'll make it fit," but their attempts were not successful, and the course of the examination was quietly but quickly changed; however, not before General Atterbury had vigorously stated, "The leaders of the American Federation of Labor are throttling the employees and the National Agreements are throttling both the employees and the management. I don't want to take anything from the employee. I want only a fair day's work for a fair day's pay." In answer to a question by Mr. H. T. Hunt, a public member of the board, Mr. Atterbury said: "You cut the 'dog collar' off and see how quickly the Pennsylvania will negotiate agreements with its men."

On continuing this line of examination, General Atterbury exclaimed that the "whole object of National Agreements is to employ more men." Objections to this statement elicited the reply: "I am a better friend of the men than their own representatives at this table. I maintain, in fact, that the men are not being represented."

The remainder of the day's testimony was of a similar character, Mr. Walsh endeavoring to obtain General Atterbury's approval of the principles of various rules of the Shop Crafts Agreement, and General Atterbury consistently maintaining his position as has already been outlined.

The morning session on March 22 found General Atterbury still on the stand with the cross examination proceeding without results for the employees' case. The necessity for classification rules was first brought up by Mr. Walsh only to be denied in substance. Regarding this, General Atterbury testified: "I take it that this board is to quiet, not foment trouble. If it were to write standard rules instead of pouring oil on the waters it would be throwing rocks into it. The Board can't write standard rules."

Mr. Walsh stated that there have been but 175 disputes in a year under the National Agreements, and upon asking General Atterbury if that would not indicate harmony under these rules, the latter replied: "No. The boards at Washington have already given the men everything they have asked for. There is nothing more to request."

The apprentice rules in the Shop Crafts Agreement were next taken up, Mr. Walsh attempting to justify their existence by reference to so-called "abuses" which took place prior to their creation. This discussion ended when General Atterbury said: "I can find restricted production under every rule of the National Agreement, and this rule is no exception. You men are trying to get more money for the men; I am trying to get an honest day's work for that pay."

Regarding the representation of employees, General Atterbury maintained through a long series of questions that the principle of representation by men elected by the majority is not fair to the minority who have a right to be represented by men of their own choosing. Following this, General Atterbury outlined his definition of and views upon the "closed shop," stating in substance that he deprecates the closed non-union shop as well as the closed union shop. Furthermore, he read a circular issued by the Railway Employees' Department of the American Federation of Labor showing conclusively that that department has issued orders which establish closed shops.

The testimony during the afternoon session of the same day continued the same. Various of the rules were brought up by Mr. Walsh, and General Atterbury as strenuously objected to their application nationally.

Mr. Walsh attempted to capitalize the evidence that the Pennsylvania had maintained prior to General Atterbury's departure for France "an extensive espionage system among its employees" and had "little arsenals" at various plants. After lengthy discussion of the charges of coercion on the part of both the Pennsylvania and the employees, the subject finally dropped upon a promise by Mr. Hunt to read General Atterbury's complete report from which the charges were taken. Just prior to the closing of the morning session, Mr. Walsh produced a letter alleged to have been written by I. W. Geer, general manager of the Pennsylvania, southwestern region, to supervisory employees, in which he charged the supervisory employees to defame the labor organizations if necessary to obtain certain information. This letter was later declared to be a fake by General Atterbury and Mr. Whiter after they had communicated with Mr. Geer.

The session on March 23 opened with Mr. Walsh still trying to picture conditions on the Pennsylvania prior to December 31, 1917, by reading extracts from industrial conference records. After continued effort to get General Atterbury to approve the principle of some rules in effect or recommended as the basis for proper relations between employer and employee, General Atterbury pointed out that principles could be agreed upon, but that rules could not unless negotiated by employer and employee. He finally stated to the Board: "You give us principles; we will work out rules." He later

qualified this by stating that rules so worked out would not be national rules.

Mr. Walsh then turned to apparent discrepancies in statements as to the cost of the National Agreements. General Atterbury immediately produced a statement which Mr. Walsh tried to keep from the record. This statement, which was filed with the board, showed by figures of the Interstate Commerce Commission that the estimated saving of \$300,000,000 was far below the actual saving possible.

A long series of questions regarding Master Car Builders' rules, etc., and their necessity followed, but throughout the session General Atterbury maintained consistently the stand which he had already taken on this subject. This completed the examination of witnesses summoned so far, and the board adjourned until March 24, when Mr. Jewell began presentation of a long statement in reply to General Atterbury's stand before the Board.

Developments so far have not indicated when or how the labor leaders will attempt to answer Mr. Whiter's presentation, but from their present tactics it is assumed that this will not be presented until the Board has decided that the case has been delayed long enough.

### Whiter's Statement

Mr. Whiter, in commenting on the progress of the case, said in part:

Five days of questioning railway officers by counsel of labor unions has failed to bring forth a single fact supporting the charges that have been made by spokesmen of labor unions against the railways and in our judgment has strengthened a case against the National Agreements.

Spokesmen of the labor unions repeatedly have charged that there is a gigantic plot to break down the labor unions, and that the efforts of the railways to set aside the National Agreements were in pursuance of this plot. They have claimed that small coteries of railway officers had got the railways to oppose National Agreements and national conferences with labor unions contrary to the views and wishes of the majority of the railway executives.

Records of the Association of Railway Executives which were put in evidence and the testimony of Messrs. Cuyler, Binkerd, Gray and Atterbury have shown that these charges are without foundation and that the railway executives always were unanimously opposed to the so-called National Agreements to which the railway companies themselves never agreed.

There was not found nor introduced nor could there have been found any evidence indicating that the railways are engaged in any attack upon the labor organizations, but much evidence showing that what they have been trying to do throughout has been to bring about negotiations between each individual railway and its own employees which would result in the establishment of rules and working conditions that would make it possible to meet varying conditions throughout the country and increase efficiency and economy of operation.

## Distribution of the Railway Dollar

THE FOLLOWING FIGURES compiled by the Bureau of Railway Economics show the distribution of railway income of Class I roads in the calendar years 1917 and 1920:

ITEM	1917	1920
Total operating revenues	100.0	100.0
Charges against operations:	Percentages of Revenue	
Labor	43.3	57.8
Fuel for locomotives	10.0	10.4
Other expenses, materials and supplies, etc.	17.2	25.3
Railway tax accrual	5.3	4.6
Equipment and joint facilities—net rents	0.9	0.9
Net railway operating income	23.3	1.0
Deficit to be made up by Government, March-September, 1920		12.1
Net income from other sources than railway operation (non-operating income)	5.8	4.7
Gross income available for capital	29.1	17.8
Capital charges:		
Rents for lease of road	3.3	2.0
Interest	10.4	7.6
Other deductions	0.6	3.6
Dividends declared (from income and surplus)	8.0	4.5
Remainder of gross income available for betterments, reserves, and surplus	6.5	0.1

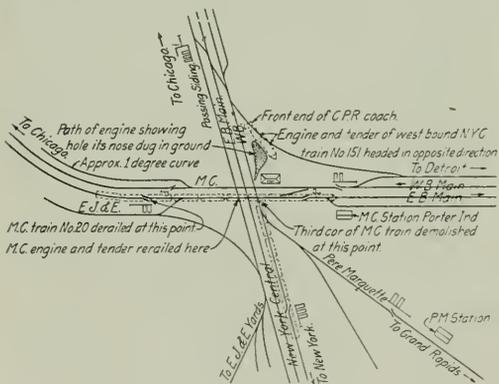

# Bureau of Safety Reports on Porter Collision

Engineman's Fault Clearly Set Forth—Speed Was About 50 Miles an Hour—Fireman Also Culpable

THE INTERSTATE COMMERCE COMMISSION has issued a report, dated March 14, and signed by W. P. Borland, chief of the Bureau of Safety, on the crossing collision at Porter, Indiana, on February 27, when westbound passenger train No. 151 of the New York Central ran into the side of eastbound passenger No. 20 of the Michigan Central, completely demolishing one coach. Thirty-five passengers and two employees were killed and eleven passengers, two employees and seven other persons were injured.

This collision was reported in the *Railway Age* of March 4, page 495, and there is reproduced here the drawing which was given with that report showing the approximate location of the tracks at the crossing. The present report says that the Michigan Central crosses the New York Central at an angle of about 45 deg.; and that the train-order signal (not shown in the drawing) is 57 ft. north of the New York Central tracks and nine feet east of the Michigan Central.

Approaching on the Michigan Central from the west (southwest) the line, beginning at the distant signal, is

Scene of Collision at Porter, Ind.

tangent for 500 ft.; then a curve of 33 minutes, to the left, or 3,960 ft.; then tangent 600 ft. to the crossing. The home signal, No. 35, is on this tangent 366 ft. before reaching the crossing. The derail is in the south rail, 55 ft. east of signal 35. The Michigan Central siding, on which a freight train was standing, is at the right of the main track (not on the north side as shown in the drawing). The grade is slightly descending eastward.

On the New York Central the distant signal is about 4,500 ft. east of the crossing and the home signal is 600 ft. and the derail about 500 ft. from the crossing. At the time of the collision it was dark, and the weather was clear.

The conclusion of the report is that the engineman of Michigan Central No. 20 saw and heeded the cautionary indication; reduced speed from 60 miles an hour to perhaps 50 miles; took the word of the fireman that the home signal indication was clear; and did not look for the home signal himself, although by leaning out of the car window he should have seen it about 1,980 ft. before coming to it. The New York Central train was moving at about 50 miles an hour.

The interlocking is Saxby & Farmer, 54 levers; electric

locks on all home signal levers; screw releases on the New York Central, requiring two minutes to operate, and clock-work release on the Michigan Central, set to operate in one minute. Approach annunciators are in use on both roads; the New York Central sounds when any part of the track is occupied for a distance of about two miles before coming to the crossing; and the eastbound Michigan Central annunciator operates when the track is occupied for about one mile before reaching the distant signal.

The Michigan Central distant signal is three-position, upper quadrant. The home signal is the same, but with a two-position, upper quadrant, calling-on signal below the main signal. The train order signal, 57 ft. beyond the crossing, is on a mast 29 ft. high. There is no train order signal for the New York Central.

Tower operator Whitehead said that prior to the entry of either train on the annunciator circuits, all levers were in normal position; the New York Central buzzer sounded first, and the signals were set for it before the other train announced itself, which was about 20 or 30 seconds after the N. Y. C. Whitehead, and Cook, the leverman, when they saw that No. 20 was not going to stop, started for the door; but the collision occurred before they reached it. Cook was a temporary man, his regular position being assistant signal maintainer at this tower. He said that after seeing the danger there was not time to set the home signal against No. 151; and that on account of the time release it would have taken about three minutes to change the routes.

Engineman Long, of No. 20, said that fireman Block called the home signal when at about the middle of the curve—that is to say, about 2,500 ft. from the crossing. He said "all the way," meaning that the home signal indication was clear. Long then released the brakes. Continuing Engineman Long's testimony the report says:

When the engine reached the tangent he looked for the home signal and thought he saw a green light above a red one; as he got close to the home signal he looked for the signal again, but it was hidden by smoke and steam; at that time he thought the speed of his train was between 35 and 40 miles an hour; he did not see the train order signal on account of the smoke and steam, neither did he see any hand signals. In discussing the indication of the home signal, in response to the inquiry: "What do you think caused those indications that you received?" Engineman Long replied: "The only thing that could be, if I did not have them, is that I mistook the order board for the green light." Long further stated that he does not depend entirely upon the fireman when he calls a signal and that he has never before had any trouble in distinguishing the signals at this point.

Fireman Block said that when about a mile from the home signal he observed the indication of that and the train order signal; two green lights and a red light. There was some steam or white smoke escaping from the freight engine standing on the side track, but he could see the signal lights notwithstanding. When he called "all the way" to Long, the engineman answered, after about 30 seconds, "all right." At that time, said Block, the speed was between 35 and 40 miles an hour. After the engineman answered him he got down and began to work on the fire. He did not see any hand signals given from the track.

Engineman Curtis, of the freight standing on the siding, testified that the home signal and the other blade on the same post were in the stop position when he arrived there;

and that he looked again when he saw the light of the headlight of train No. 20, and both blades were still in the stop position; he also noted that the train order signal displayed proceed. Some smoke or steam from his engine was blown across the main track. He said that it had never appeared to him that the train order signal could be confused with the home signal at this point.

Fireman Arthur, of the freight, also saw the signal blades at stop; and he observed two brakemen of his train, standing on the track, giving stop signals with their lanterns to No. 20. These two brakemen testified that they were west of the home signal; that they gave "ease off" signals with their white lights, but receiving no acknowledgment they began to give violent stop signals. One of these men was on the fireman's side and one on the engineman's side of the track; no response was received to the signals. They stated that there was no reason why their signals could not have been seen from the cab of No. 20.

The rule on the Michigan Central allows a passenger train to pass this interlocking at 40 miles an hour; that of the New York Central says 50 miles an hour. The report says:

"The speed of train No. 20 is variously estimated to have been from 35 to 55 miles an hour. There is no variation in the estimates of the speed of train No. 151; about 50 miles an hour. . . . The lapse of time between the announcement of train No. 151 and train No. 20 was 20 or 30 seconds, and as the distance between the announcing points on the two roads and the crossing is about 1,000 ft. longer on the New York Central, this time interval would place train No. 151 about the same distance from the tower as was train No. 20 when it was announced. Therefore, if train No. 151 was running at 50 miles an hour it is obvious that train No. 20 was running at a still higher rate of speed, as it arrived at the crossing before train No. 151."

No fault was found in the interlocking plant or signals. The electric circuits could not be tested on account of the destruction of a large amount of wires and trunking, but a careful check of the circuit plans, locking sheets and dog charts indicates a satisfactory condition. As the signal system was operating properly a detailed description of the circuits is deemed unnecessary. Observations made after the investigation disclosed that from the fireman's side of the engine the home signal could be seen from a point about 4,000 ft. back, and by leaning out of the window on the engineman's side at about 1,980 ft. back.

### Conclusions

"The direct cause of this accident was the failure of Engineman Long to observe and obey the signal indication of the home signal. . . . A contributing cause was the failure of Fireman Block properly to observe the home signal indication and convey the correct information to Engineman Long. The evidence indicates that Long relied practically if not entirely upon the announcement by Block of the indication of the home signal instead of observing it himself. The location of the signals is such that it was both possible and convenient for him to observe the signals personally, and for his failure to do so there is no excuse. Even if he did confuse the train order signal with the top blade of the home signal, he still did not receive a proper indication to proceed at normal speed, as his movement was also governed by the train order signal, the indication of which he was required to observe before passing it.

"According to his own statement, Engineman Long received a caution indication at the distant signal; this informed him that the home signal governing the crossing was then in the stop position, and required him to proceed under such control as to be able to stop before reaching the next signal. The evidence discloses that Engineman Long observed and heeded this caution indication, as he made a brake applica-

tion and slightly reduced the speed of his train. It was then necessary for him to ascertain the indication of the home signal and be governed by that signal.

"Under these circumstances, knowing the arrangement of signals at this point, Long should have exercised particular care, after having received a caution indication at the distant signal, to see that the signals governing his train were clear . . . before passing the home signal and starting over the crossing at high speed. In addition to his failure to observe and obey the stop indication of the home signal, Long failed to see and be governed by stop signals given with lanterns by two trainmen of the freight train standing on the siding. . . .

"The failure of Engineman Long in this case . . . together with the appalling loss of life resulting therefrom, adds another to the already long list of accidents resulting from the fallibility of enginemen, upon whom the safety of passengers depends. . . .

"This accident again calls attention to the necessity for an automatic train control device to be used in connection with existing signal equipment. . . .

"A signal should not be called by a fireman until he is absolutely certain of its indication. In this case Block called the signal when, according to his own statement, it was nearly a mile away and partially obscured by smoke. . . . If the home signal was in this instance obscured, it was the engineman's duty to reduce speed, or to stop if necessary, and determine its indication before passing it; nevertheless, every effort should be made to so locate signals that they are not likely to become obscured by steam or smoke from engines or to be confusing. . . . It is believed the location of both the eastbound home signal and the train order signal on the Michigan Central at this point should be improved.

"It is believed that with a train running at the maximum prescribed speed limit of 40 miles an hour, the derail located 311 feet from the crossing does not afford the protection intended, and that in order actually to provide the protection intended the maximum speed limit at this point should accordingly be reduced or the location of the derail changed.

"It is noted that the coach which was struck by the locomotive was of wooden construction, with steel center-sills, and that it was demolished by the impact. While steel passenger cars generally are safer than wooden cars, nevertheless, with the tremendous impact in this case, which was applied to the center of the side of the car, it is doubtful whether greater protection would have been furnished the occupants had the car been of all-steel construction.

"Engineman Long entered the service of the Michigan Central as a fireman in 1890, was promoted to yard engineman in 1900 and to road engineman in 1901. His service record contains the following entries:

October, 1901, suspended 10 days for running off interlocking signals against him.  
 Sept., 1907, suspended 10 days for failure to stop for telegraph signal not burning.  
 Dec., 1907, suspended 30 days for failure to stop for block signal not burning.  
 Feb., 1909, taken out of service on account of defective vision.  
 June, 1909, restored to service on account of improved vision.  
 April 1, 1914, observed surprise test; light out on telegraph signal.  
 April 23, 1918, record suspension 30 days; collided with caboose car, flag out.

"Fireman Block entered the service of the Michigan Central as a fireman in December, 1915, was promoted to road fireman in February, 1916; in military service from May, 1916, to January, 1919; promoted to switch engineman in March, 1920; April, 1919, given suspended sentence of 30 days, which was later modified to reprimand, for disregarding fixed signal in stop indication.

"At the time of the accident Engineman Long and Fireman Block had been on duty 1 hour and 47 minutes, prior to which they had been off duty 7 hours and 50 minutes."

# Railroads Continue Conferences With Employees

Few Indications of Early Agreement—Some Appeal to Labor Board—More Conferences Scheduled

THE CONFERENCES of many railroads with their employees during the past week have, in most cases, made it increasingly clear that the men are not disposed to accept any decreases in their wage scales without action by the Labor Board. The New York Central has asked the Labor Board to act in the case of its unskilled laborers who have refused to accept a decreased rate. Several other roads are contemplating similar action. The marine workers of some of the roads around New York are said to be favorably disposed to accept certain changes in their rates, but this is almost the only instance so far which promises a settlement without an appeal to the Labor Board.

## Statement to Pennsylvania Employees

The Pennsylvania has announced reductions in the wages and salaries of many classifications of officers and employees, as was noted in the *Railway Age* of last week. On March 22, Samuel Rea, president of the road, issued a statement to the employees of the company which explained in some detail the absolute necessity of operating economies to be effected by lowering the wage rates and gave his word that the employees would receive justice and fair play in any changes made. He asked for the co-operation of the men in solving the present difficulties. The statement in full follows:

If every man on this railroad could come into my office and see for himself the facts that confront us, I would not be addressing you this way.

We have come to the necessity of reducing salaries and wages. Drastic economies have been made in every other way possible. Working forces have been reduced more than 70,000 men. With less business to handle, and wages taking the abnormal sum of nearly 70 cents out of every dollar the railroad earns, the remaining 30 cents is not sufficient to buy fuel and other materials and supplies, and pay our taxes and other obligations. There is only one way left to keep our expenses within our income, and that is to lower salaries and wages. Under such circumstances as these it is necessary to ask for your co-operation, and I have known Pennsylvania men so long that I do so without hesitation.

The directors of this company have given their word that justice and fair play will be accorded to all. I promise you that policy will be scrupulously followed.

You have been asked to send representatives to meet the general managers to discuss what are just and reasonable wages in the light of present conditions. Committees are now at work preparing new schedules of rates to submit for your consideration. It is our purpose to tell you exactly what are the facts so that all may know and understand.

All I want to ask of you is one thing: Be open-minded. We have no intention or desire to reduce wages to unfair levels.

There is no conspiracy to disrupt your national organizations.

We are simply face to face with conditions that force the steps we are taking.

You men have assisted in making this the greatest railroad in the country. It is our job, yours and mine, to serve the public as economically and as efficiently as possible.

The railroad is opposed to the national agreements because they make it impossible to operate the road for the interest of the public as well as for the interest of the employees. One of the most unfortunate features of the present situation is the fact that these national agreements make it impossible for us to retain the most efficient employees and to pay them for the work they do and the energy, initiative and loyalty they put into the job.

We have succeeded in the past by working together with mutual good-will and co-operation. In that way alone we can succeed now, and I want to feel that I can continue to count on your spirit of fair play, common sense and whole-hearted service.

## Long Island Calls Conferences

The Long Island on March 19 announced that, effective April 20, decreases in wages of certain employees would be put into effect. The statement of the company says in part:

The relation between wages of railroad employees and the cost of living, and the scale of wages paid for similar classes of work in other industries, have materially changed since the present rates of pay and working conditions became effective, and the situation imperatively demands readjustment.

In the year 1920, with only eight months of the 1920 wage award charged to operating expenses, more than sixty cents out of every dollar received by the company for transportation and other services was absorbed by wages. In the year 1917, the payrolls absorbed only forty-one cents out of each dollar received, while the relation between the payrolls and the total operating expenses was the same for the two years named. The payrolls during the period 1917-1920, inclusive, therefore absorbed all increased revenues and benefits from increased rates, increased volume of traffic, and increased capital invested.

This company cannot, by any process of rate increase for passenger and freight traffic, make ends meet, pay taxes and interest, while such a relation exists between payrolls and gross revenues.

Accordingly conferences have been called with the employees affected as follows: March 30, signal department employees except foremen and inspectors, shop employees except supervisory forces, stationary engine and boiler room forces, telegraph and telephone operators and levermen, clerical and station forces; March 31, engine and train service employees and shop and signal supervisory forces.

## Reading Plans a Decrease

The Philadelphia & Reading has announced sweeping decreases in wages and salaries which will be put into effect on April 26. In the meantime conferences will be held with the employees affected in order, if possible, to arrive at an amicable agreement. The conferences are scheduled as follows: April 4, maintenance of way and structures employees; April 6, signal department employees; April 11, stationary engine and boiler room forces except coal passers; April 13, clerical and station forces; April 15, telegraph and telephone operators; April 18, engine service employees; April 19, marine employees; April 20, train service employees; April 22, train dispatchers, yardmasters and assistants; April 25, shop and signal supervisory forces.

## The Situation on Other Roads

The Central of New Jersey has announced that it will hold conferences with its unskilled laborers on March 24 and with its clerks, station employees, mechanics and other skilled laborers other than train and engine service employees on March 25. At these conferences the management will endeavor to arrive at an agreement with the men with regard to reductions in wage rates which have been announced to take effect on April 16.

The Delaware, Lackawanna & Western, which has announced a reduction in the wages of unskilled labor, marine department employees, clerks, station employees, mechanics and other skilled laborers excepting train and engine service employees, to take effect April 16, has held conferences with the unskilled laborers and the marine department employees. No agreement has been reached with the representatives of unskilled labor and the negotiations with the marine department employees are still under way. The dates for the con-

ferences with the other employees have not been announced as yet.

The Erie which held conferences with various classes of skilled and unskilled employees at Hornell, N. Y., on March 17 and 18, was not able to arrive at an agreement with the men regarding wage reductions and the management is considering asking the Labor Board to decide the controversy. The company is now conferring with its marine employees.

The Nashville, Chattanooga & St. Louis has announced that on April 16 a decrease in wage rates of certain unskilled and semi-skilled classes of employees will be put into effect. Conferences with the employees will be held in the meantime.

The New York Central, which was unable to reach an agreement in its conferences with its unskilled employees, has petitioned the Labor Board to put into effect the reductions in wages asked. It is understood that some of the marine employees of this company will accept a reduction and conferences are still in progress.

The Central of Georgia has already held conferences with its unskilled employees but as yet no agreement has been reached.

Conferences with unskilled laborers on the Lehigh Valley, having failed to produce terms acceptable to the employees and the management, the company is considering submitting its case to the Labor Board.

It was announced on March 22 that the employees of the Boston, Revere Beach & Lynn have agreed to a reduction in their wages averaging about 12 per cent.

The Bangor & Aroostook has announced that on April 16 it will put into effect reductions in the rates of pay of foremen, clerks, station and yard employees, office boys and other office assistants, maintenance of way and structures department labor, both skilled and unskilled, shop craftsmen and laborers, dining car and restaurant workers, stationary enginemen and firemen, coal passers and all other employees whose wages were adjusted under decision No. 5 of the Labor Board. Conferences with the employees affected will be arranged later.

### Conditions Improve on A. B. & A.

The Atlanta, Birmingham & Atlantic has resumed local passenger and freight service on all parts of its line, according to an announcement made on March 21. The company expects to resume the operation of through freight and passenger trains shortly. The organized employees of this company went out on a strike on March 5 following a reduction in wages by the receiver acting under orders of the court. The places of the striking employees are being filled as rapidly as possible by new men. The representatives of some of the unions have attacked the scale of salaries of the company's officers and have suggested an investigation by the Interstate Commerce Commission. To this Receiver Bugg replied in part:

The total payroll of the executive officers, according to the statement, amounts to less than \$105,000 a year, and if it should all be cut off, it would pay the deficit for only one month. The total payroll is more than \$4,000,000 per year, and less than \$105,000 goes to the executive officers, counsel and surgeon.

The total salaries paid amounts to less than 2 3/4 per cent of the total pay roll. The officers employed and the salaries paid them are small for a railroad of the length and of the difficulty of operation of the A., B. & A. The A., B. & A. meets keen competition everywhere, and its successful operation requires skillful men of much experience, who are willing to devote their entire time, without regard to the number of hours that may be involved in a day's work. None of them draws the line at eight hours per day.

Some of the engineers and conductors are paid, for five and six hours per day, about as much as some of the executive officers are paid, who work from ten to twelve hours per day, and on holidays, besides.

The executive officers have all very cheerfully accepted the proposed reduction. The appeal to the Interstate Commerce

Commission strikes me as being for advertising purposes only. At the same time any investigation the Interstate Commerce Commission wishes to make will be welcomed by me.

Representatives of the employees have maintained that the wage reduction, put into effect immediately upon the order of the court, violated a section of the Newlands Act of July 15, 1913, regarding receiverships which requires a 20-day notice and a hearing prior to a reduction in wages. It is understood that the federal Department of Justice will endeavor to uphold the Act in this regard.

### Missouri & North Arkansas Suspends Services

The Missouri & North Arkansas has been compelled to suspend service, according to a statement by C. A. Phelan, receiver and general manager, because "the depredations which have been committed would endanger the lives of passengers and employees." The statement of Mr. Phelan follows in part:

The railroad, on receipt of the Labor Board's Decision, advised the Labor Board on February 24 that it was ready to confer with the former employees involved and consider the subject of whether the present wages are just and reasonable as outlined in the Board's decision; and the railroad being aware of the fact that the dispute had been carried to the Labor Board by the representatives of the former employees, assumed that the former employees would abide by the decision of the Labor Board and join the railroad in conference as required by the decision.

An ultimatum from the representatives of the former employees was delivered to the general manager at 5 o'clock p. m., February 25, advising the railroad that unless the wage reduction order was rescinded and the rates of pay in effect prior to February 1, 1921, restored that the men employed on the Missouri & North Arkansas in the capacity of engineers, firemen, hostlers, conductors, trainmen, yardmen, agents, telegraphers, train dispatchers and maintenance of way men would withdraw from the service at 3 o'clock a. m. February 26, 1921, or ten hours after presentation of the ultimatum to the railroad.

When the former employees quit the service of the railroad at 3 o'clock on the morning of February 26 as they said they would do unless the wage reduction order was rescinded, new men were employed to fill the places of those who had quit and little difficulty was encountered in obtaining experienced and qualified railroad men. The new employees are entirely satisfied with the reduced scale of wages and it has been clearly demonstrated that the new organization can operate the railroad efficiently and take care of public convenience and necessity; but since February 26 we have encountered lawlessness and interference in the way of intimidations and threats against the new employees, the new employees and their families have been insulted by former employees, the new employees have been assaulted by former employees, and obstructions have been placed on the railroad track and trains bridges have been burned.

The people and the authorities along this railroad are familiar with conditions and while the railroad has used every means at its command to protect trains and property, that has been impossible. To attempt to continue train operation in the face of the depredations which have been committed would endanger the lives of passengers and employees, and until federal and state authorities provide adequate protection to trains and property of this railroad between Neosho, Missouri, and Helena, Arkansas, we must in the interest of safety discontinue the operation of this railroad.

### Conference with "Big Four" to Be

#### Reported to Committee

T. De Witt Cuyler, chairman of the Association of Railway Executives, announced on March 23 that the result of his conferences with the leaders of the train and engine brotherhoods would be reported to the standing committee of the Association at its next meeting. These conferences were held in Philadelphia on March 14. Mr. Cuyler said further that in his opinion the slump in traffic which has so seriously affected the earnings of the railroads has reached the bottom and that a gradual improvement may be expected from now on. This prospective improvement in traffic, however, will probably not be sufficient to offset the deficits already accrued and readjustments in wage rates and other economies will be necessary, he added.

# General News Department

The Atlanta Passenger Traffic Club, the activities of which were suspended during government operation of the railroads, was reorganized at a meeting in the Healy building, Atlanta, on Tuesday evening, March 15, with a membership of 144. Joseph P. Billups, general passenger agent of the Atlanta & West Point, was elected president of the club, and George F. Grafton secretary. Meetings will be held once a month.

Eastern railroad executives, Daniel Willard of the Baltimore & Ohio, F. D. Underwood of the Erie, A. T. Dice of the Philadelphia & Reading, A. H. Smith of the New York Central and Elisha Lee of the Pennsylvania, had a long conference with Chairman Clark and other members of the Interstate Commerce Commission at Washington on March 24. It was stated that the possibility of operating economies was under discussion.

Five passengers were killed from suffocation by gas, smoke, and other causes not known, when a Pullman car on train No. 115, on the Denver & Rio Grande, caught fire, enroute, on the morning of March 15. The train left Denver at 7:10 p. m. and picked up the sleeper at Pueblo, Col., for Alamosa, N. M. The fire was discovered at the head end of the car as the train neared Walsenburg, Col., about 1:30 a. m. Among the dead was F. S. Steelman, traveling passenger agent of the Missouri Pacific.

Two masked men held up and robbed passengers in the three rear sleepers on the Texas Special, northbound, on the Missouri, Kansas & Texas, between Chockie and McAlester, Oklahoma, about nine o'clock on the night of March 22. The robbers boarded the train at Dennison, Texas, and proceeded to line up the passengers and rifle their pockets, systematically locking each coach when they had finished with the passengers in it. When the train reached McAlester the robbers stopped it and made their escape with approximately \$2,000.

The Tax Bureau of New York State estimates that the State income tax yield for 1920 from railroad employees, who were exempt from payment of tax in 1919 on account of government operation of the railroads will amount to \$1,000,000. Careful estimates place the total number of railroad employees in New York State during 1920 at over 130,000. The railroads were not turned back to private ownership until March 1, 1920, but the additional revenue is expected from the remaining 10 months. An examination of Federal income tax returns shows that hundreds of thousands of persons are paying federal taxes for the first time and a large percentage in New York State are railroad men. The largest increases in the number of employees on New York railroads took place among machinists, boilermakers, blacksmiths, electricians, air-brake men, car inspectors, car repairers, helpers and apprentices, hostlers and enginehouse men.

## Rock Island War Gardens Continued

A total of 1,078 acres of ground were leased for "Right-of-Way Gardens" by employees on 15 divisions of the Chicago, Rock Island & Pacific during 1920, the individual lease averaging 2.65 acres. This plan has been continued on the Rock Island despite the cessation of war pressure which created the war garden plan of food production. While no data are obtainable as to the value of the products raised, it ran into thousands of dollars and is estimated at half a million for the whole system. This amount of money does not represent produce alone, for many of the lessees went in for hog and chicken raising, while one employee had a record yield of hay.

Of the divisions reporting, the St. Louis division heads the list in the matter of leases and acreage, with 136 leases for a total of 260 acres; the Indian Territory division, which comes second, had 41 leases with a total of 225 acres. That

the acreage was well distributed is shown by the fact that the Chicago Terminal division had a total of 2 leases and 1 acre cultivated.

## Railway Returns for January

Later returns of the railroads to the Interstate Commerce Commission for January show a slightly better result than on the earlier returns. One hundred and eighty-two Class I roads, operating 228,000 miles, had a net operating income of \$142,000 as compared with \$59,593,000 in January, 1920. The returns for 166 roads had shown a deficit of \$1,289,000. The 182 roads had freight revenues of \$318,000,000, an increase of 4.3 per cent as compared with January, 1920, and passenger revenues of \$104,000,000, an increase of 14.7 per cent. The total operating revenues were \$461,000,000, a decrease of 6.2 per cent, while the total operating expenses, \$432,000,000, represented an increase of 6½ per cent.

## Certificates Issued for Railroad Guaranty

The Interstate Commerce Commission has issued additional certificates since those reported in last week's issue for partial payments to railroads on account of their guaranty for the six months following the period of federal control in accordance with the provisions of the Winslow law as follows:

		Previously advanced
Boston & Maine.....	\$6,500,000	\$4,000,000
Baltimore & Ohio.....	6,400,000	14,000,000
Delaware, Lackawanna & Western.....	2,000,000	6,569,500
Alabama, Tennessee & Northern.....	40,000	.....
Atchison, Topeka & Santa Fe.....	5,425,000	.....
Central New York Southern.....	27,000	.....
Gulf, Colorado & Santa Fe.....	1,575,000	.....
Minneapolis & St. Louis.....	100,000	2,250,000
Maine Central.....	300,000	1,350,000

The certificates which had been paid by the Treasury Department up to March 22 under the Winslow law, amounted to \$64,719,990.

## Compensation of Employees

The Interstate Commerce Commission has issued a summary of statistics covering employees and their service and compensation for Class I roads for the quarter ending June 30, 1920. This statement indicates the conditions that prevailed before the increase in wages awarded by the Railroad Labor Board on July 20, 1920. The award was retroactive to May 1 but the carriers were instructed in rendering returns not to include any of the back pay for May and June resulting from the decision. The number of employees in service at the middle of the month was 1,952,446 for April, 2,005,483 for May and 2,056,381 for June, or an average of 2,004,760. The total compensation for the quarter was \$801,063,938. For the first quarter of 1920 the average number of employees in service was 1,993,524 and the total compensation was \$795,616,330.

The report gives some indication of the number of yard employees that were out of service during the strikes which were at their height in April. The average number of yard engineers during the first quarter of 1920 was 23,545. During April the number was 20,805 and by June it had increased to 22,471. The average number of yard firemen and helpers during the first quarter was 23,821, for April it was 20,771 and by June it had increased to 22,746. The number of yard conductors or foremen for the first quarter was 23,146, for April it was 17,294 and for June it was 20,562. The number of yard brakemen (switchmen or helpers) during the first quarter was 56,767, for April it was 42,368 and for June it was 51,573.

REVENUES AND EXPENSES OF RAILWAYS

New York City Votes Daylight Saving

New York City, by vote of its Board of Aldermen, is to set its clocks ahead one hour on April 24 and continue daylight saving until September 25; five months instead of seven months, as in previous years.

The New York, New Haven & Hartford announces that its New York suburban trains, and probably many others, will be run one hour earlier than at present. Other roads will, no doubt, take similar action. The New York State law now allows all cities and towns to adopt local ordinances for daylight saving. Connecticut, in which lie hundreds of miles of the New Haven road's lines, sticks to Eastern Standard time, a law just passed making it virtually out of the question for cities to take independent action.

Charges of Shop Unions Renewed

Five additional organizations of shop employees and the Railway Employees Department of the American Federation of Labor have joined with the International Association of Machinists in the complaint filed with the Interstate Commerce Commission requesting an investigation of railroad car and locomotive repair work. The original complaint was filed January 8, 1921, by W. Jett Lauck, representing William H. Johnston, president of the machinists. The press notice, just issued by way of keeping the subject alive, says that since the filing of the original complaint additional investigations have been made and the employees now claim to be prepared to fully substantiate all the charges made. The union heads who have joined with the Machinists' Association in the complaint, and the organizations which they represent, are as follows: B. M. Jewell, president of the Railway Employees Department, American Federation of Labor; J. J. Hynes, international president of the Amalgamated Sheet Metal Workers' International Alliance; Martin F. Ryan, general president of the Brotherhood of Railway Carmen of America; James P. Noonan, international president of the International Brotherhood of Electrical Workers; J. W. Kline, president of the International Brotherhood of Blacksmiths, Drop Forgers and Helpers of America; J. A. Franklin, president of the International Brotherhood of Boilermakers and Iron Shipbuilders.

Appointments Made and Pending

John J. Esch has been given a recess appointment by President Harding as a member of the Interstate Commerce Commission. This will enable him to begin service on the commission at once, pending his confirmation by the Senate, which was postponed until the opening of the extra session because of the opposition of Senator LaFollette, who asked time to file a minority report on the action of the committee in interstate commerce in recommending confirmation.

There are still two vacancies on the commission to be filled by President Harding's appointment and the claims of a large number of candidates have been urged upon the President. A delegation of Senators and Representatives from the Northwestern states has called upon the President to urge him to appoint a commissioner from that section. It is persistently reported that one of the positions is to be offered to Frank Hagenbarth of Salt Lake City, president of the National Wool Growers' Association. F. I. Cox, an officer of a traveling men's association, has also been prominently mentioned as a candidate.

The resignation of John Barton Payne as director general of railroads in charge of the Railroad Administration was made effective as of March 15, but the President has not yet appointed his successor.

The terms of office of three members of the Railroad Labor Board, H. J. Hunt of the public group, W. L. Park of the railroad group and J. J. Forrester of the labor group, expire next month under the terms of the transportation act and the President is expected to make appointments for these positions for the full term of five years. Under the law the original appointments included one man in each group for one year, one man in each group for two years and one man in each group for three years. The appointments are to be made in the same way as the original appointments, that is, on nominations by the labor organizations and by the railroads in the case of the representatives of those groups.

## Traffic News

The Traffic Club of Kalamazoo (Mich.), organized late in 1920, finds itself prosperous and growing. The regular meetings are held on the first and third Thursdays of each month. The officers are: W. C. Thoms (Mich. Cent.), president; L. R. Fulton (Barley Motor Car Company), vice-president; G. J. Bolender (Chamber of Commerce), secretary; A. H. Bock (N. Y. C.), treasurer.

W. K. Vandiver, assistant manager of the Department of Traffic, United States Railroad Administration, has resigned to become traffic manager for the Grain Dealers' National Association, with office in the Gardner building, Toledo, Ohio. Mr. Vandiver had been with the Railroad Administration for about a year, previous to which time he was assistant general freight agent of the Mobile & Ohio.

At a recent meeting of the El Paso, Texas, Traffic Club the following officers were elected: President, N. L. Rankin, traffic manager, Texas & Pacific; vice-presidents, J. D. Neely, traffic manager, Krakauer-Zork Company; W. C. McCormick, assistant general freight and passenger agent, Southern Pacific, and H. D. McGregor, division passenger agent, El Paso & Southwestern; secretary-treasurer, George Deck, district passenger agent, Texas & Pacific.

"Weighing Carload and Less Than Carload Freight" was the subject of the transportation discussion at the Traffic Club of Chicago on March 24. Among the speakers were A. S. Dodge, superintendent Western Weighing Bureau; F. V. Roy, Fairbanks, Morse & Co.; H. A. Foss, Weightmaster, Chicago Board of Trade; J. S. Brown, Chicago Board of Trade; W. J. Womer, Consumers Company; Murray N. Billings, Illinois Steel Company; R. B. Goe, Illinois Central, and C. T. Scribner, Chicago, Burlington & Quincy.

Traffic Director Hardie and Examiner Healey of the Interstate Commerce Commission will next Monday conduct a conference relative to rates on fruits and vegetables, at the Federal building in Dallas, Texas. This conference is called at the request of the Texas commission and the Texas state legislature, to investigate the alleged serious situation of producers of fruits and vegetables in Texas. The conference is to be held between shippers and carriers, and while it relates primarily to the rates to and from Texas and Southwestern points, carriers' and shippers' organizations from other fruit and vegetable producing districts, in particular the Southeast and Florida, will be given an opportunity of making a statement relative to the general situation, if they so desire.

### Coal Production Continues to Decline

Production of soft coal during the week ending March 12 dropped below the 7,000,000 ton mark. The total output is estimated at 6,891,000 net tons, according to the weekly bulletin of the Geological Survey, a decrease of 5 per cent below the revised figure for the week preceding. What was last week reported to be a slight recovery is now shown by corrected figures to have been instead a decrease, so that the decline in production since December, 1920, has been unbroken.

### Temporary Reduction of Live Stock Rates

A temporary reduction in the rates on stocker and feeder cattle from the ranges in the Southwest to the feeding grounds in Oklahoma, Kansas, Nebraska, Colorado, Wyoming and Montana, from April 15 to July 1 was agreed to by traffic officers of the western railroads at a conference in Washington with representatives of the live stock shippers and Chairman Clark of the Interstate Commerce Commission on March 17. The rates in effect on August 25, 1920, prior to the 35 per cent advance made under Ex Parte 74, will be restored. It was estimated that this reduction would result in a movement of 900,000 head of cattle and was agreed to because of the depressed condition of the live-

stock industry and the need for larger shipments of cattle to the regions which have been subject to drouths.

### Coal-Car Distribution Rules to Be Investigated

The Interstate Commerce Commission has ordered an investigation of the present car distribution rules in so far as they apply to privately owned coal cars and cars furnished for railroad fuel coal, with a view to prescribing such just and reasonable rule or regulation as may appear to be necessary. The proceeding is assigned for hearing at such times and places as the commission may hereafter direct.

Service Order No. 18, issued on September 28, providing for the assignment of cars for railroad fuel has been vacated and set aside.

### Free Tolls Through Panama Canal Proposed

The new Congress which meets in extra session on April 11 is expected to take up at an early date the question of restoring the law providing for free tolls for vessels using the Panama Canal which was repealed early in the Wilson administration. President Harding has expressed himself as being in favor of free tolls and it is commonly predicted that the measure will be passed by Congress. Such a step would greatly increase the competition against the transcontinental railroads which have been comparatively free from water competition during the war period. The transcontinental rail rates have been readjusted in various ways in accordance with the condition of comparative absence of competition; and the stimulus to shipping which would be given by taking off the tolls would doubtless reopen the question of the rail rate adjustment.

### Application of Rate Increases to

#### Points Near Regional Border Line

W. V. Hardie, director of traffic of the Interstate Commerce Commission, has issued a notice concerning increases in freight rates under Ex Parte Order No. 74 to and from points in close proximity to the border line between the eastern and southern groups as defined in the report in that proceeding.

The commission sees no occasion to question the action of the carriers in treating points on the Bristol line of the Norfolk & Western from Radford, Va., to Bristol, as border line points, applying an increase of 40 per cent to the rates locally on such line and to rates between points on such line and points in the eastern group; and 25 per cent to the rates between such points and points in the southern group.

The situation as to the Clinch Valley branch of the Norfolk & Western leading from Bluefield, Va., to Norton, Va., and of the Lexington-Louisville branch of the Chesapeake & Ohio from Ashland, Ky., to Louisville is similar.

The Big Sandy Division of the C. & O. (Huntington to Elkhorn City) and the line of the Morehead & North Fork should be considered as being within the southern group, subject to 25 per cent increase upon local rates and 33½ per cent as to rates to and from points in the eastern group.

In reaching the informal conclusions above indicated, the commission gave consideration to the following paragraph which appears in its report in Ex Parte 74 on page 247:

"In the construction of rates in accordance with these findings it is not intended that the group boundaries should be strictly observed, but the territorial boundaries heretofore recognized should be observed. For example, Richmond, one of the so-called Virginia cities, should continue on the basis which it has heretofore enjoyed."

In many cases local rates between points on the lines above described are and have been subject to the official classification; joint rates between such points and points in the eastern group have been generally subject to the official classification and have been constructed and predicated in a general way with relation to the adjustment in trunk line and central freight association territories. To apply any increase as to traffic between such points and points in the eastern group different from that applicable to the eastern group would create many fourth section violations and require numerous readjustments, many of which may be avoided by the method of applying the increases which has been used by the carriers and is considered informally by the commission not to be at variance with its findings in Ex Parte 74.

## Commission and Court News

### Interstate Commerce Commission

The Commission has issued its order in the Georgia intrastate rate case, ordering increases in the rates on cotton, cotton linters and brick, corresponding to the increases made in interstate rates.

The Commission has further suspended until April 30, proposed changes in rates for the diversion and reconsignment of fruits and vegetables and other commodities shown in tariffs of various carriers throughout the United States.

The Commission has further suspended until April 21 the operation of certain proposed cancellation of and increase in water competitive rates on lumber, c. l. from various shipping points in the Carolinas, Georgia, Florida, Virginia and eastern Alabama to Baltimore, Philadelphia, New York, and Boston, etc.

The Interstate Commerce Commission has issued its decision in Nevada intrastate rate case ordering a general increase in the rates in Nevada by the percentages previously authorized for interstate rates. The Nevada Public Service Commission had denied permission to the railroads to make such increase.

The Interstate Commerce Commission has issued a decision finding not justified proposed increased rates on lumber from points in the South to Eastern Trunk Line and New England territories. The railroads by tariffs filed to become effective November 22 had proposed to cancel the joint rates designated as water competitive rates, thereby leaving in effect higher commodity rates.

### Florida Rates Increased

The Interstate Commerce Commission has issued its order in the Florida intrastate rate case ordering increases in the state freight rates to correspond with the increases in interstate rates authorized in Ex Parte 74. No issue as to passenger fares was involved. The Florida commission had issued an order effective on October 1, 1920, directing an increase in freight rates on the basis of the rates in force prior to the effective date of General Order No. 28 of the director general of railroads, plus 25 per cent, plus a second 25 per cent. This was to avoid the effect of the general order which had increased rates for short haul traffic by more than the general increase made at that time. The opinion, by Commissioner Daniels, says that the effect of this order is to treat Florida as separate and distinct from the other states in the Southern group and to require a different scheme of rate-making which would obviously result in a serious disruption of the rate structure in Florida and indirectly in other parts of the Southern group. Referring to the Interstate Commerce Commission's order in Ex Parte 74, the opinion says that in reaching its conclusions in that case the commission "anticipated that the various state authorities would authorize corresponding increases, as most of them have since done."

### Court News

#### Foreclosure Purchasers of Unprofitable Railroad Cannot Be Compelled to Operate at a Loss

Ordinarily, the owner of a railroad may be compelled to perform the obligations which it has assumed to the public. Having constructed and operated its road under the powers and privileges of its franchise it cannot at its option or caprice abandon it and tear it to pieces. But where a railroad has never earned any surplus above operating expenses or enough to keep it in repair, pay taxes or meet interest charges, the Iowa Supreme court holds that purchasers on foreclosure cannot be compelled to restore the road at a large outlay, and to operate it at a loss.—*State v. Blaton* (Iowa), 178 N. W. 1.

### Assumption of Risk

The Wisconsin Supreme Court holds that the head brakeman of a freight train, late for his train, who attempted to board it when it was moving at 10 or 12 miles an hour, assumed the risk of being thrown under a car.—*Ramstrom v. C. M. & St. P.* (Wis.), 178 N. W. 239.

### Care of Automatic Bells at Crossings

The Indiana Appellate Court holds, in a crossing accident case, where an electric gong installed by the railroad at the crossing did not ring, that knowledge of the railroad that the gong was out of repair and want of knowledge on the part of the traveler, are both essential to recovery for failure to use reasonable care to keep the gong in good condition.—*Lake Erie & W. v. Howarth* (Ind.), 127 N. E. 804.

### Agreement to Extend Time of Confinement of Cattle

The Indiana Appellate Court holds that a contract to ship cattle within a reasonable time was not made a preferential one in violation of the statutes regulating interstate commerce merely because the shipper requested the railroad to extend the time of confinement without unloading for feed, water and rest for 36 hours, as authorized by statute, the agreement to extend the time being open to all shippers.—*B. & O. S. W. v. Bower* (Ind.), 127 N. E., 458.

### Passenger With Intoxicated Driver

The Indiana Appellate Court holds that a member of an automobile party which had been drinking intoxicating liquors, who knew of the intoxicated condition of the driver in time before a crossing was reached to have left the automobile and avoided injury when it was struck by a train, was guilty of contributory negligence, barring recovery; and this whether warning signals were given by the railroad or not.—*Kirinse v. Chicago, T. H. & S. E.* (Ind.), 127 N. E. 837.

### Limitation as to Passengers' Baggage Valid

#### Despite Cummins Amendment

The North Carolina Supreme Court holds that the amendment of Aug. 9, 1916, to the Cummins amendment of March 4, 1915, expressly exempts baggage from the provisions as to an interstate carrier's liability for full actual loss notwithstanding a release; and a railroad's limitation of its liability to \$100 in a baggage tariff duly filed and approved, restricts the passenger's recovery to \$100.—*Culbreth v. Martin* (N. Car.), 103 S. E. 374.

### "Last Carrier" Road Which Switches Car

In an action for damages to a shipment of machinery which the defendant, amongst others, carried, it appeared that the defendant delivered the sealed car to another carrier, to be switched a short distance to the plaintiff's warehouse. The other carrier received no part of the through freight, but charged defendant \$2 for switching. The South Carolina Supreme Court held that the defendant was not the last carrier, and therefore was not chargeable with the presumption that it wrought the damage; and judgment for the plaintiff was reversed.—*Southern Textile Mach. Co. 5, Piedmont & Northern* (S. Car.), 103 S. E. 475.

### Reasonable Notice of Claim Necessary Though

#### Disease Develops After Delivery

A provision in a bill of lading for live stock that a verified statement of any claim shall be filed within five days after delivery at destination, is valid. The Indiana Appellate Court holds that, while the fact that pneumonia did not develop until three days after delivery would be a reasonable excuse for not presenting the claim in five days, this would not relieve the shipper entirely from giving any notice or presenting any claim within a reasonable time; and a failure to give notice or present claim for 75 days was a violation of the contract. The railroad must have an opportunity to investigate as to its liability within a reasonable time and while the cattle were sick.—*Chicago, I. & L.* (Ind.), 127 N. E. 209.

## Foreign Railway News

### Chile Asks Bids for Electrification

The Chilean government will receive bids, beginning March 31, for the electrification of the government railway from Valparaiso to Santiago, according to a cablegram from Ambassador Shea at Santiago.

### The British Railway Situation

The Ministry of Transport of Great Britain last September appointed a committee headed by Lord Colwyn to examine into the nature and terms of the agreements made between the government and the various carriers, to determine the liabilities of the government under the agreements and whether or not any further steps should be taken to assure that the interests of the state under the agreements was adequately safeguarded. The committee was unable to report on the amount of the outstanding liabilities at the present time. Claims against the government are expected, however, to amount to a considerable sum for arrears in maintenance, abnormal wear and tear and depletion of stores. The committee reported that these claims, which it estimates at about \$750,000, can be reduced to an "insignificant figure." This statement is taken by some of the railway officers as an indication of an attitude on the part of the government which gives little promise of satisfactory legislation providing for a return of the roads to their owners in the fall and a general lack of sympathy with their requirements.

### China Notes

PEKING.

*Revenues.*—Revenues of the Chinese Government Railways for 1920 are estimated to aggregate a nominal total of \$89,000,000, or an increase of \$6,000,000 over the previous year. This is considered very favorable in view of the fact that operations on the four largest lines were almost entirely interrupted throughout July due to military demonstrations. However, the nominal increase will not be realized in cash, for it includes charges for a large increase in military transportation, and charges for grain carriage for famine relief societies, all of which will be accepted as government accounts.

*Famine Alleviated.*—Early reports of famine conditions prove not only to have been badly exaggerated, but the ability of native means for combating those conditions was under-rated. Perhaps the biggest piece of famine relief work done by any authority or group has been accomplished by the Ministry of Communications. Early in the autumn grain rates into the famine area were reduced thirty per cent and in the reverse direction were advanced by the same amount. The result has been a great movement of grain into the larger centers of the famine provinces, and stable prices. In addition, in spite of an empty treasury, the Ministry granted free transportation to food stuffs shipped by bona fide relief societies, and to relief workers. Construction work was started on the Tsangchow-Shihchiachuang line in Chihli, through the heart of the famine district, on the Cheefoo-Weihsien line in Shantung, and on the extension to the Taokow-Chinghua line in Honan, another famine district.

*Railways Assume Risks for Freight.*—On January 1, the principal Chinese Government Railway lines began to assume risk of shipment, under special conditions. Heretofore shipments have been accepted only at owner's risk, which necessitated sending of watchmen along with every shipment. On ordinary freight, now, the railway will assume full responsibility at a rate ten per cent in excess of the usual rates.

*Metric System Adopted.*—On January 1, the metric system of weights and measures went into effect on the Government Railways. All distances and rates are quoted in terms of kilometres. Passenger rates between stations are unchanged, however. Freight rates underwent considerable change on January 1, for with the change to the metric system, new classifications of goods went into effect, uniform on the principal lines. The tapering system of rates was introduced. The "taper" is effective every hundred kilometres, but the rate of taper is temporarily left to the

discretion of each line, so that local conditions may be met. Over a distance of 400 kilometres the reductions on the various lines fluctuate from 15 to 25 per cent. Standard rules for passenger and freight traffic also went into effect on January 1.

*New Passenger Service.*—Beginning January 1, the Peking-Mukden and Tientsin-Pukow lines began to operate a through express passenger train from Pukow to Peking, eliminating the necessity of change and possible loss of connection at Tientsin. This express makes through service from Peking to Shanghai with only one break, the transfer over the Yang Ste river, Nanking to Pukow. A train ferry over the river at this point has been authorized in the budget and is expected to be in service within eighteen months. An express extra-fare train between Peking and Hankow has also been inaugurated. No passes are good on this train and the soldier evil is therefore eliminated. This train is tri-weekly in each direction. A ferry service connecting the Peking-Hankow Railway with the Canton-Hankow line at Wuchang has been established by the former line. January 1, the Peking-Suiyuan line opened an extension of about 40 miles north of Fengchen. It is expected that rails will be laid into Suiyuan by mid-summer.

*Railway Funds for Railways Only.*—Yeh Kung Cho, Minister of Communications, has secured the approval of the cabinet to a resolution that hereafter "railway funds will be devoted exclusively to railway uses." The first fruit of this policy is the application of the famine sur-charges on passenger tickets and freight charges to the construction of the three railways mentioned above, upon which famine refugees are employed. This has aroused some friction with the Ministry of the Interior to whom general famine relief measures have been committed. The second fruit of the policy has been the setting aside of \$250,000 per month out of the revenues of the Peking-Hankow and Tientsin-Pukow railways, to be devoted to the construction of the Canton-Hankow line. C. J. Carroll, chief engineer of the American section of the Szechuan line, has been put in charge of surveys for this new construction.

*Bids Asked for Bridge.*—The Ministry of Communications is advertising for bids for the Yellow River bridge. The present bridge was originally intended as a temporary structure to last fifteen years. That period has elapsed, and the wheel load of new types of power render the structure unsafe at a speed in excess of eight miles per hour.

*New Accounting System.*—Because of the multiplicity of new methods coming into effect on January 1, the through billing of goods has been postponed to be effective February 1. Uniform station accounts have been postponed, effective July 1, and uniform store accounts, which were framed six months ago will not be promulgated until July 1. In the meantime the standing committee for the unification of railway accounts and statistics has framed a standard set of forms and rules for engineers on construction, which will be held over until effect has been given to the above. However, most of the lines having occasion to make changes are voluntarily following the suggestions of the committee. On February 1, the "through-traffic" lines will inaugurate standard forms and rules for car distribution and car records. These rules involve the employment of a regular "car distributor," the compilation of "car kilometrage" both loaded and empty, and the direct reporting of car detention to the car distributor. A beginning is made also toward tonnage rating of locomotives, and a record of per cent of total power utilized.

*Record Traffic.*—A tremendous strain is being put on the Peking-Mukden line to haul sufficient grain from Manchuria to supply the famine area. Manchuria is the only large source of supply, and the Peking-Mukden is the only connecting railway. Old locomotives and 65-lb. rail on the northern half of this line make a severe handicap, but during the four months September to December inclusive, 1920, the tons delivered "inside the wall" were nearly ten times any previous record. Cars average nearly 200 kilometres per day while in this service.

*Loan for New Rolling Stock.*—Probably the most significant piece of railway financing of recent years in China, is the loan just concluded by the Ministry of Communications with a group of native banks for \$6,000,000 to be used for the purchase of rolling stock. It is secured on the revenues of the Peking-Hankow line, and bears interest at 8 per cent. By some this is interpreted to be the answer of China to the alleged terms of the Consortium. This is undoubtedly overshooting the mark. But it probably does mean an intelligent interest in governmental affairs hereafter on the part of Chinese financiers, which will have a salutary effect upon governmental credit as well as expenditure.

## Equipment and Supplies

### Locomotives

THE IMPERIAL JAPANESE GOVERNMENT RAILWAYS is having 30 locomotives built in Japan.

THE HOKKAIDO KOYO TETSUDO, Japan, has ordered 1 2-6-2 type locomotive from the Baldwin Locomotive Works.

### Freight Cars

THE IMPERIAL JAPANESE GOVERNMENT RAILWAYS' program for new equipment calls for the construction in Japan of 1,500 new cars each year. The construction of 50 freight cars and 50 passenger cars may be authorized in the near future.

THE TIENSIN-PUKOW, reported in the *Railway Age* of February 4 as being in the market for 300 40-ton all-steel gondola cars, has ordered this equipment through Mitsui & Co., 65 Broadway, New York, from the American Car & Foundry Co.

THE ANGLO-BRAZILIAN COMMERCIAL & AGENCY COMPANY, LTD., Rio de Janeiro, Brazil, reported in the *Railway Age* of January 21, as inquiring through the car builders for 300 low side freight cars, has renewed its inquiries for this equipment.

### Passenger Cars

IMPERIAL JAPANESE GOVERNMENT RAILWAYS. See item under Freight Cars.

### Machinery and Tools

THE BATAVIA CAR WORKS, INC., Batavia, N. Y., is in the market for a large amount of shop equipment.

THE NEW YORK CENTRAL is inquiring for a 400-ton wheel press, a 6-ft. radial drill, a 48-in. planer, and a 54-in. boring mill, for its shops at Avis, Pa.

THE DELAWARE, LACKAWANNA & WESTERN has ordered a 5-ft. Ryerson-Conradson radial drill, for its Kingsland shops, from Joseph T. Ryerson & Son.

### Miscellaneous

THE NEW YORK CENTRAL will receive bids until noon March 28, for its requirements until July 1, 1921, for the line Buffalo and East, of fuel oil, gasoline, kerosene, gas oil and lubricating oil, also turpentine substitute and tallow candles.

THE LONG ISLAND is asking for bids until 2 p. m., March 30, for 3,000,000 to 3,300,000 gal. of fuel oil for use on vessels and boats controlled and operated by the marine department of the Long Island Railroad during the 12 months from April 1, 1921

### Signaling

MITSUI & Co., 65 Broadway, New York, has ordered 21 complete sets of automatic signals from the Union Switch & Signal Co., for use on 10 miles of double track of the Osaki Interurban Railway.

EASTERN RAILROAD EXECUTIVES, Daniel Willard of the Baltimore & Ohio, F. D. Underwood of the Erie, A. T. Dice of the Philadelphia & Reading, A. H. Smith of the New York Central and Elisha Lee of the Pennsylvania, had a long conference with Chairman Clark and other members of the Interstate Commerce Commission at Washington on March 24. It was stated that the possibility of operating economies was under discussion.

## Supply Trade News

Carl W. Bettcher has been appointed sales manager of the Eastern Machine Screw Corporation, New Haven, Conn. Mr. Bettcher will give his special attention to the expansion of its H & G die head business.

The Track Specialties Company, 29 Broadway, New York, on March 1, appointed the C. H. Small Company, Monadnock building, San Francisco, Cal., as its agent at that place and R. J. Glendinning & Co., 1102 Newhouse building, as its agent in Salt Lake City, Utah.

The Blaw-Knox Company will establish a sales office in the southwest, with headquarters in Kansas City, Mo., on April 1. R. B. Randall of the Chicago office will be in charge of the new territory and offices will be located in the Interstate Building at Kansas City.

Ralph T. Hatch, whose appointment as general manager of sales of the Reading Steel Castings Company, a subsidiary of the American Chain Company, with headquarters at Reading, Pa., was announced in the *Railway Age* of March 18 (page 738).

R. T. Hatch

entered railroad sales work with the B. F. Goodrich Rubber Company at Akron, Ohio, and was for several years railroad representative of this company. For the past 14 years he has been connected with the sales department of the National Malleable Castings Company, serving this company first as manager of Canadian sales with headquarters at Montreal, Can., and later coming to the Chicago office of the company. At the time

of his recent appointment he was serving as district manager of sales for the Northwestern territory, with headquarters at St. Paul, Minn., a position he had held for several years.

Gunni Jeppesen, formerly chief engineer of the Strauss Bascule Bridge Company, Chicago, has joined the Chicago Bascule Bridge Company, Chicago, Ill., as associate engineer. Mr. Jeppesen, who is a graduate of the State Polytechnical Institute at Copenhagen, Denmark, was connected with the Strauss Company for 12 years, from its inception until 1917, and since then has been engaged in industrial plant work as structural engineer of the Leonard Engineering Company.

The Arkansas Preservative Company has been organized by E. B. Fulks, president and John L. Pfeiffer, secretary, to make zinc chloride. The company has established offices in the Carlton building, St. Louis, and is now completing a plant to manufacture zinc chloride at Little Rock, Ark., which plant will be completed in about a month. Mr. Fulks was vice-president of the American Tar Products Company, Chicago, until last summer.

J. Brookes Spencer, assistant to first vice-president of the Southern Wheel Company, St. Louis, Mo., has been elected vice-president with headquarters at St. Louis. Mr. Spencer was born in St. Louis on January 15, 1888. He was educated at the Hill School, Pottstown, Pa., and was graduated from Yale University in the class of 1910. In 1917 he entered the service of the Southern Wheel Company at St. Louis and has been with this company since that time with the exception of a year when he served in the United States Army.

## Fairbanks, Morse &amp; Co.

The annual report of Fairbanks, Morse & Co for the year 1920 shows a net profit of \$2,678,735 for the year, after providing for sinking fund, federal taxes and special inventory depreciation, the latter deduction amounting to \$1,650,000. After allowing for preferred dividends, the net balance available for common stock is \$2,558,735, equal to \$8.25 per share on the no par common stock outstanding. The net balance available for common stock in 1919 was \$3,176,862, equal to \$10.25 per share on the present capitalization.

## Chicago Railway Equipment Company

During the year 1920 the business of the Chicago Railway Equipment Company was the largest in its history, both in volume and in money. While the volume of railway work was 50 per cent of its total business, the profit from that work was only 37 per cent of the company's total profits for that year. Dividends totaling 10 per cent were paid during the year.

No income account was issued, but the following balance sheet was given:

ASSETS		Dec. 31, 1920	Dec. 31, 1919
Property	.....	\$1,476,663	\$1,325,910
Good will, patents, etc.	.....	793,225	766,757
Inventories	.....	1,700,280	1,236,359
Investments	.....	1,176	1,176
Liberty bonds	.....	549,450	666,900
Accounts, bills, revenue and cash	.....	1,786,158	1,598,490
Deferred charges	.....	3,156	357
Total assets	.....	\$6,310,110	\$5,595,960
LIABILITIES			
Capital stock	.....	\$2,996,800	\$2,993,760
Current liabilities	.....	479,752	306,305
Reserves	.....	305,020	163,439
General reserves	.....	2,000,000	1,500,000
Surplus	.....	530,536	632,546
Total liabilities	.....	\$6,310,110	\$5,595,690

## Western Electric Company

The total sales of the Western Electric Company during 1920 amounted to \$206,112,000 as compared with \$135,722,000 in 1919. The net earnings for the year, as shown by the company's annual report, were \$8,277,414, or 7.2 per cent on the average investment for the year, which was \$114,900,000. This compares with net earnings of \$5,652,089 for 1919, or 6.9 per cent on the average investment for that year of \$81,400,000. Interest amounting to \$4,037,645 and dividends amounting to \$3,345,000 were paid, leaving a surplus of \$894,769.

The unfilled orders of the company at the end of the year aggregated \$82,655,000, as compared with \$47,442,000 at the end of the year 1919, and \$26,265,000 at the end of the year 1918.

The balance sheet, December 31, 1920, follows:

ASSETS		
Total plant	.....	\$37,838,313
Merchandise	.....	\$72,209,721
Cash	.....	7,825,257
Bills receivable	.....	848,378
Trade acceptances	.....	1,869,307
Accounts receivable	.....	44,012,698
Total current assets	.....	126,765,361
Liberty Bonds	.....	1,193,220
Trustees, employers' bond purchase plan	.....	1,066,751
Sundry investments	.....	2,703,265
International Western Electric Co., Inc.	.....	19,017,286
Grand total	.....	\$188,584,196
LIABILITIES		
Common stock	.....	\$57,949,453
First mortgage bonds, 5 per cent, 1922	.....	15,000,000
Convertible gold bonds, 7 per cent, 1925	.....	27,000,000
Total capital liabilities	.....	\$99,949,453
General bills payable	.....	\$41,550,000
Bills payable secured by Liberty Bonds	.....	1,200,000
Trade acceptances discounted	.....	1,082,384
Accounts payable	.....	14,563,466
Total current liabilities	.....	58,395,850
Reserve for depreciation on plant	.....	\$24,021,005
Reserve for employees' benefit fund	.....	1,600,000
Reserve for contingencies	.....	4,617,888
Total reserves	.....	30,238,893
Grand total	.....	\$188,584,196

## Bethlehem Steel Corporation

The net income of the Bethlehem Steel Corporation for the year ended December 31, 1920, as shown by its annual report, was \$14,458,836, comparing with \$15,356,860 for 1919. The value of unfilled orders on December 31, 1920, was \$145,286,637, as compared with \$251,422,545 at the close of 1919.

The summary of surplus account since the formation of the corporation in 1905 showed total net earnings for that period of \$317,798,983. Of that amount \$165,797,372 was deducted for interest charges, discounts, special reserves and depreciation. Cash dividends of \$41,174,825 and stock dividends amounting to \$30,000,000 were paid. The sum appropriated for and invested in additions to property and working capital aggregated \$70,000,000, leaving an unappropriated surplus of \$10,826,786 at the end of the year.

The report, which is signed by C. M. Schwab, chairman of the board, and E. G. Grace, president, says in part:

"An issue of \$2,660,000 Bethlehem Steel Company equipment trust 7 per cent gold certificates was sold in 1920 to provide in part for the purchase of 1,000 70-ton coal cars of steel construction. Another issue of \$750,000 Bethlehem Steel Company equipment trust series B 6 per cent gold notes was delivered during the year in part payment for 549 steel coal cars purchased from New England Fuel & Transportation Company.

"Through the medium of the employees' representation plan in the plants of your corporation, relations with the employees have continued on a satisfactory basis. The rapid contraction in the volume of business and the decline in the market prices of all products have necessitated a very large decrease in the number of employees, together with a reduction in wage rates. In this readjustment representatives of the employees have met the management in a fair and co-operative spirit."

The comparative income account for the years ended December 31, 1920 and 1919, is as follows:

	1920	1919
Gross sales and earnings	\$274,431,236	\$281,641,908
Less—Manufacturing cost and operating expense, including administrative, selling and general expense, and taxes	239,468,865	246,494,159
Net manufacturing profit	\$34,962,371	\$35,147,749
Interest, dividends and other miscellaneous income	1,389,182	2,293,469
Total net earnings	\$36,351,553	\$37,441,218
Less—Interest charges, including proportion of discount on and expense of bond and note issues	7,951,203	9,518,206
Balance	\$28,400,350	\$27,923,012
Provision for depreciation, obsolescence and depletion	13,941,515	12,566,152
Net income for the year	\$14,458,836	\$15,356,860

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company contemplates the construction of a craneway building, with dimensions of 50 ft. by 100 ft., at Topeka, Kan., to cost about \$13,000.

**CHICAGO & NORTHWESTERN.**—This company contemplates rebuilding its grain elevator on the Calumet river, Chicago, which was leased to the Armor Grain Company and which was partially destroyed by an explosion on the evening of March 19.

**CHICAGO UNION STATION COMPANY.**—This company has awarded a contract for fabricating the structural steel to be used in the construction of the new railway mail terminal building, Chicago, to the MacClintock-Marshall Company, Pittsburg, Pa. The company has awarded contracts to the Fort Pitt Company, Pittsburg, for fabricating the structural steel to be used in building the Madison street viaduct, and in widening Canal street between Van Buren and Harrison streets, Chicago.

**ILLINOIS CENTRAL.**—This company is accepting bids for two viaducts at Fort Dodge, Iowa, to cost approximately \$30,000 each. The company is also accepting bids for the construction of two bridges at Council Hill, Ill., to cost a total of \$60,000.

**ILLINOIS CENTRAL.**—The Groom Coal Company, which was announced in the *Railway Age* of February 11, as contemplating a coaling station on the line of the Illinois Central at Belleville, Ill., has awarded a contract for a 500-ton frame coaling station, to cost approximately \$40,000, to the Railway Water & Coal Handling Company, Chicago.

**OREGON SHORT LINE.**—This company contemplates improvements on its station at Twin Falls, Idaho, to cost approximately \$15,000.

**UNION PACIFIC.**—This company in conjunction with the United States Bureau of Public Roads and the State of Utah will construct a viaduct over the company's tracks and a bridge crossing the Weber river, Riverdale, Utah.

## Railway Financial News

**ALABAMA & VICKSBURG.**—*Authorized to Issue and Pledge Bonds and Notes.*—This company has been authorized by the Interstate Commerce Commission to issue \$542,900 of 5-year, 6 per cent, promissory notes and \$2,423,000 of 6 per cent, first mortgage bonds maturing April 1, 1951, to pledge \$543,000 of the bonds as collateral for the notes and \$1,880,000 with the Secretary of the Treasury for loans from the revolving fund.

**CHICAGO, BURLINGTON & QUINCY.**—*Declares Stock Dividend.*—The directors have declared a stock dividend of 54.132 per cent, payable to stockholders of record March 31. The stock dividend will amount to 600,000 shares on the \$110,839,100 capital stock outstanding (\$100 par value). Northern Pacific and Great Northern together own \$109,114,810 Burlington stock. Their share of the dividend will amount to 590,660 shares.

The Burlington was recently granted permission to issue \$60,000,000 additional stock as a step to assist the two owning lines to meet the \$215,000,000 Great Northern-Northern Pacific joint Burlington collateral 4s maturing July 1, next. As noted in the *Railway Age* of March 4, page 499, the commission refused that part of the Burlington's application which requested permission to capitalize an additional part of its surplus by the issuance of \$80,000,000 bonds.

**CHICAGO & ILLINOIS MIDLAND.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$1,750,000 of 10-year, 7 per cent debenture bonds to be delivered to the Commonwealth Edison Company, Chicago, to refund an equivalent amount of open account indebtedness.

**HAMPDEN RAILROAD.**—*Receivership.*—By an interlocutory decree filed in the Superior Court at Springfield, Mass., on March 19, William E. Gilbert was appointed receiver for this corporation with instructions to make a complete return of the road's assets within thirty days. Mr. Gilbert is president of the Union Trust Company of Springfield, Mass. The court action was taken on a suit brought against the road by the Hampden National Bank of Westfield, Mass. H. W. Ely, counsel for the road, said that the receivership was for the purpose of winding up the affairs of the corporation.

The Hampden Railroad was incorporated in July, 1910, in Massachusetts. It runs from the Boston & Albany, two miles east of Springfield, to a connection with the Boston & Maine at Bondsville, 15 miles. Upon completion, the Hampden Railroad was to be leased to the Boston & Maine for 99 years at rental equal to interest on the debts of the corporation and 5 per cent dividends on the stock, but as the lease has not been approved by the Public Service Commission of Massachusetts, the road has not been opened for operation, and the Boston & Maine has not assumed any obligations under the lease. The directors of the Boston & Maine voted on December 29, 1913, to buy or lease the road on terms approved by the Massachusetts Railroad Commission, but the Massachusetts legislature on June 18, 1914, defeated the bill providing for the lease. The company on July 4, 1914, filed a suit against the Boston & Maine to enforce its alleged contract liability, amounting to between \$3,500,000 and \$4,000,000, the approximate cost of the line, but the suit was decided in favor of the Boston & Maine. The case was taken to the Supreme Court on exceptions and an opinion was rendered on June 25, 1919, overruling the exceptions. The petition for a rehearing was denied by the court in the fall of 1919.

**ILLINOIS CENTRAL.**—*Authorized to Issue Equipment Trust Certificates.*—This company has been authorized by the Interstate Commerce Commission to enter into an equipment trust agreement with the Commercial Trust Company for the issuance of \$3,564,000 of 6½ per cent equipment trust certificates for the acquisition of 50, 2-10-2 type freight locomotives and 25, 8-wheel switching locomotives at an estimated cost of \$5,941,250.

**MAINE CENTRAL.**—*Annual Report.*—The annual report of this railroad is reviewed editorially in this issue.

**MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.**—*Asks Authority to Purchase Line.*—This company has applied to the Interstate Commerce Commission for authority to acquire by purchase the property of the Wisconsin & Northern, which operates 133 miles in Wisconsin, at a price of \$25,000 per mile, or \$3,339,500, of which \$668,500 is to be paid in cash and \$2,671,000 in 5 per cent consolidated gold bonds. Authority for the issuance of the bonds is also requested.

Darling in the Chicago Post

**NATIONAL RAILWAYS OF MEXICO.—Annual Report.**—The income statement of the National Railways of Mexico for the fiscal year ended June 30, 1920, does not include any earnings for the operation of the National Railways of Mexico. It shows charges, principally of interest on funded debt and short term notes, amounting to 24,708,498 Mexican gold pesos (\$12,354,249 in United States currency) and a deficit balance for the year of 23,557,264 pesos (\$11,778,632). The general balance sheet as of June 30, 1920, shows a deficit balance to profit and loss of 169,445,025 pesos (\$84,722,513). The funded debt as of June 30 is shown as 407,672,380 pesos (\$203,836,190) and among the other items on the liabilities side is 67,324,263 pesos (\$33,662,132), representing notes payable which matured in 1915, 1916 and 1917, which were not paid.

The earnings of the lines of the National Railways of Mexico as operated by the government are shown in an exhibit to the executive president's report. They show gross earnings of 73,207,569 pesos (\$36,603,785), operating expenses of 46,983,697 pesos (\$23,491,649) and net earnings of 26,223,872 pesos (\$13,111,936), but, as noted above, this figure is not included as income by the corporation. Subsidiary lines showed operating deficits under the government administration as follows: Vera Cruz & Isthmus, 179,029 pesos (\$89,515); Pan-American Railroad, 620,612 pesos (\$310,306).

**NEW YORK, NEW HAVEN & HARTFORD.**—No Receivership Contemplated.—In reply to the assertion of E. J. Rich, counsel for the Associated Industries of Massachusetts, that he doubted if anything could save this road from a receivership, E. J. Pearson, president of the New York, New Haven & Hartford, has issued the following statement:

"The unauthorized talk of receivership," he said, "is unfortunate at the present time. Edgar J. Rich is not counsel for the New Haven Road, and while I do not know what the future may bring forth, I think it may duty to say that no receivership for the New Haven Road is now in contemplation. We hope to get justice in division of rates and labor readjustment.

"We need just a little assistance to turn the corner, and, with everybody co-operating and helpful, prosperity can be restored to New England, not only for her industries, but for her transportation. Coal and supply costs are coming down and more cars will soon be moving.

"It is a pity that people should be frightened out of their railroad ownership just at this point. The New Haven Railroad Company, after charging off all its bad investments, will have an appraised valuation for its property far exceeding its entire indebtedness and its entire share capital at par."

An article and an editorial on the New England situation appear elsewhere in this issue.

**PITTSBURGH & SHAWMUT.**—Authorized to Endorse Notes.—This company has been authorized by the Interstate Commerce Commission to assume obligations as endorser in respect of promissory notes aggregating \$1,110,975 and to pledge the notes, together with \$1,000,000 of its first mortgage 5 per cent bonds, as security for collateral note to the amount of \$1,500,000.

**READING COMPANY.**—Iselin Committee Defends Plan.—The committee representing certain holders of Reading first and second preferred stock, consisting of Adrian Iselin, Robert B. Dodson, Edwin G. Merrill, and William A. Law, known as the Iselin Committee, has petitioned the United States District Court at Philadelphia for leave to intervene. The petitioners ask that the Reading plan be approved as submitted. They represent 89,611 shares of first preferred and 117,786 shares of second preferred, having an aggregate par value of \$10,369,850. The committee holds that the plan does not contemplate a distribution of Reading's \$33,000,000 surplus, as asserted by the Prosser Committee, but a distribution of assets, to acquire which the preferred stock was originally issued.

**WILMINGTON, BRUNSWICK & SOUTHERN.**—Authorized to Issue Promissory Notes.—This company has been authorized by the Interstate Commerce Commission to issue promissory notes to the amount of \$81,000 in renewal of notes about to become due.

**WISCONSIN & NORTHERN.**—May Be Purchased.—See Minneapolis, St. Paul & Sault Ste. Marie.

### Dividends Declared

Chicago, Burlington & Quincy—Stock, 54.132 per cent, payable March 31 to holders of record March 31. Quarterly, \$2, payable March 25 to holders of record March 19.

Great Northern—One and three-quarter per cent, quarterly, payable May 2 to holders of record April 2.

Kansas City Southern—Preferred, 1 per cent, payable April 15 to holders of record March 31.

Reading Company—Common, 2 per cent, payable May 12 to holders of record April 19.

## Railway Officers

### Executive

**Ross Beason**, traffic manager of the Salt Lake & Utah, with headquarters at Salt Lake City, Utah, has been promoted to vice-president, with the same headquarters, and has been succeeded by **A. V. Kipp**, general freight and passenger agent, whose former position has been abolished.

### Traffic

**T. E. Harris** has been appointed traffic manager of the Gulf & Ship Island with headquarters at Gulfport, Miss.

**J. F. Keate** has been appointed commercial agent of the Salt Lake & Utah, with headquarters at Salt Lake City, Utah.

**R. C. Semon** has been appointed commercial agent of the Southern with headquarters at Cincinnati, Ohio, effective March 15.

**C. B. Newcomb**, west bound agent on the New York Central, with headquarters at Chicago, has been appointed general agent on the Rutland, with headquarters at Chicago.

**Stuart A. Allen**, assistant freight traffic manager on the Baltimore & Ohio, Eastern Lines, with headquarters at New York City, has been promoted to freight traffic manager, Western Lines, with headquarters at Chicago, effective March 19, succeeding O. A. Constans, deceased.

**W. D. Cook**, general freight agent of the Georgia & Florida, has assumed jurisdiction over all matters pertaining to the freight traffic of that company, T. E. Harris, traffic manager, having resigned to accept service with another company.

**D. F. Kirkpatrick** has been appointed assistant general freight agent with headquarters at Augusta, Ga.

**J. B. Graham** has been appointed commercial agent on the Gulf Coast Lines, with headquarters at Baton Rouge, La., effective March 1, succeeding C. A. Richardson, who has been transferred to the transportation department. Other appointments effective this date are: **W. R. Butler**, commercial agent, with headquarters at Dallas, Tex., and **S. W. Elder**, who has been transferred from San Francisco, Cal., to Houston, Tex.

### Engineering, Maintenance of Way and Signaling

**C. C. Haire** has been appointed engineer auditor on the Illinois Central, with headquarters at Chicago, with jurisdiction over valuation and capital expenditures, effective March 1.

**W. P. Hayes**, assistant engineer on the Missouri Pacific, with headquarters at Monroe, La., has been promoted to division engineer on the Louisiana division, with the same headquarters, effective March 15. **R. G. Bush**, assistant engineer in the valuation department with headquarters at St. Louis, Mo., has been appointed assistant engineer on the Valley division, effective March 1, succeeding **N. B. Topping**, who has been assigned to other duties.

### Obituary

**H. L. Anderson**, editor of the Illinois Central magazine, died at the Illinois Central Hospital, Chicago, on March 16, after an illness of three weeks.

**H. E. Renick**, superintendent of the Colorado & Southern with headquarters at Denver, Colo., died in Los Angeles, Cal., after an illness of two months. Mr. Renick was 59 years old at the time of his death and had been with the Colorado & Southern for more than 20 years. Since 1910 he had been division superintendent.

One middle western railway has a painting schedule that calls for the painting of one-seventh of its bridges each year.

### Keep Up the Painting Schedule

In other words, each bridge is painted at intervals that average very close to seven years. Of course, some of the structures require attention oftener than others, but seven years represents the average for the entire system, including the great variety of exposures which tend to cause paint failures to occur more rapidly in some localities than in others. Seven years is by no means a short interval for what may be termed the average conditions. Nevertheless, the structures on this railroad are in very good condition as regards the paint surfaces and it is the opinion of the bridge engineer that the success attained in maintaining this painting schedule may be ascribed primarily to the policy of the management in adhering to the program year after year; the bridges are not allowed to get into a condition that calls for large expenditures for cleaning or scraping before the new coat is applied. It goes almost without saying that a coat of paint applied over one that still has some life left in it is going to last much longer than one applied over a coat that has entirely disintegrated. Herein lies one danger in the present situation. Curtailment of painting this year may result in much greater expenditures in overcoming the harm done to the surfaces on steel bridges in the years to come. Deferred painting is much more expensive than painting done before extensive scraping and wire brushing becomes necessary.

In his report to the Interstate Commerce Commission on the Porter, Ind., accident W. P. Borland, chief of the Bureau of Safety said that "the locations of the train-order and home signals were such that it would have been possible for the fireman to have mistaken the green indication of the train-order signal for a clear indication of the top blade of the home signal if the light on the latter was out or obscured by steam or smoke." This raises the question as to the necessity for the continued use of a double signal system since one system can and should be made flexible enough to meet all requirements of train operation by signals. At the present time two systems for the operation of trains are in common use, one consisting of the time table, the train-order and the telegraph or telephone and the other the automatic block signal and interlocking system. Both systems are designed to do one thing—to enable the trains to move over the road with safety and despatch. It is true that the train-order signal system was the first in use, but is it necessary to retain this system after traffic conditions have warranted the installation of automatic block signals and such installations have been made? Each system is largely independent of the other and progressive managements are now directing their efforts towards the co-ordination of the two into one well rounded system. It is realized by operating officers and signal engineers that many "potential danger points" (commented on editorially in the *Railway Age* for March 25, page 775) such as the one at Porter, Ind., exist and they realize further that "something" should be done to eliminate this condition.

### Is a Double Signal System Necessary?

"Something" will be done when the railroads conclude that one flexible system is desired—not one superimposed on the other. It is difficult and sometimes unwise to change from old established practices too rapidly but if progress is to be made along any line old practices must give way to new. Railroad officers can well consider the advisability of requiring the automatic block signal system to be self-contained and so complete as to meet all signal requirements. In this way they will obtain greater and better operating results on the initial investment made. The proper co-ordination of signal systems will also remove "potential danger points."

Brazil, as is pointed out by J. P. Risque in an article appearing elsewhere in this issue, is a country as large as the United States, the British Isles, the Netherlands, Portugal and Switzerland combined. In spite of this great area, it has a population of only 24,000,000 and only 13,340 miles of railways, 30 per cent of which is owned by British capital. The possibilities of future railway development and the consequent growth in the market for railway supplies is plainly evident from these figures: During and since the war American manufacturers have been able to hold the lead in railway supply exports to that country, but it is significant to note that before the war made it impossible, Brazil imported more railway supplies from little Belgium than from any other country—and this in spite of the large British investment in the railways of the country. During the past year there has been a marked tendency in almost every foreign market for orders to drift away from American manufacturers and back into their pre-war channels. This tendency can be checked only by conscientious and effective effort by American exporters. Effective efforts make necessary a study of foreign markets. A study of Brazil will bring out the fact that Portuguese and not Spanish is the language of the country, a fundamental fact the ignorance of which has made ineffective many otherwise well planned selling campaigns of American concerns in that country. It is to be hoped that our exporters will supplement the activities of the financiers who are trying to finance our foreign trade by studying such fundamental facts concerning the prospective markets, so that ignorance in this essential may not set at naught an otherwise well laid plan of commercial expansion.

### Selling Railway Supplies in Brazil

At one time or another, piece work systems have been developed and used in practically all branches of railroad repair shop work. Locomotive machine, boiler and blacksmith shops, also car shops, both passenger and freight, have enjoyed increased output due to the installation of piece work systems by which men are rewarded in proportion to their industry and ability to produce. While it is true that a large number of shop men are opposed to piece work, either honestly or through disinclination to do a day's work for a day's pay, some of the most ardent advocates of piece work systems are

### Shop Piece Work Systems

823

found among shop employees and workmen. It is generally admitted that the need of the day is greater production in all branches of industry including transportation, but under present standardized wages in railroad shops, superior workmen are brought down to the level of inferior ones by the absence of incentive for greater production. There is urgent need for the re-establishment of piece work in railroad shops to increase production and decrease maintenance costs. To be successful, a piece work system must be simple with fair prices set by capable, efficient inspectors. Satisfaction with the wage scale is absolutely necessary in order that the men will do their best work and the first requisite of a piece work system is that, due to its simplicity, any workman can compute quickly his actual earnings. The next important thing is the method of setting the price. It is self-evident that a price should not be set for a job unless the piece work inspector can produce a man from the ranks to do the work at that price and make 25 to 50 per cent over his day rate. Practically all the benefits of a piece work system will be nullified if rates are cut as soon as they become remunerative to the employees. With a fair price, experience has shown that no limit should be placed on earnings due to an increase in the personal efficiency of workmen. It has been maintained that the quality of work produced in shops under piece work systems is inferior, but this conclusion has never been borne out in actual practice. With a competent force of inspectors, the inspection of work is thorough under piece work systems, and when men have had to do work over once or twice on their own time, an immediate improvement in the quality of work will soon be evident. The fallacy of this old argument against piece work systems on the ground of inferior workmanship has been long since exposed.

We publish elsewhere in this issue an article entitled "Thieving and Pilfering on the Railroads," which was prepared by Alexander F. Lyman, general attorney of the New York Central. The article would be of timely interest if it ended with its analysis and discussion of the causes for the serious epidemic of dishonesty which is helping to drain railroad revenues. It is in its proposal of a remedy for this situation, however, that the paper merits close attention. Mr. Lyman presents a plan for criminal law bureaus, to be established by the carriers jointly in each of the big railroad centers where, naturally, thieving and pilfering reach their most alarming proportions. Another feature is the suggestion for reorganized police departments, called departments of surveillance, to carry out the work of the bureau on each road. It is claimed for the plan that it has a two-fold merit. It offers real economy by concentrating in one organization, jointly maintained, the needs of the individual roads for representation in the criminal courts. That there is considerable need for this economy is indicated by recent figures from the Freight Claim Division of the American Railway Association which show that during November, 1920, 180 roads reported robberies of goods valued at \$807,438, while during the same period their losses of entire packages and their unlocated losses, neither of which were officially classed as robberies, totaled \$1,790,451. A conservative estimate, based on these figures, placed the total cost to these roads of dishonesty during November at approximately \$2,000,000. In addition to its economy, it is claimed that the proposed organization offers a maximum of efficiency. By concentrating the entire attention of a well-trained personnel on securing adequate protection for all the participating carriers, the plan does away with the lack of co-ordination which is making possible much of the present dishonesty. It would no longer be easily possible for men discharged by one road on grounds of dis-

honesty, to find employment and a chance for further depredations with another carrier if these bureaus of surveillance were established to check up the past records of all applicants. Furthermore, it has been proved that those roads which have provided themselves with efficient police departments and energetic criminal counsel, enjoy comparative immunity, while the thieves concentrate on less well-protected roads. A joint criminal law bureau, looking after the interests of all, would, it is argued, strengthen these weak spots and offer a solid, well-fortified front to thieves and pilferers.

## Passenger Traffic Under Increased Rates

A FREQUENT topic of conversation during recent weeks has been the falling off of passenger travel and most railroad men have probably had to listen to sarcastic suggestions that they raise fares again to make up for the loss of revenue caused by the loss of traffic said to result from the advance in rates. It is surprising how many people think they can correctly judge the railroad situation by their personal observations during occasional business trips. Passenger travel, like most other kinds of business, has certainly fallen off during the winter and we hear of many trains carrying but a few passengers, but statistics of passenger travel and the earnings of the railroads from passenger service as compiled by the Interstate Commerce Commission fail to bear out the common impression that the passenger business of the railroads has been greatly reduced by the increases in fares put into effect on August 26, although it has, of course, failed to keep up the usual increase from year to year.

Statistics of passenger revenues are now available for five months after the increased rates were made effective, September to January, inclusive. They show an increase of revenues of about 15.6 per cent as compared with the corresponding months of 1919, resulting from an increase in rates of about 20 per cent. The number of passengers carried and the distance they traveled are not yet available for any later period than December, but figures for four months show a slight increase in the number of passengers as compared with the corresponding months of 1919 when the lower rates were in effect, although a slight decrease in the average journey, indicating doubtless a reduction in the amount of long distance travel, with the result that passenger mileage, the number of passengers carried multiplied by the mileage they traveled, was only 2 per cent less than for the corresponding four months of 1919. That the long distance travel should have fallen off is not surprising when it is considered that a large proportion of travel is for business purposes and business generally has been at a low ebb during the winter. Moreover, the long distance travel is more likely to be in Pullman cars and therefore subject to the 50 per cent surcharge. The big bulk of railroad passenger business, however, does not consist of long distance travel but of short trips of less than 40 miles on each railroad at an average cost of a little over one dollar, and this appears to have been very slightly affected by the increased rates so far as the statistics now indicate. During September, October and November there was an actual increase in the number of passengers.

In September the passenger revenues were \$129,438,552 as compared with \$110,219,099 in September, 1919; in October they were \$114,044,152 as compared with \$99,033,423; in November \$106,829,660 as compared with \$92,475,222, and in December \$115,060,511 as against \$100,080,515. Preliminary returns for 194 roads for January also show an increase in passenger revenues of 14.6 per cent as compared

### "Thieving and Pilfering on the Railroads"

with January, 1920. The passenger revenues, number of passengers carried, average journey per railroad, total number of passengers carried one mile, average fare paid and average rate per mile, according to the Interstate Commerce Commission reports, have been as follows:

PASSENGER REVENUES		
	1920-21	1919-20
September	\$129,438,552	\$116,219,009
October	114,044,132	99,033,423
November	106,829,660	92,475,222
December	115,060,511	100,080,515
January	104,777,000	91,437,000
194 roads	\$570,149,000	\$493,249,259
NUMBER PASSENGERS CARRIED		
September	104,351,950	103,204,614
October	99,118,514	99,322,004
November	96,783,529	95,239,268
December	99,181,982	100,805,201
	399,435,875	398,571,087
AVERAGE JOURNEY PER PASSENGER		
September	41.25 miles	41.84 miles
October	37.95 miles	38.99 miles
November	36.35 miles	37.17 miles
December	36.71 miles	37.73 miles
PASSENGER MILEAGE		
September	4,318,000,000	4,294,000,000
October	3,716,000,000	3,872,000,000
November	3,518,000,000	3,540,000,000
December	3,640,000,000	3,803,000,000
	15,192,000,000	15,509,000,000
AVERAGE FARE PAID PER TRIP PER RAILROAD		
September	\$1.23	\$1.06
October	1.14	.97
November	1.097	.97
December	1.153	.991
AVERAGE RATE PER MILE		
September	2.99 cents	2.54 cents
October	3.022 cents	2.556 cents
November	3.019 cents	2.609 cents
December	3.142 cents	2.626 cents

Of course, travel has been lighter during the winter than during the fall months but these figures show that a similar decrease took place during the preceding year. Many people argue strenuously that if the railroads would reduce rates they would make more money by inducing more people to travel. Those who make such assertions forget that in order to reduce rates to persuade some people to travel more or oftener (except by special rates such as are being offered for summer excursions), it would be necessary to throw away the corresponding percentage of revenue from the large number of passengers who have been traveling under the present rates. They also forget that during the past two or three years when the railroads were carrying just about all the passengers they could accommodate at lower rates they were steadily earning deficits most of the time. It is easy enough for a man to say that he knows that if rates were lower he would travel oftener. The question is whether enough such people could be induced to take enough more trips at a rate which the railroads could afford to make to offset the reduction in revenue which would result in the ordinary business. Past experience indicates that without a reduction in expenses the railroads could not carry enough passengers at any lower rate to break even.

For the five months ending January 31 the passenger revenues of the railroads were \$570,000,000 as compared with \$493,000,000 in the corresponding period of 1919-20, an increase of 15.6 per cent. For the four months ending December 31 the number of passengers carried was 399,435,875, as compared with 398,571,087, an increase of 0.2 per cent, but because of the reduction in the average journey per railroad from 38.8 miles to 36 miles, the passenger mileage was 0.2 per cent less. For the five months the berth and seat revenues of the Pullman Company increased 13 per cent, under a 20 per cent increase in rates, although for November, December and January the expenses were so great as to produce a net loss.

## Railway Labor Costs and Financial Results

THE RAILROADS constitute a great industry and their successful operation demands the application of the same principles and methods as the successful management of any other business. The principal requisite to the successful management of a business is the prompt and constant adjustment of expenses to earnings.

The railroads are now in a different position from that ever before occupied by any other industry. The rates they may charge are fixed by one government body, the Interstate Commerce Commission, or by a large number, if we include the state commissions and legislatures. The working conditions and wages of their employees, which determine their payroll, are fixed by another government body, the Railroad Labor Board. Their payroll constitutes over two-thirds of their operating expenses, and even with a normal traffic consumes over one-half of their earnings. With the present volume of traffic the payroll is consuming close to two-thirds of their total earnings.

Since the solvency of any business concern, or class of concerns, depends upon prompt adjustment of its expenses to its earnings, and since one government body controls the charges the railways may make and another government body controls the working conditions and wages that principally determine their payroll, it follows that unless both these government bodies act intelligently, promptly and harmoniously in the performance of their functions the results to the railroads must be disastrous. Disaster to them means disaster to the public, because upon the ability of the railways to earn a reasonable net return depends, first, their ability to meet their financial obligations, and, secondly, their ability to so enlarge their facilities that they will be able to handle the commerce of the country when business is active.

The foregoing statements are obviously true, and yet although the railways have for months been engaged in a desperate struggle to avert a general bankruptcy, the threat of which is due to the heavy decline of traffic and earnings which has occurred while their unit costs, especially those of labor, are the highest they ever were, they have not in this terrible crisis received any substantial assistance either from the government body that fixes their rates, or the government body that determines the working conditions and wages of their employees. No blame for this attaches to the Interstate Commerce Commission. It could not reasonably be asked to make any advances in rates under present conditions. Can it likewise be said that no blame attaches to the Railroad Labor Board?

The Labor Board last summer granted an advance in wages which it was estimated amounted to over \$600,000,000 a year, but which recent statistics of the Interstate Commerce Commission indicate, while traffic was still heavy, was running over \$700,000,000 a year. Its wage award continued the indefensible standardization of wages throughout the country which was adopted under government control. Over the protest of representatives of the railways it took jurisdiction of and continued in effect the standardized rules and working conditions which were adopted under government control. The railways, when the board five months later gave them a hearing on national agreements, took only a month to present their case. Almost two months have now passed since the railways finished presenting their case. The spokesmen of the labor unions were said by the Labor Board itself to have presented their main case in favor of these agreements in the wage hearings which ended last June. Nevertheless, at this most critical time, the Labor Board has allowed the labor leaders one delay after another in presenting their rebuttal to the case of the railways; and further delays which seem indefensible are yet in prospect.

In an effort to meet the desperate crisis through which they are passing the railways have laid off hundreds of thousands of men. They are not doing maintenance, rehabilitation and improvement work which are imperatively needed. In spite of all the retrenchments that have been made their financial results are indescribably bad. The Labor Board in one of its decisions has said that "all questions involving the expense of operation or necessities of the railroads, and the amount of money necessary to secure successful operation thereof, are under the jurisdiction not of this board, but of the Interstate Commerce Commission."

The Transportation Act mentions seven specific points the board must take into consideration "in determining the justice and reasonableness of such wages and salaries or working conditions," but adds that these are to be taken into consideration "among other relevant circumstances." It seems plain that the effect of wages and working conditions on the financial condition of the carriers is a "relevant circumstance." In fact, when, in the decision just quoted the board added, "if any of these rules and working conditions are unjust and unreasonable they constitute an unwarranted burden upon the railroads and upon the public," it practically conceded that the effect produced upon the financial position of the carriers by wages and working conditions was a "relevant circumstance." Nevertheless, thus far the board seems to have proceeded upon the assumption that the effect which its action, or failure to act, may have in preventing or precipitating financial disaster to the railroad industry is a circumstance which it is no part of its duty to consider.

The situation presents an anomaly in business management and in government regulation. The board is an administrative body, and the first consideration of every governmental administrative body in the performance of its duties should be the public welfare. The board, with its control over two-thirds of the expenses of the railways, has the power not only to see that the employees are fairly treated, but also that the railways are not so unfairly treated in respect to wages and working conditions that they will be ruined. It must be plain to members of the board that the ruin of the railroads is not in the public interest. The board was created by Congress by the passage of the Transportation Act. One of the plainest and most important purposes of that act was to put the railways on their feet financially so that they would be able to render better and more adequate service to the public. The ruin of the railroads will not help to carry out this purpose. It will defeat it.

The Railroad Labor Board has most important duties and an enormous responsibility under present conditions, and if it does not perform its duties in accordance with the spirit and plain intent of the Transportation Act, and the result is a great disaster to the transportation industry, the public will not and should not fail to hold it responsible.

### "Corresponding Members"

THE SUCCESS of an association in the railway field as elsewhere is measured almost directly by the character of its committee work. With active committees, the work of the association will be constructive; without it, probably mediocre. Likewise, one of the most important advantages to the individual membership in an association is the opportunity which is offered for the joint study of problems confronting the industry.

No association has been more successful in developing constructive committee work than the American Railway Engineering Association. From the date of its inception its work has been based upon this foundation. Last year 25 committees with an aggregate enrollment of over 500 members were at work and the reports which were presented at the recent annual convention were the result of the mature

investigations and deliberations of these groups of men for periods up to three or four years. The value of their conclusions requires no demonstration. Yet, even in this large organization only about one-fourth of the membership was assigned to committees.

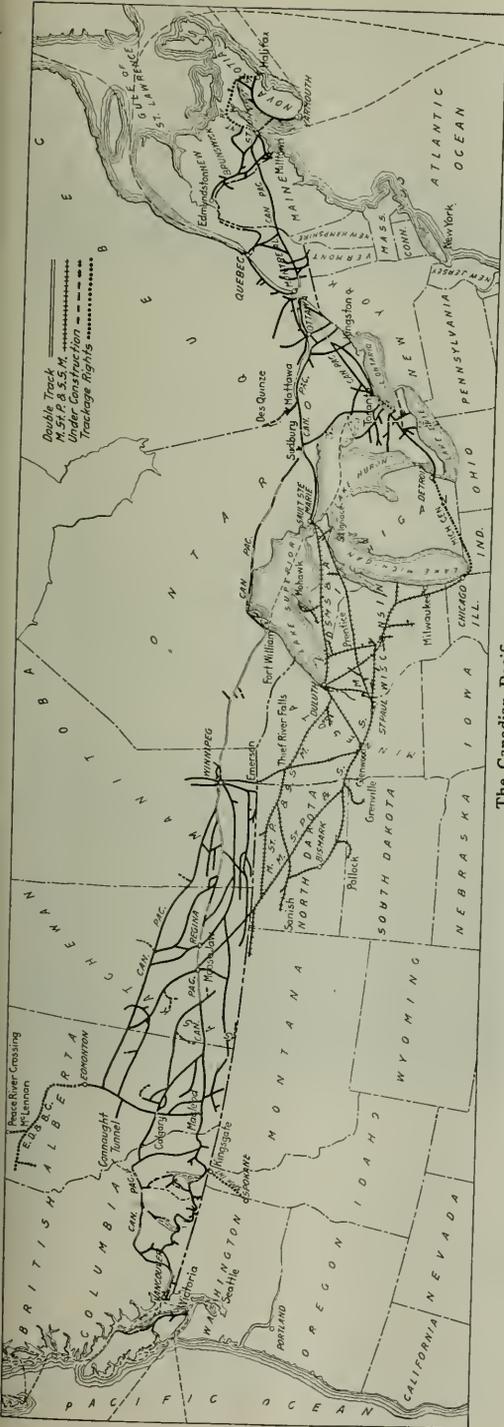

The development of means whereby the latent ability and experience of the remainder of the membership can be utilized to the best advantage and to the mutual benefit of the individual members and of the association is now receiving the careful consideration of the Board of Direction. In his address at the annual meeting H. R. Safford, president of the association, suggested the establishment of "corresponding members" of committees as one means to this end. This plan has much to commend it, especially when applied to those who are so situated geographically or for other reasons as to make attendance at committee meetings difficult or impracticable. The affiliation of such members with committees would enable them to participate to a considerable measure in the work of these committees and would place at the service of these committees the ideas and information possessed by those who are otherwise unable to share in the work. Such memberships would not only distribute the benefits of the organization among a larger number of members, but would also bring to the committees and through them to the association and to the railway industry, much information which is not now made available.

While this plan has been put forth only as a suggestion, it would seem to offer an excellent means of distributing the work of the association among a larger number of members. While the plan would undoubtedly add materially to the burden of correspondence falling on the chairmen of the committees, this is a detail which can undoubtedly be worked out satisfactorily.

### Canadian Pacific

MORALE is a rather intangible element, but it is one of the most important elements in any enterprise, business or any other kind. We heard a great deal about morale during the war, and the military officer and layman alike were made to realize that an army could not be successful in its campaigns unless its morale was of the highest order. There may have been those who thought during the war period that possibly the use of the word "morale" was a fad. That, however, is not the case. James Ford Rhodes, in his standard work, entitled "History of the United States from 1850 to 1877," published several years ago, covers the story of the Civil War. His descriptions of the campaigns and of the battles are very detailed, but in the treatment of every campaign he is careful to analyze the morale of the contending armies and to show the importance of the conditions affecting good or poor morale and of the effects of either the one or the other.

Good morale is important in any organization; it is particularly important in a large organization such as an army. A railroad is a large organization; it differs from an army in that its forces are spread over a wide territory, whereas an army is more compact. It has now become generally recognized that morale on a railroad is just as important as it is in an army. The question might arise as to why the importance of morale on a railway has not been so well realized and given as much attention in the past as in the case of an army. The reason probably is that the morale of the forces on a railway has been more or less taken for granted. There is no doubt that under the influences accompanying Federal control, the high morale on the railways of this country was lost. It has required the lack of proper morale to emphasize how important that element is to successful railway operation. The railway executives, since the return of their lines to their own control, have made every

The Canadian Pacific

effort to restore the morale of the men employed on their lines. Against the adverse conditions, some have succeeded in greater measure than others, but all realize that morale is of the greatest importance.

The Canadian Pacific was operated throughout the war period as an independent self-controlled property. It was not subjected to those influences which we in this country are now inclined to regard as included among the accompaniments of Federal control. It is not now confronted with those problems which the railroads of the United States are having to meet, relative to the return of their lines to private control. There is no gainsaying that the morale of the forces of the Canadian Pacific was not lessened as it undoubtedly was in this country. Rather the huge task confronting the Dominion during the Great World War served to strengthen the morale on Canada's leading railway rather than to weaken it. The annual report of the Canadian Pacific for 1920 is a story of how that company took advantage of the high grade morale of its organization. It shows how the company was able, despite adverse conditions, to make what under ordinary conditions would have been an extraordinary showing. The showing is all the more remarkable in the comparison with the roads in the United States, many of which have properties equally as good; organizations equally as efficient, which are also conservatively financed, but which throughout much of 1920 lacked that one element which the Canadian Pacific was able to count on so strongly—the morale of its employees.

In its annual report the Canadian Pacific makes a plain distinction between the earnings from railway operation and those from ocean steamship lines, telegraph, etc. The gross earnings from railway operations in 1920 were \$216,641,349, as compared with \$176,929,060 in 1919. Its railway net earnings in 1920 were \$33,153,045, as against \$32,933,036 in 1919, despite the fact that working expenses in 1920 were charged with income taxes which were not payable in 1919 and years immediately prior thereto because of the existence in those years of a special tax on surplus after the payment of dividends. The operating ratio was 84.70; in 1919, 81.39 per cent. Fixed charges in 1920 were \$10,775,409, as compared with \$10,161,510 in 1919. The railroad income available for dividends in 1920 was \$21,877,636, and in 1919 \$22,271,527. The usual dividends of 4 per cent were paid on the preference stock and 7 per cent on the ordinary stock. The net surplus was \$450,359. The surplus in 1919 was \$844,250, but this amount was held in reserve for the special taxes imposed by the government which are referred to above.

The dividends on Canadian Pacific ordinary or common shares are 10 per cent annually. On this 7 per cent is paid from railway earnings, as noted heretofore. The other 3 per cent is paid from what is known as special income wherein are included the net revenue from investments, interest and dividends on securities, net earnings of the ocean and coastal steamship lines, telegraph, etc. This special income account on December 31, 1920, after the inclusion of the items mentioned and the deduction of the 3 per cent dividend, stood at \$20,530,292; on December 31, 1919, the balance was \$17,363,844. The net earnings from the steamship lines were not as great in 1920 as in 1919, but the several other items showed a considerable increase in 1920 over 1919.

The operation of the railway, we have noted, showed a net surplus after the payment of the preference or preferred dividends and 7 per cent on the ordinary shares of \$450,359 as compared with \$844,250 in 1919, the latter total, however, being subject to special government taxes. In view of the trend of earnings in 1920 on most of the railways in the United States, this showing of the Canadian Pacific is nothing short of remarkable. The Canadian Pacific has a great property; it is well organized and efficiently man-

aged; it is conservatively financed and, as has been noted, the morale of its forces is of the highest. That it succeeded in deriving the advantages of all these things in 1920 is evident.

There is no intention in this review to lead the reader to think that the Canadian Pacific was not without its problems in 1920. These problems are included in higher wages; high fuel costs, in high costs of materials and in addition another factor which does not confront railroads in the United States, the matter of exchange. President E. W. Beatty, in his annual report to the stockholders, estimates that the wage increases in May added about \$12,000,000 to expenses during the year and the exchange situation about \$4,000,000.

The wage increases in Canada were effective May 1 as in the United States. In Canada the increase is known as the Chicago Wage Award, in somewhat the same fashion as the name McAdoo scale is used in reference to the increases made during the period of the Railroad Administration. The application of the scales established by the United States Railway Labor Board to Canada was, of course, a natural step, although not the least of the reasons may be said to lie in the fact that of the international railway organizations, about 92 per cent of the membership is in the United States and 8 per cent in Canada. Although the Canadian roads had to accept the so-called McAdoo scale, they did not have to accept the national agreements. These particular deterrents to efficiency of the railway crafts have not applied in Canada. Similarly the Canadian Pacific was not affected by the outlaw strikes of the spring of 1920, except insofar as may have concerned traffic interchanged with connections.

The cost of fuel affected the Canadian Pacific in much the same way as it did many of the roads in the United States, namely in the form of higher prices for coal, increased transportation charges and poor quality. The Canadian Pacific receives coal from British Columbia and from mines in Pennsylvania and other fields. Some of this coal cost in 1920 as high as \$10.50 a ton.

The matter of freight rates came up in Canada just as it did in the United States. The increase in Canada became effective September 13. It was, speaking generally, 40 per cent in eastern Canada and 35 per cent in the west, although with the provision that on January 1, 1921, these increases would be reduced to 35 and 30 per cent respectively. The increases were based principally on what the Canadian Pacific would need to pay fixed charges and dividends. The Canadian Pacific suffered a falling off in its traffic but the decline did not come until about December 15. The increased rates were thus sufficient to enable the company to absorb the increased expenses and with the road's efficient management to enable it to earn a surplus for the year's operations. President Beatty in his report puts it in this fashion: "While, for the reasons mentioned, the net earnings are not commensurate with the volume of business transacted, still in the opinion of your directors, the year's operations must be regarded as satisfactory and compare most favorably with those of any other system on the American continent."

The total freight revenue of the Canadian Pacific in 1920 was \$145,303,400 as compared with \$111,064,442 in 1919. The total tons carried were 30,160,134 as compared with 25,102,821 in 1919. The revenue ton-mileage in 1920, totaling 13,856,607,551, represented an increase of 26.81 per cent over 1919. The average revenue per ton-mile in 1920 was 1.058 cents; in 1919, 1.003 cents. The average revenue train load in 1920 was 599 tons, an increase of 6.82 per cent over 1919. The average number of revenue tons per loaded car mile in 1920 was 26.54.

The total revenue from passengers in 1920 was \$49,

125,739 and from sleeping cars, express, etc., \$20,713,980, as compared with \$46,182,151 and \$18,199,135 respectively in 1919. The total number of passengers carried in 1920—namely, 16,769,555—represented an increase of 7.01 per cent over 1919. The total of passengers carried one mile, however, represented a decrease of 2.58 per cent. The average journey per passenger in 1920 was 102.45 miles; in 1919, 112.53 miles. The revenue per passenger mile in 1920 was 2.82 cents; and in 1919, 2.59 cents.

Before referring to the matter of finances, attention should be drawn to an interesting table in the report showing where the stock of the Canadian Pacific is owned. The shares are rather widely distributed in comparatively small holdings. Of the total ordinary shares 47.8 per cent are held in the United Kingdom, 17.73 in Canada and 24.10 in the United States. The table shows ownership of common shares as follows:

	Shares	Percentages
United Kingdom .....	1,242,837	47.80
Canada .....	460,838	17.73
United States .....	626,510	24.10
France .....	79,123	3.04
Other holdings .....	190,692	7.33
	2,600,000	

President Beatty in his report has considerable to say concerning possible new financing. The amount of unissued consolidated debenture stock authorized but not issued is \$36,000,000 and issued but not disposed of \$32,000,000, a total of \$68,000,000. "The capitalization of the company," he says "is conservative and even low, and this has been accomplished largely through the utilization of surpluses in betterments and improvements which would normally have been paid for out of the proceeds of capital issues. While capital expenditures for the immediate future will be curtailed and the resumption of work requiring large amounts of money will be deferred until a decided improvement in business conditions furnishes warrant for incurring them, your directors consider that it will be desirable that a portion of the cash reserves expended on capital account should be restored within a short time and, to this end, in order to supplement and extend the powers of the company to issue forms of securities other than those it is already empowered to issue and which are more appropriate to present market conditions, have made application for an amendment to the company's charter permitting the issuance of bonds, debenture or other securities, collateral to or in lieu of any consolidated debenture stock which the company is or may hereafter be empowered to issue and for the same amount, such securities to be payable in such currency at such times and places, and bearing such interest as your directors may think proper. \*\*\* The annual meeting will be made special for the purpose of authorizing, if approved, the issuance of such securities."

The following table shows the earnings of the Canadian Pacific in 1920 as compared with 1919:

	1920	1919
Mileage operated .....	13,402	13,389
Freight revenue .....	\$145,303,400	\$111,064,442
Passenger revenue .....	49,125,739	46,182,151
Total operating revenue .....	216,641,349	176,929,066
Maintenance of way expenses .....	32,573,927	28,912,220
Maintenance of equipment .....	46,350,793	33,897,728
Traffic expenses .....	4,999,345	3,829,687
Transportation expenses .....	86,608,511	63,054,175
General expenses (inc. taxes) .....	8,969,996	6,105,783
Total operating expenses .....	183,488,305	143,996,024
Net operating income .....	33,153,045	32,933,036
Fixed charges .....	10,775,409	10,161,510
*Railroad income available for dividends .....	21,877,636	22,771,527
Special income .....	10,966,448	9,049,343
Total income .....	32,844,083	31,320,869
Transferred dividends (4 per cent) .....	3,227,277	3,227,277
Common dividends (10 per cent) .....	26,000,000	26,000,000
Surplus from all operations .....	3,616,806	2,093,593

\*The 4 per cent dividend on preference stock and 7 of the 10 per cent dividends on the ordinary stock are paid from this amount and the remaining 3 per cent on the ordinary shares from special income. Deduction of preferred dividends and 7 per cent common dividends left net surplus in 1920 of \$450,339 and in 1919, \$344,250, the latter amount, however, being placed in reserve for special taxes.

A Typical Layout of a Roundhouse and Small Shop

## Modern Engine Terminals and Repair Shops\*

The Results Contributed to Successful Operation by Proper Design  
of Terminal Buildings

By H. E. Stitt

Chief Engineer, The Austin Company, Cleveland, Ohio

**M**ANY PAPERS prepared heretofore on Modern Engine Terminals and Repair Shops have dealt primarily with the general layout of the terminals. In so doing, the results contributed to the successful operation of railway terminals by proper design of terminal buildings has been rather briefly disposed of. Too much stress and emphasis cannot be attached to the important role the buildings play in this field. They are not simply shelters, but they, them-

For this reason considerable thought and attention have been given to the development, design and construction of modern terminal buildings.

A further fact complicates the situation in that it is very difficult to add modern facilities to an existing plant which is designed and constructed without the contemplation of such added facilities. This is true, very often, because the plant has become surrounded by the city in which it is located. This makes reasonable priced land frequently unavailable for building additional units. Also, it is impossible to install crane runways and other labor saving devices in existing buildings, due to lack of clearance and insufficient strength in the existing structures.

Assuming, therefore, that the railway executive is more conversant with the facilities required for his terminals and admitting that the location and layout of each terminal is a separate, individual problem in each case—what is there, then, to influence the design of the terminal more than the major features of the terminal buildings? The major design of course must be followed up by the detail design. The design which is not based on modern practice should be superseded.

### Development of Modern Terminal Buildings

The older types of terminal buildings of all classifications, including engine houses and repair shops, almost without exception have been—as considered in contrast with the modern terminal buildings—low, poorly lighted and ventilated, devoid of proper sanitary facilities, rest rooms, artificial lighting and heating. The advent of the overhead, electric traveling crane, as well as the modern smoke exhausting devices and other such improvements, have thrown many of the older type buildings into the obsolete class.

Other changes such as the substitution of structural steel and reinforced concrete for timber, the substitution of concrete for rubble masonry or brickwork, the substitution of steel sash for wood sash, and many other well-known changes have had a marked effect in bringing about a striking contrast between the old and new terminal buildings.

(At this point Mr. Stitt called attention to a number of articles dealing with locomotive terminals and shops that have

A Modern Erecting Shop Served by Light and Heavy Cranes and Transfer Table

selves, are appliances in that they support labor saving devices.

One of the prime requisites of the up-to-date terminal is to have modern terminal buildings, or in other words, the character of the terminal buildings determines, to a very large extent, not only the present facilities at a terminal, but also in a considerable measure the facilities it is possible to add to an existing terminal.

Because of the many classes and sizes of terminals and the many uses to which these buildings are put, it is impossible to determine on a type which is suitable for all conditions.

\*From a paper presented before the Central Railway Club, March 10, 1921.

appeared recently. He supplemented his paper with comments from some of these and quoted at some length from the article entitled "Are Modern Locomotives Efficiently Used?" which was published in the *Railway Age* of February 27, 1921.)

### Design of Modern Railway Terminal Buildings

The function of engine terminals has been ably defined as a means to provide adequate facilities for the proper maintenance and repairs of locomotives and current routine operations as inspecting, cleaning, coaling, sanding, washing within the shortest possible time. Any factor, therefore, that will minimize this time is well worth our consideration. The human element as well as the mechanical element works to better advantage under proper environment and treatment.

The proper design of railway terminal buildings usually suggests itself after due consideration has been given to the facilities required for the terminal in question. By this I mean the work to be performed rather than the equipment required. In this regard the operating executive is surely most conversant with the requirements. This is true in general industrial work as well as in the railway field. Our observation indicates the railway executive needs support in determining the equipment and the general and detail design of the buildings on account of their intimate relations with the equipment to be installed.

It has been said in one of the articles quoted that "The author has purposely omitted reference to detail construction of buildings as these features generally conform to the railroads' standard practice." This is naturally applicable only to railroads having enough new construction under way to enable them to keep their standards up-to-date; likewise to enable them to maintain an organization of the proper experience and training as well as adequate capacity for this work.

If the railroad has not had the recent new construction work their engineering organization is not enabled to keep

A Small Shop with Light Crane and Unwheeling Hoist

step with the development in latest designing and construction methods. This has to do with railroads equally as well as it has to do with general industrial organizations.

The next step in the design is a careful review of the facilities required, as set up by the railway executive most conversant with the conditions involved. This review taken into consideration with the importance of the terminal and the work to be accomplished there, points its way naturally to the facilities which should be provided.

A common error, made in all kinds of designing work, is in the ignoring of the financial resources of the owner by the engineer. This practice frequently leads to the preparation of elaborate, expensive designs, entirely unsuited to the situa-

tion. Then, when estimates are prepared, the mistake is realized and the work either postponed, due to lack of available funds, or considerable time and money are lost in the preparation of revised designs.

To properly make designs for railway terminal buildings, it is necessary that the designer have a working knowledge of railway requirements, as well as being familiar with modern terminal construction. As a matter of fact, it requires an engineering corps to do this work properly. In such a corps the men will have had experience covering different operations of the design. For instance, one man may be an expert on layout, another man an expert on structural design, while still another man or group of men will be experts on the

Roundhouse with Down-Draft System and Traveling Crane Spanning the Engine Bay

trades involved by the mechanical and electrical equipment. By adhering to these principles, together with the added advantage of close co-operation with the railway executive, who defines the needs and requirements for the particular problem in hand, there is a definite plan of action provided.

The modern railway terminal building should be the result of close observation in determining the needs of railway men. As a consequence certain types of construction have been generally accepted and those most commonly used have been more or less standardized. Standardization should be used only where standard buildings or equipment meet the necessary requirements.

If a provision in the layout of the buildings for a railway terminal will permit of more than one arrangement for future expansion, it generally results to advantage to use such a design. Regardless of how sure you are that your future development will be along certain lines, it has become a matter of note that there will be some changed conditions interposed before the future extension is built. For instance, the passage of the Adamson Law imposed entirely new conditions which determined the desirable locations of railway terminals.

Believing that a table, or schedule, of the options that arise in designing terminal buildings would meet with a favorable reception, the writer has prepared the tabulated schedule given below:

### Suggested Schedule for Engine House Design

#### I. CAPACITY OF HOUSE:

- A. Approximate number of locomotives per day, at present.
- B. Approximate number of locomotives per day, ultimately.
- C. Suggested number of stalls for the present.
- D. Suggested number of stalls for ultimate capacity.

#### II. TYPES OF BUILDINGS:

- A. Roundhouse.
  - (a) Single turn-table installation.
  - (b) Twin turn-table installation.
- B. Longitudinal House.
- C. Transverse House.

- III. SPECIFY NUMBER, WIDTH, AND ARRANGEMENT OF SECTIONS.  
IV. DETERMINE TYPE OF ROOF ARRANGEMENT.
- V. MECHANICAL EQUIPMENT TO BE PROVIDED INSIDE THE HOUSE.
- A. Electric Overhead Traveling Crane.
  - B. Hoisting Jacks.
  - C. Jib Cranes.
  - D. Number of Drop Pits.
  - E. Mechanically Operated Down Draft Smoke Exhaust System.
  - F. Heating Plant.
    - (a) Blower system with underground ducts.
    - (b) Blower system with overhead ducts.
    - (c) Integral fan blowing unit—steam heated.
    - (d) Integral fan blowing unit—direct fired.
    - (e) Direct radiation. Not commonly used in modern terminal buildings.
  - G. Electric Lighting.
  - H. Plumbing.
  - I. Sprinkler System.
- VI. MECHANICAL EQUIPMENT TO BE PROVIDED OUTSIDE THE HOUSE:
- A. Turn-Table.
    - (a) Deck Girder Type.
    - (b) Through Girder Type.
  - B. Transfer Table.
  - C. Water Conditioning Plant.
- VII. KINDS OF CONSTRUCTION:
- A. Fire Proof.
    - (a) Steel encased in concrete.
    - (b) Reinforced concrete structure with hollow tile and concrete joist roof construction.
    - (c) Reinforced concrete structure with so-called tin pan concrete joist roof construction.
    - (d) Reinforced concrete structure with concrete slab roof construction.
    - (e) Brick side walls—steel sash.
  - B. Non-Combustible.
    - (a) Exposed steel structure with non-combustible roof.
    - (b) Brick side walls—steel sash.
  - C. Slow-Burning.
    - (a) Steel structure—heavy timber roof framing and plank roof decking.
    - (b) Heavy timber structure and plank roof decking.
    - (c) Brick side walls—steel sash.
  - D. Inflammable. (Practically obsolete as applied to new structures.)
    - (a) Heavy timber structure with small dimensioned timber roof framing and decking.
    - (b) Small dimensioned timber side walls and wood sash.
  - E. Floors.
- VIII. REPAIR FACILITIES TO BE PROVIDED:
- A. Heavy and Light Machine Shop.
  - B. Light Machine Shop Only.
  - C. Blacksmith Shop.
  - D. Engine Room.
  - E. Boiler Room.
  - F. Pump Room.
  - G. Pipe Tunnels.
  - H. Boiler Washing Plant.
  - I. Tool and Storeroom.
  - J. Offices.
  - K. Toilet and Locker Rooms.
  - L. Oil House.
  - M. Water Tank.
  - N. Coal, Coke and Iron Storage.
  - O. Light, or Running Repair Shop.
- IX. TYPE OF SMOKE JACK FOR NATURAL VENTILATION:

- VI. MECHANICAL EQUIPMENT TO BE PROVIDED OUTSIDE THE SHOP:
- A. Transfer Table.
  - B. Water Conditioning Plant.
- VII. KINDS OF CONSTRUCTION:  
(Same as given above for engine house)
- VIII. REPAIR FACILITIES TO BE PROVIDED:
- A. Heavy and Light Machine Shop.
  - B. Light Machine Shop Only.
  - C. Boiler Shop.
  - D. Truck Shop.
  - E. Blacksmith Shop.
  - F. Separate Boiler, Engine and Pump House.
  - G. Lye Vats.
  - H. Paint Shop.
  - I. Oil House.
  - J. Tool Room.
  - K. Storehouse.
  - L. Water Tank.
  - M. Pipe Tunnels.
  - N. Scrap Platform.
  - O. Ash Pit.
  - P. Coal Storage.
  - Q. Offices.
  - R. Toilet and Locker Rooms.
  - S. Coal, Coke and Iron Storage.
  - T. Reclamation Plant.
  - U. Foundry.

### Schedule for the Design of a Modern Car Repair Shop

- I. CAPACITY OF HOUSE:
- A. Approximate number of cars for heavy repairs per day, at present.
  - B. Approximate number of cars for heavy repairs per day, ultimately.
  - C. Approximate number of cars for light or running repairs per day, at present.
  - D. Approximate number of cars for light or running repairs per day, ultimately.
  - E. Suggested number of tracks—for the present.
  - F. Suggested number of tracks for ultimate capacity.
  - G. Suggested number of pits for the present.
  - H. Suggested number of pits for ultimate capacity.
- II. TYPES OF BUILDINGS:
- A. Longitudinal House.
  - B. Transverse House.
- III. MECHANICAL EQUIPMENT TO BE PROVIDED INSIDE THE HOUSE:
- A. Electric Overhead Traveling Cranes.
  - B. Jacks for straightening steel car frames.
  - C. Heating Plant.
    - (a) Blower system with underground ducts.
    - (b) Blower system with overhead ducts.
    - (c) Integral fan blowing unit—steam heated.
    - (d) Integral fan blowing unit—direct fired.
    - (e) Direct radiation—not commonly used in modern terminal buildings.
  - F. Electric Lighting.
  - G. Sprinkler System.
- IV. MECHANICAL EQUIPMENT TO BE PROVIDED OUTSIDE THE HOUSE:
- A. Transfer Table.
- V. KINDS OF CONSTRUCTION:  
(Same as given above for engine house)
- VI. REPAIR FACILITIES TO BE PROVIDED:
- A. Wooden Car Shop.
  - B. Steel Car Shop.
  - C. Riveting Shop.
  - D. Blacksmith Shop.
  - E. Wheel Shop.
  - F. Separate Boiler and Engine House.
  - G. Paint Shop.
  - H. Woodworking Platform.
  - I. Scrap Platform.
  - J. Miscellaneous Platforms.
  - K. Depressed Track.
  - L. Service Building.
  - M. Track Scale and Scale House.
  - N. Toilet and Locker Room.
  - O. Coal Storage.
  - P. Shop Yards.
  - Q. Light Car Repair Yard.

### Schedule for the Design of a Modern

#### Locomotive Repair Shop

- I. CAPACITY OF PITS:
- A. Approximate number of Locomotives per day, at present.
  - B. Approximate number of Locomotives per day, ultimately.
  - C. Suggested number of pits for the present.
  - D. Suggested number of pits for ultimate capacity.
- II. TYPES OF BUILDINGS:
- A. Longitudinal.
  - B. Transverse.
- III. SPECIFY NUMBER, WIDTH AND ARRANGEMENT OF SECTIONS:
- IV. TYPE OF ROOF ARRANGEMENT:
- A. Flat Roof, with Monitor.
  - B. Sloping Roof with Monitor.
  - C. Aikens or Depressed Bay, Roof.
- V. MECHANICAL EQUIPMENT TO BE PROVIDED INSIDE THE SHOP:
- A. Electric Overhead Traveling Crane.
    - (a) Light crane runway—for handling locomotive parts.
    - (b) Heavy crane runway—for lifting locomotives.
  - B. Hoisting Jacks.
  - C. Heating Plant.
    - (a) Blower system with underground ducts.
    - (b) Blower system with overhead ducts.
    - (c) Integral fan blowing unit—steam heated.
    - (d) Integral fan blowing unit—direct fired.
    - (e) Direct radiation—not commonly used in modern terminal buildings.
  - D. Electric Lighting.
  - E. Plumbing.
  - F. Sprinkler System.

### Schedule for the Design of a Modern

#### Separate Boiler and Engine House

- I. GENERAL CHARACTER OF PLANT:
- A. Plant consisting of boilers and engine room with steam driven electrical generators and motor-driven air compressors.
 

NOTE: This type of plant is required when all electric power is generated at the terminal.
  - B. Plant consisting of boiler house and engine room with steam driven air compressors and electric power furnished from central station.
  - C. Plant consisting of boiler house only—where electric power is furnished from central station.
- II. LEVEL AND ELEVATED TYPES:
- (a) Boiler room floor at elevation of surrounding grade or ground line.
  - (b) Boiler room floor elevated so that ash hopper floor is at elevation of surrounding grade or ground line.

## III. SPECIFY NUMBER, WIDTH AND ARRANGEMENT OF SECTIONS:

## IV. DETERMINE TYPE OF ROOF ARRANGEMENT:

## V. EQUIPMENT TO BE PROVIDED INSIDE THE BOILER HOUSE:

- A. Boiler Horsepower Required.
- B. Type of Boilers and Number of Units.
- C. Arrangement of Batteries.
- D. Type of Furnace.
  - (a) Mechanical stokers.
  - (b) Hand fired.
- E. Type of Natural Draft Stokers.
  - (a) Chain grade.
  - (b) Over-feed.
- F. Type of Forced-draft Stoker.
  - (a) Under-feed.
- G. Coal bunkers.
  - (a) Steel.
  - (b) Concrete.
- H. Type of Coal Conveyor.
- I. Ash Handling Equipment.

## VI. EQUIPMENT TO BE PROVIDED INSIDE ENGINE HOUSE:

- A. Generator driven by reciprocating engine.
  - B. Generator driven by steam turbine.
  - NOTE: Specify characteristic of electric current.
  - C. Condensers.
  - D. Air Compressors.
    - (a) Steam driven.
    - (b) Motor driven.
- Note: Specify cubic feet of air required per minute.

## VII. EQUIPMENT TO BE PROVIDED OUTSIDE BOILER HOUSE:

- A. Stack.
  - (a) Brick.
  - (b) Steel.
- B. Ash Loading Equipment.

## VIII. KINDS OF CONSTRUCTION:

(Same as given above for engine house.)

SUBJECT: AUXILIARY BUILDINGS FOR MODERN RAILWAY TERMINALS

The arrangement and character of construction for auxiliaries for the modern railway terminal should be determined by the general decisions determined upon for the design of the principal buildings at the terminal.

For instance, if it has been determined to build a terminal at a certain location, the more tentative assumptions which can be made before the general proportions of the building are determined and the general layout of the terminal is drawn up, the more expeditiously can the designing work and estimating work be prosecuted. Certainly, you cannot make a general layout for a terminal without knowing what buildings you contemplate erecting there and approximately the size and character of the buildings.

For this reason, then, early decisions relative to the design and character of the buildings becomes paramount. Right here let us note that where there is a lack of such decisions being made by executives, there results improper designs, lost motion in general, increased cost of designing and estimating and other numerous difficulties. Where the executive himself does not make the decision, certain assumptions have to be made by his subordinates. These subordinates make their assumptions to the best of their ability, taking into consideration the information they have at hand. Naturally, they do not have access to the resources of the company to the same degree that is available to the executive.

Assuming this occurs and the designs approved, and the estimates prepared, it may then be realized that the design is not sufficiently economical to promote the best interests of the company. In such cases, a new design may be called for; in other cases, the building might have to be constructed and a fixed charge incurred which is not warranted by the resources and the policies of the company.

If the executive who is primarily responsible for the determination of the design and the construction which is to be used in the terminal buildings will use this, or a similar schedule, we believe this procedure will be found of value.

In preparing the schedule it has been borne in mind that such a list should cover the needs and requirements of small railroads as well as large railroads, and railroads whose resources and earning capacities are limited, as well as the railroads which have unlimited resources and a well sustained earning capacity due to location, affiliations, etc.

It of course goes without saying that the schedule after having been properly developed should be given to the parties responsible for the layout of the terminal and for the design of the terminal buildings, as well as for the complete estimate.

## Wheel Burning Injures Rail

THE BUREAU OF SAFETY of the Interstate Commerce Commission has issued a report covering the investigation of a derailment of a Baltimore & Ohio passenger train at Glenwood, W. Va., on December 11, 1919, which was caused by the breaking of a rail which showed evidence of having been wheel burned. The train involved in the accident consisted of nine cars and was pulled by two engines. The accident happened at the station at Glenwood on the Kenova-Parkersburg line, while the train was traveling at a speed shown by a speed recorder to have been between 42 and 43 miles per hour. The track at this point was laid with 75-lb. rails supported on an average of 18 ties per 33-ft. rail.

This report is summarized as follows: The wheel burning of rails, in some degree, is a matter of common occurrence in many places in the track. Rails in this condition abound in yards, freight terminals, and in the vicinity of signal towers and stations. Few, if any, of these localities are free from examples of rails which are thus affected.

The derailment in question was due to the failure of a rail which broke at several places along its length, exhibiting incipient cracks in the head. Investigation by James E. Howard, engineer-physicist of the commission, showed these cracks to have had a thermal origin. That is, this was a wheel-burnt rail, although its appearance in the track was not suggestive of such action having taken place. There was a series of fine crosswise cracks visible on the running surface of the head near the gage side, but the usual evidence of wheel burning, a roughened, abraded surface, was not shown.

Sections of the rail were pickled in hot hydrochloric acid. This exposure and the microscopic examination conducted each revealed the effects of wheel burning. The rail had been exposed superficially to a high temperature and hardening had resulted therefrom. Incipient cracks were developed in the thin layer of hardened steel, some of which had penetrated the normal metal of the rail. These incipient cracks greatly weakened the rail and led to its premature failure. This type of wheel burning is one of peculiar danger.

The series of short crosswise cracks was not conspicuously shown. They were noticeable, however, because they did not present the usual characteristics of flow of metal under wheel pressures. Their full significance now appears in the results of the investigation of the rail. They stand as warning indications of the seriousness of their presence.

In cases of wheel burning, profound changes take place in the structural state of the steel, changes which take place within extremely narrow limits. Rapid transition from one phase to another so narrowly confined may in itself intensify the internal destructive forces. Special tests were made to illustrate the phases in detail which the hardened zones experience, the results of which are embodied herein. The destructive influences which prevail are clearly shown, and they constitute elements of danger in the track.

The prevention of wheel burning in its entirety presents great practical difficulties. Efforts should be directed toward minimizing these destructive influences. The presence of incipient cracks as they were displayed by this rail is evidence of impaired strength and constitutes a warning signal that a dangerous state has been reached.

ACCORDING TO A RECENT ARTICLE in the Gazette (Montreal), a movement is on foot in Canada for the establishment of a corporation for the financing of foreign trade similar to organizations in the United States under the Edge law. The proposed corporation would have a capitalization of \$25,000,000, its resources to be derived principally from the sale of debentures to the amount of four times its capital.

# Preventing Thieving and Pilfering on the Railroads

## Organized Efforts Necessary to Combat Effectively This Heavy Drain on Revenues

By Alexander S. Lyman

General Attorney, New York Central, New York City

THE WAVE OF MORAL DEGENERACY which has swept over the world in the wake of the great war, finds an all too familiar expression in crimes against property, notably in the perpetration of frauds, thefts and robberies. The condition is a general one, but the railroads have felt it with peculiar force. A large proportion of the property taken from their custody is difficult of identification, or its markings can be destroyed. In consequence nearly all of it is susceptible of ready sale at good prices.

The wage-earning classes on railroads, as elsewhere, have been selected especially as the target for bolshevist teachings under one or another guise. Much of this propaganda has as its primary object the inculcating of a contempt for the institution of private property and for the right of individuals to possess private property. These surreptitious teachings have been effective with many in the ranks of wage-earners with the result that, if not actually dishonest themselves, many railroad employees are indifferent to the depredations and frauds of others.

Another influence stimulating crime is the reluctance of judges exercising criminal jurisdiction, to impose substantial sentences upon persons convicted before them of theft. This may be due in some instances to the belief on the part of many judges that our penal institutions are merely schools for crime and moral profligacy, and that to send a young man to one of these institutions is simply to assign him forever to the ranks of the criminal classes. Again, it may happen that the judges are persuaded to leniency by political or personal influence. Too often corruption is found among members of the railroad police forces themselves, and all too frequently thefts are committed in collusion with railroad police, the local municipal police and railroad employees. Many wholesale robberies have been perpetrated under circumstances indicating a detailed conspiracy between railroad employees who are in a position to know of the arrival of large and valuable shipments at a given terminal, and well organized gangs of thieves. Last but among the most important of the malefactors, are the receivers of stolen property, men of large means who stand behind the thieves, maintain elaborate machinery for spiriting away and disposing of stolen property, and who supply any amount of unimpeachable bail when the thieves are arrested. These men even provide the services of experienced criminal lawyers.

It frequently happens, too, that the railroads or the shippers are victimized by frauds practiced on or by shipping and delivery clerks, or arising from the careless or inefficient performance of their duties.

While pilfering, or thievery on a petty scale, has been prevalent for many years and perhaps will never be wholly suppressed, the present losses are so appalling that the carriers must realize that a new situation has arisen, presenting new problems which cannot be solved satisfactorily by merely pursuing the old lines of defense. When the freight loss and damage account presents an aggregate which may mean the difference between a thin or a fat dividend on the capital stock, the managements must realize that they are confronted with one of the most serious problems in modern railroading.

Properly detailed statistics compiled by the freight claim

department should show where the weak spots are, that is, where the greatest number and the most serious depredations occur. It will be found that these are the larger cities where there are numerous railroad terminals. Experience has shown that if a particular carrier in one of these centers has an unusually effective police department, and especially if it has provided itself with criminal counsel of energy and experience in aiding the prosecution and conviction of those caught stealing property in its custody, this carrier will have comparative immunity, while the thieves concentrate their efforts on other less well fortified roads.

The obvious method of reaching this situation is through a joint criminal law bureau. This has been tried and is being employed successfully at the present time in St. Louis and in New York City. At the head of such a bureau is placed a lawyer of long criminal experience who is not only thoroughly familiar with criminal procedure from the prosecuting point of view, but who also has extensive acquaintance with the judges who sit in criminal cases and with the prosecuting officers. His qualifications for dealing successfully with thieves will be much enhanced if he also possesses means of securing reliable information from the underworld. The salary and expenses, and the hire of necessary assistants for this lawyer are supplied by the carriers whose lines terminate in a given city, and the proportionate contributions may be readily placed upon an equitable basis. Each carrier, although a party to this agreement, retains the organization and control of its own police force. Each police chief is, however, required to report at once every serious depredation and frequently minor cases, the prosecution of which will have a wholesome effect, to the criminal counsel, who takes immediate personal charge of the more important cases, securing statements and directing investigations. In most instances the thefts are of property transported in interstate commerce so that jurisdiction is conferred upon the Federal courts. One great advantage Federal courts possess over the State courts is that the jurisdiction of the former extends over the entire country so that the attendance of witnesses from remote points can be compelled. On the other hand, the fact that the goods stolen were in interstate transit must be established in order to hold jurisdiction, and this line of proof under the decisions, is frequently of a very technical nature. It follows, therefore, that the accumulation of the necessary proof can usually be secured successfully at the outset only under the guidance of an experienced criminal lawyer. Too frequently the police departments of the carriers, if they attempt to work out this investigation by themselves, fail in some technical but essential particular. Under the guidance of criminal law experts, members of the railway police force show a much greater intelligence and efficiency in handling criminal work in all its stages, and they avoid the errors which otherwise often result in the escape of guilty parties.

The measures described above, effective as they are in coping with ordinary situations, must be added to in handling the present problem. A department of surveillance, organized and conducted by a high type of executive is called for. The chief of this department should report only to the head of the corporation and should have under his charge three co-

ordinating branches, each under a separate command, as follows: (1) A bureau of efficiency, having to do with (a) the selection of men entering the employ of the company, on the score of their previous record for probity, (b) the caliber, habits and conduct of conductors, and of receiving and delivery clerks, (c) the method of receipting for, tallying and checking freight, and the notification of its arrival and delivery to the consignee; (2) a bureau of patrol to guard freight at terminals and in transit, and (3) a detective bureau to investigate and collect evidence against thieves and receivers, and to recover stolen property.

With this type of organization for each carrier, and with means adopted for exchanging information in the larger centers of traffic and for co-operation through joint criminal counsel in the prosecution of frauds and thefts, there would be a reasonable expectation of coping successfully with the problem. The average railroad police department of the present day (with some praiseworthy exceptions) is obsolete and inadequate in personnel, organization, scope and methods.

## Roads Continue Wage Reduction Conferences

**M**ANY ROADS are continuing the conferences with employees regarding the matter of wage reductions, although there are few evidences in any quarter that any considerable number of the men are going to accept decreased wages without a decision to that effect by the Labor Board. Several companies, including the New York Central and the St. Louis-Southwestern, have already laid their cases before the board and many other companies will probably follow their example.

The Delaware, Lackawanna & Western will hold conferences on April 5 with certain classes of its skilled labor in the endeavor to come to an agreement regarding wage reductions. The unskilled labor on this road has refused to accept the wage reductions proposed, and the matter will be laid before the Labor Board on April 4.

The management of the Gulf Coast Lines has held conferences with representatives of its unskilled labor and proposed new wage rates ranging from 20 to 25 cents an hour on a 10-hour day basis. The employees did not agree to accept these reductions and the question will be referred to the Labor Board for decision.

Application by certain organized employees for an injunction to prevent four subsidiary companies of the New York Central from reducing wages on April 1 which was filed in Columbus, Ohio, was withdrawn when the company's attorney announced that, pending the Labor Board's decision, the present rates would continue in effect.

The Central of New Jersey held conferences with its unskilled workers on March 24 and with certain classes of skilled employees on March 25. The attitude of the employees was that, while they admitted the necessity of certain reductions in wages, at the same time they were not disposed to accept a decrease unless it was passed upon by the Labor Board. The company is, accordingly, planning to file its petition to that body at an early date.

The Lehigh Valley, following unsuccessful attempts to secure the agreement of their unskilled employees to reductions in rates, has laid the matter before the Labor Board.

As was noted in the *Railway Age* of last week many other roads, including the Pennsylvania, the Philadelphia & Reading, the Erie, the New York, New Haven & Hartford, the Nashville, Chattanooga & St. Louis, and the Central of Georgia are also seeking reductions in the wages of various classes of their employees.

The conferences with the marine workers in New York harbor are being continued but no definite general settlement has as yet been reached.

## Court Denies Labor Board's

### Jurisdiction in A. B. & A. Case

Judge Samuel H. Sibley in an oral opinion March 25 denied the petition of former employees of the Atlanta, Birmingham & Atlantic, now on a strike, that the receiver be required to take the question of wages to the Labor Board in Chicago. He stated that in some cases the Labor Board might be a better judge of questions of wages than a court would be, but in a case involving, as this case does, the proposition that the wages fixed by the said Labor Board are so high that the railroad cannot pay them and continue to function, the question becomes a judicial one, and therefore entirely proper for the court to decide.

As to the rights of the former employees under the Newlands Act, Judge Sibley held that the Newlands Act was constitutional and affected the court's powers with reference to wages, and that the court ought not to reduce wages of men to whom the act applied without giving them a hearing after 20 days' notice, and that the act applied as he saw it now, only to engineers and train crews.

B. L. Bugg, receiver of the company, announced on March 26 that pursuant to the court's order of the day previous the train and engine men would be paid at the old wage rate for the five days they worked after the reduction order was put into effect.

The striking employees withdrew from the wage hearing before Judge Sibley on March 26 when he ruled that the receiver should not discharge 900 men taken on to replace the strikers. Earlier in the session the counsel for the railroad declined to consider a proposal of the employees that they return to work immediately accepting the wage reductions, provided that they be allowed to return to work in a body at their former status and provided that the court should appoint auditors to examine the company's books to ascertain whether or not it was able to pay wages on the old basis.

## Regional Boards Question Referred

### to Roads in Each Region

On March 24 the standing committee of the Association of Railway Executives heard the report of the conferences which T. DeWitt Cuyler, chairman of the Association, held with the leaders of the train and engine service brotherhoods relative to the question of the advisability of establishing regional boards of adjustment. The committee decided that the question should be submitted to conferences of the individual roads in each region. Accordingly the following men were chosen to arrange for conferences of the railroads in each territory: L. F. Loree, president of the Delaware & Hudson, for eastern territory; W. R. Cole, president of the Nashville, Chattanooga & St. Louis, for southeastern territory; S. M. Felton, president of the Chicago Great Western, for western territory; B. F. Bush, president of the Missouri Pacific, for southwestern territory.

A Boom is well under way in Mexico. Care, however, must be taken that it does not degenerate into a "crazy" one. The revolution gave Mexico a considerable amount of free—but costly, to speak in paradox—advertising; now that peace has come, every office boy in the United States "knows all about Mexico." The greater part of the "all" is in many respects grotesque. The average American's ignorance of the real Mexico is sublime. The prevailing idea in these United States at the present moment is that one has only to go to Mexico to pick up a fortune; the popular mind must be disabused of this notion if real progress is to be made in the development of the natural resources with which nature has endowed our sister nation.—*N. Y. Commercial*.

Sao Paulo Railway—New Line at Right—Old Line at Left

## Brazil as a Market for American Railway Supplies

Thirty Per Cent of Country's Lines Are British—Opportunities Are with State-owned Railways

By John P. Risque

SOME INDICATION of the extent of British railway operations in Brazil was given in the preceding article of this series in which the Sao Paulo Railway was described. Just as English, however, as that road, which has been called the richest railway in Brazil, is the country's longest line, the Leopoldina, which operates approximately 1,800 miles of meter gage line. This road runs from Nictheroy, across the bay from Rio de Janeiro, to Friburgo, Campos, Victoria, Leopoldina and other points in the states of Minas

be found in the Brazil Northeastern Railway, a 470 mile line, also of meter gage, which runs from the seacoast town of Fortaleza inland through the state of Ceara. It has 41 locomotives, 41 passenger cars and 285 freight cars. The state of Ceara is about the size of Illinois and has a million inhabitants. This railway is one of those which have been leased by the government to private operators and is said to be due to revert to the government in 1970, but, by terms not unfavorable to the operating company, can be returned in 1940.

The fourth British enterprise in the Brazilian railway field is the line with a very pretentious name but a diminutive mileage—the Brazil Great Southern—a meter gage road but 185 miles in length. This railway, which is owned by the Brazilian government, is leased to English operators and runs from a town called Quarahim on the Uruguayan border to another town called Itaquí, on the Argentine border, and forms a connecting link between the northwestern line of Uruguay and the Paraguay Central in that republic, both of which are owned and operated by Britons.

The British railway operations in Brazil reaches some 4,000 miles of line, or 30 per cent of the country's total mileage. It is now proposed to consider for the moment some Brazilian roads which are outside of the English "buy-at-home-at-any-price" sphere of influence. There are some railways and projected lines in the country which are now, to a certain extent, patrons of our mills and factories, and which, under the gradual but unmistakable extension of control and operation by a government which is known to be friendly to us, will, it is hoped, in due time, become "steady customers" of our railway supply interests. Before attempting to set down some statements referring to the relative locations, sizes, manner of operation and other characteristics of the country's non-British railways, a few words are introduced here on Brazil in general—and the Brazilian in particular—in the hope that those who expect to cultivate the somewhat extensive field which that country's railway possibilities will eventually offer us, will profit thereby.

The first thing which an uninitiated American should do in a plan for the cultivation of the South American railway

One of the Sao Paulo's Pacifics

Geraes, Rio de Janeiro and Espirito Santo. Its route follows the Paranyha river for some distance and then strikes out across a series of mountain ranges involving very heavy grades. This company has 220 locomotives, 278 passenger cars and 2,350 freight cars.

There is another British railway of considerable importance in Brazil, the Great Western of Brazil, the zone of influence of which radiates from the Port of Pernambuco, located in the northern part of the state of that name between the parallels of latitude 5 and 10 south. This road traverses the states of Pernambuco, Alagoas, Paranyha and Rio Grande do Norte. Its mileage is roughly 1,000, the gage is one meter and it has 160 locomotives, 255 passenger cars and 2,200 freight cars. Further British railway interests are to

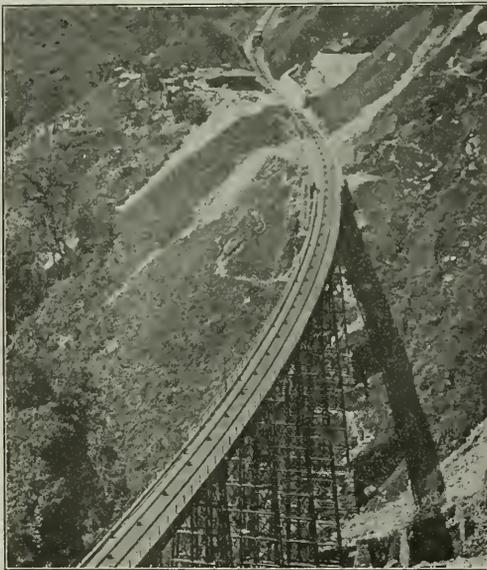

supply market is to correct the almost universal impression which he may entertain that South America is merely South America instead of, as it is, a number of distinct countries. The belief that that continent is inhabited simply by South Americans, and not by Brazilians, Peruvians, Chileans, etc., does not, for business reasons, reflect to the advantage of the would-be exporter to those fields. A thorough familiarity with the geography of South America is a paramount requisite to success. After such familiarity is attained, the intending trader can be figuratively said to have learned to crawl. Learning to walk involves a knowledge of the numerous fundamentals included in whole libraries which have been written on the subject of "trading with Latin America," the sole intent of which is to save money and time for Americans who wish to develop this trade which they, in comparison to their European—and particularly their British—competitors, know relatively little about.

South America should be thought of in the sense of its respective countries and considered as Spanish America and Portuguese America. Brazil is Portuguese America and has nearly half of the area of the whole continent, representing a single country as large as continental United States, the British Isles, the Netherlands, Belgium, Portugal and Switzerland, all combined—a fact which is not generally appreciated. The word "immense" is not misused in referring to

languages of those lands are *Spanish* and *Portuguese*. It is quite as reasonable to go to Chile or Peru and expect to do business successfully in Portuguese as it is to tackle Brazil with Spanish propaganda either written or spoken. The inhabitants of neither of these two great divisions will acknowledge the superiority of the official language of the other. On the contrary, each will strenuously maintain, in a friendly manner, that their's is the original tongue and that the other is merely a dialect. The lack of comprehension of this important subject, particularly in its reference to Brazil, constitutes the rock upon which has been wrecked many an otherwise worthy effort on the part of American merchants to introduce goods in the latter country. Any doubt as to the damaging effects of trying to win the

A Street Railway in Pernambuco

Gruta Funda Trestle on the Old Line of the Sao Paulo

this, the largest South American republic, with its 3,292,000 square miles of territory and a population of 24,000,000.

Along with other considerations comes language, the average American's ignorance of which is not making him popular in those countries where its knowledge would give him an insight into the thoughts of the people which he can get in no other way. It is generally believed by a majority of Americans that the language of South America is Spanish and they let it go at that. *Spanish America* on that continent speaks *Spanish*; *Portuguese America—Brazil*—speaks the language of its founders, *Portuguese*, and nothing else. In both of these divisions, both English and French are spoken and understood, but for all practical purposes the

Brazilian with Spanish literature will be easily allayed by a talk with any of the American representatives of the Department of Commerce in the respective cities in which they are located. Although the Spanish descendant can read Portuguese (and will read it in a pinch if the information is unavailable through any other means), and the Brazilian can likewise read Spanish (and will decline to do so in a majority of cases), both will prefer to read advertising in English rather than in the neighboring tongue.

The Brazilian gentleman, who upon opening his mail drew forth three letters in Spanish from inspired but wholly ignorant correspondents of business houses in the "States" and dumped them into the waste basket unread, voiced the sentiment of Brazil's entire business community when he expressed the fervid wish that progressive America would "wake up" to the fact that the language of his country was not Spanish, but *Portuguese*. Fortunately, due to the educating influence of many publications devoted to the interests of American export trade, the truth is gradually spreading. Consideration of the Brazilian likewise involves a study of his history and his habits today. Unlike the case of many of his neighbors, his projects are his own. He points with pride to the fact that big enterprises in his country are, in a majority of cases, operated with Brazilian capital and by Brazilian people. In this connection, he is especially proud of the fact that most of the railways are not an exception to the rule and he hopes that, in due course of time, the movement to nationalize the lines will result in success.

To the intending cultivator of the Brazilian railway supply market it may be mentioned in passing that both the Baldwin Locomotive Works and the American Locomotive Company maintain branch offices in the city of Rio de Janeiro under the direction of men, who, in our vernacular, "know the ropes" in regard to the railroad trade in those parts. Their knowledge of the possibilities of the field from an American point of view is worth having and their advice, along the lines of approaching the prospects, will follow

in some degree the tenor of the discussion written above. Their information and admonishments will, if mixed in a proper degree with the opinions and advice of Brazilians who know, provide the newcomer with an asset of worth.

Although Brazil, to use familiar terms, is "three times as big" as Argentina and has three times as many people as the latter, it has only three-fourths the railway mileage of her well-developed neighbor. This inviting comparison, when considered in connection with the friendly attitude of Brazil's government toward America and things American, constitutes a reasonable basis for hope and an inspiration for the future, *commencing now*.

A table of 27 Brazilian railways sets their combined 1915 mileages at 13,340—approximate figures and close enough for the purposes of this article. Among them, they are reported as owning 1,350 locomotives, 2,370 passenger cars and 21,500 freight cars. Deducting the combined mileages of the five British railway enterprises mentioned previously as about 4,000 and their 536 locomotives, 700 passenger cars and 8,216 freight cars, there remains that in which the American manufacturer of railroad machinery and supplies of all kinds is most interested and which might be called, for reasons due to the economic situation resulting from the war, a temporary American market. Just how permanent that market can be made is a matter of American determination, plus an inclination to study carefully the rules of the game, plus the use of common sense in their application, tempered with a knowledge of the psychology of the situation. It sounds like a lot of precautions, but the observance of these little details put tiny Belgium at the head of the list of shippers of railway materials to Brazil in the year 1912. The war's effects upon the situation resulting in America's opportunity in this direction, is ably illustrated by the following comparative table of the railway supply imports for Brazil, by countries of origin, for the years 1912, 1915 and 1916, expressed in American dollars.

Country of origin	1912	1915	1916
Belgium	\$8,025,991		
United States	6,106,622	\$745,784	\$1,793,360
Germany	3,509,863	17,730	
England	2,546,000	427,159	284,056
France	2,265,453	1,154	1,020

The significance of these figures is hard to grasp. The total of the first column represents a business in the shipment of railway supplies for one year (1912), contributed to by five nations, of \$22,444,731. As England is still in the game, and more active now than ever in her determination to maintain her world trade, quite an admirable resolution to be sure, it might be just as well to subtract that country's quota of \$2,546,000, which may have gone to her own national roads in that country, leaving a balance, in round numbers, of a business of \$20,000,000. This deduction is advised in spite of the table's showing a decline of Britain's share from over \$2,000,000 to a little over \$200,000, for it will be well to bear in mind, as stated before, that England, in spite of the damage suffered in the war, is still in the game. Just how well she is doing, in spite of the contentions of those who would have us believe that she is out of the railroad supply business and that we are going "to get it all" simply because we are not so badly "crippled" as she is supposed to be, is indicated by some highly interesting figures from the British Board of Trade. They show that in the months of January and February, 1919, Great Britain exported \$3,134,357 worth of railroad supplies. In the corresponding months of 1920, in a short space of a year, the value of those same exports reached a sum of \$16,328,369—a little matter of only 429 per cent increase.

Great Britain, therefore, is America's competitor in the market of Brazil and, for that matter, in all of the markets of South America, and it is for those reasons exceedingly logical in discussing the possibilities that those markets are

said to offer, to deduct the British owned lines and give the intending exporter the benefit of the doubt. If, as frequently happens, a good size order from a British owned railway accidentally, or for some unknown reason, falls to an American concern, all right; we are not ungrateful and will try to please in the hope that we will again be favored. However, in this respect, the Brazilian government's increasing influence in the management of all railways and its lively interest in economy creating devices offered by American manufacturers encourages, at least, a hope for business on even the English owned lines, although this qualification cannot be taken as a guaranty of rewards for efforts spent in that direction.

## New Issue of Great Northern-Northern Pacific Bonds Proposed

WASHINGTON, D. C.

**A** NEW PLAN for refunding the \$215,227,000 of joint 4 per cent bonds secured by a pledge of the stock of the Chicago, Burlington & Quincy, which mature on July 1, was filed with the Interstate Commerce Commission on March 25 by the Great Northern and the Northern Pacific. The new plan, for which the authority of the commission is asked, provides for the issuance of \$230,000,000 of 15-year 6½ per cent joint convertible gold bonds secured by the pledge of the Burlington stock, of which with the increase of \$60,000,000 recently authorized by the commission, the two roads now own 1,658,674 shares, plus \$33,000,000 of 6 per cent bonds of the Northern Pacific and \$33,000,000 of 7 per cent bonds of the Great Northern. The joint bonds are to be callable in whole or in amounts of not less than \$5,000,000 on 75 days' notice at 103 per cent and convertible into bonds of either or both the Northern Pacific and Great Northern under provisions which the application says it is believed will insure the early substitution of mortgage bonds and a gradual division of the Burlington stock which would thus be released. This would provide for a separation of the joint control of the Burlington.

This plan, which has been carefully considered by the officers of the roads after conference with the commission and with bankers, is proposed as a substitute for the earlier plan which could not be carried out because the commission by a five to four decision refused to authorize the issuance of \$80,000,000 of bonds by the Burlington against its surplus, the proceeds to be used to retire a part of the joint bonds at maturity and thus reduce the amount to be refunded.

The joint application asks approval of a joint trust indenture to be dated on or before July 1, 1921, to be executed by both applicants to the First National Bank of New York as trustee, and of the issue of the \$230,000,000 joint bonds on or before July 1. Approval is also asked of the pledge as collateral under the indenture of the 1,658,674 shares of Burlington stock owned by the applicants and now subject to prior pledge under the indenture securing the outstanding joint fours; also the issue and pledge as collateral of \$33,000,000 of refunding and improvement mortgage 6 per cent bonds, series B, of the Northern Pacific due July 1, 2047, callable after 15 years or any interest date on three months' notice, at 110 per cent; also the issue and pledge as collateral of \$33,000,000 of general mortgage 7 per cent bonds, series A, of the Great Northern, due July 1, 1936, non-callable. Approval is also asked of a general gold mortgage of the Great Northern, dated January 1, 1921, to the First National Bank of New York as trustee, providing for an authorized issue of \$140,000,000 of general mortgage 7 per cent gold bonds. Approval is also asked of the issue by each applicant under its mortgage, in event either of payment of joint bonds or their conversion into mortgage bonds, of mort-

gage bonds against deposit and pledge of Burlington stock.

It is proposed to issue and sell the new joint bonds on or before July 1, through a contract to be made with a syndicate of bankers upon the syndicate undertaking to provide the money which will then be required to pay the outstanding 4 per cent bonds, but no such contract is expected to be made until approved by the commission.

The outstanding joint bonds are said to be held by more than 18,500 holders. Applicants have no available funds with which to make a substantial payment on the bonds but they are advised by bankers and believe that, being unable to have recourse to the plan previously presented to the commission, the best and only sure method of raising on July 1 the necessary funds is the proposed issue of convertible bonds. The application says that collateral trust bonds secured on stock alone as collateral are no longer legal investments for insurance companies under the laws of New York, nor will they be purchased by insurance companies, savings banks, trust companies or similar financial institutions or trustees. It is, therefore, necessary, in order to reach this market, to offer, either directly or indirectly through conversion, securities which will be legal investments under the insurance laws and for savings banks and trustees.

The commission has sent notice of the filing of the application to the governors of the States through which the roads operate and has assigned the application for hearing before the commission at Washington on April 11.

## Results of Railroad Electrification\*

By C. C. Whittaker

Railway Engineering Department,  
Westinghouse Electric & Manufacturing Co.

**S**TEAM RAILROADS are studying the problems of electrification. Now and then some road, pressed a little harder than the others for increased road, tunnel or terminal capacity, or for lower operation costs, arrives at the solution which is the answer to its own particular requirements. That these solutions have been justified is evidenced by many statistical testimonials from these electrified roads.

Studies on the substitution of the electric locomotive for steam motive power on various railroads have indicated that the resulting operating economies are sufficient, not only to carry the charges on the capital investment, but in addition that the flexibility of this type of power permits a greater volume of traffic to be handled over the existing trackage, and thereby obviates additional capital expenditures for increased trackage required with steam operation.

Very often, where certain sections of a railroad have about reached their limit of tonnage with steam operation, it has been found that electrification would enable them to care for a 75 per cent increase in tonnage over the same trackage, and that the capital expenditure for electrification would be less than for the additional trackage and facilities to handle this same increase in business with steam motive power.

In case of electrification, in most cases, operating economies care for fixed charges on this increased capitalization.

Capital expenditure for electrification of terminals has been justified solely by the fact that electric operation afforded the only means of enlarging the traffic facilities. One dead-end terminal in the center of one of our large cities handled a large number of suburban trains. The operation of steam motive power necessitated considerable switching movement in order to remove each arriving train and make it up for departure. Business had increased to that point where it was impossible to take care of the increasing

traffic by the introduction of more trains. The physical location was such that it was impossible to increase the trackage facilities at any price. Electrification with the introduction of multiple unit car trains practically eliminated switching and making up of trains, and increased the capacity of the terminal 50 per cent. The cost of electrification was \$3,000,000, and increased earnings cared for the charges.

Another of the principal electrifications on a heavy tonnage coal-carrying road was undertaken primarily to increase the facilities of their present trackage. This section amounting to about 30 route miles of grade and 100 miles of trackage was the limiting factor in their operation, as it represented the congested section of the system. The study of electric operation indicated that the tonnage capacity of this trackage could be doubled with electric motive power, and that the saving on the difference in investment for electrification, and that necessary for additional steam equipment, was a very attractive figure. As a matter of fact, the traffic on this road after electrification did double, and the figures given in the report were justified. These figures are as follows:

	Electric Operation	Steam Operation
Gross investment .....	\$2,939,000	\$1,090,000
Net investment .....	1,849,000	.....
Operating expense .....	500,760	925,165
Saving in operation .....	.....	\$424,385
Return on gross investment .....	.....	14.45 per cent
Return on net investment .....	.....	23.2 per cent

In this tabulation the savings were largely effected by reduced maintenance and overtime crew expense. The cost of generated power was practically the same as for the steam locomotive, due to the fact that the location was in the coal mine district, and coal was cheap.

Studies in other localities where coal is scarce and expensive, and where power is developed by hydraulic plants, show economy in operation due largely to the saving made in the cost of power. This is indicated by the results of a study of a single-track western railroad of this type, where congestion was not involved, and the general method of operation with electric power is quite similar to that of steam. The section represented 133 route miles of single track, and the following tabulation is made on the bases of providing for a 40 per cent increase in business.

	Electric Operation	Steam Operation
Gross investment .....	\$12,561,000	\$3,599,260
Net investment .....	8,961,740	.....
Operating expense .....	3,826,381	5,530,217
Saving in operation .....	.....	\$1,703,836
Return on gross investment .....	.....	13.6 per cent
Return on net investment .....	.....	19 per cent

In considering steam railroad electrification, we must not look for any sudden conversion from steam propulsion to electric. From the date of the first steam engine to the present time, there appears a long succession of improvements and perfection of detail so that at no time, or certainly not at the present day, is one justified in saying that there is nothing more to expect from this system of railroading.

The development of the steam locomotive has been typical of the development of other mechanical necessities, the first efforts demonstrating little more than principles involved. From the first wood burners of a few thousand pounds weight up to the up-to-date Mallet, fitted with mechanical stokers, superheaters and all auxiliaries, weighing several hundred tons, we get some idea of the progress made.

Coincident with locomotive development, other developments essential to the use of improved locomotives, either steam or electric, such as roadbed, rolling stock, signal service, etc., have kept pace with each other.

At the present time, when more and more is required of the railroads in the way of increasing their carrying capacity and expediting their movements, in order to meet the near future demands on most railroads, there is but one economical answer, and that is to electrify.

\*Abstract of an address delivered before the Providence Engineering Society, March 15, 1921.

# Further Methods of Increasing the Car Load

## Contributors to the Contest on This Subject Suggest Various Methods for Obtaining Improvement

THIS IS THE THIRD of a series of articles on the subject of increased car loading which were submitted by representatives of the railways and the shippers in the contest on this subject. The prize winning papers and three others were published in the *Railway Age* of January 28 and six other papers appeared in the issue of February 11. In this issue nine contributors present a variety of suggestions designed to aid both the shipper and the carrier to increase the average loading of the cars to their mutual benefit.

### The Solution Is in a Graduated Freight Rate

By M. Nicholson

General Manager, Chicago, Milwaukee & St. Paul, Seattle, Wash.

The benefits derived from increasing the average load per car in excess of traffic minimum or commercial trade units during times of car shortages, are overwhelmingly in favor of both the shipper and receiver of freight, which the shippers generally do not appreciate. The railroad benefits to a considerable extent, but the shipper's advantage is so apparent that there should be a concentrated effort on the part of shippers to sell and have moved the largest unit that any freight cars will carry.

Continued efforts put forth by the War Board, prior to government operation of railroads, the Food Administration during government control and the railway officers at all times increased the average load per car from 10 to 15 per cent. Shippers were appealed to from a patriotic standpoint and a satisfactory response resulted. Following the close of the war, the old trade units were in most cases re-established and based on published tariff minimums which were established when the average capacity of freight cars was between 40,000 and 50,000 lb. The shippers generally took the position that carload trading was on the basis of so many dollars per car for the commodities rather than so many pounds for a car.

Having followed the subject of heavier car loading for the past four years and as a member of the original commission on car service, having fathered the heavier car loading under the original War Board, the writer feels justified in making the statement that the freight rate will alone govern the quantity of any commodity shipped in a freight car. The method which will produce the results required is similar to our commercial system of trading. Smaller quantities are sold at a higher price to cover the increased handling cost. A purchase from a retail store is necessarily at a higher price than the wholesaler demands from the retail merchant. The wholesale firm purchases in larger quantities and gets a lower price from the jobber or manufacturer. The difference in price of the article is influenced by the quantity involved in each transaction. The same system applies to transportation and is recognized by one rate established for l.c.l. shipments and another rate much lower in most cases, established for c.l. shipments, the distinction being made on account of the relative difference in handling cost.

It would not be contrary to past or present principles to differentiate between quantities shipped in carload lots. Assuming that the present rates can be used as a basis, they could be applied to the maximum carrying capacity of the car furnished to a shipper for loading. This maximum carrying capacity being based on structural strength or cubic capacity. Then graduate the rates upward where full capacity of equipment furnished is not used. As an

example, an 80,000-lb. capacity car fully loaded with any commodity would take the present rate. The same car loaded with 60,000 lb. would take a 10 per cent increase in rate and the same car loaded with 40,000 lb. would take a 20 per cent increase. This plan is in conformity to the rules of trade and would offer to the shippers present rates for wholesale transactions and require the payment of a slightly increased rate for a retail transaction.

### Stimulate in the Interest of the Employees and the Public

By A. P. Brown

Secretary to Superintendent, Southern Pacific, Tucson, Ariz.

Due to competition and the desire to give service, most railroads lose in l.c.l., or package freight loading. However, this loss could be overcome to a certain extent by a revision in the shipping day schedules for package freight where the service required will permit. This would not necessarily result in a decrease in the efficiency the carriers render the public, but would, in a great many instances, benefit the service and increase the carload. Only where this result could be obtained should a change be made.

Much car capacity can be saved in the loading of railroad company material by establishing days for company material shipments, stopping such cars enroute to have the load filled out with other company material which is to move in the direction the car is moving. To do this requisitions should be placed and filled to conform to the loading schedule, in order that the full car load may be secured.

In order to create keener interest in a campaign of this nature, it is at times well to offer nominal prizes to agents for the best commodity loading, giving due consideration to the business offered in different sections, and make the contest of such a nature that competition for the prizes would be universal on the railway system offering them. Interest would have to be stimulated from time to time by means best suited to the campaign; comparative statements, circular letters, or other forms of publicity.

However, to obtain the maximum results the public is the most important factor in the campaign. To attain the goal desired in car loading it is necessary to solicit and receive its co-operation. An educational campaign could be conducted to increase the load per freight car. In addition, the shippers could be solicited directly by means of attaching posters to freight bills, typing or printing phrases about car loading in conspicuous places on stationery, etc. Without the public's aid our campaign would be a failure.

### Raise the Carload Minimum

By C. H. Bristol

Assistant General Manager, Atchison, Topeka & Santa Fe, La Junta, Colo.

During the past two years the Santa Fe has conducted a vigorous campaign in the direction of heavier loading, the matter being watched very closely by all concerned from the general managers, superintendent of transportation, car accountants down to the agents. We have always required daily reports from agents showing in itemized form the cars loaded, commodity capacity of car, weight of load, etc.; these reports are checked by the superintendents and assistant

general managers and any cases of light loading noted are handled at once with shippers through the agents or by a personal call from the superintendent or other representative of the railway. A consolidated report is rendered each month showing the average loading by commodity. It is the practice to take up individual cases where it would seem that the loading might be increased, and it has been found the majority of shippers are willing to co-operate to the best of their ability in this direction.

In a campaign of this kind the result to be obtained must necessarily depend to a large extent, if not entirely, on the shipper; and it goes even farther, involving the jobber and commission man or large dealer who buys in carload lots. These people appreciate the importance of maximum loading and realize the benefit of making one car do the work of two. They are, however, frequently handicapped by the buyers, who, for various reasons, hold their orders down to the carload minimum as set forth in the tariff. This seems to be especially true right at this time, as the merchants and others are buying only what they have to. For this reason it will be necessary that the revision of such carload minimums be given immediate attention if we wish to get the maximum out of our equipment.

## Effective Crating Is Important

By N. A. Ryan

Trainmaster, Chicago, Milwaukee & St. Paul, Milwaukee, Wis.

To gain the mark of 30 tons per car as an average load will require a great deal of careful thought and hard work on the part of railroad officers and employees. So much can be accomplished in a small way along these lines—for instance, if each shipper would increase his loading even 100 lb. per car, many additional cars would result. This is merely an illustration of how easy it is to accomplish something along these lines.

An enormous amount of space is wasted in a great many cars and the best way to increase loading quickly and generally is to maintain high minimums in our several classifications on commodities that will stand it.

The proposition of economical and efficient crating and packing of products is a large study in itself for any concern and if the packing is efficiently done much space is saved. The use of awkward and odd shaped packages should be avoided wherever possible.

We do not give enough thought or time to the instruction of our district clerks in large terminals. These men can do more toward increasing loading than any other railroad employees. They distribute the equipment and sign for the freight and see a great deal of it loaded. They should be taught that when they see a shipper wasting car space they should call his attention to it, or notify the agent or a traffic representative that a call on the shipper would be of benefit, as in some cases the railroad representative might be able to tell the shipper something about his shipping department he did not know and would be glad to correct when informed of it. The clerks should also be instructed in car distribution in order that they will distribute the available equipment economically and intelligently.

The railroads handling their own material are as a general rule about the most extravagant of any shipper in the use of equipment and much can be accomplished by education in store rooms, material yards and shops. The intelligent placing of the right size and class of equipment by the yardmaster in charge of store and shop districts is also a very important item. A systematic check should be made at freight houses and transfer platforms daily by the agent and periodically, by a loading inspector or other traveling inspector to see that the freight is properly loaded, that cars

are not being used extravagantly, and that cars are loaded as heavy as should be, taking into consideration the chances of damage enroute.

## What the Shipper Can Accomplish

By R. G. Kreitler

Manager Traffic Department, Goodyear Tire & Rubber Company, Akron, O.

About three years ago the company with which the writer is connected undertook to secure increased loading of cars. The first step was to eliminate l.c.l. shipments to the 70 branch houses maintained throughout the United States at that time. During the first 3 months and 20 days of these efforts l.c.l. shipments to branches were entirely eliminated and the loading per car increased by 69 per cent.

It is impossible to load the finished product of this company to 30 tons because of its bulk and its low density per cubic foot. The minimum provided for pneumatic tires is 20,000 lb. per car and for solid truck tires and other classes of material, 30,000 lb. per car, but even with this low minimum by making a study of the best methods of loading cars and securing concessions from the various classification committees in the way of packing requirements, it was possible to produce a loading of all classes of material, including both pneumatic and other classes of rubber goods, at an average of 30,325 lb. per car for the year 1919.

In many cases it was not possible to load to the visible capacity of the car by reason of the manner in which orders were placed by the customers. In this connection it is suggested that sales organizations in co-operation with purchasing organizations of their customers might be induced to co-operate to the end that customers in placing their orders would have it understood with the seller, that cars should be loaded to the full visible capacity so far as possible. On inbound shipments, consisting of various kinds of raw materials, etc., the average loading per car was 79,335 lb. The average for the total movement, inbound and outbound, was 58,155 lb.

One of the greatest evils, as it affects the larger use of equipment, is the custom on the part of many receivers of freight to order far in excess of their daily requirements, the result being that they have a large accumulation of loaded cars on hand. However, all of the fault in this respect does not lie with the shipper or the receiver by reason of the unreliability of the service offered by the carriers. It is disconcerting to a shipper who is actually trying to get the fullest possible use from railroad equipment by loading up to the visible or carrying capacity of the car to send forward a shipment destined to a point to which ordinarily they would make delivery in six days and to find the car actually going through in from 60 to 85 days.

## What One Division Accomplished

By F. E. Slater

Southern Pacific Railway, Dunsmuir, Cal.

The following is a brief account of the methods used and results secured on the Shasta division of the Southern Pacific in increasing carloading during 1920. To start with it was necessary to ascertain the approximate number of cars of each commodity that each shipper would ship during the year, therefore in the month of January, 1919, every agent was requested to interview the shippers in his territory and secure this information first hand. During the early part of March a letter signed by the superintendent was sent to each shipper, each letter being worded slightly different to avoid having the appearance of being stereotyped. The following is an abstract of a typical specimen:

"I feel reasonably sure that a majority of the large shippers

are acquainted with the shortage of equipment at the present time, due principally to the reduction made in the building program during the past several years, and one of the best methods of combating this shortage is by loading what cars we have to 100 per cent capacity.

"I appreciate that you are often confronted with obstacles that are hard to overcome; however, when the opportunity is favorable considerable can be accomplished. Should you have any suggestions to offer whereby we can assist you in accomplishing better loading, I would appreciate your taking up the matter with me promptly."

While no reply was requested, not a shipper failed to answer the communication and assure us of his co-operation and many of the suggestions received were followed up by a division officer who investigated them personally and reported his findings. Those meriting it were favorably acted upon, thus assuring the shipper that we were anxious to do our part.

As a result of this campaign, instead of showing a loss of over 3,000 cars as during the year 1919, a saving of 4,933 cars was accomplished for the period from March to September, 1920, alone, the period beginning March being selected, as it was during that month that the appeal was made to the shippers. The following tabulation shows the result by months for 1920 as compared with 1919.

Month	Average tons per car		Per cent of contents to capacity	
	1919	1920	1919	1920
January	36.0	27.9	83.8	69.5
February	32.2	30.1	77.6	78.1
March	30.9	31.8	78.1	80.7
April	29.8	32.3	79.3	83.4
May	27.2	32.1	72.8	80.1
June	29.6	32.3	79.5	78.2
July	26.8	29.3	68.5	80.1
August	28.8	37.4	73.9	92.4
September	27.9	36.8	74.2	89.5

### Have a Consistent Policy

By A. T. Mercier

Superintendent, Southern Pacific, Portland, Ore.

Two things enter into the attainment of an average of 30 tons per car. (1) When practicable, furnish a car of the size required. (2), load to maximum space or weight capacity.

In attaining the latter, the carriers rely very largely upon the personal contact of the local agent with the shippers, as it is only through the influence of the local agent in many instances that the shipper can be prevailed upon not to take advantage of the minimum weight. In this connection, consideration should be given to the question of raising the minimum carload on various commodities as the existing tariffs work very greatly against attaining the maximum carload.

In this territory we have been working energetically to obtain maximum carloads. It is a matter of education that must be guarded very closely, as the shipper will lose interest in car conservation if after being inconvenienced and incurring additional expense, to supply a maximum load the car were permitted to remain on his siding an excessive length of time before being moved.

### Some Lading Requires Special Treatment

By G. C. Conn

General Traffic Manager, Buick Motor Company, Flint, Mich.

The question of heavy loading of freight cars is like the "Tariff," a local issue. The great variance of commodities and the lack of uniformity of railway equipment almost obliges each territory to work out its own salvation. Assuming that everyone does his best to load heavily, and usually a shipper will load all he can in order to get more money in return, there are conditions under which the cubical capacity and not the weight capacity of the car must govern the load.

In Michigan, for example, an unusual number of light and bulky articles are produced such as hay, beet pulp, refrigerators, sewing machines, kitchen cabinets, furniture, woodenware, automobiles and other commodities. These all require large cars in order to get the minimum load, and the weight capacity of the equipment is never reached. So far as automobiles are concerned, it is not a question of tonnage capacity. This is why automobiles pay the highest rate per ton per mile of any regular carload traffic. Large cars with wide doors are absolutely essential.

The Buick Motor Company and other units of the General Motors Corporation have purchased several trains of flat cars for moving automobiles. These are equipped with steel decking with the result that the load is doubled. There is no question but what double decking is feasible on open as well as closed cars for a great variety of tonnage. Shippers must experiment and find the method best adapted to their business.

### Railroads Should Set a Good Example

By G. F. Burns

Traffic Manager, United Drug Company, Boston, Mass.

It is absolutely necessary that the carriers furnish dependable equipment. Shippers can hardly be expected to load to the maximum, if such action will result in merchandise being transferred en route, as is now infrequently the case, because of faulty equipment.

The carriers' methods of loading and stowing merchandise at terminals and freight houses could be very much improved upon. In a comparison between the loading of cars by private industries and by carriers, particularly so-called merchandise or package cars, it is believed that the cars loaded by the shippers will show to much better advantage. Visits to the terminals of various carriers where there are a number of merchandise cars loaded daily lead to the opinion that these cars are, as a whole, insufficiently and improperly loaded.

It is believed that the carriers could utilize equipment loaded by themselves to much better advantage and that many shippers would load much heavier if they felt reasonably sure that a transfer en route would not result, because of cars being too heavily loaded.

### Are We Buying Coal Enough ?

DR. GEORGE OTIS SMITH, director of the United States Geological Survey, and F. G. Tryon, coal statistician of the Survey, have issued a statement making the following analysis of the obvious facts in the present coal depression:

During the first week of March the operators at some 2,600 soft coal mines reported to the Geological Survey that they worked on the average only 19 hours out of the possible 48 working hours in the week. They were closed down, so they stated, on account of "no market," or lack of orders, an average of 26 hours. They lost a little time on account of labor shortage, and a smaller amount because of local strikes in Kansas and Missouri. Here and there a mine lost a few hours' working time because cars were not placed when ordered, or because of mechanical breakdowns. But the loss on account of all these other factors combined was only 2½ hours as against the 26 hours—more than three days—because of lack of demand.

Making due allowance for what may have been happening at other mines not reporting to the Survey and for the fact that no mine can in practice long maintain output at 100 per cent capacity, it is still clear that the soft-coal industry

is at the moment very short of business. It has 8,000,000 tons a week of demonstrated mine capacity lying idle, and what is worse, piling up capital and maintenance charges waiting for the consumers in the United States or abroad to place their orders. Most serious is the fact that the bituminous coal industry has a veritable army of unemployed. The 615,000 mine workers are offered not over three days' work a week, and at many mines only two or even one day. Coal miners in the United States draw a pretty good day's wage, but they cannot continue indefinitely to make ends meet on one or two days' work a week.

It may be charged that even in times of active demand the railroads cannot provide cars to keep the mines busy continuously. Very well, then, measure the present depression against what we know the railroads can do. In the first week of March the output was 7,263,000 tons. The next week it dropped to 6,891,000. The preliminary figure for the third week of March (14-19) is 6,525,000. Now, four months ago, before the market broke, the railroads were furnishing cars enough for an output of over 12,800,000 tons a week. Indeed, on two occasions in the past, when extraordinary measures were invoked to stimulate car supply at the mines, the railroads provided transportation sufficient to get out a total of 13,100,000 tons. Thus the present rate of output is less than half what the carriers can handle under pressure, and a good 6,000,000 tons short of what they were doing last December. The best demonstration that the roads stand ready to handle more coal is that they have some 204,000 open cars lying around idle on sidings, according to the American Railway Association. Because these cars are idle the roads are discharging men by the thousands. And as in the case of the idle mines and machinery, so with the idle cars; not only are they bringing the roads no revenue, when revenue is badly needed, but they are steadily eating up other earnings with capital and maintenance charges.

All signs, then, point to the consumer as the controlling factor in the present situation. Of course the coal man has come to expect a period of dullness in early spring as one of the drawbacks of his seasonal business. But this year the slump is far worse than the normal, even considering the mild winter. For the consumer is having troubles of his own; the business depression has reduced his requirements. In December last the beehive coke ovens, for example, were taking 600,000 tons of coal a week. Today they are using only 270,000 tons. Somewhat the same reduction has been going on in other domestic industries and at the same time exports have also fallen sharply. With current consumption curtailed in this manner it is clear that the mere fact that production is down to six and a half million tons a week does not of itself prove that consumers are purchasing less than their requirements. Indeed, the rate of output has not yet touched the low point reached during our latest real business depression, in 1914. That, however, was seven years ago, and our normal rate of growth has been such that 7,000,000 tons in 1921 would be as low as 6,000,000 was in 1914. If the business depression proves to be long-sustained, then the present low rate of production carries no threat of an approaching shortage of coal. If, on the other hand, business should suddenly resume at full blast we know that the railroads will hardly be in a position to haul coal enough to rebuild stocks, meet current consumption, and handle other freight at the same time without signs of distress.

There is reason to believe, however, that the business depression is not the only consideration in the mind of the consumer at present. He remembers what he used to pay for coal before the war. He recalls that he could then get an abundance of coal for \$1.15 f.o.b. mine. He knows that on the average in 1918 coal was costing \$2.50 or \$2.60 at the mine. He sees that prices of many other commodities have fallen since 1918, and then he takes up a copy of "Coal Age"

or "The Black Diamond" and notes that the lowest price quoted on spot coal is \$2 run of mine, f.o.b. mine, with many quotations at \$2.50, \$2.75 and \$3, or over. He finds that little coal is offered for contract at less than \$3 a ton. He remembers, with resentment, the prices he had to pay last year, and he decides to buy only as needed and wait for the price to come down to a reasonable figure.

The operator, however, retorts that the price has gone down as far as it possibly can; that many mines have been in consequence forced to close, and that with the successive wage advances of April, 1916, April and October, 1917, and March and August, 1920, the cost of producing coal has so increased that a return to pre-war prices is impossible. The consumer must awaken to the fact, argues the operator, that whereas before the war he would think in terms of \$1.00 or \$1.25 coal, now he must think in terms of \$2.50, \$3.00, or \$3.50 coal f.o.b. mine.

Insofar as the consumer is waiting for the price to come down, at the risk of depleting his reserves against winter requirements, the relief turns upon a question of fact, namely, whether the present market price of coal is a reasonable price, whether it is as low as can be expected later. It is to be regretted that the Federal Trade Commission has been enjoined from learning the facts and so is not able to issue a statement of present-day costs that would enlighten the public.

"Buy only as needed" may prove too conservative advice at this time. The consumer waiting for low prices and the producer delaying price adjustment might be found equally responsible for the uneconomic seasonal fluctuation in coal output. "Buy only as needed" may result in cheaper coal in the bin, but the bin may be too nearly empty much of the time when the need is greatest.

The plain situation is that the coal buyer distrusts the coal seller and "no market" as given in the weekly returns in part simply reflects the consumer's attitude. His answer to offers of contracts may be natural, but is it safe?

The consumer must ask, "Have I sufficient stocks in my bin to tide me over a period of bad weather, or an interruption to my supply, in view of what I shall need to make the goods to fill the orders I expect to have?"

To the railroads the question becomes, "Have we as the largest consumers of coal laid in an adequate reserve against the period of active business which must one day come?"

And not the least searching should be the question asked by the producer of himself, "Have I made the utmost possible concessions to the user of coal? Have we as an industry done wisely in opposing the collection and publication by the federal government of data on the costs of production?"

Duluth, South Shore & Atlantic Train Ferry, St. Ignace, Mich

# Practical Propaganda for Fuel Conservation

## Fuel Conservation Committees a Force for Fuel Economy on the Delaware & Hudson

ANYONE HAVING OCCASION to visit a shop or terminal on the Delaware & Hudson is at once impressed with what might be termed the spirit of conservation. A neat, orderly arrangement of parts usually bespeaks attention to detail and the elimination of waste. The impression deepens at the sight of a well-proportioned bulletin board conspicuously mounted just outside the engine despatcher's office. In the glare of an electric light immediately over the board Fuel Conservation Bulletin No. 5 gives a very vivid description of what may happen as the result of pulling air hose apart under pressure. There is an illustration showing a sectional view of a hose weakened by being pulled apart under pressure with the following explanation:

"The picture shows the result of pulling hose apart under pressure. This practice punctures the inner tube when the hose straightens out, due to the nipple being at an angle of 45 deg. This practice also destroys the inner tube, allowing the pressure to reach the canvas wrapping, causing air leaks which are difficult to discover by inspection, and in a short time will cause a bursted hose, resulting when freight trains are in motion in an emergency action of brakes, sometimes buckling trains, causing derailments and detentions.

"This destructive practice can be eliminated by parting hose by hand in accordance with Rule No. 4 as covered in the Air Brake Instruction Book. Air leaks and detentions waste fuel and by complying with Rule No. 4 this waste can be eliminated. Will you help?"

If we can be persuaded that we need a biscuit because we are forever being reminded of the fact by signboards on every corner and advertisements in every street car, is it not logical to assume that a constant reminder of the fact that fuel may be saved in various ways will have its effect on all loyal employees?

The object of a fuel conservation bulletin is to sell fuel conservation to every employee and so far as practical it should conform to the principles that have made commercial advertising a success. Commercial advertising is a success because its reasoning is logical, its portrayal vivid and its message persistent. The Delaware & Hudson bulletins are good because they are logical; where practical, they are vivid and they have been persistent. What merchant would expect to sell goods on the strength of the feeble, inconspicuous and irregular bulletins that have been attempted by some railroads in the name of fuel conservation?

Some of these mimeographed documents would not serve to sell a postage stamp, much less fuel conservation,

to a skeptical engineman. What the railroads really need in this direction is the same sort of advertising appeal that helped to put over the Liberty Loans—and it would be money well spent.

### Getting Co-Operation

Some railroads have failed in fuel conservation because the problem was too big and intangible; they do not know where to start in. The Delaware & Hudson has discovered that fuel conservation is an individual problem with nearly every employee and that the whole-hearted co-operation of these employees is essential. How this co-operation is invited, encouraged and becomes a live factor in saving coal

on this railroad may be observed in the following account of the organization and activities of the fuel conservation committees taken from a manual on fuel conservation published by the railroad:

The committee organization is headed by a General Fuel Conservation Committee comprising:

- General manager, chairman.
- General superintendent of transportation.
- Chief engineer.
- Superintendent of motive power.
- General fuel agent.
- Purchasing agent.
- Superintendent of stores.
- Master car builder.
- Fuel engineer, secretary.

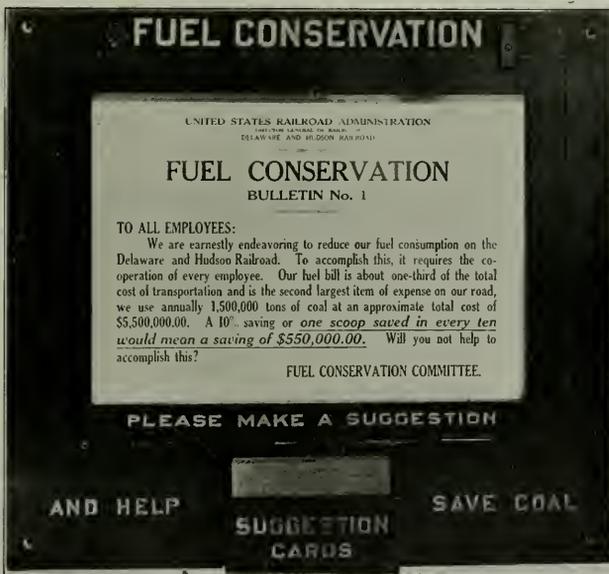

On each division the Divisional Fuel Conservation Committee is composed as follows:

- |                           |                               |
|---------------------------|-------------------------------|
| Superintendent, chairman. | Conductor.*                   |
| Fuel engineer.            | Engineer.*                    |
| Fuel supervisor.          | Fireman.*                     |
| Road foreman of engines.  | General air brake instructor. |
| Yardmaster.               |                               |

"Those members designated thus \* are to be selected for a period of six months by the chairman, in conference with the fuel engineer and the master mechanic. At the end of six months after the first committee has been organized, and each succeeding month thereafter, the chairman will appoint the number of new members, necessary to fill the vacancies from the same branches of the service, so as to bring about a gradual but complete change of members so designated every six months. A member whose term of office has expired will be an honorary member of the committee. Such honorary member is at all times free to make suggestions to the divisional committee on fuel conservation."

The activities of the committee organizations are outlined as follows:

"Fuel Conservation committeemen should always be alert to correct any practice wasteful of railway fuel, making corrections themselves when possible, and at the proper time rendering reports of their activities. They should at all times so conduct themselves as to teach fuel saving by example and precept to all

employees with whom they come in contact and employees should be urged to conserve and save fuel at every opportunity.

"The fuel engineer will act as secretary of divisional committees and prepare the minutes of the meeting and list all suggestions fully on a form provided for that purpose, giving the name of the employee offering same and numbering them in consecutive order.

"All committees must meet during convenient business hours at least once every month at divisional headquarters or other place designated. Members will be required to attend all regular meetings and supervisory officers will arrange to relieve members for the time necessary to attend.

"Members of divisional committees will report to the chairman of the Fuel Conservation Committee on prescribed forms. Every member will furnish the chairman of his committee with a report each month on the form shown in Fig. 1."

Following this outline of the activities of the fuel conservation committees, the purpose of the organization is described as follows: First, to study and correct the wasteful practice in the handling of railroad fuel, such as over-loaded tanks, coal lost in transit, and second, to study, suggest and apply the most economical use of railroad fuel on locomotives, power plants and other places where railroad fuel is used.

### How Everyone Can Help

One of the best suggestions ever offered on saving coal appears on the cover of the Delaware & Hudson manual to the effect that if employees will endeavor to save the extra shovelful, the tons will take care of themselves. Suggestions for saving coal are addressed to employees as follows:

"Over 90 per cent of railroad fuel consumed on his division is charged to cost of transportation, and of total cost of transportation the fuel bill is about one-third, hence, *superintendents* may not only assist in conserving the coal pile but may also reduce his divisional expenses by devoting a portion of his time to a study of fuel conservation and putting his efforts back to the fuel conservation campaign.

"The *trainmaster* should keep the cars moving and to full car capacity, and wherever practicable avoid moving locomotives over the road light, insist on maximum tonnage over ruling grades and quick movements in and out of yards, and keep in touch with train despatching to insure good and proper train movements.

"The *train despatcher* must see that trains are properly despatched so as to avoid as much as possible slow movements over the road and unnecessary delays in sidings.

"*Yardmasters* can see that incoming and outgoing trains are handled promptly, that proper inspection of trains is made before leaving yards, that locomotives are not ordered before the time that they are actually required and that cars are properly handled on the hump to prevent damage. Rough handling will loosen brake pipe and cylinder connections, resulting in an extra drain on the air pump, air supply and the fuel pile.

"*Car inspectors and repairmen* should see that all cars are properly inspected and repaired before leaving the yard because improper repairs to brake pipes, brake cylinders, reservoirs, brake rigging, etc., results in fuel waste.

"*General foremen and foremen* should see that all locomotives receive proper repairs. They should also supervise and inspect all work to see that it is properly done, as work intelligently and properly done will have its influence in fuel conservation.

"The *roundhouse foremen* should not fire a locomotive up too far in advance of the time it is needed nor neglect to make necessary repairs as called for on an engineer's report. He should see that fire is in good condition before the locomotive leaves the roundhouse. If a locomotive is reported not steaming, don't reduce the nozzle; have a talk with the engineer and ascertain the real cause and apply the remedy. Remember steam leaks, poor cylinder and valve stem packing, worn-out grates, valves out of square, improper drafting, exhaust nozzles smaller than required, clogged flues, etc., all tend to waste fuel.

"The *master mechanic* should bear in mind that since there is not an element of locomotive maintenance that does not in some degree affect fuel consumption, it is therefore of the utmost importance that locomotives are in proper mechanical condition before releasing them to the transportation department.

"*Road foremen of engines and traveling firemen* must ride locomotives frequently. They should keep in touch with engineers and instruct them how to handle their locomotives economically, also instruct firemen as to economical firing."

What *conductors and trainmen* are expected to do has been outlined in the following terms:

"See that your train is in proper condition before leaving terminal.

"Make an extra effort to keep your train moving to prevent blocking man back of you, thus requiring him to burn extra coal.

"In freight service anticipate and prepare for station work before you reach the station.

"In passenger service, encourage the quicker handling of passengers, mail and express. (The making up of time lost unnecessarily at stations, in yards, etc., takes fuel.)

"Leaky train lines waste fuel. Keep them tight.

"In passenger service the following will cause fuel waste: leaky steam hose connection, drip cocks too wide open, overheated coaches, all of which tend to add an additional drain on the boiler and fuel pile.

"Give prompt attention to hot journals. A hot journal means increased friction and fuel.

"Watch the brake shoes on your train; dragging shoes, whether due to stuck brakes or to train line leaks, result in fuel loss.

"Keep box car doors closed. Open doors result in resistance and loss of fuel.

"Report for duty early enough so as to leave the yard on time. A locomotive held in yard waiting for the train crew wastes fuel."

Instructions to *engineers* read as follows:

"Co-operate and assist the firemen wherever possible.

"If your locomotive is not steaming do not ask for a reduced nozzle but ascertain the real cause instead, reporting it to the roundhouse foreman.

"Keep the valves and bearings properly lubricated, as friction results in a fuel loss.

"Take advantage of grades in the operation of locomotives.

"Do not fail to make proper report of mechanical defects on your arrival at terminal, as steam blows from cylinder and valve stem packings, worn-out grates, valves out of square, etc., help to waste fuel.

"Endeavor to work your engine at the shortest practicable cut-off at all times, so as to obtain full benefit of the expansive force of the steam.

"Endeavor to feed the boiler uniformly, and do not allow the water level to rise so high that the effectiveness of the engine or the superheater will be destroyed.

"Avoid slipping your engine. It tears the fire and wastes coal."

The *fireman's* part is described as follows:

"See that the fire is in proper shape before starting the train. This is the proper time, and not after engine is using steam.

"Do not allow the locomotive to pop unnecessarily; tests show that a pop opened one minute wastes 15 lb. of coal.

"Keep deck and tank clean, and thus prevent coal from dropping off on roadway.

"Close the firedoor after putting in each scoopful of coal.

"Three or four scoops to a fire, even with the largest engines, has been proved practicable and gives the most economical result.

"Avoid bringing in dirty, heavy and dead fires. This results in an excessive amount of good coal being lost at the ash pit. When within a reasonable distance of any terminal fire very light and try to consume only what coal you have in firebox.

"On arrival at the terminal inspect the firebox. If any flues are leaking, ask the engineer to report them at the roundhouse."

Terminal operations play a very important part in the operation of the Delaware & Hudson. The time involved in every terminal movement is accurately checked with a view to reducing the number of idle locomotive hours and the condition of every locomotive is carefully observed with a view to correcting any condition that tends to impair its efficiency. In this connection, the condition of the fire on arrival is given particular attention and all heavy, dirty fires are reported by the hostler. This matter is given special attention, because it is known that heavy, dirty fires indicate inefficiency in operation and increase the time locomotives are held at terminals by delaying the progress of these locomotives over the ash pit.

### Departmental Lines Ignored

It will be apparent from the foregoing that the responsibility for fuel economy rests with all departments and on all officials from the general manager down. The following statement by an officer of the company affords a very clear conception of the scope of this work:

"Fuel conservation is in charge of the fuel engineer, who in turn reports to the general fuel agent. Reporting to him is a chief fuel supervisor on each division. To date there have been held on each division 20 meetings. There has

laws of the railway employees department of the American Federation of Labor and to its members and officers credit is due for this very desirable condition."

Taking up the advantage of a national agreement, Mr. Jewell said:

"As representing the federated shop crafts' employees, we hold that an agreement applying alike to all railroads will be a great, if not the greatest factor, in assisting to establish efficient and economical railroad operation. It will remove the costly 'labor turn-over,' which has always existed to a greater or lesser extent and is due mostly to the fact that wages and conditions of employment on one railroad were more favorable than upon another railroad.

"Management, during the fall of 1917, recognized this condition as a very important factor in computing increased expenses in the operation of railroads, and based their claims for increases in transportation rates to the Interstate Commerce Commission partly upon 'labor turn-over.'"

Mr. Jewell's presentation to the Board will require a week or more, following which the labor side will present numerous exhibits regarding various rules and principles of the national agreement.

Continuing the reading of his rebuttal statement Mr. Jewell cited voluminous correspondence between the railway employees department of the American Federation of Labor and the Railroad Administration leading up to the formation of the shop crafts national agreement. Much of this correspondence dealt with the plans for vocational training for mechanics and apprentices in railroad shops under direction of the Department of Labor.

#### Board Dismisses Short Line Dispute

The Board's decision on the demand of labor leaders for the application of the rates of pay fixed by Decision No. 2 to employees on the short lines was announced on March 23, although dated March 16. This finding dismissed the dispute because of the Board's inability to determine just and reasonable wages in view of the "varying work done under infinitely varying conditions by the 4,000 employees of the carriers parties to the dispute."

In outlining its position the Board said in part:

To determine just and reasonable wages for any class of employees requires consideration of the work done for such wages. In the present case the work done by each class of short line employees varies to a substantial extent on each carrier. In many instances the work done by any class varies substantially as between the individuals in that class. Thus the determination of just and reasonable wages for any class requires the consideration of innumerable and diverse circumstances and in many instances consideration of the work done by individual employees.

There are wide variations as between these carriers in the cost of living for employees in the communities they serve, in the scales of wages paid for similar work in other industries, in the hazards of the employment, the training and skill required, the degree of responsibility, the character and regularity of the employment, and in other circumstances relevant to a determination of just and reasonable wages.

The Labor Board has found it impracticable to decide on the evidence submitted in this case what are reasonable wages for the "varying" work done under infinitely varying conditions by the 4,000 employees of the carriers parties to this dispute. Classification of short line employees is necessary for such decision and such classification requires elaborate study. A classification of employees of standard railroads is now in progress. It is practically impossible for this Board to undertake the classification of short line employees while the classification of standard railroad employees is still undetermined.

After ruling out that portion of the controversy relating to national agreements on the ground that this question is now before the Board in another case, the finding says:

Changes are now taking place in the cost of living and in the wage scales paid for similar work in other industries which appear to justify conferences between the carriers parties to this dispute and representatives of their employees. It is the view of this Board that as to the short line carriers such conference would produce more reasonable results than would be accomplished if this Board should now undertake to determine reason-

able wages and working conditions for the employees of the short lines parties to this dispute.

Let the principles set forth in this finding be taken as an indication of the Board's views regarding the general questions of wages and working conditions, the following paragraph was appended:

This statement is to be understood as applicable to the circumstances of this dispute as to short line employees and not to be taken as indicative of the Board's view as to appropriate action as to conference in another dispute now before it as to rules and working conditions on standard railroads.

The Board's decision reads:

For the reasons stated, without prejudice to the right of representatives of employees of said carriers to meet representatives of the carriers or any of them in conference as to wages and working conditions and without prejudice to the right of the parties to such conference to refer any dispute undecided therein to this Board for decision, *these disputes are dismissed*. This decision shall not be considered as affecting any wage increase now in effect nor any agreement regarding wages between any of the carriers and their employees.

#### Wage Reduction Disputes Come Before Board

The development of paramount interest during the past week has been the initiation of controversies over the wages of employees, particularly of unskilled labor by practically all of the larger carriers. This action is in accord with the recommendations made some time ago by the Association of Railway Executives after their plea for permission to pay unskilled labor the prevailing rates in the territory in which they are employed was denied by the Labor Board. The Board held that any reduction in the wages of unskilled labor could be made only after the negotiations between the carriers and the representatives of the employees, or by the order of the Board after such conferences had ended in disagreement. Changes in the cost of living and wages paid in outside industries have led many carriers to institute controversies over the wages of skilled and unskilled employees.

Some action, either to reduce the wages of unskilled labor or of all employees, has been taken by practically all of the larger carriers throughout the country, and two of these disputes have already been docketed by the Labor Board, the controversy by the New York Central and its unskilled employees being scheduled for hearing before the full Board on March 30, and that between the St. Louis-Southwestern and its unskilled laborers on March 31.

It has been generally supposed that when these cases were brought before the Board it would, in the interest of all concerned, consolidate all of these cases into one hearing on the justness and reasonableness of the rates of pay established by its Decision No. 2 last July. However the docketing of the New York Central and the St. Louis-Southwestern cases indicates that this procedure will not be followed, at least for the present time, and that therefore that settlement of many of the controversies will probably be delayed.

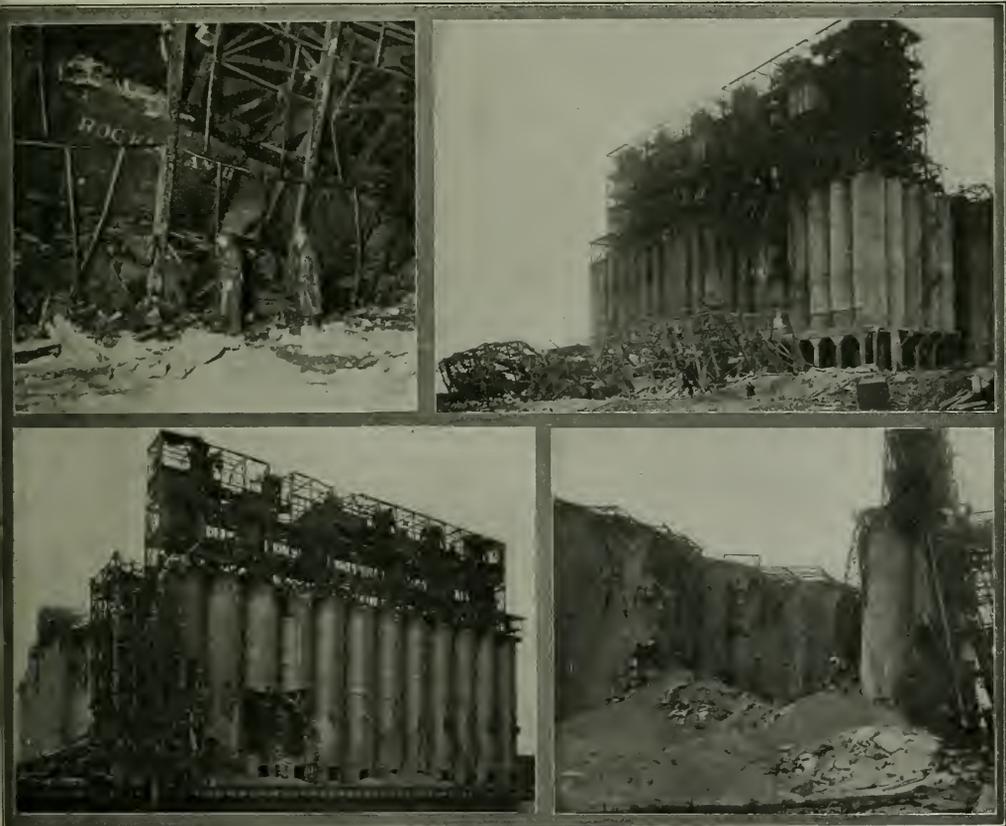

It is significant that the New York Central, in bringing the dispute with its unskilled laborers before the Board, has asked the Board to put a temporary decrease in effect on April 1 and to make the permanent decrease finally decided upon retroactive to that date. It will be recalled in this connection that a similar procedure was followed on behalf of the employees when the Board's decision of July 20 was handed down in that it made the increased rates retroactive to May 1, thus relieving the employees of the financial burden during the progress of the hearings. Similar treatment is now asked on behalf of a carrier and if this request is granted it is not improbable that all of the carriers will be similarly treated and a general wage decrease will be put into effect in the near future, pending the Board's retroactive decision. The Board has also announced that two other hearings involving two other small roads will be held on April 4 and 5. These roads have already reduced wages and the disputes were brought to the Board by the employees.

# Dust Explosion Wrecks Large Grain Elevator

Chicago & North Western Structure at South Chicago Suffers  
Enormous Damage from Blast

AT 6:20 SATURDAY EVENING, March 19, an explosion of dust wrecked the great terminal grain elevator of the Chicago & North Western on the Calumet river in Chicago. The disaster resulted in the death of six persons and a property loss estimated at about \$4,000,000. The structure was leased and operated by the Armour Grain Com-

modating cars on five tracks and surmounted in part by a dryer, a large rectangular structure having a structural steel frame covered by walls of reinforced stucco or "gunite." The walls of the galleries and cupolas above the bins were composed of the same material while the roof consisted of thin concrete slabs covered with a suitable roofing.

The River House, and the Frame of the Marine Leg

The Broken Corner of the Storage House

pany and was one of the largest plants of its kind in the world.

This grain elevator, which represents an investment of about \$10,000,000, was composed of a storage house, a work house and a "river house," each consisting essentially of concrete bins of the usual construction with a storage capacity of 6,000,000 bu. and surmounted by superstructures or galleries and cupolas, which in the case of the work house and the river house extended to a height of approximately 200 ft. above the track level. The work house, which consisted of 95 bins, was flanked on the west by a track shed accom-

All evidence now available indicates that the explosion consisted of the progressive ignition of an explosive mixture of dust and air filling practically all of the enclosed spaces in the structure which were not occupied by the grain. The greatest intensity of the explosion was apparently in the two cupolas over the work house and river house, respectively, and in the galleries over the storage bins, the effect being to burst off all of the gunite walls and concrete roofing from the steel frame which was left in a more or less distorted and otherwise damaged condition. The fragments of wall and roofing construction were blown to great distances from

the elevator and this material, falling from a great height on the roofs of the power plant, office building and other auxiliary structures, crushed in their roofs and otherwise seriously damaged them. The dryer structure was torn from its supports against the side of the work house bins and fell on the track shed which was completely wrecked, crushing 20 cars which were in the shed at the time or causing them to be thrown into the pit or track hopper below the tracks.

A superficial examination also indicates serious injury to the concrete bin structures. Fifteen of the bins at the southeast corner of the storage group collapsed completely, allowing the grain to run on to the ground, as shown in one of the photographs. The outer walls of many of the remaining exterior bins are also badly split or cracked, both horizontally and vertically. The condition of the interior walls cannot be determined until the grain now in many of these bins has been removed.

A number of small fires were started by the blast of the explosion but these were readily extinguished by firemen shortly after the accident. There has been some indication of smoldering fires in the grain but apparently very little of the damage has resulted from fire.

## Freight Car Loading

WASHINGTON, D. C.

Freight car loading, which during the first two weeks of March had shown a slight gain, was again reduced during the week ending March 19 to lower figures than had been recorded since the first of the year, with the exception of one week containing a holiday and one other week in February. According to the weekly report of the Car Service Division of the American Railway Association, the number of cars loaded with revenue freight for the week was 691,707, as compared with 702,068 the week before and with \$55,060 in the corresponding week of 1920 and 699,720 in 1919. The car loading figures have been following closely the curve shown on the chart for 1919 and for two weeks had shown a slight gain over 1919 but for the week of March 19 they again fell below 1919. The loading of all classes of commodities showed a decrease as compared with the previous week except merchandise, l.c.l., and miscellaneous freight, which amounted to 440,920 cars, a gain of 7,000 cars. There was a gain, however, as compared with 1920 in the loading of grain and grain products, which for the week

Decrease compared 1919	1921	.....	4,609	7,638	.....	6,664	9,239	.....	195,599	8,013	.....	.....	24,274	.....	.....

L. C. L. merchandise loading figures for 1921 and 1920 are not comparable, as some roads are not able to separate their L. C. L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

amounted to 36,038 cars. The largest decrease was in the loading of coal, 126,081 cars, a decrease of 60,000 as compared with 1920 and of 10,000 cars as compared with the previous week. The summary for the week of March 12 is shown in the table on the preceding page.

The freight car surplus for the week ending March 23 was the largest ever recorded in the history of the railroads, the daily average for the week being 459,411, of which 230,394 were coal cars and 164,195 were box cars. The largest previous surplus was in February, 1919, when it was about 451,000. In 1908 there was a surplus of about 413,000.

The increase in the number of surplus cars and the reduction in car loading is largely attributable to the rapid falling off of the coal movement. The coal car loading during the week of March 19 was 64,000 cars less than during the first week in January. Loading of merchandise and miscellaneous freight was increased during that time by 61,000 cars.

## President Takes Up Railroad Wage and Rate Situation

WASHINGTON, D. C.

PRESIDENT HARDING has decided to take a hand in trying to find a solution for the difficult railroad situation.

Following the cabinet meeting on Tuesday, at which the railroad situation and its effect on the business of the country was the principal subject of discussion, the President announced that he would confer on the subject at an early date with Chairman Clark of the Interstate Commerce Commission and Chairman Barton of the Railroad Labor Board. Chairman Barton arrived in Washington from Chicago on Thursday morning and shortly afterward, with Chairman Clark, went into conference with the President.

The President has expressed his deep concern in the situation and desires to do anything necessary or possible to bring relief. He has been informed that most of the railroads are not earning their operating expenses, under rates designed to give a 6 per cent net return, and that the situation has been made much worse by the large falling off in the volume of freight movement, which some of his advisers are inclined to attribute largely to the rate level. He has not publicly indicated that he has any plan in mind other than to get information from Messrs. Clark and Barton as to the questions involved in the rate and wage situations from their respective points of view, but the fact that they were considered together is taken as an indication of an appreciation of the dependence of the possibility of rate reductions on the largest item in the cost of transportation.

Most of the members of the cabinet who discussed the matter are interested in the subject from the standpoint of rates and their effect on business rather than the causes for the high rates, and it is understood that the President has been informed by railroad executives that rates are so high as to interfere in many instances with the free movement of traffic, but they have naturally emphasized the necessity for reducing wages before much can be done in the way of rate reductions. There have been predictions by the newspaper correspondents that the President would discuss the railroad question in his message to Congress, although some of his closest advisers on the subject, including Senator Cummins, have taken the position that legislation is not needed so much as the application of ordinary business principles.

"The whole question is one of operating costs," said Senator Cummins in a newspaper interview. "Rates cannot go higher. Railroad revenues last year were the greatest in the history of the railroads and they handled the greatest volume of traffic and the largest number of passengers in their history. The expense account is too big. It will be the purpose of our committee's investigation to find out where the trouble

lies. The reduction should not be limited to labor. It should apply to the whole structure. I do not see that we can do much in the matter of additional legislation. In my opinion it is impossible to make any material increase in the power of the Interstate Commerce Commission without bringing about government instead of private operation."

It is believed that Chairman Clark will tell the President that rates in general cannot be materially reduced until there has been a reduction in the cost of rendering the service. He expressed this opinion recently in a letter to Senator Harris of Georgia, in which he said: "Under these circumstances it is difficult to find an argument in favor of reducing rates unless in instances in which it can be shown that rates are stifling the traffic and that lower rates, which would still be compensatory, would effect a movement from which there would be some return."

If Chairman Clark should adhere to this position in talking to the President, the question as to what can be done in the way of reducing expenses as promptly as possible would naturally follow and Chairman Barton might be asked as to whether his board can expedite a determination of the wage issue. Railroad executives who have been in conference with Senator Cummins and other representatives of the administration have expressed the opinion that there should be a considerable reduction this year in the railroad fuel bill and they have also expressed confidence in their ability to bring about other economies, but no economies large enough to save the situation can be made without reducing the payroll.

The President will have an opportunity, if he desires to do so, to exert some influence on the complexion of the Railroad Labor Board when he comes to appoint successors to the three members of the board whose terms expire in April. The members of the railroad and labor groups, under the law, are to be selected from nominations made by the railroad executives and by the labor unions, so the President will not have a very wide range of choice as to two of the appointments and may reappoint the present members, W. L. Park and J. J. Forrester, but the three members of the public group hold the balance of power on the Board, and it is regarded as likely that the President will prefer to make his own selection for the new appointment in that group rather than reappoint President Wilson's selection, Henry T. Hunt, a Democrat. It is understood that Mr. Hunt has been inclined to side with members of the labor group on the Board more often than with the railroad representatives.

A good many prominent railroad officers have been in Washington recently and many of them have undoubtedly found ways of getting information to the ear of the President. Herbert Hoover, A. W. Mellon and Henry C. Wallace of the cabinet are also especially concerned with railroad matters. The railroads are not asking for any new legislation nor are they asking the government to do anything affirmatively for them at this time except that they are trying to collect as much cash as possible on account of their guaranty for the period of federal control and for the six months following it, as cash is their most pressing immediate requirement. Just now faster progress is being made in realizing on the six months' guaranty than in effecting settlements with the Railroad Administration for the earlier period. Up to March 28 the Interstate Commerce Commission had certified and the Treasury had paid \$97,322,990 in partial payments to 42 roads on account of the guaranty under the authority of the Winslow law, in addition to \$263,000,000 previously advanced, but some large sums are still tied up in the accounts with the Railroad Administration which the latter has been withholding pending a final adjustment. Some roads have had to borrow from the Railroad Administration and give collateral for money due on account of their compensation. Also some roads to whom sums are due on account of the six months' guaranty are still negotiating with the commission.

## Duplex Compensating Suspension Applied to Baker Tractors and Trucks

THE BAKER R & L COMPANY, Cleveland, Ohio, announces its new series C models of electric industrial tractors and trucks replacing the series B machines produced during the past three and one-half years. An important feature of the new machines is the ingenious manner in which the heavy thrusts of the axle and the driving and braking strains

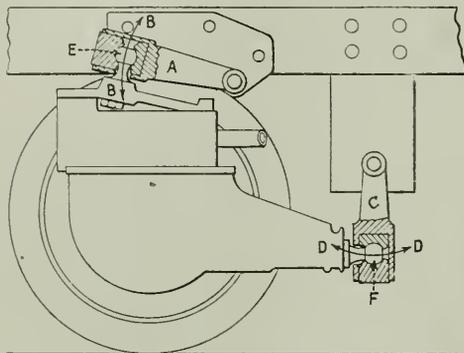

Fig. 1.—Line Drawing of Duplex Compensating Suspension

are resisted through what is known as the duplex compensating suspension. This suspension resists all torque and driving strain, provides for free spring action and maintains accurate alinement at all times between the axle and the frame.

Referring to Fig. 1, it will be seen that the axle is suspended by means of two V-shaped yokes through large ball and socket joints on the axle and trunnion bearings on the

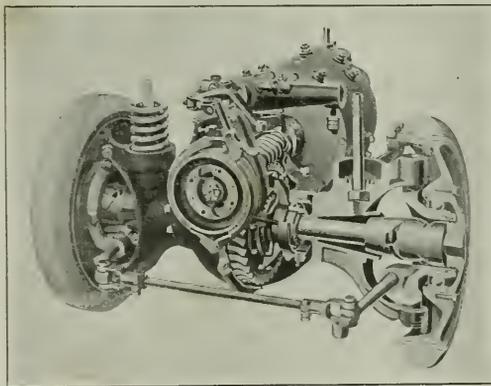

Fig. 2.—Driving Axle of Baker Truck Equipped with Duplex Compensating Suspension

truck frame. The horizontal or driving yoke A transmits the driving power from the axle to the frame while the vertical or torque yoke C resists "torque" or the tendency of the axle to rotate and also has a slight forward and backward motion when compensating for the angular movement of the driving yoke.

The double concentric helical springs support only the truck load. They are loosely seated in the frame and axle

members which are tied together against rebound with spring bolts, swiveling in their sockets. The flexibility provided by this construction permits the driving axle to negotiate either smooth or rough road surfaces, increasing traction without loss of efficiency or clamping or binding of the parts. Of equal importance is the elimination of maintenance expense, looseness and rattling when torque reactions are taken through sliding surfaces used in conventional constructions. The large lubricated trunnion bearings and adjustable ball and socket joints insure durability of parts for the life of the machine. A phantom view of the mechanism is shown in Fig. 2.

Emphasis is laid on the importance of the duplex compensating suspension because machines of the industrial truck type are subjected to extremely severe torque stresses. Although operated at slow speed they are frequently bumped into heavy objects and throughout their life must resist the strains coming from abrupt starting and stopping. In fact, many operators change abruptly from full speed ahead to full

Fig. 3.—View Showing Method of Making Impact Tests

speed reverse, subjecting the machine to heavier strains than are encountered in other vehicle work.

Sample machines incorporating this new feature were subjected to unusual tests of a spectacular nature and stood up satisfactorily under strains which would easily have caused failure to trucks equipped with a less rugged, yet flexible type of spring suspension. In one of the tests a tractor equipped with duplex compensating suspension, was operated down a 12½ per cent ramp at 10 miles per hour as shown in Fig. 3. The tractor struck a blow of 46 tons against the bumping post without damage to the spring suspension or other parts.

# Railway Business Association's Annual Meeting

## Equipment Policies and Stability of Purchases Dismissed.

### Dinner Addressed by Willard and Clark

THE ANNUAL MEETING of the Railway Business Association at the Waldorf-Astoria Hotel, New York, on March 31 marked the completion of one of the most successful years in the history of that organization, not only from the standpoint of the work done during the year, but also from that of the increase in the membership.

The meeting, following the usual custom, took place in the morning, at which time the committee reports were presented, and resolutions adopted. The annual dinner was addressed by Daniel Willard, president of the Baltimore & Ohio and chairman of the American Railway Association, and by Edgar E. Clark, chairman of the Interstate Commerce Commission. Mr. Clark came to the dinner direct from the conference with President Harding and Chairman Barton, of the Railroad Labor Board, held in Washington to discuss the present railway situation.

The feature of the annual meeting was the presentation of two reports, one by the Committee on Equipment Policies,

and the other by the Committee on Stability of Railway Purchases, both of which were adopted without discussion. They are reproduced below.

The report of the General Executive Committee reviewed the work of the year, and pointed out wherein the association had enlarged its activities. Particular reference was made to the action taken by the organization in favor of the Winslow bill, passed recently, to permit partial payments of the Government guaranty to the railroads; to a circular issued recently opposing decreased rates without decreased operating costs; to the work of the Committee on Stability of Railway Purchases, etc.

A report of the field manager showed that the organization in 1920 increased its membership by about 88 per cent, and by about 70 per cent more companies. This does not include new members secured since the first of this year. The membership at present is about 700; in 1919 it was less than 350.

## Report of Committee on Equipment Policies

THE REPORT of the Committee on Equipment Policies, E. B. Leigh, president of the Chicago Railway Equipment Company, chairman, was in the form of a suggestion that the Railway Business Association take up with the Interstate Commerce Commission the question of its attitude or policies as to new devices, etc., which may be offered to the Commission for government test. Particular reference was made to automatic train stop and train control devices. With the report was a letter addressed to Edgar E. Clark, chairman of the Interstate Commerce Commission, by Alba B. Johnson, president of the Association, taking up the question and offering the assistance of the Association.

The report follows:

Your Committee on Equipment Policies recommends that an inquiry be addressed to the Interstate Commerce Commission regarding certain aspects of the policy which that body is preparing, through the Bureau of Safety, to adopt toward automatic train-stop and train-control devices. The inquiry, which we hope will be considered before a policy is determined, is whether or not the individual railway will retain freedom to install without government test or previous government approval such devices as in the judgment of the road will meet the government requirements, leaving it for the Interstate Commerce Commission to inspect operation, to decide whether the requirements have actually been fulfilled and if not to act accordingly.

The jurisdiction of this Committee embraces every field in which the Interstate Commerce Commission under the law has authority or duty to exert an influence upon the character of railway facilities. In a previous report we summarized the provisions of the Transportation Act, 1920, which bestow such authority or impose such duties. In that report we said: "In due course the Interstate Commerce Commission in its dealings with the railways will be confronted in this field by concrete situations which will require it to proceed in accordance with some general policy." Discussing specifically safety appliances we said: "We believe the Commission will have solidly behind it the best informed part of the public if that body adheres to its traditional program of regulation without undertaking management. . . . The concern of the Commission if it adopted this policy would be not what the appliance is but what it does."

## Train Control Typical

Since that report was made your Committee has caused the course of events to be observed. The only field in which we understand that the formulation of a policy has since been undertaken is that of automatic train stops and train-control devices. The principle involved is identical with that involved in the determination of policy affecting every other kind of railway facilities over which the Commission has or may acquire jurisdiction. Whatever is determined in respect to automatic train control will establish a precedent of principle to be applied in due course to every facility upon whose character the Commission exercises an influence. All our members are therefore interested.

The Transportation Act, 1920, provides that with two years' notice the Commission may order a carrier "to install automatic train control had been made under the auspices of the Commission." Previous to that Act an investigation covering several years into the feasibility of automatic train control has been made under the auspices of the Commission. After the new Act went into effect committees were formed by the Bureau of Safety and the American Railway Association and have labored jointly upon definition of tests. They have visited manufacturing and demonstration plants. On Feb. 15 the joint board made the following announcement:

## Official Announcement

"The functions to be accomplished and the specifications and requirements to which a device to be installed in any designated location must conform will of necessity be determined by traffic, operating and other local conditions and can be prescribed in detail only when the specific location for an installation has been designated. In connection with the test installations now in contemplation, it may be necessary to establish specifications and requirements merely tentative at the outset and subject to modification and development as the work progresses. Such specifications and requirements for several test installations, together with records of alterations in the installations which may become necessary in the course of the tests, would furnish data from which the Commission may ultimately prepare specifications and require-

ments to be prescribed in accordance with the terms of the law."

On the same date the joint board adopted a tentative statement of the performance which should be expected of a system in stopping trains or in controlling their speed. More than 300 concerns and individuals have registered their desire to have appliances considered. Many of these the Bureau of Safety has reported to be without merit. There are some signs that the time may be approaching when the Interstate Commerce Commission will be called upon to determine whether or not practice on the several roads is in accordance with the Act.

### Considerations

Following are some of the considerations which have been laid before your Committee:

1. Practical conditions preclude tests by the Commission of all appliances offered.

The cost of testing out hundreds of different devices under service conditions within a reasonable time would be prohibitive even if experts could be assembled in sufficient numbers to do the work.

2. If not all the devices offered could be tested the Commission would have to choose arbitrarily which it would admit.

If a device can only be tried by the government there will be many which cannot be tried at all. Through overlooking what might prove feasible or might lead up to something feasible if tried, valuable advances may be lost and, more important and far-reaching than this, inventive effort may be discouraged. Mechanical progress not alone in safety but in economy and efficiency has been attained by leaving each of the railroads free to try such appliances as it thinks promising.

3. The Commission is under no obligation either of law or of custom to make government tests a pre-requisite for railway installations.

The law gives the Commission authority to order a railroad to install devices "which comply with specifications and requirements prescribed by the Commission." If so interpreted by the Commission this might mean the specifications and requirements could be so drawn as to exclude every device save one; but the Commission is under no compulsion so to interpret it. The bestowal of discretion is obvious.

### What Is Wise?

The question is, *What is wise?* As to custom, the railroads install, for example, locomotives with such boiler and safety appurtenances as they deem prudent and Bureau inspectors notify them when the requisite performance is not attained and prescribe what the railways shall do to meet government requirements. The same thing is true as to safety appliances on cars or track.

In other words, the train-stop and train-control provisions empower the Commission to order such devices, meeting certain stipulated requirements, and to compel observance of its order, all of which it can do if it so elects without forbidding one device or insisting upon the trial or use of another. If this policy were adopted each railroad would retain the freedom it has heretofore had of trying on its own initiative such devices and systems as it may deem promising while remain-

ing responsible for fully complying with the specifications and requirements officially promulgated under the law.

Your Committee recommends that this report be transmitted to the Commission with the inquiry whether the official purpose has been defined and whether there is such diversity of view that our Association might with advantage to the federal authorities participate in a hearing or conference.

The members of the Committee on Equipment Policies are as follows:

E. B. Leigh, Chicago, Chairman, president Chicago Railway Equipment Co.

H. F. Ball, New York, president Franklin Railway Supply Co.

W. S. Bartholomew, Pittsburgh, president Locomotive Stoker Co.

F. W. Edmunds, New York, east sales mgr., Sunbeam Electric Mfg. Co.

Frank L. Fay, Greenville, president Greenville Steel Car Co.

A. C. Moore, Chicago, assistant to president Globe Seamless Steel Tubes Co.

H. M. Pfleger, St. Louis, vice-president Commonwealth Steel Co.

A. G. Wellington, Baltimore, vice-president Maryland Car Wheel Works.

W. H. Woodin, New York, president American Car & Foundry Co.

### Letter to Interstate Commerce Commission

The letter addressed to Chairman Clark said:

By request of our Committee on Equipment Policies I transmit herewith a letter addressed to me by its chairman, E. B. Leigh.

The general scope within which this inquiry falls includes all aspects in which the Commission has statutory authority to exercise an influence over the character of railway facilities. The particular illustration here discussed, automatic train control, is understood to be within the special jurisdiction of the Bureau of Safety. We presume, however, that the Commission will consider other illustrations together with this in approving the course to be pursued in developing a policy; hence this communication is addressed to the Commission through you.

Your attention is requested to certain phases of the inter-rogatory:

1. As developers of progressive mechanical appliances and purveyors of competing devices and materials, our members have special knowledge and experience which we think should give their conclusions weight and can perform their services to transportation more effectively if the policy of the Commission takes those conclusions into account.

2. Automatic train control is merely typical. The policy adopted with regard to this will necessarily forecast future action touching other facilities. Hence all our members, whatever the character of their products, are interested in the train-control precedent.

3. Participation by developers and makers of appliances in the discussion of policy will be actual only if their point of view is known to the authorities before the official conclusion is put in effect.

The questions which our Committee propounds are these:

A. Has the official purpose governing automatic train control and stop appliance requirements been defined?

B. Is it contemplated that the individual railway will retain freedom to install without government test or previous government approval such devices as, in the judgment of the road will meet the government requirements, leaving it for the Interstate Commerce Commission to inspect operation, to decide whether the requirements have actually been fulfilled and if not to act accordingly?

C. Is there such diversity of view as to policy in this matter that our Association might with advantage to the federal authorities participate in a hearing or conference?

## Stability of Railway Purchases

THE REPORT of the Committee on Stability of Railway Purchases, S. P. Bush, president and general manager of the Buckeye Steel Castings Company, chairman, took the form of a communication to Herbert Hoover, Secretary of Commerce.

The report said:

Responsive to a resolution of the general executive com-

mittee, the chairman of the Committee on Stability of Railway Purchases, with the co-operation of the president and secretary, is engaged in the serial publication of leaflets upon various aspects of the subject as set forth in its January report. The first leaflet, with charts, was "The Next Step Toward Preventing Depressions" (abstracted in the *Railway Age* of January 7, 1921). Herewith is presented the second,

which is intended to combine action with discussion. Its text is a request to Secretary of Commerce Hoover for a conference upon industrial and commercial prosperity and stability.

### Letter to Secretary Hoover

The Railway Business Association, comprising several hundred concerns which have goods or services for sale to railroads, welcomes the opportunity for co-operation afforded by your recent utterances on industrial and commercial stability.

Other groups besides ourselves have distinct special interests parallel to ours. These include all whose customers are institutions requiring very large amounts of machinery, material and supplies. So-called public utilities are among the number. A vast buying power is that of governmental units, city, county, state and federal. Stability of purchases is important to all concerns which sell goods or services to any of these. With all such concerns our Committee on Stability is ready to work for the common end. All of them are invited to aid us in our discussion of railway buying. To all these groups everyone everywhere whose wages depend upon general prosperity can profitably accord full sympathy and help. This project is everybody's affair.

We request a conference with you upon the opportunities and responsibilities which the present situation gives to all concerned and upon ways and means for restoring prosperity and promoting stability hereafter. The possibilities of your leadership cannot be measured.

As we view it, the course desirable for large purchasing institutions to pursue in the months immediately in front of us has two aspects: (1) to prove their faith in the national future to the limit of their resources; (2) to lay foundations now, when unemployment disposes citizens to listen, for systematic accumulation of such resources in busy years to be used in dull years.

Our proposal is no more than merely sound business policy. Whatever must be bought, whether machinery, materials or labor, by a city, a county, a state, the United States, a public utility or a railroad can be obtained most economically when general business is depressed. Large buying at such a time mitigates unemployment of labor and commercial distress. Instead of being idle a large part of the time and at other times overtaxed, the men, the buildings, the machines, all the accessories of supply, including transportation facilities, are kept steadily busy; not so much plant and overhead is required, while the personnel escapes periods of acute privation.

In government works this principle has long been discussed and has begun to be applied. The commonwealth of Pennsylvania by law binds itself to that policy. The legislature in 1917 created an Emergency Public Works Commission, who were made custodians of a fund to be accumulated by successive legislative appropriations during good times and spent during other times on public works. When demobilization of the army came in 1919 the proceeds of a bond issue and a special appropriation were supplemented by the beginnings of such an accumulated fund. When the soldiers came back Pennsylvania did more on public works than in any previous year. Other cities, counties and states made special arrangements to intensify public construction in 1919 and appreciably helped minimize distress of unemployed soldiers in the transition from war to peace. The distinctive feature of the Pennsylvania state policy is deliberate financial provision in advance. A certain specified amount is annually raised, put aside and ear-marked for expenditure in an emergency.

Some famous railway presidents have made history by a similar practice. Two most often cited are A. J. Cassatt and E. H. Harriman. A familiar anecdote tells of the consternation with which some of the Pennsylvania Railroad directors heard Mr. Cassatt propose in time of depression an expenditure of many millions for intensive development of the property and his serene inquiry at what time such expenditures would buy more material or labor or interfere less with the company's merchandise traffic. Mr. Harriman with the Union Pacific was noted as a thrifty, courageous and confirmed seeker of bargains. The Santa Fe and other railroads have pursued a similar course.

Adoption of such a policy and adherence to it by railroads cannot wisely or effectively be forced by government requirement. It is one thing to command a railroad to possess a given surplus and quite a different thing for the railroad to obtain such a sur-

plus or to make it, if possessed, tide over a slump the continuance of which is any man's guess. Vice-president E. J. Engel of the Santa Fe in a letter favoring purchases in time of light traffic tells us some of the limitations. Mr. Engel says, "No one can tell how long the period will last, and there is a risk of having to carry the materials for a very long time before they can be used, with consequent carrying charges under adverse conditions, and many other points to consider; so that no railway company can establish a fixed policy and each must decide as occasion arises what will best meet its conditions."

Judgment how long a depression is going to last must of course weigh conclusively with every railroad directorate in deciding how far it is necessary to husband its surplus for interest and for dividends stabilized at a figure deliberately made moderate in busy years in order to avoid its interruption when income sags. Vice-president A. J. Conroy of the Pennsylvania points out that Mr. Cassatt's "big program and large expenditures did not occur in a period of heavy traffic losses, but only after the certainty that the bottom had been reached and that business was on the upturn and would certainly require the new tracks, facilities and equipment, revisions of grade and alignment."

We must here condense in a paragraph the momentous suggestion that if purchases of the great buyers were stabilized as proposed this itself would constitute what our committee recently set forth under the title, "The Next Step Toward Preventing Depression." Once the railroads, utilities and governments had put in operation a policy of accumulating resources for the period of acute adversity they would have come near postponing that time to the day after never. We have established a Federal Reserve system. We have practically eliminated crop failures. If now large purchasers can provide themselves with emergency funds and credits they themselves can do much to stop depression when incipient by coming into the market. Especially will they mitigate the commercial failures which result from violent fluctuations in demand for commodities and plant and hence in values. Whatever large buyers do in this direction will tend to weaken the force of industrial convulsions and to shorten their duration.

Business at this moment appears to be mending. Serious problems face us, particularly that of foreign markets, which restrict the outlet for agricultural and manufactured products. But your own grasp of that situation underwrites the prosecution of every proper available measure for our relief and that of our neighbors abroad; and already failures are less and car loading larger. This last means increased gross earnings for the railroads, and with completion of the labor liquidation now in process should in due course bring more satisfactory net railway income.

For the conference which we request the following topics are suggested:

1. What co-operation among various business interests and with the government is desirable to effect such adjustments and arrangements as will permit and induce without loss of time reasonable activity of purchasing power and of production?
2. What co-operation of interests is desirable with a view to the continuous adjustment of railway earnings, expenses and net income to a basis which will permit accumulation of funds for economical expenditure in dull years?
3. How may each large buyer be systematically advised of the methods pursued and the advantages realized by those who purchase heavily in depressions?
4. How may the several elements variously interested in stability of large purchases best reach and maintain an understanding of one another's problems and related problems of government?
5. How may signs of returning prosperity be observed and widely reported for the information of large buyers whose responsibility it is to judge the probable duration of depressions?

S. P. BUSH, Chairman.

The membership of the Committee on Stability of Railway Purchases is as follows:

S. P. Bush, Columbus, Ohio, Chairman, president and general manager Buckeye Steel Castings Co.; John K. Broderick, St. Louis, president Broderick & Bascom Rope Co.; Frank G. Echols, Greenfield, Mass., president Greenfield Tap & Die Corp.; J. M. Gillespie, Pittsburgh, vice-president Lockhart Iron & Steel Co.; R. W. Gillispie, S. Bethlehem, Pa., assistant general sales agent, Bethlehem Steel Co.; Grafton Greenough, Philadelphia, vice-president Baldwin Locomotive Works; Clarence H. Howard, St. Louis, president Commonwealth Steel Co.; N. S. Reeder, New York, vice-president Pressed Steel Car Co.; Charles R. Robinson, Buffalo, vice-president Lackawanna Steel Co.; Wm. E. Sharp, Chicago, president Grip Nut Co.; Alex. M. Steward, New York, president James Stewart & Co., Inc.; E. M. Zehnder, Scranton Pa., president Scranton Bolt & Nut Co.

## Resolutions

The meeting expressed its attitude towards the present problems of the railroads in the following resolutions:

### I.

We witness the high standard of performance established by the Interstate Commerce Commission in its administration of the Transportation Act, 1920. The Commission has functioned with wisdom, courage and energy.

### II.

We regard the very small net earnings, and in many cases deficits of the railroads at this time, and for several months past, as seriously inimical to the economic welfare of our transportation system and of the country at large.

We recognize that further advances in transportation rates are impracticable, and that a reduction thereof, as soon as possible, is imperative.

We, therefore, urge the vital necessity of prompt reductions in railroad operating costs which includes, of course, costs and prices in private industry essential thereto.

### III.

The Interstate Commerce Commission on March 1, 1922, under the statute, acquired authority to fix from time to time the rate of return upon railway property which transportation rates are to be designed to yield. It therefore becomes the duty of the Commission to define the purposes for which new capital is desirable. The United States needs a transportation program that looks further ahead than a few months, and a financial program upon which to base the rebuilding program. The Interstate Commerce Commission, entering upon a far-reaching experiment with a given level of rates to see whether it will bring to the roads the income, the capital and the improvements which the country requires, those who are tempted to agitate for rate reductions each on his own commodity should bear in mind

that if everybody was accorded the reduction he would like, railway facilities would be inevitably diminished below the requirements of our nation's commerce. A broad policy requires the fullest support of all our citizens.

### IV.

Regulation and not management should be the policy of the government in its exercise of influence upon the character of railway facilities. Engineering and mechanical progress will be best assured when each road installs devices and methods of its own selection for meeting the tests officially prescribed, subject to official determination whether or not those tests are met, and, if not, wherein the test should be not what the appliance is but what it does. This will encourage invention, assure open competition among developers and makers, and give reason for existence to the valuable plants and organizations which competing purveyors now maintain for experiment, demonstration and inspection service.

### V.

We vigorously dissent from proposals that have been made to centralize production of railway equipment under a board which would contain Government representatives. Purchase by a Government Bureau tends to over-standardization, to the arrest of advance, to emphasize upon price at the neglect of quality, upon cheapness rather than upon economy.

### Election of Officers

Alba B. Johnson was re-elected president. The following were elected vice-presidents for the ensuing year: Samuel G. Allen, Franklin Railway Supply Company, New York; Stephen C. Mason, McConway & Torley Company, Pittsburgh, Pa., and Charles J. Symington, of the T. H. Symington Company, New York.

## Three Epochs of American History

Address by Daniel Willard, President, Baltimore & Ohio

THE HISTORY OF THE American railroads very naturally divides itself into three epochs. The first great epoch embraces the period from 1827, when the first charter was granted for the construction of a railroad organized for the purpose of doing a general freight and passenger business, until December 28, 1917, at which time the President, acting under authority granted him as a war power, took possession and assumed control of the steam railroads in continental United States and proceeded to operate them as if in fact they were owned by the government. The second epoch may be said to cover the period of twenty-six months while the railroads were under the direct control and operation of the government. The third epoch began on March 1, 1920, when the railroads were returned to their owners under the provisions set forth in the Transportation Act of 1920.

I shall now refer briefly to the first epoch. The American railroad system, as we use the term, is made up of more than 1,800 independent companies which, under the terms of the Transportation Act, report to and are under the control of the Interstate Commerce Commission. Something like 200 of these companies, having annual revenues in excess of \$1,000,000 per year, are designated by the Commission as Class I railroads. These 1,800 or more companies have a combined main line trackage of about 265,000 miles, and together they own about 2,400,000 freight cars, about 69,000 locomotives and about 157,000 cars designed for passenger

train service—representing in all an aggregate investment in property of about \$20,000,000,000.

These properties were built up almost wholly from private funds invested voluntarily in the hope of receiving a satisfactory return in the form of profits. They were developed under the competitive system, and no one so far as I know ever attempted to visualize an American railroad system reaching to all parts of the country. As a matter of fact, the laws themselves discouraged such a combination or concentration of transportation agencies under one central control. It may be said, however, that until the process was checked by the Sherman Act and other similar laws, there was observable a definite and active tendency on the part of the roads to resolve themselves into groups designed to serve more effectively—and by effectively I mean efficiently and economically—the traffic needs of certain large territories. The New York Central, Burlington and Santa Fe systems reflect the practical result of such tendencies. As I have already said, even that tendency was discountenanced and checked, if not wholly stopped, by the operation of the laws. It is true that men of vision some few years previous to federal control began to discuss the problem in continental terms, but no definite steps in that direction were taken until the spring of 1917, and the action then taken, which resulted in the establishment of the War Board, was undoubtedly hastened, if not wholly inspired by the emergency created by the entrance of our country into the great war.

My friend, Mr. Kruttschnitt, who was one of the members of the War Board, prepared a very illuminating report of the activities of the Board. He stated in his report, among other things, that the American railroads as a whole during 1917 carried 127,000,000,000 more ton miles than they carried during 1915, two years previous. Mr. Kruttschnitt further stated that during the period of the War Board's activities orders were given by them for the movement of more than 200,000 empty cars, regardless of ownership, from one part of the country to another, where they could be used best to promote the winning of the war. Nothing of the kind had ever been done before or even contemplated in this country.

It has been said by some that the railroads broke down as transportation agencies in 1917. I think you will agree, however, that if the figures I have quoted from Mr. Kruttschnitt's report have any significance at all, they show clearly that the railroads not only did not break down, but on the contrary made an unprecedented performance.

It is true that in the fall of 1917 there began to be an excessive accumulation of cars on the eastern seaboard, and the transportation movement began to slow down, but there is no earthly reason for ascribing the situation to a breakdown of the railroads. On the contrary it might better and more truthfully be said that it was due to the fact that the railroads were able to carry and did carry more tonnage than could be absorbed by ships for export, and by mills for manufacture. The trouble was due to an excess rather than to a shortage of transportation.

The second epoch began with the taking over of the roads by the President. The Director General, acting for the President, had full authority to consolidate, co-ordinate and operate the railroads regardless of all laws, and he also assumed and exercised autocratic control over the movement of all traffic, and properly so under the circumstances.

The ton mileage carried by all the railroads under the Director General in 1918, he having full authority and no restrictions, was barely 2 per cent greater than it was under the unified direction of the War Board, with no control over priorities or tonnage movement and with all the restrictions imposed by a long series of restrictive laws. If the railroads had indeed broken down in 1917, then I submit that a breakdown plus 2 per cent would not of itself be a very big accomplishment in 1918. At the same time we do know that during the year 1918 the railroads rendered a splendid transportation service and thereby contributed much towards winning the war, but even so we must remember that the service rendered only reflected an increase of 2 per cent above what had been accomplished the previous year.

During the period of federal control the statement was frequently heard that the advantages of unified control and operation were so great that they should be retained in the interests of the people. It was also said that they could only be realized in connection with the policy of government ownership, or at least with federal control and operation. The fallacy of that statement, I think, has now been established; that is to say, the fallacy of that part of the statement which claims that the benefits of unified operation can only be realized in connection with governmental control. In justice to the railroads it should be remembered that the railroad presidents themselves were the first to visualize the supreme importance of unified control of the railroads in times of emergency, and not only did they visualize its value, but they gave definite expression to their vision through the operations of the War Board.

I shall not discuss further the second epoch, not, however, because it does not afford a basis for further discussion, but simply because it represents a wholly illogical development, from my point of view—brought about by war conditions and not by normal economic influences or requirements.

We now come to the consideration of the third or present epoch, which I hope and believe will be an enduring and successful one, based on the policy of private ownership and operation of the railroads with governmental control.

A careful reading of the debates which took place in Congress during the consideration of the new Transportation Act clearly establishes the fact that it was the belief of Congress at that time that private ownership and operation of the railroads ought to be continued in this country, and it was just as clearly the intention of Congress to make private ownership possible by suitable legislation, and the new Transportation Act of 1920 was framed with that end in view. While there is much that is new in the Act of 1920, I will refer only to some of its outstanding features, which I consider of fundamental importance.

Of first importance, as I view the matter, is the question of unified control, to which I have already made reference, because the advantages to be derived from unified control of the railroads are so important that unless they can be realized under private ownership in times of emergency, that fact of itself might compel the acceptance of some other policy. It should be clearly understood, however, that unified operation can only be had at any time at the expense of competition of service, and such a price is too much to pay even for unified control except in times of emergency. Congress evidently believed, having knowledge of what the railroads had accomplished under the War Board, that with suitable legislation the benefits of unified control and direction could be fully realized under private ownership when necessary, and they wrote an important portion of the law to cover that point.

In short, they gave to their agent, the Interstate Commerce Commission, full power in times of emergency to control and direct the movements of all the cars and all the engines of all the railroads regardless of ownership. Congress also said that in the exercise of this great power the Commission could make use of such agencies as it might select.

In harmony with and shortly after the passage of the law, the railroads appointed an advisory committee, consisting of eleven executives geographically selected, to take over the direction of the Car Service Commission in Washington, which had been created by the War Board and continued by the Director General.

The advisory committee was instructed to co-operate with the Interstate Commerce Commission for the purpose of carrying out and accomplishing the real intent of the law.

I think we may fairly say that the railroads have again demonstrated, if further demonstration be necessary, that the advantages of unified control and operation can be fully realized with private ownership and operation under the terms set forth in the new Transportation Act.

One other important feature of the Act, and the last to which I shall specifically refer, is worthy of consideration at this time, and that is the provision which deals with the labor problem and has to do directly with the wages and working conditions of upwards of 2,000,000 employees. We ought not to minimize the importance of the labor problem in its relation to the railroad question as a whole. It is manifestly important that there should be continuity of service by the railroads in a country such as ours, and one of the important problems before Congress was to insure if possible continuity of service, by guarding against the interruption of the service by any misunderstandings and disputes which might possibly arise between the railroad managers and their employees.

It was urged by some that the law should be written so as to prohibit strikes upon the railroads, but it was not possible to enact legislation of that character, nor do I think it would have been wise to enact such legislation at that time. While I am as much opposed as anyone to strikes upon the railroads, I believe it would be a mistake for Congress to pass a law

prohibiting strikes unless we are quite certain we shall be able to enforce such a law once it has been enacted. Personally I did not believe that we had reached a stage where we could feel confident that such a law would or could be effectively enforced, consequently I was opposed to its passage. Congress dealt with the matter, I think, in the wisest way possible under the circumstances. It created machinery or set up agencies by which the employees could be assured of obtaining just as fair wages and working conditions without striking as they could reasonably expect to obtain even if they did strike.

It may indeed be said that Congress by this Act has made a preferred class of the railroad workers, because so far as I know, this is the first and only time that Congress has ever definitely said that any particular class of the people should be given at all times and under all circumstances just and reasonable wages and working conditions. Of course Congress did not do this primarily in the interest of the workers. Congress acted only as it had a right to act in the interests of the nation as a whole. Congress acted with a full realization of the importance of an uninterrupted transportation system in a country such as ours, but being unwilling to deprive the workers of their right to strike (and nothing in this bill does deprive the workers of their ultimate right to strike), it sought to provide machinery which would make it unnecessary under any circumstances for the men to stop work in order to obtain just and reasonable treatment. In short, Congress provided or aimed to provide by law so that the railroad workers would at all times be assured of just as good wages and just as good working conditions without striking as they could reasonably expect to secure if they did strike, for it is clear that no one could justify or expect to win a strike for wages or working conditions that would be unjust or unreasonable.

It may also be that in some respects this portion of the law is incomplete and inadequate, and time may develop that changes are necessary. If so, they will undoubtedly be made. In the meantime it is certainly in the interest of all that the law, or especially this particular feature of the law, should be given a fair and thorough trial, and I firmly believe that as the law comes to be better understood by the railroad workers they will realize that they have indeed been made a preferred class, in which event I venture to predict that we shall be largely, if not wholly, immune from railroad strikes in the future, not, however, because the men have been forbidden to strike, for I repeat, there is nothing in the law which limits the right of the railroad workers to strike if they still want to do so, but simply because the law provides a way by which they can obtain without striking everything that they could reasonably expect to obtain if they did strike.

While some criticism has been voiced against the labor provision of the Act, not only by the employees but by the employers as well, I am still hopeful that this feature of the Act will eventually prove to be wise and satisfactory, and if the three features of the new legislation to which I have specifically referred work out as it was the intention and belief of Congress that they would work out, then I think Congress has made private ownership and operation of the railroads in this country possible, but whether private ownership and operation of the railroads endures—having been made possible—depends largely if not wholly upon whether the railroads under private ownership and operation are able to give and do give the public satisfactory service. At the present time it would seem that there is a majority, in fact a large majority, of public opinion in favor of private ownership and operation, but we have seen public opinion change suddenly, and I have no doubt that it would change again just as quickly and react just as strongly against private ownership, if the public felt that upon the whole they would be likely to get more satisfactory service some other way. As

I view the matter, private ownership and operation of the railroads is still on trial in this country, but it has everything in its favor and it ought to win and I believe it will win if the managers, measured by the service which they give the public, deserve to win.

Since the termination of federal control we have actually seen the railroads, operated by private management under the provisions of the Esch-Cummins Act, move in 1920, 9,000,000,000 ton miles more than in 1918, employing substantially the same facilities. We have seen the Interstate Commerce Commission, under the terms of the same Act, promptly authorize such rate increases as would, in its opinion, fulfill the requirements of the Act, and we have also seen one of the most complex labor situations ever developed, dealt with in orderly fashion by the agencies created by the Act, without interruption of the transportation service. The very fact of the controversy in Chicago speaks volumes for the Act. Questions involving wages and working conditions affecting nearly 2,000,000 human beings are certain to bring out points of difference, and if the contestants should sometimes raise their voices above the conventional pitch of polite society, it would not follow that the law had failed—on the contrary it would indicate that the problem was being worked out just as Congress intended it should be, and without interruption of the service. I am inclined to think that under the present law wages of railway workers as a whole may be somewhat higher in the future than would be the case were there no such law, but even so, if the public is thereby assured freedom from interruptions of service, the immunity so purchased will be well worth the price.

It has sometimes been said in the past that the Interstate Commerce Commission seemed to be anxious only to protect the interests of the public. Perhaps there may have been a modicum of truth in that statement; perhaps the Commission felt that the railroads were quite able to look after their own interests, and consequently let the railroads bear the burden of proof. But whatever may have been the situation in the past, the new law makes it clear that while Congress still expects the Commission to look after the interests of the public, just as carefully as it ever did in the past, Congress also recognized by definite expression that in looking after the interests of the public, the Commission should keep in mind that the public's interests will be best promoted by an efficient transportation service, and will not be promoted by a poor, badly developed and inadequate transportation service.

Opportunity has been afforded me to view the situation, and I have been convinced that the Commission has taken hold of the difficult problems confronting it under the new Act with the desire only of carrying out the clear intent of Congress. Chairman Clark and his associates with whom I have had occasion to come in contact, have always been most helpful. They have always been anxious to know all of the facts concerning any particular case, and have not hesitated to use their power and authority in such way as seemed to them most likely to promote the public welfare. The relationship which has developed between the Federal Commission and the railroads under the new Transportation Act to my mind is most encouraging, and if the relationship already established continues and if the railway managers appreciate that they themselves, as well as the institution of private ownership, are on trial, and if they meet the fair and reasonable requirements of the public for transportation, I feel confident that the success of private ownership is assured.

The fact that, from rates fixed in accordance with the provisions of the Act, the net earnings of the carriers at the present time are disappointing, is not due to any fault or failure of the Act. The condition referred to is due largely to the decline in volume of business and the excessive cost of operation. I am confident that the problems so presented, while complex and difficult, will be solved.

## The New Problems of Management and Regulation

Address by Edgar E. Clark, Chairman, Interstate Commerce Commission

CONGRESS DEALT liberally with the railroads that had been taken from the possession of their owners as a war measure. For something over two years the government fixed the level and conditions of expenditures and of rates. The operating expenses were increased in greater proportion than were the rates and fares. Recognizing this situation Congress provided, for a period of six months following the termination of federal control, certain guaranties. It recognized that further increases in rates were imperatively necessary and it was contemplated that within that guaranty period arrangements would be made to make such increased rates effective. That policy and purpose were carried out with the result that rates and fares were placed upon a higher plane than they had been for many years. This fact, of course, attracted the attention of all users of our railroads. Too many of them, however, directed their attention to the charges for service and closed their eyes to the increased operating expenses.

### Roads' Capacity Demonstrated

Immediately following the termination of federal control the railroads successfully moved a larger tonnage than had ever been moved. The capacity of the transportation machine was demonstrated. Serious interference resulted from labor difficulties and later the volume of traffic fell off due to readjustment of industrial conditions. The financial results from operation in recent months have been disappointing. Grave, and no doubt in many instances serious, losses have been experienced by producers and distributors. This has caused a good deal of impatience which has taken the form of demands for reductions in transportation charges. The official figures for the month of December show that for the United States the Class I roads had an operating ratio of 91.3. That means that the operating cost of earning each dollar was 91.3 cents, and 8.7 cents of each dollar were left with which to pay taxes, interest charges, and return upon property values. Obviously that margin is too narrow.

### Modern Charioteers

As might be expected, suggested measures of relief are extreme or moderate dependent upon the point of view of the one who makes the suggestion. Phaeton, having been promised by his father, Apollo, that any wish that he might express should be granted, demanded that he be permitted for one day to drive the chariot of the sun. Unable to dissuade his son and unwilling to break his promise Apollo gave Phaeton careful instructions and warnings and permitted him to start. The last advice Apollo gave was "Spare the whip and hold tight the reins." Phaeton started but soon found that he could neither control nor guide the fiery steeds. They dashed headlong and unrestrained into unknown regions, now high in the heavens, now down almost to earth. The earth was scorched and blackened and was saved from destruction only by Jupiter launching a lightning bolt that struck Phaeton dead from the chariot. Modern Phaetons now clamor to be given permission to drive the chariot of transportation by railroad.

I knew a locomotive fireman who had difficulty in keeping the water in the boiler warm enough to shave with, but who could see, day by day, that the master mechanic and the superintendent were making pretty nearly clear scores of errors. Such men are now in evidence.

### Reason Must Prevail

When we consider the circumstances out of which present conditions grew is it not sensible and reasonable to recognize

the necessity for gradual readjustment of the economic forces and affairs of the world as the foundation for gradual improvement in the situation we are discussing? Some rates are too high to permit the free movement of traffic. Some rates are unreasonably low. Careful study of such situations has been and is going on and readjustments have been and are being made accordingly. Doubtless there have grown up operating expenses, the aggregate of which is substantial, which cannot reasonably be defended. They should be eliminated. Every effort must be made to insure all possible, attainable, reasonable economies. The owners of the properties may be obliged for a time to accept less return upon their investment than would otherwise be expected. If reason can prevail and a united, genuine effort can be put forth and maintained, it is morally certain that the situation will improve and that we will progress toward that condition of affairs which the Congress had in view, which the law contemplates and which we all hope to see. Slightly paraphrasing an expression I read recently—"it is doubly incumbent upon us in the stand which we take to avoid the appearance of selfish shirking.

"We all know how large a part popular impressions have in forming public opinion and how long it takes for the slowly developing proof of facts to rectify such impressions when once they have taken hold." We must build upon the foundation of experience and sound business judgment that is free from "selfish shirking," and not upon the unstable ground of theories and opinions that in large part ignore the true facts.

### Necessary Preferences

Some critics assert that the law makes of the railroad business a preferred business and confers upon the owners special favors. Others assert that it recognizes a preferred class of labor.

Conceding that on the surface there is that complexion, and assuming for the purpose of the discussion, but not admitting, that these preferences exist, I ask, if this be so, is it wrong? If this be so, why is it so? Congress recognized, as did all thoughtful men, that transportation is the life blood of commerce and industry and vital to the protection of our nation. It must be provided in adequate and reasonably efficient form. Continuous and dependable operation of our transportation machine is almost as important as its existence. The law was formulated in the interest of the country and of the public. The capital invested in, and the men who operate our transportation machine are employed in serving the public which must and should compensate both. If it clearly appears that in order to give the country the quantity, quality and character of service that it needs, to which it is entitled, and for which it must pay, some preference, apparent or real, should be afforded to the capital and the men that are employed in that service, I submit that such preference is not undue so long as the public's right to reasonable and nondiscriminatory service and charges is protected. But if that capital and those men are recognized as having a preferred status because of the public character of the service in which they are employed, those men and the owners of that capital must recognize an obligation to the public which also springs from the character of the service in which they are employed.

Long before the Transportation Act was framed the Supreme Court had made it entirely clear that the Federal Commission was clothed with power and charged with the duty to require removal of undue prejudice against interstate shippers or localities and undue preference of State shippers and localities. That principle of law was accepted

as sound and as settled. The Transportation Act retains the condition that its provisions shall not apply to transportation wholly within one state. That provision is, however, in a section the foundation of which is that all rates, fares and charges shall be just and reasonable. In another section the Congress has put in statutory form what was the law before. It has made it a little more explicit by specifically prohibiting unjust discrimination against interstate commerce and has authorized a carrier to complain of such discrimination. The states are left free as they were before to regulate the state charges so long as they do not create undue preference of state traffic, undue prejudice against interstate traffic, or unjust discrimination against interstate commerce. The federal Commission does not interpret the law as conferring upon it any regulatory powers over the state rates or fares except for the purpose of removing the prohibited preference, prejudice or discrimination. It has found it necessary in several instances to exercise that power, and appeals therefore have been taken to the courts in various jurisdictions. In so far as the courts have spoken they have sustained the power exercised. The underlying question has been submitted to the Supreme Court of the United States and in due time will be by that body set at rest.

### Fluctuation of Rates

One who is not versed in transportation charges and their effect can not appreciate the extent to which changes are necessary due to constantly changing commercial and industrial conditions and to competitive relationship between carriers and between communities and commodities. It is neither necessary nor desirable that the States shall be shorn of power to regulate their internal affairs. The same considerations that led the framers of the Constitution to reserve to the federal government the powers to which I have referred require retention and exercise of those powers within reasonable and appropriate limits. If a state has the right to require the railroads traversing it to serve the citizens of that state at lower charges than they contemporaneously assess against the citizens of other states, the effect would be the same as if that state were to levy a tax upon outsiders for the privilege of transporting goods into the state.

When the Supreme Court shall have spoken and these controversies have been stilled it will, I predict, be found that in principle and substance the law is not materially different now from what it was when that court decided the Shreveport case. When that clarification of the law shall have occurred there will, I think, be no serious difficulties about the exercise by the federal and state regulating bodies of their respective powers in their respective fields.

### Local Self-Government

I would not unduly centralize power and control. I like to think of the United States as a single entity, and the experiences through which we have just passed have emphasized more strongly than ever before the fact that among the nations of the world we must be so considered and must so consider ourselves. At the same time in the conduct of our domestic affairs we can and should adhere as far as is practicable to the ideas of self-government and local government, reserving, however, certain fundamentals for control and administration by the national government.

The growth of civilization has been accompanied at every step by the maintenance and exercise of the police power. Peaceful possession of property and safety to life could not otherwise exist. The police power must extend as far as civilization and human rights extend. The limits of the jurisdiction of the various police powers must be clearly defined and properly recognized, and that after all is the real question in the controversies to which I have just referred.

It is not alone in what might be called minor matters of competition and charges that changes which affect transportation problems in substantial degree come with frequency and rapidity. These changes, some of them almost fundamental, must be taken into account along with arrangements for caring for the steadily and continuously growing population and traffic.

### Water and Highway Lines

During the war expenses of operation on vessels increased more than they did on railroads. There was a heavy demand for ships in overseas traffic and transportation by rail and water became more expensive than by rail. The currents of traffic were markedly affected thereby. In the light of the experiences of generations it can not be expected that water transportation will long remain on a higher level of cost than transportation by land. There is now an abundance of ships and no one can predict the extent to which they will be employed in direct competition with our railroads or the extent to which that competition will necessitate readjustment of the affairs of the railroads.

The development of the automobile and the auto truck and the building of good roads have made possible transportation for comparatively short distances by that means in sharp competition with the railroads. During the war the utilization of that and other methods of transportation was urged in an attempt to relieve the railroads in their efforts to move the tremendous volume of traffic which was offered. Now freight is moving in substantial quantities in that manner instead of by railroads. In many instances it is doubtless the cheaper method of transportation. The state furnishes and maintains the right of way and track.

No one can confidently predict what the effect of the solution of these problems may be upon questions which we perhaps now consider as settled. New problems will arise, and so with continuous changes in the affairs of men, of business and of nations there is an ever present necessity for changes in the facilities and machines through and by means of which transportation is conducted. No one can now see clearly the extent to which electricity will be substituted on our railroads for steam power.

### No General Rate Reduction

It is no time for stubborn thinking, but it is a time to think of facts, which are said to be stubborn things. The whole country and all of our people, excepting those who are and have been shamelessly profiteering, are suffering the after effects of a titanic war. In some places the agriculturist and the horticulturist are leaving their crops to decay in the fields and on the trees because they can not sell them at prices that more than cover the costs of harvesting, transporting, and marketing, and yet the housekeeper purchasing for the home table finds the cost of such commodities close to what it was during the active hostilities.

In some quarters zealous efforts are made to have it appear that this situation is in large part or in the main due to high freight rates. The freight rates are high. I have yet to meet a well informed man who does not feel that as a general thing they can be made no higher as a revenue measure. Careful inquiry into some distressing situations discloses that the utilization of products is prevented, not by freight rates, but by economic conditions and perhaps manipulated markets. In November, 1920, the average ton-mile revenue of the railroads of the United States was 75.7 per cent higher than in 1913. At the same time the wholesale prices of commodities that are transported in large quantities averaged 107 per cent higher than in 1913, and in May, 1920, they were 172 per cent over 1913. Reference has been made to operating costs of the railroads. Until the foundation has been laid for widening the margin between the revenue and the cost of earning it, it is difficult to find justification for a general reduction in rates.

# General News Department

The thirteenth annual meeting of the International Railway Fuel Association will be held on May 24 to 26 at the Hotel Sherman, Chicago.

Traffic was resumed on the Missouri & North Arkansas on March 24 after a tieup of more than a week due to the destruction of the road's property by strikers. One train was started each way on the northern end of the line with guards on the train and special officers and citizens volunteers to prevent further destruction of bridges or other property.

The Committee on Relations of Railway Operation to Legislation, provided for by the action of the American Railway Association at Chicago, last November, consists of the following members: W. J. Jackson (chairman), C. & E. I.; L. W. Baldwin, I. C.; E. P. Bracken, C. B. & Q. This committee will work in close co-operation with Colonel A. P. Thom, general counsel of the Association of Railway Executives.

The Freight Station Section of the American Railway Association has begun operations under a temporary committee of direction; and each railroad is requested to furnish the committee with names of officers or agents who are to serve as representative members. Where more than one is designated the advice should give the name of the individual who is to cast the vote of the railroad company. This information should be sent to R. O. Wells, secretary of the Section, 431 South Dearborn street, Chicago.

P. J. McNamara, vice-president of the Brotherhood of Locomotive Firemen and Enginemen, and W. L. McMenimen, deputy president of the Brotherhood of Railroad Trainmen, called on President Harding last week to discuss the railroad situation and urge him to appoint a railroad employee as a member of the Interstate Commerce Commission. Representatives of various organizations whose membership consists largely of the so-called "subordinate officials" called on President Harding on March 28 and submitted several names from which he was urged to select one as a member of the Railroad Labor Board.

The National Lumber Manufacturers' Association has been asked by the National Retail Lumber Dealers' Association to join in a demand upon the Railroad Labor Board that the shipping public be given consideration in the controversy over wages and working conditions in railroad employment. The association urges that the public be given a hearing, the national agreement abrogated, and that the railroads be allowed to take the action they deem necessary for the protection of the public interest and the revival of prosperity for the transportation systems in order that business conditions may be stabilized.

"Summer time" will prevail in Massachusetts for five months this year, a law to that effect having been approved on March 23. The Boston & Albany intends to adopt its summer time-table on April 24, the same date on which the New York, New Haven & Hartford changes the times of trains to correspond with the daylight saving action of New York City. The city of Providence, Rhode Island, has provided for five months' summer time, the legislature of the state having failed to take action. Towns in Connecticut near New York City have asked the governor to refuse approval of the recent act of the Connecticut legislature requiring clocks to be continued on Eastern Standard time. The Merchants' Association of New York City is working for a referendum, to be held next November, on the question of establishing summer time throughout the state of New York. The governor of Michigan has issued a proclamation urging all cities and towns in that state to adopt Eastern time, be-

ginning April 3, as a daylight-saving measure. A number of cities in Michigan have already taken action looking to the adoption of Eastern time in the summer.

Proposed changes in the classification of railway employees for statistical and similar purposes were considered at a joint hearing held at Washington on March 30 by Horace Secrist, statistician of the Railroad Labor Board, and M. O. Lorenz, chief of the Bureau of Statistics of the Interstate Commerce Commission. Mr. Secrist explained that it was of great importance for the purposes of the board to have more accurate classification of railway employees than has heretofore been found necessary and that it was especially important that there be accurate definitions of the various classifications so that there might be general agreement in discussing these matters. The board had proposed a tentative classification of 148 classes and has been working in connection with the Interstate Commerce Commission with a view to having similar classification used by the commission for statistical purposes. Alfred P. Thom, representing the railway executives, said that this increase in the number of classifications would add \$4,000,000 a year to the expense to the railroads of reporting the information and he suggested that the plan be simplified by a reduction to 123 classes. It was then decided to hold a series of round table conferences attended by the representatives of the two boards, of the railroads, and of the railroad employees, for the purpose of working out the details of the classification.

## Aishton Asked to Take Charge of Railway Mail Service

R. H. Aishton, president of the American Railway Association and formerly president of the Chicago & North Western and later regional director under the Railroad Administration, has been offered the position of second assistant postmaster general, in charge of the railway mail service, under the new postmaster general, Will H. Hays. It is understood that Mr. Hays is very anxious to have Mr. Aishton accept the position, but Mr. Aishton's attitude has not yet been stated.

## Mechanical Division of A. R. A. to Meet in Chicago

The General Committee of the Mechanical Division of the American Railway Association, at a meeting in New York on March 30, decided to hold a business session at the Hotel Drake, Chicago, on June 15 and 16, instead of the convention that was to have occurred at Atlantic City. The program has been modified and reports will be presented only by the committees on the following subjects: Prices for Labor and Material, Car Construction, Loading Rules, Brake Shoe and Brake Beam Equipment, Train Brake and Signal Equipment, Specifications and Tests for Materials, Tank Cars and Standard Methods of Packing Journal Boxes. Both morning and afternoon sessions will be held while the division is meeting.

## Railroads Report Deficit for January

Preliminary compilations of the reports to the Interstate Commerce Commission of 202 roads for January show a deficit of \$1,167,000. One hundred and nine of the companies failed to earn their expenses and taxes for the month, as compared with 88 that had deficits in December. To earn a 6 per cent return on their valuation it has been estimated that the railroads should have earned in January about \$67,000,000. Of the roads that had deficits 45 were in the Eastern district, 16 in the Southern and 48 in the Western. The total operating revenues for January were \$468,834,000, an increase of 5.2 per cent as compared with 1920. The total operating expenses were \$442,000,000, an increase of 6.6 per cent. Freight revenues for the month were \$323,000,000, an increase

of 4.2 per cent, while the passenger revenues were \$105,000,000, an increase of 14.6 per cent. For the five months dating from the rate increase the net operating income of the carriers has been \$225,000,000, which would be at the rate of 2.84 per cent a year on the valuation.

### Investors Invite Brotherhoods

S. Davies Warfield, president of National Association of Owners of Railroad Securities has asked the "big four" railroad employees' brotherhoods to appoint a committee to confer with a special committee of twenty-five financiers and bankers on the solution of the present country-wide freight-rate and wage-rate problem. "An immediate and partial remedy seems to lie in an adjustment of relations between the railroads and their employees," said his letter. "One Governmental body sitting in Washington cannot be expected to successfully adjust rates and fares to meet the expenses incident to railroad operations while another, sitting in Chicago, attempts to adjust wages, the largest and most important of all railway operating expenditures which can only be met by rates the commission alone is required to establish."

Mr. Warfield hopes to have the conference on April 4, in New York. The four brotherhoods invited, are the Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Enginemen and Firemen, Brotherhood of Railroad Trainmen and the Order of Railway Conductors.

### New Terminal Plans for Chicago

Plans for a drastic rearrangement of all of the railway terminals occupying the area immediately south of Chicago's business center have been submitted to the mayor and city council of Chicago by the Chicago Railway Terminal Commission of which John F. Wallace is the chairman. This plan involves a straightening of the Chicago river between Polk and Sixteenth streets in an area occupied almost exclusively by the railroads. It also implies the removal of all terminal developments of the railroads in the area north of Roosevelt road between the Chicago river and State street as well as a considerable area south of Roosevelt road between State street and Clark street, thereby doing away with the Grand Central, La Salle and Polk street passenger terminals, these facilities to be replaced by adequate passenger terminal developments in connection with the Illinois Central lake front project. The freight terminals to be eliminated will be replaced by an extensive freight house and team track development in the area west of Clark street and south of Roosevelt road. The advantage claimed for this plan from the standpoint of the city would be the extension of four through north and south streets southward from the central business district which are now obstructed by railway properties.

### To Make First Class Ticket Sellers

J. S. McClure, manager of the Consolidated ticket office at Denver, Colo., in a recent circular, gave his clerks a list of "a few good things to do," which will make interesting reading in any ticket office. He begins by telling the clerks that "this is old stuff"—which is true; but it is fresh advice nevertheless. Following are some samples:

**Trying.** Try to grant the passenger's request. Try to find instructions that will let you do so. Most requests can be granted if you try to find a way. When reasonable requests are apparently unauthorized, take up with agent's office and we will try to help you. When refusal is necessary, do so with regret, and explain why. We can please nearly everyone if we really try.

**Don't** take the easiest way and try to find an instruction that will allow you to refuse. Don't be curt or seem in a hurry in refusing.

**Know your business.** Know it in advance. Study and understand tariffs and fares. Understand folders and guides. Understand routes and optional routes, and give passenger the benefit. Understand tickets. If you don't know, *don't guess*. Find out, *and remember*. Learn the reason. There is a reason for rates, routes, etc., and you can find out. It will help avoid mistakes.

**Interest.** Take an interest in your passenger. His trip means a good deal to him, and he welcomes your interest. Cultivate

talking and getting an interest. It is easy to do, and enjoyable. It really makes your work easier, and much more satisfactory. It makes for a satisfied and thankful patron. But it must be a real interest, and not put-on or deceptive.

**Be sure** about little things. They count.

**Pleasing.** Most any one can get along nicely with 19 out of 20 of our patrons. Make a study of it and please the other one. The really good man can "handle" them all. If you make a mistake in your "handling" of a patron, profit by it and never make the same mistake again.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and place of meetings:

**AIR BRAKE ASSOCIATION.**—F. M. Nellis, Room 3014, 163 Broadway, New York City. Next convention, May 3-6, 1921, Hotel Sherman, Chicago. Exhibit by Air Brake Appliance Association.

**AIR BRAKE APPLIANCE ASSOCIATION.**—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.

**AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.**—F. A. Pontius, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

**AMERICAN ASSOCIATION OF DYING CAR SUPERINTENDENTS.**—S. W. Derr, Philadelphia & Reading, Philadelphia, Pa.

**AMERICAN ASSOCIATION OF ENGINEERS.**—C. E. Drayer, 29 S. La Salle St., E. I. R. R., 332 South Michigan Ave., Chicago. Next meeting, June, 1921, Quebec, Can.

**AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.**—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

**AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.**—J. Rothschild, Room 400, Union Station, St. Louis, Mo. Next convention, August 24-26, 1921, Kansas City, Mo.

**AMERICAN ELECTRIC RAILWAY ASSOCIATION.**—E. B. Burritt, 8 W. 40th St., New York.

**AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.**—C. Borchardt, 202 North Hamlin Ave., Chicago, Ill. Next convention September 12-14, Hotel Sherman, Chicago.

**AMERICAN RAILWAY ASSOCIATION.**—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Next regular meeting, November 16, 1921.

Division 1—Operating, W. J. Frupp (Chairman), General Manager, New York Central Railroad, Eastern Lines, New York, N. Y.; R. E. McCarty (Vice-Chairman), General Manager, Central Region, Pennsylvania System, Pittsburgh, Pa.

Freight Station Section (including former activities of American Association of Freight Agents), C. E. Fish (Chairman), Freight Agent, Baltimore & Ohio Railroad, Cincinnati, Ohio; J. C. Gilmore (First Vice-Chairman), Freight Agent, Pennsylvania System, Philadelphia, Pa.; C. M. Teschemacher (second Vice-Chairman), General Agent, Chicago & Alton Railroad, Chicago, Ill.; R. O. Wells (Secretary), Freight Agent, Illinois Central Railroad, Chicago, Ill.

Medical and Surgical Section, D. Z. Danott (Chairman), Chief Surgeon, Western Maryland Railway, Baltimore, Md.; G. G. Dowdall (First Vice-Chairman), Chief Surgeon, Illinois Central Railroad, Chicago, Ill.; Duncan Eve (Second Vice-Chairman), Chief Surgeon, Nashville, Chattanooga & St. Louis Railway, Nashville, Tenn.

Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association), R. S. Mitchell (Chairman), Chief Special Agent, Missouri Pacific Railroad, St. Louis, Mo.; H. L. Denton (First Vice-Chairman), Police Superintendent of Police, Baltimore & Ohio Railroad, Baltimore, Md.; Emmet Gregg (Second Vice-Chairman), Superintendent Special service, Atchison, Topeka & Santa Fe Railway, Topeka, Kan.; J. C. Cavison (Secretary), 75 Church St., New York, N. Y.

Telegraph and Telephone Section (including former activities of the Association of Railway Superintendents), H. Hulatt (Chairman), Manager of Telegraphs, Grand Trunk Railway, Montreal, Que.; W. H. Hall (First Vice-Chairman), General Superintendent of Telegraph, Missouri, Kansas & Texas Lines, Demson, Texas; R. F. Finley (Second Vice-Chairman), Superintendent Telegraph, New York Central Lines, West of Buffalo, Cleveland, Ohio; W. A. Fairbanks (Secretary), 75 Church St., New York, N. Y.

Division II—Transportation (including former activities of the Association of Transportation and Car Accountants), E. J. Pearson (Chairman), President, New York, New Haven & Hartford Railroad, New Haven, Conn.; J. J. Bernet (Vice-Chairman), President, New York, Chicago & St. Louis Railroad, Cleveland, Ohio; C. W. Crawford (Chairman, General Committee), 431 South Dearborn St., Chicago, Ill.; G. W. Covert (Secretary), 431 South Dearborn St., Chicago, Ill.

Division III—Traffic, G. H. Ingalls (Chairman) Vice-President, New York Central Lines, New York, N. Y.; J. Gottschalk (Secretary), 143 Liberty St., New York, N. Y.

Division IV—Engineering, H. R. Safford (Chairman), Assistant to the President, Chicago, Burlington & Quincy Railroad, Chicago, Ill.; C. J. Kelloway (Vice-Chairman), Superintendent of Signals, Atlantic Coast Line Railroad, Wilmington, N. C.; E. H. Fritch (Secretary), 431 South Dearborn St., Chicago, Ill. Next annual meeting, March 15-17, 1921, Chicago, Ill.

Construction and Maintenance Section, H. R. Safford (Chairman), Assistant to the President, Chicago, Burlington & Quincy Railroad, Chicago, Ill.; E. H. Fritch (Secretary), 431 South Dearborn St., Chicago, Ill.

Electrical Section, George Gibbs (Chairman), Chief Engineer of Electric Traction, Long Island Railroad, New York, N. Y.; E. B. Knute (Vice-Chairman), Chief Engineer of Electric Traction, New York Central Railroad, New York, N. Y.; E. H. Fritch (Secretary), 431 South Dearborn St., Chicago, Ill.

Signal Section (including former activities of the Railway Signal Association), F. W. Pilegig (Chairman), Signal Engineer, Union Pacific Railroad, Omaha, Neb.; F. B. Wiegand (First Vice-Chairman), Signal Engineer, New York Central Railroad, Western Lines, Cleveland, Ohio; C. A. Christofferson (Second Vice-Chairman), Signal Engineer, Northern Pacific Railway, St. Paul, Minn.; H. S. Balliet (Secretary), 75 Church St., New York, N. Y.

Division V—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), W. J. Tollerton (Chairman), General Mechanical Superintendent, Chicago, Rock Island & Pacific Railway, Chicago, Ill.; J. Coleman (Vice-Chairman), Assistant to General Superintendent Motive Power and Car Departments, Grand Trunk Railway, Montreal, Que.; V. R. Hawthorne (Secretary), 431 South Dearborn St., Chicago, Ill. A business session at the Hotel Drake, Chicago, will be held on June 15 and 16, instead of the convention at Atlantic City, N. J. Exhibit at this convention of Railway Supply Manufacturers' Association has been cancelled.

Equipment Painting Section (including former activities of the Master Car and Automobile Painters' Association), E. L. Younger (Chairman), Foreman Painter, Missouri Pacific Railroad, Little Rock, Ark.; J. G. Keil (First Vice-Chairman), Foreman Painter, New York Central Railroad, Western Lines, Elkhart, Ind.; J. R. Ayers (Second Vice-Chairman), General Manager Painter, Canadian Pacific Railway, Montreal, Que.; V. R. Hawthorne (Secretary), 431 South Dearborn St., Chicago, Ill.; A. P. Dane (Assistant Secretary), Foreman Painter, Boston & Maine Railroad, Reading, Mass.

Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association), H. C. Pearce (Chairman), General Purchasing Agent, Seaboard Air Line Railway, Norfolk, Va.; H. E. Ray (Vice-Chairman), General Storekeeper, Atchison, Topeka & Santa Fe Railway, Topeka, Kans.; J. P. Murphy (Secretary), General Storekeeper, New York Central Railroad, Western Lines, Collinwood, Ohio; W. J. Farrell (Assistant Secretary), 75 Church St., New York, N. Y. Second annual meeting June 20-22, 1921, Atlantic City, N. J.

Division VII—Freight Claims (including former activities of the Freight Claim Association), H. C. Pribble (Chairman), General Claim Agent, Atchison, Topeka & Santa Fe Railway System, Topeka, Kans.; H. C. Howe (First Vice-Chairman), Freight Claim Agent, Chicago & North Western Railway, Chicago, Ill.; D. C. Macdonald (Second Vice-Chairman), General Claim Agent, Canadian Pacific Railway, Winnipeg, Man.; Lewis Filcher (Secretary) 431 South Dearborn St., Chicago, Ill. Next meeting Coronado Beach, San Diego, Calif., May 17, 1921.

AMERICAN RAILWAY BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 Waller Ave., Austin Station, Chicago, Next convention, October 18-20, 1921, New York City. Exhibit by Bridge and Building Supply Men's Association.

AMERICAN RAILWAY EQUIPMENT ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Exhibit by National Railway Appliances Association.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division 5.)

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Next convention, August 9-11, Hotel Sherman, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.

AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whitteley, Union Trust Bldg., Washington, D. C.

AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eiseaman, 4600 Prospect Ave.; Cleveland, Ohio. Next convention, September 19-24, Indianapolis, Ind.

AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Col. H. S. Crocker (acting secretary), Engineering Societies Building, 33 W. 39th St., New York. Next convention, April 27, 1921, Houston, Texas. Regular meetings, 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Next meeting, May 23-26, Congress Hotel, Chicago.

AMERICAN TRAIN DISPATCHERS' ASSOCIATION.—C. L. Darling, Northern Pacific Ry., Spokane, Wash. Next convention, June 20, 1921, Kansas City, Mo.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J. Next meeting at St. Louis, St. Louis, Mo.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Room 411, C. & N. W. Sta., Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.

ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.

ASSOCIATION OF RAILWAY SUPPLY MEN.—C. L. Mellor, 212 W. Illinois St., Chicago. Meeting with International Railway General Foremen's Association.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division 1.)

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division 2.)

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—A. J. Filkins, Paul Dickenson Company, Chicago. Meeting with convention of American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—A. Booth, 131 Chaffon St., Montreal, Que. Next meeting, April 12.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.—Thomas B. Koeneke, Federal Reserve Bank Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel, St. Louis, Mo.

CENTRAL RAILWAY CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.

CINCINNATI RAILWAY CLUB.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio.

EASTERN RAILROAD ASSOCIATION.—E. N. Bessling, 614 F St., N. W., Washington, D. C.

FREIGHT CLAIM ASSOCIATION.—(See American Railway Association, Division 7.)

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Huhner, 321 Grand Central Sta., Chicago. Regular meetings, Wednesdays preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Next convention, August 16-18, 1921, Hotel Sherman, Chicago.

INTERNATIONAL RAILWAY FIRE ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May 24-26, 1921, Hotel Sherman, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabasha Ave., Winona, Minn. Next convention, September 12-15, Hotel Sherman, Chicago. Exhibit by Association of Railway Supply Men.

MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Next convention, October 4-6, 1921, Buffalo, N. Y.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Next convention, May 23-26, 1921, Planters' Hotel, St. Louis, Mo.

MASTERS AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—(See American Railway Association, Division 5, Equipment Painting Section.)

MASTER CAR BUILDERS' ASSOCIATION.—(See American Railway Association, Division 5.)

NATIONAL ASSOCIATION OF RAILROAD TIE PRODUCERS.—E. E. Pershall, T. J. Moss Tie Company, 720 Security Bldg., St. Louis, Mo.

NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James S. May, 19 Lafayette St., New York.

NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York. Next annual convention, May 4-7, Cleveland, Ohio.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago. Meeting with American Railway Engineering Association.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting, 2d Thursday in month, alternately in San Francisco and Oakland.

RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Building, Washington, D. C. Next annual meeting, June 8, 1921, Hotel Traymore, Atlantic City, N. J.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Naxon, 600 Liberty St., Broad and Chestnut Sts., Philadelphia, Pa.

RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, Americas Club House, Pittsburgh, Pa.

RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welty, Missouri Pacific R. R., Little Rock, Ark.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scriber, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Meeting with Traveling Engineers' Association.

RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O. Ry., Richmond, Va.

RAILWAY SIGNAL ASSOCIATION.—(See American Railway Association, Division 4, Signal Section.)

RAILWAY STOREKEEPERS' ASSOCIATION.—(See American Railway Association, Division 6.)

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Exhibit at this year, 1921, convention of American Railway Association, Division 5—Mechanical, has been cancelled.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—F. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 20-22, 1921, Chicago. Exhibit by Track Supply Association.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, Schroeder Headlight & Generator Co., New York City. Meeting with American Railway Association, Signal Section.

SOCIETY OF RAILWAY FRANCHISE OFFICERS.—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, West-cly, N. Y. Gt. N. Y. Gt. N. Y.

SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Buffalo, N. Y. Exhibit by Railway Equipment Manufacturers' Association.

WESTERN RAILWAY CLUB.—Bruce V. Crandall 14 E. Jackson Boulevard, Chicago. Meeting third Monday each month except June, July and August.

## Traffic News

F. X. Baur, heretofore supervisor of transportation on the Lehigh Valley, has been appointed transportation manager of the North American Fruit Exchange, 90 West street, New York, and W. V. Degan, heretofore manager of the freight claim bureau of the L. V., has been appointed freight claim agent of the Exchange.

The Pennsylvania Railroad has "reorganized its entire freight service" on regular schedules. From Chicago, St. Louis and the middle west to eastern terminals, and from New York, Philadelphia, Baltimore and other eastern points to western terminals the freight trains run on these schedules are delivering freight at destination in from one to two or three days earlier than heretofore. The purpose, however, is to insure regularity rather than exceptionally fast time, and the movement of these trains is followed up as though they were passenger trains. From Chicago the delivery at New York, Philadelphia, Baltimore, etc., is, for livestock, the third morning; for perishable freight, the fourth morning; and other traffic, the fifth. From St. Louis the time is one day longer. Westbound, the delivery is scheduled for Chicago, Fort Wayne, Toledo and Cincinnati on the fourth morning, and other points in proportionate time.

### The Coal Traffic of Canada

The coal production of Canada in 1920 amounted to 16,968,658 short tons as against 13,919,096 tons in the preceding year, or an increase of 21.9 per cent. Exports increased to 2,558,223 tons as compared to 2,070,050, but this was counterbalanced by an increase in imports from the United States from 16,982,773 to 20,815,596 tons. Nova Scotia yields to Alberta the honor of being the largest producer, the western province leading the eastern by nearly 4 per cent. Alberta produced 41 per cent of the total output; Nova Scotia, 37.8 per cent; British Columbia, 18.3 per cent; Saskatchewan, 1.9 per cent, and New Brunswick, less than 1 per cent. The war, which cut down shipments of anthracite from the United States, gave Alberta an opportunity to push her product. Shipments of Alberta coal eastward amounted to 500,000 tons in 1920 as against only half that amount in 1919.

### Traffic Statistics

The Interstate Commerce Commission has issued its monthly traffic summary from reports of large steam railroads for December and the 12 months ending with December, 1920. For December the revenue tons carried one mile were 31,804,415,000 as compared with 30,856,283,000 in December, 1919. The average haul per revenue ton per railroad was 185.19 as compared with 187.74 and the revenue per ton mile was 1.209 cents as compared with .98 cents. The report shows a slight reduction in the number of revenue passengers carried and in passenger mileage for the month. The number of passengers carried was 99,181,982 as compared with 100,805,201. The passenger mileage was 3,640,548,000 as compared with 3,803,166,000. The average miles per revenue passenger per railroad was 36.71 as compared with 37.73. The average revenue per passenger mile was 3.142 cents as compared with 2.626 cents.

For the calendar year the number of revenue tons carried was 2,234,000,000 as compared with 2,034,000,000 in 1919. The ton miles were 409,970,000,000 as compared with 364,025,000,000. The average haul per railroad for the year shows an increase, 183.47 as compared with 178.97. The average revenue per ton mile was 1.052 cents as compared with .973 cents. The number of revenue passengers carried was 1,234,000,000 as compared with 1,174,000,000. The passenger mileage was 47,724,000,000 as compared with 46,192,000,000. The average miles per revenue passenger per railroad was 37.86 as compared with 39.32. The average revenue per passenger mile was 2.747 cents as compared with 2.545 cents.

## Commission and Court News

### New York Commissions Reorganized

The two New York Public Service Commissions are abolished, the division of the state into two districts, first established in 1907, is done away with, and a new public service commission of five members is to be constituted for the whole state. This radical change is embodied in a new law approved on March 30, and Governor Miller says that the new appointees will be nominated by him within ten days. It is expected that one or more of the present members of the Commission for the Second District will be named.

The new commission will have increased powers. It is to be composed of five members. Their terms are fifteen years and they are removable only after a two-thirds vote of the legislature. The salary of each member is \$15,000. The Governor intends to appoint two members from the city of New York.

In place of the existing commission for the First District, the duties of which have been mainly in connection with the subway and elevated railroads of New York City, the new law establishes a Transit Commission of three members, to devote itself wholly to these city lines, including authority over the construction of new lines. It will have extensive powers in the regulation of the fares on these lines, all of which are still on the old basis of five cents. The terms of the members of the Transit Commission will be five years.

## Personnel of Commissions

### James C. Davis Appointed

#### Director General of Railroads

President Harding on March 26 issued proclamations appointing James C. Davis, heretofore general counsel of the Railroad Administration, as director general of railroads in charge of the liquidation of the affairs of the Railroad Administration and also as the statutory agent against whom suits are to be brought arising from federal control of the railroads. He succeeds John Barton Payne, who resigned as director general following his retirement as Secretary of the Interior.

Mr. Davis has been general counsel of the Railroad Administration since July, 1920, when he succeeded E. M. Underwood, having been general solicitor of the Chicago & North Western. He was born in Keokuk, Ia., on September 2, 1857. He attended the public schools there and the Hellmuth Boys' College at London, Ont. He was employed in the law office of C. P. Lomax, Keokuk, Ia., was admitted to the bar in 1877 and practiced law at Keokuk between 1877 and 1903. From 1881 to 1883 he was city solicitor of Keokuk. On January 3, 1903, he was appointed general attorney for the Chicago & North Western for the state of Iowa with headquarters at Des Moines, which position he held for 16 years, until in 1918, he was appointed general solicitor of the Chicago & North Western under the federal administration, with headquarters at Chicago.

In a letter to Judge Payne the President said:

"I have inquired for you several times this week because I wished to have a conference with you respecting the appointment of your successor. I came to the conclusion today that the matter ought not to remain open longer and I have this day issued a proclamation naming Mr. Davis for your successor as director of railroads. I cannot allow this action to pass without conveying to you my gratitude for the signal service you have rendered the country, not only in the important work you have done in connection with the administration of the railways but also your notable contributions to the government service in one of the most difficult periods of all our history. I am quite sure the country shares the gratitude which I so willingly express. I trust your retirement from direct responsibility will not make it impossible for your successor and the Executive to avail themselves of your vast knowledge and helpful experience."

## Equipment and Supplies

### Locomotives

W. R. GRACE & Co., New York, are asking for prices on 6 locomotives for export.

The EGYPTIAN STATE RAILWAYS are inquiring through the locomotive builders for some 2-6-2 type locomotives.

The CHILEAN STATE RAILWAYS are inquiring through the Vulcan Iron Works for some 2-8-2 type locomotives.

The OKINAWA-KEN (Japan) is inquiring through Mitsui & Co., 65 Broadway, New York, for 3, 0-6-0 type tank locomotives.

The TOBU RAILWAY (Japan) is inquiring through Mitsui & Co., 65 Broadway, New York, for 2 Mogul type locomotives with tenders.

### Freight Cars

The LAKE CHAMPLAIN & MORIAH is inquiring for from 12 to 15 ore dump cars.

The BALDWIN LOCOMOTIVE WORKS is asking for prices on 100 box cars for export.

The UNION MINERE DU HAUT KATANGA is inquiring through the car builders for 50 steel hopper cars of 30 metric tons capacity.

The ERIE RAILROAD is inquiring for 1,000 single sheathed 40-ton box cars. This road has also been asking for prices recently for repairing 1,000 box cars.

The RHODESIAN RAILWAYS, reported in the *Railway Age* of February 11, as inquiring through the car builders for 15 cars, have ordered this equipment from English car builders.

The PEKIN-MUKDEN, reported in the *Railway Age* of March 11 as inquiring for 200 gondola and 200 box cars, has ordered this equipment from the Metropolitan Wagon Works, England.

The DELAWARE, LACKAWANNA & WESTERN is having repairs made to 1,000 box cars at the Berwick shops of the American Car & Foundry Co. This is in addition to the 1,000 cars on which repairs were authorized to be made at the same plant last October.

The ATCHISON, TOPEKA & SANTA FE, reported in the *Railway Age* of February 25 (page 483) as inquiring for 1,000, 50-ton gondolas, has ordered this equipment from the American Car & Foundry Company; and 300, 50-ton gondola cars noted in the *Railway Age* of March 18 (page 737), from Haskell & Barker Car Company, Inc.

### Passenger Cars

The FEDERAL RAILWAYS, Eastern Brazil, are getting prices through the car builders on 2 first-class coaches and 6 combination baggage and mail cars.

### Iron and Steel

The MAINE CENTRAL is inquiring for 400 tons of fabricated steel for a bridge at Norridgewock, Maine.

### Machinery and Tools

The GENERAL ELECTRIC COMPANY, Schenectady, N. Y., is inquiring for 30 machine tools, including turret lathes, power presses and milling machines.

### Miscellaneous

The NEW YORK, NEW HAVEN & HARTFORD is asking for bids until 12:00 o'clock April 6, for between 310,000 and 385,000 net tons of deep mined, high volatile R. M. bituminous coal, to be delivered between May 1, 1921, and April 1, 1922.

## Supply Trade News

E. E. Goodwillie has been appointed sales agent in charge of the Cleveland office of the Bethlehem Steel Company, Bethlehem, Pa.

W. D. Jenkins, Dallas, Tex., has been appointed southwestern representative of the Burden Iron Company Railroad and Steamship Division, New York.

The Universal Crane Company, Cleveland, Ohio, announces the removal of its plant from Cleveland, Ohio, to its new factory at Elyria, Ohio, construction on which has just been completed.

Frank H. Freeman, assistant sales manager of the Anaconda Copper Mining Company, with headquarters at Chicago, has been appointed general sales manager of the Illinois Wire & Cable Company at Syracuse, Ill. Mr. Freeman will assume his new duties about April 1.

Allan A. Ryan has resigned as a director of the Chicago Pneumatic Tool Company, New York. Mr. Ryan also resigned as a director of the Vanadium Corporation of America and has been succeeded on the board of the latter company by T. M. Schumacher, president of the El Paso & Southwestern System.

E. G. LeLaurin has resigned as southern sales representative of the Southern Supply & Hardware Co., St. Louis, Mo., to serve in a similar capacity with W. D. Jenkins, representative of railway equipment and supplies, Dallas, Tex. Mr. LeLaurin will serve the trade in the Dallas-Houston-New Orleans territory.

The Lima Locomotive Works, Inc., has been authorized by the New York Stock Exchange to list \$2,865,000 7 per cent cumulative preferred stock, par \$100, and \$4,350,000 common stock, par \$100, with authority to add \$335,000 preferred stock and \$3,200,000 additional common stock on official notice of issuance on conversion of preferred stock, making the total amounts applied for \$3,200,000 7 per cent cumulative preferred stock and \$7,550,000 common stock.

The Lilly Varnish Company, Indianapolis, Ind., was sold on February 1 to an organization consisting of C. M. Malott, president; C. F. Brigham, vice-president and general manager, C. F. Hackathorn, vice-president in charge of manufacture and purchases, and W. I. Longworth, secretary and sales manager. Mr. Malott is also president of the Indianapolis Paint & Color Company. William Lilly, who has managed the Lilly Varnish Company for a long time, will remain with the new organization as treasurer.

A fire in the Winthrop Harbor, Ill., plant of the Austin Machinery Corporation, Chicago, on March 22, destroyed the unfinished stock, warehouse and store rooms; also both the trenching machinery assembly and paving mixer assembly buildings, and a number of machines on which assembly was practically completed; but the fire did not reach the finished machine warehouses. The damage at Winthrop Harbor will not interfere with production and prompt delivery of Austin products, as all lines of Austin machinery are also being built at the plants at Muskegon, Mich., and at the former plant of the Toledo Bridge & Crane Co., Toledo, Ohio.

### American Brake Shoe and Foundry Company

The annual report of the American Brake Shoe and Foundry Company for the year ended December 31, 1920, shows a net income, including \$542,293 received in final settlement of munitions contracts with the government, of \$2,571,848. This sum, after deducting the amount required for payment of the preferred stock dividends, is equivalent to \$12.86 per share on the outstanding common stock.

President Joseph B. Terbell in his report says: "The beginning of the year 1920 was of exceptional promise. During the

first nine months, the volume of operations in all of your company's plants exceeded that of any previous period, but the last quarter witnessed a decrease in incoming orders and a partial cancellation or suspension of orders that had previously been received, particularly in your malleable plants and the grey iron foundries, whose principal product is automotive castings. The average rate of production for the entire year was 77 per cent of capacity compared with 52.9 per cent for the year 1919.

"The duration of the period of adjustment through which the railroads and industries are passing will have considerable effect upon the earnings for the ensuing year. We are fortunate, however, in having a large proportion of our plant capacity devoted to the manufacture of commodities for which, even in periods of depression, there must be a moderate demand.

"The question of providing facilities for producing brake shoes in the Denver, Col., territory has been under consideration for some years, and the recent advance in freight rates made immediate action necessary. A new plant located at that place was, therefore, purchased. This plant started operations on September 1, 1920, and the results so far obtained have fully met expectations."

The consolidated balance sheet of the American Brake Shoe & Foundry Company, and subsidiaries, as of December 31, 1920, follows:

ASSETS	
Cash	1920
Accounts receivable	\$580,155
Notes receivable	4,757,580
Marketable loans and investments	164,475
Advances	86,665
Inventories	4,860,130
U. S. and Canada bonds	103,300
Deferred assets	152,653
Mortgages receivable	250,000
Capital stocks of associated companies	2,509,963
Plants and equipment, less depreciation	5,526,301
Patents, good will, etc.	6,814,113
	\$25,814,735
LIABILITIES	
Accounts and wages payable	\$3,321,899
Notes payable	254,000
Bond interest accrued	2,000
Federal taxes	226,151
Bonded debt	120,000
Reserves	671,055
Preferred stock	9,463,700
Common stock	*21,212,830
Capital stock of subsidiary companies	6,800
Surplus	.....
	\$25,814,735

\*Outstanding 148,410 shares of no par value represented by surplus of \$11,749,130.

## Trade Publications

**URANIUM IN STEEL.**—The history and function of uranium in the making of uranium steels, together with analytical methods and test charts, is the subject matter of a 32-page booklet published by the Standard Alloys Company of Pittsburgh, Pa.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company, which was noted in the *Railway Age* of March 25 (page 821), as contemplating the construction of a crane-way building to cost about \$13,000, at Topeka, Kan., will close bids for this work on March 29.

**CHICAGO, MILWAUKEE & ST. PAUL.**—This company contemplates rebuilding its coaling station at Wabasha, Wis., which was recently destroyed by fire.

**CHICAGO UNION STATION.**—This company, which was announced in the *Railway Age* of March 4 (page 532) as awarding a contract to the Chicago Foundation Company, Chicago, for the excavation work in connection with the new railway mail terminal, Chicago, and which was announced in the *Railway Age* of March 25 (page 821) as awarding a contract to the MacClintock-Marshall Company, Pittsburgh, Pa., for fabricating the structural steel to be used in connection with this project, will shortly accept bids for the construction of the terminal itself.

**GREEN BAY & WESTERN.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of its La Crosse branch, 6.38 miles, on the ground that it is being operated at a net loss.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of March 4 (page 532), as contemplating the installation of a new 100-ft. turntable at Waterloo, Iowa, at an estimated cost of \$45,000, is now accepting bids for this work.

**ILLINOIS CENTRAL.**—This company will shortly accept bids for building a viaduct over McLemore Avenue, Memphis, Tenn.

**LONG ISLAND.**—This company is preparing plans for grade crossing elimination at Far Rockaway, N. Y., to cost in excess of \$2,500,000.

**OKLAHOMA-SOUTHWESTERN.**—This company, which is constructing a line from Bristow to Nuyaka, Okla., a distance of 24 miles, has completed the line from Bristow to the crossing of the Canadian river at Deep Fork, a distance of 20½ miles. The company has awarded a contract to Allhands & Davis, Okmulgee, Okla., for grading between Deep Fork and Nuyaka. The company contemplates extending its line south of Nuyaka to Okmulgee, a distance of 12 miles, upon completion of the present work.

**ST. LOUIS-SAN FRANCISCO.**—This company is engaged in improving and extending its yards at Sapulpa, Okla., at a cost of \$75,000. The company also contemplates additions to its passenger station at Sapulpa to cost about \$85,000.

**UNION PACIFIC.**—This company, in co-operation with the city of Kansas City, Mo., contemplates the construction of a viaduct over 23rd street, Kansas City.

**COMING HOME TO ROOST.**—Yonder is the great Railway Farm, worth about \$20,000,000. Originally it produced transportation. See it now, covered with an enormous brood of chickens, constantly eating, yet calling for more. They were hatched in the Government Ownership incubator, which is the finest machine in the world for hatching theories, absurdities and other un-economic eggs. The brooder in which the chickens were developed is a wonder. It is the McAdoo patent, which is an improvement of the Adamson, and is warranted to produce insatiable appetites. The Director, who was not the owner of the farm, fed the chickens war-inflated wages. When more feed was needed than the farm would produce it was carted from the U. S. Treasury. Now the owners have possession of their farm, and are obliged to feed the vulture-like chickens the manager left behind. Worse yet; more of the brood are daily coming back to roost. The owners are obliged to keep them, but are not permitted to change the feed to peace-time corn, even though all the farm produces will not provide for them, and they even eat up the few eggs that are laid. The owners, in despair ask how they shall pay taxes, insurance, upkeep of the farm and make improvements when all it produces is eaten up. But the vultures swarm to the roosts and cluck and gabble for more.—*The Wall Street Journal Straws.*

# Railway Financial News

**ANN ARBOR.—Authorized to Pledge Bonds.**—This company has been authorized by the Interstate Commerce Commission to pledge \$100,000 of its improvement and extension mortgage bonds with the War Finance Corporation as substitute security for a demand note.

**CANADIAN NATIONAL RAILWAYS.—Deficit for 1920.**—Hon. J. D. Reid, minister of railways, made his annual statement on the operation of the Canadian Government Railways before the Canadian House of Parliament on March 17. Dr. Reid first outlined the policy of management decided upon when the Canadian Northern was connected up with the Intercolonial and Transcontinental Railways, describing how the board of management was constituted. A year ago, he said, he announced the deficit of 1919, on Government lines as \$47,993,312. When final figures were available, the actual loss was found to have been \$48,242,536. Continuing he said:

When I made my annual statement of the operation of these roads a year ago, I believed from discussions I had with the management I would be able to advise the House this year that the deficit of 1919 had been reduced in 1920. Instead of a reduction, I must inform the House that the loss in operation alone for the year ending December 31, 1920, is much larger. It follows: Canadian Northern, \$16,258,580; Canadian government, \$10,449,876; total operating deficit of the Canadian National Railways, \$26,708,456. To which we add the operating deficit of the Grand Trunk Pacific, which, since last August 23, has been under management of the Canadian National Board, amounting to \$10,134,514, making a total operating deficit of \$36,842,970.

To this must be added the interest on bonds, etc., or what are called fixed charges, and which have been paid or assumed by the government, and are as follows: Canadian Northern, \$24,155,988; Grand Trunk Pacific, \$9,332,776; making the total deficit for operation and fixed charges \$70,331,735.

And this does not take into consideration any interest or fixed charges on Transcontinental or Intercolonial railways.

A Canadian National income credit, which will be shown in the statement of detail, reduces this sum to \$69,593,441, which is the loss on operation and fixed charges for 1920, as against 48 millions in 1919.

The total mileage operated by the Canadian National management at the end of 1920 was 17,054.69 miles. There were added during 1920, 140 miles by purchase and 236 miles on completion of new construction.

The income statement of the Canadian National Railways for the calendar years ended 1920 and 1919 was given as follows:

	1920	1919
<b>GROSS EARNINGS</b>		
C. N. R.	\$66,695,599	\$53,562,178
Can. government	44,537,804	40,179,381
G. T. P.	14,408,560	11,294,618
<b>Totals</b>	<b>\$125,641,753</b>	<b>\$105,036,177</b>
<b>OPERATING EXPENSES</b>		
C. N. R.	\$82,953,979	\$60,034,024
Can. government	54,987,680	47,728,206
G. T. P.	24,543,063	17,587,567

<b>FIXED CHARGES</b>		
C. N. R. due public	\$13,837,118	\$12,693,584
Interest due government	10,318,870	7,276,126
G. T. P. due public	6,048,951	6,048,850
Interest due government	2,475,474	1,910,265
Interest on receiver's certificates for 1920.	808,352	.....
<b>Totals</b>	<b>\$33,488,765</b>	<b>\$27,928,925</b>
<b>TOTAL DEFICIT (OPERATING AND FIXED CHARGES)</b>		
C. N. R.	\$40,414,568	\$26,441,556
Can. government	10,449,877	7,548,825
G. T. P.	19,467,290	15,252,156
<b>Totals</b>	<b>\$70,331,735</b>	<b>\$48,242,537</b>

The results of operation of the Canadian National Railways was no worse than obtained outside of Canada, but that did not mean that every effort should not be made to prevent losses. At present the country was faced with permanent fixed charges as follows: Interest, public debt (including sinking fund), \$142,800,000; pensions, \$31,816,000; permanent expenditure for carrying on the affairs of the government (about), \$127,000,000; total (about), \$301,616,000.

This was without a dollar for carrying on necessary public works, soldier

settlement, re-establishment and other expenditure. It meant very heavy taxation for many years, and it would be a very serious matter to have increased taxation for railways to the extent of from \$50,000,000 to \$70,000,000 per annum.

I have not been able to get the annual closing statement from the Grand Trunk management up to the present. I sent an expert auditor to secure from the books and submit a statement as to results of operations for the years 1919 and 1920, and secured the report that, after providing for operating expenses, tax accruals, income deductions, etc., the amount available for interest and dividends was as follows: 1919, \$11,164,036; 1920, \$5,692,301.

Out of the above amounts the railway was able to meet in 1919 the interest on its fixed charges, but not on the share capital, which includes 4 per cent guaranteed steel, first, second and third preference stock and ordinary stock.

In 1920 the company fell short \$6,563,091 of meeting interest on fixed charges. The Grand Trunk, however, had to pay \$3,635,000 to employees for back pay between May 1 and September 1, when no increases for freight rates had been allowed. But the figures of six millions did not take into account a loss of \$19,817,873 on the Grand Trunk Pacific, a subsidiary of the Grand Trunk, for which the Grand Trunk was responsible. The loss on the Grand Trunk Pacific had been included in the deficit for last year on government lines of \$69,593,441.

**CANADIAN PACIFIC.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**CHICAGO & EASTERN ILLINOIS.—Reorganization Plan.**—A tentative draft of the reorganization plan has been distributed to members of the underwriting committee. A general meeting of the committees of bondholders will be held on or about March 31. The foreclosure sale of the road is scheduled for April 5.

Trading on the curb began March 24, when the Chicago & Eastern Illinois new common stock sold for \$13 a share and its preferred stock for \$31, with slight fluctuations.

**CHICAGO, INDIANAPOLIS & LOUISVILLE.—Ask Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$3,493,000 of first and general mortgage 5 per cent gold bonds, to be held in the treasury or to be used for purposes of collateral.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—Purchase of E. I. & T. H.**—This road has purchased the entire capital stock of the Evansville, Indianapolis & Terre Haute. The purchase is subject to the approval of the Interstate Commerce Commission.

Spencer Trask & Co. have purchased from a syndicate, represented by Raymond M. Smith, approximately \$500,000 of the Evansville, Indianapolis & Terre Haute Railway Company first mortgage 7s, due May, 1950. These bonds will be sold privately by the bankers at a price to yield about 7.15 per cent.

**DENVER & RIO GRANDE.—Sale Confirmed.**—The sale of this road to the Western Pacific for \$5,000,000 on November 20, 1920, in satisfaction of a judgment for \$36,000,000 obtained by the Equitable Trust Company of New York was confirmed in the federal court at Denver, Col., by District Judge Robert E. Lewis on March 28. The decree provides that William A. Jackson, who was appointed special master on a court order, shall deliver to the purchasers full deeds, all assets and assignments on the payment to the special master of the full amount of money within thirty days or within such time as the court later may designate. The decree also directed that all moneys held at present by A. B. Baldwin, receiver of the road, shall be turned over to the purchasers with the exception of \$100,000 which the receiver is authorized to retain for current expenses. The confirmation definitely disposes of any right of the stockholders to interfere with the road's operation. The payment of the \$5,000,000 in 5 per cent thirty-year gold bonds of the Western Pacific Railroad is given in the confirmatory decree.

Confirmation of the sale of the Denver & Rio Grande will mean its reorganization within the next thirty days, according to Charles M. Levey, president of the Western Pacific. The plans provide for the formation of a new company, the Denver-Rio Grande & Western. It will be operated under the direct supervision of the Western Pacific Company.

In spite of the court confirmation on the sale, the stockholders' protective committee of the Denver & Rio Grande will proceed with its attack on the original matters leading up to the judgment which forced the road's sale.

**EL PASO & SOUTH WESTERN.—No Merger with Rock Island.**—President T. M. Schumacher is quoted as having denied that any steps have been taken to merge this road with the Chicago, Rock

Island & Pacific and part of the Southern Pacific, but as having admitted such a plan would be agreeable to the Phelps-Dodge interests.

**ERIE.**—*Authorized to Guarantee Equipment Trust Certificates.*—This company has been authorized by the Interstate Commerce Commission to guarantee the prompt payment of principal and dividends on an issue of \$4,370,000 of equipment trust certificates to be issued under an agreement of assignment of lease by the United States Mortgage & Trust Company.

**EVANSVILLE, INDIANAPOLIS & TERRE HAUTE.**—*Purchased by Big Four.*—See Cleveland, Cincinnati, Chicago & St. Louis.

**EVANSVILLE, INDIANAPOLIS & TERRE HAUTE.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$400,000 of first mortgage bonds due May 1, 1950, with interest at 7 per cent, to be pledged with the Secretary of the Treasury for a loan.

**FORT DODGE, DES MOINES & SOUTHERN.**—*Loan from Revolving Fund Approved.*—The Interstate Commerce Commission has approved a loan of \$200,000 to this company for the purpose of assisting it in rebuilding 600 box cars.

**GEORGIA & FLORIDA.**—*Authorized to Issue Certificates of Indebtedness.*—The receivers have been authorized by the Interstate Commerce Commission to issue \$1,600,000 of receiver's certificates at 8 per cent, dated January 31, 1921, and maturing January 31, 1924; to pledge one-half of the amount with the Secretary of the Treasury as security for a loan; to sell \$600,000 of certificates and to distribute \$200,000 of certificates as payments on account pro-rata of the uncertificated indebtedness of the receivers incurred prior to January 1, 1921.

**NEW YORK, NEW HAVEN & HARTFORD.**—*Annual Meeting of Stockholders.*—The stockholders' annual meeting will be held in New Haven on April 20. Among matters to be considered are proposition for refunding the indebtedness of the company known as the European Loan which matures April 1, 1922, and to consider the acquiring or merging of the Central New England Railway Company, the Harlem River & Port Chester Railroad, the New England Steamship Company, the Hartford & New York Transportation Company and the New Bedford, Martha's Vineyard & Nantucket Steamboat Company.

**READING COMPANY.**—*More Petitions to Intervene.*—George S. Ingraham, individually and as attorney for Frances T. Ingraham, Robert S. Ingraham, Mabel B. Ingraham and Marcus L. Taft, holders of 11,000 shares of Reading common stock, has filed a petition in the United States District Court in Philadelphia asking for information from the Reading Company as to the value of their interest in the Reading property. The petition states that under the proposed plan of segregation the petitioners are required to elect as to the assets of the company in which they desire to hold an equitable interest, but that they are unable to make such election intelligently until more definite knowledge of Reading's assets has been provided.

William B. Knotz, a preferred shareholder, has also presented a petition to the court to intervene, suggesting certain modifications in the plan.

**RICHMOND TERMINAL.**—*Authorized to Issue Notes.*—This company has been authorized by the Interstate Commerce Commission to issue two promissory notes, each in the face amount of \$12,500, payable to the Richmond, Fredericksburg & Potomac and the Atlantic Coast Line.

**SACRAMENTO NORTHERN.**—*Purchase by Western Pacific.*—See item under Western Pacific.

**TEXAS CITY TERMINAL.**—*Application for Certificate.*—This company has applied to the Interstate Commerce Commission for a certificate authorizing it to operate the properties formerly owned by the Texas City Transportation Company sold at foreclosure on August 3, 1920.

**TOLEDO TERMINAL.**—*Authorized to Issue Promissory Notes.*—This company has been authorized by the Interstate Commerce Commission to issue \$72,000 of promissory notes for the acquisition of two freight locomotives.

**VIRGINIA BLUE RIDGE.**—*Authorized to Issue Notes.*—This company has been authorized by the Interstate Commerce Commission

to issue \$106,000 of promissory notes and to pledge as collateral security \$50,000 of its first mortgage 6 per cent bonds.

**WESTERN PACIFIC.**—*Purchase of Sacramento Northern Contemplated.*—This road has applied to the Railroad Commission of California for authority to issue \$4,180,000 of its first mortgage 5 per cent gold bonds in connection with its contemplated purchase of the Sacramento Northern Railroad. The bonds are to be exchanged for bonds of the Sacramento Northern, which are now in the hands of the trustee, on the basis of \$80 face value in Western Pacific bonds for \$100 face value of Sacramento Northern bonds. About 90 per cent of the Sacramento Northern stock, amounting to \$4,650,094, has also been deposited with the trustee. The Western Pacific agrees to pay \$27.50 per share for trust certificates representing first preferred stock; \$15 a share for certificates representing the second preferred stock, and \$6 for certificates representing common stock. See also Denver & Rio Grande above.

**Guaranty Certificates Issued**

The Interstate Commerce Commission has issued the following certificates for partial payments to railroads on account of their guaranty for the six months following federal control, in addition to those listed last week:

		Previously paid
Chicago, Milwaukee & St. Paul	\$2,000,000	\$17,434,000
St. Louis-San Francisco	800,000	3,000,000
St. Louis-San Francisco of Texas	200,000	.....
Paris & Great Northern	27,500	.....
International & Great Northern	260,000	1,815,000
Chicago Junction	200,000	1,000,000
Chicago, St. Paul, Minneapolis & Omaha	850,000	900,000
Kansas City, Clinton & Springfield	55,000	.....
Cumberland & Pennsylvania	60,000	.....
Brownwood North & South	5,500	.....
Fort Worth & Rio Grande	210,000	.....
Chicago, Peoria & St. Louis	60,000	238,000
Spokane, Portland & Seattle	250,000	200,000
Oregon Electric	180,000	.....
New York Central	20,000,000	.....
Pacific Coast	30,000	.....

The commission has also issued a certificate for a partial payment to the American Railway Express Company on account of its guaranty for \$4,500,000. This company had previously received advances amounting to \$19,700,000.

**Dividends Declared**

Bangor & Aroostook—Preferred, 3½ per cent, semi-annually; common, 2 per cent, semi-annually.  
 Norfolk & Western—Preferred, 1 per cent, quarterly, payable May 19 to holders of record April 30.  
 Philadelphia & Trenton—2½ per cent, quarterly, payable April 12 to holders of record April 1 to April 11.

DURING 1920 the value of the declared exports from Cairo, Egypt, to the United States was \$861,792, as compared with \$411,485 during 1919. Sheepskins, valued at \$215,811 during the past year and \$136,936 in 1919, were the leading items of this trade.—*Commerce Reports.*

# ANNUAL REPORT

## Canadian Pacific Railway Company—Fortieth Annual Report

**To the Shareholders:**

The accounts of the Company for the year ended December 31st, 1920, show the following results:

Gross Earnings	\$316,641,349.30
Working Expenses (including all taxes)	183,488,304.70
<b>Net Earnings</b>	<b>\$133,153,044.60</b>
Deduct Fixed Charges	10,775,408.99
Surplus	\$22,377,635.61
Contribution to Pension Fund	500,000.00
	<b>\$21,877,635.61</b>

From this there has been charged a half-yearly dividend on Preference Stock of 2 per cent., paid October 1st, 1920, \$1,613,638.42

And three quarterly dividends on Ordinary Stock of 1 1/4 per cent., each, paid June 30th, 1920, October 1st, 1920, and December 31st, 1920, 13,650,000.00

15,263,638.42

**\$6,613,997.19**

From this there has been declared a second half-yearly dividend on Preference Stock of 2 per cent., payable April 1st, 1921, \$1,613,638.42

And a fourth quarterly dividend on Ordinary Stock of 1 1/4 per cent., payable April 1st, 1921, 4,550,000.00

6,163,638.42

Leaving net surplus for the year \$450,358.77

In addition to the above dividends on Ordinary Stock, three per cent. was paid from Special Income.

**SPECIAL INCOME FOR YEAR ENDED DECEMBER 31st, 1920**

Balance at December 31st, 1919, \$17,363,844.27

Less: Dividend paid April 1st, 1920, 1,950,000.00

**\$15,413,844.27**

Net Revenue from Investments and Available Resources, Exhibit "C", 2,436,717.25

Interest on Deposits, and interest and Dividends on Other Securities less Exchange, 2,057,327.93

Net Earnings Ocean and Coastal Steamship Lines, 2,741,146.12

Net Earnings Commercial Telegraph and News Department, 3,731,256.51

Retainers and Miscellaneous, \$26,380,292.08

Less: Payments to Shareholders in dividends: June 30th, 1920, October 1st, 1920, and December 31st, 1920, 5,850,000.00

**\$20,530,292.08**

From this a dividend has been declared payable April 1st, 1921, \$1,950,000.00

2. The working expenses for the year, including all taxes, amounted to 84.70 per cent. of the gross earnings, and the net earnings to 15.30 per cent., as compared with 81.39 per cent., and 18.61 per cent., respectively in 1919.

3. The gross earnings of your transportation system during the fiscal year under review exceeded those of 1919 by \$39,712,289, and the net earnings by \$20,008. This large addition of \$39,492,281 in working expenses is due to the enforced application in Canada of what is known as "The Chicago Wage Award," which added approximately \$12,000,000 to the pay rolls for the year; the increase in the cost of fuel and materials and the charging of the year's Federal taxes into operating expenses, where they properly belong. The heavy and rapid movement of freight during October and November and the first half of December under the tariffs prescribed by the Railway Commission and effective on September 13th enabled your Company to absorb these expenses and earn its usual charges, directly belonging. The heavy and rapid movement of freight during the net earnings are not commensurate with the volume of business transacted, still in the opinion of your Directors the year's operations must be regarded as satisfactory and compare most favorably with those of any other system on the American continent.

4. The sales of agricultural land in the year were 468,390 acres for \$9,592,706.95, being an average of \$20.48 per acre. Included in this area were 47,848 acres of irrigated land which brought \$50.43 per acre, so that the average price of the balance was \$17.07 per acre.

5. Your Directors disposed of \$8,000,000 of Four per cent Consolidated Debenture Stock to the British Government pursuant to arrangements previously made at the time of the deposit of \$40,000,000 of the Stock with the British Treasury in 1917. The balance of the Stock deposited, namely, \$32,000,000 has been returned to the Company and is available for all or other disposition as circumstances warrant.

6. As indicated in the last annual report, and with your approval, your Directors during the year issued \$12,000,000 of Equipment Trust Notes for the purpose of acquiring necessary additions to your Company's rolling stock.

7. Your approval was obtained in 1919 and 1920 to the construction, as conditions warranted, of branch line mileage in Western Canada amounting in the aggregate to 822 miles, and during the year under review 100 miles of track of this authorized mileage have been laid.

While extensive new construction is not under the present conditions advisable, your Directors are of the opinion that a moderate amount of construction should be proceeded with during the coming year in order that the full value of the lines already under construction should be realized and that the settlers in the districts to be served should obtain the railway facilities so necessary to their prosperity. The Branch Lines heretofore approved are in good territory and well located to become revenue producing.

8. Your approval will be asked to the construction of an extension of the Suffield South-westerly Branch from Lomond, a distance not exceeding thirty miles, and for the issuance and sale of a sufficient amount of Four per cent. Consolidated Debenture Stock to meet the expenditure.

9. Four steamers for Atlantic and Pacific Service previously contracted for are now being built for the Company, namely:—

- "Empress of Canada,"
  - "Montrose,"
  - "Edmund,"
  - "Montclair,"
- and the "Koenig Friedrich August" has been purchased.

An additional ship for British Columbia Coast Service, required because of the loss of the "Princess Sophia" and "Princess Irene," and the sale of the "Princess May" and "Princess Margaret," is also under construction. The estimated cost of these six ships is \$31,175,000, of which \$18,733,138 was paid up to the year 1920. The capital requirements for the year 1920, \$3,216,318, and, subject to your approval, on this account for the year and including the amount required for the completion of the payments on the "Koenig Friedrich August" purchased, amount to approximately \$12,200,000. Your approval will be asked to the issuance and sale of a sufficient amount of Consolidated Debenture Stock to meet the expenditure for these vessels. During the year, the S.S. "Sardinian," built in 1875, was sold.

10. In anticipation of your confirmation, your Directors authorized capital appropriations, in addition to those approved at the last annual meeting, for the year 1920, \$3,216,318, and, subject to your approval, have authorized expenditures on capital account during the present year of \$4,316,236—of this amount the principal items are:—

Replacement and enlargement of structures in permanent form	\$509,624
Additional stations, roundhouses, freight sheds and shops and extensions to existing buildings	398,158
The plates, rivets, ballasting, ditching and miscellaneous betterments	35,700
Replacement of rail in main and branch line tracks with heavier section	1,000,000
Additional and side-track accommodations	377,292
Extension work on Chateau Frontenac Hotel	853,000
Lining of Connaught Tunnel	400,000
Improvements in connection with Telegraph Service	55,033
Mechanical Department, machinery at various shops	30,950

The balance of the year 1920, \$3,216,318, and, subject to your approval, for the whole system and effect proper economies.

11. In view of the importance to the Company in its personnel and the value to Canada in the development of its resources and industry through the increase in the number of trained technical men, your Directors authorized a subscription McGill University Endowment of \$250,000, and to the University of Montreal of \$50,000, payable in annual instalments. Contributions of \$10,000 to the Salvation Army and \$5,000 to the work of the Y. M. C. A. were also authorized. The value of the work of Salvation Army and the Young Men's Christian Association to the Company and its employees is of direct and indirect importance.

12. At the request of the Government of Alberta, and in order to ensure proper railway service in the districts served by the Edmonton, Dunvegan and British Columbia and Central Canada Railway Companies, your Directors have entered into an agreement with the principal stockholders, the Union Bank of Canada, and the Province of Alberta, for the operation, for a period of five years from the Twenty-first day of July, 1920, of the properties of the Edmonton, Dunvegan and British Columbia and Central Canada Railway Companies. The remuneration is the payment to your Company of 15 per cent. of the revenues in excess of working expenses, payable out of profits after payment of fixed charges, and an agreement giving your Company an option to purchase the capital stock on the terms set out in the agreement at any time during the period of five years. This arrangement provides for the improvement of capital improvements and betterments to the lines shall be loaned by the Government to the Companies to be operated, and it is estimated that an amount of \$2,500,000 will be required for this purpose, of which \$1,000,000 has already been provided. The value of the arrangement to your Company is that it enables an accurate appreciation to be obtained of the probable development of the country, and the present and prospective value of the properties as traffic contributors to your Company's system. The arrangement is likewise highly desirable from the standpoint of the people of Alberta in that it enables the benefit of a proper railway organization to be obtained and proper railway economies to be effected under the direction of your Company's officers, and at the same time permits the development of the North Country to be aided to the fullest possible extent and gives to present and incoming settlers the railway facilities so essential to their success.

13. In order to ensure the development of that portion of the Province of Quebec situated South and East of Lake Temiskaming, your Directors have entered into an agreement with the Government of Quebec, your subsidiary, the Interprovincial and James Bay Railway Company, of a railway extending from Kipawa to Des Quinze River, with a branch to Ville Marie, having a total mileage of 76 miles. Subsidies of \$8,000 a mile in cash for 66 miles and 4,000 acres of land per mile of the entire railway have been voted, which will, of course, substantially reduce the cost of construction to the Company. A productive agricultural area of large extent and valuable timber lands will be opened and served through the construction of this railway.

14. The First of the Company deposited with the British Treasury was returned to the owners on the First of October, 1920, and the common stock on the Thirty-first of December.

The position of the holdings of Common Stock as of March First of this year was as follows:—

	Shares	Percentages
United Kingdom	1,242,837	47.80
Canada	460,838	17.73
United States	626,510	24.10
France	312,222	3.16
Other holdings	190,692	7.33
	<b>2,600,000</b>	

15. During the last six and a half years the Company has expended on Capital Account, \$88,000,000; and during the same period the proceeds of the sale of capital issued, amounted to \$28,000,000. The cost of recent Equipment Issue of \$12,000,000, the proceeds of which have not as yet been received in full because of the non-completion of the rolling stock under contract for construction. In consequence of these large expenditures, the demands upon the Company's cash reserves have been extensive, while the surplus operations during the past three years, for reasons with which the Shareholders are entirely familiar, have been merely nominal.

As indicated in this report, the capital requirements for 1921, exclusive of payments on stocks and the completion of branch line construction, will be very moderate. No extensive works are contemplated in the East, save the commencement of the Interprovincial and James Bay Railway, previously referred to, and the continuance of the work on the extensions to the Chateau Frontenac, which it is expected will involve the expenditure of \$1,000,000 during the present year.

The amount of unissued Consolidated Debenture Stock for the issuance of which your authority has already been given, is \$36,000,000, and the

amount issued and undisposed of is \$32,000,000, a total of \$68,000,000. The capitalization of the Company is conservative and even low, and this has been accomplished largely through the utilization of surpluses in betterments and improvements which would normally have been paid for out of the proceeds of capital issues. While capital expenditures for the immediate future will be curtailed and the resumption of works requiring large amounts of money will be deferred until a decided improvement in business conditions furnishes warrant for incurring them, your Directors consider that it will be desirable that a portion of the cash reserves expended on Capital Account should be restored within a short time, and, to this end, in order to supplement and extend the powers of the Company to issue forms of securities other than those it is already empowered to issue and which are more appropriate to present market conditions, have made application for an amendment to the Company's charter permitting the issuance of bonds, debentures or other securities, collateral to or in lieu of any Consolidated Debenture Stock which the Company is or may hereafter be empowered to issue, and for the same amount, such securities to be payable in such currency, at such times and places, and bearing such interest as your Directors may think proper. As mentioned in the notice to Shareholders, the annual general meeting will be made special for the purpose of authorizing, if approved, the issuance of such securities.

16. The Note Certificates of the Company issued in 1914 for \$52,000,000 will fall due on March 2nd, 1924. Your Directors are glad to be able to advise the Shareholders that ample provision has been made for the retirement of these Notes at maturity.

17. Your Directors desire to express their appreciation of the loyal and efficient services of the officers and men of the Company, which have permitted it to perform its functions as a common carrier with credit to itself and satisfaction to the public, and have resulted in returns from the year's operations which, under the difficult conditions existing, cannot but be regarded as highly gratifying to the Shareholders.

18. The undersigned Directors will retire from office at the approaching annual meeting. They are eligible for re-election:—

- Mr. EDWARD W. BEATY,
  - Hon. FREDERICK L. BÉTUÉ, K. C.
  - Mr. CHARLES R. HOSBIE,
  - Hon. WM. J. SHAUGHNESSY, K. C.
- For the Directors,  
E. W. BEATY, *President*.

# Railway Officers

## Financial, Legal and Accounting

H. C. Hicks has been elected treasurer of the St. Louis, El Reno & Western, with headquarters at St. Louis, Mo. L. A. Garner has been appointed auditor with headquarters at Fort Smith, Ark.

George C. Gahan, whose appointment as general auditor of the Canadian Pacific was announced in the *Railway Age* of March 18 (page 741), was born December 28, 1874, at Montreal, Que. He entered the service of the Canadian Pacific in April, 1890, and continued until January 1, 1901, occupying various positions in the accounting department. On the latter date he was appointed general bookkeeper and continued in that position until July, 1901, when he was promoted to chief clerk to the assistant comptroller and general auditor. In December, 1916, Mr. Gahan was promoted to assistant general auditor, which position he was holding at the time of his recent promotion.

## Operating

The office of general superintendent of the Fort Worth & Denver City has been transferred from Fort Worth, Tex., to Wichita Falls and the office of superintendent of the Wichita Falls division has been abolished. Officers and employees formerly reporting to the superintendent of this division will hereafter report directly to the general superintendent. These changes are effective April 1.

A. Miller, district engineer on the Missouri Pacific with headquarters at Kansas City, Mo., has been appointed super-

intendent of the Missouri division with headquarters at Poplar Bluff, Mo., succeeding W. C. Morse. O. E. Coyne has been appointed superintendent of the Illinois division with headquarters at Illmo, Mo., succeeding H. H. Berry. The appointments are effective April 1.

## Traffic

J. F. Gracey has been appointed general agent on the Louisville & Nashville with headquarters at Clarksville, Tenn., effective April 1.

D. F. Williams has been appointed general freight and passenger agent of the St. Louis, El Reno & Western, with headquarters at Fort Smith, Ark.

J. A. Dolan has been appointed general agent on the Erie, with headquarters at Cincinnati, Ohio, effective March 1, succeeding J. H. Webster, who has resigned.

L. K. Mulkern has been appointed division freight agent of the Canadian Pacific with headquarters at North Bay, Ont., succeeding W. S. Elliot, who has been transferred to a similar position at St. John, N. B.

R. N. Collyer has been appointed vice-chairman of the Traffic Executive Committee, Eastern territory, with headquarters at New York. Mr. Collyer will continue as chairman of the Trunk Line Association.

J. H. Regal, general baggage agent of the Oregon-Washington Railroad & Navigation Company, has been given jurisdiction over the duties of general baggage agent of the San Francisco & Portland Steamship Company, with headquarters at Portland, Ore.

F. W. Jones, general agent of the Norfolk & Western, with headquarters at Richmond, Va., has been appointed division freight agent with headquarters at Winston-Salem, N. C.,

succeeding F. T. Brinkley who has retired under the pension rules of the company. **D. W. Champlin** has succeeded Mr. Jones as general agent at Richmond. These changes were effective March 19.

### Mechanical

**E. J. Summers**, smoke inspector on the Chicago, Milwaukee & St. Paul, has been promoted to fuel supervisor, with headquarters at Chicago, effective March 15, with jurisdiction over the system.

**M. B. McPartland** has been appointed superintendent of motive power of the Denver & Salt Lake with headquarters at Denver, Colo., succeeding **J. J. Connors**, resigned on account of ill health.

**J. W. Small**, formerly superintendent of motive power of the Seaboard Air Line, has been appointed superintendent of motive power and shops of the Cuba Railroad with headquarters at Camaguey, Cuba, succeeding **M. B. McPartland**, resigned, to accept service with another company. Mr. Small was born on September 24, 1870, at Chatham, Ont., and was educated in the high schools of that city and at the Collegiate Institute. He entered railway service in 1887 as a machinist's apprentice on the Northern Pacific. In 1892 he went to Pocatello, Idaho, as a machinist on the Oregon Short Line. The following year he went to Tacoma, Wash., as a machinist for the Northern Pacific. During the same year he entered the service of the Southern Pacific as a machinist and served subsequently as gang foreman, roundhouse foreman, assistant master mechanic and master mechanic for that company. In 1906 he became superintendent of motive power of the Mexican lines of the Southern Pacific. In 1910 he went to the Kansas City Southern in a similar capacity and the following year became superintendent of motive power for the Missouri Pacific. The same year he went with the Sunset Central Lines (Galveston, Harrisburg & San Antonio, Houston & Texas Central, Morgan's Louisiana & Texas, Texas & New Orleans, etc.) as assistant general manager. In 1913 he was appointed superintendent of motive power of the Seaboard Air Line. During federal control he served first as mechanical assistant to the regional director, Southern region, and later as mechanical staff officer to the regional director of the same region.

J. W. Small

### Purchasing and Stores

**A. Herrera**, formerly purchasing agent of the National Railways of Mexico, with headquarters at Mexico City, has been appointed to his former position. Mr. Herrera was born September 16, 1878, at Mexico City. He was educated at the Merchants' School of that city and entered railway service March 1, 1895, with the Mexican Central. After serving in several minor positions in the stores department he was appointed chief clerk of that department in 1901. In 1903, he was promoted to material accountant and served in that capacity until 1906 when he was appointed fuel agent. In 1909 when the Mexican Central was incorporated into the National Railways of Mexico, Mr. Herrera's duties were extended to include the maintenance of the fuel service of the entire system. In 1910 he was appointed purchasing agent. Mr. Herrera continued in this position until 1915 when, because of the revolution, he retired to private life. With the return of normal conditions he has again resumed the duties of his office.

A. Herrera

### Obituary

**Charles H. Cox**, assistant treasurer of the Ann Arbor, died on March 27, at Toledo, Ohio.

**Thomas M. Orr**, assistant secretary of the Union Pacific, died at his home in Omaha, Neb., on March 19, after an illness of several weeks. He had been with the Union Pacific for over 40 years.

**A. C. Torbert**, secretary and treasurer of the Gulf, Colorado & Santa Fe, was found dead in his berth on a Santa Fe train at Houston, Tex., on the morning of March 24. Mr. Torbert had been in the service of the Gulf, Colorado & Santa Fe for 34 years. He was born at Newtown, Pa., on July 4, 1859, and was educated at Racine College, Racine, Wis. He entered railway service in March, 1882, on the Missouri Pacific at Galveston, Tex. In 1885 he went with the Texas & Pacific, and after being employed for two years in the auditor's office at Dallas, Tex., entered the service of the Gulf, Colorado & Santa Fe at Galveston. He was promoted to cashier and paymaster in July, 1887, and ten years later was made secretary and treasurer, the position which he was holding at the time of his death.

**F. A. Lister**, formerly superintendent on the Galveston, Houston & Henderson, died at his home in Galveston, Tex., on March 23. Mr. Lister was born at Philadelphia, Pa., in 1849. He entered railway service at the age of 14 years as a messenger on the Philadelphia & Reading at Philadelphia. He later became a station clerk and subsequently station agent for this company. At the age of 24 he was appointed superintendent of the Camden & Atlantic (now part of the Pennsylvania). He later saw service on the National Railways of Mexico, the Missouri Pacific at Little Rock, Ark., the St. Louis-Southwestern at Cairo, Ill., and Tyler, Tex., the San Antonio & Aransas Pass at San Antonio and Yoakum, Tex., and the Colorado & Southern at Denver, Colo. In 1897 he went with the Galveston, Houston & Henderson as agent at Galveston and was later promoted to superintendent. He served for a time as acting general manager. In 1912 Mr. Lister met with an accident which resulted in the loss of his right foot, and since that time he had not been in active service.

### Engineering, Maintenance of Way and Signaling

**E. K. Hatten** has been appointed assistant engineer of the Georgia & Florida with headquarters at Augusta, Ga. The office of chief engineer has been abolished.

**G. H. Ballantyne**, resident engineer of the Western Pacific with headquarters at Sacramento, Calif., has been appointed acting chief engineer with headquarters at San Francisco, Calif., succeeding **T. J. Wycke**, who has been granted a leave of absence on account of ill health.

**A. L. Grandy**, assistant general manager of the Pere Marquette, with headquarters at Detroit, Mich., has been appointed chief engineer and the position of assistant general manager has been abolished. **J. Tuttle**, chief engineer, has been appointed assistant chief engineer.

The Table of Contents Will Be Found on Page 5 of the Advertising Section

The extent of the destruction of the railways of France and Belgium during the war and the rapidity with which they are being restored, and even considerably improved in many instances, is known only in a vague way in this country. The details of the reconstruction program, the peculiar difficulties

which have been met with and overcome, the general physical condition of the properties where the reconstruction is complete and the plans for future improvements are matters which are worthy of the interest of any one who is able to appreciate the successful solution of extraordinary railway problems. That the details of this work are not more generally known is due to the fact that the men who have it in charge have been, and are, so occupied with it that little opportunity has been given them to tell of their achievements even to the people of their own countries. In view of this the series of articles on railway reconstruction in France and Belgium, the first of which appears elsewhere in this issue, which Oliver F. Allen has prepared for the *Railway Age*, is especially timely. The first article deals with the extent of the destruction of the French railways and some of the work done in connection with the restoration of service on lines which had been destroyed in whole or in part. Subsequent articles will describe the work done in connection with the rebuilding of bridges and tunnels, the restoration and improvement of stations and terminals and the reconstruction work in Belgium. A knowledge of the problems which have been solved in France and Belgium may by comparison tend to make the difficulties of our own railways seem less serious.

There is a truism to the effect that exports follow investments. It follows naturally that no one earnestly working for the well-being of our export trade can afford to overlook a consideration of the feasibility of heavier American investments in foreign projects. Perhaps the greatest field for American investments in foreign countries is in railways. Such investments bring orders not only to manufacturers of railway equipment in this country but indirectly to exporters of almost every commodity. Moreover, our railway exports are each year assuming a more important place in the totals of our foreign trade. The exports of steam locomotives alone in 1920 were valued at \$53,629,847. Other items on the list bring the total value of the exports of all railway supplies to well over \$140,000,000 for the year. This figure compares favorably with the exports of many standard commodities. The foreign market for railway supplies, moreover, has great possibilities for further development, contingent to some extent upon increased investments in foreign railways. The failure to include in the program of the National Foreign Trade Convention, to be held in Cleveland from May 4 to 7, any recognition of either of these important subjects, as such, constitutes an omission which is difficult to understand. Other industries and other phases of the situation have a place on the program. The use of long term credits to increase our foreign sales is to be discussed thoroughly. The

problems of the exporters of lumber, of textiles, of agricultural products, of motion picture films—all these will be subjects for addresses by experts in each field. In addition the convention will take up the question of inland waterways to the exclusion of the American railways which now haul and probably always will haul by far the greater part of export shipments within the United States. The railway man or the supply manufacturer will, of course, find much of value, in a general way, at the convention. The financial aspect of exporting goods, advertising our products abroad and governmental assistance will be gone into fully and anyone interested in foreign trade can profit by attending. Nevertheless, the failure of an important convention of this kind to give attention to railway investments abroad or to railway transportation at home appears to be a rather serious omission.

The car manufacturers, even with production slowed down somewhat, are rapidly decreasing the number of orders on hand and undelivered, according to the monthly statement of the Railway Car Manufacturers' Association, published in full elsewhere in this issue. The February production of freight cars for domestic service, of the 25 builders reporting, was 6,276 and the freight cars for domestic service under order and undelivered at the end of the month amounted to 26,685. In January the production was 7,008 and the number on order and undelivered was 32,008. The production in December was greater than in January and the uncompleted orders totaled 35,268. The February report shows a decrease in the delivery of freight cars to foreign purchasers but somewhat of an increase in the unfilled orders. The February deliveries of passenger cars were greater than in January but the undelivered orders showed a decline. At the current production the car manufacturers have enough unfilled orders on hand to keep them busy through the month of June. By that time it is to be hoped that a revival of business and a return of buying power to the railroads will act to prevent a shutdown in the industry.

"Moral hazard" is a term used by fire insurance men to denote the risk due to possible negligence or misconduct on the part of policyholders; and it is said to be a subject of frequent discussion at the present time because of the widespread fall in commodity prices. When stocks of goods are shrinking rapidly in value the dishonest owner who would set them afire, for the purpose of selling them to the insurance company, is under a specially strong temptation. Arson fires decreased greatly between 1916 and 1919, but in 1920 they again became numerous. The moral hazard is one of which railroad officers have to take cognizance; and not alone in connection with merchandise. W. F. Hickey, president of the Railway Fire Protection Association, calls attention to the special hazard of large numbers of empty box cars now standing on lonely side tracks. This hazard is due to the dull times,

though not to any specific dishonesty. It is simply that the careless or thieving tramp has more frequent temptation to indulge in some form of devilry. The claim department feels a moral hazard, but it is not connected with fire. H. M. Moors, freight claim agent of the Southern Pacific, in a recent address, called attention to the fact that consignees are refusing valuable shipments of freight nowadays on very flimsy pretexts, the real reason being that the goods are falling in value, and every possible trick is being tried to avoid bearing the loss. The duty of the reasonable consignee is, of course, to accept damaged goods and to assist the carrier, as far as practicable, in saving as much as possible. Under present conditions the duty of the station agent and the freight conductor is to make extra efforts to deliver goods in perfect condition and without delay, leaving no valid excuse for refusal to receive.

## Rate Making Under the Transportation Act

SHIPPER WHO HAVE been complaining of the rule of the Transportation Act which requires the Interstate Commerce Commission to try to make rates which will produce "as nearly as may be" a 5½ or 6 per cent return, and which is still frequently referred to as a guaranty although it has never yet in any month produced anywhere near a 6 per cent return, may soon come to find that the rule in the long run is calculated to reduce freight rates just as surely as it has advanced them. Under the operation of the law and an advance of 33 1/3 per cent in rates the railroads in December and January did not earn 6 per cent, or 1 per cent even, on the value which Mr. Plumb or Mr. La Follette would put upon them.

Yet on March 16 the traffic officers of the transcontinental railroads agreed to a considerable reduction in rates on lumber from the Northwest to Omaha, lower river crossings and Chicago, and on March 17 the traffic officers of the western railroads agreed to a 35 per cent reduction in the livestock rates on stockers and feeders from the ranges in the Southwest. The reduction in lumber rates was merely an equalization of the rates via Omaha with those by way of St. Paul rather than a general reduction, but it was done in order to promote the movement of some traffic that was not moving at the former rates. The reduction in cattle rates represented an emergency proposition but it was agreed to by the railroads in part because they believed they could make more money from lower rates than from higher rates and undoubtedly further reductions will be made in particular rates which can be shown to be too high.

If a shipper can prove that his present rate is too high to move business and that the railroads could make more money by reducing the rate he would much better spend his time in laying the facts before the railroads or the commission than in protesting against the injustice of a 6 per cent rule. The rate-making rule of the law was intended to direct the commission to try to let the railroads earn sufficient revenue. It was not intended to produce paper rates that would not earn revenue. If the lower rate will result in more net revenue it is more in accordance with the mandate of the Transportation Act than a higher rate.

After a while more people will appreciate that the old rule of making rates "what the traffic will bear" meant that rates should not be too high as well as it meant that they should not be too low. But there is no rule that will justify a general reduction in rates without regard to the cost of operation merely because lower rates would let the shippers do more business at the expense of the railroads or even at the expense of the taxpayers.

## The National Railway Service

THE NEW PLAN proposed by S. Davies Warfield, president of the National Association of Owners of Railroad Securities, has now been before the public long enough to permit an observer to see what kind of a reaction the offering of the plan has made upon the public mind or, more particularly, in railroad and financial circles. The plan was presented to Senator Cummins, chairman of the Senate Committee on Interstate Commerce, on March 21. It was given to the press about the same time; an abstract of it appeared in the *Railway Age* of March 25, page 793. It will be remembered that the plan provides for a so-called National Railway Service. At the head is a service division composed of five members of the Interstate Commerce Commission. This division is to have supervision and initiatory and regulatory powers exercised through a National Railway Service Board composed of 40 members, subdivided into two divisions—one, finance and administrative of 20 members; the other, railroad officers, also of 20 members. This board is to have a chairman, vice chairman, etc., and an executive committee of 11 members. There are also to be organized four railway group boards, each covering one of the rate groups recently established by the Interstate Commerce Commission in the rate case. Each board is to consist of seven members, five selected by the railroads in the group, and two from the shippers. The 20 officers in the four groups make up the railway officers division of the National Railway Service Board. Further than this, each group is also to have ten committees of five members each. The ten committees of each respective group will cover different phases of railway operation; they will each report to the group board. Another clause of the plan provides for the extension of the scheme embodied in the present National Railway Service Corporation, giving the National Railway Service power to buy equipment to be leased to the carriers.

There is evidently much room for discussion as to the good or bad points of the plan. The interesting and pertinent fact is, however, that the discussion of the plan has not been along these lines at all, but rather as to the advisability and propriety of introducing and agitating a plan such as this at this time. The general impression suggested by the critics is that there are enough uncertainties in the railway situation just at this moment not to make it advisable to bring in also the discussion of these new suggestions and the many complications attendant thereto.

It is rather difficult, it will have to be admitted, to criticize a plan that has been proposed by a recognized authority like Mr. Warfield and which apparently has the approval of such leaders in the investment world as Haley Fiske, president of the Metropolitan Life Insurance Company; Darwin P. Kingsley, president of the New York Life Insurance Company, and John J. Pulleyn, president of the Emigrant Industrial Savings Bank and also of the Savings Bank Association of New York, and others of similar standing. Nevertheless, we must agree with those who submit, despite this weight of authority, that the introduction of the plan at this time is not likely to prove of as much assistance in the present railway situation as might be wished.

The Congress of the United States has but recently put on the statute books the Transportation Act of 1920. This act has been termed the most constructive piece of legislation since the passage of the Federal Reserve Act. The Transportation Act, it is true, has not done all that it was expected to do. Particularly, it has not resulted in the railroads earning the net income which is going to be necessary if the carriers are to have their proper growth and efficiency or, in fact, much of any net income. Nevertheless, the Transportation Act cannot be said to have failed. By means of its provisions, the railroads were enabled to handle in 1920 their peak load. They are not handling their peak load

now. That they are not earning sufficient net income can hardly be said to result from faults in the Transportation Act. The difficulty at present is due to the falling off in business, to the high wage scales and to the conditions of employment embodied in the national agreements with the shop and other crafts. The wage question is a most serious one. Now that President Harding has realized that fact and has taken steps to seek a solution of it, we can, no doubt, soon expect some sort of correction.

Using one of Mr. Harding's own words, what the railroads need and what the country desires is a return to "normalcy" in railroading. In view of the many omissions and commissions that took place in the 26 months of federal control, it is evident that the return to normalcy is not going to be easy. It will help most measurably, it would seem, to give the carriers a chance to operate for a period "on their own" and as provided by the Transportation Act. It does not appear that we should change the entire scheme of the act because one agency created by it, the Railroad Labor Board, has permitted a too long drawn-out discussion of an important question. That particular problem can be remedied in a simpler way, and President Harding has already taken steps to that end. The complicated plan proposed by Mr. Warfield as an amendment to the Transportation Act is not a necessary part of a program of solution to the railway problem. The rather radical changes proposed in the plan and, more particularly, its introduction to the country's attention at this time, only befog and complicate an issue that already seems to be nearing its solution.

## Exhibits at the Mechanical Conventions

WHILE THE REASON given by the Railway Supply Manufacturers' Association for abandoning the exhibition in connection with this year's convention of the Mechanical Division of the American Railway Association is thoroughly good, nevertheless, expressions of regret by both supply men and railway men are numerous. For some years the membership of the Railway Supply Manufacturers' Association has included some who do not believe that any good can come from exhibiting. In most instances they are manufacturers of what might be termed staple articles—devices which have undergone little or no change in design or workmanship for some years past. Even they are wrong in their attitude because they overlook the important fact that men come and go in railway service just as they do in every other walk of life; that where new generations are taking the place of the old they must be educated. Failure to educate means loss of business, sooner or later, to even an old established maker of a specialty; and while "old line companies" might feel that they are not warranted in spending money to show their wares to railway officers and many of their subordinates from all parts of the country, nevertheless it is a distinct loss to both buyer and seller when that opportunity is denied those who have something new to show and which cannot be carried around in a sample case.

Again, makers of appliances which mean increased economy and efficiency in railway operation sometimes complain that their devices fail because they are either not handled properly or else are not rightly understood; while on the other hand there are railway officers who are reluctant to apply more specialties to existing equipment because what they already have are not being properly used or maintained, sometimes through lack of facilities but as often through lack of knowledge. Here, too, there is a real loss to all concerned that they must forego a splendid chance to get together under ideal conditions.

As we have repeatedly said, and as railway officers themselves fully realize, there never was a time when it was more

necessary for them to get together to discuss their common problems than now; and this applies with equal emphasis to composite gatherings of railway men and supply men, of which meetings combined with practical demonstrations in the form of working exhibits, such as have been held at Atlantic City in June for a number of years, are ideal.

It seems unfortunate that in cancelling this year's exhibit it appeared necessary to the supply manufacturers to go to the drastic limit of deciding not to have any of their representatives at the convention. This action will prove costly to many concerns because it will deprive their representatives of the opportunity to talk business within a few days with a large number of railway officers and thereby make it necessary for them to incur the expense of traveling many thousands of miles and spending many months in seeing railway officers whom they could have seen in a short time while attending the convention. However, since the supply concerns have been asked by their own association not to send representatives to the convention, all of them, in justice to each other, should in good faith comply with the request.

## A Strange Hallucination About Railway Rates

ONE OF THE MOST extraordinary hallucinations regarding a business matter ever known is that of people who argue that the railways would fare better under present conditions if they would make general reductions in their rates. They reason that the high rates have stopped the movement of a large amount of freight, and that the railways would make more money if they would reduce the rates and thereby revive the traffic.

There is the strongest reason for believing that the tremendous reduction of traffic has been due almost entirely to general business conditions, and would have come if there had been no advances in rates. If this is true, a reduction of rates to the old basis would not be followed by a revival of traffic unless the general business conditions that caused it to decline were removed.

Suppose, however, that a restoration of the old rates would immediately restore the old traffic. Where would this leave the railways? We can answer this question with the greatest accuracy, because we know exactly the position they were in before the rates were advanced.

In February, 1920, the last month of government control, the railways moved the largest traffic ever handled in that month. The old rates were in effect, and they earned \$270,000 a day less than the amount required to pay their operating expenses and taxes. With the government guarantees added, they incurred a deficit of \$1,930,000 a day.

Effective May 1, the Railroad Labor Board awarded advances in wages averaging \$2,100,000 a day. In the four months from May 1 to September 1, the railways handled the largest traffic they ever did—a traffic that taxed their facilities to their capacity—and in these months, with the advanced wages and the old rates in effect, they earned \$1,444,000 a day less than enough barely to pay their operating expenses and taxes. With the government guarantees added, their deficit during the last four months before the rates were advanced was over \$4,000,000 a day, or at the rate of about \$1,500,000,000 a year.

It is obvious, therefore, that to restore the old rates, even if this did restore the old traffic, would be to restore the old deficit of over \$4,000,000 a day, and throw every railroad in the country into the bankruptcy courts. Since the rates were advanced the traffic has greatly declined, but in spite of an unprecedented decline of traffic the railways in the first five months the present rates were in effect did earn their operating expenses and taxes, which they were not doing

before, and in addition a net return averaging 2.85 per cent. This is much less than 6 per cent, and as the traffic has declined the return earned also has declined; but bad as it is, it is much better than failing by \$1,444,000 even to earn operating expenses and taxes.

The *Railway Age* agrees with those who contend that rates should soon be reduced. But from the standpoint of the welfare of the railways, of travelers and shippers and of the public, it is hardly less than insane even to suggest that any general reduction of rates shall be made until relatively much larger reductions shall previously have been made in operating expenses, and especially in the payroll.

The present financial troubles of the railways are due quite as much to an excessive payroll caused by unreasonable rules and working conditions and excessive wages as they are to the decline of traffic; and anybody who seriously suggests general reductions of rates without previous reduction of the railroad payroll is either hopelessly ignorant of the facts about the present railway situation or is an entirely fit subject for a lunatic asylum.

## Norfolk & Western

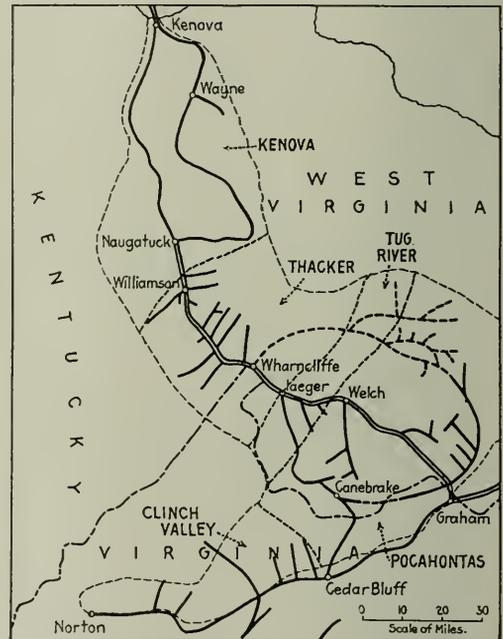

PERUSAL OF THE ANNUAL REPORT of the Norfolk & Western for 1920 indicates that this carrier did not have in like degree that great expansion in business and in gross earnings, as compared with 1919, which characterized its immediate neighbors, the Chesapeake & Ohio and the Virginian. The latter two roads were enabled to expand their net railway operating income measurably as between the two years despite great increases in expenses. On the Norfolk & Western the net railway operating income was considerably less in 1920 than in 1919. Increases of 80.83 per cent in costs of fuel, of 31.53 per cent in payrolls and of 6.10 per cent in costs of materials and supplies prevented the Norfolk & Western from realizing the advantages of increases of 7.22 per cent in tons of revenue freight carried, of 10.33 per cent in revenue ton-miles, or of 15.57 per cent in total transportation revenues.

It has become something of a fad in financial circles of late to compare the operations of the Norfolk & Western with the Chesapeake & Ohio, rather to the advantage of the latter. The comparison cannot be discussed at great length in this review, because the 1920 report of the Chesapeake & Ohio is not yet available to permit of an analysis of the detailed operating figures for that property. As far as gross and net earnings are concerned, it is apparent that the Norfolk & Western did not do nearly as well in 1920 as the Chesapeake & Ohio or the Virginian, although it did come through rather better than most of the other roads of the country.

All of these three roads are coal roads in adjacent territory. The bituminous coal tonnage of the Norfolk & Western constitutes about 64 per cent of the total tonnage. On the Chesapeake & Ohio, it constitutes about 68 per cent, and on the Virginian almost 90 per cent. One of the striking features of the coal business in 1920 was export coal, which trade reached its peak about October, but fell off considerably after that month. The three roads have coal-dumping facilities of the most modern type at Hampton Roads, the Chesapeake & Ohio at Newport News, the Norfolk & Western at Lamberts Point and the Virginian at Pinter's Point. The Chesapeake & Ohio was able to make a special "killing" in export trade in coal. In October it dumped at Newport News nearly 800,000 tons of coal, of which 60 per cent was for export. Its special advantage in export coal has been due to its having on its lines a coal specially desirable for export trade, in addition to which of late there has been a great expansion in the fields containing this coal. The Norfolk & Western apparently did not find itself in 1920 in as good a strategic position.

The total tons of bituminous coal moved by the Norfolk

& Western in 1920 were 26,035,500, or 63.99 per cent of the total tonnage. This total was in excess of the coal tonnage moved in 1919, when 24,265,803 tons were moved, but below the totals for 1916, 1917 or 1918. The number of tons moved in 1916 was 30,653,755. The coal carried on the Norfolk & Western originates from five fields—the Pocahontas, Clinch Valley, Tug River, Thacker and Kenova. As will be seen from the map, these fields adjoin one another and are in a fairly compact area adjacent to the point where Virginia, West Virginia and Kentucky join one another. Four of the five fields are on the main line; the fifth, the Clinch Valley, is on a branch. The movement from these five fields is in both directions, the Norfolk & Western being

The Coal Fields on the Norfolk & Western

especially well equipped to handle coal either at tidewater or to the north and west, or the lakes, where it has the advantage of favorable traffic relationships with the Pennsylvania system, which, it will be remembered, has a minority stock interest in the Norfolk & Western. The company is at present extending its lines in the coal fields. It began the construction on June 1, 1920, of the Lenore branch from Lenore, W. Va., to the properties of the United Thacker Coal Company in Mingo County, W. Va., consisting of some 26,000 acres of coal lands. The branch will be completed in August, 1921, but it is expected that coal shipments will commence in June or July.

The freight revenues of the Norfolk & Western in 1920 were \$73,918,301, as compared with \$62,681,028 in 1919, an increase of 17.93 per cent. The gross revenues were \$87,280,579, an increase of 15.57 per cent. Operating expenses in 1920 were \$84,943,837, as compared with \$64,021,285 in 1919, an increase of 32.62 per cent. The net railway operating income for 1920, however, was \$2,839,759 as compared with \$10,363,404 in 1919, a decrease of something like 70 per cent. The operating ratio in 1920 was 95.99 per cent; in 1919 it was 83.22 per cent, and in 1916, before federal control, it was 56.36 per cent. In comparison with these figures, the Chesapeake & Ohio in 1920 had

freight revenues of \$72,433,293, as compared with \$53,073,001 in 1919, an increase in the neighborhood of 28 per cent. The gross earnings in 1920 were \$90,190,745 as compared with \$71,475,015. It will be noted that, whereas in 1919 the gross revenues of the Norfolk & Western were about \$5,500,000 in excess of those of the Chesapeake & Ohio, in 1920 this position was reversed; the gross revenues of the C. & O. were nearly \$3,000,000 greater than those of the N. & W. The net railway operating income of the Chesapeake & Ohio in 1920 was \$11,357,968 as compared with \$7,463,955 in 1919. The operating ratio in 1920 was 86.27 per cent.

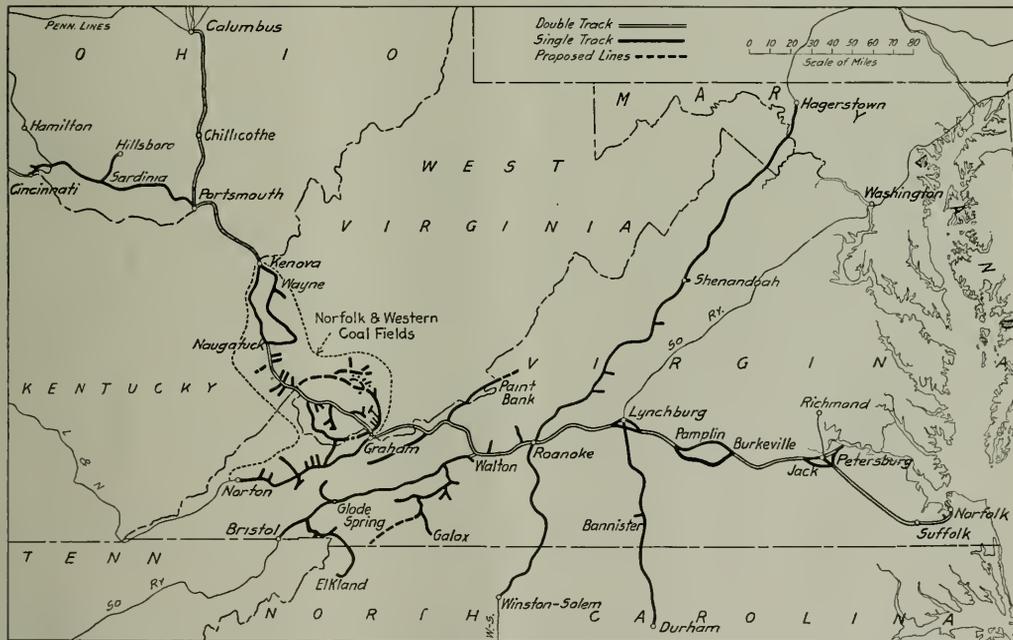

On the Virginian, the freight revenues in 1920, amounting to \$15,721,328, compared with \$10,268,428 in 1919, an increase of over one-half. The net railway operating income in 1920 was \$4,944,243 as compared with \$2,541,112 in 1919, an increase in this case of nearly double. The operating ratio in 1920 was 70.39 per cent.

The Norfolk & Western is a rather remarkable road in many ways. First of all, it is conservatively financed. In

that the company has under way as to new engine terminal facilities indicate a realization of the importance of this feature of railroad operation, such as few roads of the country can be credited with.

The Norfolk & Western, being a bituminous coal road with a large movement of that commodity to tidewater, has been enabled, like the Virginian and the Chesapeake & Ohio, to take advantage of the special opportunity presented for the use of heavy locomotives and large capacity cars. The figures for average trainload, etc., show a progressive increase over the last several years about as follows: The average revenue trainload on the Norfolk & Western in 1920 was 1,107 tons; in 1919, the average load was 1,106 tons; in 1916, 980 tons. The revenue load per freight engine-mile in 1920 was 835 tons; in 1919, 829 tons; and in 1916, 698 tons. The average revenue load per loaded car in 1920 was 40 tons; in 1919, 37; in 1916, 34 tons. The car-miles-per-car-day in 1920 averaged 34.3, and the net ton-miles per car per day 909; in 1919, the latter figure was 715.

The road had in service at the end of 1919, 1,027 loco-

The Norfolk & Western

the general balance sheet as of December 31, 1920, the investment in road is shown as \$229,129,714 and in equipment as \$83,662,149, a total of \$312,791,863. The stock outstanding consists of \$22,992,300 4 per cent preferred stock and \$121,481,100 common stock, on which 7 per cent dividends are paid. The total long-term debt consists only of \$114,241,050. The total corporate surplus as of December 31, 1920, was \$75,757,773. The railroad itself has a finished and well-kept appearance. The roadbed is of high standard and well maintained. As compared with its two neighbors, however, the Norfolk & Western is handicapped by heavy grades. Its main line is double-tracked from Lamberts Point and Norfolk through to the end of the line at Columbus, Ohio.

The distinguishing feature about the Norfolk & Western, however, is its motive power and equipment and the facilities for taking care of them. The engine terminals and the work

tives of a total tractive effort of 47,980,582. During 1920 it increased this number to 1,075, with a total tractive effort of 53,632,130, an increase in tractive effort of 11.78 per cent. The increase in tractive effort of steam freight locomotives as between the two years was 13.11 per cent. One of the features of operation on the Norfolk & Western is the use of 100-ton flat-bottom gondola cars, moved in solid trains to tidewater. In this respect the Norfolk & Western is not quite up to the Virginian, which has already received its first 120-ton cars; it is ahead of the Chesapeake & Ohio, which uses 70-ton hopper cars, and which will, however, soon receive some 100-ton gondolas. The Norfolk & Western has authorized the construction of 500 additional 100-ton cars and also of 1,000 of the 120-ton cars.

Much might be made of the improvements the Norfolk & Western is making in its engine terminals at the present time, and of those contemplated for the near future. Inas-

much as these things will be described in detail in an article in an early issue of the *Railway Age*, it will suffice here to point out merely some of the leading features of this work. At Roanoke the company has plans for two new 40-stall roundhouses, each with 115-ft. turntables. One of the houses is to be 115 ft. deep and is now nearing completion. The other, which is to be 130 ft. deep, is a later development. The building of these houses will require considerable change in the yard layout at Roanoke, thereby increasing the yard's capacity. At Roanoke, also, the company has installed a 1,200-ton coaling plant of the most modern type. Another interesting development is the project, now completed, of a 2,000,000-gal. water storage and a water treating plant, with a capacity of 100,000 gal. an hour, which will be the largest single-unit water softening plant in railroad service. At Bristol, the terminus of the Radford division, a new 16-stall roundhouse has been completed, 115 ft. in depth, and with a 115 ft. table, and similarly at Shenandoah, on the Shenandoah division, a 12-stall house of the same depth.

These engine terminals are only a part of a much larger plan of improvement for the Norfolk & Western. To handle the 120-ton cars there will be a new car-dumper at Lambert's Point; in connection with this improvement, piers 2 and 3 are to be electrified. It is expected that the entire program at this point will increase the capacity of these piers about one-half. At Lambert's Point also, a trimming machine for handling coal cargoes is planned. This machine is expected to save two-thirds of the labor at present required to trim a cargo; if it proves successful, five more will be installed. In addition to the new engine terminal at Bristol, mentioned above, new yard facilities also are planned; it is expected that the improvements at this point will enable the road to double its business through Bristol, at which point connection is made with the Southern Railway. Another interesting development of the many planned is a new tie-treating plant nearing completion at East Radford, Va., with a capacity of 1,000,000 ties yearly. Mention has already been made of the new Lenore branch. The total program for new construction on the road calls for the expenditure of about \$18,000,000. In 1920 the total additions and betterments to roadway and structures aggregated \$5,179,744 and to equipment \$7,624,665.

The total freight revenue of the Norfolk & Western in 1920 was \$73,918,301 as compared with \$62,681,028 in 1919. The total tons carried were 40,685,743 as compared with 37,944,615 in 1919. The revenue ton-mileage in 1920, totaling 11,063,033,480, represented an increase of 10.33 per cent over 1919. The average revenue per ton-mile in 1920 was 0.668 cents; in 1919 0.625 cents. The average haul in 1920 was 272 miles; in 1919, 264 miles.

The passenger revenues in 1920 totaled \$10,374,129 as compared with \$10,824,463 in 1919. The total number of revenue passengers carried was 7,376,109, the average revenue per passenger per mile was 2.996 cents, and the average journey 47 miles. The following table shows the earnings of the Norfolk & Western in 1920, as compared with 1919:

	1920	1919
Mileage operated .....	2,200	2,088
Freight revenue .....	73,918,301	62,681,028
Passenger revenue .....	10,374,129	10,824,463
Total operating revenue .....	85,459,356	76,925,599
Maintenance of way expenses .....	12,811,527	10,660,872
Maintenance of equipment .....	29,703,859	23,089,901
Traffic expenses .....	771,210	445,585
Transportation expenses .....	39,538,089	28,323,932
General expenses .....	1,895,550	1,274,624
Total operating expenses .....	84,943,837	64,021,285
Net from railway operations .....	3,545,519	12,904,314

The corporate income account is as follows:

	1920	1919
Compensation, January and February less war taxes .....	3,411,787	3,142,630
Guaranty, March 1 to August 31, less war taxes .....	10,405,436	9,427,889
Net railway operating income, September 1 to December 31 .....	3,238,122	6,282,763
Total .....	17,055,345	18,853,281
Gross income .....	17,936,740	19,972,726
Net income .....	12,496,788	14,513,779
Preferred dividends (4 per cent.) .....	919,692	919,692
Common dividends (7 per cent.) .....	8,503,989	8,459,373

## Letters to the Editor

### Problem of the Train-Order Signal

PHILADELPHIA.

TO THE EDITOR:

A "survey" to determine how many deceptive signals are in use is suggested in your editorial of March 25, page 775. In this connection you speculate on whether we shall ever know to what extent the Porter collision was due to the presence of the train-order signal near the crossing. A survey surely is a good thing, if you do not know already; but can it be that any responsible railroad officer, who is half awake, is ignorant concerning this feature of his plant? And, for that matter, who can believe that Engineman Long was really deceived by that signal? He did not see the hand-lantern motions of the two brakemen on the track, although the brakemen, and the government inspector, say that he could have seen them if he had looked.

And is any competent officer ignorant of the simple remedy for this supposed difficulty; the simple expedient of putting one of the two confusing signals fifteen or twenty feet higher than the other? Even if enginemen persist in the careless habit of depending on what they see a mile away, a sufficient difference in height will deprive them of all reasonable excuse. An engineman who is satisfied to see one light where he knows that he ought to see two is—well, are there any such on our fast trains?

Why do we perpetuate the farce of the train-order signal? An electric connection to the interlocked or the automatic semaphore would enable the operator to stop trains with equal facility, and at a saving of expense. That signalman at Porter had no train-order signal for the Lake Shore trains; why couldn't he also stop Michigan Central trains with a flag?

I am not connected with the "P. R. R.," but I am interested in the safety of American railroad signals, for I am speaking in behalf of the 8,720,159 men, women and children who make up the commonwealth of

PENNSYLVANIA.

### Plain Talk About the Seniority Rule

VIRGINIA.

TO THE EDITOR:

I have read much recently with reference to "national agreements" and the closed shop. I am not a member of any organization affiliated with the American Federation of Labor. I believe in the principles of organized labor to a certain extent, but not enough to forsake a principle for some of its aims.

I do not believe in any body of men, any salaried chairman, or others dictating to me when, how, why, where and how much work I may do for a man, corporation or others, and under what terms I may work. I feel that I am capable of deciding these questions myself. If I sell my services to a corporation with an understanding as to the nature of my work, hours and compensation, if at any time conditions are not satisfactory I do not have to continue in their service. I am employed as a clerk, having been in continuous service for five years, deducting 19 months in the service on this side and "over there." I received a furlough to enter the service. I returned and was discharged on June 5, 1919, and on the same day applied for my regular position. The general chairman, local chairman or others in the union notified the superintendent that I quit when I entered the

service. After five months of loafing I finally was restored to service with full seniority rights. This after having taken my case up with the war department, which in turn handled it with the department of labor. Naturally my impression and opinion of the clerks' organization did not change after such treatment. Immediately after going to work these same clerks sent and brought applications for membership in their organization to me daily. Some of the other organizations, even more radical than the clerks (?), threatened my dismissal as soon as they could put the closed shop into an "agreement." This did not happen in Russia. It happened in Virginia, the state of culture, refinement, hospitality, etc.

Recently during the reduction of forces and on account of "the national agreement" I have been on the move almost continuously owing to the interpretations of certain articles in an agreement, which the officials personally told me were unfair. Any fair-minded person could easily see that the interpretation of the article was made just to apply to my case because of the fact that I refused to join an organization whose general chairman made the statement that it was unfortunate we were in France and could not have the benefit of the promotions made during our absence.

I want to work and I want advancement. I have letters showing that my work has been exceptionally good, some that say even more. I have had the superintendent and other officials compliment my work highly and tell me personally that they wanted to keep me in the service. All of which sounds good to me, but how can I advance when promotions are made according to seniority? I am just like a little log floating down stream behind a lot of dead wood. I can't get by, but must follow. There is no possibility of another epidemic of "flu," fever or other dread disease removing any of those that rank ahead of me on the seniority list. Most of them are too slow and lazy to die a quick or sudden death. They will linger until Gabriel blows first call, and then delay traffic through the golden gates by being late. If they go to hell they will put the fire out because the devil works 24 hours a day without additional compensation. A grievance committee will certainly call upon him and demand an eight-hour day and time and a half for extra work. That will put hell on the bunk.

What is the use of a man giving a corporation his best services and proving to them beyond a doubt that he is an exceptionally good man? What is the use in my work being done a little better than the other fellow's? Promotions must be decided according to a seniority list. I'll get mine when a lot of dead wood drifts through the pearly gates, after I am so old that I am half dust and the other half man. None of the men ahead of me even catch a bad cold. Their physical beings will last long after Gibraltar has been made a sand pit. When opportunity comes around it hangs around the top of a list of dead ones and by the time that he reaches my door his knock will be so soft that I will not hear it. In fact I will be listening for the last bugle call. Perhaps I will have an opportunity in years to come—about the same chance I have of receiving some of the mail sent to me overseas while Mr. Burleson was postmaster-general.

Recently I was employed by the railroad as checker. I hold and have held all kinds of positions. The national agreement has made me what I term "an orphan clerk." My shift was from four in the afternoon until twelve midnight. Under the agreement the yardmaster could not send me to the west yard after 11:30 p. m., because I could not get back by relieving time. A time freight was reported in at 11:25 p. m. The yardmaster is allowed a certain time to have the train shifted and get it out of the yard. Seeing that the yardmaster was deeply concerned over a certain delay of not less than an hour to the train I told him that I would go and get the seals, check the train and assist him in any way to get it out on time. He explained to me that he could not allow overtime if I was required to stay in the yard after

midnight and under the agreement he could not ask me to even go at all.

I picked up my lantern, went to the yard, checked and listed the train and returned to the office a few minutes after twelve. The train left the yard on time. As soon as I walked into the office they met me. They? Oh, the grievance committee, I believe they call themselves. I had violated the agreement, worked ten minutes without extra compensation. To listen to their side of the case it was something like a charge of murder, rape or highway robbery.

Well, I just felt myself swell like a mountain stream after a heavy rain. Soon I overflowed my banks and with a mighty rush of "Daniel Webster's Bull" I proceeded to bawl them and hand out a few compliments. They showed about as much fight as a Hun in close-quarter physical exercise with a Yankee doughboy and a bayonet. They wanted to fight all right. They would have fought anything to get out of the way. The yardmaster almost gave me a French kiss for getting the time cars out of the yard and afterwards proved his appreciation by favoring me in many ways.

I give you this as one of the necessary evils in connection with agreements. I could wear out this No. 6 machine writing of similar cases that I actually witnessed.

The national agreement sent me here. The superintendent wanted me elsewhere. But down here and especially around this community the chief topic of conversation is "agreements," "pulls" and other nice things concerning them. Dailies are ignored and lay on the front porches until the print fades. The brotherhood this and that has taken the place of them. Read some of them. Poor, abused, crushed workman. You see him pictured in torn overalls, torn and dilapidated hat, big toe peeping out the corner of a rundown, run over \$1.98 dog cover. Pitiful sight as he looks into his dinner pail, takes out a piece of corn bread for his daily portion. Too sad!

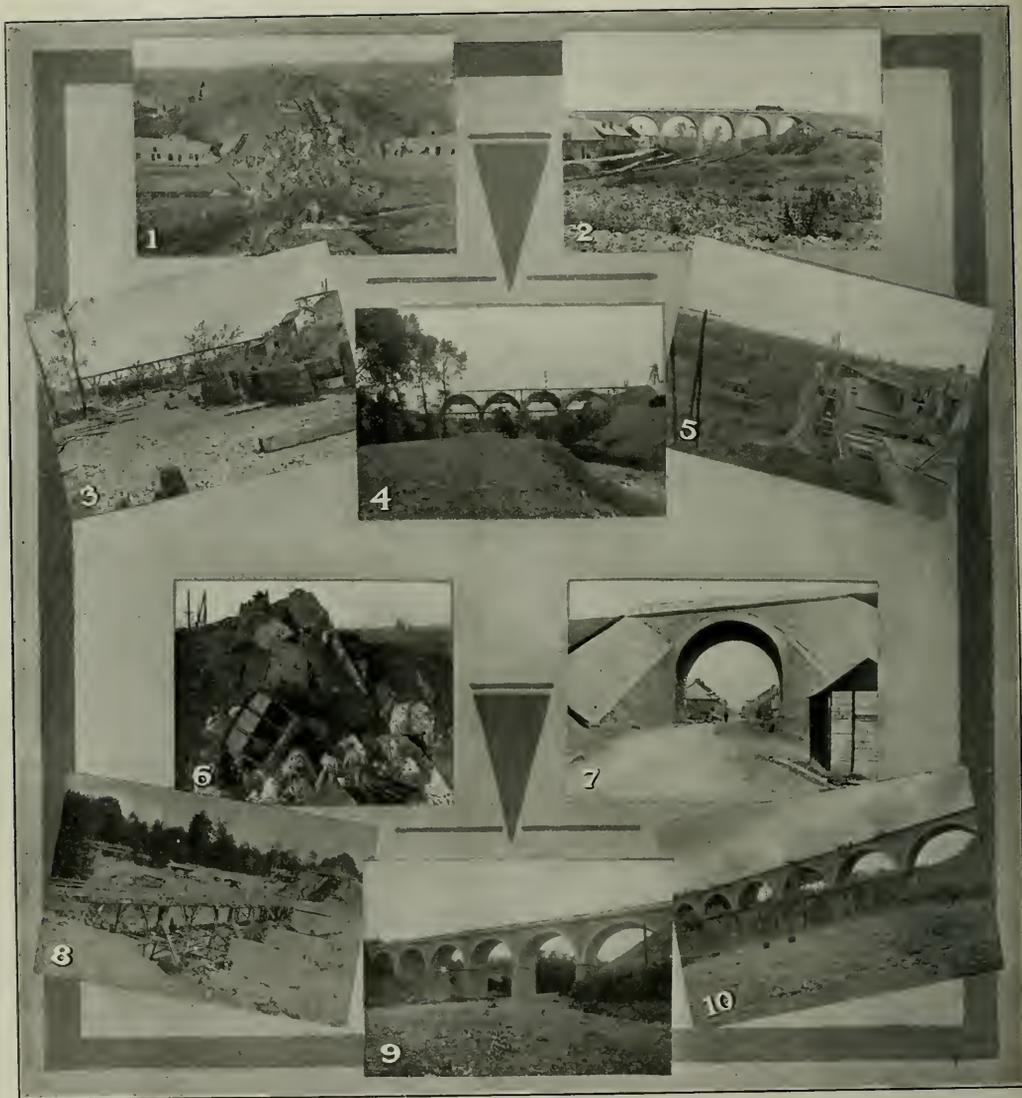

In my home town it is a little different. I see him going to work dressed in silk shirt, \$15 shoes, \$10 hat and the latest model suit. He stops at the Y. M. C. A. to change. After the change he proceeds to step the distance between the "Y" and the shop as though he were going to the electric chair. He could get there a minute or two ahead of time but he is afraid of the Grievance Committee. For dinner he has a king's spread or maybe he will crank a Ford and ride over town to get a hot meal at the hotel. He may hate cold food.

While on duty if the chairman of the Grievance Committee happens to see him working hard (they have a cemetery there to bury those that work themselves to death) he cautions (?) him without the aid of profanity. Believe me, efficiency has been buried so deep that it would require the strength of the former A. E. F. a short lifetime to extricate it from the débris.

I believe that some parts of an agreement are good. Mutual helpfulness and that sort of thing. But erase that part or article that makes promotion according to seniority. Let the man who has a desire to press forward have the right of way. Agreements that base promotion according to seniority cause a good man to apply the brakes, slow down and generally become unfit for promotion. Agreements have the same effect upon the speed of a good man as a hill does to a stream. If it doesn't stop him it certainly holds him up.

When corporations or others are allowed the privilege of selecting their men according to ability and qualifications, and not according to seniority, there will be an increase in efficiency that will shock the world. Don't force promotion on a man because he is senior. When the day comes that will find everyone working for advancement because he really deserves it, or because so and so is working for recognition and he must compete with him for promotion, we will show a long line running upward on the may of efficiency. Until then, hats off to Messrs. Lenine and Trotzky.

IMAN ORPHAN CLERK.

### Views of Typical Railway Reconstruction in France

Figs. 1 to 5. LeGland Viaduct, on the Line from Valenciennes to Hirson. (1) War Destruction. (2) The Finished Structure in September, 1919. (3) Reconstruction Started by Light Temporary Framework. (4) Piers Completed and the Forms in Place for the First Ring of the Arches, That on the Arch at the Right Having Already Been Poured. This Viaduct Has Five Semi-circular Arches of About 54 ft. Span. (5) A Closer View of the Arch at the Right of Fig. 4. Note the 60 cm. (24 in.) Military Railway on the Temporary Structure Shown in Fig. 3, and the Concrete Blocks Used as Facing and Forms on and between the Arches.

While a German Train Was Passing Over. (7) The New Bridge. A Typical Example of the Way in which the Abutments and Adjoining Slopes Are Treated in the Reconstruction.

Figs. 8 to 10. The Blagny Viaduct Also on the Line from Valenciennes to Hirson. (8) Note the Partially Finished Piers with Concrete Block Facings and the Small Aperture About Half Way up in the Side of One of Them. This is an Opening to a Chamber for Explosives Which Is Closed up and Camouflaged Later. (9) Entirely Finished in September, 1919, Six Arches of About 54 ft. Span. (10) Partly Finished. The Completed Structure With the Balustrade and Other Finishing Parts being put in Place.

Fig. 11—Ohio Viaduct. Completed, except for the balustrade, in December 1919. In order to reduce the grades on this line the viaduct, of 13 arches of about 47 ft. span, was rebuilt about 9 ft. higher than the pre-war structure. All of the viaducts of this group were rebuilt with arches having about the same span as formerly in order to utilize parts of the original foundations.

## Railway Reconstruction in France and Belgium

Extent of Destruction—Work of the Army Engineers—Plans for Permanent Improvements

By Oliver F. Allen

Formerly Major of Engineers, American Expeditionary Forces

**I**N STARTING THIS SERIES of articles on French and Belgian railway reconstruction, the author wishes to express his appreciation of the very many courtesies shown him by European friends to facilitate the study of the reconstruction program and its execution. The engineers, both civilian and

have accomplished. One of the necessary but unfortunate results is that we in America do not realize how farseeing the program is nor how much has actually been done. While under the strain of this intensive work our friends in France and Belgium found time to help in collecting accurate data of which this series of articles represents only a small part.

The Director of Railways and his staff in the Ministry of Public Works together with the engineers of the Northern Railway (Compagnie du Chemin de Fer du Nord) were especially generous, not only in furnishing information, but in giving their own precious time for showing the actual works and supplying many authentic photographs of the destruction and the different phases of the reconstruction. The engineers of the Central Association for the Resumption of Industrial Service in the Devastated Regions (Association Centrale pour la Reprise de l'Activité Industrielle dans les Régions Envahies), and of other railway and many industrial organizations, both in France and Belgium, have also been of great assistance in compiling these data.

The 10 devastated departments of France and the seriously injured parts of Belgium include a large part of their pre-war industrial regions, especially in the fields of metallurgy and coal mining. These areas were effectively served by interlaced railway lines. The invaded regions of France north of the Marne are in the territory served by the Northern Railway. One branch of it goes down the Sambre valley into Belgium along one of the lines of the German advance in 1914. From the beginning of that advance until the time of the Meuse-Argonne offensive of the American army in the late autumn of 1918 about half of the lines of the Northern Railway were in the enemy's hands. Some of the road beds were destroyed for military reasons on both sides of the fighting line as it moved back and forth. The greatest

On the line from Busigny to Hirson. A typical illustration of war destruction. A piece of German narrow gage military railway track at the right.

military, who have had to do this task have found the work so tremendous and the demand for comprehensive plans looking far into the future so insistent that they have worked feverishly without rest not only since the armistice, but most of them as army railway engineers during the long strain of the war. They have had neither time nor opportunity to tell even their own people, let alone the outside world, what they

destruction was, however, done by the enemy when retreating, especially in 1917 and just before the armistice, and was mostly not a military necessity.

The railways were laid out for the normal peace time movement of freight as dictated by industrial conditions, such as coal going from the mines to the metallurgical plants and fabricated material going from and food coming to the various industrial communities in the very active areas first over-run by the Boches. To move the supplies required by the Allied armies and secure the maximum insurance against interruptions by airplane bombing and long range shelling, certain modifications of the railways back of the lines had to be made, including such things as the construction of large transfer yards, the double tracking some single track lines, the lengthening of passing tracks and sidings and the expansion of freight terminals. In some places complete new cutoffs or loops were built around railway centers not only to furnish a detour in case of interruptions to main junctions by bombs, but to expedite the movement of freight which would have otherwise been delayed on account of the congestion at the junction points.

These modifications, while done primarily for military necessity and sometimes of a very temporary character, were frequently made a part of the general reconstruction program, especially during 1917 and 1918. For example, a loop southwest of the city of Nancy built by the French army railway engineers will be of great permanent assistance in facilitating freight movement in that part of the East and has already become an integral part of the lines of the Eastern Railway (Chemin de fer de l'Est). This loop, several miles in length, has its concrete bridges, permanent grading, drainage, first-class road bed and track as if it had been built under normal peace time conditions. Several large transfer yards built

this work. Both tracks of about 700 miles of double track line, and one of the tracks of about 70 miles of double track line together with some 100 miles of single track line were put back in service, all by military engineers of the Northern Railway. This was made possible only by the utilization of temporary structures and by making only those repairs to the road bed which were imperative for operation of the military

The original destruction followed by the destruction of the temporary military bridge. Note at the left the remains of the original masonry pier, and in the center a temporary military concrete pier built on the foundations of the old pier.

trains at slow speeds. To facilitate the movement of supplies a great many locomotives, not only from all parts of France, but new ones imported by the American, British and French armies were added to the pre-war supply on the lines employed for military purposes. There was considerable loss

Fig. 14. Villeneuve Bridge Reconstructed

The old masonry pier at the left has been utilized. The right is a new concrete pier built on the old foundation. Note how this bridge blends with the landscape, and that the lower arches are made much flatter than the semi-circular arches of the large viaducts.

and used by the American and British armies were designed so as to have permanent value and are being utilized in the readjustment of traffic under the new conditions. Extensions of lines and additions to freight yards built solely for military requirements in order to secure greater rail-head capacity are being retained to facilitate after-the-war traffic.

When road bed, bridges or tunnels were destroyed on the Allied side of the line, temporary repairs were made by military engineers as rapidly as possible, and as the enemy was driven back this temporary reconstruction was carried forward. Some of the first jobs of the American army railway engineers in the spring of 1918 were in connection with

of locomotives and cars from enemy fire, capture and excessive use without adequate upkeep.

Even as provision for industrial reconstruction started in the spring of 1915, long before America seriously considered going to war, the general features of a comprehensive plan of railway reconstruction and expansion were studied by the French early in the war. Like our own organizations of railway engineers the French army railway units consisted principally of men taken from the ranks of the permanent organizations of the various railways, and consequently the liaison between the military engineers working directly under the general staff of the army, the organization of the Director

of Railways under the Ministry of Public Works, and the civilian staffs which the railways retained was so close that they were able to outline a very comprehensive program of rehabilitation. One of the constructive advantages of that program was the knowledge and ability to shape many extensions of traffic facilities of various kinds required by military necessity so that they are now utilized as permanent improvements.

Following the final evacuation by the enemy, when the railway company took possession of its property, there was the double problem of repairs to locomotives and cars so as to have rolling stock with which to move out the great bodies of troops to be demobilized and to move in the material and personnel required for the return of the refugees and the reconstruction work, and of rebuilding the bridges, road bed, etc., to carry this traffic. There were about 500 miles of com-

the clearing up and a big start with the permanent reconstruction. Detours, military roads, temporary bridges, etc., were utilized. Temporary army barrack buildings were kept as stations. Main lines in the devastated regions were reopened for both freight and passenger traffic in the spring and early summer of 1919.

A second phase, say the year 1920, covers the completion of nearly all permanent reconstruction of bridges and tunnels and the general restoration of lines so that traffic can follow normal avenues, be greatly increased in volume and move more safely, due not only to the better condition of rolling and roadbed, but to the reinstallation of the signals, etc. Conditions steadily improved throughout the year. Service was restored on practically all lines with regular schedules for both freight and passenger service. Traveling had become relatively comfortable. Dining cars were gen-

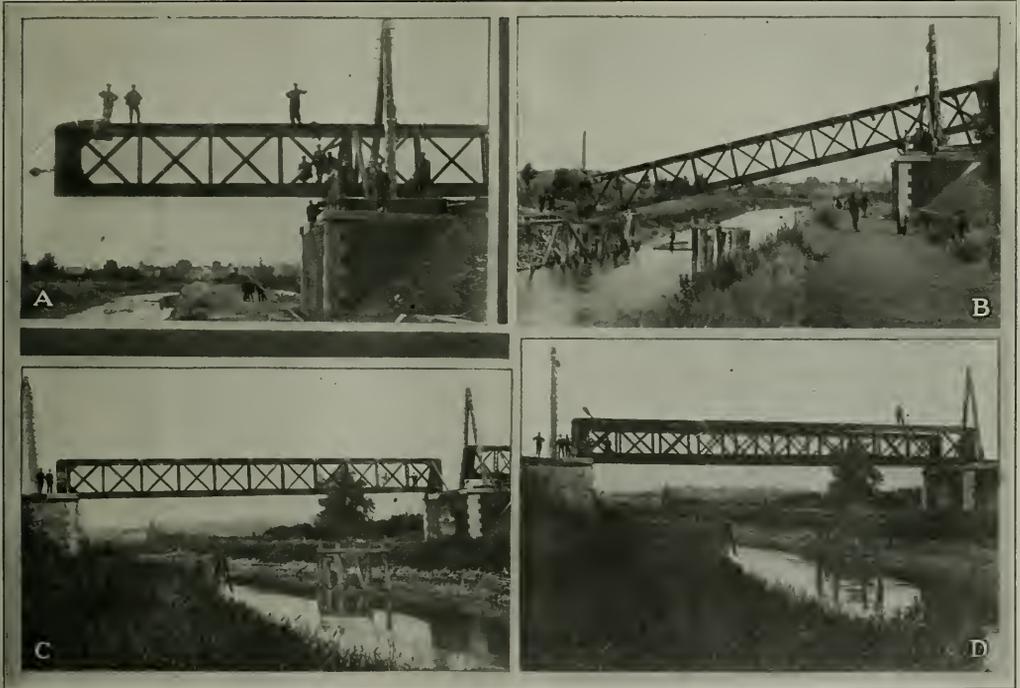

Fig. 15. Railway Bridge Over Canal at Reequignies

A—This and the successive photographs show the several phases in the placing of a temporary military girder by the French army railway engineers. This particular bridge placed a temporary wooden structure and was put in place on July 4, 1919; B—The girder further advanced; C—The first side in place; D—Both sides in place ready for floor structure.

pletely destroyed lines, mostly single track, which had not been rebuilt by the armies because they were not essential to military operations. It was, however, necessary to get them temporarily into service immediately. There were also more than 800 bridges, about 340 railway stations, at least 5 tunnels, over 1,500 employees' houses and many repair shops, round houses, etc., completely destroyed, all on the Northern Railway's system.

The first phase, which may roughly be taken as from the time of the armistice until the end of 1919, involved temporary reconstruction only so far as to provide for moving necessary freight and troops at very moderate speeds and limited passenger service at about half pre-war speeds and without most of the pre-war luxuries. It included much of

erally available on through trains. Tourists rode over and did not see the new bridges. They were protected by, but did not even realize the existence of the signal systems. They saw only the destroyed stations, the old army huts used in their stead, the slow schedules, the uncomfortable and disabled cars—and should not be blamed for not understanding that great progress had really been made in reconstruction. The railroad did first the things most essential to move freight and necessary passengers. The comforts of travel and such refinements as passenger stations could come later.

The final phase, which is commencing now and may last for some years, includes the completion of the reconstruction of roadbeds, signal systems, etc., and the rebuilding of freight and passenger stations in order to permit resumption of nor-

mal traffic conditions and speeding up of trains to pre-war schedules for passenger service. Freight trains will be heavier and faster than before the war. Freight schedules will be rearranged to meet changed industrial and economic conditions. The progress made in this last phase depends largely on the coal situation and the electrification problems which will be discussed in a later article of this series.

The accompanying illustrations give some indication of the extent of the destruction of the railway properties, the temporary structures provided by the military engineers and the permanent improvements which are rapidly being built. The next article of this series, which will appear in an early issue of the *Railway Age*, will give some details of the engineering problems, particularly with reference to bridges and tunnels, met with in carrying on the work of reconstruction and the manner in which the work was done.

## Commission Recommends Caution in Adjustment of Grain Rates

WASHINGTON, D. C.

**R**ECOMMENDATIONS of the Interstate Commerce Commission relative to the adjustment of grain and grain product rates with particular reference to the relation of rates to Atlantic ports as compared with Gulf ports, also of lake and rail charges vs. all rail charges, are made in a letter from W. V. Hardie, director of traffic of the Interstate Commerce Commission, to James T. Webster, freight traffic manager of the New York Central, and the chairman of the Western Trunk Line Committee, Eastern Traffic Executives Committee, Southwestern Tariff Bureau, and Central Freight Association, copy of which has been made public by the commission. The letter refers to the recent conference at Chicago and New York between representatives of the grain markets, Atlantic ports and Gulf ports and carriers of eastern and western territory relative to the proposed adjustments.

Under the instructions of the chairman of the commission, Director Hardie begins the letter with a statement that "the net revenues of carriers generally at the present time are far from adequate" and that "reductions in rates apparently are, therefore, at this time undesirable except insofar as they may be necessary to stimulate traffic, to remove discrimination or to relieve situations where rates appear to be unduly burdensome under present conditions."

Mr. Hardie says in part:

The whole situation is interrelated, and in determining what should be done as to any one of the situations involved, due regard should be had to the effect upon other rates and to the maintenance of a relatively proper and reasonable adjustment of rates which will not reduce the revenues of the carriers in the aggregate to a greater extent than is necessary. Various proposals have been submitted by shippers and carriers, most of which contemplate reductions in the existing rates, primarily intended to reduce differentials or differences in rates between competing markets, ports or routes, widened by percentage increases under Ex Parte 74 and previous thereto.

It is recognized that the differentials on traffic from the Missouri river to the Gulf ports for export as compared with Atlantic ports for export and of the all rail rates from Minneapolis to Eastern points as compared with the through lake and rail charges have been widened to an extent to make desirable reductions therein. Readjustments of rates to bring about this end, however, must be approached with extreme caution and having in mind all the factors which have led to the existing situation and which are likely to exist in the near future.

Having in mind these and other factors, it is not found consistent to recommend to the rail carriers that they shall adopt the proposals of the Minneapolis or of the Missouri river and Chicago markets. The former contemplates a reduction of 8 cents on export and 9½ cents on domestic traffic from Minneapolis to New York, while the latter contemplates reductions of 2 cents from the Missouri river to Chicago, 4 cents Chicago to eastern points, and 6 cents Mississippi river to eastern points. It is thought that reductions of this amount will not only reduce

the revenues of the carriers to an extent greater than appears at this time necessary upon the all rail traffic but will call for reductions in the "at the east" rates below even the present reduced rates which were established September 1, 1920, and are scheduled to expire April 15, 1921.

Neither does it appear desirable to indicate approval of the recommendations of either the western or eastern carriers in full. The latter contemplate an increase of 2 cents per 100 pounds in the rates from the Missouri river and St. Louis to the Gulf. The export rate from the Missouri river has in the past three years been increased from 18½ cents to 38 cents, and it is not thought desirable at this time to express any approval of an increase in such rate. No definite opinion will be expressed relative to the rates from St. Louis or Illinois points to the Gulf ports. These rates, however, are not upon the same level as the rates from the Missouri river, the St. Louis rate at the present time apparently being 23½ cents on export traffic whereas tariffs are now on file and under suspension in I. & S. Docket 1303 proposing to increase the domestic rate St. Louis to New Orleans to 45½ cents.

After a general discussion of the details of the proposed readjustment, Director Hardie says, in part, that

Based upon the information now available and without prejudice to any different conclusions which might be reached upon a more adequate record or in a formal proceeding, there appears to be no objection to the following readjustment of rates at this time:

(a) A reduction of 3 cents east of Chicago in the all-rail export rates on grain and grain products.

(b) A reduction of 1 cent on grain and grain products from Missouri river points (including Sioux City) to Chicago and Chicago rate points, limited to apply upon export traffic only.

(c) A reduction of 4 cents in export rates east of St. Louis on grain and grain products.

(d) Changes from Peoria and other related markets corresponding to those from St. Louis and Chicago to preserve existing equalization.

(e) No reductions to be made west of St. Louis.

(f) The existing "at and east" rates on export grain, now scheduled to expire April 15, to be continued beyond that date without expiration date, but no further reductions to be made in such rates at this time.

(g) The "at and east" domestic rates on grain on April 15 to revert to the rates in effect August 25, 1920, plus 40 per cent, such increase to be applied to the net rates.

(h) No reductions at this time appear necessary in the rates on grain products east of Buffalo, either domestic or export.

(i) Lake-and-rail rates on flour for export from Chicago, Duluth and Minneapolis to be reduced in the same amounts as the all-rail rates east of Chicago, thus maintaining differentials as compared with all-rail.

(j) No reductions appear at present necessary in the rates on grain or grain products Minneapolis to Chicago.

The above are intended as suggestions which it is hoped will produce a harmonious adjustment and at the same time have the effect of reducing the differentials on all-rail grain from Minneapolis compared with lake-and-rail traffic and also reducing differentials on export traffic from the Missouri river and western territory generally to Atlantic ports as compared with Gulf ports.

It has not been found consistent to recommend the basis sought by western millers, but the proposed reductions have been, except as noted, limited to export traffic. The same factors which enter into the export situation do not appear to apply with equal force to the domestic rates. Millers of New York are not satisfied with the rates on grain products ex-lake from Buffalo, but it has not been found consistent to recommend reductions in such rates at this time. (This is not intended as expressing disapproval of certain readjustments in the rates from Buffalo to New England points set forth in Chairman Collyer's letter of February 7, which changes should apparently be made.) Reductions in the domestic rates from the west would, however, but accentuate the complaints of eastern millers.

It has not been found consistent to recommend the establishment of 'overhead' rates from Minneapolis as proposed by that market and by some of the northwestern lines. As has been stated, it has been the practice for a number of years to maintain rates into and out of the principal markets equal to the through rates and the undersigned is not prepared at this time to recommend changes which would destroy this adjustment. It is recognized that the reductions made on traffic from Minneapolis are not as great as recommended by that market or by the northwestern carriers but it is thought that a trial should be made of the rates which will result from the changes above recommended. If it then develops that further readjustment should be made, consideration can be given thereto.

# Canada's Heavy Loss from Government Railways

Total Deficit of \$136,000,000 for Population of 8,000,000 to Pay  
Absorbs One-third of Dominion's Revenues from Taxes

By J. L. Payne

Formerly Comptroller of Statistics, Department of Railways and Canals of Canada

CANADA HAS NOW got far enough along in the matter of railway nationalization to permit of a calm survey of the results. With over 52 per cent of all mileage owned and operated by the state it will be agreed that the test is on a sufficiently comprehensive scale to warrant conclusions. The Dominion was not a novice in railway operation. Part of the bargain of Confederation in 1867 was the building of a line to connect the Maritime Provinces with what was then called Upper Canada, and just because the road was an integral factor in that pact it was always contended that results should not be counted as demonstrating either the soundness or unsoundness of the principle of state control. I allude to the Intercolonial.

There was never any doubt that the Intercolonial was a heavy load on the public treasury. Operating deficits were more frequent than operating surpluses. Interest charges were not made. In fact, it was always understood that the government road had bookkeeping methods peculiarly its own, with enough flexibility as to what should be charged to capital account and what to operating expenses to bring out a balance on either side practically at will.

Be that as it may, the people gave little concern to the matter. The road was a perennial football in politics, and each side blamed the other according as the fortunes of war put the Liberals or Conservatives in control. Certainly the road was not built to demonstrate the advantages of public ownership. It was built by government for the double reason that no company could be found to undertake it as a commercial proposition, and because it was felt that any loss arising from its operation should be borne by the whole people.

The Intercolonial, however, parted with all immunity from reasonable criticism when, in 1918, it was grouped with the Canadian Northern and the National Transcontinental to form the huge system now known as the Canadian National. The causes which led up to the establishment of this group of railways are familiar to American readers and need not be set forth in any detail. The story can be told in a few sentences, so that the essential facts of the case may be borne in mind as this sketch proceeds.

The Canadian Northern and the Grand Trunk Pacific fell into insolvency. An overwhelming proportion of their liabilities had been guaranteed by the government—Dominion provincial, or both. As the chief guarantor, the government took possession to protect the public treasury. The National Transcontinental was the 1,805 mile link built by government as a contribution to the Grand Trunk Pacific ocean-to-ocean scheme. It was to have been taken over by the latter on a three per cent basis; but the cost of construction was so stupendous that the parent Grand Trunk refused to live up to the bargain. The government therefore inherited its own expensive job.

## Government Owns 22,500 Miles of Line

When these three roads had been thrown into a single operating group it was seen that it lacked the essential elements of a well-balanced system. At all events, that was the contention of the government. It was believed the acquirement of the pioneer Grand Trunk would produce the neces-

sary balance as to traffic conditions. So the Grand Trunk was bought—or the necessary steps were taken to put the government in possession. The cost of the purchase is now being worked out by process of arbitration, and a tedious and expensive thing it is proving to be. With the Grand Trunk brought in, the Canadian National was swollen to a system of 22,500 miles, or 52.4 per cent of the total mileage of the Dominion. This final step was taken in 1919, and was ratified by Parliament early in 1920.

One further explanation and we shall have the facts all set forth in proper order for what follows. While these momentous changes were taking place, it must be clearly understood that the Canadian people held the position of passive spectators. They were not asked to express their judgment as to whether the assumption of these large responsibilities by the government was prudent or another way out could be found. Nor did they express any judgment. The war was on and absorbed public attention to the exclusion of practically everything else. If they had any opinion on the subject nothing in the way of press comment or platform utterances gave the slightest clue to what that opinion might be. They were told that the taking over of these roads could not be helped, that there was no other way, and that it would come out all right; and they let it go at that. They stood neutral. If they were apprehensive, they concealed it. If they had the slightest suspicion of the shock that was going to stir the whole country in 1921, they were also silent as to that. My own view is that a majority, not keenly interested anyway, believed nothing serious would happen.

Let us now see what did happen. Of the approaching catastrophe some warnings were given. Sir Herbert Holt, president of the Royal Bank of Canada, one of our big monetary institutions, spoke to his shareholders early in January last, as reported in the press, as follows:

"Government control has practically disappeared during the year just past—wheat, paper and sugar being the commodities to be freed from regulation. Government ownership of transportation systems has developed. Without any advantage to the public in efficiency or rates, the operation of our national railways during the last 12 months has resulted in a loss which will probably more than absorb the amounts collected on excess profits and income taxes for the year 1919. Unless government methods of operation are more efficient in this country than they have been in others, tax payers in Canada may find the maintenance of their railroads and fleet more expensive than pension charges and other legacies of the war combined. Of a total of \$6,400,000,000 spent by the United States during the last year, \$1,037,000,000 went to pay the cost incurred by the government in its control of the railroads. The present waste is obvious and the remedy should be speedy and effective. The needs of the country call for business-like administration of its assets. If this be afforded, we can attack our problems with added confidence."

Under normal conditions this statement, from such a high source, would have been a bombshell; but Sir Herbert Holt's words fell on the ears of a people grown callous. He was not heeded any more than was Noah. But I for one knew that he was talking the truth, and I took the trouble to ascertain whether or not his estimate of the probable railway loss,

as compared with the burdens arising out of the war, was under or over the mark. It was under, as we shall soon see. Sir Herbert will now know that what he foresaw as a grim possibility has actually happened.

### Railway Deficit Exceeds Cost of War

The question which this analysis assumes to answer is succinctly this: What is the government railway system costing the people of Canada? I say at once that it will cost them in this year of grace not less than \$130,000,000. The cost of the war, to which the president of the Royal Bank alluded, will not be more than \$109,000,000, made up as follows: Interest on public debt \$54,000,000, pensions \$30,000,000, and all other care of returned soldiers, \$25,000,000. The last item will grow less year by year. With the railways costing the country \$130,000,000 and the war \$109,000,000, very little is left, out of a total revenue of \$450,000,000, for general purposes. It may mean continuous borrowing. Since the Canadian National system was established it has absorbed upwards of \$500,000,000 of public money in one way and another to keep it going, and there may be worse to come.

The first step in making up a statement of facts is to set up a capital account for the Intercolonial and Prince Edward Island Railways—the two original examples of public ownership. What has appeared in official railway statements down to the present time has merely been the primary cost of construction. Not a penny of interest was ever charged, neither during construction nor at any later date. Deficits were ignored. The Dominion treasury took care of everything. The bonds were not ear-marked, and interest charges were absorbed along with the general liability on account of the public debt. Samuel O. Dunn took up the matter in 1916 and was able to bring the figures of what the capital account should be down to 1914.

I have taken up the work where he left off and have brought the account down to the present time. Taking Mr. Dunn's total of \$380,991,916 as the starting point, and using plus and minus signs to indicate an operating surplus or deficit, the calculation works out as follows:

	Capital liability	Surplus or deficit	Interest at 4 per cent	Total
1914				\$380,991,916
1915	\$7,761,544	—\$273,569	\$15,560,881	+404,879,140
1916	8,359,451	+2,224,692	16,428,947	427,152,616
1917	5,500,595	+1,392,957	17,250,410	448,510,664
1918	20,960,299	—2,842,917	18,892,555	491,206,435
1919	11,393,985	—3,898,415	20,260,033	526,760,858
1920	10,795,575	—7,000,000	21,662,258	566,218,701

It will be observed that there has been an increase of \$185,226,785 during the past six years. According to government figures the addition during that period has been but \$64,773,449, for the simple reason that only direct capital outlay for construction and purchase of equipment was charged. There was, of course, no defence for this unsound plan; but, having begun that way, accounting became a part of the general policy of easy drifting. Moreover, inasmuch as very loose methods prevailed in years gone by in railway bookkeeping, under which items were scattered around utterly out of their proper place, I am confident a true account would carry the total perhaps \$100,000,000 over what is here shown; for the compounding process carried along over more than 50 years produces startling results. At the present time the capital account of the Intercolonial is officially placed at \$152,300,044, and that of the Prince Edward Island at \$12,633,933—a total for the two of \$164,933,977. That Mr. Dunn's calculation is below the mark is clearly shown by a report just issued by the Department of Railways and Canals, which, for the first time, shows charges to capital on account of these roads amounting to \$479,956,931. That does not include a farthing for interest, to say nothing of compounding.

The National Transcontinental was built by government and followed the bad precedent of the Intercolonial in

respect of its capital account. It was begun in 1904 and opened for traffic in 1914. The cost is placed by the official records at \$165,128,742, omitting, of course, interest at all stages and deficits. I shall not take up space to tell the story of this ill-starred road; but may say at once that the true capital account is considerably in excess of \$250,000,000. The interest on that sum is reckoned at 5 per cent.

### All Government Lines Losing Heavily

In dealing with the Canadian Northern unit we are brought at once into contact with standard accounting. It was the collapse of this road which brought about the present large scheme of nationalization. In fact, in one way and another the Canadian railway problem has its core in the unwarranted expansion of the Mackenzie & Mann enterprise between 1900 and 1914. But that is a story by itself, and not quite in place here. We are, for immediate purposes, merely trying to show what the existing government railway group is costing the people of Canada. With that object in view, let it be said at once that the balance sheet of the Canadian Northern for December 31, 1919, reveals a definite capital liability of \$540,155,623. This includes \$165,230,658 advanced by government; but we are obliged to add further advances of \$69,170,910 since that date, which, with an acknowledged deficit for the past year of \$25,670,358, brings up the final total to \$634,996,891. Without going into a considerable mass of details as to all the factors entering into the results for the current year, and which I have gone over with care, the deficit is placed at \$39,000,000 in round figures. If evidence were required to make my estimate good, it is found in the fact that, since that estimate was made, the Minister of Railways has announced to Parliament an actual deficit on the Canadian Northern for the past year of \$40,-414,563.28; so that I am nearly a million and a half under the mark.

The case of the Grand Trunk demands special treatment. It is rather complicated. In 1919 it had bonds outstanding to the amount of \$183,854,623, as well as \$155,480,169 of consolidated debenture stock and \$63,884,928 of guaranteed stock. The consolidated debenture stock must be regarded as a capital liability; so that capitalization for the purposes of this analysis is placed at \$339,334,792. Within the past two years, however, including appropriations now being asked of Parliament by the Minister of Railways, advances have been made totaling \$124,687,633. This is most astounding. It has simply staggered the people of Canada. The Grand Trunk was taken over on the assumption that it would strengthen the Canadian National group, and yet it has taken this colossal sum to carry it since the end of 1919. The immediate effect has been to raise capital liability to \$464,022,425. Interest charges on this sum, as well as on a floating liability which consumed \$1,875,437 in 1919, joined to a variety of other debits of an unescapable nature, create fixed charges of \$25,346,877. These will be reduced by possibly \$5,000,000 of net operating earnings, although that is not certain. Instead of helping out the government railway system on the financial side, it now transpires that the net result of the Grand Trunk purchase will be a direct draft upon the treasury of \$12,000,000 for the current year. This adverse situation will be distinctly worsened when the purchase price of probably \$65,000,000—the limit fixed by statute—has been paid.

The Grand Trunk Pacific and Grand Trunk Pacific Branch Lines may conveniently be bracketed, although they are separate organizations. Direct capital liability of all classes amounts to \$191,570,540, to which must be added \$96,224,651 of advances by government during the past three years, making the total \$287,795,191. It must be understood that this does not include stocks. In all these calculations they are omitted as being free from permanent

charges against revenue. Again avoiding all details for the sake of brevity, the fixed charges are placed at \$9,754,498. Those are the official figures for 1919. When an operating loss of not less than \$5,000,000 is added, it will be seen that the public burden on account of these two units will exceed \$15,000,000. As a matter of fact, the Minister has placed the deficit at \$19,467,290.17, which will show how careful I have been to keep well on the inside of the truth.

From time to time during the past ten years the government has purchased branch lines in the Maritime Provinces on terms which are not immediately available and could not easily be put into definite form if they were. These purchases cover 366 miles of line all told, and fault will not be found with my estimate of the capital liability attaching thereto if I place it at \$10,000,000. It might be \$15,000,000. Charging merely a nominal 4 per cent, and nothing more, fixed charges are placed at \$400,000 per annum.

The government has also purchased a new line in the Province of Quebec, which is not quite completed—the Quebec & Saguenay. It will be thrown into the general group, and has thus far cost \$8,146,189. Interest charges of \$407,310 would attach.

The Quebec bridge is an essential part of the Canada National system, although appearing separately in the accounts. It had cost \$22,616,018, without interest charges, during its somewhat long and tragic history, and I am assigning nominal fixed charges of \$1,130,801.

Lastly, there remains the cost of the Canadian Northern common stock, for which the government paid \$25,000,000 in 1915 and \$10,000,000 more in 1918. The interest charges are placed at \$2,100,000.

To remove all suspicion of possible exaggeration in the foregoing analysis, the Hudson Bay Railway is entirely left out of the calculation. It could quite properly be brought in; but it has no direct association with the Canadian National. Nevertheless, it is being built by the government—although practically abandoned since 1917—and has cost \$25,000,000 in round figures. The interest on that considerable sum would allow for any adjustments which adverse criticism might suggest.

### Government's Railway Investment Is \$2,284,000,000

It is now necessary to bring all these accounts together. The summing up is as follows:

	Capital liability	Fixed charges
I. C. R. & P. E. I. ....	\$563,218,701	\$21,662,258
Canadian Northern .....	634,326,531	33,000,000
Transcontinental .....	250,000,000	12,500,000
G. T. Pacific .....	279,006,751	8,524,424
G. T. P. branch lines .....	17,788,440	1,230,074
Grand Trunk .....	464,022,423	25,346,877
I. C. R. branches .....	10,000,000	400,000
Quebec & Saguenay .....	8,146,189	407,310
C. N. R. stock .....	35,000,000	2,100,000
Quebec Bridge .....	22,616,018	1,130,801
Total .....	\$2,284,125,057	\$106,301,744
Net operating deficit .....		16,250,000
Total deficit .....		\$122,551,744

The Minister had announced an operating deficit of \$21,250,000 for 1919 without including the Grand Trunk. It is here assumed that the result for the current year will be no worse, although there are ample grounds for an estimate of at least \$10,000,000 greater. It will be that much more if the experience of American roads is duplicated on this side of the line, and I have never known it to vary in any considerable degree. For the Grand Trunk an allowance of \$5,000,000 is made on account of net operating earnings. To keep entirely on the safe side, and swerve as far away as possible from the reproach of exaggeration, interest has not been charged on the total deficit for the past year, which of course must be taken care of in capital account. That would add another \$7,000,000; so that, in putting down a deficit of \$122,551,744 for the current year, which omits a number of

odds and ends the aggregate of which would be material, I have tried to keep well within the mark. If my estimate of fixed charges is sound, and the amount thus established is added to the operating deficit of \$36,842,970 for last year as announced by the Minister, the deficit for the current year will exceed \$136,000,000, after allowing a deduction of \$5,000,000 for net earnings by the Grand Trunk.

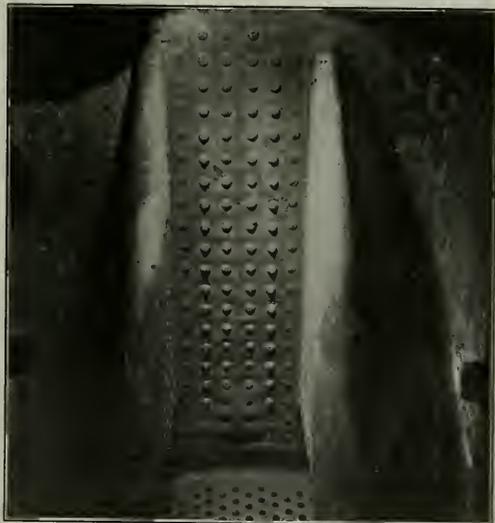

Concluding observations must be left for another article to follow.

## A Crown Sheet Failure Without an Explosion

THE SERIOUS CONSEQUENCES which generally follow the initial failure of an exposed locomotive crown sheet when the boiler is under working pressure make noteworthy any case in which such a failure, caused by low water, remains within sufficiently narrow local limits to result in no more than an engine failure.

Such a case, of special interest because of the fact that the firebox was equipped with the Nicholson Thermic Siphon, occurred January 19, 1921.

At the time of the failure the locomotive, which is of the Consolidation type, was pulling a heavy freight train with a strong draft on the fire, to which the crown sheet was exposed with a water level afterwards determined to have been

Interior View of the Firebox Showing the Most Affected Area of the Crown Sheet

between five inches and eight inches below the highest point of the sheet. The location of the failure and the affected portion of the crown sheet are shown in the sketch and photograph. It will be seen that an area about 10 in. square just back of the first two transverse rows of stays became sufficiently overheated to be pushed off of the heads of the two center stays in the next two transverse rows, and pocketed to a maximum depth of about 1 1/4 in. The stays nearest adjoining this area in the second, third, fourth and fifth transverse rows from the front of the crown sheet all were partially pulled out of the sheet. With this condition existing the train was pulled into a siding before the locomotive failed

completely, due to the blow-down through the crown stays holds in the pocketed portion of the sheet.

After shopping the engine, a careful examination of the firebox disclosed the following facts: (1) That the water level at the time of the accident was below the highest point of the crown sheet, a distance variously estimated at from five to eight inches; (2) that from the pocket in the sheet back to within 10 in. of the door sheet the crown sheet was buckled from  $\frac{1}{8}$  in. to  $\frac{3}{8}$  in. between the two center rows of radial stays; (3) that the two center rows of radial stays were loosened in the sheet; (4) that with these two exceptions there was no evidence of overheating the sheets between or outside of the siphons, and (5) that between the flue sheet and the front of the siphons evidences of over-

## Electrification of South

### African Railways\*

THE SOUTH AFRICAN GOVERNMENT RAILWAYS are about to begin the electrification of two sections of the system, and tenders are now being invited for power house equipment and rolling stock. The lines to be electrified immediately are the Cape Town-Simonstown suburban line, 22 miles long, and the Durban-Pietermaritzburg section of the Natal main line, 70 miles long.

The Simonstown line is partly double and partly single track. It carries a large and rapidly growing passenger traffic. Exclusive of season and "trip-bearer" ticket holders, the number of passengers carried rose from 2,701,105 in 1911 to 5,080,284 in 1919-1920. In the latter year 151,520 season tickets were issued, the increase over 1914 being more than 60,000. Electrification of this branch has been decided upon entirely on account of the heavy passenger traffic, and the undertaking presents no features of special interest. Multiple unit trains will be used.

The Durban-Pietermaritzburg section of the Natal main line differs completely from the Simonstown line. The Natal railway has always afforded plenty of scope for the ingenuity of the engineer. As originally located, it included a large number of grades as steep as 3.3 per cent and curves of 20 deg. radius were equally numerous. The line crosses a succession of spurs of the Drakensberg range, divided by deeply cut river valleys, so that it resembles a switchback on an enormous scale. In the distance of rather over 70 miles from Durban to Pietermaritzburg, a summit of 3,000 ft. is reached near Thoruville Junction, and the line then descends to about 2,250 ft. at Pietermaritzburg, where it again starts to climb steeply with occasional intermediate descents, to over 5,000 ft. near Highlands. It then falls 1,500 ft. as it crosses the Tugela Valley, and then mounts to about 5,500 ft., at which altitude it crosses the Drakensberg and enters the Transvaal. An up train ascends about 12,000 ft. in the 300 miles between the coast and the Transvaal border.

It may be readily imagined that under these conditions there has been a serious limitation on trainloads and speeds, while operating costs have been very high. About the time of the South African War, a Decapod side-tank locomotive, with only the six center driving wheels flanged, was introduced with the object of increasing the load hauled by a single engine unit. Though locomotives of this type possessed high tractive power, they did an extraordinary amount of damage to the track, in spite of the fact that 80 lb. rails seated on heavy iron chairs were in use. The cast iron chairs were broken by scores on each trip, and it was found necessary eventually to convert these engines to eight-coupled. Only about a dozen are still in use in their original, unchanged form.

THE TRAFFIC CLUB of Wichita Falls, Tex., has been organized and the following officers have been elected: President, A. A. Spencer, traffic manager, the Lone Star Refining Company; first vice-president, C. D. Arnold, traffic manager, the Wichita Motors Company; second vice-president, H. G. Smith, district freight and passenger agent, the Missouri, Kansas & Texas; third vice-president, C. L. Fontaine, assistant manager and traffic manager, the Wichita Falls & Southern; secretary-treasurer, J. W. Chatham, Jr. Members of the board of directors are: C. D. Arnold, G. L. Berry, W. S. Brown, J. W. Chatham, Jr., C. L. Fontaine, E. S. Goodner, F. W. Grace, O. E. Maer, H. G. Smith and A. A. Spencer. The last Friday of every month was selected as the regular meeting date for the organization.

Diagram Showing Extent of the Damage to the Crown Sheet of Engine 1929

heating were clear on an area extending down about eight longitudinal rows of stays on either side of the center line.

In observing this case from the standpoint of the relation of the Nicholson Thermic Siphon to the extent to which the crown sheet was damaged, it should be pointed out that in other cases similar or even more extended areas of the crown sheets have pulled off the stays in boilers not equipped with the siphons without a complete failure of the sheets. Two of the principal factors determining the extent of the damage in such cases are the strength of the staying and the temperature and rate at which heat is being generated in the firebox at the time of the failure. In the case of the locomotive under consideration, one of these factors was favorable to the rapid extension of the affected crown sheet area, inasmuch as the temperature of the firebox and the rate of heat generation were high at the time of the initial failure. The reports of a number of boiler inspectors who examined the firebox after the accident agree in the opinion that water was delivered from the siphon over a considerable area of the crown sheet after it was exposed above the level of the water in the boiler. While the absence of this action might not have resulted in a complete failure of the crown sheet, its presence undoubtedly tended to limit the damaged area.

# Final Valuations Served on Four Railroads

Commission Adds Estimate of Cost of Acquisition of Land Valuations Previously Served Recalled for Addition of This Item

THE INTERSTATE COMMERCE COMMISSION on April 4 made public supplemental tentative valuations including the original and present cost of condemnation and damages, or of purchase of lands in excess of original cost or present value, and also a figure representing the final value of the properties of the Kansas City Southern, the Los Angeles & Salt Lake, the Atlanta, Birmingham & Atlantic, and the Winston-Salem Southbound railroads with their subsidiaries, together with a statement of the methods pursued in developing the so-called "excess cost" of lands. The valuations heretofore have been incomplete because the commission originally held it was unable to report the excess cost of lands, but since the decision of the Supreme Court in the Kansas City Southern case last spring, it has been engaged in investigations for the purpose of developing the proper amounts to be allowed for this item.

The 55 tentative valuations heretofore served by the commission have been withdrawn and amounts will be added for the cost of acquisition of carrier lands and for the value of the property, after which they will be again served upon the carriers as tentative valuations. Three hundred and one preliminary engineering, 229 land and 163 accounting reports have been tendered to the carriers for examination.

In the case of the supplemental tentative valuations interested parties are given 30 days from April 5 in which to file protests. In the case of the Kansas City Southern the commission by Division No. 1 reports the present costs of condemnation and damages, or of purchase of lands owned and used, and used but not owned, for common carrier purposes in excess of the present value of such lands, to be \$3,467,182 for lands used and \$2,735,490 for lands owned. The valuation is as of June 30, 1914. The following is an abstract of the order in the Kansas City Southern case and the same form is followed in the other cases:

*It is ordered,* That the following be, and it is hereby declared to be, a supplemental tentative valuation, covering only matters not covered heretofore by either the tentative valuation or the final valuation by the Commission of the properties of the Kansas City Southern Railway Company; the Maywood & Sugar Creek Railway Company; the Poteau Valley Railroad Company; the Arkansas Western Railway Company; Fort Smith & Van Buren Railway Company; Texarkana & Fort Smith Railway Company; Kansas City, Shreveport & Gulf Railway Company; the Kansas City, Shreveport & Gulf Terminal Company; and Port Arthur Canal & Dock Company, as of June 30, 1914:

*Original and present cost of condemnation and damages or of purchase of lands in excess of such original cost or present value.* The present costs of condemnation and damages or of purchase of lands, owned and used, and used but not owned, by the above named carriers for common-carrier purposes, in excess of the present value of such lands, are found to be as follows:

THE KANSAS CITY SOUTHERN RAILWAY COMPANY.	
In Kansas:	
Wholly owned and used.....	\$350,266
Exclusively used but owned or leased by other common carriers .....	7,248
Total .....	\$357,514
In Missouri:	
Wholly owned and used.....	\$1,994,405
Exclusively used but owned or leased by other common carriers .....	11,924
Total .....	\$2,006,329
In Arkansas:	
Wholly owned and used.....	\$198,297
Exclusively used but owned or leased by other common carriers .....	172,587
Total .....	\$370,884

WASHINGTON, D. C.	
In Oklahoma:	
Wholly owned and used.....	\$192,522
In Louisiana:	
Exclusively used but owned or leased by other common carriers .....	\$539,933
Total used .....	\$3,467,182
Total owned .....	\$2,735,490
THE MAYWOOD & SUGAR CREEK RAILWAY COMPANY.	
Wholly owned but exclusively used by the Kansas City Southern Railway Company, in Missouri.....	\$9,768
FORT SMITH & VAN BUREN RAILWAY COMPANY.	
Wholly owned but exclusively used by the Kansas City Southern Railway Company, in Arkansas.....	\$11,570
TEXARKANA & FORT SMITH RAILWAY COMPANY.	
In Arkansas:	
Wholly owned but exclusively used by the Kansas City Southern Railway Company.....	\$161,017
In Texas:	
Wholly owned and used.....	\$579,315
Exclusively used but owned or leased by other common carriers .....	8,172
Total .....	\$587,487
Total used .....	\$587,487
Total owned .....	\$740,332
KANSAS CITY, SHREVEPORT & GULF RAILWAY COMPANY.	
Wholly owned but exclusively used by the Kansas City Southern Railway Company, in Louisiana.....	\$539,933
THE POTEAU VALLEY RAILROAD COMPANY.	
Wholly owned and used, in Oklahoma.....	\$1,686
THE ARKANSAS WESTERN RAILWAY COMPANY.	
In Oklahoma:	
Wholly owned and used.....	\$2,882
In Arkansas:	
Wholly owned and used.....	14,478
Total owned and used.....	\$17,360
THE KANSAS CITY, SHREVEPORT & GULF TERMINAL COMPANY.	
Wholly owned and used, in Louisiana.....	\$26,266
PORT ARTHUR CANAL & DOCK COMPANY.	
In Texas:	
Wholly owned and used.....	\$271,989
Wholly owned but used exclusively by the Texarkana & Fort Smith Railway Company.....	\$8,172
Total used .....	\$271,989
Total owned .....	\$280,161

The original costs shown as expended by the above named carriers in the acquisition of all their lands, owned and used and used but not owned, dedicated to common-carrier purposes, include damages to property not taken, the amounts of which cannot be segregated from the costs of the lands taken. We are therefore unable to give the excess costs of acquiring the said lands, over the original costs of the same. Incidental expenses, such as court costs, recording fees, salaries of real estate agents, etc., are shown in a gross sum of \$272,537, which cannot be assigned in whole or in part to any particular state or states through which the lines are operated.

*Statement of methods employed.*—For the purposes of this proceeding, the reference to Appendix 3 of the report in *Texas Midland Railroad*, 1 Val. Rep., 1, 108, which by reference was made part of the final valuation herein, is amended by rescinding the following portions of said Appendix 3, viz.:

All that is contained on page 168, except the first five lines; and all of pages 169, 170, 171 and the first seventeen lines on page 172.

The following portions of the report and order herein, 1 Val. Rep., 223-442, are rescinded, viz.:

Paragraph numbered 12 on page 224, in so far as it relates to the original and present cost of condemnation and damages or of purchase of lands in excess of such original cost or present value; the paragraph entitled "present cost of condemnation and damages or of purchase in excess of present value" on page 249; the subject matter under the heading "present cost of condemnation and damages or of purchase in excess of present value" on pages 260, 261 and 262; and the subject matter under the headings "present cost of condemnation and damages or of purchase of land" on pages 287, 291, 294, 299, 303, 307, 312, 316 and 320.

The matter contained in Appendix A, attached to this order,

being a statement of methods pursued in developing excess cost of lands, is substituted for the language contained on pages 168, 169, 170, 171 and 172 of the decision of the Commission in *Texas Midland Railroad*, being the analysis of methods under which the valuation work is conducted, above rescinded.

*Final value.*—After careful consideration of all the facts submitted in this proceeding, and the cost valuations heretofore made, including the excess cost of the carrier lands, appreciation, depreciation going-concern value, working capital and materials and supplies, and all other matters which appear to have a bearing upon the values here reported, the values, as that term is used in the Interstate Commerce Act, of the properties of the above named carriers owned and used and not owned, devoted by the carrier to common-carrier purposes, are found to be as follows:

THE KANSAS CITY SOUTHERN RAILWAY COMPANY	
Wholly owned and used.....	\$29,977,055
Wholly owned but not used:	
Leased to the Missouri & Louisiana Railway Company.....	40,000
Used but not owned:	
Leased from:	
The Kansas City, Shreveport & Gulf Railway Company....	\$8,725,737
Texarkana & Fort Smith Railway Company in Arkansas....	4,284,500
The Maywood & Sugar Creek Railway Company.....	34,000
Fort Smith & Van Buren Railway Company.....	47,900
Hannibal & St. Joseph Railway Company (merged with Chicago, Burlington & Quincy Railroad Company in 1901)	7,106
Kansas City Terminal Railway Company.....	612
The Missouri Pacific Railway Company.....	980
Private parties.....	60,512
Total.....	\$13,160,447
Total owned.....	\$30,017,055
Total used.....	\$43,137,502
TEXARKANA & FORT SMITH RAILWAY COMPANY	
Owned and used.....	\$3,792,651
Used but not owned	
Leased from:	
Port Arthur Canal & Dock Company.....	\$258,761
Private parties.....	310
Total.....	\$259,071
Total used.....	\$4,051,762
Owned but not used:	
Leased to:	
The Kansas City Southern Railway Company.....	\$4,284,500
Total owned.....	\$8,077,191
KANSAS CITY, SHREVEPORT & GULF RAILWAY COMPANY	
Owned but not used:	
Leased to:	
The Kansas City Southern Railway Company.....	\$8,725,447
Leased from private parties and re-leased to Kansas City Southern Railway Company.....	290
Total leased to the Kansas City Southern Railway Company.....	\$8,725,737
THE MAYWOOD & SUGAR CREEK RAILWAY COMPANY	
Owned but not used:	
Leased to the Kansas City Southern Railway Company.....	\$34,000
FORT SMITH & VAN BUREN RAILWAY COMPANY	
Owned but not used:	
Leased to the Kansas City Southern Railway Company.....	\$47,000
THE POTEAU VALLEY RAILROAD COMPANY	
Owned and used.....	\$94,068
THE ARKANSAS WESTERN RAILWAY COMPANY	
Owned and used.....	\$343,228
THE KANSAS CITY, SHREVEPORT & GULF TERMINAL COMPANY	
Owned and used.....	\$150,799
PORT ARTHUR CANAL & DOCK COMPANY	
Owned and used.....	\$1,668,548
Owned but not used:	
Leased to Texarkana & Fort Smith Railway Company.....	\$258,761
Total owned.....	\$1,927,309
The following amounts have been included in the values above stated for properties used by operating companies, on account of working capital and materials and supplies:	
The Kansas City Southern Railway Company.....	\$1,215,430
Texarkana & Fort Smith Railway Company, in Texas.....	109,066
The Arkansas Western Railway Company.....	3,228
The Poteau Valley Railroad Company.....	2,068
The Kansas City, Shreveport & Gulf Terminal Company.....	5,779
Port Arthur Canal & Dock Company.....	18,548
No working capital and materials and supplies are found to be owned and used by non-operating companies, as follows:	
Kansas City, Shreveport & Gulf Railway Company.	
Texarkana & Fort Smith Railway Company in Arkansas.	
The Maywood & Sugar Creek Railway Company.	
Fort Smith & Van Buren Railway Company.	

## Appendix A

## Statement of Methods Pursued in

## Developing Excess Cost of Lands

In meeting the requirement of paragraph entitled Second of Section 19 (a) of the Interstate Commerce Act to report the present cost of condemnation and damages or of purchase in excess of present value we attempt to show what the expense to a carrier would be of acquiring its common-carrier lands upon the date of valuation, on the assumption that it did not possess those lands, but was obliged to obtain them through purchase or condemnation at the value of similar lands in the vicinity, on that date.

It is evident that the figure reported can be only an estimate since the amount which would actually be paid would depend to a considerable extent upon circumstances and conditions which can not be definitely described. If a community is eager for the construction of a railroad the right of way can be obtained at a much lower figure than as though the building of the road is opposed by that community. So too the attitude of the carrier might exercise a considerable influence upon the amount of money expended in the acquisition of its lands. It is also apparent that if the railroad did not exist the present value of lands adjoining and adjacent to the railroad would not exist. The management of one railroad might deem it for its advantage to pay liberally, thus cultivating the good graces of the community, while another might deem it better business to force many cases into court thereby obtaining a better price where purchases were made. In our estimate no allowance whatever is made for anything of this character. We necessarily assume average conditions of all kinds, and we further assume that all lands are paid for.

One method by which this excess cost of acquisition might be shown would be to take each individual parcel and attempt to estimate how much the carrier would be compelled to pay the land owner by way of severance damages or in addition to the acreage value of the land. This would involve an examination of each parcel and a consideration of the various elements affecting these damages. In many cases testimony would be introduced. It would in effect be a proceeding in condemnation to determine what the carrier should pay. Manifestly this method can not as a practical matter be resorted to. It would require years of time and millions of dollars in expenditure to bring the work to a completion in that way.

So far as possible our prices have been determined with reference to actual transactions. The unit prices which we apply to our inventory in showing cost of reproduction are developed from a great number of actual prices paid by the carriers for the same class of work and material. In fixing the present value of lands more attention is paid to actual sales than to any other one factor. So it was felt here that if possible some method should be developed which would be based upon actual transactions.

The severance damages paid by a carrier to the land owner in one individual case would not be a reliable guide as to what would be paid or should be paid in all other cases of a similar character; but the thing aimed at is the same, in every similar case the rules of law applicable are identical and while human inclination or human judgment may go astray in individual instances still taken as a whole what has actually happened in the payment of these damages is the best guide we can obtain. While a single instance is not reliable if it is possible to find a great many instances and put those instances together in the form of an average that average will express the fact more accurately than any sort of an estimate. This is the general theory upon which this work has been developed.

First the lands of the carrier are divided into classes known as types. There is one type for city property of a certain kind, a second for city property of another kind, a third for farming land, a fourth type for wood land, etc., etc. The type may depend upon the shape of the parcel and the manner in which it is crossed by the road of the carrier.

Having determined these types we proceed to find actual cases corresponding to each type. These instances are obtained for the most part from carriers other than the one under consideration. We know with respect to each one of these actual transactions what amount paid by the carrier to the land owner was. We ordinarily know the present value which is the value which we ourselves determine and report. In some instances where the transaction is somewhat remote and where there is reason to suppose that the present value may have varied between the date of the transaction and the determination of our present value a present value as of the date of transaction is ascertained by the same methods as in our ordinary land work. This, however, is very unusual since our instances are taken from transactions occurring not to exceed ten years from the date of valuation.

Having selected these transactions which fit a particular type we carefully examine each one of them for the purpose of de-

termining whether it is apparently in all respects normal. If it appears to be abnormal it is rejected.

It will be noted that in case of each transaction we know the present value and also the amount actually paid by the carrier to the land owner. By subtracting the present value from the total amount paid the land owner we find the excess cost in each case and proceed to determine the ratio between such excess cost and present value. The result is known as the multiple of that individual case. All the multiples of a given kind are now combined into a weighted average and this average is treated as the multiple of that type. The multiple so determined is compared with multiples in other parts of the country.

When multiples have been determined for all the types into which the land of a given carrier falls the process of determining the excess cost consists of combining all parcels of a certain type, determining present value of those parcels in the aggregate and applying to that present value the multiple determined. When this has been done as to all the types it affords the basis for the estimate now made of the total amount of excess cost.

It frequently happens that a carrier is credited in our land report with the amount actually paid by it in securing the right to use a public street or some portion of the public domain. No multiple would be applied to the sum so stated since the carrier is allowed only the amount actually expended and we assume that the price charged by the municipality if this right is to be re-acquired would be the same that it originally was.

It is also evident that there would be certain expenses connected with the acquisition of these lands aside from the amount of money paid to the land owner and these are designated in our report as incidental expenses. They are made up of the fees and expenses of attorneys, right of way agents, etc., etc., together with cost of recording deeds, making maps and such like. The amount is small in comparison with the total cost. In determining the incidental expenses upon a particular carrier the expenses of a similar character upon that same carrier actually incurred when the road was constructed are examined if known. Similar expenses upon other roads are also examined and from all this an estimate is made of what the expenses would be upon the road under consideration. So far it has not been deemed proper to compile a percentage for the purpose of determining those expenses since they would vary upon different carriers according to the character of the right of way, the number of parcels and many other incidents.

If now we combine the excess cost paid to the land owner as heretofore stated and the incidental expenses incurred by the carrier in the acquiring of its lands we shall have the total excess cost. This figure is shown in our report as the excess cost of acquisition. In the column immediately following this is shown the per cent which the excess cost of acquisition bears to present value.

It is evident that this would show the excess cost to the carrier of acquiring its lands but the carrier insists that the figure shown by us should contain something beyond this. It is well known that one of the first expenses in the actual construction of a railroad is for its right of way lands and these lands develop no earning power and therefore yield no return on the investment until the road is finished and finally opened for operation. The carriers therefore insist that they should be allowed interest on their expenditure for lands from the time it is made until the money begins to earn from operation. However, this has been compensated for by basing the estimate on present value of land, rather than the value as of the time the lands would be acquired under the hypothetical reproduction theory. Further, while many of these lands would be purchased before construction actually begins others would not be, and many parcels would not be paid for until construction had ended.

The carrier would also pay certain taxes which would vary from nothing at all in some states where lines under construction are specifically exempted from taxation or where the gross receipts from operation are taxed, to other states where quite a substantial sum might be exacted if the period of construction were considerable. The taxes assessed, in practice, are levied upon lands, and for the same reasons that interest on the cost of acquisition of lands during the construction period is not consonant with the estimate here made, none is made for taxes during the construction period in this connection.

### Other Valuations

In the case of the Atlanta, Birmingham & Atlantic the commission finds \$1,818,730 as the excess cost of lands used and \$1,188,330 of the lands owned; of the lands owned by the Georgia Terminal Company \$257,255 and of the lands owned by the Alabama Terminal Railroad \$386,080. The final value for the properties owned by the Atlanta, Birmingham & Atlantic is placed at \$21,698,250, and of the proper-

ties used \$25,630,000. The value of the properties owned by the Georgia Terminal Railroad is placed at \$2,000,000 and the Alabama Terminal Railroad at \$2,850,000. There is included in the valuation stated for the Atlanta, Birmingham & Atlantic, \$617,090 representing working capital and materials and supplies. No working capital and materials and supplies were found to be owned and used by the Georgia Terminal and Alabama Terminal companies.

In the case of the Los Angeles & Salt Lake, the commission has added \$2,504,529 as the excess cost of land and states the final value as of June 30, 1914, as \$45,871,093, including \$38,774.78 as the value of certain lands used by the carrier for common carrier purposes, but owned by parties other than a common carrier. There is also included \$2,221,093 for working capital and materials and supplies.

For the Winston-Salem Southbound the commission adds \$468,022 for the excess cost of lands and states the final value as of June 30, 1915, as \$5,850,000, including \$101,535 for working capital and materials and supplies.

### Kansas City Southern Objects to Valuation Figures

The Kansas City Southern has issued a statement containing objections to the tentative valuation set by the commission's Division No. 1. The statement says:

The Kansas City Southern Railway Company does not, by any means, concede the corrections of the tentative valuation of its properties made by the three commissioners composing Division No. 1 of the Interstate Commerce Commission. It is apparently based on an incomplete estimate of the cost of reproduction of physical properties, less depreciation, with the addition of certain arbitrary but inadequate allowances for appreciation and going-concern value. As its name indicates, it is only tentative; it is a figure put forward by Division No. 1 against which the railway company is entitled to file its protest, and to make proof of the real value of its properties. The figures do not even purport to have any relation to present-day value. They represent only tentative figures as of June 30, 1914. It may be stated, in passing, that since that date the Company has expended over \$6,500,000 in additions, betterments and extensions.

The company has claimed, and still claims that the value of its properties, even as of June 30, 1914, was in excess of \$75,000,000. It introduced evidence to that effect before the Commission. It is not disposed to accept any lower valuation, and it is prepared, if necessary, to contest its rights in the courts.

In the tentative valuation, the earning power of the company, on a proper rate structure, which we contend is the real test of value, has been ignored. As an illustration, the company, for the calendar year 1917, under a rate structure claimed to be inadequate, earned approximately six per cent on \$75,000,000. That fact is given no consideration.

The stock and bond value of the company's properties has likewise apparently been ignored. During the five-year period preceding June 30, 1914, the prices of stocks and bonds, as every one knows, were unduly low, but the aggregate market value of the company's outstanding stocks and bonds, computed at the average prices during the five-year period, amounted to over \$62,000,000.

The original cost of the property is stated in the tentative valuation at \$47,000,000, which is approximately \$16,000,000 less than the company claims it should be. The cost of reproduction new of the company's properties, as of June 30, 1914, is stated at approximately \$52,000,000, which the company claims is approximately \$20,000,000 less than it should be. There has been deducted approximately \$10,000,000 for depreciation, although it is held by the courts that no depreciation should be deducted in determining value, where there is no deferred maintenance, and it is not asserted that there is any deferred maintenance in our case. The commission took into consideration its estimate of the cost of reproduction of the roadbed, bridges, buildings and other physical structures, but apparently omitted to give the same consideration to the cost of reproducing the right of way. The amount allowed for right of way is nearly \$5,000,000 less than the commission's own estimate, made after the decision of the Supreme Court in our mandamus case, of what its cost of reproduction or re-acquisition would have been. The company's interest in the Kansas City Terminal, amounting to approximately \$4,000,000, was ignored. The cost of reproducing the company's property, applying to the commission's quantities the prices current today, would materially exceed \$100,000,000.

Stockholders and others interested in the Kansas City Southern Railway Company will readily understand from the foregoing

statement why the officers of the company are prepared to contest this tentative valuation.

The final valuation issued by the Interstate Commerce Commission in the cases of the Kansas City Southern; San Pedro, Los Angeles & Salt Lake; Atlanta, Birmingham & Atlantic and the Winston-Salem Southbound railways indicate that a deduction has been made for depreciation because in each instance the value found is less than the figure previously reported in the case of these roads for cost of reproduction new plus the present value of lands. For the first three of the roads there is a wide variation between the final valuation and the company's book investment account or its capitalization, but in the case of the Winston-Salem the valuation exceeds the capitalization or the book cost.

In the Kansas City Southern case the commission had reported the cost of reproduction new plus land as \$51,262,747, and the final value is given as \$43,137,502. The capitalization of the Kansas City Southern as of the valuation date, 1914, was \$99,052,000 and the company claimed as its investment in road and equipment \$101,050,970. The commission in 1919 agreed with the company upon a figure for the investment in the property of \$45,742,093. The valuation covers 879 miles of road.

In the case of the San Pedro, Los Angeles & Salt Lake, the commission reported the cost of reproduction new plus land as \$47,226,043. The final value is stated as \$45,871,093. The investment in road and equipment claimed by the company was \$76,391,598. The capitalization in 1914 was \$81,274,000. The mileage was 999.

The commission reported for the Atlanta, Birmingham & Atlantic a cost new plus land of \$27,471,817, whereas it states the final value as \$25,630,000. The book cost of road and equipment was \$39,255,787. The capitalization was \$59,565,176 and the mileage was 663.

For the Winston-Salem Southbound the cost of reproduction new plus land was reported as \$5,939,099 and the original cost as \$5,598,999. The final value is stated as \$5,850,000 for 90 miles. The company's investment account was \$5,598,558, and the capitalization \$5,125,000.

## President Studying Railroad Problem

WASHINGTON, D. C.

PRESIDENT HARDING and members of his cabinet are still earnestly studying the railroad problem, trying to find a way by which transportation costs may be reduced and by which bankruptcy for the railroads can be averted, but have thus far found no plan on which he is ready to act and he does not propose to dictate to or interfere with the functions of either the Interstate Commerce Commission or the Railroad Labor Board. Chairman Clark of the Interstate Commerce Commission is understood to have told the President what he told the Railway Business Association at its annual dinner and what he has previously written to various senators, that there can be no general reduction in rates until the foundation is laid for a reduction in the cost of operation, and Chairman Barton of the Railroad Labor Board has undoubtedly told him that the board cannot act without hearings, and it is not an easy thing to reconcile the conflicting views of its nine members in a short time. No definite plan for meeting the situation resulted from the two-hour conference which the President had with Mr. Clark and Mr. Barton on March 31, and the President has stated that he is going to seek farther for a solution and to obtain information from all sides of the question. Following his conference with the heads of the two organizations having jurisdiction over rates and wages, respectively, it was announced at the White House that the President was merely

seeking information and that he did not propose "to go over any one's head."

The subject was again discussed at the cabinet meeting on Friday, April 1, which was largely devoted to the general business problems of the country, including productivity, transportation, agriculture and financial questions, but the President stated in his talk with newspaper correspondents that no plan had been arrived at. Both boards are operating under a law which makes each supreme in its own field and which provides neither for the exercise of any authority over either body by the President nor for co-operative action. It was believed, however, that the President may have urged upon them the importance of expediting any action which may appeal to their judgment as proper and that aside from obtaining information from them he may have desired to emphasize the importance of their working with a common purpose in any way possible.

He had not yet decided upon an answer to the telegram from B. M. Jewell urging the President to call a joint conference of railroad executives and labor leaders and proposed to make some further inquiries before doing so, but he indicated that the entire question of the extension of the National Agreements beyond the period of government operation of the railroads was for the Labor Board to settle and that he did not propose to interfere.

Mr. Jewell's request that the President call the railroad executives and the labor leaders into conference on a matter which the law places within the jurisdiction of the Labor Board raises the whole fundamental question which has been involved in the hearings before the board as to whether the principle of National Agreements, adopted while the employees were working for the national government, should be extended into the period when they are no longer working for the national government but are employees of individual railroad companies. The point is understood to have been made at the cabinet meeting that to re-establish National Agreements would eliminate the right of the employer to negotiate with his employees and also the right of the employees to negotiate with their employers, and it was rather strongly indicated at the White House that the President does not intend to reply to Mr. Jewell's telegram in such a way as to commit himself to any such policy.

While giving no response to the suggestion of a joint conference, which would recognize the principle of a national adjustment, the President, in accordance with his announced policy of seeking information from all sides, on Monday consulted with Mr. Jewell and also A. B. Garretson, former president of the Order of Railway Conductors. W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, talked with the President on Tuesday, and Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, had an appointment for Wednesday.

The railroad situation was again discussed at the cabinet meeting on Tuesday. After hearing the labor side and their suggestions for a solution the President intends to consult with representatives of the managerial side. If he is led to believe that a probability of a solution lies in bringing the representatives of the two sides together that method will be attempted, but he has not yet decided to do so.

By calling in the labor leaders the President has indicated, it is believed, an appreciation of the fact that the chief difficulty in the problem lies in the wage question.

RAILWAY WORKERS OF Lemberg, Poland, recently received from the American Relief Administration 50 outfits of clothing for the children of the poorest workers. Out of gratitude the railway men who were in better financial condition collected the sum of 1,350 marks and presented it to the Administration to use as they saw fit. It was used to cover the cost of sewing clothing for orphans in different institutions in Warsaw.

# New Civic and Railway Development Plan

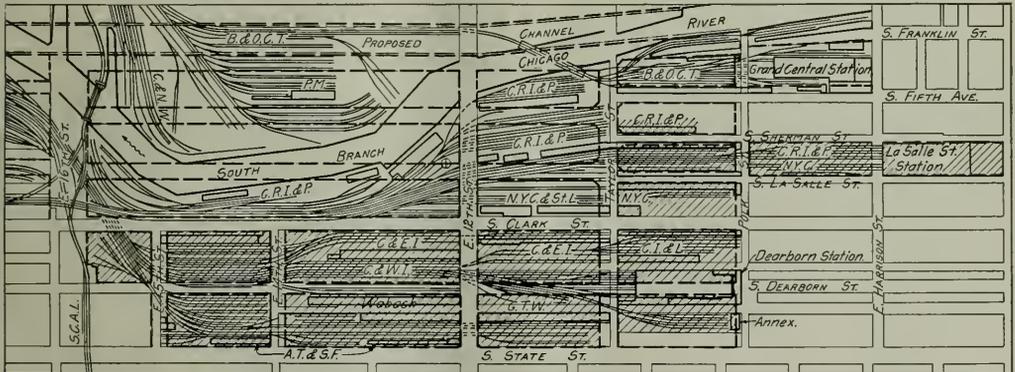

## Chicago Terminal Commission Submits Extensive Report for Revamping Transportation Facilities

JOHN F. WALLACE, chairman of the Chicago Railway Terminal Commission, has just submitted a comprehensive report to the mayor and city council of Chicago, outlining a complete plan for the rearrangement of the railway terminal facilities located directly south of the "loop" or business center of the city. The plan proposes the vacation of extensive areas now occupied by the railroads with three passenger stations and a large number of freight houses as well as a change in the channel of the Chicago river, the object from the city's standpoint being to permit the opening of four north and south streets to connect the "loop" with the southern part of the city. From the standpoint of the railroads this is considered by the commission the third important step in a general plan for the reconstruction of the railway facilities serving the central part of the city. The first two of these steps have already been carried through

The project is estimated to cost \$43,000,000 (exclusive of provision for other facilities to replace those abandoned) which would be covered in part at least by the sale of valuable property released as a result of vacations and by the sale of air rights over the proposed terminal development. The project also involves some fine questions of law concerning riparian rights, the title to the old channel of the river, relationship to the various governmental bodies involved and enabling legislation. Plans for this project were developed to the preliminary stages as early as 1914 but like a great many other projects of first magnitude, it was subject to postponement at the beginning of the war.

An abstract of Mr. Wallace's report follows:

"The present network of railroad tracks and facilities within the Chicago terminal district have been created by each railroad acting on its own initiative and for its own

The Present Railway Terminal Layout South of the "Loop," Showing Additional Through Streets Proposed and Suggested Vacation of Railway Property Indicated by Cross-hatching

the preliminary stages by ordinances establishing agreements between the city and the railroads involved. The first of these is the Union Station project which carries with it the construction of the Chicago Union Station and extensive freight terminal development by railroads west of the Chicago river. The second is the Illinois Central development concerned primarily with the construction of a large passenger station facing on Roosevelt road.

The railroads concerned with this third plan are those using the La Salle, Grand Central and Dearborn passenger stations, namely, the New York Central; the Chicago, Rock Island & Pacific; the Baltimore & Ohio; the Chicago Great Western; the Pere Marquette; the Minneapolis, St. Paul & Sault Ste. Marie; the Wabash; the Grand Trunk; the Chicago & Eastern Illinois; the Monon; the Atchison, Topeka and Santa Fe; the Erie; the Chesapeake & Ohio and the New York, Chicago & St. Louis. This plan is linked up closely with that of the Illinois Central development owing to the fact that the suggestion to eliminate the three passenger stations now used by these roads carries with it the proposal that they co-operate with the Illinois Central in providing a union station on Roosevelt road and the lake front of adequate size to provide for all of them.

interest and usually with little consideration of the interests of other railroads, or of the city. There are no topographical conditions in Chicago or in surrounding country that would serve to concentrate the lines of railroads approaching Chicago within narrow confines and as a result the lines of railroad approach the city from all directions except the side occupied by Lake Michigan. The result has been that there are railroad problems in all sections of the city and these problems increase in intensity as one approaches the center of the city where all of these lines converge and have their terminal facilities.

"This consolidation in entrance routes has resulted in the grouping of railroads in the territory immediately surrounding the business district on the north, west and south sides of the rectangle which includes the central business district. Since all of the railroad developments in each of these several districts referred to are contiguous one to the other it is impossible to apply any specific treatment or development to one railroad property without affecting the railroad property contiguous thereto, and therefore, it becomes a practical necessity for the railroads having their facilities in each of these several groups to work co-operatively on any plans for railroad development. This is particularly true where the

rearrangement of grades is necessary and it is a fact that no large improvement in the railroad property adjacent to the central business district can be made without changes in grade.

"On the south side of the rectangle enclosing the Loop District are grouped the terminal facilities of 14 railroads and the existence of the large area of railroad property in this district in its present state of development is a serious obstacle to the free flow of traffic to and from the central business district and is retarding the natural expansion of the business district to the south. In the preliminary report of the commission as well as in the reports furnished to the Railway Terminal Committee by Mr. Wallace and by Bion J. Arnold, it was shown that there was available in the property owned by the Illinois Central on the lake front, a station site of sufficient size to accommodate not only the traffic of the present Illinois Central station, but also the traffic at present using the Dearborn, La Salle street and Grand Central stations.

"It would undoubtedly be to the best interests of the city if all of the railroads now having their passenger terminals in the territory between State street and the Chicago river would make the station provided in this ordinance the terminal for their through passenger trains.

"In no location adjacent to the central business district can there be provided coach yards, engine terminals and other necessary facilities as convenient to the passenger terminal and in no other location can these facilities be provided with as small a capital expenditure. The location provided in this ordinance is readily accessible for vehicular traffic from all sections of the city without encountering the congestion in the central business district. Adequate railroad entrance routes are provided convenient for all of the railroads now using the Dearborn, La Salle Street and Grand Central stations to reach the station location provided in the ordinance, and there is an opportunity for the consolidation of entrance routes that would make possible a reduction of passenger train mileage and operating expenses.

"It should therefore be the policy of the city to encourage the removal of the passenger terminals of the railroads now occupying the Dearborn, La Salle Street and Grand Central stations to the Roosevelt Road Lake Front Station."

The report calls attention to the manner in which the property occupied by these railroads serves as an obstruction to free communication between the southern part of the city and the central business district as well as the manner in which it has served to restrict the normal development of the real estate adjoining these railway facilities. It is also suggested that many of these facilities are or will soon become inadequate and that provision for enlargement of the railway facilities in this territory cannot well be made as they are now occupied. With regard to this feature the following conclusions have been reached:

"Any future railroad development in this territory, therefore, should provide for: (1) The withdrawal, at least in part, of railroad penetration into the central business district; (2) a character of development that would permit joint railroad and commercial use of property; (3) the opening of additional street arteries between the 'loop district' and the south side.

"A study of the map of the territory immediately south of the central business district indicates that it will be extremely difficult to design a large passenger terminal in this district that would fulfill the three requirements given above."

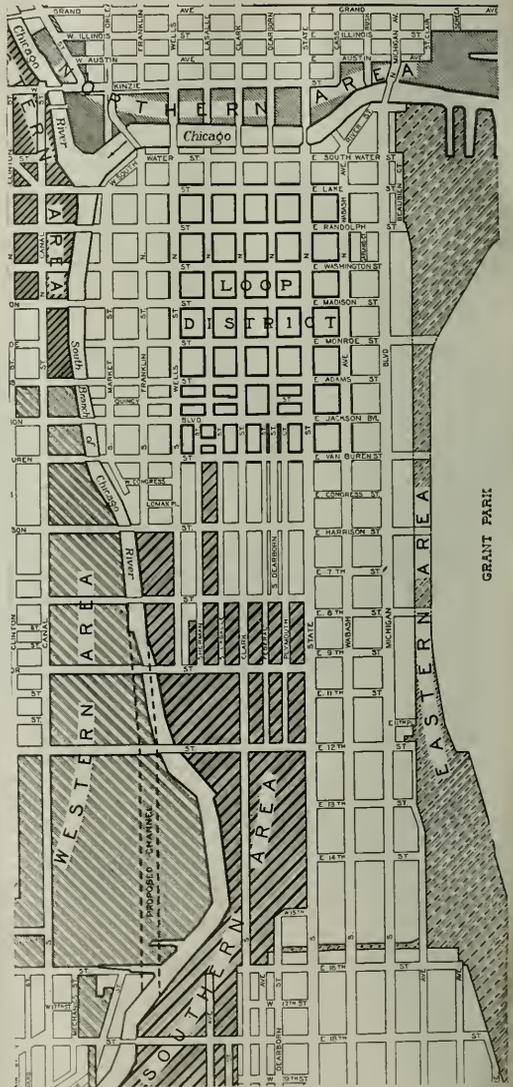

The question of electrification is brought in as follows:

"Judging from past expressions of the city council and the sentiment of the public at large it is evident that no comprehensive railroad development in the territory immediately south of the central business district will be countenanced unless such improvement carries with it operation

of trains by motive power that will eliminate smoke and in the present stage of the art this means electrical operation." Suburban and Freight Facilities

**Also Taken Into Account**

"In connection with the removal of existing passenger stations south of the loop district and the revamping of the

**How Chicago's Business Center is Hemmed in By Railroads. The New Plan Affects the 14 Railroads Occupying Terminals in the "Southern Area"**

freight facilities, provision could be made for a suburban passenger station to accommodate the suburban service of the railroads at present using the Dearborn, La Salle Street and Grand Central stations, in a location that would fit in

with the proper ultimate treatment of the suburban train problem and at a cost that would not be excessive.

"The objections to the development of a passenger terminal in the territory south of the loop district do not apply to the development of freight facilities. Freight facilities can be developed in a manner that will not interfere with the opening of streets through the district and also in a manner that will permit of the use of the space above that used by the railroads for commercial purposes.

"Linked up, however, with the question of the proper development of this territory, both in the interests of the city and of the railroads, is the question of river straightening. South of Van Buren street the south branch of the Chicago river makes a decided bend to the east, which narrows down the southern approach to the main business section of the city. The river being within 150 ft. of Clark street near Fifteenth street. North of Van Buren street there are nine north and south streets while south of Van Buren street, on account of the bend in the river and the railroad occupation there are only four streets, one of these being a boulevard from which heavy traffic is excluded, and of the remaining three, one has undulating grade, is restricted in width, and is a very unsatisfactory street for use of heavy team traffic."

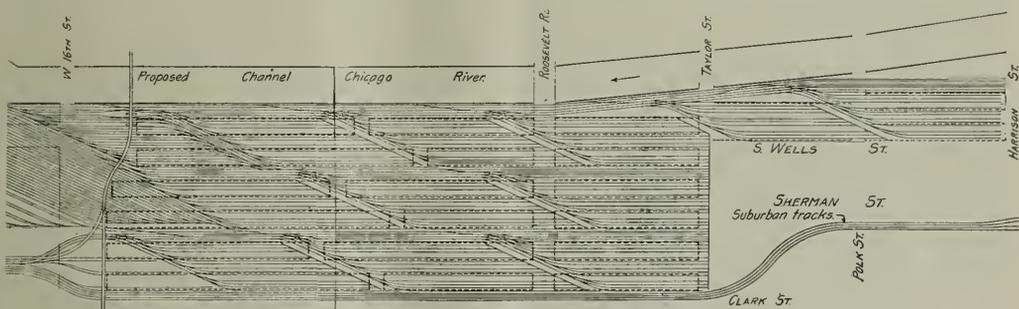

The report points out that the question of straightening the river was discussed for many years but no definite action

river and the revamping of the railroad property adjacent thereto.

"The best interest of both the city and of the railroads will be served if the railroads, in co-operation with the city, will work out a plan for the improvement and rearrangement of the railway terminals in connection with river straightening that will give the city the additional streets required and give the railroads the improvements and additional facilities which they require. It may be, however, that in order to bring this about it will be necessary for the city to be in position to serve notice on the railroads that it is proceeding to an active consideration of the river straightening project and its intention, either with or without the co-operation of the railroads to bring about this necessary improvement."

### Proposes Vacation of Large Area

"Tentative plans prepared by the commission would indicate that the best results would be obtained if the railroad occupation was confined to the territory bounded on the east by Clark street, south by Taylor street and by Wells street between Harrison and Taylor streets. Under this plan the railroad tracks would be depressed to enable viaducts to be put over them through the territory. Fig. 2 indicates the area which the railroads would vacate (shown by cross hatching), while the additional streets which it is proposed

Suggested Intensive Development of Freight Terminals

was taken until 1914 when provision was made in the Chicago Union Station ordinance, whereby the railroads entering the Union Station and occupying property abutting on the river agreed to co-operate with the city in proceedings for straightening the river. A similar agreement was made between the city and the Baltimore & Ohio Chicago Terminal in an ordinance passed in 1915. This ordinance provides for a change of channel in the river, starting at Polk street, extending a little east of south to Roosevelt road, and thence due south. Under this channel change the distance from Clark street to the straightened river will be about 1,015 ft. All of the river frontage embraced within the change described above is owned by railroad companies. The total frontage on the river channel between the lines of change contemplated amounts to 9,580 ft.

### Co-operation Between the Roads Necessary

The report demonstrates that a plan as comprehensive as this, which involves the interests of so many railroads, and involves a complicated exchange of real estate holdings can be worked out satisfactorily only if the railroads come to an agreement among themselves. Efforts to this end had been carried on with some progress until work was discontinued as a result of the war. After pointing to conditions which have served to obstruct action subsequent to the war, it is suggested that the present is a favorable time to undertake all action possible to bring about the straightening of the

to open through the railroad area are indicated by the heavy dotted line.

"It will be noticed that this plan provides for three additional streets between Clark street and the river and also provides for the opening up as a continuous thoroughfare of Dearborn street from Polk street south."

Fig. 3 illustrates a suggested development for the freight terminal in the railway area as restricted under the provisions of this plan. This provides for the railway tracks on a lower level and with a street vehicle development on the street level.

"It is possible in a plan such as outlined to give the railroads freight facilities of a car standing capacity of double the existing facilities in this territory and to work this out in a way that would enable the railroads to utilize the air space above their freight facilities for commercial purposes. This tentative plan (Fig. 3) shows the suburban tracks occupying the under level of Clark street south of Taylor street, thence extending through railroad property to a possible suburban station located at Van Buren street at the present site of the La Salle Street station.

"The present freight facilities of the railroads can only be increased in capacity by resorting to a double level development, and a development of this kind on the property at present occupied by the railroads between Clark street and State street would be found to be expensive because such a development would involve the raising of the level of State street with the consequent property damage along the east

side of State street and along each of the streets intersecting State street from the east in which ramps would have to be constructed to connect with the raised level of State street.

"On the other hand, if the river is straightened and the development is confined to the area between Clark street and the river, and does not extend farther north than Taylor street except between Clark street and Wells street, all of the connecting ramps would occur opposite property now owned by the railroads, and there would be available for the development the same area as is now used by the railroads for freight facilities."

**The Cost**

"The estimated costs of the improvement such as shown on this plan, based on 1920 prices, are as follows:

- "Straightening of the Chicago river, including building of permanent dock walls; the moving of the Roosevelt road and the St. Charles Air Line bridges; temporary construction; track alterations, etc. .... \$3,000,000
- "Viaducts and ramps for new streets opened through the district including adjustment with the Roosevelt Road viaduct .....\$17,000,000
- "Railroad facilities including removal of old structures; excavation; track work; changes to St. Charles Air Line and connections; building freight house; thoroughfare suburban tracks and station.....\$23,000,000
- "To construct a 10-story commercial development over the railroad freight houses would provide about 20,000,000 sq. ft. of rental space and would cost about.....\$95,000,000
- (This feature of the plan would be carried out only as the need for it developed.)

In considering this cost, attention is drawn to the fact that the plan provides for the release by the railroads of 3,000,000 sq. ft. of land which, at an average value of \$20 per sq. ft. would represent a total of \$60,000,000 which the railroads could reasonably be expected to realize in disposing of this property. In addition to this it would be possible to design the freight house facilities west of Clark street so that the area over the freight houses would be available for commercial purposes and this would give the railroads about 2,500,000 sq. ft. of air rights which they could sell. This at a value of \$10 per sq. ft. would represent \$25,000,000. This amount subtracted from the \$43,000,000 because of the railway and street improvements and river straightening would leave an investment of \$20,000,000 which the railroads would have to finance. In commenting on this, the report states: "Offsetting this net expenditure would be the value of the lands released from railroad occupation which has been conservatively placed at \$60,000,000, so that even if the entire cost of river straightening and the constructing of viaducts were borne by the railroads, the full development would still show a credit of \$40,000,000."

The commission says the carriers were asked to exclude from the reports for the third and fourth quarters of the year the retroactive payments for May and June in order not to distort the comparison of averages. The amounts so excluded appear in foot notes, but the reports are not quite complete, and therefore the total payroll above shown is somewhat below what will appear in the final annual report for 1920.

The number of employees shown in the commission's report for the fourth quarter of 1920 was 2,136,259 for October, 2,068,454 for November, and 1,976,429 for December. The average for the quarter was 2,060,368, as compared with 1,933,525 for the first quarter of the year, 2,004,760 for the second quarter and 2,157,989 for the third quarter. The average for the year was 2,054,000. The number of employees is that for the middle of each month. The number for December was about 6,000 greater than that for February, but it represents a reduction of 221,395 as compared with August.

The average compensation per employee for the fourth quarter was \$159 per month, as compared with \$166 for the third quarter, and \$133 for the first and second quarters. The average compensation per employee for the year, as shown by the report, was approximately \$1,818. In 1917 the pay roll was \$1,739,482,142 for 1,732,876 employees, or an average of \$1,004. In 1918 it was \$2,613,813,351 for 1,841,575 employees, or an average of \$1,419. In 1919 it was \$2,836,800,000 for 1,993,524 employees, an average of \$1,483. The pay roll for 1920 reflects not only the increase in the number of employees and the wage increase awarded by the Railroad Labor Board last July, which was in effect for eight months, but also some of the increases made by the Railroad Administration in the latter part of 1919.

**Payroll for 1920 \$3,733,816,186**

WASHINGTON, D. C.

THE RAILROAD PAYROLL for 1920, according to the official statistics just made public by the Interstate Commerce Commission, was \$3,733,816,186, to which a small amount is to be added for back pay for May and June, for which the reports are not yet quite complete. This exceeds previous estimates which had placed the total payroll for the year at \$3,600,000,000, including eight months of the wage increase, and for a full year at the increased rates of pay awarded by the Railroad Labor Board last July at \$3,800,000,000. The commission's report covers only the Class I roads, and its total for the year is made up as follows:

First quarter, old basis.....	\$795,616,330
Second quarter, old basis.....	801,063,938
May and June back pay.....	102,419,680
Third quarter, new basis.....	1,052,109,451
Fourth quarter, new basis.....	982,606,787
<b>Total, 1920.....</b>	<b>3,733,816,186</b>

Relics of an Extinct Past

# How One Road Plans to Reduce Loss and Damage

## An Outline of the Steps Taken to Show Employees How They Can Diminish This Heavy Drain

**T**H. BEACOM, vice-president and general manager of the Chicago, Rock Island & Pacific, is the author of some interesting circulars recently issued by the Rock Island to enlist the co-operation of its employees in a campaign for the elimination of causes for loss and damage claims. These pamphlets are entitled: "How You Can Help to Prevent Causes for Claims" and "Suggestions on How to Prevent Claims," and have been distributed throughout the system and are being supplemented by articles in the company's magazine. The campaign is conducted by a newly-formed organization functioning directly through the operating department of the road and headed by O. Maxey, who has been appointed general supervisor of claim prevention. Mr. Maxey will be assisted by a district supervisor on each of the two Rock Island districts, and by seventeen division supervisors who will have direct charge of the work of educating the Rock Island employees in matters of claim prevention.

In launching the new organization, Mr. Beacom stated his belief that this education will secure the co-operation of Rock Island employees who have a part in the handling of freight, and that this co-operation in turn will have a two-fold effect. In the first place, a large part of the \$2,400,000 which the Rock Island paid out in freight claims in 1919 will be saved. In the second place, reducing this waste will benefit shippers and receivers of freight by improving the service which they receive.

### Campaign Takes in All Departments

In addition to the special organization for the prevention of freight claims, a detailed plan has been worked out to carry the campaign into every department of the road. This work will be under the active direction of the district and division supervisors of claim prevention who are to devote their entire time to the campaign. To obtain the maximum efficiency, the division supervisors have been placed on the staff of their respective superintendents and report both to them and to the district supervisor. The district supervisors, in turn, are on the general manager's staff, and report jointly to the general superintendent and the general supervisor of claim prevention.

Furthermore, arrangements have been made whereby every supervising employee is to be actively engaged in claim prevention. To facilitate the work an outline has been prepared demonstrating the manner in which every supervisor and inspector can best assist. The superintendents are charged with the responsibility of enlisting the active co-operation of all subordinate officers in the work of claim prevention. They also act as the organizers and chairmen of claim prevention meetings at which causes of claims are discussed and remedies proposed.

In the case of trainmasters, the plan provides that in traveling over their districts they are to give necessary supervision to claim prevention and are to take immediate action to correct wrong practices in the "handling of freight, baggage, mail and express" wherever such practices may be found. The trainmasters also employ as much of their time as may be necessary in securing the complete co-operation of all employees.

Yardmasters are reminded that many claims are caused by "improper diversion, failure to comply properly with refrigeration instructions, mishandling of way-bills, failure to handle cars promptly through yards, and failure to exercise proper supervision over car inspectors," and neglect in choos-

ing the proper cars to apply on orders. The yardmasters, therefore, are given the task of making all yard employees thoroughly familiar with the rules for handling freight properly and of seeing to the observance of the rules. They also take necessary measures to prevent damage through the rough handling of cars by yard switchmen and enginemen.

### Officers Instruct Employees

Chief dispatchers are expected to organize their dispatchers, car distributors and other employees in order to keep close check on all important shipments so that any cars which are "set out" on account of bad order may be moved again with the least possible delay. Under the direction of the chief dispatcher efforts are to be made, not only to issue explicit instructions covering car orders so that the proper cars will be furnished, but also to maintain published schedules and to prevent delay of trains with perishable shipments.

Master mechanics are to conduct a constant campaign to obtain more prompt repairs to equipment and are to see that the work is thoroughly done. These officers are to co-operate with superintendents, trainmasters, and chief dispatchers in giving preference for repairs to cars of the class most needed. In addition to these duties, master mechanics are to supervise the education of shippers as to the proper methods of cooping cars. Road foremen of equipment are given the task of instructing enginemen in handling trains and cars carefully. They are to check repairs made both by company forces and by shippers to see that the work is being done to insure a "minimum loss to freight in transit." Road foremen are to observe conditions under which freight is being handled at stations in their territories and are to put into force practices which will work to prevent all class of claims.

### On Look-Out for Pilferage

Division engineers have been instructed to pay special attention to the condition of all buildings through which "freight, baggage, mail and express" is moved. The purpose of this work is to keep at a minimum all loss and damage claims resulting from pilferage and injury while freight is being handled in these structures. Hand in hand with the work of the division engineers in checking up the condition of buildings, are the functions of the master carpenters who are to assist in cutting down losses from pilferage and damage by making prompt repairs to railroad structures.

Roadmasters, during normal routine periods, are to observe, and where necessary correct, methods of handling freight in and around stations. In case of accidents, however, they are to supervise the collection of damaged freight and are to provide police protection adequate to prevent thievery while the freight is being gathered and checked.

Bridge and building foremen, like master carpenters, are to take steps to prevent damage to buildings housing freight, and are to make necessary repairs to these structures promptly and thoroughly.

### Will Educate Shippers

Traveling freight claim adjusters are to take an active part in educating shippers to a realization of the importance of their part in the prevent-claim movement. The adjusters are to make use of every opportunity to impress upon the shippers the necessity of delivering their freight, no matter in what quantity, properly packed in containers sufficiently strong and well-marked to carry it through to its destination.

The adjusters will not only take an active part in educating shippers; they are also to instruct agents and other employees in the proper method of handling freight. In making reports and handling correspondence these officers are to work both to prevent new claims and to give prompt disposition of those claims which are filed so that patrons of the company will receive satisfactory service.

Refrigerator service inspectors are to specialize on the prevention of claims resulting from the improper handling and disposition of freight which requires "protective service against heat or cold." Fuel supervisors will assist road foremen of equipment in educating enginemen as to proper methods of handling their trains, and will correct any bad practices in loading and unloading cars which they may observe. Scale inspectors are to make every effort to see that correct weights can be obtained in all stations and yards. Demurrage inspectors are to give necessary prevent-claim instructions to all conductors and agents with whom they come in contact.

### Correct Bad Car Loading Practices

An important function is given to the cooperage inspectors who are to exercise careful supervision and correction of any careless practices which may obtain in preparing cars for loading, particularly when shipments of small grain are being made. In districts where shippers are cooping cars themselves, these inspectors are instructed to travel on local freight trains to see that this work is done correctly. They are to make similar observations where car repairs are being made by company forces, and are to report immediately to the proper authority whenever they find evidence of insufficient or improper repairs. In the same way, local car inspectors are to assist in claim prevention work by making certain that only cars in good condition are furnished for loading. When inspections of cars are made at terminals, these employees are instructed to give special attention to cars received from connections to make sure that both cars and lading are in condition to carry the shipment through to its destination without damage. The inspectors are to keep cars moving, particularly through yards, by making minor repairs without putting cars on repair tracks.

The police and special service department employees are instructed not only to be on the lookout for improper methods of handling freight, but to watch for pilferage no matter how small it may be. The directions to these employees emphasize the fact that robbery of entire packages and of a part of the contents of packages is one of the largest sources of loss and damage claims. It is the particular province of the company's police to prevent claims of this character.

Traveling freight agents are to act as instructors of shippers in proper methods of delivering freight to the railroad, and of employees in the correct way to handle freight when it has been received by the company. The company believes the large number of causes for claims which originate either in the agent's office, in warehouses, in stations, or on platforms, can be greatly reduced by personal attention from the individual agents. Accordingly, these employees are instructed to supervise any acts which might cause a claim. The agent is also directed to refuse to accept freight, baggage, mail or express unless "it is properly marked, packed and in good condition." Freight conductors are instructed to supervise the proper loading and unloading of freight at stations. They are to see that freight improperly marked and packed is not accepted for transportation, and that once freight has been accepted it is properly stored. Train baggagemen are to exercise the greatest care in preventing damage to freight while it is en route or being unloaded at its destination.

Other classes of employees including claim agents and

personal injury adjusters, traveling auditors, traveling car agents and transportation inspectors, water and motor service inspectors, train rule examiners, service and special inspectors, traveling yard supervisors, supervisors of safety and fire prevention, and district car inspectors, all have been instructed to observe and report existing conditions, and to take steps wherever possible to carry on the prevent-claim movement.

In concluding his directions to Rock Island employees, Mr. Beacom said: "Our patrons are entitled to safe and reasonably prompt movement of the business entrusted to us and I am confident that with full co-operation on the part of the railroad employees, the Rock Island system can make a marked improvement in the handling of its business. Let us adopt as our slogan, 'Prevent Claims' and keep it before us at all times."

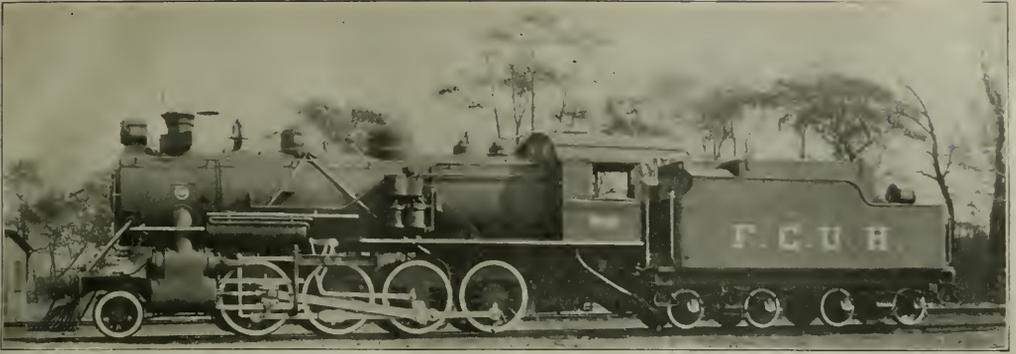

## Freight Car Loading

WASHINGTON, D. C.

ANOTHER DECREASE in freight car loading, due principally to a reduction in the coal traffic, was reported by the Car Service Division of the American Railway Association for the week ending March 26. The number of cars of revenue freight loaded during the week was 687,852 as compared with 900,386 in the corresponding week of 1920 and 713,275 during the corresponding week of 1919. This represents a reduction of nearly 4,000 cars as compared with the week of March 19, but the loading for four weeks in March is still greater than it was during four weeks in February. The total car loading since the first of the year, however, is 14 per cent less than for the corresponding period of 1920. Declines as compared with the previous week were shown in the loading of grain and grain products, live stock, coal, coke and forest products, while increases were shown in ore and merchandise and miscellaneous freight combined. Loading of merchandise and miscellaneous freight showed an increase of 6,259 cars, and this item has been increasing since the first of the year, but the coal loading set a new low record of 122,189 cars for the week. The reduction in the total loading is accounted for largely by reductions in the Central Western and Southwestern districts as compared with the previous week. Other districts show increase.

The Treatment of Smugglers in Upper Silesia. This Train, in Which 100 of Them Were Riding, Was Burned, with the Loss of Many Lives

*The Pershing Consolidation, a Popular Type for Export*

## New Power for the United Railways of Havana

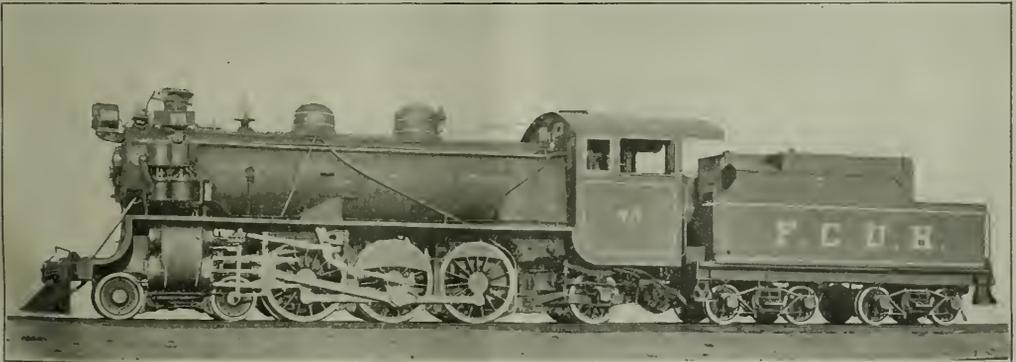

Baldwin Works Make Quick Delivery on Large Export Order  
Comprising Three Locomotive Types

THE UNITED RAILWAYS of Havana, Cuba, have recently received and are now placing in operation three distinct types of superheated oil burning locomotives manufactured by the Baldwin Locomotive Works. These locomotives include 10 eight-coupled side tank locomotives for switching service, 12 Consolidation type locomotives for freight service and 10 Pacific type locomotives for express passenger service.

The Cuban Railways deferred placing orders for addi-

and the Cuban Central Railways. These combined lines operate approximately 375 locomotives and 11,225 cars over 1,168 miles of standard gage track.

There are approximately 650 locomotives and 16,000 cane cars in operation on 1,500 miles of railroad which are owned and operated by the 193 sugar centrals scattered throughout the island. During the rush season when the sugar cane has been transported to the mills and the sugar carried to the various ports for foreign shipment, this rolling stock is

Designed for Express Passenger Service Between Havana and Santiago

tional motive power during the four years of the war with the resulting condition similar to that which confronted the railroads of the United States, that their operating departments have been compelled to transport a large increase of passenger and freight traffic with a negligible increase in motive power units. This condition has taxed their ingenuity to make ends meet and at the same time give satisfactory service. Brigadier General Jack, formerly director of British Military Railways in France, was recently made general manager of the United Railways of Havana and subsidiary lines, comprising the Western Railway of Havana

permitted to use the public service railways on a ton-mile basis. In 1920 960,000,000 lb. of sugar was moved for export.

### A Compact and Sturdy Switcher

The Eight-wheel switching locomotives are compact and modern in every respect. They are to be utilized in railway yard work in and around Havana, Santiago and other points. In order to eliminate all rocking motion this engine incorporates comparatively small oil and fuel tanks in its design as large tanks are unnecessary due to the engine being within

reach of water and fuel supply at all times. The total weight of the engine, 142,200 lb., is evenly distributed on the four pairs of coupled driving wheels, which are placed as close together as possible, permitting the locomotives to traverse curves of about thirty degrees.

Although the engines are compact the various parts are accessible for adjustment or repair; for example, the air pumps are fitted on the side of the smokebox, while the electric headlight generator is on top of it. The injector check is fitted on the top of the boiler, the valve motion is on the outside and sufficient space is allowed between the

able petticoat pipe. The smokebox front is made of pressed steel carefully fitted with a dove-tailed asbestos joint ring.

These locomotives are equipped with air brakes, electric headlights, air bell ringers and air sanders. The injectors, lubricators and safety valves are of the latest approved types. The tenders for these engines are substantially constructed of steel channel frames erected on two four-wheeled, center bearing trucks of the arch-bar type. On this frame is attached a steel flooring upon which is mounted a U-shaped water tank with a capacity of 5,000 U. S. gallons and an oil tank of 3,200 U. S. gallon capacity. These locomotives

All Appliances Are Conveniently Located on This Eight-Wheel Switcher

boiler and frames for the inspection of all parts between the frames. These locomotives are equipped with superheaters having a heating surface of 237 sq. ft., which is exceptional for engines of this type, especially for switching engines in foreign service. The cab is large, allowing the engineer plenty of room and a clear view both front and back. These switching locomotives are capable of exerting 31,860 lb. tractive effort, at which the factor of adhesion is 4.5.

**Pershing Type Consolidations**

More space has been provided for the operators in this design by the cab being widened and the top raised. The coupler lug height has been raised so that the tenders now in use by the railways may be interchangeable with their old and new motive power units. The boiler is exceptionally large and has sufficient steaming capacity to operate the engine and its rated load at a constant speed of twenty miles an hour. The maximum tractive effort exerted by these locomotives is 35,625 lb. These locomotives are modern in every respect, being equipped with air brakes, air sanders, air bell ringers and electric headlights. They are equipped with superheaters having 420 ft. of heating surface. The smoke stack is supplied with a damper which prevents, to a certain extent, a quick cooling of the engine at the end of a run.

**Pacifics for Through Passenger Service**

The Pacific type locomotives were designed to haul the Havana-Santiago express, a train of six to eight cars, at a maximum speed of thirty miles an hour. All parts of each engine are interchangeable. These locomotives are equipped with superheaters having a heating area of 487 sq. ft. The smokebox is of the extended type and fitted with an adjust-

develop 25,700 lb. tractive effort and will negotiate 20 degree curves and 2 per cent grades.

The principal dimensions for the three locomotives are tabulated below:

	Eight-wheel Switching	Consolidation	Pacific
Gage .....	4 ft. 8 3/4 in.	4 ft. 8 3/4 in.	4 ft. 8 3/4 in.
Cylinders .....	20 in. by 24 in.	21 in. by 28 in.	20 in. by 26 in.
Valves .....	Piston type	Fiston type	Piston type
Boiler:			
Diameter .....	56 in.	70 in.	65 1/2 in.
Working pressure....	180 lb.	190 lb.	180 lb.
Firebox:			
Material .....	Steel	Steel	Steel
Staying .....	Radial	Radial	Radial
Length .....	84 1/2 in.	122 1/2 in.	84 1/2 in.
Width .....	42 3/4 in.	38 1/4 in.	65 1/4 in.
Grate Area .....	25 sq. ft.	32.5 sq. ft.	38.2 sq. ft.
Tubes and Flues:			
Flues .....	15 5/8 in.	26 3/8 in.	22 5/8 in..
Tubes .....	107 2 in.	165 2 in.	151 2 in.
Length, tubes and flues	13 ft. 1 in.	13 ft. 9 1/2 in.	18 ft. 6 in.
Heating Surface:			
Arch .....			16 sq. ft.
Firebox .....	118 sq. ft.	181 sq. ft.	158 sq. ft.
Tubes .....	728 sq. ft.	1,181 sq. ft.	1,456 sq. ft.
Flues .....	300 sq. ft.	500 sq. ft.	570 sq. ft.
Total .....	1,146 sq. ft.	1,862 sq. ft.	2,200 sq. ft.

Tank capacity .....	2,000 U. S. gal.	5,000 U. S. gal.	5,000 U. S. gal.
Fuel oil capacity.....	700 U. S. gal.	3,200 U. S. gal.	3,200 U. S. gal.

# Hearings on National Agreements Continue

## More Railway Executives Cross-Examined—Employees' Representatives Present Economic Studies

DEVELOPMENTS during the past week in the dispute over the continuation of national agreements have been many and varied. They include (1) the presentation of an historical volume regarding railroad working conditions and national agreements; (2) the presentation of analytical studies by W. Jett Lauck, consulting economist of the labor organizations, who is attempting to portray the necessity for national agreements in the railroad industry by voluminous economic studies of similar developments in other industries; (3) the cross-examination of W. G. Besler, president of the Central Railroad of New Jersey; H. E. Byram, president of the Chicago, Milwaukee & St. Paul, and Frank McManamy, formerly assistant director, mechanical department, Division of Operation, of the United States Railroad Administration; (4) the decision by the board not to admit representatives of shippers as parties to the dispute over working conditions; (5) the calling of Judge R. M. Barton, chairman of the board, to a conference with President Harding and Edgar E. Clark, chairman of the Interstate Commerce Commission, at Washington; and (6) the dispatching of another long telegram to the President by Mr. Jewell.

While these numerous and various developments indicate that the Labor Board has spent an especially busy week, there is nothing to indicate that the long controversy over the employees' demands for perpetuation of their "national agreements" is nearing its close.

### B. M. Jewell Continues Rebuttal

The rebuttal of B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, and spokesman for the "Associated Standard Recognized Railroad Labor Organizations," the opening statements of which were described in the *Railway Age* of April 1 (page 845), took three and a half days to complete. All of the board's sessions on March 24, 25 and 28 and part of the session on March 29, were taken up by Mr. Jewell in reading volumes of correspondence showing the cordial relations existing between the Railroad Administration and the Railway Employees' Department of the American Federation of Labor, the co-operation extended to the railroad administration by the various shop crafts organizations and the negotiations leading up to the disputes over wages and working conditions which have been before the board since its creation.

### W. J. Lauck Presents Economic and Historical Exhibits

W. Jett Lauck, consulting economist of the labor organizations, on March 29 began the presentation of a series of exhibits which will establish, according to Mr. Lauck:

1. The policy of establishing national agreements, or uniform rates of pay and working conditions, is in conformity with custom and precedent in the transportation industry, and in accordance with the best public policy as shown by the awards of boards of arbitration, and the acts and recommendations of other official agencies during the pre-war period.

2. In other leading basic industries of this country, collective bargaining on a national scale, and national agreements as to working conditions and relations, have been found to be the best means of stabilizing conditions, promoting industrial peace, and accelerating production.

3. That in Great Britain these facts have become so clearly recognized by both employers and employees that national agreements are encouraged by the Federated Industries and the Federation of Trade Unions as a whole, and the effort is being exerted

to make them compulsory upon all employees in a given industry.

4. That the former railroad administration in entering into national agreements, therefore, merely recognized a tendency which had almost reached complete development prior to the war and which was sanctioned by enlightened opinion both within and without the transportation industry.

5. That the representatives of the railroads have practically given their sanction to national rates of pay and working conditions of engine and train crews. These classes of employees have uniform rates of pay and working conditions embodied in agreements with individual railroads, but *underwritten* by the national organizations of these employees and concurred in by the railroads on a national basis. This is just as much a national agreement or standardization as it would be to agree upon wages and working conditions nationally and then embody the agreement into agreements with individual railroads.

6. We shall show further that the arguments of the railroads are the same which have been urged in all past years to prevent the establishment of humane standards in industry, and shall demonstrate that the railroads are now consciously and deliberately taking advantage of a temporary industrial depression to destroy humane standards which are sanctioned by the thought and practice of the leading industrial nations of the world.

"The root of the railroad difficulty, we shall show, is not in national agreements but in the inadequacies of the management," Mr. Lauck said. "Conservatively stated, if railroad management was characterized by reasonable efficiency and had available for its proper use a proper amount of credit or capital, labor costs would have shown a radical decline under national agreements, and savings in operating expenses of at least one billion dollars annually would be made.

"The claim of General Atterbury that the national agreement produces inefficiency and waste we shall answer in our next series of exhibits," he continued. "We shall submit evidence to show that the output of the employees, or their productive efficiency, has greatly increased as compared with the pre-war period. That a much greater volume of traffic has been handled by fewer employees working a fewer number of hours.

"To our minds the policy of all the comparisons that are made is that they are made with 1917 when the railroad industry had been practically depleted by the tendencies which have been drawn forward since 1914 following the industrial depression at that time and the loss of forces which were not recruited up to 1917, when the railroad administration took control. When you study the number of employees at the present time you see that practically we have not got back to a normal basis as yet on the railroads, instead of having an excess over, and when that is compared with the work actually done we find that a much greater volume of traffic is handled by fewer employees working a fewer number of hours now as compared with the pre-war period.

"Our conclusion is that labor has been more productive, but it has not had a proper chance; it has not met with the proper response on the part of the managements, and especially the railroad industry being depleted of capital or credit practically since 1910—without going into the cause of that whatever the cause may be—it is handicapped by the inadequacy of managements. We are not especially charging the managements with incompetency or inefficiency, but we are speaking of the inadequacy rather than the inefficiency."

These exhibits were not made a part of the record in the case but were filed as separate exhibits, Mr. Lauck pointing out their salient features, taking so far three and a half days for this purpose. On March 30, in describing part of his

exhibit which was concerned with the agreement formed between the manufacturers of clothing and their employees, Mr. Lauck charged, in reply to a question, that the forces which are alleged to be back of the clothing manufacturers in their attempt to nullify this agreement in New York are the same forces which are behind the railroads in their attempt to abrogate the national agreements. This remark brought forth the statement from J. G. Walber, a member of the Conference Committee of Managers of the Association of Railway Executives, that Mr. Lauck was probably "suffering from a mental hallucination."

### The Movement Toward National Agreements

In presenting his first exhibit, entitled "The Movement Toward National Agreements," Mr. Lauck said, "The logic of events has demanded that national organization of labor and the negotiation of national agreements. Organization of the employees, as well as organization of the unions, has become nation-wide because the industries themselves have become nation-wide, markets have become at least nation-wide, competition or consolidation has expanded, the fields of finance have widened, migration of labor has increased, and the trade associations of employers have become national in scope."

Mr. Lauck explained that the exhibit dealt particularly with conditions in other industries which had led to national agreements, the experience in working out such agreements and the results achieved through their being placed in operation.

He traced the development of labor organizations from a local to a national scale and quoted labor historians as stating that no change in industrial technique, not even the utilization of steam as a motive power, had ever had so simultaneous an effect upon all industries as had the sudden extensions of markets due to the railroad consolidations of the fifties.

"The national agreement averts industrial interruption," he continued. "The consensus of the evidence adduced shows that in the rapid expansion of our industries we have reached the point where nothing but discord results from independent action by shop committees and local unions. The national labor organizations, like the national associations of employers, can view policies from a national standpoint, they have greater responsibilities and therefore give all questions more careful thought before acting. The testimony on the part of employers where the national agreement has been in effect shows conclusively that it opens the way to industrial peace."

Mr. Lauck then reviewed the genesis and operation of national agreements in the stove industry, in the glass bottle industry, in the pottery industry, between the workers and the international association of electrical contractors and the dealers, between the typographical publishers' association, in the bituminous coal mining industry and in the clothing manufacturing industry. All these agreements, he declared, had been productive of beneficial results both to capital and to labor and he outlined the views of employers, economists, government investigators and arbitrators, all of which, he said, tended to show (1) that industrial peace is attained by national agreements; (2) that the establishment of uniformity is socially important; (3) that unions do observe their contracts; (4) that it is important that national agreements cover working conditions; (5) that trade agreements are not inconsistent with the genuine open shop, and (6) that trade agreements humanize the industrial situation. The document also included a discussion and account of the historical experience of England in the matter of collective bargaining and national agreements. The British experience, he said, parallels substantially the same principles which have been developed in American progress in industrial relations.

### The Unity of the American Railway System

Mr. Lauck's second exhibit, an analytical summary of "The Unity of the American Railway System," was presented to show, Mr. Lauck said, the substantial unity of the American railway system by the following facts:

1. The basic roadways and rail systems of America's railways have become virtually inter-connected and unified into one great system of continental extent, substantially uniform in character and standard in construction throughout, the differences obtaining being matters not of primary importance.
2. The equipment is essentially national in the range of its movement and use, and substantially uniform in its character, except for secondary differences.
3. The American railway system, in its national scope, is operated under a system of uniform time, uniform train rules, signals, etc.
4. The entire system is controlled under substantially one system of accounting, nation-wide in its application.
5. The public service requirements of the railway system have become essentially general in character—the shipper requires and receives through rates and through billing of goods, or passenger transport from any point to any point.
6. The entire system operates, with certain regional variations, under highly unified and standardized systems of freight and traffic classification and with largely identical rates.
7. The system is controlled by a highly unified system of financial organizations, and operative and administrative associations.
8. A nationally unified system of operating intelligence, car-service information, traffic statistics, is maintained and cleared through the American Railway Association, and a more general railway information system is maintained through the Bureau of Railway Economics, besides the unifying information and control exercised through the Interstate Commerce Commission.
9. Governmental recognition of the unity of the American railway system, in matters essential and fundamental, is expressed in the legislative, the administrative, and also in the judicial pronouncements of the United States government.

"This exhibit," he said, "relates particularly to the matter of the elimination of inequalities in treatment upon the railway system, to the question of who should be parties to agreements and who may be parties to this dispute."

"It tends to show," he continued, "between what parties the question of working conditions is normally joined. It may have a bearing also upon the respective privileges, rights, and duties of carriers and their employees, and may relate to the making of regulations necessary for the efficient execution of the functions vested in the board, to the end that interruptions of traffic shall be avoided."

### Ex-President Taft's Interpretation Attacked

During the presentation of this last exhibit an interesting discussion was started by G. W. W. Hanger, public member of the board, who called attention to the interpretation of the Transportation Act which has recently been made by ex-President William H. Taft and which has been widely circulated in the press. Mr. Taft's interpretation of the principle of collective bargaining as defined in the act, is contrary to that of the brotherhoods, and was characterized by Mr. Lauck as being founded on partial information furnished by railway executives. Mr. Lauck admitted, however, that material regarding the present controversy had been sent to Mr. Taft in an effort to present the employees' interpretation of collective bargaining. Both Mr. Jewell and Mr. Lauck stated definitely that they did not agree with Mr. Taft's interpretation.

The next exhibit presented by Mr. Lauck was entitled, "Railroad Boards of Labor Adjustment," the purpose of which is that national agreements are closely inter-related in principle and therefore practically inseparable, and that the Transportation Act itself contemplated national adjustment boards.

At various times throughout the hearing the introduction of much of this evidence was objected to by Messrs. Hanger, Park, Elliott, Walber and others, but in the majority of cases these objections were over-ruled after representatives

of the employees had protested against interfering with the presentation of their cases.

At the close of the public session on April 1 Mr. Jewell stated that the preliminary presentation on behalf of the employees had been completed, but that they had several additional exhibits in the course of preparation and these would be filed with the board after completion of the cross-examination of the executives summoned to appear before the board on April 4.

#### Cross-Examination of W. G. Besler

W. G. Besler, president of the Central Railroad of New Jersey, summoned to appear before the board at the behest of Frank P. Walsh and Mr. Jewell, like his predecessors on the witness stand, proved a tartar when he consistently met Mr. Walsh's attack with the apt expression, "circumstances alter cases." Mr. Walsh, in his examination of the witness, followed the same line of attack pursued in questioning T. DeWitt Cuyler, General W. W. Atterbury and Carl R. Gray two weeks ago. The points he attempted to establish at that time were outlined in the *Railway Age* of March 25 (page 303). The effort and the failure at that time were repeated in the examination of Mr. Besler.

Mr. Besler freely admitted that certain rules in the shop crafts' national agreement were in effect on the Central of New Jersey prior to federal control, but the attempt of Mr. Walsh to infer that therefore the rules were applicable nationally failed on the stand that "circumstances alter cases." The only rule upon which Mr. Besler and Mr. Walsh agreed as a fair rule and fit for national application was the Golden Rule, which the former stated he had tried to apply on his road and which both agreed could easily be applied on all roads.

In going through the rules of the shop crafts agreement Mr. Besler pointed out that many were silly, others unnecessary and still more unfair. Regarding many of the rules, Mr. Besler said: "Many of the rules have no place in the book. They are properly a function of management and of far more interest to an intelligent, efficient management than they are to the employees. The managerial function presupposes an agreement between the company and its employees and perhaps agreement among the employees, but the one is not contingent upon the other."

The original proof of the Central of New Jersey plan, which Mr. Besler's employees advocated heartily at the end of federal control until interfered with by national union officials, was introduced into the records. Mr. Besler also went on record as believing without prejudice in the right of men to organize or belong to any organization they wish, and said no one should be discriminated against by reason of his affiliations. Mr. Besler's opinions on the right of the majority to represent the minority were contrary to the stand taken by General Atterbury that the minority had a right to direct representation. Mr. Besler not only conceded majority representation as regards all employees, but also granted the right of the majority of each craft on each road to select a committee to represent them.

When the subject of the eight-hour day was taken up by Mr. Walsh, Mr. Besler replied that the length of the day depended entirely upon circumstances, and that it was conceivable that a ten or twelve-hour day might be preferable under certain circumstances. To this Mr. Walsh returned the verdict, "that is unethical, if not immoral."

"But," said Mr. Besler, "the farmer has never regarded the eight-hour day. Is that unethical?"

"Not at all," replied Mr. Walsh.

"Why isn't it?" asked Mr. Besler.

"That's the sad condition of the farmer," returned Mr. Walsh. "The farmers desire leisure like the next man, but there are a great many factors which enter into consideration. Were it not for the machinery at work, principally

the railroads, the farmer would not have to work from sun-up to sun-down."

The examination at one time touched upon government ownership, when Mr. Besler asked if a man were not worse off to ask wages so high that the industry could not pay them and so have to shut down than he would be if he accepted a lower wage and more permanency.

"The industry then should turn to government ownership," said Mr. Walsh, but the whispered advice of one of the labor leaders ended the discussion as quickly as possible.

#### E. E. Loomis Declines to Testify

Immediately preceding the cross-examination of Mr. Besler a letter was read into the board's records from E. E. Loomis, president of the Lehigh Valley, who had been summoned to appear with Mr. Besler and Mr. Byram. Mr. Loomis declined to testify on the grounds that "he had no information that would throw any light on the workings of the rules of the national agreements." On the strength of this assertion the labor leaders waived their request for his cross-examination. At the same time they requested the summoning of Frank McManamy to appear on April 6.

At the opening of the session on April 6 Mr. McManamy and Mr. Jewell began the presentation of their direct rebuttal to the testimony presented on behalf of the carriers regarding the Shop Crafts' Agreement. Mr. Jewell's testimony was largely in commendation of the work performed by Board of Adjustment No. 2 during the period of federal control and he cited as evidence of this the fact that there was no legal strike on any railroad under federal control while this Board was in existence. When Mr. McManamy appeared Mr. Jewell permitted him to take the witness stand and he opened the examination by reading a long list of questions which were to be asked. These questions all aimed to establish facts in opposition to the carriers' stand as expressed by several witnesses, viz. that the Railroad Administration was coerced into entering into National Agreements and that the establishment of these agreements has resulted in decreases in efficiency and destruction of the morale of individual workers. Several of the questions indicated one of the employees' contentions that the uneconomical and inefficient practices brought about by the application of the National Agreements and cited by Mr. Whiter in this presentation are the result of a studied effort on the part of the railway executives who were in control of the carriers during the period of federal control. After presenting these questions Mr. McManamy was permitted to answer them without examination and in taking up the first 18 of these questions at this session his testimony throughout was in favor of employees' contentions. In general he contended that the National Agreements promoted efficiency and economy, removed unrest, reduced labor turnover and prevented competition for labor. Mr. McManamy's testimony will be covered more fully in next week's issue of the *Railway Age*.

#### Examination of H. E. Byram

When Mr. Byram was placed on the stand on April 5 Mr. Walsh was confronted with the same situation which has prevailed in the cross examination of all of the executives during the past two weeks. The same effort to get the witness to admit the applicability of some rules to national use was made and the same result was obtained; the reiteration that the only rules which are good rules and fair are those negotiated between the men who work under them and the men who are responsible for their proper application.

In reply to questions, Mr. Byram outlined the developments which took place in the meetings of the labor committee of the Association of Railway Executives and interpreted these developments. Following this Mr. Walsh tried to get Mr. Byram's sanction to all of the rules established by the arbitration board of six, under the Newlands

act in 1915, of which Mr. Byram was a member. These rules were adopted by ninety-eight roads west of the Mississippi river, but Mr. Byram made it clear he did not favor all of these rules, but had to agree in the arbitration.

Asked if the work day was not an important thing in industry, Mr. Byram said that it was a most important thing. "There should be an agreement on hours a man should work each day," he added, "not a rule or law."

"When you have agreed," asked Mr. Walsh, "do you think such agreements should be stated in some kind of rules?"

"I agree with that," said Mr. Byram, "but the parties who apply these rules should be the ones who made them. There is a great difference between what you mean and what you say. The great difficulty is in the application."

Before Mr. Byram took the stand, Mr. Besler was recalled. He immediately refused a request of Mr. Walsh for the notes from which he had previously read in commenting on national rules.

James M. Sheehan, counsel for the railroads, then cross-examined Mr. Besler, questioning him particularly on the rules of the National Agreement which Besler said yesterday were substantially in effect on the Central of New Jersey prior to government control.

Mr. Besler's answers were to the effect that if these rules were properly applied they were acceptable, but not as applied under interpretations placed upon them under the Railroad Administration.

### B. M. Jewell Again Appeals to the President

On March 31, Mr. Jewell again appealed to the President asking him to use his influence to bring about a conference between the railway executives as they are organized nationally and the railway employees as they are organized nationally to compare the differences on all points in dispute. This request was predicated on President Harding's statement in his inaugural address when he said, "I had rather submit our industrial controversies to the conference table after conflict and suffering" and upon the employees' interpretation of the Transportation Act which "contemplates such a conference."

Reports from Washington indicate that the President will not act upon this request.

### Board Denies New York Central's Petition

The Labor Board on April 7 denied the application of the New York Central for the granting of an immediate temporary decrease in wages of unskilled labor and set April 18 as the date for hearings on the justness and reasonableness of the rates of pay established by Decision No. 2. At the same time the Board set April 18 as the date upon which the hearings will be held on all of the disputes over wages so far referred to the Board or which may be referred in the meantime. The employees will be given eight hours for oral presentation and the carriers a similar period and the remainder of testimony is to be filed with the Board.

Hearings on the request of the New York Central for the authorization of a temporary decrease in the wages of its unskilled laborers were held by the Railroad Labor Board at Chicago on March 30 when Jacob Aronson, counsel for the road, presented briefly the carrier's request and data relative to the wages being paid unskilled laborers in outside industries along the New York Central. The dispute and the proposal of the road was described in the *Railway Age* of April 1, (page 846). In bringing the controversy before the Board, the New York Central asked that a temporary decrease be authorized effective on April 1, the final award of the Board to be retroactive to that date.

In outlining the reasons for this request, Mr. Aronson said:

"The policy of making awards of wage increases retroactive has heretofore been recognized. That policy has been

followed by this Board. Justification for this practice was undoubtedly that neither side should suffer or profit by the delay necessarily entailed in the deliberate consideration and determination of wage controversies. We submit that by virtue of the same logic any downward adjustment of wages should also be made retroactive. In the case of wage increases it is practicable to make the award retroactive because in such case there is only the employer to deal with, but because of the large number of employees involved it is manifestly impracticable if not impossible to make a reduction in wages retroactive merely by virtue of the ultimate award. The only feasible method by which reduction in pay can be made retroactive is by the establishment of the reduced rates provisionally upon the understanding that such establishment by the Board is without prejudice to its ultimate determination of just and reasonable wages and that the ultimate award of the Board shall be retroactive. In this way the employees are not financial losers below the basis that may be determined by the Board to be just and reasonable."

Following the presentation of this request, Mr. Aronson filed data regarding the wages being paid for unskilled labor in outside industry, the changes in the cost of living and other facts pertinent to the determination of a just and reasonable wage. In addition the following witnesses were called upon for data on the wages being paid for farm labor, Silas L. Strivings of the New York Farm Bureau Federation; Frank M. Bradley of the New York State Federation of Agriculture, and F. E. Warner of the Michigan Fruit Exchange.

B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, speaking for the employees, objected strenuously to the carrier's request, saying, "The employees waited for eighteen months, suffering under a rapidly increasing cost of living, for relief." His objections to the request were based on the grounds that rates of pay did not go up apace with the cost of living and that therefore they should not come down apace, that the present financial situation of the railroads is due to a temporary depression and that a temporary decrease is therefore unnecessary and that since freight and passenger rates were raised to meet the wage award of last July no reductions should be made in the wages of employees unless the savings therefrom be turned back to the public by lower rates.

The hearing was closed on March 30.

### National Industrial Traffic League Petition Denied

On March 29 the Labor Board formally denied the petition of the National Industrial Traffic League to be made a party to the hearings on rules and working conditions now before the Board. The resolution holds that the league "is not entitled to be heard in this dispute."

"In the opinion of this Board," the decision said, "the hearing of the said petitioner as a witness would not be helpful and would not be in the public interest. If this petitioner is heard, other organizations of shippers, of which there are many, must be heard. If such organizations are to be heard, manufacturers, Chambers of Commerce, farmers, bankers, and other interests must also be heard. If these are to be heard, adverse organizations, such as labor unions and organizations whose members hold definite economic views opposed to the views of those named, must also be heard."

To this the Board objects on the ground that it would involve long delay, and adds, it is not unmindful of the public interest in the matters in dispute, "as it affects the interest of the public as well as the interests of the two parties directly concerned."

The league's answer to the Board's denial was an immediate challenge through its attorney, Luther M. Walter. He

wanted to know among other things how the three members of the Board, whose terms expire April 1, voted on the petition, in order that the league might fight reappointment of any of the three who voted against the public.

**St. Louis Southwestern Case**

On April 1 the St. Louis Southwestern came before the Board as a result of a resolution passed by the Board and stating that it had reason to believe that that road had violated Decision No. 2 in cutting the wages of employees in pile driver, bridge and building paint gang, house gang and tinner services on November 25. W. A. Webb, vice-president and general manager, denied the charges in toto and stated that the only modification of Decision No. 2 made by the road was made by contract with individual men. J. C. Smock, representing the employees, submitted letters and affidavits to prove that the road had violated the principle of collective bargaining as outlined in the Transportation Act and that no conferences have been held in conformity with the provisions of the Act. He charged the carrier with coercion and intimidation on the grounds that economic necessity made it necessary for the individual men to accept the contracts offered by the road for the work outlined above. The Board took the case under advisement.

**Short Lines Get Postponement**

The nineteen short lines which were to have appeared before the Board on April 4 and 6 have had their cases postponed until April 18 and 20. These carriers have reduced the wages of their employees without the authority of the Board and when the employees appealed to that body for redress, it advised them to accept the lower wage scales under protest until hearings could be held and a decision rendered.

The roads involved in these disputes are the Atlanta & St. Andrews Bay, Boyne City, Gaylord & Alpena, Brooklyn Eastern District Terminal, Butler County, Butte, Anaconda & Pacific, Canton Railroad, Georgia & Florida, Philadelphia, Bethlehem & New England, Waupaca-Green Bay, Tennessee, Alabama & Georgia, Alabama, Tennessee & Northern, Cornwall, De Queen & Eastern, Gulf, Texas & Western, Northampton & Bath, North Western of So. Carolina, Patapsco & Back River, South Georgia, Texas, Oklahoma & Eastern.

**Many Roads File Wage Reduction Petitions**

The conferences which have been held this week on many railroads between the management and the employees looking toward wage reductions have been no more successful than the conferences held previously, and it is evident that the number of cases before the Board will increase.

Among the roads which have wage reduction cases before the Board are the New York Central, the Boston & Maine, the Chicago, Indiana & Western, the Denver & Salt Lake, the Boston & Albany, the Ann Arbor, the Lehigh & New England, the Indiana Harbor Belt, the Maine Central, the Detroit & Mackinac, the Gulf, Colorado & Santa Fe, the Pittsburgh, the Toledo & Ohio Central, the Rutland, the Delaware, Lackawanna & Western, the Lehigh Valley, the Erie, the Chicago & Northwestern, and the Cleveland, Cincinnati, Chicago & St. Louis.

**New York Times' Story on Lauck's Exhibits**

Mr. Lauck's various exhibits mentioned above are expected to contain some rather interesting criticisms of railway management and operation, if a statement purporting to give some of the high points of what Mr. Lauck is expected to say, which appeared in the New York Times of Monday last, is any indication. The article shows that Mr. Lauck has in many cases taken his material from statements of railway

officers and other experts who have outlined acknowledged omissions in expressing their desire to remedy them, provided there were sufficient funds available to do so. The exhibits in question had not been made public up to the time of going to press. In other words, they do not form part of the testimony which had been presented to the Labor Board up to that time. The material which follows is an abstract of the story as it appears in the Times.

Mr. Lauck's evidence to support his charge that inadequacies and inefficiencies of railroad management add \$1,000,000,000 annually to the expenditures of the railroads of the United States is in the shape of an exhibit prepared by a "group of engineers." Parts of it are supported by statements of railroad executives and engineers. Technical journals, such as the *Railway Age* and *Railway Mechanical Engineer* also are quoted extensively. Some of the items of the estimated saving which efficient management might bring about, according to Mr. Lauck, are tabulated as follows:

Modernizing locomotives .....	\$272,500,000
Locomotive opr. firing methods.....	50,000,000
Shop organization improvements.....	17,500,000
Power plant fuel savings.....	10,000,000
Water consumption savings.....	12,600,000
Service of supply savings.....	75,000,000
Shop cost accounting savings.....	10,900,000
Labor turnover savings.....	40,000,000
Less and damage savings.....	90,000,000

Total estimated annual savings..... \$578,500,000

Other items which will be enumerated in the exhibit as offering opportunities for additional savings include car equipment, operation and maintenance, engine terminals, permanent way improvements and maintenance, signal maintenance, train operation, research and engineering, miscellaneous overhead advertising, etc. Savings on these items, it is claimed, will bring the total well above the \$1,000,000,000 mark fixed by Mr. Lauck in his opening statement.

Twelve devices are listed in the exhibit as available for modernizing all of the present inefficient and uneconomical locomotives, and detailed figures are given to show that of the 65,000 locomotives in service only a small percentage are equipped with any of these devices. For example, the statement is made on the authority of an engineering expert that 22,000 locomotives are being operated without brick arches, which, it is asserted, could be economically installed in any roundhouse, with a reduction in fuel consumption of 10 per cent or an increase in boiler capacity of 11 per cent.

Another expert who is quoted on repair shops, says the railroads are \$140,000,000 behind in improvements which should have been made in the last ten years, and adds: "The railroads will not purchase a new outfit of lathes, but continue to use some over 50 years old, and are paying modern wages to watch those antiquated curiosities feebly fooling away their time. Meanwhile the operator is resigned to slow death. It is certainly poor reasoning to spend \$10 in labor when \$1 in tool service and \$4 in labor properly supported could have saved \$5 on the same job."

On the item of service of supply the exhibit says:

"The railroads spend over \$1,000,000,000 for supplies each year. They use nearly 50,000 different working parts and accessories. At any given time \$600,000,000 worth of supplies will be on hand, of which 40 per cent is scattered along the line. With a few outstanding exceptions, the companies are negligent in caring for these immense stocks. They have not co-ordinated their purchasing and storing functions. They do not budget requirements properly, lacking which, both purchasing and delivery are inefficiently administered. They do not care adequately for their stores; they pile them badly; they leave them without suitable shelter to rust and decay; their storehouses are poorly arranged and often poorly located; they do not properly reclaim worn out material; their stock records are seriously deficient and their accounting for stores primitive.

"The Railroad Administration has estimated that the

waste and abuse of materials amount to not less than \$75,000,000 a year, a figure which the *Railway Age* endorses."

On the subject of "miscellaneous losses" the exhibit says: "The question of operating efficiency of the railroads cannot be closed without reference at least to possible savings in various items of overhead expense. Millions are now being spent in propaganda advertising to secure the good will of the public. The same amount spent on scientific research would be many times as effective, and reduce costs into the bargain. The salaries of railroad officers are well known to be exorbitant in some cases.

"From \$12,000,000 to \$15,000,000 a year is spent for legal services. How much of this represents lobbying and special pleading? How far have the railroads burdened their expense accounts with the carrying charges of injudicious investments in non-railroad properties? How far are the great sums spent for competitive advertising and outside agencies in line with efficient service, even under private ownership? All these items need careful scrutiny from the standpoint of preventable waste."

Mr. Lauck proposes to discuss also economies that might be effected through consolidation of the railroads into a few large systems, the financing of the transportation industry on a permanent instead of a hand-to-mouth basis, with large, long term credits, and the operation of the roads on a cost of service plan. He estimates these possible economies at another billion annually, and by many illustrations points out that inadequate terminal facilities of the roads is almost entirely responsible for the large items of overtime and idle or non-productive labor costs of which the railway executives complain.

## Brotherhood Leaders Confer with Securities Owners

ON APRIL 4 a committee representing the National Association of Owners of Railroad Securities, headed by S. Davies Warfield, president of the association, met in conference with the heads of the train and engine service brotherhoods, at the Hotel Astor, New York, to consider problems affecting the railroads. The conference was requested by Mr. Warfield.

The representatives of the organized employees present were Warren S. Stone, president of the Brotherhood of Locomotive Engineers; L. E. Sheppard, president of the Order of Railway Conductors; W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen; E. L. Cease, representing the Brotherhood of Railway Trainmen; W. H. Johnson, representing the shop crafts, and E. J. Mannion, of the Order of Railroad Telegraphers. The last two men were included in the conference at the request of Mr. Stone.

Following the announcement in the daily press that Mr. Warfield had asked for this conference with the heads of the "big four" brotherhoods, A. H. Smith, president of the New York Central, addressed a letter to Mr. Warfield stating that the board of directors of the New York Central had directed him to advise that the "board and the officers appointed by it represent the New York Central stockholders in all matters of management, including relations between the corporation and its employees." Copies of this letter were sent to the heads of the four brotherhoods. The letter follows:

The newspapers this morning print the letter dated the 30th instant addressed by you to the Brotherhood of Locomotive Engineers, the Brotherhood of Locomotive Firemen and Enginemen, the Brotherhood of Railway Trainmen, and the Order of Railway Conductors of America, in which you, as president of the Railroad Securities Owners Association, invite representatives of those brotherhoods to confer with a committee of your associa-

tion for the purpose of considering what should be done in regard to wages and other matters affecting the railroads.

The board of directors of the New York Central Railroad Company has directed me to advise your association and you, as its president, that the board and the officers appointed by it represent the New York Central and its stockholders in all matters of management, including relations between the corporation and its employees, whether those relations have to do with wages, working conditions or practices. The board further directs me to say that it regards as most unfortunate the attempt which you, and the association of which you are president, are apparently making to intervene in the present labor situation, and that it cannot recognize any right or propriety in your doing so.

Copies of this letter have been sent to the chiefs of the four brotherhoods so that they may understand that neither you nor the Security Owners Association speaks for the New York Central or the companies which it controls in asking for the conference which you propose to hold.

The representatives of the employees at the conference made plain their attitude with reference to readjustments of deficits "at their sole expense, unaccompanied by comprehensive methods that will lead to general economies." The conference was held behind closed doors and no definite decision was reached.

It is understood that further conferences will be held and that in the meantime the association will endeavor to enlist support for the national service plan proposed by Mr. Warfield which was summarized in the *Railway Age* of March 25.

The joint statement issued at the close of the meeting by Mr. Warfield and Mr. Stone follows in part:

The discussion took a wide range and covered all phases of the railroad situation, including the present difficulties involving employees' relations.

The conference did not deal in detail with wages and working conditions, the committee of the Association having stated that, as expressed in their letter suggesting the conference, it was the purpose and desire of the Association to be helpful in the situation to bring about better relations.

There was full discussion of the procedure up to date and of the viewpoint of the employees' representatives. All the conferees recognized the gravity of the situation and an earnest effort was made to approach it through a common understanding of the public interest involved. It was realized that all parties in interest, the public, the investor and the employees, can accept as satisfactory no solution which is not based upon efficiency and general economy in service. The employees' representatives made plain their attitude toward the adjustment of deficits at their sole expense, unaccompanied by comprehensive methods that will lead to general economies.

After full consideration of the position of the representatives of the employees and of the possible basis for solution of the outstanding difficulties, the representatives of the Association of Security Owners feel convinced that a solution is practicable, and through proper co-operation between all the parties in interest and the governmental agencies charged with the responsibility in these matters there should be avoided any further substantial delay in adjusting a situation that if continued is recognized by the conferees as being destructive and impossible.

The discussion was earnest and free from any suggestion that would indicate any fundamental impasse, and it was distinctly recognized by the participants that differences in economic theories have no immediate bearing on the existing emergency and should not prevent its immediate consideration on the merits, and that questions of procedure should not be permitted to intensify the extreme peril now confronting American transportation.

With a thorough understanding of the views of the representatives of the railway employees the representatives of the security holders expressed the opinion that suggestions should be promptly developed that would make possible a tangible and constructive result.

An additional bulletin said:

After the meeting the members of the committee of the Security Owners Association expressed themselves as well pleased with the co-operative spirit shown by the other parties to the conference. Those representing the various organizations of labor said that they were greatly pleased with the manner in which they were approached by those representing the great investments in railroad properties.

All through the proceedings there was a decided recognition shown of the purposes of those concerned in the conference to assist in meeting the situation.

## The Container Car Applied to L. C. L. Freight Handling

**T**HE CONTAINER SYSTEM of rail and motor truck transportation as applied to express matter was described in the *Railway Age* for February 4, page 315. A similar system applied to L.C.L. freight has now been put into opera-

One of the Large Containers Loaded on a Motor Truck

tion on the New York Central between Chicago and Cleveland, Ohio, and is being extended to include other cities.

The type of equipment used for this service is shown in the illustrations of the complete car and the individual container. The car itself resembles a low side gondola, the only novel features being the guide at the side for holding the containers in place and the transverse steel plates extending across the car which are designed to prevent the doors being opened in case the car is not carrying its full complement of containers. Each of the three compartments of the car is capable of holding one large or two small containers, thus permitting various combinations of the two sizes. The large containers are 14 ft. long and have a capacity of 7,000 lb. while the small containers are 7 ft. long and hold 3,500 lb. The body of the container is of wood with a steel frame. At the four corners pressed steel guides are provided which engage with the members on the car body to hold the container in place. The roof is of steel and the doors of heavy wooden construction, fitted with refrigerator car door fixtures. Hooks are provided at the upper corners for lifting the containers with cranes.

The container system as applied to the transportation of less than carload lots of freight has the same advantages that are realized in express service. The labor of checking and handling at intermediate stations is eliminated; injury to the goods in transit will be negligible and theft will be done away with entirely. Increased utilization of the cars will also be secured due to the speed with which a load of containers can be removed or loaded. From the viewpoint of the shipper, the container system has important advantages in handling L.C.L. shipments. The individual packages may be stowed in the containers with cardboard or even paper wrappings as it is only necessary to protect them from the weight of the load within the container itself. There is no possibility of damage due to heavy shipments shifting

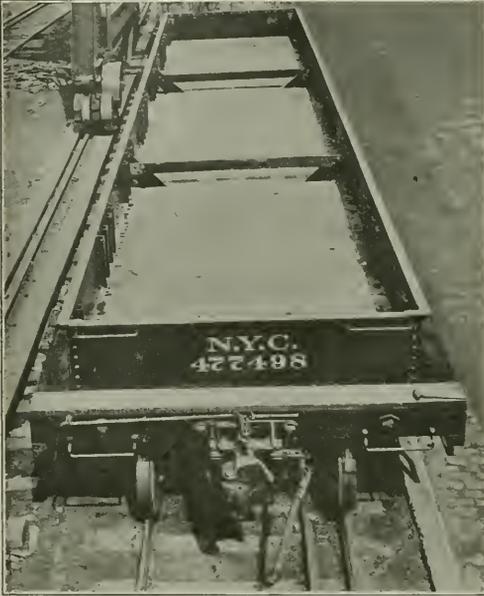

Car Loaded with Two Small and Two Large Freight Containers

against fragile materials and it is not necessary to provide costly wooden boxes or crates.

The container car for freight service was built by the Merchants Dispatch Transportation Company, East Rochester, N. Y., under the supervision of the New York

tory at Rockaway, N. J., where this industry is expending \$50,000 annually in experimental work. The director of this laboratory was formerly chief of the box testing section of the United States Forest Products Laboratory at Madison, Wis., and the work is conducted according to the established standards and practices for this form of investigation while the facilities of the laboratory include the revolving drum, compression and drop test.

One of the prime objects of the laboratory experimentation has been to provide the necessary data for the correct design and construction of the various forms of boxes and crates and with a view to this end the association has issued complete standard specifications for the design and construction of containers for a great variety of commodities. Another important result has been to demonstrate the necessity for the proper packing and closing of boxes constructed according to approved designs, and the association has directed much of its activities in educational propoganda to this end. The prime element in the strength of this particular type of box lies in the bands of wire which surround the package and resist the bursting stresses which result from almost any distortion accompanying severe usage. However, to be thor-

Car Arranged for Carrying the L. C. L. Freight Containers

Central. Plans are now being made for the handling of mail shipments between New York and Chicago in container cars of the express type, previously described.

## How Box Manufacturers Aid Claim Prevention

**T**HE DRAIN ON RAILWAY EARNINGS resulting from freight claims not only is a menace to the solvency of the carriers but it also constitutes a reflection on the effectiveness of private management which the railroads must exert every effort to overcome. So serious is the problem that it behooves them to take advantage of any agency designed to further this end. For this reason railway officers should be interested in the efforts being made by one group of box manufacturers to promote better packing and crating as a part of a campaign for the sale of a particular type of containers to the shippers.

This organization, the Four-One Box Makers' Association, Chicago, comprises a group of manufacturers in all parts of the country licensed to make boxes and crates embodying the use of a patented construction, whereby a wooden frame, veneer sheathing and wire bands are used jointly to make a container of unusual strength. But this original invention covers only the basic idea. The extension of this principle to the construction of boxes and crates for a wide variety of commodities and various classes of service has led to intensive scientific investigation to determine just how this principle should be applied to obtain the desired results with each requirement. This work is being carried on at a labora-

Using a Twister to Close and Seal a "Four-One" Box

oughly effective these bands of wire must be properly united in closing the box and the association has taken particular pains to call this to the attention of the shippers. To insure the proper twisting of the wires, two forms of wire twisters are recommended, either of which will perform this operation quickly and thoroughly.

One particular value of providing a neat, secure twist of the wires lies in the fact that it makes the package practically proof against concealed pilfering, since the package cannot be opened without breaking unless the wires are untwisted and it is next to impossible to refasten the wires without breaking them. Herein lies the opportunity for the railroads to co-operate in reducing loss and damage. Since security against breakage of the package in handling or tampering depends upon the wires being properly twisted, it is to the interest of the roads to insure that the boxes or crates have been properly closed when they are delivered at the freight house and also that the wires are examined whenever the packages are rehandled en route.

# General News Department

The Western Railway Club at its meeting on April 18 will listen to a paper on Locomotive Terminal and Motive Power Management by L. G. Plant, associate editor of the Railway Review.

H. C. Chase, superintendent of telegraph of the Atchison, Topeka & Santa Fe, will present a paper on "Railroad Electrical Communication" before the Western Society of Engineers, Chicago, on April 21.

The Illinois Manufacturers' Association, on April 1, made a direct appeal to President Harding to reorganize the United States Railroad Labor Board in order that the public might be given hearings before that body. The Association had been denied by the Railroad Labor Board the opportunity of presenting the views of shippers on the question of national agreements and wages.

Thirty-three persons killed and as many more injured, was the total of casualties in a collision reported in press dispatches of April 4, as occurring between a freight and a passenger train on the Mexican National. The collision occurred at Villa Garta, between Parradon and Monterey. Fifteen were reported seriously injured in a derailment, on March 28, between Chihuahua City and Torreon, where a coach and a sleeping car were overturned.

## New York Railroad Club Meeting

"Conditions on Foreign Railways" will be discussed at the meeting of the New York Railroad Club on Friday evening, April 15, at the Engineering Societies Building at 8 o'clock. The discussion will be opened by David Van Alstyne, of the American Locomotive Company, who recently returned from a seventeen months' trip around the world.

## Signal Section—A. R. A.

The annual meeting of the Signal Section, American Railway Association, is to be held this year in the month of June, in accordance with the vote of the association following the action taken at the meeting held in New York City last December; and it is to be held at Hotel Drake, Chicago, on Monday, Tuesday and Wednesday, the 6th, 7th and 8th.

## Another Deficit in February

Preliminary compilations of the returns of the railroads to the Interstate Commerce Commission are making a worse showing than that for January. For 195 roads, operating 229,000 miles, there was a net deficit of \$7,601,000 as compared with a deficit of \$14,509,000 for the same roads in 1920. The total operating revenues were \$396,000,000, a decrease of 4.7 per cent, and total operating expenses were \$376,000,000, a decrease of 7.3 per cent. The railroads of the Eastern district had a deficit of nearly \$10,000,000. The Southern roads earned net \$357,000 and the Western district had a deficit of nearly \$2,000,000. The returns indicate that most of the decrease in earnings was attributable to the falling off of freight traffic. Passenger revenues show an increase.

## Will Reduce Passenger Fares

The Alabama, Tennessee & Northern desires the Alabama Public Service Commission to authorize a reduction of 20 per cent in passenger fares, this being the amount of increase that was granted under the Transportation Act of 1920, last August. President John T. Cochrane in making this announcement says that the surest way to get back to pre-war conditions, and revive business, is for every one to do his part. All railroads need all the revenue they can get; and while, in the main, the advanced rates

are a just charge and must necessarily be maintained to keep the railroads going, the increase has in some instances acted as an embargo on business. However, the A. T. & N. is a producing line, and nearly all of its freight business is handled in connection with other lines; and until the railroads in general are able to bring about material reductions in their expenses, no rates can be lowered. But this does not apply to passenger fares on the A. T. & N., and the company therefore has determined to do its part by making a start toward final adjustment.

## Manager of Department of

## Transportation and Communication

James R. Bibbins, has resigned as supervising engineer of The Arnold Company, Chicago, to become manager of the Department of Transportation and Communication of the United States Chamber of Commerce at Washington, D. C., on April 1. He was

J. R. Bibbins

ber of Commerce at Washington, D. C., on April 1. He was educated at Baltimore City College and the University of Michigan. After spending some time with the electric and railway utilities of Detroit, Mich., he entered the service of the Westinghouse Company, in whose employ he was promoted to commercial engineer. In this capacity he was engaged in economic research in the field of steam and gas power development. In 1909, Mr. Bibbins became associated with The Arnold Company at Chicago, and since that time has been

in charge of numerous technical investigations and reports undertaken for state, municipal and other public bodies, and for various corporations. The activities of the Department of Transportation and Communication include shipping, both ocean and on inland waterways; steam and electric railroad transportation; air transportation; cables and telegraphs; postal facilities, and highways.

## Air Brake Tests

On March 26 there was operated over the Radford division of the Norfolk & Western from Bluefield, W. Va., to Roanoke, Va., a train of seventy 100-ton cars equipped with the Automatic Straight Air brake. The total weight of the train, exclusive of the locomotive, was 9,148 tons, which is the heaviest tonnage ever handled down this particular division which contains grades of 1.6 per cent. The demonstration of the action of the brake on these heavy grades formed the conclusion of a series of tests of the new type of brake equipment as applied to the Norfolk & Western cars and was witnessed by a large number of representatives of railroads from all parts of the country.

For the purpose of making the test, the equipment was assembled in the yard at Bluefield. Here contact gages were attached to the first, twenty-seventh, fifty-third and seventieth cars and wires were run to the dynamometer car at the head end to give a record of the time elapsing between the development or release of the pressure for which the gages were set. Electric recording devices in the dynamometer car gave a continuous record of the position of the engineer's brake valve. Trainographs recording the pressures in the train pipe, auxiliary reservoir and

brake cylinder were applied on the first, fifteenth, forty-fifth, fifty-seventh, sixtieth and seventieth cars.

A series of standing tests was also made in the Bluefield yard on March 24 and 25. These were intended to develop the rate of serial action, rate of build-up in brake cylinder pressure and the operation of the various functions of the brake. During the course of the tests, service and emergency applications were made with all valves set first in quick release position, and later in graduated release. The results of these tests were registered on a chart in the dynamometer car and are not available at this time.

So many factors enter into a test of this sort and the records which were taken were so extensive and voluminous that it is obviously out of the question to publish any satisfactory report of the test at this time; we shall defer further comment until the official report from the railway is available.

### Storekeepers' Annual Meeting

The Division of Purchases and Stores of the American Railway Association (Division VI) will hold a convention in Chicago, at the Hotel Blackstone, on Thursday, Friday and Saturday, June 9, 10 and 11.

General Secretary J. E. Fairbanks has issued a circular which says that the general committee of this Division, because of the financial stress and serious business conditions, has determined that it is necessary to defer the annual convention scheduled for Atlantic City. The Chicago meeting will be strictly for business. The sessions will convene at 10 a. m., city time. The general committee and standing committees will be in attendance. Members are requested to have such representatives of their supply departments attend as can conveniently do so. The meeting will consider Committee reports which are ready and will formulate a constructive plan for the future activities of the Division. The endeavor of the meeting will be to handle such subjects as will produce economy in the operations of the supply departments of the railroads.

Arrangements will be made to exhibit a series of motion pictures illustrative of the reclamation work on our railroads.

### International Railway Association—Ninth Congress

The program for the ninth congress of the International Railway Association, which is to be held in Rome, Italy, from April 18 to May 1, 1922, was given in the *Railway Age* of June 18, 1920, page 1925, including the names of the "reporters" who are preparing papers, so far as these names could be given at that time.

From a list published in the Bulletin of the Association, for March, we are able to give the names which were left blank in the earlier announcement. The number of reporters from America altogether is thirteen. The additional names now announced, with subjects, are:

- Construction of Roadbed and Track, C. H. Ewing (P. & R.).
- Maintenance and Supervision of Track, Earl Stimson (B. & O.) and G. Barbieri, Italian State Railways.
- Special Steels, W. C. Cushing (Penn.).
- Passenger Cars, W. J. Tollerton (C. R. I. & P.).
- Electric Traction, A. D. Donati, Italian State Railways.
- Operation; Passenger Terminals, A. S. Baldwin (I. C.) and L. MacCallini, Italian State Railways.
- Freight Stations, E. Ehrenfreund, Italian State Railways.
- Slow-freight Traffic, W. H. Williams (D. & H.) and V. U. Lamalle, Belgian State Railways.
- Locomotive Cab Signals, F. Villa, Italian State Railways (for all countries except France).
- Calculation of Costs of Passenger Service and Freight Service; an officer of the Northern Pacific.
- Interchange of Rolling Stock, C. W. Crawford, chairman of the General Committee of Division II (Transportation) American Railway Association.

Workmen's Dwellings, F. Lolli, Italian State Railways.

Types of Cars, Passenger and Freight, for Light Railways; C. Gaviraghi, Upper Valteline Railway, Tirano, Italy.

Mr. Weissenbruch, general secretary of the permanent commission of the association will make a special report on the wording of the statutes and the regulations of the association; and Sir Henry Fowler, Midland Railway of England, will present a discussion of the use of liquid fuel in locomotives.

## Traffic News

The Transportation Club of Buffalo, N. Y., at its election for 1921, chose Kendall B. Hassard as president; J. M. Sells, first vice-president; Godfrey Morgan, second vice-president and Redmond J. Walsh, secretary.

The National Lumber Manufacturers, at the closing session of their convention at Chicago, on April 1, adopted a resolution requesting that the Interstate Commerce Commission and the railroads be asked to suspend for 60 days, in the interest of new building, the latest freight rate advances on lumber.

The Peninsular Railway, operating between San Jose, Cal., and other towns in Santa Clara county, has been authorized by the Railroad Commission of California to discontinue the handling of freight in less than carload lots. Since 1916, inroads by auto truck lines upon the freight business of the company have resulted in a decrease of 83 per cent in the tonnage handled. Gross revenue has fallen off approximately 60 per cent and is still declining, according to the testimony of the company. The company will continue to move freight in carload lots.

Dock operators from the Northwest and mine operators from every district in the eastern soft coal fields, at a conference held at Cleveland, Ohio, on April 1, framed an appeal to the presidents of eight eastern railroads for readjustment of freight rates on coal to lower lake ports, in order to stimulate the movement of bituminous coal to the northwest. A difference of 58 cents a ton, as compared with the Illinois field, is given as the dominant reason why the shipment of coal from the eastern field to the northwest has been practically suspended.

### Survey of Present Coal Stocks

The Geological Survey has undertaken a survey of the stocks of coal in the hands of consumers on April 1, the opening of the new coal year, for the purpose of a report to the Secretary of the Interior along the lines of the one made a year ago. It will cover public utilities, railroads, industrials and retail dealers. Production is down to the lowest point since April, 1914, and exact information is desired as to whether the consumption has fallen off or whether consumers are holding off buying and burning up their stocks as they did in 1919.

Production of soft coal continued to decline during the week ended March 26, according to the Geological Survey bulletin. The total output, including lignite and coal coked, is estimated at 6,412,000 net tons as against 6,506,000 during the week preceding.

President Willard, of the Baltimore & Ohio, has called on Judge McGee, formerly fuel administrator of Minnesota, for suggestions looking toward prevention this year of a repetition of last year's difficulties in supplying the fuel requirements of the Northwest. In a letter Mr. Willard, referring to the last half of 1920, said:

"I am very much afraid that we may have the same condition again unless steps are taken by those in authority or with influence to prevent such a recurrence.

"There is no doubt at all that the railroads of this country are quite able to carry within 12 months all the coal that can possibly be consumed in this country, or put over our tidewater docks for export, provided only the movement is somewhat uniform throughout the period, and I am just as certain that they cannot satisfactorily meet the transportation requirements in connection with the fuel program if the shipments are concentrated too greatly within a too limited period. \* \* \* There are in the United States today more than 400,000 idle freight cars, and considerably over 100,000 of the number are open-top cars suitable for the movement of coal.

"There seems to be a growing fear that the movement of coal to the Northwest by lake will be again postponed or delayed, resulting in a condition later in the season similar to the one which existed a year ago; in which event shippers in other regions would very strongly oppose and resist any arrangement intended to give preference to the Northwest to the detriment of other regions."

## Commission and Court News

### Interstate Commerce Commission

The Commission has further suspended until May 19 the operation of certain schedules which provide for the cancellation of the commodity rates on mixed shipments of lithopone and zinc oxide.

The Commission has suspended until July 30, the operation of certain schedules which propose to increase the existing rates on grain and grain products from Missouri River points to points in Illinois.

The Commission has further suspended until May 28 the operation of a Cincinnati, New Orleans & Texas Pacific tariff providing for increased class and commodity rates between Ohio River crossings, etc., and Cumberland River landings.

The Commission has suspended from April 15 to August 13 the operation of a supplement to an Atchison, Topeka & Santa Fe tariff proposing to increase loading and unloading charges on live stock at stock yards at Fort Worth and Oklahoma City.

The Commission has further suspended until May 14, the operation of certain schedules which provide for the cancellation of rates on cement from points in Missouri and Kansas to Garfield, Avoca, Bentonville and other places on the St. Louis-San Francisco.

The commission has suspended from April 1 to July 30 the operation of certain schedules which propose to increase from 19 cents to 25 cents per 100 pounds the carload commodity rate on lumber from Memphis to Chattanooga, Tenn., and points taking same rates.

The Commission has further suspended until May 7 the operation of certain schedules shown in F. A. Leland's tariff, I. C. C. No. 1289 applicable on manufactured iron and steel articles carloads from Houston and Galveston, Texas, and intermediate points to destinations in Louisiana.

The Commission has suspended from April 1 to July 30, the operation of a proposed reduction from 60,000 lb. to 33,000 lb. in the carload minimum weight in connection with commodity rates on sugar from points in Colorado, Idaho, Kansas, Nebraska and Utah to destinations in Arkansas, Colorado, Iowa, Kansas, Louisiana, Missouri, Nebraska, New Mexico and Oklahoma.

The Commission has further suspended until May 10 the operation of certain schedules which provide increased class and commodity rates, the cancellation of commodity rates, errors in minimum weights, reference to tariffs for future rates, indices of station numbers and commodities, resulting in the application of erroneous rates, the operation of which was suspended until April 10.

The Commission has suspended from May 1 until August 29, the operation of a supplement to a Southern Pacific Atlantic Steamship Lines tariff, providing increased class and commodity rates from New York, N. Y., and points in Atlantic seaboard territory, to points in Louisiana and Mississippi purported to be established in conformity with order of the Commission in the Murfreesboro case.

The Commission has suspended from May 1 until August 29, 1921, the operation of a supplement to a Clyde Steamship Company tariff proposing changes in class and commodity rates from Eastern points to destinations in Mississippi, Alabama and Florida, via the Mallory Steamship Company through the Port of Mobile, Ala., and rail connections beyond, constructed on basis of established differentials under the rates applicable through the South Atlantic Ports, the latter being now under suspension in Investigation and Suspension Docket No. 1303.

The Commission has further suspended until May 14 the operation of certain schedules providing class and commodity rates, purporting to be established in conformity with order of the

Commission in Docket No. 9190, 55 I. C. C., 648, from Ohio and Mississippi river crossings and related points to Nashville and other points generally in southeastern territory, and from Chattanooga, Tenn., Montgomery and Birmingham, Ala., and other points generally in southeastern territory, to Nashville, Tenn., Ohio and Mississippi river crossings and points related thereto, the operation of which was suspended to April 14 by an order previously entered.

The Commission has suspended from April 6 until August 4 the operation of schedules providing that where no through published rates are in effect from point of origin to final destination, the proportional rates on petroleum and petroleum products will apply without deduction in constructing combination rates on all shipments originating beyond or destined beyond the points from or to which the proportional rates are applicable, whereas at present, rates 2½ cents less than rates published in tariff are applicable on shipments originating at points north of the Ohio river or west of the Mississippi river or in the state of West Virginia from which no through rates are in effect.

The Interstate Commerce Commission has rendered a decision finding the rates on coal from the head of the lakes to various points in the states of Minnesota, North Dakota and South Dakota unreasonable and unduly prejudicial and has prescribed a distance scale of rates which it declares will be reasonable for the future. The case results largely from discriminations involving the application of state rates put into effect by state authorities, as a result of which some of the roads published separate lines of rates applicable respectively to interstate and intrastate traffic. The commission's order in many cases will result in increases in rates held down by the state rates.

The Commission has suspended until July 30 the operation of certain proposed changes in the application of proportional rates on lumber and other forest products from Minneapolis, St. Paul, Minnesota Transfer, Cologne and Hills, Minn., Sioux Falls, S. D., and Council Bluffs and Sioux City, Iowa, on traffic originating west of the Montana-Dakota state line to points in C. F. A. and Western Trunk line territories. This proposed change would cancel the provision requiring surrender of inbound freight bills in order to secure the benefit of proportional rates outbound. On shipments stored at points named and subsequently reshipped the rate to apply would be that in force at date of reshipment.

### Changes in State Rates Allowed

The Interstate Commerce Commission has found a method to prevent some of the so-called "freezing" of intrastate rates, as a result of its orders ordering the railroads to increase intrastate rates by the amount of the increases applied to interstate traffic, by issuing supplemental orders in the various state rate cases providing as follows:

*"It is further ordered,* That nothing in this order shall be construed as requiring any common carrier to establish or maintain any rate or charge for the transportation of passengers or property in intrastate commerce which is greater than its corresponding charge applicable to transportation in interstate commerce from, to, or at the same points in effect on March 8, 1921, or greater than its corresponding charge contemporaneously in effect and applicable to interstate commerce."

One of the principal arguments made by the state commissions is that the federal commission's orders in the state cases were effective until further notice and this they claimed made it impossible to change a local rate without appeal to the Interstate Commerce Commission. The supplemental orders will relieve one source of difficulty in this respect.

### State Commissions

The Public Service Commission of Alabama announces that any citizen of the State may have his freight bills audited and checked by the commission and, if overcharges are shown, the commission will order the railroad or express company to refund the amount and to pay the costs of auditing the account. This service is authorized by special statute and the announcement virtually makes the commission a "traffic bureau" for the whole State.

## Foreign Railway News

### England's Exports of Railway Material

According to the Board of Trade returns, the exports of railway material for the month of January, 1921, were as follows:

	January 1921	January 1920
Locomotives .....	\$2,189,712	\$1,304,588
Rails .....	1,819,548	787,812
Passenger cars .....	425,772	625,488
Tires and axles .....	626,460	489,332
Wheels and axles .....	996,456	669,788
Chairs and metal ties .....	811,612	63,776
Miscellaneous track material.....	902,588	742,808
Total track material .....	5,513,572	2,403,720

The weight of the rails exported was 17,953 tons as against 6,707 tons for January, 1920. The value of the exports shown above is converted to dollars and the prevailing rate of exchange.

### January Exports of Track Materials

During the month of January 4,630,222 lb. of track spikes, valued at \$251,926, were exported. There were also 59,739 tons of rails, valued at \$3,906,441, and switches, frogs, splice bars, etc., valued at \$1,161,126, shipped from American ports. These totals all show a marked improvement over similar totals for December. Cuba received more of this equipment than any other country. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, are as follows:

	Spikes		Steel rails		Switches, frogs, splice bars, etc.
	Pounds	Dollars	Tons	Dollars

## Equipment and Supplies

### Car Deliveries in February

The number of freight cars delivered in February by the 25 car building companies reporting to the Railway Car Manufacturers' Association, totaled 6,276 for domestic service and 500 for export. The passenger cars delivered totaled 50 for domestic service and 14 for foreign service. On February 28 the companies had on hand undelivered orders for 26,685 freight and 750 passenger cars for domestic service and 3,225 freight and 28 passenger cars for export.

The figures for the month are as follows:

New Cars Delivered			
	Domestic	Foreign	
Freight .....	6,276	500	
Passenger .....	50	14	
On Order and Undelivered			
Freight .....	26,685	3,225	Total
Passenger .....	750	28	29,910
			778
Car Repairs			
Delivered—February .....			4,499
On order and undelivered February 28 .....			18,303

### Locomotives

The PEKIN-MUKDEN has ordered 19 locomotives from English builders.

The F. C. DEL SUR, of Colombia (South America), has ordered 2, 2-6-6-2 type locomotives from the Baldwin Locomotive Works.

The F. C. DEL NORTE, of Colombia (South America), has ordered 2, 2-6-0 type locomotives from the Baldwin Locomotive Works.

The LAURENTIDE COMPANY, Ltd., Grande Mer, Quebec, has ordered 1, 2-6-2 type locomotive from the Montreal Locomotive Works.

The ATCHISON, TOPEKA & SANTA FE, reported in the *Railway Age* of March 4, as inquiring for 10 Pacific, 15 Mikado, 15 Mountain and 10 Santa Fe type locomotives, has ordered this equipment from the Baldwin Locomotive Works.

### Freight Cars

The NEW YORK, ONTARIO & WESTERN is inquiring for 12 to 15 caboose cars.

The GREAT NORTHERN is inquiring for 500 60-ton refrigerator cars, 40 ft. in length, with wooden underframe, metal draft arms and steel roof.

The UNITED FRUIT COMPANY, New York, reported in the *Railway Age* of March 18 as inquiring for 50 all steel ballast cars for the Praxillo Railroad, Honduras, has ordered this equipment from the Magor Car Company.

### Passenger Cars

The SOUTH AFRICAN RAILWAYS are inquiring through the car builders for 26 first class and 26 third class electric motor coaches.

The NEW YORK, NEW HAVEN & HARTFORD, reported in the *Railway Age* of October 15, 1920, as inquiring for 8 steel motor cars and 14 trailer cars, has ordered this equipment from the Standard Steel Car Company.

### Iron and Steel

The DELAWARE, LACKAWANNA & WESTERN has ordered 390 tons of fabricated bridge material from the Shoemaker & Satterthwait Bridge Company.

The PEKIN-MUKDEN has ordered 12,000 tons of rails from English manufacturers.

The SOUTH MANCHURIAN RAILWAY Company has ordered 10,000 tons of rails from the United States Steel Products Company. The rails will be rolled in the works of the Tennessee Coal & Iron Company.

## Machinery and Tools

THE FLORIDA EAST COAST has bought a 150-ton wrecking crane mounted on 6-wheel trucks, from the Industrial Works, Bay City, Mich.

## Miscellaneous

THE DELAWARE, LACKAWANNA & WESTERN is asking for bids until noon April 11, for a type 0 turntable center.

THE NEW YORK, SUSQUEHANNA & WESTERN is asking for bids until 12 o'clock noon, April 14, 1921, for 77,100 gross tons anthracite coal for use during the period ending April 1, 1922.

THE NEW YORK CENTRAL and subsidiary lines are asking for bids until 12 o'clock noon, April 19, for the requirements of said companies for one year commencing April 1, 1921, of incandescent lamp bulbs, aggregating in excess of \$300,000 in new value.

THE ERIE RAILROAD is asking for separate bids until 12 o'clock noon, April 14, 1921, for from 1,000,000 to 1,200,000 net tons bituminous coal; also for from 150,000 to 200,000 net tons of bituminous coal and for 138,600 gross tons anthracite coal, all for use during the period ending April 1, 1922.

## Signaling

ATCHISON, TOPEKA & SANTA FE.—This company will install automatic block signals between Las Vegas and Sands, N. M., a distance of 33 miles, at a cost of \$150,000.

THE RICHMOND, FREDERICKSBURG & POTOMAC has awarded a contract to the Union Switch & Signal Company, Swissvale, Pa., for the installation of an electro-pneumatic interlocking plant at Seminary, Va., to use alternating current for both track circuits and functional control. The machine will have a 39-lever frame and a spotlight track model.

## Railway Construction

AMERICAN NIAGARA RAILROAD CORPORATION.—This company, which was recently incorporated, proposes to build a line from the New York Central near its junction with the Lehigh Valley at Tonawanda, N. Y., to connect with the proposed railroad and bridge of the Canadian Niagara Bridge Company which has been organized under an act of the Canadian Parliament.

CHICAGO UNION STATION.—This company, which was announced in the *Railway Age* of April 1 (page 864), as accepting bids for the construction of a new railway mail terminal, Chicago, will close bids for this work on Monday, April 11. The company will shortly accept bids for the construction of a viaduct on Harrison street between Canal street and the Chicago River, Chicago.

GRAND TRUNK.—This company contemplates improving its yard facilities at Pontiac, Mich.

TEXAS & PACIFIC.—This company, in co-operation with the International & Great Northern, will construct a new union station at Logview, Tex., in accordance with a recent order of the Texas State Commission.

A RECENT REPORT of Commercial Attaché Cunningham, of Madrid, on the exportation of automobiles from Spain shows that during the year 1919 the exportations amounted to 58, as compared with 26 in the previous year. During 1915, 1916, and 1917 the exportations amounted to 42, 29, and 43, respectively. Ceuta and Cuba are the chief destinations of the exports.—*Commerce Reports*.

## Supply Trade News

W. H. Holdorf has been appointed railroad representative of the Western Electric Company, with headquarters at St. Paul, Minn., succeeding A. L. Frankenberger.

The General Railway Signal Company, Rochester, N. Y., will, on May 1, remove its New York office from 30 Church street to the Canadian Pacific building, 342 Madison avenue.

H. C. Brown, assistant general sales manager of the Chicago Bridge & Iron Company, with headquarters at Chicago, has been transferred to the New York City office of the company, effective March 15.

The Standard Paint Company on April 1 changed its corporate title to the Ruberoid Company. There will be no change in the management or policy of the company, whose general offices will remain at 95 Madison avenue, New York.

William H. Bassett has been appointed special railroad representative in charge of railroad sales and development work of the Elliott-Fisher Company, Harrisburg, Pa. Mr. Bassett has been engaged during the past 15 years in accounting organization work and in mechanical accounting sales and organization work. He became associated with the Delaware, Lackawanna & Western in 1909 in the accounting department and during a period of six years made an intensive study of railroad accounting and statistical problems, particularly as to the mechanical accounting devices best suited to the requirements of general offices and freight stations. Some large installations of mechanical equipment were evolved and carried to a successful conclusion under his direct supervision, with resultant economies and increased efficiency. In April, 1915, Mr. Bassett went to the Powers Accounting Machine Company, New York, as metropolitan district manager. He later became assistant general manager, and for the past two years has been general sales manager, which position he resigned April 1 to become special railroad representative of the Elliott-Fisher Company.

Charles M. Chamberlin, secretary and director of A. M. Castle & Co., Chicago, for the past 20 years, retired from all active business associations on April 1. Fred C. Conners has been elected a director and secretary to succeed Mr. Chamberlin.

The Pressed Steel Car Company, Pittsburgh, Pa., will remove its New York City office on May 1, from 24 Broad street, to the Seaboard National Bank building, corner of Broad and Beaver streets. The stockholders of this company at a recent meeting ratified an increase of capitalization from \$25,000,000 to \$50,000,000.

Wallace W. Glosser, of the Maintenance Equipment Company, Chicago, has been appointed district sales manager of the Verona Tool Works, with headquarters at New York City, effective April 1. W. C. Dawkins, who has been associated with the Verona Tool Works for some time, has been appointed assistant district sales manager at New York.

W. H. Bassett

Robert B. M. Wilson, sales engineer in the Indiana district for the **Conveyors Corporation of America**, Chicago, has been appointed sales engineer of the Chicago district and **E. W. Wolfe**, who has been for several years with the company in a sales capacity, becomes an assistant to Mr. Wilson, with headquarters in the corporation's main office at 326 West Madison street.

**A. P. Van Schaick** has been appointed general manager of sales of the **Page Steel and Wire Company**, New York, succeeding **E. C. Sattley**, resigned. **W. T. Kyle** has been appointed assistant general manager of sales. The headquarters of both Mr. Van Schaick and Mr. Kyle will be at the Grand Central Terminal, New York. The appointments were effective March 31.

**A. E. Lee**, general freight agent on the Chicago & Alton, has been appointed general sales manager for the **Union Fuel Company**, with headquarters at Chicago, and **George W. Hatch**, general sales manager, with headquarters at Springfield, Ill. The Chicago offices of the company have been moved to 123 W. Madison street, while the Springfield offices are in the Reich building.

**Ralph G. Coburn**, president of the Stone Franklin Company, New York, has been elected also a vice-president of the **Elvin Mechanical Stoker Company** with headquarters at 50 Church street, New York, and **E. W. Englebright**, who became associated with the Elvin Mechanical Stoker Company in December, 1920, has also been elected a vice-president of that company. Mr. Coburn was born in Boston in 1882 and was graduated from Harvard in 1904. He then served, until 1909, with the American Glue Company in charge of its western territory, with headquarters at Des Moines, Iowa, and Chicago. On May 1, 1909, he opened the Chicago office of the Franklin Railway Supply Company as resident sales manager and in June, 1911, was appointed assistant to the vice-president in charge of eastern-southern territory, with headquarters at New York. In December, 1913, he was appointed eastern sales manager of the same company. In May, 1919, the Stone Franklin Company, New York, was organized to market the Stone Franklin car lighting system in the United States and Canada and Mr. Coburn was elected president of the new company, which position he still retains in addition to his new duties as vice-president of the Elvin Mechanical Stoker Company.

R. G. Coburn

**William T. Lane**, district manager of the Pacific Coast territory of the **Franklin Railway Supply Company, Inc.**, New York, has been transferred from San Francisco to Cleveland, Ohio, as district manager of the Cleveland territory, and **James McLaughlin**, assistant to the vice-president at Chicago, has been transferred to San Francisco as district manager of the Pacific Coast territory to succeed Mr. Lane.

**Haskell & Barker Car Co., Inc.**

The annual report of the **Haskell & Barker Car Company, Inc.**, for the fiscal year ended January 31, 1921, shows net profits after deducting charges and estimated federal taxes of \$2,278,319, equivalent to 20.71 per cent on the \$11,000,000 capital stock, compared with \$1,727,653, or 18.51 per cent, on \$9,332,000 capital stock in 1919. Gross earnings increased chiefly as the result of estimating federal taxes at \$700,000, compared with \$1,100,000 in the preceding year. The capital stock account was readjusted

and a corresponding increase made in the property account. The financial statements follow:

INCOME ACCOUNT			
	1920-21	1919-20

**The Westinghouse Air Brake Company**

The financial results of the operations of the **Westinghouse Air Brake Company** for 1920, after providing for dividends, show a net addition to surplus of \$1,249,122. **H. H. Westinghouse**, chairman of the board, in his report to the stockholders for the year ended December 31, 1920, said:

"During the year under review the volume of orders received and product shipped was satisfactory. The year closed with a fair amount of unfilled orders on hand, but owing to the unprecedented condition of the railroads of the country and their necessary policy of curtailing purchases, current orders show a marked falling off as compared with the same period of previous years. Manufacturing operations thus far this year have been at an almost normal rate, but obviously they must be materially reduced unless there is a marked increase in new business.

"The increase in accounts and bills payable for the year of approximately \$8,300,000 as compared with the previous year, is accounted for by the increase in accounts and bills receivable of almost \$8,000,000 and \$2,800,000 in inventory.

"It is hoped that the remedial legislation recently enacted by Congress, known as the Winslow Bill, will result in payments that will reduce outstanding accounts to normal proportions."

The financial statements for the year include the operations of the following companies: **Westinghouse Traction Brake Company**, **Westinghouse Friction Draft Gear Company**, **Westinghouse Pacific Coast Brake Company**, **Westinghouse Air Brake Home Building Company**, **Union Switch & Signal Company**, **Union Signal Construction Company**, **the American Brake Company**, **National Brake & Electric Company**, **National Steel Foundries**, **Milwaukee Locomotive Manufacturing Company**, **Safety Car Devices Company**, **Locomotive Stoker Company**, **National Utilities Corporation** and **Westinghouse Union Battery Company**.

The consolidated balance sheet for 1920 follows:

ASSETS		
Cash.....		\$2,947,664
Accounts and bills receivable.....		13,550,169
Liberty loan bonds.....		1,991,399
Inventories.....		15,628,812
Investments.....		8,734,348

# Railway Financial News

**ATCHISON, TOPEKA & SANTA FE.—Authorized to operate line in Oklahoma.**—The Interstate Commerce Commission has issued a certificate authorizing this company to operate the property of the Buffalo Northwestern, including 52½ miles of line in Oklahoma, which the Santa Fe has leased.

**BALTIMORE & OHIO.—Authorized to Issue Bonds.**—The Interstate Commerce Commission has authorized this company to issue \$2,782,000 of refunding and general mortgage bonds, to pledge and repledge from time to time all or any part of the bonds as security for short term notes, and various subsidiaries have been authorized to issue various bonds and deliver them upon the order of the Baltimore & Ohio to trustees under certain mortgages.

**BERGEN COUNTY.—Authorized to Extend Maturity of Bonds.**—This company has been authorized by the Interstate Commerce Commission to enter into extension supplements with the holders of \$200,000 of first mortgage bonds, extending the maturity date from April 1, 1921, to April 1, 1931, and increasing the rate of interest from 5 to 7 per cent.

**CHICAGO GREAT WESTERN.—Annual Report.**—The annual report for the year ended December 31, 1920, shows a deficit after taxes and charges of \$2,530,682. This compares with net income in 1919 of \$1,263,669 equivalent to \$2.87 a share earned on the \$43,926,602 preferred stock.

The income account for the year 1920 follows:	
Two months ended February 29, 1920, under federal control:	
Balance after expenses.....	\$471,653
Six months ended August 31, under guaranty period:	
Net deficit from railway operation.....	\$3,406,271
Compensation under transportation act.....	1,700,000
Other income.....	69,328
Deficit.....	1,636,943
Four months ended December 31, 1920:	
Net income from railway operation.....	214,724
Other income.....	81,613
Total income.....	296,337
Deficit.....	\$868,953
Interest and other deductions.....	1,661,729
Total deficit.....	\$2,530,682

The operating revenues and expenses in detail and the principal traffic statistics of the Chicago Great Western Railroad compare as follows:

	OPERATING REVENUES	
	1920	1919
Freight.....	\$15,990,231	\$14,555,496

The annual report of the Chicago Great Western will be reviewed editorially in an early issue.

**CHICAGO JUNCTION RAILWAY.—Hearings on acquisition by New York Central.** See New York Central.

**CHICAGO, MILWAUKEE & ST. PAUL.—Asks Authority to Acquire Road.**—This company has applied to the Interstate Commerce Commission for authority to acquire the property and stock of the Chicago, Terre Haute & Southeastern.

**CHICAGO & EASTERN ILLINOIS.—Reorganization Plan.**—Kuhn, Loeb & Co., reorganization managers, have announced the de-

tails for the organization of a new company capitalized at \$91,033,750. The capitalization of the old company, exclusive of unpaid interest, was \$94,204,448. Fixed charges of the old company were \$3,759,996, while those of the new company will be \$2,327,051.

According to the announcement the new company will not acquire the coal properties formerly embraced in the mortgage dated February 1, 1912, made to secure the purchase of first lien coal bonds of the Chicago & Eastern Illinois Railroad Company, nor the lines of railroad formerly owned by the Evansville & Indianapolis Railroad Company, which have been sold under foreclosure of the respective mortgages thereon, nor the lines of railroad formerly owned by the Chicago & Indiana Coal Railway Company. In case delay would occur in acquiring any of the mortgaged lines of railroad or any of the properties embraced in the plan, the execution of the plan will not necessarily be thereby postponed, but existing bonds upon such lines deposited under the plan may be pledged under the mortgages of the new company until such lines of railroad shall be acquired by the new company.

New securities to be presently issued include \$35,500,000 general mortgage bonds, \$22,051,050 preferred stock and \$24,135,100 common stock. Prior lien mortgage bonds amounting to \$5,262,500 will be used as collateral for notes amounting to \$4,210,000 covering indebtedness to the United States. The general mortgage bonds will be limited to the total authorized principal amount of \$35,500,000 at any one time outstanding. They will mature not later than 1951, and will bear interest from May 1, 1921, payable semi-annually, at the rate of 5 per cent per annum. They will be secured by mortgage which will embrace all of the lines of railroad, franchises, equipment, terminals, securities and other property which may at any time be included under the prior lien mortgage. The general mortgage will be subject to the prior lien mortgage on all property covered by the latter. The preferred stock will be at the rate of 6 per cent per annum, cumulative from January 1, 1924. Each share of preferred stock shall have the same voting rights as a share of common stock.

Securities to remain undisturbed in the reorganization amount to \$9,347,600, and include Chicago & Eastern Illinois Railroad Company first extension mortgage 6 per cent bonds due 1931, \$91,000; Chicago & Eastern Illinois Railroad Company first consolidated mortgage 6 per cent bonds due 1934, \$2,736,000; Evansville Belt Railway Company first mortgage 5 per cent bonds due 1940, \$142,000; Chicago & Eastern Illinois Railroad Company equipment certificates, Series "I," 5½ per cent maturing serially from September 1, 1921, to September 1, 1925, \$1,477,000; receiver's equipment notes to Director General of Railroads maturing serially to 1935, \$691,600; loan from United States Government, 10 years 6 per cent, \$3,425,000; loan from United States Government, 15 years 6 per cent, \$785,000.

Cash requirements estimated to carry out the plan amount to \$16,110,370, and include \$6,000,000 as payment of receiver's certificates; \$3,000,000 for payment of Evansville & Terre Haute first consolidated mortgage 6 per cent bonds maturing July 1, 1921; \$4,003,292 on account of \$3,478,909 C. & E. I. general consolidated and first mortgage 5 per cent bonds, and \$524,383 Evansville & Terre Haute first general mortgage 5 per cent bonds, and \$3,107,078 to pay other claims of receiver.

The cash required will be provided as follows: \$10,300,000 available in the hands of the receiver and \$5,810,370 from the sale of 5 per cent general mortgage bonds of the new company to stockholders of the old company or underwriters.

The report of the receivers made to the reorganization managers shows that the average annual net railway operating income, under normal conditions and after the segregation of the Chicago & Indiana Coal Railway, can be conservatively estimated at \$5,300,000, and net railway operating income for the year ending December 31, 1921, estimated at approximately \$4,100,000, such estimate being predicated on a gradual resumption of business during the year. The last half of the year normally produces approximately two-thirds of the year's earnings.

The capitalization and fixed charges of the new company are as follows:

		Fixed Charges
Outstanding.....		
\$2,736,000 C. & E. I. first consolidated 6s.....	\$164,160	
91,000 C. & E. I. first extension 6s.....	5,460	
142,000 Evansville Belt Ry. 5s.....	7,100	
1,677,000 C. & E. I. equipment notes, Series H 5½s.....	81,233	
691,600 Receiver's equipment notes to Director General.....	41,496	
4,210,000 Notes secured by \$5,262,500 prior lien mortgage 6s.....	252,600	
35,500,000 General mortgage 5s.....	1,775,000	
22,051,050 Preferred stock.....		
24,135,100 Common stock.....		
\$91,033,750.....		\$2,327,051
Capitalization of old company (exclusive of unpaid interest).....	\$94,204,448	
Capitalization of new company.....	91,033,750	
Fixed charges of old company.....		\$3,759,996
Fixed charges of new company.....		2,327,051

The lines of railroad formerly owned by Chicago & Indiana Coal Railway Company, and Evansville & Indianapolis Railroad, and the coal properties formerly embraced in the purchase money first lien coal mortgage will not be acquired by the new company.

**Foreclosure Sale.**—The Chicago & Eastern Illinois, in the hands of receivers since May 27, 1913, was sold at foreclosure on April 5, at Danville, Ill.

George M. Murray and Joseph P. Cotter, attorneys of New York, representing Kuhn, Loeb & Co., bid in all parcels except Parcel D, extending from Mokena, Ill., to Brazil, Ind., for \$13,285,000. There were no bids on Parcel D, and another sale date was fixed.

**CHICAGO & NORTH WESTERN.—Bonds to Be Paid.**—The \$10,000,000 30-year 5 per cent debentures, due April 15, 1921, will be

paid upon presentation on and after that date at the office of the company, 111 Broadway, New York City.

**DENVER & RIO GRANDE.—Stockholders' Protective Committee to Push Suit.**—The protective committee has received the text of the decision of the federal court at Denver on the motion of Western Pacific interests to dismiss two suits attacking the legality of the judgment to satisfy which the road was sold recently. Two suits were filed identical in text, the committee says, and one was dismissed Saturday. The court held that the stockholders had the right to prosecute the other suit, and the court would grant leave to amend the bill in that case to bring in additional or supplementary matter relating to the confirmation of the sale.

**EUREKA NEVADA.—Expiration of Lease.**—This railway operated under lease by the Nevada Transportation Company since May 8, 1912, will, after March 31, 1921, be operated by the Eureka Nevada Railway Company, the lease having expired.

**FONDA, JOHNSTOWN & GLOVERSVILLE.—Bonds Extended.**—The \$200,000 6 per cent bonds which fell due April 1, were extended until March 29, 1922, with interest at 6 per cent.

**GEORGIA & FLORIDA.—Loan Approved by Commission.**—The Interstate Commerce Commission has authorized a loan of \$800,000 to this company to assist it in meeting maturing indebtedness and paying for additions and betterments. This loan is for three years.

**GOLDEN BELT.—Certificate of public convenience denied.**—The Interstate Commerce Commission has denied this company's application for certificate of public convenience and necessity for the construction of a new line of railroad between Great Bend and Hays, Kan., on the ground that the record does not develop an economic justification for the proposed line nor indicate reasonable prospect of a substantial return on the estimated investment.

**HOUSTON & BRAZOS VALLEY.—Board reports just compensation.**—The board of referees appointed by the Interstate Commerce Commission has rendered a report to the President finding this company entitled to just compensation for the period of federal control in the amount of \$65,368.05. The company had claimed \$144,343 and had failed to agree with the Railroad Administration.

**LOUISVILLE & NASHVILLE.—New Directors.**—J. R. Kenly and Frederic W. Scott have been elected directors to succeed Warren Delano and M. H. Smith.

**MARSHALL & EAST TEXAS.—Certificate of public convenience held unnecessary.**—The Interstate Commerce Commission has rendered a decision that this company having ceased operation under order of a federal court prior to the passage of the transportation act, the issuance of a certificate of public convenience and necessity applied for by the receiver to permit the abandonment of the line is not within the commission's jurisdiction and is not required.

**MINNEAPOLIS & ST. LOUIS.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$1,382,000 of refunding and extension mortgage 5 per cent gold bonds and to pledge them with the Secretary of the Treasury as partial security for a loan.

**NEW YORK CENTRAL.—Hearings on Acquisition of Chicago Junction Railway.**—Hearings were begun on April 5 at the Great Northern Hotel, Chicago, before W. H. Colston, director of the department of finance of the Interstate Commerce Commission, upon the application of the New York Central for authority to acquire the terminal properties of the Chicago Junction Railway and the Chicago River & Indiana Railroad. A. H. Smith, president of the New York Central, has made the following statement concerning the application:

The plan proposed in the application will, of course, continue wholly tentative until the Commission has investigated its merits and announced conclusions. It would be inappropriate for me to make other than general comments upon what we seek to accomplish by leasing the Junction terminals. The New York Central has long since been in need of an extensive amplification of its terminal facilities at Chicago. The opportunity to relieve this situation to the mutual advantage of the public, our connections and ourselves, has now been discovered in a surprisingly natural way.

In 1907 the Lake Shore road, through the medium of a switching subsidiary, acquired the outer belt line of the Chicago Junction Railway. This property is now operated as part of the Indiana Harbor Belt, which performs service in the outer Chicago switching district as an interchange connecting link between the trunk lines entering at Chicago. Its railroad complement is the railroad of which it was formerly a part, namely the Chicago Junction Railway has unlimited opportunity in the development of River & Indiana Railroad, comprises an extensive inner network of tracks spread through the heart of central manufacturing Chicago and serving a highly industrial territory.

Railroad expansion in this thickly settled industrial district has about reached its limit. These properties are bottled up, so to speak, within the community which they serve. Conversely the former outer belt line of the Chicago Junction Railway has unlimited opportunity in the development of railroad facilities but no means of reaching, except indirectly, interior Chicago. Each of these properties therefore lacks important facilities which the other has and which neither could secure for itself. Handled together they will serve all the industrial territory tributary to each with higher efficiency. Furthermore to identify the Chicago Junction Railway properties with the New York Central Railroad ought to increase exceedingly their value to the industrial public and, on the other hand, such identification will enable the New York Central and its affiliated line, the Michigan Central, to greatly improve and extend their Chicago terminal service.

Should the Interstate Commerce Commission approve of our plan it would be our policy to continue the operating and traffic relationship now existing between the Chicago Junction Railway and other carriers operating at Chicago.

On opening the hearing, Luther Walter, counsel for the Pennsylvania, Baltimore & Ohio and six other lines reaching Chicago, opposed the application stating that the proposed acquisition would give the New York Central monopolistic control of the traffic of a great industrial portion of the city. He said that the roads he represented proposed to file an intervening petition suggesting a joint ownership of the junction lines, if they must be sold.

Certain shippers also protested, alleging that the acquisition would deprive them of certain rights, facilities and services now enjoyed and would greatly injure them and others. Another group of shippers filed an intervening petition, asking that if the Commission approve the petition of the New York Central, they do so in such terms and conditions as will fully and permanently protect shippers in their present rights, privileges, facilities and services or others to which they may be lawfully entitled, in which case they would have no particular interest in the matter.

The New York Central presented a petition at the hearing which it was said was signed by 395 of the 400 shippers on the junction lines, urging that the New York Central be permitted to buy the property.

The filing of the formal application with the Interstate Commerce Commission by the New York Central for authority to base and ultimately purchase the Chicago Junction terminal properties was noted in the *Railway Age* of January 7, 1921, page 32.

**NORFOLK & WESTERN.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**New Director.**—A. C. Needles, vice-president in charge of operation and traffic, has been elected a director, and also a member of the executive committee.

**Asks Authority to Sell Bonds.**—The Norfolk & Western has applied to the Interstate Commerce Commission for authority to issue and sell \$269,000 of 4 per cent convertible bonds, \$1,213,000 of 4½ per cent convertible bonds, and \$522,000 of 6 per cent convertible bonds now held in its treasury, to reimburse the treasury for expenditures.

**RENNSELAER & SARATOGA.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$2,000,000 of first mortgage 6 per cent, 20-year gold bonds, dated May 1, 1921, to be delivered to the Delaware & Hudson, which leases the road and which has also asked authority to guarantee the bonds, and which proposes to sell them to pay off first mortgage bonds of the Rennselaer & Saratoga, which mature on May 1.

**SEABOARD AIR LINE.—Loan Approved by Commission.**—The Interstate Commerce Commission has approved an additional loan to this company of \$1,451,500 from the revolving fund, in addition to \$1,173,500 previously approved.

**VALDOSTA, MOULTRIE & WESTERN.—Sale.**—This road will be offered for sale in Savannah for the second time on April 9. There were no bids made at the first sale on February 22.

**WESTERN PACIFIC.—Asks Authority to Issue Securities.**—This company and the Denver & Rio Grande Western, the new company organized to take over the properties of the Denver & Rio

Grande, have filed a joint application with the Interstate Commerce Commission for authority for the issuance by the Denver & Rio Grande Western of 300,000 shares of common stock of no par value, representing the property of the Denver & Rio Grande. The Western Pacific Railroad Corporation of Delaware, the Western Pacific holding company, is to provide the funds necessary for the purchase of the properties of the Denver & Rio Grande and the proposed stock issue is to be assigned to the holding company, which will then control both the Western Pacific and the Denver & Rio Grande Western. The Western Pacific has also applied for authority to issue \$4,180,000 of its first mortgage 5 per cent gold bonds to be sold to the holding company at 85 and to be exchanged by it for the bonds of the Sacramento Northern, whose stock is to be purchased for cash.

**WHEELING & LAKE ERIE.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$884,000 of refunding mortgage 6 per cent bonds, and to pledge them with the Secretary of the Treasury as partial security for a loan. The company has also been authorized to issue \$1,351,000 of refunding mortgage 5 per cent bonds maturing September 1, 1966, to be pledged as collateral security.

**Guaranty Certificates Issued**

In addition to those mentioned in previous issues, the Interstate Commerce Commission has issued certificates to railroads for partial payments on account of their guaranty as follows:

	Previously advanced
Oregon Trunk.....	\$40,000
Minneapolis & St. Louis.....	100,000
Wabash.....	2,350,000
Live Oak Perry & Gulf.....	5,077,000
Wheeling & Lake Erie.....	12,000
Bennetsville & Cheraw.....	455,000
Gainesville & Northwestern.....	10,000
San Antonio & Aransas Pass.....	7,000
Charleston Terminal Co.....	475,000
Pittsburgh, Cincinnati, Chicago & St. Louis.....	50,000
Gulf, Florida & Alabama.....	4,000,000
	6,100,000
	200,000
	356,360

The Treasury Department is paying the certificates as fast as they are issued and up to April 4 had paid out \$103,000,000 in partial payments under the Winslow law.

**Dividends Declared**

- Atchison, Topeka & Santa Fe—Common, 1½ per cent quarterly, payable June 1 to holders of record May 6.
- Boston & Providence—2½ per cent, quarterly, payable April 1 to holders of record March 19.
- Delaware, Lackawanna & Western—5 per cent, quarterly, payable April 20 to holders of record April 9.
- Georgia Railroad & Banking—3 per cent, quarterly, payable April 15 to holders of record April 2 to April 14.
- Meadville, Conneaut Lake & Linesville—2 per cent, payable April 2 to holders of record March 21.
- New London Northern—2½ per cent, quarterly, payable April 1 to holders of record March 16 to March 31.
- Northern Railroad of N. H.—1½ per cent, payable April 1 to holders of record March 14.
- Norwich & Worcester—Preferred, 2 per cent, quarterly, payable April 1 to holders of record March 16 to March 31.
- Pere Marquette—Prior preferred, 1¼ per cent, payable May 2 to holders of record April 14.
- Pittsburgh & West Virginia—Preferred, 1½ per cent, quarterly, payable May 31 to holders of record May 6.

**Railway Officers**

**Executive**

**W. C. Morse**, formerly superintendent of the Missouri Pacific with headquarters at Poplar Bluff, Mo., has been elected vice-president and general manager of the Louisiana Railway & Navigation with headquarters at New Orleans, La., effective April 5.

**Operating**

**J. Bruner** has been appointed trainmaster of the Colorado & Southern with headquarters at Cheyenne, Wyo.

**George Geiger**, assistant superintendent of the Virginian with headquarters at Princeton, W. Va., has resigned, effective April 10.

**J. A. Gleason**, whose appointment as superintendent of telegraph of the Chesapeake & Ohio was announced in the *Railway Age* of March 11 (page 576), was born February 10,

J. A. Gleason

1859, at Portsmouth, Va. He was educated at private schools and at the Charlotte (N. C.) Academy. He entered railroad service in 1874 at Charlotte as a clerk and assistant operator for the Charlotte, Columbus & Augusta and the Atlantic, Tennessee & Ohio (both absorbed since by the Southern). In 1876 he went with the Richmond, York River & Chesapeake (also a part of the Southern). The following year he became personal telegrapher to President Rutherford B. Hayes and later served as chief operator on the government lines in Texas with headquarters at San Antonio. In 1882 he became a train dispatcher on the Richmond & Danville (now a part of the Southern). He went with Norfolk & Western in 1887 in a similar capacity at Lynchburg, Va. The following year he became a dispatcher on the Chesapeake & Ohio at Lynchburg and was later transferred to Clifton Forge, Va., and was promoted to chief dispatcher at Cincinnati, Ohio. From 1891 to 1898 he served the Norfolk & Western at Lynchburg, Roanoke, Va., and Crewe, Va., as a train dispatcher and night chief dispatcher. In 1898 he went to the Chesapeake & Ohio again as a dispatcher and, in turn, occupied the positions of chief dispatcher, division superintendent and special assistant to the general manager until, in February, 1921, he was appointed to his present position.

**D. W. Thompson** has been appointed acting superintendent of dining cars and hotels of the Los Angeles & Salt Lake, with headquarters at Los Angeles, Cal., effective March 28, succeeding **W. M. Sceman**, deceased.

**E. F. Lott**, formerly superintendent of the Ft. Worth & Denver City with headquarters at Wichita Falls, Tex., has been appointed superintendent of the South Park division of the Colorado & Southern with headquarters at Denver, Colo.

**D. P. Gerety** has been appointed trainmaster on the Colorado division of the Missouri Pacific, with headquarters at Council Grove, Kan., with jurisdiction over the Council Grove district and the Salina branch, Central Kansas division, and the Great Bend branch and Hoisington, Kan., Yard, on the

Photo by Underwood & Underwood

A Street Railway, Port-au-Prince, Haiti

Colorado division. **D. W. Hickey**, assistant superintendent on the Colorado division, with headquarters at Pueblo, Colo., has taken over the duties of trainmaster on the Hoisington district and that position has been abolished. The appointments and changes are effective April 1.

**Frank O'Brien**, superintendent of the East Iowa division of the Chicago & North Western, with headquarters at Belle Plaine, Iowa, who has been on an extended leave of absence, has resumed his duties, effective April 1, and **F. F. McCauley**, acting superintendent, has resumed his position as superintendent of the West Iowa Division, with headquarters at Boone, Iowa. Mr. McCauley succeeds **S. A. Morrison**, who has resumed his position as superintendent of the North Iowa division, with headquarters at Eagle Grove, Iowa. **G. E. Bonner**, acting superintendent of the North Iowa division, has resumed his duties as trainmaster, with headquarters at Eagle Grove, Iowa.

### Financial, Legal and Accounting

**Henry L. Stone**, general counsel of the Louisville & Nashville, with headquarters at Louisville, Ky., will retire from active service, effective April 21.

**George N. Yard**, paymaster on the Gulf, Colorado & Santa Fe, with headquarters at Galveston, Tex., has been appointed acting treasurer, succeeding **A. C. Torbert**, whose death was announced in the *Railway Age* of April 1 (page 870).

**G. W. Lamb** has been appointed general auditor by the Association of Railway Executives under the provisions of Article No. 18 of the uniform express contract to audit the accounts of the American Railway Express Company. **C. H. Waterman** has been appointed assistant general auditor. The auditing bureau has its headquarters at 65 Broadway, New York.

### Traffic

**E. N. Todd** has been appointed general foreign freight agent of the Canadian Pacific with headquarters at Montreal.

**Thomas Y. Morris** has been appointed commercial agent on the Atlantic Coast Lines, with headquarters at Chattanooga, Tenn., effective March 22.

**R. Vaughan-Lloyd** has been appointed district passenger agent of the Seaboard Air Line with headquarters at Richmond, Va., effective April 1, succeeding **H. E. Bickel**, resigned.

**Z. M. Kincaid**, district passenger agent on the New York, Chicago & St. Louis with headquarters at Buffalo, N. Y., has been transferred to Erie, Pa., in a similar capacity, effective April 10.

**F. L. Talcott** has been appointed general agent on the New York Central, with headquarters at Erie, Pa. The division freight agencies at Erie and Hillsdale, Mich., have been discontinued.

**W. H. Andrews** has been appointed general agent, freight department of the Toledo, St. Louis & Western with headquarters at Los Angeles, Cal. **J. R. Holcomb** has been appointed to a similar position with headquarters at San Francisco, Cal.

### Engineering, Maintenance of Way and Signaling

**R. D. Stewart** has been appointed chief engineer of the Denver & Salt Lake, with headquarters at Denver, Colo., succeeding **V. B. Wagner**, who has been assigned to other duties.

### Special

**J. A. McGrew** has been appointed superintendent of maintenance of the Delaware & Hudson with headquarters at Albany, N. Y., effective April 1. The maintenance department was formed, effective April 1, by consolidating the maintenance of way and structures, the motive power and the car departments. The superintendent of maintenance will be responsible for all maintenance work and will report to the general manager. The following officers will report to the superintendent of maintenance: Engineer maintenance of

way, superintendent of motive power, master car builder, signal engineer and efficiency engineer.

## Obituary

**E. B. Crosley**, vice president in charge of traffic of the Philadelphia & Reading died on April 3 at Philadelphia. Mr. Crosley was born June 27, 1865, at Clinton, Ill., and began his railroad career as a clerk on the Indiana, Bloomington & Western (now a part of the Cleveland, Cincinnati, Chicago & St. Louis) at Indianapolis, Ind. In 1890 he entered the service of the Philadelphia & Reading Coal & Iron Company as chief clerk to the general manager. After holding various positions with that company he was appointed assistant general freight agent of the Philadelphia & Reading in 1898. In 1907 he was appointed coal freight agent and subsequently general coal freight agent. During the period of federal control Mr. Crosley was a coal traffic manager and, when the roads were returned to their owners, he was appointed vice president in charge of traffic.

**J. F. Keegan**, general superintendent on the Baltimore & Ohio, with headquarters at Pittsburgh, Pa., died at Pittsburgh on April 1. Mr. Keegan was born at Cleveland, Ohio, on March 29, 1870 and was educated at St. Columbia's Academy in that city. He entered railway service in 1885 with the Cleveland, Columbus, Cincinnati & Indianapolis (now a part of the Cleveland, Cincinnati, Chicago & St. Louis). In 1890 he became a telegraph operator and car distributor on the Cleveland, Lorain & Wheeling (now a part of the Baltimore & Ohio). The following year he was promoted to train dispatcher at Uhrichsville, Ohio, and served in that capacity until 1902 when he became chief dispatcher of the Baltimore & Ohio at Cleveland. In 1903 he was promoted to assistant trainmaster and, in 1906, to trainmaster. In 1911 he was appointed division superintendent and served in that capacity until 1916 when he became general superintendent.

**Rolla J. Parker**, general manager, Western Lines, Atchison, Topeka & Santa Fe, died in the Santa Fe Hospital at Topeka, Kan., on April 1. He was born on June 27, 1857, at Roscoe,

R. J. Parker

Minn., and entered railway service in 1872 as a brakeman on the Chicago, Milwaukee & St. Paul. In 1877 he was promoted to conductor and held this position until 1881. In 1884, after three years of service as a conductor on construction trains on the Northern Pacific, he entered the service of the Atchison, Topeka & Santa Fe, and has been with this road continuously for 34 years. In May, 1887, he was promoted to division road master. He was made general road master, with headquarters at Topeka, Kan., in December, 1892, and five years later was promoted to superintendent of the Middle division, with headquarters at Newton, Kan. From February, 1900, to January, 1901, he served as superintendent of the Western division at Pueblo, Colo.; from January, 1901, to April, 1903, he was superintendent of the Colorado division; from April, 1903, to June, 1905, he was superintendent of the Missouri division, with headquarters at Marceline, Mo., and on the latter date was promoted to general superintendent of the Western Grand division, with headquarters at La Junta, Colo. He was transferred to Newton, Kan., in August, 1907, but returned to La Junta in April, 1909. Mr. Parker served as general superintendent, Eastern lines, with headquarters at Topeka, Kan., from October, 1910, to September, 1916, on which date he was promoted to general manager, with headquarters at Amarillo, Tex.

The adoption of cars of high capacity has been one of the most notable recent developments in operating practice on the roads serving the Eastern coal fields. The Norfolk & Western has taken a leading part in developing equipment especially suited for the handling of export coal traffic and at the beginning of the year had in service 1,669 one-hundred-ton gondola cars. After several years' experience with these heavy cars the road has developed a new design which is described in an article by John A. Pilcher, published in this issue. A careful reading of the description of the cars will show how thoroughly the business aspect of operation has been kept in mind by the officers of the road. There are three principal opportunities for saving in the use of large capacity cars. The tonnage per train can be increased due to the lessened number of units and decreased length for the given weight. The number of movements in handling a given tonnage and the number of parts to be maintained is reduced. Last, and perhaps most important, the ratio of load to gross weight can be increased. By the adoption of a truck which supports the load on side bearings, instead of at the center plate, the weight of these cars has been decreased and the ratio of paying load to gross weight increased to 78.9 per cent, an extremely high figure. This equipment is notable, not merely for the engineering features of the design, but also for the manner in which the economic problem has been analyzed and steps taken to insure maximum earning capacity per car, per train and per dollar expended.

### Economic Aspects of Car Design

It might well be expected that labor on the British railways would be well pleased with the government's plan for the return of the roads to their owners inasmuch as, under this plan, labor is to be given a hand in the management of the properties. Such, however, is not the case. The National Union of Railwaymen, it appears, is extremely hard to please, and its representatives are now seeking an interview with the Minister of Transport with the view of laying before him their plan for the future organization of the carriers. The union's scheme provides for government ownership and operation under the administration of a board consisting of an equal number of representatives of the government and of the employees. This proposal goes even farther than our own Plumb Plan in its provision for operating the railroads for the benefit of the employees. In a country where organized labor is as strong politically as it is in Britain it would be strange indeed if at least one of the government's representatives were not a strong sympathizer with the unions. A majority on the board, and consequent control of the railroads, could well be expected under such an arrangement. The union proposes further that employees discharged as a result of reductions in force should be given "adequate compensation." It would be difficult for any one to surpass in audacity this proposal, involving as it does the virtual turning over of the railroads to the employees to be run as best suits their interests. Fortunately, however, for the railroads and the people of Great Britain, there is little likelihood that

### The Plumb Plan in England

the present government will approve any such proposal. It is to be hoped that the government will, before the return of the carriers to their owners, provide legislation which will protect the shareholders and the public against the unions which are manifestly looking out for their own interests regardless of anyone else.
