Transition curves are as little discussed today as the relative merits of the "practical man" and the technical graduate in railway engineering service. The reason is the same in each case—the subject has ceased to be controversial. Although the spiral curve was developed and put to some practical use many years ago, it served for a long time as a fruitful source of contention between those who recognized the necessity for an accurate means of obtaining the gradual change from the tangent to the curve and those who deemed the use of mathematics in this connection as the height of unnecessary refinement. As years have passed by, however, less and less has been heard of this branch of railway engineering so that at present it is almost never mentioned outside the routine of office and field. Believing that a review of this subject could not but develop some interesting and valuable facts the *Railway Age* sent a questionnaire to 42 of the larger American railroads, making inquiry concerning present practices in the use of the transition curve. The result of this is published elsewhere in this issue and goes to show that there is now a very common agreement on the necessity of this refinement in the railway alignment. Railway engineers, including those who responded cheerfully in answering the questionnaire, will find much of interest in this report.

### The Transition Curves in General Use

One of the great difficulties in making progress with the improvement in the bad order car situation is the large number of old cars of weak construction which are still in service, many of which should be retired and replaced by equipment of more modern design. The detrimental effect of these cars has been particularly evident during the past year because of the tendency to keep them in service, in the face of the acute shortage of equipment, long after they would normally have been retired. But if the effect of this condition is particularly acute now, the condition itself is by no means a new one. It was the same condition which led to the adoption by letter ballot, following the 1914 convention of the Master Car-Builders' Association, of the provision in Rule 3 of the Interchange Rules which read, "After October 1, 1916, all cars of less than 60,000 lb. capacity, having wooden or metal draft arms which do not extend beyond the body bolster, will not be accepted in interchange." And if we look forward a few years into the future, there is no reason for believing that similar conditions will not then exist. It seems evident that legislation against the recurring specific manifestation of the evil does not remove the cause. One of the strongest incentives for raising the average structural strength of the freight cars of the country which could

### Structural Improvement of Freight Cars

917

be offered would be the establishment of standard billing prices for labor and material high enough to include a fair commercial profit above the average outlay for labor, material and overhead expenses. During periods of equipment shortage there is little direct inducement to the owner of such equipment to reconstruct it to meet modern conditions because a large percentage of its time is spent on foreign lines where such repairs as it receives are paid for at prices often below the owner's costs for doing the same work, and where failures in transit cost the owner nothing in delays to train movement. An adequate scale of prices established to include a profit, by increasing both the amount and cost of repairs to such equipment, will unquestionably raise the limit beyond which its operation becomes too expensive to be considered.

Intensive studies of fuel conservation, tonnage loading, freight handling, track capacities, the location of facilities, and many other items, are constantly being made in order to obtain the most efficient service at a minimum of cost. It is pertinent to raise the question, however, whether such studies are not

being conducted by the heads of various departments in a more or less unrelated manner, in contrast with their concentration under the direction of one person who is in a position to co-ordinate these results to the greater benefit of the system as a whole. The busy operating officer is not in a position to prosecute such studies or to gather the facts to support any change or improvement in present day practices. Consequently someone in the organization should be charged with this duty. Such a man should of necessity be familiar with operating, engineering and mechanical problems inasmuch as these are the three departments which are most directly affected by such studies. He must be familiar with train operation over the entire system, the proper utilization of motive power and the effect which various additions made by the engineering department to track facilities will have on train operation and track capacity, if he is to handle the work successfully. Such studies, however, could no doubt better be handled by a committee, with a chairman who may be a signal engineer, as on one road, a mechanical engineer, as on another road, or an operating or engineering officer. It would appear that such a man or committee should be in a position to co-ordinate results obtained by the various departments for the greatest benefit of the road. The preparation of such data for the busy executive officers should prove profitable in a number of ways.

On nearly every railroad in the United States there are widely varying conditions that will and do affect the maintenance of the track structure. In one case, it may be unstable soil, in another drainage; and in others the character of the ballast, the rail, the traffic, etc. Under such circumstances

#### The Uniform Maintenance of Track

no two sections, for instance, can be maintained with the same amount of material or the same labor effort, nor can identical results be secured for the same unit cost per mile or per section. Expanded, this is equally true of sub-divisions and divisions. Thus it would seem that, ordinarily, the best sections, sub-divisions and divisions would be those whose natural conditions made it most easy to maintain them. But it is doubtful if this is actually the case in many instances. It is frequently true that the sections that are nearest 100 per cent have reached that condition because of the advantages of better and closer supervision as well as

perhaps a slight "edge" on the prompt delivery of materials and a more adequate supply of labor at most needed times. With such the case the best sections of a road generally continue to remain the best, for it is a natural inclination to favor that which is good, progressive or successful. Thus there is a tendency to continue the wide spread between the best sections and the poorest and this is especially true during periods of limited funds available for maintenance of way expenditures. Such a spread is not desirable from the standpoint of economical railroading, for a railroad is but a correlation of working units and its efficiency depends upon the uniform efficiency of those units. It is chiefly a question of which makes for the better in the long run, a few 100 per cent or nearly 100 per cent sections and many mediocre ones, or as nearly 100 per cent uniformity as can be maintained in practice, on all. In this respect, it is interesting to note, though perhaps not entirely relevant, that a few roads whose maintenance of way slogan has been "Uniformity" have also had uniformly low costs per mile of road when compared to others in the same section of the country.

## Huge Deficit of Canadian Government Railways

THE ARTICLE by J. L. Payne on results of government operation of railways in Canada which appears on another page discloses a situation which should be very interesting and extremely instructive to the people of the United States at the present time. Owing to the excessive operating expenses and the unprecedented decline of freight business the railways of the United States have been doing very badly financially since the present freight and passenger rates were fixed. Many persons have persuaded themselves and are trying to persuade others that the only solution of the problem presented is to return our railways to government control.

In Canada, 52 per cent of the railway mileage is owned and operated by the government, and the other 48 per cent, which is made up almost entirely of the mileage of the Canadian Pacific, is privately owned. The same advances in wages and increases of rates have been made in Canada as in the United States. The Canadian railways, fortunately, have not had applied to them the national agreements with the labor unions that are in effect in this country. Under these conditions, as Mr. Payne shows, not a single railway of the system owned and operated by the Dominion Government earned its operating expenses last year. Their expenses were from 109 cents to 410 cents for every dollar they earned. While the Minister of Railways has conceded that the government system had a deficit of over \$70,000,000, Mr. Payne, who was formerly controller of statistics of the Department of Railways and Canals, shows that a proper allowance for interest on the total cost of the railways would make the deficit \$140,000,000. This is \$17.50 for every man, woman and child of the country's population. An equally large deficit per capita for the railways of the United States would be \$1,837,500,000. It must be borne in mind, also, that this deficit was incurred by only half of the railways of Canada.

All the railways of Canada have been very adversely affected by the increases in operating costs, unaccompanied by proportionate advances in rates. The Canadian Pacific, however, under private operation succeeded in keeping its expenses down to 85 cents for each dollar of earnings, and had net earnings of \$33,000,000. The present management of the Canadian government lines is not responsible for the bad financial results. They are partly due to unfavorable conditions which are affecting all the railways of the United States and Canada, and partly to the extremely unwise policy which the Canadian government has followed for fifty years

in building and operating state railways in disregard of sound business principles. Certainly, however, the comparative results of government and private operation in Canada suggest anything but the desirability of consideration of a return to government operation in the United States. What they do very forcibly suggest is the imperative need, in both countries, of government aid to the railways, whether under public or private management, in bringing about a reasonable relationship between operating costs, on the one hand, and earnings on the other hand.

## The Menace of the Dust Explosion

THE DESTRUCTION of the large grain elevator of the Chicago & North Western at Chicago on March 19 has directed widespread attention to a menace that has long given deep concern to the owners and operators of these great grain storage structures. The dust explosion represents a hazard against which modern fireproof construction is no protection. The greater and more costly the installation, the greater the potential loss.

The dust explosion is becoming increasingly common in American industry owing primarily to the production of dust in greater volume with the more intensive use of high-speed, automatic machinery and the fact that minute particles of any inflammable material, if suspended in the air in proper proportions, will produce an explosive mixture with tremendous potentialities. The dust explosion does not differ greatly from the gas explosion. In fact, some chemists believe that the process involves the formation of combustible gases by the action of heat on the dust particles, followed by the ignition of a mixture of these gases with air. Very small quantities of dust will suffice to produce an explosion. Experiments show that the explosion of one sack of flour, when mixed with an adequate quantity of air, will develop an amount of energy equivalent to that required to lift 2,500 tons 100 ft.

The study of these explosions demonstrates that they seem invariably to embrace a series of detonations or the progressive ignition of successive clouds of dust stirred up by the preceding detonations. Consequently, deposits of dust serve as a reservoir of enormous reserve energy which intensifies the destructive effect resulting from the initial ignition of the dust suspended in the air. The ignition of this initial blast may be accomplished in so many ways that an attempt to safeguard a structure by measures to prevent the introduction of any spark or flame to set off the explosion is at best an insecure protection.

Casual consideration would point to the wisdom of keeping the structure as free as possible of any accumulation of dust deposits, but this would not solve the problem since it is the dust in suspension which represents the real danger and in the opinion of David J. Price, engineer of dust explosions for the Department of Agriculture, the only effective means of eliminating the hazard of explosions in grain elevators lies in the introduction of dust exhausting appliances at all points in the plant where the grain is in motion. This remedy has been advanced with a full realization of the obstacles imposed to its execution. Not only would this involve drastic alterations of existing elevators and marked changes in the designs of new installations, but still more formidable are the problems of grain weights which would be introduced by the removal of a portion of the weight of the grain in the form of dust. Trade customs with respect to these weights involving the interrelations of the shipper, the carrier and the consignee are circumscribed by rules and statutes that obviously cannot be changed without the united co-operation of a great many diversified interests. In view of all these difficulties it is not surprising that this problem

has not yet been solved, but the situation is realized fully by those who are most intimately concerned with it and active measures are being taken to obtain a solution. This movement should receive the hearty support of the railway managements.

## Chicago, Rock Island & Pacific

THE ANNUAL REPORT of the Chicago, Rock Island & Pacific for 1920 is but the story of the railroads of the country as a whole for that year written with the particular problems of the Rock Island in mind. The report shows that the Rock Island in 1920 did the largest freight and passenger business in its history. In view of this fact and the increase in rates during the year, it naturally had the largest gross earnings in its history. On the other hand, as in the case of the larger part of the roads, the net earnings were considerably less than in 1919. The net operating revenue per mile of road was only about one-third or one-half the average for almost any previous year for an extended period.

The report gives some interesting details as to the reason for these results. They are chiefly epitomized in the following statement: "The startling feature of the present situation is that after the government has had your property for nearly three years it comes back to you saddled with an increase in payrolls of approximately \$44,000,000 per annum over the payrolls December 31, 1917, when the property was taken over. Your company now must pay in wages and salaries \$44,000,000 a year more than it paid in 1917. This is about 59 per cent on the outstanding common stock."

The Chicago, Rock Island & Pacific system in 1920 received a total freight revenue of \$94,451,558, an increase of 22.42 per cent over 1919; a passenger revenue of \$35,472,938, an increase of 9.14 per cent, and total railway operating revenue amounting to \$141,946,973. This last figure compared with a total of \$116,624,684, and represented an increase of 21.71 per cent over 1919. The total operating expenses in 1920 were \$133,535,832 as compared with \$101,497,733 in 1919. There was thus an increase of 31.57 per cent in operating expenses as compared with an increase of but 21.71 per cent in operating revenues. The operating ratio in 1920 was 94.07 per cent; in 1919 it was 87.03 per cent, whereas in 1916 it was but 68.10 and in 1917 but 73.70. The total railway operating income in 1920 was \$2,500,565, whereas in 1919 it was \$10,071,099, a decrease of 75.17 per cent.

Referring now to the corporate income account, where are shown the results after the inclusion of the standard return for January and February and the guaranty for March to August, it will be found that the system had a balance of income for 1920 available for dividends amounting to \$4,663,155 as compared with \$4,887,891 in 1919. Full dividends were paid on both the 7 per cent and 6 per cent preferred stocks in 1920 as in 1919, leaving a surplus in 1920 amounting to \$1,095,670, equal to 1.46 per cent on the common stock as against a surplus of \$1,320,988 in 1919, equal to 1.76 per cent on the common stock.

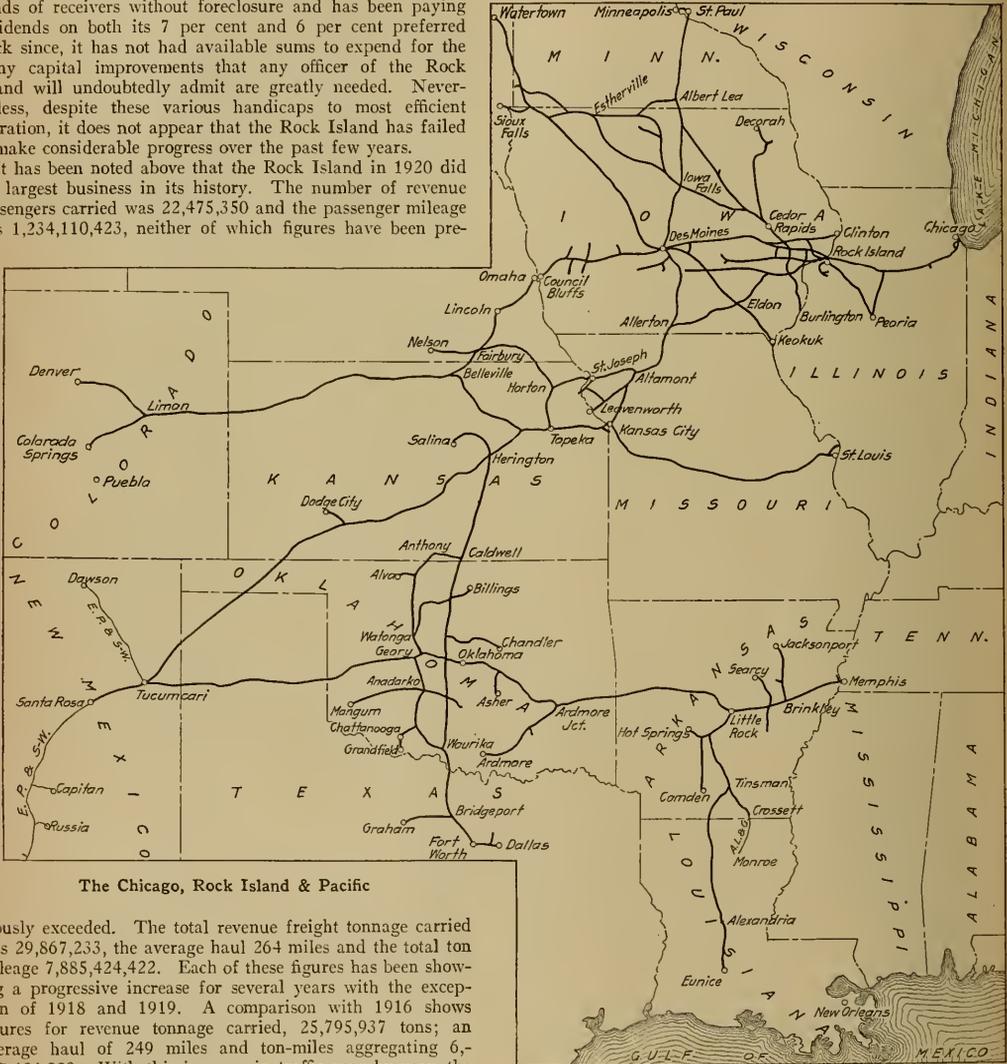

The Rock Island is a system of 8,102 miles, most of which is owned either by the Chicago, Rock Island & Pacific itself, or by its Texas subsidiary, the Chicago, Rock Island & Gulf. Included in its 8,102 miles, outside of the mileage owned there are 262 miles of leased line and 449 miles of line operated under trackage rights. The system's lines extend over a widely extended area; as will be seen from the map this area includes parts of no less than 14 states. Naturally, under these conditions the traffic of the road is quite varied; in 1920, the tonnage consisted of 24 per cent products of agriculture; 21 per cent bituminous coal, or 37 per cent

products of mines, and 22 per cent manufactures. Some of the main lines of the Rock Island carry only a light traffic, while there are also many branch lines which further bring down the average of traffic density. The system is competing with lines, many of which are stronger financially and which, in a number of cases, have more direct routes between important traffic centers. The road has been in the hands of receivers as late as 1916, and although it got out of the hands of receivers without foreclosure and has been paying dividends on both its 7 per cent and 6 per cent preferred stock since, it has not had available sums to expend for the many capital improvements that any officer of the Rock Island will undoubtedly admit are greatly needed. Nevertheless, despite these various handicaps to most efficient operation, it does not appear that the Rock Island has failed to make considerable progress over the past few years.

It has been noted above that the Rock Island in 1920 did the largest business in its history. The number of revenue passengers carried was 22,475,350 and the passenger mileage was 1,234,110,423, neither of which figures have been pre-

tion, however, of 1918, it represents an increase over any previous year.

One of the principal factors in determining train loading, of course, is locomotive capacity. The Rock Island at the end of 1916 had on its lines 1,595 locomotives with a total tractive effort of 47,722,500 lb. and an average traffic effort of 29,921. On December 31, 1920, it had 1,633 locomotives

The Chicago, Rock Island & Pacific

viously exceeded. The total revenue freight tonnage carried was 29,867,233, the average haul 264 miles and the total ton mileage 7,885,424,422. Each of these figures has been showing a progressive increase for several years with the exception of 1918 and 1919. A comparison with 1916 shows figures for revenue tonnage carried, 25,795,937 tons; an average haul of 249 miles and ton-miles aggregating 6,427,424,220. With this increase in traffic year by year, the road has been able also to maintain a similar progressive increase in revenue trainload and with the exception of one year in revenue car load. The revenue trainload in 1920 was 431 tons; in 1919 it was 421 tons; in 1916 but 370 tons. The trainload given for 1920 is not particularly heavy as trainloads go; the steady increase, however, may be regarded as a good indication. The average revenue load per loaded car in 1920 was 21 tons. This is not high. It is not as high as it was in 1918 when the figure was 21.65; with the excep-

tion of a total tractive effort of 52,436,100 and an average tractive effort of 32,110 lb. No one can safely say that the Rock Island is noted as having on its lines the best motive power in the country; nevertheless, as in the case of progressive increase in train loading, this progressive increase in total and average tractive effort of locomotives is interesting. The Rock Island acquired from the United States Railroad Administration but 20 light Mikados and 10 switching

locomotives. In 1920, however, it purchased and has since put in service 10 Mountain, 15 Santa Fe and 10 Mikado locomotives.

The increase in freight car capacity on the Rock Island has not been as marked as the increase in motive power. The total number of cars owned on December 31, 1920, was 52,757 with a total capacity of 1,799,705 tons and an average capacity of 76,122 lb. The number of cars owned on June 30, 1916, was 50,315, the total capacity was 1,750,630 tons and the average capacity per car 75,634 lb. The Rock Island accepted from the U. S. R. A. 2,000 double sheathed box cars and later purchased from the Administration 500 additional cars.

J. E. Gorman, president of the Rock Island, has some rather interesting remarks concerning the maintenance, or rather lack of maintenance, of the property while it was under federal control. The report shows that the maintenance of way expenses in 1920 were 35 per cent greater than in 1919. The figures of work done, while they indicate considerably more accomplished than in 1919, are hardly to be called excessive as compared with more normal years such as 1916 or 1917. Mr. Gorman's remarks relate to the deferred maintenance of the federal control period (26 months) as compared with an average for 26 months of the test period. He gives a number of details of which the following is an abstract:

For maintenance only	Test Period.		Federal control 26 mos.	Deficit
	Average 26 mos.	26 mos.		
Cross ties .....	\$5,125,564	\$3,348,075		\$1,777,489
Switch ties, F. B. M. ....	10,026,542	6,937,215		3,089,327
New steel rails laid, miles.....	430.49	230.73		199.76
Ballast, cubic yards placed.....	1,315,196	965,652		349,544
Pile trestle bridges built, lineal feet.	49,220	17,455		31,765

**Locomotives.**—In 26 months of test period, general repairs made to 2,024 locomotives; federal control, to 1,765; a decrease of 259 or 13 per cent. Excess mileage of locomotives between general shoppings 7,872,549 miles greater under federal control than in test period.

**Freight Cars,** difficult to estimate. During federal control 33.8 per cent on home lines as compared with 61.9 per cent in test period. Cars away from home neglected; estimated increase of 6,705 cars in bad order as compared with beginning of federal control.

**Passenger Cars.**—During 26 months of test period, 1,424 passenger cars given general repairs as against 1,206 during federal control—decrease 15 per cent.

Mr. Gorman says, "The property was in such splendid physical condition when taken over by the government that even the deficiency in maintenance work shown above has not seriously affected efficient operation, although sooner or later the former high standard of maintenance must be restored." A claim for deferred maintenance has been prepared approximating \$12,000,000.

Mr. Gorman in his report has a great deal to say about the present high wage scales and the handicaps to efficient and economical operation resulting from the National Agreements. It is unfortunate that lack of space prevents the use of some of the pointed examples brought out. However, there is one paragraph that can hardly be passed over; it says, "We believe that railway service should be well compensated, because it requires intelligence, energy, watchfulness and patience of a high order. That the policy of the Rock Island towards its employees has at all times been a fair and liberal one is illustrated by the large number of men who have been in our service for many years—who, so to speak, have grown up on the railroad and have become honored and respected citizens of the communities in which they live. At the same time the present situation, which is not the result of anything done by the company or by its officers, is most burdensome and must be corrected."

The following gives the results of operation in 1920 as compared with 1919:

	1920	1919
Mileage operated .....	8,102	8,055
Freight revenue .....	\$94,451,558	\$77,153,311
Passenger revenue .....	35,472,938	32,502,435
Total operating revenue.....	141,946,973	116,624,684
Maintenance of way expenses.....	26,694,843	19,791,122
Maintenance of equipment.....	34,517,238	26,671,916
Traffic expenses .....	1,843,282	1,331,860
Transportation expenses .....	66,708,244	50,347,834
General expenses .....	3,483,831	2,926,962
Total operating expenses.....	133,535,832	101,497,733
Net from railway operations.....	8,411,141	15,126,950
Taxes .....	5,894,857	5,046,922
Total operating income.....	2,506,565	10,071,100

The corporate income account is as follows:

	1920	1919
Balance of income (available for dividends)	\$4,663,155	\$4,887,891
Dividends—		
7 per cent preferred.....	2,059,547	2,059,547
6 per cent preferred.....	1,507,938	1,507,356
Total dividends .....	3,567,485	3,566,903
Balance surplus .....	1,095,670	1,320,988

## Louisville & Nashville

LIKE MOST OF THE RAILROADS of the country the Louisville & Nashville did not have as good net earnings in 1920 as it did in 1919. Perusal of its annual report, issued this week, indicates, however, that it succeeded in coming through the year rather better than most railroads. Taking into consideration the standard return for the first two months of the year and the guaranty for the following six months, the road had a surplus of \$7,758,368 which permitted it to pay quite handsily the usual 7 per cent dividends, amounting to \$5,040,000 on its common stock. The surplus available for dividends in 1919 was \$11,086,869. These results, as good as they may be as compared with those of most other roads, cannot, of course, be called satisfactory. Nevertheless they would seem to indicate that the Louisville & Nashville, once the present handicaps in the form of high wage scales and the national agreements are removed, should be able to continue in the future as one of the more prosperous and efficiently operated railroads of the country.

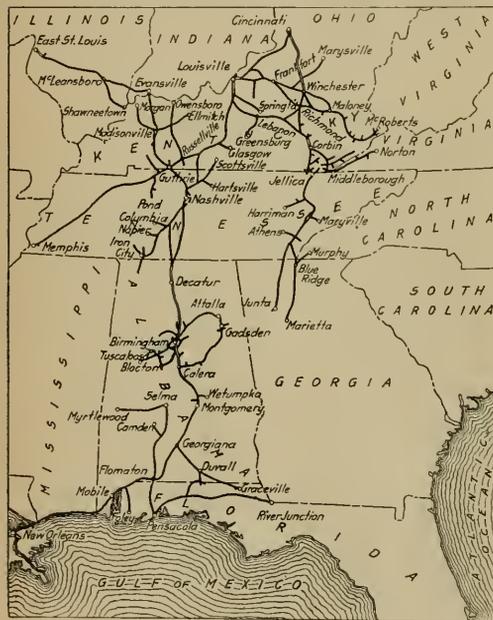

The Louisville & Nashville annual reports do not give a great amount of detail as to the operations of the property during the year covered by a particular report. The lack of these details prevents a detailed analysis of the operating results such as we are able to give in these editorial reviews for most other roads. However, such details as are available either in the annual report or elsewhere go to show what is perhaps already well known—namely, that the Louisville & Nashville is an efficiently operated property and is continuing to show real progress in operating efficiency.

The Louisville & Nashville is a system of no less than 7,696 miles. This does not take into consideration the Atlantic Coast Line, which owns a majority stock interest in L. & N. It does, however, take into consideration the Nashville, Chattanooga & St. Louis, a line of 993 miles which the Louisville & Nashville controls by majority stock ownership; the Chicago, Indianapolis & Louisville, a line of 658 miles, and a majority of the stock of which is owned jointly with the Southern Railway, and also the Georgia Railroad and subsidiary lines in which the Louisville & Nashville is interested as joint lessee. The lines mentioned are each separately operated. The mileage operated by the Louisville & Nashville itself amounts to 5,044. The lines are shown on the map. It will be seen that they extend from Cincinnati and St. Louis south through Kentucky and Tennessee and through the Birmingham district to the Gulf of Mexico with various corollary lines. They cover an extended and pros-

perous area and through their entrance on the Gulf of Mexico at the important ports of New Orleans, Mobile and Pensacola give the Louisville & Nashville a favorable position in traffic from the Birmingham and other districts through the Panama Canal, traffic to South America, etc.

The road is conservatively capitalized. Its investment in road and equipment and in investments in other companies was given as of December 31, 1920, at \$339,463,062. Its outstanding stock, on which it has been paying of late 7 per cent, amounts to \$72,012,117 and its long term indebtedness to \$182,574,282. The company had a corporate surplus as of December 31, 1920, amounting to \$80,489,584. Its interest charges annually amount to slightly over \$8,000,000.

The total freight revenue of the Louisville & Nashville in 1920, as shown in the December monthly statement to the Interstate Commerce Commission, amounted to \$90,686,170, and the passenger revenue to \$26,725,621. The total oper-

The Louisville & Nashville

ating revenues were \$126,371,693 as compared with \$107,514,965 in 1919. The total operating expenses in 1920 were \$121,395,811 as compared with \$92,544,137 in 1919, the operating ratio in 1920 being 96.06 per cent. The net railway operating income in 1920 was \$3,321,221; in 1919 it was \$11,791,845. The standard return for the property while it was under federal control was \$17,310,495; the Louisville & Nashville was one of the few roads which earned its standard return in 1918, when the net railway operating income amounted to \$19,568,935.

The Louisville & Nashville has been doing rather better than most of the roads in southern territory when it comes to average car load, average train load, etc. It has not succeeded, however, in rivaling the Illinois Central, which of late has been making some rather enviable records. The average train load on the Louisville & Nashville in 1920 was 531 tons; the average number of tons per loaded car amounted to 30.5; the car miles per car per day to 30.6 and the ton miles daily per car to 613. These figures all represent in-

creases over 1919. In most cases they exceed the figures for the other roads running in the same territory with the exception, as above stated, of the Illinois Central.

The standard equipment allocated to the Louisville & Nashville by the Railroad Administration included 1,300 50-ton composite gondola and 1,000 55-ton hopper cars, and 18 light Mikado, 50 heavy Mikado, 6 light Pacific and 10 Eight-wheel switching locomotives, all of which were financed through the equipment trust arranged between the railroad, the director-general and the Guaranty Trust Company. In 1920, the road ordered also two Six-wheel switching, 31 Mikado, 12 Eight-wheel switching, and 18 Pacific locomotives, the larger part to be built in its own shops. It ordered also 2,000 55-ton hopper cars and 56 passenger train cars. When this equipment is received the road should be in a favorable position from this standpoint.

H. Walters, chairman of the board, and W. L. Mapother, president, in their remarks reviewing the year's results have this to say concerning the conditions which now confront the property:

"Under the Adamson Act and federal operation, the Louisville & Nashville's actual operating labor payrolls increased \$51,216,022 from \$24,427,677 in 1916 to \$75,643,699 in 1920, equal to 209.6 per cent. During this same period all other expenses increased \$30,239,643, or 172 per cent. Of these other expenses \$19,740,439 are estimated as the increases in the cost of materials and supplies, among which coal increased \$9,790,808 and cross ties \$2,140,277. Since September 1, 1920, all the railroads have suffered from a continuing shrinkage in business. This has become more intense since January 1, 1921, and has reached a point of decline far beyond anything ever experienced before. They are all endeavoring to meet this shrinkage by the exercise of the most rigid economy. The Louisville & Nashville management has seized every opportunity to make savings in the cost of materials and supplies, including coal, lumber and cross ties. Wherever possible train service has been and is being curtailed. Forces of all departments have been reduced by 10,000 men, which still leaves a surplus of more than 5,700 men above those employed in 1916."

The operating results for 1920 as compared with 1919 follow:

	1920	1919
Mileage operated .....	5,040	5,033
Freight revenue .....	\$90,686,170	\$76,828,467
Passenger revenue .....	26,725,621	24,842,673
Total operating revenue .....	126,371,693	107,514,965
Maintenance of way expenses .....	22,607,961	16,098,488
Maintenance of equipment .....	34,750,294	27,828,958
Traffic expenses .....	2,108,749	1,454,563
Transportation expenses .....	38,283,655	44,455,752
Total operating expenses .....	121,395,811	92,544,137
Net from railway operations .....	4,975,882	14,970,827
Taxes .....	3,647,448	3,008,063
Net railway operating income .....	3,321,221	11,791,845

The corporate income account is as follows:

	1920	1919
Standard return 1919 .....		\$17,298,920
Compensation, January and February .....	\$2,885,082	
Guaranty, March 1 to August 31 .....	9,194,719	
Net railway operating income, September 1 to December 31 .....	2,062,920	
Gross income .....	16,877,199	19,979,120
Net income .....	7,863,651	11,176,281
Dividends (7 per cent) .....	5,040,000	5,040,000

TRADE COMMISSIONER Louis E. Van Norman reports that the Polish government, with the object of encouraging home industries, has recently signed contracts with a number of engineering firms in Poland for the delivery of large quantities of rolling stock for the Polish railways within the next 10 years. Obviously, these firms will need foreign capital and assistance to enable them to carry out the orders. For their first deliveries they will have to rely on importation from abroad of wheels, springs, and locomotive parts. Eventually it is their intention to execute the orders completely in Poland.

## New Norfolk & Western 100-Ton Coal Cars

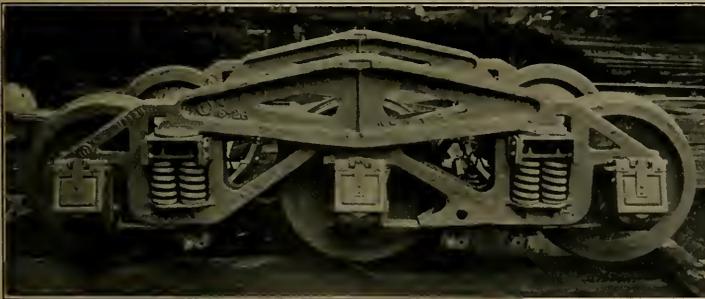

Body Supported on Side Bearings Instead of Center Plate—New Type Six-Wheel Truck

By John A. Pilcher

Mechanical Engineer, Norfolk & Western

**T**HE LIGHTEST CAR for its load carrying capacity ever built for heavy train service is illustrated in the accompanying drawings and photographs. An order of 500 of these cars is now nearing completion at the Roanoke shops of the Norfolk & Western, under the supervision of A. Kearney, superintendent of motive power. The advantages of a car of such light weight can be judged from an estimate of the cost of operation prepared in connection with this

ries the load on the side bearings instead of on the center plate. This arrangement not only gives perfect equalization of loads between the wheels at all times, but reduces the oscillation of the car to a minimum and contributes very materially to the lightness of both body and trucks. The average weight of car and lading is very near 253,500 lb., the A.R.A. limit for a six-wheel car with  $5\frac{1}{2}$  in. by 10 in. journals. The general dimensions and weights of the car are shown in the tabulation. The

Side View of the New Type Truck, Which Carries the Load on the Side Bearings

design. It has been computed that if all these cars could be kept running at the same rate that the first one operated for the first three months, (about 90 miles per day), the additional earnings over those of the previous large capacity cars built by the Norfolk & Western, would pay for them in five years. This accomplishment is due in part to the light weight of the trucks and body and in part to the larger cubic capacity.

The special feature of the design is the truck which car-

ries the load on the side bearings instead of on the center plate. This arrangement not only gives perfect equalization of loads between the wheels at all times, but reduces the oscillation of the car to a minimum and contributes very materially to the lightness of both body and trucks. The average weight of car and lading is very near 253,500 lb., the A.R.A. limit for a six-wheel car with  $5\frac{1}{2}$  in. by 10 in. journals. The general dimensions and weights of the car are shown in the tabulation. The equipment applied to this order includes wrought steel wheels. Miner friction draft gear, type A-18-S, with Farlow single key horizontal yoke draft attachments. Four hundred of the cars are equipped with Westinghouse K-2 triple valves and 100 with the Automatic Straight Air brake. The brake rigging has one brake beam per axle. The hand brake, arranged with a quick take-up, is geared to give braking power equivalent to the air brake.

The truck is of the three-axle, articulated type, mainly of cast steel, with two side frames on each side, secured together over the center boxes. The boxes used are the regular A.R.A. standard, although the design lends itself readily to the use of the semi-pedestal type of box, now in very general use. It is the lightest six-wheel truck of this capacity ever constructed. The pair of trucks weighs 24,480 lb.

The springs are so located in the frames as to give equal load distribution on the wheels when equal loads are applied to each group of springs. Beams made to straddle the frames

reach from one group of springs to the other, on each side of the truck, and support the weight of the car at their centers. This gives an equal load on each group of springs. The beams rest upon and are secured to spring caps, tying them

brake levers. A cable guard, to protect the brake beams from the cable used in hauling the cars up to the dumper, is attached to the under side of the diagonal braces, and is itself braced back to the center so that it can serve as a fulcrum for the dead end of one of the brake levers.

The brake is arranged with one beam per axle, using No. 2 beams. The pull from the cylinder rods comes to two of the brake levers set on opposite sides of the truck, eliminating any turning moment on the truck. The separation of the brake lever system on the truck into two parts gives independent adjustment for brake shoe and wheel wear, and prevents accumulating lever angularity. All of the adjusting points are readily accessible. The truck is open and can be easily inspected from alongside the car.

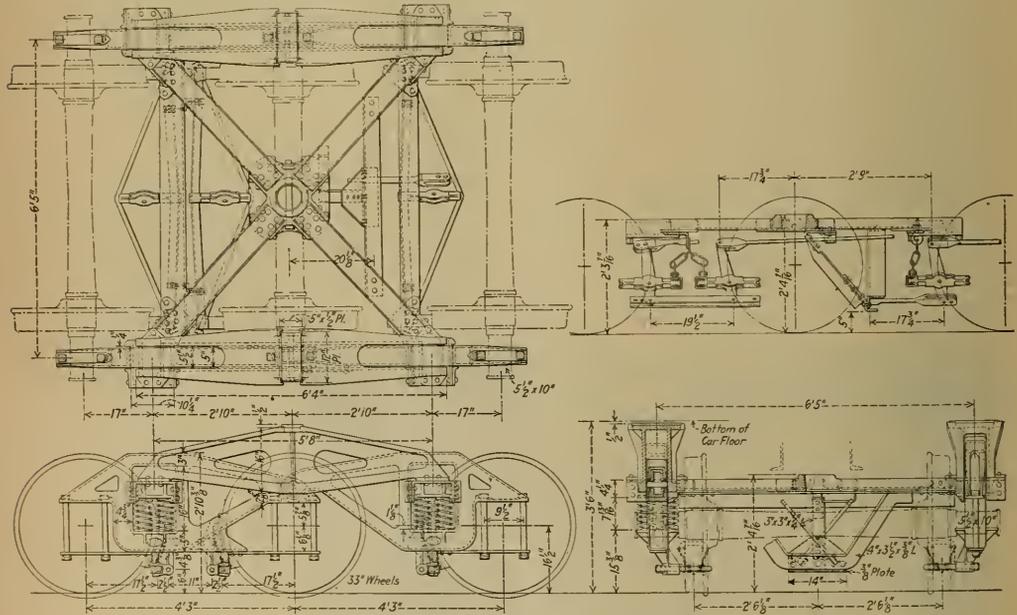

Since there is a possibility of low or soft spots in the track, the four points on the truck side upon which the four groups of springs rest, cannot always be kept in the same plane. The structure resting on the springs must, therefore, be either vertically strong enough to resist the differences in reaction at the four corners, produced by the differences in spring tension in case any one of the spring seats leaves the normal plane, or it must be vertically flexible enough for any corner to follow the spring seat out of the normal plane, without having set up within it destructive stresses.

This rectangular cross-braced centering spider has been

together lengthwise of the truck, and are themselves side members of a rectangular, cross-braced centering spider, which serves to hold the two sides of the truck together and

General Arrangement of the Six-Wheel Truck

in proper relationship. The truck is thus held square. The cross bracing holds the guide for the centering pin on the car body. The keepers, riveted to the outside of the spring caps, and the projecting lugs cast on them coming inside the frames, are the guides to hold the frames together and apart. The carrying beams, straddling the frames, are riveted to the top of spring caps and serve in a like capacity.

The design, which is light in weight, readily gives the strength to resist forces in any horizontal direction. One of the cross-tie members is made of an angle to give it stiffness and permit the attachment of the dead end of one of the

designed to meet these conditions. Careful tests were made by fastening three corners to a rigid frame and raising and lowering the fourth corner by means of a rail gaging machine with a stroke of 1 1/2 in. Two corners were tested, being subjected to 80,000 and 100,000 reversals of stress respectively. Measurements of the stresses showed that only a relatively small differential of loading at the corners will overcome the vertical stiffness of the spider and the unit stress is so low that there is little danger of fatigue failures in ordinary service.

The use of the side bearings placed over the center of the

truck side frames for load carrying, obviates the necessity for the strong, heavy bolster members from side to side of truck, supporting the load at its center. This not only decreases the weight of the truck, but also decreases the weight of the car body bolster, in that it does not need the strength to carry the load from the car side all the way to the center, but only for the very much shorter distance to the points over the truck side frames.

### The Car Body

The general drawing of the car and the arrangement of the body bolster show the location and details of the load carrying conical rollers. Only enough of the middle section

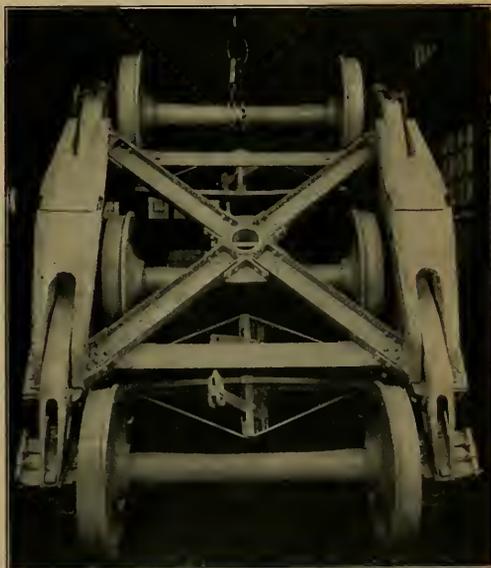

Interior of the Car Body

of the conical roller is used to provide sufficient lateral movement at the roller for the car to negotiate a 35 deg. curve. The bottom of the roller is limited in its lateral movement by the sides of the opening in the bottom of the car through which the roller projects. The body bolster is made hollow to allow room for the roller. The bottom face of the roller is set in a horizontal plane normal to lines of load forces, in order that there may be no horizontal components tending to displace the load-carrying side beams on the truck. The projections on the bottom side of the roller at each end serve as guides for proper placing. Normally these projections should not come into action for holding the bottom of the roller in place on the truck side beam.

The upper sides of the conical rollers incline toward the center. The lateral component of reaction against the inclined surface on the roller seat is taken up by compression in the body bolster and tension in the rod tying the two opposite rollers together. In case anything should happen to this rod, these reactions will all be within the roller seat itself. The outside end of the roller seat is made of sufficient strength to take care of these forces. The tie rod passing through a slotted hole in the inside projecting lug on the seat serves to hold the rollers in place in case the car is jacked off the trucks. The roller is guided on its top side by the pocket in the seat. It is cast of high carbon steel and bears against hardened-steel plates, top and bottom. It is made long and of large diameter, reducing to a minimum the probability of flattening the contact surfaces.

The use of conical rollers of large size makes this approximately an anti-friction bearing, and reduces to a minimum

A View of the Truck from Above, Showing the Centering Spider and Beams Spanning the Side Frames

the forces needed to rotate the truck under the car. Any slight flattening of the contact surfaces that might occur after a long period of service would only very slightly increase the forces needed for the turning. Even if after years of service the surfaces should flatten to an objectionable extent, the renewal of rollers and seats is a simple and comparatively inexpensive operation.

The roller seat at its top side conforms to the shape of the inside of the bolster plates and distributes the load over a large portion of the surface, requiring very little riveting to hold it. The holes in the sides of the car are used for entering and securing the tie rod connecting the rollers. They are reinforced on the inside of the side plates with bracket castings and furnish a place for a special hook provided with the wrecking outfits, for lifting the car body in any emergency. Some such arrangement is necessary since the use of ordinary hooks indiscriminately at any point on the loaded car would give such heavy concentration of loading as to tear and mutilate the car body.

A tee is used to increase the section of the top flange of

the bolster girder, and its top extending web serves for the attachment of the bolster gusset plate. This gusset plate connection with the side of the car, together with the beaded angle at each end of the bolster, connecting the bolster web plates with the car side, transfers the load coming from the car side through the body bolster to the roller seat, without undue concentration at any point. The car body bolster is placed above the car floor line so as to give room under the car for the supporting beam on the truck over the center box and truck side frames. This allows reasonable depth and economy in the design of the beam.

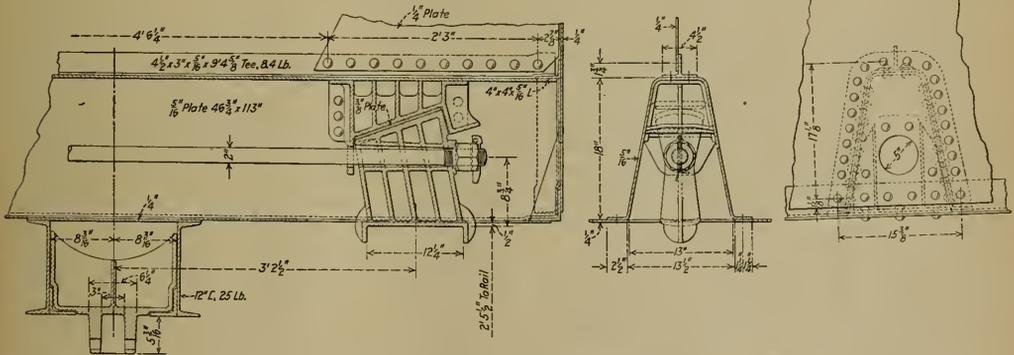

On a hopper car the hollow bent plate bolster can be placed in the same relative position to the truck without being placed above the inclined floor of the car. The centering casting on the car body is integral with the draft gear back stop. The holes receiving the pin fastening together the body and truck center castings are slotted in order to allow the necessary angular movement between truck and car. There is no normal vertical movement between these two parts.

The center portion of the car, between trucks, has the bottom placed on a line with the bottom of the center sills, thus gaining additional cubic capacity and slightly lowering the center of gravity. The cross diaphragms in the car framing become the ends of the depressed bottom. On the outside

the track, without undue stresses within itself, and without great differences in the load pressure on the four supporting points. This would not be possible with a closed-top, rigid car body. When such a rigid car body is used, a method of cross equalization on one end of the car must be introduced with a truck of this type.

Observations made on previously constructed large open-top cars, in connection with the adjustment of the side bearings, indicated there would be no difficulty in supporting such a car on four points. In fact, with the close adjustment of the side bearings, to prevent excessive rocking, the car body had, in a measure, to accommodate itself to the changes in the plane of the track, and has been doing this for a number of years without any apparent detriment.

Some experiments were conducted with the object of determining just to what extent such a car body could be warped out of its normal plane without detriment, and without excessive changes in the loading on the four points of support. The first tests were made on a flat bottom gondola, both empty and loaded. The car body was brought to a level plane resting on four groups of calibrated springs. By measuring the height of these springs, the load on each corner could be determined. Liners of various thicknesses were then placed on top of the springs at diagonal corners

Arrangement of Body Bolster and Conical Roller

of the car, short pieces of tee section, the same as the side stakes, are placed so as to come opposite the cross diaphragms and bear against the car dumper blocking, supporting the car at a strong point of reaction. The side stakes and top coping angles serve the same purpose.

The vertical corner angles connecting the side plates of the car with the end plates have the flanges attached to the end plates turned out, so that the projecting edge of this flange, together with the edge of the plate riveted to it, will bear against the dumper blocking, thereby helping support the weight of the car and lading and protecting the grab irons from injury. Both the corner push-pole pocket and reinforcing bracket casting, under the center of the body bolsters, furnish places for jacking and stooling the car. The general details of construction can be understood from the drawings:

**Car Body Support**

A car body resting, as does this one, on four points of support, two on each truck, on rollers, allows for the vertical angling between the plane of the truck and plane of the car in passing the sharp vertical curves of the tracks leading to the dumper. These four points of support also make it necessary that the car body be measurably flexible, in order that it may accommodate itself to the changes in the surface of

so as to bring the car body to a warped plane. Readings were taken with several different adjustments. The maximum warp in the car body for the light car was 3 in. off the plane of the other three points and on the loaded car,  $2\frac{1}{2}$  in. The maximum change of load at any one point during the test was 5,834 lb., a little more than 10 per cent of the load on any one point. Similar tests were made on the empty body of a 100-ton hopper car. The results were similar to those made on the 90-ton car, but the readings indicated that this car body was erected with about  $1\frac{1}{2}$  in. or 2 in. warp out of the true plane.

On the completion of the first new side bearing supported car an additional series of winding tests was conducted, both with the car on blocks and mounted on its own trucks. This car body also was found to have a warp of about  $2\frac{1}{2}$  or 3 in. The results bear out the previous test for winding on the car body and show conclusively that an open-top car of this character can be carried on four points of support and conform itself to the changing plane of the track without undue stress and without marked change in relative loading on the four points. About 400 of these cars are now in regular service and nothing has developed to indicate other than the deductions given above.

Before the first car was delivered for regular service, it was tested for clearance between the truck and car in curving

up to curves of 35 degrees using for this purpose a conveniently located turntable. One truck was placed in a fixed position on the turntable, with the other truck moving along the track as the table was turned to the extreme point the clearance between the truck and car would allow. By using the diagram shown in the drawing, and reading the movement of the turntable in inches at its circumference, the angular difference between car and truck and the corresponding curvature in track over which the car could run without fouling, was readily determined.

## Security Owners' Position Defended

THE ACTION of the National Association of Owners of Railroad Securities in meeting with representatives of the "big four" brotherhoods on April 4 was defended by Haley Fiske, president of the Metropolitan Life Insurance Company, in a letter addressed to A. H. Smith, president of the New York Central, which was made public on April 11. Mr. Fiske is a member of the sub-committee of the Association which met with the employees' representatives and his letter was in reply to a letter of the previous week from Mr. Smith to S. Davies Warfield, president of the Association, in which the action of the Association in calling the meeting was characterized as "unfortunate" (*Railway Age* of April 8, page 904).

Mr. Fiske in his letter warned that "the present truculent attitude of some railroad administrations toward the operatives and the unions" is a "mistake which may lead to disaster." Mr. Fiske stated further that it was "disturbing to find" Mr. Smith and the New York Central directors resenting the action of the Association to protect its interests. Furthermore Mr. Fiske said that his associates have met with "rather violent antagonism" in their "efforts to promote helpful legislation, which, now that it has been passed some of your people are taking credit for."

Mr. Fiske's letter follows:

When we read in the newspapers to which you sent it in advance of its receipt by the addressees your letter of March 31 to Mr. Warfield and Mr. Stone we were disposed to reply in as sharp a tone as that displayed by you. But it seemed better to take the matter under cool consideration. Now, after the lapse of a week, we feel that we should make protest.

This company holds securities of your railroad and its subsidiaries to the amount of nearly \$23,000,000 par value, and in addition has on its books loans and agreements to loan over \$9,000,000 on bonds and mortgage upon real estate to finance your operations in the neighborhood of your terminal. Altogether our financial interest amounts to \$32,000,000. This is about 15 per cent of our total investment in railroad securities.

Frankly, it disturbs us to have your board of directors say that they represent in their dealings with the present condition of affairs the stockholder, without any recognition of the superior obligations of the railroad companies. It may very well be that as matters are now threatening the stock will become a rather negligible quantity; the bonds will never become so. Our interest in your company is a vital one. It is very disturbing to read that you are disposed to ignore this interest. It is even more disturbing to find yourself and the board resent any action on our part to protect our interests. We have seen no disposition on your part to recognize our interests or to consult with those who in a sense own your property. On the contrary, we have seen in the past rather violent antagonism to our efforts to promote helpful legislation, which, now that it has been passed, some of your people are taking credit for. None of the railway managements has thought it wise to seek any counsel or to recognize in any way the serious situation in which we find ourselves. On the other hand, you are objecting—if you will pardon us for saying so—in an offensive, not to say impertinent way, to our endeavor to protect our own investments. We feel that we had a right to expect co-operation and help rather than opposition.

Your assumption that in seeking a conference with the labor representatives, the most important element in the present problem, we are pretending to represent you or your board was quite unwarranted. We very frankly put our real position before these organizations and the public. We think the present truculent attitude of some railroad administrations toward the operatives and

the unions a great mistake which may lead to disaster; and that it is time that all concerned in the properties should show some conciliatory disposition, at least to the extent of endeavoring to get the point of view of labor and to seek some method of negotiation to end the present impasse.

And now that our conference is over, we feel that we have accomplished much. In our opinion it is time that all of the interests—the investors, administrators and operatives—get together, and that it is not a time for recrimination.

## New York Public Service Commission Law

THE LAW OF NEW YORK STATE reorganizing the public service commissions of the state was briefly noted in the *Railway Age* of April 1, page 862. A single commission has authority throughout the state except that a separate commission, the Transit Commission, has jurisdiction over elevated and subway railroads, surface railroads and stage or omnibus lines lying wholly within New York City; also, within the city, over street railroads whose lines may extend outside; and over local service, within the city, on all railroads.

The law consists wholly of amendments to the existing law as it was framed in 1910, which law, as affecting railroads, was based on the act passed in 1907. This last mentioned act was printed in full in the *Railroad Gazette* of May 31, 1907.

The new public service commission, sitting at Albany, and taking the place of the present commission for the second district, is to consist of five members, the governor designating the chairman. The term of a commissioner is ten years and he is removable only on the consent of the legislature by a two-thirds vote. The Transit Commission consists of three members with terms of five years each. These are removable in the ordinary way, by the governor. The salaries of all eight commissioners are \$15,000 each.

The public service commission is to regulate not only railroads, gas companies, lighting companies, heating companies, etc., as has been done heretofore, but also omnibus routes (except in New York City).

The public service commission is to maintain a branch office in New York City and the offices of both commissions, as now, are to be kept open from 8 a. m. to 11 p. m. The secretary of each commission is to receive a salary of \$6,000.

One of the important reasons for the enactment of these revisions at this time was to relieve the critical financial condition of the subway and elevated railroads in New York City; and the Transit Commission is empowered to authorize an "immediate, reasonable, temporary" increase in fares. This power is granted also to the public service commission as related to all carriers, and includes authority to fix rates for fares and freight "notwithstanding a higher or lower rate has been prescribed by a general or special statute, contract, grant, franchise condition, consent or other agreement." The Transit Commission, however, dealing wholly with New York City, is subject to restrictions requiring co-operation, with city authorities in the revision of any of the existing contracts between the railroad companies and the city.

The public service commission has power to revise prices of gas and electricity in general on the same terms as the authority granted in connection with railroad rates.

Article VI of the present act consists of ten pages setting forth additional powers and duties of the Transit Commission, and providing for co-operation with the city authorities.

THE ROUMANIAN GOVERNMENT has signed a contract with the government of Austria for the rental of 100 locomotives and 2,000 cars.

# Canadian Government Railways Incur Heavy Losses

Deficit, Including Interest on Entire Investment, Over \$140,000,000  
a Year—Operating Ratios 109 to 410 Per Cent.

By J. L. Payne

Formerly Comptroller of Statistics, Department of Railways and Canals of Canada

TO THOSE WHO READ the analysis which I offered in a preceding issue\* of the deficit on the Canadian National Railways group for the current year it will be obvious that a capital liability of \$2,284,125,057 could scarcely fail to produce the fixed charges of \$106,301,744 assigned to it. That would represent an interest rate of but 4.65 per cent, which is rather low. There are, however, rents, taxes, interest on floating debt and so on, attaching to 22,500 miles of line to be added; so that suspicion of exaggeration could not reasonably arise. Moreover, it must be borne in mind that nearly \$400,000,000 has been contributed to the total liability since 1914 in government advances to acquired roads, apart from several hundred millions on account of the Intercolonial and Transcontinental, and probably half of that amount, if not more, will bear a rate up to or over 6 per cent. Late last year \$50,000,000 was borrowed on long term notes in New York at 7 per cent.

These more modern advances by the government suggest at once one of the most distressing features of this whole matter. Let us agree it is mere fatality, whatever some might be disposed to say as to other reasons, that the government has found the burden growing at a truly alarming pace year by year since this huge scheme of nationalization was given effect. Proof of that growth is found in the steadily rising volume of cash aid which the government has been obliged to give. The Minister of Railways is now before Parliament with a request for \$168,000,000 on this account, which omits \$35,000,000 borrowed a few months ago on notes. These two sums are equal to nearly 50 per cent of the total revenue of the Dominion. It is actually \$31,000,000 in excess of the total national receipts for 1916.

It is the swelling character of this load which makes the situation so grave and causes such acute apprehension for the future. Last year the deficit was nominally placed at \$47,000,000; this year at \$70,000,000. At that rate of progression the burden would soon be disastrous. It is unbearable now, and measures of relief must be found. If all other conditions remain stationary, it will be seen that the capital additions for the year alone will raise the deficit next year by upwards of \$12,000,000 by reason of new fixed charges.

## Operation Ratios of 109 to 410 Per Cent

The weakness of the various units composing the Canadian National group may be gathered from one or two comparative statements which will be peculiarly enlightening to railway men. Take the operating ratio, for example. In the report of the deputy minister of railways, issued this year for the first time, the position of the various units is shown in that regard to have been as follows in 1919-20:

Canadian Northern.....	112.08	Moncton & Buctouche.....	231.86
Canadian Government.....	114.52	Elgin & Havelock.....	285.69
Canadian National.....	113.14	St. Martin.....	409.60
Intercolonial.....	108.95	York & Carleton.....	326.59
P. E. Island.....	167.55	Salisbury & Albert.....	257.61
International.....	280.78	St. John & Quebec.....	205.07
Transcontinental.....	125.63		

While these names will be a little puzzling to American readers, and it is not worth while trying to explain them, the figures which are opposite to them are significant. These roads are all included in the Canadian National system, and

the ratio of operating expenses to gross earnings as shown must be measured against, say, 75 per cent in determining the measure of unsoundness. That is to say, no road which goes beyond 75 per cent can be regarded as healthy, unless the conditions are quite exceptional. This adverse showing is in part explained by the fact that the moment a small line is taken over by the government, standard rates are charged instead of local, and an immediate shrinkage of revenue takes place. Of course, while that explains the cause in small part, it does not alter the financial aspect in the slightest; and we are here merely concerning ourselves with the facts in their relation to the total burden upon the people.

The situation is not bettered when earnings and operating expenses per mile of line are considered. Here are the facts for 1919-20:

	Earnings	Expenses
Canadian Northern.....	\$5,558	\$6,230
Intercolonial.....	17,735	19,344
Prince Edward Island.....	3,335	5,588
International.....	1,673	4,698
Transcontinental.....	5,804	7,292
Moncton & Buctouche.....	1,682	3,900
Elgin & Havelock.....	857	2,449
St. Martin.....	616	2,523
York & Carleton.....	1,458	4,761
Salisbury & Albert.....	1,350	3,426
St. John & Quebec.....	965	1,980

In fact, no matter from what angle the problem is approached the financial aspect shows up discouragingly. While that aspect has been peculiarly worsened as the result of exceedingly adverse conditions affecting all railways in North America, it is more serious on the government road than on others. I do not care to discuss probable reasons. That the people did not know how bad it was is due in part to the system of accounting which has been followed—or lack of system. A very large annual deficit, which should have been specifically assigned to the government railways, was scattered about in the public accounts, chiefly in the form of charges connected with the national debt. What has here been done in large part, has been to bring all such liabilities out of the places where they did not belong and put them where they did belong. This has not to the extent of a penny increased the actual loss. It has merely revealed and consolidated it in its proper place.

In keeping with the orthodox plan, sanctioned by ancient precedent, the minister of railways announced the other day that the deficit would be "about" \$50,000,000; but, he added, that figure "did not include certain fixed charges." He did not hint at the probable volume of those charges. He followed the pattern set by his predecessors and left the facts to be assumed. That has been the course followed for two generations. Several days later, and just as this article is being sent out, he has definitely placed the deficit for the past year at \$70,331,734. But his call for appropriations aggregating \$168,000,000 and the realization that this sum may bear some relationship to the real deficit on the Canadian National Railways when all factors have been reckoned, has profoundly stirred the whole country. There is an insistent demand for information. As has already been said, the newspapers have taken up the matter in a spirit of earnest enquiry. As many columns are being written these days about the railway situation as were lines in the times when this vast liability was in process of

\**Railway Age*, April 8, p. 883.

accumulation. Just what may develop out of this new attitude of the public no one may say at this moment.

### Business Men "View With Alarm"

The first shot has been fired by the Board of Trade of the ancient city of Quebec. At a meeting held on the afternoon of March 15, the following resolution was adopted and telegraphed to all sections of the country:

"That the Quebec Board of Trade views with alarm the recent declaration of the Honorable the Minister of Railways, in the House of Commons, to the effect that last year's operation of railways by the government would result in an increase of the public debt of Canada to the extent of \$140,000,000, to meet the deficits in the operation of these railways and to provide additions to their equipment and betterments.

"That this board, in common with other commercial bodies in Canada, has repeatedly expressed to the government its disapproval of the policy of government operation of railways.

"That the policy of the management of the government railways in diverting the grain trade of the west to New York for export, and, by means of prohibitory freight rates, preventing this grain from coming to Canadian seaports for shipment, is most reprehensible and unpatriotic, and has resulted in the payment of many millions of dollars of freight money to United States railways, that should have been earned by Canadian railways, and if so, would have gone a long way to reduce the alarming deficit under government operation which all now deplore.

"That it is impossible for Canada to go on meeting losses of this magnitude, which in a few years might seriously impair the credit of the country, and this board is of opinion that the government should seriously consider the future management of the Canadian Northern railway, before going any further with regard to the acquisition of the Grand Trunk."

The protests to which the foregoing resolution makes reference are not available at the moment. Under any circumstances, they were taken as a matter of course, and did not arouse any particular feeling in the country. It would seem that a great change has suddenly taken place in that regard. Today a marked spirit of inquiry, suggesting a determined desire to know the truth, whatever it may be, is in evidence. Out of this public awakening may come some new constructive policy. I am not disposed to speculate upon the probable character of that policy. All sorts of suggestions are heard, some of them extremely radical. There is even some hint from labor circles of the expediency of trying the Plumb plan, with which the people of Canada are wholly unfamiliar at the present time. There would not seem to be the slightest probability of that being done; but as to what else may be urged, as the matter more and more engrosses public thinking, I could only guess.

### Government Ownership Never

#### Submitted to Public Consideration

That such stupendous events should happen without the question of state ownership having been submitted to public judgment will naturally surprise your American readers. Yet I have tried to make it clear under what extraordinary circumstances the present government railway system was brought into existence. While all well-informed men knew that it would be a costly business for a time, there was no doubt a general expectation that the weakness of the Canadian Northern would give place to strength as time proceeded. Few people realized how desperate was that weakness, or how much would be required to bring it up to a sound operating position. Its traffic density was exceedingly low, and it was one of the poorest equipped roads in the world. Equipment costs a great deal of money today. The Canadian Northern was not, however, essentially weaker than was the Grand Trunk Pacific, because of the tremendous capital cost per mile of the latter. It amounted to \$104,000 per mile, now greatly increased by government advances. These two roads ran parallel for hundreds of miles and competed for traffic which either could have handled.

If there is any one fact in connection with the whole Canadian railway problem which stands out as an example of state blundering it is to be found in the creation of these two rival systems. Neither could have been financed without public help, and to a large extent both were constructed on state credit and under state auspices. The volume of private capital put into these roads was relatively small. If there had been a careful survey of the transportation needs of the West, and a policy of progressive construction adopted as those needs became real rather than prospective, it is just possible these two systems could have found a place in western Canada. As it is they both occupy practically the same territory, showing slow development of traffic.

It has not been a pleasant task to write this story. It is dismal and distressing. But, if a personal explanation will be pardoned, it has been my life work to study matters of this nature, and it has seemed to me that I was in a peculiarly favorable position to present the facts. That has been my sole purpose. Not a syllable has been written about the broad principle of public ownership. That is an issue which has never arisen in connection with the Canadian railway problem—at all events not before the people. If there had been a deliberate choice of the present plan as against the corporate plan, then, quite properly, a great many pertinent conclusions would seem to be suggested; but I have left the drawing of deductions from the Canadian experience to others. As for myself, I have written wholly without prejudice. My own judgment as to what might have occurred under capable corporate management is decided; but has no place in this review.

### Whole Country Is Aroused

It is perhaps unfortunate, in some respects, that my analysis of the situation had been completed, and much of the foregoing matter actually written, before the Minister of Railways presented his annual statement to Parliament on March 17. Had his figures been available to me, instead of merely the advance press abstract, I should have adopted them as more or less authentic—at all events as not being open to question by his department. Any difference that exists between his calculations and mine clearly shows that I have understated rather than overstated the facts, and I would rather have it that way. If what he omits is brought into the reckoning, as I have tried to do in a judicial spirit, it will be seen at once that the burden now resting on the Canadian people as the result directly and indirectly of railway nationalization is well over \$140,000,000 a year; for the press statement, which bore all the stamp of official authenticity, placed the operating deficit for the fiscal year 1920 at \$21,250,000, while the Minister later enlarged it to \$36,842,970. The difference between these two figures must be added to my calculation of the probable deficit for the current year, and it will be seen at once that it is thereby raised to considerably over \$140,000,000.

Parliament is in session, and it seems there is a movement on foot to take the matter out of all party controversy. It is felt that the situation is far too grave to be discussed in the ordinary way. One of our leading newspapers implies that the very life of the nation is involved in the finding of a practicable solution. The supporters of the nationalization idea have hitherto been discounting adverse results as due to conditions purely temporary in character, and it must be confessed that the fine optimism growing out of that view was shared more or less by the people at large. Now there is a great change. Until, however, time has been given for the evolution of some definite policy it would be idle to speculate. As a matter of fact, I have not the remotest idea what will even be proposed. All I know is that the whole country is aroused, and that everybody is convinced there must be a vital change. When the people take a hand something is likely to happen.

# President Urges Reduction of Transportation Costs

Mr. Harding Continues Conferences—Meets Labor and Security Owners' Representatives

WASHINGTON, D. C.

PRESIDENT HARDING, in a brief discussion of the railroad situation in his address to Congress on Tuesday, probably disappointed numerous believers in legislative panaceas when he declared that "railway rates and the cost of operation must be reduced" without recommending any additional legislation to accomplish such a result. Probably a more definite feeling of disappointment was caused among those who have been shouting for rate reductions regardless of costs by the fact that he coupled the two in such a way as to carry the thought that a reduction of costs is perhaps a necessary precedent to a reduction in rates.

The President also made it plain, if there had been any doubt on the subject, that his mind has not been turning in the direction of another experiment in government operation as a possible solution when he said: "If we can have it understood that Congress has no sanction for government ownership, that Congress does not levy taxes upon the people to cover deficits in a service which should be self-sustaining, there will be an avowed foundation on which to build." He had previously referred to "government operation in heedlessness of cost" in referring to the period when railway deficits were being covered by taxation and in his reference to the merchant marine he had urged "government encouragement, not government operation."

He made clear, however, his opinion that freight carrying charges are too high—he did not mention passenger rates specifically—but he referred to the low tide of business as a cause of the present difficult transportation situation rather than as an effect, as so many have preferred to consider it.

The part of President Harding's address relating to railroads read as follows:

The great interest of both the producer and consumer—indeed, all our industrial and commercial life, from agriculture to finance—in the problems of transportation will find its reflex in your concern to aid re-establishment, to restore efficiency, and bring transportation cost into a helpful relationship rather than continue it as a hindrance to resumed activities.

It is little to be wondered that ill-considered legislation, the war strain, government operation in heedlessness of cost, and the conflicting programs, or the lack of them, for restoration have brought about a most difficult situation, made doubly difficult by the low tide of business. All are so intimately related that no improvement will be permanent until the railroads are operated efficiently at a cost within that which the traffic can bear.

If we can have it understood that Congress has no sanction for government ownership, that Congress does not levy taxes upon the people to cover deficits in a service which should be self-sustaining, there will be an avowed foundation on which to build.

Freight-carrying charges have mounted higher and higher until commerce is halted and production discouraged. Railway rates and costs of operation must be reduced.

Congress may well investigate and let the public understand wherein our system and the federal regulations are lacking in helpfulness or hindering in restrictions. The remaining obstacles which are the heritage of capitalistic exploitations must be removed, and labor must join management in understanding that the public which pays is the public to be served, and simple justice is the right and will continue to be the right of all the people.

## President Continues Conferences

No suggestion was made that any plan of action which has been urged upon the President during his recent conferences on the railroad situation has yet commended itself to him and there was no indication as to whether he has more faith than some others have as to the willingness or ability of the Railroad Labor Board to function in time and in the

right way to help remedy the situation or as to whether he has in mind some plan not yet matured which he proposes to discuss later. He has consulted with the chairmen of the Interstate Commerce Commission and the Railroad Labor Board and with representatives of the labor organizations and of the bondholders but he was to begin his discussion with the representatives of the managerial chiefs of the roads on Wednesday with T. DeWitt Cuyler, chairman of the Association of Railway Executives.

President Harding has continued his conferences with labor leaders on the railroad situation and in addition to those previously mentioned, he conferred on April 6 with W. L. McMenimen, deputy president of the Brotherhood of Railroad Trainmen, and on April 9 with L. E. Sheppard, president of the Order of Railway Conductors. He had previously talked with B. M. Jewell, representing the organizations affiliated with the American Federation of Labor, and with W. S. Stone, representing the engineers, and W. S. Carter, representing the firemen. It is understood that the heads of the train service brotherhoods advocated the plan they had previously discussed with the railroad executives, for regional agreements and regional boards of adjustment, which was referred by the Association of Railway Executives to the railroads in the various districts.

## Security Owners Representatives

### Confer With President

Darwin P. Kingsley, president of the New York Life Insurance Company, and S. Davies Warfield, president of the National Association of Owners of Railroad Securities, conferred with the President on April 8 as members of the executive committee of the association. They were also members of the special committee that conferred with the heads of the train service brotherhoods and other organizations at New York on April 4 and they urged upon the President the plan that has been advocated by the "big four" brotherhoods for a discussion of the wage questions by bi-partisan regional boards. This differs from the plan proposed by Mr. Jewell and his associates, who have urged the President to call a conference of the railroad executives and of the labor leaders for the purpose of discussing a national adjustment. Mr. Warfield and Mr. Kingsley, however, insisted that wage adjustment is only part of the problem and called attention to the Warfield plan put forward by the association as a means of effecting other economies. After the conference a memorandum left with the President by Messrs. Warfield and Kingsley was made public, as follows:

In your intensive study of the railroad problem we respectfully direct your attention to these facts:

You are aware that for the months of January and February—and a similar result is forecasted for March—the railroads of the country, as a whole, are not earning, by many millions, sufficient to pay the interest on their bonds and other outstanding debt.

This condition cannot continue without numerous receiverships with far-reaching effect. The resulting reorganizations would cause great loss not alone to owners of railroad securities but in other values. The alternative of a legislative suspension of legal proceedings through a national railroad moratorium or of temporary relief through large additional government loans, are necessities to be avoided if humanly possible. Further suspension of earning power is fatal.

The situation is of peculiar concern to the investment institutions of the country, its savings banks and life insurance companies particularly. Many millions of people are dependent upon the current payment of interest on the railroad securities owned

by them. A prolonged suspension of the payment of interest on the bonds of a great number of railroads would materially lessen the ability of these institutions to meet their requirements.

If this emergency continues much longer, the bonds must be drawn actively into the situation; and bondholders' protective committees will become necessary for the protection of the various classes of securities affected by the conflicting equities of receiverships or suspended payments. This will add to already greatly disturbed conditions.

Representatives of the railway executives' association ascribe the trouble to wages and working conditions; representatives of the employees insist that the fault lies largely with inefficient railway operation.

The suggestion is heard that railway managements if left alone will produce results—meaning reduction in wages sufficient to enable the roads to meet their obligations.

There has been unnecessary delay, friction, and a sacrifice of the merits of the question to controversies over procedure. There is lack of co-ordination between railway managements and the employees. Policies have been adopted, reversed, rescinded and new policies started through the same process.

The National Association of Owners of Railroad Securities represents in its membership nearly \$12,000,000,000 of railroad securities, largely bonds. It is the means through which the security owners, as a body, are collectively heard. In the present crisis we could not stand by and await the inevitable result without an endeavor to ascertain at first hands the causes for the existing conditions before urging intervention upon your Administration which alone can secure immediate results. Since September 1, 1920, the drift toward the present difficulty has been constant and progressive.

To ascertain if the results indicated can be avoided, the association of security owners, through its executive committee, after reviewing the contentions of representatives of the railway executives' association and the general procedure advocated, named a special committee to confer with those who represent large numbers of railroad employees. One of the principal impediments to a settlement is the lack of proper understanding between the roads and those who work upon them. There has been wholly unnecessary delay and uncertainty as to procedure, with lack of appreciation of the real questions in controversy. We believe our known attitude toward intensive economies in railroad operation would guarantee to those we were to meet the sincerity of our approach.

The conference has been held. It covered a wide ground and the conclusions of the committee representing the security owners are that a solution can be found and a just settlement arrived at. We suggest that properly called meetings between the men and those representing the railroads be held, under the auspices, if you think proper, of the existing governmental agencies—the labor board and the commission. Perhaps these bodies will co-ordinate their efforts, in some degree, in this emergency.

We are on record that wage adjustment is only part of the problem. That this should be attained under circumstances carrying assurance to railway workers that whatever may be fairly brought about is reasonable and just. This was one of the reasons for presenting our statement to Senator Cummins on March 21, in advance of his proposed investigation.

It occurs to us that it is not an unreasonable position on the part of those representing the men that deficiencies in revenue should not be met by wage reductions alone unaccompanied by evidences of the definite intention to bring about obligatory general economies.

The association of security owners is now preparing the data for suggestions of economies to be laid before the committee of the Senate which will review existing railway conditions. We believe that fundamental economies can be effected. We feel that in justice to the shipper and railway labor, they must be inaugurated. We have stood definitely committed to that program since January, 1919. This however takes time. That program cannot become finally effective without the co-operation of the necessary governmental agencies, including Congress.

We believe that affirmative action on the part of the administration in calling upon the managements and the employees to discuss and settle differences that are not composed on the individual roads will be effective. A multiplicity of trials before the labor board will not accomplish the result in time to avoid major damage.

If assured that your administration will urge an adequate program of economies, accompanied by legislation to that end, we believe that in the cases in which an agreement cannot be reached with an individual railroad management, that the employees would enter into immediate discussion of their differences by regional boards, equally divided, formed by each of the four groups of railroads as now arranged by the commission for ratemaking purposes. Procedure of this character is encouraged and contemplated by the Esch-Cummins act. It would avoid endless hearings and clogging of the dockets of the labor board,

which means perhaps fatal delay. Your intervention, Mr. President, along the lines suggested can put an end to the impossible conditions that now exist and which threaten the financial structures of the railroads with serious consequences.

Thomas DeWitt Cuyler, chairman of the Association of Railway Executives, with Alfred P. Thom, general counsel of the association, called upon the President on Wednesday by appointment for the purpose of handing in the six names from which the President, as provided in the transportation act, will select one for appointment to fill the vacancy in the management group on the Labor Board, which will occur on April 15, and also to discuss with the President the general railroad situation.

After the conference Mr. Cuyler stated that he, of course, could not repeat what had occurred in the interview as it was manifestly proper that the President should not be quoted and should himself determine whether any and what statement should be issued; but that the President had discussed the railroad situation quite fully and had shown a complete grasp of the problem, to which he had evidently been giving most careful and earnest consideration. The President listened with interest to all the views which were presented, which necessarily covered the entire railroad situation, including revenues and expenses, wages and working conditions, and other matters vitally affecting the railroads and the public.

A group of employees' organizations has nominated J. J. Forrester for re-appointment to the Labor Board.

### Banker Urges Regional Boards

The attention of President Harding has been called to the concern felt by the savings banks because "the railroads as a whole are not even making their bond interest," in a letter addressed to him by G. E. Brock, president of the National Conference of Mutual Savings Banks and president of the Home Savings Bank of Boston. This letter was made public on April 11. It is further stated that "we have had altogether too much red tape in procedure before the Labor Board" and that the attitude of the "representatives of a great number of railroad employees" is fair and shows "a desire of compromise." Mr. Brock closed his letter with a statement to the effect that "regional discussion between railroad officials and representatives of the employees will solve this problem."

The letter follows:

The railroads as a whole are not making their bond interest, so we savings bank people are much concerned. A great many of the workers on the railroads are depositors in savings banks and many millions of them have what are known as industrial policies of insurance on their lives. We believe they realize that what adversely affects railroads must adversely affect them. This is apart from the pay they receive from the railroad.

I have no sympathy for those who have in their keeping the billions of securities belonging to the people we represent who do not interest themselves in a crisis like the present to the extent of knowing from first hand what is going on and what the trouble is. We have had altogether too much red tape in procedure before the Labor Board. We now need co-operative suggestion and action.

The attitude of those we met who represented great numbers of railroad employees was fair and showed a desire of compromise and the distinct wish to prevent a catastrophe in the railroad world.

I was glad to see that Mr. Warfield wrote you and presented to you the views of those of us who are active in the situation in representing our institutions with their great investment and that something constructive was suggested by these two gentlemen to you, to which I trust you will give great consideration.

Regional discussion between railroad officials and representatives of the employees will solve this problem. For it will lead to regional boards created by the four groups of railroads which have now been formed by the Interstate Commerce Commission. This proposition is a fair one. Such regional boards would be used until after the railroad manager of each road sees the road employees. It would secure prompt action and enable disputed points to be promptly taken up. Those not settled shall then go to the Labor Board at Chicago.

**A** RESUMÉ OF THE practice of representative railroads shows that the use of the transition, easement, spiral or taper curves, as they are variously called, is now almost universal for main line railroads. This is in direct contrast to the conditions 25 years ago when the prevailing differences as to the advisability of providing any form of easements gave rise to frequent controversies. From a study of the present attitude toward this matter, it would seem that the intervening years, during which the subject received decreasing attention in technical papers or articles, have witnessed a general acceptance of an accurately located taper, founded on more or less rigid mathematics, as the only satisfactory means of accomplishing the transition from a tangent with the rails on the same level to a circular curve properly super-elevated.

The present virtual unanimity of opinion in favor of easement curves has been brought out in a questionnaire recently addressed to the larger railroads of the United States and Canada to which replies were received from 39 systems, covering an aggregate mileage of 190,000 miles of line. It is entirely possible that this general acceptance of the easement curve as a necessary feature of railway alinement accounts for the scant attention which this subject has received in recent years, either in pages of the technical journals or by engineering societies.

An insight into the attitude of railway men a quarter of a century ago is obtained from an article in the *Railroad Gazette* of May 24, 1895, where Walter Loring Webb presented a summary of replies which he received from 18 leading railroads in answer to a questionnaire he addressed to them on this same subject. Other contributions and editorial comments appearing in the same volume of that periodical showed that this subject was then one of live consideration. Estimates based on information available at that time indicated that only about twenty-five per cent of the railroad curvature of the country had been provided with easements.

Believing that a knowledge of the present practices with respect to this particular feature of railroad engineering would be of interest and value to railway engineers and maintenance of way officers, the president of one of the eastern railroads, who in former days took an active part in the introduction of transition curves, suggested to the *Railway Age* that this subject presented a fertile field for investigation. In pursuance of this idea the following questionnaire was addressed to the chief engineers of forty-two railroads in this country and in Canada, replies to which were received from thirty-nine of the railroads which were addressed.

### Questionnaire Regarding the Use of Easement Curves

To what extent do you employ easement curves?

What type of easement curve do you employ?

Do you use easement curves for all degrees of curve, or do you restrict their use to curves of a certain degree or sharper and if so, what degree?

Is the length of easement curve based upon the train speed as well as the degree of curve and if so, how?

Is the easement curve established by your engineer corps or by the supervisors?

Is the use of the offset method or the method by deflections given preference?

Do you employ the string method of establishing easement curves in existing tracks?

Are the limiting points of the easement curves defined on the ground by permanent markers and do these carry the date as to full elevation and rate of run-off?

Are easements introduced at the time a new line is constructed or subsequently?

The replies have been tabulated in the large chart in as near the form in which they were received as was possible. Practice as regards matters of this kind is not subject to abrupt modification. Consequently, we find that the replies received from three officers of the Canadian National reflect the individual practices of the several lines absorbed in this system. Similarly, it has been found desirable to tabulate the replies received from the four regions of the Pennsylvania system so as to show the practices as they have prevailed on the lines east and west of Pittsburgh.

### Use of Spirals Almost Universal

By far the most pertinent fact disclosed by this chart is that all the roads reporting except one, the Chicago & North Western, make some use of transition curves. On one other road the use is characterized as "limited," this being the Pere Marquette, a road with a relatively high proportion of light traffic branch lines. The extent of the use of spirals, as reported by the 38 lines which use them, is somewhat varied, but in general it may be said that they are used on main-line, high-speed tracks in nearly all cases. The classification of these lines as tabulated is as follows: On all lines, 4; on practically all lines, 9; on main lines and important branches, 2; on main lines, 7; on high speed tracks, 6; "limited use," 1; replies indefinite, 9.

Another field for variation in usage relates to the minimum degree of curvature for which it is deemed necessary to provide easements. The replies to this question are classified as follows: On all curves of 1 deg. or over, 11; curves of 1 deg. 30 min. or over, 1; curves of 1 deg. 45 min. or over, 1; curves of 2 deg. or over, 11. The replies received from six roads indicated a more elaborate classification. Thus, the Canadian Pacific spirals all curves of 2 deg. or over on main

lines, but only curves of 4 deg. and over on branch lines. On lines of the Pennsylvania System west of Pittsburgh, all curves of 2 deg. or over are spiraled, but on lines carrying trains at speeds in excess of 40 miles per hour, the minimum limit of curvature is reduced to 0 deg. 45 min. Obviously, the faster the speed the greater the refinement necessary in easements. However, a study of the table does not show that the roads handling a larger proportion of high speed traffic

are given to providing spirals for flatter curves than roads with slower trains.

Many Forms of Spirals in Use

The spiral dates back to early days in railway building. Rankine made references to it. Wellington developed some simple approximations. In 1880 the Holbrook spiral was first made public and in 1882 Searles published the first

SUMMARY OF PRACTICE WITH RESPECT TO EASEMENT CURVES

edition of his "Railroad Spiral"—"to reduce the well known theory of the cubic parabola or multiform compound curve to a practical and convenient form." Since then a multitude of variations have been developed and put to use on the different roads.

In 1911 the American Railway Engineering Association adopted for inclusion in its manual of recommended practice an easement curve devised by J. B. Jenkins, valuation engineer of the Baltimore & Ohio, which is known as the 10-chord spiral, but from the results of this investigation it would appear that this effort of the association to effect uniformity of practice has not been as successful as has been the case with some of the other standards published in the manual. Only two roads report the use of this particular form of spiral; of the other replies, 11 name the Talbot spiral; eight favor the Searles transition curve and 11 use the rather general term "cubic parabola." Three replies do not indicate a preference for any particular type of curve while the others report a variety of easement so that, in all, curves with 12 different names are mentioned.

This variety may be explained in part by the fact that the true cubic parabola is a matter of intricate mathematics, approximations of which are to be had in a variety that affords a most fertile field of operation for the mathematician. Without doubt the 10-chord spiral of the American Railway Engineering Association has not received as wide a use as is warranted by the merits of this particular form of transition curve. Failure to apply it must, therefore, be ascribed to other causes. For instance, it may be suggested that the presentation of this transition curve in the manual is not as attractive nor in as detailed a form as the characteristic expositions of easement curves commonly appearing in the handbooks of field engineering.

As the railroad taper is of necessity a matter of more or less intricate mathematics, it is not surprising that the replies from all roads favor the employment of engineers for the application of the tapers to the alignment. In noting that the answer of the Pennsylvania System, eastern lines, contains the word "supervisors," it should be recalled that on that road the supervisor is an engineer in nearly all cases. In the same connection it is of interest to note that under Method of Application, 28 of the roads favor the method of deflections, four the method of off-sets, two express no preference, while four give indefinite replies. On this point, William Hood, chief engineer of the Southern Pacific, states that careful work by the off-set method requires more time than the deflection method.

The question as to the use of the string method of lining spiral curves received only one unqualified affirmative reply and that from the Pennsylvania System, eastern lines. This method is not used at all on 25 roads, it is used only occasionally on five and it has supplemental or emergency use on four. Since the replies to the questionnaire were in nearly all cases received from the chief engineers of the railroads, it is entirely possible that "unofficial" use of the string method may be more extensive than these replies would indicate.

### How the Length of Spirals Is Determined

Another important matter in the discussion of spirals is the determination of the length, which involves a number of considerations, among which the most important is the distance required for an easy run-off of the superelevation. On new location in easy country, there is no limit on the length to which the easements may be extended. In difficult country a long spiral introduces complications as will be explained later. There are also limitations on the lengths of spirals when they are being introduced on old lines, since long spirals increase the difficulty of fitting the curve to the old roadbed.

Broadly speaking, this problem involves the inter-relation of curvature, speed and superelevation which are not properly a part of this discussion. Consequently, the question concerning this matter in the questionnaire was stated simply as: "Is the length of the easement curve based upon the train speed as well as the degree of curve and if so, how?" Answers to this question showed that 25 railroads consider speed as well as degree of curve, while 9 determine the length of the easement from the curvature alone. Five replies were indefinite as to this question or reported varying practices. On three roads the length of the spiral is determined directly from the speed and curvature through the formula  $L = K V E$ , where  $L$  is the length of the spiral curve in feet,  $K$  is a constant,  $V$  is the velocity of the train in miles per hour and  $E$  is the superelevation of the curve in inches. The constant  $K$  was given in two cases as 1.0 and in one case as  $1\frac{1}{2}$ .

On a number of roads the length of the spiral is made directly proportional to the elevation of the circular curve, the rules to this end calling for 40 ft. to 66 ft. of transition curve to each inch of superelevation. For convenience these rules are commonly expressed as  $\frac{1}{2}$  in. or  $\frac{5}{8}$  in. for each 30 or 33-ft. rail length.

That the length of the spiral has an important bearing on railway location in difficult country is brought out very emphatically in a statement by Mr. Hood of the Southern Pacific which accompanied his reply to the questionnaire. This is as follows:

"The usefulness of the taper depends on the general maximum running speed of the trains in the several localities, and where speed restrictions result in slow speeds, as for instance either up or down steep mountain grades, the taper is not needed to a very great extent, and in such localities a very short taper is justifiable if its use will result in an appreciable saving over the cost of construction required by a longer taper.

"It is evident that when a train is once on the main curve, the taper has no further effect and it is no more appropriate to run too fast, for instance, on a tapered eight-degree curve than on an eight-degree curve that is not tapered. On valley lines, a taper beginning with 30 ft. of a 15-min. curve provides adequate easement for the use of the fastest trains. On a mountain side and similar lines with steep grades and moderate grades, a taper beginning with a 2-deg. 30-min. curve is found to give excellent results, and its use is entirely justified where a flatter (and longer) taper would involve increased cost of construction.

"Too flat a taper and too long a reversing tangent increases the cost of construction in a mountain country with steep transverse slopes, or in a confined river gorge where flood water is dangerous and the mountain sides are steep, to an extent not always fully appreciated. The effect of the taper and reversing tangent in increasing the cost of construction is indicated by the amount that the resulting distance, in a direct line between the centers of the corresponding main curves, is in excess of the sum of the main curve radii, the difference of these distances indicating the additional horizontal distance to be disposed of in excess of that involved in the case of reversed curves without tapers and without reversing tangents between them.

"The greatest effect of this sort results from the use of flatter tapers, indicating that more benefit is to be derived with the same expenditure in construction from the use of longer reversing tangents than from the flatter tapers. A reversing tangent 180-ft. long provides amply for the longest engine and tender now in use, including a suitable length at each end of the reversing tangent for handling the elevation of the track for the first 30 ft. of the taper curve.

"To illustrate this, take the case of two six-degree curves with tapers commencing with 30 ft. of one-degree curve and

with 120 ft. of reversing tangent. These curves will have their centers separated by a distance 21.7 ft. greater than the sum of their radii. Two six-degree curves with tapers commencing with 30 ft. of 30-min. curve and with 120 ft. of reversing tangent will have their centers separated by a distance of 63.1 ft. in excess of the sum of their radii. Thus in the latter case it is necessary to dispose of an additional horizontal distance of 41.4 ft. in excess of that in the first case and this 41.4 ft. might result in prohibitive or at least in extravagant cost of construction. This indicates the need of conservatism in deciding on the financially appropriate taper curve rate."

### Spirals Are Inserted During Construction

It is clear from the replies received that the use of spirals has extended over a considerable period of years and that since their adoption the easements are being applied to the alinement at the time of construction in nearly all cases. The work of applying the easement to the lines built previous to the adoption of the easement curve has, of course, been carried out as opportunity afforded or as the increase in the traffic or the importance of the line demanded. Thus, the Canadian Northern reports that these easements are being introduced on old lines at times of re-ballasting, while other roads report that this is done during extensive reconstruction work. The replies with regard to this feature of the questionnaire are summarized as follows: On 32 roads the spirals are introduced at the time of reconstruction; on three they are applied subsequently; on one road they are introduced at the time that the track is laid and being lined; on another they are laid out just before ballasting. One road reports a varied practice.

No discussion of easement curves is complete without some consideration of the means provided for a permanent record of the spiral locations and of the information supplied to track forces for maintaining the alinement and superelevation. It was for this reason that the questionnaire included the question "Are the limiting points of the easement curve defined on the ground by permanent markers and do each carry the data as to the full elevation and rate of run-off?" To this question 12 roads replied that such permanent markers were provided with complete data; 11 stated that markers were provided without any data; 3 reported the use of stakes; while 10 roads replied that no markers were provided; one road reported a variable practice while another stated that the location of the spirals was carefully referenced and recorded.

## Chairman Clark Discusses the Rate Question

WASHINGTON, D. C.

CHAIRMAN CLARK of the Interstate Commerce Commission is making it increasingly clear where the Interstate Commerce Commission stands on the question of rate reductions which is so prominent just now. He has stated it in letters to senators who have written to him voicing the complaints of constituents against high rates. He stated it in his speech before the Railway Business Association on March 31, and it was stated in the letter to the heads of the railway traffic committees regarding proposed reductions in grain rates, which the commission's director of traffic wrote under his instructions and which was made public last week. Mr. Clark stated again in a letter to Senator Shortridge of California, dated April 6, that "it is difficult to see how the railroads could be urged to reduce their rates" and that if shippers are experiencing difficulties their plight cannot well be much worse than that of the railroads. It is believed that

with all these expressions it should not be difficult to guess what he told the President at their conference on March 31. Mr. Clark also shows some skepticism as to the merit of numerous complaints that the rates themselves are the principal cause of the trouble. The letter to Senator Shortridge was in reply to one from the senator on behalf of shippers of California fruits and vegetables urging a conference or a hearing at Los Angeles on the subject of freight rates. Chairman Clark said:

The request grows out of the fact that we recently arranged to have our director of traffic hold an informal conference with representatives of the fruit and vegetable industry and of the railroads at Dallas, Texas. The purpose of the hearing was to have a full exchange of ideas, to give the shippers opportunity to present the difficulties which they encounter, and to have the railroad representatives consider carefully whether or not conditions were such as to justify a reduction in the freight rates on these commodities. We sent notices of the hearing to railroads and interested shippers in various sections of the south and southwest, including California. The Los Angeles people requested that a hearing be had at Los Angeles following the conference at Dallas, but it was not practicable to comply with that request.

We have had numerous communications from California interests on this subject, and, as I said over the phone, the question is under negotiation between the representatives of the railroads and representatives of the Citrus League. This league, as we understand, represents more than 90 per cent of the citrus shipments. I do not know what conclusions will be reached in the negotiations that are now progressing.

We have no authority to require the railroads to reduce rates except after a full hearing at which the propriety of the reduction is demonstrated. We would be obliged to find that the existing rates are unreasonable.

The freight rates are on a very high level. No one would be more pleased than we if conditions would permit general reductions therein. It is, however, difficult to see how the railroads could be urged to reduce their rates, when, as shown by the official reports, they are as a whole earning scarcely more than their operating expenses and taxes. It is obvious that the present condition can not long continue without bringing widespread bankruptcy to the roads. More than 90 cents of every dollar they earn is spent in the operating cost of earning it. Less than 10 cents of each dollar is left with which to pay taxes, interest and return on investment. Sixty cents out of each dollar earned are paid out in wages, and on some roads this runs as high as 64 cents.

At the time the increased rates were inaugurated in August last it was recognized that some readjustments would be necessary. Many readjustments have been made. In some instances investigation has demonstrated that some reduction in the rates would move a substantial volume of traffic, with some profit, which would not move under the then existing rates. Under those circumstances readjustments have been made and are under consideration. We have tried to be helpful in such negotiations and that was the purpose of the conference at Dallas. That conference, however, does not seem to promise any readjustment of the rates on fruits and vegetables. The railroad representatives have, so far at least, taken the view that the reduction would not increase the volume of movement and that in view of the financial conditions, to which I have referred, the roads cannot afford to reduce the rates.

We had some vigorous representations from interests in Florida that the rates were stifling the movement of fruits and vegetables from Florida; but upon investigation and ascertainment of all the facts it developed that the movement of fruits and vegetables for the period of November 1, 1920, to March 1, 1921, exceeded by several hundred cars the movement during the same period of 1919-1920.

We are in no wise insensible to the difficulties which shippers generally are experiencing, but, as I have said, the plight of the shippers can not well be much worse than that of the railroads. In many instances inquiry into a situation demonstrates that it is not high freight rates that is preventing the sale of goods at the prices that must be paid. We are passing through a period of readjustment following the convulsions of the war, and many hardships exist which are the result of the world-wide economic forces which it is hoped will progressively adjust themselves with steadily improving conditions.

It is not pleasant to have to write in this tone, and I do not want to be understood as pessimistic. I believe that the situation is clearing and will gradually clear, and that readjustment of the operating expenses of the railroads will produce a much brighter outlook and make it possible to effect more readjustments of rates with consequent benefit to commerce and industry generally.

# National Agreements Case Decision to Come Soon

## Twenty Rules Called Just and Reasonable—Employees Continue Testimony in Support of Rules

A DECISION IN THE controversy between the railroads and certain of their employees regarding perpetuation of the National Agreements has been practically completed by the Labor Board. This decision, offered by a member of the public group, adopts as just and reasonable about 20 principles regarding working conditions of railway employees. The negotiation of these principles into agreements is remanded to the individual carriers and their own employees. This briefly summarizes the action which the Board will take in this dispute within a few days. The effect of this action cannot be foretold at this time, inasmuch as the employees are still engaged in presenting rebuttal evidence to the Board. It is probable, however, that the employees' representatives will fight for their opportunity to complete the presentation and oppose the rendering of a decision until this presentation is ended.

### The Week's Developments

Developments during the past week in the hearings before the Railroad Labor Board on the employees' demands for continuation of their national agreements have been colorless. The presentation of testimony on behalf of the employees continued in the form of (1) a rebuttal by B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor and spokesman for the labor organizations; (2) exhibits by W. Jett Lauck, consulting economist for the unions, and (3) the cross examination of Frank McManamy, formerly assistant director, mechanical department, division of operation, United States Railroad Administration. Mr. Jewell's opening statements in rebuttal and the beginning of Mr. McManamy's examination were described in the *Railway Age* of April 8 (page 899). The list of questions submitted by Mr. Jewell to Mr. McManamy as a guide for his testimony in defense of the shop crafts' agreement, took the latter four days to answer due partially to the frequent interrogation of the witness by W. L. Park, a representative of the carriers on the Board.

The questions presented by the labor leaders and upon which Mr. McManamy based his testimony were intended to establish facts: (1) opposing the "charge that the Railroad Administration was ill-advised in negotiating national agreements, also that the director general was coerced by actual physical fear into making the agreement;" (2) opposing the charge that shop crafts' agreement has resulted in a great decrease in the efficiency of the individual employee working under the agreement and in the destruction of the morale of shop forces; (3) opposing the charge that national agreements prevent the carriers from conducting the transportation industry economically; (4) opposing the claim that national agreement rules are impossible of fair interpretation for all parts of the country and that the decisions of adjustment boards have made it possible for employees to extract a maximum of money from the railroads; and (5) opposing the carriers' assertion that the restoration of efficiency in railroad shops is largely dependent upon the restoration of piece work. The outline included approximately 60 questions, all directed at bringing out relevant facts.

Before entering upon his testimony, Mr. McManamy said: "In testifying before this board the director general desires that I make it clear that this is not the testimony of the present railroad administration; it is the testimony of myself, as an individual, based on the experience which I had

with the railroad administration during the period of active federal control."

Mr. McManamy's reply to the first question in general characterized all of his testimony during the four days he was on the witness stand. The question was: "What led the railroad administration to negotiate a national agreement with the shop crafts?" The answer was: "In general the national agreement was negotiated with the shop crafts because it was believed that it would promote efficiency and economy in shop operation, remove much of the unrest which at that time prevailed among the railroad shop employees, reduce the labor turnover at the various shops, prevent the practice on the roads which had favorable agreements and favorable rates sending men—usually some member of a labor organization—to other roads to solicit employees to come to work for them because of the more favorable rates and better working conditions. This I believe was an unnecessary expense and affected the efficiency of shop operation and in a measure stirred up discontent among the employees."

In answering the remaining questions, Mr. McManamy frequently reverted to this statement and stated that the placing in effect of the shop crafts' agreement resulted in accomplishing all of these purposes.

His testimony throughout was in favor of the continuation of the national agreement and supported at every turn the case which the employees' representatives are attempting to build up in support of their demands.

During the intervals of each day when Mr. McManamy was not on the witness stand, Mr. Jewell continued the presentation of his direct rebuttal in support of his demand for continuation of the shop crafts' agreement, taking up first, the scope of this agreement and citing various decisions by Railway Board of Adjustment No. 2, to support his contention that the workers covered by this agreement have not been improperly classified under its rules and the interpretations thereto.

### Mr. McManamy's Examination

After Mr. McManamy had completed his response to the questions submitted by the labor leaders he was cross-examined by James M. Sheean, counsel for the Conference Committee of Managers, which is presenting the railroad's case. A large portion of this cross-examination dealt with Mr. McManamy's statements regarding the comparative efficiency and economy obtained under piece work pay as compared with the hourly system of pay. Mr. Sheean by his examination analyzed the import of the data on this subject presented to the Board by Mr. McManamy. The bases of the comparisons were attacked by Mr. Sheean, who maintained that they were not just in that they did not take into consideration a large number of variables.

Mr. Park and Mr. Sheean, in further questioning Mr. McManamy, developed the point that despite Mr. McManamy's assertion that the existence of agreements has tended to alleviate unrest and restrain employees from striking, many strikes occurred during 1919 on roads on which agreements were in effect. In support of this contention, Mr. Sheean submitted a list of roads upon which general or system strikes have taken place, and upon which agreements were in effect at the time of the strike.

Following this, Mr. Sheean established by examination that the committee of four, which acted upon the question of National Agreements, after a disagreement between the com-

mittee representing the regional directors and the employees, was composed of men, none of whom had ever had managerial responsibility and yet who represented the managements in the final negotiation of the National Agreements.

Mr. McManamy was then excused.

On April 12 Mr. Jewell continued his direct rebuttal to the evidence placed before the Board on behalf of the carriers, taking up the Shop Crafts Agreement rule by rule and outlining the employees' stand upon the application of each rule and upon the evidence submitted in opposition to its continuance.

To establish the authenticity of a letter read to the Board by Frank P. Walsh, counsel for the labor organizations on March 22, and declared a fake by representatives of the carriers, Mr. Jewell requested the Board on April 8 to summon five employees of the Pennsylvania who would be familiar with the contents of this letter if it had been written at the time and place indicated. The character of this letter was outlined in the *Railway Age* of March 25 (page 807). The Board has not acted upon this request up to the present time, although it is generally conceded that these witnesses will be called inasmuch as the letter has been submitted to the Board and proof of its authenticity demanded by representatives of the carriers. I. W. Geer, general manager of the Pennsylvania, Southwestern Region, alleged author of the letter, has denied any knowledge of its existence.

### Wage Case Docketed

The order of the Board docketing hearings on the request of various carriers for wage reductions, as briefly described in last week's *Railway Age*, is as follows:

Whereas, There are reasonable grounds to believe that a number of other carriers parties to Decision No. 2 are about to file application for decision on disputes as to what shall constitute just and reasonable wages; and

Whereas, In the judgment of the Labor Board, it is desirable that this Board hear at one time and decide in one decision, so far as may be possible, the question as to what may constitute just and reasonable wages for all classes of employees of carriers parties to Decision No. 2 as to whose wages there may be disputes. Therefore be it

*Resolved by the United States Railroad Labor Board*, That 9.30 a. m., Chicago time, Monday, April 18, 1921, be set as the date of hearing when this Board will hear the representatives of the parties to disputes on the carriers named above and all other disputes filed and docketed prior to that time between carriers and employees of carriers parties to Decision No. 2 if ready for presentation.

*Resolved, further*, That the carriers will be allowed eight hours and the organization eight hours for oral presentation and argument. The carriers and organizations will arrange for representation accordingly. Evidence to any extent desired by either party may be submitted in writing, furnishing adverse party with copy thereof. All such written evidence must be submitted prior to April 20, 1921.

No action has been taken as yet upon the controversy between the St. Louis Southwestern and its employees, hearings on which were outlined in the *Railway Age* of April 8th (page 903).

### "Human Standards and Railroad Policy"

The present industrial situation of paralysis is the result of a strike of organized capital against society, according to an exhibit on "Human Standards and Railroad Policy," submitted to the Board on April 14 by Mr. Lauck.

"Capital, nationally and internationally organized and concentrated," the exhibit declared, "takes the stand that the capital strike shall go on until labor comes to its knees and consents to sweeping reductions of wages and also consents to surrender its right to bargain collectively on a scale co-extensive with the organization of the employers."

The summary of the exhibit stated in part:

"The evidence presented in this exhibit, summarized, has the following purport: It shows that there is a capital com-

bine consisting of the major banks, the railroads and the industries controlling basic materials, and that this combine has and exercises a power over the economic destiny of the United States. It shows that this interrelated capital group deliberately 'deflated the farmers' and then undertook, by precipitating industrial stagnation, to 'deflate labor.' It shows that within the same capitalist group lies the power to adjust or misadjust relative prices in a manner that will stimulate or suppress industrial activity. It points out that this focal capitalist group has deliberately maintained high prices of steel, coal, cement and other basic materials and that the railroads, financed by the same interests, have refused to place the orders for plant maintenance, or even the orders necessary to prevent plant and equipment deterioration. The consequence of the general constrictive policy practiced by every branch of this capital combine has clamped a brake upon all industry and has precipitated the army of unemployment.

"The exhibit surveys the costs of national unemployment and shows that the wastes due to unemployment represent, in terms of products unproduced, an amount of goods and services fully equal to one-half of the total wealth that is produced.

"The exhibit shows that the greater factors in American industry, the railway equipment producers, the railway repair works, the steel interests, the coal, cement and other basic material producers—all are closely bound together by intercapital relations and interlocking directorates, and that the determination of their major policies centers in, and is controlled by a number of men scarcely larger than go to make up the administrative and executive staff of the government of the United States."

"The railway employees in their exhibit make no issue as to the propriety or the possible necessity of a centralized system of economic co-ordination and control in a highly industrialized and interdependent country like the United States," Mr. Lauck said. "The point of the employees' exhibit is its challenge of the misuse which the combine in this instance has made of its power. The employees call attention to the national responsibility which the possession of such power entails and note that this responsibility in the case of the railway industry has been legislatively and judicially recognized and written into the federal laws of the United States, and the employees specifically point out that this responsibility has been and is being unscrupulously evaded.

"The railroads are pleading poverty. The banks are making unprecedented profits and declaring unprecedented dividends and the same applies to steel, coal, railway equipment and similarly situated concerns. The capital combine, in preparing to precipitate unemployment, adopted the policy that the railroads 'should do it first.' Railway improvement programs were deferred; railway maintenance was reduced below minimum legal requirement; a kink was put in the purchasing power of the American people and industry sent 'head on' into stagnation.

"In exhibiting the enormous profits that have been 'plowed under' by the banks and basic industries, and in exposing the fact that the railways have been and are paying over 200 to 300 per cent excess profits to railway auxiliary supply concerns, the employees deny that there is any valid railway poverty necessitating retrenchment at the expense of the status of labor."

The exhibit, a printed document of 150 pages, outlines the opposing views of unemployment as they are interpreted by the employees' organizations, the employees themselves presenting the subject in its purely sociological phases, while the managements are pictured as regarding it purely as a means for the forcible "deflation of labor." The growth of unemployment on the railroads since June, 1920, said to aggregate

300,000 men of which about one-third were employed in railroad shops, is sketched and specific cases of equipment conditions on a number of railroads are cited to substantiate the claim that the curtailments of shop forces during this period were not justified by any reduction in the volume of maintenance work actually awaiting attention. One instance is cited where overtime, following the lay-off of six machinists at Raton, N. M., on the Atchison, Topeka & Santa Fe, is said to have accumulated during January, 1921, to an amount a few hours short of enough to have kept six machinists and four helpers employed during the entire month. Several specific cases are cited on the Norfolk & Western and the Baltimore & Ohio where bad order cars are reported to have been removed by foremen from cars having serious defects and the cars allowed to run in trains.

A large amount of evidence, in the form of copies of official correspondence and letters from railway employees, is presented to show that extensive contracts for repairs to equipment were in effect and in some cases have been extended during this period of reduction of the shop and repair track forces of the railroads. In this respect the New York Central and its freight car repair contracts have been singled out for especially detailed treatment, and correspondence is quoted tending to show that a flow of equipment to meet the requirements of this road's contract has at times been maintained with difficulty.

The development of the Hornell Repair and Construction Company to take over the Erie shops at Hornell, N. Y., the Owen Construction Company to take a contract for maintenance of way work on a portion of the Erie, and the Phoenix Transit Company to take over and operate the road's New York harbor equipment, are cited as further evidence of the beginning of a new policy in which it is alleged the railroads intend to sub-contract as many of their functions as possible in order to remove these operations from the "protection afforded to railroad workers under the Transportation Act by the Railroad Labor Board" and "to utilize the resulting uncertainty of employment to worry the remaining railroad employees into accepting by 'agreement' lower standards of wages and living conditions." The evidence presented, however, shows that so far as the Hornell Repair and Construction Company is concerned, its employees are working under the same conditions and rates of pay and have the same privileges as similar employees of the railroad.

The recent establishment or extensive development of a number of other contract repair shops was referred to in this connection, some of which are as follows:

The Buffalo Steel Car Corporation has been built up to handle the repair work for all roads running into Buffalo, N. Y. These include the Buffalo, Rochester & Pittsburgh, the Delaware, Lackawanna & Western, the Lehigh Valley, the Michigan Central, the New York, Chicago & St. Louis, the Pennsylvania, the Wabash, and the New York Central.

The Manitowac Shipbuilding Company has been taken over by a new corporation which will operate it for the railroads. New buildings have been erected and tracks laid to handle both locomotive and car repair work. The new plant for railroad work probably represents \$300,000 investment.

The Boston banking firm of Hornblower & Weeks is promoting a deal whereby the weak Laconia Car Company will lease and operate under contract, the shops of the Bangor & Aroostook.

The East St. Louis Locomotive and Car Company, capitalized at about \$5,000,000 has been created and has built a large plant in East St. Louis, Ill., to be given over exclusively to the repairing of locomotives and freight cars, serving the 24 railroads that converge in St. Louis. It is expected to start with 500 men and to increase its force to 2,000.

Financial publications continue to talk of the fact that Baldwin Locomotive will take over the big shops of the Pennsylvania and handle the repairs of that system under contract. It is also rumored that the same company will take over the Baltimore & Ohio shops.

The evidence presented in an attempt to show that the

railroads are using unemployment to subjugate their men is in the form of statements of several railroad employees, of a more or less hearsay character, to the general effect that the roads on which they were employed were "going to have piece work back if they had to lay off every man." These statements were supplemented with newspaper comments on the labor situation and rumors which have appeared in the public press.

In support of the assertion that the railroads could have kept all shopmen employed, the exhibit presents a large volume of data to substantiate the claim that "the total excess cost of equipment repairs made under contract by outside concerns has been sufficient to pay all the shop employees laid off throughout the country for full time work," the following statement is made: "Broadly speaking, the cost of locomotive repair work when done under contract by large equipment concerns costs the roads on an average four times as much as it would cost the roads to do similar work in their own shops. In other words, repair work which would under ordinary circumstances when done at the present time in railroad shops, cost from \$4,000 to \$5,000, tends when under contract with equipment concerns, to cost between \$19,000 and \$20,000."

A table is presented in which are shown by railroads a total of 617 locomotives repaired in outside shops, for 413 of which, what are said to be the actual contract prices are given. These are compared with the cost of similar work done in railroad shops which are said to be Railroad Administration figures.

The railroads are said to have contracted with outside concerns for the repair of at least 100,000 freight cars and on the basis of somewhat similar evidence the statement is made that "these outside repairs are costing the railroads all the way from \$700 to \$1,700 per car, and that this cost would average very nearly double the cost of similar work if performed by railroad mechanics in the railroad shops."

The second part of the exhibit is replete with charts showing the connection through directorships of the railroads, railroad equipment companies, coal companies and banks with the constant inference that these connections indicate a control of the basic industries by a financial group headed by J. P. Morgan & Co., New York. The "deflation of labor" referred to in the summary of the exhibit is attributed to this control.

Throughout this portion of the exhibit references are made to the *Railway Age* and other trade publications, in many cases complete editorials and articles being reproduced as evidence in support of the employees' contentions that this combine has created unemployment and stagnation in industry as part of a gigantic plan.

It will be noted that this evidence is exactly that which has already been ruled out by the Board on the grounds of irrelevancy. Threats that nevertheless this material would be presented have been frequent during the course of the hearings, the employees' representatives deviating from their plans only in presenting the evidence in the form of an exhibit instead of by cross examination.

The exhibit abstracted in the New York Times of April 4 and later in the *Railway Age* of April 8 (page 903) has not been presented to the Board so far but it is expected that this material, dealing with "the inadequacies of management," will be offered as evidence early next week.

THE TICKET SCALPING evil has been brought to the attention of the United States Treasury Department by the Railway Ticket Protective Bureau and internal revenue collectors have been notified to impose the provisions of the Revenue Act of 1918 strictly upon those engaged in the business. The department has directed internal revenue collectors to secure the names and addresses of ticket scalpers and brokers from the bureau and to collect the regular 8 per cent tax on all amounts paid.

## Hearing on Great Northern-Northern Pacific Joint Bonds

WASHINGTON, D. C.

NO OPPOSITION DEVELOPED at the hearing before the Interstate Commerce Commission at Washington on April 11 on the application of the Great Northern and the Northern Pacific for authority to issue \$230,000,000 of joint 15-year, 6½ per cent convertible gold bonds, \$33,000,000 of Northern Pacific 6 per cent bonds and \$33,000,000 of Great Northern 7 per cent bonds, which with the stock of the Chicago, Burlington & Quincy owned by the two roads is to be pledged as collateral for the joint bond issue. The new issue is to refund the \$215,000,000 of joint 4 per cent bonds secured by the Burlington stock without the recent increase of \$60,000,000 which came due on July 1. In addition to the witnesses for the railroad companies, Ralph Budd, president of Great Northern, and Howard Elliott, chairman of the Northern Pacific, a number of bankers were called to testify regarding details of the proposed bond issue, the reasons for adopting this form of financing and the probable terms of sale. C. W. Bunn, general counsel of the Northern Pacific, said that no contracts for the sale of the bonds had yet been made and none would be until the application had been approved by the commission. The commission would also be asked to approve the terms under which it would be proposed to make sales.

George B. Whitney of J. P. Morgan & Co. said that the railroads, if the market for railroad bonds does not get worse, can probably realize from 90 to 91½ on the sale of the joint bonds, which would make the cost approximately 7.45 per cent. This would realize about \$210,000,000 and it would be necessary for the railroads to provide the additional amount in some other way. He thought they could probably be sold to the public at 96½ per cent. He was asked a number of questions as to why it would be necessary to allow 5 per cent for commissions and selling expenses and said that the purchasing syndicate would probably charge from ½ to 1½ per cent commission, while 3½ to 4½ per cent would be required by the distributors. He said that practically every bond dealer of the country would be called upon to assist in the distribution and he had a list of over 700. He said that even if the average sale of the bonds is \$5,000 it would be necessary to call on 46,000 people and perhaps several calls would be required to effect the sales. He also described some of the expenses incident to handling such a large bond issue, which represents the largest piece of corporate financing in the history of the railroads. He said that about \$54,000,000 of the joint bonds are held by insurance companies and trustees that are prohibited by law from buying bonds secured only by stock as collateral, but that these could convert the bonds at once into individual issues of the Great Northern or Northern Pacific. He said that it had been estimated that about \$60,000,000 of the bonds could be exchanged for the old bonds, but that this now appeared to be an overestimate. He said the plan of making the bonds convertible would increase their attractiveness to certain classes of buyers and the plan also provides for gradually releasing the Burlington stock pledged as collateral so as to divide it between the roads instead of continuing the joint holding. While no definite agreement had been made, he said that J. P. Morgan & Co. and the First National Bank of New York might contract with the railroad companies to purchase the bonds and simultaneously contract for the sale of the bonds to the distributing syndicate. Commissioner McChord asked whether the short term refunding issue, say for two years, at 7 per cent, would not temporarily tide the refunding over into a period of easier money. Mr. Whitney said the question was entirely hypothetical. If such a thing could be done, it might be wise, but he doubted very much

whether it could be done for only two years at seven per cent.

Mr. Whitney was followed by E. B. Sweezy, vice-president, First National Bank; H. L. Stuart, of Halsey, Stuart & Co., of Chicago, and John E. Oldham, of Merrill, Oldham & Co., of Boston, who said that the selling price of 96½ per cent was as high as could possibly be charged and who considered the commission of 5 per cent fair. Commissioner Potter asked the bankers to discuss the question as to whether it is to the interest of bankers to increase the rate of interest or to try to keep it down. They all testified that the bankers do not fix the rate and that it is to their interest that the rate be as low as possible, but all placed the greatest importance on fixing the terms of the issue in such a way that it would be sure to be successful.

## Senator Cummins Asks Railroad Investigation

WASHINGTON, D. C.

SENATOR CUMMINS on April 12 introduced in the Senate his proposed resolution providing for a general investigation by the Senate committee on interstate commerce into the railroad situation with particular reference to the increase in expense since the return of the railroads to private operation and the best means of bringing about a condition that will warrant a reduction in rates. The text of the resolution, which was referred to the committee on contingent expenses of the Senate, also indicates that the investigation is likely to bring out some interesting comparisons of the efficiency of management under the Railroad Administration and under private operation. Senator Cummins has stated that he expects to begin hearings about May 1 and that he proposes to call first upon the railroads who have been preparing a large amount of statistical information on the subject in advance, at his request. Testimony will also be offered on behalf of the National Association of Owners of Railroad Securities, the labor organizations and the shippers, and the Interstate Commerce Commission will also be called upon for information and the views of the commissioners. It is also considered probable that various bills which are expected to be introduced by individual Senators bearing on the railroad question will be referred to the committee in connection with its investigation. The resolution introduced by Senator Cummins provides as follows:

That the Committee on Interstate Commerce is hereby authorized and directed to inquire into and report to the Senate as speedily as practicable upon the following matters, to wit:

First. The operating revenues and expenses of the railroads of the country which under the law make reports to the Interstate Commerce Commission, comparing these revenues and expenses with like revenues and expenses (including the period of Federal Control) since 1912.

Second. The reasons which led to the extraordinary cost of maintenance and operation from March 1, 1920, to March 1, 1921.

Third. The reasons which induced the diminished volume of traffic in the latter part of the year 1920 and first two months of 1921, and in that connection the influence of the increased freight and passenger rates prevailing during that period.

Fourth. The efficiency or inefficiency of railroad management during Federal control and during the year beginning March 1, 1920, and the efficiency or inefficiency of labor employed by the management during the same periods.

Fifth. The best means of bringing about a condition that will warrant the Interstate Commerce Commission in reducing freight and passenger rates.

The Committee is authorized to act under this resolution either as a whole or through any sub-committee appointed for the purpose; to subpoena witnesses, administer oaths, send for persons and papers; and to employ counsel, experts and stenographers. The expense incurred shall be paid from the contingent fund of the Senate, upon vouchers approved by the chairman of the committee.

# Recent Slump in Traffic Worst in History

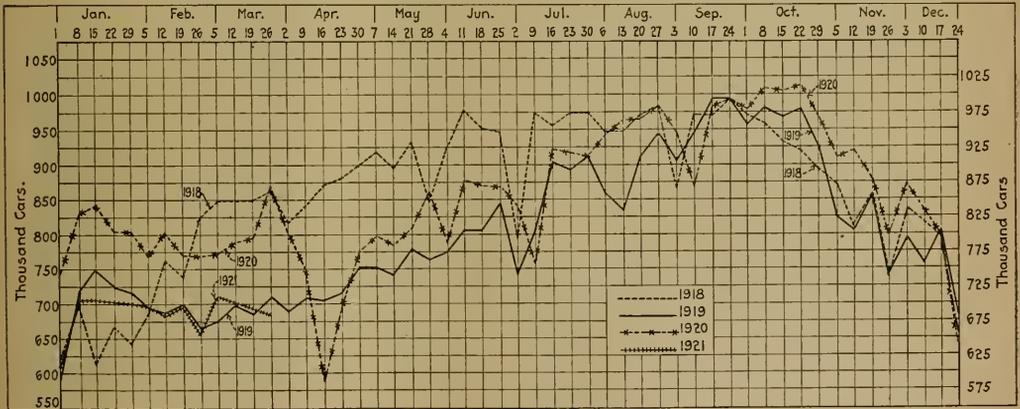

Drop in Freight Business, October to February, 40 Per Cent—Car Loading Since January First, 15 Per Cent Less Than for 1920

THE SLUMP in the volume of railroad freight traffic which has occurred since the peak of last fall, is probably the worst that has been experienced in the recent history of the railroads for which comparable statistics are available. It is rather difficult to show whether it is any worse than that which followed the so-called bankers' panic of October, 1907, and it closely parallels the experience following the termination of the war in 1918, but it is now apparent that the reduction in railroad freight business has fallen from a higher point in 1920 to a lower point in 1921 than was the case in 1918-1919.

The number of idle freight cars for the week of March 31, which was 495,904, was the largest ever recorded, and the percentage of the total cars owned, 21, was greater than the surplus of 451,739 in March, 1919, which was 19.77 per cent, or the surplus of May, 1908, which was 413,605,

for January, 1921, (estimated) were 26 per cent less than those for August, 1920, which was the peak month in that respect. From August, 1918, to January, 1919, the drop was also 26 per cent. From August, 1918, to February, 1919, there was a drop of 37 per cent. For February, however, the revenues were about 4½ per cent less than in 1920.

The ton miles for February are not yet available, but will show even lower figures than January. The car loading figures, however, are available to April 2. From the peak of October, 1920, to February, 1921, the drop in monthly car loading was 45 per cent as compared with 41 per cent from July, 1918, to February, 1919. To January, 1921, the drop was 31 per cent as compared with a drop of 25 per cent to January, 1919. The decrease from the peak week of 1920 to the low point of 1921 was 33 per cent, the same as the corresponding drop in 1918-1919. From Oc-

Car Loading from January, 1918 to Date

or 19.78 per cent. The total earnings and the freight earnings for January, 1921, were greater than they had ever been in any previous January, but that was largely because the rates were higher than ever before. The railroads in the fall of 1920 handled a larger traffic than ever before, but in January, even with the increase in rates, the operating revenues were only 5 per cent larger than in 1920, the freight earnings were about 4 per cent larger and the ton miles were about 15 per cent less, while the number of cars loaded with revenue freight was 16 per cent less. From January 1 to April 2, 1921, the number of cars loaded has been 9,012,795, as compared with 10,628,808 in 1920 and 9,158,457 in 1919.

As compared with the peak of 1920, October, the February earnings show a drop of 36 per cent as compared with a drop of 30 per cent from August, 1918, to February, 1919. From August, 1918, to February, 1919, the drop was 30 per cent, but the comparable figures for 1921 are not yet available. It is known, however, that February this year will probably make a worse showing than January. The freight revenues dropped 33 per cent from October, 1920, to January, 1921, as compared with a drop of 20 per cent from October, 1918, to January, 1919. From October, 1918, to February, 1920, the decrease was 33 per cent. The ton miles

tober, 1907, to January, 1908, there was a decrease in the gross revenues of 30 per cent but figures for ton miles and car loads for that period are not available. There was also a marked decrease in the volume of traffic between October, 1919, and April, 1920, when the switchmen's strike occurred, but the reduction was less marked than that of 1921 and the period of decrease was of shorter duration. Following the depression of 1908 a large number of railroads went into receivership but during 1919 and 1920 the effects of the slump in traffic were borne by the government because the railroads were then under a guaranty at the expense of the taxpayers while at the present time the railroads are operating on their own resources.

## Fluctuations in Railroad Traffic

A study of the statistics of railroad earnings and traffic for the last few years reveals some remarkable fluctuations. There are wide fluctuations each year from fall to spring, usually from October to February, but in some years the variation has been much more pronounced than in others and the months which show the widest variation are not always the same. February is likely to be the low month for the year, partly because it has only 28 or 29 days, and it

includes a holiday on Washington's birthday, while October has 31 days. In a year of sustained heavy traffic August is sometimes the heaviest month, partly because it includes one more day than September or November. Sometimes the January results, when equated on a daily basis, are lower than those for February. In 1920 April made a worse showing than February, because of the switchmen's strike.

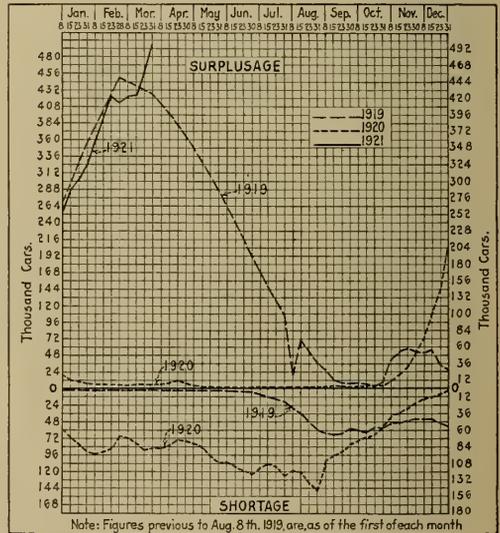

While in many quarters it is the fashion just now to attribute the present depression largely to the increase in freight rates put in effect on August 26, 1920, analysis of previous years shows that reductions in traffic almost as pronounced have occurred without such a cause. There was no particular change in rates in 1907 and the market depression in 1918-1919 came a long time after the increases in rates which were made in June, 1918. The analysis also indicates that pronounced periods of depression in the past have been followed by upward swings which have invariably reached higher levels and that in 1919 and 1920 the new high records were established in the same year that the low records were made.

There was a big increase in railway traffic in 1906 and 1907, accompanied by a large car shortage and followed by a sharp falling off in traffic after the panic. Statistics showing the volume of traffic by months are not available for periods earlier than 1916 but a fairly accurate index of the fluctuations by months is afforded by the total earnings of the railroads. After having reached a peak for that period in October, 1907, when the gross earnings of the railroads were \$250,000,000, there was a slump to \$161,000,000 for February, a drop of 35 per cent, although when the years 1907 and 1908 are compared as a whole the ton miles of freight fell off only from 236,000,000,000 to 218,000,000,000, a decrease of 7 per cent. Whereas in November, 1907, there was a shortage of 90,000 cars, this had given place by May, 1908, to a surplus of 413,000 cars.

**Variations in Earnings**

There was a general upward trend of traffic until the fall of 1913 when the gross earnings reached \$290,000,000 in October, but there was another marked period of depression in the early part of 1909 when the car surplus in January reached 333,000, although this was followed by a shortage of about 36,000 cars in November. In 1910 and 1911 there was a net surplus of cars, reaching 143,000 cars in the summer of 1910, and 196,000 in April, 1911, but there were also some shortages in both years, as well as in 1912 and 1913, and throughout most of 1914 and 1915 there were large surpluses, attaining a maximum of 242,000 in June, 1914, and 327,000 in April, 1915. In February, 1914, the gross earnings of the railroads had fallen to \$203,000,000, a decrease of 30 per cent as compared with October, 1913, but by September they had again increased to \$266,000,000. In February, 1915, they fell to \$205,000,000, a drop of 23 per cent, and in October, 1915, they were \$303,000,000. In January, 1916, the earnings were \$261,000,000, a reduction of 14 per cent from October, and in October, 1916, there was another gain to \$338,000,000 followed by a drop of 21 per cent to \$265,000,000 in February. In October, 1917, there was another peak, \$382,000,000, followed by a drop of 25 per cent to \$285,000,000 in January, 1918. There was a general advance in freight rates in the East in 1917 but it was in effect before October, so the comparison is not affected. In 1918 the largest monthly earnings were in August when they reached \$504,000,000, having been swelled by the general increases in rates put into effect by Director General McAdoo in June. Following the signing of the armistice in November, 1918, there was a sharp reduction in traffic, although it had begun to fall off earlier, and for February, 1919, the earnings were only \$351,000,000, a reduction of 30 per cent as compared with August. Car shortage had begun

to develop in 1915 and to increase in 1916. In November, 1916, about the time the country began to feel the effects of the war orders, there was a shortage of 140,000 cars and throughout 1917 there was a shortage, which reached its maximum with 164,446 in May. The car shortage continued through 1918 although it was steadily reduced after having reached about 160,000 in March, and in March, 1919, it had given place to a larger surplus than had ever before been recorded, 451,739. By the end of 1919 traffic had again increased until the earnings under the same rates which had been in effect during the latter part of 1918, in October reached \$509,000,000, and there was a shortage of about 60,000 cars during the fall months. In April, 1920, the earnings fell to \$401,000,000, a drop of 21 per cent, although traffic had been unusually heavy preceding the switchmen's strike which culminated in that month, and throughout most of the balance of the year it was of record-breaking propor-

**Car Surpluses and Shortages**

tions. In January the earnings were \$509,000,000. In October, 1920, under the influence of the heavy traffic and also the new increase in rates made effective on August 26, the earnings were \$642,000,000 but by January, 1921, they had fallen to \$470,000,000, a drop of 27 per cent, and by February to \$406,000,000, a drop of 36 per cent. Throughout the greater part of 1920 there was a car shortage beginning with about 54,000 in January and rising to 147,000 in September, but by November a slight surplus had developed which steadily increased until the week of March 31.

**Freight Revenues**

Gross earnings, of course, do not exactly reflect the changes in the volume of traffic because they include the reflection of the previous month's business, and the total earnings including passenger revenues often make a showing slightly different than the freight earnings. While the widest fluctuation in total operating revenues between 1918 and 1919 was from August to February, a drop of 30 per cent, the greatest fluctuation in freight revenues was from \$364,000,000 in October to \$242,000,000 in February, a drop of 33 per cent. While the total revenues dropped 21 per cent from October, 1919, to April, 1920, the freight revenues fell 18 per cent

from \$368,000,000 in October, 1919, to \$299,000,000 in February, 1920, but in April they were only \$268,000,000, a drop of 27 per cent. From October, 1920, to January, 1921, while the total revenues show a decrease of only 27 per cent, the freight revenues show a decrease of 34½ per cent, and to February, 1921, the drop was 40 per cent.

**Ton Miles**

For the period since 1917 statistics are available for the ton miles of freight by months. From May, 1917, to January, 1918, the drop in ton miles was 28 per cent; from August, 1918, to January, 1919, it was 26 per cent and from October to February it was 37 per cent. From October, 1919, to April, 1920, it was 30 per cent, while from August, 1920, to January, 1921, the drop was 26 per cent. The reduction from October to February, for which the figures are not yet available, will, of course, be greater.

**Car Loading**

Another measure of the falling off of freight traffic for recent years is afforded by the weekly and monthly reports of cars loaded with revenue freight compiled by the Car Service Division of the American Railway Association. In

2,090,612, (including those of Mexican and Canadian roads). In March, 1919, the total was 2,284,716 (excluding Mexican and Canadian) and in March, 1921, it was about 2,343,000.

During the last 16 years there have been net car shortages in some parts of nine years, 1906, 1907, 1912, 1913, 1916, 1917, 1918, 1919 and 1920, while in seven of the years there have been considerable surpluses. While in three years, 1908, 1919 and 1921, the surplus cars have reached approximately 20 per cent of the total cars owned, the maximum shortage, 164,446 cars in May, 1917, represented the equivalent of only 6.7 per cent of the 2,454,000 cars owned at that time. During and following the great car shortage of 1906 the railroads placed large orders for additional cars. According to the records of the *Railway Age*, 341,315 freight cars were ordered in 1905, and 310,315 in 1906. In 1907, 151,711 were ordered and in 1908 only 62,669. At the end of 1906 the railroads owned about 1,840,000 freight cars and the number shows a fairly steady increase to about 2,400,000 at the end of 1914. In 1909, 189,360 cars were ordered; in 1910, 141,024 and in 1911 only 133,117. In 1912 there was a car shortage, which amounted to about 70,000 cars in November and in 1912 the railroads ordered 234,758 cars. In 1913 the shortage continued to some extent and in that

	Jan. 31%, Feb. 45.5%				
<b>Decrease</b>					
<b>Cars loaded:</b>					
Week October 18	1,010,961				
Week February 12	681,627				
	32%				

1918 the peak was reached in the last week of September when 991,980 cars were loaded. Omitting weeks in which holidays occurred the greatest reduction from that peak reached in the following year was shown for the first week in March, 1919, when the loading was 675,704 cars, a decrease of 316,704 cars, or 32 per cent. In 1920 the peak week was that ending October 18, when 1,010,961 cars were loaded, a new record, and omitting the weeks in which holidays occurred, the lowest figure since recorded was that for the week of February 12, when the loading was 681,627, a reduction of 329,334, or also 32 per cent. For the week of April 2 the loading was 666,642.

The biggest freight month in railroad history was August, 1920, when the ton miles aggregated 42,656,000,000; the net ton miles per mile of road per day were 5,995; the total earnings were \$555,000,000, and the freight earnings \$369,000,000. The lowest month in recent years, taking into consideration the number of days, was January, 1918, when the ton miles were only 27,619,000,000.

**Car Surpluses and Shortages and Car Purchases**

The fact that the car surplus of March 31 is a higher percentage of the total than previous record-breaking surpluses is in spite of the increase in the number of cars owned. In 1906 the total was 1,840,005, and in May, 1908, it was

year the railroads ordered 146,732 cars, but throughout 1914 and 1915 there was a large surplus of cars and in 1914 only 80,264 cars were ordered and in 1915 only 109,792. During 1915 and 1916 the number of cars owned was reduced but after the appearance of the shortage which began in the latter part of 1915 the orders were increased and in 1916 aggregated 170,054, but in 1917, although the maximum shortage ever reached occurred in that year, 164,446, in May, only 79,367 cars were ordered. The number of cars owned apparently reached its maximum about April, 1918, when the number owned was 2,547,000, including Mexican and Canadian, which account for over 200,000 cars. Since June, 1918, the car statistics of the American Railway Association do not include Mexican and Canadian roads, but for January, 1921, the total owned is reported as 2,343,217. There were 123,770 cars ordered in 1918 but only 25,899 in 1919 and 84,207 in 1920.

The comparison between the peaks and depressions of the past three years is shown in the accompanying table.

TWELVE HUNDRED quart bottles of whisky were found in a car of hides, received by the Maine Central from Canada, when the car was examined after its arrival at Calais, Me., recently, and three men were arrested on charges of smuggling.

### Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight again declined during the week ending April 2, according to the weekly report of the Car Service Division of the American Railway Association. The total was 666,642, as compared with 858,827 for the corresponding week of 1920 and 688,567 for 1919. This is the lowest figure reported for a week this year, with the exception of the week of the Washington's Birthday holiday, and represents the fourth successive decline since the increase during the first week of March. Although the holiday on Mitchell's day, April 1, in the coal mines, accounts for part of the decrease, it does not account for the drop in the loading of other commodities. The loading for the last five weeks is about the same as it was for the preceding five weeks, but the total loading since January 1, 9,012,795, is about 15 per cent less than for the corresponding period of 1920, when it was 10,682,808 and is also less than for 1919 when it was 9,158,457.

The principal decrease was in the number of cars loaded with coal, the total for the week being only 109,284 cars or 12,905 cars below the total for the previous week. It was more than 59,000 below the same week in 1920.

With the exception of grain and grain products, which showed a slight increase, decreases were reported in the loading of all other classes of freight as compared with the previous week. Next to coal, the greatest loss was reported in the loading of merchandise and miscellaneous freight which fell off 4,000 cars. This is the first decrease in the loading of this class of freight since January 1 last. A reduction of

2,600 cars was also reported in the loading of forest products, while ore dropped 970 cars. Compared by districts, the number of cars loaded during the week in each region was under that for the preceding week except in the central and southwestern districts. Decreases, however, were shown in all districts as compared with the corresponding week in 1920.

The freight car surplus for the week ending March 31, according to the weekly report of the Car Service Division of the American Railway Association, was 495,904 cars, the largest ever recorded in the history of American railroads and an increase of 36,493 over the total on March 23.

It is also an increase of 82,000 within a month, due almost entirely to the falling off in coal shipments. Of the total surplus slightly more than half, or 255,055, consisted of coal cars, compared with 172,850 on March 1. A steady decline in the loading with coal has been reported each week, the total for the week ended on April 2 being 109,284. The report also shows an increase in the number of surplus box cars, the total on March 31 being 171,119 or 6,900 more than on March 23. It is, however, about 2,400 below the total on March 1.

Increases in the surplus for all classes of cars, as compared with March 23, were shown in all districts except the Pocahontas and Southern. The former broke even while the latter showed a decrease of 3,000. In the Eastern district there was an increase of 13,000; Allegheny, 5,000; Northwestern, 6,000; Central Western, 11,000, and South Western, 4,000 cars. The percentage of freight cars on home lines on April 1 was 70.6, as compared with 21.9 on March 1, 1920, when the government relinquished the railroads. This is the highest percentage attained during the war period.

# General News Department

The American Association of Engineers will hold its seventh annual convention at the LaFayette Hotel, Buffalo, N. Y., on May 9, 10 and 11.

**Committee Reports** to be represented at the meeting of the Signal Section, A. R. A., at Chicago, on June 6, 7 and 8, will be mailed to members on May 16.

**W. O. Thompson**, secretary of the Traveling Engineers' Association, has changed his headquarters from New York to 1177 East 98th street, Cleveland, Ohio.

Minnesota and New York have appealed to the United States Supreme Court from lower court decisions upholding the orders of the Interstate Commerce Commission increasing intrastate freight and passenger rates to correspond to the advances made in interstate rates.

The Southeastern Express Company will begin operations on May 1 over all the lines of the Southern. The general offices of the company are located at Atlanta, Ga. J. B. Hockaday is president of the company and G. H. Kerr is traffic manager.

The car records of the yards of the Pennsylvania Railroad and around Pittsburgh, Pa., are now kept in a single consolidated office, in charge of W. T. Wolff. Yards included in this arrangement are Pitcairn, Wilkinsburg, Forty-third street, Etna, Island avenue, Scully and Conway.

Six persons were killed and 30 injured when the Royal Palm Limited on the Southern was derailed near New River, Tenn., on April 6 while en route from Jacksonville, Fla., to Chicago. Three day coaches were overturned and three sleeping cars derailed. The accident is thought to have been caused by spreading rails.

The American Society for Testing Materials will hold its twenty-fourth annual meeting at the New Monterey Hotel, Asbury Park, N. J., on June 20 to 24, inclusive. Monday, June 20, will be devoted to committee meetings, and the first session of the annual meeting will be held on Tuesday morning, June 21.

The Underwriters' Laboratories, and their service to safety engineering, will be the subject for discussion at the meeting of the American Society of Safety Engineers, at 29 West 39th street, New York City, on Friday evening, April 22. The principal papers will be by Dana Pierce, vice-president of the Underwriters' Laboratories, and George B. Muldaur, general agent.

The Chamber of Commerce of the United States has announced the appointment of a committee of five, with five alternates, to co-operate with Secretary Hoover in working out a plan for closer relationship between business and the Department of Commerce. Included among the alternates are Howard Elliott, chairman of the Northern Pacific, and A. L. Humphrey, president of the Westinghouse Air Brake Company.

The four brotherhoods of railway train service employees have joined forces with the American Federation of Labor "to defeat legislation inimical to the rights of wage-workers," according to a statement given out by the Federation of Labor at Washington after a conference of labor leaders at which the legislative situation in Congress was discussed. A committee was appointed to consider labor legislation and to report at a meeting of the joint conference later.

Twelve hundred and fifty calls in 24 hours is the record recently made on one train dispatchers' telephone circuit, as reported by W. P. Cline, superintendent of telegraph of the Atlantic Coast Line. This is equal to over fifty calls an hour, and

illustrates in a striking way one of the advantages of the telephone for sending train orders. The statement was made in a brief address before the last meeting of the Southern & Southwestern Railway Club, at Atlanta, on the use of the telephone in train dispatching. Mr. Cline is satisfied that by the operations, with marked benefits to the general conduct of train movement on his division, but also does his work with less nervous strain and less fatigue, which, of course, makes for increased efficiency.

## Master Boiler Makers' Convention Deferred

The executive board of the Master Boiler Makers' Association has voted to defer the annual meeting which was scheduled to have been held at St. Louis, Mo., May 23 to 26.

## A Correction

In the article describing the special run made with a Pacific type engine on Erie train No. 3, which appeared on page 708 of the issue of March 18, an error occurred. The leaving time at Jersey City was given as 12:18 p. m., though it should have been 2:18 p. m. The mistake is evident from the context as the leaving time did not check with the time of arrival and the elapsed time.

## More Than a Trillion Units of Traffic

At noon on Wednesday, April 13, every locomotive and shop whistle on the entire Pennsylvania Railroad System was blown continuously for thirty seconds, to signalize the seventy-fifth birthday of the Pennsylvania Railroad. The company was started in 1846 by an act of the Legislature of the Commonwealth of Pennsylvania. American flags were displayed throughout the day, Wednesday, from all of the road's station, shops and buildings. The accounting department estimates that in its 75 years of existence, the Pennsylvania system has rendered public service equivalent to the carrying of one ton of freight 950 billions of miles and one passenger 115 billions of miles.

## Hearings on Cost of Locomotive Repairs

The Interstate Commerce Commission has announced that public hearings will be held on April 18 at Philadelphia and on May 9 at New York with reference to the cost of locomotive repairs made in outside shops, as to which charges were filed with the commission by the International Association of Machinists and other organizations of shop employees that the railroads were paying excessive prices as compared with the cost if the work had been done in their own shops. The hearings are to be held by Examiner Barclay. That at Philadelphia is to be in reference to the locomotive equipment of the Pennsylvania and affiliated lines and that at New York in reference to the locomotives of the New York Central. The commission some time ago announced a formal proceeding of investigation under the title "construction and repair of railroad equipment" and it has been making an informal investigation and obtaining information by the questionnaire method.

## The Most Important Problem

The Fidelity & Deposit Company of Maryland has recently published a general survey of national business conditions, with an analysis by David F. Houston, formerly Secretary of the Treasury. The information is based on a questionnaire sent to a thousand selected representatives of the company in all parts of the country. In answer to the question, "What problem has the greatest bearing on business prosperity?" the reply from New England, Middle Atlantic, East North Central, West North Central and Pacific States was, first, taxation, and second, railroads.

From the South Atlantic, East South Central and West South Central the answer was taxation first and peace question second. From the Mountain states the answer was taxation first and tariff second. In reply to the question, "Are general transportation conditions good?" the answer from all sections was in the affirmative.

### Business-Getting on the B. & O.

H. O. Hartzell, manager of the commercial development department of the Baltimore & Ohio, is holding meetings at prominent points on the lines of that company to interest employees of all classes in the importance of soliciting freight and passengers. It is desired that every employee be on the watch to do a good turn for the road, in this direction, whenever opportunity offers. The Veterans' Association of the road, acting on a suggestion made by President Daniel Willard some months since, has been active in this work; and now Vice-President Archibald Fries has initiated the present campaign, with rallies at the principal division points. All of the officers of the company are requested to attend the meetings and employees in all departments are called upon to post themselves. The first meeting was at Pittsburgh, Pa., on April 11. About twenty meetings will be held, the last one in the present schedule being set for Fairmont, W. Va., on April 29.

### Accident Bulletin No. 77

The Interstate Commerce Commission has issued quarterly accident bulletin No. 77, dated February 28, containing statistics of railroad accidents occurring in the United States in the three months ending with September, 1920. During this quarter, 24 passengers, 126 employees and 26 other persons were killed in train accidents, and 1,246 passengers, 840 employees and 67 other persons were injured. In train service accidents 49 passengers, 524 employees and 1,295 other persons were killed, and 1,159 passengers, 12,273 employees and 2,362 other persons were injured; making a total for both classes of 2,044 persons killed and 17,947 injured. Adding to these, the casualties in non-train accidents and there is a total for the quarter of 2,168 persons killed and 47,003 persons injured.

The total number of train accidents in the quarter was 10,292, including 3,258 collisions and 5,922 derailments; and the total damage to cars, engines and roadway by these accidents was \$9,982,870.

### Colonel Shaughnessey Appointed Second Assistant Postmaster General

E. H. Shaughnessey, assistant director of the Division of Transportation of the American Petroleum Institute, formerly trainmaster of the Chicago & North Western, and later an officer of the transportation corps of the A. E. F. in France, has been appointed second assistant postmaster general, in charge of the railway mail service, an office which Postmaster General Hays had originally offered to R. H. Aishton, formerly president of the Chicago & North Western, and now president of the American Railway Association. Mr. Shaughnessey entered the service of the Chicago & Northwestern in July, 1899, as a telegrapher. In 1917 he was trainmaster, and was given leave of absence to enter the military service. He assisted in the organization of the 13th Engineers, and later assumed command of Company E as first lieutenant and later as captain. After some service in the Verdun sector in France he was assigned to duty with the transportation corps, and was promoted to colonel.

### Steam Heated Cars for Perishable Freight

A system of heating cars while transporting highly perishable food stuffs has recently been developed by Alfred L. Moorshead, industrial commissioner of the Erie Railroad. Instead of providing heaters operated with oil or charcoal in each car as is the usual practice, the new type of equipment derives its heat from the locomotive. A steam duct leads from the locomotive under each car with a connection to the interior. A thermostat is installed to prevent the car from becoming overheated and auto-

matically shuts off the steam when the interior reaches a predetermined temperature, varying with the commodity in the car.

The elimination of oil and charcoal heaters has numerous advantages, including the elimination of fire risk and damage to the lading resulting from the gases produced by combustion. It is stated that the initial cost of installation of the new type of equipment is low and that it is more effective than the ordinary type of heaters. Preliminary tests, in which the Department of Agriculture participated, have been conducted to determine the results that can be obtained. In one trip the outside temperature varied from 28 deg. F. to minus 20 deg. F., while the air inside the car was never below 52 deg. F. and never above 66 deg. F.

### Revenues and Expenses for February

The railroads of the United States suffered a deficit in February of \$7,344,669, while 106 out of 200 reporting to the Interstate Commerce Commission failed to earn their expenses and taxes. In January 109 out of 202 roads failed to make expenses and taxes. Of the 106 roads in February, 46 were in the Eastern, 16 in the Southern and 44 in the Western districts. The carriers fell short about \$64,000,000 of earning the amount which it was estimated they should earn under the increased rates fixed by the Interstate Commerce Commission in accordance with the Transportation act. Total operating revenues for February were \$405,783,000, or a decrease of 4 1/2 per cent, as compared with February, 1920, while total operating expenses were \$385,443,000, a decrease of 7 1/2 per cent.

During the six months since the increased rates were made effective, the net railway operating income of the carriers has totaled \$218,311,800, which would be at the annual rate of return of 2 1/2 per cent on their tentative valuation. On the basis of an annual return of 6 per cent it was estimated they would earn during that period \$531,686,000. During the first four months of the increased rates, that is, from September 1 to January 1, their net operating income was at the annual rate of 3.3 per cent.

While the freight earnings show a decrease of 5.1 per cent as compared with last February, the passenger earnings increased 7.2 per cent.

### Cash Fare Penalty

The Pennsylvania Railroad, to encourage the purchase of tickets and reduce the burden of collecting cash fares, which has become especially serious on suburban trains, proposes, beginning May 15, to assess a penalty of five cents for each fare paid on trains, on its lines east of Pittsburgh, Erie and Buffalo; and the five cents will not be refunded. Tariffs covering the new regulations have been filed with the regulative commissions. The tendency of passengers to pay cash fares, rather than take the trifling trouble of purchasing a ticket in advance, has increased greatly. In a single year more than four million passengers on the Pennsylvania System east of Pittsburgh paid cash fares in cases in which tickets could readily have been bought. The new rule applies only when and where ticket office facilities are available.

In some states west of Pennsylvania measures have already been taken by this company, with the approval of the regulative commissions, to discourage carelessness by imposing and retaining cash penalties. The new charge is not to be imposed with any desire to produce revenue, but solely for the purpose of affording an incentive to avoid the payment of cash fares when tickets may be purchased in advance. The company hopes that the five-cent penalty will prove adequate to accomplish the result sought, but if it does not, a higher charge may be imposed.

### Graft in Chicago Railroad Construction

A committee of the state legislature of Illinois, which is inquiring into building conditions at Chicago, is said to have uncovered evidence, at the hearing on April 9, of a conspiracy which netted certain union labor interests in Chicago thousands of dollars in connection with the construction of the Union station. Although the hearings were held behind closed doors, it was reported that at various times it was necessary to pay fees in order to use material purchased from manufacturers outside of Chicago and to employ workmen not directly under the jurisdiction of the local unions. One witness is reported to have told of numerous strikes in

connection with the construction of the station and to have stated that a five weeks' tieup of excavation work was caused because the union hoisting engineer was not under the jurisdiction of the local union, although a member of a union affiliated with the American Federation of Labor. Another witness is said to have told the committee of the payment of an "insurance fee" of \$10,000 for the settlement of a strike on a roundhouse construction job on the Chicago & Alton in order that the work might proceed. According to the testimony, the use of material and labor obtained outside of Chicago was dictated by Chicago interests, who exacted a fee which, in the case of the material, increased the cost from 50 to 200 per cent.

**Railroads to Collect from War Department**

The office of the quartermaster general of the War Department has recently made arrangements with the finance officer of the department for expediting the payment of a large number of outstanding bills in favor of the railroads for past services in passenger and freight movement, as well as of current bills, which is expected to result in the payment of \$10,000,000 to \$15,000,000 to the roads this month. The government has owed the railroads some \$20,000,000 and owing to the reductions of force being made by the government for purposes of economy, the finance office has until very recently been getting further behind each day. Col. Hayes, chief of the rail transportation service, quartermaster general's department, has been interesting himself in the matter and has notified the railroads that arrangements have now been perfected both for the payment of a large proportion of the old accounts and the prompt payment of future accounts.

**January Revenues and Expenses**

The Interstate Commerce Commission has issued the following compilation of the operating revenues and expenses of 201 Class I roads for January:

	United States	
	1921	1920
Average number of miles operated.....	235,528.20	234,504.37
<b>Revenues:</b>		
Freight.....	\$324,825,450	\$311,565,615
Passenger.....	105,295,673	91,874,146
Mail.....	8,225,256	60,528,728
Express.....	7,443,572	13,899,174
All other transportation.....	13,469,135	10,946,507
Incidental.....	10,367,335	11,538,294
Joint facility—Cr.....	707,198	713,970
Joint facility—Dr.....	185,495	227,231
Railway operating revenues.....	470,148,124	500,839,204
<b>Expenses:</b>		
Maintenance of way and structures.....	61,318,932	57,891,205
Maintenance of equipment.....	124,376,673	117,755,937
Traffic.....	7,357,685	4,944,891
Transportation.....	231,440,606	218,913,350
Miscellaneous operations.....	4,496,530	4,361,883
General.....	15,285,224	12,887,473
Transportation for investment—Cr.....	575,108	336,545
Railway operating expenses.....	443,700,662	416,418,194
Net revenue from railway operations.....	26,447,462	84,421,009
Railway tax accruals.....	22,633,061	20,413,074
Uncollected railway revenues.....	83,247	117,630
Railway operating income.....	3,531,154	63,890,305
Equipment rents (Dr. bal.).....	3,227,569	2,429,765
Joint facility rent (Dr. bal.).....	1,261,984	1,820,842
Net railway operating income.....	958,399	59,639,698
Ratio of operating expenses to operating revenues..... per cent	94.37	83.14

**Air Brake Meeting Cancelled**

Because of the present depressed railway and business conditions now existing throughout the country, the executive committee of the Air Brake Association recently met in New York and decided to cancel the 29th Annual Convention regularly scheduled to be held in Chicago, May 3, 4, 5 and 6. A business meeting of the Executive Committee, however, will be held in the Hotel Sherman, beginning May 3 and lasting not more than two days, at which reports of the various committees will be received, and other business in furtherance of safety and economy in railroad air brake practice will be attended to. This meeting while primarily intended for the members of the executive committee and the chairmen and members of the committees reporting, will be made an open one to which all members who can attend without inconvenience to themselves and their railroads will be welcomed.

Two regular committee reports will be received on Recommended Practice and Air Consumption of Locomotive Auxiliary Devices. Also, papers prepared by the several air brake clubs of the country will be tendered as follows: Manhattan Air Brake Club, "Empty and Load Brake"; Northwest Air Brake Club, "Triple Valve Repairs"; Dixie Air Brake Club, "Hand Brake Efficiency"; Central Air Brake Club, "Installation and Maintenance of the Vent Valve"; St. Louis Air Brake Club, "Backing Trains into Terminals"; Montreal Air Brake Club, "Steam Heating of Passenger Trains"; Pittsburgh Air Brake Club, "Modification of Present Terminal Test to Insure an Effective Grade Brake as well as an Operative Brake."

Regular notices advising members of this change will be mailed from the secretary's office in a day or two.

**Locomotive Boiler Code Adopted by A. S. M. E.**

An important step in engineering standardization was taken at the Boston meeting of the council of the American Society of Mechanical Engineers, when it adopted in its final form that portion of the A. S. M. E. Boiler Code known as the Locomotive Boiler Code. This code contains the rules for the construction of locomotive boilers which are not subject to federal inspection and control.

The necessity for such an addition to the Boiler Code arose from the fact that, while the boilers of locomotives operated on railways engaged in inter-state service are covered by the construction and inspection rules of the Interstate Commerce Commission, there was found to be a vast mileage of industrial and short-line railroads in operation in the various states, which by virtue of their location, are not subject to the interstate requirements.

As a result of calls for a code to cover the construction of boilers of this class, the Sub-committee on Railway Locomotive Boilers was appointed in 1916. This committee consisted of F. H. Clark, chairman; F. J. Cole, chief construction engineer of the American Locomotive Company; A. L. Humphrey, vice-president and general manager of the Westinghouse Air Brake Company; S. F. Jeter, chief engineer of the Hartford Steam Boiler Inspection & Insurance Company; William F. Kiesel, Jr., mechanical engineer of the Pennsylvania, and H. H. Vaughan, vice-president of the Dominion Copper Products Company, Montreal. The work of this sub-committee was interrupted somewhat by the war, but its preliminary report was submitted to the Boiler Code Committee in April, 1919.

The preliminary report was printed and distributed at the Spring Meeting in Detroit where it was accepted by the meeting. It was thereupon published in the August issue of Mechanical Engineering. The sub-committee has been co-ordinating the points of view of all who would be affected by such a code and the final result approved by the main committee and the council is now ready for use. H. V. Wille, assistant to the vice-president of the Baldwin Locomotive Works, and Kenneth Rushton, chief mechanical engineer of the Baldwin Locomotive Works, were brought into the committee and with Mr. Cole and James Partington, estimating engineer of the American Locomotive Company, appointed in place of Mr. Humphrey, resigned, represented the locomotive manufacturers.

Constructive assistance was given by the Mechanical Division of the American Railway Association through its representatives, A. W. Gibbs, mechanical engineer of the Pennsylvania; W. I. Cantley, of the Lehigh Valley; and N. A. Ferrier, of the New York Central. A. G. Pack, chief inspector of the Bureau of Locomotive Inspection, Interstate Commerce Commission, has expressed great interest in the code and with his staff has been in frequent attendance at meetings of the sub-committee.

During the past two years Mr. Clark, the original chairman of the committee, has been in China as Technical Adviser to the Ministry of Communications at Peking. Mr. Vaughan has carried on the work of the committee as acting chairman.

The code, itself, follows the general form of the Code for Stationary Boilers. The materials to be used and methods of construction of the various braced and stayed surfaces are very carefully specified. Attention is given to the desire of the locomotive builders to maintain the lowest possible weight consistent with strength. As compared with stationary boilers with a safety factor of five the allowable factor for locomotive shells is four. Requirements in the use of safety valves and their method of test are rigid as are the hydrostatic tests specified.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF FEBRUARY AND TWO MONTHS OF CALENDAR YEAR 1921

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total revenues, Maintenance of way and equipment, Traffic, Operating expenses, Total, Operating ratio, Net from railway operation, Operating income (or loss), Net after rentals, Increase (or decrease) comp. with last year.

Traffic News

Application of the Denver & Salt Lake for permission to continue tri-weekly passenger service instead of resuming daily passenger service, was granted by the Colorado Utilities Commission on April 4.

The Interstate Commerce Commission on April 11 vacated three service orders issued last year, which provided for priority for coal transportation, which have been under suspension for some time. These are Service Orders No. 5, No. 10 and No. 11, applying to lake coal and to New England coal.

The Car Service Division of the American Railway Association announces that the district embargo zone with headquarters at Fort Worth, Texas, will be consolidated on April 15 with the zone headquarters at Chicago. The roads now assigned to the Fort Worth district have been reassigned to the Chicago district. District embargo headquarters will thereafter be maintained at Washington, Montreal, Chicago and Winnipeg.

The University of California Traffic Association, at its meeting on March 28, in the Monadnock Building, San Francisco, listened to an address by Mr. Lowe, of the Freight Claim Department of the Southern Pacific, on the method of handling freight claims in the office of that company. He followed through a specific claim on a cantaloupe shipment from origin to settlement. The University of California Traffic Association was formed by the graduates of the Extension Division of the University of California upon completion of a ten months' course in traffic management and transportation. A second class is now going through the course. M. B. Baker, of the United States Rubber Company, of San Francisco, is president of the association.

At the annual banquet of the Chicago Traffic Club on March 31, the following officers were installed: president, R. B. Robertson, assistant freight traffic manager, Union Pacific; first vice-president, J. A. Brough, traffic manager, Crane Company; second vice-president, J. E. Weller, freight traffic manager, Pennsylvania; third vice-president, J. H. Walden, president, Chicago Railway Printing Company; secretary, E. S. Buckmaster, general agent, American Railway Express Company, and treasurer, J. F. Coykendall, treasurer, Chicago, Great Western; directors for two years, E. L. Dalton, general traffic manager, Montgomery Ward & Company; C. E. Barry, general western agent, Livermore, Dearborn & Company, Inc.; W. J. M. Lahl, traffic manager, American Seating Company, and T. J. Wall, general agent, passenger department, Canadian Pacific.

Anthracite Shipments in February

The shipments of anthracite in February, as reported to the Anthracite Bureau of Information, in Philadelphia, established a new record for that month, amounting to 5,966,101 gross tons. The nearest approach to this figure for February shipments during a normal year, was in February, 1912, when the shipments amounted to 5,875,968 tons, and the next nearest approach was in the war year of 1918, when 5,812,082 gross tons were shipped. The shipments last month exceeded the previous month of January, a long month, by 225,563 tons, and exceeded February of last year by over 900,000 tons.

Shipments by originating carriers were:

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until August 7, the operation of certain proposed reductions in freight rates on crude petroleum in tank cars from 10 to 6½ cents per 100 lb. from Sabine, Port Arthur, Chaison and Beaumont, Texas, to Sulphur Mine, La.

The commission has suspended, from April 17 until August 15, the operation of certain schedules published in a Kansas City, Mexico & Orient tariff, proposing increased rates on grain from points in Oklahoma and Kansas to Algiers, New Orleans, La., and other points in Louisiana.

The commission has further suspended until May 14 the operation of schedules providing increased freight rates between Ohio river crossings, St. Louis, Mo., and points related thereto on the one hand, and Memphis, Tenn., lower Mississippi river crossings and Gulf ports and points related thereto and points in Mississippi Valley territory on the other hand between other points in Mississippi Valley territory.

The commission has suspended from April 8 until August 6 the operation of certain schedules, which provide for the elimination of the application of rates on lumber and other forest products from California and Oregon to various points in Minnesota via the Chicago, St. Paul, Minneapolis & Omaha and the Great Northern, leaving combination rates applicable instead, resulting in increases varying from 4½ to 9 cents per 100 pounds.

### Personnel of Commissions

President Harding is considering candidates for appointments to the two vacancies on the Interstate Commerce Commission has before him communications from the Engineering Council of the Federated Engineering Societies urging the appointment of an engineer as a member of the commission and submitting the names of six prominent engineers as candidates. It is understood also that Herbert Hoover, Secretary of Commerce, who is president of the organization, has discussed the matter with the President. Other candidates who have been strongly urged upon the President, usually by congressional delegations or by commercial organizations from various sections, include E. I. Lewis, chairman of the Public Service Commission of Indiana; W. A. Wimbish, a traffic lawyer of Atlanta, Ga.; James B. Campbell, a traffic lawyer of Spokane, Wash.; Mason Manghum, counsel for the Virginia Corporation Commission, and Henry J. Ford, whose recess appointment as a member of the commission expired on March 4 and who has since been retained by the commission as an attorney.

### Court News

#### Recovery of Connecting Carriers' Charges Notwithstanding Claims for Damages

A shipment was diverted from the original consignee to parties who ordered a further diversion, the railroad in possession of the goods agreeing to deliver the car in time for a certain train on the terminal road. The car was not so delivered, however, and the consignee suffered damage thereby. In an action by the terminal road against the last consignee for its and all prior charges, it was held that the plaintiff could recover those accruing to the railroad which had been in default in failing to deliver the car to the terminal road in time for its train; leaving the parties to bring action directly against the road in default to recover such damages as they could show they had sustained by the failure to keep its agreement to deliver.—Grand Trunk v. Satuloff, 182 N. Y. Supp. 81.

## Equipment and Supplies

### Locomotives

The GREAT WESTERN OF BRAZIL has ordered 4 4-6-0 type locomotives from the Baldwin Locomotive Works.

The HAWAII CONSOLIDATED RAILWAY, LTD., has ordered 1 4-6-0 type locomotive from the Baldwin Locomotive Works.

The CERVECERIA CUAUHTEMOC, Monterey, Mexico, has ordered 2 Consolidation type locomotives from the American Locomotive Company. These locomotives will have 19 by 26 in. cylinders and a total weight in working order of 138,000 lbs.

MITSUBI & Co., 65 Broadway, New York, representing a Chinese banking group and on behalf of the Chinese Ministry of Communications, are inquiring for 30 Prairie type locomotives for the Pekin-Hankow, and 2 Mikado and 3 Pacific type locomotives for the Pekin-Kalgan.

NATIONAL RAILWAYS OF MEXICO.—The General Equipment Company, New York, has sold to The Oliver American Trading Company, Inc., with New York City office at 61 Broadway, 65 rebuilt locomotives, including Mogul, 10-wheel and Consolidation type locomotives for use over the lines of the National Railways of Mexico in connection with the operation of the private freight trains of the Oliver company. This company, in addition to these 65 locomotives just purchased, also has leased within the past few days 20 locomotives from American railroads, which, with the equipment they are now operating, gives it a total motive power of about 95 locomotives. This sale of the General Equipment Company has been made possible by virtue of certain arrangements between Senor Francisco Perez, Director-General of the National Railways of Mexico and The Oliver American Trading Company, Inc., which plan provides a practical means of financing this equipment.

### Freight Cars

The LEHIGH VALLEY is asking for prices on repairs on 1,000 box, 500 steel gondola and 500 hopper cars.

BETANZOS FERROL RAILWAY.—Bids will be opened on April 25, at Madrid, Spain, for 94 freight cars of various types.

The UNITED FRUIT COMPANY, New York, has ordered from the General American Tank Car Corporation 2 tank car tanks, to be used on the Truxillo Railway, Honduras.

### Iron and Steel

The UNITED STATES STEEL CORPORATION on April 12, announced a change in prices effective April 13, lowering the price on bars from 2.35 cents to 2.10 cents Pittsburgh, and plates and shapes from 2.65 cents and 2.45 cents respectively, to 2.20 cents. It also reduced billets from \$38.50 to \$37; steel brass from \$42 to \$39; wire rods from \$52 to \$48, and tin plates from \$7 to \$6.25 per box.

### Track Specialties

The NORFOLK & WESTERN will receive bids at Roanoke, Va., until 12 o'clock noon, April 20, for 51 kegs of track bolts, 14 switch stands, 5,000 rail bonds, 650 lbs. flux rods, 6 clamps for holding bonds to rail, 8 steel gate posts and 50,800 tie dating nails.

### Miscellaneous

MADRID MUNICIPAL RAILWAY.—Bids will be opened on April 25, at Madrid, Spain, for 2,750 tons of steel rails and a large quantity of rails, plates, clamps, screws, ball extractors, and switches.

The NEW HAVEN, NEW HAVEN & HARTFORD will receive bids at New Haven, Conn., until 12 o'clock noon, April 22, for its requirements of locomotive and car couplers, to be ordered as required during the period from April 1 to and including December 31, 1921.

## Supply Trade News

The **G. M. Basford Company** will remove its office on April 20 from 30 Church street to the National City building, 17 East Forty-second street, New York City.

The **Busch Corporation**, 13 North Seventh street, St. Louis, Mo., has been appointed agent in that territory for the **Track Specialties Company**, 29 Broadway, New York.

The **Rome Iron Mills, Inc.**, will remove its general offices on April 20 from 30 Church street to the National City building, 17 East Forty-second street, New York City.

The **Superheater Company** will remove its general offices on May 1 from 30 Church street to the National City building, 17 East Forty-second street, New York City.

The **Stone Franklin Company** will remove its general offices on April 20 from 30 Church street to the National City building, 17 East Forty-second street, New York City.

The **Franklin Railway Supply Company, Inc.**, will remove its general offices on April 20 from 30 Church street to the National City building, 17 East Forty-second street, New York City.

The **American Arch Company, Incorporated**, will remove its general offices on April 20 from 30 Church street to the National City building, 17 East Forty-second street, New York City.

The **Lima Locomotive Works, Incorporated**, will remove its executive and sales offices on April 23 from 30 Church street to the National City building, 17 East Forty-second street, New York City.

The **International Pulverized Fuel Corporation** will remove its general offices on April 20 from 30 Church street to the National City building, 17 East Forty-second street, New York City.

The **Brown Hoisting Machinery Company**, Cleveland, Ohio, has opened a southern office at 530 Whitney-Central building, New Orleans, La. The states of Texas, Louisiana, Mississippi, Alabama, Georgia and Florida will be covered from this office. **Charles H. White**, who has been with the Brownhoist company for a number of years, is manager of the new office.

The executive and general sales offices of the **Elliott-Fisher Company** will be removed from Harrisburg, Pa., to New York City early in May. The company will occupy the entire sixteenth floor of the new Canadian-Pacific building, at Madison avenue and Forty-third street, in the Grand Central Terminal zone. The sales offices of the New York City branch have also been removed from 217 Broadway to the same floor of the Canadian Pacific building.

The **National Steel Car Lines Company**, 34 Pine street, New York, has been incorporated with an authorized capitalization of \$1,000,000 preferred stock and 20,000 shares of common stock of no par value, to finance purchases of locomotives and cars. The officers and directors of the company are **Ernest L. Nye**, president; **Leon S. Freeman** and **E. Kirk Haskell**, vice-presidents; **S. Halline**, secretary; **R. J. Burton**, treasurer; **Southgate B. Freeman** and **James A. Cotner**.

The **Engineering Business Exchange** announces the opening of a Southeastern branch with **Marshall O. Leighton**, consulting engineer of Washington, D. C., as director, and with offices in the McLachlen building. Mr. Leighton was for 12 years one of the principal officers of the United States Geological Survey. During the past three years he has served as chairman of the National Service Committee of the Engineering Council and as leader of the national organization which has carried on the campaign to reform the government's business methods and establish a federal department of public works. Mr. Leighton graduated in 1896 from the

Massachusetts Institute of Technology. Associated with Mr. Leighton in carrying on the exchange will be **A. C. Oliphant**, who was also active in the work of the Engineering Council's National Service Committee. Mr. Oliphant is a graduate of Drexel Institute and Columbia University, and was engaged in electric central station work and industrial engineering until he entered the Ordnance Department of the Army during the war.

### Page Steel & Wire Company

**A. P. Van Schaick**, whose appointment as general manager of sales of the Page Steel & Wire Company, with headquarters in the Grand Central Terminal, New York, was announced in the *Railway Age* of April 8, began his business career in 1903, at which time he left Williams College, Williamstown, Mass., to enter the railroad sales department of the Pittsburgh Plate Glass Company, with headquarters in Chicago. From 1906 to 1910 he was in the employ of the Universal Railway Supply Company, with headquarters in the same city, resigning from that position during the latter year to become district sales manager of the Lackawanna Steel Company at Chicago. In May, 1919, he went to the American Chain Company, Inc., Bridgeport, Conn., as special representative, with headquarters in Chicago, and subsequently was appointed assistant general manager of sales of the same company at New York. On January 1, 1921, he was promoted to general manager of sales of the American Chain Company and other subsidiary companies, and now becomes also general manager of sales of the Page Steel & Wire Company. Mr. Van Schaick has been active in the work

A. P. Van Schaick

of railway supply organizations and especially of the National Railway Appliances Association. He was elected a member of the executive committee of this association in 1910, vice-president in 1911, and president the following year.

**W. T. Kyle**, who has been appointed assistant general manager of sales of the Page Steel & Wire Company, was born in 1883, at Baltimore, Md. He was educated in the high schools and took academic courses in various academies, specializing in civil engineering. In 1901 he began an apprenticeship course with the Bell Telephone Company, at Philadelphia, Pa., and two years later went with the American Pipe & Construction Co., Philadelphia, as district superintendent, on general railroad construction work. He left that position in 1908, to go to the Duplex Metals Company, New York, as a salesman, and later became sales manager of the same company. In 1914 he went to the Okonite Company as special representative at New York. In 1916 he entered the service of the Page Steel & Wire Company as sales manager of its Armco wire department at New York,

W. T. Kyle

and on April 1 was promoted to assistant general manager of sales, with headquarters at New York. All the company's general sales are now handled at New York for both the Adrian, Mich., and the Monessen, Pa., plants. Mr. Kyle served in 1917 and 1918 as chairman of the Railway Signal Appliance Association, and is now chairman of the Railway Telegraph & Telephone Appliance Association.

The E. Horton & Son Company, Windsor Locks, Conn., has bought the chuck business of the American Company, Hartford, Conn. The American Company has specialized in the manufacture of a 3-jaw geared drill chuck known as the Ellison chuck.

### Obituary

H. Kirke Porter, president of the H. K. Porter Company, Pittsburgh, Pa., died on April 10, at his home in Washington, D. C. He was born on November 24, 1840, at Concord, N. H., and studied at Newton Theological Institute and at Rochester Theological Seminary. He enlisted with the 45th Massachusetts Volunteers in 1862, and was mustered out of service in July, 1863. Mr. Porter served in the United States Christian Commission during the winter of 1864, and began his business life in 1866, as a member of the firm of Smith & Porter, manufacturing exclusively light locomotives. In 1871 the firm became Porter, Bell & Company. In 1879 it was changed to H. K. Porter & Co., and in 1899 was incorporated under the name of the H. K. Porter Company. During the past 20 years, the firm has been engaged in manufacturing heavy as well as light locomotives. This concern was the first to make compressed air locomotives for mine and general industrial use. Mr. Porter was a member of the 58th Congress from 1903 to 1905.

H. K. Porter

Robert Alexander Bole, vice-president, director and district sales manager of Manning, Maxwell & Moore, Inc., New York, died on April 2, at the age of 62 in the Schenley Hotel, Pittsburgh, where he made his home. Mr. Bole was widely known in the iron, steel and railroad circles. He was born in Old Allegheny City, and received his education in the Pittsburgh schools. In early life he became identified with the Westinghouse Machine Company and rose from the ranks to secretary of that company. Following his long service with the Westinghouse interests, he became identified with the manufacturing company of Niles-Bement-Pond Company, New York, and resigned from that company to become associated with Manning, Maxwell & Moore, Inc. At the time of his death, he had been identified with the latter company for a period of 26 years.

R. A. Bole

### Trade Publications

**FROM TREE TO TRADE.**—The Long Bell Lumber Company, Kansas City, Mo., has issued a profusely illustrated 48-page booklet under this title which describes the operations incident to the manufacture of lumber. The book is elaborately illustrated with photographs in color of the various steps incident to logging, sawing and distribution of lumber, poles, posts and similar products of wood.

**POWER UNITS FOR MOVABLE BRIDGES.**—The Norwood-Noonan Company, Chicago, has issued a four-page leaflet illustrating and describing self-contained gasoline engine units and auxiliary appliances, designed and built especially for the operation of movable bridges. The leaflet also contains tables of sizes, weights and other physical proportions of this equipment and a list of railroad structures on which it has been used.

**DUST COLLECTING EQUIPMENT.**—A four-page bulletin (No. 12) has been issued by the Dust Recovering & Conveying Company, Cleveland, Ohio, which illustrates the development of this form of equipment from the simple cyclone separator to the modern Dracco filter cloth system. The bulletin explains the defects of the original equipment in that it failed to remove the finest particles from the exhausted air and introduced the hazard of explosions resulting from sparks developed by the fan blades striking foreign particles in the air. These defects are eliminated in the modern apparatus.

**FREIGHT CARS AND APPLIANCES.**—The Canadian Car & Foundry Co., Ltd., Montreal, Canada, has recently issued a series of bulletins describing cars built by the company and some of the specialties manufactured in its plant. The numbers of the bulletins and the subjects are as follows: No. 11, Simplex safety brake head; No. 12, A. R. A. standard D coupler; No. 21, box cars for the Canadian Pacific; No. 22, box cars for the Canadian National Railways; No. 23, composite underframe refrigerator cars for the Canadian National; No. 24, all wood stock cars for the Canadian National; No. 31, cars for foreign service.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company which was noted in the *Railway Age* of April 1 (page 864) as accepting bids for the construction of a craneway building at Topeka, Kan., to cost approximately \$13,000, has awarded a contract for this work to Joseph E. Nelson & Sons, Chicago.

**ATCHISON, TOPEKA & SANTA FE.**—This company, in co-operation with the railroad Y. M. C. A. of Topeka, Kansas, will remodel the Y. M. C. A. building at Topeka and build an addition to cost about \$25,000.

**CANADIAN NATIONAL.**—This company is advertising for bids for the construction of a number of concrete structures in the Ontario district.

**CHICAGO UNION STATION.**—This company which was noted in the *Railway Age* of April 8 (page 911) as accepting bids for the construction of a new railway mail terminal, has awarded a contract for this work to R. C. Wiebolt, Chicago.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.**—This company contemplates the construction of an engine terminal at Jeffersonville, Ind.

**ILLINOIS CENTRAL.**—This company, which was announced in the *Railway Age* of March 4 (page 532), as contemplating the construction of a new 100-ft. turntable at Waterloo, Ia., has awarded the contract for this work to the Ellington-Miller Company, Chicago.

**ILLINOIS CENTRAL.**—This company, which was announced in the *Railway Age* of March 25 (page 821) as accepting bids for the construction of two bridges at Council Hill, Ill., to cost a total of \$60,000, has awarded the contract for this work to the Gould Construction Company, Davenport, Iowa.

**INTERSTATE.**—This company will shortly ask for bids for the construction of approximately 18 miles of single track line with passing tracks and an interchange yard. The proposed line will lead through mountainous country, and the work will involve the construction of three tunnels.

**SEBOMOOK LAKE & ST. JOHN.**—This company which is owned by the Great Northern Paper Company, Boston, has let a contract to J. T. Mullin, Bangor, Me., for the construction of a line 20 miles in length, from Sebomook Lake to St. John Lake, Maine. This line is all through forest land. The maximum gradient will be 2 per cent and the maximum curvature 6½ deg. All bridges will be of wood and there will be one piling trestle 1,100 feet long. A round house and repair shop will be built and some rolling stock and a few locomotives will be purchased, according to the company's announcement.

**SPOKANE & BRITISH COLUMBIA.**—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon its entire line from Danville to Republic, Wash., 36.3 miles.

**TEXAS & PACIFIC.**—This company is accepting bids for the construction of bridges across Bayou-Plaquemine, La., and will award the contract for this work on April 20.

**WHISTLE FOR CARELESS AUTOMOBILE DRIVERS.**—The Chicago & North Western, in its campaign to reduce highway crossing accidents, has sent out a letter to the home address of every engineman on the system and another letter to the home address of each fireman. The attention of the enginemen is called to the heavy toll of lives lost by accidents at crossings and they are directed to be on the alert and to use their whistles more. Specific instances are cited and concrete examples are given of the causes of certain accidents; and it is shown how a continued use of the whistle would have avoided them. The letter to the firemen outlines the crossing accident problem from the firemen's side, directing them to be on the alert and to inform the enginemen of all approaches from their side of the engine.

## Railway Financial News

**BELT RAILWAY OF CHICAGO.**—*New Directors.*—A. E. Wallace and L. W. Baldwin have been elected directors to succeed Mitchell D. Follansbee and A. S. Baldwin, respectively.

(credit).....		\$244,007	\$244,007

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919 as follows:

	OPERATING REVENUES	
	1920	1919
Freight.....	\$9,329,004	\$8,366,515
Passenger.....	2,952,344	2,891,919
Total operating revenues.....	\$13,611,131	\$12,355,827
	OPERATING EXPENSES	
	1920	1919
Maintenance of way and structures.....	\$1,986,341	\$1,464,707
Maintenance of equipment.....	4,030,894	3,304,501
Traffic expenses.....	320,181	172,144
Transportation expenses.....	6,336,517	5,384,032
General expenses.....	361,731	314,946
Total operating expenses.....	\$13,210,542	\$10,764,781
Net revenue from railway operations.....	\$400,588	\$1,591,046
Railway tax accruals.....	465,064	494,840
Railway operating income.....	Def. \$91,842	\$1,094,704
PASSENGER TRAFFIC		
Number of passengers carried.....	2,202,426	1,991,204
Number of passengers carried one mile.....	116,889,061	106,166,134
Average distance hauled per passenger (miles).....	53.07	53.32
Average receipts per passenger per mile (cents).....	2.896	2.724
FREIGHT TRAFFIC		
Number of tons carried.....	7,519,803	5,759,540
Number of tons carried one mile.....	1,143,743,829	770,284,023
Average distance hauled per ton (miles).....	152.10	133.74
Average receipts per ton per mile (cents).....	3.86	1.085
Average number of tons of freight in each train.....	601.18	536.65
Average number of tons of freight in each loaded car.....	29.98	25.18

President H. R. Kurrie in his remarks refers to maintenance as follows:

Cross ties renewed during the year was 160,486 as compared with 82,702 in the previous year. New 90 lb. section steel rail laid, replacing light rail was 2,917 tons, compared with 5,215 tons last year. New ballast placed in track was 165,669 cubic yards, as compared with 71,151 cubic yards, last year. In equipment maintenance, the average cost per locomotive repaired, excluding renewals and depreciation, was \$12,796, as compared with \$10,034. The average cost of repairs per passenger train car was \$2,822, as compared with \$1,643 in the previous year. Cost of repairs per freight train car excluding renewals and depreciation was \$279, as compared with \$160 last year. The difference in the cost of repairs to equipment arises from increased wages and more complete repairs.

**CHICAGO JUNCTION.—Hearings on Acquisition by New York Central.**—See New York Central.

**CHICAGO, ROCK ISLAND & PACIFIC.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**CHICAGO & NORTH WESTERN.—New director.**—Marshall Field has been elected a director to succeed James Stillman, resigned.

**CHICAGO & WESTERN INDIANA.—Annual Report.**—The annual report for the year ended December 31, 1920, shows a net income for the year of \$516,411. The income account for the year 1920 compares as follows:

	1920	1919
Total operating revenue.....	\$233,828	
Operating expenses.....	418,223	
Net operating loss.....	184,395	
Compensation from U. S. Government.....	317,873	\$1,880,737
Joint facility rent income.....	1,930,586	
Income from lease of road.....	1,980,167	1,863,943
Total non-operating income inc. other.....	4,444,485	
Gross income.....	4,260,090	3,081,993
Interest on bonds.....	2,365,000	3,071,250
Interest on unfunded debt.....	814,776	
Total deductions from gross income, inc. other.....	3,743,679	3,490,114
Net income for year.....	516,411	591,177

OPERATING EXPENSES

	1920	1919	Increase or Decrease
Maintenance of way and structures.....	\$805,937	\$585,366	\$220,571
Maintenance of equipment.....	366,043	265,998	100,045
Traffic expense.....	3,492	3,546	146
Transportation expense.....	1,857,073	1,351,286	505,787
General expense.....	158,511	159,900	1,388
Total.....	\$3,202,932	\$2,379,164	\$823,769

The report in speaking of maintenance says:

The expense incident to maintenance of way and structures increased \$220,571, or 37.7 per cent, practically all of which was due to the increased rate granted in Decision No. 2 of the United States Railroad Labor Board effective May 1, together with the increased cost of materials. The total man-hours for the year in this department reflect a decrease of 3 per cent as compared with the man-hours worked in 1919 and approximately 40 per cent as compared with 1918.

Maintenance of equipment expense increased \$100,045, or 37.6 per cent, and as in the case of the maintenance of way department the increase was principally due to the higher wage rates made effective May 1 by the United States Railroad Labor Board Decision No. 2, as well as the higher cost of materials needed for the repair of locomotives and car equipment. Transportation expense increased \$505,786, or 37.4 per cent, and was principally due to the higher wage rates for all classes of employees made effective May 1 by United States Railroad Labor Board Decision No. 2, also the higher cost of materials.

The strike of the switchmen, which went into effect April 4, and which was not formally declared off until September 13, also contributed to the increased cost of operation in the transportation department. The work of this department also increased during the year as evidenced by the fact that the number of passenger trains at the beginning of the year numbered 119 per day, whereas at the end of the year a total of 125 passenger trains were handled in and out of Dearborn Station per day.

**New Directors.**—A. E. Wallace and Mitchell D. Follansbee have been elected directors.

**Erie.—Annual Report.**—The corporate income account for 1920 as compared with 1919 shows results as follows:

	1920	1919
Compensation accrued under federal control, January and February.....	\$2,630,861	
Guaranty, March 1 to August 31.....	7,892,563	
Net railway operating income, September 1 to December 31.....	3,288,620	\$15,841,263
Total compensation, etc.....	13,812,044	4,569,998
Total non-operating income.....	4,704,919	4,569,998
Gross income.....	18,516,963	20,411,261
Total deductions from gross income.....	14,078,397	14,284,156
Net income.....	4,438,566	6,127,104
Applied to sinking of other reserved funds.....	976,015	1,005,000
Balance for year.....	3,462,570	5,122,104

The annual report of the Erie will be reviewed editorially in an early issue.

**GULF PORTS TERMINAL COMPANY.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$300,000 of first mortgage, 5 year, 8 per cent bonds to finish the uncompleted line to Mobile, Ala., a distance of 7 miles.

**GRAND TRUNK.—Defaults Bond Interest.**—This company has defaulted interest payments due April 1 on one of its bond issues floated in London.

The Canadian Government has informed the Grand Trunk that it must turn over possession and control of the lines to the government to gain consideration of its application for further advances and an extension of time in the arbitration proceedings now pending on the physical value of the road.

**LOUISVILLE & NASHVILLE.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**NASHVILLE, CHATTANOOGA & ST. LOUIS.—New Director.**—J. J. Gray, Jr., has been elected a director.

**NEW YORK CENTRAL.—Hearings on Acquisition of Chicago Junction Railway.**—The hearings before W. H. Colston, director of the division of finance of the Interstate Commerce Commission, upon the application of the New York Central for authority to acquire the terminal properties of the Chicago Junction and the Chicago River & Indiana, were adjourned on April 9 and another session of hearings is to start in three weeks. Testimony brought out during the last days of the first hearing concerned the financial condition of the properties and statements of shippers who are in favor of the purchase of the line by the New York Central. It was stated by L. D. Porter, assistant comptroller in charge of accounts of the New York Central, that the total annual switching revenue for the two belt roads in the year 1917 and 1918 was \$7,701,000. In 1920 the Chicago Junction showed a deficit of \$199,192 and the Chicago River & Indiana an income of \$432,228. The latter figure, it was shown, represents about 86 per cent re-

turn on the capital stock of \$500,000 and about 57½ per cent return on the \$750,000 investment the New York Central proposes to make to acquire the road. The total net on the two roads of \$232,000 is about 40 per cent. Other evidence introduced showed the car movement in tonnage, in different classes of freight handled by the Junction. A detailed analysis of the destination of such freight by roads in commodities was called for by Luther M. Walter.

Several witnesses for the New York Central testified the purchase would be advantageous to the shippers. When the hearings are again started shippers who oppose the purchase, it is claimed, will seek to show that the petitions signed by 98 per cent of the shippers on the Chicago Junction property favoring the New York Central plan, were obtained by representing to them that the Belt line was in such shape as to face imminent receivership and that it would shortly be operated by a receiver with a corresponding effect on service. Attorney Ballard, for the opposing shippers, declared he would produce testimony to show that the Junction net work of city tracks must be kept open to all roads or serious consequences to shippers will result.

**NORTHERN PACIFIC.—Annual Report.**—The corporate and federal income account for 1920 as compared with 1919 shows results as follows:

	1920	1919	Increase or Decrease
Operating income:			
Operating revenues	\$113,084,408	\$100,739,354	\$12,345,054
Operating expenses	100,983,874	78,672,509	22,311,365
Net operating revenue	\$12,100,534	\$22,066,845	—\$9,966,311
Tax accruals	10,108,686	9,000,737	1,107,949
Uncollectible railway revenues	18,469	23,940	—5,471
Total operating income	\$1,973,378	\$13,042,167	—\$11,068,789
Total operating income, inc. other	14,358,569	10,866,140	3,492,429
Compensation	5,301,309	30,089,692	—24,788,383
Guaranty under federal control act	14,760,606		14,760,606
Deduct, federal income included above	*4,002,970	*18,353,597	14,350,627
Gross corporate income	\$32,390,893	\$35,644,402	—\$3,253,509
Total deductions from gross income	13,558,634	13,880,509	—321,876
Less federal deductions	*261,924	*1,072,844	810,920
Net deductions	\$13,296,709	\$12,807,665	\$489,044
Net corporate income	\$19,094,183	\$22,836,737	—\$3,742,553
Disposition of net income:			
Dividend appropriations of income	17,360,000	17,360,000	
Income balance for year—transferred to profit and loss	\$1,734,183	\$5,476,737	—\$3,742,553

\*In arriving at "Gross income" federal items for 1919 amounting to \$18,353,597 and in 1920 to \$4,002,970 have been added to corporate items. In arriving at "Total deductions from gross income," federal items for 1919 amounting to \$1,072,844 and for 1920 to \$261,924 have been added to corporate items. In order to arrive at the correct "Income balance" for each year it has been necessary to deduct from "Gross income" and "Total deductions from gross income" the amounts shown above.

The annual report of the Northern Pacific will be reviewed editorially in an early issue.

**READING COMPANY.—To Hear Intervening Petitions.**—Joseph E. Widener, a director of the Reading Company, has withdrawn his power of attorney given the Prosser common stockholders' committee and has presented a petition to the Federal District Court at Philadelphia to intervene in the matter of the segregation of the Reading Company properties, together with a separate answer to certain intervening petitions and cross petitions. The estate of P. A. B. Widener holds 100,000 shares of Reading common. Mr. Widener approves the plan as originally presented by the Reading Company, but desires to register a disclaimer and protest with respect to the "attempt of certain intervening interests to obtain a construction of the basic contracts between the different classes of stockholders of the Reading Company."

Federal Judge J. Whitaker Thompson at Philadelphia on April 13 set May 2 for argument in the United States Court of Appeals in the matter of the segregation of the Reading company properties as decreed by the United States Supreme Court. The court allowed eleven parties in interest in the case to file intervening petitions.

**TENNESSEE CENTRAL.—Hearing on Order of Sale Postponed.**—Judge E. T. Sanford in the federal court at Nashville, Tenn., on April 4, decided to postpone the order of sale for a hearing in Chattanooga on May 2.

**VALDOSTA, MOULTRIE & WESTERN.—Foreclosure Sale.**—This road, operating between Valdosta, Ga., and Moultrie, 42 miles, was sold at foreclosure on April 9 to Charles L. Jones, who put in a bid of \$87,000 for the stockholders. The road has been in the hands of receivers since November 5, 1920.

**WATERLOO, CEDAR FALLS & NORTHERN.—Loan from revolving fund approved.**—The Interstate Commerce Commission has approved a loan of \$1,260,000 to this company to assist it in meeting maturing indebtedness.

**WESTERN PACIFIC.—Hearing on Application to Issue Securities.**—The Interstate Commerce Commission has announced a hearing to be held at Washington on April 25 on the application of the Western Pacific for authority to issue \$4,180,000 of first mortgage bonds and of the Denver & Rio Grande Western to issue 300,000 shares of its common stock without par value.

**WICHITA FALLS & NORTH WESTERN.—Authorized to Issue Receiver's Certificates.**—The receiver has been authorized by the Interstate Commerce Commission to issue receiver's certificates in an amount not exceeding the indebtedness of the applicant to the United States arising out of federal control and to pledge the certificates with the director general of railroads as collateral security for notes by which the funding of the indebtedness shall be accomplished. A tentative statement of account shows a balance of \$311,816 due to the director general.

**Guaranty Certificates Issued**

The Interstate Commerce Commission has issued the following certificates for partial payments on account of the railroad guaranty for the six months following federal control:

		Previously paid
Big Fork & International Falls	\$25,000	
Gainesville Midland	25,000	\$4,300
Georgia, Florida & Alabama	40,000	90,000
Montana Western	3,000	
Knoxville, Sevierville & Eastern	9,540	
Mobile & Ohio	375,000	950,000
Minneapolis, St. Paul & Sault Ste. Marie	1,400,000	3,135,000
Minnesota & International	150,000	
Gulf, Florida & Alabama	370,000	200,000
Appalachia Northern	38,000	
Atlantic Coast Line	2,400,000	2,500,000
Nashville, Chattanooga & St. Louis	150,000	1,200,000
Texas Midland	100,000	
Western Allegheny	45,000	
Georgia Northern	4,000

## Railway Officers

### Executive

**Robert L. Russell**, freight traffic manager of the Philadelphia & Reading, with headquarters at Philadelphia, has been elected vice-president in charge of traffic, effective April 11,

succeeding E. B. Crossley, deceased. Mr. Russell was born in Howard county, Maryland, July 19, 1867. He began his railroad career in October, 1882, as a clerk for the Baltimore & Ohio, at Baltimore. Subsequently he was employed as a clerk with the Philadelphia & Reading Express Company, the Adams Express Company, the Woodruff Parlor Car Company, and the Long Island. He entered the service of the Philadelphia & Reading as a clerk in the transportation department at Philadelphia in October,

1887. He was transferred to the general freight office in March, 1888, and became chief clerk of that department in June, 1891. He was promoted to freight claim agent in April, 1894, and to assistant general freight agent in June, 1907. In December, 1909, he was appointed general freight agent, and in July, 1918, he was appointed assistant freight traffic manager of the Philadelphia & Reading; the Central of New Jersey, the Staten Island Rapid Transit, and the Baltimore & Ohio New York terminals. In December of the same year he was made freight traffic manager of the same roads. Upon the return of the railroads to private control on March 1, 1920, Mr. Russell was appointed freight traffic manager of the Philadelphia & Reading.

**Ross Beason**, whose election to vice-president of the Salt Lake & Utah, with headquarters at Salt Lake City, Utah, was announced in the *Railway Age* of March 25 (page 822), was

born on February 19, 1887, at Birmingham, Ala. He entered railway service in April, 1907, as a rate clerk in the freight offices of the Southern at Mobile, Ala. In 1908 he was employed as rate clerk in the division freight offices at Selma, Ala., and in 1909 was made chief clerk in the same office. During the same year Mr. Beason was transferred to Memphis, Tenn., as chief quotation clerk in the general freight offices. In 1910, he was promoted to chief clerk in the commercial office at Memphis. A year later he was made traveling freight

agent, with headquarters at Huntsville, Ala., but in 1912 he left railroad service on account of ill health. He re-entered railroad work in 1913 as traveling freight agent on the Chicago, Rock Island & Pacific, with headquarters at Salt Lake

City, Utah. In January, 1914, he organized the Traffic Service Bureau of Utah at Salt Lake City, and remained with that organization until November, 1914, when he was appointed traffic manager of the Salt Lake & Utah Railroad, which was then under construction. He was serving in that position at the time of his election as vice-president. During the past three years Mr. Beason has spent considerable time in Washington, D. C., with the American Short Line Railroad Association, of which organization he has been a member of the Committee on Legislation and the Western Freight Rate Committee.

**H. C. Nutt** has been elected president of the Monongahela, with headquarters at Pittsburgh, Pa., effective April 4. **J. A. McCrea** and **J. B. Yohe** have been appointed vice-presidents of the company.

**E. R. Oliver**, freight traffic manager of the Southern, Lines West, has been elected vice-president, with headquarters at New Orleans, effective April 15. Mr. Oliver was born in La Fayette county, Miss., February 25, 1883. He was educated in the public schools, and was graduated from the Jefferson Law School, Louisville, Ky., with the degree of LL. B. in 1910. Mr. Oliver began his railroad career in 1898 as a clerk in the traffic department of the Southern. He held various positions in that department until January, 1906, when he was appointed traveling freight agent at Chicago. The following year he was promoted to soliciting freight agent at Louisville. In 1910 Mr. Oliver was appointed chief clerk to the assistant freight traffic manager and, in 1912, to assistant general freight agent at Louisville, Ky. On January 1, 1916, he was transferred in a similar capacity to Washington, D. C., and on October 1 of the same year to Atlanta, Ga. He was promoted to general freight agent in Cincinnati in March, 1920, and to freight traffic manager in January, 1921. He was occupying this position at the time of his recent promotion.

### Financial, Legal and Accounting

**T. E. Trigg** has been appointed auditor of the Christie & Eastern and the Kinder & Northwestern, with headquarters at Shreveport, La.

**J. N. Ford**, auditor of capital accounts of the Chicago, Rock Island & Pacific, with headquarters at Chicago, has resigned, effective April 9, to become associated with the Allied Dye & Chemical Corporation, New York City.

### Operating

**J. S. Adsit**, general agent on the Chicago, Milwaukee & St. Paul, with headquarters at Kansas City, Mo., has been promoted to general southwestern agent, with the same headquarters, effective March 22.

**W. K. Etter**, assistant general manager on the Atchison, Topeka & Santa Fe, Western district, with headquarters at Topeka, Kan., has been promoted to assistant to the vice-president in charge of operation, with headquarters at Chicago, Illinois, effective April 11, succeeding **F. A. Lehman**, who has been promoted to the position of general manager, Western lines.

**A. M. Umshler** has resumed his duties as terminal superintendent on the Illinois Central, with headquarters at Chicago, effective April 10. Mr. Umshler, who has been on leave of absence, succeeds **A. Bernard**, who has been appointed superintendent of passenger service, with headquarters at Chicago. Mr. Bernard succeeds **D. E. Hilgartner**, who has been appointed passenger service inspector of the Illinois Central system.

**E. W. Scheer** has been appointed general manager, Eastern Lines, of the Baltimore & Ohio with headquarters at Baltimore, Md., effective April 15, succeeding **Stanton Ennes**, who resigned on January 1. **R. B. White**, superintendent of the Baltimore division, has been appointed general superintendent of the Maryland district with headquarters at Baltimore, succeeding Mr. Scheer. **F. G. Hoskins**, superintendent of the

R. L. Russell

R. Beason

Baltimore Terminal division, has been appointed superintendent of the Baltimore division, succeeding Mr. White.

Coincident with the reorganization of the operating forces of the Michigan Central, effective March 14, **B. H. Winans**, assistant superintendent, with headquarters at Detroit, Mich., has been appointed trainmaster, with the same headquarters. **L. J. Robbins**, trainmaster, North Toledo yard, has been transferred to Junction yards, Detroit, Mich. **F. McElroy**, trainmaster, Windsor, Ont., has been transferred to St. Thomas, Ont. **E. Holst**, trainmaster, North Toledo yard, has been appointed general yardmaster. **E. C. Beckwith**, **A. D. Williams** and **E. D. Heingway**, trainmasters at Detroit, have been appointed general night yardmasters. **E. J. Tallman**, trainmaster at North Lansing, Mich., has been appointed yardmaster at Saginaw, Mich. **G. W. Kemp**, trainmaster at Detroit, has been appointed assistant yardmaster. **T. J. Keenan**, assistant trainmaster at Chicago, has been appointed chief clerk to division superintendent. **W. B. Gibbs**, trainmaster with headquarters at Chicago, has been granted a leave of absence. The position of trainmaster and assistant trainmaster at Chicago have been abolished. The following trainmasters have been assigned to other duties: **G. L. Prehn**, Grayling, Mich.; **J. Purvis**, St. Thomas, Ont.; **A. R. Bailey**, Detroit; **C. G. Campbell**, Detroit; **J. A. Fahey**, Jackson, Mich.

**F. A. Lehman**, assistant to the vice-president in charge of operation of the Atchison, Topeka & Santa Fe, with headquarters at Chicago, has been promoted to general manager, Western lines, with headquarters at Amarillo, Texas, effective April 6, succeeding **R. J. Parker**, deceased. Mr. Lehman was born on May 31, 1871, at Masthope, Pa., and entered railway service in August, 1888, as a telegraph operator on the Atchison, Topeka & Santa Fe. In May, 1890, he was made clerk in the maintenance of way department and in January, 1891, he was promoted to chief clerk in the trainmaster's office. From November, 1891, to May, 1892, he served as telegraph operator and dispatcher and on the latter date returned to the maintenance of way department as chief clerk. In May, 1900, Mr. Lehman was made clerk in the office of the vice-president in charge of operation, with headquarters at Chicago, and seven years later was promoted to superintendent of transportation, with the same headquarters. In April, 1909, he was promoted to assistant to the vice-president and served in that capacity until November, 1914, when he was appointed acting general superintendent, with headquarters at Newton, Kan. In May, 1915, he returned to his position as assistant to the vice-president and was serving in that capacity on the advent of federal control. In July, 1918, he was appointed assistant to the federal manager, which position he held until March, 1920, when he resumed his duties as assistant to the vice-president in charge of operation.

**A. A. Miller**, whose appointment as superintendent of the Missouri division of the Missouri Pacific, with headquarters at Poplar Bluff, Mo., was announced in the *Railway Age* of April 1 (page 869), was born at Zanesville, Ohio, on September 28, 1879, and was educated at Ohio State University, graduating in 1902. He entered railway service in June, 1902, as a rodman on the Baltimore & Ohio at Wheeling, W. Va., and during the next five years served successively as assistant division engineer, with headquarters at Cleveland, Ohio; as assistant engineer at Baltimore, Md., and as division engineer with headquarters at Philadelphia, Pa. In September, 1907,

he accepted an appointment as chief engineer with the West Coast Company at Los Angeles, Cal., but returned to railroad service in June, 1909, as assistant engineer on the Missouri Pacific, with headquarters at St. Louis, Mo. In June, 1911, he was promoted to division engineer with headquarters at Kansas City, Mo., and in June, 1912, was transferred to Poplar Bluff, Mo. Five years later he was promoted to district engineer, with headquarters at Little Rock, Ark. At the time of his recent appointment, Mr. Miller was serving as district engineer with headquarters at Kansas City, Mo., where he had been transferred in August, 1918.

The following changes have taken place on the Northwestern Region of the Pennsylvania coincident with the abolishment of the Northern Ohio division and the consolidation of the Mansfield and Fort Wayne divisions, effective March 16: **J. B. Hutchinson**, junior general superintendent of the Northern Ohio and Mansfield divisions, has been appointed general superintendent of the Toledo division with headquarters at Toledo, Ohio. **Paul Jones**, superintendent, with headquarters at Toledo, has been transferred to the Grand Rapids division with headquarters at Ft. Wayne, Ind., succeeding **G. R. Barry** who has been appointed division engineer with headquarters at Logansport, Ind. **T. A. Roberts**, superintendent, with headquarters at Mansfield, O., has been appointed acting superintendent of the Ft. Wayne division with headquarters at Ft. Wayne, succeeding **B. H. Hudson**, transferred to Logansport, Ind. Mr. Hudson has succeeded **C. B. Reynolds** who has been appointed trainmaster with the same headquarters. Mr. Reynolds has in turn succeeded **G. W. Bradley** who has been appointed assistant trainmaster. **C. L. Hamilton**, superintendent of transportation, with headquarters at Chicago, has been appointed assistant superintendent of the Ft. Wayne division. The office of superintendent of transportation at Chicago has been abolished.

## Traffic

**F. W. Ditman** has been appointed commercial agent on the Hocking Valley, with headquarters at Detroit, Mich.

**W. E. Burnett, Jr.**, has been appointed commercial agent on the Norfolk & Western, with headquarters at Fort Worth, Texas.

**R. H. Snead**, assistant to the president of the Chesapeake & Ohio, has been appointed manager of mail and express traffic, effective April 1.

**M. Broaddus** has been appointed commercial agent of the Norfolk & Western, with headquarters at St. Louis, Mo., effective April 1.

**F. L. Maher** has been appointed district freight and passenger representative on the Baltimore & Ohio, with headquarters at Seattle, Wash.

**T. J. Shelton** has been appointed general freight agent of the Christie & Eastern and the Kinder & Northwestern, with headquarters at Shreveport, La.

**M. S. Throne** has been appointed general agent, freight department, of the Canadian Pacific with headquarters at New York. **F. T. Goodman** has been appointed district freight agent with headquarters at Philadelphia, Pa.

**A. M. Dudley**, division freight agent on the Chesapeake & Ohio, with headquarters at Cincinnati, Ohio, has been promoted to general Western freight agent, with the same headquarters. **Hilliard Russell** has been appointed commercial agent, with headquarters at Nashville, Tenn.

**V. C. Baughn**, traffic representative on the Detroit, Toledo & Ironton, with headquarters at Ironton, Ohio, has been promoted to commercial agent, with headquarters at Detroit, Mich., succeeding **W. G. Howard**, who has been transferred to Pittsburgh. **L. H. Welch** succeeds Mr. Baughn.

**H. C. Stauffer**, general coal freight agent of the Philadelphia & Reading, with headquarters at Philadelphia, has been appointed general freight agent with the same headquarters,

F. A. Lehman

effective April 11, succeeding E. D. Hilleary, promoted. **J. W. Hewitt**, division freight agent, Reading Terminal, Philadelphia, has succeeded Mr. Stauffer.

**C. S. Morse**, district freight agent of the Canadian Pacific with headquarters at London, Ont., has been transferred to a similar position with headquarters at Toronto, succeeding **W. B. Bamford**, who has been transferred in a similar capacity to Nelson, B. C. **H. G. Buchanan** has succeeded Mr. Morse at London. **R. W. Chateauvert** has been appointed chief of the tariff bureau with headquarters at Montreal, succeeding **R. J. Hunt**.

**J. H. Carey** has been appointed district freight agent on the Canadian Pacific, with headquarters at Memphis, Tenn. **C. P. McGhee** has been appointed district freight agent with headquarters at Los Angeles, Cal. **J. H. Fox** has been appointed district freight agent with headquarters at Edmonton, Alta. **J. Halstead**, district freight agent, with headquarters at Calgary, Alta., has been transferred to Winnipeg, Man., succeeding **A. T. McKean**, who has been transferred to Calgary.

**Edgar D. Hilleary**, general freight agent of the Philadelphia & Reading, with headquarters at Philadelphia, has been appointed freight traffic manager, with the same headquarters,

effective April 11, succeeding **R. L. Russell**, promoted. Mr. Hilleary was born in Frederick county, Maryland, on September 1, 1877. He is a graduate of St. John's College, Annapolis, Md., of the class of 1897, and holds the degree of Bachelor of Science. He entered the service of the Philadelphia & Reading as a clerk in the office of the foreign freight agent at Philadelphia on July 1, 1897. In the same year he entered the office of the assistant general freight agent in charge of export and import traffic. Later he was

appointed chief clerk of this department, and in June, 1905, he was appointed agent of the Central States Despatch Fast Freight Line at Philadelphia, and in January, 1906, was promoted to division freight agent of the New York division and the Atlantic City Railroad. On February 14, 1910, he was appointed division freight agent at Harrisburg; on December 1, 1918, assistant general freight agent; and on March 1, 1920, general freight agent, which position he held until his appointment as freight traffic manager.

**F. S. Riegel**, assistant general freight agent on the Southern, with headquarters at Cincinnati, Ohio, has been promoted to general freight agent, with the same headquarters. **W. Humphrey** has been appointed general Western freight agent, with headquarters at Chicago. **J. P. Tocher** has been appointed division freight agent, with headquarters at Louisville, Ky. **J. N. Templeton** has been appointed division freight agent, with headquarters at Lexington, Ky. **W. T. Keating** has been appointed commercial agent, with headquarters at Indianapolis, Ind. The promotions and appointments are effective April 15.

**J. W. Bray**, division freight agent of the Southern with headquarters at Greensboro, N. C., has been appointed assistant general freight agent with headquarters at Atlanta, Ga., succeeding **G. H. Kerr**, who has resigned to become traffic manager of the Southeastern Express Company. **P. A. Wright** has been appointed assistant general freight agent in charge of solicitation with headquarters at Atlanta, Ga. **Hamilton Baxter** has been appointed division freight agent with

headquarters at Norfolk, Va., succeeding **W. T. Turner**, who has been transferred to Greensboro, N. C., to succeed Mr. Bray, promoted. **E. R. Gardner** has been appointed commerce agent with headquarters at Washington, D. C. These appointments were effective March 15.

**G. H. Kerr**, assistant general freight agent of the Southern with headquarters at Atlanta, Ga., has resigned to become traffic manager of the Southeastern Express Company with headquarters in the same city. Mr. Kerr was born at Homer City, Pa., December 4, 1878, and was educated in the public schools. He entered railway service in 1900 as a clerk in the freight office of the Pennsylvania at Bessemer, Pa. In 1905 he became a rate clerk in the division freight office at Pittsburgh, Pa. He was appointed traveling freight agent for the Eastern & Southern Despatch in 1907 and, in 1909, agent for the Despatch at Pittsburgh. In 1913 he became a commercial agent for

the Southern with headquarters at Pittsburgh and, the following year, he was transferred in a similar capacity to Atlanta, Ga. In 1917 he was promoted to assistant general freight agent, which position he held until he resigned to enter upon his present duties.

**Stuart A. Allen**, whose promotion to freight traffic manager of the Baltimore & Ohio, Western lines, with headquarters at Chicago, was announced in the *Railway Age* of March 25

(page 822) was born at Oral Oaks, Va., on January 18, 1873. He was educated at the University School, Petersburg, Va., and at the United States Military Academy, West Point, N. Y., and entered railway service in 1891, as a clerk in the offices of the Savannah, Florida & Western at Gainesville, Fla. In 1892, he was employed by the Savannah, Americus & Montgomery in the clerical department at Americus, Ga., and in 1893 he became a clerk on the Central of Georgia at Albany, Ga. In 1894, he was appointed traveling freight and passenger agent on the Knoxville, Cumberland Gap & Louisville, with headquarters at Knoxville, Tenn., and in 1896 was made traveling freight agent on the Cincinnati, Hamilton & Dayton, now part of the Baltimore & Ohio system, with headquarters at Cincinnati, Ohio. He was promoted to general agent on the same road in 1898 and two years later was made general southern agent, retaining his headquarters at Cincinnati. In 1904, Mr. Allen was made southern agent at Cincinnati, and in 1907 was promoted to general southern freight agent. Three years later he was again promoted, becoming assistant general freight agent of the Cincinnati, Hamilton & Dayton, and in 1912 he was made general agent on the Baltimore & Ohio, retaining his headquarters at Cincinnati. After two years of service in this position, he was made manager of the

E. D. Hilleary

G. H. Kerr

S. A. Allen

Baltimore & Ohio Fast Freight Line, the Continental Line and the Central States Dispatch, at Cincinnati. He was promoted to general eastern freight agent on the Baltimore & Ohio and transferred to New York in 1916, and in 1917, he was made general freight agent, with the same headquarters. At the time of his recent promotion, Mr. Allen was serving as assistant freight traffic manager, with headquarters at New York, to which he had been promoted in 1920.

### Mechanical

**J. F. Speigle** has been appointed assistant master mechanic on the Canadian National, with headquarters at Hornepayne, Ont., succeeding W. G. Strachan, who has been transferred to Capreol, Ont.

**O. P. Reese**, superintendent of motive power of the Pennsylvania, Northwestern Region, with headquarters at Toledo, has been transferred to Chicago, succeeding **O. C. Wright**, assigned to other duties.

**G. T. De Pue**, mechanical superintendent of the Erie, with headquarters at Chicago, has been appointed shop superintendent at Galion, Ohio, effective April 1. The office of mechanical superintendent at Chicago has been abolished.

### Engineering, Maintenance of Way and Signaling

**F. P. Sisson**, division engineer of the Grand Trunk, with headquarters at Detroit, Mich., has been transferred to a similar position at Chicago.

**C. W. Johns**, engineer of construction of the Chesapeake & Ohio, has taken over, without change of title, the duties of **F. I. Cabell**, chief engineer, retired, effective April 1.

**J. R. Sexton**, regional engineer of the Erie, with headquarters at Chicago, has been appointed division engineer at Huntington, Ind., effective April 1. The office of regional engineer at Chicago has been abolished.

**C. T. Jackson**, principal assistant engineer of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been appointed district engineer of the Southern district, with the same headquarters, effective April 16, succeeding **D. C. Fenstermaker**, who has been granted a leave of absence.

**D. S. Farley**, division engineer of the Atchison, Topeka & Santa Fe, with headquarters at Dodge City, Kan., has been promoted to assistant general manager, Western district, with headquarters at Topeka, Kan., effective April 11, succeeding **W. K. Etter**, appointed assistant to vice-president.

In connection with the abolishment of the Northern Ohio division of the Northwestern region of the Pennsylvania, and the consolidation of the Mansfield and Fort Wayne divisions, effective March 16, the following changes have been made: **G. R. Barry**, formerly division superintendent at Fort Wayne, Ind., has been appointed division engineer, with headquarters at Logansport, Ind., succeeding **F. M. Hawthorne**, who has been appointed assistant division engineer. **W. R. Hillary**, engineer maintenance of way, with headquarters at Toledo, has been appointed division engineer, with the same headquarters, succeeding **J. K. Sherman**, who has been transferred to Grand Rapids, Mich., succeeding **T. L. Doyle**, who has been appointed assistant division engineer, with the same headquarters. **R. G. Jones**, division engineer at Mansfield, has been appointed assistant division engineer at Fort Wayne.

### Purchasing and Stores

**L. J. Green**, formerly assistant general storekeeper on the New York Central at West Albany, N. Y., has been appointed storekeeper at Otis, N. Y., succeeding **F. C. Vroman**.

**R. S. Huffman**, assistant general storekeeper on the New York Central at West Albany, N. Y., has been appointed district storekeeper, with headquarters at the same point, succeeding **J. H. Seim**, transferred.

**W. H. King, Jr.**, assistant to the vice-president in charge

of operation of the Seaboard Air Line, has been appointed general purchasing agent, succeeding **H. C. Pearce**, resigned to enter the service of another company.

**B. W. Griffeth**, former assistant general storekeeper on the New York Central at Collinwood, Ohio, has been appointed district storekeeper, third district, with headquarters at Collinwood. Mr. Griffeth succeeds **F. J. McMahon**, who has been assigned other duties in the stores department at the same point.

**H. C. Pearce**, general purchasing agent of the Seaboard Air Line, has resigned to become director of purchases and stores of the Chesapeake & Ohio with headquarters at Rich-

H. C. Pearce

mond, Va., effective April 10. Mr. Pearce was born on June 1, 1867, at Westberry, Quebec, and was graduated from St. Charles-Baromme College at Sherbrooke, Quebec. He entered railway service in 1885 as a clerk in the office of superintendent of the Minneapolis, Lyndale & Minnetonka and subsequently served as a material clerk and conductor on the same line. In 1887 he went with the Minneapolis, St. Paul & Sault Ste. Marie as a clerk to the superintendent of construction. He later served as a clerk in the auditor's office, chief clerk to general superintendent, general storekeeper and purchasing agent. He went with the Chicago, Rock Island & Pacific in April, 1903, as assistant purchasing agent. The following year he was appointed general storekeeper and remained in that position until 1906, when he resigned to enter the service of the Southern Pacific in a similar capacity. In 1913 he became general purchasing agent of the Seaboard Air Line and remained in that position until his present appointment. Mr. Pearce is chairman of the division of purchases and stores of the American Railway Association.

### Special

**John A. McGrew**, whose appointment as superintendent of maintenance of the Delaware & Hudson was announced in the *Railway Age* of April 8 (page 916), was born June 8, 1873, at Bridgewater, Ohio. He was graduated in civil engineering from Ohio State University in 1895. He entered railway service in 1894 with the Columbus & Westernville Electric. Upon his graduation from college he became assistant superintendent of construction of that company and held that position until November, 1896, when he resigned to enter the engineering department of the Pennsylvania at Wellsville, O. From 1899 to 1901 he was assistant engineer, maintenance of way, at Logansport, Ind. From 1901 to 1903 he was engineer, maintenance of way, with the same headquarters. He then went to Pittsburgh, Pa., in the same capacity. For six months in 1904 he was special agent for the general manager of the Chicago, Rock Island & Pacific at Chicago. From 1904 to 1909 he was a consulting engineer and contractor at Columbus, Ohio, and subsequently president of the National Engineering Company. In September, 1909, he went with the Delaware & Hudson as inspector of maintenance on its lines, allied lines and controlled street railways. In 1910 he was appointed superintendent of the Saratoga and Champlain divisions, with headquarters at Albany, N. Y. In July, 1917, he entered the army as a consulting quartermaster in the construction division. In July of the following year he served as a major of engineers in the railway division of the American Expeditionary Forces. Mr. McGrew was discharged from the army on February 21, 1919, and returned to his position as superintendent of the Delaware & Hudson in April, 1920. He was holding this position at the time of his recent promotion.

"If ninety per cent of the typewriters could be relegated to the scrap pile, and officials instead of being tied to them, as they are now, could go about and get acquainted with the employees, the grievance committee's work would be reduced to a minimum." This statement was made by a railway executive who has had unusual success in administering his department.

### The Art of Working with Men

Reductions in wages and salaries or even prospects of such measures are sure temporarily to cause a serious reduction of the esprit de corps in any organization. Such an agitation affects officers and employees alike for it is disheartening to any man to curtail his plan for saving or his budget of living expenses. The situation becomes aggravated when the individual does not fully appreciate the conditions which enforce the retrenchment. This is a fact which the railroads cannot afford to overlook in carrying out their proposed wage reductions, because efficiency of operation will probably be affected in greater measure by the depressing influence on the subordinate officer and the loyal employee than on those who are affiliated with the stronger labor organizations. If nothing is done to combat this influence, it will serve largely to offset the efforts for increased loyalty which the managements have undertaken since the return to private control. The answer is education in the form of statements explaining in simple language the present financial predicament of the roads as a consequence of a disproportionate relation between revenues and expenses. But this alone will not suffice. It should be made clear that every possible effort is being made to introduce economies which do not entail the reduction of wages. The employee should be given to understand that the management will be pleased to entertain any suggestions which will effect further economies. A reduction in wages is a painful procedure and should be conducted in a spirit that manifests a realization of the sacrifices involved.

The railway manager is confronted under present conditions with two conflicting lines of thought as far as his passenger service is concerned. He is desirous, on the one hand, of taking such steps as he can to restore his road's pre-war passenger service and may even wish to improve on it. On the other hand, he is met with the necessity of reducing expenses and possibly has been called upon to consider the advisability of dropping from his time-table some of the less important and more poorly patronized trains. He is, of course, limited in a measure when it comes to dropping trains because there must always be a minimum service and because the state commissions are not particularly enthusiastic about reductions in service. Nevertheless, in working out the proper solution of his problem, he would be assisted measurably if he had some way in which he could estimate the earnings and cost of his individual trains with a view to seeing if they are carrying their proper share of the burden

of increased operating costs. To determine the cost in sufficiently detailed manner, for the purposes here in mind, of running an individual train does not offer great difficulty, inasmuch as to get a rough idea alone is sufficient. To determine its earnings, however, appears on the face to be a rather more complicated matter. Nevertheless, a method has been worked out and is now in use with various modifications on a number of roads which allows for the determination of the earnings of individual trains in a comparatively simple fashion and at comparatively slight expense. The method as it is used on one of the railroads is described on another page of this issue. The article is intended primarily for accounting officers, but we doubt not that the method outlined in it will be of more than ordinary interest to transportation officers also.

Time and again during the period when more traffic was being offered to the railroads than they could handle, their officers were urged to get out and see their shippers. In these circumstances the underlying idea has been to secure better co-operation from the shippers, particularly in the direction of better and heavier car-loading. Generally speaking, this was made a part of the duties of every railway employee who came in contact with or had anything to do with the shippers, the loading, and the moving of cars, etc. Distinct improvements were usually made and the concerted "drive" proved its worth. With the slump in traffic the drive lost its punch, though the benefits to be derived from it are still as important as ever. It can now be rejuvenated to great advantage by making it more applicable to present conditions, i. e., it should be more on lines directed toward the encouragement of increased shipping and heavy car loading. A better understanding of the problems confronting the shipper and the road also can be reached. A good example of a drive adapted to present conditions is afforded by the traffic department of an eastern road. On this line the higher traffic officers who, because of the rush of business and the complexity of their organization, seldom found time in the past to get in actual contact with their shippers were required to spend an entire week brushing up their acquaintanceships with the shippers, both old and prospective. The results more than justified the efforts and the program will be repeated at intervals. The old shippers were benefited and new shippers were interested. This road materially increased its revenues by being a "live wire" in dull times. The business today goes to those who go out and get it.

While the statement that there has not been a time when the railroads were more in need of additional facilities may at first thought appear widely at variance with the facts in view of the present acute slump in traffic, its accuracy has been demonstrated repeatedly by the experiences of the last four years and as late as last October. In spite of the large expenditures which were made for increased facilities between 1905 and

### Get Out and See the Shipper

### Preparing For the Future

1916 the capacity of the roads was taxed more severely during the periods of heavy traffic since 1917 than ever before. While the present is a period of acute depression railway men realize that a return to conditions even approaching normal will bring with it a demand for railway service which can only be satisfied by large increases in facilities. Engineering officers have therefore busied themselves in the preparation of plans for new shops and engine terminals, for freight facilities, for new and heavier bridges, for added tracks and all the various facilities which increase the capacity of a road. Undoubtedly a greater volume of work is covered by plans and estimates now awaiting authorization than at any previous time in the present generation. These plans will be revised and improved while the opportunity offers. Advantage is also being taken of the opportunity to revise standards and to bring them into conformity with the latest developments in materials and equipment, for during periods of widespread activity there is no time for such work, necessary though it is. In the preparation of plans for new work as well as in the revision of standards, the wide-awake engineer is studying intently the latest and most modern equipment and materials at his disposal with a view to incorporating such of them in his designs as will improve his structures. Manufacturers of railway materials and equipment adapted for such use are finding evidences of this interest on the part of engineers in the increased attention which these engineers are giving to their products, and they are securing audiences which it would be impossible to secure when the time of engineers is taken up in the rush incident to a large construction program. Engineers and manufacturers alike can afford to give the closest consideration to the materials and equipment available at the present time in order that the roads may be best prepared to launch their improvement programs when conditions permit.

Government control of the British railways will under present legislation terminate in August. As that time approaches

### Railway Problems in England

analogy of certain phases of the railway situation in Great Britain with problems which have arisen in this country becomes more apparent. The railways were placed under the Ministry of Transport in 1919 for a period of two years during which time a plan for the final disposition of them was to be worked out. The government has not, however, advanced a plan as yet for meeting this situation, although it is understood that such a bill is now in course of preparation. In the meantime the railway unions have brought out in Parliament a bill of their own. This bill proposes government ownership under the administration of a board of seven commissioners, three to be from the ranks of labor and four representing the government. Purchases of the properties would be effected by an issue of 5 per cent stock and shareholders in the present companies would be paid at the average market price of their shares in 1913, less the average depreciation of railway securities since, or about 30 per cent. It is not generally believed that this labor bill will be enacted into a law. It is understood that the government will advocate the grouping of the carriers into a few large systems but just what methods will be adopted to secure an adequate return to the companies when the present guaranties cease are as yet a matter of conjecture. The British railways are faced with a labor situation in many ways like our own. Wages and working conditions are standardized for the whole country regardless of the varying conditions in each locality. Labor costs have increased tremendously, both because of increased rates and shorter hours. On one system alone, the London & North Western, the increase has been from approximately \$30,000,000 (£ to \$ at

par) in 1913 to approximately \$100,000,000 in 1920. Rates are so high now that further increases are not considered advisable. Recent labor troubles due to the alliance of the railway unions with the miners appear to have been avoided for the moment, but the general status of the employees and the companies under private operation presents a problem yet to be solved. It is to be hoped that Parliament will show the same appreciation of the railway problem that our Congress did when it passed the Transportation Act. It must be admitted, nevertheless, that the lack of progress to date is rather disconcerting.

The second article by Oliver F. Allen dealing with railway reconstruction in France and Belgium, which appears elsewhere in this issue, describes in some

### Rebuilding the Railways in France

detail the problems met with in rebuilding destroyed bridges and tunnels. In many ways the difficulties encountered were peculiar. In rebuilding the Vauxillon tunnel, for instance, it was found that the earth around and over the tunnel was so disintegrated by repeated explosions that the internal pressure had increased to a point where timbering was very difficult and the side walls of the entire tunnel had to be rebuilt much stronger than before. In rebuilding bridges the engineers were greatly hampered by the lack of steel, brick and cut stone. Skilled labor, too, was difficult to obtain. Recourse was had, consequently, to concrete whenever it could be economically employed. In many cases the debris of old masonry structures was crushed and utilized as a part of the concrete mixture. The shortage of labor and the scarcity of lumber made the building of forms slow and expensive. The plan was finally evolved of pouring the concrete piers into a shell made up of concrete blocks. Because of the scarcity of timber, light wooden forms were used for the arches and the concrete poured about a foot thick. After standing about a week this concrete had set sufficiently to support a second pouring and the remaining portion of the arch rings was then poured with a thin layer of pure concrete applied first as a binder. All the new structures were provided with chambers for high explosives so located that their destruction would be a relatively easy matter should military necessity ever again require it. All the new bridges have been built from a point of view of appearance and harmony with the surroundings as well as utility, speed and economy. That all of these phases of the program have been realized and given full consideration in the reconstruction program makes the achievement of the engineers who had the matter in charge even more noteworthy. The next article in this series, which will appear in an early issue of the *Railway Age*, will deal with the rebuilding of the destroyed terminals.

It should be a source of gratification to every man in railroad service whose efforts are centered on the economical use of fuel, that with an increase of 11.3 per cent in the gross ton miles handled in 1920 as compared with 1919, and an increase of 5.1 per cent in the passenger train miles, the fuel consumption of locomotives in road service showed an increase no larger than 13 per cent. But why, it may be asked, should any increase larger in proportion than the increase in the amount of traffic handled, be subject for congratulation?

First, because the switchmen's strike during April and May and the enormous volume of traffic offered during the succeeding months up to November, of necessity made measures for economy minor considerations in comparison with the importance of keeping up with the demands of the country

### A Good Fuel Record

at any price; and second, because local officers, many of whom for a time were required to take the places of the striking switchmen, were without the assistance of the Fuel Conservation Section of the Railroad Administration, which had just been abolished and for which on many roads no effective successor had been found. The temporary effect of some of these factors is clearly reflected in a month to month comparison of the fuel consumption for 1,000 gross ton miles in freight service. Comparing periods in 1920 with corresponding periods in 1919, there was an increase in the fuel consumption for March of 3.3 per cent, which had further increased in April to 11.2 per cent. Going on to June, a marked improvement was evident; during that month there was a decrease of about eight per cent, while during the month of September there was an increase of but one per cent and in December, about one-half per cent. The net result for the 12 months ending December 31 was an average increase in the fuel consumption per 1,000 gross ton miles of only two per cent. In passenger service the increase per passenger train mile was somewhat larger, averaging about five per cent for the 12 months. This figure, however, does not take into account the effect of the return to competitive conditions in passenger service. On the whole, considering the unfavorable conditions obtaining during most of the year, the result is one which should be a source of considerable satisfaction to officers and men, particularly those in the locomotive service, and to those who have ever doubted the loyalty of these men it furnishes a striking bit of evidence that their doubts are largely groundless. These results, in the face of most unfavorable circumstances, indicate the possibilities for real economy now that economy has again become one of the principal objectives of railroad operation.

Not many months ago when railroads were hard pressed to maintain an adequate number of locomotives in service, it was common to hear the complaint that repair shop capacity had not increased in proportion to the increased number and size of locomotives. This complaint was probably justified, but very much could have been done to relieve the situation by a more general use of systems for scheduling or routing work in repair shops. In view of the fact that shop scheduling has received such a thorough try-out on over fifteen railroad systems in this country, demonstrating its ability to increase shop capacity and output, it is surprising to find that some shop executives are not yet thoroughly convinced of its value. To these men the shop schedule is only a cumbersome system, designed to occupy the time of one or more clerks and increase the output on paper only. The exact opposite is true. It would be just as foolish for a general to advance his troops in battle without first mapping out objectives and methods of approach, as for a shop superintendent to order locomotives in for repairs without knowing what work is to be done, seeing that necessary material is on hand and scheduling the work through the various departments so that all parts are repaired in time for the locomotive to go out of the shop on a given day. The old-fashioned method of getting output was to bring in as many locomotives as a shop would hold, incidentally blocking passageways and flooding the shop with locomotive parts in various stages of repair. No one knew when a particular part would be needed; all was hustle and bustle; little was accomplished. In many instances a shop with 25 pits was made to accommodate 35 locomotives with a resultant decrease rather than increase in output. Beginning the repair of locomotives shown first on the list, a cylinder or a deck casting might be needed unexpectedly and work on this particular locomotive would be abandoned in favor of a more promising one. The result

—a big loss of time in transferring tools, robbing material from one locomotive to another and, in some cases, removing parts already bolted to planers or other tools for machining. This unscientific shop management demoralized foremen and men, caused a lot of unnecessary driving and resulted in an output not exceeding one locomotive per pit per month, or 25 locomotives per month. It has been shown conclusively that a shop schedule, under the direction of a competent supervisor, indicates what departments are weak, enabling them to be strengthened and so co-ordinates the work of all departments that the output in the case cited above could be increased to 35 or 50 locomotives per month.

## Piratical Commission Merchants' Attacks on Freight Rates

ONE OF THE MOST DISHONEST and selfish propagandas we have ever observed is being carried on by commission merchants, and papers devoted to their interests, regarding the effect of existing freight rates upon the movement of fruits and vegetables. The producers of these commodities are receiving very low prices for them. The prices they are being paid are in many cases so low that they can hardly afford to market them. Through the columns of such papers as the Produce News, editions of which are published at New York, Chicago and Los Angeles, and The Packer, editions of which also are published in various cities, the commission merchants are trying to use this condition to promote a movement among the producers for reductions of freight rates.

Whether or not the freight rates should or should not be reduced, it is easy to show that it is the extortion practiced by the commission merchants and the retail dealers, rather than the present freight rates, which are responsible for the fact that a producer at present is being paid very low prices for his products, while the consumer in the cities is being forced to pay high prices for them. Recently much propaganda has been spread among the producers of vegetables in Texas, Florida, and other southern states, and also in California, regarding the present freight rates. It is time that a few cold facts regarding these important matters should be told.

On April 16 the average price paid to the producer for cabbage in Texas was \$7 per ton. The cost of transporting it to Chicago was \$26.30 per ton. This includes not only the freight rate, but also the cost of icing the refrigerator car and the federal tax on freight charges. The total amount that the producer received for producing it, and that the railroad received for hauling it about 1,300 miles, was 1.67 cents a pound or \$33.30 a ton. On the same date cabbage retailed in Chicago for 7 cents a pound or \$140.00 a ton, or \$106.70 per ton more than the total amount that the producer received for producing it, and that the railroad received for bringing it to Chicago. Where did this \$106.70 per ton—which was 75 per cent of the total retail price—go to? A very large part of it went into the pockets of the commission men who are carrying on the present propaganda, and the rest went into the pocket of the retailer. The toll taken by them was four times as much as the railroad received for hauling the cabbage from Texas to Chicago.

On the same date the producer in Texas received \$42 per ton for white onions. The cost of transportation to Chicago was \$29.64, and the total received by the producer and the railroad was \$71.64 a ton or 3.58 cents a pound. At the same time white onions sold at retail in Chicago for 10 cents a pound or \$200.00 a ton, or \$128.36 more than the amount that the producer received for producing them, and that the railroad received for bringing them to Chicago. Most of this

difference went into the pockets of the commission merchant and the retailer.

On the same date the producer in Texas was paid \$5.00 a ton for spinach. The cost of transportation to Chicago was \$30.36 per ton, making a total of \$35.36 per ton or 1.77 cents a pound that the producer and the railroad together received. At the same time the retail price of spinach in Chicago was 15 cents a pound or \$300.00 per ton, or \$264.64 per ton more than both the producer and the railroad received. Who got this \$264.64 per ton, which was almost 90 per cent of the retail price? Most of it went to the very commission merchants who are carrying on propaganda against the present freight rates.

On March 26 the Chicago Produce News published an editorial entitled "Your Business in Peril! Help Save It!" It was addressed to the producers of cantaloupes and vegetables in the Imperial Valley of California. It stated that "big distributors in that section are worried because of the prohibitive freight rates to the eastern markets." It added, "It is the duty of every receiver of cantaloupes in the east, and of every man or firm interested in this industry, to cooperate with the distributors in an effort to reduce the ruinous freight rates."

These "distributors" are the very same men who, on April 16, were getting most of that \$265.00 per ton from spinach, for the production and transportation of which the producers and railroads together had got only \$35.36. The inference might have been drawn from what the Produce News said that the cantaloupe crop in the Imperial Valley was ready to be moved but could not be shipped on account of the high freight rates. The fact is, that no cantaloupes grown in the Imperial Valley were then ready for transportation and that they probably will not move until about May 15. The crop was reported in good condition and a harvest of 10,000 or 11,000 cars was expected. Traffic experts stated that they knew of no reason why the cantaloupes would not freely move to market under present conditions and rates. The commission merchants started their propaganda against the present freight rates in the hope, no doubt, that they could get them reduced before the shipments of the cantaloupe crop began and thereby pocket as a part of their own profits the revenues which, in the absence of a reduction in rates, will go to the railways.

There recently have been loud complaints from the same general source upon the ground that the rates on fruits and vegetables from Florida have been so high as to interfere with their shipment. Chairman Clark, of the Interstate Commerce Commission, investigated the matter and ascertained that from November 1, 1919, to February 28, 1920, the number of carloads of fruits and vegetables shipped from Florida by rail was 26,886, while from November 1, 1920, to February 28, 1921, under the present freight rates, the number of carloads shipped was 28,420, an increase of 1,534 carloads.

It has long been known that the commission merchants dealing in fruits and vegetables have been among the most remorseless profiteers in this country. The above facts show that in addition to continuing their efforts to enrich themselves by paying producers as little as possible for their products, and charging consumers as much as possible for them, they are now trying to force down freight rates by a campaign of falsification. A Congressional investigation of the railroad situation is soon to be held. In view of the fact that these commission people are showing such earnest interest in the subject of freight rates, we suggest to the Congressional Committee the propriety and expediency of ascertaining not only the effect of the present freight rates upon the movement of perishable commodities, but also the effect upon the welfare of both the producer and the consumer of the exorbitant toll taken from them by the commission merchant and the retail dealer, especially the former.

## The Decision on National Agreements

THE DECISION of the Railroad Labor Board in the National Agreements' controversy seems, on the whole, to be a sensible one. Neither the railways nor the labor unions can reasonably claim a victory. The final results of it will not be known until the negotiations between individual railways and their employees provided for have been finished and the rules agreed upon have been approved by the Board, or rules have been made by the Board itself to apply to matters regarding which no agreements shall have been reached.

At present it appears probable that the railways will gain more by the decision than the labor unions. We say "labor unions" rather than employees, because the carrying out in good faith of the principles laid down by the Board will increase the efficiency of labor, and while the labor unions may temporarily be strengthened by rules which promote inefficiency, their members have as much to gain in the long run from rules that promote efficiency as have the railways and the public.

The decision recognizes the principle of the eight-hour day. This is a victory for the unions. The Board adds, however, that it believes this principle "should be limited to work requiring practically continuous application during eight hours." This plainly implies that it should not be applied to work not requiring practically continuous application. Furthermore, the Board says very significantly, "for eight hours' pay eight hours' work should be performed" except by train service employees, who are paid on a mileage as well as on an hourly basis.

These statements, read in connection with others in the "principles" enunciated, make very clear that the Board has no sympathy with, and indicate that it will not tolerate, rules whose plain intent is to limit production or to cause men to be paid for work not done. The necessity for proper classification of employees and reasonable definitions of the work to be done is recognized, but it is stated that the classifications and definitions "should not unduly impose uneconomical conditions upon the carriers." The fact that the obligation "to render honest, efficient and economical service" rests upon each organization of employees as well as upon the management, is specifically recognized. While the principle of seniority is approved, "it should be so applied as, not to cause undue impairment of the service."

The Board clearly recognizes the right of employees to organize, and of the majority of each craft to be represented in negotiations by representatives of their own choosing. In other words, it recognizes both labor unionism and collective bargaining. At the same time it refuses to accept the views of the labor leaders as to what necessarily constitutes collective bargaining. They contended that the entire subject of rules and working conditions ought to be referred to a national conference of representatives of the railways and the labor unions, and implied that only in such conferences could true collective bargaining be carried on. By remanding the negotiation of rules and working conditions to conferences between the individual railways and their own employees, subject to the principles it laid down, the Board recognized bargaining between each railway and its own employees as true collective bargaining. The employees contended that rules and working conditions should be uniform throughout the United States. By remanding the determination of rules and working conditions to conferences between individual railways and their employees, the Board has recognized the principle that rules and working conditions should vary with and be adapted to the varying local conditions in different parts of the country.

It was estimated by General Atterbury that by restoring the rules and working conditions in effect on December 31, 1917, a saving of \$300,000,000 annually could be made. The Labor Board has refused to restore these rules and

working conditions, and has recognized the principle of the eight-hour day. It has thereby rendered it impossible to effect anywhere near as large a saving as General Atterbury estimated could be made. At the same time the Board has said that it "is unable to find that all rules embodied in the National Agreements, orders, etc., of the Railroad Administration constitute just and reasonable rules for all carriers and parties to the dispute." Therefore, while the eight-hour day and the increase in expenses caused by it must be continued, a wide field is left open for the framing of rules which will be much more reasonable and economical than those now in effect. Agreements may, and, indeed, must, be made by the individual railways and their employees by which the present large payments for work not done, and the pyramiding of wages for work done, will be abolished. Straight time for overtime may be substituted for time and a half. Piece work may be established.

These improvements can be effected, however, only, first, by agreements between the railways and their employees, or, secondly, if they do not agree, by orders of the Railroad Labor Board. It is to be feared that the representatives of the labor unions on all the individual railways will make a strong effort to retain most, or all, of the present unreasonable rules. To secure reasonable settlements railway officers will have to show great tact, skill and courage, and this it is vitally important that they shall do. Otherwise, little or nothing will be gained for efficiency and economy through the Board's decision.

It is to be hoped the employees can be made to see that it would not be to their permanent advantage to retain unreasonable rules, and that, as a matter of fact, they cannot be retained without directly violating the sound principles of efficiency and economy laid down by the Labor Board. On the other hand, it is to be hoped that railway officers will conscientiously and consistently observe the spirit of the principles laid down by the Board, recognizing the right of employees to carry on negotiations through representatives of their own choosing.

Firmness, reasonableness and fairness on both sides will result in the establishment of rules and working conditions which will be beneficial to the employees, the railways and the public; while unreasonableness or unfairness on either side will simply throw the whole matter back into the hands of the Labor Board.

## The Audible Signal and Automatic Train Control

**T**RAIN ORDERS are issued to direct the movement of trains, a flagman is required to protect his train and the block signal system has been developed to safeguard and facilitate train movements. Still, with all these precautions serious accidents continue to occur, because a train order has been transmitted or transcribed incorrectly or a train crew has overlooked it, or a flagman has failed to perform his duty properly, or a signal indicating stop has been overlooked by an engineer, etc. As a consequence, railway men and others are looking for means to prevent accidents which result from such failures of the human element. One of the results of the consideration of this problem was the incorporation of certain provisions regarding automatic train control in the Transportation Act. There are, however, honest differences of opinion on this subject. Some feel, as indicated elsewhere in an article in this issue, that excellent results may be obtained by means of audible warning devices to call to the attention of enginemen and others the fact that a dangerous condition exists. In this article the writer well brings out the fact that no devices should be used which

will tend to take the control of the train away from the engineman and it is believed that all will agree that the control should *not* be taken away from an engineman when he is alive and "on the job."

Audible warnings have been advocated and used to some extent in this country, but more generally in Europe where fog conditions have made such warnings a necessity, although accidents have occurred because of the failure of the apparatus at critical times. It seems to have been due to this fact that automatic train control has been developed to the point which it has reached today in this country, and it is significant that it is receiving serious study in England and France, where the audible warning has been developed to a high state of efficiency. Any device which will reduce accidents should receive careful consideration, whether of an audible nature or automatic train control. It would appear that any audible device will have to "prove its case" in comparison with the record made with automatic train control systems already in service.

## A Good Time to Study Terminal Operation

**R**AILWAY MEN ARE agreed that the present recession in railway traffic, although acute, will be of a temporary character and will soon give way to a volume of business heavier than ever before handled. This has been the history of past depressions, and there is nothing to indicate that the present will be an exception. The far-sighted railway officer will use this lull in business to study ways of improving his methods of operation so that he may be able to handle this increased business with the maximum economy when it comes to him.

No feature of the railway plant constitutes a greater tax on the capacity and on the net revenues of the roads today than the terminals. In many instances they are outgrown or antiquated, while in others methods are in vogue which unnecessarily complicate operations. While sound railroading demands that cars be kept out of the yards and in road movement as much as possible, the present condition of many of the terminals makes it even more necessary that this be done in the interests of economy.

As pointed out by Colonel E. H. Shaughnessy in a letter to the editor, elsewhere in these columns, there is too much switching of freight cars in intermediate terminals. This switching not only costs money directly, but it results in injuries to equipment and more particularly in delays in movement. It is still the common practice on many roads to reclassify the dead freight trains at each division point. This is done in spite of the fact that there are repeated illustrations of the economy of making up trains as near the point of origin of the traffic as possible for movement to remote points without breaking up and reclassification at intermediate yards. While this practice requires the holding of this freight somewhat longer at the originating terminal in order to concentrate it in trainload lots, the time so lost is made up several times over by the delays saved in intermediate yards where only routine inspection and switching are done.

An officer who has not studied this problem will be surprised to note the amount of freight which can be assembled in trainload lots in this way. This plan not only saves a large expense of switching at intermediate terminals but it greatly expedites the movement of freight, a consideration of as much importance to the railways as to its patrons, since it promotes a more intensive use of the railway plant by increasing the capacity of a line and by securing the more prompt return of the equipment for further loading.

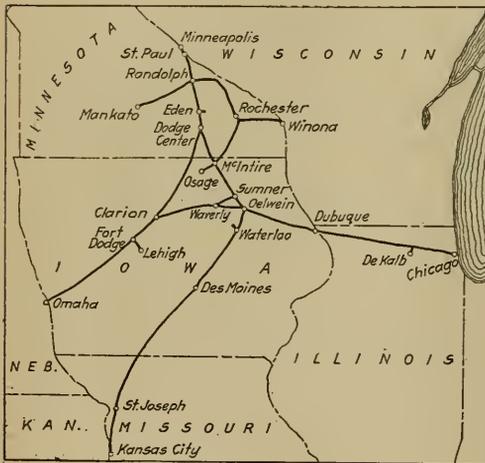

## Chicago Great Western

THE CHICAGO GREAT WESTERN operates 1,496 miles of line, of which it owns 1,035, operates under lease 375 and has trackage rights over 86. The main lines of the parent company extend from Chicago to Minneapolis and from Oelwein, Ia., to Kansas City, Mo. The lines of the Wisconsin, Minnesota & Pacific, a road formerly controlled by entire ownership of stock and by lease, but acquired on June 1, 1920, by the parent company, extend from Mankato, Minn., through Red Wing and Simpson to Osage, Ia., with a branch to Winona, Minn. The Mason City & Fort Dodge, controlled by entire stock ownership and by lease, has lines from Oelwein, Ia., and Hayfield, Minn., to Omaha, Neb. This resumé should be sufficient to show that the road runs through a highly competitive territory and that it has to compete with a number of larger systems, many of which have through lines of their own and some of which are in a much stronger financial position. In years past the Chicago Great Western has had some success in making a living under

ment of interest, of \$2,530,682. In 1919 there was a corporate net income of \$1,263,670.

The Chicago Great Western, when it was reorganized in 1909, was expected to be able to pay 4 per cent dividends on its preferred stock, which dividends were to be cumulative from June 30, 1914. An initial dividend of one per cent was paid December 1, 1915; one per cent dividends were also paid in May, 1916; October, 1916, and April, 1917. In August, 1918, one per cent was paid and again in January, 1919. In 1920, not only were no dividends paid on the preferred stock, but the company found itself unable to pay the unearned interest on the first mortgage bonds of the Mason City & Fort Dodge. It proposed not to pay this interest, but finally paid it after receiving a loan by the Interstate Commerce Commission from the revolving fund, covering the amount of interest due.

The story of the increase in gross earnings and the decrease in net in 1920 is the same in the case of the Chicago Great Western as it is in the case of most of the other railroads of the country. The freight revenue in 1920, amounting to \$15,990,231, represented an increase of 9.86 per cent over 1919 and the total operating revenues of \$24,032,435, an increase of 8.61 per cent. The operating expenses amounting to \$26,452,243, on the other hand, increased no less than 36 per cent. The increase in expenses for maintenance of way as between the two years was especially notable, being 70 per cent. The figures of maintenance work done in 1920, however, do not indicate that the charges for maintenance in 1920 were excessive nearly so much as that the maintenance work done in 1919 must have been insufficient. Detailed figures for 1919 are not given in the report; a comparison as between 1920 and of two years prior to federal control—namely, 1917 and 1916—gives us figures somewhat as follows:

The Chicago Great Western

Total miles of track rebalasted.....	1920	1917	1916
Linear feet of bridges, trestles and culverts re-built or replaced.....	274	67	125
Cubic yards of material moved—roadbed.....	6,575	7,576	11,969
Total miles of track relaid.....	129,187	138,660	238,520
Cross-ties put in track:			
Treated.....	60	124	120
Untreated.....	193,547	71,630	31,186
Total.....	381,541	486,837	571,335
New tie plates.....	575,088	558,467	602,521
New rail joints.....	88,796	36,698	246,149
New rail joints.....	10,420	31,233	101,799

The Chicago Great Western's best year since its reorganization in 1909 was in 1916, not only from the standpoint of business alone, but also from that of net earnings. In that year it earned its 4 per cent on the preferred stock (although it paid only 2 per cent) and its prospects of continuing to do so looked rather bright. The road, however, suffered acutely from federal control, particularly, as already stated, because it lost business, much of which was diverted to other lines and which has not been restored to its former channels. It is perhaps natural, therefore, that the progress that has been made since 1916 has not been as great as might be wished. The tons of revenue freight carried in 1920 and the total ton-miles were greater than in 1919; they were, however, less than in 1916.

A road in the position of the Chicago Great Western needs plenty of cars and can only be successful against the competition of longer through lines on the basis of superior service. Owing to the Chicago Great Western's financial disabilities, the total number of freight cars in service recently has been decreasing. No standard cars were received from the Railroad Administration, nor were any new cars ordered during 1920. The average capacity of the freight cars in service in 1920 was 35.36 tons; in 1916 it was 35.69 and in 1917, 36 tons. There has been some increase in the number of locomotives in the past few years. Ten Mikado and five switching locomotives were allocated by the U. S. R. A., although over the road's protest. Ten

these conditions. In 1920, however, it suffered from all the handicaps in general characteristic of the aftermath of federal control.

Under government control it had a large amount of its business diverted to other lines. After it was returned to private operation it tried, by giving scheduled and more frequent freight service, to win this business back. It succeeded in getting back only part of the business it had lost, and the changes in its freight service resulted in the reduction in its average freight train load, of which mention will be made later. In the latter part of 1920 it suffered early and more than most railroads from reduction of traffic, because it is a large grain carrier and the effects of the action of the farmers in holding back their grain were felt earlier and more acutely in its territory than in almost any other part of the country.

The operations of the property showed a net operating deficit for 1920 of \$4,158,344 as compared with a net railway operating income in 1919 of \$893,307. The corporate income account for 1920, after taking into consideration the standard return for operation by the Railroad Administration in January and February, and the guaranty for the six months ending August 31, showed a deficit, after the pay-

additional Mikados were ordered in 1920. The report does not give any figures as to locomotive tractive effort.

An index to a road's efficiency is most often found in the figure of the average revenue trainload. From 1910 to 1916 the Chicago Great Western succeeded in nearly doubling its figure for average revenue tons per train mile, increasing the average trainload in 1910 of 331 tons to 603 tons in 1916. In 1918 the average revenue trainload had been increased to 620 tons; since then, for reasons already indicated, there has been retrogression: the average revenue trainload in 1919 was 588 tons; in 1920, 587 tons.

The Chicago Great Western's business is rather varied; it consists of about 28 per cent products of mines; 27 per cent products of agriculture and 26 per cent manufactures. Its average haul for revenue freight in 1920 was 274 miles. The Chicago Great Western has a high percentage of loaded car miles to total car miles, running about 72 per cent. It had in 1920 an average load per loaded car of but 26 tons and a mileage per car per day of but 24. The ton-miles daily per car in 1920 were 433; in 1919, 427.

The following table shows the principal figures for operation in 1920 and 1919:

	1920	1919
Freight revenue .....	\$15,990,231	\$14,555,496
Passenger revenue .....	5,692,494	5,979,147
Total operating revenue .....	24,032,435	22,128,189
Maintenance of way expenses .....	5,987,678	3,525,827
Maintenance of equipment .....	6,736,579	5,010,519
Traffic expenses .....	520,662	320,950
Transportation expenses .....	12,258,484	9,745,333
General expenses .....	722,369	629,799
Total operating expenses .....	26,452,243	19,389,535
Net from railway operations .....	Def. 2,419,809	2,738,654
Taxes .....	1,010,657	798,590
Net railway operating income .....	Def. 4,158,344	893,307

The corporate income account was given in last week's issue, page 913. It showed figures as follows:

	1920	1919
Total income (or deficit) .....	Def. \$868,953	\$3,051,344
Deductions for interest, taxes, etc. ....	1,661,729	1,787,674
Net income (or deficit) .....	Def. 2,530,682	1,263,670
Dividends (preferred, one per cent) .....		439,266

## New Books

*British Railways and the Great War, Part I.* By Edwin A. Pratt, 6 in. by 10 in., illustrated. 108 pages. Published by Selwyn & Blount, Ltd., 21 York Buildings, Adelphi, London, W.C.2, England.

This volume is the first of a series of ten which proposes to give as complete an account as possible of the workings of the British railways during the war years from 1914 to 1918. Approximately a half of this book, which is known as Part I, is devoted to a summary of the various steps which led up to the actual taking over of the railways by the government in 1914. The various plans proposed since as far back as 1847 for providing government control and unified operation in times of national peril are described briefly and the plan actually adopted is explained in some detail. With this preparation the author takes up the discussion of the situation which confronted the government's administration when it took over its work on August 4, 1914. The extent of government control, the methods adopted by the "executive" for handling its work, the financial arrangements with the carriers, the provision made for the handling of abnormal war time traffic, and other problems which were met with early in the war are set down here and described in painstaking detail. In view of the fact that the intensiveness of the work would tend to make it of great value for purposes of reference it is unfortunate that the material is not so organized that any particular phase of the situation is easily available to the casual reader. On the whole, however, if the remaining parts of this work follow the general plan of Part I, this series will be a remarkable contribution to the history of the British railways.

## Letters to the Editor

### Eliminating Rough Handling Of Passenger Trains

NEW YORK.

TO THE EDITOR:

With reference to the article by F. W. Dean in the January 21 issue of the *Railway Age*, on the rough handling of passengers, I wish to point out one way which would eliminate the uncomfortable "slam-bang" at the start of a passenger train.

By employing anti-friction bearings in place of the present journal bearings on passenger cars, the resistance at starting these cars is so reduced that from 10 per cent to 15 per cent of the pulling force required with journal bearings will set the train in motion. This figure is obtained from comparative tests made on the Swedish State Railways with ball bearings and journal bearings.

The reason why anti-friction bearings, of either the ball or roller-type, have not come into more extensive use on railroad cars, in spite of such a good showing, is no doubt the fact that the hitherto known forms of these bearings have proven insufficient in their carrying capacity, in either a radial or axial direction, or both, to make them an economic success in the railroad service.

However, there is now a new type of anti-friction bearing coming into use in this field, technically known as a disc bearing. The first bearings of this kind were installed about two years ago by the Swedish State Railways, and their tests have given such results that the use of these bearings is now being extended. These bearings combine the easy running of the ball bearing with the strength and carrying capacity of the roller bearing, thus contributing at the same time to an increased comfort for the passengers as well as to reduced operating expenses for the railroads. E. F. MAAS.

### Terminal Operation Needs Constructive Study

NEW YORK CITY.

TO THE EDITOR:

The oil industry is very much concerned over the question of what the railroads are going to be able to do toward handling freight business in a prompt, regular way when good times return, and the terminals, perhaps the side tracks, will again be filled with loaded cars awaiting movement. No doubt other branches of industry are just as much concerned as the oil people about what is going to happen, but the fact that there are some 100,000 odd tank cars already in the service of the oil companies makes their case a pressing one and perhaps justifies a rather frank discussion of the situation.

It is a temporary conclusion that the present slump in business is foregone and sooner or later the wheels of industry will once more be turning at high speed. Our industries are continually growing, which means that the railroads will again be confronted with the necessity for handling a heavier traffic than they have ever handled before. When this time comes, what is going to happen? Are they going to carry on satisfactorily and be able to accept all the business offered or are they going to fall by the wayside and be obliged to resort to embargoes, priorities, permits and all that sort of dreadful expedience?

Everyone familiar with the mechanism of railroad trans-

portation knows that at the present time the railroad facilities of the country, as a whole, are far short of what they ought to be to handle the peak railroad traffic scientifically and economically. There is nothing to be gained in spending time trying to figure out why this is so; it is so, and what is more, there is no immediate relief in sight. At the very time when dirt should be flying we find the railway managements tied up with wage questions, and to a lesser extent, rate questions, and in most cases the great big question of keeping out of the hands of a receiver.

Accepting this situation as it exists, what can be done to make the best of it? With this thought in mind, attention is invited to the apparent necessity for studying terminal operation in a constructive far-reaching way, perhaps more attentively than ever before, because it seems that there is a lot of lost motion in that phase of railway operation that can be eliminated, thereby bringing about better service without additional expenditure on the part of the railroads.

We all know there is too much switching and reswitching of freight cars in intermediate terminals. We know that freight trains, particularly the so-called "dead freights" are reclassified wholly or in part at nearly every division point, or about every hundred miles, and sometimes oftener. (This statement is not literally true, for there are some notable exceptions, but it is close enough to serve the purpose.) Switching cars costs money and causes delay, therefore, extra switching causes unnecessary expense and delay, hence the possibility for benefiting both the railroad and shipper by keeping this intermediate handling to an irreducible minimum.

Following this thought further and in the light of past experience, we find the intermediate terminal handling of cars increases faster proportionately than the traffic does; the unnecessary expense and delay being compounded at a time when it should be avoided. In other words, the better business is, the poorer service is, until the saturation point is reached, when there is practically no service worthy of the name.

The way to maintain dependable service and to reduce the expense and delay mentioned, is to do the work in the initial terminal, assembling trains that will move long distances without reclassification. This, of course, is not a new idea at all. For years past every railroad of any consequence has had some sort of through freight service but at best the service so provided has been merely with the idea of handling the "preferred" freight which is but a small part of the general traffic. I want to submit for consideration the idea of handling all freight on through freight trains that will move from the point of origin to the logical breakup point without being disturbed enroute.

When I say further that these through freight trains should not be thought of as confined to restricted districts or even to railroad systems, but nation-wide in extent, some idea may be gained of just what is passing through the minds of those vitally concerned in this problem.

Of course real progress cannot be made along this line unless the railroad managements get together and co-operate among themselves to that end and call on the shipping interests to help out. Surely the responsibility rests upon them to take the initiative in this respect. There is need for real railroad statesmanship in formulating comprehensive plans not only in connection with the subject under discussion, but in other directions as well, wherein joint action would bring about better utilization of the existing railroad plant.

Short-sighted persons among the railway and shipping folks are enthused because the railroads are again putting up the competitive barriers and they put great stress on what is being done in the way of restoring the old time high speed "de luxe" freight service that makes a first, second or some such morning delivery between fortunately situated business

centers. It is common knowledge that some railroads are going into this sort of thing to such an extent that they are on the verge, if not already into, a freight speed war. Under the existing circumstances, could anything be more indefensible? Those who have been through the mill and can therefore see well into the future know what little bearing this frilly sort of service has upon the handling of the great bulk of freight traffic and how quickly it goes by the board when things break loose. The answer to the problem does not lie in that direction but in the less spectacular one of taking care of all the traffic fairly well instead of a small portion extremely well and letting the rest get along somehow or other.

During the war, that is to say during governmental control, I was in France helping the French army handle an extremely heavy and important railway traffic, which, by the way, was handled on through freight schedules without even a train dispatcher, but that is another story; so that I do not know from personal observation what took place here. Getting the story second-handed and noting the after results, I am convinced that governmental railway operation is a thoroughly unsatisfactory proposition to even think about. Yet some things were done during the governmental régime which appealed very much to the oil shippers. What impressed them was the way in which trainloads of petroleum products were assembled in mid-continent and handled through intact to the Atlantic seaboard at an average speed of around two hundred miles per day in spite of the blocked terminals and sidetracks and very severe weather conditions. Of course, the secret, if it was a secret, to such movement was merely keeping the trains intact and out of the terminals. The rest was comparatively easy. I understand that other commodities such as flour, grain, lumber and steel were put through in the same manner, running by similarly important cars that had started out singly and had been completely immobilized in the blockaded terminals and storage tracks.

The lesson learned at the time has not been lost sight of by the traffic managers of the oil companies. Ever since they have consistently worked towards the idea of shipping in trainload lots as long distances as they could possibly arrange for, and have, with the aid of the American Petroleum Institute and cordial support of their railroad friends, secured remarkably good results, in spite of the fact that the oil business is only a small part of the whole and the return to private control pretty thoroughly disrupted the through freight arrangements.

If this sort of thing can be done in a small way by one group of shippers, it certainly can and should be done in a big way by concerted action on the part of the railroads and shippers working as two groups. As I have said before, it is my judgment that the duty for taking the initiative rests with the railroads and they should assume the burden so that by no possible chance will the initiative pass from them to those who are not so well fitted for the task.

COL. E. H. SFAUGHNESSY,  
Assistant Director, Division of Transportation, American Petroleum Institute.

THE UNITED STATES Civil Service Commission has announced an open competitive examination for shop apprentices. Vacancies in the Bureau of Standards at \$720 a year and positions requiring similar qualifications will be filled from this examination. Applications will be received by the commission at Washington, until August 1, 1921.

THE ANNUAL REPORT of the relief department of the Chicago, Burlington & Quincy shows that during the year 1920 the department paid \$627,148 in sick and death benefits. Employees contributed \$678,817, income from investments was \$20,625 and interest on cash advanced by the railroad was \$7,013. There was an excess of receipts over disbursements of \$65,279.

## Reconstruction of Bridges and Tunnels in France

Peculiar Difficulties Overcome—Reinforced Concrete Used Extensively—Rebuilding the Canals

By Oliver F. Allen

Formerly Major of Engineers, American Expeditionary Forces

**I**N THE FIRST ARTICLE of this series, which appeared in the *Railway Age* of April 8 (page 879), attention was called to the general state of destruction of the French and Belgian railways after the signing of the armistice and the plans which were adopted for rebuilding the lines. In this

ing illustrations. This is an important link connecting two valleys in a hilly country where it would be practically impossible to establish adequate railway communication for either civilian or military uses without a tunnel. It was utilized by the Germans in 1914, 1915, and 1916 and effec-

article it is proposed to describe in some detail the problems which were met with in the reconstruction of bridges and tunnels. This was one of the first difficulties encountered in putting the lines in order for the transportation of freight and passengers.

An example of tunnel reconstruction is the Vauxaillon tunnel between Soissons and Laon, shown in the accompany-

tively destroyed by them when retreating in 1917 by blowing in both ends and the middle. With the exposed northern end camouflaged the French military engineers, working with the staff of the Northern Railway, repaired the tunnel, using concrete in place of stone and brick and had it ready for service early in March, 1918, when the Boche drive came. Forced to abandon it, the French destroyed it. The Germans

immediately started reconstruction and were able to use the tunnel for some time before their evacuation in September, 1918, when they again blew in both ends.

The heavy rains of the winter of 1918-19 added to the

timbering very difficult. The best of lumber was used but, as the accompanying illustrations show, the tremendous pressure which the loose earth exerted made the work difficult. It was found necessary to rebuild the side walls very much

upheaval caused by the high explosives used in the several destructions and left the earth around and over the tunnel in a very spongy, granular, disintegrated condition. The French found the internal pressure so great as to make

stronger than they had been originally to a height of about 13 ft. (4 meters). These concrete walls were completed in March, 1918. Afterwards the headings were finished at the top and the whole arch was covered with concrete. This work

included massive concrete foundations under the reconstructed portions. Finally liquid concrete was pumped into the voids above the completed arch. Both tracks were in service in May, 1919, and the work was entirely finished a few months later.

### Concrete Used Largely

In studying the question of rebuilding the destroyed bridges it was soon apparent that lack of time, manufacturing facilities and transportation combined to prohibit the use of bricks and cut stone to rebuild the masonry work as it had existed before, as well as the use of steel where there had been many steel bridges. Skilled labor was difficult to get. Full advantage was taken of the latest developments in the use of reinforced concrete which had proved so effective for many military operations and the majority of the bridges and viaducts were rebuilt of that material. In many cases the debris from the ruins of old piers, abutments, foundations, arches, buildings, etc., were collected, crushed and utilized for new concrete structures. Where possible old foundations were used. They were generally found sound after taking off a few feet of the top below the point where the explosion occurred.

The shortage of labor and the scarcity of lumber made the problem of forms a serious one. This was realized in the early days of the war when the reconstruction problem was first studied and experiments were carried on in an aviation field near Paris by railway and military engineers with a view to developing a method of pouring concrete piers and arches without the expense and delay of large and heavy timber forms.

Piers were built by putting up a shell of concrete blocks similar in appearance to the cut stone formerly used. This shell was used as a form into which the mass of concrete for the pier was poured. (See illustrations, Figs. 6 and 10.) A light structure of wooden forms, sometimes balanced on each side of the pier as for a cantilever truss, just strong enough to hold a concrete arch about a foot thick was next employed in place of the massive forms previously used. A ring of concrete was then poured on this fragile form and after standing about a week was hard enough to form a truss by itself upon which the rest of the arch could be built without any noticeable deformation of the original timber truss. (See illustrations, Figs. 6 and 10.) The faces of the arches are also of concrete blocks the same as the shells for the piers, the whole interior mass being filled into such forms. Cinder concrete was used sometimes. When filling in, the new material was bonded with the first rings by a thin layer of pure cement and no serious difficulty was encountered in making a perfect joint. A model arch built in this manner was wrecked by the engineers who built it and the cleavages did not follow the bonding line between the first and second pourings. The union of the parts was perfect. Subsequently two bridges which had been built in this manner following the German retreat of 1917 were destroyed by the Boches in 1918. In this destruction the central parts of the arches only were blown out. Parts of the arches on each side of the piers were left in position, cantilever fashion, and it was found that no cleavages appeared between the concentric rings forming the arch. This method not only effected an enormous saving in lumber costs, but permitted the same size working crews to carry on much faster than would have been possible in the old way.

### Chambers for High Explosives

Accompanying illustrations of the Saint-Benin and other viaducts show this method of construction in its various stages. (Especially Figs. 4, 6, 8 and 10, and Figs. 2, 3 and 4 on page 878 of the *Railway Age* of April 8.) It is an interesting side light on the European situation to note

that all of these new bridges are provided with chambers for high explosives so located as to facilitate complete destruction in case of another invasion. Even steel structures are provided with shelves or pockets so that explosives can be placed easily and quickly if their destruction becomes a military necessity.

Attention is especially called to the artistic appearance of the finished concrete bridges. (See Figs. 1, 4 and 6.) Where outside facings are not of concrete blocks they are coated over with fine cement. Balustrades have been included. In some cases, where salvaged bricks were available or there were neighboring brick yards already restored, the shells of the piers and the surfaces of the arches were built of them. The bricks were used as forms the same as the concrete blocks.

At Lille six old steel-arch bridges over streets were destroyed with their abutments. This destruction was so complete as to eliminate any thought of rebuilding. The available height and the carrying capacity required by the new railway program prohibited ordinary masonry being used for reconstruction from the original designs. The unsightly steel lattice or webbed girders were ruled out from an aesthetic point of view, as well as because of the difficulty of getting material from which to make them. Here again reinforced concrete was taken advantage of and the debris utilized. The abutments and very flat arches were so carefully designed that there is only about a foot between the bottom of the arch at the center and the bottom of the rail. These bridges were finished with iron balustrades salvaged from the old bridges.

The illustrations, Figs. 6 and 8, of the St. Benin and Origny viaducts are not only typical of the type of reconstruction so generally employed, but show the rapidity of reconstruction work in the areas held by the enemy until the time of the armistice.

### Canal Transportation

It is difficult for Americans to realize the importance of canal transportation in Western Europe. We are prone to picture canal shipments as slow and inefficient. But even in the rush of war work our American Army engineers found cases where canal transportation was the quickest and best from a military point of view, and all the Allied armies utilized canals very extensively during the war. They were even protected by little gunboats which were dispatched after the armistice to the Rhine by the way of the Marne and the Moselle. The destruction of the canals was of the same order as the railway destruction and the necessity for their rebuilding urgent. Here again, reinforced concrete was taken advantage of as illustrated by Lock No. 6 at Cottigny (Figs. 4 and 5). While many canals were restored to use by the spring of 1920, others will not be available for a long time, especially some of those in the coal regions, the streams which supplied them having been diverted into the mines by the Germans.

The next article of this series, which will deal with the rebuilding of terminals and transfer yards, will appear in the *Railway Age* at an early date.

THE NORTHWESTERN PACIFIC reports for the year 1920 eleven fewer casualties to employees than during the preceding year. This was a decrease in the number of casualties of 7½ per cent. This company operates 507 miles of road with 75 locomotives. The number of locomotive miles per train service casualty was increased 35 per cent and man hours per industrial casualty 29 per cent. During the year 10,156 man hours were devoted to safety committee work, and W. S. Wollner, general safety agent, estimates that the salaries and expenses of his department amounted to about \$30,000.

# Train Operation and Automatic Train Control

## Caution Signals, Properly Located with Audible Signals, Should Solve the Collision Problem

By J. B. Latimer

Signal Engineer, Chicago, Burlington & Quincy, Chicago

THE IDEA of automatically stopping a railroad train which has entered a danger zone is not a new one. It is certainly as old as the derail which was the first crude up to the present. The idea of speed control is of more recent origin and was never looked on as a practical possibility until electricity began to be used in railway signaling or, more specifically, after the use of automatic block signals had become a practical fact.

There is little to be written of the history of automatic train control prior to the adoption of the Kinsman system on the Boston Elevated railways in 1901 and on the New York subways in 1903, though it is the writer's recollection that the Intramural railway at the World's Columbian Exposition in Chicago in 1893 was equipped with such a safeguard of the Rowell-Potter type.

### Investigations of Train Control

In 1907 the Block Signal and Train Control Board was appointed by the United States government to investigate safety appliances on railways and from that time on during the life of that board and thenceforth by its successor, the Safety Bureau of the Interstate Commerce Commission, a careful and painstaking study of the subject of automatic train control has been conducted under government supervision.

In 1914 a committee of the Railway Signal Association, at the request of the American Railway Association, drew up a set of requisites for the installation of train control apparatus which the latter body adopted on May 20th of that year; and in 1919 these were adopted by the Safety Bureau of the Interstate Commerce Commission. They are as follows:

An installation so arranged that its operation will automatically result in either one or the other or both of the following conditions:

First—The application of the brakes until the train has been brought to a stop.

Second—The application of the brakes when the speed of the train exceeds a prescribed rate and continued until the speed has been reduced to a predetermined rate.

### Requisites of Installation\*

1. The apparatus so constructed that the failure of any essential part will cause the application of the brakes.
2. The apparatus so constructed that it will automatically control the train in the event of failure by engineer to observe signals or speed regulations.
3. The apparatus so constructed that it will control the train in the event of a failure of fixed signals to give proper indications.
4. The apparatus so constructed that proper operative relation between those parts along the roadway and those on the train will be assured under all conditions of speed, weather, wear, oscillation and shock.
5. The train apparatus so constructed as to prevent the release of the brakes after automatic application has been made until the train has been brought to a stop or the speed of the train has been reduced to a predetermined rate.
6. The train apparatus so constructed that when operated it will make an application of the brakes sufficient to stop or control the train within a predetermined distance.
7. The apparatus so constructed as not to interfere with the application of the brakes by the engineer's brake valve or the efficiency of the air brake system.
8. The apparatus so constructed as to be operative when the engine is running forward or backward.
9. The apparatus so constructed that when two or more engines are coupled together or a pusher is being used the apparatus can be made effective on the engine only from which the brakes are controlled.

\*These requisites are drawn for application in connection with a properly installed block signal or interlocking system.

10. The apparatus so constructed as to be operative on trains moving only with the current of traffic.
11. The apparatus so constructed as to conform to The American Railway Association standard of clearances of rolling equipment and structures.
12. The apparatus so constructed as not to constitute a source of danger to employees or passengers, either in its installation or operation.
13. The apparatus so constructed as not to interfere with the means used for operating fixed signals.

### Adjuncts

The following may be used:

- (A) CAB SIGNAL; a signal located in the engine cab indicating a condition affecting the movement of the train and so constructed that the failure of any part directly controlling the signal will cause it to give the "stop" indication.
- (B) DETONATING SIGNAL APPARATUS; an apparatus located along the roadway and so constructed as to give an audible signal by means of a torpedo or other explosive cartridge.
- (C) SPEED INDICATOR.
- (D) RECORDING DEVICE; an apparatus located on the train and so constructed as to make a record of the operations of the automatic applications of the brakes and of the speeds of the train, and such other records as may be desirable.

It is the writer's belief that the committee which first drew up these specifications had in mind more the substitution of train control for existing block systems than the design of the apparatus to be used as an auxiliary and a check on the operation of an existing block system, and for that reason that the specifications are unnecessarily severe.

### The Object of Automatic Train Control

*In medio tutissimus ibis*, "in the middle course we steer most safely," runs the old Latin proverb, and it has always appeared to the writer that this was a very good thought to have in mind in connection with the adoption of automatic train control.

Automatic train control seeks one object, and one only, and that is to add safety to the movement of trains on railroads; and the simplest and least expensive device which will do that is the device which ought to be adopted.

The running of a locomotive is an operation which requires considerable skill. It is safe to say that the average locomotive runner serves an apprenticeship of at least five years before he is entrusted with the charge of a train in main line service. Varying classes of trains, varying grades and curvature and varying speeds all require special handling of the brakes, and to equip a railroad with a device which makes a brake application of a uniform sort compulsory under certain conditions is likely to introduce elements of danger into train operation just as great as those it is the endeavor to eliminate.

To analyze the whole situation, we are confronted with the problem of preventing collisions between railroad trains. The methods most generally followed at the present time are the instructions to trainmen to protect their trains by flag, the issuance of orders to advise trains where they are to meet or pass each other and the action to be taken by them at the meeting points to guard against collision, and the use of block signals. It is a lamentable fact that these precautions have proved to be inadequate and that collisions continue to occur. Trainmen fail to flag properly, orders are forgotten, misread, garbled in transmission or improperly issued, block signals are improperly displayed or are overlooked. All this has forced the belief on thinking railway men and those interested in railway operation as representatives of the public that something further must be done to add additional safeguards to train operation.

The question now before us is, how is this to be done?

Shall we wipe the slate clean and start over again along

the line of the development of apparatus which leaves the runner of a locomotive a mere automaton, able only to start his train when conditions are favorable and entirely dependent on the control machinery to stop it when a stop is necessary?

Shall we reverse the practice which has hitherto prevailed and which requires the locomotive runner to be the most highly trained man in the train crew and, relieving him of responsibility, shift it to the shoulders of the man who maintains the control apparatus, or shall we take what 90 years of experience has developed and build on to it a little further?

To the writer the latter course seems by far the safest and the most likely to attain the desired end. Although it is admitted that flagging rule 99, that the most careful development of a system governing the issuance of train orders and that the best block system yet invented have failed entirely to eliminate collisions, the ratio of the times in which they fail to the times in which they succeed is very small. Neither the public nor the railroad officer really realizes the matter of train control than to add a fourth factor which will act when the present methods have failed?

The writer's observation covering an experience of 38 years in active railroad work has convinced him that the vast majority of collisions are due either to failure to flag or to non-observance of signals. An increase in the mileage of automatic block signals would be a remedy for the first and an adjunct to block signals, either automatic or mechanical, which would insure that an engine runner was awake and attending to business at the time he passed a caution block signal would come pretty near taking care of the other. It is the writer's belief that the current practice of allowing the block signal at the entrance of one block to act also as a caution signal for the signal of the next block ahead is a weakness in much of our signal practice today, unless the blocks are less than a mile in length.

The trouble with the train order system is that orders must be delivered some time in advance of the time they are to be acted on and the interval between delivery and action is often sufficient to allow of their being forgotten. The giving of a caution signal too far from the signal, approach to which it controls, is open to the same objection. It is not infrequent to find the practice just referred to in use in a block system where the blocks average two to two and one-half miles in length. The A. R. A. rule for a caution signal is: "Approach home signal with caution." Now, nobody expects the runner of an engine in such a system as we are discussing (one with blocks two to two and a half miles long) to slow down on passing the caution signal and to run slowly until he picks up the home signal for the next block, two miles away. What is expected of him is to realize that he may have to stop at a signal a couple of miles further on and to use his own best judgment in controlling his train so as not to pass this other signal if it is at stop when he reaches it. Is it any wonder under these circumstances that with his other duties an engineman does occasionally misjudge the point at which he should stop? Some railroads install their block systems with a separate caution signal for each home signal, placing the caution signal at a uniform distance from the home, this distance to be not more than good braking distance. It is a safe prediction that, other qualifications being equal, there are a good many less cases of signals being overrun on roads so equipped than on those where the former and more generally used system is in vogue.

#### Causes of Collisions

But to get back to the question of automatic train control. Admitting that the two most fruitful causes of collision are inadequate flagging and non-observance of signals, the third is the failure of the train order system. Here again the installation of automatic block signals is the cure; and right here I want to warn any reader of this paper who is

disposed to criticize my twice made statement that automatic block signals are the cure for two evils, poor flagging and overlooked, forgotten or erroneous orders, that he had better wait until I finish before he cries out that automatic block signals have failed to do this in the past; because I am going to suggest an addition to present automatic practice which will insure that engine runners will know in ample time to make a stop when they are approaching a block signal in the stop position.

There are a number of inventions covering apparatus which may be connected to a caution signal which will warn enginemen as they pass it that it is in the caution position. In some systems this warning is given by a brake application. In some by an audible or visual signal displayed in the cab of the engine. In others by an audible roadside signal. Some of these are arranged so that if the engine runner performs some action, such as pressing a button or moving a lever as he approaches the signal, thereby showing that he is awake and realizes the condition, the apparatus does not act; but if he fails to do this, as would be the case were he asleep or unconscious, the apparatus takes action.

As explained in the earlier part of this paper, there are many objectionable features to any apparatus which makes an arbitrary brake application and the use of such apparatus should be avoided if the object sought, the prevention of collisions, can be attained without it. Cab signals, or at least all of them that have come under the writer's observation, require a good deal of delicate electrical apparatus on the engine which it is hard to keep in working order. The failure of more than one theoretically good train control device has been because of this fact. In the writer's opinion, a good audible wayside signal is all that is necessary. This leaves the control of the braking system entirely in the hands of the engine runner, which is where it should be, and we have improved present conditions to the extent that if a train passes a signal displayed at caution without the engine runner's answering the caution signal, the fireman and everyone else on the train is informed of the fact at once. True, if the engine runner after receiving the warning continues to dash on at full speed at the risk of his life the apparatus will not stop him; but what is the chance of such an occurrence? Has the investigation of any collision on record ever suggested the thought that the engineman willfully attempted to wreck his train? Has it not always been established that he was asleep, unconscious or had overlooked a signal? And should he be bent on suicide, is it likely that the fireman would care to join him?

#### Prevention of Collisions

As the first step towards the prevention of collisions it is the writer's recommendation that all lines of railroad carrying any considerable traffic be equipped with automatic block signals as soon as possible. That these block signals be so installed that there is a caution signal for each stop signal not more than 3,750 ft. from the stop signal, and that each caution signal be equipped with an approved type of audible signal which will sound the alarm not less than 3 consecutive times when an engine is within 300 ft. of it unless the engineman performs some action in the cab which he could not perform unless he fully realized what he was doing and why he did it. The writer will stake his professional reputation that on a road so equipped the word collision would be unknown.

No doubt this suggestion will be met with derision. It will be said that the plan herein suggested is too incomplete; that it leaves a possible chance for the apparatus to fail to give the warning. To this the answer is that no engineering construction guards against or can guard against possibilities. All we can do is to guard against probabilities. No one can design a rail, a wheel or an axle which cannot possibly break and cause a derailment. Our best efforts end when we have

designed them strong enough to bear all reasonable stresses that we can foresee, add a fair factor of safety and carefully inspect them at the factory and while in service.

With the arrangement proposed a flagman must fail to do his duty, a signal must fail to give its proper indication, the warning device must fail to operate or the enginemen (fireman included) must fail to obey the warning, for a collision to occur. Knowing as we do that none of these chances is likely to occur oftener than once in many thousand times, what is the probability of enough of them occurring coincidentally to cause a disaster? Not once in many millions of times.

We must consider this question from a practical point of view. To equip a few miles of important terminal with a train control device of the most elaborate sort is not going to accomplish anything. We must spread this additional safety over a vast amount of mileage if we are to get results, and therefore we must consider a device within a reasonable cost figure. Collisions are costly and disgraceful. We must stop them everywhere, not only at a few isolated places. The arrangement herein suggested can be added to an existing automatic block system where separate distant signals are already provided, at a nominal cost; to an existing automatic block system where additional distant signals must be provided at a cost greater but not prohibitive, and to a new installation of automatic block signals at practically no increase over what the installation would cost without it.

## Administration Seeking Way To Reduce Rates

WASHINGTON, D. C.

PRESIDENT HARDING and members of his cabinet are still giving a great deal of consideration to the railroad question in its relation to the whole program of trying to bring about a "return to normalcy" in general business conditions. Following the cabinet meeting on April 15 it was stated that no definite plan has yet been formulated but that it was possible some idea as to a program might be made known in another week. The various branches of the government, particularly Congress and the departments of commerce and agriculture, are receiving numerous complaints of the high rates and many opinions are expressed that lower rates on some commodities would produce more revenue for the railroads, but it is apparent that those in a position of responsibility in the matter feel it necessary to go slow in the matter of rate reductions until the possibility of reductions in the cost of transportation has become more clearly apparent. The decision of the Railroad Labor Board on the national agreements, which proved so satisfactory a compromise that it was claimed as a victory by both sides, was received with great interest in Washington and the fact that the board was able to find a compromise in that case fostered more hope than had previously existed of a peaceable outcome of the wage reduction controversy. It had been rumored that the President intended to call a joint conference of the railroad executives and labor leaders but he has not yet indicated that he has been convinced of the value of such a plan.

The most insistent demand for rate reductions has come from the agricultural interests, whose prices have fallen so rapidly that the rate level has become a factor of more importance than it is in the case of most commodities, and the question has been discussed from varying points of view at a meeting of the executive committee and delegates of the American Farm Bureau Federation. At the meeting on April 15 the speakers were Herbert Hoover, Secretary of Commerce, and E. E. Clark, chairman of the Interstate Commerce Commission.

"Unless we can readjust our railroad rates we will have

to re-write the whole agricultural geography of the United States," said Mr. Hoover. "Railroad rates bear an intricate relation to our national prosperity and unless they are lowered quickly there will be a decided shifting of agricultural industry. Our present rates will soon move our granaries to foreign shores, for today it costs 30 cents per bushel to ship grain from Missouri to New York and the same amount can be shipped by water from Argentina for 10 cents. We should take a lesson from Europe and think of our agriculture. Those countries have developed industry to the detriment of agriculture; have imperiled their national defense and even their civilization. We cannot afford to depend upon overseas for our food, for it undermines our basic industry."

Chairman Clark pointed out, however, that "all the trouble does not lie with freight rates." Mr. Clark said:

Industries are entirely inter-dependent. If the Florida man did not grow oranges, the railroad in the orange belt would be of no value. If he did not have the railroad, his orange tree would be of no commercial value. These matters must be considered not only from the standpoint of the present,—the question of the movement of the crops of this year, but next year and future years must be considered. It is in the interests of the railroad that the fruit grower and the farmer should raise the largest crops possible, and should find a market for these crops. It is in the interests of the growers that there shall be efficient, well equipped railroads, able to provide a reasonable, adequate service when needed.

The California lemon grower is unable to sell his lemons in the east at prices that will pay him to produce, pack and ship his fruit. At first he blamed the freight rates, but as he looked further into the situation he found that the reason for this is the fact that the Sicilian lemon growers were bringing into this country and selling their lemons at \$1.25 per box. That Sicilian grower has this advantage—he can take that \$1.25 in our money back to Italy and it immediately is changed into a \$5.00 bill. So in this particular instance the only way in which the California lemon grower can successfully compete is through the levying by Congress of an import tax that will give him a reasonable degree of protection. Then it may be that within a few years or a short time it will be possible to reduce that import tax.

Mr. Clark also referred to the wide difference between the price that the grower gets and the price that the consumer pays.

We have made it our business to inquire considerably out of our line in order to get a correct understanding of the situation. We have had complaints about the rates on fruits and vegetables in great numbers, and we have studied the situation as far as we have been able. For instance, there were complaints on the rates on spinach from the south. The facts are that the retail dealer in New York is paying just one-half what he paid last year, but his price to the consumer is identical with that of last year. Obviously the freight rate in that case is not what is preventing the grower from getting the price he got last year, and under those conditions we do not see where a reduction in freight rates would benefit the grower. This is because those who control the market will not pay any more than they are compelled to pay. The farmer is back to almost pre-war conditions so far as the price he gets for his wheat is concerned, but we are paying the same price for the same loaf of bread.

We produce and we must continue to produce large volumes of agricultural products in excess of what can be consumed in this country. We must find markets for the surplus in other countries, and we must do that in competition with products of the same kind in other parts of the world.

Not long ago the cotton growers received 42 cents per pound for cotton, now it is about 12 cents. That isn't because there is any great reduction in the price of cotton goods to the American people, but because the principal market for that cotton has disappeared temporarily in Japan. The fact is, they stopped buying the goods from the spinner in Manchester, England, and he stopped buying cotton here.

Some things have been learned from the experiences of recent years with regard to the question of transportation. The serious war conditions were the cause of largely increased expenditures for operation of railroads, including very large increases in compensation to their employees. Before the war the general average of operating expenditures was in the neighborhood of 65 per cent of the revenue,—somewhere between 65 per cent and 70 per cent. Now it is a little over 92 per cent. As soon as the railroads were taken over by the government during the war the operating expenses began to climb. The question of compensation of employees came up. A commission was appointed by the director general, and it recommended increases that aggregated very large sums of

money, and these increases were retroactive for some time before the decision was handed down. Shortly before that the director general made what might be termed a 20 per cent increase in rates. This was effective about half of the year, and the increase in wages was effective throughout the year. The result was a deficit. The increase in wages went on, but no further increase in rates was made, with the result that the government paid out of the Treasury very large sums to make up the deficit in the course of operating.

After the return of the railroads to the owners there was a period of six months during which the government guaranteed them against any heavier losses, and it was understood by everybody that there would be a general readjustment in the rates. That was undertaken in a careful, methodical way. At first it appeared that there would be no occasion for increase in passenger fares, but an increase of 30 per cent in freight rates which would produce the desired revenue. However, after careful consideration, more increased wages were awarded, which necessitated a recasting of figures and an increase of passenger fares.

For the first two or three months after these rates became effective it looked as though everything would work out as had been anticipated. Then for some reason or other the volume of business began to drop off and the ratio of expenses to income began to increase, and that condition has progressed until at the present time about 90 per cent of our gross revenues is expended in operating expenses. There are not more than ten, and perhaps not more than six individual roads that are earning the interest on their bonds. About one-half of the railroads are at the present time failing to earn their operating expenses and taxes.

During the year ended December 31, 1917, a little over 42 cents out of every dollar earned by the railroads was paid in compensation to employees. The amount thus paid during the year ended December 31, 1919, was 42 cents and during the year ended December 31, 1920, 60 cents.

Secretary Wallace of the Department of Agriculture declared in a statement on April 18 that a substantial reduction in freight rates would be "helpful now and would produce more traffic for the carriers." Secretary of the Treasury Mellon is quoted as having told newspaper men that a reduction of rates on certain commodities would have a stimulating effect on business but that he did not believe there could be a general reduction in rates at this time.

Senator Harris and the Congressional delegation from Georgia called on Chairman Clark of the Interstate Commerce Commission on April 15 to urge reductions in rates on fruits and vegetables from Georgia. As a result of the conference Lincoln Green, vice-president of the Southern, arranged to send a representative of the railroad to accompany representatives of the shippers on an investigation of the conditions referred to to see if the trouble was with the rates.

A large delegation of representatives of the Farmers' Union, accompanied by members of Congress from the agricultural states, had a conference with members of the Interstate Commerce Commission on April 20, urging an immediate reduction in freight rates on farm products. Commissioners Aitchison, Esch, McChord, Meyer and Potter were present, together with W. V. Hardie, director of traffic of the commission. Some of the commissioners were interested in suggestions as to how rates could be reduced in the face of the high prices still being paid by the railroads for labor and materials and Commissioner McChord pointed out that the railroads had had a deficit of \$8,000,000 during the first two months of this year. After Representative Campbell of Kansas had insisted that rates be reduced at once, Commissioner Potter reminded him that the commission has not power to order summary reductions in rates and that at least 60 days would be required for action, using all the short cuts possible, even if the rates were proved to be too high.

Mr. Campbell suggested that the commission could call in the traffic officers of the railroads in three days and insisted that they would be very glad to reduce rates, but Director Hardie said that he had recently talked with some 30 railroad traffic managers on the subject and not one of them regarded the high rates as the most important factor in the present situation. He said that all admitted that they are a factor, but not the most important. Mr. Hardie also pointed

out that during the latter part of last year when the railroads were handling a maximum tonnage under the present rates they had only earned at the rate of 3 per cent on the valuation. After the conference it was stated that the request for lower rates will be taken to the White House.

## Cost of Railroad Fuel in 1920

WASHINGTON, D. C.

THE COST OF FUEL to the Class I railroads of the United States in 1920 was approximately \$297,000,000 greater than the cost in 1919, according to a report made by the Interstate Commerce Commission to the Senate in response to a resolution calling for detailed information as to railroad fuel costs in the two years. A considerable part of the increase was on account of the increased quantity used in handling the increased amount of traffic. The cost, delivered, of bituminous coal was \$641,224,469 for 155,343,635 net tons in 1920, as compared with \$390,036,556 for 123,907,508 net tons in 1919. The cost at the mine was \$531,854,888. The cost of anthracite delivered was \$24,268,764 for 5,779,819 net tons in 1920, as compared with \$16,661,149 for 4,796,353 net tons in 1919. In addition 55,590,783 barrels of fuel oil cost \$97,874,094, as against \$61,515,473 for 42,961,406 barrels in 1919. Coke cost \$1,027,336 for 91,642 tons in 1920 and \$1,476,000 was paid for wood and fuel.

The information called for by the resolution was obtained by a special sworn report. For all regions the average delivered cost of bituminous coal was \$3.15 per net ton in 1919 and \$4.13 in 1920, an increase of 98 cents a ton. At the mine, the increase in the cost per ton was 66 cents for contract coal and \$1.70 for spot coal. The increases shown for New England are much higher. The increase in the delivered cost for bituminous coal in the New England region was \$2.92 per net ton. The increase in the mine price of the bituminous coal purchased for this region was \$1.27 per net ton, contract, and \$3.79 spot. Anthracite coal delivered cost the railroads 73 cents a net ton more in 1920 than in 1919. The increase in the cost of fuel oil delivered was 33 cents a barrel.

The report includes the following table among others:

QUANTITY AND COST OF FUEL PURCHASED BY CLASS I STEAM RAILS IN THE CALENDAR YEARS 1920 AND 1919 BY TERRITORIAL REGIONS

Region and year	Bituminous Coal		Delivered	Average cost per net ton		
	Total cost at mine			At mine		
	Contract purchases	Spot purchases		Contract	Spot	
New England, 1920	\$15,115,872	\$20,307,472	\$35,423,344	\$8.09	\$3.79	\$6.25
1919	9,221,145	3,851,068	13,072,213	5.17	2.52	2.46
Great Lakes, 1920	63,107,462	20,422,979	83,530,441	4.34	3.24	4.01

Note—In computing the average cost per net ton certain tonnage for which the cost was not available was excluded. These exclusions, except as specifically stated in the footnotes below, are practically negligible in their effect and hence are not stated in detail.

<sup>1</sup>Arrived at by excluding 1,952,017 tons for which the price was not furnished.

<sup>2</sup>Arrived at by excluding 2,599,153 tons for which the price was not furnished.

<sup>3</sup>Arrived at by excluding 153,679 tons for which the price was not furnished.

<sup>4</sup>Arrived at by excluding 48,168 tons for which the price was not furnished.

<sup>5</sup>Arrived at by excluding 1,993,058 tons for which the price was not furnished.

<sup>6</sup>Arrived at by excluding 2,787,622 tons for which the price was not furnished.

<sup>7</sup>Arrived at by excluding 354,774 tons for which the price was not furnished.

<sup>8</sup>Arrived at by excluding 183,471 tons for which the price was not furnished.

# The Earnings of Individual Passenger Trains

Describing Simple Method for Determining Whether Selected Trains Pay Out of Pocket or Other Costs

By T. W. Mathews

Assistant Treasurer, Seaboard Air Line, Portsmouth, Va.

THERE WAS AN AVERAGE of over forty vacant seats in all passenger coaches in all passenger trains in the United States in 1919. When we recall the crowded trains and the difficulty in getting accommodations in 1919, we question the accuracy of this statement. The average number of passengers per passenger car in 1919 was 13.5; other figures show that the average number of seats per car is at least sixty. For every crowded passenger car, therefore, with 40 passengers, there were four cars with seven passengers each, running on some branch line of small traffic.

Certainly this statement of facts is sufficient to show that railway managers need information as to the net earnings

passenger service, and the still further sub-division to individual passenger trains.

It is sufficient for practical purposes in setting a standard to consider only those expenses easily assignable to individual trains. Even so crude an allotment of expense to individual trains when compared with the earnings of such trains will "spot" the unprofitable runs.

Such standards can be used from month to month, and be rechecked from time to time as may seem necessary. The out-of-pocket costs include in a large degree fixed items of expense, such as crew and fuel. If desired the annual repair charge for passenger equipment and per locomotive for the

of individual passenger trains. Of course, many passenger trains will be continued, even at a loss. Regulating bodies, the necessities of the public, and other considerations will make the continued operation of a large number of non-paying passenger trains unavoidable. It would not seem that such reasons make it unnecessary for a careful study of individual passenger trains to be made. Certainly, if there are already more than enough trains between certain points any attempt to put on additional service should be resisted. If there is service at a loss, some effort should be made to reduce it. On branch lines it may be possible with profit to substitute self-propelled cars with a much smaller crew. In some cases Ford bodies have been mounted on trucks and have furnished, at greatly reduced expense, sufficient service on branch lines.

A comparative study from week to week, or month to month, of cash collections on individual trains may reflect discrepancies worthy of careful investigation.

## Expenses of Individual Passenger Trains

A competent analyst of operating costs can in a few days set standards of out-of-pocket costs for all of the individual trains of a large system. A thorough and technical study of cost of passenger train operation would include an elaborate apportionment of all items of expense as between freight and

types used can be added. Further charges for maintenance of track and for interest may be added, but are more difficult to develop.

## Earnings of Individual Passenger Trains

We now come to the task which looks on the surface as possible only at prohibitive cost—to price and tabulate for individual trains the millions of tickets collected yearly, even on the smaller of the large systems. Several roads have developed the plan described in this article, and have had it in successful operation for more than five years. On one road it requires one clerk at minimum pay of \$115 per month for each 750,000 passengers. This means probably \$5 to \$10 per month per train. This does not seem a heavy charge when the advantages of having the information are considered.

The plan is based on systematic and orderly arrangement, and the use of mechanical devices. A form of conductor's report must be used containing report of "cash fares collected" and "tickets honored but not lifted," as shown in Fig. 1.

Instructions to conductors should be as follows:

The cash fare report must be made out complete in every particular as provided.

The summary at the foot of the report should be filled

tickets honored but not lifted. The two left hand keys of the adding machine should be used for this purpose. Half tickets should be counted as full passengers. The tickets should next be priced from the local passenger fare chart, using the right hand keys of the adding machine. Local tickets honored but not lifted should be priced along with the local tickets sent in. Half tickets should, of course, be priced at one-half of the full fare. Entry can now be made from the machine to Fig. 3 under "Local," showing the number of passengers and the value of tickets. The operator may then clear the machine.

In the same manner Fig. 3, "Home Coupons" and "Foreign Coupons," should be filled out. Two extra columns are provided for clergy, party and other special tickets.

The local passenger fare chart should be used for all classes of tickets. At the bottom of Fig. 3 the word "Reduced" appears to the left. A careful study should be made of home coupons, foreign coupons, and other special rates to ascertain what percentage relation each class bears to local rates. Percentages thus ascertained should be used to "Reduce" all columns necessary. No reduction, of course, is necessary for "Mileage," "Cash Fares" and "Local."

Some roads use distance mileages on the chart, and thus work a figure of passengers one mile for each class of tickets. Of course, to the figure of passengers one mile thus obtained the average rate for each class of tickets are applied.

Aggregate passenger train earnings for a year figured out as described above, as compared with an actual passenger revenue of \$10,000,000 have shown a variation of less than 2 per cent. This has been true year after year. In making monthly comparisons, due consideration must be given to the fact that passenger train earnings include actual passengers handled. Passenger revenue includes the entire revenue from round trip tickets when sold, although the return portion may not be used until some weeks later.

A statement of individual passenger train earnings (Fig. 4) is compiled from Fig. 3 monthly, and placed in the hands of the management ten days after the close of each month.

As by-products of the method described, weekly estimated passenger revenue and earnings by states are being compiled with very little additional work by using Fig. 3 as a basis.

## Rails Should Be Tested Head Down

By M. H. Wickhorst

Engineer of Tests, Rail Committee, American Railway Engineering Association

WHEN THE NECESSITY of testing rails first dawned upon the minds of railroad engineers, the method that naturally first suggested itself was to lay a piece of rail on two supports and drop a heavy weight upon it. Naturally also the rail was placed with its base upon the supports as it is in the track. Since that time, and particularly during the last ten years, our information has become much more extensive and precise concerning the physical and chemical properties of rails and concerning the manner of development of rail failures. In the last analysis, the drop test is a test of the tensile ductility of the part in tension, and as the performance of the rails as regards failures is determined mostly by the condition of the metal in the interior of the head, the tests of the rails should therefore be made with the head in tension, that is, with the head down.

In the early work of the rail committee of the American Railway Engineering Association, tests were made to compare the results of bending rail pieces with the head in tension with those with the base in tension. Tests were made both in the drop machine and by slow bending in the laboratory test machine. It soon developed that when the rail is tested

with the head in tension, the ductility results obtained correlate well with the condition of the metal in the interior of the section as shown by chemical analyses, tensile tests and etchings. That is to say, the chemical segregation which is determined by comparing analyses of samples from the interior and outer parts of the head of the rail, has its counterpart in a low ductility when the rail is bent with the head in tension. Thus used, the drop test answers the purposes of the chemical segregation test. With the base in tension, the correlation between the chemical and bending tests is of the same trend, but the influence of interior segregation is not as definitely shown in reducing the ductility, particularly with thin base rails.

The shattering which sometimes occurs in the interior of the rail head causes a complete lack of ductility when the rail is tested with the head in tension but has no effect on the ductility with the base in tension. The writer recalls an instance where a rail specimen was tested base-down in the hydraulic bender, bending with considerable deflection and display of good ductility, but the recoil resulted in the specimen breaking into four pieces and revealing the presence of fissures in the head.

The non-parallelism of the results in the drop test with the base in tension with the interior condition of the ingot was also seen in some interesting and valuable work by the Bureau of Standards in which Hadfield sink-head ingots were compared with ordinary ingots. The interior of ordinary ingots contained considerable segregation of carbon and phosphorus which in the Hadfield ingots was confined to the top. This condition was reflected in the rails when tested by chemical analysis, tensile test and etching, but not when tested by the drop test. The drop tests were made with the base in tension but if they had been made with the head in tension, the rail committee's work indicates that the drop test results would have paralleled the results of the other tests.

A few remarks may now be made concerning the drop test, considered as a "shock" test. It has usually been thought that the drop test gave a "shock" that does not occur in slow bending as in the laboratory test machine, and would therefore be a more severe test. In order to determine quantitatively the difference between the two methods of bending, tests were made of companion pieces from several complete rail bars, using the entire ingots. The pieces were tested alternately by drop bending and by slow bending in the test machine and the outcome was that the ductility was the same in the two methods of bending. In other words, the ductility is not a function of the rate of bending between the limits of about 36 ft. per second as in the drop test and about 0.2 inch per minute as in the test machine. This difference in speed is as 129,600 to 1. There is, however, an important point of difference between the drop test and slower bending, in that in the drop test a break frequently starts in a seam in the base, either where it rests upon a support in base-down tests or where struck by the tup in head-down tests, and in such cases the full ductility of the material is not developed.

As bearing further on the question of the effect of the rate of bending on the results of the test, mention should be made of the work of the Pennsylvania Railroad with the hydraulic method of bending the rail, more usually called the "quick bend test" (the expression "quick" referring to the speed of the whole operation of testing and not the speed of the actual bending itself). That work likewise showed that the results of bending in the drop machine were about the same as those of bending in the hydraulic bender. The hydraulic bender probably has, however, several points of advantage as follows: the breaks are always normal and due to the exhaustion of the ductility of the part in tension, a record can be kept on an indicator card and then also the work of testing can be carried on much faster.

The reports of the investigations and other work on which

the above statements are based, are contained mostly in the proceedings of the American Railway Engineering Association from 1910 to the present time, but for the benefit of those who may be interested in looking up the basic data, a few of the references are mentioned below.

### References

Comparisons of the head tension and base tension results are given in a number of reports, but probably the most convenient exposition is given in a diagram submitted in a report on the influence of size of ingots. (Proc. Am. Ry. Engrg. Assn. for 1912, Vol. 13, p. 702, fig. 18.)

The work of the Bureau of Standards mentioned above was described in Technologic Paper of the Bureau, No. 178, Steel Rails from Sink-Head and Ordinary Ingots, by George K. Burgess, December 15, 1920, p. 48. The paper was abstracted in the *Railway Age* for Feb. 4, 1921, and an abstract of the remarks concerning the drop test results appear on p. 334.

Several comparisons were made of the results of bending rails in the drop machine and by slower bending, the principal one being contained in a report on the influence of silicon. (Proc. Am. Ry. Engrg. Assn. for 1913, Vol. 14, p. 542.)

The hydraulic bend or "quick bend" method of the Pennsylvania Railroad was described and results of tests were given in the publications of the American Railway Engineering Association. (Proceedings 1917, Vol. 18, p. 1095, and 1919, Vol. 20, p. 591.)

## Repairs in Outside Shops Defended

HEARINGS ON THE ALLEGED high prices paid by the Pennsylvania for repair work done in outside shops which were held by the Interstate Commerce Commission at Philadelphia the early part of the week have been adjourned until May 7. The hearings will be resumed at Washington. The hearings at Philadelphia were devoted principally to investigating the costs of repairs to 200 locomotives which were repaired under contract by the Baldwin Locomotive Company.

The position of the railroad in contracting for repairs by outside companies was defended by Samuel Rea, president of the Pennsylvania, in a statement authorized on April 17. Mr. Rea said that the "direct labor cost of doing this work in outside shops was much less than in railroad shops." He further called attention to the fact that at the time the contracts were entered into all the railroad shops were working to capacity and that "traffic demands upon the railroad necessitated getting outside assistance." His statement follows in part:

From March 1, 1920, when the Pennsylvania Railroad resumed the management of its property, to December 31, 1920, locomotive and freight car repair work done outside the railroad's own shops has amounted to about six per cent of the total cost of this work. Locomotive and car repairs, from March 1 to December 31, 1920, cost the railroad approximately \$140,400,000, of which \$8,200,000 was for repairs in outside shops. In other words, out of every dollar spent for repairing Pennsylvania Railroad cars and locomotives, about 6.2 cents was spent for outside work.

In newspaper articles published a few days ago, Mr. William H. Johnston, International President of the machinists' union, is reported to have said:

Only recently the Pennsylvania Railroad, in having 200 locomotives repaired in the Baldwin shops, spent \$3,500,000 in excess of the cost if the road had done the work itself. Between \$20,000 and \$25,000 were spent in rebuilding obsolete locomotives that originally cost \$9,000 thirty-three years ago.

The total number of Pennsylvania locomotives repaired under contract was 200. On the other hand, 5,160 locomotives were given classified repairs in the railroad's own shops in addition to a very much greater number of locomotives that were given

lighter repairs requiring more than twenty-four hours work each. All the locomotive repair work on the Pennsylvania Railroad during this period cost \$79,112,800, out of which approximately \$4,500,000 was for outside contract work.

The lowest bill for any single locomotive repaired in outside shops was \$12,661.13 and the highest \$29,836.10. The oldest locomotive repaired was thirteen years old, and the newest one year old, instead of being thirty-three years old and obsolete. The smallest locomotive repaired weighed 235,000 pounds, and the largest 435,000 pounds. The original cost of the cheapest was \$19,813; and the most expensive \$83,560 instead of \$9,000, as quoted above.

The number of freight cars repaired outside was approximately 3,600 as compared with a total of 1,415,435 freight cars repaired in the Pennsylvania's own shops. The cars repaired at outside plants were all heavy repairs, whereas the above figure for cars repaired at the shops of the railroad includes heavy and light repairs. All the repair work to Pennsylvania Railroad freight cars during this period cost \$61,300,000, of which approximately \$3,700,000 was for work performed under contract in outside shops.

The fact is that the direct labor cost of doing this work in outside shops was much less than in railroad shops. For instance: direct labor required to repair 3,066 of these cars in outside shops cost \$608,494. The same work in railroad shops would have cost the Pennsylvania Railroad \$1,000,360. The labor cost outside was 40 per cent less. Outside concerns paid their men on a piece work basis. Under the so-called "National Agreement," the Pennsylvania Railroad had to pay its men by the day.

This Company accepted such contracts as the United States Railroad Administration had made and which were not yet completed and let contracts of its own on which 826 cars were repaired at prices relatively the same as the costs on the United States Railroad Administration contracts.

Outside shop assistance was essential but it was kept down to a minimum. The 200 locomotives repaired under contract by the Baldwin Locomotive Works required the heaviest repairs and sending them outside, therefore, afforded the railroad shops greater capacity to handle more locomotives and return them to service more quickly.

To summarize: the situation confronting the Pennsylvania Railroad, as well as practically every other railroad on March 1, was one of abnormal business demands upon its transportation facilities and an abnormal percentage of bad order equipment on its lines. Secondly, the business of the country demanded that the work be done at the earliest possible moment and the Pennsylvania obtained the best terms possible on work it had to have done outside. Finally, aside from the facts of the case itself, the records of performance of the railroad in meeting this situation fully warrant and justify the steps taken to meet it.

Among the witnesses who appeared at the hearing, besides Mr. Rea, who testified on April 19, were J. T. Wallis, general superintendent of motive power of the Pennsylvania; P. G. Blecke, an examiner of accounts for the Interstate Commerce Commission, and H. Boltwood, a mechanical engineer for the Railroad Administration. F. P. Walsh, attorney for the Railway Employees' Department of the American Federation of Labor, cross examined the witnesses in his capacity as counsel for the employees' organizations which instigated the investigation.

Mr. Wallis in his testimony contended that the Pennsylvania was justified in contracting with the Baldwin Locomotive Company for repairs to locomotives in view of the inability of the railroad shops to put them in shape in time to help relieve the congestion in traffic which existed at the time.

THE FOLLOWING ESTIMATE of the national census of Brazil taken on September 1, 1920, was published in a Brazilian newspaper on December 6, 1920, and forwarded by Consul General Haerberle: State of Alagoas, 990,278; Amazonas, 435,448; Bahia, 3,372,901; Ceara, 1,436,309; Federal District, 1,130,080; Espirito Santo, 479,188; Goyaz, 528,879; Maranhao, 853,050; Matto Grosso, 274,138; Minas Geraes, 5,788,837; Parana, 992,290; Parahyba, 785,344; Parana, 674,113; Pernambuco, 1,975,441; Piauh, 548,250; Rio de Janeiro, 1,501,969; Rio Grande do Norte, 552,071; Rio Grande do Sul, 2,138,831; Santa Catharina, 633,462; Sao Paulo, 4,823,100; Sergipe, 335,094; Acre Territory, 104,436. The total population was estimated at 30,553,509.—*Commerce Reports.*

# Inefficiency Marks Government Operation Abroad

David Van Alstyne and F. H. Shepard Tell New York Railroad Club of Conditions on Foreign Roads

**I**N A PAPER read before the New York Railroad Club on April 15, David Van Alstyne of the American Locomotive Company, who has recently returned from a 17 months' journey around the world, discussed briefly some of the outstanding features of the many railroads with which he came in contact. The itinerary of this trip included South Africa, Portuguese East Africa, India, the Federated Malay States, Java, Australia, the Philippines, China and Japan. To Mr. Van Alstyne the most striking characteristic of a majority of the roads was that they were government lines and were, in his opinion, operated under conditions which were not at all conducive to efficiency, enterprise and loyalty to the service.

## Evils of Government Operation

Of his impressions of government operation as he saw it abroad Mr. Van Alstyne said in part;

"With few exceptions, the railways traveled over were government owned and operated, the exceptions being some of those in India, which are government owned and privately operated. Many times I wished that the advocates of government operation, or the Plumb plan, might make the journey which I was making and hear what the railway officials had to say on the subject. The trend of their remarks to me was that there is interference from politicians, that it is difficult to maintain discipline, that there is a tendency to create useless positions and that in general there is a lack of enterprise, enthusiasm and loyalty to the service. For many reasons, chief of which is that in all countries where I traveled, with the exception of Australia, the railways employ mainly inefficient natives, it is impossible to make comparisons of statistics which would be fair to the government ownership side of the case, but the impression is that there are many more employees required on a government than on a privately operated road for a given volume of work.

"I cannot let this opportunity escape for observing that my travels have fully convinced me that government operation in this country would be a calamity from the standpoint of the public in general, of the railroad management and the supply and equipment people in particular, and especially of labor not in the service of the railways. If government operation of railways is as defective as it has seemed to me to be in countries where railways are small, what might we expect in this country where the mileage is greater than in all the rest of the world put together?

"However important the arguments of the shipping and employing classes against it may be, it seems to me that the laboring class not in the employ of the railways has even more to fear from it. From the very nature of the railway business, its organized employees are able to more nearly exact their demands than employees in other industries.

"To the extent that railroad labor increases unreasonably the cost of transportation other labor must bear the burden, either in the form of higher passenger and freight rates or higher taxes to pay for railroad deficits. This is what is now going on in most countries, including the United States, as a result of government control. I cannot see government ownership and operation, therefore, other than as rank discrimination between railroad and other classes of labor. Organized labor insists on uniform wages for everybody doing the same kind of work. It would seem that it has better arguments in favor of government control of everything or nothing."

A considerable portion of Mr. Van Alstyne's paper was de-

voted to a discussion of some of the peculiarities of construction, equipment and operation of the various roads which came under his observation. His impressions in this regard were published in the *Railway Age* of February 11.

## Labor Conditions

From Mr. Van Alstyne's remarks it would seem that unionism has flourished everywhere; even the unskilled native workers have in many countries been organized. At Bulawayo, South Africa, he witnessed a conference between a general manager and 300 striking laborers of the semi-savage Matabele tribe. Regarding this conference he said: "A young Englishman translated for me as the conference progressed and explained that the general manager was trying to persuade the strikers to go back to work and send their committee to confer with him. The Matabele orators were willing to accede to the general manager's request but were trying to impress upon him that if the committee failed to get what they were sent for, they would probably be killed."

Of India, Mr. Van Alstyne said in part:

"The railway officials hold military rank and are subject to call for military service. All the mechanics, all the firemen and about half of the enginemen are natives. Skilled mechanics earn from 1 rupee 8 annas to 2 rupees a day (60 to 80 cents). One white mechanic is said to be worth about three natives except on duplicate work. Most Englishmen seem to think that traveling in India is the height of luxury. With the exception of one or two trains I was impressed quite differently."

Speaking of Australia he said:

"It is a white man's country with a labor government, minimum wage, arbitration, etc. Numerous strikes are going on continuously and the openly professed policy of labor is to limit output. The ratio of employees for the same output in railway and locomotive builders' shops was about three to one as compared with this country, as nearly as I could judge."

"The best judgment I could form for all countries, including Australia, where practically all labor is white," he said in conclusion, "is that in the shops and engine sheds they have about three times as many men for the same work as we do, but this, of course, would not mean that the cost is always higher because nowhere are wages anywhere nearly as high as ours."

## Electric Traction in Foreign Countries

Railroad conditions in European countries as seen by an electric traction expert were outlined by F. H. Shepard, director of heavy traction, Westinghouse Electric & Manufacturing Company. Mr. Shepard has just returned from an eleven-weeks' trip through the more important European countries and he outlined his impressions as follows:

The high rate of exchange makes railroad development a difficult problem in almost all foreign countries. Efficiency of labor has fallen off and government operation has caused many undesirable conditions to arise. In addition a jealousy between some of the new countries has complicated the situation.

Traffic in England has fallen off to almost the same extent as it has in the United States. The equipment is in fair condition. In Sweden it was learned that a trip into Russia was a possibility but was extremely dangerous. Russia is in dire circumstances because of lack of transportation. The

absence of paint and lack of finish is particularly noticeable in Germany. Many employees are required for a comparatively small amount of work and some women are still employed in train service. Traffic movement is probably not more than 50 per cent of normal. The various electric plants are, however, in better general condition than the railroads and throughout most of the country there is evidence of a serious intent to get production started. Switzerland has suffered from the general depression, but is well off insofar as equipment is concerned. The depression has also had its effect in Italy and the situation has been complicated by strikes caused by Bolshevist propaganda. In France the railroads in the devastated regions have been fairly well restored. Business is slow in Belgium, but there are indications that there will soon be a resumption. Railroad equipment is in very fair condition. Holland has been doing a large amount of business.

The high cost of fuel and the difficulty of obtaining it have affected the railroads of most European countries and have made electric operation particularly desirable. Furthermore, each country is now more than ever desirous of being self-contained insofar as industry and transportations are concerned. The result of these conditions is an electrification program which is outlined roughly in this table:

	RAILROAD ELECTRIFICATIONS (ROUTE MILES)			Proposed
	In operation	Under construction		
Sweden .....	300	125	1,000	
Norway .....	60	50	500	
Germany .....	400	100	1,500	
Austria .....	200	...	1,000	
Switzerland .....	250	275	1,000	
Italy .....	600	...	3,000	
France .....	50	...	5,000	
England .....	300	...	1,000	
Holland .....	50	...	600	
Belgium .....	...	...	500	

### New Members of Labor Board

**P**RESIDENT HARDING on April 16 sent to the Senate his nominations for three appointments to membership on the Railroad Labor Board, to succeed the three members whose terms expired on April 15. The new appointees are Ben W. Hooper, former governor of Tennessee, as a member of the public group, succeeding Henry T. Hunt; Samuel

in 1894, and practiced at Newport. He was a member of the Tennessee House of Representatives in 1893 and 1895, was assistant United States attorney for the eastern district of Tennessee from 1906 to 1910 and was governor of Tennessee for two terms, 1911-1913 and 1913-1915. He is a Republican.

Mr. Higgins was born February 19, 1860, at San Francisco. He graduated from Sheffield Scientific School, Yale University, in 1881, in which year he entered the service of the Erie at Susquehanna, Pa., as a special apprentice. He served in various positions in the mechanical department until April 1, 1892, when he was appointed assistant superintendent of motive power. In 1894 he became superintendent of motive power of the Lehigh Valley and on April 1, 1901, he was appointed superintendent of motive power of the Union Pacific. On July 1 of the following year he went to the Southern as mechanical superintendent and remained in that position until April 1, 1904, when he became general manager of the New York, New Haven & Hartford. On January 1, 1912, he left the New Haven and spent the following three years as a technical expert for various railroads in this country and in Europe. From February 25, 1915, until April 1, 1917, he was president of the Standard Heat & Ventilation Company and since the latter date he has been vice-president of the Vapor Car Heating Company, with headquarters at New York.

Mr. McMenimen was born at Cambridge, Mass., and is about 40 years of age. He was employed for several years as a trainman on the Boston & Maine and became state legislative representative of the Brotherhood of Railroad Trainmen in Massachusetts. For several years he has been in Washington as assistant national legislative representative of the Brotherhood and he was recently appointed deputy president.

The Senate committee on interstate commerce held a meeting on April 18 to consider a report to the Senate on the confirmation of the new members of the Railroad Labor Board but decided to withhold action temporarily because members wanted time to obtain additional information regarding the men. Senator Cummins said the committee would consider the matter again before Thursday. A protest against the confirmation of Mr. McMenimen's appointment by the

S. Higgins

W. L. McMenimen

B. W. Hooper

Higgins, former general manager of the New York, New Haven & Hartford, to succeed W. L. Park of the railroad group, and W. L. McMenimen, deputy president of the Brotherhood of Railroad Trainmen, to succeed J. J. Forrester of the labor group.

Mr. Hooper was born at Newport, Tenn., on October 13, 1870, and was graduated from Carson and Newman College, Jefferson City, Tenn., in 1890. He was admitted to the bar

Senate will be made by the United Brotherhood of Maintenance of Way Employees, according to J. B. Malloy, vice-president of that organization, who objected to Mr. McMenimen's appointment both because he makes the second representative of the train service brotherhoods on the board and on the ground that he was nominated by the Order of Railroad Station Agents, which includes some of the so-called "subordinate officers."

# Labor Board Rules National Agreements End July 1

## Hearings on Revision of Present Wage Scales Begun. —Carriers File Voluminous Data

THE LONG controversy over the railway employees' demand for the perpetuation of their national agreements was ended on April 14 by a decision handed down by the Railroad Labor Board which sustained some contentions of both the carriers and employees. The award abrogated national agreements, remanded the negotiation of new agreements to the individual carriers and their own employees, and upheld the railroads' interpretation of the principle of collective bargaining and their contention that varying local conditions should govern in fixing rules and working conditions. In these respects the decision was favorable to the railroads. The award also outlined 16 principles with which the new agreements should be consistent. This constitutes one of the chief points for which the employees' representatives have been fighting. And accordingly, both sides have expressed satisfaction with the terms of the decision.

### Text of the Board's Decision on National Agreements

After outlining the history of the controversy the decision said in part:

The evidence and arguments submitted in this case support the following conclusions:

The duty imposed by Section 301 on all carriers and their officers, employees and agents to consider and if possible to decide in conference all disputes between carriers and their employees has not been performed by the parties hereto either with regard to the wage or the working conditions portion of this dispute. The record shows that the representatives of the carriers were unwilling to assume the responsibility of agreeing to substantial wage increases. Hence, the conference of March 10 to April 1 on the side of the carriers was merely a perfunctory performance of the statute. Nor was the action of the organizations with regard to the individual carriers more than perfunctory. Naked presentation as irreducible demands of elaborate wage scales carrying substantial increases, or of voluminous forms of contract regulating working conditions, with instructions to sign on the dotted line, is not a performance of the obligation to decide disputes in conference if possible. The statute requires an honest effort by the parties to decide in conference. If they cannot decide all matters in dispute in conference, it is their duty to there decide all that is possible and refer only the portion impossible of decision to this Board.

Although Section 301 has not been complied with by the parties, the Board has jurisdiction of this dispute as it is and has been one likely substantially to interrupt commerce.

The carriers parties hereto maintain that the direction of this Board in Decision No. 2, extending the national agreements, orders, etc., of the Railroad Administration as a *modus vivendi* should be terminated at once; and that the matter should be remanded to the individual carriers and their employees for negotiation and individual agreement.

The organizations maintain that the national agreements, orders, etc., with certain modifications desired by the employees should be held by this Board to constitute just and reasonable rules; and should be applied to all carriers parties to the dispute, except to the extent that any carrier may have entered into other agreements with its employees. They maintain that local conferences requiring necessarily the participation of thousands of railroad employees for several weeks would constitute an economic waste and would produce a multiplicity of controversies as well as irritation and disturbance. They also urge that to require local conferences would be to expose the local organizations on the several carriers to the entire power and weight of all the carriers acting through the Association of Railway Executives on the conferring carrier, that such a disparity of force would produce an inequitable result highly provocative of discontent and likely to result in traffic interruptions. They, accordingly, insist that the conference should be national.

The carriers maintain that rules negotiated by the employees and officers who must live under them are most satisfactory, that the participants in such negotiations know the intent of the rules agreed to and advise their fellow workmen and officers accordingly thereby avoiding a litigious attitude on both sides,

that substantial differences exist as between the several carriers with relation to the demands of the service, necessary division of labor and other factors which differences should be reflected in the rules, that these local differences can be given proper consideration only by local conferences. The carriers refuse to confer nationally.

The Labor Board is of the opinion that there is merit in the contentions of each party and has endeavored to take action which will secure some of the advantages of both courses.

This Board is unable to find that all rules embodied in the national agreements, orders, etc., of the Railroad Administration constitute just and reasonable rules for all carriers parties to the dispute. It must, therefore, refuse the indefinite extension of the national agreements, orders, etc., on all such carriers as urged by the employees.

This Board also deems it inadvisable to terminate at once its direction of Decision No. 2 and to remand the dispute to the individual carriers and their employees. Such a course would leave many carriers and their employees without any rules regulating working conditions.

If the Labor Board should remand the dispute to the individual carriers and their employees and should keep the direction of Decision No. 2 in effect until agreements should be arrived at, it is possible that agreements might not be arrived at.

The Labor Board believes, nevertheless that certain subject matters now regulated by rules of the national agreements, orders, etc., are local in nature and require consideration of local conditions. It also believes that other subject matters now so regulated are general in character and that substantial uniformity in rules regulating such subject matters is desirable.

The Board also believes that certain rules are unduly burdensome to the carriers and should in justice be modified. It may well be that other rules should be modified in the interest of employees.

To secure the performance of the obligation to confer on this dispute, imposed by law on officers and employees of carriers, to bring about the recognition in rules of difference between carriers where substantial, to preserve a degree of uniformity in rules regulating subject matters of a general nature, to prevent to some extent the operation in negotiations of a possible disparity of power as between the carriers and their employees, and to enable the representatives of employees of each carrier and the officers of that carrier to participate in the formulation of rules under which they must live, the Labor Board has determined upon the following action.

### Decision

1. The direction of the Labor Board in Decision No. 2, extending the rules, working conditions and agreements in force under the authority of the United States Railroad Administration, will cease and terminate July 1, 1921.

2. The Labor Board calls upon the officers and system organizations of employees of each carrier parties hereto to designate and authorize representatives to confer and to decide so much of this dispute relating to rules and working conditions as it may be possible for them to decide. Such conferences shall begin at the earliest possible date. Such conferences will keep the Labor Board informed of final agreements and disagreements to the end that this Board may know prior to July 1, 1921, what portion of the dispute has been decided. The Labor Board reserves the right to terminate its direction of Decision No. 2 at an earlier date than July 1st with regard to any class of employees of any carrier if it shall have reason to believe that such class of employees is unduly delaying the progress of the negotiations. The Board also reserves the right to stay the termination of the said direction to a date beyond July 1, 1921, if it shall have reason to believe that any carrier is unduly delaying the progress of the negotiations. Rules agreed to by such conferences should be consistent with the principles set forth in Exhibit "B," hereto attached.

3. The Labor Board will promulgate such rules as it determines just and reasonable as soon after July 1, 1921, as is reasonably possible and will make them effective as of July 1, 1921, and applicable to those classes of employees of carriers parties hereto for whom rules have not been arrived at by agreement.

4. The hearings in this dispute will necessarily proceed in order that the Labor Board may be in position to decide with

reasonable promptness rules which it may be necessary to promulgate under Section 3 above.

5. Agreements entered into since March 1, 1920, by any carrier and representatives of its employees shall not be affected by this decision.

### Sixteen Principles to Govern in New Agreement

Exhibit "B," mentioned above, sets forth the principles believed by the Board to be just and reasonable in governing working conditions as follows:

1. An obligation rests upon management, upon each organization of employees and upon each employee to render honest, efficient and economical service to the carrier serving the public.

2. The spirit of co-operation between management and employees being essential to efficient operation, both parties will so conduct themselves as to promote this spirit.

3. Management having the responsibility for safe, efficient and economical operation, the rules will not be subversive of necessary discipline.

4. The right of railway employees to organize for lawful objects shall not be denied, interfered with or obstructed.

5. The right of such lawful organization to act toward lawful objects through representatives of its own choice, whether employees of a particular carrier or otherwise, shall be agreed to by management.

6. No discrimination shall be practiced by management as between members and non-members of organizations or as between members of different organizations, nor shall members of organizations discriminate against non-members or use other methods than lawful persuasion to secure their membership. Espionage by carriers on the legitimate activities of labor organizations or by labor organizations on the legitimate activities of carriers should not be practiced.

7. The right of employees to be consulted prior to a decision of management adversely affecting their wages or working conditions shall be agreed to by management. This right of participation shall be deemed adequately complied with, if and when, the representatives of a majority of the employees of each of the several classes directly affected shall have conferred with the management.

8. No employee should be disciplined without a fair hearing by a designated officer of the carrier. Suspension in proper cases pending a hearing, which shall be prompt, shall not be deemed a violation of this principle. At a reasonable time prior to the hearing he is entitled to be apprised of the precise charge against him. He shall have reasonable opportunity to secure the presence of necessary witnesses and shall have the right to be there represented by a counsel of his choosing. If the judgment shall be in his favor, he shall be compensated for the wage loss, if any, suffered by him.

9. Proper classification of employees and a reasonable definition of the work to be done by each class for which just and reasonable wages are to be paid is necessary, but shall not unduly impose uneconomical conditions upon the carriers.

10. Regularity of hours or days during which the employee is to serve or hold himself in readiness to serve is desirable.

11. The principle of seniority long applied to the railroad service is sound and should be adhered to. It should be so applied as not to cause undue impairment of the service.

12. The Board approves the principle of the eight hour day, but believes it should be limited to work requiring practically continuous application during eight hours. For eight hours' pay eight hours' work should be performed by all railroad employees except engine and train service employees, regulated by the Adamson Act who are paid generally on a mileage basis as well as on an hourly basis.

13. The health and safety of employees should be reasonably protected.

14. The carriers and the several crafts and classes of railroad employees have a substantial interest in the competency of apprentices or persons under training. Opportunity to learn any craft or occupation shall not be unduly restricted.

15. The majority of any craft or class of employees shall have the right to determine what organization shall represent members of such craft or class. Such organization shall have the right to make an agreement which shall apply to all employees in such craft or class. No such agreement shall infringe, however, upon the right of employees not members of the organization representing the majority to present grievances either in person or by representatives of their own choice.

16. Employees called or required to report for work, and reporting but not used should be paid reasonable compensation therefor.

Following the announcement of the award, spokesmen for

the labor organizations hailed it as a complete victory, one vindicating their position before the Board. At the same time E. T. Whiter, chairman of the committee representing the railroads before the Board, said in commenting on the decision:

The Board has laid down certain principles which must be recognized, and subject to these principles, has abrogated the national agreements and remanded the negotiation of rules and working conditions to conferences between the individual railroads and representatives of their own employees. While the representatives of the railroads would have preferred that all the questions involved should be referred to conferences between the individual railroads and their own employees, the decision reached has given opportunity for arrangements between individual railroads and their employees which can be made much more reasonable than the rules and working conditions established by the national agreements, and which in a large measure can be adapted to the local conditions of each carrier.

The extent to which it will be practicable, under the principles laid down by the Board, to increase the efficiency and economy of railway operation is problematical. The decision will not permit the restoration of the rules and working conditions in effect on December 31, 1917, and to the extent that it prevents this it will prevent restoration of the efficiency and economy which formerly prevailed under private operation.

The Board approves the principle of the eight-hour day, but states that "it should be limited to work requiring practically continuous application during eight hours." This plainly indicates that the principle need not be applied to work that does not require such continuous application. The Board also says that "for eight hours' pay eight hours' work should be performed by all railroad employees" except those in train service, who are paid on a mileage as well as on an hourly basis.

These and other statements in the principles laid down by the Board clearly indicate its disapproval of rules which representatives of the railroads have shown result in employees being paid for time greatly in excess of that actually worked. The entire tenor of the Board's decision is that the railroads should be economically operated, that employees should render efficient labor for all the time for which they are paid, and that the artificial "pyramiding" of wages, which under the present rules has resulted in large waste, shall cease.

The Board has recognized the principle of collective bargaining but it does not recognize the interpretation placed upon it by the spokesmen of the labor unions. The spokesmen of the labor unions have taken the position that collective bargaining meant national bargaining between all the railroads and the national labor unions. The Board, by remanding the determination of rules and working conditions to conferences between the individual railroads and representatives of the majority of its own employees of each craft, has recognized the fact that true collective bargaining consists of negotiations between each railroad and its own employees.

If both the carriers and the employees act in good faith in accordance with the spirit of the Board's decision, rules and working conditions will be established which will be more reasonable than those now in effect, and which to a large extent will have the merit of meeting the local conditions which vary widely throughout the country.

### Wage Hearings Begin

In accordance with an order of the Board, announced in the *Railway Age* of April 15, (page 938), the wage question was reopened on April 18 when hearings were started to determine what constitutes a just and reasonable wage under present conditions for various classes of employees. At the time the Board's announcement was made, disputes between 26 railroads and their employees had been certified. When the hearings began the Board had docketed 92 disputes. These were consolidated into one case although each carrier was granted the right to make a separate presentation.

The fact that the three new members of the Board were not present at the beginning of these hearings led to vigorous protests against the opening of the case on the part of representatives of the employees. Only five members of the Board, including but one representative of the employees, were present. W. S. Carter, L. E. Sheppard, W. S. Stone and W. G. Lee, of the train service organization, speaking for the sixteen railway organizations, objected strenuously to hearings before the three new appointees had taken their seats.

They asked, in addition, for more time to prepare and present their cases and a separate hearing for the train service employees on the grounds that their pay and relationship to the transportation industry are entirely different from those of the shop crafts and other organizations and because there is no work in other industries comparable with the work of the train service employee. After a short recess the Board refused to yield its authority to hear the case immediately. It did, however, grant a time concession in allowing the carriers and unions, instead of one day each for the presentation of their cases, as it had announced, five days each for this purpose. The Board also ruled that there would be a week's intermission between the carrier's presentation and that of the unions and that an additional week would be allowed for rebuttal.

The railroad's arguments for wage reductions were opened by J. G. Walber, speaking on behalf of the eastern carriers and taking up those arguments which are common to all of the roads in that territory.

He presented a memorandum and statistical exhibits showing the reductions in wages in other industries and in the cost of living which have occurred since the present railway wage scales were fixed by the Board in July, 1920.

Mr. Walber showed by bulletins issued by the Bureau of Labor Statistics of the United States Department of Labor dealing with wage rates in a dozen important branches of industry, that very substantial reductions of pay were made in these industries in the period from January to March, 1921. The statistics cited, Mr. Walber pointed out, "indicate a general and widespread reduction in wages from 10 to 30 per cent—the majority of reductions are 15 per cent or over."

With reference to the cost of living, Mr. Walber said:

"It is common knowledge that about July 1, 1920, prices of commodities entering into the cost of living began to recede; also that the falling off in the demand for commodities generally began to be reflected in curtailment of the forces and reductions in wages paid in other industries. This situation became more and more pronounced toward the end of the year, and has been continuing steadily up to the present time. These conditions contributed to adjustment in the scales in other industries."

Mr. Walber also submitted statistics regarding the reductions in the cost of living, based upon compilations made by various commercial agencies and also by the Bureau of Labor Statistics and the National Industrial Conference Board.

"The latest figures available from the Department of Labor," he said, "are for the period ending December, 1920, while the National Industrial Conference Board has compiled its figures to March, 1921. By reference to the declines from the peak (July, 1920, when the present wages were fixed) to December, 1920, as shown by these tables, it will be observed that the Department of Labor Statistics indicate a decline in the cost of living of 7.4 per cent, and the figures of the National Industrial Conference Board a decline of 7.1 per cent. The decline to March, 1921, according to figures of the National Industrial Conference Board, is 17 per cent, and if the Department of Labor figures for March, 1921, were available it is reasonable to assume that the similarity in the results obtained by both organizations would have continued."

In substance, the exhibits filed by Mr. Walber showed that when the present railway wages were fixed in July, 1920, the cost of living was 104.50 per cent more than it was in 1914, while in March, 1921, it was only about 67 per cent more than in 1914, and is still declining. These exhibits also indicated that the average railway wage per annum is now about 133 per cent more than it was in 1914.

Following Mr. Walber's general presentation on behalf of the eastern lines, a statement was made on behalf of the railways in New England by C. L. Bardo, general manager

of the New York, New Haven & Hartford. In this statement the changes which have occurred in the cost of living in New England, as disclosed by the report of the Special Commission on the Necessaries of Life in Massachusetts, were particularly dealt with. This showed that in July, 1920, when the present wages were fixed, the cost of living in Massachusetts was 102.6 per cent more than in 1913, while in March, 1921, it was only 66.4 per cent more than in 1913. The reduction shown in the cost of living since the present wages were fixed was 35.3 per cent. The statement on behalf of the New England lines says in part:

"From the evidence as to the reduction in the cost of living and rates of pay for positions of like service and responsibility in outside industries, which will be fully covered in the briefs submitted by individual roads, the New England roads believe that your Board is fully justified in fixing as maximum and reasonable wages the rates requested by the several lines. Your petitioners believe that the financial condition of the employers is worthy of some consideration. The regular reports of results of operation of the New England lines, which are matters of public record, show that even with the recent increase in rates your petitioners are failing by a substantial sum to meet costs of operation, to say nothing of fixed charges. This situation exists notwithstanding the most drastic economies which can be exercised, having due regard for the safety of operation."

It was shown that on the New England lines the hourly wages of track and work train laborers have increased since 1914 from 15 cents to 48½ cents, that the rates of shop and enginehouse laborers have increased from 16 cents and 17 cents to 48½ cents and 53 cents, and the rates of freight house laborers from 15 cents to 54 and 55 cents. The standard hours of work per week in 1914 were 60 hours, while since September, 1918, they have been 48 hours.

"The attention of the Board is invited to the fact that the increase in the basic hourly rates and weekly compensation vary between 140 and 240 per cent, whereas the increase in the cost of living at its peak was 102.6 per cent over 1913-1914 and at the present time is 66 per cent higher than in 1914."

#### Individual Carriers Present Their Cases

Following the presentation of these two general statements, the individual carriers began the submission of volumes of statistical analysis, charts and data relating largely to decreases in the cost of living and the wages being paid by outside industries for both skilled and unskilled labor at various points and comparisons between this data and respectively the increases which have taken place in the wages of railway employees and the present scale of railroad wages. The enormous amount of evidence presented to the Board during the past week makes its analysis at this time impossible. However, the character of the testimony being given by the carriers in support of their pleas for lower wage scales can be seen in the following brief abstracts of two of the presentations which have already been made.

One of the first large roads to present its case was the Pennsylvania whose statement and brief to the Board said in part:

In arriving at the amount of reductions we requested the employees to accept, exhaustive studies were made of the cost of living and the rates paid in outside industries located along the Pennsylvania. In connection with the reductions we desire to make in the cases of maintenance of way and structures and unskilled forces, shop employees and freight handlers, we direct the Board's attention to the fact that we have recommended that rates of pay proposed be varied territorially, according to the rates paid generally in the territories in question. In the case of certain signal department employees and shop employees, we also propose certain spreads of rates for the various crafts varying with the skill required for the particular operation performed.

We further call the attention of the Board to the fact that

prior to 1918, the spread of rates on the railroads for shop employees was very much greater than it is at present and attach an exhibit which shows the spread of rates on the Pennsylvania prior to 1918 as compared with now. It is the desire of the management eventually to expand the differentials recommended and adjust all of their rates in accordance with the skill required and with respect to conditions in the territories where these rates are applied.

We desire to call particular attention to the studies made of wages paid in outside industries marked Exhibit No. 8 which is the result of a study of 1235 plants and covers over 155,000 employees, or approximately three times as many employees as in these trades on the Pennsylvania. This exhibit clearly shows that the prepondering rates paid in outside industries are generally below those proposed in the carrier's submission and in addition, it is shown that there have been further reductions since the information was first obtained.

The exhibit referred to in the preceding paragraph shows that in comparison with the prevailing rate of 85 cents an hour now being paid by the Pennsylvania to shop employees and 62 cents an hour to helpers, the weighted average rates of pay in 1235 outside industries for similar work are as follows:

Number of men	Occupation	Weighted average rate per hour
51,586	Machinists	64.7 cents
4,536	Blacksmiths	66.1 cents
10,271	Boilermakers	64.3 cents
7,364	Sheet metal workers	65.8 cents
6,296	Electrical workers No. 1	60.9 cents
3,247	Electrical workers No. 2	61.9 cents
23,198	Carmen	60.9 cents
10,870	Moulders	70.0 cents
38,138	Helpers	49.4 cents

The total study summarized above takes in the entire territory from New York to Washington, Philadelphia, Pa., to Chicago and St. Louis, Mo., and northward to the Great Lakes.

The statement added:

We also submit in Exhibit No. 9, the trend of the cost of living in certain cities along the lines of the Pennsylvania, showing conclusively that the trend of the cost of living along the Pennsylvania follows generally the line established by the Bureau of Labor Statistics for the United States.

Concluding the Pennsylvania statement said:

The information presented is the most recent we have been able to obtain and if taken at a later date would unquestionably show a greater reduction in the cost of living and further reductions in rates of pay in outside industries. The information considered from all angles proves conclusively to our mind that the rates of pay now in effect are not just and reasonable and that we would have been justified in asking for lower rates than those presented to our employees.

Western roads began the presentation of their cases on the second day of the hearings and among the first of these was the Chicago & North Western whose brief is representative of those given to the Board in behalf of these carriers. It said in part:

"It is deemed important to submit the cause as to common labor first for the following reasons:

"1. The season of the year has arrived when it is necessary that the railway company employ its full and complete quota of common laborers in its maintenance of way department.

"2. There are thousands of common laborers now out of employment in the territory traversed by this company's lines of railroad.

"3. There can be no doubt but that the present minimum scale for common labor is greatly in excess of that paid in other industries.

"4. The present minimum scale for common labor upon the railroad imposes a financial burden which the company cannot meet if it is to employ the number of men now necessary for the proper maintenance of its property."

In support of this plea to reduce the wages of unskilled labor exhibits were filed showing:

1. That common labor can be employed at the present time at rates varying from 25 to 45 cents per hour according

to the locality in which they are employed and that in a large part of the territory covered by the Chicago & North Western men can be obtained for 40 cents per hour.

2. That the rates being paid for unskilled labor in industries in the territory served by the North Western are substantially below the rates being paid under Decision No. 2.

"From an examination of these exhibits," the statement said, "it will be seen that there has been a marked decline in the wages of common labor for substantially all industries between the rates paid in April, 1920, and April, 1921."

Regarding the decline in the cost of living, references were made to the data prepared by the United States Bureau of Labor Statistics showing by means of weighted index numbers the decreases in the cost of commodities, both wholesale and retail, which have taken place since last summer when the peak was reached in commodity costs.

In presenting the case of the western carriers it was decided that six of the larger roads which cover that territory in general should carry the major part of the burden of proving that the decline in the cost of living and in the wages paid for comparable work in outside industries justify decreases in the wages of railway employees, the remaining carriers to file presentations covering peculiar local conditions.

It will be noted that there is no uniformity in the requests being made of the Board by the various roads. Some are asking for reductions in the wages of practically all of their employees, others for reductions in the wages paid unskilled labor, others for reductions in the wages of various classes of employees, the wage scales to vary according to the varying local conditions, while still others are asking for a return to the wage scales in effect prior to Decision No. 2. The manner in which the Board will act on these varying requests is unknown; its policy being to allow the carriers and employees to present their own cases in their own way.

### St. Louis Southwestern Loses Case Before Board

A ruling in the controversy between the St. Louis Southwestern and its employees in pile driver, bridge and building, paint and house gangs and in tinner service was handed down by the Board on April 14 and announced on April 18. The decision upheld the employee's position throughout and criticized the carrier for the action it had taken in abolishing certain positions and thereafter contracting for the same work. The progress of the hearings in this case was described in the *Railway Age* of April 8, (page 903).

After reviewing the history of the controversy and the positions taken by both sides in the hearings held before the Board on April 1, the ruling said in part:

It is urged by the carrier that it has abolished positions, that they no longer exist, that the work formerly done by the incumbents of such positions is now being done by contract, and, that the persons performing said work are not employees but contractors.

It is not believed that any long legal disquisition is necessary to demonstrate the fallacy of this device to evade the obligations of Title III of the Transportation Act and of Decision No. 2 of the Labor Board. All employees of carriers are contractors. There is in every case a contract imposing an obligation of service on the one side and of compensation on the other. Nor are the persons performing the duties of the positions specified any the less employees of the carrier because bids may have been taken and the contract awarded to the lowest bidder. The question whether the persons performing the duties formerly attached to the specified positions are employees of the carriers or not employees, is to be determined by the character of their duties and not by the form of contract employed. It appears that the positions and occupations named, except cooks, have been long established in the railroad service, that the duties attached to them are duties which must be regularly performed year in and year out, and that such performance is necessary in order that the carrier may perform its duties to the public. These positions in general inhere in the service of a common carrier and are necessary to that service. This carrier con-

sidered them necessary, for after the abolition it re-established them by individual and special contracts.

It is found by the Labor Board accordingly that the persons performing the duties formerly allotted to the positions named, or substantially such duties, are in fact the employees of the carrier, that the pretended abolition of such positions was not in good faith, but was a device to evade the obligations of Decision No. 2 of this Board. Such a device cannot and will not be allowed to prevail. It can easily be seen that if a carrier may evade the decision of the Labor Board by abolishing a position and re-establishing it as in this case, there is an end to any obligation to obey a decision of the Labor Board as to wages, if the carrier is willing to employ this subterfuge.

As to track foremen and track laborers there seems to have been not even the "abolition" of the positions to mask the attempt at evasion. With regard to these positions, this carrier has very simply and directly violated Decision No. 2 and the plain provisions of the Transportation Act.

But it is urged that the compensation paid the carrier's "contractors" was arrived at by agreement and that such an agreement is within the authority set out in Decision No. 2 that changes might be made by agreement. This position is untenable.

For the reasons stated the Labor Board finds that the St. Louis Southwestern Railroad Company has violated Decision No. 2. It is the decision of the Labor Board that this carrier restore the said positions and the pay, duties and obligations of said positions to what they were on July 20, 1920, as established by this Board's Decision No. 2; and it is

further decided that the persons serving in said positions just prior to the effective date of the order of the carrier be reinstated therein if they so desire, and that each such person so reinstated receive pay equal to what he would have received, if occupying such position, at the rate provided by Decision No. 2 from the date removed or reduced in pay to the date of reinstatement, less what any such person may have earned by personal service in the meantime.

If the carrier shall make it appear to the Board that this decision requires the reinstatement of employees in excess of the requirements of the service, this decision will be modified accordingly.

The presentation of cases on behalf of individual carriers ended on April 20, and the Board adjourned until April 28 in spite of the pleas of the employees' representative for additional time before being required to reply to the carriers' arguments for wage reductions.

The sudden ending of the National Agreements case left the labor organizations with several voluminous exhibits regarding the "inadequacies and inefficiencies of management" which had not yet been presented to the Board. These exhibits, prepared by W. J. Lauck, consulting economist for the labor organizations, have however been injected as evidence in the wage case dispute. The character of these exhibits filed during the past week has been outlined in previous issues of the *Railway Age*.

## Freight Claim Reduction on the Central of Georgia

### Special Drive on Careless Freight Handling Results in 50 Per Cent Reduction of Claims

By G. L. Candler

Assistant General Manager, Central of Georgia

A RECENT ARTICLE in one of the New York newspapers declared that to mention freight losses and damage to the average railroad man was to strike him between the eyes. The truth of this statement lies not only in the enormous expense of freight claims to the carriers in 1919, but also in the materially increased amount which they paid out in 1920. To the writer it would seem that loss and damage are chargeable largely to one thing—improper handling of freight and, further, that this improper handling occurs either when the freight is being received from the shipper, when it is being loaded or when it is being billed. He cannot agree with the opinion held by many, that improper packing is an important factor in causing loss and damage to freight. The classification rules in the final analysis are based on sound principles. If they are adhered to they offer adequate protection to the carriers by providing receiving agents with the right to refuse any shipment not in condition to stand ordinary transportation. This power to refuse improperly packed shipments should be exercised regardless of any pressure caused by competitive conditions. When we consider the relatively small number of shipments that are refused it would seem that shippers after all are reasonably careful in packing and marking their shipments for transportation. What, then, are the factors contributing to these heavy increases in loss and damage claims during the past two years?

#### Careful Supervision Is Lacking

It does not appear reasonable to suppose that indifference and inefficiency in freight handling are a natural consequence of the world war. If this were the case, the same carelessness would be reflected in other branches of transportation. It is true, however, that those in charge of and responsible for

freight transportation have failed in many instances to give adequate service and direction in matters of claim prevention. It has been my experience and observation that the rank and file of the employees who handle freight are not only willing but anxious to co-operate with the management in any movement for better service. They must, of course, be informed of the conditions which they are asked to remedy and this work of education can be made to stimulate interest among all other employees. I would suggest that division officers hold frequent meetings for the sole purpose of discussing the causes of loss and damage of freight and for developing means of eliminating them. In the same way meetings for officers throughout the system should be held periodically, at which plans can be formulated for the entire organization. Claim prevention bulletins issued frequently to drive home some strong points, based upon a specific instance of loss or damage, are of great value in prevention work. Finally, much desirable information can be brought to the attention of the employees through a monthly or semi-monthly review of the claims paid, together with a summary of the facts in cases where the amount is very large or the facts surrounding the claim are unusual. I have recently had occasion to discover that the average employee at a freight agency welcomes this sort of information and desires suggestions that will improve his methods of handling freight.

#### "No Exception Week" Successful

The Central of Georgia has realized that without the closest co-operation of all officers and employees, any effort to reduce freight claims will fail utterly. To secure this very desirable combination of effort, and to make known the necessity for close supervision of freight handling, the com-

pany recently made a special drive for one week, known as "No Exception Week," which, incidentally, provided ample evidence of the results which this close co-operation can secure. The campaign was advertised among the personnel for a month before it was to commence. Numerous circulars and bulletins were issued, in addition to a great many personal letters sent out by officers of the transportation department to agents, conductors and yard men over the system. The purpose of this publicity was to drive home to our employees the serious situation which had developed from inefficient freight handling and to bring them to realize that better service was necessary immediately to stop this drain on the company's resources. A spirit of friendly rivalry was in evidence from the start, and a most remarkable and gratifying showing was made. The number of exceptions issued to cover over, short, and damaged freight during "No Exception Week" showed a decrease of approximately 95 per cent in comparison with the weeks immediately preceding the drive. More important than the campaign itself, however, has been the permanent interest which our organization has taken in claim prevention work. Statistics recently compiled indicate a reduction of 50 per cent in the number of exceptions filed since the campaign.

In my opinion considerable attention should be directed toward the duties of agents, since their functions are mainly concerned with freight handling. An especially careful study of conditions at each agency should be made in times of depression such as the present, so that any reduction in forces will not work to prevent adequate supervision by the agent and his assistants. We should not neglect to encourage the agent who displays evidence of interest in improving his methods, and we should be ready to co-operate with him by providing better facilities to aid him in securing more economical freight handling at his station.

#### Receiving Clerks Must Be Competent

I have referred to our classification requirements. There is one feature in this connection that should be considered carefully. Much more attention should be paid to the position of receiving clerk and, instead of being the lowest paid at an agency, it should be decidedly on the preferred list so that thoroughly competent employees can be made available. Our classification rules are both voluminous and complicated, yet very few receiving clerks are sufficiently familiar with them to be able to protect the interests of the company as they should be protected. Special inspectors have told me that they have found men acting as receiving clerks at important stations who had never heard of a classification or its rules. It is little wonder, then, that we find many instances where these rules are violated. Not only should the receiving clerks be competent, but they should be sufficiently numerous to insure a close inspection and check of every shipment offered for transportation at all times. Any number of packages, many of them valuable, cannot be identified and are disposed of at a great sacrifice because they were not properly checked at the point of origin. I am an advocate of inside marking and I favor instructing shippers to place some sort of an identification mark on each case as it is packed for shipment. Start all shipments right—that is, receive them properly, load them carefully and bill them correctly and they will have every chance of reaching their destination in first-class condition.

Many claims are caused by the loss of entire packages. Fifty per cent of the exceptions issued by the Central of Georgia, and I take it this condition obtains generally, are issued to cover over and short freight. To minimize this loss, particular care should be taken to bill freight strictly in accordance with the bill of lading that has been issued. Officers should insist that a check of waybills against bills of lading be made at the close of the day's business, notwithstanding the additional time required.

#### Capacity Car Loading Requires Care

The importance of increasing the average number of tons per car and the average tons per train is always before us. Economical and hence successful operation depends more on this than upon any other factor. Where sufficient tonnage of the proper class is available I hold that it is a distinct advantage to load the car to its capacity, provided, of course, it is destined to an agency or transfer point which has a force and facilities adequate to handle it. But when a car is loaded to capacity care must be taken to avoid piling heavy packages on light or fragile shipments, as this frequently causes considerable damage. When merchandise cars destined for long hauls are not loaded to their full capacity their freight should be bulkheaded. This can be done at a nominal cost and with proper care the bulkheading can be used a number of times.

An exception to this practice of capacity loading must be made in the case of merchandise cars which are to be worked locally by the train crews. These must be loaded light to avoid serious delays as well as to insure careful checking. To accomplish this end loading clerks and stevedores must be thoroughly familiar with the location of stations at which stops will be made so that the cars can be loaded with reference to the order in which they must be unloaded. We have found it advantageous to require loading clerks, agents and warehouse foremen to ride local freights periodically so that they can observe their own work and the methods of others as well. We encourage our conductors to criticize the methods followed at all times, letting them realize that proper loading of freight lessens their own work and responsibility. The average conductor has neither the time nor the inclination to make a full report on irregularities which come to his attention. To get around this we have provided them with a concise printed form which they can readily fill out and which is always at hand in the waybill pouch of each car. This idea has proved decidedly effective by bringing in reports which otherwise would not be made.

#### Conclusion

There is likely to be a certain amount of damage to freight no matter how carefully it may be loaded and braced. Emergency stops of long freight trains, the bursting of an air hose, or a careless stop at a water station are all likely to prove disastrous. When a train consists of more than 25 cars the locomotive should be detached before reaching a water crane at which a stop is to be made, unless the grade or some other physical conditions prevent. The same caution should be taken in inspecting air hose before a train leaves its terminal. It happens very frequently that the bursting of an air hose is accompanied by a shock so severe that not only is the freight damaged but the equipment suffers as well.

At the present time defective equipment, especially rolling stock with roofs, sides and doors in bad condition, is accounting for more damage to freight than at almost any time in the past. Until conditions are such that this equipment can be repaired, unusual care should be used in loading shipments that can be damaged by water or exposure.

Loss and damage to freight present a serious problem which must be solved quickly. No such drain on our revenues as this, which is wasting more than \$100,000,000 annually, can be justified. If every one of us can be brought to realize that efficient handling means better service to our patrons and that better service to them means more traffic and revenue for us, a long step forward will have been taken. For certainly every one of us knows that additional revenue must be obtained.

WHAT THE RAILROAD brotherhoods are really up against is a combination of General Atterbury, general apathy, and the general public.—Columbia (S. C.) Record.

## E. H. Shaughnessy

**E.** H. SHAUGHNESSY, assistant director of the Division of Transportation of the American Petroleum Institute, has been appointed second assistant postmaster general. This appointment has a two-fold interest to railroad men. It is noteworthy, in the first place, because Colonel Shaughnessy is a railroad man, and consequently is fitted by training for the duties of his new office which, it will be recalled, has jurisdiction over the railway mail service. Equally significant is the fact that Colonel Shaughnessy's selection apparently indicates the intention of the new administration to bring to an end the controversy between the carriers and the post office department over payments for the service of mail transportation.

This controversy has been of long standing. As early as July 28, 1916, on the recommendation of Postmaster General Burleson, Congress passed a law, over the opposition of the carriers, fixing tentative rates for the transportation of the mails on a space basis. The Interstate Commerce Commission, however, was directed to investigate the matter fully and to prescribe the rates and permanent basis for the future. On November 1 of that year the postmaster general issued an order changing the system of payments from a weight to a space basis, which he claimed, would materially reduce the payments to the railroads. This order of the postmaster general made full use of the "consent and approval" of the Interstate Commerce Commission for a proposed trial period, providing a comparison of the space and weight bases on "certain selected groups" of mail routes. The "certain selected groups" as interpreted by the post office department, included practically all the railway mail routes in the country and the "trial period" provided for was continued indefinitely.

Again, in January of this year, the attention of Congress was directed to the fact that, although the Interstate Commerce Commission had announced an increase in the rates which the post office department must pay the carriers for the transportation of mails, effective on March 1, 1920, as well as a readjustment, retroactive to November 1, 1916, the post office department had not yet asked Congress for the necessary appropriation to cover this obligation. It was further pointed out that the amount withheld from the roads was by no means negligible since the increase for the future had been estimated at \$35,000,000 a year and the retroactive payments were expected to reach \$95,000,000. With these and other incidents fresh in memory, railroad men will regard the appointment of a transportation man as second assistant postmaster general as an indication that efforts will be made to handle the hauling of the mails as a transportation problem, which it is.

As to the new incumbent himself, Colonel Shaughnessy was born in Chicago, on October 26, 1882, and entered railway service in July, 1899, as a telegraph operator on the

Chicago & North Western. During the next 18 years he served continuously in various capacities on the North Western, both in Chicago and at other points on the line. On May 28, 1917, while serving as trainmaster, with headquarters at Chicago, he was granted leave of absence to enter military service. The War Department had just called on the railroads entering Chicago to raise a regiment of engineers, and Colonel Shaughnessy applied for service. He was asked to aid Colonel Langfitt in a civilian capacity in recruiting work, but was shortly commissioned first lieutenant and given command of a company in the regiment which became the well-known 13th Engineers.

He accompanied the regiment to France and remained with the organization during its first operations in the Verdun sector. In June, 1918, he was detached from the 13th Engineers and assigned to duty with the Transportation Corps, serving successively as general superintendent, assistant general manager, general manager and acting deputy general of transportation of the advance section. He was promoted to major in September, 1918, and to lieutenant colonel in February, 1919.

During the organization of the Transportation Corps, Colonel Shaughnessy collaborated with French military and civilian railway men in the preparation of a French-English book of rules for railway operation which was used by the American forces during the entire period of the war. He was awarded the Distinguished Service Medal by a general order of the War Department, was commended for conspicuous service at Chateau-Thierry, and was decorated with the Legion of Honor by the president of France. Colonel Shaughnessy returned to the United States in September, 1919, and was commissioned colonel in the Officers Reserve Corps, Engineers Section, in January, 1920. He was also included in the list of officers declared competent

for General Staff duty without further training.

Upon his return from overseas, Colonel Shaughnessy resumed his duties with the Chicago & North Western, but a short time later resigned from railway service to accept an appointment as assistant director, Division of Transportation, American Petroleum Institute, with headquarters at New York City.

SINCE THE PERIOD immediately preceding the war the number of freight cars on the Italian railways increased from 90,000 to 120,000, while the number of locomotives in the same period fell from 4,400 to 4,200. This diminution accompanied an increase in the length of line operated amounting to 900 miles. Locomotives have not yet recovered from the hard usage undergone in meeting war demands. Proper repairs and the building of new locomotives were slighted during hostilities, and since the cessation of hostilities various dislocations and labor conditions have interfered with construction work in this line.—*Commerce Reports.*

E. H. Shaughnessy

## Pacific Type Locomotives for the Reid Newfoundland

THE REID NEWFOUNDLAND COMPANY operates a railway on the island of Newfoundland, extending from St. John's to Port-aux-Basques, a distance of 546 miles. The character of much of the country is extremely hilly and the motive power used in passenger and freight service is designed to operate on grades of two per cent and curves of 14 degrees. The track is laid with 50 lb. rails and the gage is 3 ft. 6 in. Much of the passenger traffic is handled by locomotives of the ten-wheel type, the most recent of which were built in 1917. The Baldwin Locomotive Works has recently constructed six Pacific type locomotives which are designed to meet the requirements of heavier traffic. A brief comparison between the Ten-wheelers and Pacifics is as follows:

	Ten-wheel type	Pacific type
Cylinders	17 in. by 22 in.	17 in. by 24 in.
Valves	Balanced slide	Piston—8 in. diameter
Boiler type	Straight top	Straight top Belpaire
Diameter	56 in.	56 in.
Working pressure	160 lb.	170 lb.
Firebox—Length	89½ in.	66¾ in.
Firebox—Width	29 in.	60½ in.
Tubes—Diameter	2 in.	5¾ in. and 2 in.
Number	184	18, 5¾ in.; 111, 2 in.
Length	12 ft. 0 in.	16 ft. 0 in.
Heating surface—Firebox	106 sq. ft.	93 sq. ft.
Tubes	1,148 sq. ft.	1,358 sq. ft.
Firebrick tubes		12 sq. ft.
Total	1,254 sq. ft.	1,463 sq. ft.
Superheater		343 sq. ft.
Grate area	18 sq. ft.	27.6 sq. ft.
Driving wheels—Diameter	50 in.	52 in.
Engine truck—Front, diameter	26 in.	30 in.
Back, diameter		30 in.
Wheel base—Driving	11 ft. 0 in.	10 ft. 0 in.
Total engine	20 ft. 5 in.	27 ft. 3 in.
Total engine and tender	47 ft. 9 in.	50 ft. 8 in.
Weight—On driving wheels	72,700 lb.	78,000 lb.
Total engine	92,100 lb.	115,000 lb.
Total engine and tender	148,000 lb.	199,000 lb.
Tender—Tank capacity	2,800 U. S. gal.	3,600 U. S. gal.
Fuel capacity	5 tons	9 tons
Tractive effort	17,300 lb.	19,250 lb.

The boilers of the Pacific type locomotives are of the straight top type with Belpaire fireboxes and are equipped

Interesting Design of Passenger Engine for 3 ft. 6 in. Gage

with superheaters. The boilers are designed to carry a pressure of 200 lb., although the work-pressure used in service is 170 lb. The machinery is designed for a boiler pressure of 190 lb. should it be found desirable subsequently to raise the pressure. Brick arches are installed and are supported on tubes. The front of the firebox crown is supported on two rows of Baldwin expansion stays and the tubes are welded into the back tube sheet.

The cylinders are 17 in. in diameter with a 24 in. stroke and the steam distribution is controlled by 8 in. piston valves operated by Walschaert valve motion. The cylinders are fitted with cast-iron bushings. The frames have single front rails with extra heavy bumpers designed to resist snow bucking. Hodges trailing trucks are used. The equipment includes A.R.A. couplers, Westinghouse air-brakes, electric headlights, air sanders and steam heat. The extreme height of these locomotives is 12 ft. 6 in. and the width 9 ft. 3 in.

The tenders are of the eight-wheel type having a capacity of 3,600 U. S. gal. of water and 9 tons of coal. The frames are constructed of steel channels with steel plate bumpers. The trucks are of the arch-bar type with cast steel bumpers and chilled cast iron wheels.

## Prices Still Higher Than Freight Rates

IN SPITE OF THE RECENT SHARP DROP, average prices are still on a higher basis than freight rates. This is shown in figures just compiled by the Bureau of Railway Economics. The following table is based on the wholesale price index number of the Bureau of Labor Statistics, and gives a relative freight-rate index number based on average receipts per ton-mile.

Year or month	Average railroad receipts per ton mile		Index number of wholesale prices
	Actual	Relative	
1913	.719	100	100
1914	.723	100	100
1915	.722	100	101
1916	.707	99	124
1917	.715	100	176
1918	.849	118	196
1919	.973	135	212
1920	1.052	146	243
Sept. 1920	1.131	160	242
Oct. 1920	1.226	171	225
Nov. 1920	1.263	177	207
Dec. 1920	1.209	168	189
Jan. 1920	1.192	166	177

Up to the close of 1920 rates lagged far behind prices. It is only since the drop in prices began that the margin between increase of prices and increase of rates has narrowed. For 1920, as a whole, prices exceeded rates by almost one hundred points, and even in January of this year prices were eleven points higher than rates.

Traffic in the last four months of 1920, with increased rates, was heavier in the United States than during the corresponding period of the three previous years. The depres-

sion which set in, was therefore not an effect of increased rates; it came from causes which have produced business depression all over the world.

The ANDALUCES RAILWAY in Spain will probably purchase 35 or 40 American locomotives in the near future in spite of lower bids from other manufacturers because of the ability of American concerns to make early deliveries, according to reports from Consul Gaston Smith at Malaga. It is indicated also that purchases of cars are being negotiated.

THE SOUTHERN PACIFIC has just completed a first aid station or emergency hospital at Bay Shore, South San Francisco shops, which makes the thirteenth emergency hospital unit on the Company's Pacific system. The unit has an operating room, small ward, kitchen, waiting room and doctors' office, and the station is in charge of a trained nurse at all times.

# I. C. C. Authorizes Lackawanna Stock Dividend

## Issue of Additional Common Stock as a Dividend—Capitalization of Entire Surplus Not Authorized

WASHINGTON, D. C.

THE DELAWARE, LACKAWANNA & WESTERN was authorized by the Interstate Commerce Commission, in a decision dated April 18 and made public on April 20, to issue \$45,000,000 of additional common stock to be distributed as a dividend. The company had asked authority conditioned upon its disposal of its coal properties and acceptance of certain provisions of the Pennsylvania constitution to issue capital stock to the full amount of its corporate surplus, which amounts to about \$90,000,000, or such part thereof as the commission might approve. The present capital stock of the Lackawanna is \$42,220,550, and it has outstanding only \$102,600 of bonds. Its leased lines have \$44,811,710 of stock and \$53,697,657 of bonds.

The commission finds that the evidence establishes (1) that the Delaware, Lackawanna & Western railroad has a large uncapitalized surplus; (2) that the present capitalization is below the actual investment or fair value of the property; (3) that the increase in capitalization which would follow the grant of authority hereinafter suggested would still leave the total capitalization of the applicant below the fair value of the property; and (4) that the remaining uncapitalized surplus will be sufficient to serve the purposes for which a surplus should be accumulated.

It also finds that the proposed issue of stock as a dividend has been justified to the extent of \$45,000,000 and that to that extent it (a) is for a lawful object within its corporate purpose and compatible with the public interest, which is necessary and appropriate for, and consistent with the proper performance by it of service to the public as a common carrier, and which will not impair its ability to perform that service; and (b) is reasonably necessary and appropriate for such purpose; but that applicant has not justified an authorization of the issuance as dividends of the balance of its proposed capital stock in excess of \$45,000,000 and that authority therefore should be denied.

The authorization of the issuance of \$45,000,000 capital stock is conditioned in the order upon the issuance of evidences of indebtedness by the leased lines to applicant for the \$10,344,048.64, carried on its books as advances to leased lines, and the transfer by the Delaware, Lackawanna & Western of that sum to the proper subsidiary account under investment in leased lines:

An abstract of the majority report follows:

Applicant's situation, is in a sense equivalent to that of a road having outstanding \$42,220,550 of stock and \$98,611,967 of funded debt upon which it pays yearly interest of \$5,084,681, or about 5.15 per cent, with a total capitalization aggregating about \$150,000 per mile of road and \$52,100 per mile of track.

It is not shown what portion of the stock was paid for in cash, by service, or in property. Nor, as the effect of the many early consolidations does not appear, is it possible to state what portion may represent estimated value of merged properties. Stock dividends of \$10,890,013 are included in the "cash value of proceeds" column. It is therefore a fair conclusion from the record that the original subscribers actually paid for the outstanding stock, in cash or its equivalent, representing direct sacrifice on their part, not in excess of \$30,980,950.

Applicant distributed cash dividends of about 72 per cent upon its stock in 1909, of 22½ per cent in 1917, and of 20 per cent in every other year from 1905 to 1919, inclusive. The total dividends from 1853 to and including May 31, 1919, are given as \$210,159,430.64, of which nearly \$23,000,000 was in stock of applicant or of its subsidiaries and the remainder in cash. The average rate of dividends during this period was about 12.8 per cent.

Since 1853, according to one of its exhibits, applicant's net income from transportation has been \$208,004,765.04, that from sale

of coal \$66,009,776.02, that from other sources \$40,840,137.99, and its total net income \$314,854,679.05. From this the exhibit shows payment of \$210,159,430.64 in dividends and \$14,233,472.38 in interest, leaving a book surplus of \$90,461,776.03. The dividends exceeded the net income from transportation by \$2,154,665.60 but net income from that source and sources other than sales of coal exceeded dividends by \$38,685,472.39.

Applicant states that these surplus earnings are represented by the following items:

Investments in railroad property.....	\$32,030,645.47
Other investments:	
In mining properties.....	\$2,205,988.00
In other non-operating properties.....	2,344,179.31
In railroad, etc., stocks and bonds.....	24,824,046.25
In other stocks, bonds, etc.....	14,229,385.67
In advances to leased roads, etc.....	10,344,048.64
	53,947,848.07
Current assets (excess over current liabilities).....	3,136,714.80
Net accounts, U. S. R. R. Administration.....	1,326,567.69
	Total surplus.....\$90,461,776.03

This result is obtained by deducting from the book investment in road and equipment, less reserve for depreciation, the aggregate outstanding stock and funded debt, and assuming that the remainder and the other assets listed were paid for out of surplus earnings.

Applicant contends that its actual surplus is much larger, since its coal properties are carried in these figures at their remaining original cost rather than their value, and since expenditures for additions and betterments were frequently charged to operating expense prior to 1907.

Authority to issue stock can not be claimed as a right. It is within our discretion, subject to the limitation that we shall grant authority only if we are able to make the necessary finding. If applicant is lawfully entitled to earn a return upon the fair value of property acquired out of surplus this right will persist whether or not the stock issue is permitted.

Applicant contends that we should permit the capitalization of the full surplus of the company. It argues that refusal to grant the application would seriously discourage, if not entirely prevent, investment by the public in railway stocks. It alleges that a refusal to grant this application would be public notice of a lack of advantage in investing in stock. And it suggests that in the event of denial of the application there would be no inducement in the future to use surplus earning for additions and betterments, and that stockholders would insist each year upon the distribution of all available earnings.

Applicant points out that the lawful declaration of dividends at a rate high in comparison with that of other railroads in the same territory has led the public to the unwarranted conclusion that applicant has received and is receiving an excessive return on its investment in property devoted to public use, and that the proposed increase in stock would tend to remove this source of distrust and suspicion. It suggests also that in case of consolidations with other lines applicant could secure much better terms if its capital stock more nearly represented its value than as at present.

There is no proof that the surplus sought to be capitalized is the result of excessive transportation charges. Traffic has been carried by applicant at rates, controlled by state or interstate regulatory bodies, substantially the same as those applicable over competing lines. And there is no showing that the return from transportation charges upon the fair value of applicant's property owned or used for common carrier purposes has been excessive. Clearly the amount of the return from the coal property is immaterial except as it tends to explain what might otherwise appear to be excessive carrier return.

The question of the reasonableness of applicant's past return is not in fact before us at this time. Where the public has found it expedient to adopt a *laissez-faire* policy to encourage utility development, it cannot be said that profits have been illegally collected in the absence of regulation. The title to the surplus has vested without limitation or condition in the corporation and benefits the shareholder. The doctrine of implied trust, sometimes applied by courts and commissions to donated property, has no application to excessive return, for the payment of rates carried with it no requirement that the funds be left in the business or used for the public benefit. Its strained application to carriers who have made additions and betterments

from surplus would only penalize those who came nearest to benefiting the public. The surplus from income was unrestricted legal property of the company, and ceased to be funds of the public, before the decision to divert it to either dividends or additions and betterments was made.

Such reasoning, however, does not warrant authorization of the issuance of securities merely upon a showing of invested earnings.

To render the proposed issuance "compatible with the public interest" within the meaning of the statute, we are convinced that a substantial surplus should remain uncanceled as a support for applicant's credit, providing for emergency needs, offsetting obsolescence and necessary investments in non-revenue producing property and serving as a general financial balance-wheel.

We do not share applicant's apprehension as to the effects which will follow the required maintenance of such a surplus. Such a reserve is a direct benefit to the stockholder. It maintains the market value of his stock and protects not only his dividends but his *pro rata* share of the assets available on dissolution.

The terms of possible future consolidations and mergers are not now before us and can be dealt with when the occasion arises.

Applicant claims a total surplus available for capitalization of \$90,461,776.03. In view of the proposed sale of its mining property and distribution of the proceeds, the \$2,205,988 shown as surplus invested in such properties may be dismissed from further consideration.

Several items of the remaining \$88,255,788.03 of said surplus, do not fall within that class of assets which we deem it proper to permit applicant to capitalize.

Applicant, on May 31, 1920, held in its treasury stocks of railroad, terminal, transfer, and ferry companies to the amount of \$9,151,048.75, and bonds of such companies to the amount of \$15,672,997.50, making a total of \$24,824,046.25. Of this amount, \$56,450 was applicant's own stock. The balance consisted mainly of stocks and bonds of lines leased by applicant. The record discloses no intercorporate relations or other circumstances which bring these holdings within the sphere of securities which could properly be capitalized by a common carrier. It is not necessary for applicant to hold securities of its leased lines in order to operate its system if as it states its leases are in perpetuity. We are unable to form any sound opinion on the record before us as to lines controlled by stock ownership. Neither the actual value nor the earning power of the securities is shown. So far as the record shows all of these securities are in the same class with the recognized shifting assets. Applicant on that date also held in its treasury stocks of advertising, mining, timber and land companies to the amount of \$1,662,813.37 and United States government bonds and certificates of indebtedness, municipal bonds, and steel company bonds to the amount of \$12,566,772.30, making a total of \$14,229,585.67. These are flexible assets which we deem it improper to permit applicant to capitalize. If it should be thought desirable to distribute the portion of its surplus invested in such securities among the stockholders applicant would be able to apportion the securities themselves or distribute the proceeds thereof. They are neither property used or useful in rendering the public service, nor an assured part of any surplus.

Nor is any reason manifest why applicant should be permitted to issue capital stock against its net account of \$1,326,567.69 with the United States Railroad Administration which is merely an unadjusted balance.

The record contains no showing which would justify our authorizing applicant to capitalize its investments in non-operating properties. The reasons for acquiring and holding these properties are not stated, and no present or contemplated future use of them in connection with applicant's transportation service is shown.

Applicant's lines are stated to have been entirely rebuilt since 1900, the work, with the exception of the construction of the Lackawanna Railroad of New Jersey and the cut-off line in Pennsylvania being accomplished solely by the use of applicant's earnings. The testimony is that no charge was made to the capital account in connection with the excess cost of replacements prior to 1914 because no depreciation reserve was set up, and these expenditures were considered as off-setting depreciation. No comparison of these items is made of record, and the policy as to writing off abandoned property other than equipment is not shown.

Applicant is not seeking to capitalize any equity in its leases of railroad property, but only the amount of earnings said to have been invested by it in the properties of such roads. The evidence is that most of these roads are leased in perpetuity, but that some are leased for the corporate life of the subsidiary

line. Without the leases before us we are unable to determine the length or nature of applicant's tenure, and cannot on the present record authorize applicant to capitalize its total investment in such property.

Applicant has advanced from its earnings \$10,344,048.64 to leased and controlled lines. These advances are carried into the capital accounts of such roads and credited by them to applicant. They differ little from investments in leased lines, and when shown upon applicant's books as such investments may be capitalized by it.

Applicant seeks to capitalize \$3,136,714.80, the excess of its current assets over its current liabilities as working capital necessary in the operation of the road. The record indicates that there are included in its current assets mining materials and supplies valued at \$1,364,618.19 which doubtless would be turned over to the purchaser of its coal properties and therefore should not be considered in passing upon this application.

Commissioners Daniels and Potter wrote concurring opinions. Mr. Daniels concurred in the report so far as it goes, but refrained from giving entire adhesion to the basis which seems to underlie the report, saying he is not persuaded that the entire remainder of applicant's surplus not allowed to be capitalized is requisite for the necessary purposes of a surplus. Mr. Potter did not concur in the view that the amount to be issued should be limited to \$45,000,000, nor in all of the reasons or conclusions upon which the report is based. Commissioner Eastman filed a long dissenting opinion on the ground that the capitalization of surplus is contrary to the public interest and ought not to be permitted.

No opposition to the granting of the application was made by any state authority.

## The Estimated Service Life of Western Tie Timber

By P. R. Hicks

Engineer in Forest Products, U. S. Forest Service,  
Madison, Wis.

DECAY IS INFLUENCED by a great variety of factors, among the most important of which are the species and quality of wood used, climate, soil, drainage, etc. Since various combinations of these factors will occur in different cases, the durability of a given species cannot be expected to be always the same. In most species of timber the sapwood is very much less durable than the heartwood, and the amount of sapwood present, therefore, is an important factor in the durability of untreated wood. Timber cut from dense (heavy) close ground wood is usually considered more durable than that cut from more rapidly grown wood. Decayed heartwood, which is often found when the tree is felled, may be a big factor in the short life of many ties, although a small amount of heart rot in cedar ties may not have much influence. Timber used in soils that are always wet or always dry is more durable than that placed in soils alternately wet and dry, and it usually resists decay much longer in cold than in warm climates.

Fire-killed or dead timber that is sound and free from decay is as strong and as durable as green timber. Such timber should be very carefully inspected for decay, however, and the unsound ties should be rigidly excluded. Douglas fir usually remains sufficiently sound to make ties for five to six years after being killed. After this the sapwood becomes infested with insects and decay, but the heartwood remains sound for eight to 10 years with the exception of the outer two or three inches. The interior of trees over three feet in diameter may remain sound for still longer periods. Lodgepole pine also remains sound and will make good ties for several years after being killed, but dead western yellow pine should be very carefully inspected, as it contains much sapwood and may deteriorate rapidly.

Definite and reliable data on the durability of several western tie species are not available, so the opinions of railway officers on the durability of these ties were solicited. The replies for the untreated ties may be summarized as follows:

Douglas fir is estimated to have a life of six years east and north of the Missouri and in New Mexico, Arizona, and California. In Oregon, Washington, Montana, Idaho, Colorado and Wyoming a life of seven to eight years is estimated. In California locally grown Douglas fir is estimated to last four to six years. In Colorado, native Douglas fir, known locally as red spruce, or red fir, is variously estimated to last from nine to 14 years. Estimates on the life of western larch in Montana, northern Idaho and western Washington are from five to eight years. Western yellow pine is said to last two to eight years in California and four to five years in Colorado, Idaho and Montana. Incense cedar is said to have a life of 10 to 12 years in California and western red cedar eight to 10 years in Montana and Idaho. Western hemlock ties are estimated to have an average life of five years in Washington, redwood and Port Orford cedar 12 years in California and Oregon, and lodgepole pine four to six years in Wyoming.

Fewer estimates were made on the durability of treated western species. With a zinc-chloride treatment Douglas fir was variously estimated to have a durability of seven to 15 years, the lower figure being for ties treated with but about 1/4 lb. of zinc chloride per cubic foot in southern Idaho. Similar ties in Oregon, California, Arizona and New Mexico were estimated to last nine years. In Montana, with a treatment of 0.5 to 0.7 lb. per cu. ft., the estimate was 15 years. Western larch in Montana with a similar treatment was also estimated to last 15 years. Western yellow pine ties, treated with 0.5 lb. of zinc per cubic foot, are estimated to last 12 to 14 years in Colorado and 12 years in Wyoming, Kansas and Nebraska, but only seven to eight years in California if treated with but 0.25 lb. of zinc chloride per cubic foot. Lodgepole pine treated with 0.25 lb. of zinc chloride per cubic foot was estimated to last eight or nine years in southern Wyoming. The estimated life of creosoted Douglas fir and western larch ties in Washington, Montana and Idaho was 18 years, and western yellow and lodgepole pine 15 years.

These estimates are from various sources and represent the use of ties under many conditions of service. After a consideration of all the available data, the accompanying table was compiled, in which the durability of western ties

Much more accurate and definite data are desirable on the durability of ties, and this can be obtained only by service tests in which accurate records are kept. The best durability records at present available are those in the files of the Forest Products Laboratory\* and these indicate that treated and untreated ties of Douglas fir, western yellow pine, lodgepole pine and western hemlock often last longer than estimated in the accompanying table.

## Rail Production in 1920

THE PRODUCTION of rails in the United States in 1920, according to the statistics issued by the American Iron & Steel Institute, amounted to 2,604,116 gross tons. Compared with 1917, the year of greatest rail production since the beginning of the European war, this figure is low by 340,045 tons or 11.55 per cent, but it shows an increase over the production of 1919 or 400,273 tons or of 18.16 per cent.

The production of rail for 1920 and that for each preceding year back to 1906 are given in Table 1. In studying the table it is of interest to note the decline in the production of rail made of Bessemer steel from 3,791,459 tons, or 95.31 per cent of the total, in 1906 to 142,899 tons, or 5.49 per cent, in 1920. In the latter year open-hearth rail comprised 89.63 per cent of the total and miscellaneous steels 4.88 per cent.

TABLE 1—PRODUCTION OF RAILS BY PROCESSES, GROSS TONS

Years	Open-hearth	Bessemer	Rolled*	Electric	Iron	Total
1906	186,413	3,791,459			15	3,977,887
1907	252,704	3,380,025			925	3,633,654
1908	571,791	1,349,153			71	1,921,015
1909	1,256,674	1,767,171				3,023,845
1910	1,751,359	1,884,442				3,635,801
1911	1,576,923	1,053,420	91,751	462	234	2,822,790
1912	2,105,144	1,009,926	119,390	3,455		3,327,915
1913	2,527,710	817,591	153,043	2,436		3,502,780
1914	1,525,851	325,897	95,169	178		1,945,095
1915	1,775,168	326,952	102,083			2,204,203
1916	2,269,600	440,092	144,826			2,854,518
1917	2,292,197	533,325	118,639			2,944,161
1918	1,945,443	494,193	101,256			2,540,892
1919	1,893,250	214,121	96,422	50		2,203,843
1920	2,334,222	142,899	126,698	297		2,604,116

\*Rolled from old steel rails. Included with Bessemer and open-hearth steel rails from 1906 to 1910 inclusive.

†Small tonnages rolled in 1909 and 1910, but included with Bessemer and open-hearth rails for these years.

There has been an appreciable revival in the production of alloy steels, principally titanium, which had been reduced almost to the vanishing point in 1918, as shown in Table 2.

TABLE 2—PRODUCTION OF ALLOY-TREATED STEEL RAILS, 1910-1920

Years	Production by alloys			Production by processes			Production by weight per yard			
	Total alloy in gross tons	Titanium	Aluminum	Other alloys	Open-hearth and electric	Bessemer	Under 45 lb.	45 and under 85 lb.	85 and under 100 lb.	100 lb. and over
1910	257,224	256,759		865	27,385	229,935		70,170	187,154	
1911	153,899	152,990		909	33,539	115,450		27,097	126,892

1913	59,519	47,655		11,864	33,567	25,952	*1	†9,414	50,014	
1914	27,937	23,321		4,616	27,447	490	†4	†1,168	8,301	18,454
1915	24,970	21,191		3,779	24,367	603	†6	†1,977	6,553	16,432
1916	28,562	26,493		2,069	27,675	887		†1,761	10,506	16,295
1917	16,535	15,273		1,262	16,535			†335	6,671	9,529
1918	3,111	2,891		220	3,111			†747	2,640	424
1919	6,476	6,070		406	6,476			†1,974	3,920	2,556
1920	12,909	11,652		1,257	12,911			†514	5,069	7,326

\*Includes rails under 50 pounds.

†Includes 50 pounds and less than 85 pounds.

The total production of rail, as given in Table 1, includes in addition to new rails rolled, the rails rolled from defective rails and from old rail. The total production in gross

\*Detailed tie service test records can be obtained from the Forest Products Laboratory upon request. Applicants are requested to give the specific names of the timbers concerning which information is desired.

ESTIMATED AVERAGE DURABILITY OF WESTERN TIES\*

	Un-treated, years	Treated with 0.5 lb. zinc chloride per cu. ft., years	Treated with 10 lb. creosote per cu. ft., years
Redwood	10-12	..	..
Port Orford cedar	10-12	..	..
Incense cedar	8-10	..	..
Western red cedar	7-9	..	..
Douglas fir	6-7	..	..
Western larch	6-7	..	..
Western hemlock	5-6	..	..
Lodgepole pine	4-5	..	..
Western yellow pine	4-5	..	..
Spruce	3-4	8	10
White fir (Abies concolor)	3-4	8	11
White fir (Abies grandis)	3-4	8	11
Red fir (Abies magnifica)	3-4	8	11
Engelmann spruce	3-4	8	11
Alpine fir	3-4	7	11

\*Based on use of tie plates on all treated ties and the assumption that the ties are subject to heavy traffic.

†Used only in Montana, northern Idaho and western Washington. Douglas fir ties in this region have about same average life as western larch.

has been estimated. The table is based on the assumption that all treated ties are well tie-plated. Since the estimates are based on western conditions they may not apply to eastern conditions. Probably from 30 to 50 per cent variation from these estimates in the durability of these ties may be expected on account of differences in climatic conditions.

tons of renewed or rerolled rails so included is given in Table 3.

TABLE 3—PRODUCTION OF RENEWED AND REROLLED RAILS, 1913-1920  
Rerolled from new seconds, new defective rails, etc.

Years	Open-hearth	Bessemer	Total	Rolled from old rails	Total rerolled
1913	13,052	30,741	43,793	155,043	198,836
1914	13,538	13,234	26,772	95,169	121,941
1915	6,477	2,652	9,129	102,083	111,212
1916	1,711	2,149	3,860	144,826	148,686
1917	1,825	7,182	9,007	118,639	127,646
1918	13,296	19,462	32,758	101,256	134,014
1919	1,933	5,766	7,699	96,422	104,121
1920	19,493	1,979	21,472	126,698	148,170

In Table 4, which shows the production of rails by weight per yard for each of several years, it is of interest to note that tonnage of the rails weighing 100 lb. per yd. and over forms a larger proportion of the total (28.0 per cent) than in any year since this weight of rail has been recorded separately. During 1918 and 1919 the proportion fell off appreciably because the Railroad Administration bought no rail weighing over 100 lb.

TABLE 4—PRODUCTION OF RAILS BY WEIGHT PER YARD, 1905-1920

Years	Under 45	45 and less than 85	85 and less than 100	100 pounds and over	Total Gross tons
1905	228,252	1,601,624	1,546,053	3,375,929	3,375,929
1906	284,612	17,49,650	1,943,625	3,977,887	3,977,887
1907	295,838	1,569,985	1,767,831	3,633,654	3,633,654

1919	*263,803	*495,377	2,063,571	478,892	2,203,843
1920	*489,043	*1,433,333	952,622	729,118	2,604,116

\*Includes rails under 50 pounds.  
\*Includes 50 pounds and less than 85 pounds.

the week was 693,719 cars, an increase as compared with the previous week of 27,077 cars, although it was 107,000 cars less than for the corresponding week of 1920 and 17,000 cars less than for the corresponding week of 1919. The loadings for the week of April 9 also represents an increase over the previous three weeks. During the first two weeks of March there was a gain but it was not maintained for the ensuing weeks.

There was a gain in the loading as compared with the previous week in all districts except the Central Western and the South Western, although the reports show a decrease as compared with 1920 in all districts. Increases as compared with the previous week were shown in the loading of grain and grain products, livestock, coal, forest products and merchandise and miscellaneous freight combined, and an increase as compared with 1920 was shown in the loading of grain and grain products. The coal loading was about 44,000 cars less than for the corresponding week of 1920. The loading of merchandise and miscellaneous freight, which reached a total of 449,493 cars, was greater than the loadings for any previous week this year, but was still about 34,000 cars less than the total loadings for the corresponding week of 1920.

The total car loading since January 1 this year has been 9,706,514 cars, as compared with 11,484,467 in 1920 and 9,869,739 in 1919.

The increase in loading was not reflected in the car surplus report, however. Previous records for the number of surplus freight cars on the railroads of the United States were again broken during the week ending April 8. The number of cars for which there was no freight averaged 507,427, or approximately 21 per cent of the total freight cars owned by the railroads of the United States.

This is an increase of over 11,000 cars as compared with the previous week and an increase of 210,000 cars since the first of the year. Of the total number of idle cars 261,294 were coal cars, an increase of about 6,000 cars in a week, while there were 176,916 surplus box cars, an increase in a week of 5,000.

At the time of the business depression in 1919, following the armistice, the number of surplus freight cars reached 451,739 for one week of March.

The summary follows:

## Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight showed a considerable gain during the week ended April 9, according to reports compiled by the Car Service Division of the American Railway Association. The total for

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

# A Rapid Tilting Cradle Unloader for Box Cars

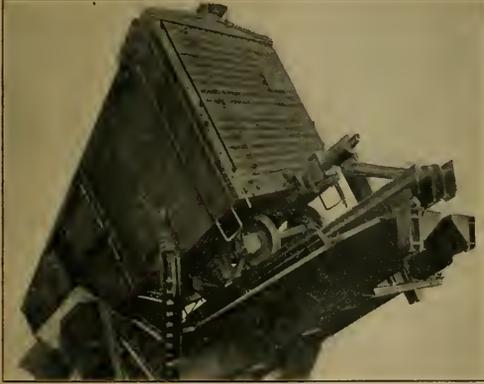

Box Cars Unloaded With New Device as Rapidly as Gondolas

—For Use Where Many Cars Are Handled

**A** TILTING CRADLE DEVICE which makes possible the mechanical handling of bulk material to or from box cars with a rapidity comparable with that which may be obtained where similar materials are handled in open top cars, has been developed by the Ottumwa Box Car Loader Company, Ottumwa, Iowa. The unloader is designed for use at large elevators, terminals and transfer points where the number of box cars loaded with bulk material to be handled daily requires an extensive equipment of

cially designed chains with pin-connected links, which are located around the circle of the rockers and attached to them at the ends with bolts, the nuts of which bear on coil springs to absorb the shocks of starting and stopping the tilting movement. The side tipping is accomplished by locating the track on a deck hinged at one side and lifted on the opposite side by pin racks and power driven sprockets.

The car is mechanically centered and held in position on the unloader by two grab arms on the cradle which disappear in small pits at either end of the foundation when not in use. After a car has been run on the unloader, these grab arms are raised out of the pits by motor driven sprockets and pin racks and are then moved simultaneously toward each other until they reach and center the car on the unloader. The heads of the grab arms are designed to bear against and hook over the top of the couplers to prevent the car from overbalancing when the cradle is tilted. Steel dogs engaging notched bars on the tilting deck prevent the grab arms from running back until the car is to be removed from

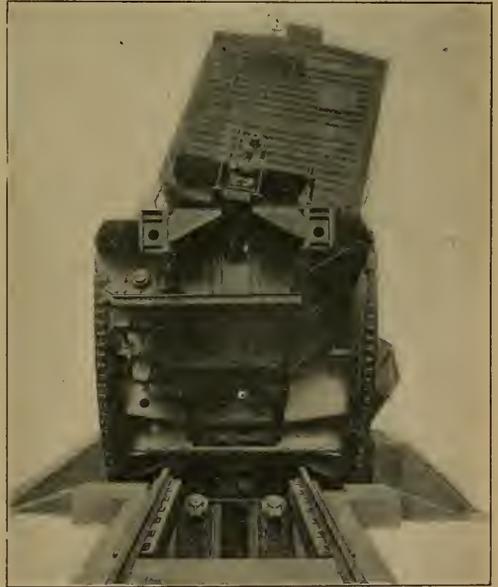

Unloading Side of the Cradle with Car in Unloading Position

unloading pits and the expenditure of a large amount of labor under the usual methods of handling.

This device is capable of completely discharging the load from a box car in from five to nine minutes without the expenditure of any labor aside from that of the single operator. This time includes that necessary to place the car on and remove it from the cradle and depends largely on the facilities provided for moving cars to and from the unloader. The rapid unloading is effected by tilting the car longitudinally to a maximum angle of 46 deg. from the horizontal, at the same time tipping it sideways from 15 to 24 deg.

The unloader consists essentially of a cradle built up of steel plates and angles with rockers at the sides which are carried on eight large steel rollers. The cradle is approximately 70 ft. long and 15 ft. wide and is placed in a pit approximately 19 ft. in depth from the top of the rail, 72 ft. long and 17 ft. between the side walls. The rockers, which are built up of reinforced steel plates, are circular in contour. Around the circles they are faced with heavy steel rails of standard railroad section. These rails bear directly on the steel rollers, which are mounted on double-beam girders which in turn rest on the foundation in the bottom of the pit. Heavy posts, hinged at the bottom and moved mechanically from the operator's station, are placed in the pit where they may be swung into position under the ends of the cradle when it is in its horizontal position. The cradle is thus securely supported against tipping when being loaded or unloaded, and heavy locomotives or cars may safely be moved across the unloader.

The cradle is tipped toward either end by means of spe-

End View of the Unloader with the Cradle Tilt and Side Tip in Unloading Position

cially designed chains with pin-connected links, which are located around the circle of the rockers and attached to them at the ends with bolts, the nuts of which bear on coil springs to absorb the shocks of starting and stopping the tilting movement. The side tipping is accomplished by locating the track on a deck hinged at one side and lifted on the opposite side by pin racks and power driven sprockets.

The car is mechanically centered and held in position on the unloader by two grab arms on the cradle which disappear in small pits at either end of the foundation when not in use. After a car has been run on the unloader, these grab arms are raised out of the pits by motor driven sprockets and pin racks and are then moved simultaneously toward each other until they reach and center the car on the unloader. The heads of the grab arms are designed to bear against and hook over the top of the couplers to prevent the car from overbalancing when the cradle is tilted. Steel dogs engaging notched bars on the tilting deck prevent the grab arms from running back until the car is to be removed from

the unloader. They are then mechanically raised by means of wedges, permitting the grab arms to be removed from the car and lowered into the pits.

A hopper bin is provided in a pit at one side of the unloader, to receive the material discharged from the car and deliver it to a suitable conveyor system. A chute connects the car door opening with this hopper. The lower end of this chute is stationary while the upper end is movable and is arranged to telescope with the lower end. The movable section is propelled against the side of the car at the door-

way by means of a small air cylinder, which holds the chute firmly in position just below the floor of the car during the unloading operation.

For unloading cars regularly fitted with grain doors or with boards nailed across the doorway inside of the car, a grain door opener has been developed for use with the unloader. This device consists of a large square plate studded with barbs which is moved against the grain door or boards by air pressure. This device engages the door while the car is horizontal. When the car is tipped to the side the grain door is held stationary while the car moves away from it. At the same time a wedge is dropped to the floor of the car and is forced under the bottom of the grain door, thus assisting in removing the bottom board and in holding the entire door out of the way, after it has been removed. When the car is empty the boards are dropped back inside.

The unloader is operated by three motors. A 75-hp. motor is used to tilt the cradle toward either end and a 50-hp. motor is provided to operate the side tipping mechanism. The grab arms are operated by a 20-hp. motor. Both the side and end tilting mechanisms are operated through gear reductions to worm gear drives which automatically lock the cradle and tilting deck in any position when the power is shut off. In addition to this, both of these motors are fitted with air brakes by means of which the momentum of the moving parts may quickly be absorbed after the power is shut off. When compressed air for this service is not available from an outside source the unloader is fitted with a small air compressor, driven by a 5-hp. motor and a small air reservoir.

The operator's station is located outside the foundation at the track level and on the side of the car from which the material is to be removed, so that he may observe at all times the progress of the operation. He is also provided with signals, usually electric, which indicate the various positions of the travel of both the end and side tips.

In operating the unloader, after the car has been secured by the grab arms it is first tipped to the side, the grain door or boards across the door opening being removed at the same time. This permits the material in the center of the car to flow out under the lower board. At the same time the operator starts the motor which tilts the cradle longitudinally. As the end tilting continues the material in the high end of the car flows out. As soon as one end is empty the cradle motor is reversed and the other end is unloaded. The small amount of material which runs past the door during this second operation is removed by once again reversing the tilt of the cradle.

One of these unloaders has been installed by the Commission of Public Docks of the city of Portland, Ore., at Pier No. 5 of the new No. 4 Terminal. By its use a compact and flexible arrangement has been obtained whereby material may be handled directly from the unloading pit of the unloader by conveyor to the hold of a ship, to storage bins on the pier or to open top cars. The device is also used as a loader for stowing bulk material in box cars as it is unloaded from shipboard, from open top cars or taken from the storage bins on the pier. At this installation the machine has unloaded phosphate rock from box cars in a total of nine minutes per car, including the entire time of getting the car to and from the cradle.

WHISKEY EASILY OBTAINABLE on Pullman cars was one of the items in the Pittsburgh (Pa.) Prohibition agent's notebook last month; and large numbers of empty bottles found on the ground along the line of the Pennsylvania Railroad constituted one of the bits of evidence supporting it; and on Sunday morning last, in Pittsburgh, a Pullman porter was arrested and 400 half-pint bottles of liquor, just brought to the station by a confederate, in five suit cases, were seized.

## An Arrangement for the Safe Storage of Gasoline

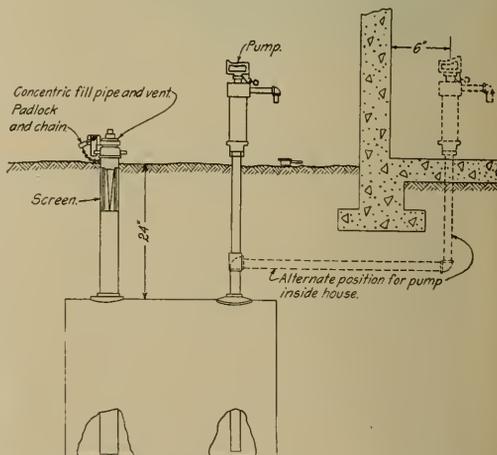

**S**UPPLIES OF GASOLINE and other fuel oils must be provided at so many points on a railroad that it is very difficult to control the housing of these highly inflammable materials in a way that will avoid excessive fire hazard.

For this reason, an account of a convenient storage outfit recently placed on the market is of interest. The elimination of drums and other shipping containers or receptacles means the elimination of fire hazard and loss in quality and quantity of oil through evaporation, leakage, spilling, etc. These storage outfits consist of an underground tank with a concentric filling pipe and vent and an outlet pipe equipped with the type of pump shown in the illustration. This pump consists of a seamless brass cylinder with a brass plunger and weatherproof housing over stuffing box. The handle is arranged to be secured by a padlock. A second padlock is provided to control the inlet pipe.

The storage tanks are made of 14-gage galvanized steel in sizes ranging from 70 to 290 gal. and are normally buried 24 in. below the ground level with the inlet pipe and pump placed directly above the tank. However, with additional piping it is possible to bury the tank outside and install the pump inside an adjacent build-

The Pump

The Storage Outfit Complete, Showing Alternate Locations for the Pump

ing, the entire equipment being complete with the exception of the horizontal pipe which will be of variable length depending upon the distance from the tank to the building.

This storage outfit has been developed by the St. Louis Pump and Equipment Company, St. Louis, Mo.

A PRACTICAL DEMONSTRATION of the type of beef that Alberta produces will be made next May or June when the department of agriculture of the province will ship to England 50 or 60 head of the best animals that can be obtained.

# General News Department

The Western Railroad Association will on April 25 move its office from 122 South Michigan avenue, Chicago, to the Wrigley building, 400 North Michigan avenue.

The Long Island Railroad expects to electrify its division between Valley Stream and Babylon as soon as financial conditions will permit, according to a statement made by P. H. Woodward, general passenger agent, at a meeting of the Community Association of Bayshore on April 11. The distance from Valley Stream to Babylon is 21 miles.

The Boston & Albany announces that henceforth the following stations will be closed on Sundays: Longwood Brookline Hills, Beaconfield, Reservoir, Chestnut Hill, Eliot, Waban, Woodland, Faneuil, Wellesley Farms, Wellesley Hills, Ashland, North Grafton, Rochdale, East Brookfield, Brookfield, Warren and West Warren. Ten of these are on the main line.

"Commissioners of the Port Authority" to administer the laws and treaty under which the states of New York and New Jersey are to co-operate in the development of New York Harbor, have been appointed by the Governor of New York, as follows: Eugene H. Outerbridge, president of the New York State Chamber of Commerce; Alfred E. Smith, former governor of the state; and Lewis H. Pounds, former president of the Borough of Brooklyn.

Ninety miles in one hour and twenty minutes was the time made by a special train of two cars from Philadelphia to Jersey City last Monday afternoon over the Philadelphia & Reading and the Central of New Jersey, a speed equal to 67.5 miles an hour. This train was run for J. L. Stokes, a banker, to enable him to connect with a train for Montreal, the Pennsylvania being blocked by a derailment and the Reading having no regular train for two hours. Mr. Stokes paid for the train \$427.

The Chamber of Commerce of the United States has appointed a committee of five members and five alternates to co-operate with Secretary of Commerce Hoover in working out a plan for closer relationship between business and the Department of Commerce. Members of the committee are: A. C. Bedford, chairman of the board of directors of the Standard Oil Company of New Jersey, G. E. Smith, John L. Fahey, H. L. Ferguson and P. H. Gadsen. Alternates are: Howard Elliott, chairman of the board of directors of the Northern Pacific; A. L. Humphrey, president of the Westinghouse Air Brake Company; L. B. Stillwell, consulting engineer of New York; R. G. Rhett and H. M. Victor.

The legislature of the state of Tennessee recently enacted a statute providing for the elimination of grade crossings of state highways with railroads under the direction of the State Highway Commission, which is given the power to require the elimination of such grade crossings whenever it is considered necessary. Under this law the railroads are accorded the right of appeal to the Railroad and Public Utilities Commission of the state, which is authorized to make changes in the Highway Commission's order in the interests of the railroads. The law also definitely fixes the subdivision of expenses of such grade crossing elimination equally between the railroad and the public, the share borne by the public to be taken from highway funds, although this subdivision will be modified in the case of new highways or new railroads.

## Senate Orders Railroad Investigation

The Senate on April 19 adopted without debate or discussion the resolution introduced by Senator Cummins providing for a general investigation of the railroad situation by the Senate

committee on interstate commerce. It is planned to begin hearings about May 2 and to hear the testimony of railroad executives first.

## A Correction

In the tables of Revenues and Expenses of Railways, which appeared in the *Railway Age* of April 13, page 948, the operating revenues of the Chicago, Burlington & Quincy for the two months were incorrectly given. The figure of operating revenues for the two months should have been given as \$26,126,472 instead of \$36,126,472 as it was given and the operating ratio for the two months as 81.56 per cent instead of 58.98 per cent as was shown.

## Pennsylvania Service Record for March

Of the passenger trains operated on the Pennsylvania system in the month of March, 94.1 per cent arrived at their destination on time and 96.9 per cent made schedule time, an improvement over March, 1920, of 16.7 per cent in the number of trains arriving on time and 9.1 per cent for trains making schedule time. Passenger train performance has improved for five consecutive months. On April 1 there were 92,738 idle freight cars stored in good order on the Pennsylvania System. At the same time 85.8 per cent of the locomotives owned were available for service, an increase of 7.5 per cent in available power over April 1, 1920.

## The Two Essentials

The completion of a record of three-quarters of a century of the life of the Pennsylvania Railroad, which was organized on April 13, 1846, was noticed briefly in our last issue. The date was made the occasion by President Samuel Rea of a brief address to employees and the public, sketching the history and the present greatness of the corporation and "rededicating the property to the public service and to the maintenance of sound policies and practices."

The way out of the present crisis can be found, says Mr. Rea, by

"1. The realization of an understanding between railroad corporations and their employees as a result of which every officer and employee will have reasonable compensation depending on traffic and business and financial conditions, and will give to the public and to his company loyal service and the utmost effort of which he is capable; and

"2. The development of such relations between the railroads and the public that adequate revenues may be maintained with which to provide satisfactory transportation service, to supply adequate facilities in the future for the needs of a growing country, to pay fair wages, and to give the investors who furnished the money a fair return, with full confidence in those whom they employ to manage and operate the property they have provided for public use."

## International Chamber of Commerce

The International Chamber of Commerce will hold its first annual meeting in London, England, from June 27 to July 2, 1921. The keynote of the meeting will be "The Restoration of the World's Commerce." There will be general sessions and group meetings for the discussion of economic problems in the fields of finance, ocean and land transportation, communications, production, distribution and the restoration of devastated areas. Subcommittees are to be appointed to consider topics of secondary importance under the main headings. The countries which will participate in the first meeting will be asked to name representatives for the various committees. The American Section of the International Chamber has asked the following men to serve on the American Land Transportation Committee: W. W. Atter-

bury, vice-president, Pennsylvania; Samuel O. Dunn, editor, *Railway Age*; S. M. Felton, president, Chicago Great Western; Carl R. Gray, president, Union Pacific; Colin M. Ingersoll, New York City; Col. J. A. McCrea, vice-president, Pennsylvania, Pittsburgh; Col. F. A. Molitor, consulting engineer, New York City; T. C. Powell, vice-president, Erie; John F. Stevens, Chase National Bank, New York City; John F. Wallace, consulting engineer, New York City, and Col. W. J. Wilgus, consulting engineer, New York City.

**Executives Favor Senate Inquiry**

A meeting of the steering committee of the Association of Railway Executives was held in New York on April 15. The purpose of the meeting was to consider the presentation of the railroad situation to be made before the Senate inquiry if the pending resolution by Senator Cummins is adopted.

"Although in some quarters it has been questioned whether such an inquiry is desirable or necessary," said Thomas DeWitt Cuyler, chairman of the Association, "the executives present expressed themselves unanimously as favoring the inquiry proposed by Senator Cummins. It was the unanimous opinion of the executives present that, in view of the very great importance of having the full support of an enlightened public opinion in meeting the present difficulties confronting the railroads, the fullest inquiry into the situation as proposed by Senator Cummins would be most helpful in the present situation."

**Railroad Earnings for February**

The Interstate Commerce Commission's monthly summary of railway revenues and expenses for February and for two months is as follows:

	February		Two months	
	1921	1920	1921	1920

**Railroad Administration to Ask**

**Additional Appropriation**

The Railroad Administration is planning to ask Congress at an early date for an additional appropriation which will be needed to enable it to liquidate its affairs. Chairman Good of the House committee on appropriations stated in the House on April 19 that he had been advised by Director General Davis that the amount required would be approximately \$400,000,000, but it was stated at the Railroad Administration that the exact amount has not yet been determined. The Railroad Administration has already received in appropriations \$1,780,000,000, in-

cluding \$500,000,000 appropriated by the federal control law, a deficiency appropriation of \$750,000,000 in 1919, \$200,000,000 appropriated by the transportation act, and an additional amount by a later appropriation bill. At the time of the return of the railroads Director General Hines estimated the additional requirement at that time at \$436,000,000 in addition to the \$1,450,000,000 which had then been appropriated and a later appropriation was made to cover this amount subject to certain adjustments made by the transfer of Liberty bonds to the War Finance Corporation, etc. Mr. Hines made no estimate for payments to the railroads on account of undermaintenance, contending that the government would not have to pay any large sums on this account. Comparatively few of the claims of the railroads have yet been adjusted and although many of the railroads are making larger claims than were expected, it is not yet known what proportion of them will be allowed.

**Why Should Employees' Families Ride Free?**

The stockholders of the Boston & Maine, at the annual meeting of the company in Boston last week voted, *via voce*, unanimously, that free passes should not be issued except to employees traveling on the business of the road. As no announcement has come from the president concerning the matter it would appear that the action of the meeting has not as yet been confirmed by a stock vote. This vote evidently is a sequel to the report of the New Hampshire Public Service Commission, on February 16, in which the Boston & Maine was granted leave to close certain small stations in that state. In justification of its approval of that measure of economy the Commission issued a long report, rehearsing in forceful language the restrictive acts of the federal government which have necessitated the drastic curtailments of expenses that all railroads are now compelled to make; and then, in closing, declared that the "first economy" on the Boston & Maine ought to be the discontinuance of free service. Continuing, the report says:

"We refer to the pernicious practice, unjust and indefensible, of issuing free passes to officers and employees and their families; to surgeons, physicians and attorneys-at-law when not traveling on railroad business. Is it fair to furnish a private car, with servants, free of expense to officers of the railroad to take pleasure trips about the country? We are not saying that this privilege is often made use of, but the point is that the privilege should not exist. The words "free service" are outlawed in the vocabulary of railroad and public utility regulations. Justice requires that a railroad or public utility should serve all of the public alike. If part of the public does not pay for the service it receives, then the cost of that service must be taken care of by those who do pay. To the employee with a family of five, the free transportation privilege is worth a considerable sum, while to one with no family it is of no value; yet both may be doing the same kind of work and receive the same pay per day. A better arrangement would be to have the one traveling on railroad business pay his fare and be reimbursed by the railroad upon proper bill being presented. In its present situation the Boston & Maine cannot afford to turn its back on additional income, however slight."

**A New Representative of "The Public"**

Senator La Follette, in a statement to the press, announces the beginning of active work with the opening of the Sixty-Seventh Congress of "The People's Legislative Service," which was organized at a conference at Washington on December 17, 1920. The need for such an organization, he said, "arises out of the fact that while special interests of all kinds are represented in Washington and bring their influence to bear upon legislation, the interest of the general public is not represented." The People's Legislative Service is to "help meet this need by furnishing the facts on which intelligent legislation must be based." It is to be distinguished from lobbying organizations by the Senator's statement that "It is not a lobby. It is a fact service." With the statement is given a list of 77 members of the National Council of the People's Legislative Service, which includes, in addition to a number of so-called progressive congressmen and others, the heads of most of the railroad labor organizations affiliated with the American Federation of Labor and the Plumb Plan League; Edward Keating, business manager of the league;

Frederic C. Howe, the head of one of its bureaus, former congressman John M. Baer, cartoonist of the league's paper Labor; W. J. Lauck, Frank P. Walsh and Donald R. Richberg, one of Mr. Plumb's legal associates, and Col. S. W. Brookhart. The executive committee consists of Senator La Follette, William H. Johnston, W. G. Lee, Warren S. Stone, George Huddleston, congressman from Alabama, who has frequently appeared as spokesman for the Plumb plan in the House, and George P. Hampton. It is stated that the service "will direct its efforts to increasing the effectiveness of those senators and representatives who are battling for the public interest."

The People's Legislative Service gave a dinner at Washington on April 16 at which Senator La Follette spoke. He gave a list of 19 "great combinations of financial power which maintain active organizations in Washington" but in this he counted the railroads twice by including not only the Association of Railway Executives, which does have an office to keep in touch with legislation, but also the American Railway Association, which is represented in Washington only by the Car Service Division. He mentioned also the "Association of Railway Security Holders." The National Association of Owners of Railroad Securities has its headquarters in Baltimore. Senator La Follette also referred to the "adoption by Congress of a fixed percentage return" for the railroads, "which forced the Interstate Commerce Commission to increase the annual transportation bill of the nation by hundreds of millions of dollars . . . a striking example of the enormous power which can be marshalled by a single interest."

Senator La Follette also attacked the railroads at a meeting of the "People's Reconstructive League" on April 14. This is another organization in which the railroad labor leaders are active. A delegation from the meeting, which included the national legislative representatives of the four train service brotherhoods, called on congressional leaders to urge a "restoration of the railroads to unified government operation."

### Railroad Bills in Congress

In the usual flood of bills which are introduced at the opening of a Congressional session, a large number pertaining to railroad matters this year are "old-timers," having been pending without action in previous sessions. The most important was the resolution providing for a general investigation of the railroad situation by a Senate committee. Most of the bills introduced were referred to committee. There is no change in the membership of the Senate committee of which Senator A. B. Cummins of Iowa is chairman. There have been several changes, however, in the House committee and Samuel E. Winslow of Massachusetts has been elected chairman to succeed John J. Esch, who was not returned to Congress but has been appointed a member of the Interstate Commerce Commission. The other members of the committee are as follows: James S. Parker, New York; Burton E. Sweet, Iowa; Walter R. Stiness, Rhode Island; John G. Cooper, Ohio; Edward E. Denison, Illinois; Everett Sanders, Indiana; Schuyler Merritt, Connecticut; J. Stanley Webster, Washington; Evan J. Jones, Pennsylvania; Carl E. Mapes, Michigan; William J. Graham, Illinois; Sherman E. Burroughs, New Hampshire; Walter H. Newton, Minnesota, and Homer Hoch, Kansas, republicans; and A. W. Barkley of Kentucky, S. Rayburn of Texas, G. Huddleston of Alabama, C. F. Lea of California, P. B. Johnson of Mississippi and H. B. Hawes of Missouri, democrats.

Among the bills relating to railroads introduced in the Senate are the following: By Senator Poindexter, to amend Section 4 of the interstate commerce act to provide a rigid long and short haul rule and to prohibit interference with commerce. This bill was passed by the Senate at the last session but received no further consideration. By Senator McKellar, a bill authorizing and directing the Interstate Commerce Commission to establish a system of mileage books to be issued to commercial travelers at reduced rates. By Senator Smoot, two bills to amend Section 10 of the Clayton act, similar to the Townsend bill reported by the Senate committee last session. By Senator Cummins, a bill to amend the safety appliance act and a bill to make it unlawful to give commissions, bribes or rewards to employees or to accept them. By Senator Harrison, a bill to establish

the standard of work and duty of common carriers of freight and to establish uniform rates.

Senator Pittman of Nevada presented to the Senate a resolution of the Nevada legislature petitioning Congress to amend the transportation act to protect and preserve the powers of the several states with relation to intrastate rates, services and facilities. Senator Ashurst of Arizona presented a similar resolution by the legislature of Arizona. Senator Trammell of Florida presented a resolution directing the interstate commerce committee to investigate the high freight rates being charged on citrus fruits, vegetables and other perishable farm products, with a view to bringing about early legislation that will result in a reduction in the existing freight rates on such perishable products. Senator Jones of Washington introduced a bill exempting vessels of the United States from paying tolls when passing through the Panama Canal. This was referred to the committee on interoceanic canals. Senator Frelinghuysen re-introduced his bill for seasonal coal rates.

Bills introduced in the House of Representatives include one by Representative Tincher of Kansas to abolish the Railroad Labor Board and transfer its functions to the Interstate Commerce Commission. Representative Logan introduced a bill to provide a penalty of \$50 for failure of a common carrier to adjust and pay in 40 days claims for freight overcharge or for loss or damage. Representative Madden re-introduced his bill to abolish the use of "Jim Crow" railroad cars for negroes by prohibiting discrimination on account of race, color or previous condition of servitude. Representative Anderson introduced a bill to require carriers to supply necessary warehouse facilities. Representative Black re-introduced his joint resolution directing the Railroad Labor Board to make further investigation of the wages of railroad employees and such modifications in its decisions as are justified in the public interest and directing the Interstate Commerce Commission at the same time to review its rate decision and make such reductions in rates as it may find to be just and reasonable. Representative Wright introduced a bill to prescribe rates, fares and charges of railroads for a period of one year. Representative Blanton introduced a bill to prohibit strikes on railroads.

Senator Lenroot has re-introduced in the Senate his measure of last session to provide for the creation and organization of the National Railway Corporation and for the acquisition, control and operation of railroads and water carriers by it under what is known as the Amster plan.

Senator Smoot has introduced a bill to amend Section 10 of the Clayton act, so that none of its provision shall apply to any railroad which is wholly owned by a person or corporation whose plant or factories such railroad is principally engaged in serving, nor to any director, agent or officer of any such road.

Senator McKellar: to authorize the Interstate Commerce Commission to establish mileage books for commercial travelers at 20 per cent less than regular passenger fares.

Senator Watson: to require railroads to issue interchangeable, non-transferable 5,000 mile tickets for 2½ cents a mile. The bill, however, provides for a modification of the rate from time to time by the Interstate Commerce Commission in accordance with changes in the average rate level.

Representative Mason: authorizing carriers to make special rates for school children and necessary attendants between any states in the United States and Washington, D. C., to enable them to visit the Capital for educational purposes.

Senator Cummins: to amend the valuation act by striking out the requirement that the commission report separately the original and present cost of condemnation and damages or of purchase of land.

Senator Fletcher: to amend Section 206 of the interstate commerce act so that freight claims based on alleged unreasonable rates during federal control may be filed with the commission within two years from the termination of federal control.

Representative Wright: forbidding railroads, for one year beginning 30 days after its passage, to charge rates higher than those in effect on February 27, 1920; and during the prescribed year the Interstate Commerce Commission "shall fix new rates under the terms of the transportation act, taking into consideration the business and financial conditions of the section or territory to be affected by the rates."

## Traffic News

The New York State Barge Canal is to be opened on May 1. The Transmarine Corporation of Newark, N. J., expects to use 20 barges in freight service on the canal. The United States War Department, which has a fleet of 70 barges, has, as yet, taken no public action looking to the beginning of service.

A reduction in freight rates on Canadian roads approximating \$4.30 a thousand feet on lumber and shingles from British Columbia points to Toronto will become effective on April 21. The reduction is authorized by the Canadian Railway Commission to permit British Columbia lumbermen to compete with lumbermen of the Southern states.

### Anthracite Shipments in March

The shipments of anthracite in March as reported to the Anthracite Bureau of Information, amounted to 5,737,771 gross tons as compared with 5,966,101 tons during the preceding month of February, and 6,077,821 tons in March, 1920. The decrease is attributed to the mild weather and to consumers' holding off on account of uncertainty as to April prices. The total shipments for the coal year ending March 31, amounted to 69,366,731 tons as compared with 69,815,034 for the year ended March 31, 1920, a decrease of 448,303 tons, which, considering the mild weather of the past winter, is remarkably small.

Shipments by originating carriers were:

	March, 1921	February, 1921
P. & R.	1,018,858	1,170,753
L. V.	1,022,714	1,063,508
C. of N. Y.	540,556	515,551
D. L. & W.	1,020,381	920,788
D. & H.	837,644	813,191
Penna.	333,687	426,350
Erie	561,013	633,705
N. Y. O. & W.	144,330	153,017
L. & N. E.	257,988	269,237
Total	5,737,771	5,966,101

### Coal Production

The coal year came to an end on April 1 with production of soft coal still declining, according to the weekly bulletin of the Geological Survey. The output for the week ending April 2 was estimated at 5,797,000 net tons, a decrease of 7 per cent as compared with the week preceding. How much of the decline in output was due to the occurrence of the Mitchell Day holiday on April 1 and of Easter Monday, and how much to a further slackening in demand, is said to be uncertain. For the week as a whole, the two days seem to have accounted for about 1½ normal working days. The estimated production for the month of February, according to the bulletin, was 30,851,000 tons as compared with 40,270,000 tons in January and 52,123,000 in December. The total bituminous production for the coal year ended March 31 is estimated at 522,000,000 net tons as compared with 486,899,000 tons in 1919-1920, 552,041,000 in 1918-1919, 548,715,000 in 1917-1918, and 504,102,000 in 1916-1917.

The first week of the new coal year, that ending April 9, brought no relief from the depression which has affected the bituminous industry in recent months, says the weekly bulletin of the Geological Survey. The total output of soft coal is estimated at 6,089,000 net tons. Although this was an increase over the output of the holiday week preceding, the rate per working day declined slightly.

The National Coal Association has issued a review of the soft coal situation urging efforts to obtain an even distribution of coal output the year round. The statement points out that there should be an average weekly production of approximately 10,500,000 to 10,750,000 tons and that if production falls below this line of safety for any material period there will be danger of a pinch later. "It is all a matter of transportation," the statement says. "If the mines have the cars as they are needed, the public will have its coal. How to keep the bituminous coal moving so that the railroads do not become clogged . . . is a problem that confronts the industry no less than the railroads."

## Commission and Court News

### Interstate Commerce Commission

The Commission has further suspended until June 4 the operation of the proposed increased charges from \$2.50 to \$7.00 per car for switching cars between industries located on the St. Louis-San Francisco and interchange tracks of connecting lines, published in a St. Louis-San Francisco company's tariff, the operation of which was suspended until May 5.

The commission has suspended from April 20 until August 18 the operation of certain schedules published by the Missouri Pacific which propose to eliminate the existing transit privileges on grain and grain products at St. Louis, Kansas City, Mo., Atchison, Kan., and other points, when destined to Texas Gulf Ports for export on shipments originating at points on the Missouri Pacific in Missouri, Kansas, Nebraska and Colorado, Colorado.

The Commission has further suspended until May 17 certain class and commodity rates between points in defined territories in eastern and southern group to points in southwestern territory. The suspended schedules propose to apply an increase of 35 per cent over the rates in effect on August 25, 1920, to and from the basing points, used in the construction of through rates in lieu of these interterritorial percentage increase of 33 1/3 per cent established under approval of the Commission in Case No. 74, Ex Parte, the operation of which was suspended until April 17, 23 and 30, 1921, by orders previously issued.

The Commission, deciding the case instituted by the National Industrial Traffic League, holds that the commission is without jurisdiction to prescribe uniformity in the liability clauses of contracts for the construction, maintenance and use of private sidetracks. The liability clauses contained in the contracts made by most of the railroads were attacked by the league as unjust, unreasonable and unduly prejudicial, but after negotiations between the League and the railroads a set of liability clauses was jointly submitted to the commission with a request that it recommend their general adoption.

### Personnel of Commissions

President Harding on April 14 sent to the Senate the nomination of John J. Esch for appointment as a member of the Interstate Commerce Commission. Mr. Esch has been serving under a recess appointment.

### New Commissioners in New York

The new public service commissioners of the State of New York, provided for in the law revising the commissions, which was noticed in the *Railway Age* of April 15, page 928, were announced by the governor on April 16. The chairman is William A. Prendergast of New York City, former comptroller of the city. His term expires on February 1, 1931. The other commissioners are William K. Pooley of Buffalo, for a term expiring February 1, 1929; Charles Van Voorhis of Rochester, for a term expiring February 1, 1927; Oliver C. Semple of New York, to February 1, 1925, and Charles G. Blakeslee of Binghamton until February 1, 1923.

Mr. Prendergast took part in the negotiations between New York City and the railroads when the subway contracts of 1913 were made. He served twice as city comptroller. Mr. Van Voorhis is a leading Republican in Monroe County. Mr. Semple took part in an investigation of the New York City transit lines. He has counseled Governor Miller in public utility matters. Mr. Blakeslee is an engineer as well as a lawyer, and is corporation counsel of Binghamton. He went to France as a lieutenant and came back as a major. He is state commander of the American Legion.

For the "Transit Commission," to exercise authority over local transportation within New York City, the governor named as chairman George McAney, former president of the board of

aldermen; Leroy T. Harkness, who has had much experience as a legal officer of former New York City commissions, and Major-General John F. O'Ryan. General O'Ryan, a lawyer, commanded the 27th division of the American Expeditionary Forces in France, and is now the head of the New York National Guard.

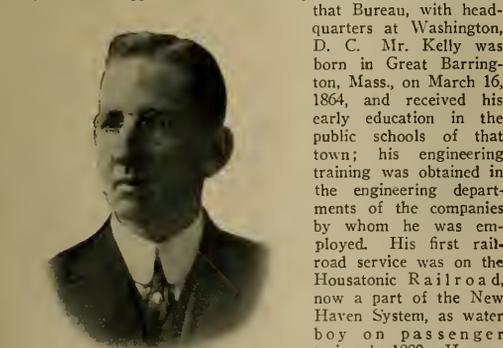

John J. Esch assumed his duties as a member of the Interstate Commerce Commission under a recess appointment pending his confirmation by the Senate.

Mr. Esch's appointment was confirmed by the Senate on April 18 by a vote of 52 to 3. Those who opposed him were Senators La Follette of Wisconsin, Trammell of Florida, and Watson of Georgia. Senator La Follette submitted a long minority report dissenting from the action of the committee on interstate commerce in recommending Mr. Esch's confirmation, in which he said that an examination of the records of Congress during the 17 years of Mr. Esch's services on the committee on interstate and foreign commerce "will show that he has been in substantial accord with the governmental policies in which the carriers of the country have been brought to their present plight and that his attitude revealed in his speeches and votes has been one of consistent friendliness to the railroads."

Mr. La Follette says that for many years Mr. Esch joined with his colleagues on the committee in ignoring recommendations of the commission; that he did not become an advocate of railroad valuation until the fight had been practically won; that he supported the federal control bill which, the Senator says, gave the railroads an exorbitant rental, that he voted for what Senator La Follette refers to as the 6-per-cent guaranty in the Transportation Act, and that he supported the bills extending the effective date of Section 10 of the Clayton law and to provide for the payment of the six months' guaranty. The Esch-Cummins law as it exists today was the work of Mr. Esch and the results of its application may be attributed largely to his authorship. The appointment of Mr. Esch to the Interstate Commerce Commission at this time, he said, will be an act of great significance to the people of the country who are crying for relief from conditions which have been aggravated by the operation of the Esch-Cummins law. It is recognized that Mr. Esch is more responsible than any other one man for the present Transportation Act.

**John P. Kelly**

John P. Kelly, for the past two years inspector of safety appliances in the Bureau of Safety, Interstate Commerce Commission, has been appointed senior railway mechanical engineer for that Bureau, with headquarters at Washington, D. C.

J. P. Kelly

born in Great Barrington, Mass., on March 16, 1864, and received his early education in the public schools of that town; his engineering training was obtained in the engineering departments of the companies by whom he was employed. His first railroad service was on the Housatonic Railroad, now a part of the New Haven System, as water boy on passenger trains, in 1880. He was locomotive fireman in 1884, and locomotive engine man in 1887. He served as locomotive engineer on the New Haven and later on the New York Central; and in 1898 was appointed air brake instructor on the Central. In 1899 he was road foreman of engines on the Chicago & Alton; in 1901 he went to the New York Air Brake Company, where later he was appointed assistant mechanical engineer. In 1905 he resigned and went to the Westinghouse Air Brake Company but in 1910 resigned and devoted his time to the business of consulting air brake engineer, and to writing for the technical press. In 1912 he entered the employ of the New York Central Lines as consulting air brake engineer. Later he went into government employ as above stated.

**Foreign Railway News**

**Chinese Government to Order Locomotives**

The Chinese Government is asking for bids on 41 locomotives to be supplied to the government railways, according to advices from Commercial Attache Julian Arnold at Peking. All bids received will be opened at Peking on June 15. The purchase of these locomotives will be financed by a group of Chinese bankers.

**Retirement of England's Minister of Transport**

LONDON.

Sir Eric Geddes, Minister of Transport, is to retire from this position in August next, when the State control of the railways ends. Sir Eric wished to resign from the Government in 1918, but was persuaded to remain for a period of two years in order to organize the whole system of transportation on a workable basis. Sir Eric Geddes stated that he will not renew his connection with any railway company.

**Roumanian Committee to Study Railway Problems**

LONDON.

It is announced that the Roumanian Ministry of Communications has appointed a special committee to study the problem of the railway organization and the possibility of electrification of part of the Roumanian railways. The committee consists of technical and financial experts and is to visit the United States, France and Italy, to study what facilities and credit institutions are offered in these countries for co-operating with Roumania for the electrification of the State railways.

**Locomotive Building in France**

LONDON.

The French output of locomotives at the end of the year 1922 will be 1,300 per annum. As its normal home consumption will not be more than 600, France will, states the Times (London) Commercial Supplement, become an important rival in South America and other foreign countries. At present, however, the workshops are busy refitting the home railways, not yet having executed the order placed just after the armistice of 1,100 locomotives.

**Proposed Purchase of British Railroad in the Dominican Republic**

It is reported that the Dominican government has been considering the purchase from the British owners of the Samana & Santiago, which connects the various towns in the interior with the port of Sanchez. The road is a 4-ft. gage, and has about 100 miles of track. It is understood that the price for which it was offered to the government was somewhat under \$2,500,000. Further information may be obtained from the Bureau of Foreign and Domestic Commerce or any of the district and co-operative offices upon reference to file No. 24151.

**Inspection of the Orient in Mexico**

Representatives of British and American interests which own the Kansas City, Mexico & Orient are making a trip of inspection of that property with the view of determining the advisability of constructing in the near future the unfinished gaps in the line in Texas and Mexico, as well as building the proposed branch line that is to run from San Angelo to Del Rio, according to reports from San Angelo, Tex. At Del Rio this line would connect with the transcontinental road of the Southern Pacific and with the branch line that the National Railways of Mexico is constructing from Allende, Mexico, to Villa Acuna, situated just across the Rio Grande from Del Rio. The inspection party consists of Frederick Hurdle and W. S. Poole of London, Eng., and Charles H. Jones of New York. Mr. Hurdle stated while in San Angelo that if a favorable report is made on the project all of the gaps will be built at the earliest possible time, and that the branch line between San Angelo and Del Rio would be the first work done.

American Specifications for France

The United States Department of Commerce is now translating into French, for publication in a French-English edition, 62 specifications of the American Society for Testing Materials particularly applicable to export trade. These specifications include those for rails and splice bars, structural and reinforcing steels, steel forgings and castings, steel wheels and tires, steel and iron tubes and pipe, boiler steels, wrought-iron products, pig iron, cast-iron pipe, malleable and gray-iron castings, copper wire, copper bars, spelter, bronze, cement, linseed oil and turpentine. These same specifications were translated into Spanish two years ago, and have since been distributed among consular offices and elsewhere in South America.

Exports of Car Wheels and Axles in February

The exports of car wheels and axles in February were valued at \$306,076. Shipments to the value of \$72,518 went to Cuba and \$56,523 to Chile. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce follow:

Countries	Dollars	Countries	Dollars
France	95	Brazil	5,256
Netherlands	1,107	Chile	56,523
Spain	12,950	Colombia	2,000
Switzerland	250	Ecuador	188
England	263	Paraguay	1,800
Canada	11,455	Peru	3,153
Costa Rica	1,835	Uruguay	8,500
Guatemala	750	China	92
Honduras	736	Kwangtung, leased territory	3,840
Mexico	85	British India	3,032
Panama	47,471	Dutch East Indies	41,156
Jamaica	360	Japan	11,688
Trinidad and Tobago	183	New Zealand	458
Cuba	72,518	Philippine Islands	6,580
Dutch West Indies	313	British South Africa	291
Dominican Republic	2,973	Portuguese Africa	1,470
Argentina	6,725	Total	306,076

January Exports of Car Wheels and Axles

January's totals of exports of car wheels and axles show a decided improvement over the figures for December. The total exports for the month were valued at \$802,351, and Brazil, with \$230,515 of this equipment, was the country which led all the others in the value of the shipments of this material. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Dollars
Belgium	21,421
France	80
Spain	9,600
Canada	70,817
Costa Rica	2,829
Guatemala	6,406
Honduras	4,012
Nicaragua	1,610
Panama	4,888
Mexico	56,126
Jamaica	3,554
Trinidad and Tobago	5,714
Cuba	30,436
French West Indies	290
Dominican Republic	1,375
Argentina	22,550
Brazil	230,515
Chile	53,500
Colombia	4,547
Ecuador	1,620
British Guiana	4,523
Paraguay	2,430
Peru	28,458
China	81,466
British India	6,672
Dutch East Indies	71,800
Japan	36,211
Australia	979
New Zealand	1,380
Philippine Islands	31,738
Morocco	4,200
Total	802,351

Roumanian Plan for Financing

Locomotive Purchases

LONDON.

A decree issued on January 26, 1921, authorizes the Roumanian Minister of Communications to make contracts along the lines indicated in a pro forma agreement. These agreements are to be made between national or local authorities and private firms who either pay for locomotives acquired by the Railroad Administration, or themselves purchase locomotives of types to be approved by the Railroad Administration. The agreements will give

to the firms advancing the necessary sums, or purchasing directly such locomotives, the right to run the locomotives for the purpose of transporting their own goods or goods purchased by them in the course of business. The necessary rolling stock is to be placed at the disposal of the firms supplying the locomotives and the trains will be run on a fast freight schedule, but contracting firms are to debit themselves with the ordinary transportation charges and are entitled to keep the locomotives at their own disposal until the sum of these ordinary transportation charges covers the cost of the purchase of the locomotives. Although the pro forma agreement does not clearly state it, it is understood that the firms advancing the necessary money or purchasing the locomotives will have the right to charge interest on the sums advanced.

Car Exports in February

The totals for the exports of passenger cars in February fell off sharply from the January figures and a measurable decline in freight car exports is also noted. The passenger cars shipped totaled 5, valued at \$20,725, and the freight cars 1,383, valued at \$2,314,499. Parts of cars exported during the month were valued at \$2,230,176, a marked increase over January. Cuba was the destination of 1,005 of the freight cars and Argentina of car parts to the value of \$1,100,922. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	STEAM Passenger		Freight and other		Parts of cars. Dollars
	Number	Dollars	Number	Dollars	
Germany	.....	.....	.....	.....	622
Norway	.....	.....	1	9,950	65

Railway Wages in England

LONDON.

The London Times reports that the National Union of Railwaymen has decided to impose an additional levy of 12 cents per week upon all its members. It is reported that this additional revenue will be used to increase the unemployment benefit and strengthen the resistance of out-of-work members to accepting wages below the present rates.

It is evident that the railway unions are endeavoring to strengthen their financial position in an attempt to meet any situation that may arise, either in regard to wages or the final solution of the railway problem which is soon to be discussed in Parliament. According to the present railway agreements, which the railwaymen have thus far shown no disposition to question, the wages of the railwaymen cannot be reduced below an average of about 125 per cent above their pre-war rates. It will be remembered that the English railwaymen have agreed to a sliding scale of wages depending upon the cost of living. The present figures in this respect indicate that there will be an average reduction of

about a dollar a week in wages on account of decreased cost of living, which the railwaymen have stated they are ready to accept in accordance with their agreement.

At the present time the annual wage bill of the railways has increased from \$235,000,000 in 1913 to \$865,000,000 (at par). The 8-hour day is responsible for a large amount of this increase. In some cases, as that of small stations open for, say, 10 hours, two men, whose hours overlap, are often required to perform one man's work. An instance was mentioned in Scotland where before the war 15 men were engaged for certain work at a total cost of \$3,410. At the present time 30 men are required for the same work at a cost of \$37,075.

The Railway Wages Board of Great Britain has, in accordance with the latest Board of Trade figures on the cost of living, and further in accordance with the wage agreement between the government and the unions, reduced the weekly wages of the railwaymen by four shillings (about \$1.00 at par) per week. Since the beginning of April, 1920, wages have been increased eight shillings a week (about \$2.00) in accordance with this scale, and the present reduction, which takes effect on April 1, is the first to have been made under the sliding scale. It is estimated that this reduction of four shillings a week will reduce the railways' wage bill by approximately \$29,000,000. The railway clerical staffs have also been affected by a fall in the cost of living. They will suffer a reduction of about \$100 a year in salaries.

### Track Material Exports in February

The exports of track materials in February showed some decline over January's totals, but the falling off is not serious except in the case of track spikes, of which the February shipments were but 2,742,959 lb., valued at \$144,675. Rails weighing 59,300 tons, valued at \$3,603,938, and miscellaneous materials valued at \$1,148,612 are the other totals. The detailed figures as compiled by the Bureau of Foreign and Domestic Commerce follow:

Countries	Railroad spikes		Rails of steel		Switches, frogs, splice bars, etc.
	Pounds	Dollars	Tons	Dollars

## Equipment and Supplies

### Locomotives

The LOUISVILLE & JEFFERSONVILLE BRIDGE & RAILROAD COMPANY is inquiring for some 0-6-0 type locomotives.

MITSUI & COMPANY, New York, are inquiring for 6 English type, 4 wheel, coupled, passenger locomotives, for the Shanghai-Hanchow Railway, China.

The JAPANESE GOVERNMENT has ordered from the Baldwin Locomotive Works for the Imperial Household 3 saddle tank locomotives with a total weight in working order of 16,000 lb.

### Freight Cars

The BEACON OIL COMPANY, Boston, Mass., has ordered 20 tank cars, of 10,000 gal. capacity, from the General American Tank Car Corporation.

MITSUI & COMPANY, New York, are inquiring for 40 all-steel air dump cars, for the South Manchurian Railway, and also for 40 all-steel box cars of 40-ton capacity, for the Shanghai-Hanchow Railway, China.

MITSUI & Co., 65 Broadway, New York, representing a Chinese banking group and on behalf of the Chinese Ministry of Communications, are inquiring for 100 all-steel 40-ton gondola cars for the Pekin-Kalgan; also for 100 all-steel 40-ton box cars for the Tientsin-Pukow.

### Passenger Cars

The TIENSIN-PUKOW is inquiring through the car builders for from 30 to 50 passenger cars.

BETANZOS FERROL RAILWAY.—Bids will be opened on April 25, at Madrid, Spain, for 34 passenger and 4 baggage cars.

THE SAO PAULO-RIO GRANDE (Brazil) is inquiring through the car builders for some passenger train equipment, to include sleeping cars.

MITSUI & Co., New York, are inquiring for 6 first-class and 6 second-class sleeping cars, 6 dining cars, 6 combination first and second-class, 10 third-class and 6 third-class with buffet passenger cars, for the Peking, Hankow Railway, China. This company also ordered from J. G. Brill & Company, 141 car sets of trucks, for the Osaki Municipal Railway.

### Machinery and Tools

The DULUTH & IRON RANGE, Duluth, Minn., is inquiring for a 90-in. wheel lathe, 2 16-in. engine lathes, 1 14-in. engine lathe and a 48-in. by 48-in. by 12-ft. planer. All of these machines are to be motor driven.

R. S. STOKVIS & SONS, INC., 17 Battery Place, New York, has received specifications comprising about 250 tools for machine shop equipment for a railroad project in Africa. Complete specifications will be issued shortly and tenders submitted as soon as quotations have been received from manufacturers. The list includes a double centering machine axle lathe, vertical lathe, car wheel lathe, hydraulic shrinking press, extension gap lathes, turret lathes, shapers, high speed drills, planers, slotters, horizontal milling machines, double reaming machines, shearing machines, forging machines, bulldozers, steam power hammer, double frame steam power hammers, compressed air hammers, spring leaf shaping machines, leaf bending machine, hydraulic presses, universal shearing and punching machine, double shear and punch, plate straightening machine, rotary shearing machine, hydraulic press for boiler heads, double-end grinding machine, radial drills, double-head bolt threading machine, bolt pointing machine, nut threading machine, 14 in. lathe facing lathes, vertical drilling, reaming and grooving machine, milling machine, grinding machine, vertical grinding machine, tool grinder, twist drill grinder, disk polishing and grinding machines, universal radial.

## Supply Trade News

The Roberts & Schaefer Company will remove its office on April 23 from the McCormick building to the Wrigley building, Chicago.

Homer C. Johnstone, formerly with the Midvale Steel Company, now represents the Gould Coupler Company, with headquarters at New York City.

The Consolidated Steel Corporation has removed its office from 165 Broadway to the Cunard building, 23 Broadway, New York City.

The Wonham, Bates & Goode Trading Corporation has removed its office from 17 Battery Place to 231 Fourth avenue, New York City.

D. T. Groff has been elected vice-president of the Jefferson Union Company, Lexington, Mass., and C. E. Cook, who was traveling representative, has been appointed sales manager.

The Hutchins Car Roofing Company, Detroit, Mich., will remove its New York City office on May 1 from 103 Park avenue to room 910 Canadian Pacific building, 342 Madison avenue.

The Southern Hardware & Supply Company, St. Louis, Mo., has appointed E. L. Ruby, Eastern sales agent, 1338 Real Estate Trust building, Philadelphia, Pa., for the sale of Saunders car stopper.

Victor T. Goggin, formerly New England sales manager of Fred T. Ley & Co., Springfield, Mass., has been appointed contracting engineer with Dwight T. Robinson & Co., Inc., with headquarters at New York City.

The Gold Car Heating & Lighting Company on May 1 will remove its offices from 17 Battery Place, New York City, and its warehouse to larger quarters at the Bush Terminal, 220 Thirty-sixth street, Brooklyn, N. Y.

H. G. Barbee, formerly in charge of eastern railroad sales of the Chicago Pneumatic Tool Company, has been appointed manager railroad sales, with headquarters in the Chicago Pneumatic building, 6 East Forty-fourth street, New York.

Dwight E. Robinson, until recently eastern railway representative of E. I. Du Pont de Nemours & Co., on May 1 will become manager of the railway sales department of Breinig Brothers, Inc., manufacturers of paints and varnishes, Hoboken, N. J.

The Keller Pneumatic Tool Company, Grand Haven, Mich., announces the removal on May 1, of its Chicago branch to larger and more up-to-date salesrooms and service station, on the main floor in the Transportation building, 624 South Dearborn street, Chicago.

The Merchants Shipbuilding Corporation, New York, announces that it will extend operations at its Chester, Pa., plant from the shipbuilding field into general steel construction. Power plant equipment, plate shop work and railroad equipment, to consist of the fabrication of steel for structures and for general structural work, will in future be manufactured at the plant.

Frank N. Grigg has been appointed southeastern sales manager of the Morton Manufacturing Company, with headquarters at 630 Louisiana avenue, Washington, D. C. Mr. Grigg will handle the sale of the entire "Acme Line" of railway appliances. C. H. Kadie, formerly master mechanic on the Southern Railway, is now in the sales department of this company and will assist Mr. Grigg.

John Hyland, formerly in the railway supply business at Chicago, is now located at Atlanta, Ga., representing the Edgewater Steel Company, Pittsburgh, Pa., the Joliet Rail-

way Supply Company, Burry Railway Supply Company, DeRemer-Blatchford Company, G. S. Wood Company and the Economy Torch Company, all of Chicago. His headquarters are at 1209 Fourth National Bank building, Atlanta, Ga.

The W. R. Hickman Lumber Company has been organized in Cleveland, Ohio, with W. R. Hickman, for the past five and a half years sales manager for the Nicola Stone & Myers Company, as president. The company will specialize in railroad and industrial lumber, handling yellow pine, West Coast stock, ties and hardwood car material. The general offices of the company are at 1264 Hanna building, Cleveland, Ohio, with representatives in Hattiesburg, Miss., and Seattle, Wash.

The Texas Company, Houston, Texas, announces the following appointments in its railway sales department. On February 1, W. H. Noble was appointed district manager at Chicago, vice John J. Flynn, deceased. On March 1 an office was established at St. Louis, Mo., 1689 Arcade building, with F. E. Sheehan, representative in charge, and an office in Los Angeles, Cal., 1206 Merchants National Bank building, with J. B. Flynn, representative in charge. Effective April 1, an office was established at Oklahoma City, Okla., with L. R. Dallam, representative in charge.

F. B. Jewett, chief engineer of the Western Electric Company, has been elected a vice-president and director of the company, continuing his present duties in charge of the technical forces of the company. Dr. Jewett, who was a lieutenant-colonel in the Signal Corps during the war and was decorated with the Distinguished Service Medal, was born at Pasadena, Cal., on September 5, 1879. He was graduated from the electrical engineering course of Throop Polytechnic Institute, of Pasadena, in 1898. From that time until June, 1902, he was a graduate student at the University of Chicago. During the next two years he was instructor in physics and electrical engineering at the Massachusetts Institute of Technology. Dr. Jewett's connection with the commercial telephone business dates from September, 1904, when he became transmission engineer for the American Telephone & Telegraph Company. While acting in this capacity, the loading of eight gage circuits was perfected; phantom tables and phantom loading for open wires and cables were developed; the New York to Denver circuit and line was engineered and also the Boston to Washington underground cable. In April, 1912, Dr. Jewett became assistant chief engineer of the Western Electric Company in charge of all development and research work. He has been chief engineer since 1916. Dr. Jewett was an advisory member of the Special Submarine Board of the Navy and contributed much towards the perfection of devices for detecting hostile submarines. The perfection of wireless telephoning is one of the undertakings which was completed under his direction.

F. B. Jewett

The Air Reduction Sales Company, Inc., manufacturers of Aircro oxygen, acetylene and welding and cutting apparatus, will move its executive offices on May 1, from 120 Broadway to 342 Madison avenue, New York City. The New York district office at 160 Fifth avenue, New York, after May 1 will be located at the Aircro factory, 191 Pacific avenue, Jersey City, N. J. The company has secured control of the National Carbide Corporation of Virginia, with a new plant at Ivanhoe, Va., and beginning May 1, 1921, will direct the policy and control the operation and sales of the Carbide Corporation.

# Railway Financial News

**BELT RAILWAY OF CHICAGO.—Annual Report.**—The annual report for the year ended December 31, 1920, shows the following income account as compared with 1919:

	1920	1919
Operating Income—		
Operating revenues	\$3,940,302	3,788,749
Operating expenses	3,763,022	3,457,700
Net revenue from operations	\$177,280	Dr. \$45,700
Tax accruals	251,482	14,859
Railway operating income	Dr. \$74,201	Dr. \$60,558
Non-Operating Income—		
Joint facility rent income	\$1,433,951	1,616,359
Income from lease of road	278,101	1,616,359
Total non-operating income	\$1,812,823	\$1,691,306
Gross income	\$1,741,621	\$1,630,748
Deductions from Gross Income—		
Rent for leased roads	\$1,530,597	\$1,457,662
Interest on funded debt	716	255
Total deductions from gross income	\$1,568,821	\$1,457,947
Net income	\$172,800	\$172,800

The Belt Railway did not accept the guaranty for the six months ended August 31, 1920.

The operating revenues and expenses in detail of the Belt Railway compare as follows:

	OPERATING REVENUES		Increase or Decrease
	1920	1919	
Transfer switching	\$3,698,588	\$2,864,762	\$833,826
Local switching	937,118	864,059	73,059
Total operating revenues	\$4,704,324	\$3,780,322	\$924,002
	OPERATING EXPENSES		
	1920	1919	
Maintenance of way and structures	\$669,034	\$357,145	\$311,889
Maintenance of equipment	762,632	665,153	97,479
Traffic	10,156	4,285	5,871
Transportation	2,959,763	2,260,654	699,109
General	117,291	146,333	-23,042
Total operating expenses	\$4,518,877	\$3,427,570	\$1,091,307

The number of cars handled by the Belt Railway in 1920, both interchange and local, was 1,045,814. In addition, there was a total of 320,462 cars interchanged between owner roads at Clearing and other yards, handled by the Belt Railway through such yards in 1920.

President H. G. Hetzler in the report refers to maintenance as follows:

The expense for maintaining roadway and structures increased \$311,889.05, or 87.3 per cent, and was due to the following causes:

- (1) Higher wage rates in effect under Decision No. 2 of the United States Railroad Labor Board.
  - (2) Increased unit prices for materials.
  - (3) More extensive maintenance work performed.
- The necessity for increased maintenance work in 1920 was largely the result of deferred maintenance growing out of the fact that a considerable portion of the property was acquired new or rebuilt under track elevation within the period 1911 to 1916, the natural result of this circumstance being that for a number of years accruing depreciation was greater than could profitably be offset with equal replacements. Hence a portion of the increased maintenance work in 1920 was due to normally deferred maintenance, and a smaller part due to circumstances which dictated a program of renewals below normal during the year 1919.

The business handled during the years 1920 and 1919 was approximately the same, but the extremely adverse conditions from the standpoint of efficiency which prevailed in the transportation department during the first three months of the switchmen's strike, were productive of very expensive operation, whereas only a comparatively small amount of business was handled during that period.

**BOSTON & MAINE.—New Directors.**—At the annual meeting of the stockholders in Boston on April 13 the board of directors was enlarged to nineteen. The new members chosen were Woodward Hudson, vice-president and general counsel, and William J. Hobbs, a vice-president of the company.

**CHICAGO, SAINT PAUL, MINNEAPOLIS & OMAHA.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares as follows:

	1920	1919
Operating revenues	\$26,489,817	23,767,081
Operating expenses	23,767,081	21,211,000
Net revenue from railway operation	2,722,736	2,556,081
Tax accruals	1,461,938	1,461,938
Uncollectible railway revenues	8,285	8,285

Railway operating income	1,252,513	1,252,513
Net rental income	37,717	37,717
Net railway operating income	1,290,351	1,290,351
Compensation for lease of road	815,603	\$4,934,790
Compensation guaranty period	2,740,197	2,740,197
Total non-operating income	3,785,649	3,785,649
Gross income	5,075,879	5,031,160
Interest on funded debt	2,405,763	2,282,180
Total deductions from gross income	2,488,209	2,654,443
Net income	2,587,670	2,376,718
Dividends:		
Preferred stock, 7 per cent	788,151	788,151
Common stock, 5 per cent	927,835	927,835
Balance income for year	871,684	660,732

The annual report of the Chicago, Saint Paul, Minncapolis & Omaha will be reviewed editorially in an early issue.

**CENTRAL VERMONT.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$100,000 of 5 per cent refunding gold bonds to cover additions and betterments made since January 1, 1920.

**CHICAGO GREAT WESTERN.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**CHICAGO & ALTON.—Authorized to Issue Stock.**—The Interstate Commerce Commission has authorized this company to issue (1) 1,753 shares of its cumulative four per cent prior lien and participating stock; (2) 514 shares of its non-cumulative four per cent preferred stock; and (3) 45 shares of its common stock, in exchange for stocks of the old Chicago & Alton Railway Company and the Chicago & Alton Railway Company, which were consolidated March 8, 1906, into the present company.

**CHICAGO & NORTH WESTERN.—Annual Report.**—The annual report for the year ended December 31, 1920, shows the following comparative statement of income account:

	1920	1919	Increase or decrease
Operating revenues	\$140,755,628	\$140,755,628	
Operating expenses	130,252,212	132,314	129,869,899

Dividends:			
Preferred stock (8 per cent in 1919; 7 per cent in 1920)	1,567,650	1,791,600	-223,950
Common stock (7 per cent in 1919; 5 per cent in 1920)	7,257,625	10,160,675	-2,903,050
Total appropriations	8,911,878	12,057,797	-3,145,919
Balance income for year	3,633,979	2,030,307	1,603,671

The annual report of the Chicago & North Western will be reviewed editorially in an early issue.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—Authorized to issue promissory notes.**—This company has been authorized by the Interstate Commerce Commission to issue a promissory note for \$500,000 to the Guaranty Trust Company of New York and one for \$425,000 to the Central Union Trust Company.

**DETROIT, TOLEDO & IRONTON.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$182,000 of first mortgage 50-year, 5 per cent gold bonds due March 1, 1964, which are to be sold to Henry Ford and his associates.

**INTERSTATE RAILROAD.—Authorized to issue stock.**—This company has been authorized by the Interstate Commerce Commission to issue \$338,000 of capital stock to reimburse the treasury for

expenditures made out of income and to pay for certain additions and betterments.

**NEW YORK, NEW HAVEN & HARTFORD.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with 1919 as follows:

	1920	Increase or decrease
Railway operating revenues:		
Freight .....	\$55,348,919	\$6,111,956
Passenger .....	\$52,270,794	7,496,576
Total railway operating revenues.....	\$123,512,313	\$16,967,190
Railway operating expenses:		
Maintenance of way and structures.....	\$20,654,480	\$6,374,426
Maintenance of equipment.....	30,443,016	9,060,734
Traffic .....	7,567,798	215,709
Transportation—rail line.....	67,233,026	16,575,517
Total railway operating expenses.....	\$126,346,384	\$33,516,682
Net revenue from railway operations.....	Def. \$2,834,073	—\$16,543,492
Railway tax accruals.....	4,500,175	426,635
Railway operating income.....	Def. 7,349,935	—16,957,998
Non-operating income:		
Dividend income.....	\$1,343,457	—\$908,780
Income from funded securities.....	1,095,047	—121,333
Income from unfunded securities.....	1,823,996	565,331
Rent from locomotives, passenger train cars and work equipment.....	1,456,876	376,014
Income from lease of road.....	1,198,262	—4,473
Total non-operating income.....	\$7,926,145	\$78,625
Gross income.....	576,210	17,036,623
Deductions from gross income:		
Rent for locomotives, passenger train cars, floating and work equipment and balance for hire of freight cars.....	2,969,484	1,836,037
Joint facility rents.....	3,897,528	263,780
Rent for leased roads.....	5,852,016	—2,704
Interest on funded debt.....	10,341,382	706,027
Interest on unfunded debt.....	3,184,001	—461,644
Total deductions from gross income.....	\$27,996,235	\$2,459,394
Net income, excluding government guarantees.....	Def. 27,420,025	19,496,017
Less government guarantees (see note).....	\$22,798,519	\$15,751,572
Net corporate income.....	Def. \$4,621,506	\$3,744,445
Ratio of operating expenses to total operating revenues.....	102.29	15.16
Ratio of operating expenses and taxes to total operating revenues.....	105.94	14.98

Note—Government guarantees include: Deficit in U. S. Railroad Administration operations for months of January and February; lap-overs audited from March 1 to December 31 applying to Federal control period; guaranteed standard return due from Director General for January and February; also amounts charged government under Transportation Act applicable to the guaranty period operations from March 1 to August 31, inclusive, as shown on books as of December 31.

The annual report of the New York, New Haven and Hartford will be reviewed editorially in an early issue.

**Stockholders Vote for Merger at Annual Meeting.**—The stockholders at their annual meeting in New Haven, Conn., on April 20, voted favorably on the proposal to merge into the company five subsidiaries, the Central New England, the Harlem & Port Chester Railroad, the New England Steamship Company, the Hartford & New York Transportation Company, and the New Bedford, Martha's Vineyard & Nantucket Steamboat Company. The vote was 913,371 shares in favor, none against. The vote was the same on acceptance of the annual statement of the road for the year ended December 31, 1920; on ratification of an agreement with the director general of railroads in regard to equipment and on refunding at maturity next year a loan placed in Europe in 1907. The board of directors was re-elected.

**NORFOLK & WESTERN.—Board Chairmanship Ended.**—At the stockholders' annual meeting at Roanoke, Va., on April 14, the company's by-laws were amended so as to abolish the office of the chairman of the board, which office has been vacant since the retirement of L. E. Johnson, since deceased, on January 1, 1921.

**OREGON, CALIFORNIA & EASTERN.—Asks Authority to Issue Securities.**—This company has applied to the Interstate Commerce Commission for authority to issue \$485,600 of bonds and 4,714 shares of stock.

**PERE MARQUETTE.—Asks Authority to Pledge Bonds.**—This company has applied to the Interstate Commerce Commission for general authority to pledge or sell \$3,231,000 of first mortgage, 5 per cent gold bonds now nominally issued and held in the treasury. The company does not propose to sell the bonds at this time, but desires to issue notes from time to time to provide funds for its corporate requirements and desires general authority to pledge the bonds as collateral.

**TEXAS SHORT LINE.—Authority to Issue Bonds Denied.**—The Interstate Commerce Commission has denied the application of this company for authority to issue \$175,000 of first mortgage bonds to retire maturing bonds, on the ground that the company's prospective earning power does not justify the fixed charges.

**TOLEDO, ST. LOUIS & WESTERN.—Asks authority to issue receiver's notes.**—The receiver has applied to the Interstate Commerce Commission for authority to issue \$692,000 of receiver's certificates of indebtedness to be used as collateral security for the payment of a loan from the United States.

**VALDOSTA, MOULTRIE & WESTERN.—Sale Not Yet Approved.**—C. L. Jones, president of this company, who purchased the road at a foreclosure sale on April 9, is awaiting confirmation of the sale by Judge Evans of the federal court.

**WESTERN PACIFIC.—Authorized to Issue Bonds for Purchase of Sacramento Northern.**—The Railroad Commission of California has authorized this company to issue and sell at 85 and accrued interest, \$4,180,000 of its first mortgage 5 per cent bonds. The bonds will be acquired by the Western Pacific Railroad Corporation and then distributed to bond holders of the Sacramento Northern, who have agreed to sell their bonds to the Western Pacific. The Western Pacific, as noted in the *Railway Age* of April 1 (page 866), has agreed to pay \$27.50 a share for the first preferred stock of the Sacramento Northern, \$15 a share for the second preferred and \$6 a share for the common stock. It has also offered to exchange for the bonds of the Sacramento Northern, first mortgage bonds of the Western Pacific on the basis of \$80 face value of the Western Pacific bonds for \$100 face value of the Sacramento Northern bonds.

**WHEELING & LAKE ERIE.—Authority to Pledge Securities Denied.**—The Interstate Commerce Commission has denied this company's application for authority to pledge from time to time any bonds, stocks or other securities which are now or may hereafter be held in its treasury as collateral security for any short term notes which it may issue within the limitations prescribed by Paragraph 9 of Section 20-a of the interstate commerce act. The commission says it is required to make investigation of securities before authorizing their issue and it cannot with propriety issue general authority of the nature contemplated in this application.

**Guaranty Certificates Issued**

The Interstate Commerce Commission has issued additional certificates for partial payments to railroads on account of their six months' guaranty as follows:

	Previously paid
Louisville & Nashville.....	\$4,750,000
Kingston Carolina.....	1,500
Georgia.....	300,000
Long Island.....	450,000
Rio Grande Southern.....	100,000
New York, Ontario & Western.....	600,000
Detroit, Toledo & Ironton.....	225,000
St. Joseph & Grand Island.....	155,000
Louisville & Wadley.....	6,500
New York, Philadelphia & Norfolk.....	300,000
	256,000

Total payments to April 19 made by the Treasury under the provisions of the Transportation Act have been as follows:

(a) Under Section 204, for reimbursement of deficits during federal control.....	\$969,923.82
(b) Under Section 209:	
(1) To carriers to which final payment of the guaranty has been made under paragraph (g) including previous advances under paragraphs (h) and (i).....	1,311,700.63
(2) For advances under paragraphs (b) and (c) to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission.....	263,235,874.00
(c) Under Section 212:	
(1) For partial payments in respect to the guaranty provided in Section 209.....	123,311,490.05
(2) For partial payments in respect to the reimbursement for deficits during the period of federal control provided in Section 204.....	418,000.00
(d) Under Section 210, for loans from the revolving fund of \$300,000,000 therein provided.....	193,685,137.00
Total.....	\$582,932,125.50

**Dividends Declared**

Central of New Jersey.—\$2.00, quarterly, payable May 2 to holders of record April 29.  
 Pullman Company.—\$2.00, quarterly, payable April 30 to holders of record May 16.

# Railway Officers

## Executive

W. C. Morse, whose appointment as vice president of the Louisiana Railway & Navigation Co., with headquarters at Shreveport, La., was announced in the *Railway Age* of April 1 (page 915), was born in 1867 at Vineland, Mo. He was educated in the public schools and entered railway service in 1883 with the St. Louis, Iron Mountain & Southern (now the Missouri Pacific). He served the Iron Mountain as a telegraph operator and station agent until 1888 when he was promoted to train dispatcher at De Soto, Mo. Ten years thereafter he was promoted to chief dispatcher with the same headquarters. He resigned that position in 1902 to enter the service of the Atchison, Topeka & Santa Fe in a similar capacity at Chillicothe, Ill. In 1906 he returned to the service of the Iron Mountain as trainmaster at McGee, Ark. The same year he was promoted to superintendent of the Natchez division. Subsequently he served as superintendent of the Memphis, Central and Missouri divisions, until he resigned on April 1, to enter upon his new duties. Mr. Morse's name will be recalled as that of a contributor to these columns on interesting questions connected with operating problems.

W. C. Morse

H. C. Nutt, formerly president of the Central Equipment & Coal Commission, an organization having charge of all bituminous coal mining and distributing operations in Silesia, has been elected president of the Monongahela and the Pittsburgh, Chartiers & Youghiogeny, with headquarters at Pittsburgh, Pa. Mr. Nutt was born at Council Bluffs, Ia., November 12, 1863. He was graduated from the Sheffield Scientific School, Yale University, in 1883, and began his railroad career as a rodman for the Burlington & Missouri (now a part of the Chicago, Burlington & Quincy). He served in various capacities in the engineering department of that road and, in 1889, was appointed trainmaster at Alliance, Nebr. In 1892, he was promoted to assistant superintendent at Edgemont, S. D., and a year later was transferred to Sheridan, Wyo. In 1900 he became assistant superintendent of the Chicago, Burlington & Quincy with headquarters at Burlington, Ia. Three years later he was promoted to superintendent and the following year to general superintendent of the Iowa district. In 1905 he was transferred to the Missouri district and the following year became general superintendent for the

H. C. Nutt

Michigan Central, with headquarters at Detroit. In 1907 he went with the Northern Pacific as general manager of the western lines and, in 1909, was elected fourth vice-president. Mr. Nutt left the Northern Pacific in 1912 to become general manager of the Los Angeles & Salt Lake with headquarters at Los Angeles, Cal. During the war Mr. Nutt was commissioned a lieutenant colonel and served in France as deputy director general of the American military railways. Upon his return to this country he resumed his position as general manager of the Los Angeles & Salt Lake. He resigned this position early in 1920 to become president of the Central Equipment & Coal Commission in Silesia.

## Operating

James M. Wachter, who has been appointed superintendent of terminals of the Mobile & Ohio and the Southern at Mobile, Ala., was born on March 7, 1863, at Bolivar, N. Y. He was educated in the public schools and entered railway service in 1880 as a switchman for the Louisville & Nashville at Birmingham, Ala. He later served the same road as a brakeman, conductor and general yardmaster until 1905, when he resigned to enter the service of the Mobile & Ohio as general yardmaster. From 1911 until 1914 Mr. Wachter was superintendent of terminals of the International & Great Northern at Houston, Tex. In 1914 he left the service of that company to become general yardmaster of the Mobile & Ohio. He was serving in this capacity at the time of his recent promotion.

E. W. Scheer, whose appointment as general manager, Eastern Lines, of the Baltimore & Ohio was announced in the *Railway Age* of April 15 (page 961), was born on April 28, 1875, at Zaleski, Ohio. He entered railway service February 10, 1890, as a messenger in the office of the superintendent of the Cincinnati, Washington & Baltimore (now a part of the Baltimore & Ohio). From May 1, 1890, to December 15, 1895, he was employed as a clerk and stenographer for the Baltimore & Ohio Southwestern. From the latter date until January, 1899, he was chief clerk to the division superintendent and then served as secretary to the vice-president and general manager until 1906. From then until 1912 he served consecutively as chief clerk to the general manager and assistant secretary and chief clerk to the general superintendent at Cincinnati. He then became assistant to the general superintendent of the same road at Cincinnati. The following year he became superintendent of the Illinois division with headquarters at Flora, Ill. In 1915 he was transferred in a similar capacity to the Indiana division at Seymour, Ind. In July of the following year he was promoted to general superintendent with headquarters at Cincinnati. In October of the same year he was transferred to the Northwest district of the Baltimore & Ohio and, in February, 1920, to the Maryland district, which position he held at the time of his recent promotion.

E. W. Scheer

Coincident with the abolishment of the Burlington division of the Chicago, Burlington & Quincy the lines from Albia to Des Moines, from Burlington to Tracy, and from Winfield to Washington have been consolidated with the Ottumwa division, while the lines from Fort Madison to Batavia and from Carthage Junction to Quincy have been consolidated with the Hannibal division. The following appointments have been made: N. H. Young, superintendent of the Burlington division, has been transferred to the Brookfield division, with headquarters at Brookfield, Mo., succeeding W. F. Giles, who has been

transferred to the Wymore division, with headquarters at Wymore, Neb., succeeding F. D. Gurley, who has been appointed assistant superintendent with the same headquarters. Mr. Gurley succeeds H. J. Hoglund, who has been appointed trainmaster with headquarters at Chicago. C. W. Orbin, chief dispatcher on the Burlington division, has been assigned to other duties and the position abolished. The changes were effective April 16.

### Traffic

Harry C. Stauffer, whose appointment as general freight agent of the Philadelphia & Reading was announced in the *Railway Age* of April 15 (page 962), was educated in the common schools and in preparatory schools. Upon completion of his education he entered the service of the Philadelphia & Reading as agent at Kimberton, Pa. Later he served as agent at Byers, Pa., and then at Douglassville, Pa. From the latter position he was transferred to the position of chief clerk at the 31st street and Girard avenue station, Philadelphia. After serving at that point for some time he was appointed freight agent at Chester, Pa., and then freight agent at Reading, Pa. He remained on duty at this point for seven years and went to Philadelphia in 1910 as division freight agent in charge of the New York division and the Atlantic City Railroad. He continued in this position during the time the railroads were operated under federal control. When they were returned to private ownership on March 1, 1920, Mr. Stauffer was appointed general coal freight agent. He held this position until the time of the present appointment.

H. C. Stauffer

R. H. Morris, general western freight agent of the Southern, with headquarters at Chicago, has been promoted to freight traffic manager, with headquarters at Cincinnati, Ohio, effective April 15. Mr. Morris was born on February 25, 1866, at Xenia, Ill., and entered railroad service in 1884 as a telegraph operator on the Louisville, Evansville & St. Louis, at Fairfield, Ill. In 1886 he was appointed secretary to the general manager at Louisville, Ky., where he remained until 1887, when he was transferred to Evansville, Ind., as local agent. Two years later he accepted an appointment as commercial agent for the Louisville, Henderson & St. Louis, with headquarters at St. Louis, Mo., where he served until 1898, when he returned to the service of the Louisville, Evansville & St. Louis, as general agent, with headquarters at Evansville, Ind. When the Louisville, Evansville & St. Louis was taken over by the Southern, Mr. Morris continued to serve as general agent at Evansville. In 1905 he was appointed commercial agent, with headquarters at Cincinnati, and in 1909 he was transferred to Chicago. He was promoted to assistant general freight agent, with headquarters at Louisville, Ky., in February, 1917. In March, 1920, Mr. Morris was made northwestern freight agent, with headquarters at Chicago, Illinois.

### Engineering, Maintenance of Way and Signaling

C. R. Mee has been appointed chief engineer of the Louisiana Railway & Navigation with headquarters at Shreveport, La., effective April 8.

W. A. Duff, assistant chief engineer of the Moncton Division of the Canadian National Railways, has been appointed engineer of standards with headquarters at Toronto, effective April 1.

### Purchasing and Stores

J. F. Blasie has been appointed district storekeeper of the New York Central at Depew, N. Y., succeeding H. L. Grandy, transferred.

A. L. Prentice has been appointed district storekeeper of the New York Central, with headquarters at Elkhart, Ind., succeeding C. F. Heidenrich, who has been transferred to Collinwood, Ohio, in the stores department.

### General

#### MISSOURI—ILLINOIS

The Missouri-Illinois which was organized to take over the operation of the Illinois Southern and which established its general headquarters at Bonne Terre, Mo., in February, has announced the appointment of the following officers:

F. J. Thomure.....	Vice-president and gen'l mgr.	Bonne Terre, Mo.
W. G. Patton.....	Assistant to vice-president.	Bonne Terre, Mo.
V. M. Johnson.....	Auditor	Bonne Terre, Mo.
M. Rittmaster.....	Assistant auditor	Bonne Terre, Mo.
E. L. Kimmel.....	Assistant general manager	Sparta, Ill.
C. M. Swan.....	Traffic manager	St. Louis, Mo.
F. P. Sackbauer.....	Ass't gen'l fr't and pass. agt.	St. Louis, Mo.
H. Schantl.....	Chief engineer	Bonne Terre, Mo.
C. E. Morrow.....	Assistant chief engineer	Sparta, Ill.
T. A. Roussin.....	Master mechanic	Sparta, Ill.

### Obituary

M. M. Kirkman, former vice-president of the Chicago & North Western, died of apoplexy at the Henrotin Memorial Hospital, Chicago, on April 18. Mr. Kirkman was born in Morgan County, Ill., on July 10, 1842, and entered railway service in 1857 as a messenger for the Chicago & North Western. From 1857 to 1861 he served in the telegraph and traffic departments and as a train dispatcher. In 1861 he was made auditor of traffic accounts. He was promoted to assistant general accounting officer in 1865, and in 1867 was made general accounting officer. In June, 1870, he was given additional jurisdiction over the duties of local treasurer, and continued this work up to the time of his retirement from railroad service. He was promoted to controller in June, 1881, and was elected vice-president in November, 1889. Mr. Kirkman retired from active railroad service in April, 1910, after 53 years' continuous service with the North Western. He was the author of a number of treatises on transportation subjects, including "The Science of Railways," published in 1894.

Lester G. French, for thirteen years editor and assistant secretary of the American Society of Mechanical Engineers, and manager of the journal "Mechanical Engineering," died on April 18 at the French Hospital, New York. Mr. French was born at Keene, N. H., in April, 1869. He received his technical education at the Massachusetts Institute of Technology, from which he was graduated in 1891 with the degree of S. B. He served the year 1891-92 with the Cranston Printing Press Company as draftsman, and then became connected with the International Correspondence Schools, Scranton, Pa., as instructor in mechanical engineering. Leaving this institution in 1895, he went to Providence, R. I., where he entered the employment of the Builders Iron Foundry as assistant to the superintendent. In 1897 he became editor-in-chief of "Machinery," continuing in this position until 1906, when he resigned to take up the publication of technical books, among them being one of the earliest American treatises on the steam turbine, of which he was the author. In 1908 he was appointed editor of the publications of the American Society of Mechanical Engineers, which organization he served to the date of his death. Mr. French had been a member of the American Society of Mechanical Engineers since 1899.

THE SENATE has decreed another investigation of the railroads. Does the trouble with Congress in framing regulative railroad legislation lie in a want of the facts of the situation or does it lie in an incapacity of Congress to deal with the situation in the light of the known facts?—*New York World*.

Many signs indicate that the turn has come in business, and that it may reasonably be hoped that from now on it will more or less steadily and substantially improve. The money market is easier, and the prices of securities somewhat higher than for some time. Of significance, unquestionably, are the changes

### Signs of Improving Conditions

which are occurring in the railroad freight situation. Recently, for the first time in months, the car surplus has shown a small decline. The number of cars of freight loaded, including even coal cars, has been showing increases, and in the week ended April 16 total car loadings of all kinds of freight were 738,906, the largest figure reported since the week ended January 15. Probably it is too early to begin to express much optimism, but certainly there are many indications that the worst of the depression has been experienced and passed.

It is now over ten years since the disastrous derailment on the Lehigh Valley at Manchester, N. Y., brought the transverse fissure before railway men as a new and particularly dangerous form of rail failure. Since that time thousands of similar failures have occurred

### Are We Really Getting Anywhere?

in all parts of the country, in rails from different mills and under varying densities of traffic. Because of its particularly dangerous character the transverse fissure has received a great deal of attention from metallurgists and engineers, both individually and collectively. Their investigations have developed certain information of value, such as the fact that all rails of a heat commonly show the same characteristics in this respect. The reason for this tendency and the conditions which give rise to these fissures are, however, as yet unknown. Various theories have been projected from time to time but none has yet been proven. This form of failure is so dangerous and it is increasing so rapidly in frequency that no stone should be left unturned to arrive at the determination of its cause and the formulation of means for its elimination.

While much of it is due to improper packing, the causes of the greater part of loss and damage, aside from theft, are

### Better Supervision to Prevent Loss and Damage

improper handling and improper loading. This is well understood and on many of the more progressive roads, numerous plans and "drives" have been inaugurated to help remedy the situation. In general, such plans as have proved to be of value have been based on the principle of securing better supervision of loading. One road, as an experiment, assigned the loading of three cars daily to each of its agents at one of its terminals. These three cars were "charged" to each agent and he was required personally to oversee their loading. Notes were kept of the contents, the manner in which they were stowed, the name of the man in charge, etc. The car numbers were then sent to the agent at destination or, if bulk was to be broken en route, to the designated point. On arrival an inspection was made of each car. Where any irregularities were noted, a complete record was made of the condi-

tion of the load and the loading as observed on arrival and copies sent to the loss and damage department. Through this the agents were checked up and interested in securing better loading and causing less loss and damage claims since, with complete data at hand as to the loading at the point of origin and condition of shipments at destination, it was possible to get at some of the underlying causes.

One of the effects of the present acute necessity for retrenchment in expenses is the tendency to consolidate operating divisions with the consequent enlargement of territory under the supervision

### The Consolidation of Operating Divisions

of a division staff. Within the past three or four weeks several roads, particularly in the west, have eliminated one or more division organizations. The most drastic change of this character which has been announced is that on the Chicago, Rock Island & Pacific where six divisions have been eliminated, as announced in our news columns this week. This tendency emphasizes the contrast in the practices of different railroads regarding the mileage which they assign to various divisions. Thus the average length of division on the Chicago, Burlington & Quincy, the Atchison, Topeka & Santa Fe and the Chicago, Rock Island & Pacific prior to the recent consolidations was about 425 miles, while the corresponding figure on the Union Pacific and the Southern Pacific was approximately 725 miles. While it is frequently stated with a great deal of truth that the railways as a whole suffer from deficient rather than excessive supervision, this contrast in operating organizations offers food for thought. The cost of a division organization is not confined to the salaries of the officers thereon but is incurred in large measure for the necessary office organization and increased correspondence resulting therefrom. It is possible that the stress for reductions in expenses now confronting the railways may cause other systems to study their organizations and perhaps find possibilities of consolidating divisions here and there. At the same time, with conditions such as they are now, the need for intensive supervision is so great that steps of this kind should not be taken except after most careful consideration.

Almost every railroad which serves great industrial centers finds itself at some time or another in need of extending its

### An Opportunity Recognized

facilities to take care of increasing traffic. Practically every road in such a position finds the high cost of additional lands an important limiting factor in any program for extensive improvements. The size and importance of the industrial concerns in the vicinity have increased land values and all available space close to the railroad is highly developed so that additional property can be obtained by the road only at almost prohibitive prices. The railways of the devastated regions of France and Belgium at the close of the war found themselves in a particularly favorable situation as regards this problem. Many important industrial cities were practically destroyed by the enemy. Because of this the railways were able to secure additional lands at comparatively low prices not only to meet their present requirements but to take

care of their needs for a number of years to come. In addition, many improvements contemplated for years before the war have been embodied in the program for the reconstruction of the old railways. This phase of the railway reconstruction program, together with detailed examples of the extensive improvements provided for at several places, is discussed by Oliver F. Allen in an article appearing elsewhere in this issue. It would appear that this phase of the reconstruction program gives evidence of the same foresight and ability on the part of those in charge as did the solution of the many difficult problems of the early phases of reconstruction when the necessity for the greatest speed in opening the railways to traffic and the shortage of labor and many essential materials combined to challenge engineering skill of a high order.

Closely allied with the question of scheduling work in locomotive repair shops is the need for carefully placing machine

### Placing Machines Scientifically

tools so that repair parts may be handled with the least possible lost motion. It is self-evident that the greatest economy lies in so arranging machines that a locomotive part will be moved from one to the other until all machine operations are completed without back travel. In this way there is big saving in time and the labor of trucking and long crane hauls are reduced to a minimum. Mechanical department officers as a rule fully appreciate the need for scientifically locating machine tools and many who have been unable to do so before will take the present opportunity to rearrange tools and shop equipment along the lines indicated. Considerable savings can be effected by localizing detailed repair work in sub-departments. This enables machines required for the repair of a given part, as for example a driving box, to be arranged in the order in which machine operations occur and all located in a comparatively small area. In this connection, it is worth while to emphasize the importance of properly locating lye vats for removing dirt and grease from locomotive parts. This is perhaps one of the most common causes of lost time and effort in railroad shops. Many shops try to centralize cleaning operations at one central lye-house and the result is that material repaired at sub-departments must be trucked back and forth a long distance. While large central vats are needed for certain heavy work, the answer to the problem seems to be in the installation of smaller individual tanks in the separate departments. Taken all together, the careful location of railway shop equipment to provide minimum trucking and no back movement offers possibilities of labor saving which are decidedly important.

### “Inadequacies of Railway Management”

THE RAILWAYS have presented to the Railroad Labor Board a large amount of evidence showing that the cost of operation is being made excessive and burdensome to them and the public by a grossly inflated payroll. They have tried to prove that rules and working conditions inherited from government control cause inefficiency of labor and make it necessary to employ too many men. They have also tried to prove that the existing wage scales are too high in proportion to the present cost of living and the wages now being paid in other industries, and make necessary passenger and freight rates that are higher than the public ought to be required to pay.

The spokesmen of the labor organizations have made hardly any serious effort to defend the existing rules, working conditions and wages by evidence and arguments tending to show their reasonableness. Almost the sole answer they have made is that large amounts of money are being wasted

by the railway managements themselves through financial manipulation, and by failure to effect operating economies which, it is claimed, are perfectly feasible. They contend that no economies should be effected at the immediate cost of labor until every other form of alleged inefficiency and waste has been eliminated. They have introduced before the Labor Board several large printed documents in which they have set forth at length the “evidence” in support of their charges of bad management. The chief author of these exhibits is W. Jett Lauck, who styles himself “consulting economist” of the labor brotherhoods. The most pretentious of them is entitled “Inadequacies of Railway Management.”

Upon the theory of the labor leaders themselves, these documents are not pertinent to any question before the board. The labor leaders contend that the railways should be required to establish reasonable rules and working conditions, and reasonable wages, regardless of the financial ability of the companies to meet the resulting payroll. If the inability of the railways to meet the payroll should not be considered in fixing working conditions and wages, then the reason why the railways are unable to meet the payroll, whether it be mismanagement or rates that are too low, has no bearing on the question of working conditions or of wages.

Why, then, do the spokesmen of the labor unions persist in introducing documents designed to show that the railways are being mismanaged? They do it for two obvious purposes. They cry “Stop thief!” to divert attention from the evidence regarding the excessive payroll. They do it, also, as a part of their propaganda to destroy public confidence in private management and further their movement for the Plumb plan. Mr. Lauck and other spokesmen of the unions hypocritically denounce the comparatively small expenditures the railways are making to present the facts about the railroad situation to the public and at the same time spend many thousands of dollars in the dissemination of libels upon railway management which, if unanswered, would poison public opinion.

Mr. Lauck's document on “Inadequacies of Railway Management” is a classic example of the misrepresentations the labor unions are spending many thousands of dollars in compiling and disseminating. It consists almost entirely of quotations from editorials and articles in the *Railway Age* and the *Railway Mechanical Engineer*, and from addresses made by railway officers. How could he get from such sources evidence that the railways are grossly mismanaged? Very easily. The papers mentioned and railway officers have been engaged for many years in describing at length and in detail the great achievements of the managements in devising and carrying out improvements in plant and in operating methods which have made the railways of this country the leaders of the world in efficiency and economy. They have never claimed, however, that the management of our railways is 100 per cent efficient. They know that, like other human things, it is far from perfect, and they have recognized the fact that it is the function and duty of railway papers and railway officers constantly to point out the respects in which railway plant and operating methods are still imperfect, and to advocate the improvements needed still further to increase efficiency and economy. Among other things, railway papers and railway officers recently have emphasized the fact that the things most needed to increase efficiency and economy are measures which will correct the conditions which are causing the railroad payroll to be excessive.

Mr. Lauck, with commendable diligence, has searched through the files of the *Railway Age* and the *Railway Mechanical Engineer* for months for everything that these papers or railway officers have said regarding efficiency and economy. He has ignored everything he found tending to show that most railroads have been as progressive in making improvements in plant and methods as conditions would permit, and regarding the great gains in efficiency and economy that have been thus obtained. He has ignored all that has been

said about the extent to which the railways have been prevented from making other needed improvements by their inability, due to inadequate net earnings, to raise sufficient new capital. He has ignored all that has been said about the effects of the inefficiency of labor and the excessive wages.

On the other hand, he has pounced upon every article, editorial and statement which has been published pointing out shortcomings of plant and methods of operation. All articles, editorials and statements of this kind he has assembled and published in such a manner as to give the impression that they are the only things that have been said upon the subject of efficiency and economy. When articles, editorials and statements from which he has quoted have pointed out that improvements which they advocated could not be made unless the railways were enabled to earn larger net returns, he has found it convenient to suppress these parts of them.

Having ignored all evidence militating against his preconceived theory of railroad management, and seized upon every fact or statement which apparently tended to support it, Mr. Lauck of course concludes, as he intended from the start, that the railways are grossly mismanaged. He then places the annual cost of this mismanagement at the good round figure of \$1,000,000,000. In his exhibit he gives details for only \$578,500,000, but he issued a statement to the press placing the entire waste at \$1,000,000,000. As for any basis of actual fact his estimate had, he could just as well have made it \$1,500,000,000 or \$2,000,000,000 a year.

In the discussion of Mr. Lauck's views and estimates regarding railroad efficiency and economy the *Railway Age* does not have to set itself up as an authority, or to prove that it is frank and fair.

Mr. Lauck has tacitly admitted these things. For him to refuse now to accept our views as authoritative would be to destroy the force and effect he has tried to give to all the pages of quotations he has made from our columns. He has bound himself to admit that we are frank and fair in the discussion of problems of railroad efficiency and economy, for he has himself proved our fairness and frankness by quoting so much material from our columns in alleged support of his own views.

Premising our remarks, therefore, on his recognition of the fact that this paper is authoritative, frank and fair, we brand the documents regarding railroad efficiency and economy he has presented to the Railroad Labor Board as among the most wilfully dishonest and misleading productions ever submitted to a government body or to the American public. The man who will deliberately take perhaps one-fifth of the facts presented by any publication or man, upon a given subject, ignore the other four-fifths of the statements made and the facts presented by that publication or man upon the same subject, and then use the one-fifth to prove "mismanagement" which he must know the other four-fifths disprove, is not an "economist," however much he may advertise himself as such. He is merely the cheap, soap-box type of propagandist, who is reckless in what he says either because he does not know what he is talking about or because he does not expect to experience any of the effects of any harm he may do.

The managements of the railways are engaged in great efforts to restore efficiency and economy of operation. The far the leaders of the labor unions, who employ Mr. Lauck, have done all they could to defeat these efforts. The fact that they employ Mr. Lauck to spread propaganda, such as his thesis on "Inadequacies of Railway Management," indicates that in efforts to restore efficiency and economy the railway managements cannot hope for any more help from Mr. Lauck's employers than they have received in the past. Fortunately, hundreds of thousands of railway employees and a large part of the public cannot be misled by this low kind of propaganda.

## Mr. Lauck's "Estimated Possible Savings"

W. JETT LAUCK, "consulting economist" of certain railway labor unions, has introduced before the Railroad Labor Board elaborate exhibits designed to show that mismanagement of the railways is causing wastes aggregating at least \$1,000,000,000 a year. He and other spokesmen of the labor unions contend that no changes in working conditions or wages which will reduce the compensation of labor should be made until all these alleged wastes due to mismanagement have been eliminated. Mr. Lauck also has denounced as unnecessary the course of the railways in laying off many thousands of employees within recent months. It follows, on his theory, that there should not have been any reduction of the payroll below what it was when a large business was being handled last year.

The payroll at that time was running at the rate of about \$4,000,000,000 a year. Total operating expenses were running at the rate of about \$6,300,000,000 a year. The difference of \$2,300,000,000 a year consisted almost entirely of expenditures for fuel, materials and supplies, and loss and damage.

It seems logically to follow, on Mr. Lauck's theory, that the railways should reduce these items an average of 45 per cent before curtailing the payroll in the slightest degree. The total cost of fuel, materials and supplies depends on their prices and the amount of them used. The railways cannot control the prices they must pay for them, and therefore to contend that but for "mismanagement" expenditures for these items would be so enormously reduced would be manifestly absurd. Whether Mr. Lauck really means to be understood as taking this position we are unable to tell from his documents, but this is what they imply.

The largest item in his estimated possible savings is one of \$272,500,000, which he claims could be made by "modernizing locomotives." He says there have been available for the last ten years devices which have demonstrated beyond question their ability to effect large savings. This is true, but it has no real relationship to his estimate of the amount that could be saved by the universal use of these devices. The figure of possible saving he gives is merely a wild guess based upon nothing tangible except his desire to show mismanagement.

Furthermore, the figures he himself gives disprove his imputation that the railway managements have not largely taken advantage of the availability of these devices. There are about 65,000 locomotives in the United States. Even the oldest of the devices to which he refers have been available in practical form for only about ten years, and others for shorter periods. In this comparatively brief time 35,000 locomotives have been equipped with superheaters, 43,000 with brick arches, 37,000 with automatic fire doors and 15,000 with power reverse gears. Many other improvements have been made which might be mentioned. Never before in the history of the railroads of this or any other country were steam locomotives and the service rendered by them improved as much as they have been in the United States within the last ten years. And yet, because more improvements have not been made Mr. Lauck roundly denounces the railways for alleged "mismanagement!"

Besides condemning the railways for not having raised all their locomotives to the highest possible point of efficiency, Mr. Lauck condemns them as being wasteful because they have not standardized all their freight and passenger cars, brought all their engine terminals up to present needs, installed all the machine tools needed in their shops, perfected the power plants of their shops and standardized all the materials used in maintenance of way. His assumption that general standardization is desirable is simply an evidence of his ignorance, since the extent to which standardization

should be carried in any branch of railroading is still recognized by experts as a debatable question.

As to improvements in locomotives and in engine terminals, the installation of needed machine tools in shops, the improvement of power plants, and many other things mentioned by Mr. Lauck, they can be made only by the investment of large amounts of new capital. New capital can be raised only if net operating income is earned to pay a return upon it. With the exception of the years 1916 and 1917, the railways have never had a net return which approached adequacy since 1910. The only way their net return can be made adequate now is by reduction of the present operating expenses. Adequate reductions cannot possibly be made in the near future in present operating expenses without reducing the payroll. But Mr. Lauck opposes all reductions in the payroll. Therefore, at one and the same time he denounces the railroads for alleged wastes due to mismanagement and opposes the only means by which they can be enabled to eliminate the larger part of the wastes which he charges exist, and many of which unquestionably do exist.

The kind of intelligence and fairness Mr. Lauck manifests throughout his discussion is strikingly illustrated by what he says under the heading, "Train Operation." "High powered locomotives have been developed with zeal," he remarks, "but the corresponding efficiency of train loading has been overlooked. It is a case of being all dressed up and no place to go." Now, the fact is, that the average train load increased from 475 tons in 1915 to 728 tons in 1920, or over 53 per cent in five years—which, of course, Mr. Lauck does not mention. Meantime, Mr. Lauck's clients, the labor unions, did all they could to defeat this increase in efficiency by trying to secure the passage of legislation requiring the employment of extra men in train crews, or legislation reducing and absolutely limiting the length of freight trains and thereby reducing or limiting their loads. As an example of hypocrisy, the criticism of the labor unions' own "economist" that the railway managements have not sufficiently increased the average train load is a "pippin." In no other respect has the efficiency of management been more strikingly demonstrated than by these increases in train loading in spite of constant labor union opposition.

Among the largest items in Mr. Lauck's list of estimated savings is one for loss and damage. Being a defender of government control, he makes no reference to the fact that the increase in freight claim payments from \$35,000,000 in 1917, to \$106,804,000 in 1919, or 205 per cent, which he mentions, occurred under government control. He quotes the *Railway Age* as authority for the statement that a 50 per cent reduction can be made in loss and damage. He makes no mention whatever, however, of the many columns of information published in this paper and elsewhere showing that immediately after the return of the railways to private operation the American Railway Association organized, and has since been conducting, a special bureau for the express purpose of carrying on a campaign to reduce by 50 per cent the enormous item of loss and damage which developed under government control.

Far be it for the *Railway Age* to contend that under good management economies as large as Mr. Lauck has estimated can not be made. But even though all the needed capital were available, it would take years to make the improvements in the physical plants which would be required to effect the large economies he claims are possible. If, therefore, no reduction in the payroll were to be made, as Mr. Lauck contends should be the case, until all these other economies had been effected, the present payroll would have to be maintained without diminution for years to come, regardless of its intrinsic reasonableness or unreasonableness.

But the maintenance of the existing payroll and the effecting of the various economies Mr. Lauck himself advocates

would be incompatible. In the first place if the present payroll should be maintained this would render it impossible for the railways to earn the net return necessary to enable them to make the improvements Mr. Lauck says should be made. On the other hand, if these improvements should be made and the economies they would render practicable should be effected, these economies would result chiefly from reductions in the amount of labor that the railways would have to employ, and from consequent reduction of the payroll. Mr. Lauck mixes up economies in the purchase and use of fuel and supplies, and in the use of labor, without apparently knowing at any given time which kind of economy he is talking about.

The more the documents he has presented to the Railroad Labor Board are studied by persons who know anything about the railroad business, the more admiration they will have for the colossal gall he has shown by the way he has dealt with the problem of railroad efficiency and economy, and the more they will be impressed with the unscrupulous lengths to which labor union leaders are willing to go in their propaganda against private management and in favor of the Plumb plan.

## Boston & Maine

THE ANNUAL REPORT of the Boston & Maine for 1920 shows that this carrier is far from being in a particularly happy position, despite the progress that has been made during the administration of President Hustis both in the way of improvements to the physical property and in the financial structure. The fact that the railroad is confronted with serious difficulties of various kinds is not a new one. It has been given no small amount of attention of late in the hearings before the Interstate Commerce Commission in the New England divisions case and in the more recent hearings before the New England governors' committee.

The Boston & Maine in 1920 did the largest freight and passenger business in its history. The handicaps which have characterized the aftermath of federal control on the railroads of the country in general, combined with the special conditions which have had to be met by the New England roads, were such, however, that the operations for the year resulted in a deficit of imposing proportions. The amount of the deficit may be stated in various ways, but in whatever way it may be stated, it looks equally serious. Suffice it to say that if there had been no federal compensation or guaranty, the deficit after the payment of taxes, interest, etc., would have been no less than \$17,132,482. Taking into consideration the standard return for January and February and the guaranty for the six months of the guaranty period, the corporate income account shows a deficit amounting to \$1,364,693 after the payment of \$1,227,948 of dividends on preferred stock.

Even at the risk of repeating what has already been given considerable attention in the *Railway Age*, it may be worth while to touch briefly upon the special conditions which confront the New England roads and the steps that are being taken in the attempt to compensate for them. The special conditions are principally the high costs of fuel, the increased rates which have to be paid on such fuel as is delivered by rail and the fact that the New England lines are short haul terminal lines; as such, they are subjected to large debit balances for the hire of freight cars, and it is well known that terminal labor costs have risen out of proportion to labor costs in general. The debit balance for the hire of freight cars on the Boston & Maine in 1920 was no less than \$3,866,947; the size of this figure is perhaps best shown by the fact that the interest on funded debt was \$5,272,223.

The steps that have been taken by the New England lines

to compensate for these difficulties have been varied and inconsistent but thus far without measurable success. They include an attempt to secure larger divisions on through rates, which matter is now pending before the Interstate Commerce Commission. An attempt has been made to secure a payment from the Central freight association and trunk lines amounting to \$15,000,000 annually pro-rated among the connecting carriers and covering the period from March 1, 1920, to March 1, 1922. This matter also is pending and does not seem to be making noticeable progress. The latest step is a proposal to increase freight rates and passenger fares within New England by an amount equal to 10 per cent, with exceptions on certain kinds of traffic; this is the question which is now being investigated by the committee of 30 appointed by the governors of the New England states and known as the governors' committee.

An increase of rates would be most inopportune at this time, and naturally it is being met with great opposition on the part of the New England shippers. The fact that the carriers have taken the step of asking for it shows, as nothing else could, how desperate is their situation. It is evident, nevertheless, that no matter what one may think about the efficiency or the methods of the New England carriers, they must have relief of some kind if they are to continue to function. The importance of the facts stated is brought out even more pointedly when it is realized that in the first two months of the present year, the Boston & Maine had a deficit after rentals of no less than \$3,027,756.

The year 1920 was a rather busy one for the Boston & Maine from the standpoint of financing. Between June 1 and October 1 there matured bonds and notes to the amount of \$26,449,000, of which \$17,606,000 was represented in Boston & Maine 5 per cent series A mortgage bonds due July 1 and \$8,843,000 in bonds and notes of subsidiary companies. The latter maturities were met by a loan from the revolving fund for \$5,000,000 and an agreement whereby the holders of the maturing obligations agreed to accept 50 per cent of their holdings in cash and 50 per cent in new 10-year general mortgage bonds, payable June 1, 1930, bearing interest at 6 per cent, which agreement was accepted in spite of the prevailing conditions in the money market.

The \$17,606,000 Boston & Maine bonds were refunded by Boston & Maine 6 per cent mortgage bonds to the amount of \$17,606,000 at 98½ taken by the United States government, in compliance with the agreement with the director general in connection with the reorganization plan. Bonds were also issued to the director general for \$8,000,000 on account of expenditures for additions and betterments during federal control. Other financing included a loan from the revolving fund amounting to \$1,212,500 for new locomotives and one for \$5,443,979 for improvements to way and structures and equipment. The Boston & Maine was allocated by the Railroad Administration 500 box cars, 1,500 gondola cars and 20 Santa Fe type locomotives. The equipment trust notes covering this equipment amounted to \$5,329,500.

The changes which have been made in the financial structure of the Boston & Maine in recent years are well known. They are embodied in the fact that prior to the receivership in 1916 and the subsequent reorganization, the great burden of the road was its rentals for leased lines, amounting in 1916 to no less than \$5,626,029. When the road was reorganized, effective as of January 1, 1919, the finances had been changed so that there was exchanged for the stock of the leased lines preferred stock of the Boston & Maine. The rent for leased roads in 1920 was but \$927,845, a reduction of nearly \$5,000,000 from 1916. When the leased roads were acquired, the Boston & Maine, of course, took over their bonded indebtedness, amounting to \$39,330,000. Including the indebtedness incurred during federal control, the total long term debt on December 31, 1920, was \$123,775,084. At the

end of 1916 it was \$43,338,000. The interest on funded debt in 1916 was \$1,754,980 and on unfunded debt \$970,497. In 1919 the interest on funded debt was \$5,272,223 and on unfunded debt \$18,857, an increase as between the two years of about \$2,500,000.

Even with the changes in indebtedness following federal control and the increase in interest charges caused by the 1920 refunding, the decrease in fixed charges has been over \$2,000,000. In 1920 the dividends paid on preferred stock amounted to \$1,227,948, of which about \$1,000,000 was paid on the preferred issued to the former holders of stock in the leased lines. These dividends were all declared in the first part of the year; the dividends for the latter part were passed because of the conditions at that time. It will be seen that the holders of this preferred stock have thus made a sacrifice that it would seem is more than railroad security owners should, in all fairness, be asked to make. The fact that they have suffered in this wise is only another indication of the seriousness of the situation on the Boston & Maine.

It has been aptly said that under present conditions the problems of operation represent only about 2 per cent of the problems of the Boston & Maine, and finances, etc., the other 98 per cent. Even with this in mind, however, it is worth while making a note of one of the important improvements in operation which have recently been made. This is the introduction of Santa Fe locomotives on the Berkshire division between Mechanicville, N. Y., and East Deerfield, Mass. The Berkshire division is the Boston & Maine's connection with the west, and it is practically the main stem of the Boston & Maine system. To put these Santa Fes in service required the strengthening or rebuilding of no less than 44 bridges between East Deerfield and Rotterdam, N. Y. A larger turntable was put in at Rotterdam and improvements in the engine terminal at East Deerfield included the addition of 11 stalls. The Santa Fes have not been in operation a sufficient length of time to show what they may be able to do. They are hauling trains that were formerly handled by two Consolidations and, inasmuch as the Berkshire division has no heavy grades, the improvement in train loading should be a marked one. The road has also made improvements on other parts of its line, but these on the Berkshire division are the most interesting. The Boston & Maine has been handicapped in the past by lack of motive power of the most modern type. The operation of these Santa Fes will therefore be watched with interest.

It has been noted above that the Boston & Maine in 1920 did the biggest freight and passenger business in its history. The revenue ton-miles amounted to 3,705,528,286—an increase of 12.52 per cent over 1919 and an increase of 2.57 per cent over 1918, the best previous year. The total number of tons of revenue freight carried in 1920 were 27,186,674, the average haul was 136 miles and the average revenue per ton-mile was 1.439 cents. The average revenue train load was low, being but 479 tons, but this was an increase over the average of 472 tons in 1919. In view of the conditions governing on the Boston & Maine, with its large mileage of branch lines and the fact that it is a terminal road, it is to be expected that we should see figures of but 23.2 tons per loaded car; 17.5 miles per car per day and ton-miles daily per car amounting to but 294.

The Boston & Maine, although to a lesser extent than the New Haven, is distinguished by its proportionately large passenger business. The total number of passengers carried in 1920 was 54,933,009. The revenue passenger miles totaled 1,014,734,717—an increase of 3.96 per cent over 1919, the best previous year. The average distance carried per passenger was 18.47 miles, the average number of passengers carried per train mile was 97.81 and per car mile 25.66. The report gives the interesting detail that there were carried in and out of Boston in 1920 no less than 33,913,598

passengers, which is presumably the record for any passenger station used by one road, although it is possibly exceeded by the New Haven's business handled in and out of South Station in Boston, that station being used by two roads.

The principal figures for operation in 1920 as compared with those for 1919 are as follows:

	1920	1919
Mileage operated .....	2,256	2,258
Freight revenue .....	\$53,306,738	\$43,302,141
Passenger revenue .....	24,680,435	22,116,094
Total operating revenue .....	86,652,745	72,935,146
Maintenance of way expenses .....	15,093,264	9,612,460
Maintenance of equipment .....	20,168,923	15,287,526
Traffic expenses .....	704,051	498,722
Transportation expenses .....	51,348,806	38,437,592
Total operating expenses .....	90,989,433	67,144,063
Net from railway operations .....	Def. 4,336,687	5,791,083
Taxes .....	3,001,087	3,043,388
Operating income .....	Def. 7,385,901	2,746,694

The corporate income account is as follows:

Gross income .....	\$11,223,095	\$8,453,456
Interest on funded debt .....	5,272,223	3,419,337
Interest on unfunded debt .....	18,857	1,008,570
Total deductions from gross income .....	10,609,265	5,795,933
Net income .....	614,730	2,657,523
Dividends .....	1,227,948	2,035,716
Net balance .....	Det. 1,364,693	523,248

## New Books

*Handbook of Building Construction*, by George A. Hool and Nathan C. Johnson. In two volumes totaling 1,474 pages, illustrated. 6 in. by 9 in. Bound in flexible leather. Published by the McGraw-Hill Book Company, 239 West Thirty-ninth street, New York City.

Physically this work consists of two separate volumes, but in the arrangement and treatment it is essentially a single treatise since the page numbering is continuous from one volume to the next and the table of contents in Volume I and the index in Volume II refer to both books. The title "Handbook of Building Construction" quite properly describes the contents of the two volumes and the brief preface in Volume I declares that the book is designed as a reference work for the architect, engineer and builder. It would seem, however, that the needs of the engineer or truly engineering requirements are given the most generous consideration. It is true that under the head of "General Design Data" at the end of the first volume, architectural design is given some space including charts of the "orders" and typical floor layouts of structures for various purposes; there are also details of mail chutes, plunge baths, window frames, doors, etc., but in the main the first volume is concerned with the structural design of buildings composed of steel, concrete or wood, rather than with architectural design while a large part of the second volume is devoted to the design and layout of the heating, plumbing, ventilating, lighting, telephone, elevators, sanitation, etc. While the first 79 pages are devoted to the elements of structural design, this is of value primarily as a general review or handy reference rather than with the idea that it would enable the novice to acquire a thorough working knowledge of the subject.

The first 86 pages of the second volume are devoted to all manner of construction equipment used in building construction, including the excavating machinery used for taking out the foundations. The next 140 pages are devoted to general information on various building materials, including tables of standard sizes and styles and physical properties. This is followed by a number of chapters on estimating contract specifications, etc., while the remaining portion of the book is devoted to the special trade or auxiliary features of buildings referred to above. The subject matter as a whole bears the mark of authoritative accuracy, references to marine borers which cover only the effect along the North Atlantic seaboard without any reference to the more serious attacks to the Gulf and Pacific coasts being an oversight of a nature that may be expected in any work covering so broad a field as this handbook.

## Letters to the Editor

### Some Suggestions as to the Sixteen Points of Decision No. 119

NEW YORK.

To the Editor:

The decision of the United States Railroad Labor Board, No. 119, is offensively objectionable in that it forces the recognition by the railroads of union labor and imposes the conditions of a closed shop. This is the more offensive in view of recent history—such a recognition of the unions was refuted by the United States War Labor Conference Board. Mr. Gompers withdrew from and broke up the President's First Industrial Conference because of its refusal to give such recognition and the President's Second Industrial Conference avoided the difficulty by making no mention of it.

It was frequently said of the Director-General's administration that he was apparently far more concerned with organizing the railroad employees than he was with their efficient operation.

The decision is further objectionable in its lack of firm definiteness and its 16 points are open to the objections made by Secretary Lansing, of President Wilson's famous 14 points. Said Lansing, "When the President talks of self-determination, what unit has he in mind? Does he mean race, a territorial one or a community? Without a definite unit, which is practical, application of the principle is dangerous to peace and stability. . . . The phrase is loaded with dynamite—it will raise hopes that will never be realized."

Secondarily, what does the United States Railroad Labor Board mean by saying that, "There shall be a proper classification of employees and a reasonable definition of the work to be done . . . but shall not *unduly impose unnecessary conditions* upon the carriers," or again, "The principle of seniority . . . should be so applied as not to cause *undue impairment of the service*."

What about dynamite, hopes and disappointments?

I should like to make the following suggestions regarding handling of negotiations with maintenance and other employees (except train service) in the preparation of agreements covering working conditions.

Decision No. 119 handed down by the United States Railroad Labor Board on April 14, 1921, terminates the national agreements and all rules and working conditions thereunder enforced by authority of the Director-General or extended by that of the Labor Board. This in effect makes necessary the consideration of rules affecting all classes of labor embraced in said decision.

In the negotiation of agreements with employees in the maintenance of way and maintenance of equipment departments, and others, each road is required to negotiate its individual agreements, but in order that all may give consideration to the same important principles, roads should immediately call together the officers who will conduct the negotiations. It is suggested that general consideration be given to the following, believing that in agreements of this character there should be as few rules as possible and these confined to the basic principles of the schedules:

The present national agreements with the Federated Shop Crafts alone comprise 186 rules, and those with the other crafts are relatively as bad.

Generally, these agreements are objectionable as violative of economic and efficient production in the following particulars:

*First.* They fix compensation upon an hourly basis, eliminating piece-work, bonuses and other methods of incentive

to individual effort, which should be restored by such roads as desire to avail themselves of them, and should not be contracted away by any road.

*Second.* The business of transportation is conducted 24 hours each day for 365 days in the year. The business of production, except farming, is practically limited to periods of from eight to ten hours daily, customarily for about 300 days each year. It is further subject to substantial fluctuations in the volume of traffic moving over a series of years and much of the traffic is seasonal in each year. Wide latitude must, therefore, be exercised by management in the disposition of the railroad forces in order to adjust the one situation to the other.

*Third.* In the last 20 years, in no year of depression has the ton-mileage declined more than 10 per cent, and in but one year—1916—has the ton-mileage increased more than 20 per cent (when it amounted to 23.9 per cent), the largest other increases being in 1910, 16.6 per cent, and in 1906, 15.7 per cent. It would, therefore, seem very desirable as a means of stabilizing labor conditions that the standard work-day range between eight hours and ten hours, no reduction in forces being made in times of depression until they have been placed upon an eight-hour basis, and no increases in forces being made in times of business activity until the hours of labor have been increased to ten. Payment of overtime is a very questionable device, and in any event should not be allowed until the time is increased beyond 55 hours per week or for unusual service.

*Fourth.* No restrictions of lap-shifts should be permitted and the many methods for securing payment of overtime on Sundays, holidays, emergency work, travelling, etc., under which the overtime, which is never less than 1½ times the regular rate, may be increased to as much as five times the regular hourly rate, should be eliminated; so also the unreasonable travel expense allowances. Where employees are called and cannot then be employed upon the work for which they were called and there is an arbitrary allowance, provision should be made for their use in other occupations during the time paid for.

*Fifth.* While reasonable recognition should be given to seniority, it should be entirely and definitely subordinated to the judgment of management, as to the capacity, capability and productive efficiency, reliability and loyalty of the employee, and this whether the forces are to be reduced or enlarged, and the demoralizing effects of "bumping" and other practices to which it has given rise, should be avoided.

*Sixth.* All rules which interfere with discipline or weaken control of management, should be eliminated. No employee should be permitted to lay off without first securing permission.

*Seventh.* No payment should be made for punching time clocks, time consumed in receiving payment of wages, time consumed for lunches and other meals, or other time not worked known as "bonus time."

*Eighth.* The employment of men must not be restricted by labor union conditions as to apprenticeship and other qualifications, long experience having fully demonstrated the ability to prepare men for much of the maintenance work in a comparatively short period. Equally, management must not be hampered by labor union restrictions as to the "right to a job." All the work, if within the capacity of one individual, should be performed by him and to the extent possible full freedom should be given for the employment of handymen and apprentices under the direction of or associated with skilled labor.

*Ninth.* There should be a definite separation of all the forces of management down to and including gang leaders. These men should not be permitted to become parties to any agreement between the company and its employees. They should be definitely excluded from association with or obligation to the employees, their sole interest being that of

management and their sole duty being to the employing company; nor should there be any restriction upon their engaging in and doing the work of an employee where their services can be in that manner utilized.

*Tenth.* Rules which limit the initiative of management in prescribing conditions under which new men are employed, have no place in agreements with employees. All employees shall be required to furnish full statements as to their employment over a period of five years, and shall pass physical and mental tests, including those of eyesight and hearing, it being in the interest of safety of life and property and of management to have full information as to the health, habits and association of persons entering its employment, as well as their qualifications and fitness for the particular places they are to fill; and this not only to prevent fraudulent claims in cases of personal injury and the undue loading of pension lists, but to protect others from communicable diseases which might endanger their health and even their lives.

*Eleventh.* That the agreements run for one calendar year, but that all wages be subject to revision on 30 days' notice to keep pace with changes in the cost of living until more normal conditions are restored.

EXECUTIVE.

## Bettering Train Movements By Telephone

CHICAGO.

TO THE EDITOR:

In an editorial entitled, "Bettering Train Movements by Telephone," in the *Railway Age* of February 25, attention is called to the serious delays which often occur to freight trains after being made up, because of poor facilities for delivering running orders preliminary to their departure. It is stated that, to overcome this condition, one road has installed telephones, connected to the dispatcher's circuit, at outgoing ends of certain busy yards, so that when a train is made up and ready to leave, the conductor can communicate directly with the dispatcher who gives him his running orders, the conductor copying these orders and, after completing them, depositing one copy in a box provided for the purpose.

While it is true that at some points freight trains are delayed in this manner, which in turn results in delays to other trains on the line, and the suggestion that these delays be eliminated or reduced is a good one, it can not be done (without limiting conductor's hours of service) in the manner in which it is stated that one road has undertaken.

To require the conductor to copy train orders, receiving them over the telephone, as a regular thing and not in emergency, and as it is said this road will do, would restrict his hours of service to those prescribed by the hours of service act for operators, train dispatchers and others handling train orders. (See Interstate Commerce Commission's Conference Ruling 342, February 12, 1912.) The matter is of such importance I feel I should call your attention to it.

W. N. N.

THE GREATEST NUMBER of immigrants into Canada during 1920 came from Ireland. The total immigration from 64 countries in 1920 was 147,502, of which 98,636 entered via ocean ports, and 48,865 from the United States. Of this number, 49,248 came from England, 19,496 from Scotland and 61,112 from Ireland.

AN ACTIVE CAMPAIGN for the extension of Canadian trade will be undertaken by Canadian trade commissioners in Europe this summer. Plans have already been made to cover Norway, Denmark, Sweden, northern Africa, Spain and Portugal, while an intensive campaign will be carried out by the Canadian trade commissioner in London among British buyers.

# War's Devastation Aids Railway Reconstruction

Depreciated Land Values in Ruined Sections of France and Belgium Permit Increased Facilities

By Oliver F. Allen

Formerly Major of Engineers, American Expeditionary Forces

PREVIOUS ARTICLES of this series have dealt with the rebuilding of bridges and tunnels in the devastated regions of France and Belgium (*Railway Age* of April 8 and April 22). This was described as one of the first steps taken in the reconstruction program of the railways after the lines

and fixes factory centers. Space is rarely saved for future railway extensions, and betterments are usually a compromise between traffic requirements, interference with existing industrial plants, destruction of valuable buildings, utilization of important sites and the funds available for the improvements.

A unique result of the terrible destruction in the north of France has been the opportunity to take property at a low

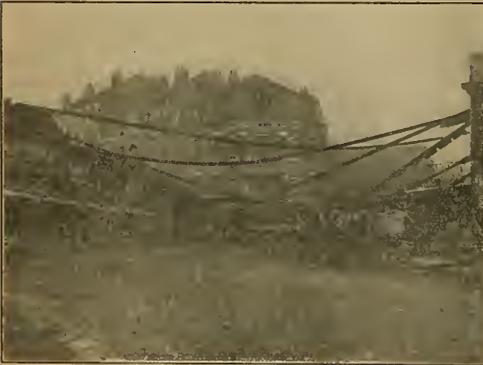

Fig. 2—A Destroyed Steel Railway Bridge at Lille

had been opened to traffic with only those structures and facilities which were absolutely necessary for operation. The problem of rebuilding the yards and terminals had next to be solved and it is now proposed to give some attention to this phase of the reconstruction work.

Railway engineers always face a difficult problem when trying to provide increased facilities in thickly populated districts. The industrial growth which creates the demand for increased facilities at the same time raises property values

Fig. 3.—Further Destruction of Steel Bridges at Lille

The debris of the destroyed abutments has been cleared away to allow military truck trains to use the street.

valuation without interference with industry. The destruction of many communities has been so complete that neither industrial plants, residences, nor even streets have survived. This is illustrated by Fig. 1, showing the destruction at

Continuation of Photograph Shown on Opposite Page—Temporary Buildings Being Used as Homes, Stores and Offices—Destruction of This Sort Made the Relocation of Railway Tracks and Terminals Possible

Estaires after the cleaning up process was partially completed. Inasmuch as both factories and railroad terminals have to be rebuilt, it is possible not only to enlarge facilities comparable with the increase in traffic, but to rearrange things so as to facilitate greatly the rapid and easy movement of both freight and passengers. In many cases where the destruction of a town or city was only partial, it was worst near the railway. This depreciation in value of property adjacent to both freight and passenger stations has enabled the French railways in the devastated regions to purchase additional land not only for present requirements but for further anticipated growth during the next 20 to 30 years. The government has assisted in this work and it was started so early that several thousand projects outlining anticipated requirements for the next generation have been studied with sufficient detail to justify already the purchase of the required property.

out regard to the time of day or Sundays and holidays. While the eight-hour day is sometimes used principally as a means for getting higher pay while still working ten or eleven hours, the tendency is, of course, toward the shorter day. The railroads are contemplating conforming to eight-hour laws in such a way as to move the maximum tonnage with one or two shifts with the minimum amount of Sunday and

Fig. 4—Reconstructed Bridge at Lille

Same as that shown in Fig. 2. The arches are very flat and the concrete very thin at the centre. The iron balustrades have been salvaged and used.

Not only are bigger transfer yards, passing tracks and sidings required because of the growth in industry, the use of the bigger trains, etc., but they are demanded by changed labor conditions. For instance, under pre-war conditions at the transfer points adjacent to the coal mines trains could be made up and dispatched as cars came in from the mines with-

Fig. 5—New Reinforced Concrete Bridges at Lille

These structures replace those shown in Fig. 3.

overtime labor. They are, therefore, in such places as Lens taking advantage of the destruction to increase greatly the capacity of the transfer yards so that incoming local coal trains can be made up into through trains and stored for 36 hours if necessary. The train crews can go on duty at regular hours and the storage capacity will be sufficient to avoid sending out many coal trains on Sundays. Trains will be sent out in rapid succession at such hours as will result in the minimum labor cost for their crews between the coal fields and Paris or other large centers or junction points.

A typical case of taking advantage of the war's havoc where the destruction of the city was only partial is at Lille. The map, Fig. 6, shows the pre-war railroad arrangement. Four double track lines fanned out toward the south. The one at the western extremity led via Bethune to the center of the coal fields and metallurgical industry of the north. The

one to Paris made the most direct connection to the capital. The one to Valenciennes traversed the areas largely given up to textiles and vitreous products, including Mons and other large towns in that direction. The fourth swung off to the east toward Tournay and so to the central parts of Belgium. Another line led to the northwest, in the direction of Dunkirk

fortifications between St. Sauveur and Port Vauban will be retained. The loop around the western and northern sides of the city is located substantially as projected before the war, but arranged to handle traffic quicker and easier. A loop has been added to the cut-off between the Bethune line below Santes and Armentieres by way of Beauchamps where

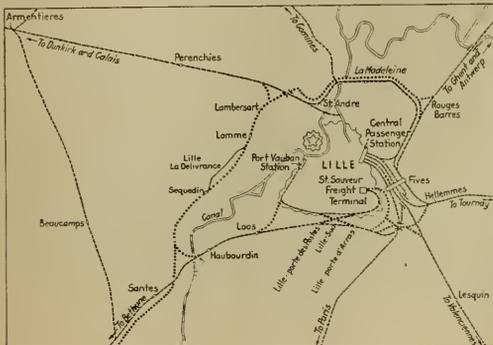

Fig. 6—Lille Before the War

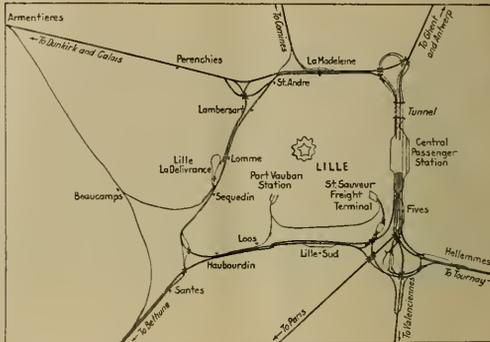

Fig. 7—Lille After the War

Showing Improvements Completed by the Northern Railway in February, 1920. A comparison with Fig. 6 will indicate the improvements.

and Calais, and the sixth, northeast in the direction of Ghent and Antwerp, in Belgium.

The central passenger station was a stub end terminal. The principal freight station at St. Sauveur was also a terminus and the facilities for getting from some of the lines to this yard were very inadequate. There was another freight terminal, the Port Vauban station, which was equally difficult of access.

Before the war, improvements as outlined by the dotted lines on Fig. 6 were contemplated. These included shops and transfer yards at Lille-la-Delivrance and large transfer yard at Rouges Barres. This pre-war program contemplated only the partial elimination of grade crossings of intersecting lines, and the abandonment of the stub end passenger station would have been so expensive that it was not even considered. The lines came into the city above the street grade before the war and their destruction was very complete as shown by Figs. 4 and 5. These old steel bridges were rebuilt with reinforced concrete as described in the preceding article in this series (*Railway Age*, April 22, page 973) and the completed structures are shown in Figs. 4 and 5.

Taking advantage of the destruction the management decided to build a comprehensive belt line around the city, to abandon the old central passenger station site and to build nearby a new station with through tracks. The relocation of lines decided upon includes an arrangement of the through tracks so that trains from and to all six lines mentioned above, as well as on the less important suburban and branch lines, and through trains over any combination of these lines, can come into town, pass through the station and go out again without passing over any grade crossings at intersecting lines or streets, and without changing direction.

The two main freight terminals are retained but are so connected as to improve and expedite the handling of both incoming and outgoing freight. The map, Fig. 7, shows the new arrangement. The southern part of the city not economically served by the Port Vauban and St. Sauveur freight stations will be taken care of by new freight and passenger stations at Lille-Sud midway between the existing stations of Lille-Porte-des-Postes and Lille-Porte-d'Arras, shown in Fig. 6, which will be abandoned. The connection inside the

it is brought over to the new transfer yards at Lille-la-Delivrance.

The connections on the east side of the city have been greatly modified on account of providing for through traffic, both freight and passenger.

Classification yards, storage tracks and repair shops are provided southeast of the city at Hellemmes, not far from the new passenger station and the St. Sauveur freight terminal.

The next article of the series which will continue the discussion of the rebuilding of yards and terminals in the devastated regions will appear in an early issue of the *Railway Age*.

# Needed Improvements in Locomotive Design\*

## Operating Conditions Demand Large Units Which Introduce Difficult Problems in Design and Maintenance

By H. W. Snyder

Mechanical Engineer, Lima Locomotive Works

NO ONE, IT IS BELIEVED, will dispute the fact that present day operation of high-power locomotives is one of the most vital questions with which our railroads are concerned. The demands of constantly increasing passenger and freight traffic have brought about a constant increase in size and power of our locomotives.

In view of the rapid strides that have taken place in increasing the size and power of locomotives within the last few years, it seems rather out of place to predict that the maximum has been reached. It is also true that the use of improved devices has made possible the satisfactory operation of the large locomotives of today. Everything seems to indicate that we have not reached the maximum capacity of the locomotive even within the present limits of clearance and rail load, and we may expect to see these same engines made far more powerful and economical by the application of devices which are now available or which are already being given serious attention.

In view of the foregoing, the most vital matter which confronts locomotive designers and operating officials is that of increasing the capacity as well as the efficiency of the locomotives which we have today. In many ways these problems have already been attacked and great improvements are continually being made.

In the following paragraphs an attempt will be made to bring to attention some of the problems which our present day locomotives bring forth and upon the proper solution of which depends their success.

### Combustion and Steam Generation

In order that large engines may operate properly, it is of course necessary that a sufficient supply of steam be furnished to cylinders so that they can be made to produce their maximum horsepower. It is not enough to provide a given number of square feet of heating surface in the firebox and the tubes so that we may be reasonably certain that sufficient water will be evaporated to supply the cylinders. It is, however, necessary that we take into account proper construction of the boiler, necessary firebox volume to produce the best possible combustion of fuel, and the design of grates so that fuel will be economically burned to such an extent only as required by the maximum evaporation of the boiler.

In producing heavy motive power it has been necessary on account of prohibitive axle loads to apply a sufficient number of axles under the engine to reduce the individual axle load to within reasonable limitations. This has lengthened out the engine to such an extent that boiler design and maintenance has become a serious problem. In the first place, it is necessary to design a boiler that will properly function with the other vital parts of a locomotive. At the same time the length has become such that the use of combustion chambers is a necessity to avoid a prohibitive length of tube. Large engines have been constructed with a tube length of 25 ft. and it seems that no definite rule has been established as to what the limit of length of tube of a given size should be. Experiments have been made on this subject and it has been said that the maximum length in inches of a

tube of a given size should be approximately 100 times its diameter in inches. It would seem that this is as nearly correct as any general rule which has been devised and one which can be readily followed.

The author does not feel that any definite rule should be made in regard to length of tubes, for this might bring about a condition whereby other vital features of the engine would be involved in order to abide strictly to the length as noted above. Tubes 2 or 2¼ in. in diameter in excess of 20 ft. in length are questionable, and this feature should be looked into carefully before a decision is reached.

The advent of long combustion chambers has brought along with it the necessity for increased attention to boilers. The application of a long combustion chamber requires a large number of additional staybolts and it would naturally be expected that a boiler of this kind would require more staybolt attention. For this reason, if for nothing else, there is no doubt that a proper installation of flexible stays in the firebox and combustion chamber will prevent a great deal of the staybolt trouble which has been experienced in the past. Although long combustion chambers require more attention in maintenance this will be offset by the increased firebox volume and the resulting better combustion.

On account of height limitations, the height of the dome as well as the steam space in the boiler has been reduced to such an extent that difficulties are being encountered with the proper life and maintenance of superheater equipment, because too much water is drawn over through the throttle into the superheater. This is a question requiring experiment to determine as nearly as possible the minimum steam space which should be provided for boilers working on various grades.

### Increased Capacity Needed Without Increase in Size

As noted above, it seems that we have about reached the limit of size of cylinders and size of boiler due to road clearances. To undertake to provide additional road clearance on practically all of the main lines today would mean a total expenditure of money, entirely out of proportion to the benefits that would accrue.

On account of the apparent limitations of piston thrust and road clearances the greatest problem with large locomotives today, is to increase their capacity without exceeding greatly present sizes. Anything to increase the hauling capacity of the locomotive without increasing the height and width limitations under which the locomotive must work might be called an essential capacity-increasing device. A few of these with which we are most familiar and which have proved beyond doubt their desirability are the superheater, the brick arch and the mechanical stoker. There are possibilities of still increasing the efficiency of the superheater without increasing the size of the boiler in which it must operate. There are also possibilities and constant improvements in the design of brick arches which lend to higher evaporation and better combustion of fuel.

It has been stated that when a locomotive requires as much as 6000 lb. of coal per hour it has gone beyond the limits of the ordinary fireman. Automatic stokers have been in use so long that their dependability for heavy power is no longer

\*Abstract of a paper to be presented at the spring meeting, Chicago, May 23-26, 1921, of the American Society of Mechanical Engineers.

in question. Many men are studying this particular feature of locomotive design and operation and we may confidently expect in the future a gradual increase in the efficiency of these mechanisms. As they stand today they are an unqualified success, and time and study will bring about the necessary refinements so that better combustion and less coal per horsepower will be used.

We have not as yet gone very extensively into the use of feed-water heaters. It has been proved without a doubt in foreign countries that the feedwater heater is an essential capacity-increasing device as well as an economical addition to the locomotive. In this respect, then, it would seem that we are somewhat behind the Europeans, and there is no doubt that in the near future when the economies that can be effected by the use of feedwater heater are realized it will become almost as general as the superheater today.

Another small item which has received only passing attention in this country is the variable exhaust. As is well known, a variable exhaust that can be properly operated and which will not require much maintenance attention will have a great tendency to relieve high back pressure at high speeds, and its operation will also provide the necessary draft at slow speeds. It is one of the small things that deserves consideration and study and something which it is felt will be worked out satisfactorily for the future.

### The Engine Proper

There have been no radical changes in the general design of cylinders. The use of outside steam pipes has resulted in advantages both from a casting and maintenance standpoint. It would seem well worth while to consider a design of cylinder by means of which the weight could be reduced to a great extent, permitting of additional weight of other parts, and thereby increasing the capacity of the locomotive.

The design of valve gears has received a great amount of attention and many accepted types are now available. In all of these every effort has been to better the steam distribution. In maintenance we are far ahead of engines used twenty years ago. There is yet, however, much to be desired in steam-distribution and this subject will bear as careful study in the future as it has in the past.

### Power Transmission

When we consider that as much as 150,000 lb. piston thrust is being transferred through a single main rod and from this into the driving wheels of a locomotive, it is not difficult to understand why troubles are experienced with main crankpins and particularly side rod bearings at the main pin. In order to provide the proper strength to take care of this tremendous piston thrust it has been necessary to design extremely heavy main and side rods. The piston thrust is not the only consideration in this connection. The inertia forces, particularly in drifting, at times reach figures that are even greater than the piston thrust. Practically all of this must be taken care of through the main crankpin and the necessary connections to the side rods at this point.

All are familiar with the large number of experiments which have been carried on to produce a steel that would give a higher elastic limit than the ordinary high-carbon open-hearth steel which was successfully used until engines reached their present proportions. The use of such steel for side rods, main rods and piston rods has been principally confined to heat-treated and quenched forgings, which permitted the use of sections which were considerably lighter than what could be used with the ordinary open-hearth annealed forgings. Steel has also been produced which gives a high elastic limit and which can be successfully used with ordinary annealing, permitting very considerable reductions in weight compared to the ordinary open-hearth steel formerly employed. The use of such a steel does away with quenched

forgings and permits of rods being heated for closing-in straps and similar work without destroying the quality of the material as is the case with quenched forgings.

Main and side rods have been produced and have been in successful operation for the past few years in which the piston thrust is carried directly from the main rods to the side rods back of the main wheel. Such a design does not increase the total weight of the rods to an extent likely to cause any appreciable increased difficulties from a counterbalance standpoint.

The design of main and side rods as well as main crankpins will always be a vital question in the construction of locomotives. It has been necessary, and always will be in designing the rods for locomotives, to assume certain arbitrary limits of fiber stress based principally upon past experience. It is impossible to take into account all the stresses produced in rods when a locomotive is in operation, and for this reason the allowable fiber stresses in tension, compression and bending must be taken comparatively small in comparison to the elastic limit ordinarily obtained in such forgings.

There has already been a great deal written and a number of experiments conducted regarding the proper design of rods to successfully stand up under severe usage and at the same time reduce to a minimum the ordinary difficulties presented from the standpoint of counterbalance. Hollow-bored piston rods, light designs of crosshead and piston, the use of high-tension steel for side and main rods as well as the use of hollow-bored crank pins are familiar to all. More careful attention should be paid to the quality and upkeep of rod bearings and every endeavor should be made to provide bearings of such quality and design that renewals will be reduced to a minimum.

A main pin designed properly for heavy piston thrust must be so proportioned that the length will bear a certain relation to the diameter within very close limits. On account of the necessity for keeping cylinder centers as close together as possible because of rod clearances, if a proper length of main pin is obtained, its proper size presents a difficult proposition. This is one of the great difficulties which the author is confident will be overcome in the near future by the proper application of a design previously mentioned, wherein a large part of the piston thrust is transmitted directly from the main rod into the side rod.

### Counterbalance

It is a very difficult matter to separate the question of counterbalance from the design of connecting rods and reciprocating parts. There is a great diversity of opinion in regard to the proper amount of counterbalance which should be applied to locomotives. The author believes that with our present heavy engines with long wheelbase it is not necessary to balance as much as 50 or 55 per cent of the reciprocating weight. In fact, it is quite possible that we may be able to counterbalance a smaller percentage of reciprocating weight than has heretofore been attempted, especially for long, heavy engines, provided the revolving weights at the main pin can be properly taken care of. Every effort, however, should be made to balance all of the revolving weights on the main pin.

The author is of the opinion that no definite set rule can be established in this regard, but that each particular design is a study in itself, and wherever revolving weights at the main pin are encountered such that they cannot be properly counterbalanced, steps should be taken to provide the best means possible of reducing revolving weights at this point as well as providing reciprocating parts as light as possible consistent with strength. This of course has been accomplished in the past by hollow-boring the main pins and piston rods and by using a light design of piston head, which in-

dicates that a steel having a high elastic limit with the proper elongation and reduction of area should be employed. The use of such steel has already proved that it can be depended upon. One of the principal fundamentals in counterbalance is to keep the reciprocating weight light.

### The Running Gear

On account of the large increase in the size of cylinders of present-day heavy locomotives over those used several years ago, the cylinder centers have been spread until they have reached practically the clearance limitations of the railroads, and the necessity for larger journals to carry properly the increased axle loads has caused the frame centers to be brought nearer together.

This condition increases very materially the distance from the center of the cylinder to the center of the frame, which of itself produces greater strain in the frame and at the same time increased pressure on the driving-box bearings as well as shoes and wedges. In addition to the above, piston thrusts have increased from approximately 65,000 lb. to approximately 150,000 lb., and means must be provided to properly take care of the increased piston thrust along with the increased overhang.

While discussing the subject of frames it is hardly possible to ignore the vital question of frame cross-bracing. Substantial and sufficient cross-braces should be applied between the frames and rigidly bolted thereto to form a rugged structure which will not rattle to pieces.

It seems as though the design of driving boxes and driving-box brasses has not successfully kept pace with the rapid increase in piston thrust. We have in almost general use the same type of driving-box brass which has been standard on locomotives for years. The design is such that the brass extends about half-way down over the journal. Inasmuch as this brass must take up the piston thrust, it is very evident that we shall have trouble in taking care of driving-box brasses until a suitable design is produced—one in which the brass will cover much more of the front and back projected area of the journal than is now the case.

### Guiding and Trailing Trucks in

#### Connection With Long Wheelbase

With our present heavy Mikado and Santa Fe type locomotives the length of rigid wheelbase is almost if not quite double the rigid wheelbase in ordinary service 20 years ago. It is unnecessary to comment upon the fact that it is a difficult matter to operate such engines around curves of even comparatively small degree and at the same time prevent the rapid wear of hub liners and driving-box faces, thus increasing quickly the lateral play to a prohibitive point and necessitating work in the shop to overcome it.

Santa Fe type engines with 22-ft. rigid wheelbase are not uncommon. Engines of this type and of this size will weigh in the neighborhood of 400,000 to 420,000 lb. When we stop to think that to move this tremendous mass of material around a 16- or 18-deg. curve a force of many thousand pounds is required, is it any wonder that we obtain rapid flange wear and the necessity for returning tires before the proper amount of mileage has been obtained? In the majority of cases, it is believed, the force necessary to properly curve an engine of this kind has been applied at the front truck and the first driver. In most cases types of leading trucks have been used which produce a very small resistance on curves of small degree. In order to prevent rapid flange wear as well as to overcome the development of lateral play unnecessarily, designs have been produced which will give a high initial resistance of the front truck and provide a lateral motion for the front driver with adequate resistance so that some of the guiding force is transferred back to the second pair of drivers.

Since locomotives operate the greater part of the time on tangent tracks, it is necessary to have a high initial guiding resistance which will not be increased when curving. In other words, a flexible wheelbase is produced which has all the requisites of the ordinary rigid wheelbase, but at the same time will overcome many of the difficulties now encountered in an attempt to operate engines of this size and length. Many designs of trailing trucks have been produced with the idea in mind of helping to remedy the conditions which have been noted above. These of course have met in a way the conditions which it was necessary to overcome. There is much yet to be done in producing a trailing truck which will have the proper facilities for equalization of spring rigging and at the same time produce an initial guiding force which can be kept nearly constant, thus avoiding the high final lateral resistance which is found in a good many of the trailing trucks now in use.

In addition to the foregoing some work has been done in the way of producing a design by means of which the lateral play in locomotive driving wheels can be taken up without removing the wheels from under the engine or taking the boxes off from the axles. No doubt in the near future a practical device of this kind will be produced. This is another one of the many problems which can be worked out which will enable the railroads to keep their locomotives in service.

The advent some years ago of the power reverse gear overcame one of the great objections that engineers had to large locomotives. It is a fact that it is almost impossible for one man to reverse one of our large locomotives equipped with the ordinary hand reverse lever. Power reverse has come to be an essential part of engine equipment and has been found to be economical even though it may be used on a locomotive which could be comparatively easily reversed by hand.

Probably no one thing contributes more to the failure of side rods than the improper adjustment of shoes and wedges. If these are allowed to run loose, stresses in the side rods will amount to a very high figure and it is impossible to determine to what extent they may go. A satisfactory automatic wedge if properly applied and maintained will, no doubt, go a long way toward preventing side rod failures.

### Means for Increasing Nominal Tractive Effort

All railroads have points on certain divisions where there is a critical grade or the necessity of starting a heavy load under adverse conditions. At such places increased tractive effort is required which is not needed elsewhere. We are therefore confronted with the problem of producing a device which can be set to work to increase the tractive effort of a locomotive to such an extent that the critical grade or the necessity for increased tractive effort to start a train under adverse conditions will be overcome, thus enabling the engine to take its full tonnage over the entire division. This device should be so made that it can be applied when necessary and thrown out when the additional tractive effort is not required. Designs have already been produced wherein an additional tractive effort of 8,000 or 10,000 lb. has been applied to the trailing trucks of large locomotives. There is also a possibility of applying such a device to the tender truck, thus availing ourselves of the adhesive weight of the tender to help boost the engine over the critical points in a division. There is always present a possible potential boiler capacity which can be brought out by the use of a variable exhaust or other device sufficient to obtain rapid combustion at slow speeds.

What has already been done along this line may be taken as a start in the right direction. A certain amount of development work must be done in order that these necessary improvements may be made to operate satisfactorily. These problems require the co-operation of the railroads to provide

the necessary means for trying out such devices which, after having been carefully considered, show that they have possibilities for the future use.

The question of ash pans is also one needing serious consideration. With the large increase in size of locomotives in many cases we have evidently lost sight of the importance of this necessity.

### Lubrication

Lubrication is a subject which has received much attention and a great number of combinations and experiments have been made to determine the most satisfactory method. With our present high superheat the proper introduction of oil into the cylinders and valves of a locomotive is worth serious consideration.

It is common practice in European countries to provide a force-feed lubricator located very close to the cylinder. The ordinary method which they use in connecting up this lubricator is to provide a pipe to each end of the piston-valve steam chest. This oil supply opens directly over each end of the valve when it is in central position. In addition an oil pipe is supplied to the cylinder at its center. It is reported that by this method there is less carbonization of the oil than when it is fed into the steam pipes or into the center of the piston valve steam chest. Whether or not this is so the author has no means of proving, but it seems logical.

In order to increase the tonnage which a locomotive can haul it is just as vital to decrease the resistance as to increase the power. It is not an impossibility to provide roller bearings for passenger cars and there seems to be no reason why they cannot be used on freight cars. Of course, this would mean very radical changes in design and a gradual displacement of present equipment, but the reduction of rolling resistance and the better facilities for lubrication which would be provided would be sufficient in time to overcome the necessary expense. All this may seem rather far-fetched, but is at least worthy of consideration.

### Conclusion

In summing up the situation, it may be said that the use of the superheater alone has increased the capacity of locomotives when compared with saturated engines of the same design to such an extent that no one would think of building a large locomotive for up-to-date railroad service without the application of superheat. This is one of the greatest strides that has been made in the construction of locomotives in the past few years. We must not content ourselves, however, with what has been done with this one device. The large locomotive of today has become a necessity and is here to stay. What we need to do now is to avail ourselves of the opportunities offered in the application of many of the labor-saving and capacity-increasing devices which have already been worked out and are giving satisfactory service and at the same time look forward to the possibilities of applying other devices which are yet in their infancy, but which have proven beyond doubt that they are well worth our consideration and are of sufficient importance to warrant their adoption. There are many improvements yet to be made in locomotives and it behooves the operating officials of railroads as well as the leading minds in locomotive operation and design to get together and to continue to produce locomotives which in the next 20 years will be as far ahead of our present engines as our present locomotives are ahead of the locomotives that were built 20 years ago. Without the capacity-increasing devices which have been mentioned the large locomotive of today would be impossible—it could not be operated satisfactorily. Our large engines are an absolute justification of these improvements. Further developments are ready at hand and in their use lie the possibilities of still more powerful and economical transportation units built to operate within our present limitations of clearance and permissible rail loads.

## A Welfare Campaign Among Mexican Laborers in the Southwest

By F. M. Richardson

Railroad Secretary, Young Men's Christian Asso., Chicago

THE RAILROAD DEPARTMENT of the Young Men's Christian Association is now conducting a welfare campaign among track laborers on the Rio Grande and the Albuquerque divisions of the Atchison, Topeka & Santa Fe in New Mexico that possesses much of interest to railway officers. As Mexican labor predominates in this territory, it was essential that the man selected to conduct this work have a speaking knowledge of Spanish. Other qualifications considered essential were a sympathy with the aspirations of the Mexican laborer, a teachable and inquiring mind and a willingness to accept the hospitality of a lodging in the labor camps to be visited. S. L. Hernandez, a secretary experienced in mining camp work was selected.

Colloquial instruction in English, educational talks in Spanish and the distribution of carefully selected literature printed in Spanish are the three principal channels through which educational contacts have been made. This work has been done at visits to sections and construction camps.

A typical program for an evening spent at a section, with practically every man, woman and child assembled either in the section house or in the station waiting-room, is generally as follows: (1) A 20-min. musical program, using the phonograph; (2) an educational talk upon some subject of interest; (3) English instruction; (4) distribution of literature.

The musical records most in demand are band numbers. Mexican national airs and Mexican folk songs are largely used in these programs. The talk following the musical program gives opportunity for general instruction in Americanization, for a discussion of relations of fidelity to one's employer and many other topics related to the circumstances of their life and employment. Especially does the talk present an opportunity to promote a better international feeling by pointing out America's traditional policy in relation to neighbors as exemplified by Cuba and the Philippines.

Mr. Hernandez has been able to counsel the family on the problems confronting them in relation to the education of the children, upon thrift and why they should deposit their savings in banks. Unfortunately, the Mexican attaches the same suspicion to our American banks that he holds regarding the fidelity of those in old Mexico. Every problem in the range of personal and family problems seems to have been brought to him, each complicated by ignorance and yet each reflecting a desire for adjustment to the conditions that obtain on this side of the border. Articles in the better Spanish literature, published in Mexico and in the United States, are brought to their attention to substantiate this traditional attitude of America as opposed to statements in the incendiary literature that has reached them. When it is remembered that the unmarried men of these groups return by the hundreds to old Mexico as often as every six months for a short visit, this work cannot be without real significance in promoting a better international feeling among the people.

On cars in transit with labor parties to distant points, sometimes requiring a trip of several days' duration, a program similar to those for the section men's evenings is conducted at intervals when the car is at layover points or on sidings. The phonograph contributes much to the contentment of such a party. The literature is in demand on the part of the few who can read, while the talks are listened to attentively by all. These labor parties are made up mostly of immigrants from old Mexico. Instruction regarding how to live in America is eagerly received. Popular subjects are: How to Keep Healthy, Things to Eat, and How to Count.

## Joseph H. Young

**J**OSEPH H. YOUNG, who becomes president of the Denver & Rio Grande on its reorganization and release from receivership, is one of that large majority of railway executives who have risen from the ranks. He entered railway service as an office boy when he was 18 years old, and had a varied experience in the traffic, operating and other departments of railroads in different parts of the country before he attained to executive responsibilities. Nine years ago he became president of the Spokane, Portland & Seattle and other Hill lines in the northwest. In 1914 he became president of the Norfolk Southern. Under government control he was first federal manager of the Virginian and the Norfolk Southern and later senior assistant director of the division of operation of the Railroad Administration.

Mr. Young is thoroughly acquainted with the Denver & Rio Grande and the people in the territory it serves. He was born and grew up in Salt Lake City and at different times held traffic and operating positions on different railroads in the territory of the Rio Grande, including the Rio Grande Western. The Denver & Rio Grande is, financially speaking, what is commonly called a "poor" railroad. Mr. Young has had experience as an operating officer in both rich railroads and poor railroads. Besides being an experienced and able operating executive he has always shown unusual diplomacy and skill in dealing with questions arising between the railroads and their employees, on the one hand, and the public on the other. All things considered, he is probably as well equipped as any man that could have been selected to deal with the problems that will confront the management of the Denver & Rio Grande for some years to come.

Mr. Young was born January 17, 1864, at Salt Lake City, Utah, and was educated at the University of Utah. He entered railway service in 1882, as office boy and warehouseman on the Utah Central, at Sandy Station, Utah. He was later agent and operator at various stations and then bill clerk, at Salt Lake station, the same road. He was with the Union Pacific as ticket clerk and train agent at Ogden, Utah, from 1883 to 1886. From 1886 to 1889 he was traveling passenger agent of the Chicago & North Western and in 1889-91 was general agent of the Salt Lake & Eastern at Salt Lake City, and general superintendent of the Utah Central. From 1891 to August 1, 1902, he was superintendent of the Utah division of the Oregon Short Line. Mr. Young was general superintendent of the Rio Grande Western, now part of the Denver & Rio Grande, at Salt Lake City from August 1, 1902, to December 1, 1904. On the latter date he became general superintendent of the Colorado & Southern. On December 11, 1905, he was promoted to general manager of the same road. From May 1 to October 1, 1907, he was general superintendent of

the St. Louis & San Francisco, and then served in a similar capacity with the Southern Pacific at San Francisco until May 1, 1910. In the latter year he was elected president of the Alaska Steamship Company, the Northwestern Steamship Company, Ltd., the Northwestern Commercial Company, the Northwestern Fisheries Company, and the North Coast Lighterage Company; and vice president of the Copper River & Northwestern. From May 15, 1912, to January, 1914, he was president of the Spokane, Portland & Seattle, the Oregon Trunk Railway, the Oregon Electric Railway, the United Railroads, the Spokane & Inland Empire, the Pacific & Eastern and the Dalles, Portland & Astoria Navigation Company with office at Portland, Ore. He was elected president of the Norfolk Southern, with headquarters at Norfolk, Va., in May, 1914. He was appointed federal manager of the Virginian in May, 1918, and in addition federal manager of the Norfolk Southern in the following month. He became senior assistant director of operation of the Railroad Administration in January, 1919, and returned to the presidency of the Norfolk Southern on March 1, 1920.

J. H. Young

## Car Loading

WASHINGTON, D. C.

**A**NOTHER GAIN in the number of cars loaded with revenue freight indicating an improvement in general business conditions is shown in the weekly report of the Car Service Division of the American Railway Association for the week of April 16. The total was 703,896, a gain of 10,000 in a week and of 37,000 in two weeks. This is the largest total for a week, with one exception, since January 15, although still below the figure for the corresponding week of 1919, when the total was 706,012. It was greater than for the corresponding week of 1920, when the loading was reduced to 601,695 by the switchmen's strike. For the week of March 5 the loading was 712,822. There was an

increase as compared with the previous week in all districts except the Southern, where there was a drop of 1,457 cars. The increase is mainly in coal, which showed a gain of over 7,000 cars for the week, and merchandise and miscellaneous freight which showed a gain of 1,633 cars. Merchandise and miscellaneous has been gaining steadily since the first of the year, while coal has been falling off about an equal amount, but for two weeks in April the coal movement has been increasing. There were small gains as compared with the previous week also in livestock, forest products and ore.

An improvement in the demand for cars is shown by reports received by the Car Service Division for the week ended April 15. The average number of surplus or idle freight cars for the week was 499,479, or a decrease of 7,948 as compared with the previous week when a new high record in the number of idle cars was shown. This reflects the increase in loading shown in the week's report of April 9.

This reduction in surplus was due entirely to an increase

in the demand for coal cars, the number of surplus coal cars being 252,010, or a decrease of 9,284 compared with the previous week. The number of idle box cars remained virtually unchanged, there being 176,805 on April 15 as compared with 176,916 on April 8.

Compared by districts, decreases in the number of surplus

theory of this Act has not worked out during the last seven months.

The value of the New England roads is included in trunk line territory; therefore, the New England railroads are certainly entitled to earn as much on their value as the trunk lines as a whole, and if they fail substantially in that, the deficit should be made good in some way.

REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—ALL DISTRICTS; COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO FOR WEEK ENDED SATURDAY, APRIL 16, 1921

Districts:	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise L.C.L.	Miscellaneous	Total revenue freight loaded			Received from connections

L.C.L. merchandise loading figures for 1921 and 1920 are not comparable as of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

some roads are not able to separate their L.C.L. freight and miscellaneous

cars were shown in the Allegheny, Pocahontas, Southern, Central Western and Southwestern regions, while increases were reported in the Eastern and Northwestern.

Suggests Solution for New England Railroad Problem

F. J. LISMAN, head of the investment house of F. J. Lisman & Co., New York, and recognized as a leading authority in matters of railway economics, has suggested to the Interstate Commerce Commission a plan for solving the pending argument as to the divisions or allowances to be given the New England roads, which solution he believes would probably have a better chance for adoption than some of the other plans which have thus far been suggested. Briefly, Mr. Lisman suggests that the New England roads and the lines doing business with them should keep an account of the earnings derived from business interchanged with New England and that a sum sufficient to equalize the net earnings of the New England roads with those of the trunk line carriers should be paid the New England lines monthly, the sum to be pro rated among the carriers in proportion to each line's New England business. He further suggests that the plan should be made effective for a period of, say, twelve or fifteen months and that the present New England divisions case be suspended until the information to be derived from the procedure in the suggestion will be available.

He has outlined the details of his plan in the following statement:

Suggested Solution to Keep New England Lines Out of Bankruptcy

The intent of the Transportation Act was to enable the railroads to earn 3½ per cent on the fair value of their property devoted to public service. Owing to unforeseeable conditions the

The adjustment or rates and divisions is a very lengthy process and urgent help is needed. It is, therefore, suggested that all the railroads in trunk line territory should keep an accounting of all earnings derived from business interchanged with the New England railroads and should pro rata and in proportion to their earnings from this traffic (not exceeding, however, 12½ per cent of such gross earnings) pay over to the New England lines, a sum which will equalize the net earnings of the New England railroads. That is to say, if in any one month all the railroads in trunk line territory have had net earnings as a whole at the rate of 3½ per cent per annum of their value and if the deficiency of the New England roads below 3½ per cent during that month, should have been \$1,000,000, then the lines in trunk line territory, out of their earnings, are to make good this difference pro rata. For instance, if the earnings of the Pennsylvania Railroad on business interchanged with the New England lines during that month should have been \$1,000,000, which may have been 20 per cent of the total gross earnings on this interchange business earned by the lines West of the Hudson River, then the Pennsylvania Railroad should be required to pay this pro rata, that is up to \$125,000, to the New England roads, or as much less as may be required.

As the three systems in what was formerly known as "Pocahontas Region" have been large beneficiaries from the rate increase granted to the trunk line group, which includes the valuation of the New England roads, they should also contribute their proportion of the deficiency of the New England railroads on business carried by them and destined for New England points. This tonnage which moves out by water from Hampton Roads aggregates between 7,000,000 and 10,000,000 tons annually.

The connecting lines now claim the New England roads are not administered as economically as they might be, nor their local rates sufficiently high. It is, of course, easy to see the mote in your brother's eye and ignore the beam in your own eye. These points will be brought out by the investigation proposed by Senator Cummins and need not be considered at this time.

If the above suggested division of earnings should be ordered for twelve to fifteen months, it would give time to investigate the matter of fair divisions because it would not be proper to make this plan a permanent one in view of the fact that such a division is somewhat communistic in its nature and does not offer sufficient incentive to the New England roads to get the most out of their property.

Bankruptcy of the New England roads would not in the least serve or increase the facilities to the New England public; it would further disturb confidence in railroad securities and in view of the large advances of the government to these railroads, it would undoubtedly bring forth much adverse comment in

Congress and elsewhere, on part of men not familiar with the past and present needs of the situation.

It is in his letter to the Interstate Commerce Commission that Mr. Lisman suggests the suspension of the New England divisions case. In that letter he urges the need of prompt action and further details the plan of keeping separate accounts on the business interchanged with the New England lines. Concerning the latter feature of the plan he says in his communication:

"(3) That the commission suggests or recommends to the carriers that they shall keep separate accounts not only of the earnings accruing from the business interchanged with New England lines, but also as near as possible of the expenses here incurred in connection with said traffic; that the carriers west of the Hudson River file with the New England carriers, and the New England carriers vice versa file with their western connections, etc., not more than 90 days after the close of each month a detailed report of the earnings and expenses incurred in connection with this interchange tonnage. If any carriers should feel that these accounts are not properly kept they shall endeavor to arrive with each other upon an understanding as to the proper method of keeping such accounts, and if they fail to come to an agreement within forty-five days after the question of improper accounting has been raised they should appeal

to the commission with a request for a decision on the subject."

"The object of these suggestions is," the letter to the Commission says, "that the necessary material for a final decision on New England divisions will thus be gathered together in course of the next 12 months, and that in the meanwhile most of the details on which a final decision must necessarily be based will largely be threshed out between the carriers themselves. I am using in the first line of Suggestion 3 the words 'suggests or recommends' in preference to the word 'order' for the following reasons: Many of the carriers, especially those in C. F. A. territory, participate to a small extent only in the New England tonnage and therefore will not want to bother to keep cost accounts in connection with this business. I am referring to such roads for example as the Ann Arbor, the Detroit & Mackinac, etc., and possibly some of the more important companies who get only a short haul from this traffic."

"The costs of operation of the New England railroads," Mr. Lisman continues, "have risen much more owing to the high wages than those of all other railroads. This is due to the fact that wages constitute nearly the entire cost of the expensive terminal and switching service. With decreasing wages the costs on the New England railroads should contract correspondingly more rapidly than on the other lines."

## Do Mill Defects Cause Transverse Fissures?

Study of These Rail Failures Points to Influence of Chance  
Mishaps in Particular Heats

By C. W. Baldridge

Assistant Engineer, Atchison, Topeka & Santa Fe, Chicago

**D**URING THE YEAR of 1920 there occurred on some of the American railways a seeming epidemic of broken rails due to transverse fissures. On January 1, 1920, the number of identified failures on one railway amounted to 39 rails and on March 12, 1921, the identified failures due to fissures on this road amounted to 199 with a dozen or more failed rails which are suspected of being transverse fissure failures on their way to the test department for positive identification. Most of these suspects are broken rails that became so rusted before inspection as to make their positive identification impossible without running them through the drop machine and testing them for further fissures. The remainder are rails showing cracks in the gage side of the head of the rail, indicating a transverse fissure, but not yet broken for inspection.

A study of these broken rails develops some interesting facts, the first one being that out of more than two hundred rails involved, only one, a rail rolled by the Colorado Fuel & Iron Company in August, 1904, is charged with being of Bessemer process steel, this being assumed because it does not bear the process mark, "OH" to indicate that it is of open-hearth process steel. Serious doubt is cast upon its being of Bessemer steel by the fact that the Colorado Fuel & Iron Company, which made the rail, commenced making open-hearth steel in 1903. But owing to the fact that both open-hearth and Bessemer furnaces were in operation, and ingots from all furnaces were worked in the same rolls, no process marks were added to the brand on the rails until the use of Bessemer steel for rail making was abandoned, in the latter part of 1908.

Other mills followed much the same practice. The dates of commencing the use of open-hearth steel for rails, and

the times of adopting of a process mark are indicated in brief as follows:

The Carnegie Steel Company began the operation of its open-hearth plant at Bessemer in 1913, but had rolled some rails from open-hearth steel shipped from its Edgar Thompson plant since 1910. It does not use the process mark "OH" as part of the brand except on request, but uses a stamp "OH" along with the heat number.

The Cambria Steel Company began the manufacture of iron rails July 27, 1854, of Bessemer steel rails in 1867, from steel obtained from outside sources. It began the manufacture of Bessemer steel July 10, 1871, and the rolling of rails therefrom on July 12, 1871. It began manufacture of acid open-hearth steel rails in 1878 and of basic open-hearth steel rails in 1906. The distinguishing process mark "OH" was adopted at that time. The first rolling of Bessemer steel rails in the United States is reported to have occurred at North Chicago Rolling Mill, in 1865.

The Colorado Fuel & Iron Company first rolled "OH" steel rails in latter part of 1903, gradually increasing the "OH" tonnage until June, 1908, when the use of Bessemer steel for rail making was discontinued. There is no information as to process marks prior to latter part of 1908, but discontinuing of the use of Bessemer steel, the mark "OH" was added to brand. Previous to this the process mark could not be added to the brand, as both kinds of steel were passed through the same rolls.

The Lackawanna Steel Company began the manufacture of open-hearth steel rails on February 2, 1907. The open-hearth process mark was stamped on the rails until 1920, when "OH" was added to the brand.

The Tennessee Coal, Iron & Railroad Company com-

menced the manufacture of rail from open-hearth process steel in 1903, and adopted the process mark in 1906.

The Illinois Steel Company started rolling open-hearth steel at Gary Works, February 17, 1909, and "OH" was added to the brand at that time.

On one railway with which the writer is familiar, over ten thousand miles of Bessemer steel rails have been used, more than half of it having served the first cycle of its usefulness in main line track, with only one transverse fissure failure being charged against it, and that one case being seriously open to doubt.

About 400 miles of 85-lb. A.S.C.E. section rail of Bessemer process steel, or perhaps mixed processes are still in main line running track, and carrying the same axle loads, the same locomotives and same trains that are being carried by the 90-lb. open-hearth rails adjoining. Not a transverse fissure failure has been found in this Bessemer steel, while a considerable number of such failures have been found in the open-hearth steel adjoining.

Very few failures due to transverse fissure have been reported in Bessemer steel rails by other companies, and in view of the mixture of rails made from the two kinds of steel, before process marks were adopted, it is advisable that the heat number of every transverse fissure failed rail which is now charged to Bessemer steel be traced to prove if possible to which process the rail really belonged. If the tracing of the heats of the fissure failed rails now charged to the Bessemer process should prove them to be of open-hearth steel, it would practically prove that transverse fissures are due to some difference in the two processes, and even if these rails are of Bessemer steel, the very few of such failures in that process steel indicates that the failures are due to something which almost never happens in the Bessemer process and only occasionally happens in the open-hearth process.

Returning to a study of the fissure failures as quoted above, 23 identified transverse fissure failures have been found in one heat of steel, 6 of the 23 rails being "B" rails and 8 of them "G" rails. Another heat has developed 6 identified failures, all 6 of them occurring in "G" rails. Another heat has developed 13 identified fissure failures and 8 suspects; another heat recently inspected has a record of 6 identified fissure failures, 4 suspects, 2 mashed heads and 1 split head failures.

Another heat recently inspected showed 13 identified fissures and rail failure reports indicate 3 suspects not yet inspected; 4 of these identified being "C" rails, 3 "D" rails and 2 "B" rails. Another heat shows 5 identified fissures, 3 of them occurring in "C" rails.

The total identified fissure failures are divided among rails of letters as follows: A—19, B—32, C—46, D—24, E—26, F—22, G—25, H—1, and unknown 2.

The large number of failures occurring in an individual heat, and the number of failed rails of the same letter in the heat, indicates that transverse fissures are due to some defect which affects the heat as a unit. In this case transverse fissure failures have been found in only about one-half of one per cent of all the heats of open-hearth steel in use to date and in only one or in none of the Bessemer heats. It is, therefore, possible to trace back for the cause. The rails of heats which have not produced failures are carrying the same loads as are those which have produced failures. They are laid in the same manner, supported in the same manner, and were handled in the same manner from the mills to their present position in the track.

At the mills the rails of different heats were loaded alike, were gagged in the same gagging presses and in the same manner, were handled over the hot beds in the same way, and were rolled through the same rolls, in as near the same way as it is possible to roll them. Should any of these features be the cause of transverse fissure, the failures would naturally

scatter indiscriminately through the entire output and not bunch up in a few heats.

In tracing back, the soaking pit is the first point where a difference of any consequence could occur, but here again the scarcity of fissure failures in Bessemer steel brings a verdict of acquittal. Therefore, the cause for the failures must lie still further back. The real point of difference between the two processes of steel making, as well as the difference between different heats made by the same process, must originate between the charging of the furnace and the teeming of the ingots, for the charging of the furnace is the beginning and the teeming of the ingots is the ending of the heat's existence as a unit.

A study and comparison of the two processes of steel making show several points of difference, a slight derangement of any one of which may be the cause of transverse fissure failures. In the open-hearth process, a larger amount of cold carbonizing reagent is added to the molten metal in the ladle, and usually with less agitation of the metal to insure thorough mixing, than occurs in the Bessemer process. Some heats in the open-hearth process require more "coking up," that is, the casting of bags of powdered coke and shoveling of lump coal, etc., into the ladle while the steel is running from the furnace, than do others.

It is possible that in one-half of one per cent of the heats, this is improperly done, or possibly over done, and brings about a defective state of the steel. Another possible source of trouble might be the addition of too much lime to the bath in the open-hearth furnace too shortly before the tapping of the furnace. However, the most probable cause is the frozen tap hole, which occurs occasionally in the open-hearth furnace and cannot occur in the Bessemer furnace.

The frozen tap hole delays for a time the removal of the heat of metal from the furnace, after it has reached the proper condition for removal, the length of time depending upon the means at hand for cutting the hole open. This delay results in burning out the carbon from the melt to a greater extent than was intended and usually results in heavier recarbonizing, or addition of spiegel, powdered coke, etc., in the ladle than would have been necessary had the tapping been accomplished without delay. It is true that a delay in pouring the heat of metal from a Bessemer converter might occur, due to some derangement of the plant, but such a delay occurs much less frequently than does the frozen tap hole in the open-hearth furnace.

It may be that none of the conditions mentioned is the cause of transverse fissures, but since only about one heat in two hundred is affected, there can be little doubt that the trouble can be easily remedied, or avoided, when it is known what to do, or what not to do, in the making of the steel. The indications are that the cause of transverse fissures in rails is connected with the furnace practice, therefore, the surest way of determining just what is the cause would probably be to have a careful log kept of every detail of the furnace practice of each heat, and when transverse fissure heats are located (which will usually be from 3 to 10 years after the manufacture of the rails), make a careful study and comparison of the details of the furnace practice of the good and bad heats.

Mrs. M. E. WILBER, a typist in the general office of the Southern Pacific at San Francisco, wrote during the year 1920 a total of 38,756 letters, spending in this work 2,165 hours. Mrs. Wilber's portrait is printed in the April number of the Southern Pacific Bulletin, and she is called the Mistress of the Keyboard. The year's record averages 143 letters per day of eight hours, and the total number of hours given seems to indicate that she worked about five and a half days a week for fifty weeks. It is estimated that the average number of lines in each letter written was seventeen.

# Great Northern-Northern Pacific Bonds Approved

## I. C. C. Authorizes New Joint Bonds and Also Additional Bonds for Collateral and Conversion

WASHINGTON, D. C.

THE PLAN proposed by the Great Northern and Northern Pacific railroads for refinancing their purchase of the stock of the Chicago, Burlington & Quincy by the issue of \$230,000,000 of joint 15-year 6½ per cent convertible gold bonds secured by the Burlington stock and some additional collateral in the form of individual bonds of the two companies was approved by the Interstate Commerce Commission in a decision dated April 21 which was made public on April 25. The new joint bonds, which under the commission's order are to be sold at not less than 91½ per cent of par, are to refund the \$215,000,000 of joint 4 per cent bonds issued 20 years ago to finance the Burlington purchase, which mature on July 1. Commissioners McChord and Eastman filed dissenting opinions opposing the plan as being unduly expensive. Commissioner Potter filed a concurring opinion answering their arguments and pointing out that the commission had prevented the carrying out of the plan proposed by the roads under which \$80,000,000 of Burlington bonds would have been issued against improvements made out of income and used to retire a part of the joint bonds.

The application has attracted unusual interest because of the size of the financial transaction involved, as it represents the largest railroad bond issue ever made at one time.

The various steps in the refunding transaction as authorized were as follows:

### Various Issues Authorized

The commission's order approves the proposed joint trust indenture of the Northern Pacific and the Great Northern, in the form submitted.

The Northern Pacific and the Great Northern are authorized (1) to issue \$230,000,000 of their joint 15-year 6½ per cent convertible gold bonds under a proposed trust indenture to be executed and delivered under date of July 1, 1921, by them to the First National Bank of the City of New York as trustee.

The Northern Pacific is authorized (1) to issue nominally \$33,000,000 of its 6 per cent refunding and improvement mortgage bonds, series B, under its mortgage dated July 1, 1914, to the Guaranty Trust Company of New York; and (2) to pledge the bonds as collateral under the proposed

indenture; the bonds to be dated January 1, 1921, and to mature July 1, 2047.

The Great Northern is also authorized (1) to issue nominally \$33,000,000 of its 7 per cent general mortgage gold bonds, Series A, under its proposed general gold bond mortgage, dated January 1, 1921, to the First National Bank of the City of New York; and (2) to pledge the bonds as collateral under the proposed indenture; the bonds to be dated July 1, 1921, and to mature July 1, 1936.

The Northern Pacific is authorized to issue at par and accrued interest, and from time to time upon payment or conversion of the joint bonds in accordance with the provisions of the indenture, its refunding and improvement mortgage bonds, series B, to an amount not exceeding \$107,000,000 under its mortgage; the bonds to be similar to the \$33,000,000 of bonds described to be used for purposes specified.

The Great Northern is also authorized to issue at par and accrued interest, and from time to time upon payment or conversion of the joint bonds in accordance with the provisions of said indenture, its general mortgage gold bonds, series A, to an amount not exceeding \$107,000,000 under its proposed general gold bond mortgage; the bonds to be similar to the \$33,000,000 of bonds above described and to be used solely for the purposes specified.

The proposed general gold bond mortgage of the Great Northern, in the form submitted, is approved.

The Great Northern is also authorized to pledge as collateral under its proposed general gold bond mortgage \$12,132,000 of its first and refunding mortgage gold bonds, bearing interest at 4¼ per cent, dated May 1, 1911, maturing May 1, 1961, issued under its first and refunding gold bond mortgage, dated May 1, 1911, to the Bankers Trust Company, and now held unencumbered in its treasury.

The Great Northern is authorized to pledge as collateral under its proposed general gold bond mortgage, an additional \$24,200,000 of its first and refunding mortgage gold bonds, subject to the existing pledge thereof with the Secretary of the Treasury as security for a loan under section 210 of the transportation act; said bonds being similar to the \$12,132,000 of such bonds above described.

Following is an abstract of the report:

### Report of the Commission

A hearing upon the application was had on April 11, 1921. At the hearing there were no appearances except in behalf of the applicants. No objection to the granting of the application has been offered by any authority of any State in which either applicant operates.

The application grows out of the necessity of paying or refunding \$215,227,000 of 4 per cent joint and several bonds, in the hands of more than 18,500 holders, issued under date of July 1, 1901, in payment for 1,076,135 shares of the capital stock of the Chicago, Burlington & Quincy of the par value of \$100 per share. They are secured solely by the pledge of 1,658,674 shares of that stock owned by the applicants. The applicants, lacking available funds with which to pay them, must issue and sell some form of securities sufficient in amount to raise substantially all of the required \$215,227,000. For this purpose they have decided to issue the joint 6½s; and the uncontradicted evidence is that the issuance thereof is the best means now available for obtaining the necessary funds.

#### Conversion Privilege

The joint 6½s will be callable for redemption, as a whole or in amounts of not less than

\$5,000,000, on 75 days' notice at 103½ per cent of par and accrued interest. Each holder of joint 6½s, whether or not they be called for redemption, will be entitled to convert them at any time before maturity into a like amount of the Northern Pacific refunding and improvement mortgage bonds, and/or of the Great Northern general mortgage gold bonds. But this right of conversion into the mortgage bonds of either applicant will cease when \$115,000,000 of its bonds, less an amount equal to one-half of the principal amount of joint 6½s redeemed, shall have been issued upon such conversion. Upon such conversion, except when made upon an interest date, accrued interest will be adjusted in cash. The evidence shows that the calling of joint 6½s for redemption would probably result in the conversion of the greater part of the bonds so called.

Many of the joint 4s are held by insurance companies, savings banks, trust companies, trustees and other similar investors. In several of the chief investment states bonds secured by stock collateral alone cannot now be lawfully purchased and held by such investors. It is believed, however, that the provision for conversion will not only enable the applicants to

reach this market but will also insure the early substitution of mortgage bonds for a considerable portion of the joint 6½s without any calling of the latter for redemption.

Between July 1, 1914, and December 31, 1920, the Northern Pacific expended for additions and betterments properly chargeable to capital account \$45,208,084, none of which has been capitalized. It now proposes to reimburse its treasury in part for these expenditures by drawing down on account thereof, under its refunding and improvement mortgage, \$33,000,000 of series B bonds, and to pledge the same under the indenture. These bonds will be callable for redemption after July 1, 1936, on any interest date on three months' notice at 110 per cent of par and accrued interest.

The Northern Pacific mortgage reserves \$22,400,000 of the bonds issuable thereunder for issuance from time to time for the purpose of purchasing, paying or retiring joint 4s before, at or after their maturity. Section 4 of the third article thereof provides that \$1,000 of the bonds so reserved may be issued for each \$500 of the pledged stock upon its release from pledge and deposit with the trustee thereunder. That company seeks authority to issue from time to time,

pursuant to this provision, its mortgage bonds to an aggregate amount of not more than \$107,300,000.

The maximum interest rate permissible under the Great Northern first and refunding gold bond mortgage is 5 per cent. That company can not procure the issuance of bonds thereunder against deposits of the stock, unless it deposits a majority of the issued and outstanding shares. It does not own a majority of the shares. It therefore determined to execute and deliver under date of January 1, 1921, to the First National Bank of the City of New York its proposed general gold bond mortgage. Section 5 of the third article thereof provides for the issuance of \$140,000,000 of series A bonds to be dated July 1, 1921, mature July 1, 1936, and bear interest at the rate of 7 per cent. These bonds will not be redeemable before maturity.

The Great Northern proposes to draw down under that section and to pledge under said indenture \$33,000,000 of series A bonds. The remainder, \$107,000,000 thereof, are reserved by that section for issue from time to time for the purpose of exchanging, redeeming, or retiring upon surrender for conversion, in accordance with the terms of the indenture, a like principal amount of the joint 6½% bonds. Authority is sought to issue, from time to time, pursuant to this provision, series A bonds to an aggregate amount of not more than \$107,000,000.

The proposed indenture provides that, upon any redemption of joint 6½%, the trustee shall release to each applicant in respect of each \$1,000 of bonds so redeemed \$100 of its pledged mortgage bonds and \$85 per value, of the pledged stock. It also provides that, upon any surrender of joint 6½% for conversion into the mortgage bonds of either applicant, the trustee shall release to that applicant, for each \$100 of bonds so surrendered and against delivery to the trustee of \$100 of such applicant's mortgage bonds, \$77, par value, of the pledged stock and \$20 of its pledged mortgage bonds. Each redemption or conversion of joint 6½% will, therefore, result in a partial severance of the applicants' joint ownership of the stock.

There have been issued and are actually outstanding \$35,668,000 of the Great Northern first and refunding mortgage gold bonds due May 1, 1921. There have been pledged with the Secretary of the Treasury \$24,200,000 of similar bonds. It is desirable that this company's proposed general gold bond mortgage be a first lien on a majority of the bonds issued and outstanding under its first and refunding gold bond mortgage. Therefore, it proposes to close its first and refunding gold bond mortgage with \$72,000,000 of bonds issued and outstanding thereunder, of which \$35,668,000 will remain in the hands of the public. The balance, \$36,332,000, will be pledged under the proposed general gold bond mortgage, which will provide for the pledge thereunder of \$24,200,000 of such bonds, subject to the existing pledge thereof with the Secretary of the Treasury, and of an additional \$12,132,000 thereof now held by the company unencumbered in its treasury.

#### Proposed Terms of Sale

The applicants propose to issue and sell the joint 6½% at some convenient time on or before July 1, 1921, through a contract to be made with a syndicate of bankers, who will agree to provide on or before that date the moneys needed to pay the joint 4s. No contract or commitment of this kind has as yet been made and will be made without our approval. The applicants propose to sell the joint 6½% at the best prices obtainable at the time when their issue is authorized. They represent that it is not possible to obtain definite prices in advance of such authorization; but that the joint 6½% probably could not be sold to the public for more than 96½ per cent of par and accrued interest, and that the cost to the applicants of marketing the same, including a reasonable compensation to the syndicate and to the distributors, will be about 5 per cent. If the transaction should be consummated on this basis, the joint 6½% would be purchased by the syndicate at 91½ per cent of par and accrued interest and the discount thereon would cover the cost to the applicants of marketing the same. The amount 6½% to be sold to the syndicate at that price the effective rate of interest which the applicants would have to pay would be about 7.45 per cent. While this rate is very high the uncontradicted evidence is that the terms mentioned are the best which can be obtained at the present time.

If the proposed issue of bonds should net the

applicants but 91½ per cent of par, it will be necessary for them to provide \$4,777,000 in addition to the proceeds thereof in order to pay the joint 4s. This evidence shows they will be able to do.

The principal issue of joint 6½% will increase the fixed annual interest charges of each of the applicants by \$3,170,460, provided that none of the bonds are converted. Assuming a conversion of half the issue into the 7 per cent bonds of the Great Northern and half into the 6 per cent bonds of the Northern Pacific the fixed annual interest charges would then be further increased by \$75,000 in the case of the Great Northern and be correspondingly decreased by \$75,000 in the case of the Northern Pacific. These figures do not reflect the additional cost to either applicant resulting from the sale of the joint 6½% at a discount.

We approve the applicants' proposed joint trust indenture and the proposed general mortgage of the Great Northern in the respective forms in which they have been submitted.

The applicants have had their joint 4s outstanding for nearly 20 years. During that time they have made good earnings but have not reduced the principal amount of this obligation. The interest thereon has been more than met currently by their dividends from the Burlington stock, to purchase which the joint 4s were issued. The near approach of maturity presents the alternative of default, or of such refinancing as now appears to be practicable. And the testimony is that an extension or refunding of the present loan for a short term would be of no material benefit to applicants. The situation presents an emergency and we must deal with that situation as it is.

#### Commissioner Potter Calls Plan Sound Financing

Commissioner Potter in his concurring opinion said in part:

It appears to me that there is reason to apprehend that the dissenting opinions of Commissioners McChord and Eastman may leave erroneous impressions regarding the views of the commissioners who concur in the majority report.

Undoubtedly the carrying out of the plan will be expensive. It should be pointed out, however, that the element of expense is due in substantial part to the fact that we declined to approve of the plan submitted to us on the application of the Burlington, and forced the utilization of the more expensive plan now submitted.

There is a suggestion of criticism because of the fact that the Great Northern and the Northern Pacific acquired the Burlington stock. I fail to see wherein we have license to criticize that transaction. Its merit is not involved in this case. There has been no inquiry regarding the propriety of it, and there is no record upon which fairly it could be criticized. It has stood unquestioned for 20 years, and for the purpose of this proceeding must be presumed by us to have been sound. Beyond this, the phenomenal record made by these three properties during the last 20 years, in fairness should be regarded as justifying the relation which existed between them. That relation seems to harmonize with the consolidation provisions of the Transportation Act and to indicate that those who were responsible for it were leaders about 20 years ahead of the leaders of the present day.

It is suggested that some sinking fund scheme should have been followed heretofore. A sufficient answer is that no such plan was adopted, and we must deal with conditions as we find them. It has not been pointed out how any sinking fund scheme would have been helpful. The carriers have not, during the last 20 years, disbursed any undue or disproportionate amounts in dividends. They have spent vast sums for additions and betterments which were needed in the public interest. Any sinking fund scheme which would have withdrawn earnings with which to retire the Burlington joint 4s would have served no purpose except to force the issuance of other securities with which to replace them. Under the plan which we have already prevailed a large part of capital invested in railroads has been represented by bonds. This has been in the public interest, and this method of financing undoubtedly will continue. The plan represents sound financing and has been forced by necessity as the best method. It would not have been and could not have been used if it were not supported by sound economic reasons.

It is likely that when the Burlington joint 4s were put out the 20-year maturity was decided upon because it was believed that they could be refunded on a basis better than 4 per cent—which probably could have been done except for the World war.

The suggestion that an extension of two or three years should have been obtained has been answered by testimony that it is impossible to obtain such an extension. The intimation that a forced refunding on a 6 per cent basis should have been resorted to, suggests a policy of repudiation which should not be encouraged by us. In this country the investor has the right to choose the investments which he will make. When, as in this case, he is entitled under the contract which he holds to receive a definite amount at a certain time, he has the right to demand that amount in the medium which his contract provides. To force an investor to receive in payment of his debt another security worth only 80 or 90 cents on a dollar would represent a policy of dishonesty, which we, on behalf of the American public, have no right to enforce and approve.

The situation before us is relatively simple. The joint 4s must be met on July 1, 1921, if the credit of the applicants and railroads generally is to be preserved. The results of a denial of this application would be disastrous to the railroads and to the public. It probably would be impossible to put through any other plan by July 1. This application and the prior application by the Burlington joint 4s, and our assistance for more than six months. The uncontradicted evidence is that the method proposed, despite its cost, is the best available and the only one the success of which is virtually assured.

#### Commissioners McChord and Eastman Dissent

Commissioner McChord, in a dissenting opinion, said in part:

The plan submitted is, in my judgment, so expensive and so at variance with the spirit and purpose of the amended act, and so foreign to the interests of the public and the carriers, that I am constrained to withhold my assent. Twenty years ago the northern lines jointly acquired approximately 97 per cent of the capital stock of the Burlington, and to obtain the funds issued their joint and several 4 per cent bonds collaterally secured by deposits of the capital stock so purchased. During that period the Burlington dividends have paid the interest upon the bonds. The northern lines have distributed dividends upon their own capital stock, and have expended various sums in maintenance, betterments and extensions; but nothing has been set aside as a sinking fund to retire any part of their bond issue, and at the end of the 20-year period they have failed to cancel a single dollar of the indebtedness incurred for the sole purpose of obtaining control of another trunk line. To postpone the day of reckoning they now propose a joint refunding issue of \$230,000,000, initially increasing their outstanding obligation by approximately \$15,000,000, to be floated in accordance with a plan which will net them about \$210,000,000, after deducting the discount and underwriting costs. Thus, at the threshold, not only are they faced with an expenditure of approximately \$20,000,000 to accomplish merely the flotation of the issue, but the net proceeds will fall almost \$5,000,000 short of the principal sum necessary to meet and retire the outstanding joint 4s, and, as frankly admitted, this deficit must be "dug up" from other sources. This is not all; they are to assume a 15-year undertaking to pay an interest rate increased by more than 50 per cent annum, which for that period will aggregate over \$86,000,000 additional fixed charges, based upon a principal enlarged by nearly \$15,000,000, and callable at 3½ per cent above par, equal to 12 per cent of par in excess of the initially available net. So, also, in the event the privilege of the conversion into the Northern Pacific 6s is exercised, within the prescribed limits, the bonds, although enjoying a lower interest rate, are callable after 15 years at a premium of 10 per cent of par.

The foregoing discloses the prodigality of the transaction, the cost of which must sooner or later be met by travelers and shippers or else impair by so much the resources of the applicants. Having been unable to abate a single dollar's worth of their outstanding joint 4s there is scant hope that the northern lines will

be able to reduce the new and more burdensome undertaking or even recoup the initial sacrifice with which it is to be launched, and the approval by the majority includes no such requirement for the future. Certainly, the present progression is in the direction of disaster. This is not a matter of negotiating a loan with which to continue those lines as going concerns, but solely to enable them to retain control of the Burlington; and it can not be successfully contended that the present scheme is necessary to maintain this triple alliance as a transcontinental system, in view of our power to prescribe through routes and joint rates, and to provide for joint use of terminals upon appropriate terms.

I think we should limit our authorization to an issue of refunding bonds of the northern lines in an amount sufficient to retire the maturing issue, bearing interest at 6 per cent and secured by the joint mortgage and by the collateral now having a materially increased value, to be exchanged par for par by negotiation with the present bond-holders. An admissible alternative would be an appropriate extension or renewal of the present obligations for a further period of something like 2 or 3 years, even at 7 per cent, the present indications being that the interest rate has passed the peak and will then have declined to a reasonable figure; and before the expiration of that time steps could be taken to place refunding bonds in the hands of investors on less costly terms.

Commissioner Eastman said in part:

Applicants and their financial advisers, while no attempt has been made to communicate with any considerable number of the holders of the joint bonds, state that they have interviewed a few of the larger holders and find no disposition

to accept 6 per cent bonds, however secured, in substitution for the maturing 4 per cent bonds. On the contrary, they doubt whether many of the holders will accept in exchange even the proposed new bonds on a 6 1/2 per cent basis, and they believe that it will be necessary to pay cash in settlement in more than three-fourths of the cases. Their plans, therefore, contemplate the sale of most of the new bonds to new purchasers for cash, and it is testified that the cost to applicants of this marketing will be about \$11,500,000.

Notwithstanding these statements, I cling to the belief that with our help and without employing brokers at the huge cost proposed, applicants could carry through this refunding operation upon much better terms. In this belief I rely, not upon altruism, but upon the enlightened self-interest of the holders of the joint 4's. Railroads generally are passing through a very trying period, and their welfare is vital to the welfare of the country. Friendly co-operation, such as I have in mind, on the part of the holders of maturing securities would not be an act of charity, but in the long run an act of selfish wisdom. If given the opportunity, I believe they would be quick to grasp the essentials of the situation and act accordingly. And such co-operation on their part would most assuredly react favorably both upon labor and upon the general public.

But we have the public interest to consider, and not merely the attitude or desires of the bondholders. The maturing joint 4's were originally issued to purchase the Burlington stock. The issue added nothing to the railroad property of the country, but had for its purpose only a shifting of control. To retain this control, applicants now propose to mortgage their own

properties, invade the investment market with a new issue of \$230,000,000 of bonds, and pay brokers \$11,500,000 for selling these bonds to the public on a 6 1/2 per cent basis. It seems to me that we should not, under existing critical conditions, permit railroad credit to be drawn upon in such a way and for such a purpose. It is admitted that many of the large holders of the maturing bonds, if paid in cash, will not now reinvest in railroad securities. The new bonds will, therefore, tap and be a heavy drain upon the present inadequate market for such securities, without adding in the slightest degree to railroad facilities. The same would have been true of the original plan for refunding with the help of Burlington bonds.

Reduced to simple terms the facts are that applicants did not pay cash for the Burlington stock in 1901, but gave for it their 20 year notes, secured by the stock as collateral. These notes are due next July, and it is claimed that the holders are unwilling to extend, even if offered a very large increase in interest rate. Applicants therefore desire to meet their obligations in cash, and they can undoubtedly do so if permitted to pay the price; but the transaction will place a heavy burden upon the country and will impair the market for railroad securities which are needed for much more vital purposes.

I therefore concur in the conclusions which Commissioner McChord has reached.

I feel confident, in view of prevailing railroad conditions, that these conclusions, if adopted by the commission, would meet with widespread approval, and that this approval would even be shared by the holders of the maturing bonds if the situation were made clear to them.

## Southern Road Develops High Power Weed Burner

**A** NEW TYPE of weed burning apparatus was recently developed in the shops of the Texas & Pacific which is capable of destroying vegetation for a distance of 10 ft. each side the center of the track while operated at a speed of five miles per hour. In addition to the weed burner

The new weed burner was constructed on the principle of a direct application of heat at a temperature of 1,400 to 1,500 deg. F., and experience has developed that this may be done with safety. The heat is blown upon the vegetation beneath a hood 38 ft. long suspended over the track, giving a length of contact sufficient to destroy vegetation while the burner is moving five miles per hour.

The heat is developed by the efficient combustion of fuel oil, combined with the correct quantity of air applied by

The Weed Burning Outfit Complete with Burner in the Foreground, Followed by Tank Cars, Locomotive, etc.

car itself, the full complement of equipment required for this work includes a locomotive, an oil tank car, a water car, a camp car for employees and a caboose. The total cost of destroying vegetation with this equipment is said to be less than \$5 per mile, including the consumption of 60 gal. of fuel oil per mile by the locomotive and the weed burner.

forced draft, the combustion taking place in a furnace lined with refractory materials. The temperature of the furnace gases is reduced to safe limits for application to the track by the further admixture of air in suitable quantities. A particularly complete arrangement has been worked out for the mechanical handling of dampers, wings, hoods, etc., so that

the process is thoroughly under the control of the operator. The apparatus is mounted on a steel underframe flat car lengthened to 60 ft. The machine is carefully designed to assure continuous operation at a low maintenance cost. Standard commercial equipment is used for parts subject to wear or breakage, thus minimizing expense and delay for repairs. The apparatus has proved successful in operation.

## Farmers' Organizations

### Demand Rate Reduction

WASHINGTON, D. C.

THE DELEGATION of representatives of the National Farmers' Union and other agricultural organizations which have been in conference at Washington and which called on members of the Interstate Commerce Commission on April 20 to urge an immediate reduction of freight rates, took their appeal to President Harding on April 21. A memorial was presented pointing out the serious conditions faced by the agricultural industry and urging that immediate relief be given, but in the memorial no effort was made to place the entire blame for the situation upon freight rates and the President was urged to consider the agricultural and transportation problem as a part of the broad national question of economic readjustment. The memorial said in part:

"With frozen credits, with almost prohibitive freight rates and with costs of distribution so enormous, it is impossible for the farmer to market his products without incurring a loss. The consequence is that while millions of tons of food rot in the field or are held in the barns or in other places of storage, scores of thousands of our children in the cities are unable to obtain food sufficient to nourish their little bodies. The farmers are overwhelmed with debt. They are unable to buy necessary fertilizer. They cannot obtain needed credit and there are in hundreds of thousands of cases no markets open to them. The freight rates constitute a crushing burden on the farmer. We maintain that the rise in freight rates to heights hitherto undreamed of a time when their products were being marketed at figures far below the ten-year average price is crushing the life out of the industry and if continued will retard the development of that co-operative spirit among the great industries of the nation which must be fostered in order to bring about in an orderly manner the reconstruction of our disordered national life.

"It is true the railway executives complain that they are making no money and some of them fear that a reduction would mean ruin for the mammoth enterprises they are directing. There is no element in American industrial life would more regret the ruin of the great carrying industry than would the farmers. Therefore it is in no spirit of petty criticism that we approach this immense subject. Transportation is second only in importance to production. The one is dependent upon the other. The one gives life to the other.

"So it is in a spirit of friendliness to the railways that we make our appeal to you. The railways cannot continue to be wholesome without the assistance of agriculture. When farms are abandoned or production restricted railway securities must suffer impairment in value. We are here to offer to yourself and the railways the hearty, intelligent and enlightened co-operation of the tillers of the soil. Agrarian America cannot survive unless it is in constant contact with urban America and this contact is secured by the railways and other carrying agencies.

"But, Mr. President, to settle this problem and to settle it right, agriculture needs the co-operation of all basic industry. It is ready to take its place by the side of steel, oil, finance, coal, lumber, labor, the railway executives and other great agencies. But we want you to lead all."

The President was asked to call a conference of the heads of finance, the coal industry, the oil industry, the railway industry and labor, and especially the railway labor board, in order that they, in harmony with agriculture and under the leadership of the President, may work out a solution of the problem.

A committee report presented by S. W. Brookhart and adopted by the meeting was less conservative than the memorial. In attributing a large part of the losses of the farmer to the "unreasonable rise in railroad rates" the report declared that the rise in freight rates was caused by a "cost

plus guaranty law," that the valuation used by the commission was too high and covered over five billion dollars of water, that the men who controlled the railroads controlled the price of steel and coal and it referred to the wage advance of last year as if it were the only one that had to be met by the increase in rates.

"A unified government regulation under the management of honest and competent men would reduce costs of transportation in vast amounts," the report said. "The railroads now have about 10 billions of capital at an average rate of 4½ per cent. Upon all of this they have a guarantee of 6 per cent. This means a bonus of 150 millions. Add to this the guarantee on capital above market value and there would be a saving of 450 millions on capital charge alone. Seven hundred millions could be saved on coal, steel, and other expenses when the power of the trusts is broken. The waste of competition could be reduced by over 400 millions. The capitalization of unearned increment at the rate of over 300 million dollars per year would be saved. These items make a grand total of nearly 2 billion dollars, most of which could be used in the reduction of rates with proper readjustment of wages. The farmers pay 56 per cent of the freight rates and have a just demand for this reduction."

The executive committee of the American Farm Bureau Federation, which has been holding a two-weeks' meeting in Washington, has formulated a legislative program calling for a repeal of the "guaranty section" of the Transportation Act and a reduction of freight rates.

## Rates to Intermountain Territory

### Found Not Unreasonable

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION has issued a decision dismissing the complaint of the Intermediate

Rate Association, a voluntary organization of shippers' organizations and state commissions in the intermountain territory, which had asked for graded rates to the intermountain territory lower than those to the Pacific Coast. The commission finds that the rates from points of origin east of the Rocky Mountains to the so-called intermountain territory are not unreasonable, unduly prejudicial or otherwise unlawful. The opinion by Chairman Clark points out that this case differs from previous cases in which rates from and to these territories were considered in that now the rates to the intermountain territory are not higher than to the coast and there is no contention that they should be higher. The question is as to whether the rates to intermountain territory should be lower than to the coast and, if so, to what extent. After outlining the history of the long-drawn-out controversy over transcontinental rates, the report points out that on March 15, 1918, all departures from the long and short haul rule in westbound transcontinental rates were removed under the commission's decisions, in which it was found that, due to conditions brought about by the war, water competition between the Atlantic and Pacific ports was no longer a compelling force, and it was held that the maintenance of lower commodity rates to the coast than to intermediate points unduly preferred the coast. The commission also expressed the view that rates in certain instances, at least, might be graded. These decisions required no change in the class rates as they were already lower to the intermediate points than to the coast.

In the spring of 1918, shortly after the revised rates referred to were established, intermountain shipping interests took up with the Railroad Administration the question of graded rates for all commodities; that is, lower rates to intermountain territory than to the coast. After hearing before the Chicago western district freight traffic committee in July, 1918, the matter was referred to a joint committee, composed

of the members of the San Francisco district freight traffic committee and the Portland district freight traffic committee, with directions to work out in detail and submit for consideration a complete system of graded rates. A plan of readjustment was prepared and agreed to by the members of the coast committee, and referred to the Chicago committee for consideration and transmission with recommendations to the director general's director of traffic. In the meantime, the director general and his director of traffic visited Spokane and indicated to its citizens that graded rates would be accorded intermountain territory. However, the Chicago committee failed to act on the coast committee plan and the director of traffic eventually took the matter out of its hands and referred it to the Interstate Commerce Commission under section 8 of the federal control act, with a request that it give him its recommendations. Apparently because of the prospects of an early return of the roads to their owners, the request was withdrawn, but finally, at the suggestion of the director of traffic, the matter was drawn to the commission's attention by the filing of the complaint in this case.

In terms, violations of sections 1, 2 and 3 of the act to regulate commerce were alleged; but the principal complaint was brought under section 3, namely that the Pacific coast is given unreasonable preference, and intermountain territory is subjected to undue prejudice and disadvantage, because the commodity rates are not graded so as to afford intermountain territory the full benefit of its location nearer the east. The class rates were satisfactory to complainant. They are graded and, except for recent general increases, have been in effect for a number of years.

At a hearing on the complaint in 1919 the coast committee plan had the almost unqualified support of the intermountain interests, and, the report says, if adopted, it would practically satisfy the complaint. The director general and the carrier corporations vigorously opposed its adoption and later appointed a committee of railroad traffic officials to propose a readjustment which they would be willing to make in case the commission should find undue prejudice against intermountain territory. Such a proposal was prepared and submitted to the commission late in December, 1919, and it was understood that this proposal, although submitted during federal control, was primarily on behalf of the carrier corporations and looked forward to the then prospective period of private control. The carriers contended that the present rates are not unduly prejudicial and their plan was presented for adoption only in the event that the present rates (which referred to the rates in effect prior to the 33 $\frac{1}{3}$  per cent advance made last August) were found unlawful. It contemplated a complete readjustment of the class and commodity rates giving effect to the grading principle, but entailed the disruption of important commodity rate relationships as between eastern points of origin and the cancellation of many commodity rates which latter matters were beyond the scope of the proceeding.

The complainant asked an adjustment which entirely disregards water competition and based solely on distance and other transportation conditions. The coast committee plan also assumed the non-existence of rail and water competition for transcontinental traffic and the rates proposed were based on distance and other transportation conditions. The eastern groups were retained, but the intermountain blanket was broken up and all rates were based on a first-class rate of \$4.00 from the Atlantic seaboard to the Pacific coast. Plans based on this with some modifications were also presented by the Utah and by the Idaho interests. The various plans and the positions taken by various groups of shippers are discussed in the report, after which the conclusions are stated in part as follows:

Complainant's allegations with respect to the propriety of the present commodity rates have not been sustained. Speaking of these rates, as a whole, no undue prejudice to intermountain ter-

ritory appears, and we can not say that the rates should be graded. Conditions warrant the carriers, in their discretion, in continuing the present blanket adjustment on many and perhaps most of the commodities that move in considerable volume. The ships that now ply between the Atlantic and Pacific ports are not nearly so numerous and the tonnage now moving is not nearly so heavy as during the period that followed the opening of the canal and preceded our entry into the war, but it is, nevertheless, certain that there is now sufficient transportation by water and ample indication that it will further develop and increase, to warrant the belief that within a comparatively short time it will reach a point where it will be felt in a serious loss of tonnage by the rail lines unless they have available appropriate measures to meet the situation. There is not that strife and rivalry that formerly characterized the coexistence of these two modes of transportation to and from the Pacific coast, but as between these separate sets of carriers there is that natural and well-grounded fear of each other's ascendancy and power, sufficient, especially in view of the existing movement by water, to warrant a finding that there is actual competition at the present time. Energetic business competitors in their struggle for success always look beyond the present and are justified in keeping themselves fortified against each other's activities, even before the situation becomes serious. It is mainly for these reasons that the commodity rates have been held to their present level and largely for these reasons that the carriers are now opposing a disturbance of the present adjustment. Moreover, it was for these reasons, and in the interest of rate stability, that the suggestions as to grading made in our report in *Transcontinental Rates, supra*, were not couched in more positive and forceful language. There is less reason now than then for grading. We are not now prepared to say that the rail carriers can well be put in a position to lose or to risk losing a considerable portion of their present and prospective traffic to and from the coast by having their rates increased in order that there may be a differential in favor of intermountain territory. An increase to the coast would be necessary unless we found the present rates to be not less than reasonable maxima. On this record we can not say that this is so. Moreover, rates for long hauls, particularly on low-grade traffic, are often blanketed over extensive territories, and even if the rates to the coast were found to be reasonable maximum rates it would not necessarily follow that all of them should be graded. In view of the special conditions under which these commodity rates were established and have been maintained, we can not fairly, unless we find them to be reasonable maximum rates, spread their effects farther into the interior. It is understood, of course, that these findings apply to the general rate structure. A somewhat different conclusion might be reached with respect to a specific commodity rate constituting an exception to the general adjustment. The fact that rates from certain interior eastern points of origin to the Pacific coast are lower than from the Atlantic seaboard is discussed in the record although not definitely brought in issue by the pleadings. This grouping of eastern points of origin applies to the intermountain territory as well as to the Pacific coast terminals. The grouping is not a source of injury to complainant. It reflects an adjustment of long standing.

Methods of rate making based upon theories that are no longer tenable or upon conditions that no longer exist should be discarded. When distances are relatively great, and when transfer at rate-breaking points is not attended by unusual costs, the combination basis, using local rates, ordinarily is abnormal and unscientific and often discriminatory. The railroads should be regarded more and more as one national system, and the time may not be far distant when we should proceed to the establishment of joint through class and commodity rates, lower than the combinations of locals, between practically all points in the country. We have generally recognized that through rates should be less than the combinations, but prompted chiefly by considerations of paramount public interest, growing out of the revenue conditions of certain carriers, we have refrained from and even declined absolute condemnation of combinations. We are now vested with specific authority to initiate rates that will protect revenues, and where carriers will suffer depletion of revenue by reason of the establishment of new joint rates, appropriate measures can be taken for their protection. We are not, however, prepared to now require the joint through rates here prayed for.

Since the record in this case was made up many and far-reaching changes in economic and transportation conditions have occurred. Conditions are unsettled. The future of transportation by rail and by water is uncertain. The suggested comprehensive plans for readjusting all of the rates over this large territory and the evidence submitted for and against each plan tread far outside the limits of the complaint. We deemed it advisable to hear what the parties desired to submit regarding a possible readjustment that would do justice to all. We have discussed some of those matters rather fully in this report. The record and

the discussion should be helpful in paving the way for a final settlement of this vexed situation. The extent of the territory that would be affected by a readjustment of all of these rates is indicated by the interests for which appearances are shown. Their interests are diverse and their contentions are often diametrically opposed. These questions can not be settled justly by accepting the views of those on either extreme.

## Labor Board Rules A. B. & A. Wage Cut Illegal

THE ACTION of the receiver of the Atlanta, Birmingham & Atlantic in reducing the wages of its employees, in compliance with a ruling by Federal Judge S. H. Sibley recently, is in direct violation of the Transportation Act, according to a decision of the Railroad Labor Board announced on April 21. The Board, however, declared that "there is nothing to be gained at the moment by requesting the court to recall its wage reduction order and to direct a reinstatement of the former employees" and suggested that the employees, most of whom are on strike, hold conferences with the receiver and if an agreement is not reached, bring the case again before the Board. The decision also criticised the employees for striking instead of referring the wage dispute to the Board.

This case, the progress of which has been described in the *Railway Age* of February 4 (page 319), February 11 (page 367), February 18 (page 412), February 25 (page 454), March 4 (page 520), March 11 (page 548), and March 18 (page 724), has attracted a great deal of interest as the first case which has brought forth a clash between the Labor Board and a federal court and as the first legal tangle which the Board has been called upon to unravel.

After outlining the history of the controversy and the positions taken by the contending sides in the hearings held before the Board, the decision analyzed the stand taken by the carrier in opposition to the charge of violation. The receiver, in defending his position contended that: (1) he was not a party to Decision No. 2 and therefore not bound thereby; (2) he acted only under the orders of a federal court; (3) the Labor Board had decided that it was without jurisdiction in the case; (4) the Board's refusal to consider the carrier's financial ability to pay was not consistent with the Constitution in that it would deprive a carrier of its property without due process of law; (5) the Atlanta, Birmingham & Atlantic was not a party to Decision No. 2; and (6) the Labor Board being without jurisdiction the federal court had a right to fix just and reasonable wages.

Referring to the first two of these contentions, the decision termed them "insufficient" saying:

Assuming that the Atlanta, Birmingham & Atlantic was a party to Decision No. 2, it is believed to be clear that this receiver is also bound. The appointment of a receiver does not alter the status of a property. It effects remedies and does not change the rights or obligations of the carriers. Among the obligations resting on a carrier is to carry goods and passengers at the rates approved by the Interstate Commerce Commission; to pay the engine and train service employees according to the basis of pay set by the Adamson Act; and to conduct transportation pursuant to the Hours of Service Act and numerous other Federal Acts enacted by Congress for the regulation of carriers. The appointment of a receiver by a federal court does not and cannot warrant the operation of the property by him free of these obligations.

But it is urged that the act of the receiver in reducing wages was authorized by the District Judge. In the opinion of the Labor Board and with all respect to the learned judge who approved the order, the said order was beyond the jurisdiction of the District Court. Under Title III of the Transportation Act, 1920, Sections 301 and 307, the duty of determining just and reasonable wages upon a dispute duly referred, is imposed upon the Labor Board.

Referring to the third contention of the receiver, the Board denied that it had ruled it was without jurisdiction in the case saying:

The Labor Board found that Section 301 had not been complied with, and it required the parties to comply therewith as was its duty under the law.

The fourth contention of the receiver was called "unsound" in the decision which said in this connection:

It is difficult to see how a requirement that the conference should be on the justness and reasonableness of the then wages should amount to a taking of the carrier's property without due process. It was contemplated that the parties might agree at least in part, if they so conferred. It appeared that all prior conferences concerned themselves only with the ability of the carrier to pay, which is certainly not the only factor to be considered. If the conference had decided nothing, the dispute could have been referred to this Board for decision pursuant to law, and if the receiver had paid the wages according to Decision No. 2 for the brief period necessary for this Board to consider and decide the matter, it is very probable that the property would have been less reduced than by the course adopted. Furthermore, by this procedure the law would have been complied with.

The fifth contention was categorically denied, the Board stating that the carrier was a party to conferences held at Washington, March 10 to April 1, 1920, at which the just and reasonable wages were discussed.

In closing its finding the Board said in part:

It is believed to be important to state again that in the opinion of this Board Title III required that in conferences on wage disputes the question should be what shall constitute just and reasonable wages. Throughout the conferences in this case the sole question discussed was the inability of the carrier to pay.

Not until February 14 did the representatives of the carrier claim that the wages were not just and reasonable. Then for the first time did the carrier maintain that a decline had taken place in the cost of living. This claim laid the foundation for the valid dispute, over which the Board could take jurisdiction provided an attempt had first been made to settle the differences in conference. Such a conference the Labor Board in Decision 89 directed the parties to hold. The employees endeavored to comply with the direction; the receiver refused immediately putting into effect the wage reduction. This action on the part of the receiver the Labor Board regards as a violation of Decision No. 2.

The Labor Board finds also that the receiver in reducing wages by authority of the Court instead of referring the dispute to the Board, has proceeded contrary to the letter and spirit of the Transportation Act.

The Board believes that the exigencies of the case, and a misunderstanding of Decision No. 89, led the court into an error in assuming jurisdiction and authorizing the receiver to reduce wages instead of directing the receiver to comply with Decision No. 89. The action of the Court is regrettable since it has resulted in a strike, injurious alike to the Atlanta, Birmingham & Atlantic, its employees, and the region served by it, in which situation the Labor Board is powerless to act effectively so long as the Court differs from the Labor Board in its interpretation of the Transportation Act, 1920.

Assuming the correctness of the Labor Board's conclusion that the receiver was subject to the Board's jurisdiction and that he violated the Transportation Act in reducing wages there remains the question whether the petitioners also violated the Act.

While the Labor Board appreciates the provocation to which the employees were subjected by reason of the receiver's action, nevertheless, the Board cannot condone what in itself was a wrongful act on the part of the employees. It was their duty, on learning that the receiver would not join in referring the dispute to the Labor Board, but insisted in putting the wage order into effect, to themselves refer the wage dispute to this Board.

The complication resulting from the strike and the replacement of former employees by others now working at a reduced rate, are such that the Labor Board believes there is nothing to be gained at the moment by requesting the Court to recall its order of February 28, and to direct a re-instatement of the former employees. It does, however, request that the Court direct the receiver to confer with the petitioners upon the question as to what constitutes a just and reasonable wage for the employees on the railroad, taking into consideration all factors set forth in Section 307 of the Transportation Act, 1920, and upon other questions involved, and in case of disagreement, to submit the dispute to this Board for decision.

The Labor Board also requests the petitioners to attempt again to confer with the receiver regarding the justness and reasonableness of the wages and in case of failure to agree to submit the dispute to this Board for decision.

However, as the United States District Court of the Northern District of Georgia, Northern Division, is exercising jurisdiction in regard to the matter of wages for the employees, it is decided by the Labor Board that in order to prevent a conflict in jurisdiction, it will take no further action in the matter until the Court shall approve or deny this Board's requests herein.

# Rational Electrification of Steam Railroads

## Method for Determining What Values of Profile and Traffic Density Make Electric Operation Desirable

By George R. Henderson

THE FINANCIAL CONDITION of the railroads in this country makes every economical suggestion of more than usual interest, and especially is this true of electrification, although the expense of installation at this time is, in many cases, prohibitive. A few years ago mechanical engineers received the unlimited claims of the electricians with considerable skepticism, but since a number of roads have electrified sections of their line and more rational claims are now in order, the subject has become one of importance to all the large roads.

A few weeks ago, at the Franklin Institute in Philadelphia, A. H. Armstrong of the General Electric Company gave a most interesting lecture on this subject, presenting facts and figures which had been obtained largely from the Chicago, Milwaukee & St. Paul line in Montana, of which 440 miles have recently been electrified. As this represents main line operation in a mountainous country, the results are of more general interest than those of local applications, such as the New York Central and the Pennsylvania in the vicinity of large cities.

Mr. Armstrong's claims were moderate and entirely free from the "cure-all" type which did more harm than good a few years ago. The important matters of repairs, inspec-

tion, turn-arounds, hosting, etc., were presented so forcibly that the writer considered it would be of interest to compare the costs of steam and electric operation over a hypothetical mountain division and to discover what importance the cost of coal assumes in the discussion. As present figures for material and labor are considered abnormal, pre-war prices were assumed, such as those prevalent a dozen years back. A division of 300 miles in length, with 50 miles each of 1/2 per cent, 1 per cent and 2 per cent up and down grades was used as a basis of calculations, and is shown in profile by the sketch. Roundhouses for steam locomotives are located at each end of the profile and at points 100 miles from each end. Locomotives may be considered as the Railroad Administration standard Mikado (2-8-2) type with the following characteristics:

Sec.	Locomotive	Total train weight	Total resistance	Ratio to trac. force, per cent	Speed upgrade
A	1	3,400 T.	51,000 lb.	85	15 m. p. h.
B	2	3,650 T.	91,000 lb.	76	17 m. p. h.
C	3	3,900 T.	175,000 lb.	97	10 m. p. h.

Down hill a speed of 20 m.p.h. may be attained, and perhaps 30 m.p.h. permitted on Sec. F. These speeds, with two hours allowance for changing engines, water stops, etc., would indicate a total of 20 hours over the 300 miles. Transportation delays, of course, would often increase this time.

The amount of coal has been estimated at 3 1/2 lb. per horsepower-hour, which corresponds with 100 lb. per square foot of grate per hour for sections A and B, and 4 lb. per horsepower-hour for Sec. C. Downhill 1/4-ton of coal per hour has been assumed. This gives coal used as

Sec. A	12 tons burned in 3 hrs. 20 min.
Sec. B	20 tons burned in 3 hrs. 0 min.
Sec. C	45 tons burned in 5 hrs. 0 min.

Down hill movement would use about 4 tons. The cost of coal varies greatly, especially at this writing, but some years ago \$2 would represent a fair price per ton. The cost of pumping and treating water is likewise variable, but 25 cents per 1,000 gal. may be assumed, and as roughly one pound of coal will evaporate one gallon of water, we may charge water costs at 50 cents per ton of coal.

Repairs constitute another variable, but 20 cents per engine mile would probably represent pre-war figures for a locomotive of this size.

The pay of enginemen (engineer and fireman) will be covered at the rate of 8 cents per mile, that is, \$5 for engineer and \$3 for fireman per 100 miles.

The cost of handling at terminals, including hosting, turning, wiping, inspecting, etc., will be taken at \$1.50 per engine, and these various figures will be compared with estimated costs of electric operation. The coal consumed at terminals is not included, but would be considerable—on the other hand, the power plant for generating the electric current must be kept constantly in operation, and a loss of some fuel must here be apparent.

The comparative costs for electric operation will consist largely in fuel and operating methods. For the locomotives we may consider a total of 12 pairs of drivers with 60,000 lb. on each, and four truck wheels with 45,000 lb. on each, a total of 900,000 lb. or 450 tons, and with train of 3,150 tons we have a total of 3,600 tons. Whether satisfactory results could be obtained by using this tractive force of 180,000 lb. at the head of the train would depend upon the construction of the cars placed in this service, and it might be necessary to have one unit at the head and another at the rear of the train to prevent destruction to draft rigging and center sills. If the latter course were necessary two engine crews would be needed, whereas one crew (of two men) could operate both units at the head of train by multiple control.

The question of fuel will also depend upon the possibility

Theoretical Profile Used as Basis of Calculation

tion, turn-arounds, hosting, etc., were presented so forcibly that the writer considered it would be of interest to compare the costs of steam and electric operation over a hypothetical mountain division and to discover what importance the cost of coal assumes in the discussion. As present figures for material and labor are considered abnormal, pre-war prices were assumed, such as those prevalent a dozen years back. A division of 300 miles in length, with 50 miles each of 1/2 per cent, 1 per cent and 2 per cent up and down grades was used as a basis of calculations, and is shown in profile by the sketch. Roundhouses for steam locomotives are located at each end of the profile and at points 100 miles from each end. Locomotives may be considered as the Railroad Administration standard Mikado (2-8-2) type with the following characteristics:

Tractive force	60,000 lb.
Adhesive weight	240,000 lb.
Weight engine and tender	500,000 lb.
Heating surface (water)	4,285 sq. ft.
Superheater surface	990 sq. ft.
Grate area	70 sq. ft.

A train of 63 cars of 50 tons total weight each, or 3,150 tons for the load back of the tender, will require one engine for Sec. A, two for Sec. B, three for Sec. C and one for D, E and F down hill, the train being considered as operating in the direction of the arrow. The helper engines would start from the intermediate roundhouses, and in order to operate return trains would make 200 miles and 100 miles, respectively, for 300 miles of through train, one engine being used as a pusher over sections B and C. We may consider the

of using regeneration, which means that there must be an ascending train at the same time that one is descending the grade, and this may not always be possible of arrangement. If the power house is steam operated, a kilowatt hour could readily be produced at the switchboard by the combustion of 2½ lb. of coal, and if 25 per cent loss be allowed from switchboard to rims of drivers, we will have a total coal consumption of 2½ lb. per horsepower-hour.

The train need not be broken (except for the possible shifting to the rear unit in passing over the heavy grades), as the electric locomotives can run 300 miles without difficulty, whereas we have considered that the steam locomotives would have to lay over each 100 miles of upgrade. This will reduce the terminal expenses, as repairs are generally found to be less than for steam locomotives; they are taken at one-half the amount, or 10 cents per mile for each of the two units. If the road was constructed as an electric line the intermediate roundhouses, with the coal, ash and water arrangements, shops, etc., could be eliminated, thereby saving considerable initial expense.

Electric locomotives operate satisfactorily on inspections made every 3,000 miles, and while they are much more expensive to build than steam locomotives, the fact that a greater car mileage can be gotten from them under ordinary conditions puts the initial cost of locomotives at about the same figure. The alternating current locomotive runs at a nearly constant speed, regardless of the load, so that we may assume 15 miles per hour throughout, or 20 hours to pass over 300 miles.

In the subjoined table two columns are provided for the electric operation, the first considering that regeneration is not possible and that one unit of power must push over the 2 per cent grade; the second utilizes the force of gravity of the descending train to assist those ascending, and virtually to put coal back into the bunkers; also considers that one engine crew only is needed by putting all the power at the head of the train. By calculating the horsepower needed to operate the 3,600-ton train, we find the fuel required as follows:

Sec.	Horse power required	Fuel required
A	2,160	9.5 tons
B	3,600	16.0 tons
C	6,500	28.0 tons
D	-5,000	-20.0 tons
E	-2,160	-8.5 tons

The minus signs are the credits to be allowed where regeneration is possible, and would reduce the coal requirements from 53.5 tons to 25 tons. These various values may now be tabulated for comparison, remembering that the second electric column includes regeneration and multiple unit control.

	Steam	Electric 1	Electric 2
Cost of coal per trip, at \$2.....	\$162.00	\$107.00	\$50.00
Cost of water per trip, at \$0.50.....	40.00		
Cost of repairs per trip.....	120.00	60.00	60.00
Cost of handling.....	9.00	1.00	1.00
Pay of engine men.....	48.00	32.00	24.00
Total per trip.....	379.00	200.00	135.00
Cost per train mile.....	1.26	0.67	0.45
Saving per train mile.....		0.59	0.81

Items such as train crew, car repairs, etc., which would be the same in both cases, have been omitted. It is evident from this table that the economies of electric operation should be considerable and must depend largely upon the original cost and fixed charges, as well as the traffic conditions of the section.

From the statements of Mr. Armstrong, the pre-war costs would have been something like \$30,000 per mile of road for electrification, and in order to save 10 per cent of this there would have to be earned \$3,000 a year over steam operation. By the first column of electric operation there would be a saving of 59 cents per train mile, which would require over 5,000 trains a year, or seven trains a day in each direction of 63 cars each, a total of 882 cars to pass

over the division in each 24 hours; if the traffic did not approach this figure, electrification could hardly be considered.

Then a variation in the cost of fuel might change the conditions enormously so that the saving would be greater or less than expected. If water power were available the cost of electric operation would be much more stable, but, in any event, each case would be a problem of its own and a careful study of all the conditions involved would be necessary to estimate the probable economic advantages which might be obtained. The above is a hypothetical case to show some of the possibilities of rational electrification.

## Safety First on the Chicago & North Western

THE SAFETY RECORD of the Chicago & North Western for the 10½ years ending with 1920, just issued, by R. C. Richards, chairman of the central safety committee, in Bulletin No. 53, again shows the remarkable results accomplished on that road. For the years 1912 to 1920, inclusive, the members of the Safety Committees made 50,029 recommendations for the elimination of dangerous conditions and practices; and all but four per cent of them were adopted and put into effect. Comparing these years (10 years 6 months), with 10½ years ending June 30, 1910, before the safety committees were organized, the bulletin shows the following large reductions (although the number of employees, the business and the mileage of the company have largely increased):

- 417 fewer employees killed, a decrease of 37 per cent.
- 22,600 fewer employees injured, a decrease of 24.7 per cent.
- 4 fewer passengers killed, a decrease of 3.5 per cent.
- 2,003 fewer passengers injured, a decrease of 20.4 per cent.
- 629 fewer outsiders killed, a decrease of 25.3 per cent.
- 330 fewer outsiders injured, a decrease of 5.1 per cent.

Colored diagrams are given which show what very large percentages of casualties to employees are due to dangerous practices on the part of the employees themselves.

In closing, the Bulletin says:

"This company will appreciate, carefully consider and adopt, if practicable, any suggestion or recommendation from its employees, patrons or neighbors which will make its operation safer, more regular and more satisfactory to the public.

"And the end is that the workman shall live to enjoy the fruits of his labor; that his mother shall have the comfort of his arm in her age; that his wife shall not be untimely a widow; that his children shall have a father, and that cripples and helpless wrecks who were once strong men shall not long be a by-product of industry."

# U. S. Chamber of Commerce Discusses Railroads

## Report of Committee on Railroads Presented to Group Session at Atlantic City Annual Meeting

IN THE ANNUAL report of the Committee on Railroads of the Chamber of Commerce of the United States, which was presented to the Chamber at its convention at Atlantic City, N. J., on April 27, emphasis was laid on the necessity for reductions in railroad operating costs, particularly with reference to wages. After reviewing briefly the important railroad history for the past year, the report, in calling attention to the necessity for greater economy, pointed out that the increased gross revenues which will come to the railroads with reviving business conditions will not in all probability be sufficient to offset the present operating expenses. Increased co-operation of the carriers with each other in the performance of their services, particularly in the organization and management of terminals, was also advanced as one method of securing more efficient operation. Considerable importance was attached to the present state of railway credit and to the various plans for railway consolidations.

This report was read at a meeting of the railroad group of the convention on Wednesday, and the reading was followed by a discussion. The subject of the discussion was "What can be done to reduce cost and increase efficiency of railroad transportation?" The principal speakers were E. J. McVann, secretary of the Smokeless Coal Operators of West Virginia, representing the shippers, and F. A. Molitor of the Institute of Consulting Engineers, New York, representing the engineering profession. It had been planned to have a speaker representing the railroad executives and one representing the banking interests, but this part of the program could not be carried out.

### The Committee's Report

The meeting of the railroad group was presided over by George A. Post, chairman of the Railroad Committee and president of the Hudson River Bridge Corporation, New York. The report was read by Richard Waterman, secretary of the Railroad Committee. Other members of the committee are: W. S. Dickey, Kansas City, Mo.; F. C. Dillard, Sherman, Tex.; E. J. Frost, Boston, Mass.; E. R. Johnson, Philadelphia; Charles E. Lee, New York; W. L. Salmon, Rochester, N. Y.; G. W. Simmons, St. Louis, Mo.; A. W. Smith, Atlanta, Ga., and Harry A. Wheeler, Chicago. An abstract of the report follows in part:

The railroads together with the other industries of the country are passing through a period of readjustment. The effect of the business depression which began about October last will appear from the following facts of record:

That the March traffic (in cars loaded) was about 13 per cent lower than in the corresponding month of 1920, and 18 per cent below the rather high average of March, 1918. Normally there is, of course, an annual traffic decrease from the fall peak to mid-winter. But in February, 1921, the earnings were 36 per cent below the previous October peak (the high record) as compared with a drop of 30 per cent between the 1918 peak (August) and February, 1919. The total car loading January to April, 1921, was about 15 per cent less than in 1920. The railroad business is subject to two controlling factors—economic conditions and government regulation. Public policy can determine the relations of the government to the railroads, but the economic forces to which the railroads are subject can be modified only by changes in prevailing economic conditions. There is no legislative panacea that will completely solve the railroad problem or any other economic difficulty.

### The Transportation Act

In adopting the Transportation Act of 1920 Congress recognized the fact that the war had brought about large changes in the conditions under which production and transportation must in the future be carried on in the United States. In leg-

islating for the railroads in 1920, the primary purpose of Congress was not to correct railway abuses, but to facilitate the re-establishment of railroad credit, thereby making possible the improvement and extension of railroad facilities. It was a constructive and not a punitive measure.

The provisions of the Transportation Act of 1920 as regards the adjustment of disputes concerning wages and working conditions are among the most important. The law provides that employers and employees shall negotiate with each other and by negotiation settle as many controversies as possible. When disputes as to working conditions cannot be settled by negotiation, they may be considered by boards of adjustment established by agreements of employers and employees. These boards of adjustment may be either local, district or national. They are composed of representatives only of the carriers and their employees. There are to be no public members of the adjustment boards. Disputes as to wages that cannot be settled by direct negotiation by the parties in interest are to be referred to the Railroad Labor Board of nine men, three representing the carriers, three the employers and three the public. No boards of adjustment, local, district or national, have thus far been established. This deadlock remained unbroken. The President promptly appointed the Railroad Labor Board in the spring of 1920, and a few months after it had been established, it decided a dispute as to wages that had been pending for more than a year. About \$700,000,000 was added to the wages of railroad employees by this decision. In January, 1921, the Railroad Labor Board began hearings on the question of the continuance or abolition of the national agreements as to working conditions that had been entered into by the United States Railroad Administration with the railroad unions other than the four brotherhoods having to do with train operation. Three months later the Board decided that the national agreements should be terminated July 1 of this year. Prior to that date, the carriers and their employees are to work out new agreements to be submitted to the Labor Board for its approval.

### Present Railroad Problems

It may be helpful to analyze some of the major questions with a view to stating some of the factors that must be considered in bringing about satisfactory conditions as regards railroad transportation.

The question that reaches to the heart of the matter is, "How can the railroads increase net operating income?" To find an answer to this question, the railroads must somehow reduce operating expenses. This they are striving to do by efforts to increase operating efficiency and to reduce the costs of materials and labor required for the performance of the services rendered. It is recognized by the railroads that rates and fares cannot be increased. Gross revenues will undoubtedly rise with the gradual revival of business as economic conditions return to normal. It is, however, believed that the increased net operating income that will come with the gradual expansion of business will not be sufficient to re-establish the financial stability and the credit of the railroads, unless the cost per unit of service can be greatly reduced.

The first step towards the accomplishment of greater economies in the operation of railroads is the larger co-operation of the carriers with each other in the performance of their services. In terminal organization and management the co-operation of the carriers is especially urgent, and in this field undoubtedly many economies can be brought about.

The Committee feels that an earnest effort on the part of the carriers to reduce operating expenses wherever possible, and to increase the efficiency with which they conduct their business will be appreciated by the public. Whatever economies may be effected by changes in operating methods, there must inevitably be a reduction in the percentage which salaries and wages comprise of the total operating revenue. The pay roll of the railroads in 1917 amounted to \$1,700,000,000, or about 45 per cent of the operating revenue. In 1920 the pay roll had more than doubled, having risen to \$3,750,000,000, which was about 60 per cent of operating revenue. Readjustment of salaries and wages is in progress in all industries, and it is to be assumed that railroad wages will in the future, as they have in the past, bear an equitable relationship to wages paid in other activities. The Railroad Committee assumes that every effort will be made by the carriers to maintain equitable scales of wages for different classes

of employment. While wages must be reduced, no class of labor should bear an inequitable share of the burdens of the rehabilitation period and all should render a full eight hours' service for eight hours' pay.

### Capital Requirements

For several years comparatively little new capital has been invested in railroads. Had there been no European war, and had business conditions been prosperous, from \$3,000,000,000 to \$5,000,000,000 would have been invested in American railroads during the past six or seven years. In order that the business of the country may revive and go ahead at a desirable pace, a large amount of capital must be put into the facilities for railroad transportation.

This capital must be obtained by railroads owned and operated by private corporations, and the capital must be supplied by the investing public. It is obvious that the public will not invest in the railroads unless a return of at least five and one-half or six per cent per annum is reasonably certain. In planning for the future of the railroads, provision must be made for a net operating income that will enable the railroad companies to pay a reasonable return upon capital investment.

### Consolidation and Federal Incorporation

The Interstate Commerce Commission is working upon a plan for the grouping or consolidation of American railroads into a limited number of permanent competitive systems of approximately equal strength and stability. The plan of voluntary consolidation is to be tried out. At the present time it is uncertain how far railroad companies will be disposed to go or how far they will be able under probable financial conditions to proceed in accomplishing the grouping or consolidation of our many railroad lines into the contemplated limited number of large permanent systems. The grouping or consolidation of railroads must ultimately be accomplished. In order to maintain rate structures that are fair to the public as a whole and adequately profitable to the railroads, it is necessary to have railroad systems of approximately equal financial stability and strength. In order to enable those sections of the country now served by weak and struggling railroads to obtain the transportation facilities required in the public interest, it is necessary to do away with the "weak sisters" as separate entities.

The Committee does not recommend additional legislation on the railroad question at the present time. It will be desirable to have further experience under the Transportation Act of 1920 before considering amendments or additions to that law. As has been pointed out in this report, the railroads are sharing with other enterprises the misfortunes of the hour. Before another year is over, it is possible that business conditions and railroad traffic and earnings will be more favorable. Another year will give Congress a better perspective of the railroad situation. In the meantime, a Committee of the Senate will have inquired into the present difficulties of the railroads and into the workings of the Act of 1920. That investigation will enable Congress to act with a fuller knowledge than it possesses at the present time.

### The Shippers' Viewpoint

E. J. McVann, secretary of the Smokeless Coal Operators' Association of West Virginia, led the discussion from the point of view of the shipper. Mr. McVann emphasized the point that whatever suggestions he had to offer were tendered in the spirit of helpful co-operation rather than in that of destructive criticism. He sketched the growth of the mileage of the railroads of the country from 30,000 in 1860 to 260,000 in 1920 and remarked that any country which could show such a record of accomplishment need not be greatly alarmed by the present railroad situation, perplexing though it is. One of the difficulties of the railroads in the past, according to Mr. McVann, was that regulation showed to some degree a lack of knowledge of the subject. Now, he said, the same difficulty was being experienced again in the demands which are being made on Congress for amendments to the Transportation Act before it has been given a fair trial.

Mr. McVann quoted figures to show the present high operating rates of most of the roads and emphasized the necessity of reducing expenses. He declined to express an opinion regarding the contention which is being made in some quarters to the effect that the present high freight rates are "higher than the traffic will bear" and that they are delaying the return of normal prosperity. "A little ray of light" could

be made out in the present dark outlook, Mr. McVann said, in the reports of a slightly declining car surplus.

As a possible solution of one phase of the railroad problem Mr. McVann suggested a campaign for greater car mileage per car per day. He gave as an example of the possibility of improvement in this direction the case of the Virginian, which road, he said, when faced with an acute car shortage a year ago was enabled to increase its mileage per car per day from less than 25 to more than 60. He remarked that in the days of congested traffic last year miles per car per day of all the roads reached the highest figure in history only to decline when traffic fell off. Mr. McVann considered that such economies as this offered the opportunity for increasing service without additional capital.

Another point which was particularly stressed in Mr. McVann's address was the waste of the present lack of co-ordination of terminal facilities. He said also that waterways should be used to a greater extent to relieve railway congestion. Waterways, he said, should not be considered as competitors to the railroads but should be co-ordinated with them. As an example of this he cited the railroads which make a special business of moving coal up to the lake ports for the lake boats and which carry ore to the coal regions as a return load. He closed with a plea for better water terminals for the railroads.

### The Opinion of an Engineer

F. A. Molitor, who discussed the railroad problem from the point of view of an engineer, devoted his address almost entirely to the labor phase of the problem. He first gave some index numbers on the cost of living and railroad wages, with 1915 as a base at 0. The index numbers he gave for 1916 were 8.7 for cost of living and 7.3 for railroad wages; for 1917, 31.3 as living cost and 29.9 as wages; for 1918, 71.0 as living cost and 52.2 as wages; for 1919, 72.2 as living cost and 71.0 as wages, and for 1920, 104.0 as living cost and 117.6 as wages. He called attention to the following: that in 1920 the wage index greatly exceeded the index for the cost of living; that the wage index of 117.6 was the average for the whole year of 1920; that with the July, 1920, wage award wages are now at the index of 130.0 while prices have receded from 1920 to 81.2 in January, 1921.

Mr. Molitor estimated that the railroads would fail to secure their legal return this year by about one billion dollars. He believed the abrogation of the National Agreements, which he was not so sure would be brought about, would result in a saving of not more than \$250,000,000. This would leave \$750,000,000 yet to be taken care of. This, he said, could be done either by an increase of about 1¼ mills per ton per mile in freight charges or by reducing wages. If wages should be reduced to the level previous to the July, 1920 award a saving of \$700,000,000 would be effected, according to his estimate. This would still leave \$50,000,000 to be taken care of, and Mr. Molitor would do this by a further reduction of one cent per hour in every wage rate.

Mr. Molitor asked that no favoritism be shown in dealing with labor. He urged also that the managements of the roads should take the public into their confidence more than they have and that the open shop, with piece work, should be restored. Discipline, he said, should be improved and employees should be made to realize the quasi-public nature of their position in which strikes should not be permitted; they should learn that they are not a privileged class. He advocated the incorporation of the unions, the access of the public to their records and the provision for a secret ballot on strikes. He expressed the opinion that the final valuation of the carriers would be in the neighborhood of 25 billion dollars and suggested that freight rates to pay 5½ per cent on that sum would be rather high. He closed his address with an appeal to the bond holders to assist in solving the problem.

# President Finds Railroad Problem Difficult

## Cabinet Still Seeking Solution—Complaints from Many Quarters That Present Rates Check Business Revival

WASHINGTON, D. C.

PRESIDENT HARDING and members of his cabinet are finding the railroad problem one of great difficulty and many complications. Efforts to regard it as a Gordian Knot to be severed by a single sword-stroke have thus far proved fruitless, and something like the "watchful waiting" policy of the last administration seems to have been adopted, but apparently the administration is still hoping with some impatience for an Alexander who will make it unnecessary for the Interstate Commerce Commission and the Railroad Labor Board to continue their slow progress of trying to untie the knot. The problem, from the viewpoint of Washington officials, is how to reduce rates in view of the position taken by the railroads and the Interstate Commerce Commission that there can be no general reduction in rates until the foundation has been laid for a reduction in operating costs, and that material reductions even in rates on particular commodities can hardly be made until it is shown, somewhat more conclusively than by a mere assertion, that the reductions will so increase the movement as to result in better net revenues.

Recent cabinet meetings have been very largely devoted to the economic situation, with particular reference to agriculture, industry and transportation, and the President and his advisers appear to have been persuaded that the railroad question is the key to the whole problem, but they have as yet found no "plan" or "solution." As yet there is great reluctance on the part of the administration to go over the heads of the bodies constituted by law to decide on wages and rates but it is understood that some impatience is being felt at the length of time required by those bodies to function under the provisions of the laws from which they derive their authority and the President is still giving some consideration to the plan of calling a general conference of representatives of various interests to see if something cannot be done by agreement. It is understood that the question has also been raised at cabinet meetings as to whether the existing machinery for the regulation of rates and wages, which makes it impossible for the Interstate Commerce Commission to act with a free hand but requires it to await the action of another body, is not too cumbersome to keep pace with economic conditions and as to whether the forthcoming investigation by Senator Cummins' committee may not develop the need of some change in the law.

The theory also persists in some quarters that the rate-making rule of the Transportation Act, which requires the Interstate Commerce Commission to take into consideration operating expenses and to try to make rates produce "as nearly as may be" a 6 per cent return in the cause of the high rates and that its repeal would in some way reduce rates which in January and February did not even pay expenses for more than half the roads. This theory entirely ignores the fact that if the Interstate Commerce Commission should be convinced that lower rates would produce more net revenue it would be complying with the law if it reduced the rates, and it is advanced rather by the habitual critics of the railroads, but many Senators and others who are receiving floods of complaints from their constituents who believe they could make more money if rates were lowered, find it easy to believe that they are not proposing to injure the railroads in any way because the belief is so commonly held that the railroads would make plenty of money if they would only reduce rates enough to increase their traffic.

As the rates, rather than the expenses which have caused

the advances in rates, represent the point of contact between the railroads and commerce, the President and his cabinet are looking at the problem largely from the standpoint of the effect of the rates as it has been stated to them by numerous complainants. They have apparently been convinced that the level of the rates, particularly those on basic commodities, is largely responsible for the halting condition of business generally, and somewhat disturbed that prompt action cannot be taken to bring about a reduction at least on some of the commodities as to which the freight rate represents an important factor in the cost.

### Cabinet Looks at Problem from Standpoint of Rates

The President showed in his address to Congress a recognition of the fact that the present high cost of transportation is an inheritance from the period of federal control and he is showing no disposition to urge a general reduction of rates without regard to the cost, because he has no desire to return to the plan of making up deficits from the federal treasury as was done for 28 months, but he is convinced that certain rates are too high and that their reduction would have a beneficial effect. For example, it has been represented to the President that the citrus fruit growers of the Pacific coast are unable to market their products in the East at a price that will give them any return after paying freight and the middlemen's charges, that grain prices have fallen so low that the farmer has little left after paying the freight and that the principal reason for the no-market condition in the coal industry is that consumers are holding off their orders waiting for lower prices to such an extent that the country is heading into a coal shortage situation similar to that which existed last year. It is assumed by those who complain about the rates that a reduction in coal rates, for example, would reduce the price sufficiently to attract buyers. Administration leaders also are convinced that the application of a uniform percentage advance was a mistake and it is apparent that any move to bring about a readjustment which would speed up the movement of certain basic commodities will have their support, but there is no one who has any authority to give orders to the Interstate Commerce Commission to reduce rates without awaiting action by the Labor Board to reduce expenses nor to the Labor Board to speed up a wage decision.

The coal situation is being pointed to by those who insist that the application of a uniform percentage advance last August was a mistake, although at the time the rates were made the purchasers of coal were bidding against each other to get it almost regardless of price.

### Complaints Made to I. C. C. Concerning Rates

The Interstate Commerce Commission has before it many formal complaints asking for rate reductions, and presumably these represent the rates which the shippers feel it is most important should be reduced, but the commission is following the usual procedure in handling these cases and is not inclined to pay much attention to such requests as were made of it last week by a delegation of Congressmen and delegates to the convention of the National Farmers' Union that it order a summary reduction in rates. The complaints regarding rates which reach Washington are of several kinds. There is the argument that the railroads are a public servant and that as low rates are desirable the railroads ought to reduce their rates regardless. If prices can-

not be regulated rates can. There is the complaint of the grain grower, the price of whose product is fixed by the market and has fallen so low that it leaves the producer very little after transportation costs have been deducted. There is also the complaint of the fruit and vegetable growers, whose products still cost the consumer about as much as ever but who are told by the middlemen that the freight rate leaves practically nothing for the producer. There are also many articles on which the price has been reduced, in spite of the rate increase, but apparently not enough to break the "buyers' strike" and it seems easy for many to believe that a reduction in the freight rate would move the business. There are also heard in Washington occasionally the voices of those who have not yet discovered that the "transportation crisis" of which they read in the newspapers is not the same kind of a crisis that was experienced last year and they are advocating waterway improvements to "take the load off the over-burdened railroads."

### Considered at Cabinet Meeting Tuesday

At the cabinet meeting on Tuesday the discussion regarding the program for a "return to normalcy" apparently turned aside a little from the freight rate question to a consideration of what can be done in other directions to improve business conditions, for it was stated at the White House that there were no new developments in the railroad situation but that the Federal Reserve Board was going to relax a little the harshness of its efforts to promote deflation and that it would encourage a more liberal credit policy in the agricultural sections and in some industrial sections which have been complaining of "frozen credits" as well as of freight rates.

### Another Letter from Chairman Clark

Chairman Clark of the Interstate Commerce Commission is becoming a voluminous letter writer in his replies to Congressmen and others who write to him urging a reduction in rates as a means of restoring business. The letters are not made public by the commission but some of them have been given out by the recipients. A few have already been published in the *Railway Age*.

In a letter to Senator Willis of Ohio, Mr. Clark said:

The commission is as anxious as the shipper and the carrier to find a solution of the transportation problem. We are well aware and I think fully advised of the unfortunate conditions that exist at the present time. We cannot, however, look at the situation from one side alone. It is not a question to-day whether or not the rates shall produce 5½ or 6 per cent upon the value of the carriers' properties. The unfavorable conditions in commerce and industry generally and the unfortunate plight of individuals and individual industries can not be worse than the present plight of the railroads. It is obvious that the present condition can not long continue without general and widespread bankruptcy of the railroads.

We have participated in some instances in arranging and encouraging readjustments of rates where it has been made clear that such readjustments would move a substantial volume of traffic at rates that would yield some profit, which traffic would not otherwise move at all, but, in view of the facts above stated, it is difficult to see how the commission could urge any reductions in rates that would result in reductions in the revenues of the carriers which, as stated, are insufficient now to pay the interest on their bonds, to say nothing of any return to the stockholders.

This whole subject is receiving the most careful study and consideration. It is obvious that until a wider margin can be established between the dollar earned and the cost of earning it conditions cannot substantially improve. This result must be brought about through appropriate readjustment of operating expenses, the adoption of every possible and reasonable economy and general revival in business. We are not hopeless nor pessimistic as to the future.

### Conference on California Fruit Traffic

The Interstate Commerce Commission on April 23 took cognizance of the numerous complaints regarding the rates on fruits and vegetables by announcing that Henry J. Ford,

special assistant to the commission, and formerly a commissioner, will conduct conferences relative to rates on fruits and vegetables in Los Angeles, Cal., on May 3; in San Francisco, Cal., on May 6; and in Denver, Colo., on May 10. These conferences were called at the request of the California and Colorado legislatures, which passed resolutions requesting the Interstate Commerce Commission to investigate the alleged serious situation of producers of fruits and vegetables in those states.

The conferences are to be held between shippers and carriers, and while they relate primarily to the rates to and from California and Colorado points, carriers' and shippers' organizations from other fruit and vegetable producing districts will be granted an opportunity of making statements at these conferences relative to the general situation if they so desire. The commission's Bureau of Traffic has been investigating the fruit and vegetable situation for some time.

The Washington newspaper correspondents on April 26 received a statement "from producers and shippers of perishable and high tonnage commodities on the Pacific Coast," declaring that California's entire cantaloupe crop is endangered by the excessive freight rates to the East, according to telegrams received by Senator Shortridge of California from growers and bankers of Southern California. The Senator was quoted as saying that the crop is valued at about \$11,000,000, of which a great portion will be lost to the growers if freight rates are not reduced and he urged the establishment of emergency rates.

### "Loss of Entire Package"

THIS IS THE TITLE of one class of the freight claim agent's problems, distinguishing such cases from pilferage, wreck damage and other kinds of trouble. "Loss of entire package" necessitates oftentimes a persistent pursuit of many blind leads. This was the subject of a recent address by E. F. Ford, freight service inspector of the Chicago, Burlington & Quincy, at Kansas City, from which the outstanding lesson is that even the most puzzling and complicated loss and damage cases are due in most cases to disregard of the simplest fundamental rules. Mr. Ford cited four illustrative cases, all of which would have been prevented by these four rules: (1) Look at marks. (2) If boxes are numbered, put numbers on way-bill and compare the numbers in checking. (3) File receipts with care. (4) Freight for which there is no way-bill should be delivered only on satisfactory evidence of ownership. Following is an abstract of the descriptions of the four cases as given in Mr. Ford's address:

Case 1.—Claim for \$369 for shortage of a case of dry goods No. 4707 consigned to B. M.; unloading tally showed it checked out OK but when consignee called no trace of it could be found. After checking B. M.'s receiving records and finding no trace it occurred to me that this firm's freight was floored next to McCord's and that it might have got into a trap car made up for that firm. I accordingly called on and checked the receiving record at McCord's and, sure enough, found it duly recorded, even to the same case number. Months had elapsed since the transaction; and while McCord's receiving record was clear the stock record was not; and it required several visits to the manager before he was convinced that the goods moved through his stock.

Case 2.—Claim for \$1,200 filed by an Eastern shipper for alleged loss in transit of a centrifugal pump consigned to S. T. C., Kansas City. Our unloading record showed a clear tally, but we could not show delivery; and the consignee's receipt was missing from files. A special visit to the S. T. Company was rewarded by finding the pump set up and in operation; and it was identified by the shop number on the pump.

Case 3.—Several large consignments of drugs in boxes shipped from Philadelphia to J. W. & B., Kansas City; claim for shortages to the value of \$750. This transaction involved a total of several hundred boxes, and when they left the factory each box was stenciled clearly and was numbered, bills of lading carrying the same numbers. Originating Eastern line did not put those case numbers on way-bills. Successive consignments overtook one another and got mixed at our junction with the Eastern line. The checkers applied the proper number of cases against each billing and forwarded to Kansas City; and delivery was made of enough cases to fill out each way-bill, as long as the cases lasted. Now, one of these cases would contain high class drugs valued at, say, \$65; another would be valued at perhaps \$2. By disregarding case numbers, and not enough cases eventually showing up to balance the transaction, it was left to the honesty of the consignee to base his claim upon the higher or lower priced goods, just as he chose. Our delivery record being faulty as to case numbers, and the teamster's records being no better, we were at the mercy of J. W. & B., but that firm was found to be managed by a man who proved to be the very soul of honesty and square dealing.

Case 4.—Seven bundles of rugs which checked over in a certain car on billing of other rugs for W. V. These seven bundles were delivered as an overage to W. V. on that billing and without lifting bill of lading or certified copy of invoice. On account of faulty and incomplete records at W. V.'s we have never been able to convince them that they received seven bundles of rugs which did not belong to them. V. also has a house at Denver and one at Dallas; and what happened, as a matter of fact, was that the shipper billed the seven bundles to V. at Denver or Dallas and marked them to V. at Kansas City in error.

In case 1 the trucker went wrong by flooring a B. M. case in McCord's section; and the check clerk who later made up the trap car for McCord compounded the trucker's error by not securing a careful check. In case 2 we seem to have handled the pump all right, but we could not produce the receipt. In case 3 the Eastern line went wrong by not billing the case numbers; but we would have been safe, never-

4. If cases carry numbers which are not on the receipts enter such numbers.

5. If a consignee advises you that a certain overage is due on a preceding bill, find out what was delivered instead of it. If receipt is clear and if that article, according to your record was astray, or over, keep after him for proof of ownership until you get it.

6. When certain overages are still on hand despite reasonable notice to consignee, open such packages and give him a complete invoice, including stock or invoice numbers found within.

7. Notices sent out on arrival of astray and over freight should carry the fullest possible description. If notice is furnished at the start, nine times out of ten you will find consignee is able and quite eager to surrender documentary proof or advise you what billing it is short on, perhaps over some other road.

8. If you are still unable to get a reply after fair notice, arrange for a representative to make a call. Exhaust every effort to secure disposition before you finally report that you cannot; because, when you do thus report, such articles are forwarded to the over freight station and are sold for little or nothing.

## Tests of Franklin Precision Power Reverse Gear

UNUSUAL AND INTERESTING tests of the new Franklin Precision power reverse gear, manufactured by the Franklin Railway Supply Company, Inc., New York, were made recently at Franklin, Pa. The object was to put the gear through tests that would duplicate locomotive service as nearly as possible and to subject it to conditions more severe than would occur on the locomotive itself. The specific purposes of the tests were to determine whether the piston would absorb valve motion shocks without moving, whether the gear would remain when set without creeping, whether the cut-off could be readily adjusted under load, whether the cut-off indicator and gear would work in synchronism, whether

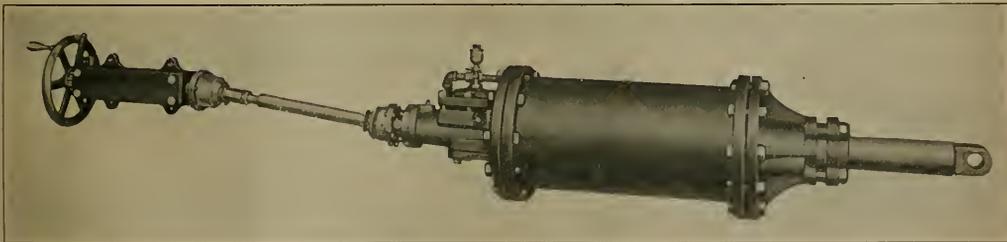

Fig. 1—Gear Assembled as Applied to the Locomotive

theless, had we taken those individual case numbers and had made an accurate check upon delivery. In case 4 we simply gave W. V. seven bundles of rugs without proof of ownership.

### Important Freight House Rules

1. Be on the lookout that your freight is plainly marked to start with; if it carries two or three marks and you are very busy don't load it but set it aside until the marking can be made right.

2. Look out for foxy teamsters slipping in bills of lading for receipt on freight that they take to some fence and dispose of.

3. Mr. Trucker: When you are not sure of your section or your car, drop your truck right there, and ask your stowman or check clerk to set you right.

shocks and stresses would be eliminated from the control going to the cab and whether the gear would automatically and instantly resist movement if an unbalanced load was suddenly applied.

To determine these points special testing apparatus, shown in Fig. 2, was constructed. The gear was secured to the frame in the same way in which it is applied to a locomotive. Application of the cab control wheel and operating rod was made in the same relative position as actual service requires and the cut-off indicator set at its proper relation to the gear. Compressed air at a pressure of 105 lb. per square inch was applied to the cylinder. A set of gages was attached to the cylinder compartment for pressure reading, bleed cocks being installed at each gage.

To subject the reverse gear to stresses similar to those re-

ceived from the valve gear when a locomotive is running an extended rod was attached to the gear piston rod. This rod passed through an adjustable friction clutch by means of which varying and very heavy resistances could be applied. To the friction clutch was attached a connecting rod, which was operated by an eccentric with one inch travel, driven by an electric motor. The eccentric served to reciprocate the clutch on the extended piston rod, subjecting the gear to shock and reversal of stresses equaling those occurring in actual service.

Frictional resistance between the adjustable clutch and extended piston rod was obtained by tightening the clutch. These frictional resistances were calibrated by hanging known weights on a cable which passed over a pulley and was hooked on the extended piston rod. When the friction of the clutch stopped the weight from moving, the frictional resistance equalled the load on the cable. This weight arrangement was used to establish a known frictional resistance.

Two conditions were considered, the first where the force acting on the gear piston was the same in both directions, the second an unbalanced force acting in one direction only. In the first case the desired frictional resistance between the clutch and rod was obtained as outlined above, and the cable and weights were disconnected from the rod. The motor was then started and the clutch forced to travel back and forth on

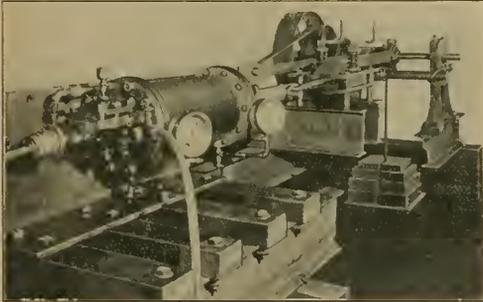

Fig. 2.—Gear with Rod and Clutch Attached for Test

the piston rod 320 times per minute. Observations were taken on ten separate tests, each test being run without a stop for 30 minutes.

To duplicate the condition of an unbalanced force acting on the gear in one direction only the frictional resistance of the clutch was first set to equal the weight hung on the rod and the weight not disconnected.

In starting these tests observations were taken with no load on the gear in order to establish the position of the cab indicator relative to the actual point of cut-off. Moving the indicator from corner to corner and setting to any desired cut-off the relative positions of the indicator and piston checked in every case within  $1/32$  in.

Seven separate running tests were made with the clutch operating against the gear in each direction. The first test was run with 500 lb. frictional resistance between clutch and piston rod and the resistance was increased 500 lb. for each test until a load of 3,500 lb. was reached. With the motor reciprocating the clutch 320 times per minute there was absolutely no movement of the piston. The gear was moved from corner to corner slowly or as rapidly as desired and the cut-off always checked with the position shown by the cab indicator. While under load the force required to adjust the cut-off was so small that the operating rod could be rotated by hand without using the cab control wheel. The gear absorbed all shocks, no vibration or stresses being transmitted to the cab control wheel or indicator.

To demonstrate the operation in case of leaks the pressure in the cylinder was bled down approximately 15 per cent. Under these conditions the piston moved .005 in. each way under load. When the leakage cock was closed the pressure automatically rose and stopped entirely all movement of the piston.

To determine the effect of an unbalanced load in one direction only the clutch was set for 2,000 lb. and weights left attached, the clutch and weight equaling 4,000 lb. one way and zero the other. Under these conditions the gear immediately set up the differential pressure in the cylinder required to absorb the shocks. There was no movement of the piston and bleeding of each cylinder compartment by hand had no effect.

To further unbalance the load the clutch pressure was increased to 2,500 lb., making a load of 5,000 lb. acting on the gear in one direction only. No movement of the gear was perceptible, the cut-off being held as rigidly as before.

### Description of Gear

This power reverse gear, as its name implies, is designed for precise adjustment of cut-off. It consists of a 10 in. by 18 in. cylinder with all parts enclosed. It has ample strength for the heaviest work. The operating valve is attached to the rear end of the cylinder and is controlled by a hand wheel in the cab. This wheel is provided with an indicator showing the point of cut-off and is connected to the gear by an operating rod. This wheel and rod are relieved of all stresses or shocks in the functioning of the gear.

No crosshead or guide is used with this gear, the thrust being taken through the piston. Levers and rods have been eliminated and there are no pins or bushings to wear and affect the accuracy of cut-off. No adjustments are provided as none are required. Wearing parts have been reduced to the minimum. Steam can be used as a medium for operating the gear in emergencies.

The results of the tests described above show that the gear provides extremely accurate adjustment of cut-off and freedom from creeping. Pressure is automatically set up to resist sudden unbalanced forces and maintain stability of adjustment. All shocks from the valve gear are absorbed by the air in the gear cylinder. The design gives a low air consumption and provides adjustment of cut-off with minimum physical effort. When air is cut off the gear remains positioned corresponding to the last adjustment and cannot be changed until air or steam is again used.

Idle Shipping at Hoboken, N. J.

# General News Department

A. H. Rudd, chief signal engineer of the Pennsylvania system, presented a paper on "Modern Signaling" before the Railway Club of Pittsburgh, Pa., on April 28.

President Harding has been asked by the Washington representatives of the four brotherhoods of train service employees, and by local representatives, to urge a Congressional investigation of the situation on the Missouri & North Arkansas, where the train employees have been on strike. It is charged that the management had violated the orders of the Railroad Labor Board.

## Senate Railroad Investigation to Begin May 10

Senator Cummins, chairman of the Senate committee on interstate commerce, has announced that the committee's hearings in the general inquiry into railroad conditions will begin on May 10, with railway executives as the first witnesses.

## Progress in Automatic Train-Control

The Bureau of Safety of the Interstate Commerce Commission and the American Railway Association will at once place inspectors on the Chicago & Eastern Illinois and Chicago, Rock Island & Pacific to watch the operation of the automatic train stops which are in use on those roads and to report on the effect of automatic train control on railroad operation. The two inspectors representing the government are P. W. Jones and R. B. Johnson, the recently appointed examiners. Those for the American Railway Association are O. C. Underwood, formerly signal supervisor, Southern Railway Lines, East, and L. C. Heilman, formerly office engineer, signal department, Chicago, Rock Island & Pacific. Messrs. Johnson and Underwood are assigned to the Chicago & Eastern Illinois and Messrs. Heilman and Jones to the Rock Island.

A. W. Newton, chief engineer of the Chicago, Burlington & Quincy has been appointed an engineering member of the joint committee on automatic train control, in place of H. R. Safford, who resigned recently.

## Senator Capper Would Repeal 6

### Per Cent Rule of Rate-Making

Senator Capper of Kansas on April 25 introduced a bill to repeal the 6 per cent rule of rate-making in Section 15-a of the act to regulate commerce as amended by the transportation act, and the Senator issued a statement to the press which indicated a belief on his part that the repeal of this section would tend to reduce freight rates. The Senator's bill would also repeal the provision of the law under which the Interstate Commerce Commission has taken jurisdiction to order increases in intrastate rates on the ground of discrimination against interstate commerce. The bill would amend the first paragraph of Section 3 of the act to regulate commerce as amended by Section 405 of the transportation act, the first paragraph of Section 15 as amended by Section 418 of the transportation act, repeal paragraphs 3 and 4 of Section 13 as amended by Section 416 of the transportation act, and repeal Section 15-a as amended by Section 422 of the transportation act. The Senator's statement took the position that a reduction of freight rates would save the railroads from receivership and bankruptcy.

## A New Proposal for the Canadian Railway Crisis

Lord Shaughnessy, chairman of the Canadian Pacific (speaking, however, as an individual citizen and not officially), has written to the Prime Minister, proposing that all of the government-owned railways of Canada be put into the hands of the Canadian Pacific, to be operated by that company, along with its own lines, as a single system. He says that even at this late date, it would be wise for the government to drop the Grand

Trunk; that the Canadian Pacific could manage the National lines under a perpetual contract; that the National Transcontinental scheme was a deplorable blunder in conception and execution, and that wages and working conditions are on a fictitious basis, and must be amended. Savings would result from consolidation by elimination of unnecessary train service, duplicate terminal work, and common use of cars and locomotives.

Lord Shaughnessy submits an elaborate tentative plan for solution of the difficulties that confront the government. He would relieve the Grand Trunk of some of the burdens it is now carrying. He would provide for certain guarantees to the stock and bond holders of all companies concerned, improving as the situation improved; and he would look hopefully to the wiping out of the deficit by immigration and development of the country.

## International Chamber of Commerce

The International Chamber of Commerce, in which the United States Chamber of Commerce is interested, is to hold a meeting in London June 27-July 2, as noticed in the *Railway Age* of April 22, page 1000. It will discuss various important aspects of the general topic, "Restoration of the World's Commerce." The United States has been assigned leadership in one of the five divisions of the Congress, namely, "Transportation and Communications." Walker D. Hines, who is now engaged in the arbitration of questions pertaining to European River Shipping, is in charge of this subject. Other divisions of the London Congress, such as finance, production and distribution are organized under the auspices of Britain, France and Italy. The Transportation Group, under Mr. Hines' general direction, has been organized in four branches as follows: Communications, John J. Carty, chairman; J. Rowland Bibbins, secretary. Port Facilities, L. E. Stilwell, chairman; N. Sumner Myrick, secretary. Ocean Transportation, H. H. Raymond, chairman; N. Sumner Myrick, secretary. Land Transportation, Chairman to be assigned; Richard Waterman, secretary. These committees are already at work on the programme.

## Freight Claim Division A. R. A.

### Meeting Chicago, May 17 to 19

The Freight Claim Division of the American Railway Association will hold its 30th annual session at the Hotel Sherman, Chicago, on May 17, 18 and 19. Coronado Beach, Cal., had originally been selected as the place of meeting, and Denver, Colo., had been substituted later. The present railroad situation made necessary a further consideration, however, and Chicago was selected. Wednesday, May 18, has been set aside for a special order of business, at which the report of the Committee on Cause and Prevention, followed by a discussion of claim prevention matters, will occupy the attention of the members throughout the day.

## Hoover Resigns from American Engineering Council

Herbert Hoover has resigned as president of American Engineering Council of the Federated American Engineering Societies. Mr. Hoover's resignation was submitted and accepted as the closing action of the sessions of the council held April 16 at the Engineers Club of Philadelphia, Pa. Mr. Hoover gave as his reasons the fact that American Engineering Council by its constitution was necessarily engaged in furthering national activities which involve legislation; and that he as a member of the executive branch of the government could not consistently direct such activity as an officer of American Engineering Council. The council, in a resolution of regret at Mr. Hoover's retirement, voted its appreciation of Mr. Hoover's leadership during the organization period of the council and his initiation of policies and effort.

One of the most important matters before the council was the

report of the Committee on Elimination of Waste in Industry, of which J. Parke Channing is chairman and L. W. Wallace, executive secretary of the council, vice-chairman. The committee has been conducting an assay of waste in principal industries for more than three months and now reports that the results of the assay will be ready in June.

E. E. Hunt, who has been on Mr. Hoover's staff, and who has been identified with the Elimination of Waste in Industry committee since its formation, has been retained to direct the work of that committee until its completion. In submitting the report of the Patents Committee the executive secretary noted the favorable attitude of members of Congress toward pending patent legislation sponsored by the council. Every effort will be made to bring about necessary Patent Office reforms at the present session of Congress.

Other matters discussed by the secretary were petitions of the council for the appointment of an engineer as Assistant Secretary of War, in which favorable action was not obtained, and for the appointment of an engineer to the Interstate Commerce Commission, which is still under consideration. The executive secretary of the council has been appointed on the advisory board to the Board of Surveys and Maps to succeed A. D. Flinn, who represented old Engineering Council.

The next meeting of the council will be held in St. Louis, Mo., on June 3. This meeting will probably be the most important yet held by the society as it will synchronize with the report on the waste assay.

### Comparison of Steam and Electric Locomotives

At a meeting of the Franklin Institute held at Philadelphia on April 14 two papers were read on steam and electric motive power. The characteristics of the electric locomotives were discussed by N. W. Storer, general engineer of the Westinghouse Electric & Manufacturing Company, while the characteristics of the steam locomotive were treated by A. W. Gibbs, chief mechanical engineer of the Pennsylvania System.

Mr. Storer stated that he considered it probable that there would gradually be a radical evolution of operating methods in order to utilize the electric locomotive most effectively and discussed some of the factors to be considered in this connection. An important advantage would result from making the speed of passenger and freight trains more nearly uniform as could be done advantageously with electric motive power. On account of its greater reliability the electric locomotive would not impose the same limitations on the length of operating division as the steam locomotive and greater mileage could be obtained from the individual units. Under certain conditions the use of aerial right over track was of great importance. Electrification opens up possibilities in the use of multiple level stations to increase station capacity and improves the operation of stub-end stations by decreasing the number of switching movements. In concluding, Mr. Storer discussed at some length the relative advantages of various types of motors and compared the speed-pull curves with those of typical steam locomotives.

Mr. Gibbs confirmed his remarks to the mechanical problem of transmitting power from the motors to the wheels and the behavior of locomotives as vehicles. He stated that while the transmission of power in electric locomotives seems simple, it really is very difficult and while the electrical features of the motive power were often satisfactory, the mechanical features were troublesome. After discussing briefly the various types of transmission, Mr. Gibbs outlined some of the difficulties encountered in designing locomotives for high speed. In developing the design of Pennsylvania electric passenger locomotives, tests were conducted to determine the riding qualities of electric engines with various wheel arrangements. A section of track was prepared especially for measuring the stresses, a record being obtained by the impression of a steel ball on a steel plate inserted in special ties. The tests showed that a high center of gravity was advantageous and that symmetrical driving wheel arrangements were unstable. Some of the electric engines proved very destructive to the track and as a result of these tests, a design of locomotive with wheel arrangements corresponding to two eight-wheel engines facing in opposite directions and with motors above the wheels was adopted. In conclusion, Mr. Gibbs stated that there was still much to learn with regard to the behavior of electric locomotive as vehicles and further tests should be made to determine the most satisfactory types.

## Traffic News

The Department of Domestic Distribution of the Chamber of Commerce of the United States, which has been making a survey of business conditions, reports that by far the largest number of answers to its question as to how the department might help in lowering the cost of merchandising said: "Do something to lower freight rates." Answers were received from some two thousand business men, retailers, wholesalers and manufacturers.

The Postmaster General has filed with the Interstate Commerce Commission an answer to the petition filed by the New England railroads asking for a reexamination of the facts and circumstances surrounding transportation of mail in New England and for an order readjusting the rates since September 1, 1920. The Postmaster General asks that this petition be denied on the ground that such a retroactive order would be in contravention of the rights of the government.

At the annual meeting of the Transportation Club of San Francisco, Cal., the following officers were elected: President, W. B. Hinchman, assistant traffic manager, Tonopah & Tidewater; first vice-president, P. G. Williams, auditor, Associated Oil Company; second vice-president, Harry C. Ewing, commercial agent, Pere Marquette; secretary, E. A. Senneff, general agent, St. Louis-Southwestern; directors, J. J. Shea, bar pilot; J. T. Bate, Pacific coast agent, Missouri, Kansas & Texas; D. M. Swobe, vice-president, McCloud River Railroad; F. C. Lathrop, assistant general passenger agent, Southern Pacific; and M. F. Cropley, assistant general manager, Pacific Steamship Company.

### Coal Production

Production of soft coal in the week ended April 16 was marked by a slight but distinct recovery, says the weekly bulletin of the Geological survey. The output is estimated at 6,325,000 net tons, an increase of 416,000 tons over the week preceding and the largest since the second week of March.

### Seasonal Coal Rates Proposed

A plan proposed for promoting the "off-season" movement of coal in the early part of the year, in order to avoid shortage and congestion in the fall and winter and to promote a uniform rate of production, is embodied in a bill introduced in Congress by Senator Frelinghuysen providing for seasonal coal rates. The bill was strongly endorsed by the Interstate Commerce Commission and was introduced in the Senate last year; and it was favorably reported by the Senate committee; but it was not acted upon by the Senate. Chairman Clark has appeared before the committee and favored the bill. It provides for a reduction of from 5 to 25 cents a ton from the normal or basic freight rate, from March to July, with corresponding increases in the rates from August to February. The bill was opposed last year by the railroads on the ground that there was a demand for more coal than the railroads could haul anyway and it was opposed by various boards of trade and coal dealers' associations on the ground that it would penalize those industries or communities that necessarily must obtain most of their coal late in the year. This year both the railroads and the coal operators are trying to induce the early purchase of coal. The Interstate Commerce Commission takes the position that it could not authorize seasonal differentials without specific authority of law.

Members of the Senate committee appeared reluctant to have Congress itself legislate so directly on rates as to fix the seasonal differentials itself, but it was informally decided to report a bill authorizing the Interstate Commerce Commission to make an investigation and if it deems it desirable to initiate seasonal rates.

Some negotiations between the Eastern railroads and the shippers of lake cargo coal have been going on for some time, looking to an immediate reduction in coal rates, and it is understood that a number of the railroads are willing to make some reduction. A reduction of 28 cents per ton has been discussed.

## Commission and Court News

### Interstate Commerce Commission

#### Port Terminal Charges to Be Investigated

The commission is to investigate the reasonableness of the charges for wharfage, storage, etc., at south Atlantic and Gulf ports at and south of Hampton Roads, Va., and also the propriety of including in the rates of the carriers to and from the ports, the cost of these services. The commission will investigate in a broad and comprehensive way the charges, the nature of the services rendered, the cost thereof and the facilities employed. Comparison will be made with similar charges, costs and services of water terminals not owned or operated by the carriers.

The commission will also inquire into the propriety of absorptions of terminal charges at the ports by the carriers; whether the proper growth and development of any ports are unduly restricted; and whether the free flow of commerce at the ports is unduly impeded.

The proceedings will be set for hearing at places and dates to be determined later.

### Personnel of Commissions

The Senate on April 25 confirmed the appointments of B. W. Hooper, Samuel Higgins and W. L. McMenimen as members of the Railroad Labor Board. The committee on interstate commerce had approved the appointments on April 23 though representatives of the maintenance of way employees' organizations had protested the appointment of Mr. McMenimen, who is the second representative of the train service brotherhoods on the board. The Senate has also confirmed the appointment of Col. E. H. Shaughnessy as second assistant postmaster general.

Robert B. Johnson, heretofore in the Bureau of Valuation of the Interstate Commerce Commission, has been appointed signal engineer examiner in the Bureau of Safety of the Commission. Mr. Johnson was born at Leesburg, Va., and was educated at Virginia Polytechnic Institute. His railroad service has been in the signal department on the Southern Railway; as general foreman for the General Railway Signal Company and also as assistant signal engineer for the General Railway Signal Company of Canada. During the world war he served as major of field artillery and while in France was in the 79th division.

Percy W. Jones, heretofore with the Chicago & North Western, has been appointed signal engineer examiner, Interstate Commerce Commission, Washington, for service in the Bureau of Safety. Mr. Jones was born at Reading, Pa., and was graduated from Pennsylvania State College in 1910 in electrical engineering. His railroad service has been on the Pennsylvania lines west of Pittsburgh, the Chicago, Rock Island & Pacific and Chicago & North Western, doing various kinds of work in the signal department. In 1917, 1918 and 1919 he served in the construction division of the United States Army with rank of Lieutenant, being in charge of the electrical and building repair sections at Fort Oglethorpe, Ga. Since the war he has been in the valuation department of the signal engineer's office of the North Western.

President Harding on April 27 sent to the Senate nominations for appointment as members of the Interstate Commerce Commission for E. I. Lewis, chairman of the Public Service Commission of Indiana, and J. B. Campbell of Spokane, Wash., who has for many years represented the intermountain interests in rate litigation as attorney for the Spokane Chamber of Commerce and later as attorney for the Intermediate Rate Association, whose complaint asking a reduction in the rates from the east to the intermountain territory was dismissed by the Interstate Commerce Commission in a decision made public on April 27. Mr. Lewis was appointed for a term expiring December 31, 1925, to succeed J. S. Harlan and Mr. Campbell for one of the new positions on the commission for a term expiring December 31, 1924.

## Foreign Railway News

### Italian Locomotives for Bulgaria

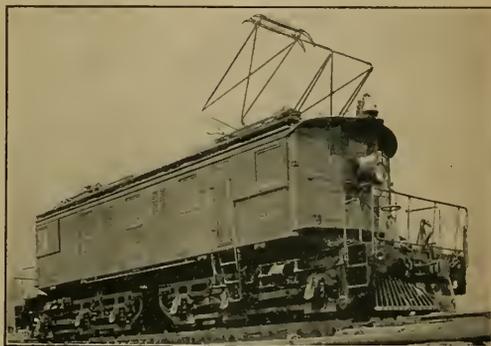

LONDON.

It is reported that the Ansaldo Company, Rome, has made a contract with the Bulgarian government for the construction of 40 locomotives for freight and passenger service.

### Electric Locomotives for South America

The first Baldwin-Westinghouse freight locomotive for the Paulista Railway Company, Brazil, S. A., has been completed and tested. The passenger locomotives are nearing completion. Announcement of the proposed electrification of the Paulista Railway was made in the April 23, 1920, issue of the *Railway Age*.

The locomotives are to be used in freight service on the principal broad gage trunk lines of the railroad which runs through

Freight Locomotive for the Paulista Railway

the most prosperous and productive part of the state of Sao Paulo. The freight locomotives each weigh 116 tons and have six driving axles, each equipped with one 280 hp. direct-current motor, arranged for operation with two motors in series on the 3,000-volt line. They are designed to handle trailing loads up to 770 tons over a line having a maximum grade of about 2 per cent. The locomotives are equipped with M. C. B. couplers for testing purposes, but will later be equipped with continental draft gear and arranged for vacuum train brakes.

### Railway Situation of India

The annual report of the railway department of the government of India for the year ending March 31, 1920, shows an addition to the total railway mileage of the country of 119, bringing the total up to 36,735. None of the railways are of standard gage. Of 5 ft. 6 in. gage there are 17,990 miles; of 3 ft. 3½ in., 15,181 miles; of 2 ft. 6 in., 2,926 miles; and of 2 ft. gage 638 miles.

The net earnings of all the railways totaled \$124,729,308 (rupees to dollars at par), or \$3,396 per mile. The total capitalization was \$1,835,063,748 and the net income represents an earning of 6.8 per cent on the capital outlay. The total passenger train miles during the year was 52,092,000, the total freight train miles was 70,061,000 and the mixed train miles 34,169,000. The average freight haul was 232 miles and the average freight charge per ton mile was 7 mills.

The orders for equipment during the fiscal year included 364 locomotives, 14,157 freight cars and 699 passenger train cars. The railway department is experimenting with central automatic couplers with the view of adopting them as standard if it is found advisable. It is reported that Simplex couplers are being tried on the Great Indian Peninsula Railway. With the use of these couplers and strengthened underframes it has been

found that trains of about twice the ordinary weight can be handled.

The year was marked with strikes and various labor troubles. In many cases wages were advanced as much as 50 per cent over the pre-war rates. The railways gave employment during the year to 711,690 persons. Of these 693,884 were natives, 10,865 were Anglo-Indians and 6,941 were Europeans.

**March Exports of Locomotives**

Exports of steam locomotives in March totaled 105, valued at \$5,317,029. This figure represents a slight increase in number and an enormous increase in value over the February totals. Fifty of these locomotives, valued at \$3,570,100, were destined for France. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	No.	
France	50	\$3,570,100
Canada	3	33,865
Honduras	1	9,522
Mexico	6	83,000
Jamaica	1	5,525
Cuba	6	231,629
Brazil	1	22,000
Venezuela	1	13,425
China	7	344,628
Japan	6	72,000
Philippine Islands	6	289,800
British East Africa	2	14,098
Egypt	15	627,437
<b>Total</b>	<b>105</b>	<b>\$5,317,029</b>

**March Exports of Car Wheels and Axles**

The exports of car wheels and axles in March were valued at \$295,336, slightly less than the total for February. The complete figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce follow:

Countries		
Greece		\$40,975
Canada		12,473
Guatemala		99
Nicaragua		123
Panama		2,403
Mexico		9,954
Cuba		19,500
Dominican Republic		13,400
Argentina		28,350
Brazil		64,325
Chile		78,321
Ecuador		892
Peru		7,537
Uruguay		509
China		18,988
British India		900
Japan		12,990
Philippine Islands		11,503
British South Africa		984
<b>Total</b>		<b>\$295,336</b>

**Locomotive Exports in February**

The exports of steam locomotives in February suffered a violent slump. The total is 97, valued at \$2,355,295, while similar figures for January show 149, valued at \$4,248,147. Mexico was the destination of 31 of these engines, valued at \$831,980. Most of the slump can be laid to the falling off of Cuban shipments from 66 in January to 13 in February. The detailed figures by countries as compiled by the Bureau of Foreign and Domestic Commerce follow:

Countries	Number	Dollars
Costa Rica	4	54,909
Honduras	2	33,600
Mexico	31	831,980
Newfoundland and Labrador	6	221,700
Cuba	13	325,180
Virgin Islands of U. S.	1	574
Dominican Republic	3	61,465
Dutch Guiana	1	97,386
China	7	6,046
Dutch East Indies	1	205,060
Hongkong	1	2,200
Japan	8	14,112
New Zealand	4	60,230
Philippine Islands	4	21,261
British West Africa	7	301,400
British East Africa	1	18,771
British South Africa	3	87,726
<b>Total</b>	<b>97</b>	<b>2,355,295</b>

**Amalgamation of Two Great English Companies**

A provisional agreement has been made by which the London & North Western Railway will absorb the Lancashire & Yorkshire; and it seems to be understood that there will be no doubt of the approval of the stockholders of the two companies. For

several months past, one man, Arthur Watson, has been general manager of both these companies, and they have for many years worked in friendly co-operation. For 12 years past there has been a pool by these two companies and the Midland of certain competitive freight traffic. An amalgamation was proposed fifty years ago, but Parliament then refused its approval.

The main lines of the London & North Western extend from London to Liverpool, Holyhead, Carlisle, Manchester and Leeds. The principal lines of the Lancashire & Yorkshire lie east and west, Liverpool and Southport being prominent western termini and Goole the principal eastern terminus. The aggregate mileage of the London & North Western is 2,066 and of the Lancashire & Yorkshire 601. The smaller road has the densest traffic of any road in Great Britain, its receipts per mile in 1917 being \$53,081. Those of the larger road were \$38,418. For the year 1920 the following statistics have been published:

	L. & N. W.	L. & Y.
Gross receipts	\$195,905,871	\$84,787,108
Net income	33,355,633	12,911,591
Dividends on preferred stock	8,969,660	5,174,811
Dividends on common stock	15,640,739	4,120,527

Note—Pounds shown as dollars at par value.

For the four weeks ending January 2, 1921, the government has published the following items:

	L. & N. W.	L. & Y.
Freight ton miles	163,788,686	44,141,901
Average haul, miles	41.34	24.91
Average freight train load, tons	139.07	122.77
Ton miles per mile of road	80,407	74,188
Passengers carried	8,089,634	6,454,477

The Lancashire & Yorkshire has been one of the most enterprising of English companies, Sir John A. F. Aspinall, its general manager for about twenty years, up to about 1908, being one of the distinguished railroad engineers of the country. The company owns a large fleet of steamers plying between Goole and the Continent.

**French Railway Deficits**

The railways in France, in common with those of almost every other country, are suffering heavy deficits. According to the latest statistics, which have been supplied by the Bureau of Railway Economics, revenues fell short of expenditures at the end of 1919 by \$260,878,100 (francs to dollars at par). In fact, for each successive year since 1913, the French railways have been writing their net returns in red ink. The deficits remained within relatively moderate limits during the first years of the war, increased quickly from the beginning of 1917, then made a formidable leap in 1919. The deficits of the French railways from 1913 to 1919 are shown below:

Year	Deficits All Roads
1913	\$15,188,900
1914	54,095,300
1915	58,617,600
1916	53,094,300
1917	77,026,300
1918	101,595,200
1919	260,878,100

Freight rates have been increased approximately 140 per cent since the war, with a corresponding increase in passenger rates of 55, 50 and 45 per cent. The railways cannot hope to look for a great measure of further relief by asking for an additional increase in rates. Although traffic is growing, the French roads have by no means begun to resume their normal peace time standards. Only July 1, 1920, the number of loaded cars was 35,273, although in March, April and May it was over 36,000, the normal peace time standard being from 57,000 to 67,000 cars daily.

The French Minister of Public Works hopes to bring about some relief by reducing costs of operation. As in the United States the wage item appears to absorb the greatest percentage of operating revenues, with the cost of fuel running second. If the abnormal price of coal decreases, this itself may be sufficient to convert the aggregate deficit into a surplus, otherwise relief will have to be sought which may necessitate either a reduction in wages or a transference of the deficit to the tax payer. On January 1, 1913, employees on the French railways numbered 356,789; by January 1, 1920, this number had increased to 460,947, or 29 per cent. Their compensation, which in 1913 amounted to \$148,525,880, has increased today to \$637,706,160, or an increase of 329 per cent. The annual compensation per man before the war of \$52 has reached \$1,744, or an increase of 216 per cent. The introduction of the eight-hour day alone was responsible for an increased expenditure of over \$150,000,000 annually.

## Equipment and Supplies

### Locomotives

THE UNION PACIFIC is inquiring for 65 locomotives.

MITSUI & Co., New York, are inquiring for prices on material for the construction of 3 Pacific type locomotives, for the South Manchurian Railway.

THE CHILIAN STATE RAILWAYS will open bids on July 6, in Santiago, Chili, for 20 Mikado type locomotives of 1.676 meter gage, also for 10 Mikado type locomotives of one meter gage. Other information can be obtained at the New York City office of the company, 141 Broadway.

NATIONAL RAILWAYS OF MEXICO.—Francisco Perez, director general of the National Railways of Mexico, on a recent visit to the United States, bought 91 locomotives from the Illinois Central, for the National Railways. These lines are not in the market for any additional locomotives at the present time.

### Freight Cars

THE CHILIAN STATE RAILWAYS will open bids July 6, in Santiago, Chili, for 100 Hart convertible cars of 45 tons capacity, 200 box cars of 30 tons capacity, 300 flat cars of 30 tons capacity and 20 refrigerator cars of 30 tons capacity, all to be of 1.676 meter gage.

### Passenger Cars

THE CHILIAN STATE RAILWAYS will open bids on July 6, in Santiago, Chili, for 80 coaches of 1.676 meter gage, also for 2 sleeping coaches, 2 dining cars, 2 first-class coaches, 2 third-class coaches and 2 mail cars, all of one meter gage.

### Iron and Steel

THE KANAWHA & MICHIGAN has ordered 1,500 tons of rails from the United States Steel Corporation.

THE MISSOURI, KANSAS & TEXAS has ordered four through riveted truss spans, requiring a total of 680 tons of steel, from the Lackawanna Bridge Company, Buffalo, N. Y.

MITSUI & Co., New York, are inquiring for 5,000 tons of 75 lb. rail and the necessary splice bars for the Japanese Government Railways, also for 1,560 tons of steel for bridges, for use in Japan.

### Miscellaneous

THE CHICAGO & NORTH WESTERN is inquiring for 400 tons of iron bars for delivery May 3.

THE NEW YORK CENTRAL is asking for bids until 12 o'clock noon May 5, for a minimum of 200,000 gal. and a maximum of 800,000 gal. of asphaltum base fuel oil, with gravity of 14-16

### Signaling

THE UNION PACIFIC has ordered from the General Railway Signal Company, to be installed by the railroad company at a tunnel between Altamont, Wyo., and Aspen, two electric interlocking machines with illuminated track diagrams: one machine to have 20 working levers and the other 21.

"SUMMER TOURS" is the title of an attractive booklet now being distributed by the Chicago & North Western and the Union Pacific, describing 33 personally escorted tours to Yellowstone and Rocky Mountain National Parks to be made this summer. Each tour covers two weeks and provides over 500 miles of auto-mobiling.

## Supply Trade News

C. B. Cole, formerly manager of the Chicago territory of the Union Twist Drill Company, has joined the sales staff of the Tool Sales & Engineering Company at Chicago.

The Simmons-Boardman Publishing Company, publishers of the *Railway Age* and other publications, will, effective May 1, move their Cleveland, Ohio, office to 4300 Euclid avenue.

The Railway Materials Company announces that on May 1 its general offices will be removed from the Railway Exchange to suite 1900 Wrigley building, 400 North Michigan avenue, Chicago.

The offices of the Official Guide, published by the National Railway Publication Company, have been removed from 75 Church street to larger quarters at 424 West Thirty-third street, New York City.

A. H. Weston, formerly sales engineer, Lackawanna Steel Company, is now associated with the American Chain Company, Reading specialties division, with headquarters at 1054 Grand Central Terminal, New York City.

The W. T. Dunn Co., 10 High street, Boston, Mass., has been appointed New England sales agent for B. M. Jones & Co., Inc., 192 Chambers street, New York, importer of Mushet and Titanic tool steels, and Taylor's best Yorkshire iron.

J. J. Connors, until recently superintendent of motive power of the Denver & Salt Lake, has formed a connection with the Lowe Brothers Company, Dayton, Ohio, as railway representative, with office at 1243 Monadnock building, Chicago, Ill.

Russell B. Reid, for several years assistant sales manager of the Edward R. Ladew Company, has been made manager of sales for the Sharon Pressed Steel Company, Sharon, Pa. Mr. Reid will have his headquarters at 66 Broadway, New York City.

The offices of the Pocket List of Railroad Officials and the official Railway Equipment Register, published by the Railway Equipment and Publication Company, have been removed from 75 Church street to larger quarters at 424 West Thirty-third street, New York.

F. W. McIntyre has been appointed general sales manager of the Reed-Prentice Company and the Whitcomb-Blaisdell Machine Tool Company, Worcester, Mass., also the Becker Milling Machine Company, Hyde Park, Boston, succeeding J. P. Hsley, who has resigned to go with the Taylor Steel Construction Company, New York.

Fred H. Dorer, Wells building, Milwaukee, Wis., has been appointed sales representative for the American Spiral Spring & Manufacturing Company in Wisconsin and the northern peninsula of Michigan. McCreery & Taussig, Railway Exchange building, St. Louis, Mo., have been appointed sales representatives for the company in Missouri and southern Illinois.

H. M. Davison, who was from 1903 to 1919 with the Hayward Company, New York, and for two years just past was general sales manager for the Ohio Locomotive Crane Company, Bucyrus, Ohio, has again become associated with the Hayward Company and will hereafter be connected with the management of that company. Among other duties he will have the general management of sales.

Sidney G. Johnson, formerly vice-president and general sales manager, of the General Railway Signal Company, has been appointed eastern sales representative for the Hazard Manufacturing Company, Wilkesbarre, Pa., to look after its

interests in rubber insulated railroad signal wire and kindred products, with the railroads in eastern territory Mr. Johnson's office is at room 626, 30 Church street, New York City.

The Multiple Storage Battery Company, of New York City, has reorganized with Herbert G. Clopper, formerly of the New Jersey Zinc Company, elected president and treasurer; Norman D. Sturges remains as vice-president and general manager, and Jasper Bayne retains the position of secretary. The board of directors has been increased to include Howard Bayne, vice-president of the Columbia Trust Company, New York City, and L. M. De Vausney, vice-president of the Seaboard National Bank, New York City.

**Crane Company**

The Crane Company showed net income of \$8,969,311 for the year 1920, after writing down its inventory \$5,617,000. This compares with net income for the previous year of \$11,363,051. Only \$1,917,000 of the inventory written off was charged to 1920 earnings, the balance being charged against reserve. In 1920, \$27,061,000 of accumulated surplus was distributed as a stock dividend.

The statement follows:

Income Account	1920	1919
Net after dependencies, taxes, etc.	\$8,649,624	\$11,248,242
Income from investments	685,263	328,829
Total net earnings	9,334,887	11,777,071
Interest and premium on bonds	365,576	414,019
Net income	\$8,969,311	\$11,363,051

**Obituary**

Willard L. Candee, formerly for about 20 years previous to 1915, president of the Okonite Company, Passaic, N. J., died on April 24 of heart failure in New York City, while on an automobile trip from Long Island. He was born 70 years ago at Yonkers, N. Y., and was one of the pioneer men in the telephone field, also in the electrical lighting field. He was associated with Charles A. Cheever in organizing the first telephone company in New York City, in the early eighties. In 1884, with Mr. Cheever, he organized the Okonite Company for manufacturing insulated wires and cables for electrical purposes, and about ten years later he became president of that company. Mr. Candee remained as president until he retired from active business five or six years ago.

W. L. Candee

**Trade Publications**

**TRACK WORK.**—The Ramapo Iron Works, Hillburn, N. Y., has recently issued a complete new catalogue of its products comprising about 500 pages. The book is bound in loose leaf form and is devoted to sectional, diagrammatic and half-tone views of switch-stands, switches, frogs, crossings, guard rails and accessories in heavy and light equipment.

**HORIZONTAL RETURN TUBULAR BOILERS.**—The Bigelow Company, New Haven, Conn., has reprinted in a separate book matter relating to their return tubular boilers appearing in the company's regular catalogue. This includes a general description of this type of boiler, detailed instruction for setting, illustrations of boilers and furnaces and comprehensive tables of data.

**Railway Construction**

**ATCHISON, TOPEKA & SANTA FE.**—This company has awarded the contract for a craneway building at Topeka, Kan., to Jerome Moss, Chicago, instead of to Joseph E. Nelson & Son, Chicago, as was announced in the *Railway Age* of April 15 (page 958).

**ATCHISON, TOPEKA & SANTA FE.**—This company, which was noted in the *Railway Age* of April 15 (page 958), as co-operating with the railroad Y. M. C. A. at Topeka, Kan., in planning additions and improvements to the Y. M. C. A. building at Topeka, at a cost of approximately \$25,000, is now accepting bids for this work.

**ATCHISON, TOPEKA & SANTA FE.**—This road, which was noted in the *Railway Age* of March 11 (page 574), as contemplating the construction of a blacksmith shop at San Bernardino, Cal., with dimensions 80 ft. by 307 ft., has awarded the contract for this work to Joseph E. Nelson & Sons, Chicago. The estimated cost is \$150,000 and construction will commence at once.

**BALTIMORE & OHIO.**—This company will replace its present double-deck, single track bridge across the Allegheny River at Foxburg, Pa. The new structure will consist of three double-deck, riveted, single track trusses, each 173 ft. 6 in. long. The contract for the fabrication and erection of this structure has been awarded to the Bethlehem Steel Bridge Corporation.

**CHICAGO & NORTH WESTERN.**—This company has awarded contracts for the construction of concrete bridges throughout the system to the Widell Company, Mankato, Minn.; S. G. Cool, Manitowoc, Wis.; Peppard & Burrill, Minneapolis, Minn., and White & Duffy, Milwaukee, Wis. The total cost of the work will be approximately \$200,000.

**CHICAGO UNION STATION COMPANY.**—This company will shortly accept bids for a viaduct on Van Buren street between Canal street and the Chicago River.

**ILLINOIS CENTRAL.**—This company, which is accepting bids for the construction of a viaduct over McLemore avenue, Memphis, Tenn., will award the contract for this work about May 5.

**MAINE CENTRAL.**—This company will build an 8-span steel bridge with concrete piers over the Kennebec river at Norridgewock, Me. T. Stuart and Sons, Newton, Mass., have been awarded the contract for the foundations and the Bethlehem Steel Bridge Company for the steel. The cost of the work is estimated at approximately \$125,000.

**TEXAS MIDLAND.**—The Interstate Commerce Commission has issued a certificate authorizing the construction of an extension from Commerce to Greenville, Texas.

A Seven-foot Gage Locomotive on the Great Western, England, in 1880.

# Railway Financial News

**ALASKA ANTHRACITE RAILROAD.—Asks authority to issue bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$1,500,000 of 6 per cent, 20-year bonds to be sold at 90, the proceeds to be used in completing the extensions of its property in Alaska.

**ATCHISON, TOPEKA & SANTA FE.—Annual Report.**—The income statement for the year ended December 31, 1920 compares with the preceding year as follows:

	1920	1919
Operating income, four months ending December 31, 1920	\$12,983,725	
Compensation under federal control		\$44,615,087
Compensation, January and February	7,699,832	
Guaranty, six months ending August 31, 1920	22,553,225	
Other income	9,842,116	15,100,116
Gross income	\$53,078,597	\$59,715,203
War tax accruals	2,608,497	3,373,271
Interest on bonds, including accrued interest on adjustment bonds	\$49,650,372	\$54,752,917
	12,015,621	11,654,259
Dividends:		
Preferred (5 per cent)	\$6,208,685	\$6,208,685
Common (6 per cent)	13,441,110	13,351,695
Surplus carried to profit and loss	\$17,881,460	\$23,438,819

The annual report of the Atchison, Topeka & Santa Fe will be reviewed editorially in an early issue.

**BOSTON & MAINE.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**CHESAPEAKE & OHIO.—Authorized to pledge bonds.**—This company has been authorized by the Interstate Commerce Commission to pledge and repledge from time to time until otherwise ordered all or part of \$487,000 of general mortgage 4½ per cent gold bonds of 1892 held in the applicant's treasury as collateral security for short term notes.

**CHICAGO, BURLINGTON & QUINCY.—Bond offering.**—Announcement was made by J. P. Morgan Co. on Monday, following the receipt of news that the issue had been approved by the Interstate Commerce Commission, to the effect that a national syndicate of banking institutions and investment houses in New York, Boston, Philadelphia, Pittsburgh, Chicago, Cincinnati, Detroit, Cleveland, Minneapolis, St. Paul and St. Louis would offer the following day \$230,000,000 Northern Pacific-Great Northern joint 15-year 6½ per cent convertible bonds to the public at 96½ and interest, to yield about 6½ per cent.

Details of the issue are summarized as follows from the letter to the bankers prepared by Howard Elliott, chairman of the Northern Pacific, and Louis W. Hill, chairman of the Great Northern:

The joint fifteen-year 6½ per cent convertible bonds are to be the direct and joint obligations of the Northern Pacific and of the Great Northern Railway companies, and are to be secured by a pledge of 1,658,674 shares (approximately 97 per cent of the outstanding stock) of the Chicago, Burlington & Quincy Railroad Company (which percentage of stock has heretofore constituted the sole collateral security for the maturing Burlington joint 4s), and in addition by \$66,000,000 in mortgage bonds of the two obligor companies, the deposited collateral being valued at an amount in excess of 120 per cent of the principal amount of joint 6½ per cent bonds to be issued.

The joint 6½ per cent bonds may be converted, par for par, without charge, at the option of the holder, at any time (upon presentation not later than fifteen days before maturity or earlier redemption) into 6 per cent refunding and improvement mortgage bonds (Series B) of the Northern Pacific Railway Company, due 2047 (callable after fifteen years, at the company's option, at 110 per cent and accrued interest), or into 7 per cent fifteen-year general mortgage bonds (Series A) of the Great Northern Railway Company, due 1936 (with no option of prior redemption), or into bonds of both issues in any ratio between the two which the holder of the joint 6½ per cent bonds may desire, but not more than \$115,000,000 of either of such mortgage bonds will be issuable upon such conversion.

Such Northern Pacific bonds are, in the opinion of counsel, a legal investment for savings banks and trust funds in New York, Massachusetts, Connecticut and Vermont. Both such Northern Pacific bonds and such Great Northern bonds are, in the opinion of counsel, a legal investment for life insurance companies in the State of New York.

Special features of the financing are that discount will be allowed at 6½ per cent a year on the principal sum of the bonds from the date of payment to July 1, from when interest on the bonds will accrue, and that the Burlington joint 4s, which mature on July 1, 1921, with final coupon attached, will be accepted in payment at 100 and accrued interest to date of payment on allotments, scheduled for on or about May 16.

The decision of the Interstate Commerce Commission approving the issue will be found in the article entitled "Great Northern-Northern Pacific Bonds Approved" which appears on another page.

**CHICAGO, MILWAUKEE & ST. PAUL.—Annual Report.**—The corporate income account for 1920 compares with 1919 as follows:

	1920	1919
Railway operating income March 1 to December 31, inclusive:		
Railway operating revenues	\$141,643,202	
Amort operating expenses	134,087,552	
Net railway operating revenue	7,555,650	
Railway tax accruals	6,179,992	
Railway operating income March 1 to December 31, inclusive	1,372,519	
Rents—received	912,536	\$183,313
Interest on other securities and accounts	1,502,736	1,756,393
Amount accrued under guaranty provision	22,250,811	
Compensation, January and February	4,640,721	
Compensation accrued		27,945,820
Total other income	29,755,776	3,787,714
Gross income	31,128,295	31,733,534
Interest on funded debt	17,593,581	16,690,835
Interest on unfunded debt	2,240,811	
Hire of equipment	3,874,141	
Rents—paid	1,171,334	92,609
Total deductions	26,762,224	24,090,489
Net income	4,366,071	7,643,045

The annual report of the Chicago, Milwaukee & St. Paul will be reviewed editorially in an early issue.

**DENVER & RIO GRANDE WESTERN.—Directors Elected.**—At the first meeting of stockholders at Denver, Col., on April 22 of this company which was organized to take over the properties of the Denver & Rio Grande sold at foreclosure on November 20, 1920, Alvin W. Krech, of New York, was elected chairman of the board. Mr. Krech is also chairman of the board of the Western Pacific Railroad Company and president of the Equitable Trust Company of New York, which holds a \$30,000,000 mortgage on the property.

The directors elected, all of them from New York, were: F. W. M. Catchen, I. de Bryn, John B. Dennis, Frederick H. Ecker, A. M. Hunt, Alvin W. Krech, John B. Marsh, Robert W. Martin, George Welwood Murray, Lyman Rhoades, John Y. Robbins and R. B. Young.

After the regular meeting a special meeting of the stockholders amended the articles of incorporation of the new company to make the \$1,000,000 issue of common stock of no par value. The original incorporation filed with the Secretary of State had fixed a par value of \$50 a share. The change was made to conform with a law passed by the last Colorado Legislature.

The comment on the election of J. H. Young as president of the Denver & Rio Grande Western appears on another page of this issue.

**FERNWOOD, COLUMBIA & GULF.—Authorized to issue bonds.**—This company has been authorized by the Interstate Commerce Commission to issue and sell \$200,000 of refunding mortgage bonds.

**FREDERICKSBURG & NORTHERN.—Authorized to Issue Promissory Note.**—This company has been authorized by the Interstate Commerce Commission to issue, under date of January 1, 1921, its promissory note for \$36,936, bearing interest at 6 per cent per annum, payable to the order of J. L. Browne to cover certain advances made to the applicant.

**KINDER & NORTH WESTERN.—Asks Permission to Abandon Line.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of 6 miles of its line from Bullard to Vizard, La., and the abandonment of operation as a common carrier of 8 miles from Vizard to Enad, proposed to be sold for use as a logging road.

**LOS ANGELES & SALT LAKE.—Asks authority to issue notes.**—This company has applied to the Interstate Commerce Commission for authority to issue \$2,500 of one year, 7 per cent promissory notes.

NEW YORK, ONTARIO & WESTERN.—*Annual Report.*—The annual report for the calendar year 1920 shows the following corporate income account as compared with 1919:

	1920	1919
Compensation from U. S. Govt. ....	.....	\$2,103,589
Interest on deferred payments of above.....	.....	56,513
Compensation, January and February.....	\$350,598	.....
Net railway operating income, March 1 to December 31 .....	355,952	.....
Estimated partial payment on account of guaranty deficit in net railway operating income, period March 1 to September 1.....	795,950	.....
Miscellaneous rent income.....	6,673	4,815
Income from securities and accounts.....	843,163	316,760
Income from sinking and other reserve funds.....	3,217	960
Equipment rents—net .....	23,262	.....
Gross income .....	\$2,378,815	\$2,482,642
Rent for leased roads.....	200,752	197,708
Interest on funded debt.....	1,176,430	1,185,115
Total deductions from gross income, inc. other.....	1,523,477	1,548,668
Net income .....	\$855,339	\$933,974
Balance for year.....	\$805,890	\$900,680

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919 as follows:

	OPERATING REVENUES	
	1920	1919
Merchandise freight .....	\$3,115,005	\$2,493,348
Coal freight .....	4,885,788	3,909,251
Milk .....	1,167,585	1,093,873
Passenger .....	3,098,508	2,697,357
Total operating revenues.....	\$13,154,689	\$10,190,027
OPERATING EXPENSES		
Maintenance of way and structures.....	\$2,249,095	\$1,742,907
Maintenance of equipment.....	3,449,277	2,637,554
Traffic .....	145,718	108,569
Transportation .....	6,279,307	4,811,278
General expenses .....	355,750	320,783
Total operating expenses.....	\$12,684,317	\$9,841,748
Net revenue from railway operations.....	\$470,372	\$1,068,279
Railway tax accruals.....	457,040	401,809
Railway operating income.....	\$10,714	\$666,445

PASSENGER TRAFFIC		
Number of revenue passengers.....	1,925,897	1,761,870
Number of passengers carried one mile.....	98,911,515	91,369,678
Average distance carried (miles).....	51.36	51.86
Average receipts per passenger mile (cents).....	3.133	2.952

MILK TRAFFIC		
Number of tons carried of milk earning revenue.....	152,835	151,662
Number of tons carried one mile.....	27,131,032	26,476,451
Average distance haul of one ton.....	177.52	174.58
Average receipts per ton per mile.....	4.303	4.131

FREIGHT TRAFFIC		
Number of tons carried of freight earning revenue .....	5,279,972	5,165,934
Number of tons carried one mile.....	691,073,698	602,704,487
Average distance haul of one ton .....	130.89	116.67
Average receipts per ton per mile.....	1.158	1.062

The report, signed by President John B. Kerr, says: The financial results of operation since September first on all roads have been disappointing for causes that are well known, but the results on our line compare favorably with those of the great majority of the carriers.

PENNSYLVANIA.—*Dividend Reduced.*—This company on April 27 reduced its quarterly dividend from 1½ to 1 per cent. The decrease is a quarterly reduction of one half of 1 per cent. This is the first time in twenty-two years the Pennsylvania has reduced the annual dividend basis below 6 per cent. Since 1899 it has paid 6 per cent annually, with the exception of 1906 when it paid 6½ per cent, and in 1907 when it paid 7 per cent. For seven years prior to 1899, the dividends were 5 per cent.

RENSSELAER & SARATOGA.—*Authorized to Issue Bonds.*—This company has been authorized by the Interstate Commerce Commission to issue \$2,000,000 of first mortgage 6 per cent, 20 year, gold bonds and to deliver them to the Delaware & Hudson Company in accordance with a certain lease. The Delaware & Hudson was authorized to guarantee the bonds and to sell them at par to pay off a like amount of bonds of the Rensselaer & Saratoga which mature on May 1.

TEXAS MIDLAND.—*Authorized to issue bonds.*—This company has been authorized by the Interstate Commerce Commission to issue \$500,000 of first mortgage 4 per cent, 30-year refunding bonds and to sell them at not less than par.

TOLEDO, ST. LOUIS & WESTERN.—*Referees Report on Just Compensation.*—The board of referees appointed by the Interstate Commerce Commission has issued a report finding that the gov-

ernment should pay \$1,113,486 as just compensation for the use of the company's property during the period of Federal control for each year and pro rata for the fraction of the year comprised in that period. This represents \$1,022,468 as the average annual operating income for the three year test period, and three additional items to which the referees say the company is entitled in addition to the standard return. The company had claimed \$1,500,000 a year.

WABASH.—*Annual Report.*—The corporate income account for 1920 compares with 1919 as follows:

	1920	1919	Increase or Decrease
Operating revenues:			
Freight .....	\$43,324,700	\$35,255,548	\$8,069,152
Passenger .....	11,218,051	10,143,356	1,074,695
Total operating revenues.....	59,982,282	48,847,086	11,135,197
Operating expenses:			
Maintenance of way and structures .....	10,541,360	8,086,880	2,454,480
Maintenance of equipment.....	14,735,801	9,358,676	5,377,125
Traffic .....	1,169,383	1,157,109	12,274
Transportation .....	30,023,953	24,610,615	5,413,338
General .....	1,999,814	1,997,569	402,245
Total operating expenses.....	58,859,395	44,587,030	14,272,366
Net operating revenue.....	1,122,887	4,260,056	—3,137,169
Tax accruals.....	1,574,473	1,445,726	128,747
Total operating income.....	Def. 454,940	2,805,154	—3,260,094
Total non-operating income.....	863,291	728,708	134,584
Gross income.....	408,351	3,533,861	—3,125,510
Total deductions from gross income .....	7,778,178	6,082,812	1,695,366
Net income.....	Def. 7,369,827	Def. 2,548,951	—4,820,876
Compensation accrued under federal control.....	971,135	.....	.....
Guaranty .....	8,063,778	.....	.....
Total .....	9,034,910	.....	.....
Credit income balance transferred to profit and loss.....	1,983,943	.....	.....

The annual report of the Wabash will be reviewed editorially in an early issue.

**Guaranty Certificates**

The Interstate Commerce Commission has issued the following certificates for partial payments on account of the six months' guaranty for last year:

Toledo, Peoria & Western.....	\$175,000
Buffalo & Susquehanna.....	100,000
Michigan Central.....	650,000
Tennessee Central.....	80,000
Delaware & Hudson.....	500,000
Georgia Southern & Florida.....	130,000
Chicago, Indianapolis & Louisville.....	125,000

**Dividends Declared**

Keokuk & Des Moines—Preferred, 3 per cent, payable May 5 to holders of record April 26.  
Reading Company—First preferred, 50 cents, quarterly, payable June 9 to holders of record May 24.  
Pennsylvania.—1 per cent quarterly, payable May 31 to holders of record May 2.

# Railway Officers

## Executive

Edward S. Jouett, assistant general counsel of the Louisville & Nashville, has been elected vice-president and general counsel, with headquarters at Louisville, Ky., effective April 21, succeeding Henry L. Stone, resigned.

B. B. Greer, vice-president of the Chicago, Milwaukee & St. Paul, has been elected president of the Des Moines Union Railroad in addition to his other duties, succeeding F. C. Hubbell, of Des Moines, who has resigned.

## Financial, Legal and Accounting

J. M. Gayle has been appointed auditor of the Beaver, Meade & Englewood, with headquarters at Oklahoma City, Okla.

## Operating

Roger T. Taylor, assistant general superintendent of the Northern Pacific, with headquarters at Livingston, Mont., has been appointed trainmaster, with the same headquarters, effective April 15.

Walter D. Pearce, trainmaster of the Northern Pacific, with headquarters at Forsyth, Mont., has been appointed supervisor of bridges and buildings, with headquarters at Glendive, Mont., effective April 15.

A. L. Soule has been appointed assistant to the general manager of the Atchison, Topeka & Santa Fe with headquarters at Topeka, Kan., effective April 25, succeeding F. J. Mackie, assigned to other duties.

F. J. MacKie, assistant to the general manager of the Atchison, Topeka & Santa Fe, with headquarters at Topeka, Kan., has been appointed superintendent of the Plains division, with headquarters at Amarillo, Tex., effective April 20. Mr. MacKie succeeds O. J. Ogg, who has been transferred to the western division, with headquarters at Dodge City, Kan., succeeding D. S. Farley, who has been promoted to assistant general manager.

## ROCK ISLAND CONSOLIDATES DIVISIONS

The Chicago, Rock Island & Pacific has consolidated divisions, effective May 1, as follows: That part of the Minnesota division between Cedar Rapids and St. Paul-Minneapolis, and between Vinton, Iowa, and Iowa Falls, has been consolidated with the Cedar Rapids division, the consolidated division to be known as the Cedar Rapids-Minnesota division. That part of the Minnesota division between Manly, Iowa, and Short Line Junction has been consolidated with the Des Moines Valley division. The Colorado division has been consolidated with the Nebraska division, and is to be known as the Nebraska-Colorado division. The St. Louis division has been consolidated with the Kansas City terminal division, and is to be known as the St. Louis-Kansas City division. The Louisiana division has been consolidated with the Arkansas division, and is to be known as the Arkansas-Louisiana division. The Indian Territory division has been consolidated with the Panhandle division, and is to be known as the Panhandle-Indian Territory division. The Amarillo division has been consolidated with the El Paso-Mexico division, the new division to be called the El Paso-Amarillo division.

Coincident with these consolidations, appointments and transfers have been made as follows: H. R. Saunders, superintendent, with headquarters at El Reno, Okla., has been transferred to the Chicago Terminal division, with headquarters at Chicago. Mr. Saunders succeeds C. T. Ames, who has been appointed trainmaster, with headquarters at Des Moines, Iowa. Mr. Ames succeeds W. E. Warren, who has been trans-

ferred to Cedar Rapids, Iowa. A. L. Haldeman, superintendent, with headquarters at Manly, Iowa, has been transferred to Cedar Rapids, succeeding E. D. Hungerford, who has been appointed assistant superintendent, with headquarters at Minneapolis, Minn. Mr. Hungerford succeeds F. M. Patt, who has been appointed trainmaster of the Colorado division, with headquarters at Colorado Springs, Colo. Mr. Patt succeeds O. F. Young, who has been assigned to other duties. H. E. Allen, superintendent, with headquarters at Fairbury, Neb., has been transferred to Estherville, Iowa, succeeding C. E. Green, who has been appointed trainmaster, with headquarters at Cedar Rapids. Mr. Green succeeds W. L. Pauley, retired. F. N. Tinsman, superintendent, with headquarters at Colorado Springs, Colo., has been transferred to Fairbury, Neb., succeeding Mr. Allen. J. A. McDougal, superintendent, with headquarters at El Reno, Okla., has been appointed superintendent of the Oklahoma division, with the same headquarters, succeeding H. R. Saunders. D. Van Hecke, superintendent, with headquarters at Haileyville, Okla., has been transferred to El Reno, succeeding Mr. McDougal. H. P. Greenough, superintendent of the El Paso-Mexico division, with headquarters at Dalhart, Tex., has been appointed superintendent of the El Paso-Amarillo division, with the same headquarters. C. H. Hubbell, superintendent, with headquarters at Amarillo, Tex., has been appointed trainmaster, with the same headquarters. G. W. Rourke, superintendent of the Kansas City Terminal division, with headquarters at Kansas City, Mo., has been appointed superintendent of the Kansas City division, with the same headquarters. Mr. Rourke succeeds H. E. Correll, who has been appointed trainmaster, with headquarters at Eldon, Mo. J. S. Jones has been appointed trainmaster, with headquarters at Kansas City, Mo. A. E. Walker, superintendent of the Arkansas division, with headquarters at Little Rock, Ark., has been transferred to the Arkansas-Louisiana division, with the same headquarters. Mr. Walker succeeds J. G. Bloom, who has been appointed division engineer, with headquarters at Fairbury, Neb.

## Traffic

D. H. Hoops, division freight and passenger agent of the Chicago & North Western, with headquarters at Chicago, has been promoted to general freight agent, effective May 1. Mr.

Hoops was born in Chicago and entered railroad service in 1885 as a junior clerk in the accounting department of the Chicago & North Western. His entire railroad career has been spent in the service of that company. He was transferred to the traffic department in 1888 and has served continuously since then in that department. He was made chief clerk to the general freight agent in 1895, and in 1898, was promoted to general agent, with headquarters at Des Moines, Iowa. He was shortly transferred to Chicago as acting

general agent in the freight department, and in 1900 was promoted to general agent in the passenger department, with the same headquarters. In 1906, he was transferred to Denver as general agent in the freight and passenger departments. In 1911, he was transferred as general agent, freight department, at Denver. Mr. Hoops was promoted to division freight and passenger agent, with headquarters in Chicago, as stated above, in 1917.

John P. Williams, general agent, freight department, of the Chicago & North Western, with headquarters at Chicago, has been promoted to division freight and passenger agent,

D. H. Hoops

with the same headquarters. **H. S. Bischoff**, general agent, with headquarters at Salt Lake City, Utah, has been transferred to Chicago, succeeding **Mr. Williams**. **N. O. Browne** succeeds **Mr. Bischoff**.

**U. G. Soule** has been appointed commercial agent of the Southern, with headquarters at Chicago, effective March 15.

**A. W. Gill** has been appointed assistant to the freight traffic manager of the Southern, with headquarters at Cincinnati, Ohio, effective April 15, succeeding **E. M. Lane**, deceased.

**R. T. Powers** has been appointed commercial agent of the Winston-Salem Southbound Railway, with headquarters at Cincinnati, Ohio. **J. H. Swaim** has been appointed commercial agent, with headquarters at Winston-Salem, N. C.

**Samuel F. Miller**, general freight agent of the Chicago & North Western, with headquarters at Chicago, has been promoted to assistant freight traffic manager, effective May 1, succeeding the late **E. D. Brigham**. **Mr. Miller** was born at We- nona, Ill., on January 17, 1867, and entered railway service on July 21, 1881, as a telegraph operator for the Chicago & North Western. His entire railway career has been spent in the service of this company. In 1884, while serving as cashier, he was made station agent and was employed in that capacity at various points on the line in Wisconsin until 1890, when he was promoted to traveling agent. In 1896 he was made general agent, and after five years' service in this capacity he was promoted to assistant general freight agent, with headquarters at Chicago. From 1906 to 1912, he served as general freight and passenger agent of the Nebraska and Wyoming division, with headquarters at Omaha, Neb. He was promoted to general freight agent in September, 1912, and held that position continuously up to the time of his recent promotion.

S. F. Miller

### Mechanical

Coincident with the consolidation of divisions on the Chicago, Rock Island & Pacific, appointments and transfers have been made, effective May 1, as follows: **G. M. Stone**, master mechanic, with headquarters at Manly, Iowa, has been appointed general foreman, with the same headquarters. **B. H. Smith**, master mechanic, with headquarters at Fairbury, Neb., has been appointed general foreman, with the same headquarters. **W. E. Danvers**, master mechanic, with headquarters at Amarillo, Tex., has been appointed road foreman of equipment, with the same headquarters. **A. Hambleton**, master mechanic, with headquarters at El Dorado, Ark., has been appointed general foreman, with headquarters at Shawnee, Okla.

### Engineering, Maintenance of Way and Signaling

**H. Schantl**, who has been appointed chief engineer of the Missouri-Illinois, with headquarters at Bonne Terre, Mo., was born at Festus, Mo., on September 8, 1876. He was educated at Washington University, St. Louis, graduating in 1903. He entered railway service in September, 1906, as an assistant engineer for the Mississippi River & Bonne Terre Railway. In December, 1918, he was promoted to engineer maintenance of way, and was serving in this position at the time of his appointment as chief engineer of the Missouri-Illinois. **Mr. Schantl** has also been appointed chief engineer

of the Mississippi River & Bonne Terre, in addition to his other duties, effective April 1.

Coincident with the consolidation of divisions on the Chicago, Rock Island & Pacific, appointments and transfers have been made, effective May 1, as follows: **A. C. Bradley**, division engineer, with headquarters at Colorado Springs, Colo., has been transferred to the Chicago Terminal division, with headquarters at Chicago, succeeding **C. P. Richardson**, who has been appointed assistant engineer, with headquarters at Fairbury, Neb. **G. Davis**, division engineer, with headquarters at Cedar Rapids, Iowa, has been transferred to Manly, Iowa, succeeding **H. T. Livingston**, who has been appointed master carpenter and division engineer on the Des Moines Valley division, with headquarters at Cedar Rapids, Iowa. **Mr. Livingston** succeeds **W. E. Heimerdinger**, who has been appointed office engineer, with the same headquarters. **B. A. Wait**, assistant engineer, with headquarters at Fairbury, Neb., has been appointed instrumentman, with the same headquarters. **J. G. Bloom**, division superintendent, with headquarters at El Dorado, Ark., has been appointed division engineer, with headquarters at Colorado Springs, Colo., succeeding **A. C. Bradley**. **R. Leas**, assistant engineer, with headquarters at El Reno, Okla., has been appointed instrumentman, with the same headquarters. **F. F. Tate**, assistant engineer, with headquarters at Amarillo, Tex., has been appointed instrumentman, with the same headquarters. **W. E. Brown**, division engineer, with headquarters at El Dorado, Ark., has been appointed roadmaster on the Nebraska division.

### Purchasing and Stores

**W. H. King, Jr.**, has been appointed general purchasing agent of the Seaboard Air Line, with headquarters at Norfolk, Va., succeeding **H. C. Pearce**, resigned to accept service with another company, effective April 11.

### Special

**H. B. Hull**, general claim agent of the Illinois Central, with headquarters at Chicago, has been appointed editor of the Illinois Central Magazine in addition to his other duties.

### Obituary

**F. V. McDonnell**, master mechanic of the Pennsylvania with headquarters at Ft. Wayne, Ind., died on April 26.

**W. E. Phillips**, formerly president of the Chicago & Western Indiana, died of heart disease at his home in Chicago on April 27.

**J. W. Mulligan**, real estate and tax agent of the Chicago, Rock Island & Pacific, died at his home in Chicago, on Saturday, April 23.

**Z. V. Taylor**, president of the Piedmont & Northern and vice-president of the Durham & Southern, died suddenly on April 18 on a train en route from Charlotte, N. C., to New York. **Mr. Taylor** was active in the promotion and organization of the Piedmont & Northern in 1912. He was also the founder and president of the Southern Public Utilities Company, which operates street railways and other public utilities at Charlotte, N. C., Winston-Salem, S. C., Greenville, N. C., and Anderson, S. C.

**M. T. Pyne**, who was general counsel of the Delaware, Lackawanna & Western from 1880 to 1892 and who served for a time as president of the Warren Railroad and the Cayuga & Susquehanna (companies subsidiary to the Lackawanna), died at New York on April 22. **Mr. Pyne** was born in New York on December 21, 1855. He graduated from Princeton University in 1877 and from Columbia University School of law in 1879. From the time of his retirement from the practice of his profession in 1892 until his death **Mr. Pyne** directed the affairs of several large estates and was a director in a number of industrial and financial concerns. **Mr. Pyne** had been identified with Princeton University as a trustee for the past 36 years.

The action of the directors of the Pennsylvania Railroad in reducing the dividend rate on Pennsylvania stock from one and one-half to one per cent quarterly did not cause as much excitement as might have been expected from a step so important and far-reaching. The possibility of a reduction in the dividend had been discounted and students of the railway situation had felt that the action taken was such as to have been looked forward to under the present conditions of railroading. The unfortunate feature of the whole affair is that the Pennsylvania stock is widely held by small investors, to whom the reduction in the dividend and the accompanying decline in the value of the stock represents a real hardship. The Pennsylvania is recognized as one of the leading railroads of the world; prior to federal control its physical standards, its management and the morale of its men were recognized as being a model that other properties could look up to. The Pennsylvania System was hit hard by the many sins of omission and of commission of federal control. The officers of the property are now engaged in the tremendous task of remedying the situation and of bringing the system back to its old standards of accomplishment. With the national agreements, high wage scales and the delays attendant upon the changing of these things, they are not, judging from the monthly reports of earnings, having what might be called a glittering success. If any one wants an argument in favor of some kind of action before it is altogether too late on the part of the Railroad Labor Board, we believe that this reduction in the Pennsylvania dividend is as good a one as can be found.

The legislature of Pennsylvania has repealed the full crew law of that state—after the said law has wasted about forty millions of dollars. The final vote was taken on April 28. Whether or not the news about the Pennsylvania's dividend, published the day before (that the company had been obliged to reduce the rate to a figure lower than that of any former year since 1880) had an influence on the minds of the legislators, does not appear; but the coincidence is noticeable. A good many citizens of Pennsylvania own stock in that railroad, and the legislators have, no doubt, heard from some of them. A reduction of 33 per cent in a stockholder's income will open some mouths which have long been silent. This Pennsylvania law has been in force almost ten years; and if there is any virtue in reviewing the mistakes of the past, these stockholders may well ponder this matter; may well ask themselves what kind of men they have been sending to the legislature during the years since 1911. Truth crushed to earth will rise again, though oftentimes it rises with exceeding slowness. The truth that full-crew laws are wasteful and unnecessary, and are substantially nothing but blackmail, has been fully evident, to everybody who cared to look, on every day since that law was passed. Railroad stockholders, outside of Pennsylvania, who may not be interested in the loss of 40 millions in ten years in that state, will do well to reflect that 40 millions in *one year* is the estimated aggregate of the present cost of the full-crew laws in all of the states

which keep up this foolishness. Not every stockholder can reach the legislators who rule his railroad—his position may be like that of an absentee landlord—but every stockholder has a duty to make his voice heard. If he can speak with the right tone and force, the Associated Press will telegraph his words to every state in the Union within 24 hours after they are uttered.

The recommendations of the governors' committee of the New England states, which are reproduced on another page of this issue, are to the effect that the executives of the New England roads have not shown that an increase of ten per cent in freight rates and passenger fares will remedy the New England situation or that with such an increase New England's interests will not suffer. This means that another of the several efforts of the New England carriers to remedy their situation has come to naught. The real gist of the committee's recommendations seems to lie, however, as much in its expressions of opinion concerning the railway situation of the country as a whole as in its comments on the desirability of the suggested increase in rates. The committee makes some rather far-reaching proposals, some of which will be generally agreed with and others of which will probably meet with opposition. It will be agreed that the government should be more prompt in fulfilling its obligations toward the railroads as to paying the amounts due them. The proposal that the period of federal guaranty should be extended, retroactive to September 1, 1920, will probably not be so readily accepted. One of the recommendations says, "We believe Congress should consider whether the present method of settling labor disputes is entirely adequate, and if not in what respect it may be remedied or altered." This is a thought that is undoubtedly being brought to the minds of many other observers; the expression of it emphasizes that the realization that railroad progress is waiting upon the Labor Board is becoming more wide-spread from day to day. It is rather evident from the committee's decision as a whole that the New England states are not prepared, as yet at least, to take it upon themselves to solve the New England railroad problem. They apparently feel that since it was the national government that brought on federal control, it is the national government's duty to bring about the remedy of the faults of federal control. Apparently, however, the committee does not believe that the government thus far has done as much to remedy the situation as might be wished.

Railroad repair shops and enginehouses are greatly in debt to the electric storage battery truck as a means for transporting material of all kinds from one department to another promptly and at a low cost. Second only to the scientific layout of shops, departments, machinery and equipment, is the need for wide, clear passage-ways and rugged, reliable, power-operated trucks. Hard, smooth walks should connect all shops and buildings and inside the shops passage-ways from one department to another should be kept clear. Some

### New England Increases Opposed

### One Full-Crew Law Repealed

### Railroad Shop Transportation Systems

form of motor truck, operated either independently or with trailers, should be used for transporting locomotive parts and other material from one place to another. While other forms of motive power may be used, the electric storage battery truck, on account of its ease of operation, reliability and relatively low cost, has won high favor for this purpose. Not only should all possible hand trucking be eliminated but careless, irregular operation of motor trucks should also be discouraged. In many shops a schedule of truck operation has been installed whereby the trucks leave certain points at specified times; for example, every hour. This scheduling greatly facilitates the movement of material and in many cases has been developed to such a state that the shop may accurately be said to have a transportation system. As a means of obtaining more economical shop operation and increasing capacity, railway shop managers can hardly do better than attend to the construction or improvement of walks and passage-ways between shops and outline systematic shop transportation systems. The advantages consist not only in moving material at a reduced labor cost, but the actual production of individual departments will be increased. As soon as a machine part has one operation completed, it should be moved promptly to the next machine. This accomplishes two purposes; it shows the man who has just completed the operation that the part is needed and it enables the man who is to perform the next operation to see what work is ahead of him. No man is going to speed up his production if he sees only a little work ahead which can be completed in a short time. The result of promptly moving material and keeping work always ahead of the men will be a surprisingly large increase in shop output.

The retirement of William Hood from active service as chief engineer of the Southern Pacific, as noted elsewhere in this issue, marks the passing of a period

#### William Hood, Railroad Builder

in American railway history. William Hood has been a railway builder and his principal activities have been in that portion of the United States where pioneer railroading has had its longest lease of life. The railway engineer of the newer type studies the railroads as a field for more intensive development. Mr. Hood stands foremost among those who studied the undeveloped country as a place to build railroads. His career has been one of unusual human interest, notwithstanding the fact that his entire active railway service of over half a century has been devoted to one property. Of particular note is the fact that it commenced in 1867 with employment in a minor capacity on the construction of the Central Pacific through the Sierra Nevadas during the drive to complete the first transcontinental line. This initial section of the present Pacific system of the Southern Pacific was then only 90 miles long and the 7,000 miles of line which have since been added to the Pacific system were built largely under his direction, for whether he was locating engineer, assistant chief engineer, or chief engineer, the position he occupied for the last 37 years, his place was always out on the line where the location was being fitted to the country. Mr. Hood has always been a leader in that school of railway men who believe in the gospel of "It can be done." By the same token he has been no respecter of the conventional when it came to the selection of the method. The Lucin cut-off testifies emphatically to this and to his courageous loyalty to his established convictions. His particular value to his employers may be ascribed primarily to his profound knowledge of the detailed topography of the territory naturally tributary to the Southern Pacific lines. This made him a tower of strength in the days of competitive railway building and of particular economic value in the later days of more conservative railway projec-

tion. With the virtual closing of the period of great railway extensions in this country, Mr. Hood has earned a well merited retirement with his work completed.

### Patience Needed in Rate Readjustment

THE OPINION is quite commonly held, particularly among people whose impressions and knowledge of railroad conditions are somewhat more general than those they hold regarding their own business, for example, that high freight rates are a very important, if not the most important factor in, or cause of, the general business depression which is attending our efforts to get readjusted from wartime to more normal conditions. Herbert Hoover, Secretary of Commerce, is one of the most prominent of those whose remarks, at least as quoted or reflected in the newspapers, would tend to create such an impression. President Harding is understood to have expressed similar views in his talks to newspaper men and such an impression might easily be gained from his address at the opening of Congress. We are not aware, however, that either of these gentlemen has expressed himself specifically on the question which is being much discussed as to whether rate reductions should precede or should merely be expected to follow important reductions in the operating costs which are the cause for the high rates.

Mr. Hoover's address before the United States Chamber of Commerce at Atlantic City last week indicates that perhaps he is less radical or less impatient on the subject than a mere statement that "rates are too high" might indicate. He refers to "complaints" that the latest increase in rates is stifling production, and he says "we must look forward to *ultimate* reductions in rates if the economic levels of the country are to find an equilibrium," but that is quite different from the demand being made in some quarters for an *immediate* reduction in rates as the primary requisite of the situation.

Since Mr. Hoover is so looked to as an oracle we should like very much to see him develop a little further the thought he expressed in saying, "Part of the bitterness of the situation arises from the inequalities in the progress of these readjustments in the different walks of life and in different branches of industry." To illustrate this he presented a table comparing recent commodity and labor indexes as compared with a 100 pre-war basis (apparently 1913) which showed that while railroad receipts per ton-mile have increased to 166, farm prices for crops are now at 115, farm prices for animals 123, wholesale food 150 and retail food 156, while building materials are 212, the New York Industrial Commission wage index is 212 and the Department of Labor union wage index is 199. He omits the Department of Labor index of wholesale prices, which was 162 for March, and we believe it is generally agreed that retail prices have fallen less than the wholesale prices. This table would seem to indicate that the freight rates are not so far out of line as to prove that they are the chief factor in the situation. It indicates that the producers of farm products, whose prices are fixed by the market without much reference to cost, are at present less successful than other industries in passing their costs along to the consumer, but we fail to find in it any argument that the railroads, that for 28 months were specifically limited to their pre-war profits and are now as a whole earning less than their operating expenses, should be the first to hasten to the aid of the farmers. The idea that they should is undoubtedly due to the fact that we have got into the habit of regulating freight rates while we have not developed to any great extent a practice of regulating prices, although to attempt to regulate prices through the medium of freight rates is to try to make the tail wag the dog. We refrain from saying that the farmer "got his" during the war,

while the railroads did not, because we are aware of his claim that the guaranteed price of wheat, which most people think represented a large profit, in reality represented a restriction, just as railroad men know that their guaranty, which the farmer thinks represented a huge profit, was in reality a restriction.

Possibly if we had an all-powerful Interstate Commerce Commission with a jurisdiction as broad as its name instead of being restricted mainly to the transportation side of commerce, it might proceed to correct the discrimination indicated by Mr. Hoover's table by ordering a general reduction of wages, a smaller reduction in wholesale and retail prices, somewhat less of a reduction in freight rates and perhaps an increase in the prices of farm products. Undoubtedly if every one knew that everybody else were to have his wages or prices cut he would soon discover that his own compensation could stand a cut of similar proportions, because of the increased purchasing power of his money, but it would seem rather hard to ask the last man to have his units of income inflated begin the process of deflation. Prices and wages have for several years kept a couple of jumps ahead of the increases in freight rates. The fact that the governmental policy which postponed the latest advance until some of the other prices had begun to fall naturally magnified the effect of the rate increase and leads to irritation but does not change the fact that freight rates are not relatively high.

Mr. Hoover questions "the continued use of an emergency horizontal basis of rate increases" and says that "even though the same total income must be earned by the railways there must be a commodity and class readjustment in rates both in the interest of the community and the railways themselves."

He adds that such a readjustment was forecast by the Interstate Commerce Commission as a necessity at the time of the rate increase and he might have added that no one disputes his point, except where it is made in total disregard of the cost of performing the service.

## Limitations on Economical Speed of Trains

IN AN ARTICLE elsewhere in this issue, the effects of increasing running speeds on the energy required to perform a given train movement is discussed by G. S. Chiles and R. G. Kelley, whose conclusions are based on the results obtained in the University of Illinois train resistance tests. There has been some reluctance to accept the results of these tests so far as they apply to low speeds because in road tests conducted primarily for tonnage rating purposes or to study locomotive performance, other unmeasured variables have masked the effects of any tendency toward increasing train resistance for speed increases from five to fifteen or twenty miles an hour which might have existed. Considering the accuracy with which the University of Illinois test data were obtained and the care used in arriving at the conclusions stated, it seems probable that were a sufficiently large number of train movements considered to average out the effect of variable weather conditions and differences in the condition of equipment, the effect of speed increases in increasing train resistance would be evident within the common rates of freight train speeds. In any attempt to determine the most economical freight train speed this tendency cannot safely be dismissed without consideration.

Another factor which must also be taken into account is the characteristics of the locomotive itself. In most discussions of steam locomotive capacity there is a tendency to place great stress on its horsepower characteristics. From an engineering standpoint this may be justified, and in the case of passenger locomotives where the maintenance of schedules requires the

operation of the locomotive to its full capacity at high speeds, the horsepower is a practical unit for measuring capacity. In the case of freight locomotives, however, the horsepower unit is misleading. By inference it leads to the erroneous assumption that full power capacity may be utilized advantageously irrespective of whether it be attained at low speed with a high tractive effort or at high speed with a low tractive effort.

The full horsepower capacity of modern freight locomotives will probably not be reached at speeds much under 30 to 35 miles an hour and in operating to capacity the most economical fuel rate will not be reached short of these speeds. Now, considering the utilization of the locomotive purely from the standpoint of the amount of work produced per unit of distance rather than per unit of time, it will be found that a given tractive effort may be maintained with a materially smaller coal consumption per mile at speeds considerably below the maximum speed that may be attainable with that tractive effort.

This matter is of importance in considering the economical speed of freight trains because of the fact that the conditions which fix the maximum tonnage usually apply for a comparatively small portion of the total distance over an operating district and hence, if the full horsepower capacity of the locomotive is to be utilized with the reduced tractive effort required over the remaining portions of the district it can only be done by increasing the speed, frequently well beyond the point at which overtime ceases. From the standpoint of operating expenses such speeds are detrimental because of the fact that above, say, ten miles an hour the lower the speed at which a given tractive effort is maintained the lower the cost of fuel per 1,000 gross ton-miles. For instance, one modern Mikado type locomotive capable of developing about 65 per cent of its maximum tractive effort at a speed of 25 miles an hour can do so only at the expense of a 36 per cent increase in the amount of fuel per unit of work produced, over the amount required to maintain the same tractive effort at 20 miles an hour, while the increase in the fuel consumption per unit of work required to maintain the maximum speed of 25 miles an hour over that required to operate at 15 miles an hour is about 55 per cent. This fact is well recognized in every-day operating practice in the attempts which are made to determine the most economical cut-offs for a given set of conditions, rather than the cut-off which will produce the highest speed. In discussions of locomotive capacity in terms of horsepower, however, it is not infrequently overlooked.

The same effect on fuel consumption, though to a less marked degree, will be produced if the running speed of a freight locomotive is increased at the expense of the train load, that is, by keeping the cut-off within the economical range, which will probably be around 50 per cent in most cases. In a range of speed from 10 to 25 miles an hour under these conditions, there will probably be an increase in the cost of fuel per unit of work performed of 10 or 15 per cent. Whether running speeds higher than those now commonly employed are obtained by working the locomotive nearer to its horsepower capacity or by reducing the tonnage and maintaining the most economical cut-off, there is likely to be a material increase in the coal consumption per unit of work performed.

The tendency of speed increases to increase both the fuel cost per unit of work and the amount of work to be done for a given gross ton-mile movement creates a direct charge against the saving in wage costs effected by reducing overtime which may make it cheaper to pay some overtime if high running speeds are necessary for its complete elimination. In any case, it is evident that reductions in crew overtime can best be obtained by providing facilities, both road and terminal, by which delays may be eliminated. Fuel as well as wage costs will thus be reduced and there will not be the

increase in enginehouse expense which would follow the increase in train mileage made necessary if the higher running speeds were obtained by tonnage reductions.

## The "Fancy" Salaries of Railway Officers

IN THE indictments which somebody always is drawing against the managements of the railways there always is included the charge that they pay their officers excessive salaries. Hardly a day passes that somebody does not publicly and solemnly allege that if the railways would eliminate the "waste" due to "fancy" salaries they could pay their employees more or reduce their rates. The other day a member of Congress introduced a bill to provide that in future no railway company pay any officer more than \$15,000 a year without the previous approval of the Interstate Commerce Commission.

Of all the asinine charges made against the managements of the railways this one about excessive salaries is perhaps the most asinine. It may cause some astonishment to those who believe the railways waste large amounts in salaries to be told that if in the year 1920 they had not paid a dollar of salary to any of their 22,000 general and divisional officers their total payroll would have been only 2.5 per cent less than it was, and their total operating expenses would have been only 1.7 per cent less than they were.

All of the alleged "fancy" salaries are included in those paid to the general officers. The general officers include all the chairmen, presidents, vice-presidents, general managers, traffic managers, and so on; and many people believe that since some of these officers receive \$50,000 to \$75,000 a year the total amount paid to them is enormous and the burden imposed on the railways and the public very great. People who think thus will be surprised to learn the statistics of the Interstate Commerce Commission show that if the railways in the year 1920 had not paid a dollar of salary to any of their general officers their operating expenses would have been less than six-tenths of one per cent less than they were. To state the matter in another way, if not a dollar of salary had been paid to any general officer the operating expenses would have been 99.42 per cent as much as they actually were.

Since the extravagant talk about railway salaries is always being renewed, we have had compiled and publish in

single officer the total expenses would have been from 97.8 per cent to 98.4 per cent of what they actually were.

In 1916 and 1917 salaries of all officers were 1.4 per cent of the total earnings; in 1918, 1.3 per cent, and in 1919 and 1920, 1.5 per cent. In other words, in these years, out of each dollar that the public paid for all kinds of railroad transportation, freight, passenger, mail and express, the officers as a whole received from 1.3 cents to 1½ cents. In 1920 out of each 100 cents the public paid the railways, the general officers, including all those with alleged "fancy" salaries, received 7.5 mills.

In recent discussions of needed reductions of the railroad payroll, it repeatedly has been suggested that if wages are to be reduced the salaries of officers should be reduced in proportion. Let us see, then, what have been the relative increases in salaries, on the one hand, and wages on the other, since 1916. In 1916 the average salary of a general officer was \$4,508, and in 1920 it was \$5,542, an increase of 20.7 per cent. In 1916 the average salary of a division officer was \$1,998, and in 1920 it was \$3,319, an increase of 66.1 per cent. The average pay of passenger locomotive engineers and motormen in 1920 was \$3,310, or only \$9 less than that of division officers. Between 1916 and 1920, however, the average compensation of all employees increased 104 per cent, and it is now almost 114 per cent more than in 1916. Since the advances in salaries of officers as a whole have been relatively less than half as great as in the wages of employees, and have not at any time even approached the increases in the cost of living, while the advances in wages have exceeded the increases in the cost of living, it is wholly unfair to suggest that if wages are to be reduced salaries shall be reduced in the same proportion.

The only year for which the salaries of all officers receiving \$20,000 or more have ever been published is 1917. The figures for that year showed there were 200 officers who received this much or more and that their total compensation amounted to \$6,644,074. This was 2.3 mills out of each dollar of operating expense the railways incurred in that year and 1.6 mills out of each dollar they earned. There were only 29 officers who received \$50,000 or more and their total compensation was \$1,900,000. This was two-thirds of one mill out of each dollar of operating expense the railways incurred and one-half of one mill out of each dollar of their total earnings. The ratios of the salaries amounting to \$20,000 or more and of those amounting to \$50,000 or more

	1916	1917	1918	1919	1920
Total compensation all officers and employees.....	\$1,468,576,394	\$1,739,482,142	\$2,613,813,351	\$2,843,128,432	\$3,698,216,351
Total compensation all officers.....	\$53,273,758	\$57,346,610	\$65,551,316	\$77,435,168	\$92,460,835
Per cent of officers' compensation to total compensation all employees.....	3.6	3.9	2.5	2.7	2.5
Total operating expenses.....	\$2,426,250,521	\$2,829,325,124	\$3,982,068,197	\$4,419,441,949	\$5,826,197,474
Per cent officers' compensation to total operating expenses....	2.2	2.0	1.6	1.7	1.7
Gross earnings.....	\$3,691,065,217	\$4,014,142,747	\$4,880,933,480	\$5,184,064,221	\$6,225,402,763
Per cent officers' compensation to gross earnings.....	1.4	1.4	1.3	1.5	1.5

an accompanying table statistics showing the total compensation paid to railway officers in each of the years 1916 to 1920 inclusive, together with the total compensation paid to all officers and employees, the total operating expenses incurred, and the total earnings earned in these years.

In 1916 the salaries of all officers, general and divisional, were 3.6 per cent of the total payroll (including both the salaries of officers and the wages of employees); in 1917, 3.9 per cent; in 1918, 2.5 per cent; in 1919, 2.7 per cent, and in 1920, 2.5 per cent. In other words, in these years the wages of the employees amounted to from 96.1 to 97½ per cent of the total payroll.

In 1916 the salaries of all officers were 2.2 per cent of the total operating expenses; in 1917, 2 per cent; in 1918, 1.6 per cent; in 1919 and 1920, 1.7 per cent. In other words, if not a dollar of salary had been paid in these years to a

total operating expenses and total earnings in 1920 undoubtedly were smaller than they were in 1917.

These figures demonstrate conclusively that no reduction of salaries that conceivably could be made would have any perceptible effect in reducing the operating expenses that the railways incur or the rates that they must charge. The fact is that salaries as a whole in the railway business are low as compared with those paid in other industries, and that even the largest salaries paid are small compared with the earnings of successful men in other lines of professional and business activity. When people talk about salaries of \$25,000 to \$75,000 a year in the railroad business being excessive, they do not stop to think that successful men in almost all other lines of business make larger incomes than this. There is hardly an opera star or a moving picture star who does not earn much more. The public goes to the movies night

after night and indirectly pays Charlie Chaplin many times as much for getting his face bespattered with pie as it pays any man in America for managing a great railroad system.

How long would men of ability and ambition enter or stay in the railroad business if they knew that there was no opportunity in it to earn incomes comparable with those earned in other lines of professional and business activity? Hardly a month passes when men of this kind do not leave the railroads to accept higher salaries than the railroads will pay. Remove all the large prizes from the business and within a generation there will hardly be left in it a man of ambition and ability. But it is absolutely necessary to have such men in important positions if the railroads are to be efficiently developed and managed; and if they are not efficiently developed and managed their service is bound constantly to grow worse and more expensive to the public.

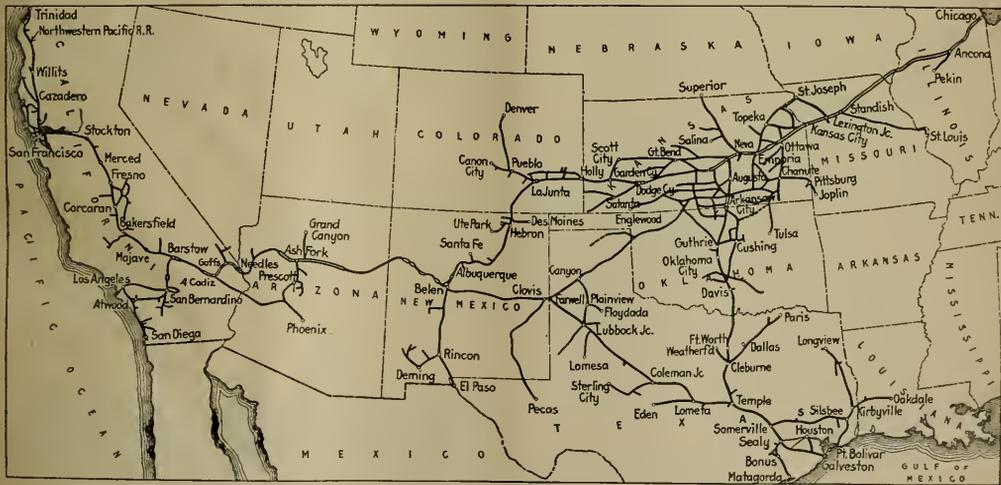

### Atchison, Topeka & Santa Fe

THE ANNUAL REPORT of the Atchison, Topeka & Santa Fe for 1920 and the figures of operation of that system for the first two months of the present year furnish about the most effective reply that we have yet seen to the fanciful and misleading propaganda which the labor economist, W. Jt Lauck, has been expounding for the past few weeks. Mr. Lauck has secured wide circulation for the published statements containing his charges of inefficiency in railroad opera-

ferred and 6 per cent on its common stock, which, in 1920, amounted to \$19,649,795. These figures characterize the Santa Fe as very much of an exception.

The Santa Fe is recognized to be almost all that a railroad property ought to be. It is built through a territory of great traffic possibilities; its roadbed and equipment are in exceptionally good shape despite the deferred maintenance of the federal control period. The system is efficiently operated and the character of its high grade service, both freight and passenger, is too well known to need comment. The question that might arise is what is the system doing at present. Perusal of the monthly reports to the Interstate Commerce Commission shows that for the first two months of the present year it had a net railway operating deficit. It did not even earn its fixed charges, still less its dividends.

We submit that the fact that a road like this—one of the very few which earned a net for the government during federal control and which in 1920 earned enough from operations to have paid its usual dividends—failed to earn its fixed charges in the first two months of 1921, is most disconcerting. It indicates how really serious the railway situation has become and shows how prompt must be the measures taken to remedy it. We are nevertheless optimistic on the railway situation in general and particularly on the Santa Fe. Measures to remedy the situation in general are being taken by the one man who can probably do the most toward securing results, namely, President Harding. There can, of course, be no question that whatever improvement may be made in the

The Atchison, Topeka & Santa Fe

tion, which he has been issuing in his attempts to divert the public's attention from the real issues before the Labor Board.

The Santa Fe system is one of the very few properties that earned a net for the government during the federal control period. Its net railway operating income, as defined in the federal control act, for the 26 months of federal control, as stated on the federal books, was \$98,919,277, whereas the standard return for the federal control period was about \$95,000,000. This earning power was further evidenced during the year 1920. The net railway operating income for 1920, that is, without taking into consideration the standard return for January and February and the guaranty for the guaranty period, was \$24,005,615. In other words, the system would have been able, without the standard return or the guaranty, to pay the usual 5 per cent dividends on its pre-

ferred and 6 per cent on its common stock, which, in 1920, amounted to \$24,005,615. This compared with \$38,035,651 in 1919. The explanation should be made, however, that for the purpose of approximating the amount of the maintenance to which the company was entitled under the Transportation Act, it set up an equalization reserve for maintenance. In creating this reserve there was charged to maintenance of way and structures and maintenance of equipment an amount of \$13,374,956 in excess of the expenditures for such purposes and the normal depreciation and retirement charges usually made by the company. "The setting up of these equalization accounts, it is noted in the annual report, which has not heretofore been customary for this company, is

reflected in Santa Fe earnings.

reflected in the amount of \$14,030,036 in the decreases in the net railway operating income (corporate and federal) for the year 1920.<sup>17</sup>

The corporate income account for the year, in which is taken into consideration the standard return for January and February and the guaranty for the guaranty period, shows a net corporate income of \$37,634,752 as compared with \$43,098,658 in 1919, or \$28,348,433 in 1918. The usual dividends of 5 per cent were paid on the preferred stock and 7 per cent on the common. These dividends with the addition of certain small appropriations to fuel reserve and sinking funds amounted to \$19,753,292, so that there was a surplus carried to profit and loss amounting to \$17,881,460.

The Santa Fe system in 1920 carried 36,850,553 tons of freight as compared with 31,811,576 in 1919. The revenue ton-mileage was 12,806,128,501 in 1920; in 1919, 11,931,107,874. The Santa Fe secures an unusually long haul on the freight it carries; in 1920 the average haul was 348 miles; in 1919 it was 375. Although the business done in 1920 was in excess of that done in 1919, it was about on a par with that done in previous good years. During the latter part of 1919 and up to the latter part of 1920, with the exception, of course, of the period last April, when operations were handicapped by the outlaw strike, the Santa Fe was handling a tremendous volume of freight traffic. This traffic did not continue during the last four months of 1920 when the road was operating on its own. The falling off since November has been especially marked, the traffic handled in December, January, etc., being at a low level.

The Santa Fe system as a whole comprises 11,675 miles of line. Covering such an extended area as it does, it is to be expected that its traffic should be well diversified. In 1920 products of agriculture made up 20.83 per cent of the total tonnage; products of animals, 4.08 per cent; products of mines, 35 per cent; products of forests, 7.75 per cent, and manufactures and miscellaneous, 27.39 per cent. Because of its well located line in the San Joaquin Valley of California and its many feeders in the region inland from Los Angeles the system is in an especially favorable position for handling the many varied products of that territory, and because of its direct line to the east it is able to offer a fast service on which it gets a long haul. The road's operations are not characterized, however, by heavy train loads or by a high figure of ton-miles daily per car. The net tons per train—revenue and non-revenue freight—in 1920 were 569. This compared with 557 in 1919 and represents a progressive increase over many years, the average train load in 1916 being 442; in 1917, 468, etc. In 1920 the average load per loaded car was 23.12 as compared with 22.23 in 1919. The average revenue per ton in 1920 was \$4.57; per ton mile 1.316 cents. The average haul was, as noted above, 348 miles.

The story of the expansion and improvement of the Santa Fe for the past two decades is one of the epics of American railroading. This expansion and improvement was continued in a degree during 1920. The mileage of the system at the beginning of the year was 11,483, at the end of the year, 11,674, an increase of 191 miles. This increase was brought about principally through the following developments: The Buffalo Northwestern, extending from Waynoka, Woods County, Okla., to Buffalo, Harper County, 51 miles, acquired while partly completed, was finished and placed in operation July 1. The North Texas & Santa Fe, Shattuck, Ellis County, Okla., to Spearman, Hansford County, Texas, 85 miles, was placed in operation July 1. Extensions of the Minkler Southern from Porterville, Calif., to Ducor, 12 miles, and from Oil Junction to Bakersfield, 3 miles, were placed in operation July 15. Trackage rights over the Southern Pacific between Ducor and Oil Junction, secured in a contract effective also July 15, give the Minkler Southern its necessary outlet.

Considerable improvement has also been effected in the way of equipment. The total number of locomotives owned on December 31, 1920, was 2,188. The average tractive effort of these locomotives was 37,898 lb. as compared with an average tractive effort of locomotives on January 1, 1920, of 36,741 lb., an increase of 3.1 per cent during the year. The Santa Fe was allocated 2,700 forty-ton double sheathed box cars by the Railroad Administration, which equipment was financed through the equipment trust agreement made between the Director-General, the Guaranty Trust Company and the railroad. None of the standard locomotives were allocated to the Santa Fe system by the U. S. R. A. During 1920, however, orders were placed by the road for 30 heavy Mikado, 10 Santa Fe and 10 Mountain type locomotives and for 500 gondola and 2,500 refrigerator cars. These orders have since been supplemented by orders placed in March, this year, for 1,300 gondola cars. The Santa Fe is noted for being a careful buyer of equipment, more particularly because it generally places an order or two in times of depression when prices are at their lowest. It is significant, therefore, that the order mentioned as placed in March this year is one of the very few which have been placed by railroads since January 1, 1921.

The figures for operation for 1920 as compared with 1919 are given as follows:

	1920	1919
Operating revenues—		
Freight .....	\$168,472,129	\$144,743,867
Passenger .....	63,473,165	52,982,906
Total operating revenues .....	254,249,002	209,500,004
Operating expenses—		
Maintenance of way and structures .....	*48,832,692	29,322,158
Maintenance of equipment .....	*63,039,846	46,020,979
Traffic .....	3,173,385	1,976,515
Transportation .....	98,515,309	75,529,553
General .....	5,216,198	4,421,588
Total operating expenses .....	218,077,115	156,642,823
Net operating revenue .....	36,171,887	52,857,181
Railway tax accruals .....	12,004,141	12,510,735
Railway operating income .....	24,117,711	40,304,204
Net railway operating income .....	24,005,615	38,035,651

\* Including equalization charges.

The corporate income account is given in brief as follows:

	1920	1919
Standard return, 1919 .....		\$44,615,087
Standard return, Jan. and Feb., 1920 .....	\$7,699,531	
Guaranty, Mar. 1 to Aug. 31 .....	22,533,225	
Operating income, Sept. 1 to Dec. 31 .....	12,983,725	
Other income .....	9,842,116	15,100,116
Gross income .....	53,078,597	59,715,203
Net income .....	37,634,753	43,098,658
Dividends—		
Preferred, 5 per cent .....	6,208,685	6,208,685
Common 6 per cent .....	13,441,110	13,351,695
Surplus .....	17,881,460	23,438,819

The Enginehouse and Machine Shop Layout

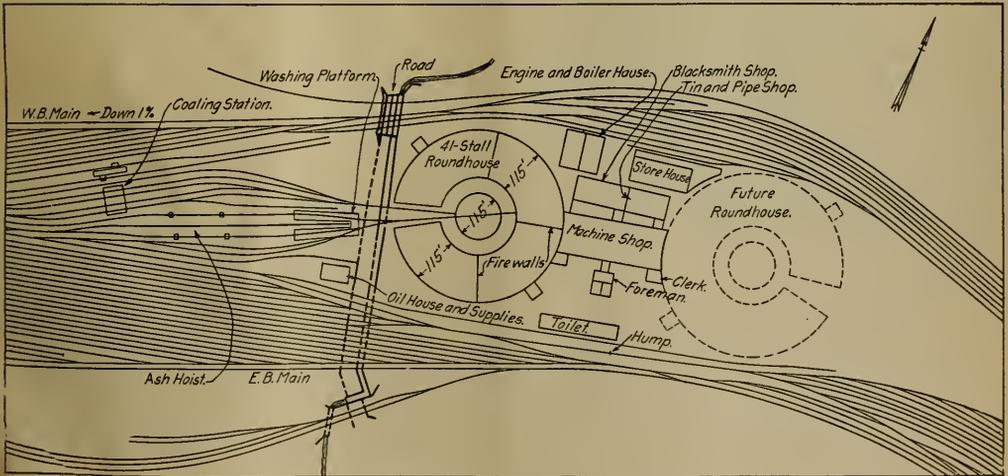

## Improving Terminals for Mallet Operation

Facilities for Norfolk & Western at Roanoke, Va., Form Part of Progressive Development Plan

AS A STEP in the provision of more adequate terminal facilities, the Norfolk & Western has recently completed and put into operation three 115-ft. enginehouses with complementary buildings. These structures are of modern type and construction and are designed primarily for the housing and care of Mallet locomotives. The completion of the enginehouses is another step farther in a long

ments at the latter location are by far the most comprehensive in their scope and because of that fact as well as the engineering and operating conditions created by the geographical location of the terminal and yard, they form the most interesting of the three developments.

The new structures have been built about two-thirds of a mile west of the existing engine facilities. This location has

Layout of the New Engine Terminal at Schaefer's Crossing

term program of development of yard and terminal facilities which was started previous to government control, carried forward to some degree during that period and since continued progressively at Roanoke, Va., Bristol, Tenn., and Shenandoah, Va. The work at the latter two places is practically completed in its final form. The work at Roanoke is, however, completed only up to and including the fourth step of what might be termed a six-step program. The improve-

ments at the latter location are by far the most comprehensive in their scope and because of that fact as well as the engineering and operating conditions created by the geographical location of the terminal and yard, they form the most interesting of the three developments. The new structures have been built about two-thirds of a mile west of the existing engine facilities. This location has

of roundhouse operation. A large machine shop will connect the two enginehouses, while the enginehouses and machine shop as a unit will be flanked by supporting structures, such as a power plant, wheel, forge and tool shops, offices, oil storage, lavatories and locker rooms, etc. Coal is supplied by means of a 1,200-ton Roberts & Schaefer coaling plant, now in full operation.

The yard work, of which little has been done so far, will consist of some re-arrangement of the present tracks, but chiefly of the extension of practically all of the existing yards in order to provide a minimum capacity of 100 cars per track. The old engine facilities at West Roanoke will be abandoned and the area so obtained utilized in the extension of the yards. The four steps so far completed, or about to be completed, include the construction of the coaling plant, the enginehouse, a 2,000,000-gal. water storage reservoir, a pump house, a water treating plant and parts of the supporting structures necessary to meet immediate needs. The fifth and sixth steps will consist of the completion of the second enginehouse and the remaining portions of the other buildings and shops and the extension of the yard tracks along with the necessary re-arrangement of the tracks caused by the elimination of the old enginehouses.

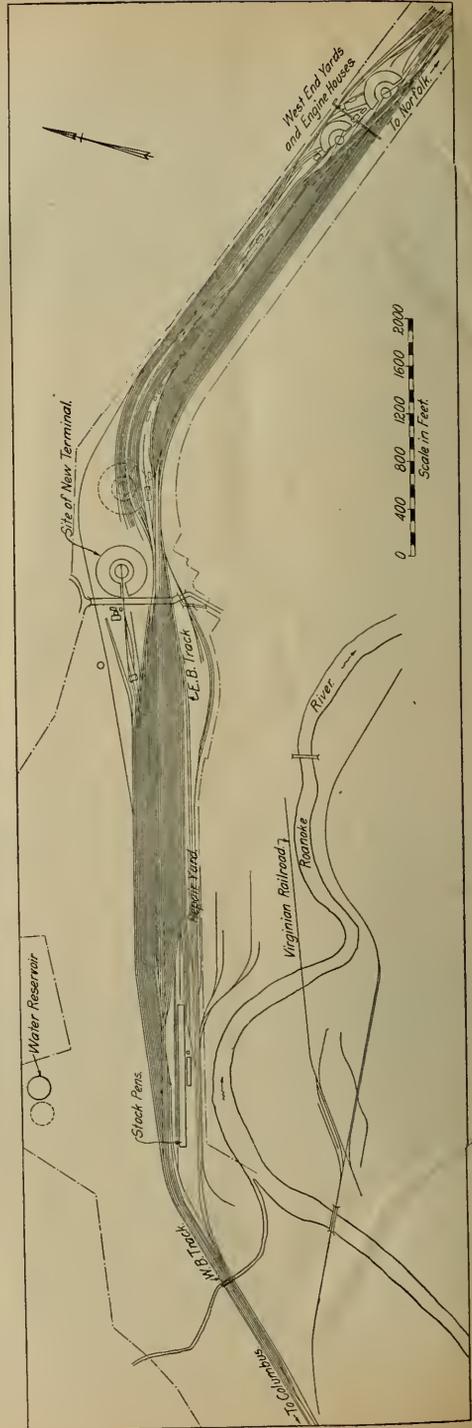

**The Trend of the Yard Development**

The Norfolk & Western, in passing through the city of Roanoke, follows the line of a valley located between surrounding low-lying hills upon which the city proper is built.

The Concrete Viaduct Over Schaefer's Crossing

From a point about two miles west of the passenger station and continuing west, the right of way practically parallels the low hills on one side and the Roanoke river on the other. In the earlier days, the yard developments, such as there were, were to the east and to the west of Jefferson street, one of the main thoroughfares of the city adjoining the passenger station. With subsequent increased traffic, additional yard and terminal facilities were made chiefly to the west of the station, the other facilities being used for car and locomotive shops. This development, however, was more of an end-to-end increase because of the limiting conditions imposed by the growth of the city on both sides of the railway's right of way and, to some extent, by the topographical conditions. This resulted in making the west end yards a string of small yards with capacities ranging from 340 cars up to 1,215 cars, which extended over a length of approximately five miles. The two enginehouses remaining from the older development work have been kept in operation and will probably be retained for this purpose until the completion of the second new house. These houses have respectively 23 stalls, 100 ft. in length and 20 stalls, 71 ft. in length.

The West End Yards of the Norfolk & Western at Roanoke, Va.

The city of Roanoke forms the receiving and dispatching center for five operating districts. These include the lines to and from Norfolk, Va., Hagerstown, Md., Winston-Salem, N. C., Bristol, Tenn., and Bluefield, W. Va. The double track main line extends from Columbus, Ohio, on the west through Bluefield and Roanoke to Norfolk or more strictly speaking to Lamberts Point, the deep water terminal of the Norfolk & Western. The traffic to and from Bristol and Bluefield is considered as a "west" movement, the remaining

movement through the yard from west to east follows the so-called south half of the yard. Freight from Bristol consists chiefly of lumber, merchandise and live stock, while the freight from the north, i. e., from Hagerstown, consists very largely of merchandise consigned to Bristol and other points farther south and to the west. Other freight from the north comes via water to Lamberts Point and moves chiefly west through Roanoke, although there is a small southern distribution. Freight from Winston-Salem generally moves

Showing the Interesting Construction of the Inner Circle

districts being classified as north, east and south movements. Thus, Roanoke actually forms the neck of a bottle and during normal freight hauling periods, a passenger or freight train is received or dispatched on an average of about every eight to nine minutes during the 24 hours. The engine turnover is approximately 180 locomotives a day, of which about 60 per cent are Mallets.

The movement from west to east is chiefly coal from the fields west of Bluefield, a majority of the trains entering

west. In spite of the large westward merchandise movement, a large proportion of the total westward movement is empty coal cars. Each of these movements, merchandise, empty coal cars, etc., is received and handled through the Roanoke yards and with a few exceptions the movement is continuously in the direction that these cars are to go.

Broadly speaking, the yards are divided into north and south sections, that is westbound traffic both on the main line and in its movement through the yards follows the more

A String of Mallet Locomotives at the Old Terminal

Roanoke being routed directly to Lamberts Point in solid trains that require little or no change in their make-up while in the Roanoke yards. The trains are received and dispatched from a receiving yard now containing 11 tracks with a capacity of 840 cars. Miscellaneous coal, merchandise and time freight form the balance of the traffic from Bluefield and other points west on the main line. This is received in a four-track yard from which it is humped into a centrally-located yard having 19 tracks of 1,215 cars capacity. The

northerly tracks. In this way back-up movements are eliminated as far as possible and with the proposed extension it will not be necessary to break trains. In addition, the location of the new engine facilities, plus the more modern and increased equipment there, will permit better housing and care of the locomotives as well as a probable decrease in the time required for their turnover.

The complete rehabilitation plans for this work will eliminate the two old enginehouses, as stated, as well as their

supporting buildings, such as power plants, machine shop, coaling station, etc. By means of this elimination of the old structures and the extension and re-arrangement of the present yard tracks so as to hold 100 cars each, it will be possible to secure approximately 40 to 50 per cent increase in the capacity of the yards. This will be done without any appreciable over-running of its present limits except at the extreme west end where the increased length of tracks will be secured by necessary extensions of the area now used for that purpose.

**The Re-arrangement of the Yard Tracks**

Practically the only re-arrangement of trackage that has been completed so far is the relocation of the westbound main. This originally was situated at the extreme north of the yard, but as the right of way at the site of the new engine-house facilities turned slightly to the west, it passed almost directly through the center of the proposed 115 ft. engine-house. In conformity with the final program, this main track was therefore re-located still farther to the north, and cut into the old westbound main at points some distance to the east and west. This change, accompanied by other minor changes in trackage, opened up an area upon which the first house could be constructed. However, before the second house can be built, it will also be necessary to relocate the ends of those yards now terminating in ladders opposite the east side of the first enginehouse. These will be swung to the north so that both the yard tracks for westbound movements as well as the westbound main will pass around and to the north of the completed engine terminal facilities. These changes, as well as the construction of the leads to the engine-house, have made it necessary to build a new four-track reinforced concrete viaduct and to widen another, both of which span a highway known as Schaefer's Crossing. This is in addition to a 15-track overhead crossing in use before the terminal improvements were begun. A creek crossing the

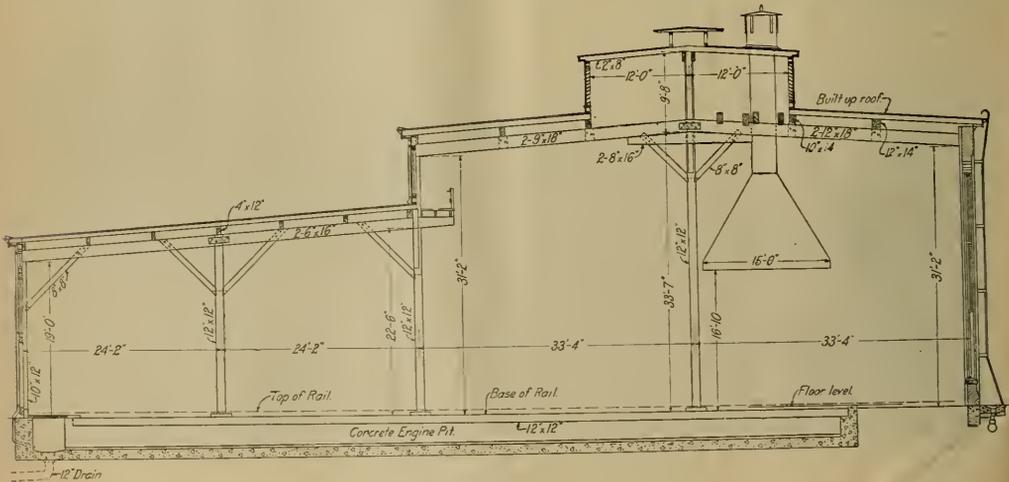

driven by an electric tractor. The inner radius of the house to the center line of the door posts is 96 ft. 7 1/4 in., with an angle between center lines of stalls of 8 deg. 18 min. 11 sec. The depth of the house is 115 ft. from the center of the door posts to the center line of the rear wall. This has been divided into four bays, two large and two small, each 33 ft. 4 in. and 24 ft. 2 in. in length respectively. The foundations and engine pits are of concrete and the rear walls, end

The Efficiency of the Lighting and Ventilation Is Clearly Illustrated. The Locomotive in the Foreground Is Exhausting Dense Clouds of Smoke

walls and fire walls of brick. The roof is of timber overlaid with tar and gravel roofing.

One of the most noticeable features of the structure is the ample provision for light and ventilation. For this purpose a modern monitor-type roof design was adopted which might in a way be called a double monitor. In this design the

A Section of the New Engine House

right of way at approximately this point has been led across under the tracks by means of an open concrete duct paralleling the roadway.

**The Enginehouse for Mallet Locomotives**

The enginehouse now practically completed is a typical circular structure with 40 stalls, served by two lead tracks from the west, and a 115-ft. deck plate girder turntable

rear walls have been carried up to give a clear height of 31 ft. 2 in. above the base of rail, corresponding with an equal clearance at the opposite side of the monitor section. The remaining section, consisting of the two 24-ft. 2-in. bays, has a typical shed roof sloping toward the turntable. The overhead clearances of this section are 19 ft. and 22 ft. 6 in. respectively. The monitor section covers the two 34 ft. 4 in. bay sections mentioned and in all but 12 stalls is carried on

9-in. by 18-in., and 12-in. by 18-in. rafters supported on the outer walls and two circumferential lines of 12-in. by 12-in. posts. The second or super monitor is also carried by this construction and extends 12 ft. each way from the center post of the monitor section, making it 24 ft. wide over all and giving a total clearance at the center post of 43 ft. 3 in. This second monitor also carries a continuous ventilator with clear openings on two sides 1 ft. 4 in. in height. The main ventilation is provided, however, by means of the smaller monitor which has opposed openings 5 ft. high fitted with louvers.

Additional ventilation as well as light is obtained by a row of pivoted sash running around the entire inner circle of the monitor section and by pivoted sections in the sash

One of Old West End Enginehouses

windows, forming a part of the rear walls. With a distance of 30 ft. 7 $\frac{3}{4}$  in. from center to center of pilasters and a clearance of 31 ft. 2 in., ample opportunity is afforded for a large light area. This has been accomplished through the construction of extra large sash windows covering almost the entire available space. The total width of each installation, consisting of three sections, is 21 ft. 10 $\frac{1}{2}$  in. with minimum and maximum heights of windows of 22 ft. 6 in. and 24 ft. 11 in. respectively. The entrance doors, with clear openings of 13 ft. 11 $\frac{1}{8}$  in. and clearances of 17 ft. 7 in. above the base of rail, have been built to correspond with the general lighting plan. Each half of the door contains 20 panels of glass, 11 in. by 18 in. in size, while two smaller sections of sash, consisting of six panels, each of the same size glass, have been installed in the walls just over the doors.

The locomotive exhaust gases are carried off by means of 4-ft. by 15-ft. asbestos smoke jacks, this size being used in all of the stalls except the 12 stalls mentioned in reference to the change in roof structure. In these stalls large 12-ft. by 15-ft. smoke jacks have been installed since it was necessary to raise them considerably higher than usual. This was necessitated because of the installation of a 10-ton traveling crane.

In order to accommodate this crane, the use of which was decided upon after the structure was under construction, the center posts of the monitor section were removed throughout the 12 stalls and another line set up directly under the outer edge of the secondary monitor. This provided an open bay 43 ft. wide along the center line of the stall and necessitated the use of a truss to support the roof structure. The crane runways were supported on additional posts fastened to the original line of posts under the inner circle of the main monitor section and the new line just mentioned. The clearance at the bottom of the truss was 28 ft. in this case. With the exception of this change in 12 of the 40 stalls, the superstructure is the same throughout, the roofing being of the built-up type mentioned, with tar and gravel roofing, all on a slope of  $\frac{1}{4}$  in. per ft. All posts are supported on 2-ft.

6-in. square concrete foundations extending from 2 ft. to 6 ft. down into solid earth.

### The Foundations Varied to Fit Conditions

Because of the wide irregularities of the earth contours at the site of the building over one half of it is on filled land, requiring up to 20 ft. of filling as a maximum. As a result it was necessary in about 20 stalls to support the walls on heavy 4-ft. by 6-ft. concrete piers placed under each pilaster. These piers in turn support reinforced concrete girders 2 ft. 6 in. in depth and 1 ft. 10 in. thick. The remainder of the house rests on solid concrete foundations carried down to solid earth. The irregular topography also had an effect on the design of the engine pits, the base of the pits on filled-in ground being made 10 ft. wide and reinforced with old rails in contrast to the pits of 8 ft. width used on firm ground. The latter pits were of mass construction. The engine pits, of which there is one for each track in the house, are 95 ft. long with 2-ft. by 5-ft. side walls poured integral with a base 1 ft. 3 in. thick which has been given the customary crown. The track is laid on two longitudinal lines of 12-in. by 12-in. timbers, the tops of which are 4 in. below the general floor level. A complete system of wheel pits following the same general idea regarding reinforcement and bearing area, etc., has been included in 8 of the 40 stalls. This layout consists of four complete sets of engine wheel drop pits, one set of which covers two tracks, two trailer pits for Mallet locomotives and two drop pits for tender trucks. The engine-house floor consists of 6 in. of limestone rock which is free from mud or clay and which has been sprinkled thoroughly and tamped as placed.

Pit drainage has been secured by giving the base of the pits a slope of 0.5 per cent toward the door end where they empty into a concrete trough 4 ft. wide just inside the en-

A Modern, Large Capacity Coaling Plant Rounds Out the Necessary Facilities

ginehouse doors. The major part of the roof drainage is toward the door end of the house and is emptied into the same concrete trough through down spouts. The drainage of the outer roof circle is handled in a similar manner, the trough in this case being on the outside of the building. Both arrangements are connected with a regular tile underground drain system.

### The Second Enginehouse and Supporting Buildings

The second enginehouse, when completed, will be located 685 ft. center to center of turntables and to the east. It will also have 40 stalls constructed similarly to the first house except that their length will be 130 ft. As already stated, these two buildings will be connected into a unit by a machine shop 100 ft. wide and 250 ft. long, the center line of

which will correspond to the center line connecting the turntables. A standard gage track will be laid along this line, thus forming an extension to the stall tracks at each end. The shops will be equipped to handle all ordinary running repairs and, for the purpose of facilitating this work, a complete 5,000-lb. monorail crane system will be installed.

In cross-section, the machine shop is of the monitor type with three bays of approximately equal widths. The clearance of the side bays is 21 ft. and of the central bay 26 ft. 5 $\frac{3}{8}$  in. The side walls are of brick carried on concrete foundations, a form of construction similar to that of the enginehouse and one that is used practically throughout all of the buildings. The roof structure, however, is entirely different, being steel trusses supported on built-up steel posts. The monitor has a rise of 12 ft. 5 $\frac{3}{8}$  in. and, for the purpose of light and ventilation, is equipped on each side with two longitudinal rows of steel sash and wire glass windows, the upper row of which is hinged. As the sides of the monitor are inclined inward 60 deg. from the horizontal, it was necessary that the sash of the top row overlap those of the bottom and likewise that the bottom row overlap the extension of the roofing at the base of the monitor in order to prevent the rain from beating in. The roof drainage is not permitted to run down over the sash windows, galvanized iron gutters and down spouts being installed for that purpose. Lighting in the side walls is obtained by double rows of sash windows installed the full length of the building.

The design of the enginehouse layout has made it possible to secure a very compact arrangement of supporting buildings, such as offices, carpenter shop and store house, etc. With the exception of a 35-ft. by 200-ft. toilet and wash-room building and a 50-ft. by 60-ft. office building, the remainder of the terminal structures have been located just to the north of the machine shop and between the two enginehouses. The smaller shops, such as carpenter, pipe, forge, etc., will be housed in a 60-ft. by 230-ft. building, connected to the machine shop at the center by a tool room. The other two structures of the unit will consist, when completed, of a 60-ft. by 150-ft. store house and a 94-ft. by 94-ft. engine and boiler house. Heavy concrete pavements or runways will be laid between and connecting all of the structures and a system of tractors and trailers installed to handle the necessary stores and materials.

When completed, the store house will have a platform around three sides of the building with a ramp leading down from the platform level to the level of the concrete pavement between the various structures. The interior will be arranged with lines of racks, giving aisles 10 ft. wide over which will be hung trolley beams in order that stores materials may be handled by either traveling trolleys or by the electric trucks and trailers.

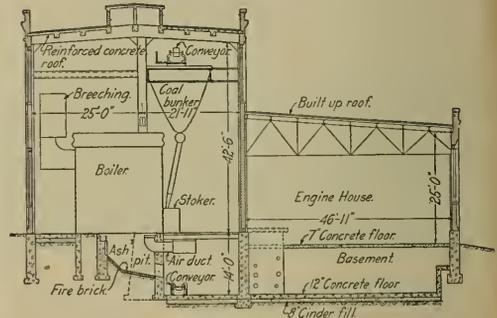

The engine and boiler house is of concrete construction practically throughout. The roof structure is supported on steel columns encased in brick while the roof proper has been built up of reinforced concrete roof beams and girders upon which concrete slabs have been laid. The present installation consists of four 300-h.p. boilers and an automatic coal and ash handling conveyor system. Coal, when delivered in cars, is elevated by this conveyor and dropped into parabolic hoppers which in turn feed it automatically to the boilers. Ashes are dropped into concrete pits underneath, where they are picked up by the conveyor and carried around to one end of the building and up to an ash storage bin.

#### A Large Capacity Water Supply System Installed

The Norfolk & Western has in the past purchased all of its water for both the East Roanoke and west end shops. However, owing to the restricted supply available for its use, it became necessary to furnish its own water at this new terminal. For this purpose a modern pumping unit was installed on the bank of the Roanoke river which supplies water

through an 18-in. main to a 2,000,000-gal. reservoir situated on a hilltop adjoining the railway's right of way. This reservoir, which consists of a large circular concrete tank with a baffle wall through the center to aid sedimentation, delivers water through about 3,800 ft. of 18-in. pipe to the new enginehouse, etc. Various piping arrangements have been installed in order that its flow may be directed to either a 100,000-gal. per hour water softening plant or, if so desired, direct to a 200,000-gal. concrete tank and thence to the numerous stand pipes. The flow can also be cut off from the reservoir proper and the water obtained directly from the pumping plant on the river site. The estimated consumption at this point is about 2,000,000 gal. per 24 hours.

The coal handling installation consists of a 1,200-ton re-

A Section Through the Power House

inforced concrete coaling plant of Roberts & Schaefer design, completely equipped with automatic bucket hoists and tram cars, a wet sand storage plant, a sand dryer and a coal crusher and cleaner for stoker coal. This plant serves six tracks, and is so located that a continuous movement of locomotives may be obtained direct from the receiving yards to the coaling plant, ash plant and washing platforms and into the roundhouse. The ash handling facilities consist of five hoists of a type whereby the ashes are dropped direct from the engine into buckets located in pits under the tracks. These buckets are then elevated by means of an inclined track and dumped automatically into open top cars on an adjoining track. Among the other facilities to be completed are an inspection pit serving two tracks and a concrete washing platform also serving a like number of tracks leading direct to the roundhouse.

The new facilities at Roanoke, Va., as well as those at Bristol and Shenandoah were designed by and erected under the direction of the engineering department of the Norfolk & Western, J. E. Crawford, chief engineer; W. P. Wiltsee, assistant engineer; F. P. Turner, engineer of bridges and buildings, and A. Bruner, assistant engineer in direct charge of the field work. The contractor doing the work was J. P. Pettyjohn & Co., Lynchburg, Va.

A PETITION has been filed with the Interstate Commerce Commission by F. B. Whitney, of Waukegan, Ill., as a railroad stockholder and a citizen of the United States, proposing the consideration by the commission for a plan of railroad consolidations through a limited number of transcontinental systems running in an east and west direction with roads running northerly and southerly as laterals, with particular reference to providing facilities for export and import trade. Mr. Whitney was formerly a member of the transportation committee of the American Manufacturers' Export Association.

# Proposes C. P. R. Operate Canadian National

## Searching Review of Canadian Crisis—Suggestion That Government Lines Be Handed Over to Canadian Pacific

**L**ORD SHAUGHNESSY, chairman of the Canadian Pacific, has proposed to the Canadian Government that his road operate all of the principal Canadian lines, except the Grand Trunk, and that a contract for that purpose be negotiated. This proposal, as was noticed briefly in the *Railway Age* of April 29, page 1045, was embodied in a letter to Prime Minister Arthur Meighen, in a letter dated April 6, but not made public until April 24.

In the letter, Lord Shaughnessy refers to the fact that he made a similar proposal in 1917 which evidently the government did not care to entertain lest such a monopoly (real or supposed) would be rejected by the country. Now, however, the situation demands drastic action; for the present burden on the public treasuries amounts to about \$200,000 a day. He says that the Canadian Pacific has no concealed purposes in the matter. Indeed, the chairman is not sure that this plan would be approved either by the directors or the shareholders; but something must be done, and the loyal citizen cannot remain silent.

Following is Lord Shaughnessy's proposal, substantially in full:

Since 1917 conditions have substantially changed. Capital expenditures that might have been avoided have been incurred, and the deficits of the weaker lines have increased by leaps and bounds.

It is not my purpose to discuss the railway policy of successive governments, federal and provincial, during the past thirty-five years. In most cases the legislation defining the policy received the approval of the electorate at the polls, and therefore if serious and expensive blunders were made, we should be prepared to pocket our chagrin and foot the bills with equanimity. We have, however, the obligation to try to discover and develop plans that may serve to relieve the Canadian people from some part of the distressing and dangerous financial results now in evidence and which threaten the future.

Canada has now about 40,000 miles of railway lines, of which 37 per cent earn annually their interest charges and give a return on the share capital; 54 per cent fail to earn their working expenses, and 9 per cent earn interest on some of their major securities, but have nothing to apply as dividend on the share capital.

### Grand Trunk System

Included in the last mentioned is the Grand Trunk Railway System, which is international in character, owning or controlling important railways in the United States with termini at Chicago, Portland and elsewhere. Serving considerable portions of the Provinces of Ontario and Quebec, the Grand Trunk System enjoys a substantial volume of Canadian traffic; but its international business yields the greater part of its gross revenue. Relieved of the handicap that was imposed by the Grand Trunk Pacific, the parent company should, in normal times, be in a position to pay the annual interest on most of its securities that take precedence of the common stock, but a return on the common stock would appear to be exceedingly remote in any circumstances. This railway system is, however, of national importance, and it would be unfortunate from our Canadian standpoint, if, hampered by the methods and ambitions of previous managements, the company should be kept in a state of embarrassment and should be prevented from carrying out plans for increased efficiency and economy. It would be still more unfortunate if by any process the Grand Trunk should be placed in a position that would have the effect of destroying, either on sentimental grounds or others, the movement through Canada of international traffic to and from its feeders in United States territory.

Even at this advanced stage it would be wise for the Dominion Government to drop all measures looking to the acquisition or control of the Grand Trunk to relieve that company of all obligations in connection with the Grand Trunk Pacific and to grant easy terms covering a period of years, for the repayment of any amounts advanced by the government to the Grand Trunk or secured on the credit of the government in the last two years.

### The Transcontinental Line

The National Transcontinental-Grand Trunk Pacific scheme of a line from Moncton to Prince Rupert was a deplorable blunder in its inception and execution. Doubtless the Grand Trunk objected to the line from Cochrane east, and only yielded under pressure, but the eastern and western termini of the line having been once determined, the Government was, I know, guided by the advice and wishes of the Grand Trunk management of that day in fixing the location and standard of construction. It was pointed out that grades of 0.4 per cent and light curvature would make for economical operation, because of the increased weight of the train that could be hauled over the line by a single engine. The theory was all right, but the basic essential was ignored. The traffic was not available and would not be available for a long period of time to furnish loads for these heavy trains, and therefore the advantages could not be utilized unless the practice were pursued of holding traffic until a sufficient amount was accumulated, with the consequent delay and expense and the dissatisfaction of patrons. A railway quite sufficient for any traffic likely to develop for many years could have been built in less than half the time, and at a saving of 50 per cent to 60 per cent in cost, and as business increased and revenue improved, the requisite changes to meet new demands could be carried out, as in the case of the Canadian Pacific.

Recognizing the National Transcontinental portion of the route as a national incubus, the Borden Government soon after coming into power, relieved the Grand Trunk Company from financial responsibility with reference to it, and the burden fell on the country.

### Grand Trunk Pacific

The extravagantly constructed Grand Trunk Pacific with its terminal at Prince Rupert, proved a most disappointing enterprise, because over most of the route there was no traffic to yield revenue sufficient to meet the interest charges on its mandatory securities, or, indeed, to cover the cost of maintenance and operation; meantime these interest charges, as well as any operating deficits, had to be met at regularly recurring periods, and the Grand Trunk Company could not have shouldered the burden without incurring financial disaster.

The Dominion Government finally took over the Grand Trunk Pacific; but coupled with it was the decision to acquire the Grand Trunk Railway System as well. Clearly this was a mistake, as all the advantages that would result to the Grand Trunk Pacific and other portions of the Canadian National Railways could have been secured by a traffic agreement.

By its Grand Trunk policy the Government is unnecessarily adding to its burdens, and the Grand Trunk System, as I have stated before, would now and hereafter be a much greater asset to Canada if privately owned and operated than it can possibly be if merged into the National System.

While the transfer of the Grand Trunk Pacific to the Government of Canada, and the consequent relief of the Grand Trunk Railway Company would appear to be a jug-handled transaction, it is not without its justification, because when the Dominion Government was framing its policy with reference to the route and character of the line the objections, and, indeed, dangers of the policy were frequently pointed out to the Government by those who had the requisite knowledge of the country and the technical experience to entitle their opinion and advice to more consideration than they received. The Government cannot escape its share of the blame.

### The Canadian Northern

The Canadian Northern System was by over-expansion made a hopeless business proposition. Without wishing to criticise the policy pursued by the company, it is evident that the future of the property was founded on the assumption that the prosperity and expansion which Canada enjoyed for a period of eight or ten years would continue indefinitely, and the mileage of the system was increased year by year until the annual interest charges of the company reached a sum out of all proportion to present or prospective revenue. Had the promoters confined themselves to the territory between Lake Superior and Edmonton, their venture would have been of advantage to the country and profitable to themselves, but their exploits east of Port Arthur and west of Edmonton were untimely and disastrous. It became clear that the company must collapse unless kept alive by very

large grants from the public treasury. For this there could be no justification, and the only other alternatives for the Government were to permit default and liquidation or to take the property over under the terms of the Act of 1914. The Dominion Government, having become a partner in the enterprise by accepting 40 per cent of the share capital at a cost to the country of \$57,000,000 in subsidies and guarantees, and being guarantor of the company's securities to a large amount, default and a receivership would have had their disadvantages. While it is probable that in the circumstances the country's interests were best served by the acquisition of the property, the legislation relating to the transaction would have been the subject of less criticism had provision been made for the payment of a very substantial honorarium to the men who had devoted nearly twenty years of their lives to the establishment and development of the enterprise instead of the creation of a tribunal to determine the value of something that in the minds of the large section of the public was valueless.

With the ownership or control of the Intercolonial, National Transcontinental, Canadian Northern and Grand Trunk Pacific lines vested in the Dominion Government, the Canadian people are now the proprietors of about 17,000 miles of railway, with a capital investment of say \$850,000,000, and an annual interest charge of something like \$34,000,000. In the annual interest charges nothing is included for the Intercolonial and Prince Edward Island Railways, for these have long been with us as unproductive and expensive property; nor for the National Transcontinental absorbed in the Consolidated Fund.

There is no rolling stock equipment nor are there terminal yards, freight facilities, repair shops or other requirements commensurate with a system of this magnitude, and the cost of providing them will be very great indeed.

### Operating Revenues

The operating revenue of the Canadian National Railways, including the Grand Trunk Pacific, for the year 1920, was as follows: From passengers, \$23,713,834; from freight, \$90,982,832. The train mileage required to earn this money was as follows: Passenger trains, 13,322,587 miles; freight trains, 24,485,286 miles. In the same period, Canadian Pacific earned from passengers \$49,125,738, and from carriage of freight, \$145,303,399, with passenger train mileage 20,538,038, and freight train mileage 26,281,627.

The train mileage on the Canadian National System is out of all proportion to the revenue, taking the Canadian Pacific as a standard. Were it possible to effect a reduction in train mileage on the National System to make the ratio of train miles to earnings, the same as that on the Canadian Pacific, the saving in transportation alone would represent upwards of \$22,000,000 per annum. This, however, is out of the question, because, while there might be a substantial shrinkage of train mileage without serious public inconvenience, the great mileage of the National System to be served and the limited traffic available prevent a proper relation between traffic and train miles.

The Canadian Pacific handled traffic representing revenue 71 per cent in excess of the Canadian National, with an additional cost of transportation of only 13 per cent. This is accounted for to some extent by the greater expense per train mile for transport on the National System. In this unit of operating expenses there would have been a saving of about \$6,500,000 if the Canadian Pacific basis had been reached.

### Maintenance Costs

Maintenance of way and structures cost the Canadian National about \$43,000,000 for 17,000 miles of railway, or an average of \$2,520 per mile. On the same account the Canadian Pacific expended \$32,574,000 on 13,402 miles of railway, an average of about \$2,430 per mile. Doubtless considerable expense was involved in bringing to a higher standard main lines of the National System that had been permitted to run down, but so large a percentage of the system consists of unimportant branches with light traffic where maintenance charges should be comparatively low that the average for the whole system would appear to be rather excessive. If it be assumed that destroyed and obsolete cars and locomotives were replaced in accordance with the Canadian Pacific practice, the expenditure for maintenance of equipment was not excessive, based on the Canadian Pacific average cost in the same year per locomotive and per car. Taking into account the extent of the System, the traffic and general expense of the Canadian National Railways are not excessive.

If the very large annual deficit resulting from the operation of these lines is to be reduced, it must come either from a substantial increase in revenue from traffic or a shrinkage in the cost of operating.

If immigration and settlement are not restricted by legislation or other conditions, there will in the ordinary course of events be a continuing growth of traffic, but at best this growth is apt

to be slow and quite insufficient to make any important impression on the annual results for some years to come.

Meanwhile the Canadian people will be compelled year after year to raise, by taxation, sufficient money to meet the appalling annual deficits, unless by some process the cost of the maintenance and operation of the National Lines can be brought to much lower figures. This, however, would not appear to be practicable, as the National System engaged in competition for traffic with another very strong railway company would be at serious disadvantage unless in train service, equipment and in other respects it offered the public facilities approaching those obtainable on other lines.

### Reduction of Rates

I have made no reference to the economies that will result from a revision of the schedule of wages and working conditions, which are on a fictitious basis and must be amended, because concurrent with this will be a reduction in the rates for the carriage of commodities that are essential if the country's basic industries are to be kept alive.

The situation is a serious one and almost hopeless unless some plan can be devised that will promptly and effectively bring to this National Railway System additional financial strength and sustenance.

With but one set of shareholders, the Canadian Pacific Railway Company is really two separate entities. The shareholders have their railways constituting the Canadian system of over 14,000 miles, with lake, river and Pacific coast steamship lines, express and other accessories whose income is included in last year's total of \$216,000,000, and the net revenue of \$33,000,000. And then they have their other assets that are dealt with in a separate account, consisting of their ownership in railway companies in the United States that are under separate management, but that interchange traffic with the company at the frontier, the ocean steamship lines, lands still owned and payments accruing on lands already sold, mining and other interests, in all representing a substantial sum from which revenue is derived to supplement the distribution to the shareholders from the proceeds of the railway operations.

If by some arrangement with the company these assets could be segregated and the railway property added to the government system that I have just described, the system would comprise 31,000 miles of railway with a considerable amount of parallel lines unimportant or useless.

### Price to Be Paid C. P. R.

The consideration to be given the shareholders of the Canadian Pacific in exchange for the properties above defined would, I imagine, be in the nature of an undertaking by the Government of Canada to pay to the shareholders in perpetuity a fixed annual dividend on the share capital, to be supplemented by a further payment when the whole property was yielding a specified return.

The extraneous assets of the Canadian Pacific would be transferred to and administered by trustees or by a subsidiary company with another board of directors, so that the directors of the railway company would be interested only in the administration of the trust placed in their hands by the people of Canada. There would be no motive for selfishness, if such a thing were possible in the circumstances. The income on their shares being fixed and unchangeable, excepting as above provided, the Canadian Pacific shareholders could receive no advantage from preferential treatment given to any particular portion of the railway system. The directorate would have every incentive for wise, prudent and business-like administration.

Of course there are many details that would have to be worked out, but it is not necessary to refer to them here.

### C. P. R. a Comprehensive Organization

Now, having brought these properties together, we are faced with the most serious problem of all, namely, that of administration and operation. Political management would be impossible, because among other reasons, policy and management must have the elements of continuity and could not be changed with each change of Government without ruinous results. While I have great regard for the opinion of my friends, Sir Henry Drayton and Sir William Acworth, I do not agree that their plan of management would eliminate the danger of political interference, because it could be changed at any session of Parliament. My suggestion would be that if an agreement with the Canadian Pacific on the lines that I have indicated were found feasible, that company would be used under the terms of a contract approaching perpetuity in its duration to administer and operate the whole property for account of the Canadian people. I mention the Canadian Pacific because the magnitude, scope and variety of its operations compel a comprehensive organization, and this could be supplemented by judicious selections from the staffs of the other companies to meet the demands of the larger work.

### Savings to be Effected

On the returns for the year 1920, the gross earnings of the combined system would be \$342,283,000, and the operating expenses \$345,973,000, a deficit in operation of approximately \$3,700,000. The annual fixed charges of the whole system, including the dividend on Canadian Pacific Preference Stock, would be \$47,490,000, or a total deficit of about \$51,190,000.

Essential expenditures on capital account from time to time will tend to swell these charges, but by the addition of the Canadian Pacific with its ample rolling stock equipment, its splendid terminals and other facilities, in the use of which the whole system would participate, important expenditures which could not be avoided in other circumstances would be rendered unnecessary.

To this amount of \$51,190,000 per annum, of course it would be necessary to add the guaranteed dividend on Canadian Pacific common stock hereafter to be determined, but if we set aside an estimated amount for that purpose, the total deficit, including everything, would be approximately \$80,000,000. In the light of these figures, present conditions would not be improved, but then we must take into account the saving that would result from the consolidation by the elimination of unnecessary train service and of duplicate work at important terminals and at other points; the restriction of maintenance work on unnecessary duplicate lines; the decrease in general as well as traffic and agency expenditures; the common use of cars and locomotives, reducing to a minimum capital expenditures on that account with greater economy in the maintenance of equipment and the stoppage of outlay in many other directions.

### Operating Ratio Should Be 80 Per Cent

In 1920 the operating cost of the combined system was about 101 per cent of the gross earnings. The Canadian Pacific cost was 84.7 per cent of its gross earnings. If the average for the combined system could be brought to the Canadian Pacific level it would represent a saving in the cost of operating of about \$56,000,000 per annum. There would still be a deficit of \$24,000,000 per annum, but for a number of reasons, 1920 was an expensive year, and I see no reason why the operating ratio should not be brought as low as 80 per cent at most, which would reduce the total deficit to eleven or twelve million dollars. To catch up with this a growing volume of traffic would have to be relied upon, but with immigration settlement and development this should come in gradual stages, and the saving to the country in the meantime would be very large.

In connection with these transportation matters there are sure to be miscalculations and disappointments, but the consolidation that I have outlined above would appear to be the most logical and economical policy.

Besides the National Railways, Canada would then have an International group consisting of the Grand Trunk, the Canada Southern, the Toronto, Hamilton & Buffalo, and the Pere Marquette Railways of 4,600 miles, and other lines of local or provincial character. These latter lines may well be left to work out their own salvation, and if they require aid, the provinces, having been relieved of their major liabilities under their guarantees, can well afford to give it.

I am not giving expression to these views as chairman, director or shareholder of the Canadian Pacific Railway Company, and it is quite possible that neither my fellow directors nor the shareholders would be in accord. The Canadian Pacific, with its low capitalization and capacity for securing and handling a vast volume of traffic, should, as time passes, yield a larger return to its owners than at any time in the past. Indeed, about this there is little room for doubt, but with a satisfactory annual dividend guaranteed in perpetuity by the Canadian Government, the shareholders could probably be induced to forego their speculative benefits, as their shares would then have the security and stability of government bonds.

It is my sole purpose to assist if I can in the solution of what is beyond doubt the most serious and menacing problem that faces our country, and to frankly outline the policy that I would adopt and carry into effect if the responsibility were upon me to act as the representative and trustee of the Canadian people in safeguarding the present and future railway transportation interests of the Dominion, and in endeavoring to stop, or at any rate minimize the vast demands on the treasury and the credit of the country that are pretty sure to be made yearly if the present policy is continued.

FOR THE THREE MONTHS ending March 31, 1921, only two out of 1,122 Louisiana & Arkansas passenger trains were late at junction points or terminals. One of the delays was directly chargeable to the Louisiana & Arkansas, while the other was occasioned by the derailment of a freight train of another line on joint track.

## Governor's Committee Opposes Rate Raise in New England

THE JOINT COMMITTEE appointed recently by the Governors of the New England States, in a report signed by each of the 31 members of the composite committee published on April 29, declared that the railroad executives had failed to show that the desired general advance of ten per cent in freight rates for a limited time would remedy the situation, or that by such an increase New England interests would not suffer. The committee recommends:

"1. The Federal Government should be asked to give assistance to the railroads in their extremities, not as an act of paternalism but as an act of justice. The obligation of the government to return the railroads in the same condition in which they took them over has not been fulfilled. The period of Federal guarantee should be extended (retroactive to September 1, 1920) and arrangements should be made at once for the payment of the amounts claimed by the railroads to be due them from the government, leaving exact determination to be made afterward. A memorial should be addressed to the President of the United States, pointing out to him the present conditions of the railroads in New England and asking him to take prompt measures to fulfill the obligations of the government.

"2. The prevailing wage scale and the terms of the so-called national agreements have been a large factor leading to the present financial condition of the railroads; and Congress should consider whether the present method of settling labor disputes is entirely adequate, and if not in what respect it may be remedied or altered.

"3. \* \* \* The Interstate Commerce Commission might well avail itself of its authority and make without delay such investigation as may be desirable toward a permanent solution of the railroad difficulties."

To carry out the foregoing recommendations the committee desires to be authorized to present these considerations to the President of the United States, the Railroad Labor Board and the Interstate Commerce Commission, and to take such further action as may be found necessary.

The committee finds the financial condition of the separate roads not the same. The Boston & Albany took no part in the request for advance in rates. The Rutland Railroad in January and February showed a deficit of \$121,091 and the committee thinks that it can continue to operate for the present without serious difficulty. The Bangor & Aroostook asked for an increase of rates only on one-half of one per cent of its entire business.

For the six months ended February 28, 1921, deficits after payment of fixed charges have been as follows: Maine Central, \$915,359; Central Vermont, \$918,652; Boston & Maine, \$8,292,846; New York, New Haven & Hartford, \$11,212,022.

In its summing up the committee says: "There is grave doubt in our minds whether the proposed increase would produce the amount of revenue which the railroad executives estimate and which would be really necessary for any effective relief. There is, of course, a point where traffic will not move.

"The idea of New England as a distinct district for rate making purposes has been resisted heretofore by the New England public and ought, in our opinion, to be objected to upon every occasion when it is proposed. It seems to us that neither New England railroad executives nor any other persons in the New England community ought to propose or assent to a scheme of rate making which will so surely react to the disadvantage of New England industry, and likewise of the railroads themselves. In all essential respects there is no New England railroad problem as such. It is a railroad problem for the whole country."

The committee is not convinced that the borrowing ca-

capacity of the railroads has been exhausted. Special stress is laid on the "unfortunate precedent" that would be established if freight rates were advanced in New England, without a full hearing, when not advanced in the rest of the country. The Interstate Commerce Commission has made it a rule not to allow advances without full hearings; and the commission should not be asked to break that rule now. New England mercantile interests surely will make objections and, therefore, there must be delay. At the same time the railroads say they must have relief now if ever; they say they cannot wait. However, the danger of financial ruin, due mainly to the delay in getting decisions from the Labor Board, affects not New England alone, but the railroads of the whole country. The committee undertook to confer with the leaders of the railroad brotherhoods, but those leaders declined to confer. The delays incident to the restoration of conditions by the Federal Government are characterized as a "mockery of fair dealing."

The committee's action on this report was unanimous. The president is George R. Nutter, president of the Boston Chamber of Commerce, and its secretary is Charles A. Andrews, president of the Associated Industries of Massachusetts.

Comments by New Haven Executive

President E. J. Pearson, of the New Haven road, commenting on this report, said: "The present situation of the New England railroads is

The first is common to all roads; the second is that of adequate compensation through divisions for the handling of intertrunk line freight, which comprises about 80 per cent of the traffic in ton miles on the New Haven system. The New Haven has presented the facts in these matters to the proper governmental authorities and is confident they are receiving careful and full consideration."

Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight during the week ending April 23 showed a slight increase as compared with the previous week to 704,527. This represents the third consecutive week of increase but the increase as compared with the week before is only 631. For the corresponding week of 1920, which was affected by the switchmen's strike, the loading was 717,772. For 1918 it was 715,042. Increases are shown as compared with the corresponding week of the previous year in the loading of grain and grain products, and merchandise and miscellaneous freight. Increases as compared with last year are also shown in the Eastern, Allegheny and Southwestern districts. As compared with the previous week, however, there was a decrease in grain and grain products, forest products, and merchandise and miscellaneous freight, although there was an increase in livestock, coal, coke and ore. Merchan-

REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—ALL DISTRICTS: COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. FOR WEEK ENDED SATURDAY, APRIL 23, 1921

Districts:	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise L.C.L.	Miscellaneous	Total revenue freight loaded		Received from connections

L. C. L. merchandise loading figures for 1921 and 1920 are not comparable as some roads are not able to separate their L. C. L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

developing closely in accordance with the information and forecast which have been furnished to the Federal authorities and to the New England Governors. The public has been receiving transportation from the New Haven system at less than cost. The deficits for the New Haven and Central New England, excluding Federal guarantees, were \$8,000,000 in 1918, \$8,900,000 in 1919, \$30,000,000 in 1920 and \$7,675,000 for the three months of January, February and March, 1921; a total for such period of \$54,575,000.

"These accruing deficits have compelled reduction of service, the deferring of maintenance, and have resulted in the accumulation of obligations which will compel the continuance of reduced service for a considerable time ahead in order that the amount of deficits which are in excess of Federal guarantees may be liquidated when conditions become more favorable and make such action possible. There are two essential features in the New England railroad problem.

dise and miscellaneous freight has heretofore been increasing practically every week, but this represents the third consecutive week of increase in coal loading after a steady drop from January 1 to about April 1. The summary as reported by the Car Service Division of the American Railway Association is shown in table above.

Owing to an increased demand for open top cars for the transportation of coal, a further decrease of 16,412 in the total number of idle freight cars was shown for the week ending April 23. The number of surplus cars was 483,067 as compared with 499,479 for the week of April 15. Surplus coal cars totaled 235,275, which was a decrease of 16,735. A slight increase was reported, however, in the number of idle box cars, which totaled 177,360 or an increase of 555. Compared by districts, decreases in the number of cars for which there was no freight were reported in all except the Northwestern district.

# Designing Large Locomotives for Maximum Utility\*

Power Should Not Be Dwarfed by Physical Limitations of the Road—Co-operation Needed for Further Development

By M. H. Haig

Mechanical Engineer, Atchison, Topeka & Santa Fe

THE DESIGN of a large locomotive depends on the service to which it is to be assigned. The service varies with the weight of the train to be hauled and the number of cars in the train, and is affected by the topography of territory on which it is to operate, ruling grades in each direction, length of grades, average speed between terminals, method of dispatching, whether single or double track between terminals, etc. This information being available, it is a reasonably simple matter to determine upon the leading features of a locomotive to meet the requirements.

## Restrictions and Limitations Imposed

For a locomotive to give practically 100 per cent service, its design and construction must not be restricted by personal opinion or by physical limitations of the road. If the weight needed for adhesion in starting a given train is restricted by an opinion that certain wheel loads should not be exceeded or because bridges and track are not capable of carrying the necessary weight, then the capacity of the locomotive is restricted and the train must be adjusted to the locomotive, instead of the locomotive being built to suit the train. This in turn has a tendency to limit a division or a railroad as a whole. Limitations such as these, together with clearances of bridges and structures, obstructions along the right of way, etc., affect the locomotive design and construction. The locomotive as a whole is dwarfed, or some of its vital or essential parts are so dwarfed as to cripple the machine as a whole.

A railroad is a plant, establishment or organization for manufacturing transportation. The locomotive is a very important part of the plant and is one of the most direct earners of revenue from which the transportation-manufacturing plant obtains its income. As such, it is a matter of business and economical principle to adjust some of the physical conditions of the road to meet the requirements of the locomotive, to prevent dwarfing it and to prevent sacrificing its power. Meeting these requirements of the locomotive amounts to meeting the necessary requirements of traffic. No turntable installed at a principal roundhouse should be less than 100 ft. long, and in many cases the length should be 125 ft. The distance between the walls of a modern roundhouse should be great enough to permit closing the door behind the tender of a Santa Fe or Mikado type locomotive and have ample room for trucking between the locomotive pilot and the outer wall of the roundhouse. Passing tracks should be long enough to take trains justified by the business and traffic of the division or territory. Bridges, rail and roadbed should be capable of carrying a static wheel load of at least 65,000 lb. per pair and of permitting the additional stresses resulting from a freight speed of at least 45 miles per hour. In meeting the requirements of rail stresses particular attention should be given to the employment of heavy rails on curves.

Unless these physical conditions are provided, a locomotive cannot be designed and constructed without restriction and proper power cannot be furnished to meet requirements. The only governing factors should be the size of train and the traffic of the territory.

Leading features of locomotive construction such as rela-

tive size of cylinders, length of stroke, total heating surface, superheating surface, grate area, etc., have been well covered by handbooks and pamphlets issued by locomotive builders and by reports to the various associations, as well as by articles in the technical press. Tables of principal dimensions of large locomotives are obtainable from the same sources, together with detailed descriptions of features of design and construction which have met with general favor and some which have been short-lived. A discussion or comment on these features would therefore be largely a repetition of facts already presented and easily available.

## Leading Features of Locomotive Construction

Features which have not been so generally discussed and exploited are those which keep a locomotive in service a maximum length of time, reduce engine failures to a minimum, reduce cost of maintenance and repairs, and increase revenue-earning power. Among these, durability of material and accessibility of parts are important factors. The latter implies arrangements by which a locomotive is made free from complications in construction, inexpensive to repair, easy to maintain, and so put together that needed repairs can be made handily and quickly.

Almost as important as providing a locomotive that will meet the requirements of trains to be hauled and traffic conditions, is providing one that requires minimum repairs—a locomotive that after one trip is ready to be turned for the next trip.

A locomotive is in revenue-earning service only when it is hauling trains. Any road can make a study and determine what proportion of its locomotives are unserviceable and what percentage of the time its serviceable locomotives are on the road. Such information will show what percentage of the time its engines are earning revenue.

To maintain the advantages of designs already existing and to develop these still further requires the unlimited co-operation not only of the mechanical, civil engineering and operating forces of the railroads, but also of the locomotive builders, and particularly of the manufacturers of material. The necessity for unlimited co-operation by manufacturers of material is evident from the study of failures of parts both large and small.

Mr. Haig discussed in detail problems in the design of important parts of the locomotive, including counterbalancing crosshead and crosshead pins, piston rods, cylinders, driving wheels, frame braces, boiler braces, tube sheets, ash pans, brake rigging, water columns and cab equipment, concluding with the following discussion of the advantages of high capacity tenders.

## Tender Capacity

Tender capacity should be arranged so as to reduce to a minimum the time a locomotive is detained from the productive work of hauling trains for the purpose of taking water and fuel. This implies large fuel and water capacities, but in arranging for suitable tender capacity care must be taken to avoid unnecessary weight, as any increase in the weight of the tender produces an equal decrease in the weight of train that can be hauled behind the tender.

Tender fuel space should be arranged so as to enable the

\*Abstract of a paper to be presented at the railroad session of the spring meeting of the American Society of Mechanical Engineers, Chicago, May 26, 1921.

locomotive to handle a full train with as few stops for fuel as may be feasible.

On territories equipped for water to be taken on the run or when stops for purposes other than taking fuel or water are made regularly at stations where water may be taken, the water capacity should be only sufficient to supply the locomotive when handling a full train, between water stations.

On territories handling a large percentage of through trains with few stops, tenders of large capacity are desirable as they permit keeping locomotives more continuously at work.

In addition to reducing time consumed by trains on the road, together with overtime pay to train and engine crews, large-capacity tenders effect a substantial saving by reducing the fuel consumed in starting and accelerating trains as well as the damage to locomotive machinery, draft rigging, tires and rail which frequently results from stopping and starting long freight trains. Train dispatching is simplified and the movements of superior and opposing trains is expedited, as a train which keeps moving interferes less with the movements of other trains.

## Railroad Hearings Before Senate Committee

WASHINGTON, D. C.

HEARINGS BEFORE the Senate committee on interstate commerce, which has been directed by a Senate resolution to make a general inquiry into the railroad situation with particular reference to the increases in expenses and what should be done to reduce the cost of transportation, will begin on Tuesday, May 10, with representatives of the railroad executives as the first witnesses. Among those expected to testify are Thomas De Witt Cuyler, chairman, and Alfred P. Thom, vice-chairman and general counsel, of the Association of Railway Executives; Daniel Willard, president of the Baltimore & Ohio, and Julius Kruttschnitt, chairman of the Southern Pacific. The railroads have made extensive statistical preparations for the hearing and other witnesses will be called later. The hearings are expected to run for several weeks and may last well into the summer. The railroad testimony will probably consist largely of a demonstration of the effect of the war and of federal control upon their operations, in order to show why repeated rate increases have failed to offset the increases in wages and other items of operating expenses. S. Davies Warfield is expected also to present his plan for a reorganization of the railroads and labor leaders and shippers will be heard from.

Senator Cummins, in a newspaper interview, expressed a hopeful view of the prospects for a readjustment of the railroad situation.

"The railroads," Senator Cummins said, "are in no different situation from the other industries of the country. Like many other producing industries they are confronted with a sudden and violent shrinkage of business which helps to make the selling price of what is produced lower than the cost of production. They will have to solve the problem in the same way as other producers are trying to solve it; by the bringing of the cost of materials and the cost of labor into line with the proceeds of what they have to sell.

"To assume the contrary would be to assume that a national transportation system cannot be self-supporting in this country. If that were so, there would be nothing to do but for the government to take it over and pay the annual deficit, however heavy, out of the Treasury. The country must have its transportation system.

"But there is no reason to imagine anything of the kind. There will be a very large saving in cost of materials. Coal will be lower this year, ties are lower, steel and iron material

is lower except rails, and rails will also have to come down. The question of the wage scale is in the hands of the Labor Board.

"When railways were placed in receiverships and their mortgages foreclosed in the past, there were two motives for such procedure—to get rid of an incapable management or to reorganize and recapitalize the roads. At present the latter motive, at least, does not exist. Foreclosure would not help the bondholders. The circumstances give reasonable assurance of adequate net revenue in due course to meet all interest, due or overdue. What reason is there, then, that in such a case the bondholders should not consent to forego their interest temporarily until the readjustment of cost to revenues shall have been effected?"

President Harding and his cabinet appear to have dropped for the time being their efforts to find a quick solution of the railroad problem, having come to the conclusion that time will be required to work it out and that the subject is one which does not lend itself to executive interference in view of the fact that jurisdiction over the most important phases of the problem has been vested by law in the Interstate Commerce Commission and the Railroad Labor Board and that rate-making is a legislative function. For the first time in several weeks the railroads were not discussed at the cabinet meeting on Tuesday and in his last two conferences with the newspaper correspondents the President has had very little to say on the subject except to point out that the matter is largely in the hands of the Interstate Commerce Commission and the Labor Board and to indicate his pleasure at news that the railroads had voluntarily agreed to some readjustments of rates. The President hopes that the hearings before Senator Cummins' committee may suggest some form of improvement in the governmental machinery for dealing with transportation questions, if the investigation shall develop the need for any change, but while he is anxious to see rates reduced he has apparently been convinced that nothing can be accomplished by efforts on his part to hurry matters unduly.

The President made it clear when he first took up the problem that he did not believe in going over the heads of the commission or the board, but it is thought that he may have made suggestions to both of them calculated to stimulate their handling of the questions involved and that some of the results may be seen in the fact that the Labor Board handed down its decision on the National Agreements sooner than was expected, and that it is apparently handling the wage reduction case in a somewhat more expeditious fashion than it did the National Agreement case. The Interstate Commerce Commission has been active in working with the railroads and shippers on rate readjustments, and it is understood that more has been accomplished than has been given publicity, but the commission has taken a firm stand against the idea that the situation could be improved by rate reductions regardless of the cost of operation. It is understood that the railroad question was brought up at one of the cabinet meetings in March by Vice-President Coolidge in connection with the serious condition of the New England lines, and that it was first approached as a question of what should be done to avoid wholesale railroad bankruptcies. The propaganda to the effect that high freight rates were stifling business and that the railroads would do better if rates were reduced, at least on some commodities, was then brought forward and was fostered in the President's mind by delegations of farmers and shippers of coal, building materials and other commodities that the public has been slow to buy at the prices asked or at prices satisfactory to the producers. The same view has been presented by many members of Congress who have been receiving complaints from their constituents. The President, however, made up his mind to obtain information from all sides of the question.

# Employees Begin Fight on Wage Reductions

## Labor Board Hears Defense of Present Rates of Pay—Unions Vigorously Oppose Reductions

**R**AILWAY LABOR'S DEFENSE of the justness and reasonableness of the rates of pay established by the Railroad Labor Board last July, will be based largely on (1) the fact that there have been no decreases in the wages of the workers in the coal and steel industries up to the present time; (2) the reiteration of the hackneyed charges regarding the "inefficiencies and inadequacies of management" and (3) a flat denial that the decreases in the cost of living justify wage reductions at this time. This was clearly indicated in statements made before the Board by various labor leaders on April 28, when hearings in the controversy over wages were resumed.

The presentation on behalf of the railroads in this controversy was described in the *Railway Age* of April 22, (page 988). After a recess of one week, the employees presentation was opened by B. M. Jewell, spokesman for the labor organizations, who said:

The Board can make no reduction in railroad wage rates at this time because there have been no reductions in wages paid in the basic industries comparable to the transportation industry, and because there has not been a sufficient reduction in the cost of living to justify a reduction in wage schedules that were inadequate to meet living costs at the time they were established. Coal mining and the steel industries are the only basic industries that may be compared to the railroad industry, and it is well known that there have been no wage cuts for the miners or for the steel workers.

In addition to the facts which bear directly upon the principles which have been set up as a guide for the Board in wage determinations, there are also other and more fundamental conditions of which the Board must take judicial notice.

He then reiterated the spectacular but fallacious charges of mismanagement which have been used as a smoke screen in this and in the national agreements controversy, drawing from these charges the conclusions that "the Board cannot entertain a plea from the railroad managers for a reduction in wages under any circumstances until the inadequacies of management and the high operating costs resulting therefrom have been eliminated" and that "this Board should not consider any complaints relative to the rates of pay of railway employees until it is satisfied that the railroads are not being forced to purchase their fuel, equipment, oil, timber and other supplies at exorbitant prices."

Mr. Jewell continued:

We shall hold and we shall submit data and argument to show that no action looking towards a reduction in wages can now be taken by the Board which can be predicated upon any sound basis. No justification can be found in ethics, in economic reason, or in the cold, concrete facts of present-day industrial life and activity, to support the Board in making any changes in the existing rates of pay to railroad employees.

For 18 months preceding Decision No. 2 of this Board, when living costs were steadily and rapidly rising, railroad employees sold their Liberty Bonds at a sacrifice, went into debt, deprived themselves of even the necessities of life, and waited for some measure of relief. If the cost of living should decline in the future as rapidly as it did from June to December, 1920, it would be three years before railroad employees, with the increased purchasing power arising from the maintenance of existing rates of pay, would be able to recoup the losses which they sustained during the war period by the failure of their earnings to keep pace during that time with the increased cost of living.

In the first place, the cost of living has not declined since the wage decision of this Board which was manifestly based on the official returns not for June, 1920, but for December, 1919. Any reduction in food prices since the first of the year have been practically neutralized by increases in house rents and fuel. Furthermore, an examination of official figures for past years, even for the war period itself, show that there has always been a down-

ward fluctuation during the early months of each calendar year followed by a trend upward. Finally, it is the consensus of the best opinion available that the lowest point in the existing depression has been passed, that wholesale prices have practically become stabilized, and that retail prices, or the measure of the workingman's cost of living, will probably advance in the future.

In the second place, the Board has accepted in its last wage award the principle of a living wage for the lowest paid railway employees. In the light of this fact, we feel assured that the Board will not accept the supply and demand theory of wage-fixing which has been urged by the representatives of the railroads as a justification of wage-reductions. We shall show that the Board cannot reduce the rates of pay of unskilled workers without rejecting the principle of the living wage, or impairing the maintenance of an American standard of living by the unskilled groups of employees.

In the third place, we shall not deny that rates of pay have declined in certain outside industries, but we shall show that the facts submitted by the railroads do not afford any justification for a wage-cut in the transportation industry. We shall point out that the comparisons made by the railroads are not in point, that the instances of wage-cuts which they have submitted are not characteristic of basic industries analogous to the transportation industry such as coal-mining or iron and steel making, and finally, we shall claim in this connection that rates of pay which have been arbitrarily imposed upon workers in other industries without regard to principles or standards which public policy has sanctioned should not be cited or accepted as precedents upon which to base action from this Board.

In the fourth place the increases granted to the federated shop craft employees of the railroads have not in any sense kept pace with the rising cost of living computations, which show that the mechanics whom the shop crafts represent have received increases totaling over 100 per cent since 1915, are founded upon the false basis that increases can be shown in terms of hourly rates. The only fair basis of comparison is the average daily earning power of the employee based upon the standard measure of the recognized work day. We shall show with data drawn from authoritative sources that not one of the shop crafts has received increases in daily earnings since 1915 totaling as much as 100 per cent and that the weighted average total increase in daily earnings granted to railroad shop mechanics since 1915 amounts to approximately 83.5 per cent.

Finally, we wish especially to emphasize our contention that there should be no action taken by the Board relative to rates of pay until conferences have been held and new working conditions agreed upon, in accordance with the recent decision of the Board in connection with national agreements. Manifestly there can be no just determination of wages until it is known what the new working conditions or rules will be.

### Other Employees' Representatives Testify

Mr. Jewell was followed by E. J. Manion, representing the Order of Railroad Telegraphers; D. W. Helt, president of the Brotherhood of Railroad Signalmen of America; Timothy Healy, president of the International Brotherhood of Stationary Firemen and Oilers; J. G. Luhrsens, president of the American Train Dispatchers' Association, and Mr. Lauck, speaking on behalf of the organizations represented in Groups 2 and 3.

The testimony of Mr. Helt and Mr. Luhrsens dealt with the seven relevant factors which the Board must take into consideration in fixing just and reasonable wages, both maintaining that there is no comparable work in any industry to that performed by the men they represent and that the decreases in the cost of living do not justify a wage cut at this time.

Mr. Manion followed the same reasoning, basing his arguments as to the cost of living on the statement, "that rates of wages in relation to the cost of living extend far back of the period the railroads use in their exhibits as a base and we can never subscribe to the inferred theory that an ideal condition existed during the year of 1915. This Board cannot and must

not proceed on the assumption that a just comparison can be made between wages and the cost of living by using 1915 as a common basic starting point."

Mr. Healy's testimony was directed mainly at the refutation of the statistics given to the Board by the carriers regarding the wages being paid for similar work in outside industries. He presented numerous reports of the Board of Estimate and Apportionment which sets forth rates for employees in building trades in New York City.

### W. Jett Lauck Presents Numerous Exhibits

Mr. Lauck then began the presentation of a large number of exhibits. His preliminary statement was directed at minimizing the importance of the cost of living as a factor in the determination of a just and reasonable wage, the contention being that "the living wage principle must first be applied," that "the cost of living principle was only a wartime emergency measure" and that it was not therefore intended as a permanent standard.

In justifying the presentation of his exhibits, Mr. Lauck said in part:

Mr. Jewell stated that we would not limit our presentation to the specific principles upon which the railroads base their contentions, but that we would enter into a discussion of the fundamentals which underlie the entire question. We are conscious of the fact that among the unthinking and the prejudiced it may provoke some criticism. It will be thought perhaps that we are introducing irrelevant material or indulging in what has been popularly termed as muckraking. We were conscious of the same criticism during the hearings on national agreements. The constant inquiry was made as to when we were going to discontinue the submission of irrelevant matter and confine ourselves to the discussion of "the reasonableness or unreasonableness" of rules.

The results of that case justified our insistence upon fundamentals. In the present case we shall also proceed upon the basis of the fundamentals, not because the consideration of such matters may be colorful, sensational or distracting from what some persons at first blush may consider the real issue but because they are fundamental in industrial justice and equity, and in the consideration of matters which affect the economic and human well-being of ten million men, women and children; and because justice and equity can not come from any decision in this case unless these fundamentals are seriously and deeply considered. We have no doubt that ultimately, as in the case of national agreements, these fundamentals will be recognized and sanctioned.

### Financial History of the Railroads Reviewed

Again in submitting several volumes on the financial history of the railroads, Mr. Lauck justified his action by saying:

In connection with these exhibits we wish to say at the outset that we are not presenting these exhibits to show that if the railroads had not improperly used their resources in the past they would now have abundant funds and it would not be necessary at the present time to ask for wage reductions. We realize that most fortunately the conditions described in these exhibits have been corrected by the Transportation Act and are no longer possible. Our purpose in submitting these data is threefold:

1. To place on record in this case the fact that large resources have been dissipated or unwise distributed by railroad financial management in the past, or that railroad management by its issuance of fictitious securities imposed a perpetual drain upon railroad operating revenues and

2. That the funds which have been dissipated or absorbed, if they had been used to cover depreciation and maintenance, or used for improvement, or, as a basis for credit to secure permanent additions and betterments, would have obviated the existing inadequacies of railroad management.

3. Finally, that these resultant inadequacies of management must be met before in reason or equity a wage reduction can be properly considered.

It is not our purpose to develop the fact that if the results of financial mismanagement had not been as they had been, there would not be in existence now about a billion dollars' worth of securities now drawing dividends and which amount to about \$55,000,000 per year, and that the funds which have been absorbed by fictitious securities in the past would have been available to the financial officers and operating officers to keep up maintenance and cover depreciation of equipment and carry on improvements which they have not been able to do under the cir-

cumstances and which are now deferred. The employees should not be made a vicarious sacrifice for this past financial mismanagement. That does not help the railroads, but they will have to find some other means than deflating labor to cover the increased costs of operation which have resulted from the happenings in their past history.

All of the Board's session on April 29 was consumed by Mr. Lauck in the presentation of exhibits regarding the "inadequacies of management." The character of Mr. Lauck's contentions regarding the efficiency of the country's transportation system has been outlined in previous issues of the *Railway Age*. Part of the material filed at this time had previously been filed in the controversy over national agreements. However, the scope of the exhibits has been greatly enlarged. Throughout the volumes regarding the alleged "inadequacies of management," the *Railway Age* is quoted extensively, particularly the Six Billion Dollar Number published in January, 1920.

The exhibit on alleged "inadequacies of railway management" is in four volumes, the first two volumes of which deal with alleged economies possible without additional capital investment, the third volume with the economies possible through additional capital expenditures, and the fourth volume with economies possible under unified management.

The manner in which this material is being received by the Board was indicated by Chairman R. M. Barton, who, in discussing the continuation of the employees' presentation, said, "I think it is all far afield, but we want to let in all of the light that is possible on the matter. Your argument is that if we are going to look to the financial condition of the railroads at all, we should consider the fact it is not your fault and the high wages being paid is not the cause of the present condition, but is due to general mismanagement of the past, and in some cases the sins of the fathers have been visited on the children."

To this Mr. Lauck replied: "We go farther than that, we claim that the present plight of the railroad in this time of depression is the result of accumulated evils of financial mismanagement which are expressed now in physical infirmities and impossibility of economical operation, and it would not be equitable to grant a reduction of wages of employees to give financial relief to the railroads until these infirmities of the railroads, which the operating management has inherited from past financial mismanagement, are rectified."

The session was closed with the presentation of additional exhibits regarding the causes of the present industrial depression, Mr. Lauck contending that the influences which have caused this depression have spent most of their force, that the factors of revival have begun to be felt.

Public hearings were resumed on May 2, when representatives of the various independent organizations presented their arguments against wage reductions to the Board. The bases of these arguments were that the wages being paid to the various employees represented are still below those paid for comparable work in other industries and that the cost of living has not declined enough to justify a wage reduction at this time. The independent organizations appearing before the Board at that time include the United Association of Railway Employees of North America, the International Association of Railroad Supervisors of Mechanics, the Order of Railroad Station Agents, the American Federation of Railroad Workers, the International Longshoremen's Union, Knights of Labor, Brotherhood of Station Employees, Railroad Yard Masters, Lighter Captains' Union of the Port of New York, International Union of Steam and Operating Engineers, Dining Car Conductors, Brotherhood of Dining Car Employees, Cooks and Waiters, Philadelphia & Camden Ferry Employees, Railway Men's Benevolent & Industrial Association.

The Board recessed until May 4 when representatives of the train service employees were heard.

Where Traffic is Facilitated

## Outlying Switch Control Facilitates Train Movements

Development of Low-Voltage Mechanisms Controlled from a Central Point Has Expedited Traffic

By C. C. Anthony

Consulting Signal Engineer, Santa Rosa, Cal.

**L**OW-VOLTAGE electric switch mechanisms were developed by the manufacturers to meet a demand that was somewhat hesitatingly expressed by certain railroad signal men six or seven years ago. It was felt that real economy could be effected by the power operation of certain switches located too far from available points of operation to be reached with mechanical connections. As in so many cases dealt with by the signal engineer, however, there was some uncertainty whether money savings could be proved. At the same time there was a question as to the satisfactory operation of such mechanisms.

It was evident that any net return over the usual items of maintenance cost, interest on investment, etc., would have to come almost entirely from the saving of the cost of stopping and starting trains—unless, in a given case, the operation of one or more switches from an existing interlocking plant or station would save the employment of switchmen or the installation and operation of an additional interlocking plant. And not only was the cost of stopping a train an unknown quantity, but the saving, whatever it should be, might be undiscoverable in the expense accounts. If, then, the financial gain should be invisible, purely theoretical, and the train delays, due to even a few switch failures, would prove to be serious, the signal engineer might be sorry that he had ever urged a low-voltage switch installation. Happily, the step was taken, and the experience of the last few years seems to have proved its wisdom.

### Where Low-Voltage Machines Are Advantageous

The situations in which low-voltage switch machines may be used to advantage are of three general classes. First, in connection with existing mechanical or electro-mechanical interlockings, where one or more switches and the necessary signals at too great a distance for mechanical working, may be operated from the existing plant. Second, where switches

and signals at such distances may be operated from a station at which operators are continuously on duty; and, in some cases, it may even pay to employ an additional operator for the sake of saving the delay and expense of stopping many trains each day for switches to be thrown by the trainmen. Third, where a power interlocking is necessary and can be installed at a cost less than that of a high-voltage electric plant; as at a drawbridge, where, on account of long bridge approaches, derails must be located at too great distance for mechanical operation.

Interlockings to which remote switches might be connected with advantage are almost numberless. Thus there is frequently a mechanical interlocking at the end of a yard, handling the crossover and yard switches; but, to facilitate train movements double track through the yard has been extended several thousand feet beyond. From the point of view of both safety and economy, it is evidently of advantage to connect up the switch at end of double track, at no increased cost for signalmen, as such a switch has to be thrown twice for each of practically half the trains on the road. So, too, many double-track, and not a few single-track, lines are well provided with mechanical or electro-mechanical interlockings at passing sidings. Progressive railroad officers already realize the absurdity of having an operator sit idly by while a train stops for a switch to be thrown directly in front of the office, when an interlocking of moderate cost would eliminate the stops and increase the safety of operation. But such an interlocking can handle only one switch of each siding, although it is just as desirable that the remote switches be operated from the plant; and this can be done at an operating cost insignificant in comparison with that of the original plant, since there will be little if any increase in the principal item, wages of signalmen.

Similar conditions are met with at many stations where interlockings have not heretofore seemed to be justified. For

example, the operators at a station located at about the middle of a passing siding can readily operate both switches with low-voltage machines; whereas, a mechanical interlocking at one end would do only half the work at a greatly increased cost for additional men. In addition to drawbridges, previously mentioned, a gauntlet through a tunnel or over a bridge can be handled by one set of men at a single interlocking located at one switch, mechanically connected, while the other switch is operated by a low-voltage machine. The work can be done at least as well as, and much more economically than, by two sets of men.

### The First and Subsequent Installations

The Northern Pacific is believed to have been the first road to use low-voltage machines. Two were installed in 1914 at the entering ends of passing sidings on double track on either side of the single track through Bozeman Pass tunnel. The purpose was to enable heavy freight trains, on the ascending grades approaching the tunnel, to enter the sidings without stopping. This installation is described in the *Railway Age* of April 16, 1915, page 831. It is said to have worked so far without failure and to have shown a great saving in operating tonnage trains on heavy grades where they are compelled to take siding.

In 1916 five machines were installed on the Nashville, Chattanooga & St. Louis. Four of these are on crossovers at the ends of a short section of double track on a 2 per cent grade, ending at a single-track tunnel at the summit. Cross-overs are necessary on account of an engine track at the summit and a runaway track at the lower end. The fifth machine operates an end of double track switch at the foot of the grade, two miles from the point of operation. A sixth machine was installed in 1917 at an end of double track one mile away and across a river from the point of operation. These installations are described in the *Railway Age* of May 31, 1918, page 1323.

Probably the largest single undertaking of this kind is that started by the New York, New Haven & Hartford in the latter part of 1918. This involved the use of about 25 machines at a cost, with signal changes, of approximately \$100,000. These machines provide for the operation of all the passing-siding switches not previously interlocked, on the Shore Line between New Haven, Conn., and Readville, Mass., 147 miles. On this double-track line there were already interlocking plants, nearly all mechanical, at the passing sidings, but, of course, only one switch of each siding was connected. With the very heavy train movement, both passenger and freight, it was felt that the expenditure would be amply justified by the saving of delays due to stopping heavy freights for switches to be thrown. The decision to make this extensive installation was based on favorable experience with one of the low-voltage machines that had been in use on that line about two years. The installation, as proposed, was fully described in the *Railway Age* for April 19, 1918, page 1041.

A very advantageous installation on the Philadelphia & Reading consists of the switch and two derrails at the end of a third main track operated from a station about 4,500 ft. distant. An average of 39 trains daily pass over this switch, and as a considerable proportion of these trains would have to stop for the switch to be thrown by hand, it may well be admitted that "the time lost in stopping and starting would, when capitalized, amount to much more than the interest on the cost of the present interlocking installation." If there is any doubt about this the other items in the cost of stopping trains should easily show a favorable balance.

In the annual interlocking statistics it is probable that not all the low-voltage switch machines installed were reported. But the information furnished shows that two were installed at the ends of a gauntlet on the St. Louis-San

Francisco in 1916, and in 1917 a good many were installed or under construction on the Delaware & Hudson, the New York Central, the Norfolk & Western, the Southern Pacific and the Buffalo, Rochester & Pittsburgh. In 1918 others were installed on the Southern Pacific and one on the Oregon Short Line at a junction switch 1.6 miles from the point of operation. Several are in use also on the Pennsylvania. The Southern Pacific now has 15 machines in service, several at drawbridges where the derrails are too far away for mechanical operation. The questions of reliability and of the delays that might result from failures, which, it was felt, required answers from experience, are now regarded as settled in favor of the machines.

### The Circuits Required

There seems to be a rather wide choice of circuits for the control of low-voltage switch machines and the signals operated in connection with them. Circuit plans are given in the article on the Northern Pacific installation referred to above. It is evident that line wire may be an important item in the cost of installation, especially if the number required is so great that it is difficult or impossible to provide for it on an existing pole line. Ingenious circuits that economize line wire, while providing all the usual safeguards of power interlocking, have been worked out on the Pennsylvania. Taking the case of a switch, or switch and derail, at an end of double track or siding, with signals for all movements: the primary controls require only five lines, including a common return; one with polarized relay for the switch control; one, with three-position lever and polarized relay selecting the signals as to direction, for the control of all the signals—the selection of signals as to routes being made through circuit controllers on the switch; one with polarized indicator and relay for the indication of both switch and signals; one for track-circuit locking of the switch lever and a stick indicator providing for semi-automatic operation of the signals, and one for the common return. Even at more elaborate single-track layouts, with mechanical interlocking at one end of a siding, and a low-voltage switch machine, and complete signaling at the other, three-position signals, inter-control of the third positions of the main-line signals, track-circuit control of main-line signals between the ends of the siding, and time (not approach) locking, only nine or ten lines are used.

### Anticipated Objections to Low-Voltage Machines

The anticipated objections to the use of low-voltage switch machines were the slow movement of the switches and the possible excessive train delay in case of a switch failure. In a great many cases slow movement of the switch is of no consequence, as it can be thrown in ample time before a train is to pass. Even when a train is waiting for another at an end of double track or siding, and should start as soon as the other clears the switch, the delay of, say, 30 sec. while the switch is operating, is insignificant compared with the time that would be lost in stopping or moving very slowly to allow the switch to be set normal by a trainman. It was naturally felt, however, that the delay in case of a switch failure might be very serious. There would be no maintainer close at hand, as there usually is at a power interlocking of any considerable size at least, to clear the trouble or throw the switch promptly. And it would be out of the question for the signalman to leave his office and walk a mile, more or less, to the switch. The usual provision of a crank, accessible to the trainmen, with which the switch machine can be operated by hand, seemed an uncertain reliance because of the possibility that the trainmen, having little experience in its use, might become confused and lose a great deal of time in getting the switch lined up for the required movement. This difficulty, however, seems not to have proved serious in practice. Tele-

phones are, of course, provided so that the trainmen can get instructions as soon as a train is stopped by signal at such a switch. If necessary, no doubt the signalman can usually explain clearly enough what is to be done when the switch has failed to operate.

### The Advantages of Low-Voltage Machines

The advantages to be gained by the use of low-voltage switch machines are increased safety and economy. Safety should be increased exactly as in any other case where one or more switches are interlocked and movements over them governed by fixed signals. As specific instances: The switch being under the absolute control of a signalman, a train may sometimes be held on double track or on siding when otherwise, through oversight on the part of the train crew, it might have proceeded before the passing of the last of two or more trains for which it should have waited; although, of course, block signals might prevent any disastrous result from such an error. Or a side collision with a train pulling out of a siding may be prevented; for flag protection in this case is apt to be particularly desultory.

Economy, as previously remarked, is sometimes difficult to prove. Leaving out of account the more obvious cases, such as the operation of derricks at too great distance for mechanical connection—where an interlocking plant is a necessity and would otherwise have to be a small power interlocking with its own power plant, any economy in the low-voltage operation of remote junction, passing-siding or end of double track switches, must usually be found in the saving of train delays and the more direct cost of stopping and starting trains. On this subject an article by the writer in the *Railway Age* for May 2, 1919, page 1105, may be of interest. It is perfectly clear that it costs money to stop a train at an intermediate point. The only question is, how much. It may not be possible to do better than make a conservative estimate of the cost, direct and indirect, for given conditions. But an amount having been arrived at which is deemed reasonable by those having to pass upon the proposition, it is a simple matter of arithmetic to find out whether it will pay to install one or more low-voltage switch machines at any point under consideration. There is practically no doubt, however, that, at numerous places all over the country, it will pay, and pay well, to make use of these machines.

## The Cost of Transportation In Relation to Other Cost Factors

By Julius H. Parmelee

Director Bureau of Railway Economics

IN A TIME of economic readjustment, when prices, wages and costs are constantly shifting, and no one factor in production and distribution is stable with respect to any other factor, the problem of ascertaining the relative position of any one of the factors is difficult. For example, it may be asked whether the cost of transportation to the users of the railways, that is, the level of railway freight and passenger rates, has increased in greater ratio than other production costs, whether it has remained stationary, or whether it may even have declined, relatively speaking. The inquiry is pertinent at any time, especially so when, as at present, the whole fabric of railway expenses and charges is being closely scrutinized; expenses, through the examination of wage levels now being conducted by the Railroad Labor Board, and charges, through daily analysis by the Interstate Commerce Commission of the effect of increased railway rates.

The fundamental reasons why there is so much interest in railway rates at present, and in their effect on and relation to production costs and general prices, are two: First, economic

conditions are in process of post-war liquidation, and the effect of every factor on all other factors becomes of relatively greater importance than usual; secondly, the increased rates instituted by the Interstate Commerce Commission in August, 1920, became effective at almost the same time that prices commenced to decline, a decline that has been maintained virtually without interruption to the present moment. Prices were at their peak in the months of May and June, 1920, and the present decline started in July. The decline in prices has led many to inquire whether railway rates may not now be at a relatively higher level than before the war, and whether they ought not to be reduced. By "relatively higher" is meant an upward trend in rates greater in degree than the upward trend in prices. If rates go up 60 per cent during a given period, and prices 50 per cent, rates are relatively higher at the end than at the beginning of the period.

Before taking up the question of the relative position of railway rates, it is well to note that even if rates are found to be relatively higher than formerly, such a result would not *per se* call for their reduction. What determines the level of freight and passenger rates is not primarily their relation to other economic factors (although that relation cannot wholly be ignored) but the financial needs of the railways. Of necessity, if the United States is to have an adequate and efficient transportation system, the public must pay for their transportation service such rates as will meet the cost of the service plus a reasonable return on the investment. So, and only so, can the service be continued efficiently and satisfactorily. If under these conditions transportation rates should at any time become, and remain, relatively a greater proportion of the cost of production, then the economic structure must be adjusted to such greater proportion, for without adequate rates the transportation system would break down, and with its breakdown all economic processes would go to their ruin.

As a matter of fact, compared with the situation in the last normal pre-war year of 1913, transportation rates have not assumed a relatively greater weight among the cost factors in the production, but have lagged behind. For the greater part of the period since 1913 they have lagged far behind, although the rapid decline in prices during the latter half of 1920 went far toward closing the gap.

In showing the facts underlying this statement, the year 1913 will be taken as the base year, and later data will be related to the averages for that year. The year 1913 is selected as the base year because that was the last complete year prior to the outbreak of the war in 1914, also because the Department of Labor's price statistics are related to the year 1913 as a base. The average receipts per ton mile in 1913 were lower than in any other year save two. This being so, the increase in any subsequent year will be greater than if the comparison were made against most other years: that is, selection of 1913 tends to weight the scale against the railway rates, and makes it by so much the harder to prove either that rates have gone up at a relatively lower rate than prices, or that they have increased at a greater rate, but only slightly greater. The lower the point from which a given increase is measured, the greater the increase will be, and the higher the percentage of the increase, because computed on a lower base as divisor.

Comparison will be made of the increase in freight rates (stated in terms of average receipts, or price per ton mile) from 1913 to the latest date for which statistics are available, and the increase in the average wholesale price of 327 commodities, as determined by the Bureau of Labor Statistics of the U. S. Department of Labor. These are official statistics, the large number of commodities included makes it sure that the basis of measurement is a broad and representative one, and the several commodities are averaged together in proportion to their relative importance. The prices are whole-

sale prices, it is true, but speaking generally, the trend in wholesale prices in the long run tends to parallel the trend of retail prices. In fact, changes in wholesale prices usually precede corresponding changes in retail prices, and the recent sharp declines in wholesale prices have not been fully reflected as yet in retail prices. In this respect, as well as the one indicated above, the comparison will run against the railways.

Beginning with the year 1913, the changes in average receipts per ton mile (stated both in actual figures and in percentages of the 1913 average) and in the index number (or relative average price) of all commodities have been as follows:

Year or month	Average receipts per ton mile	Actual-cents relative	Index number of wholesale prices
1913	719	100	100
1914	723	100	100
1915	722	100	101
1916	707	99	124
1917	715	100	176
1918	849	118	196
1919	973	135	212
1920	1,052	146	243
September, 1920	1,151	161	242
October, 1920	1,226	170	225
November, 1920	1,263	177	207
December, 1920	1,209	168	189
January, 1921	1,192	166	177

This comparison shows that as late as January, 1921, prices were 11 points higher than rates, even after the considerable decline in prices since the summer of 1920. The index number of prices was 177, while the relative of rates was 166.

It should also be observed that up to the close of 1920 rates lagged far behind prices. In 1916 rates were at 99 and prices at 124; in 1917 the spread was between 100 and 176, prices being up three-quarters with no appreciable change in rates; in 1918 the spread was 118 and 196; in 1919, 135 and 212, and in 1920, 146 and 243. In 1920, therefore, prices had outrun rates by almost 100 points, that is, by 100 per cent of the 1913 base.

The turn came in September, 1920, when rates started up to 160, then to 171, then to 177, and finally declined to 168 and 166; whereas prices declined from 242 in September to 225 in October, and then to 207, 189, and finally to 177.

In February, 1921, the price relative was 166, while rates were at probably the same point. For the first time since 1914, therefore, freight rates had become relatively as high as prices. It must be recalled in this connection, however, that railway rates in the years 1913 to 1917 were the lowest on record, and that the railways were even then finding their revenue inadequate to meet expenses and fixed charges. It was during those years that the railways were appealing for higher rates, in the Five Per Cent Case of 1913-14, the Western Rate Case of 1915, the C.F.A. Class Scale Case of 1916-17, and the Fifteen Per Cent Case of 1917. Thus in February the situation had temporarily assumed the same relation as in 1913-1914, when rates were low, in fact too low for the financial security of the carriers.

One point in this connection deserves comment, and that is the effect of increased rates on prices and on business. It was freely predicted in August, 1920, that increased freight rates would still further increase prices, and would shut off traffic. *Both predictions proved incorrect.* As already pointed out, prices have been declining ever since the increased rates went into effect, so that the effect of the higher rates has not been in the direction of boosting prices. Respecting the effect on traffic, the months of September and October, following the rate increase, showed no ill effects from the increased rates. On the contrary, September traffic was good, while October traffic was with one exception the greatest ever handled by the railways in a single month. Beginning in November, traffic has declined heavily, but the underlying reason has been not the increased rates, but the general business depression.

## The Peculiar Position of the Denver, Boulder & Western

By J. B. Day

A SITUATION apparently without parallel in the history of rail transportation has been precipitated by a decision and order of the Colorado Supreme Court, stipulating that the defunct Denver, Boulder & Western Railroad, which operated from Boulder to Ward and Eldora, in the north-central part of Colorado, shall resume operations, notwithstanding the fact the road was junked nearly two years ago—its rails torn up, its locomotives sent to China, South America and other far parts of the globe, and its coaches and freight cars sold to other lines.

Asserting, in effect, that Humpty Dumpty cannot be put together again, officers of the defunct road have, through E. E. Whitted, the road's attorney, filed with the state public utilities commission, the medium through which the decision of the Supreme Court was passed on to the company, a petition asking that they be excused from obeying the order. There the matter rests at present. Attorneys, railroad men and Colorado residents, generally, are awaiting the final outcome with keen interest.

The history of the Denver, Boulder & Western road, known as "The Switzerland Trail of America," because of the scenic grandeur along its route, makes one of the most absorbing chapters in the romantic story of the Centennial State.

But a score of years ago, to tap rich mining fields and unfold for the benefit of Coloradans and visitors within the state's borders a panorama of nature's wonders declared to be unsurpassed anywhere in the United States, the road represented a vast outlay of money, and was considered one of the greatest engineering feats accomplished up to that time.

The road was built in the shape of a "Y," having for its stem a 13-mile stretch of track from Boulder to the town of Sunset. At Sunset the road branched, one line running southeast, to Eldora; the other northeast, to Ward. The Eldora branch was 20 miles long; the Ward branch, 13 miles. From the terminus at Eldora a wagon road extended to the famed Arapahoe peaks and glacier. An automobile stage road connected the Ward terminus with the celebrated Estes park.

Some idea of the engineering feat involved in the building of the road may be gained from the fact that in the 26 miles between Boulder and Ward it climbed from an altitude of 5,333 feet to 9,450 feet, without a tunnel. In a nine-mile stretch between Sunset and Glacier Lake, on the Eldora branch, the road ascended 1,300 feet, winding and twisting in and out like a huge serpent.

But the road, according to its officers, was never a financial success. In 1917, when the soaring costs of materials and labor added to its financial burden, officers of the road petitioned the public utilities commission for permission to discontinue service and junk the property. The petition was resisted by various residents and mining companies in the territory tributary to the road, and the commission ordered the company to continue operations, granting it permission to increase freight and passenger rates as a means of coping with its financial difficulties. On July 23, 1919, the company again petitioned the commission for permission to junk the road, asserting the increased rates had not proven sufficient to balance operating costs. The petition was granted the following month, and the work of dismantling the road was begun shortly afterward.

The city of Boulder, the Boulder Commercial Club, and various mining companies along the route of the road protested the order, and when the commission declined to grant their petition for a rehearing they took the case into the Supreme Court. They failed, however, to ask for an order to stop the dismantling of the road pending the decision of

the court, with the result that the junking process was practically complete when, in July, 1920, the court handed down its decision holding the public utilities commission should not have permitted the road to discontinue service. The court declared in this decision that it had not been conclusively shown that the road could not be operated at a profit under normal conditions, if allowed certain concessions in the way of increased freight and passenger rates.

A rehearing of the case was asked for and granted. On March 7, 1921, the court handed down a decision upholding its previous finding, and two days later issued an emphatic order to the utilities commission to vacate the permit under

throughout the junking process, and that the mining companies and other protestors should have taken steps to stop the work of dismantling the road until the decision on the protest had been arrived at.

Quoting the language of the act under which the state public utilities commission was established, in 1915, the petition seeks to show the company was entirely within its rights in proceeding with the junking process, because of the failure of the protestors to ask the Supreme Court to stay the work of dismantling.

The act states specifically that the pendency of a writ of review from an order or decision of the utilities commission

Scenes on the Denver, Boulder & Western

This photograph gives an excellent idea of the topography of the territory through which the road passed, and of the engineering difficulties encountered in building it; B—Glacier lake, on the Eldora branch. This lake is formed by the snow waters from the famed Arapahoe peaks and glacier; C—Four Mile canyon at what was known as "The Parting of the Ways," where the road forked, one branch to Eldora, the other to Ward; D—A view of the famed Long's Peak, Estes Park.

which the road discontinued operations. In the meantime, the junking of the road had been completed.

In compliance with the mandate of the court, the commission, on March 14, issued an order requiring the road "to resume operations until it shall have made a fair test of its ability to earn the necessary income to justify its further operation."

On March 26, Attorney Whitted filed the supplementary petition with the commission, asking that the road be excused from complying with the order.

The petition asserts that it is physically and financially impossible to obey the order; that the company acted lawfully

"shall not of itself stay or suspend the operation of the order or decision," and that, in the event a stay is asked for and granted, it "shall not become effective until a suspending bond shall first have been filed with and approved by the commission."

Continuing, the petition says that several hundreds of thousands of dollars more than the price received for the junked material would be necessary to rebuild the road and resume operations, and that the company has no money and insufficient credit to undertake the rebuilding.

The petition declares further that there is not and never has been sufficient business tributary to the road to provide

a return large enough to pay operating expenses and taxes, and that to require the company to obey the order to resume operations would be, in effect, confiscatory. In conclusion, the petition asks that the commission find that the road's acts have been lawful throughout the proceedings; that the commission set aside its order requiring the road to resume operations, and that the road be exonerated and excused from obedience to the order.

Charles D. Marvin, of Boulder, was president of the company which operated the now defunct road, and William M. Culbertson, of Erie, Pa., was vice-president. L. R. Ford, of Boulder, was general manager.

## Open Executive Committee Meeting of Air Brake Association

**I**N LIEU OF THE twenty-ninth annual convention, which was postponed because of the prevailing business depression, the Executive Committee of the Air Brake Association held an open meeting at the Hotel Sherman, Chicago, on May 3, for the conduct of the essential business of the Association and to receive the committee reports and papers prepared for presentation and discussion at this year's convention. The reports and papers were presented in abstract only and were received without action or discussion, it being the plan of the Executive Committee to issue them to the membership in proceedings form and to bring them up at the next regular convention for final disposition by the membership as a whole.

The following reports and papers were presented.

Report of the Committee on Recommended Practice; Tests of Steam Heating Apparatus on Locomotives and Passenger Cars, Montreal Air Brake Club; Terminal Tests to Insure Effective as Well as Operative Brakes, Pittsburgh Air Brake Club; The Schedule "U C" Brake; The Brake Pipe Vent Valve, Central Air Brake Club; and Report on Air Consumption of Locomotive Auxiliary Devices.

### A Terminal Test to Secure Effective Grade Brakes

The paper presented by the Pittsburgh Air Brake Club suggests an extension to the retaining valve and pipe of the same close attention which has been so effective during the past few years in reducing brake cylinder leakage to a point where practically 100 per cent of all brakes are now operative, pointing out the importance of the retaining valve as a factor in making operative brakes effective in grade work. An abstract of the paper follows:

The method used in making the terminal test has become well established practice, its object, of course, being to determine the number of operative brakes in the train. This insures that as far as ordinary stops are concerned the trains can be stopped in a reasonable distance, but it does not insure that these same trains can be controlled and stopped on certain grades. It is for this reason that the recommendations in this paper are presented for the consideration of this Association.

A very few years ago it was found by actual terminal tests of freight trains that approximately 30 per cent of 51 trains tested had less than the required 85 per cent operative air brakes. This condition, of course, was due to excessive brake cylinder and cylinder pipe leakage.

During the 1917 convention a paper was presented by R. C. Burns, then chief air brake inspector of the Pennsylvania, recommending that, instead of doing this kind of work on the repair or shop track, the piston and leather should be taken to a shop provided with necessary facilities for proper cleaning, lubricating and testing of packing leathers.

The recommendations suggested at that time have since been recommended by the American Railway Association and

most of the large railroads of the country are now using this method for taking care of brake cylinder packing leathers. As a result brake cylinder leakage has been reduced very materially, since recent tests of a large number of trains show that operative brakes are now very close to 100 per cent.

It is well known that in order to control heavy tonnage freight trains down heavy grades with air brakes exclusively, the air brakes must be in good condition. In order to assist in increasing the per cent of effective brakes up to the point where they will equal the per cent of operative brakes, the Pittsburgh Air Brake Club recommends that the present terminal test be modified to insure an effective grade brake as well as an operative brake.

A terminal test of a number of freight trains in any yard no doubt will disclose trains with 95 per cent to 98 per cent operative brakes. But subject these same trains to a retaining valve test and it will be found in all probability that there are only 45 per cent to 55 per cent effective air brakes.

To insure a full recharge of the brake system between the time of release and the time of next application, the retaining valve and pipe should be in such condition that the brakes will remain applied from two to four minutes, and have a good exhaust of air from the brake cylinder when the retaining valve handle is turned down.

In order to ascertain the percentage of effective brakes, a retaining valve test should be made with all retaining valves in holding position. Following an initial fuel service application and release, succeeding full service applications and releases are made at four-minute intervals until the train crew or inspectors have completed the inspection of the train. Following the whistle signal at the first application the crew or inspectors, stationed at the front and rear of the train, wait two minutes after the release of the brakes is heard and then start over the train, turning down retaining valves as they go. They continue to do this until the signal for the next application is given and two minutes after the next release, repeat the process. This is continued until the retainers are all released. Ineffective brakes are indicated by a lack of exhaust, or only a faint exhaust at the retainer when the handle is turned down.

If this test could be substituted for the present terminal test, there is no reason why the latter could not be eliminated for the reason that the retaining valve test determines both the number of effective brakes and the number of operative brakes as well.

The retaining valve test was conducted on eight freight trains last summer, all coal trains, 50 cars per train, and it was found that a fast man would turn down as many as 10 retaining valves in the two minutes allotted between the release and application of the brakes, but the average was found to be about eight cars in each two-minute period. It would, therefore, require on a 50-car train approximately 12 minutes to make the test with two men, one starting at the front and the other at the rear end of the train.

The tests of the eight trains just referred to developed the fact that with from 88 per cent to 100 per cent of the brakes operative only 40.7 per cent to 71.7 per cent of the brakes were effective. The tons per effective brake ranged from 112 to 143. If every operative brake had been an effective brake the tons per good brake would have ranged from 62 to 83.

It is also recommended that when cars are going over repair or shop tracks, even though they are in date, they should be submitted to a retaining valve test and if the combined leakage of brake cylinder, retaining valve and pipe, exceeds 12 lb. per minute, the brake equipment should receive attention.

It is believed that if these recommendations are adopted by the railroads in general, only a short time will elapse until all freight grades will be in condition to control trains down average grades.

# Effect of Train Speed on Energy Consumption

This Relationship Directly Involves One of the Largest Expenses of Freight Train Movement

By G. S. Chiles and R. G. Kelley

ESSENTIALLY, the movement of traffic between terminals is simply a problem of the application of mechanical energy to overcome train resistance. Many conditions affect the cost of producing and applying this energy as well as the amount of energy which must be expended. Some of these conditions are beyond control, but others, such as train loading and speed, are subject to a considerable measure of control. The following discussion will be confined to a consideration of the effect of train speed on the amount of energy which must be applied to effect a given freight train movement, or in other words, to produce a given number of gross

rate of doing work. It is important that work and power should not be confused. In the case of train movement, the distance (the operating district) is fixed and the work done in completing a movement is directly proportional to the force required to effect the movement under its particular set of conditions. The power required will depend on the time allowed for the completion of the movement.

The values for the resistance of cars of 20 tons, 40 tons and 75 tons gross weight, taken from the curves in Fig. 1, are shown in the table and may be considered as typical of the minimum, the average and the maximum car weights generally encountered in freight train make-up.

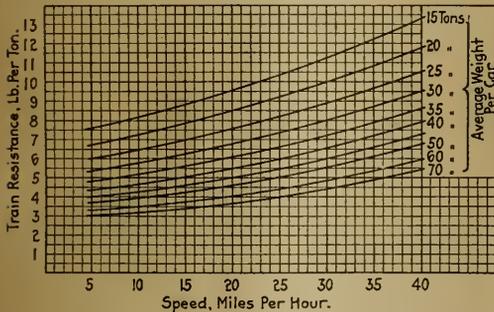

Fig. 1—The Relation Between Resistance and Speed, for Various Average Weights per Car

ton-miles. This consideration is of importance because it directly involves the locomotive fuel bill, which constitutes practically one-half of the direct expense of train movement.

In considering the amount of work or mechanical energy expended in freight car movement it is always somewhat difficult to determine the influence of any one of the several factors, such as the number of cars, weight of cars, train speed, condition of rail and right of way, weather conditions, etc., all of which enter into that complex quantity termed freight train resistance. In car resistance formulas there are usually three variables recognized as affecting car resistance, viz., speed, average weight of cars, and air temperature or weather. However, in order to analyze the effect of speed alone on the energy expended, the other variables will be eliminated by the assumption of constant car weight and weather conditions.

The best available data on freight train resistance were developed by Edward C. Schmidt as the result of an elaborate series of tests on the Illinois Central, published in 1910 in Bulletin No. 43 of the University of Illinois Experiment Station, and the resistance curves determined from these tests will be used. These are shown in Fig. 1.

When force is applied to the draw-bar of a car and is sufficient in amount to cause the car to move, work is performed. The amount of work performed depends on just two factors, namely, the force applied and the distance through which it acts. If the car is moved at a uniform rate of speed on straight, level track in still air the force acting, expressed in pounds per ton, is equal to the train resistance, as shown in Fig. 1.

Work is the product of force and distance. Power is the

EFFECT OF SPEED ON TRAIN RESISTANCE OF 20-TON, 40-TON AND 70-TON CARS, ON STRAIGHT, LEVEL TRACK

Speed m.p.h.	Train resistance					
	20-ton cars		40-ton cars		75-ton cars	
	Lb. per ton	Per cent inc. over 10 m.p.h.	Lb. per ton	Per cent inc. over 10 m.p.h.	Lb. per ton	Per cent inc. over 10 m.p.h.
5.....	6.5	...	4.4	...	3.0	...
10.....	7.3	...	4.7	...	3.2	...
15.....	7.9	8.0	5.1	8.3	3.4	6.0
20.....	8.5	16.3	5.5	17.0	3.7	15.5
25.....	9.3	27.0	6.0	27.5	4.0	25.0
30.....	10.0	37.0	6.6	40.0	4.5	40.5
35.....	10.9	49.5	7.2	53.0	4.9	53.0
40.....	11.8	62.0	7.9	68.0	5.5	72.0

Referring to the table, and using as a base 10 miles an hour, which is the lowest speed likely to be maintained for any great length of time, it will be seen that there is a well defined proportionate increase in the amount of energy required to move trains made up of cars averaging respectively 20 tons, 40 tons and 75 tons gross weight per car for all speeds above 10 miles an hour and that within the range of speeds likely to be encountered in freight train operation, this proportionate increase does not vary materially for cars of the

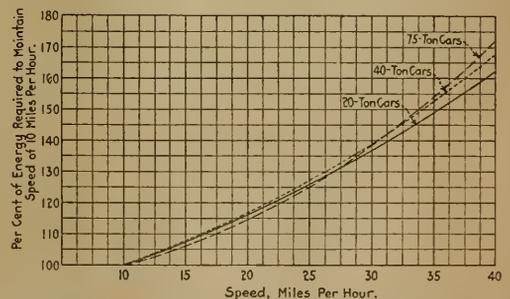

Fig. 2—Proportionate Increases in Energy Required to Move Cars at Speeds Above 10 m.p.h. on Straight Level Track

different weights. These facts are shown graphically in Fig. 2.

It, therefore, seems evident that the total work expended in freight car movement is materially influenced by changes in the speed of train movement anywhere within the whole range of practicable freight train speeds. Maximum efficiency in ton-miles produced per unit of mechanical energy expended would evidently be attained at about five miles an hour. Of course, the savings to be effected in train and engine crew

wages, fixed charges on investment, and in the improved efficiency of conversion of the chemical energy of the coal to mechanical energy at the drawbar, actually fix the most economical running speed considerably above five miles an hour.

The final determination of the best speed for freight train operation is a complex problem which can only be solved after taking into account the many special conditions affecting each case as well as the fundamentals of general application. This article will have served its purpose if it clearly draws attention to one of the latter which has not generally been taken into account in discussing the possibilities of increasing freight train speeds. Its importance is evident from the fact that even under present conditions, with punitive rates for overtime, the fuel cost of train movement is but a fraction of one per cent less than the cost of engine and train crew wages.

## Commercial Stocks of Coal

WASHINGTON, D. C.

**A** PRELIMINARY REPORT on commercial stocks of coal as of April 1 has just been made public by the United States Geological Survey, giving results of an inquiry conducted in part for the purpose of ascertaining whether the low production of coal thus far this year has been due mainly to undue postponement of coal purchases or whether it has not been due in part to the accumulation of reserves as a result of decreased consumption. The preliminary estimate indicates that on April 1 the stocks on hand of bituminous coal were approximately 37,000,000 tons as compared with about 45,000,000 tons on January 1. If the draft upon stocks is not soon checked, the report states, reserves will fall below the level of safety, but the report indicates that the slump in production is to a considerable extent due to decreased consumption. The railroads on April 1 had a reserve of about three weeks and five days' supply or about the same as on January 1. An abstract of the report of which the figures are still subject to revision, follows:

Stocks of coal are significant because they are the consumers' reserve against a possible interruption in supply. Such interruptions have occurred in the past through mine strikes, traffic congestion on the railroads, or severe weather interfering with the delivery of loaded coal. When stocks are large, consumers can delay purchasing until offered favorable terms. Small stocks, on the contrary, drive many consumers to enter the spot market and conduce to higher prices. The condition of stocks, therefore, has an important effect on the coal market, and is a matter of consequence to all who buy and sell coal in quantity. In considering stocks, a sharp distinction must be made between anthracite and bituminous coal.

### Current Production and Consumption

Production of bituminous coal declined steadily from December, 1920, to the end of the coal year, March 31. In late March and early April, the soft coal miners were working on the average only two or three days a week. Mine capacity and demonstrated transportation facilities sufficient to produce another 6,000,000 tons of coal every week, were and still are lying idle. An army of men dependent on the mines for livelihood are unemployed, or at best, working but a few hours a week. From a maximum of 12,800,000 tons a week in December, production had sunk to a bare 6,000,000 tons, the lowest point (except, of course, for the great strike of 1919) touched since April, 1914. Indeed, if the growth in the country's requirements during the past seven years be considered, the present depression in the soft coal industry is more acute than that of 1914, and one must go back to the panic of 1893 to find its parallel.

At first thought, this profound slump in production might give ground for alarm as to the sufficiency of next winter's supply of coal. Before, however, it is assumed that the slump in output foretells a shortage of coal, two other facts must be taken into account. The first fact is that the slump was preceded by several months of heavy production, which brought the total output in 1920 up to 556,000,000 tons, exceeding even the war year, 1917, and approaching the record production of 1918—579,000,000 tons. Not all of this large output was consumed or exported. Some millions

of tons of it were added to consumers' stocks, and it was to be expected that these stocks would be drawn upon during the late winter. The second fact to be remembered is that the slump in output was accompanied by a great cut in consumption. While complete data on current consumption are lacking, there is enough evidence to show that the combined domestic consumption and exports during the first quarter of 1921 were 20 per cent less than during the first quarter of 1920. Comparing the month of March, 1921, with March, 1920, the decrease was about 30 per cent.

Piecing together the available facts concerning production, consumption and stocks, it appears that the output during the first quarter of the year 1921 was 100,000,000 tons; that consumption and exports were in round numbers 108,000,000 tons, and that the deficit between production and consumption was made up by a draft upon consumers' stocks of about 8,000,000 tons.

Moreover, this draft upon stocks did not end with March 31. Although the returns for the week ended April 23 show an increase in production, the total output for April will fall short of the total consumption. Six million eight hundred and twenty-nine thousand tons a week is not enough to meet our current requirements, even in the present atmosphere of business depression.

A final estimate of the total stocks on hand can not be made until more complete returns are received from consumers. It is, however, possible to state that the stocks on hand as of January 1, 1921, were somewhere between 42 and 48 million tons—say 45 million, and that on April 1 they had fallen to somewhere between 34 and 39 million—say 37 million. In the following table are given the stocks at various times in the past:

Estimated Total Commercial Bituminous Coal in the United States (Net Tons.)

October 1, 1916.....	27,000,000	January 1, 1919.....	57,900,000
October 1, 1917.....	28,100,000	April 1, 1919.....	40,400,000
July 15, 1918.....	39,700,000	March 1, 1920.....	24,000,000
October 1, 1918.....	59,000,000	June 1, 1920.....	20,000,000
Day of the Armistice.....	63,000,000		

Coal in transit not included.

### Stocks Held by Different Consumers

**Retail Yards.**—Stocks of bituminous coal in the yards of retail coal merchants were greater on April 1, 1921, than on the corresponding date two years before, and very much greater than last year. The 1,107 dealers reporting had an average of four weeks' and two days' supply on January 1. They reduced their stocks by 15 per cent during the three months from January to March, and on April 1 their supplies were sufficient for three weeks and five days. The maximum stock carried by retailers during the period over which the records of storage coal extend was five weeks and four days on January 1, 1919.

**Railroad Fuel.**—The railroads of the country had about three weeks' and five days' supply of coal in cars, stock piles and chutes on April 1. Reports from 283 roads had been assembled by the American Railway Association up to Friday, April 29, and complete returns for all roads are promised. The 283 roads had on hand 6,741,000 tons as of January 1, and almost exactly the same amount—6,737,000 tons—on April 1. This was equivalent to 26 days' requirements at the going rate of consumption. Thus while the quantity of coal purchased currently by the roads apparently decreased, their consumption had so decreased that their takings sufficed to maintain their reserves. It is not yet possible to state the railroad fuel stock in tons, but by expressing it in terms of weeks' supply, it may be compared with the stock on other dates. Like the majority of other consumers, the railroads are much better stocked with coal than they were in 1920, but have no such reserve as they carried in 1918 and early 1919.

The coal in transit forms a sort of mobile reserve as opposed to the stationary reserve in the bins of consumers. This mobile reserve includes not only the coal in cars, but also the coal on the commercial docks at the head of the Lakes. The tonnage on the docks is normally greatest in the fall at close of navigation, and least in the spring when navigation opens.

Complete returns concerning the carry-over on April 1, 1921, are not yet available, but the total is thought to be at least 2,250,000 tons. The following statement shows the bituminous coal on hand at the opening of navigation, held by companies now reporting to the Northwestern Coal Dock Operators' Association. Though incomplete, the figures cover an identical group of companies operating at Duluth, Superior, Ashford and Washburn:

1917.....	387,968
1918.....	987,246
1919.....	2,439,749
1920.....	514,902
1921.....	1,643,034

Though smaller than in 1919, the 1921 carry-over was much larger than in either of the war years, and three times as great as last year.

# General News Department

The hearing before Examiner Barclay of the Interstate Commerce Commission on the cost of repairs to locomotives sent by the New York Central to outside shops, originally set for hearing at New York on May 9, has been postponed until May 23.

The New England Railroad Club, at its regular meeting to be held at the American House, Boston, on Tuesday evening, May 10, will listen to a talk by E. S. Jones, official photographer of the Boston & Maine, on New England: its lakes, rivers, mountains, seashore and history. The lecture will be illustrated with original colored lantern slides.

Express messengers and others who, for several weeks, have been on trial in the federal court at Macon, Ga., on charges of a conspiracy to rob the American Railway Express Company, were sentenced on April 30. Thirteen men were sentenced to terms in the penitentiary, and 28 others were fined in amounts ranging from \$300 to \$3,000.

In a bold theft of mail bags at the station of the Central of New Jersey at West Eighth street, Bayonne, N. J., on the morning of April 30, the baggageman at the station was shot and wounded. The robbery occurred before daylight, immediately after the bags had been left by a southbound train. Seven men were arrested soon afterward and were held in \$25,000 bail, each, for a hearing this week.

The Missouri Pacific has abolished its Valley division, effective May 1, and has assigned the Pine Bluff district from Little Rock, Ark., to McGehee, to the Arkansas division, the McGehee district, from McGehee to Monroe, La., and the Hamburg district, to the Louisiana division and the Lake Providence district, the Eudora district and the Arkansas City and Warren branches to the Memphis division.

Officers of the Mobile & Ohio and representatives of the two organizations representing unskilled employees of that road, have agreed upon a reduction in wages of approximately 20 per cent below the rates prescribed in the United States Railroad Labor Board decision No. 2. The new rates became effective April 16. The reductions apply in all departments of the service where unskilled laborers are employed, including track, bridge, building, shop, coal chute, cinder pit, dock and freight house workmen.

The full crew law of Pennsylvania, which has been in force in that State since July, 1911, will be repealed by an act passed by the legislature last week, and since signed by the governor, authorizing the Public Service Commission to regulate the number of men to be employed in each train crew. The House adopted this bill by a vote of 110 to 88. In 1915 the legislature voted to repeal the full crew law, but its action was vetoed by Governor Martin G. Brumbaugh.

Senator Frelinghuysen has introduced in the Senate a bill to provide for the payment of a salary to Henry J. Ford, who served as a member of the Interstate Commerce Commission until March 4 under a recess appointment, after the Senate had failed to confirm the original appointment. M. W. Potter, who served in the same way, is entitled to his salary for the period because he was later reappointed and the Senate voted confirmation. Mr. Ford has been retained by the Interstate Commerce Commission as special assistant.

Three of the five bandits who participated in seizing the ticket receipts of the New York Central at Toledo, Ohio, on January 17, as the money was being moved from the station to the bank when two railroad detectives were murdered, have been captured. Frank Seward, the last of the robbers apprehended, was injured in trying to make his escape from

officers who had been sent to arrest him at Omaha, Neb., on April 25, and later died from self-inflicted wounds. The other two bandits captured have been sentenced, one to life imprisonment and one to be hanged.

Bird M. Robinson, President of the American Short Line Association, says that about 75 per cent of the employees of the short lines of the country have accepted reductions in wages. The amount of the reductions is not known with precision, but Mr. Robinson thinks the percentages were as great, and perhaps in some cases greater than, the reductions proposed by the larger railroads. It is said that nineteen disputes now before the Railroad Labor Board involve "short lines" and Mr. Robinson plans to go before the Board and show that that body has no jurisdiction of roads which were not operated by the government during the war.

V. Fitzpatrick, speaking for 15 organizations of strikers who left the services of the Atlanta, Birmingham & Atlantic on March 5, wrote last week to B. L. Bugg, receiver in charge of the road, requesting a conference, as suggested by the Railroad Labor Board, in its decision on the A. B. & A. controversy (reported in the *Railway Age*, April 29, page 1036); but Colonel Bugg, in a long reply, declines to confer; his new employees are satisfactory; the public is being served, by both passenger and freight trains, and Mr. Fitzpatrick's constituents, having voluntarily left, are not now employees and have no standing before the Labor Board. Colonel Bugg calls attention to the fact that Judge R. M. Barton, chairman of the Railroad Labor Board, filed a dissenting opinion, declaring that the decision of the Board in this matter was based on a misconception of the law. Judge Barton believes that the action of the Federal Court in Georgia was wise, and fully justified.

## Railroad Surgeons' Meeting

The first annual meeting of the Medical and Surgical Section of the American Railway Association is to be held at Hotel Westminster, Boston, Mass., on Friday and Saturday, June 3 and 4. Members attending this meeting will be accorded half rates on Pullman sleeping cars, for themselves and their families, the arrangement being to pay full fare both ways, taking receipt, and then making application for refund, afterward, through the secretary of the Section, J. C. Caviston, 75 Church street, New York city.

## Elimination of Transportation Taxes Not Included in Tax Revision Plan

Secretary of the Treasury A. W. Mellon, in a letter to the chairman of the Congressional committee, proposes a plan of tax revision, including a repeal of the excess profits tax on corporations and a possible substitution of a flat additional tax on corporations. He recommends the retention of the transportation tax on freight and passengers. It is objectionable and he wishes it were possible to recommend its repeal; but it produces about \$330,000,000 in revenue per year and could not safely be repealed or reduced unless Congress is prepared to provide an acceptable substitute.

## St. Paul Employees Want to Acquire Stock

Employees of the Chicago, Milwaukee & St. Paul have started a movement to acquire stock in the company. At a recent informal dinner of the employees of the auditor's office, 189 employees subscribed for 379 shares of the stock. They formed the "Action Club" and each employee owning a share of stock will wear a button on which will be inscribed, "I Am An Employee Stockholder." When the subject was discussed at the dinner the

clerk who proposed the purchase of stock by employees said the company offered nothing and that officers of the road were in no way back of the proposition. Arrangements will be made to purchase the stock through brokers and payment will be made on the installment plan.

### New Rules for Classification of Employees

New rules governing the classification of employees for statistical and reporting purposes, to go into effect on July 1, have been issued by the Interstate Commerce Commission. They provide for more detailed reports than have hitherto been required. The resulting statistics are intended to meet the needs of both the Railroad Labor Board and the Interstate Commerce Commission. The classification is made largely in accordance with the recommendations of the director-general of railroads. It is requested that duplicate copies of the reports be sent to the Labor Board. There will be 148 classes of employees, in place of the 68 classes heretofore used by the commission. The number of employees is to be counted 12 times a year as of the 15th of the month, with additional counts for certain occupations.

### New Acting Secretary Announced for A. S. C. E.

At the regular meeting of the American Society of Civil Engineers on May 4, notice was presented that E. M. Chandler, formerly chief engineer, Washington State Reclamation Service, Olympia, Wash., had been elected acting secretary of the society. Following this, Ernest E. Howard, Kansas City, Mo., presented a paper on Vertical Lift Bridges. With the aid of lantern slides, Mr. Howard presented and described the development of the lift bridge, the general elements of the design as well as going into considerable detail over the methods used in constructing some of the more notable of the structures illustrated. The greater part of the paper covered data relative to the design, etc., of the Columbia River Interstate bridge, the North Kansas City bridge and the Harriman bridge at Portland, Ore. The discussion was chiefly by D. B. Steinman and Shortridge Hardesty who compared the relative economies of the vertical lift bridge and the bascule span.

### Cost of Train Operation in January

A further increase in the cost of train operation as indicated by selected accounts is shown by a statistical bulletin issued by the Interstate Commerce Commission for the month of January. The average cost per freight train mile for the selected accounts was \$2.16 as compared with \$1.87 in January, 1920, an increase of about 16 per cent. The cost of locomotive repairs increased from 45.7 to 54.8 cents, engine house expenses from 11 to 13.9, engine men from 27.6 to 28.5, trainmen from 31.4 to 33.7, fuel from 60 to 73 and other locomotive and train supplies from 11.3 to 12.4 cents. The cost of coal per net ton, including freight, was \$4.61 as compared with \$3.71. The average cost of train operation per 1,000 gross ton miles was \$1.59 as compared with \$1.41. The cost per passenger train mile, selected accounts, was \$1.16 as compared with \$1.01.

### March Income Shows Some Improvement

A preliminary compilation of revenues and expenses as reported by the railroads to the Interstate Commerce Commission for the month of March makes a better showing than that for the preceding three months. As the result of a considerable reduction in operating expenses, which show a decrease of 5 per cent as compared with March, 1920, 181 Class I roads show a net operating income for the month amounting to \$28,000,000, as compared with \$12,000,000 for the corresponding month of last year. To receive a 6 per cent return for the year the Class I roads should earn about \$81,000,000 net in March, but in January and February the roads had deficits and in December the net operating income was only about \$10,000,000. Total operating revenues of the 181 roads for March were \$434,000,000, or almost exactly the same as those for March, 1920. Operating expenses were \$380,000,000, a reduction of \$20,000,000. The more detailed statement which will be issued later is expected to show, however, that this reduction was accomplished largely at the expense of maintenance. The Eastern roads had a net operating income of \$10,000,000, the Southern roads \$7,000,000 and the Western roads \$10,600,000.

### Opposition to Sale of Chicago Junction

Luther M. Walter, attorney for eight railroads, opposing the purchase of the Chicago Junction belt line by the New York Central, sent a letter to the shippers along the Belt Lines on April 26, urging them to write to the Interstate Commerce Commission to the effect that they preferred to have the property remain under its present ownership, management and operation, since learning the facts regarding the present financial condition of these properties. "When the New York Central entered into its agreement to buy the Belt Lines on September 27, 1920," said Mr. Walter in his letter, "the lines were in poor condition financially. However, substantial increases in allowances by all the connecting trunk lines have made possible sufficient revenues to adequately maintain and expand the property as well as to return a fair rate of interest on the investment." Mr. Walter stated that the trunk lines would continue the present rates and allowances that have made the increased revenues possible, would continue to absorb the present switching charges and would retain the present flat rates to and from industries.

### Traffic and Operating Statistics for January

The net ton miles of revenue and non-revenue freight handled by the railroads in January, 1921, aggregated 29,817,000,000 as compared with 34,964,000,000 in January, 1920, a decrease of 14 per cent, according to the monthly statistical bulletin issued by the Interstate Commerce Commission, covering 169 Class I roads. The average carload for the month was 30.2 tons as compared with 28.3 in the corresponding month of 1920, and the average mileage per car per day was 23.2 as compared with 22.8. The average number of unserviceable cars was 8.7 as compared with 6.5.

The average haul of freight per railroad was 187.62 as compared with 182.10 in 1920, in spite of the increase in the rates. The average revenue per ton mile was 1.21 cents as compared with 0.969 in 1920.

The number of passengers carried one mile was 3,358,000,000 as compared with 3,501,000,000 and the revenue per passenger mile was 3.11 cents as compared with 2.61 cents. There was a slight increase in the average journey per road, from 35.95 to 35.99, but there was a decrease in the number of passengers per car from 18.66 to 17.19.

### A. R. A. Committee for Coal Hearings

The board of directors of the American Railway Association announces the appointment of a committee of six railway officers to look out for the interests of member roads at the hearings which are to be given by the Interstate Commerce Commission in its investigation of the practices of railroads in the distribution of private cars used in coal traffic and cars used for railroad fuel. The commission is to conduct these hearings at a number of points in different parts of the country. The committee now appointed is to co-operate with Col. A. P. Thom, general counsel of the Association of Railway Executives. It consists of C. H. Markham (I. C.); F. H. Alfred (P. M.); H. E. Byram (C. M. & St. P.); Elisha Lee (Penn.); E. E. Loomis (L. V.) and W. D. Robb (G. T.).

This committee has appointed a committee of railroad counsel to handle the case in behalf of the members, as follows: R. V. Fletcher (I. C.); H. W. Bikle (Penn.); John C. Bills (P. M.); W. S. Bronson (C. & O.); E. G. Buckland (N. Y., N. H. & H.); K. F. Burgess (C. B. & Q.); H. T. Dick (C. & E. L.); O. W. Dynes (C. M. & St. P.); E. S. Joutet (L. & N.); J. G. McMurray (D. & R. G.); and Chas. J. Rixey (Southern).

A. G. Gutheim, of the car service division, A. R. A., is also associated with the committee.

### A Full Day's Work for a Full Day's Pay

Francis H. Sisson, vice-president of the Guaranty Trust Company, New York city, speaking before the American Newspaper Publishers' Association at its annual convention last week, called the attention of farmers and other persons making insistent demands for freight rate reductions to the fact that the railroads, like every other institution, must have an income at least equal to their expenses. "Railroad rates are unquestionably too high in instances, not only for the wel-

fare of business generally, but also for the best interests of the railroads themselves. There they should be reduced. But the farmers and business men who are clamoring for a general readjustment of these rates to a pre-war basis should realize that they are demanding drastic action on the part of the Interstate Commerce Commission which would mean financial disaster to the railroads and eventually to the commerce of the country. Here is a striking instance of the lack of knowledge on the part of some of our people regarding one of the most vital domestic problems of the day. It should be patent to all that to reduce rates without first reducing railroad operating costs would be calamitous. Operating costs, however, cannot be materially curtailed so long as 63 per cent of railroad revenue is absorbed in wages, as contrasted with only 43 per cent in 1917. So, in the final analysis the farmers' quarrel is not with the railroad managements but with organized railroad labor, which is opposing a reduction in the largest item of operating cost and thereby penalizing the farmer and all other producing interests in the country. Instead of applying pressure on the Interstate Commerce Commission, the farmers should address themselves directly to the railroad brotherhoods and demand a deflation of unjustifiable war wages and a full day's work for a full day's pay.

### Program for Annual Meeting of

#### Mechanical Division A. R. A.

The Mechanical Division of the American Railway Association has issued a program for the business meeting to be held at the Drake Hotel, Chicago, June 15 and 16. The sessions will convene at 10:00 a. m., city time, which is 9:00 a. m., central standard time, and continue all of each day with luncheon period from 12:30 to 2:00 p. m.

Reports from the following committees will be considered:

#### WEDNESDAY, JUNE 15

General Committee.  
Committee on Nominations.  
Arbitration Committee.  
Committee on Prices for Labor and Material.  
Committee on Loading Rules.  
Committee on Standard Method of Packing Journal Boxes.

#### THURSDAY, JUNE 16

Committee on Car Construction.  
Committee on Brake Shoe and Brake Beam Equipment.  
Committee on Train Brake and Signal Equipment.  
Committee on Tank Cars.  
Committee on Specifications and Tests for Materials.  
Election of officers will be held Wednesday, immediately after report of Nominating Committee is presented. Advance copies of the reports to be considered will be mailed to the members before the meeting.

### For Reasonable Railroad Regulation

The Chamber of Commerce of the United States, in resolutions adopted at its ninth annual meeting at Atlantic City, N. J., declared safe and adequate rail transportation, at the lowest rates consistent with fair wages to employees and with just returns to the owners and also sufficient to insure constant growth and improvement in facilities, to be essential to the upbuilding of the nation.

"Reasonable returns on fair value are necessary, not only as an act of justice, but also to attract new money for expansion, and to promote the safety of railway securities. Proper aggregate earnings must be maintained, but rates and the relation of rates between various commodities, particularly the products of agriculture, should be established with great care. In a country of great distances it is important for the farmer, the laborer and every producer and every consumer to have the widest distribution of commodities.

"The unrivaled railway system of the United States was created through the courage, energy, brains and money of individuals, . . . and the nation, speaking through the last Congress, decided that it wishes its railway system owned and operated by individual citizens, subject to regulation by Federal and State authority; and that it does not want government ownership or operation.

"The Chamber of Commerce of the United States reiterates its opposition to government ownership or operation. Regulation is reasonable only when it is not so restrictive as to cripple initiative and when it permits prompt action by those responsible for results. Unduly restrictive laws retard the railways rather than assist them and, in the long run, work in the direction of increased rather than reduced rates. . . ."

### Railroad Regulation Gone Too Far

Otto H. Kahn, of New York, speaking before the Traffic Club of Pittsburgh on April 28, made a strong plea for such modification of federal control over railroads as shall give the directors of the companies adequate powers of initiative.

"I venture to hope—though I know it to be a daring hope," said Mr. Kahn, "that out of the investigation which shortly will be inaugurated by Senator Cummins' committee into the railroad situation there will come recognition that regulation and control have gone too far, and that more scope again must be allowed to the old American method of personal initiative, enterprise and responsibility, if the railroads are to be enabled to give the fullest and best measure of service to the people."

Mr. Kahn would continue a flat tax on corporate earnings, would abolish the excess profits tax, eliminate minor irksome and invidious special taxes and broaden the basis of indirect taxation. He would favor a sales tax, believing that the various practical objections brought forward by its opponents can all be met.

In speaking of the railroads, Mr. Kahn said:

"Practically nothing of any importance can be done without a hearing before the nine governmental appointees in Washington. Initiative has been blunted, vision deadened, daring rendered impossible, decision removed, the qualities of leadership dispossessed, men of commanding ability discouraged from entering the railroad field.

"The Interstate Commerce Commission is both an advantage and a necessity. But it should be entirely possible to attain both the things which I believe a majority of our people desire to see preserved: government surveillance and authority, and private initiative, resourcefulness, zest and responsibility. . . . It is greatly to be hoped that the bulk of employers will use the present emergency not to get even with labor, but to set an example of fair and considerate dealing."

### Commission Asked to Amend Valuations

The Kansas City Southern and the Los Angeles & Salt Lake have filed motions with the Interstate Commerce Commission asking that the supplemental tentative valuations issued by the commission on March 31 be amended to set forth an analysis of the methods of valuation employed and the reasons for any difference between the final value found and the cost schedules or cost values stated by the commission. It is stated that the valuation act requires such an analysis of the methods and that the commission in failing to give it has not complied with the plain and express terms of the valuation act.

The Kansas City Southern motion states that the carrier is deprived of the right given by the valuation act to protest against the rules, principles, methods and procedure which have been employed and that it cannot prepare intelligently its protest against the supplemental tentative valuation. As an illustration, the carrier points to the fact that the value stated as the final value of the carrier is less than the cost of reproduction new as computed by the commission and in excess of the cost of reproduction less depreciation as computed by the commission, but it is nowhere stated by what method or processes such value has been reached. Objection is also made that there is no ascertainment of other values and elements of value and that the valuation does not give or purport to give the commercial or pecuniary value of the property. The final figure given is described as "an arbitrary and artificial sum determined by some undisclosed process and not a compliance with the law."

The Los Angeles & Salt Lake has also filed a protest against the supplemental tentative valuation stating that a valuation as of June 30, 1914, will not comply with the act or serve any purpose thereunder. Protest is also made against the finding of a final value of \$45,871,093 and the company alleges that the value of its property was not less than \$70,000,000. It is also

stated that the commission in finding a value "as that term is used in the interstate commerce act" has employed language which is indefinite and subject to misconception and misunderstanding, in view of the fact that there is an important controversy whether the value to be reported shall be "real or pecuniary value" or simply an amount to be designated as the value for rate-making purposes.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

**AIR BRAKE ASSOCIATION**.—F. M. Nellis, Room 3014, 163 Broadway, New York City. Exhibit by Air Brake Appliance Association.

**AIR BRAKE APPLIANCE ASSOCIATION**.—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.

**AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS**.—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

**AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS**.—S. W. Derr, Philadelphia & Reading, Philadelphia, Pa.

**AMERICAN ASSOCIATION OF ENGINEERS**.—C. E. Drayer, 29 S. La Salle St., E. L. R. N. 2, South Michigan Ave., Chicago. Annual convention, May 9-11, La Fayette Hotel, Buffalo, N. Y.

**AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS**.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

**AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS**.—J. Rothschild, Room 400, Union Station, St. Louis, Mo. Next convention, August 24-26, 1921, Kansas City, Mo.

**AMERICAN ELECTRIC RAILWAY ASSOCIATION**.—E. B. Burritt, 8 W. 40th St., New York.

**AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION**.—C. Borcherdt, 202 North Hamilton Ave., Chicago, Ill. Next convention September 12-14, Hotel Sherman, Chicago.

**AMERICAN RAILWAY ASSOCIATION**.—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Next regular meeting, November 16, 1921.

Division I—Operating, W. J. Fripp (Chairman), General Manager, New York Central Railroad, Eastern Lines, New York, N. Y.; R. E. New (Vice-Chairman), General Manager, Central Region, Pennsylvania System, Pittsburgh, Pa.

Freight Station Section (including former activities of American Association of Freight Agents), C. E. Fish (Chairman), Freight Agent, Baltimore & Ohio Railroad, Cincinnati, Ohio; J. C. Gilmore (First Vice-Chairman), Agent, Pennsylvania System, Eastern Region, Philadelphia, Pa.; M. Teschemacher (Second Vice-Chairman), General Agent, Chicago & Alton Railroad, Chicago, Ill.; R. O. Wells (Secretary), Freight Agent, Illinois Central Railroad, Chicago, Ill.

Medical and Surgical Section, D. Z. Dunott (Chairman), Chief Surgeon, Western Maryland Railway, Baltimore, Md.; G. G. Dowdall (First Vice-Chairman), Chief Surgeon, Illinois Central Railroad, Chicago, Ill.; Duncan Eve (Second Vice-Chairman), Chief Surgeon, Nashville, Tenn.; J. C. Nashville, Chattanooga & St. Louis Railway, Nashville, Tenn. J. C. Caviston, secretary, 75 Church Street, New York. Annual meetings, June 3 and 4, Hotel Westminster, Boston.

Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association), R. S. Mitchell (Chairman), Chief Special Agent, Missouri Pacific Railroad, St. Louis, Mo.; H. L. Denton (First Vice-Chairman), General Superintendent of Police, Baltimore & Ohio Railroad, Baltimore, Md.; Emmett Gregg (Second Vice-Chairman), Superintendent Special Agent, Santa Fe Railway, Topeka, Kan.; J. C. service, Atchison, Topeka & Santa Fe Railway, Topeka, Kan.; J. C. Caviston (Secretary), 75 Church St., New York, N. Y.

Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents), H. Hellatt (Chairman), Manager of Telegraphs, Grand Trunk Railway, Montreal, Que.; W. H. Hall (First Vice-Chairman), General Superintendent of Telegraph, Missouri, Kansas & Texas Lines, Denison, Texas; R. F. Finley (Second Vice-Chairman), Superintendent Telegraph, New York Central Lines, West of Buffalo, Cleveland, Ohio; W. A. Fairbanks (Secretary), 75 Church St., New York, N. Y.

Division II—Transportation (including former activities of the Association of Transportation and Car Accounting Officers), E. J. Pearson (Chairman), President, New York, New Haven & Hartford Railroad, New Haven, Conn.; J. J. Bernet (Vice-Chairman), President, New York, Chicago & St. Louis Railroad, Cleveland, Ohio; C. W. Crawford (Chairman, General Committee), 431 South Dearborn St., Chicago, Ill.; G. W. Covert (Secretary), 431 South Dearborn St., Chicago, Ill.

Division III—Traffic, G. H. Ingalls (Chairman) Vice-President, New York Central Lines, New York, N. Y.; J. Gottschalk (Secretary), 143 Liberty St., New York, N. Y.

Division IV—Engineering, H. R. Safford (Chairman), Assistant to the President, Chicago, Burlington & Quincy Railroad, Chicago, Ill.; C. I. Kelloway (Vice-Chairman), Superintendent of Signals, Atlantic Coast Line Railroad, Wilmington, N. C.; E. H. Fritch (Secretary), 431 South Dearborn St., Chicago, Ill.

Construction and Maintenance Section, H. R. Safford (Chairman), Assistant to the President, Chicago, Burlington & Quincy Railroad, Chicago, Ill.; E. H. Fritch (Secretary), 431 South Dearborn St., Chicago, Ill.

Electrical Section, George Gibbs (Chairman), Chief Engineer of Electric Traction, Long Island Railroad, New York, N. Y.; E. B. Kette (Vice-Chairman), Chief Engineer Electric Traction, New York Central Railroad, New York, N. Y.; E. H. Fritch (Secretary), 431 South Dearborn St., Chicago, Ill.

Signal Section (including former activities of the Railway Signal Association), F. O. Piesing (Chairman), Signal Engineer, Union Pacific Railroad, Omaha, Neb.; F. B. Wiegand (First Vice-Chairman), Signal Engineer, New York Central Railroad, Western Lines, Cleveland, Ohio; C. A. Balliet (Vice-Chairman), Signal Engineer, Northern Pacific Railway, St. Paul, Minn.; H. S. Balliet (Secretary), 75 Church St., New York, N. Y. Annual meeting, June 6-8, Hotel Drake, Chicago.

Division V—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), W. J. Tollerton (Chairman), General

Mechanical Superintendent, Chicago, Rock Island & Pacific Railway, Chicago, Ill.; J. Coleman (Vice-Chairman), Assistant to General Superintendent Motive Power and Car Departments, Grand Trunk Railway, Montreal, Que.; V. R. Hawthorne (Secretary), 431 South Dearborn St., Chicago, Ill. A business session at the Hotel Drake, Chicago, will be held on June 15 and 16, instead of the convention at Atlantic City, N. J. Exhibit at this convention of Railway Supply Manufacturers' Association has been cancelled.

Equipment Section (including former activities of the Master Car and Locomotive Painters' Association), E. L. Younger (Chairman), Foreman Painter, Missouri Pacific Railroad, Little Rock, Ark.; J. G. Kell (First Vice-Chairman), Foreman Painter, New York Central Railroad, Western Lines, Elkhart, Ind.; J. P. Ayers (Second Vice-Chairman), General Manager Paint, Canadian Pacific Railway, Montreal, Que.; V. R. Hawthorne (Secretary), 431 South Dearborn St., Chicago, Ill.; A. P. Dane (Assistant Secretary), Foreman Painter, Boston & Maine Railroad, Reading, Mass.

Purchases and Stores (including former activities of the Railway Storekeepers' Association), H. C. Pearce (Chairman), General Purchasing Agent, Seaboard Air Line Railway, Norfolk, Va.; H. E. Ray (Vice-Chairman), General Storekeeper, Atchison, Topeka & Santa Fe Railway, Topeka, Kans.; J. F. Murphy (Secretary), General Storekeeper, New York Central Railroad, Western Lines, Collinwood, Ohio; W. J. Farrell (Assistant Secretary), 75 Church St., New York, N. Y. Second annual meeting June 9-11, Hotel Blackstone, Chicago.

Division VII—Freight Claims (including former activities of the Freight Claim Association), H. C. Pribble (Chairman), General Claim Agent, Atchison, Topeka & Santa Fe Railway System, Topeka, Kans.; H. C. Howe (First Vice-Chairman), Freight Claim Agent, Chicago & North Western Railway, Chicago, Ill.; D. C. MacDonald (Second Vice-Chairman), Assistant General Claim Agent, Canadian Pacific Railway, Winnipeg, Man.; Lewis Pilcher (Secretary) 431 South Dearborn St., Chicago, Ill. Next meeting, May 17-19, Hotel Sherman, Chicago.

**AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION**.—C. A. Lichtig, C. & N. W. Ry., 319 Waller Ave., Austin Station, Chicago. Next convention, October 18-20, 1921, New York City. Exhibit by Bridge and Building Supply Men's Association.

**AMERICAN RAILWAY ENGINEERING ASSOCIATION**.—(Works in co-operation with the American Railway Association, Division I.) E. H. Fritch, 431 South Dearborn St., Chicago. Exhibit by National Railway Appliances Association.

**AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION**.—(See American Railway Association, Division 5.)

**AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION**.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Next convention, August 9-11, Hotel Sherman, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.

**AMERICAN SHORT LINE RAILROAD ASSOCIATION**.—T. F. Whittlesey, Union Trust Bldg., Washington, D. C. Next meeting, May 18, Washington, D. C.

**AMERICAN SOCIETY FOR STEEL TREATING**.—W. H. Eiseaman, 4600 Prospect Ave., Cleveland, Ohio. Next convention, September 19-24, Indianapolis, Ind.

**AMERICAN SOCIETY FOR TESTING MATERIALS**.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June 20-24, New Monterey Hotel, Ashbury Park, N. J.

**AMERICAN SOCIETY OF CIVIL ENGINEERS**.—Col. H. S. Crocker (acting secretary), Engineering Societies Building, 33 W. 39th St., New York. Next convention, April 27, 1921, Houston, Texas. Regular meetings, 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.

**AMERICAN SOCIETY OF MECHANICAL ENGINEERS**.—Calvin W. Rice, 29 W. 39th St., New York. Next meeting, May 23-26, Congress Hotel, Chicago.

**TRAIN DISPATCHERS' ASSOCIATION**.—C. L. Darling, Northern Park City, Spokane, Wash. Next convention, June 20, 1921, Kansas City, Mo.

**AMERICAN WOOD PRESERVERS' ASSOCIATION**.—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis.

**ASSOCIATION OF RAILWAY CLAIM AGENTS**.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J. Next meeting, May 18-20, at St. Louis, Mo.

**ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS**.—Joa. A. Andreucetti, C. Association of Railway Manufacturers' Association.

**ASSOCIATION OF RAILWAY EXECUTIVES**.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.

**ASSOCIATION OF RAILWAY SUPPLY MEN**.—A. W. Clokey, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.

**ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS**.—(See American Railway Association, Division 1.)

**ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS**.—(See American Railway Association, Division 2.)

**BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION**.—A. J. Filkins, Paul Dickenson Company, Chicago. Meeting with convention of American Railway Bridge and Building Association.

**CANADIAN RAILWAY CLUB**.—W. A. Booth, 131 Charron St., Montreal, Que. Next meeting, April 12.

**FOREMEN'S ASSOCIATION OF CHICAGO**.—Aaton Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

**CAR FOREMEN'S ASSOCIATION OF ST. LOUIS**.—Thomas B. Koenke, Federal Reserve Bank Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.

**CENTRAL RAILWAY CLUB**.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION**.—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION**.—D. B. Wright, 34th St. and Artesian Ave., Chicago.

**III. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.**

**CINCINNATI RAILWAY CLUB**.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio.

**EASTERN RAILROAD ASSOCIATION.**—E. N. Bessing, 614 F St., N. W., Washington, D. C.

**FREIGHT CLAIM ASSOCIATION.**—(See American Railway Association, Division 7.)

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Next convention, August 16-18, 1921, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May 24-26, 1921, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hall, 1061 W. Wabasha St., Winona, Minn. Next convention, September 12-15, Hotel Sherman, Chicago. Exhibit by Association of Railway Supply Men.

**MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.**—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Next convention, October 4-6, 1921, Buffalo, N. Y.

**MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York. Next convention, which was scheduled to be held May 23-26, 1921, Planters' Hotel, St. Louis, Mo., has been deferred.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.**—(See American Railway Association, Division 5, Equipment Painting Section.)

**MASTER CAR BUILDERS' ASSOCIATION.**—(See American Railway Association, Division 5.)

**NATIONAL ASSOCIATION OF RAILROAD TIE PRODUCERS.**—E. E. Pershall, T. J. Moss Tie Company, 720 Security Bldg., St. Louis, Mo.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.**—James B. Walker, 49 Lafayette St., New York.

**NATIONAL FOREIGN TRADE COUNCIL.**—O. K. Davis, 1 Hanover Square, New York. Next annual convention, May 4-7, Cleveland, Ohio.

**NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago. Meeting with American Railway Engineering Association.

**NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

**NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 99th St., New York.

**PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting, 2d Thursday in month, alternately in San Francisco and Oakland.

**RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson, 1116 Woodward Building, Washington, D. C. Next annual meeting, June 8, 1921, Hotel Traymore, Atlantic City, N. J.

**RAILWAY BUSINESS ASSOCIATION.**—Frank W. Noxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.

**RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, Americus Club House, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION.**—D. C. Welty, Missouri Pacific R. R., Little Rock, Ark.

**RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—R. J. Himmelricht, American Arch Company, Inc., 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.

**RAILWAY FIRE PROTECTION ASSOCIATION.**—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.

**RAILWAY REAL ESTATE ASSOCIATION.**—R. H. Morrison, C. & O. Ry., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION.**—(See American Railway Association, Division 4, Signal Section.)

**RAILWAY STOREKEEPERS' ASSOCIATION.**—(See American Railway Association, Division 6.)

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Exhibit at June, 1921, convention of American Railway Association, Division 5.—Mechanical has been cancelled.

**RAILWAY TELEPHONE AND TELEGRAPH APPLIANCE ASSOCIATION.**—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 20-22, 1921, Chicago. Exhibit by Track Supply Association.

**ST. LOUIS RAILWAY CLUB.**—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, Schroeder Headlight & Generator Co., New York City. Meeting with American Railway Association, Signal Section.

**SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.

**TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

**TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, 117 East 98th St., Cleveland, Ohio. Exhibit by Railway Equipment Manufacturers' Association.

**WESTERN RAILWAY CLUB.**—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Meeting third Monday each month except June, July and August.

## Traffic News

The New York Central, beginning May 15, will place in effect a 30 per cent reduction in round trip passenger fares from Chicago to all Michigan resorts for the summer season.

The Illinois Central and the Nashville, Chattanooga & St. Louis have established new fast freight-train schedules from Chicago, St. Louis and points north and west to Atlanta, Ga., Jacksonville, Fla., Havana, Cuba, and other Georgia, Florida and Cuba destinations.

The portrait of the owner will be required on commutation tickets of the Long Island Railroad if the company carries out its conditional proposal announced last month in notices to passengers. These tickets are very frequently used wrongfully by persons who do not own them, and the company has appealed to all ticket holders to use their influence to stop this unlawful practice.

The San Diego & Arizona has completed arrangements with the Southern Pacific and with the Acheson, Topeka & Santa Fe for an interchange of passenger traffic at San Diego, Cal., on both one-way and round trip business, tariffs to become effective May 1. This will permit passengers from the east to travel over the San Diego & Arizona to San Diego and then to Los Angeles or San Francisco without extra cost.

The Southern Railway has established district claim offices under the direction of the following traffic officers: J. H. Drake, general freight agent for Virginia, North Carolina and the District of Columbia, with headquarters at Richmond, Va.; W. H. Paxton, general freight agent for Georgia, South Carolina and Florida, with headquarters at Atlanta, Ga.; W. C. Stephens, district freight agent, for Alabama, Tennessee and Mississippi, with headquarters at Chattanooga, Tenn.; K. B. Hennigan, general freight agent for Illinois, Indiana, Ohio and Kentucky, with headquarters at St. Louis, Mo.; J. B. Bannon, assistant general freight agent for the New Orleans & Northeastern for the territory between New Orleans and Meridian, Miss., with headquarters in the latter city.

An adjustment of rates on grain from Missouri river points to Chicago via Minneapolis is to be put into effect on May 15 with the authority of the Interstate Commerce Commission. A committee representing the carriers and shippers called on Chairman Clark of the commission on April 29 and suggested the making of a rate to apply through Minneapolis with transit at that point of 11 cents over the rate on direct routes from the Missouri river to Chicago. This represents a reduction in the rate, but it is stated it will give a larger revenue to the roads than if the same grain were shipped south through the Gulf ports. The proposed readjustment of export grain rates recommended by the commission as a modification of proposals made by the shippers and the carriers was put into effect by the Eastern roads on May 5.

### Lake Cargo Coal Rates to Be Reduced

For the purpose of stimulating the movement of coal to the northwest, by water, in order to avoid congestion and car shortage later in the year, the railroads serving the lower lake ports have asked, and the Interstate Commerce Commission has granted, a sixth-section permission-order authorizing the publication on five days' notice of tariffs providing for a reduction of 28 cents a ton in the rates on coal shipped to the lower lake ports and trans-shipped across the lakes. The tariffs are to be in effect only until October 31, which is about the latest date when coal can leave the mines for lake shipment before the close of navigation. They require payment of the established rate, refund to be made on proof that the coal has been trans-shipped. They do not cover coal moving to Chicago or points south of the Illinois-Wisconsin line and the commission has received a large number of telegrams from shippers of Illinois and Indiana coal complaining of discrimination.

## Senators Try to Reduce Rates

Senator Robinson of Arkansas has introduced in the Senate a bill to prevent increases in rates, fares, charges or classifications until approved by the Interstate Commerce Commission.

Numerous bills have been introduced by both Senators and Representatives authorizing and directing the Interstate Commerce Commission to issue interchangeable mileage books for 1,000 to 5,000 miles at reductions from 20 to 33½ per cent from the established rates.

Senator Trammell of Florida has introduced a bill in the Senate to repeal Section 15-a of the act to regulate commerce, which contains the 5½ to 6 per cent rule of rate-making.

## Construction Material Interests Ask

### Reduction in Freight Rates

Representatives of the industries interested in road-building and construction materials that have been urging the President and the Interstate Commerce Commission to assist them in getting a reduction in freight rates have arranged for a conference at Washington on May 13 with representatives of the railway executives and the Interstate Commerce Commission to discuss the subject. A meeting was arranged with President Willard of the Baltimore & Ohio, who agreed to such a conference with the understanding that representatives of both sides in interest be prepared to discuss the matter in its broadest aspects and with a spirit of co-operation. He stated that he doubted if much would be accomplished by such a conference if the discussion were confined merely to the matter of railway rates. A delegation of representatives of the construction and road-building interests urged a reduction in freight rates at a conference with President Harding on April 29, at which they presented a memorial stating that the situation is urgent and can not await the ordinary process of appeal for relief through the Interstate Commerce Commission. It was stated that the chief cause of deferment in building work is excessive freight rates applying on that class of materials which are heavy loading and of no value and that freight rates on buildings and road materials have increased an average of 110 per cent since 1917, or far beyond the point the traffic will bear. It is understood that Chairman Clark asked whether the producers would be willing to reduce prices and was told that such steps would be considered provided the railroads would cut rates.

## Average Revenue Per Ton and Per Passenger Per Mile

The average revenue received by the railroads of the United States for transporting a ton of freight one mile is less under the present rates than it was during the period before the creation of the Interstate Commerce Commission, according to a compilation just made by the Bureau of Railway Economics comparing the statistics for the years 1882 to 1887, reported in Poor's Manual of Railroads, with those reported by the Interstate Commerce Commission for the years since. In 1882, according to Poor's Manual, the average receipts per ton mile were 1.23 cents. In 1920, according to the Interstate Commerce Commission, the average was 1.05 cents. The latest increase in freight rates, however, was in effect for only the last four months of 1920. For January, 1921, the average receipts of the railroads for hauling a ton one mile were 1.21 cents. In 1887, the year of the organization of the Interstate Commerce Commission, the average was 1.6 cents and there was a steady reduction until 1916, when the average was 7.7 mills per ton mile. There has been an increase in each year since 1916; in 1917 to 7.15 mills, in 1918 to 8.49 mills and in 1919 to 9.73 mills. The average receipts per ton mile are affected by other factors than changes in the freight rates, notably by changes in the character of the tariff which make an increase or decrease in the proportion of commodities which pay a lower rate than others, but the average receipts afford the best general index of the trend of rates.

The average receipts per passenger per mile, however, are now slightly higher than they were before 1887. In 1882 the average was 2½ cents and in 1887 it was 2.27 cents. In January, 1921, the average was 3.11 cents and for the year 1920 the average was 2.74 cents. Passenger revenues per mile reached their lowest point in 1909 when the average was 1.92 cents. In 1916 the average was 2.4 cents, in 1918 it was 2.41 cents and in 1919 it was 2.54 cents.

# Commission and Court News

## Interstate Commerce Commission

Conferences will be held at Yakima, Wash., and Boise, Idaho, in addition to those previously announced, on rates on fruits and vegetables; at Yakima on May 10, and at Boise on May 14. The Denver conference has been postponed to May 19.

The commission has further suspended until June 24, the operation of certain increased rates on glass fruit jars, etc., from Sand Springs, Sapulpa and other points in Oklahoma and Texas, to Memphis, Tenn., and points taking same rates.

The commission has further suspended until June 14, the operation of certain reduced class and commodity rates from New York, Philadelphia and other points to Houston and Galveston, Texas, via water and rail, or rail, water and rail lines.

The commission has suspended until August 29 the operation of certain schedules published in supplements to Louisville & Nashville tariffs which propose increased commodity rates on rough, sawed or dressed stone, carloads, from Bowling Green, Ky., to eastern points, Ohio River crossings. St. Louis, Mo., Memphis, Tenn., New Orleans, La., Birmingham, Ala., etc.

## Suspension Procedure

The Commission has issued a public notice outlining the main points of its rules of practice concerning suspension of proposed rates under Section 15 of the interstate commerce act as amended. It says:

The statutory maximum period of suspension is 120 days beyond the time when the rate would otherwise go into effect. It is therefore important that in such proceedings there be no unnecessary delay.

Before filing changes in rates the carriers should have considered the action, the reasons underlying it and the effects of it so thoroughly as to be prepared in case the changes are protested to immediately present in full their defense. They should also, as requested in the commission's circular letter of February 9, 1915, send with each schedule containing increased rates, a statement of the changes and the reasons therefor. A similar statement should be submitted with each schedule containing reduced rates as to which there is reasonable ground to believe that protests may be filed.

Suspension of proposed rates should not be requested unless protestant is sure that he understands the effect of the rates and that his request rests on good grounds. The request should state clearly and concisely the reasons relied upon in support thereof. The one who requests suspension should at the same time send direct to the carrier or the tariff agent who issued the tariff advice that request for suspension has been filed, and of the reasons for that action. The request upon the commission should be accompanied by a statement that the carrier or agent, naming them, has been so advised. If the carrier or tariff agent makes answer to protestant's petition, a copy of such answer must be sent by the carrier direct to the protestant at the same time that it is forwarded to the commission.

If the protestant desires to be heard orally by the suspension board, the request for suspension should so state and be filed with the commission at least 15 days prior to the effective date of the tariff.

The commission must determine its action upon a request for suspension in the light of understanding of the situation. In order that opportunity may be had for such understanding it is important that the request shall be filed as far in advance of the effective date of the rate as is practicable and not less than 10 days before that effective date. See Rule XIX of the commission's rules of practice. It will be the policy of the commission to afford carriers an opportunity to answer or explain allegations or questions raised in a request for suspension, but it is essential that the carriers shall give immediate attention to such matters and forward at once such representations as they desire to have considered. If the request for suspension is not presented within the time above mentioned it may ordinarily be expected that it will not be favorably acted upon. If the carrier's neglect to promptly forward the data which they desire to have considered in answer to a request for suspension they may expect that it will be unavailing. It will be the purpose of the commission to avoid suspending proposed rates except where the date of that action affords opportunity to publish notice of such suspension before the effective date of the proposed rates.

## Personnel of Commissions

Ira B. Mills, chairman of the Minnesota Railroad and Warehouse Commission, and a former president of the National Association of Railroad and Public Utility Commissioners, died at St. Paul on May 4 at the age of 70. Judge Mills had been in office about 28 years.

The Senate on May 3 confirmed the appointments of E. I. Lewis and J. B. Campbell as members of the Interstate Commerce Commission. These appointments fill the remaining vacancies on the commission and it now has 11 members for the first time since the law was passed a year ago, increasing the number from 9 to 11.

Johnston B. Campbell, of Spokane, Wash., who has been nominated a member of the Interstate Commerce Commission, as noted in the *Railway Age* of April 29, was born in

J. B. Campbell

Stillwater, Minn., and his first twenty-one years were spent on a farm. He was graduated from the University of Minnesota in 1890 and was engaged in the practice of law in Duluth, Minn., for the next eight years. In 1898 he moved to Moorhead, Minn., but he soon moved from there to the State of Washington and for a time was engaged in farming; but in 1903 he began the practice of law in Spokane. Here he was the prime mover in the establishment of the Spokane Merchants' Association,

and he has been the attorney and secretary of the association ever since. The management of the "Spokane rate case," in which for twenty or thirty years the merchants of that region have been contesting the long-and-short-haul provisions of the Interstate Commerce law, under which the freight rates from the east are higher to Spokane than to the Pacific Coast, has been carried on largely under his direction. Mr. Campbell has devoted most of his time to transportation matters since 1910, and during the period of government operation of the railroads he was a member of the Portland District Freight Traffic Committee.

## State Commissions

The State Railroad Commission of California, on April 13, ordered a reduction of more than 25 per cent in freight rates on the Atchison, Topeka & Santa Fe, and the Southern California between Los Angeles and Palo Verde valley points.

A petition has been filed with the Illinois Public Utilities Commission by the village of Oak Park, Ill., asking that the Aurora, Elgin & Chicago and the Baltimore & Ohio Chicago Terminal be compelled to elevate their tracks through the town. The cost of this work has been estimated by the Commissioner of Public Works of Oak Park at \$1,600,000. The hearing was set for May 12.

The Michigan Public Utilities Commission on April 23 ordered all carriers in Michigan to reduce by May 10th freight rates for the transportation of sand, gravel and stone 25 per cent in the lower peninsula and 22 per cent in the upper peninsula. This order does not affect the rates on these materials where the sand is to be used in foundries or in the manufacture of glass, fertilizer, chemicals or cement, it being the purpose of the order to reduce rates on materials to be used in road construction.

The New York State Public Service Commission, second district, has denied the application of the Erie Railroad for permission to discontinue the services of an agent at a number of small stations in the western part of the state. It seems to the commission "that an impoverishment of the ordinary service of the company to the extent here proposed is a device pregnant with most grave and perhaps fatal results. It is difficult to see how any ultimate good can inure to the benefit of the investors in these properties by a deletion of the service to a point where it is unjust, unreasonable and inadequate."

The Public Utilities Commission of Utah has granted a certificate of convenience and of necessity for the operation of an automobile freight line between Salt Lake and Ogden, 37 miles, although there are two steam railroads and an electric line already serving this territory. The application of the proprietors of the automobile line has been pending since last August, strong protest having been made by the Oregon Short Line and the electric road. It appears that these automobiles have already done considerable business over this line and their application is endorsed by numerous business men in both cities. The commission requires tariffs to be filed and also a time table; and suggests that warehouses and other facilities will be needed. The commissioners expect that their order will give stability to a useful service now done outside of any regulatory law.

The move to abolish the railroad commission of the state of Wisconsin and substitute in its stead a utility commission of three members was reported unfavorably by the transportation committee in joint session with the Senate corporation committee at Madison, Wis., on April 27. This provision was incorporated in the Peterson utility bill and provided further that earnings of utilities in excess of 8 per cent on the investment should go into a sinking fund instead of being divided among stockholders. The committee agreed that the provision calling for the abolition of the present railroad commission in the Peterson utility bill should be removed from the bill and agreed to accept an amendment to be drawn by Louis E. Gettle, recent nominee as a member of the commission, altering the section which would govern the earnings of the utilities. In this form the bill will be recommended for passage.

## Court News

### Safety Appliance and Boiler Inspection Acts

The Minnesota Supreme Court holds that the presence of a piece of coal upon a step leading to a locomotive cab does not constitute a violation of the federal Safety Appliance Act; nor does the federal Boiler Inspection Act guarantee the employee against such obstruction. The court thinks both acts must be construed so as not to include cases where some foreign substance has found a temporary lodgment upon the appliances of the locomotive or tender, and which is not the result of the ordinary use of such instrumentalities, but came there accidentally from some unforeseen cause.—*Reeves v. C. St. P. M. & O. (Minn.)*, 179 N. W., 689

### Contract to Give Notice of Injury Held Void

The Texas Commission of Appeals holds that under section 5 of the federal Employers' Liability Act, declaring void any contract or rule to exempt a common carrier from any liability created by the act, a contract by which an interstate railroad employee agrees to give notice of injury and claim for damages within 30 days, failing which his cause of action would be barred, is void. So far as the court could find the only prior case on this point is *Rock Island v. Pearce*, 118 Ark. 6 (1915) where a similar contract was held void under the act. The Supreme Court of the United States has had no opportunity to review that decision, and no federal court appears to have had such a contract before it for construction.—*Panhandle & Santa Fe v. Brooks (Tex.)* 222 S. W., 186.

### Assumption of Risk of Dangerous Duty

A member of a train crew was, in the course of a well-known dangerous yard movement, stationed on the front of a caboose pushed by the engine, with a duty to signal the engineer in time for him to stop if a derail should be found set against further passage. It was so set, but either through the negligence of the trainman himself or of the engineer in not noticing or heeding his signaling, the latter did not stop in time, the caboose was derailed, and the trainman was crushed to death between it and cars on the adjoining track. In an action under the federal Employers' Liability Act the Pennsylvania Supreme Court, assuming for the purpose of decision that the negligence was that of the engineer and not of the trainman, held that the latter assumed the risk of injury or death as a result of the movement, so that no recovery could be had therefor under the act.—*Reed v. Director General of Railroads (Pa.)*, 110 Atl., 254.

## Foreign Railway News

### Training Plans on English Railway

The Great Western Railway of England has announced a training plan for salaried employees which involves a period of four years, during which time the employees who are selected to take the course will be taken from their regular duties and assigned for a brief period to work in each of several of the company's departments. In this manner the selected employees will be given an opportunity to observe the workings of as large a number as possible of the railway's various departments. It is contemplated that each selected employee will spend at least a year in the general offices of the company. Candidates for appointment to these courses must be recommended by the heads of their departments or by the division or district officers. No application is to be considered from any employee who does not hold a merit certificate in the company's examinations in either signaling or station accounts or who has attended a course of lectures and gained a first class certificate at one of the schools where educational facilities are provided by the company. The actual selection of the candidates and the observation of their progress in their studies will be in the hands of a committee made up of a number of general officers. The proposal does not carry any promise of preferment in promotions to those who are selected for this course.

### England Escapes a Railway Strike

LONDON.

What threatened to be a general strike of all transport workers, including all classes of railway transportation employees, has been averted by what may be called a freak of fortune. The miners' union, which went out on a strike on April 1 on account of the drastic reductions in wages made necessary by the decontrol of the mines by the government, succeeded in gaining the support of the National Union of Railwaymen and the Transport Workers, who threatened a sympathetic strike to take effect on Friday, April 15. The chief argument for this co-operation by the railway union was that what the mine owners were trying to do to the miners the railway owners would try to do to the railwaymen when the railways were handed back to their owners on August 31, and that every support must be given the miners. From the time the strike announcement was made—April 9—until the date for which the strike was set, there were marked evidences of a lack of support in the ranks of the railway men. When the miners refused to consider what appeared to everyone, including the railwaymen, a fair proposal, which was suggested unofficially by the secretary of the miners' union, for reopening negotiations with the mine owners, the leaders of the railwaymen's union broke away and declared the strike off, no longer than five hours before the strike was to have taken effect. The miners are still holding out for a national wage board and the pooling of receipts for a uniform wage scale throughout the country.

### Railway Operations in South Africa

The annual report of the general manager of the South African Railways and Harbors for the fiscal year ending March 21, 1920, shows a total route mileage of 9,541 for the South African Railways. In addition 1,285 miles of railway in the Southwest African Protectorate and 651 miles of privately operated lines are included under the administration. Of the 9,541 miles in the Union of South Africa, 154 miles are double tracked, 2 miles are three tracked and 12 miles are four track lines. None of the lines are of standard gage. Of 3 ft. 6 in. gage there are 8,981 miles and of 2 ft. gage 561 miles. No new lines were built during the year. The total capital investment at the end of the fiscal year was \$470,598,942 (£ to \$ at par) and the deficit after the payment of interest was \$2,213,318. The general manager complains in his report of unsatisfactory financial agreements existing between his and other government departments which he says cost his administration some \$3,645,000 per annum, or more than the deficit for the year.

The operating revenues of the railways totaled \$93,165,160, an increase of 25 per cent over the previous year. Operating expenses amounted to \$73,512,375, an increase of 29 per cent. Of the total revenues, 43 per cent were derived from merchandise and mineral traffic, 28 per cent from passenger traffic and 19 per cent from coal traffic. The annual wages bill increased \$30,982,500 over the same total for the fiscal year 1911-12. Freight train mileage for the year was 19,730,700; passenger train mileage was 6,247,389 and mixed train mileage was 5,330,069. Total train mileage increased 8 per cent over the previous year.

### Japanese Railway Statistics

A statement covering the operating statistics of the Imperial Government Railways of Japan has just been released for the year ended March 31, 1919. This statement has been summarized by the Bureau of Railway Economics. The statistics represent approximately four-fifths of the total railway mileage of the country, the remaining one-fifth consisting of minor privately owned lines and light railways. The miles of single track operated in 1919 were 5,269 as against 5,206 in 1918, and the total miles of all track operated were 9,503 as against 9,313. Capitalization in 1919 amounted to \$636,836,513 as compared with \$593,171,996 in 1918.

The statistics show that the freight traffic on the Japanese government railways in 1919 increased by 9.4 per cent when compared with 1918, or 59,711,366 tons as compared with 54,603,406; the number of passengers carried increased by 17.5 per cent or 288,061,584 as compared with 245,234,480. The revenue derived from freight service amounted to \$54,707,599, while passenger earnings were \$59,769,956. Total earnings in 1918 were \$121,408,327, against \$91,487,284 in 1918. Operating expenses in 1919 were \$71,834,690, and in 1918 \$42,058,458. The increase of \$29,921,043 in revenues was thus offset by the increase of \$29,776,232 in expenses, the net operating revenue remaining nearly stationary. Interest charges amounted to \$21,097,112, additional works expenses \$6,019,889, and subsidies to private light railways \$747,750, leaving a net profit of \$23,632,908 in 1919 as compared with a profit of \$23,272,534 in 1918.

### American Firm Secures Contract

#### for Construction in Bolivia

A contract has been signed between the Bolivian government and an American firm for the financing and construction of the railway from La Quiaca, on the Argentine border, to Atocha, Bolivia, a distance of 126 miles, the only link needed to give La Paz, Bolivia, an all-rail route to Buenos Aires, Argentina, according to Vice-Consul Nelson at La Paz. The company engages to negotiate a loan of \$7,000,000 in favor of the Bolivian government to cover the expense of construction and equipment of this railroad, and to complete the road by August 1, 1925. As the work progresses completed sections of 6 miles are to be turned over to the Bolivian government. Some work has already been done on the projected line, through previous contracts made with the Bolivian government by a French company, and in June, 1920, by an Argentine firm; however, both of these contracts were annulled for nonfulfillment. It is understood that 30 miles of the railway from La Quiaca are ready for the laying of the rails and that other parts of the La Quiaca-Tupiza section, 62 miles long, are also under construction. The Tupiza-Atocha section, 64 miles in length, has not yet been started. Total expenditures on the entire La Quiaca-Atocha line up to November 25, 1920, principally payments to previous contractors, have been approximately \$1,818,700 (bolivianos to dollars at par).

The construction of this line will mark the completion of the second trans-Andean railway in South America, the other being the railway connecting Valparaiso and Santiago, Chile, with Buenos Aires, Argentina. The latter line, however, is not serviceable for several weeks in the year on account of severe snowstorms and snowslides which occur occasionally on the route, whereas the La Quiaca-Atocha line will be serviceable all the year round. By means of this new railway the trip from New York to Buenos Aires via Arica or Melendo, Chile, can be made in 18 days, and by way of Antofagasta, Chile, in 19 days.

Miscellaneous

Equipment and Supplies

Car Deliveries in March

The number of freight cars delivered in March by the 27 car building companies reporting to the Railway Car Manufacturers' Association totaled 5,753 for domestic service and 700 for export. The passenger train cars delivered totaled 69 for domestic service. On March 31 the companies had on hand undelivered orders for 21,808 freight and 681 passenger cars for domestic service and 4,029 freight and 28 passenger cars for export. The detailed figures for the month follow:

NEW CARS DELIVERED			
	Domestic	Foreign	
Freight	5,753	700	
Passenger	69	0	
ON ORDER AND UNDELIVERED			
		Total	
Freight	21,808	25,837	
Passenger	681	709	
CAR REPAIRS			
Delivered—March		4,824	
On order and undelivered March 31		14,348	

Locomotives

The SAO PAULO & RIO GRANDE (Brazil) is inquiring for 10 Mikado type locomotives.

PEKIN-KALGAN.—The American Locomotive Company has been given an order for 42 locomotives of the Pacific, Mikado and Mallet types for the Pekin-Kalgan Railway, China. The total value of the contract is in the neighborhood of \$2,600,000. The Pekin-Kalgan is owned by the Chinese Government, and the payment for these locomotives is financed jointly by the American Locomotive Company and Mitsui & Co. The latter company is to pay to the locomotive company 50 per cent cash upon completion of the contract, and the remaining 50 per cent is to be paid in eight semi-annual payments. This order in value is one of the largest single orders placed by the Chinese government in the United States. Of the 42 engines there will probably be seven to ten Mallet type locomotives which will be the largest ever shipped out of the United States or in use in any other part of the world except the United States. Each locomotive and tender will weigh 640,000 lb. in working order.

Freight Cars

PERIN & MARSHALL, 1107 Broadway, New York, are inquiring for 60 all steel gondola cars, for export to India.

The SAO PAULO & RIO GRANDE (Brazil) is inquiring for 75 general freight, 25 open high side cars and 75 flat cars.

The PITTSBURGH & WEST VIRGINIAN is asking for prices on repairs to 500, 70-ton coal cars.

Passenger Cars

THE DELAWARE & HUDSON is inquiring for 12 milk cars.

THE SAO PAULO & RIO GRANDE (Brazil) reported the *Railway Age* of April 22, as inquiring through the car builders for some passenger train equipment, is asking for 6 first-class and 6 second-class coaches, also 8 baggage, 4 mail and 4 sleeping cars.

Machinery and Tools

The NEW YORK CENTRAL will receive bids, until 12 o'clock noon, May 16, for the manufacture, delivery and erection in complete working condition, of one 1,500 kw. direct current geared turbine generator, to be installed in the turbo-generator building, Grand Central Terminal, New York City, and the removal of the existing turbine generator located at the same place.

The CHICAGO, ROCK ISLAND & PACIFIC has ordered 8,000 tons of tie plates from The Railroad Supply Company, Chicago.

The SOUTHERN PACIFIC COMPANY will receive bids at 165 Broadway, New York, until 12 o'clock noon, May 20, for one year's requirements of calcium carbide, which will approximate a minimum of 1,451,000 lb. and a maximum of 1,919,000 lb.

THE LEHIGH & NEW ENGLAND will receive bids at Philadelphia, Pa., until 12 o'clock noon, May 16, for its requirements estimated at approximately 32,000 gross tons of No. 1 buckwheat anthracite coal to be delivered at Pen Argyl, Pa.; 15,000 gross tons of No. 1 buckwheat anthracite coal to be delivered at Lansford, Pa., and 150 gross tons chestnut coal to be delivered at Pen Argyl, Pa.

THE LONG ISLAND is asking for bids until 12 o'clock noon, May 12, for 340-360 wooden barrels of 150 deg. kerosene oil for headlights; 50-60 wooden barrels of long time burning oil for use in lamps controlled by the signal department; 20-30 wooden barrels 300 deg. of mineral seal oil; 175-200 steel barrels motor gasoline; 5 cars or about 35,000 gal. gas oil, for making Pintsch gas for cars; 25,000 gal. roadbed oil for laying the dust on tracks.

THE NORFOLK & WESTERN will receive bids at Roanoke, Va., until 12 o'clock noon, May 11, for 2 100-lb. crossings; 1 100-lb. manganese steel crossing; 4 switchboard panels; 2,000 socket terminals for 130-lb. rail bond; 2,000 7/16-in. steel expansion pins; 2 steel gates; 4 steel gate posts; electrical material; 5,000 No. 2 B. & S. gage copper rail bonds; 650 lb. flux rods; 6 clamps for holding bonds to rail, and 400 D bevel steel bars 3/8-in by 3 1/2-in by 20 ft.

Railway Construction

CENTRAL OF GEORGIA.—This company has awarded a contract to the Wright-Nave Company, Ashville, N. C., for the construction of 7 miles of branch line and about 1 mile of mine spurs. The branch line will run in a southeasterly direction from McCombs Station, Ala. The grading will average about 40,000 sq. yds. per mile. There will be no important structures on the new line and coal will be the principal commodity handled.

CHICAGO, GREAT WESTERN.—This company will close bids on May 11, for the construction of a new passenger station at Afton Junction, Iowa, to cost about \$8,000.

CHICAGO, ROCK ISLAND & PACIFIC.—This company closed bids for the construction of a 500-ton frame coaling station at Morris, Ill., on May 3.

CHICAGO UNION STATION.—This company will shortly accept bids for the completion of the filled portion of the Polk street viaduct, Chicago, at a cost of about \$12,000.

GRAND TRUNK.—This company is reconstructing its bridge over the Beauharnois canal near Cecile Junction, Que., at an expenditure of approximately \$70,000. The company is also adding a roadway and side walk to its international bridge at Black Rock, N. Y., involving the expenditure of \$40,500.

ILLINOIS CENTRAL.—This company will shortly accept bids for the construction of additions to its roundhouses at Waterloo, Iowa, and Freepport, Ill.

KENTUCKY AND TENNESSEE.—The Interstate Commerce Commission has issued a certificate authorizing the construction of a branch line in McCreary County, Kentucky, a distance of 9,230 feet, to reach a tract of coal land.

LOUISIANA & ARKANSAS.—This company is preparing plans for the construction of a machine shop and other buildings at Stamps, Ark., and will soon be ready to accept bids on the work.

PITTSBURGH & WEST VIRGINIA.—This company contemplates the construction of a branch line, 3 1/2 miles in length, running north from Virginia Station, W. Va. The grading on this line will be done under contract.

UNION PACIFIC.—This company will close bids on May 5, for the construction of a two-story, interlocking tower, with dimensions of 16 ft. by 20 ft., at Council Bluffs, Iowa, to cost approximately \$12,000.

## Supply Trade News

Moore, Cameron & Hill, Limited, has removed its Montreal, Que., office from 284 Beaver Hall Hill to 205 Drummond building.

The Blackburn-Smith Corporation has removed its office from 105 West Fortieth street to the Terminal building, 103 Park avenue, New York City.

The Dutilh-Smith McMillan Company, Inc., and Lam, Glines & Co., Inc., have removed their offices from 50 Broad street to 40 West street, New York City.

The Ryan Car Company will move its Chicago office from the McCormick building, 332 South Michigan boulevard, to the Fisher building, 343 South Dearborn street, on May 1.

John J. Swan, for the past two years with the Prest-O-Lite Company at Indianapolis, Ind., has resigned to become associated with the Engineering Business Exchange, New York city.

J. M. Davis, formerly vice-president of the Baltimore & Ohio, has been elected president of Manning, Maxwell & Moore, Inc., 119 West Fortieth street, New York City, to succeed the late A. J. Babcock. Mr. Davis was born on November 5, 1871, and began railway work in 1888, as a freight brakeman on the San Antonio & Aransas Pass. From September, 1891, to 1900, he served consecutively as stenographer to the superintendent of the Gulf, Colorado & Santa Fe, chief clerk to the superintendent of the Mexican Central, clerk in the general manager's office of the Great Northern, assistant superintendent and later superintendent of the Great Northern. In 1900, he went

to the Erie as superintendent at Scranton, Pa., subsequently serving as superintendent of the Union Steamboat Line of the Erie, at Buffalo, N. Y., and as superintendent of the Allegheny division of the Erie. He returned to the Great Northern in 1903, as superintendent, and in 1905 was promoted to assistant general superintendent of the Central district. In 1907 he went to the Oregon Short Line as assistant general superintendent, and was subsequently made acting general superintendent and later general superintendent. In 1910 he was appointed general superintendent of the Central district of the Southern Pacific, with headquarters at San Francisco, Cal. He entered the service of the Baltimore & Ohio on January 1, 1914, as assistant general manager at Cincinnati, Ohio, of the Baltimore & Ohio Southwestern-Cincinnati, Hamilton & Dayton, and later in the same year was promoted to general manager of these lines. In July, 1916, he was appointed vice-president in charge of operation and maintenance of the Baltimore & Ohio System, with headquarters at Baltimore, Md., and held that position until July 1, 1918, when, under federal control of the railroads, he was appointed manager of the New York properties of the Baltimore & Ohio, including the Staten Island lines. In September, 1919, he left the Baltimore & Ohio to become president of the Rock Hill Iron & Coal Company and associated corporations, including the East Broad Top Railroad & Coal Company, with office at New York.

J. M. Davis

The H. K. Ferguson Company, Cleveland, Ohio, has removed its Chicago office from the Rookery building to 1637 Monadnock Block. O. C. F. Randolph remains in charge of the Chicago territory.

The Ross Heater & Manufacturing Company, Inc., Buffalo, N. Y., has opened a branch office at 2 Rector street, New York City, and has discontinued its sales agency. The new office is in charge of C. M. Hardin, who was formerly located at the home office.

The Automatic Coupler & Trailer Equipment Company, 954 West Twenty-first street, Chicago, has been incorporated with a capital of \$100,000, by Norman T. Brenner, Meyer B. Mervis and Charles A. Holland, to manufacture railroad and other heavy mechanical equipment.

R. L. Shepard, until recently engaged in railroad sales promotion work for the Burroughs Adding Machine Company, Detroit, Mich., is now handling railroad sales for that company in Chicago. Mr. Shepard was formerly connected with the Union Pacific Railroad at Omaha.

Mark R. Briney, eastern manager of the Federal Signal Company, in charge of sales and installations in that district, has been appointed sales manager, with headquarters at 52 Vanderbilt avenue, New York City, effective May 1. Mr. Briney will have charge of all railway signaling sales and installations, both domestic and foreign, and his jurisdiction will extend over all branch offices, agencies and the commercial end of the business. J. J. Hubbard, formerly in charge of installations, has been appointed resident manager of the company, effective May 1. Mr. Hubbard will have charge of sales and installations in the eastern district, with offices as above.

### Pittsburgh Base on Steel Products Opposed

The Federal Trade Commission on April 29 issued a formal complaint against the United States Steel Corporation and 11 subsidiary companies, upon application of the Western Association of Rolled Steel Consumers and other users of steel products, on the ground that the Pittsburgh basing point system of basing the prices of steel products except rails on the price at Pittsburgh plus the freight rate from that point to destination constitutes an unfair method of competition in violation of Section 5 of the organic act of the commission and Section 2 of the Clayton Act. The case was set for hearing on May 31 or as soon thereafter as it is reached on the docket. The complaint alleges that this price practice makes it impossible for purchasers of rolled steel to secure the product from any manufacturers at prices substantially different from those contained in the price schedules issued by the corporation.

### Obituary

Ambrose Monell, for 15 years previous to 1917 president of the International Nickel Company, New York, and during the war a colonel in the aviation section of the A. E. F., died on May 2, at Beacon, N. Y., at the age of 47. Colonel Monell was born in New York City and was graduated from Columbia University with the class of 1896. After leaving Columbia, he went to the Carnegie Steel Company, Pittsburgh, as a metallurgical engineer, serving for six years in various capacities until he became assistant to the president. Later he became president of the International Nickel Company. Mr. Monell was a director of a number of companies, including the Haskell & Barker Car Company, the Air Reduction Company and the International Nickel Company.

### Trade Publications

SPREADER PLOW.—The Bucyrus Company, South Milwaukee, Wis., has issued Bulletin SP-502 describing its Class 50 spreader plow. This eight-page booklet describes the machine and illustrates its appearance and the character of work performed. Information and a drawing are also given of a method of making a 31-ft. fill with the plow, without the use of trestle work.

# Railway Financial News

**ATCHISON, TOPEKA & SANTA FE.—Annual Report.**—A review of this company's annual report appears on another page of this issue.

**New Directors.**—John W. Davis and W. C. Potter, both of New York, have been elected directors to succeed E. J. Engel of Chicago, and F. L. Julliard, of New York.

**BANGOR & AROOSTOCK.—Annual Report.**—The income account for the year ended December 31, 1920, compares with 1919 as follows:

	1920	1919
Rental from U. S. Railroad Administration entire year 1919, and January and February, 1920	\$231,789	\$1,555,775
March 1, 1920, to August 31, guaranty from U. S. Government as per contract <sup>1</sup> due from the U. S. Government account net income being less than guaranty, difference	448,994	.....
Rail operations—revenues March 1 to December 31	\$5,786,756	.....
Less rail operations—expenses	5,030,406	34,594
	\$756,350	\$1,521,182
Compensation and net operating revenues	1,437,133	1,521,182
Other income	397,045	72,303
Gross income	\$1,834,179	\$1,593,484
Railway tax accruals	286,561	42,171
Interest on funded debt and other deductions	927,251	1,077,724
Total deductions	\$1,283,812	\$1,119,895
Net income	550,367	473,589
Dividends:		
Preferred 7 per cent	243,600	243,600
Common 4 per cent	154,400	154,400
	\$398,000	\$398,000
Balance of net income	\$152,367	\$75,589

<sup>1</sup>Includes \$79,393 freight revenue from Maine Central Railroad covering period prior to January 1, 1918, in final adjustment in divisions as per contract of 1913. Does not include \$26,486 increased mail revenue applying to period prior to January 1, 1918, which has been credited to profit and loss during 1920 on instructions of the Interstate Commerce Commission.

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919 as follows:

	1920	1919
OPERATING REVENUES		
Freight	\$5,240,928	\$4,063,169
Passenger	1,117,246	953,917
Total operating revenues	\$6,675,481	\$5,287,300
OPERATING EXPENSES		
Maintenance of way and structures	\$1,445,082	\$1,177,240
Maintenance of equipment	1,585,035	1,506,244
Traffic expenses	46,782	45,872
Transportation expenses	2,649,211	2,040,865

Passengers carried one mile	45,294,652	39,541,851
Earnings per passenger per mile	3.23 cents	3.02 cents

**CHICAGO & EASTERN ILLINOIS.—Confirmation of Sale Deferred.**—Confirmation of the sale of this road, scheduled to take place in Chicago on May 3, before United States Judge Carpenter, met strong opposition from the Mechanics and Metals National Bank, through Isaac H. Mayer, its counsel in Chicago. The court refused the motion of Attorney George W. Murray on behalf of the reorganization managers to approve the reorganization plan in its entirety. The bank's claims as a creditor were expressly reserved for future consideration, and the matter was referred to Master in Chancery C. B. Morrison.

**CHICAGO & WESTERN INDIANA.—Lessees Authorized to Guarantee Bonds.**—The Interstate Commerce Commission has granted the applications of the Chicago & Eastern Illinois; Chicago, Indianapolis & Louisville; Wabash; Grand Trunk Western, and the Chicago & Erie, for authority to assume obligation or liability in respect of \$7,000,000 of Chicago & Western Indiana collateral trust bonds, by entering into a joint supplemental lease with that company under which each applicant agrees to pay \$5,000 monthly to the trustee under the collateral trust indenture for the purpose of satisfying certain sinking fund requirements thereof.

**CHICAGO, BURLINGTON & QUINCY.—Northern Pacific-Great Northern Bonds Oversubscribed.**—Representatives of the syndicate offering the Northern Pacific-Great Northern \$230,000,000 bonds, state that those who have subscribed up to \$100,000 will get the full amount of their subscriptions. Because of the oversubscription, which is reported to be between 10 per cent and 12 per cent, some of the largest subscribers will be scaled down in the allotments. Announcement of these allotments and of the division of subscriptions on the three issues, made available under the terms of the offering, will not be made, syndicate bankers said, probably until next Monday, when a complete history of the subscriptions, in tabulated form, will be made public.

**CHICAGO, MILWAUKEE & ST. PAUL.—Loan Approved.**—The Interstate Commerce Commission has approved a loan of \$10,000,000 to this company from the revolving fund to enable it to meet maturing indebtedness.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—Authorized to Acquire E. I. & T. H.**—The Interstate Commerce Commission has issued a decision approving and authorizing the acquisition by this company of the control of the Evansville, Indianapolis & Terre Haute by purchase of its entire capital stock for \$1,000,000 as of January 1, 1921.

**DELAWARE, LACKAWANNA & WESTERN.—Stockholders to Vote on Stock Dividends.**—A special stockholders' meeting will be held July 21, to vote for the approval of plans relative to capitalization of \$45,000,000 of the road's surplus. If the stock increase

is approved as expected, directors will meet on July 28 and declare a stock dividend to holders of the company's \$42,220,550 outstanding stock.

The New York Times had an article last Friday, to the effect that there has been considerable dissatisfaction among the Lackawanna stockholders over the ruling of the I. C. C., which allowed the capitalization of only \$45,000,000 of the company's \$90,461,776 surplus. The Times' story said:

They hold, and they are approved in this by their officers and directors, that the stockholder has a greater equity in the surplus than have the stockholders in the surpluses of many other railroads. This, it is asserted, is due to the fact that the D. L. & W. has followed the plan of leasing in perpetuity about 70 per cent of its mileage, for which it pays a yearly rental of \$4,000,000. These properties have been developed out of earnings rather than as the result of bond issues, which is the usual railroad practice, and they yield the road in the neighborhood of \$2,000,000 a year. Much of the difference between this figure and the rental has grown into surplus. In the case of many other roads, they assert that the development of properties has been partly out of earnings and partly out of bond issues, while the roads have been acquired through the issuance of bonds. This has in many instances set up a heavy burden of interest charges, and it has been the policy of the Interstate Commerce Commission to require such roads to maintain surpluses in proportion with such charges. The Lackawanna holders feel that this is not necessary in the case of their company and that, therefore, they should have been allowed to capitalize their entire surplus.

The ruling of the Interstate Commerce Commission authorizing the Lackawanna stock dividend was given in the *Railway Age* of April 22, page 995.

The stockholders will also vote on the segregation of the company's coal properties. The company filed its acceptance of the Pennsylvania state constitution, which contains a provision prohibiting ownership and operation of coal properties by railroads.

**DENVER & RIO GRANDE.—Annual Report.**—The income account for 1920 compares with 1919 as follows:

	1920	1919
<b>OPERATING REVENUES</b>		
Freight	\$29,960,361	\$24,099,452
Passenger	7,481,518	6,922,474
Total operating revenues	\$40,590,345	\$33,016,237
<b>OPERATING EXPENSES</b>		
Maintenance of Way and Structures	\$6,252,620	\$4,856,556
Maintenance of Equipment	9,342,746	7,923,546
Traffic	481,576	241,398
Transportation	14,664,166	11,295,477
General Expenses	1,034,204	928,666
Total operating expenses	\$32,552,648	\$25,753,232
Net operating revenue	\$8,037,698	\$7,263,024
Railway Tax Accruals	\$1,648,663	\$1,380,793
Uncollectible revenues	19,042	5,616
Total operating income	\$6,369,993	\$5,876,616
Standard return		\$8,319,377
Compensation, January and February	\$1,386,563	
Guaranty, estimated amount due	2,373,248	
Total non-operating income	\$5,461,714	\$9,436,844
Gross Income	\$11,831,707	\$15,313,460
Total deductions	\$10,820,771	\$17,800,906
Net Income	\$1,310,935	\$2,487,446

The annual report of the Denver & Rio Grande will be reviewed editorially in an early issue.

**DULUTH & IRON RANGE.—Settlement with Railroad Administration.**—This company has effected a final settlement with the Railroad Administration by which it receives \$4,866,000 in full settlement of its claim arising from the period of federal control. The company had claimed \$6,420,052.

**DULUTH, MISSABE & NORTHERN.—Settlement with Railroad Administration.**—This company has effected a final settlement with the Railroad Administration by which it receives \$8,525,000 in full settlement of its claim for the period of federal control. The company had claimed \$12,104,397.

**EAST ST. LOUIS JUNCTION.—Asks Authority to Issue Notes.**—This company has applied to the Interstate Commerce Commission for authority to issue \$85,000 of 7 per cent promissory notes for advances made by the St. Louis National Stock Yards Company to meet the 1920 payroll including back pay.

**EVANSVILLE, INDIANAPOLIS & TERRE HAUTE.—Purchase by C. C. C. & St. L. Approved.**—See Cleveland, Cincinnati, Chicago & St. Louis above.

**Certificate Not Required for Acquisition of E. & I. Line.**—The Interstate Commerce Commission has decided that the pro-

posed acquisition and operation by this company of a line heretofore owned and operated by the Evansville & Indianapolis does not require the issuance of a certificate of public convenience and necessity.

**GRAND TRUNK.—Stockholders Meeting.**—A special meeting of stockholders will be held in London on May 12, to consider a proposed amendment to the agreement entered into March 8, 1920, with the Canadian Government. The amendment extends the time for arbitration proceedings to determine the price to be paid by the government for Grand Trunk shares on condition that the present directors resign in favor of government representatives. This bill has passed the Canadian House of Commons and is awaiting action by the Senate. Acceptance of the new agreement will clear the way for immediate government control, after which the unpaid Grand Trunk interest due in April, will likely be paid. Interest due May 1, including that on obligations bearing provincial guarantees, has been paid.

**KANSAS CITY TERMINAL.—Asks Authority to Issue Notes.**—This company has applied to the Interstate Commerce Commission for authority to issue \$2,000,000 of ten year 6½ per cent notes secured by the pledge of \$3,125,000 of first mortgage 4 per cent bonds. The proceeds are to be used in part to retire an issue of \$2,500,000 of 4½ per cent notes maturing July 1. The new notes are to be sold through E. H. Rollins & Sons and the Continental & Commercial Trust Company of Chicago.

**LEHIGH & HUDSON RIVER.—Annual Report.**—The annual report for the year ended December 31, 1920, shows the following income account:

	1920	1919
Railway operating revenues, ten months	\$2,780,302	
Railway operating expenses, ten months	2,378,244	
Revenue from railway operation, ten months	\$402,058	
Less—		
Hire of equipment—Balance	\$168,054	
Joint facility rents	134,940	
	282,994	
Income from lease of road (U. S. R. R. Administration), two months	86,562	
Income from other sources	54,112	
Income, U. S. Government guaranty period	386,836	
	\$646,574	
<b>Deductions—</b>		
Taxes	\$106,731	
Interest on debt (due and accrued)	184,369	
	291,101	
Net income transferred to profit and loss	\$355,473	\$231,193
Dividends (6 per cent, 1920; 12 per cent, 1919)	103,170	206,340

The operating revenues and expenses in detail and the principal traffic statistics for the year ended December 31, 1920, compare with the preceding year as follows:

	1920	1919
<b>OPERATING REVENUES</b>		
Freight	\$2,984,251	\$2,545,342
Passenger	52,240	49,259
Total operating revenues, inc. other	\$3,146,209	\$2,687,526
<b>OPERATING EXPENSES</b>		
Maintenance of way and structures	\$394,109	\$333,186
Maintenance of equipment	607,442	503,321
Traffic expenses	23,711	20,953
Transportation expenses	1,651,475	1,125,756
General expenses	95,667	70,277
Total operating expenses	\$2,772,404	\$2,042,593
Net revenue from railway operation	\$373,805	\$644,933
<b>PASSENGER TRAFFIC</b>		
Number of passengers carried	140,984	133,652
Number of passengers carried one mile	1,705,329	1,705,222
Average receipts per passenger (cents)	11.7	12.8
Average receipts per passenger per mile (cents)	3.1	2.9
<b>FREIGHT TRAFFIC</b>		
Number of tons carried	3,927,434	5,322,354
Number of tons carried one mile	409,680,013	383,194,047
Average distance hauled per ton (miles)	69.2	71.9
Average receipts per ton per mile (mills)	7.3	6.6

**LOUISVILLE & NASHVILLE.—Asks Loan from Revolving Fund.**—This company has applied to the Interstate Commerce Commission for a loan of \$5,000,000 for 15 years, of which it is desired to apply \$4,000,000 on the purchase of freight equipment to the amount of \$12,324,258 and \$1,000,000 on additions and betterments on the Cumberland & Eastern Kentucky divisions, which will amount to \$4,204,139.

**New Directors.**—J. R. Kenly and Frederick R. Scott have been elected directors.

**LEHIGH VALLEY.**—*Extension Granted.*—The United States District Court has granted this company an extension of 60 days, until June 24, for filing its segregation plan.

**MISSOURI, KANSAS & OKLAHOMA.**—*Deferred Interest to be Paid.*—Notice has been received by the New York Stock Exchange that the interest on this company's guaranteed first mortgage 5 per cent, forty-year gold bonds, matured November 1, 1920, will be paid on presentation of coupons on and after April 30, 1921, and that payment of interest due May 1, 1921, will be deferred. Notice was also received that interest matured November 1, 1920, on the Dallas & Waco Railway Company's guaranteed first mortgage bonds due 1940, will be paid on April 30, 1921, and that May 1 interest will be deferred.

**MUSKEGON RAILWAY & NAVIGATION COMPANY.**—*Authorized to Issue Securities.*—This company has been authorized by the Interstate Commerce Commission to issue and sell \$304,900 of common capital stock and \$304,900 of first mortgage 6 per cent bonds, for the purpose of completing extensions to its road from Muskegon to Muskegon Heights, Mich.

**PENNSYLVANIA.**—*Asks Loan from Revolving Fund.*—This company has applied to the Interstate Commerce Commission for a loan of \$5,700,000 for 15 years to enable it to reimburse the treasury for the payment of obligations of subsidiary companies. The company offers as collateral security some stock of the Philadelphia, Baltimore & Washington. The Pennsylvania on May 27, 1920, applied to the commission for a loan of \$18,000,000. It received a loan of \$6,780,000 for expenditures on roadway and structures and it was proposed to apply \$11,000,000 on the purchase of new equipment, but the loan for new equipment was not pressed and the company now desires \$5,700,000 to meet maturing obligations. The Pennsylvania's application gives a statement of its accounts with the Railroad Administration, showing a total of \$214,787,420 due from the government as of December 31, 1920, and \$236,130,681 due to the government, including several amounts which may be funded. The company had received from the administration \$20,000,000 on account in 1920 and \$35,000,000 since the first of the year. The application also states that the company has received \$53,000,000 on account of its guaranty for the six months period of 1920 and that there is still due \$45,988,622.

*Asks Authority to Guarantee Bonds.*—This company has applied to the Interstate Commerce Commission for authority to guarantee the principal and interest of \$3,876,000 of refunding mortgage bonds of the Long Island.

**READING COMPANY.**—*Decision on Segregation Plan Withheld.*—After a hearing Monday on modification of the plan for dissolution of the Philadelphia & Reading Coal & Iron Company and other concerns from the Reading Railway interests, Judges Buffington, Davis and Thompson reversed decision in the United States District Court at Philadelphia. The court asked the Reading Company and the government to file a modified plan within ten days.

In beginning the discussion, William Clark Mason, of counsel for the Reading Company, said that since the last hearing in the case conferences between representatives of the government and representatives of the Reading Company had resulted in the elimination of two points which were to have been discussed. One, he said, was an agreement that the stockholders should not be required to pay 10 per cent to the bondholders for the release of the coal property from the lien of the general mortgage and the other was for keeping the stock intact and the Reading Company assigning its equity in the stock to a new corporation and issuing certificates of interest to the stockholders benefiting under the dissolution plan.

Allan McCarthy, counsel for the Prosser Committee, presented the side of the common stockholders. He spoke on the new proposed modification of the plan to place the stock of the coal company in the hands of a trustee for the Reading Company, subject to the jurisdiction of the court so that the property may be sold in time at its full market value.

The brief submitted on behalf of defendant Reading Company gives the following points:

1.—(a) The sale provided for in paragraph five of the Reading plan is such a disposition of the interest of the Reading Company in the stock of the Philadelphia & Reading Coal & Iron Company, as accomplishes the expressed purpose of the mandates of the Supreme Court of the United States requiring disposition by the Reading Company of such stock. (b)

such disposition does not confer on any one class of stockholders of the Reading Company any benefit to the prejudice of the legal rights of any other class of stockholders.

2.—The stock of the coal company need not be sold free from the lien of the general mortgage. A sale of certificates of interest therein would be a compliance with the provisions aforesaid of the mandate of the Supreme Court of the United States.

3.—In view of the expressed opposition of bondholders and stockholders it is believed the Reading Company should not offer a premium of 10 per cent to the general mortgage bondholders for the release of the coal company's property from the lien of the general mortgage and the requirement of the mandate of the Supreme Court of the United States may be fulfilled by proper injunctive provisions in the decree to be entered in this cause.

**RUTLAND RAILROAD.**—*New Director.*—E. J. Pearson, of New Haven, Conn., has been elected a director, succeeding George F. Baker, of New York.

**ST. LOUIS SOUTHWESTERN.**—*Authorized to Issue Promissory Notes.*—The Interstate Commerce Commission has authorized this company and the St. Louis Southwestern of Texas to issue joint promissory notes to the amount of \$384,990 in connection with the purchase of 10 locomotives from the Baldwin Locomotive Works.

**TOLEDO, PEORIA & WESTERN.**—*Annual Report.*—The operating revenues and expenses for the year ended December 31, 1920, compare with the preceding year as follows:

OPERATING REVENUES			
	1920	1919	
Freight .....	\$1,285,608	\$961,829	
Passenger .....	630,174	592,599	
Total operating revenues.....	\$2,090,667	\$1,645,768	
OPERATING EXPENSES			
	1920	1919	
Maintenance of way and structures.....	\$382,554	\$335,955	
Maintenance of equipment.....	676,494	517,549	
Traffic expenses .....	36,154	25,131	
Transportation expenses .....	1,249,355	857,896	
General expenses .....	97,024	65,621	
Total operating expenses.....	\$2,441,420	\$1,799,407	
Net revenue from railway operations.....	Def. \$350,753	Def. \$153,639	
Ratio of operating expenses to operating revenues .....	116.78%	109.54%	
Railway tax accruals.....	123,000	102,000	
Railway operating deficit.....	472,753	235,639	

The principal traffic statistics for 1920 compare with 1919 as follows:

FREIGHT TRAFFIC			
	1920	1919	
Number of tons carried.....	1,292,232	1,006,279	
Number of tons carried one mile.....	89,521,581	68,953,481	
Average distance hauled per ton (miles).....	69.28	68.52	
Average receipts per ton per mile (cents).....	1.44	1.40	
PASSENGER TRAFFIC			
	1920	1919	
Number of passengers carried.....	846,295	843,847	
Number of passengers carried one mile.....	20,982,556	20,367,659	
Average distance hauled per passenger (miles).....	24.75	24.14	
Average receipts per passenger per mile (cents).....	3.00	2.91	

**Guaranty Certificates Issued**

The Interstate Commerce Commission has issued certificates for partial payments on account of the railroad guaranty for six months of 1920, as follows:

Charleston & Western Carolina.....	\$260,000
Chicago, Terre Haute & Southeastern.....	26,000
Cincinnati, Indianapolis & Western.....	230,000
Hawkinsville & Florida Southern.....	10,000
Illinois Central.....	2,000,000
Missouri & North Arkansas.....	22,500
Norfolk & Western.....	2,000,000
Northern Alabama.....	80,000
Philadelphia & Reading.....	350,000
Sulphur County.....	45,000
San Antonio, Uvalde & Gulf.....	17,000
Sulphur County.....	17,000
Texas Short Line.....	6,000
Western Maryland.....	400,000
Wrightsville & Tennille.....	75,000

**Dividends Declared**

Cleveland & Pittsburgh—Guaranteed, 1 1/2 per cent, quarterly; special guaranteed, 1 per cent, quarterly; both payable June 1 to holders of record May 10.

Delaware & Hudson—2 1/2 per cent, quarterly, payable June 20, to holders of record May 28.

Elmira & Williamsport—Common, 2.26; payable May 2 to holders of record April 20.

Illinois Central—1 1/4 per cent, quarterly, payable June 1 to holders of record May 28.

Norfolk & Western—Common, 1 1/4 per cent, quarterly, payable June 13 to holders of record May 31.

**SALARIES OF RAILROAD OFFICERS** would be limited to \$15,000 a year, unless a higher figure were approved by the Interstate Commerce Commission if congress should pass a bill introduced on April 25 by Representative Black of Texas.

## Railway Officers

### Financial, Legal and Accounting

**Henry L. Stone**, general counsel of the Louisville & Nashville, with headquarters at Louisville, Ky., whose retirement from active railroad service was announced in the *Railway Age* of April 8 (page 916), was born in Bath County, Ky., on January 17, 1842. He was educated at Bainbridge Academy and at the law school conducted by Messrs. Gordon and Coburn in Indianapolis, Ind. Mr. Stone was engaged in the private practice of law and as city attorney of Louisville, Ky., from the close of the Civil War until January, 1905. On the latter date he was appointed general counsel of the Louisville & Nashville, and has served in this position continuously since that time. In addition to his duties as general counsel of the Louisville & Nashville, Mr. Stone, on two occasions, has been chairman of boards of attorneys appointed to consider and make recommendations upon proposed acts of Congress, enlarging the powers of the Interstate Commerce Commission.

Col. H. L. Stone

### Executive

**W. S. Lee**, vice-president of the Piedmont & Northern, has been elected president, effective April 26, succeeding Z. V. Taylor, deceased.

**Edward S. Jouett**, whose election as vice-president and general counsel of the Louisville & Nashville, with headquarters at Louisville, Ky., was announced in the *Railway Age* of April 29 (page 1055), was born at Winchester, Ky., on October 21, 1863. He was educated in the public schools of Winchester and at the University of Virginia, graduating from the law school of that institution in 1885. He became a member of the bar in Winchester and practised there and throughout Kentucky until September 1, 1912, when he entered railroad service as general attorney of the Louisville & Nashville, with headquarters at Louisville. He was appointed general solicitor in charge of the law department of the Louisville & Nashville during the period of federal control, and served in this position until the railroads were returned to private management, when he was appointed assistant general counsel of the Louisville & Nashville system. He was serving in this position at the time of his recent election as vice-president and general counsel.

E. S. Jouett

**C. D. Mackay** has been appointed assistant to the vice-president of the Southern, with headquarters at Washington, D. C., effective May 1, and will be charged with the duties hitherto entrusted to **George R. Loyall**, who has resigned as assistant vice-president to accept service elsewhere.

**Charles T. O'Neal** has been appointed receiver of the Fort Smith & Western, with headquarters at Fort Smith, Ark., effective April 15. Mr. O'Neal was born at Brandywine Springs, Del., and entered railroad service in 1890 as a clerk in the offices of the Philadelphia & Reading. In 1891 he entered the service of the Lehigh Valley, serving in various capacities until 1903, when he was appointed trainmaster on the Pennsylvania division. In 1905 he was transferred to the New Jersey and Lehigh division, and in 1906 was promoted to superintendent of the New York division. From 1908 to 1916, Mr. O'Neal served as superintendent of the Buffalo division and the Lehigh Valley Transportation Company. He was promoted to general superintendent in 1917, and served both in that capacity and as assistant vice-president and marine manager until 1919, when he was appointed manager of terminals of the various roads running to the Niagara frontier by the United States Railroad Administration. At the time of his appointment as receiver of the Fort Smith & Western, Mr. O'Neal was serving as assistant to the Director General of railroads, being assigned to the settlement of claims arising during federal control, with headquarters at Washington, D. C.

### Operating

**J. S. Jones** has been appointed trainmaster of the Chicago, Rock Island & Pacific, with headquarters at El Reno, Okla., effective May 1, succeeding C. F. Radans, who has been assigned to other duties.

**C. E. Lanham** has been appointed superintendent of car service of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., effective May 1, succeeding D. W. Davis, assigned to other duties.

**F. Wear**, superintendent of the Butte division of the Great Northern with headquarters at Great Falls, Mont., will also act as superintendent of the Havre division, effective May 1, succeeding **J. L. Close**, who has been transferred to the Breckinridge division with headquarters at Breckinridge, Minn.

**E. W. Hoffman**, general superintendent of the Chicago terminal of the Baltimore & Ohio, has been transferred to the Northwest district with headquarters at Cleveland, O., succeeding **E. A. Peck**, who has been transferred to the Pennsylvania district, with headquarters at Pittsburgh, effective May 1.

**J. F. Anderson**, superintendent of the Kansas City Terminal division of the Chicago, Milwaukee & St. Paul, with headquarters at Kansas City, Mo., has been appointed assistant superintendent of the Kansas City division, with the same headquarters, the Kansas City Terminal division having been consolidated with the Kansas City division, and the position of superintendent abolished.

**E. Thwaites** has been appointed superintendent of the Cleveland division of the New York Central with headquarters at Cleveland, Ohio, succeeding **F. H. Wilson**, resigned to accept service with another company. **F. F. Riefel** has been appointed superintendent of the Toledo division with headquarters at Toledo, Ohio, succeeding **Mr. Thwaites**. **E. W. Brown** has been appointed superintendent of the Alliance division with headquarters at Alliance, Ohio, succeeding **A. E. Lloyd**, who has been appointed superintendent of the Michigan division with headquarters at Elkhart, Ind., succeeding **F. F. Riefel**.

**A. E. Macdonald**, superintendent of the Canadian National, with headquarters at Dauphin, Man., has been transferred to Saskatoon, Sask., succeeding **R. King**, assigned to other duties. **T. J. Brown**, superintendent, with headquarters at Calgary, Alta., has been transferred to Dauphin, Man., suc-

ceeding Mr. Macdonald. J. P. Johnson, assistant superintendent, with headquarters at Melford, Sask., has been transferred to Prince Albert, Sask. E. W. Cameron, assistant superintendent, with headquarters at Humboldt, Sask., has been given additional jurisdiction over the Humboldt sub-division, the Battleford sub-division and the Carlton sub-division. The appointments and changes were effective May 1.

D. S. Farley, whose promotion to assistant general manager of the Atchison, Topeka & Santa Fe, with headquarters at Topeka, Kan., was announced in the *Railway Age* of April 15

D. S. Farley

(page 964), was born at Albion, Mich., on June 24, 1870. He entered railway service on October 15, 1887, as a yard clerk for the Atchison, Topeka & Santa Fe at Denver, Colo., and his entire railroad career has been spent in the service of this company. In August, 1899, after serving as switchman and in various positions in the station service at Denver, he was made chief clerk at Pueblo, Colo., where he served until May, 1900. At that time he was transferred to Kansas City, Mo., where he served until August,

1907, when he was promoted to superintendent, with the same headquarters. He was transferred to Amarillo, Tex., on June 1, 1915. At the time of his recent promotion Mr. Farley was serving as superintendent with headquarters at Dodge City, Kan., where he had been transferred in June, 1920.

O. E. Coyne, whose appointment as superintendent of the Illinois division of the Missouri Pacific, with headquarters at Illmo, Mo., was announced in the *Railway Age* of April 1 (page 869), was born on November 2, 1876, at Broadwell, Ill., and entered railway service in May, 1892, as a telegraph operator for the Chicago & Alton. In 1899 he became a train dispatcher for the Grand Trunk, Western lines, remaining in the service of that road until 1902, when he went with the St. Louis, Iron Mountain & Southern, in a similar capacity. From 1905 to 1908 Mr. Coyne served as train dispatcher for the Atchison, Topeka & Santa Fe and in the latter year was appointed chief dispatcher for the Missouri Pacific. At the time of his recent promotion, Mr. Coyne was serving as trainmaster, to which position he had been promoted in 1913. He served with the American Expeditionary Forces during the war, being commissioned a captain in the Railway Transportation Corps. From March, 1919, to June, 1920, he had charge of the terminal switching at the port of St. Nazaire, France.

William K. Etter, whose promotion to assistant to the vice-president in charge of operation of the Atchison, Topeka & Santa Fe was announced in the *Railway Age* of April 15 (page 961), was born at Shippensburg, Pa., on January 16, 1874. He was educated at McPherson College and entered railway service in June, 1891, as a rodman for the Atchison, Topeka & Santa Fe. During the next two years Mr. Etter served successively as stenographer, clerk, timekeeper and chief clerk to the superintendent at various points on the Santa Fe. In February, 1901, he was made chief clerk to the superintendent, with headquarters at Needles, Cal., and a few months later was appointed chief clerk to the general superintendent at La Junta, Colo. In September, 1902, he was transferred to Topeka, Kan., where he served until August, 1905, when he was promoted to trainmaster, with the same headquarters. In January, 1906, Mr. Etter was promoted to superintendent of the Rio Grande division, with headquarters at San Marcial, N. M. He was transferred to

the Oklahoma division, with headquarters at Arkansas City, Kan., in October, 1907. Mr. Etter was promoted to general superintendent, with headquarters at Newton, Kan., in September, 1916. At the time of his recent promotion, he was serving as assistant general manager, with headquarters at Topeka, Kan., to which position he had been promoted in November, 1918.

### Traffic

W. J. Cartwright has been appointed commercial agent of the Southern with headquarters at Chattanooga, Tenn., succeeding R. D. Miller, transferred, effective May 1.

E. G. Heilbronner has been appointed general freight and passenger agent of the Pittsburgh, Lisbon & Western, with headquarters at Lisbon, Ohio.

D. B. Hevron has been appointed district freight agent of the Southern, with headquarters at Evansville, Ind., succeeding J. T. Mudd, who has resigned.

H. F. Kern, general agent of the Southern Pacific with headquarters at Kansas City, Mo., has been transferred to a similar position at Cincinnati, O. L. B. Banks succeeds Mr. Kern at Kansas City.

H. P. Thrall, mail traffic manager and service inspector of the Southern Pacific, with headquarters at San Francisco, Cal., has been appointed mail and express traffic master, with the same headquarters, effective April 23.

J. P. Tocher has been appointed division freight agent of the Southern with headquarters at Louisville, Ky. J. N. Templeton has been appointed to a similar position at Lexington, Ky. The following have been appointed commercial agents: W. T. Keating, at Indianapolis, Ind.; R. D. Miller, at Chattanooga, Tenn.; and G. B. Miller, at Anniston, Ala. These appointments were effective April 15.

W. Humphreys, whose promotion to general western freight agent of the Southern, with headquarters at Chicago, was announced in the *Railway Age* of April 15 (page 963), was born at Louisville, Ky., on January 6, 1876. He entered railway service in August, 1898, in the traffic department of the Southern, and has served in various positions in that department at Cincinnati, Ohio, Mobile, Miss., Evansville, Ind., and New York City. At the time of his recent promotion, Mr. Humphreys was serving as division freight agent with headquarters at Louisville, Ky.

Fred S. Reigel, whose promotion to general freight agent of the Southern, with headquarters at Cincinnati, Ohio, was announced in the *Railway Age* of April 15 (page 963), was born at Louisville, Ky., on April 21, 1879, and entered railway service in August, 1899, as a messenger in the local freight offices of the Southern at Louisville. In March, 1905, he was made rate clerk in the assistant freight traffic manager's office at Louisville, and the following year was promoted to chief clerk to the assistant general freight agent, with the same headquarters. In December, 1911, he was made assistant chief clerk to the assistant freight traffic manager, and in June of the following year was promoted to chief clerk in the same office. In July, 1916, in addition to his other duties, Mr. Reigel was made acting assistant general freight agent at Louisville, and in June, 1917, he was promoted to assistant general freight agent, with headquarters at Cincinnati, Ohio. He was serving in this position at the time of his recent promotion.

### Mechanical

E. C. Huffman, superintendent of the Great Northern with headquarters at Breckinridge, Minn., has been appointed master mechanic of the Sioux City division with headquarters at Sioux City, Ia., effective May 1, succeeding F. J. Fero, deceased.

T. E. Paradise, assistant superintendent of motive power of the Chicago, Burlington & Quincy, with headquarters at Lincoln, Neb., has been appointed master mechanic with headquarters at Hannibal, Mo., succeeding H. Modaff who

has been transferred to Ottumwa, Ia. The position of assistant superintendent of motive power at Lincoln, has been abolished. Mr. Modaff succeeds **H. D. Turner** who has been appointed road foreman of engines with headquarters at Burlington, Ia. These changes are effective May 1.

### Engineering, Maintenance of Way and Signaling

**D. C. Fenstermaker**, district engineer of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been granted a leave of absence effective April 16, to become associated with Peterson Brothers, contractors, Omaha, Neb., who will construct a new branch line in Cuba for the United Fruit Company.

**William Hood**, chief engineer of the Southern Pacific, with headquarters at San Francisco, Cal., has retired from active railroad service, effective May 3, after 54 years of service. **G. W. Boschke**, assistant chief engineer, succeeds Mr. Hood. A sketch of Mr. Boschke's career appeared in the *Railway Age* of February 11, 1921 (page 394).

**William Morrison**, assistant signal engineer of the electric division of the New York Central, with headquarters at New York City, has been appointed assistant engineer, with the same headquarters, effective April 16, and the position of assistant signal engineer has been abolished. Effective this date **J. Stolz**, supervisor of signals of the electric division, was appointed assistant supervisor of signals, with the same headquarters.

**C. D. Cronk**, assistant signal engineer of the New York Central, with headquarters at Buffalo, N. Y., has been appointed chief signal inspector, with headquarters at Cleveland, Ohio, and the office of assistant signal engineer has been abolished. **E. A. Black**, chief signal inspector, with headquarters at Cleveland, Ohio, has been appointed supervisor of the Franklin signal district, succeeding **L. L. Whitcomb**, who has been appointed signal supervisor on the Cleveland signal district, succeeding **J. C. Seaman**, who has been appointed signal inspector of the Cleveland signal district.

### Purchasing and Stores

**H. C. Pearce**, director of purchases and stores of the Chesapeake & Ohio with headquarters at Richmond, Va., will serve the Hocking Valley in a similar capacity, effective April 21.

### Special

**J. A. Rittenhouse**, superintendent of the Pullman Company, with headquarters at Philadelphia, Pa., has been transferred to Detroit, Mich., with jurisdiction over the Detroit, Buffalo and Cleveland districts, effective May 1. **W. A. Hartley**, assistant to the assistant general manager, with headquarters at Philadelphia, Pa., has been given jurisdiction over car movements and other matters local to the Philadelphia district. **J. T. Ramsom**, assistant general manager, with headquarters at Washington, D. C., has been given jurisdiction over all matters general in character, affecting the Philadelphia district.

### Obituary

**Frank H. Davis**, vice-president of the Chesapeake & Ohio with office at New York, died at his home in Elizabeth, N. J., on May 2. Mr. Davis was also vice-president of the Hocking Valley and vice-president and treasurer of the Minneapolis & St. Louis.

**C. W. Pifer**, office engineer, Department of Way and Structures, United States Railroad Administration, with headquarters at Chicago, died at his home on April 21. Mr. Pifer was born at Lafayette, Ind., October 21, 1863, and graduated from Purdue University in 1889. He entered railway service in 1892, with the Pennsylvania. In 1896 he became engineer

in charge of special inspections for the Cleveland, Cincinnati, Chicago & St. Louis. Three years later he became assistant engineer of the Illinois Central. In 1914 he was appointed senior civil engineer, Interstate Commerce Commission, and in April, 1920, he was appointed office engineer for the Railroad Administration.

**Joseph W. Moore**, assistant engineer, valuation department of the Illinois Central and Yazoo & Mississippi Valley, died at the Illinois Central Hospital on April 13, following a protracted illness. Mr. Moore was born at Louisville, Ky., March 20, 1874. He attended the University of Kentucky where he took a special three-year course in engineering. He first entered railway service in August, 1898, in the engineering department of the Louisville & Nashville, with which road he served as rodman, instrumentman, assistant engineer and assistant roadmaster. In 1907 he served for one year as track engineer of the A. & B. Construction Company on the Atlanta, Birmingham & Atlantic and from June, 1908, to November, 1909, was roadmaster of the latter road. He was assistant engineer in the valuation department of the Central of Georgia from March to June, 1910, when he went to the Southern Pacific, Texas and Louisiana lines as roadmaster at Morgan City, La. Mr. Moore became roadmaster of the International & Great Northern at Navasota, Texas, in December, 1914, and in September, 1916, he was appointed pilot engineer in the valuation department of the Illinois Central. In August, 1919, he was appointed assistant engineer in the valuation department of the Illinois Central, which position he held at the time of his death. Mr. Moore served through the second training camp at Plattsburg in the Summer of 1916, and soon after the entrance of the United States into the war he entered the training camp at Camp Grant and was commissioned captain and assigned to command Company "B", 35th Engineers. He served until August, 1919, and following his discharge from service was commissioned Major in the Engineers Reserve Corps.

**Elmer A. Howard**, vice-president of the Chicago, Burlington & Quincy, died at his home in Chicago, on May 4, after a long illness. Mr. Howard was born at Fairfield, Iowa, on July 18, 1858. He was educated in the public schools and attended the University of Iowa for one year. At the age of 18 he entered the employ of the Burlington as telegrapher and station agent at Fairfield, Iowa, and remained in that position for eight years. In 1885, he entered the Indian service under the Cleveland administration. He resigned as Indian agent in 1887, to go into the banking business at Fairfield, Iowa, and in 1900 was appointed national bank examiner for the state of Iowa. In 1903 he returned to the service of the Burlington,

E. A. Howard

and for seven years served as real estate and industrial commissioner. In November, 1915, he was elected vice-president in charge of the land and industrial departments, which position he held at the time of his death.

THE BUREAU OF STANDARDS, Washington, which had been investigating the causes of failure of chilled iron and rolled steel car wheels, using special apparatus for duplicating service conditions and for measuring the temperatures and stresses developed in the wheels, held, last week, several conferences with representatives of the Association of Manufacturers of Chilled Car Wheels for the purpose of preparing a paper on the stresses developed in wheels of this type through the heating of the rim. A representative of the association spent the week at the Bureau going over the data which has already been secured.

While Jett Lauck's "Estimated Possible Savings" have been so discredited that further comment would serve to clothe it with an unwarranted significance, it is well to bear in mind that this document had its inception in a knowledge that the public has taken on a new attitude with respect to the railroads.

### Don't Overlook Any Bets

Under the Transportation Act the officers of the roads are charged with responsibility for the efficient management of the properties. No matter how successful they may be in this endeavor, both as to earnings and service, their's will always be the burden of proof that every effort is being made to promote efficiency. In other words, it will be strictly up to all the roads to take advantage of any development as to methods and materials that show a real economy. If some roads prove successful in obtaining excellent results in this direction through the use of treated timber and tie plates, water softeners, mechanical freight handling equipment, mechanical stokers, superheaters, locomotive cranes, etc., and (if we may dare to hope so), bonus and piece work systems, the officers of other roads will be compelled to take more than an academic interest in such improved methods. On them is immediately imposed the problems, can it be applied on our road? If so, how? If not, why? These are not merely questions of accountability to the directors and stockholders, but represent a responsibility to the public in general and the shippers in particular.

The Railway Accounting Officers' Association at its annual meeting at Atlantic City, N. J., beginning June 8, will complete one of the most successful years in the history of that active and increasingly influential organization. The docket this year is about twice as large as that of last year, and among the proposals to be presented by the various committees are a number of steps of unusual importance. The Railway Accounting Officers' Association is composed of men of high calibre. It is unusually well officered; the members think a great deal of their organization and are willing to work hard for its success and for the welfare of their profession. The association became affiliated with the Association of Railway Executives a little over a year ago. This affiliation has given the accounting officers' organization something of a new standing and prestige. Combined with this, the accounting officers have been greatly assisted during the past year by the elimination of the restrictions which hampered them during the period of federal control. It is these factors which the association has been able to take advantage of and which have assisted it in making for itself a record year. It is interesting to note one or two of the important features of the year's work. One is the progress made as to standard forms. Those originated for station accounting and practices are especially noteworthy, but, in general, it may be said that the number of new standard forms originated, not counting revisions, this year exceeds the number originated in nearly all the previous years of the association's history combined. An even more important step in the work during the past year is the proposal to make R. A. O. A. interline

### Accounting Officers Meeting

accounting recommendations mandatory. Important steps along this line will be brought up at the June meeting and it is the expectation that eventually all the interline accounting recommendations will be made mandatory. It is fitting that this important step towards further greater uniformity in railway accounting should be a part of the work of a year which has been so successful.

Practically all railroads in the United States and Canada were requested to furnish information on ashpits to a committee of the American Railway Engineering Association last year. Answers to the questionnaires sent out failed to develop a great deal of the information desired but one thing was forcibly illustrated; namely, the many different types of ashpits and the wide diversity of opinion regarding their respective merits. It is said that almost every type of ashpit in common use was recommended by some roads and criticized by others. Regarding water ashpits, the disadvantages are said to include relatively high first cost, high cost of maintenance and operation, difficulty with wet ashes in winter and possible danger to workmen. In view of these objections, why are water ashpits the most popular type for modern terminals turning sixty and more locomotives in 24 hours? The advantages of water ashpits include the elimination of hot gasses and warped cinder cars, high emergency storage capacity, reduction of manual labor to a minimum and ability to handle large amounts of ashes rapidly. A relatively high first cost of ashpit and crane must be conceded but the interest on this investment is saved many times over where large amounts of ashes are involved. The cost of maintenance is almost solely a question of proper design, and operating costs, exclusive of interest and depreciation, are small. The difficulty of handling wet ashes in severe winter weather is very real but should not be charged against water ashpits solely since all ashes must be sprinkled or cooled before being loaded into cinder cars. Regarding danger, it is significant to note that not one of the railroads referred to in the committee's report mentioned danger as a disadvantage of water ashpits. Evidently this objection also is overcome by proper design.

### The Pros and Cons of Water Ashpits

An employee with but a slight knowledge of the fundamental principles underlying his work and of its importance to the organization as a whole cannot manifest the interest which is necessary to make him the most efficient worker. In order to overcome this handicap and to obtain the greatest possible co-operation, railroads as well as other organizations are coming to realize more and more the benefits to be derived from a systematic plan of education. An excellent example of the work being accomplished along this line is the system employed by the telegraph department of the Chicago, Rock Island & Pacific. The superintendent and assistant superintendent of telegraph organized the wire chiefs,

### Education and Efficiency

Education and Efficiency

operators and repeater attendants of the system into a society for the purpose of the improvement of the members in the practical technical details of the telegraph and telephone work. The society is the outgrowth of a course of instruction which has been carried on by G. D. Hood, superintendent of telegraph, for the past year and a half with a view of bringing to the men of his department a better knowledge of the telegraph and telephone. Officers were elected, a constitution and by-laws adopted and committees appointed, and the organization is now well under way. The Committee of Direction consists of three members elected annually, one of whom shall be chairman-secretary. Thus, not only have the men had an opportunity to learn of the fundamental principles underlying their work and of the latest developments in the telegraph field, but because of this increased knowledge their interest has been aroused and they take a greater pride in their department and its efficient operation than was possible before. Similar methods may be found of value for use by other department heads who are considering plans for increasing efficiency.

At the National Foreign Trade Convention in Cleveland last week great emphasis was laid on the importance of a thriving

### The Foreign Trade Convention

foreign trade in maintaining healthy economic conditions in this country. Indeed, one speaker went so far as to blame the present depression principally on the stagnation in our foreign markets. Whether or not the volume of our foreign business is the chief factor in determining prosperity or depression in this country, there can be no doubt but that it is at least a contributing factor of no small importance. It is to the interest of everyone, therefore, who is seeking a revival in business, to assist in bolstering up our foreign commerce and to do everything possible to insure its future stability. The various Edge law banks which have been organized to extend long term credits to foreign purchasers will doubtless be of great assistance in enabling American manufacturers to increase their sales abroad. Possibly in the development of these institutions lies the solution of our present difficulties in reviving our foreign business. However, the root of the problem lies deeper: in order to put our export trade on a sound footing, we must either accept a great quantity of imports or we must plan to make large permanent investments abroad. Credits advanced under the Edge law plan are satisfactory as a temporary arrangement, but to secure the future stability of foreign trade, which is necessary if it is to be a desirable part of our economic structure, American investors must be induced to become regular purchasers of the securities of legitimate foreign enterprises. One of the most important fields for such investments, especially in relatively undeveloped countries where the opportunities for building up trade are consequently the greatest, is in foreign railways. Permanent investments of this character have the added advantage of securing a preference for American goods to fill the needs of the concerns in which the investments are made. In view, probably, of the severe decrease in our foreign trade in late months scant attention was given at the convention to this and other fundamental phases of the problem. Interest was diverted instead to popular remedies which promise a speedy, although probably not a permanent, solution for the present situation. Neither was any particular attention paid to the phases of the problem affecting the railroads or the railway supply manufacturers beyond, possibly, the suggestion that no return to normal conditions could be complete without a reduction in freight charges. The plan of the convention, however, was doubtless well considered beforehand by those in charge and it must be admitted that the phases of foreign trade chosen for discussion were handled in a thorough and painstaking manner.

Two advanced steps have been taken by the Mechanical Division of the American Railway Association in dealing with the problem of improving general freight car conditions. Interchange rules 114 and 120, the former dealing with the rebuilding of cars destroyed on foreign lines and the latter with the repair of cars on foreign lines requiring extensive repairs, now permit the repairing line to apply such betterments as metal draft arms, steel draft members, truss draft gears, etc., where formerly the rules required that the original plan of construction be strictly followed. The adoption of a special letter ballot in December, 1920, authorized the application of ends on box cars as specified for new cars when cars with steel underframe or steel center sills with a sectional area of sills of not less than 24 sq. in., required repairs to the ends consisting of new posts and braces. The nature of these two steps, however, is negative rather than positive. The provisions of these rules are not mandatory and their value lies largely in the fact that the door has been opened so that obsolete equipment coming within their provisions may be improved if the repairing line is inclined to do so and does not meet too much opposition from the car owner. Weak as these rules are likely to prove, so far as actual results are concerned, however, they undoubtedly mark the maximum advance which the sentiment of the representative membership of the Mechanical Division would permit, and they are strong evidence of the difficulty of improving equipment conditions when the general interests of the railroads as a whole meet the opposition of the immediate interests of the individual roads. This suggests the need for placing the interchange rules on a basis which will bring into harmony these two opposing interests. One of the most logical means of accomplishing this end is the establishment of prices for labor and material chargeable for repairs under the interchange rules, on a basis which will include a clear profit above the costs and the overhead. Such a policy not only will create an incentive for the repairing line to do all of the work which should be done on each foreign car repaired, but will make it distinctly to the advantage of the car owner either to retire or completely rehabilitate most of the equipment coming under these rules.

### Where the Money Went

THE SENATE COMMITTEE on Interstate Commerce began this week an investigation of the railroad situation. While the railways are suffering from a heavy decline in traffic there is, so far as we know, no dissent from the proposition that their troubles are mainly due to the fact that their operating expenses have been, and still are, too high. Therefore, the Senate committee's investigation probably will resolve itself chiefly into an inquiry as to why the operating expenses have been, and still are, so high.

Upon this point, wide differences of opinion have been expressed. Railway executives contend that expenses of all kinds have been too high, but that their difficulties are chiefly due to an excessive payroll. The labor leaders claim that the payroll is not excessive, but that the operating expenses are excessive almost entirely because the railways have been "wasting" money in the purchase of fuel and materials.

There is no question that the money has been, and is, going too fast. Where has it been going? Statistics of the Interstate Commerce Commission throw light upon this subject.

In 1916 the payroll, of which 96.4 per cent consisted of the wages of the employees, consumed 60.5 cents out of every dollar of operating expense incurred. In 1920 the employees got 97.5 per cent of the payroll, and out of every dollar of operating expense incurred 63.4 cents was chargeable to the

payroll. These figures show that during this period the payroll increased relatively more than other operating expenses.

The largest expenditure made by the railways, except that for labor, is that which they make for materials used in maintenance of their equipment (locomotives and cars) and of their tracks and other permanent structures. They buy material used in the maintenance of equipment and in the maintenance of way and structures from numerous manufacturing concerns. The labor leaders claim that they have paid excessive prices to these concerns because, as is alleged, the railways and the manufacturing concerns are under the same financial control.

Is it a fact, then, that the cost of the materials used in maintenance has increased more than the cost of the labor used in maintenance? In the three years ending with 1917 the railways paid to labor 47.32 cents out of every dollar expended for maintenance of equipment, while in 1920 they paid labor 57.49 cents out of every dollar they spent for maintenance of equipment. In the three years ending with 1917 the railways paid for materials 29.08 cents out of every dollar expended in the maintenance of equipment, while in 1920 they paid for materials only 26.57 cents out of every dollar expended for maintenance of equipment. These figures show conclusively that the increase in the cost of maintaining equipment was due in much larger measure to increase in the cost of labor than to increase in the cost of materials.

In the three years ending with 1917 the railways paid to labor 55.64 cents out of every dollar they expended for maintenance of way and structures, while in 1920 they paid to labor 60.55 cents out of every dollar that they spent in maintenance of way. How about the cost of materials? In the three years ending with 1917 they paid for materials 35.63 cents out of every dollar expended for maintenance of way, while in 1920 they paid for materials only 30.22 cents out of every dollar they spent for maintenance of way.

These figures leave no room whatever for question as to where the greatest relative increase in railway expenses occurred. It was in the payroll.

Probably the greatest increase in expenses should have been in the payroll. Those, however, who got the benefit of the fact that the increase in the payroll was greater than other increases in expenses hardly seem to be in a good position to denounce the other increases as excessive and due to mismanagement.

Within recent months not only wages in other industries and the cost of living, but also the prices that the railways have to pay for materials have declined. The decline in the prices of materials has been accompanied by reductions in the wages of the workmen employed by the concerns which make these materials. Can anybody logically contend that the prices of the materials that the railways buy should be reduced, with resulting reductions in the wages of the men employed by those who make them, and at the same time contend that railway wages should be maintained at much the highest level to which they ever were advanced?

## Development of Port of New York

THE STATES of New York and New Jersey have, after about four years of effort, succeeded in the establishment of a centralized port authority. The effect of this will be widespread not only because of the bearing which the port of New York has upon the nation, but also because of the fact that it establishes a precedent upon which the solution of similar matters of mutual interest to other states can be based. The port of New York has long stood out as the greatest of all American ports but it has likewise stood out as one of the most expensive when viewed from the angle of unit transportation costs. Split geographically by the Hudson river and its lower reaches into two major parts and then again divided and subdivided by numerous municipal-

ities on the New Jersey side, its development has been influenced by almost as many different plans and policies as there were municipalities. This was clearly recognized by the joint harbor commission appointed in 1917 to make a study of the situation as it existed and to recommend a plan for the development of the port. In its report as presented a short time ago and given in abstract on page 269 of the January 28 issue of the *Railway Age* it distinctly pointed out the need of a single authority created under a compact that would be more than a mere pledge or agreement since it must of necessity, to be of any real worth or value in building up the port, be of a nature that would define and bound a district within which the two states would actually cooperate, as well as create an organization or agency with sufficient powers to bring about the needed results.

Yet, in spite of the very obvious need for such a joint board with clearly defined powers, petty jealousies, partisan politics and what not, all revolving about the loss of jurisdiction over parts of the harbor by individuals and by municipalities, made their usual appearance. The signing of the port treaty between the states of New York and New Jersey on April 30 marks the realization of the two states that if progress is to be made in and at the port of New York, all local jealousies and other similar detriments must be eliminated or be made inconsequential. This has been done and the port of New York as it stands now is under the jurisdiction of a single port authority or joint board. Each of the states has relinquished its rights over its own particular shore lines, thus conferring upon the new board the power to control or to designate the building and developing of piers, warehouses, rail and water connections and any other facilities thought necessary.

Thus the first or legal part of the plan of the joint commission has been carried out to a successful conclusion. The physical plan comes up next before the two legislatures. Involving as it does some radical departures from orthodox port methods, its adoption will undoubtedly be strongly fought. Honest and sincere endeavor will vie with personal ambitions and jealousies in bringing about various changes in the physical plan as proposed, for there are features contained in the plan open to considerable criticism. The necessity for action is so great that it is sincerely to be hoped that these conflicting interests will be able quickly to get together on a workable basis.

## Wabash

THE CAREER OF THE WABASH since it was reorganized and taken out of the hands of receivers on November 1, 1915, has been characterized by progressively increasing efficiency of operation. This improvement in operation was reflected in net earnings in 1916 and 1917, but during federal control increased costs of fuel, higher wage scales and other factors typical of the federal control period resulted in decreased net and in 1920, in an operating deficit. The standard return for the Wabash was set at \$5,826,810, although the corporation protested that the charges made during and after the receivership entitled the company to a compensation of \$8,681,000. In 1918 the first year of government control, the net railway operating income earned for the Railroad Administration was \$3,715,518; in 1919, \$831,152, and in 1920 there was a net railway operating deficit for the entire year of \$3,759,790. So far in 1921 the road has been doing better than it did in the corresponding months of 1920. The road had a net operating deficit for January, 1921, amounting to \$145,113. In February, the balance was on the other side and there was a net operating income of \$105,597, making for the two months a deficit of \$38,516, as compared with a deficit more than ten times that figure, or \$385,442, in the first two months of 1920.

The Wabash operates 2,473 miles of line, of which it

owns 2,034, leases 9 and operates 430 under trackage rights. These lines are shown on the map. It should be observed that more than half the mileage over which the road has trackage rights constitutes that part of the system which gives it its entrance into Buffalo, N. Y. The lines of the Wabash extend to the neighborhood of Detroit. From there east the road operates over the Grand Trunk to Black Rock, N. Y., 228 miles, and thence on the Lackawanna to Buffalo, 15 miles. Considering the territory traversed by the Wabash, it is natural that its traffic should be highly diversified. In 1920 the figures were as follows: Products of agriculture, 17 per cent; products of animals, 5 per cent; products of mines, 39 per cent; products of forests, 6 per cent, and manufactures and miscellaneous, 28 per cent. The road gets a comparatively long haul on this traffic and in 1920 the average haul was 271 miles.

The Wabash in 1920 did more business than it did in 1919, but not as much as in 1918 or 1917. It differed from the larger number of roads whose annual reports have already been reviewed in these columns in that 1920 was not a record-breaking year from the standpoint of business done. The freight revenue in 1920 was \$43,324,700, as compared with \$35,255,548 in 1919. The total tonnage of revenue freight carried was 16,845,541, as compared with 14,686,194 in 1919. The 1917 figure was 18,156,259, that being the greatest in the company's history. The revenue ton-mileage in 1920 was 4,566,144,218; in 1919 it was 4,027,016,200, but in 1917, 4,785,374,795.

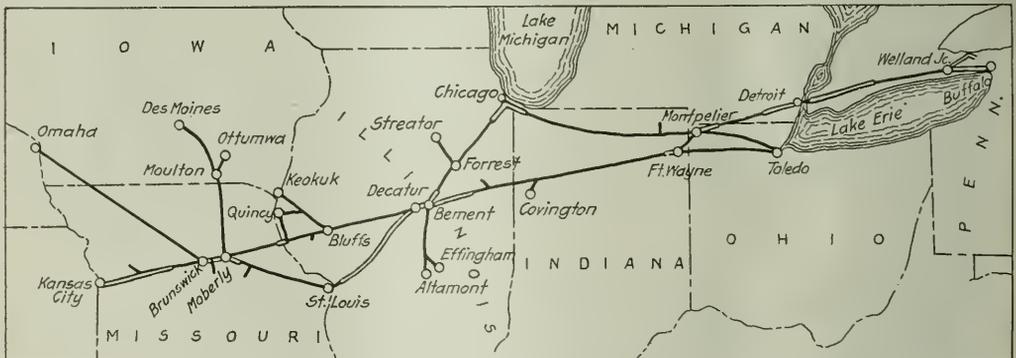

The road has increased its operating efficiency rather markedly in recent years. One of the factors that stands out in greatest relief in this connection is that of the progressive

siderably above the average for the eastern district and, in fact, for the country as a whole.

The story of the increase in revenues in 1920 over 1919, the even greater increase in operating expenses and the corresponding decrease in net was the same on the Wabash as on nearly every other railroad. The increase in operating revenues in 1920 over 1919 was 22.8 per cent; in expenses, the increase was 32 per cent. The decrease in net has already been commented on. The operating ratio in 1920 was 98.13 per cent and in 1919, 91.28 per cent. The increase in operating expenses as between the two years amounted to \$14,272,366. The report shows that increases in pay through the Labor Board's award last July amounted approximately to \$4,700,000 and that increased prices of fuel, materials and supplies made up about \$1,900,000. The Wabash paid for fuel coal in 1920 \$3.52 a ton; in 1919, \$2.74. In 1916 the average cost per ton was \$1.60.

The Wabash in 1920 effected considerable improvement in its equipment and roadway. It received from the Railroad Administration 2,800 double sheathed box cars, and 1,000 hopper cars. It also authorized the rebuilding of 600 box, 200 flat and 500 coal cars and the conversion of 250 box cars to automobile cars. The acquisition of 20 light Mikado locomotives has already been noted. During the year there were laid 21,178 tons of new 90-lb. rail, as compared with 5,337 tons in 1919; there were put in main track 797,576 ties and 165 miles of track were rebalasted. These figures represent as a whole considerably more work done than the average for several years.

The corporate income account for 1920 shows that without the standard return and guaranty the road would have had a

The Wabash

increase in revenue train loading. The average revenue train load in 1920 was 638 tons. In 1919 it was 627 tons, the progressive increase over previous years being shown by comparison with the figures for those years, which are as follows: 1916, 517 tons; 1917, 568 tons; 1918, 606 tons. This increase in train loading has been largely due to new power of larger capacity and to the modernizing of existing locomotives. The average tractive effort per locomotive at the end of 1916 was 30,317 lb.; at the end of 1919 this average had become 32,597 lb., and at the end of 1920 it was 33,134 lb. The increase in 1920 was due to the acquisition of 20 light Mikado locomotives allocated to the road by the United States Railroad Administration. Another figure that is of interest in showing the efficiency of operation is the average revenue load per loaded car. In 1920 this was 23.4; in 1919, 22.56. In 1920 the Wabash secured a mileage per car per day of 27 as against 26.2 in 1919. The ton-miles daily per car in 1920 were 526. This compared with 469 in 1919 and was con-

net deficit for the year of \$7,369,827. The standard return for the first two months of the year amounted to \$971,135. The amount accrued in accordance with the guaranty provisions of the Transportation Act covering the six months of the guaranty period was \$8,063,775. The balance for the year was \$1,983,943, as compared with \$1,747,228 in 1919, \$632,705 in 1918, or \$4,172,045 in 1917.

The following gives the figures for operation in 1920 as compared with those for 1919:

	1920	1919
Mileage operated.....	2,473	2,476
Freight revenue.....	\$43,324,700	\$35,255,548
Passenger revenue.....	11,218,051	10,143,356
Total operating revenue.....	59,982,282	48,847,086
Maintenance of way expenses.....	10,541,360	8,086,850
Maintenance of equipment.....	14,735,861	9,358,676
Traffic expenses.....	1,169,383	657,109
Transportation expenses.....	30,023,953	24,610,615
Total operating expenses.....	\$8,859,395	44,587,030
Net from railway operations.....	1,122,887	4,260,056
Tax accruals.....	1,574,473	1,445,726
Total operating income.....	Def. 454,490	2,805,154

The corporate income account was shown in the Railway Financial News column of the *Railway Age* of April 29, page 1054.

### Lehigh Valley

ANTHRACITE COAL furnishes in the neighborhood of 42 per cent of the total freight tonnage of the Lehigh Valley. The road ranks second among the anthracite carriers as to the amount of anthracite tonnage originated, but it is first as far as concerns the tonnage of domestic sizes. Because of the recent decision of the Supreme Court ordering the segregation of its coal properties, the Lehigh Valley has been more or less in the public eye of late and it will probably be in the public eye more rather than less in the near future when the segregation plan is announced. In addition to its being one of the anthracite coal carriers, the Lehigh Valley is also characterized by the excellent service it renders to shippers of coal and other freight.

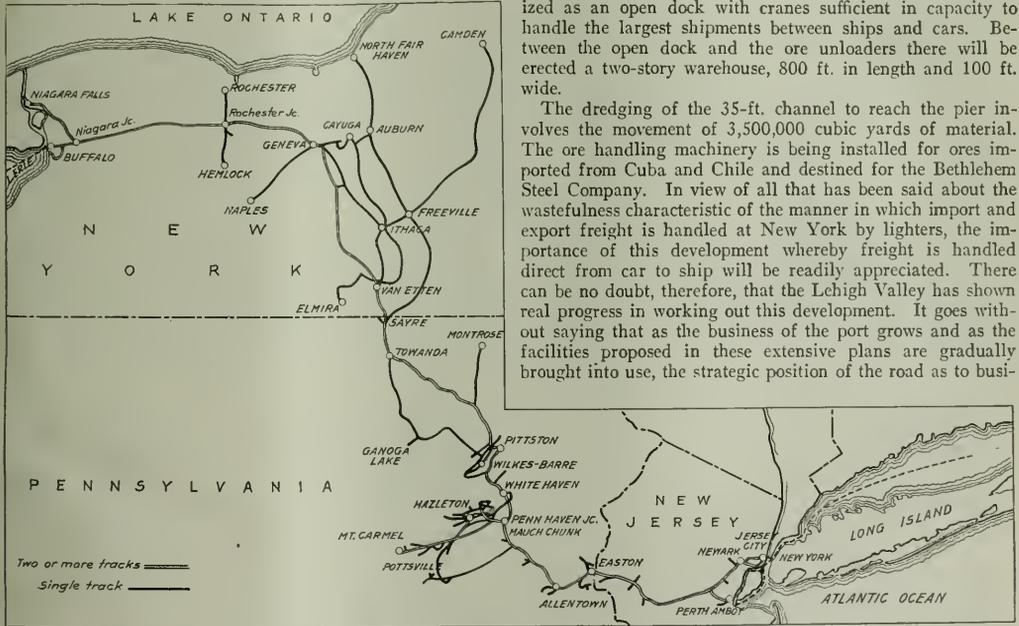

Probably the most striking thing about the Lehigh Valley, however, is the improvement program that road has been carrying out over a term of years to give it a greater capacity

York harbor and to keeping its rolling stock in first-class condition."

No one who has read of the improvements or additions which the Lehigh Valley has been making to its terminal facilities in New York harbor can fail to have been impressed by the great amount of work which the road has already carried out at that port. Still less can he fail to be impressed by the plans contemplated for the future. Particular reference, as far as speaking of the future is concerned, is made to the development now partly under way at what is known as the Claremont terminal. When this terminal is completed, it will be without much doubt the most extensive and best equipped facility of its kind in New York harbor. It is situated on the New Jersey side of New York Bay, between the Lehigh Valley's present terminals at Black Tom and Constable Hook. The plans call for a rail and water terminal with three piers each approximately 7,000 ft. long with slips 450 ft. wide and with sufficient depth of water to accommodate vessels drawing up to 35 ft.

Work is now proceeding on the first pier. For the present this is to be 3,596 ft. long, offering berthing space for five large ocean going ships. At the outer end ore unloading machinery capable of handling 2,500 tons of ore an hour from vessels to cars will be installed. The shore end will be utilized as an open dock with cranes sufficient in capacity to handle the largest shipments between ships and cars. Between the open dock and the ore unloaders there will be erected a two-story warehouse, 800 ft. in length and 100 ft. wide.

The dredging of the 35-ft. channel to reach the pier involves the movement of 3,500,000 cubic yards of material. The ore handling machinery is being installed for ores imported from Cuba and Chile and destined for the Bethlehem Steel Company. In view of all that has been said about the wastefulness characteristic of the manner in which import and export freight is handled at New York by lighters, the importance of this development whereby freight is handled direct from car to ship will be readily appreciated. There can be no doubt, therefore, that the Lehigh Valley has shown real progress in working out this development. It goes without saying that as the business of the port grows and as the facilities proposed in these extensive plans are gradually brought into use, the strategic position of the road as to busi-

The Lehigh Valley

and to enable it to be a more efficient carrier in general. The improvement program has included, more particularly, substantial progress as to its equipment and increases in the terminal facilities at various strategic points on the system.

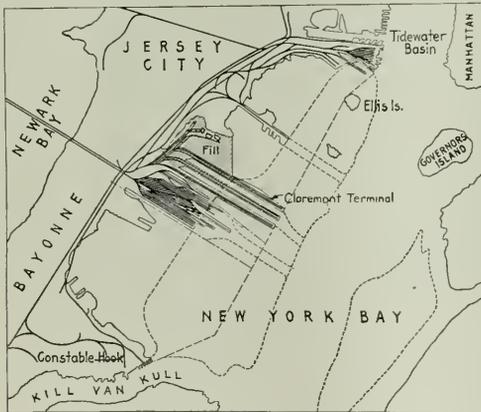

President E. E. Loomis, in the 1920 annual report, refers to the program in these words: "Probably the greatest problem confronting the railroads will be to provide adequate facilities to handle the business of the country, which, it is fair to assume, will increase in the next ten years in the same proportion as in the past decade. This your company has constantly in mind, and at this time is giving special attention to enlarging its terminal facilities at Buffalo and in New

York and through the port of New York will be greatly enhanced.

President Loomis in the statement quoted above, referred also to the maintenance of equipment. This matter was a somewhat striking feature of the Lehigh Valley's operations during 1920 and for that reason merits more than passing attention. The Lehigh Valley has for many years been carrying out a program of securing larger power and of modernizing locomotives already in service. When the property was returned to private control on March 1, 1920, it was found, as was commonly the case on most roads, that the equipment had not been properly maintained. This was true particularly of cars which had been off line and which were returned

in poor repair. The Lehigh Valley promptly took steps to remedy this situation and to this time it has not reduced its expenditures for maintenance of equipment despite the present high costs or the sharp falling off in business. The expenditures for maintenance of equipment in 1920, it will be noted, were nearly double those for maintenance of way. In the first two months of 1921 expenditures for maintenance of equipment were nearly \$1,000,000 in excess of those for the same period of 1920, although expenses of other kinds were considerably less in this period in 1921 than in 1920. It was not unusual for a road to spend more for maintenance of equipment in January and February, 1921, than in the same two months of 1920, but it was unusual for a road to spend as much more in proportion as the Lehigh Valley has done.

The Lehigh Valley did more business in 1920 than it did in 1919, but not as much as in some of the years immediately preceding. The total tons of revenue freight carried in 1920 were 32,103,897 as compared with 30,934,972 in 1919, or 37,250,739 in 1918. The ton-mileage of revenue and non-revenue freight in these years compared as follows: 1920, 6,558,302,627; 1919, 5,968,348,276 and 1918, 7,136,881,128. The average haul of revenue freight in 1920 was 197 miles; the average revenue per ton per mile 0.971 cents. The Lehigh Valley in the years up to 1918 made some rather remarkable increases in its average train load. The average revenue tons per train in 1916 were 654; in 1917 this figure was raised to 751 tons, an increase of 15 per cent in a

Relation of the Claremont Terminal to Other Terminals on New York Bay

single year. In 1918 it became 892 tons, a still further increase in a single year of no less than 19 per cent. This increase, however, has not been kept up since that time presumably because of the smaller amount of business carried. The revenue train load in 1919 was 878 tons; in 1920, 864 tons. The average load per loaded car in 1920 was 32.21 tons as compared with 30.62 tons in 1919. In 1920 the car miles per day were 21.9.

The operations of the Lehigh Valley in 1920 resulted in an operating deficit of \$7,649,345 as compared with operating income in 1919 amounting to \$3,408,253. This is the familiar story of an increase in gross, a still greater increase in expenses and a decrease in net. The operating revenues in 1920 amounted to \$72,229,584, an increase of \$9,687,082 over 1919; the operating expenses to \$80,503,974, an increase of \$20,194,776 over 1919. The operating ratio in 1920 was 107 and in 1919, 92.

The corporate income account for the year, however, shows

a quite different result from the figures of operation; it showed a net income of \$13,511,917 as compared with \$4,977,213 in 1919 or \$6,592,834 in 1918. The 1920 net income includes, of course, the standard return for January and February, and the guaranty for the guaranty period. It also includes an item of \$15,532,351 dividend income. This item was \$14,343,674 greater than in 1919, the difference being due to the fact that in 1920 the Lehigh Valley received extraordinary dividends from its coal properties, Coxo Brothers & Co. and the Lehigh Valley Coal Company, paid out of earnings in former years. Dividends paid by the Lehigh Valley during the year amounted to \$4,245,749, the payment on the common stock being 7 per cent. The interest charges for the year totaled \$4,580,839 on funded debt and \$393,362 on unfunded debt. Rent for leased roads, however, amounted to \$2,195,092. The profit and loss surplus at the close of the year was \$36,326,576, having increased from \$25,965,934 at the close of 1919. An interesting feature of the Lehigh Valley's financial standing is that although the road has \$2,400,000 of equipment trust certificates outstanding none of these certificates are in the hands of the public.

President Loomis in his report has some pertinent remarks concerning the present railroad situation that are so well put as to deserve quoting. He said, "There has been a recent tendency to find a connection between the present business depression and the increased transportation charges. A study of the situation, however, indicates rather that business conditions merely are reflecting the general disorganization and unsettlement following the war and, while some rate reductions may be possible as the result of decreased operating costs, no general reduction in transportation charges should be made if the railroads are to furnish the facilities and high standard of service the commerce of the country demands.

"We feel that the Transportation Act has not had a fair trial up to this time, principally because of the decline in volume of traffic, which, toward the close of the year, accompanied the general business depression. Before any legislative changes are considered, it is to be hoped that the present law will be given further opportunity to demonstrate its value."

The operating results for 1920 as compared with those of 1919 are as follows:

	1920	1919
Mileage operated	1,448	1,448
Anthracite coal freight revenue	\$23,727,484	\$20,740,261
Bituminous coal freight revenue	2,630,066	2,335,477
Merchandise freight revenue	35,011,415	28,531,805
Total operating revenue	75,229,584	65,542,502
Maintenance of way expenses	11,952,836	9,824,647
Maintenance of equipment	23,656,316	18,152,710
Traffic expenses	984,338	481,733
Transportation expenses	41,486,497	28,870,526
Total operating expenses	80,503,975	60,309,198
Net from railway operations revenue	Def. \$7,274,390	\$5,233,304
Taxes	2,367,895	1,822,987
Operating income	Def. \$7,649,345	\$3,408,253

The corporate income account is as follows:

	1920	1919
Operating income, 10 months	Def. \$4,263,487	
Standard return, 1919		11,316,196
Other income, including standard return for January and February, guaranty, dividend income, etc.*	26,453,346	
Total income	22,189,859	13,164,434
Deductions from gross income	8,677,942	8,187,221
Net income	\$13,511,917	\$4,977,213
Dividends (7 per cent, 1920, 7 1/2 per cent, 1919)	4,245,749	4,699,512

\*Dividend income in 1920, \$15,532,351; in 1919, \$1,188,678.

SENATOR TOWNSEND has submitted to the Senate concurrent resolutions adopted by the Michigan legislature petitioning Congress to repeal the Esch-Cummins act and also urging the amendment of the act so as to restore to the states the control of the capital securities of railroad corporations created under the sovereignty of the states or of railroads operating wholly within the territorial limits of a state.

Electric Passenger Train at Airolo

## Electrification of St. Gotthard Line, Switzerland

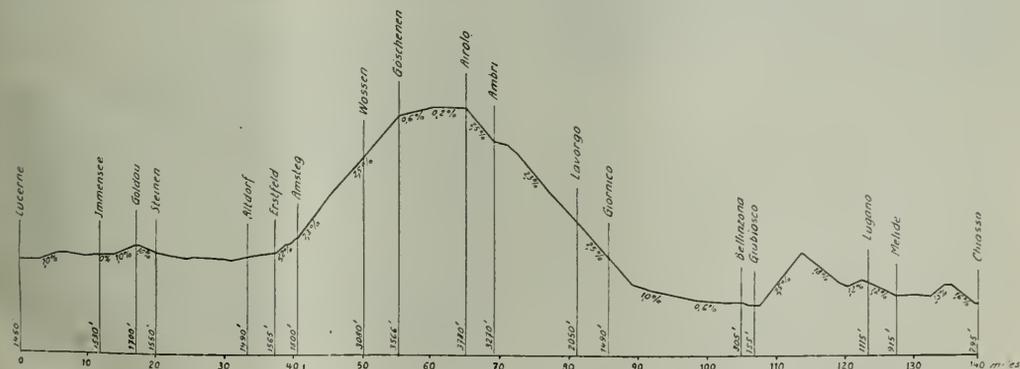

Road Has 60 Trains a Day—Average Grade of 2.5 Per Cent for Thirty Miles—Coal Is at a Premium

By Hans W. Schuler  
Electrical Engineer

THE SWISS FEDERAL RAILROADS decided to electrify the St. Gotthard Line from Erstfeld to Bellinzona, a distance of 101 miles, in August, 1913. The St. Gotthard Line extends from Lucerne to Chiasso on the Italian border, a distance of 180 miles. That part of the line which is electrified represents a mountain railroad of the first order,

able were used in electrifying because of the heavy traffic, the severe climatic conditions and the importance of the line as a main connection between Germany and Italy.

The electrified section is all double track and has the heaviest and longest grades of any of the standard gage railroads of Switzerland. The northern part, from Erstfeld

Profile of the St. Gotthard Railroad. The Section from Erstfeld to Bellinzona Has Been Electrified

with its heavy grades, long tunnels and with the great differences in altitudes that are to be overcome.

In 1912 the amount of traffic handled from Erstfeld to Bellinzona was about 405,000,000 ton-miles. Every day 20 through passenger trains, 8 local passenger trains, 22 freight trains and from 10 to 20 special trains were run over this line. The best material and methods of construction obtain-

to Goeschenen, at the northern portal of the St. Gotthard tunnel, has an average grade of 2.6 per cent for 18.7 miles, and the southern part from Biasca to Airolo, at the south portal of the St. Gotthard tunnel, has an average grade of 2.5 per cent for 28 miles.

The original plan for electric power called for two power stations equipped with single phase generators, one situated

near Amsteg in the Reuss Valley on the north side of the Alps, and the other near Ambri-Piotta on the south side. In 1914 the work of building these power stations was started and it was planned to get them finished and ready for service in 1918. The world war checked this program. Because of the enormous difficulties created by the war, it was necessary to neglect some of the construction work of the Amsteg power station and concentrate the work of building on the Ritom power station at Ambri-Piotta. This station began

Because of the difficulties involved in getting materials such as iron, copper and insulators from other countries the construction of the contact line was delayed. Other obstacles encountered were the necessary reinforcement of the numerous bridges, due to the fact that the electric locomotives were heavier than the steam locomotives displaced, and to the necessity for rebuilding the stations at Goeschenen, Airolo and Bellinzona, which had reached their capacity in 1913. In spite of these delays the contact line through the St. Gotthard tunnel was ready for service in May, 1920, when the Ritom power station began to supply current. In July the construction of the contact line from Erstfeld to Goeschenen was completed and in November the contact line from Biasca to Bellinzona was ready for service. The great amount of rebuilding work now going on in the station of Bellinzona will make it impossible to start electric operation from Biasca to Bellinzona before early summer this year.

### The Power Stations

The power station at Ritom is a hydro-electric plant with a head of 2,620 ft. Lake Ritom, situated about 2,950 ft. above the village of Ambri-Piotta, at an altitude of 6,000 ft., is used as a reservoir, and the water is held in the lake by a small dam at the outlet of the lake. The useful volume

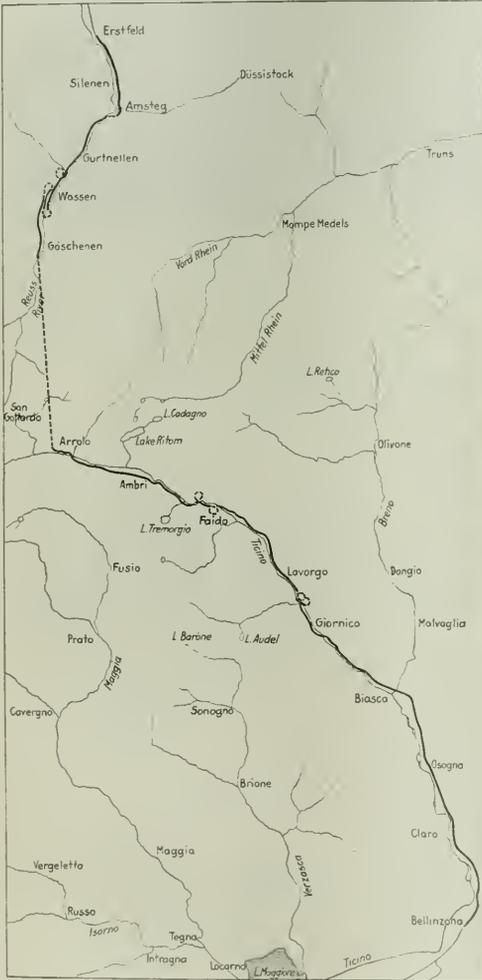

The Ritom Power Station. Pressure Pipe Lines from Lake Ritom Are Brought Down Through Cleared Space in the Timber Shown in the Rear

of the lake is 918,000,000 cu. ft. and the average outflow is 35.3 cu. ft. per second. This flow and head maintain a continuous output of 8,500 hp. at the shaft of the turbine. The reservoir capacity of this plant makes it admirably suited for co-operation with the plant at Amsteg, which has a varying output caused by the widely fluctuating flow of the Reuss River, on which it is located.

The Ritom power station is now built for an output of 48,000 hp. and its capacity will later be enlarged to 72,000 hp. At present there are three 9,000 kva. generators in service, each direct connected to a 12,000 hp. Pelton turbine, while a fourth set is being mounted. The generators develop single-phase, 15,000-volt power at a frequency of 16 2/3 cycles. The current is delivered directly to the contact line at the power stations and also to 11,000 kva. transformers which step the voltage up to 60,000 volts to transmission lines which take it to the various sub-stations. At present it is necessary to mix electric traction with steam traction between Biasca and Bellinzona, and until it is possible to discontinue this practice, the tension on the contact line will be maintained at 7,500 volts.

The Amsteg power station uses the fall of the Reuss river. A pressure tunnel, 4 1/2 miles long, conveys the water to a

Map of the Electrified Section of the St. Gotthard Railroad

to deliver current to the contact line in the spring of 1920. The reason for this procedure was that when Italy entered the war the traffic on the St. Gotthard Line diminished considerably; it was evident then, that this traffic regress would continue for some time. The Ritom power station should be able to furnish all of the power required to run trains until about 1922, and it seemed advisable not to hasten the construction work of the Amsteg power station, but to wait a year or two for better conditions for construction work.

water chamber 920 ft. above the power house. The average minimum output during the three winter months is 12,000 hp. at the shaft of the turbines. Water wheels aggregating a total of 60,000 hp. will be installed at first and later increased to 90,000 hp. The Amsteg power station should be ready for service early in 1922, and as soon as it is put in operation the Ritom station will be practically idle in the summer, thus allowing a large volume of water to accumulate in Lake Ritom, while Amsteg, due to the immense flow of the water in the Reuss river during the summer months, will

The Amsteg Power Station Under Construction. Photograph Was Taken in November, 1920

be able to generate all the power that is needed to run all trains over the St. Gotthard line. During the three winter months the Amsteg station will have its output limited to 12,000 hp. and Ritom will be able to satisfy the balance of the power demand by drawing on the water accumulated in the lake during the summer months.

#### Transmission Lines

From the power stations the power is transmitted over 60,000-volt transmission lines to the sub-stations. Between

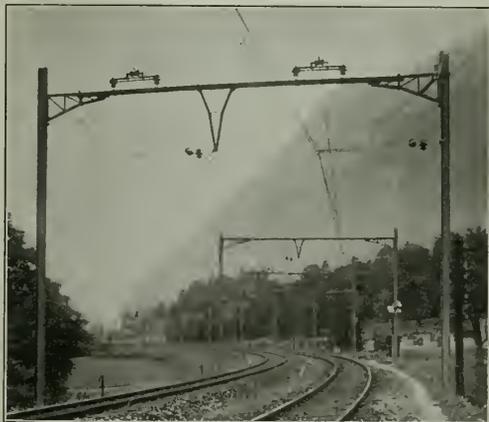

Catenary Construction on Tangent Track

the Ritom power station and the sub-stations of Goeschenen and Giornico these transmission lines are built as underground cables. As the middle point of the transformer high tension winding is grounded, the tension between each conductor and ground is only 30,000 volts. The cables are insulated to stand 30,000 volts in normal service. Before they are laid they are tested with 90,000 volts. At present

there is only one two-conductor transmission line consisting of two cables of 135 sq. mm. copper cross-section between Ritom and Goeschenen and two lines consisting of four cables of 120 sq. mm. cross-section each between Ritom and Giornico. A second line between Ritom and Goeschenen and two lines between Amsteg and Goeschenen are being installed. Each of the cables used in these lines has a cross-section of 135 sq. mm.

The 30,000-volt cables are placed on the right of way in concrete channels. Junction boxes are placed in the concrete channels at intervals of about 1,600 ft. for the purpose of making splices in the cable. In the St. Gotthard tunnel the cables are laid in reinforced concrete channels that are attached to the side wall of the tunnel at a height of 4 ft. 11 in. above the top of the rail. The channel supports are placed at intervals of 10 ft. 9 in. The insulation of the cables consists of specially impregnated Manila paper, which is covered by a lead sheath 3 mm. thick, which in turn is enclosed in a jute wrapper.

From the Giornico sub-station to the south and from Amsteg to the north the transmission lines are aerial. The line to the sub-station of Giubiasco is now ready for service and the line further south to the sub-station of Melide will be completed by the end of this year. For the greater part

Catenary Construction on Curve. Supporting Bridge in Foreground. Second Bridge Is a Pull-Off

of the distance these lines parallel the track at a distance of 66 ft. and consist of 4 copper strands of 100 sq. mm. cross-section. The average distance between poles is 262 ft. A ground wire consisting of a  $\frac{1}{2}$  in. galvanized steel strand is strung over the top of the poles. The transmission lines from Amsteg to the north will be built during the coming summer and fall and should be ready for service early in 1922. It will connect the Amsteg power station with the sub-station at Steinen.

#### Sub-Stations

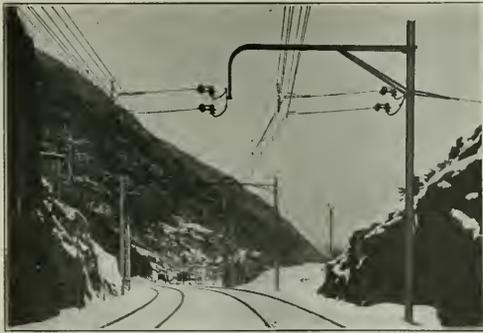

There are five sub-stations in all. The sub-stations of Goeschenen and Giornico are already in operation, the sub-station of Giubiasco is about completed and the sub-stations at Melide and Steinen will be put in service at the end of this year. In the sub-stations the single phase current from the power stations is transformed from 60,000 to 15,000 volts and delivered to the contact line. The sub-stations of Goeschenen, Giornico and Giubiasco are built for the installation of three transformers of 5,000 kva., continuous rating, but only two will be installed until the traffic demands

a third. The sub-station at Steinen will be equipped with three and later on with four transformers of 5,000 kva. capacity.

### The Contact Line

The contact line is built as a catenary. Over the main line track it consists of a No. 0000 hard drawn copper contact wire, a  $\frac{1}{2}$ -inch 19-strand galvanized iron auxiliary messenger and a  $\frac{1}{2}$ -inch 7-strand galvanized iron messenger wire. The contact wire is suspended from the auxiliary messenger at intervals of 23 ft. and the auxiliary messenger is supported from the messenger by hangers placed at intervals of 92 ft. The bridges which support the messenger are spaced 184 ft. apart. At these bridges the contact wire and auxiliary messenger strand are held in their position, relative to track, by a special pull-off construction. On curves with radii less than 2,950 ft. the contact wire, the auxiliary messenger and the messenger are pulled off in the middle of the span. The span of 184 ft. was chosen because it was found the most advantageous one with respect to the many curves and because of the small width of the pantograph shoe made necessary by the form of the tunnel. On adjoining lines, where curves are less frequent, the length of span will be 197 ft.

The maximum tension of the contact wire at the lowest

Catenary on a Curve Showing Another Type of Pull-Off Construction (See Preceding Illustration)

temperature reached in winter is 883 lb. At the highest temperature in summer, this tension goes down as far as 530 lb. With the greater number of catenary systems used in Europe, a constant trolley wire tension is obtained by tension weights used to suspend the contact wire at various points of the line. No tension weights are employed in the construction of the catenary on the St. Gotthard Railroad and much care has been taken to obtain a perfectly level contact wire, as the pressure of the pantograph shoe is kept at only  $5\frac{1}{2}$  lb.

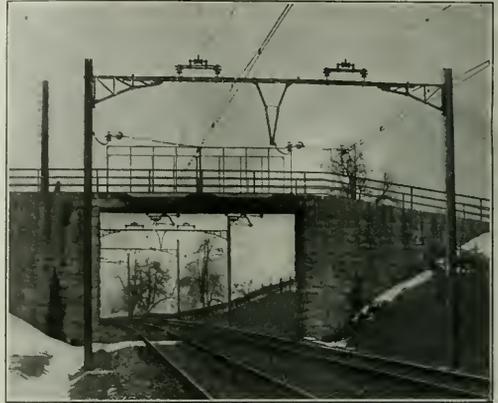

In the tunnels the auxiliary messenger is replaced by a copper wire that is mounted close to the main contact wire. The messenger is replaced by a copperclad steel wire that has a copper cross-section of 28 sq. mm. and a steel cross-section of 28.5 sq. mm. The messenger is supported by special frames, which are about 82 ft. apart.

The height of the contact wire above the top of the rail at the highest temperature is 18 ft. on the open line, 19 ft. at highway crossings and 20 ft. in stations. The total difference in height, on account of temperature change, is 1.5 ft. In tunnels and under low bridges the height above the top of rail is 16 ft. at all temperatures.

The contact line is insulated with a double insulation that consists of two pin-type and one spool-type insulator at all points where the messenger strand is supported. At pull-off points the insulation consists of one pin and one spool-type

insulator. On account of the limited space in tunnels it was impossible to install double insulation. As a substitute a pin-type insulator of especially heavy design is used. All of the insulators used have a cylindrical section which makes it possible to use them with a sturdy type of insulator support or armature.

The yard tracks are equipped with a contact line which

Special Contact-Wire Support and Protective Devices Are Used on Highway Bridges

consists of the contact wire 70 sq. mm. cross-section, of a  $\frac{3}{8}$  in. 19-strand galvanized iron auxiliary messenger and a  $\frac{3}{8}$  in. 7-strand galvanized iron messenger.

The pole lines on the open line between Erstfeld and Bellinzona are made of H-beams, 8 in. wide. Between Bellinzona and Chiasso and between Erstfeld and Lucerne structural steel poles are used which have the same mechanical

Sectionalizing Insulators and Circuit Breakers on Pole in Yard Catenary Construction

strength. The yokes between the poles are made of two "T's" or of four angles. Structural steel poles are used in the stations with rigid steel cross-spans. All insulator supports and all bolts and small parts for the contact line are heavily galvanized.

Section insulators and switches are so located that all the tracks in a station can be disconnected from each other and so that all of the main line tracks between any two stations

can also be disconnected from the rest of the system. There are no feeders along double track lines, but feeders are provided on single track lines for continuity of the circuit while repair work is being done on the contact line.

The different sections of the contact line are connected by oil circuit breakers. Four of these circuit breakers are located

Sectionalizing Switches Used to Disconnect the Catenary Over the Station Tracks from the Main Line Catenary

at either end of every station. When all of the lines are in service, the contact line transmits the current through the stations to points farther away from the feeding point. Each station is provided with a special jumper line that goes around the station and maintains continuity of the circuit when the lines in the station are disconnected.

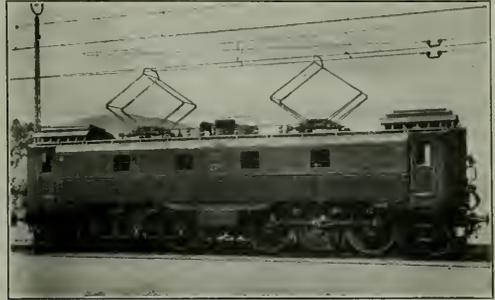

#### Telegraph and Telephone Lines

All of the telegraph and telephone lines in Switzerland not owned by the railroads are owned by the government and it is common practice to run both government and rail-

and telephone lines in a cable laid in a concrete channel in the right of way and the state removed its lines as far away from the railroad as the rather narrow valley would admit. Along this line both the railroad and the state have discontinued the use of a grounded return, and as the lines are either in a cable or from 1,640 ft. to 2,600 ft. from the contact line and frequently transposed, there is no trouble from inductive interference and no danger of actual contact. In some localities the induced voltage in the railroad telegraph and telephone lines runs as high as 240 volts at peak loads, but as the lines are not grounded this does not interfere with normal service.

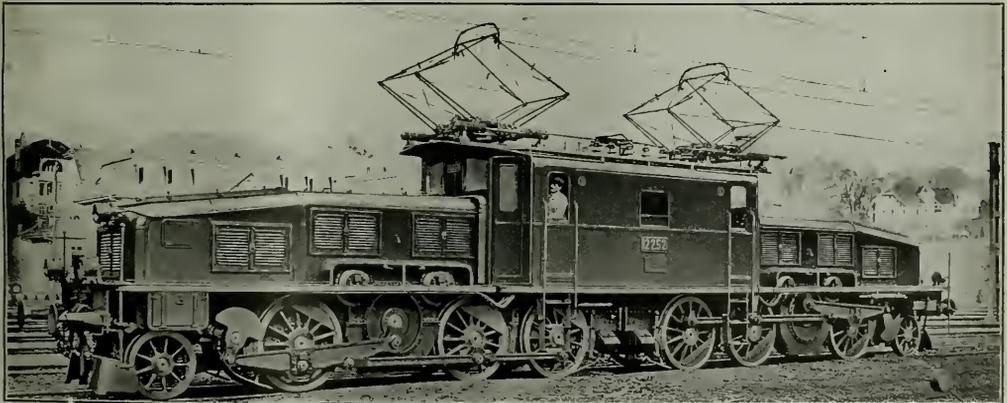

#### Locomotives

When a decision was reached to electrify the St. Gotthard line, it was planned to obtain trial locomotives as soon as

Electric Passenger Locomotive

possible and to test them out on the Loetschberg Railroad for the purpose of finding out which type was the best suited for the St. Gotthard line. The war also delayed the delivery of electric locomotives for the test, and for this reason the locomotives for the St. Gotthard line had to be ordered before the trial locomotives had been delivered and tested.

Electric Freight Locomotive

road telegraph and telephone lines along the railroad right of way. As many of these lines use a grounded return, it is not possible to have them on the right of way of an electrified road because of the noise caused by inductive interference and the danger of actual physical contact with the overhead system of the electrified railroad.

On the St. Gotthard line the railroad placed its telegraph

At the present time there are about 30 locomotives in service, 15 of which are freight and 15 passenger locomotives. The data for the two types are given in Table 1.

The coal situation, often referred to as the coal misery, reached its climax in 1918 and taught Switzerland to consider steam railroad electrification as a vital as well as an economic problem. With the high prices being paid for coal,

many roads could probably show considerable saving if electrified, but more than this it was desirable to maintain the continuity of traffic and not be dependent upon the good will

TABLE 1

	Passenger locomotive	Freight locomotive
Type	2-4-2	3-6-2
Continuous rating (hp.)	1650	1825
One hour rating (hp.)	1800	2250
Drawbar pull (continuous)	20,000 lb.	26,000 lb.
Drawbar pull (one hour)	23,000 lb.	37,500 lb.
Speed	47 miles per hr.	40 miles per hr.
Length over all	54 ft.	63 1/2 ft.
Diameter of driving wheels	60.2 in.	53.2 in.
Gear ratio	1:3.5	1:4.03
Weight of mechanical parts	59.3 tons	72.0 tons
Weight of electrical parts	47.3 tons	56.0 tons
Total weight	106.6 tons	128.0 tons
Weight on drivers	76.8 tons	103.9 tons
Electric parts made by	Brown, Boveri & Co.	Maschinenfabrik Oerlikon
Mechanical parts made by	Locomotivfabrik Winterthur	Lokomotivfabrik Winterthur

of foreign countries for coal. These were the primary reasons for deciding on a program for the electrification of all of the lines of the Swiss Federal railroads, and a decision has been reached not to wait for the completion of the electrification

TABLE 2

Lines	Length of line	Year operation was started	Kind of power used
Brig-Iselle (Simplon tunnel)	13.7 miles (single track)	1905	Three phase 3000 volts freq. 16 2/3
Brig-Sitten	35 miles (partly double track)	1919	As above
Thun-Bern	20 miles (double track)	1919	Single phase 15,000 volts freq. 15
Erstfeld-Biasca	56 miles (double track)	1920	As above but freq. 16 2/3
LINES BEING ELECTRIFIED			
Lines	Length of Line	Time work will be finished	Kind of power used
Biasca-Bellinzona	12.5 miles (double track)	Apr., 1921	Single phase 15,000 volts freq. 16 2/3
Bellinzona-Chiasso	34 miles (double track)	End, 1921	As above
Erstfeld-Lucerne	37.3 miles (partly double track)	Apr., 1922	As above
Goldau-Zug	12 miles (single track)	Apr., 1922	As above
Lucerne-Zug-Zuerich	28.3 miles (partly double track)	End, 1922	As above
Sitten-Lausanne	60 miles (double track)	Aug., 1923	As above

work on the line from Erstfeld to Bellinzona but to go on at once with the electrification of adjoining lines. Table 2 lists the Swiss Federal roads now electrically operated and those on which the work of electrification is in progress.

## Senator Elkins Urges Public to Buy Coal Now

“HOW TO BREAK the ‘buyers’ strike,’ if such it may be called, affecting the coal industry is one of the grave and immediate problems confronting the government in its executive and legislative branches,” said Senator Davis Elkins, of West Virginia, in a statement to the press.

“Sudden restoration of a market, and an attempt to crowd the hauling of the bulk of the nation’s coal in the fall and winter months, will place upon the railroads a burden which they are admittedly unable to adequately discharge. That will simply mean a repetition of the so-called ‘coal famine’ of last year, which was *per se* a car famine.

“It is proposed in bills before Congress to induce the public to lay in its fuel supply in ample season by authorizing and directing a reduction of seasonal freight rates on coal. That idea put into practice might prove effective. If it should, it is hardly likely to meet the present critical situation with the desired promptness. That help would be likely to come rather late.

“Under existing freight rates and scales of miners’ wages, the prices for soft coal are as low now as they are likely to be. They are less than those established by the late fuel administration, which allowed, according to Dr. Garfield, an average profit of 46 cents the ton.

“Since then, during 1920, the miners secured an increase in two installments of 47 per cent, which increase was written into the present wage scale under government supervision, and which scale has until April, 1922, to run.

“It is therefore useless to hope for a reduction in wages as an aid to lower soft coal prices this year. Wages and freight rates are the main supports of the present market prices.

“Since 1914 the soft-coal industry has had to sustain six successive increases in wages. These increases have added, it is estimated, \$1.70 to the cost of each ton. On a yearly production of 550,000,000 tons, this would represent an increase of \$935,000,000 in wages alone over what it cost to produce soft coal before the war.

“Freight rates have approximately doubled since 1914. Where the average freight rate was about \$1.50 a ton in pre-war days, the average rate now, so far, is about \$3 a ton. For long distances from the mines the freight rates run much higher than \$3 a ton.

“The increase of \$1.50, applied to a yearly production of 550,000,000 tons, represents an advance in the cost of soft coal to the consumers and the country over on account of freight rate charges, of \$825,000,000.

“Taken together, advances in wage scales and in freight rates since 1914, it is estimated, have added \$1,750,000,000 to the yearly coal bill of the nation.

“The conclusions to be drawn from the foregoing are that (1) the wage scale stands until April, 1922, a scale written under government supervision, if, indeed, not by government direction; (2) that any reduction in freight rates on coal is likely, if it comes and when it comes, to be too late to correct the present situation before the damage has been done; and (3) that the grave concern felt by the officials of the government over coaling the country for next fall and winter is abundantly justified.

“The public’s interest and concern in this matter are second to no other. What the public needs is to clearly understand that by holding off it is assuming too great a risk on its own account; is unwittingly contributing to the vexations and burdens of the railroads, already weighted down with vexations and troubles; is keeping many thousands of miners idle, and causing distress to the dependents of these men, and doing that which it does not at heart want to do—helping to retard the rebirth of prosperity, confidence and optimism in our industrial and economic life.”

# Carriers Answer Lauck's Charges Before Board

## Railroad Representatives Close Testimony in Wage Case With Reply to Employees' Exhibits

**D**ECLARING the voluminous exhibits submitted to the Railroad Labor Board by W. Jett Lauck to be irrelevant, fallacious and having no foundation in fact, representatives of eastern and western carriers on May 7 completed presentation of the railroads' plea for wage reductions. The last two days of hearings in the case were given almost wholly to an attack upon material prepared by Mr. Lauck as a "consulting economist" for the labor organizations. The attack was made by J. G. Walber, speaking on behalf of the eastern roads; F. W. Sargent, general solicitor of the Chicago & North Western, speaking for the North Western and for the western roads; R. M. Shaw, general counsel of the Chicago Great Western, speaking for six presidents of western roads, and E. H. Senneff, general counsel of the Pennsylvania.

The statement read by Mr. Shaw on behalf of the western roads was signed by Charles H. Markham, president, Illinois Central; Hale Holden, president, Chicago, Burlington & Quincy; H. E. Byram, president, Chicago, Milwaukee & St. Paul; W. H. Finley, president, Chicago & North Western; J. E. Gorman, president, Chicago, Rock Island & Pacific; S. M. Felton, president, Chicago Great Western, and W. B. Storey, president, Atchison, Topeka & Santa Fe, and said in part:

For some weeks Mr. Lauck has been presenting to the Labor Board and giving to the press statements charging that large amounts of money are being wasted in the financial and operating management of the railroads. These statements have no relationship to any question before the Board, or which it has authority to determine. The Board itself has expressly stated that the Interstate Commerce Commission is the only federal body having authority over the general management of the railroads, and that the Board has authority only to fix reasonable wages and working conditions.

The sole purpose of these statements is to divert public attention from matters actually pending before the Board. They are bald propaganda intended to discredit private management and promote the Plumb plan. We respectfully protest against the Board continuing to allow hearings before it to be made a means of spreading this propaganda.

Since these statements have been permitted to be presented to the Board, we call your attention to the fact that in addition to being irrelevant, they are gross misrepresentations of the management of the railroads and that their tendency and purpose is to mislead the public regarding the actual facts as to both railway management and railway regulation. We shall briefly point out a few of these misrepresentations to illustrate the true character of all of them.

1. It is charged that in various ways the capitalization of the railroads has been made excessive and that in this way a burden has been imposed upon the public. We deny that the capitalization of the railroads as a whole is excessive. Even if it were, this would have no effect on passenger and freight rates, since the Transportation Act and the Interstate Commerce Commission, in carrying it out, have specifically based the rates upon a valuation made by the Commission itself.

2. It is charged that the railroads and concerns from which they buy fuel, materials, supplies and equipment are under the same financial control, and that, in consequence, the railroads pay excessive prices to these other concerns. Every railway buys fuel, materials, supplies and equipment from literally hundreds of different coal, iron and steel, lumber and equipment companies all over the country, and the charge that the railroads and all these concerns are under the same financial control is absurdly untrue. Even if they were under the same financial control it would not prove that the railroads pay excessive prices, and indisputable facts regarding almost innumerable transactions of the purchasing departments of the railroads could be presented to show that they do not, and have not, paid higher prices than other purchasers of the same things. Absolutely the only evidence purporting to support this charge is that the railroads paid high prices last year for having a very small part of their locomotives and cars repaired

in outside plants. Any fair comparison of the prices paid for these outside repairs, and what it would have cost to have made them in railway shops, will prove that the prices paid to outside plants were not excessive. Furthermore, the only reason why the railroads had these repairs made in outside plants was that their own shops were unequal to the demands upon them at the time.

3. It is charged that the railroads have wasted immense sums by not "modernizing" their locomotives. Figures given by Mr. Lauck himself show, however, that improved devices have been installed with remarkable rapidity on locomotives within the last ten years, considering the difficulties the railroads have had in raising capital for improvements. Mr. Lauck's inconsistency is shown when he charges the railroads have not sufficiently improved their locomotives, says at the same time that they have greatly increased their average tractive power, and then criticizes them because they have not fully utilized this increased tractive power. The best measure of the increase in the service obtained from locomotives is the average trainload. The average trainload of the western railroads in 1915 was 393 tons, while in 1920 it was 643 tons, an increase of 61 per cent. No better evidence could be cited than these figures of the increase in the efficiency with which locomotives have been used, and in general operating efficiency.

4. Mr. Lauck criticizes the railroads for many other alleged wastes which, even if proven to exist, could be remedied only by making great improvements in the physical properties. These improvements could be made only by the investment of large amounts of new capital. This new capital could be obtained only if the railroads were enabled to make enough net operating income to pay a return upon it. The railroads are trying to increase their net operating income by the only means immediately available—that is, by reducing their excessive operating expenses—and in this effort almost the only opposition they are receiving is from the labor leaders that Mr. Lauck represents. Within recent months the prices of everything the railroads buy except labor have been reduced.

5. Among the items of alleged "waste" Mr. Lauck mentions loss and damage. In 1917, the last year before government control, payments for loss and damage to freight were only \$35,000,000. In 1919, after two years of government control, this had increased to \$106,804,000, or 205 per cent. Mr. Lauck defends unified government control, but fails to point out that such a large saving in this item is possible because it was so increased under government control. He also fails to mention that since the railroads were returned to private operation the American Railway Association has been carrying on a campaign to reduce loss and damage 50 per cent, which already is beginning to meet with great success.

6. It is claimed that while the managements have been inefficient, the "productive" efficiency of the employees as measured by the amount of traffic handled per employee has increased. This claim is in direct contradiction of the facts. In 1916 the number of ton-miles of freight handled per employee was 243,218 and in 1917 250,997. The latter was the highest figure ever reached. In 1918 the average ton-miles per employee was only 241,541 and in 1919 only 208,026. In 1920 it had increased to 221,921. It declined under government control and increased under private operation in 1920, but even in 1920 was much less than that in 1916 or 1917.

When the railroads were still handling a large business, their operating expenses were running about \$6,200,000,000 a year, of which about \$4,000,000,000 was going to labor. Mr. Lauck has estimated that the railway managements have been "wasting" \$2,500,000,000 a year, while B. M. Jewell, head of the Railway Employees' Department of the American Federation of Labor, has completely outdone Mr. Lauck by estimating that in various ways there could be made economies amounting to over \$3,376,000,000 a year. At the same time, both Mr. Lauck and Mr. Jewell contend, first, that the railroads have not been justified in laying off employees, and, secondly, that there is no justification for any reductions in wages. The necessary effect of these contentions is that there is no justification for any reduction in the payroll. When they claim that from \$2,500,000,000 to \$3,500,000,000 a year could be saved by better management, and at the same time contend that there should be no reductions in the payroll, the inconsistencies and baselessness of their propaganda becomes apparent.

The railway managers are trying to reduce operating expenses through changes in rules and working conditions and reductions in wages which they believe will be just to the public, the railroads and the employees in view of the changes in conditions which

recently have occurred. They are also making the utmost efforts to effect every other economy that is practicable under present conditions. They realize that if they could raise sufficient new capital to make needed improvements in the properties they could effect very large economies by reducing the amount of labor, fuel and materials used. Until, however, they are allowed to earn enough net return to enable them to raise the new capital for these improvements, the large economies that could be effected through these improvements must remain in abeyance.

In the hearings on the railroad situation soon to be held before a Senate committee in Washington the subject of railroad management will be fully investigated, but we have felt that since charges of mismanagement having no relation to any matter pending before your honorable Board continue to be made day after day in statements before your Board, we could not, in justice to the properties we represent, refrain any longer from calling attention to the irrelevancy, inconsistency and baselessness of these charges and the purposes for which they obviously are being made.

### J. G. Walber Analyzes Lauck Exhibits

Mr. Walber's analysis dealt largely with the alleged "economies" which Mr. Lauck has maintained should be placed in effect before reductions are made in the payroll.

With respect to alleged possible economies amounting to \$2,026,355,000, through the use of various mechanical appliances and in general the revamping of all facilities and equipment, Mr. Walber said:

Notwithstanding the railroads have been using such devices, treated ties, etc., upon which so much stress is laid, the operating results and the ratio of operating expenses to gross earnings do not reflect economies capable of being measured to any extent as claimed, nor does the experience of the railroads justify estimates of economies of the magnitude represented.

Since these total economies (\$2,026,355,000 as stated by Mr. Lauck) amount to more than one-third of the total operating expenses, it is reasonable to assume that economies would be effected in expenses for labor and material in the same proportion that these items of operating expenses now bear to the total operating expenses. At the present time expenses for labor approximate 60 per cent of the total operating expenses. It is, therefore, reasonable to assume that 60 per cent of the savings claimed would have to be savings in labor, which would mean the reduction of 668,000 employees based on the number in service in 1920.

Referring to one of Mr. Lauck's statements headed "Immediate Savings" amounting to \$272,500,000 covering economy devices for locomotives, he stated:

Granting that expenditures for such devices were justified, it must be manifest that it would be wholly impracticable within any brief period of time which would justify the statement that they would be "immediately available" and the management of any railroad that followed this suggested practice could not survive the test of the Transportation Act as to honest, efficient and economical operation.

With reference to an alleged saving of \$50,000,000 a year through freight handling at terminals, Mr. Walber said:

This allegation is purely hypothetical and based on someone's estimate of a total possible saving of \$350,000,000 at all points in the United States on railroads and steamships. The railroads have been alive to this for years and are constantly studying the situation, adopting, where found practicable and economical, such mechanical devices and other means as will reduce the cost of operation.

Referring to alleged savings on shop cost accounting, he said:

There is nothing in this statement which indicates that such a saving is possible; it is merely an assertion that if 1 per cent can be saved it will amount to so much money. The roads have pointed out that while time studies are a prime essential in any proper system of shop accounting, nevertheless during Federal control the railroads were met with threatened strikes or actual strikes because they used such methods after piece work had been abolished and were then instructed by the United States Railroad Administration to discontinue such accounting methods.

With respect to other accounting economies alleged to justify a saving of \$50,000,000, Mr. Walber said:

A casual consideration of the factors entering into this cost will demonstrate how little reliance can be placed thereon, and in addition we merely call attention to the fact that as one saving

they point out the desirability of introducing systems which require largely increased accounting and statistics and in another exhibit show how accounting and statistics should be curtailed.

Referring to the roads' alleged failure to utilize modern labor saving devices for office work, Mr. Walber said:

In this instance, as in practically all the other allegations, they are purely visionary and evidently prepared without any knowledge whatever of the actual conditions.

It is also noted that an alleged saving of \$40,000,000 per year would be accomplished by the elimination of labor turnovers. This estimate is the personal estimate of an individual and, from the way it is used, it is assumed that turnovers can be eliminated. The fallacy of such an assumption is apparent.

In connection with the alleged possible annual saving of \$100,000,000 for tie renewals, Mr. Walber stated in part:

It is estimated that to install a plant capable of treating 1,000,000 ties per annum would require approximately \$500,000. Any railroad which would undertake this installation would have to provide this capital and assume the interest, depreciation, maintenance of the plant and cost of treating ties over a period corresponding with the life of the untreated ties before any benefits would accrue. Again, it should be understood in treating ties it is only done to protect them against decay, and for this reason only certain kinds of wood are treated.

In reply to charges of financial mismanagement of the railroads, Mr. Senneff said in part:

Railroad capitalization has no effect whatever on railroad wages or rates. If any of the transactions to which reference is made have proved unjustifiable in the past they have received public condemnation and the bad results have been borne by the investors and not by the employees or the public using the railroads. Wages have been determined and will hereafter be determined irrespective of any railroad's capitalization.

Therefore, as neither railroad valuation rates nor wages have been gaged by stock or bond issue of any single railroad company nor of all the railroads, as no individual company is assured any return upon the value of its property as found by the Commission, the attempt to introduce these irrelevant matters growing out of transactions in the past years conduces only to confusion and beclouds the whole issue respecting just and reasonable wages.

It was also pointed out that the right of the railroads to apply surplus earnings to betterments and subsequently capitalize them is a method of financing that has been universally approved in this country and has been largely responsible for the efficient transportation system that the country enjoys; that it has stood the test of Public Service Commission, the Interstate Commerce Commission and the Supreme Court of the United States; that there is no possible danger in the future of overcapitalizing in this method of financing; and that the valuation work undertaken by the Interstate Commerce Commission even now proves conclusively that the value of the assets of the road far exceeds capitalization.

The respondents criticized many of the railroads because they have sold their stock for par value instead of market value. Again we insist that this specious argument really has no place in this hearing. Sufficient to say, however, that the principle of attempting to issue new stock in any amount at existing market is unsound. The effect of a new issue on the market is generally an immediate depreciation in price and the governments of the world and municipalities cannot escape this law of supply and demand. What has been said respecting the sale of stock applies generally to the sale of bonds. Bonds are sold to best advantage after careful consideration of all factors after ascertaining what the public is willing to pay.

A great deal is said in respondents' exhibits about interlocking directorates of the railroads and corporations with which they have business transactions. Respondents are attempting to create the impression that because of these interlocking directorates some great wrong is being done to the public and to the railroads themselves, which claim cannot be supported.

In fact, it has not been shown that such transactions have resulted in any injury to the public or to the railroads. However that may be, the contention is completely answered by the fact that such transactions are now governed by the provisions of the so-called Clayton Act, so that once paraphrasing Mr. Lauck, this is "water over the dam," and may be dismissed at this time without any further discussion as wholly irrelevant and immaterial in so far as this hearing is concerned.

## F. W. Sargent Continues

## Bombardment of Lauck Exhibits

Mr. Sargent followed with another broadside at Mr. Lauck's case, stating at the outset:

We have accepted it as fundamental for the purpose of this case that Decision No. 2 fixed just and reasonable rates of pay. That Congress directed this Board to adjust wages when disputes arose from time to time, having in mind, first, wages in other industries, and, second, cost of living, and thereafter the other five elements named in Section 307.

Mr. Lauck asks the Board to abandon the specific directions given to it by Congress in Section 307 of the Transportation Act. He in effect asks the Board to first create an artificial condition by the establishment of some standard of living which may meet the Board's conception of what the standard for every class ought to be, and, second, compel the transportation industry to pay wages that will support such a standard regardless of the productivity of the employee and regardless of the ability of the industry to maintain the standard thus set up. Realizing that the scale of wages is now so high that common carriers cannot continue to meet it, Mr. Lauck then proceeds to justify his theory upon two general propositions. First, he says that the railway employees did not receive all they were entitled to during Federal control and that, therefore, the corporations should now be compelled to continue the present scale in order to reimburse railway employees for their failure to receive their advances. In the second place, he claims that the railway companies prior to Federal control had been guilty of financial mismanagement, that they had in a large measure, through such mismanagement, destroyed their credit, had failed to make proper and essential improvements which would produce enormous economies, and on this account have placed themselves in a position where they are unable to continue the present scale of wages and at the same time take care of their other operating expenses, taxes and fixed charges. That in view of this prior financial mismanagement the roads should not now ask the employees to bear any portion of the present depressed conditions, but should continue to pay wages which the traffic will not bear and which are bound to result in bankruptcy for most of the properties.

If this Board is to set up a standard of living for railway employees and fix wages to support such a standard, regardless of the effect upon the ability of the employer to meet the same, then it will of necessity impose a greater burden upon all other classes of industry and all other classes of labor than is warranted or contemplated by any theory thus far announced in the Transportation Act. When you suddenly call upon the transportation systems of the country to pay a level of wages that traffic will not bear, then you ask all other industries responsible for the payment of freight and passenger rates to support a transportation expense that of necessity forces a reduction of wages in other industries or a suspension of business, with the consequent loss of employment for employees in other industries.

It is not an answer to say that the income of railway companies may be fixed by law through the establishment of rates, for there is no law that will support the payment of rates higher than the traffic will bear, and if the present scale of wages is to be continued then it can be readily seen by the most casual observer that one of two things must happen. Either the volume of traffic must increase even beyond that of any business ever heretofore conducted by the carriers in the country or there must be still a further increase in freight and passenger rates.

If this Board is to set up a standard which meets its own judgment as to the so-called living wage for the family of five, as urged by Mr. Lauck, and if this is to be the basis of wage adjustments rather than the items mentioned in the Act of Congress, it follows, as a matter of course, that the Board should fix a different standard for different sizes of families and for individuals. The statisticians have taken the family of five because it is said to be the average family, but the average family has more than one producer. We are, therefore, asked to pay a wage to the breadwinner in the family or ten or to the unmarried man or woman with no family, based upon the so-called living wage for the family of five. The very statement of the proposition illustrates how impracticable it is to apply the theory. You fix, for instance, the so-called living wage for the family of five as the basis to guide your deliberations, and that compensation would be wholly unnecessary for thousands of employees in the railway service, such as young clerks, unmarried men and women, including the large number of employees in extra gangs for section labor, etc.

I am not prepared to admit that, in view of the changed conditions, the wages we are contending for would not afford living wages to the various employees falling within the respective classes under consideration. I maintain that if the decision of this Board was just at the time it became effective, May 1, 1920, then it follows that a reduction in the various scales of compensation

must be granted at this time in view of the overwhelming evidence regarding changed conditions with reference to the scale of wages in outside industries and with reference to the cost of living.

The railway companies are dependent upon competitive industrial and economic conditions for the successful operation of their properties. They may not make up deficiencies and pay the obligations of the federal government through the processes of taxation, as the government was and is prepared to do from time to time. We cannot draw upon the public treasury to make good the shortages in operation costs. It is quite impossible for me to conceive upon what theory it is now claimed that wages should be maintained at an abnormal level by railway companies and on a basis which traffic will not bear for the purpose of paying an obligation which it is claimed the government owed to its employees and which the government would have to meet, if at all, through the process of taxation.

The logic of Mr. Lauck leads to the absurdity of saying that we must now pay wages which the traffic will not bear and thus continue to impair railroad credit in an effort to re-establish railroad credit for the purpose of making the alleged deferred improvements which will enable other operating economies that will in turn make it possible to pay his scale of compensation.

Mr. Sargent then analyzed the various "economies" suggested by Mr. Lauck and concluded his remarks on this subject by saying:

All these estimates are based upon theories mostly by experts who have never had upon their shoulders the responsibility of the payroll and the financing of great industrial undertakings. Mr. Lauck is dealing in theories characteristic of one who indulges only in statistics and is not charged with the responsibility of management which must secure practical results.

Later, in taking up the charges of financial mismanagement, Mr. Sargent showed that in so far as the Northwestern was concerned, Mr. Lauck's charges were not based on facts and were wholly misleading and unsound.

Mr. Walber followed with another attack upon the "living wage" theory capitalizing the impracticability of applying such a theory to the transportation industry.

## Employees Complete Testimony

## Against Wage Reductions

The Board's sessions on May 4 and 5 and half of the session on May 6 were given to representatives of the employees for the completion of their testimony. On May 4, Mr. Lauck continued the presentation of his exhibits, filing many volumes of opinions and statistics in an attempt to prove his contention that the establishment of a "living wage" was the problem before the Board, that neither the cost of living nor the wages paid in outside industry have declined and that the present depression is temporary. In addition he attacked the data presented in this case by the railroads as inaccurate and misleading.

G. W. Easty, vice-grand president of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees, and E. F. Grable, grand vice-president of the United Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers, also presented short statements on behalf of their organizations.

On May 5, B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, speaking on behalf of the Federated Shop Crafts, reiterated with some embellishments the contents of Mr. Lauck's 51 exhibits. L. E. Sheppard, speaking on behalf of the train service employees, urged the Board to ignore the necessity of the railroads for immediate relief and make its award only after careful deliberation. W. S. Stone, head of the Brotherhood of Locomotive Engineers, spoke on behalf of a "living wage" based on American standards and not on the standard of living maintained by the Mexican or other foreign laborers on American railroads. The cost of living should not be a factor in the determination of wage scales, he contended.

W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, and Captain J. J. Scully, on behalf of the Master Mates and Pilots of America, also testified.

On May 6, W. G. Lee, president of the Brotherhood of

Railroad Trainmen, Mr. Sheppard, S. E. Heberling, president of the Switchmen's Union of North America, and Mr. Carter testified against wage reductions for the members of their organizations, using arguments similar to those already outlined. Mr. Carter spoke at length against the alleged "open shop" movement and painted a dismal picture if such a movement were to be successful. He also attacked the accuracy of the statistics compiled by the United States Department of Labor, stating that because of lack of funds the department is unable to compile complete and accurate data.

#### American Short Line Hearing

Bird M. Robinson, president of the American Short Line Railroad Association, appeared before the Board on May 10 in behalf of certain short line railroads cited to appear before the Board in dockets 331 and 332 and styled the calling before the Board of the short lines listed in the above dockets as unusual and in his opinion so far outside of the authority conferred upon the Labor Board by the Transportation Act of 1920, that he felt it not only due the short line railroads represented by the association of which he was president but likewise a duty he owed the Board to present his personal views in regard to the case. He stated that the scope of his presentation would be to call attention of the Board to the questionable right of consideration of complaints that are without any justification in fact, or in any event, without such foundation in fact as gives the Board the right to hear and decide them.

In this connection he called attention to the notices sent to carriers located in varied and distant sections of the country to appear before the Board which do not advise or inform such carriers as to what particular organization of employees is making complaint or what particular craft or class of employees are members of organizations in whose behalf application is filed. Moreover, he went on to say, they do not show what person or officer filed the application in the several cases or any other fact which would enable the carrier to come prepared to answer the complaint, that there seems to be no rule of the Board which required such *prima facie* showing of fact as will give protection to the carrier against such proceedings.

In rounding out the position of the Association, he said that the Association had objected and still objected to the joinder of separate and independent carriers in the hearing and decision of complaints. Continuing, he said, that beginning with the eighteenth of October, 1920, the Association appeared in hearing in docket No. 26 and then and there showed to the Board that the requirements of Section 301 of the Transportation Act, 1920, had been disregarded in every case and that the Association therefore contended and still contends that in the case of each and every carrier represented by it, there was not such a dispute as could be submitted to the Board for hearing and decision. That in that presentation, he said what he now repeated, that the alleged disputes were not genuine but were in truth and fact part of the plan of the leaders of organized labor to nationalize all labor engaged in transportation service in the United States and place the employees in direct control of general officers, thus compelling the carriers to deal directly with them rather than with the employees engaged in their service.

"The law," Mr. Robinson said, "clearly contemplates that carriers shall not only have the right to deal directly with their employees, but this right is a mandate of Section 301 and it was never intended that the Board should become a National Board of Adjustment such as the leaders of organized labor seem to think it should be.

Mr. Robinson stated that the Association expected to show to the Board that in substantially all of the cases involved in docket No. 331 and 332 wherein the Association appeared for the individual carriers, there is in fact no foundation for the applications which were filed and the action of the Board cannot possibly serve any good purpose, whereas it naturally

has the effect of bringing about discontent and in some cases dispute which would not otherwise have occurred.

In concluding his statement, Mr. Robinson said: "From my place as president of the American Short Line Association, I have opportunity to know and do know the opinions of the managements of these numerous small properties. The opinion I get, without exception, is that the management would have no trouble in effecting a proper adjustment with their employees if it were not for the interference of officials or labor organizations. The interpretation which this Board seems to give to the Transportation Act is such that every carrier will be compelled to have a closed shop or else refuse in any case to employ any person who happens to be a member of a labor organization. It is obvious that Congress did not intend to bring about such a situation. The labor provisions of the Transportation Act, both in letter and in spirit, are intended as a method of conciliation and settlement as between the parties directly interested. It did not intend to create a labor autocracy such as will be, if the carrier is denied the right to initiate its own scale of wages without agreement of some employee or employees who may be members of labor organizations."

On May 11 B. M. Jewell filed exhibits with the Board, closing the wage hearings which began January 10. The American Short Line hearing was continued on May 11 when E. P. Curtis, vice-president of the Order of Railway Conductors, appeared in rebuttal to Bird M. Robinson's presentation. The hearing on the Greer letter was postponed until May 12.

#### Freight Car Loading Increases

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight continued to increase during the week ended April 30, according to the weekly report of the Car Service Division of the American Railway Association. The total was 721,997, as compared with 800,960 for the corresponding week of 1920 and 752,362 for the corresponding week of 1919. This is a gain of 17,000 in a week. Increases were shown in the loading as compared with the previous week in all classes of commodities, also increases as compared with the corresponding week of the year before in grain and grain products and merchandise and miscellaneous freight.

The freight car surplus also showed a further reduction during the week of April 30, to 482,352. The number of surplus coal cars shows a reduction of 6,000, to 229,443 but the surplus box cars shows a slight increase, to 178,037.

## Consolidation Locomotives for the Western Maryland

Weight and Tractive Effort Establish New Records for This  
Type Tender of 15,000 Gallons Capacity

THE DESIGN OF LOCOMOTIVES adapted to special operating conditions has led to the development of some notable examples of the standard types of freight and passenger power. A striking illustration of the high tractive effort that can be secured with a restricted wheel-base is found in the Consolidation locomotives recently built for the Western Maryland by the Baldwin Locomotive Works. These engines have a rated tractive effort of 68,200 lb., the weight on drivers being 268,200 lb. or 67,050 lb. per pair of drivers. In these particulars they exceed any engines of either the Consolidation or Mikado types heretofore constructed by the builder.

During the past ten years the Consolidation has been largely displaced by the Mikado and in view of the selection of the former type by the Western Maryland, a brief discussion of the advantages and disadvantages of each may be of interest.

The Consolidation type locomotive was introduced in this country in 1866, the first engine of this type having cylinders of 20 in. diameter and 24 in. stroke, and a total weight of 90,000 lb. The Consolidation wheel arrangement is well adapted for general freight service and following its introduction was widely adopted, being for many years the prevailing type of freight power. About twelve years ago the Mikado began to displace the Consolidation and comparatively few of the latter type have been built for heavy freight service in recent years.

The principal advantage of the Mikado lies in the fact that the longer wheel-base, with a trailing truck, permits the use of a longer boiler barrel and a deeper firebox, thus improving the capacity and efficiency of the boiler. The Consolidation, however, can be designed to give equally high tractive effort at low speeds where the boiler capacity is not the limiting factor. The absence of the trailing truck eliminates certain maintenance costs and the non-symmetrical wheel-base is easier on the track.

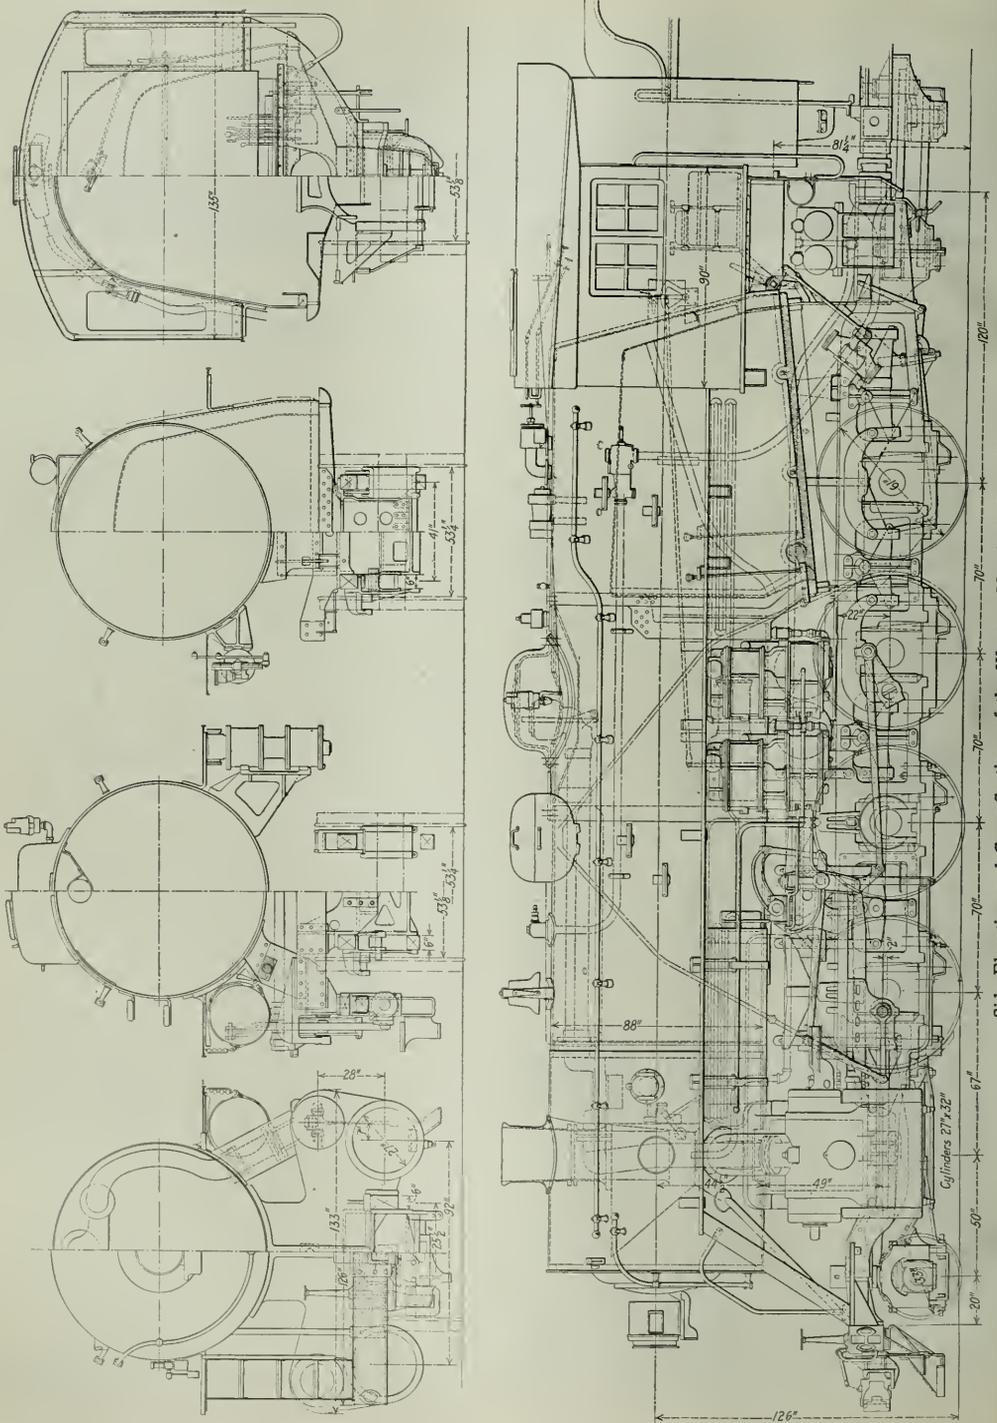

The improved utilization of fuel and higher speed capacity have generally been considered to outweigh the disadvantages of the Mikado. However, Consolidations are still used to a considerable extent for heavy drag service where slow speeds will suffice. With driving wheels of the size that are suitable for work of this kind, it is possible in a Consolidation engine to obtain a reasonably good boiler design. The firebox throat can be made of sufficient depth to install a brick arch without raising the boiler to an excessive height. Such a locomotive, with a high percentage of total weight on driving wheels, is well fitted for heavy, slow speed service.

The Consolidation engines which the Baldwin Locomotive Works are now building for the Western Maryland are a remarkable example of locomotives for such work. These engines are designed to operate on 90 lb. rails, to traverse curves of 22 deg. and grades of  $3\frac{1}{2}$  per cent. The total weight is 294,900 lb. The ratio of adhesion is 3.93, indicating that the weight on drivers is utilized for tractive purposes to the fullest possible extent. As compared with a design of heavy Consolidation built for the Western Maryland in 1910 and using saturated steam, these new locomotives show an increase in total weight of 31 per cent, and in tractive effort of 40 per cent.

The boiler is of the straight top type with horizontal roof sheet and sloping throat and back head. The diameter of the first course of the barrel is 88 in. The throat has a depth of 19  $\frac{13}{16}$  in., measured from the under side of the barrel to the bottom of the mud ring. The firebox is supported at the front and back on vertical plates. The front end of the crown is supported on three rows of expansion stays, and about 550 flexible staybolts are applied in the breaking zones in the sides, throat and back. The distance between the two sheets is 15 ft. 3 in. Fifty superheater tubes of  $5\frac{1}{2}$  in. diameter and 240 water tubes of  $2\frac{1}{4}$  in. diameter are used. The ratio of length to internal diameter in the water tubes is 91.5, this low value indicating that the capacity of the boiler has been made high at some sacrifice of fuel economy. The safety valves are placed just forward of the firebox and, as the clearance is limited, they are tapped directly into the boiler shell instead of being mounted on an auxiliary dome.

The firebox equipment includes a brick arch, power operated fire door and grate shakers and a Standard stoker. The drop plates are at the back of the grate. The ash pan has two hoppers with swing bottoms, both of which are controlled by one handle. Flushing pipes are applied for washing ashes from the slopes of the pan.

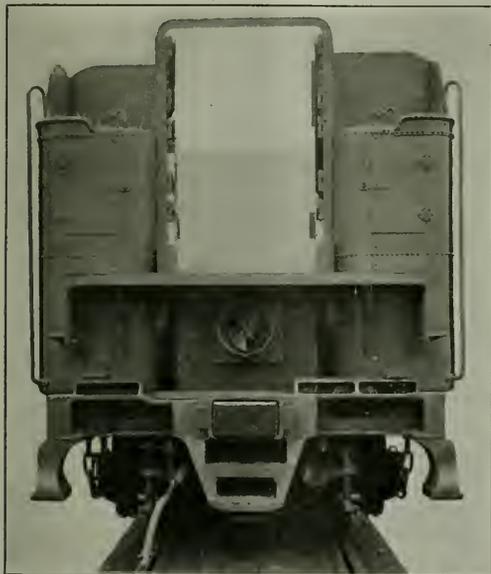

The frames are 6 in. wide, spaced 41 in. between centers, each frame being cast in one piece with a single front rail to which the cylinders are bolted. The transverse bracing calls for special attention. A most substantial steel casting, placed just back of the cylinders, extends the full length of the leading driving pedestals and serves as a fulcrum for the driving brake shaft. The guide yoke crossie is also of cast steel and it is extended back sufficiently far to brace the second driving pedestals. This crossie also serves as a support for the driving brake cylinders, one of which, because of lack of room, is placed in a horizontal, and the other in a vertical position. The two brake shaft arms are placed

Side Elevation and Cross-Sections of the Western Maryland Consolidation

at right angles to each other, the horizontal cylinder being connected to the vertical arm by means of pull rods, while the vertical cylinder is directly connected to the horizontal arm. The frame braces further include a steel casting at the main driving pedestals and a casting, placed between the main and rear pedestals, which is bolted to both the top and bottom frame rails and serves as a support for the forward end of the firebox.

The cylinders are fitted with gun iron bushings, and the steam distribution is controlled by 14 in. piston valves. Walschaert valve motion is used and the gears are controlled by the Pittsburgh power reverse mechanism. The equipment

Front View of the High-Capacity Tender

includes automatically operated drifting valves designed by the railway company. The links are carried on longitudinal supports of cast steel, which are bolted in front to the guide bearers, and at the rear to a cross-tie placed between the second and third pairs of drivers. The reverse shaft is located immediately in front of the links and the lifting arms extend in a backward direction, each radius rod being suspended at its rear end. The valve motion is so designed that the link blocks are down when running ahead. Other machinery details include cast steel piston heads of dished section with cast iron bull rings and packing rings. The guides and crossheads are of the Laird type. The main rod stubs are of the open end type which permits renewing the brasses without removing the eccentric cranks.

The driving boxes are of cast steel and are fitted with bronze hub faces and brass lined pedestal faces. Cast iron shoes and wedges are used, the latter being of the self-adjusting type. The driving axles and engine truck axle are of heat treated steel, and flanged tires are used on all the wheels. Flange oilers are applied to the front and back drivers.

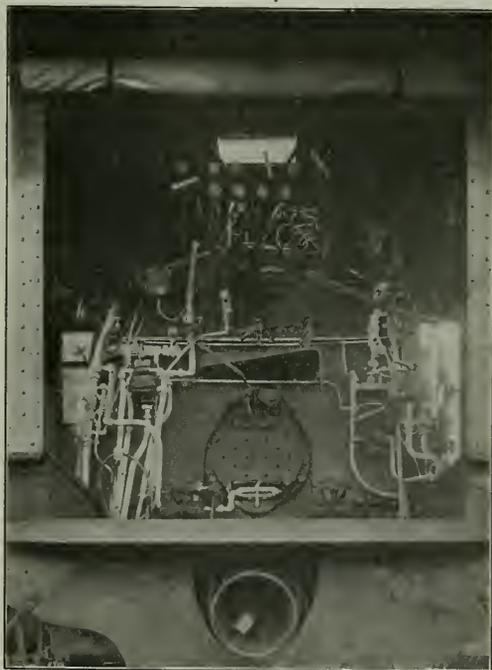

The truck is of the Economy constant resistance type and is equalized with the first and second pairs of driving wheels. Dolphin beams are placed over the boxes on the third and fourth pairs of drivers and are connected on each side of the locomotive with three inverted leaf springs which are

placed below the upper frame rail. Limited clearance space under the firebox did not permit placing the springs over the boxes of the two rear pairs of wheels.

The cab is unusually roomy and comfortable with all fittings placed within convenient reach of the crew. The injectors and steam turret are placed outside the cab and have extension handles identified by small aluminum plates with raised letters. The equipment includes a breather pipe for providing fresh air while passing through tunnels. This arrangement consists of a  $\frac{1}{2}$  in. pipe placed across the boiler back head and having five  $\frac{1}{4}$  in. globe valves equally spaced, each fitted with 3 ft. of  $\frac{1}{2}$  in. hose. The air supply is drawn from the brake system.

An interesting detail is the arrangement of the hand rail columns, which are in the form of clamps, so that the hand rail can be readily taken down without removing the columns. The headlight dynamo is placed on the right hand side of the boiler, ahead of the cab, and the wiring is run through the hand rail. The pilots are adjustable as to height above the rail and are of short design so that two locomotives can be coupled pilot to pilot without interference.

The tenders of these locomotives are of special interest,

Breather Pipes for Use in Tunnels Are a Novel Feature of the Cab Equipment

having the unusual capacity of 15,000 gal. of water and 16 tons of coal. The tanks are comparatively long and low in order to keep the center of gravity as low as possible. The extreme length of the tank is 36 ft. 6 in. and the width 10 ft.  $5\frac{1}{2}$  in., while the depth is 6 ft. 6 in. with a collar 32 in. high on each side of the fuel space. The sides and rear of the fuel space are sloped so that the coal will gravitate into the stoker trough even when only a small amount is on the tender. The stoker trough is constructed so that it may be removed as a complete unit even when the tender has a full load of coal. An unusually complete arrangement of

transverse and longitudinal dash plates is applied to prevent the water from surging.

The frames are of one piece cast steel construction made by the Commonwealth Steel Company. The total length is 38 ft. 8 in. and the width over outside sills is 8 ft. 11¼ in. The distance between truck centers is 22 ft. 11¾ in.

The trucks are of the six wheel type, manufactured by the Commonwealth Steel Company. The truck frames are constructed with longitudinal and transverse members of steel, cast in one piece. The pedestals are bolted to the frames and the wheel loads are equalized on each side. Swing bolsters are used and are hung on three-point suspension links. The brakes are of the clamp type. It is found in practice that these tenders take curves smoothly and are very easy riding.

The locomotives have a height of 15 ft. 10 in., a width over cab boards of 11 ft. 4 in., and a total length of engine and tender, measured from face to face of beams, of 80 ft. 4¾ in. Their leading dimensions, in comparison with those of a number of heavy Consolidation type locomotives built during the past few years by the Baldwin Locomotive Works, are given in the accompanying table.

## Director General Estimates Loss from Railroad Operation

WASHINGTON, D. C.

AT THE REQUEST of the chairman of the Committee on Appropriations of the House of Representatives the director general of railroads, James C. Davis, has submitted a statement showing the progress made in the adjustment of disputes between the Railroad Administration and the carriers arising out of or incident to federal control. This report shows there were 555 separate properties taken over by the government, with which adjustments must be made. In addition to these properties, there are 355 short line railroads, each making claim for adjustment covering the first six months of federal control, from January 1 to June 30, 1918, on which latter date these lines were formally relinquished.

Up to this time 149 companies have filed their claims on final settlement with the Railroad Administration. This represents about 33.5 per cent in number and about 58.5 per cent in mileage of the entire number of properties, excluding the short lines. The aggregate amount of claims filed to date is \$633,708,281, and, if the remaining claims are filed on the same general lines as the claims already filed, the director general estimates that the total amount of claims will aggregate about \$1,250,000.

Up to May 1, 1921, 47 roads had been settled with. The aggregate amount claimed by the 47 roads was \$124,040,867. These claims have been settled on the basis of about 40 per cent of the face of the claims.

In the aggregate claims filed, amounting to \$633,708,281, \$359,000,000 represents claims for undermaintenance, \$183,000,000 for undermaintenance of way and \$175,000,000 for undermaintenance of equipment. It is estimated that, when the carriers have all filed their claims, the undermaintenance claimed will aggregate between \$700,000,000 and \$800,000,000. In the settlements already made but a small percentage of undermaintenance claims have been recognized, the report says.

Marked differences have arisen between the administration and the carriers as to the liability of the administration for undermaintenance. Up to this date the companies which have settled have adopted the theory of the administration. The aggregate of these differences is very large, amounting to several hundred million dollars, and it may be necessary to obtain the opinion of the Supreme Court of the United States before final adjustment is made with some of the companies.

Director General Hines estimated that the loss to the government in operation during the period of federal control would be \$900,478,756.56. Because of claims which have arisen that were not considered by Mr. Hines and the underestimate made in the allowance for maintenance, fire losses, additions and betterments made solely for war purposes, and other accounts, it is the estimate of the present director general that the operating loss to the administration will be about \$1,200,000,000, or \$300,000,000 in excess of the estimate made by former Director General Hines.

"It must be borne in mind," the report says, "that this estimate is based on making settlement upon the administration's construction of the upkeep section of the standard contract. Should the Supreme Court ultimately approve the carriers' contention in regard to maintenance, as set out in said upkeep section, the liability of the Railroad Administration would be very largely increased." The report adds that the Railroad Administration records fail to support claims for overmaintenance sufficient in amount to offset the amounts claimed, and that "it is quite evident that some allowance must be made on account of undermaintenance." The differences of construction of the act between the carriers and the administration, it is said, will amount to several hundred million dollars.

The report also gives a short summary of the nature and character of claims of third persons against the Railroad Administration apart from the claims of the carriers. There are now pending before the Interstate Commerce Commission over two thousand formal complaints for reparation against the director general on account of rates put into effect during federal control. These complaints involve unknown amounts but in some cases a tremendous tonnage movement is involved. In addition to calling on the individual carriers to defend these claims the administration has provided a special department for this purpose in the division of Law. A large number of claims for personal injury, loss and damage, overcharge, labor, fire losses, and taxes were also left over as a result of federal operation and these claims are liabilities of the director general. As a result of a ruling of the supreme court of Minnesota some five thousand cases have been instituted against the Railroad Administration for damages resulting from a devastating fire in the forest regions of Minnesota in October, 1918, which caused a money loss of from \$25,000,000 to \$40,000,000. So far quite a number of judgments have been rendered against the Railroad Administration in lower courts on account of these claims on the ground that railroads started some of the fires.

It also appears that the Railroad Administration has assets aggregating \$430,930,138.08, composed of negotiable obligations of the various carriers. These consist of equipment trust obligations and notes and bonds taken by the Railroad Administration during the period of federal control.

Also the Railroad Administration has to its credit in available cash \$228,977,311. It is suggested that if, instead of making a direct appropriation for the use of the Railroad Administration, the Secretary of the Treasury could be authorized, upon a proper showing of necessity, to take over at their face value, from time to time, such amounts of the obligations of the railroads held by the Railroad Administration as may be required to complete the liquidation, the liabilities of the Railroad Administration could be adjusted without a direct appropriation in its favor. As subsequent settlements are made additional obligations of debtor roads will be taken and held by the Railroad Administration, such indebtedness being for purposes provided for and in accordance with the transportation act. If the Railroad Administration could cash a sufficient amount of these securities, it has in all probability assets considerably more than sufficient to pay all of its obligations. If an arrangement of this kind is not feasible, an additional appropriation of \$200,000,000

will be required to continue the Railroad Administration liquidation up to the end of the fiscal year 1922.

The controlling reason why more settlements have not been made is stated to have been the delay of the carriers in filing their final claims. Practically no such claims were filed during the calendar year 1920.

In concluding the report, the director general gives the following summary of the situation:

"I have no desire to exaggerate the importance or the complexities of making this final adjustment of the 26 months of federal control and operation of the transportation systems of the country. It is undoubtedly the greatest adjustment between one tenant and over five hundred landlords that has ever occurred. A brief repetition of familiar figures emphasizes this.

"The railroads constituted an immense industrial plant, comprising in round numbers 250,000 miles of main line, with all of the innumerable structures which go to make up and operate railroads—shops, yards, roundhouses, machine shops, store houses, bridges and the like; 2,500,000 freight cars, in all stages of repair; 66,000 locomotives; 55,000 passenger cars; some \$600,000,000 of materials and supplies scattered over the many lines of road, with no inventory taken at the time; 555 separate companies, with nearly 2,000,000 employees; the gross earnings of the properties for the year ending December 31, 1917, over \$4,000,000,000, with net earnings for the same period of nearly \$1,000,000,000, and the entire value of the property estimated at from \$15,000,000,000 to \$20,000,000,000. This property was operated under the abnormal conditions of a world war. The demand for labor and materials in all industrial enterprises was greatly in excess of the supply. In the effort to combine this stupendous aggregate of independent lines into a single and co-ordinating concern much of the operating property of the individual carriers was inextricably intermingled. The adjustment and straightening out of this wonderful adventure on the part of the government presents for solution novel, complex, and important questions wholly without precedent.

"The government took this great plant over night. It was taken at a time when serious and almost unprecedented winter weather greatly embarrassed and increased the expense of operation, and at a time when congestion of traffic, largely brought about by unusual exigencies in the business incident to the war, and priority orders of war material intended for export, had in effect practically broken down the ordinary efficiency of railroad transportation, especially those eastern lines connecting with Atlantic ports.

"The property was in all stages of obsolescence. It was taken under a proclamation issued by the President, who, in a statement of even date with the proclamation, declared that he would recommend to Congress the passage of a law providing 'that the railway properties will be maintained during the period of federal control in substantially as good repair and as complete equipment as when taken over by the government.'

"The Congress, following this recommendation, in the federal control act provided that the standard contract should contain such provisions 'as may be requisite in order that the property of each carrier may be returned to it in substantially as good repair and in substantially as complete equipment as it was in the beginning of federal control.'

"Most of the roads entered into standard contracts, the terms of which attempt to provide rules by which the questions of upkeep shall be determined. It is differences of opinion as to the construction of these rules from which arises most of the controversies between the Railroad Administration and the carriers in carrying out final settlements.

"In conclusion, I want to suggest and emphasize that in reaching final settlements the disputes to be adjusted between the carriers and the Administration are not mere matters of

accounting, to be settled by the application of fixed and definite rules that may be followed by accountants and statisticians, but every settlement presents serious practical questions, many of them new and novel, that can only be fairly determined by men on both sides who have had actual and extensive railroad experience in the field."

## Results of Extended Tests With Titanium Treated Rails

**T**HE TITANIUM ALLOY MANUFACTURING COMPANY, Niagara Falls, N. Y., has just made public the results of an extended series of investigations inaugurated in 1913 to determine the effects of the use of titanium in rail steel. Earlier results of these investigations were published in a series of eight bulletins, the last of which was issued in 1915 while data from the more extended tests since that date are incorporated in Bulletin No. 9 which has just been issued. The later investigations were undertaken to determine (1) the exact structural and physical differences between titanium-treated and untreated rails and the causes for difference in service; (2) a simple practical method for ascertaining the efficiency of the titanium treatment so that improperly treated heats might be identified and separated from those free from excessive segregation; (3) the service which several thousand tons of titanium-treated rails rendered in four to six life years in track as compared with rails rolled under similar conditions but without this treatment.

During 1913 and 1914 samples of A-rails (the top rails of the ingots) from 111 different heats of standard and 101 heats of titanium-treated open-hearth steel, made for various railroads at mills of six different steel companies, were forwarded to the laboratories of the Titanium Alloy Manufacturing Company for analysis. Early in 1915 the Pennsylvania Railroad adopted its 100-lb. P. S. section rail which included a limitation as to segregation. In an earlier report it was stated that the application of this segregation specification to each of the A-rail samples from the 212 heats above referred to indicated that the A-rails from only 37 per cent of the heats of standard open-hearth steel passed the Pennsylvania requirements, whereas these rails from 93 per cent of the titanium-treated heats passed the specification.

While this improvement in the total segregation was very interesting it was thought that there must be some discernible difference between the titanium-treated steels, which showed negative or moderate segregation of carbon in the A-rails and those few which showed excessive segregation. In an effort to determine if any such difference existed, samples of each of the titanium-treated steels were analyzed for titanium by two methods; one in which the total titanium present was determined, while in the other only that part of the titanium insoluble in hydrochloric acid. This latter method, it is believed, gives the amount of titanium remaining in the finished steel in excess of that usefully consumed in deoxidation. When the determinations for insoluble titanium were made on these titanium-treated samples numerous samples of untreated steels were also analyzed in the same way and in no case was over .002 per cent of insoluble titanium found in any untreated steel; whereas in the titanium-treated steels the amount of insoluble titanium varied from as low as .002 per cent to .03 per cent, while the average content of insoluble titanium in the treated steels was approximately .01 per cent or 10 per cent of the total titanium (0.10 per cent) added to the ladle in the form of ferro carbon-titanium.

Further experiments were conducted to substantiate the recommendation of the manufacturer that where recarburizer in the form of liquid spiegel was added it should be done in the furnace before tapping and the titanium added alone in the ladle, since where a large amount of liquid spiegel, with

its accompanying acid slag, is poured into a ladle of steel, the metal is so agitated and the slag so intimately mixed with it that an immediate addition of titanium is apt to be lost by expending itself in deoxidizing the slag. As a result no benefits are derived from the use of titanium, such as are normally obtained when the spiegel is added in the furnace and its reactions completed before tapping, or when no spiegel is used but only comparatively small and much cleaner additions of ferromanganese and ferrosilicon precede the ferro carbon-titanium in the ladle.

The determination, in steel, of titanium insoluble in hydrochloric acid is a very simple method and can be made very quickly and accurately. This determination will ordinarily make further analytical work unnecessary because so high a percentage of titanium-treated rail steel will meet the required specification for segregation.

It has been suggested that, in order to conform to regular mill practice, all rails that pass the usual physical requirements be accepted by the purchaser. Samples for titanium determination could be taken by inspectors for the purchaser and sent to its laboratories or those of any agency it might employ. Results of the analytical work would be available before deliveries of rail were made and the A-rails from any heats that showed more than the allowable segregation could be placed where track service was not severe. Arrangements might be made with the rail mills that such rails would be classed as seconds or specials.

It is claimed by the manufacturers that the adoption of this simplified method should (1) eliminate the majority of rail failures; (2) assure the purchasers of rails of the more uniform steel throughout all the ingots of a heat; (3) provide a larger yield of acceptable rails by eliminating serious segregation in the upper portion of the ingot and (4) offer the possibility of raising the carbon content of the steel slightly as the segregation can be controlled effectively by this method. This would result in better wearing steel.

In substantiation of its claim that these results have been obtained in practice attention is called to the comparative test of 14,310 tons of standard 90-lb. A.R.A. type A open-hearth rails rolled at four different mills and 6,000 tons of titanium-treated open-hearth rails of the same weight and section laid in tracks of the Chicago & Alton in 1913. These tonnages were laid so that the service for all rails was approximately the same. In this investigation of nearly eight years the total failures of standard open-hearth rails has been 116 and of titanium-treated rails 16, or 114.56 and 37.72 per 100 track miles respectively.

Similarly, analyses of the rail failure statistics of the American Railway Engineering Association for 1918 show average failures per year in service per 100 miles of track to be 13.7 for standard open-hearth rails as compared with 6.8 for titanium-treated open-hearth rails, while similar figures contained in the report for 1919 show 14.6 and 4.9 failures respectively.

Attention is also called to a report of the A.R.E.A. Rail Committee in May, 1917, which included inspection results on approximately 195,000 tons of 100-lb. P. S. section open-hearth rails made for the Pennsylvania railroad under its 1915 special segregation specification in which the average discard from the top of the ingot was 26.2 per cent and the average rejections 9.0 per cent, giving a total average discard and rejection of 35.2 per cent. In comparison, inspection records on the manufacture of 13,000 tons of titanium-treated open-hearth rails rolled in 1913, 1914 and 1919, showed an average discard from the top of the ingot of 9.0 per cent and a rejection of 3.8 per cent. Applying the Pennsylvania segregation specification to this tonnage, the total discard and rejection would have been 15.67 per cent, or less than one-half that which actually occurred with the Pennsylvania railroad rails.

# Prosperity Dependent Upon Revived Foreign Trade

## Decline in Exports Cited by Foreign Trade Convention as Cause of Depression—Remedies Proposed

THE NECESSITY of a revival in foreign trade before normal business conditions can be restored in this country was emphasized in the final declaration of the Eighth National Foreign Trade Convention which was held at Cleveland from May 4 to 7. The declaration further asserted that no readjustment to meet the new conditions in business could be complete without "reduction in the costs of railroad transportation both for domestic and export shipment." In opening the convention, J. A. Farrell, president of the United States Steel Corporation and chairman of the National Foreign Trade Council, characterized the difficulties of financing our exports as the chief problem to be solved in the restoration of normal foreign trade. He pointed out that "no nation can long carry on with success an unbalanced foreign trade, whether the disproportion be on the side of imports or exports." He said further that the original cause of the present business depression was "the almost complete stoppage of foreign trade."

The convention this year presented a marked contrast to the one held a year ago at San Francisco. The discussion at that time centered on ways and means to take care of the then enormous volume of our export trade and how to maintain our position in the markets which had been built up. At Cleveland some 1,500 delegates were in attendance. At San Francisco a year ago the attendance was in the neighborhood of 2,300. Last year when the problem involved taking care of the trade already acquired the chief activity of the convention was the discussion of the peculiarities of the various foreign markets and of means whereby our various industries could meet the demands placed on them by heavy foreign orders. This year the discussion was centered on the solution of the financial difficulties which are hindering the sales of American goods abroad.

### Various Subjects Considered

The convention was conducted as usual by general sessions and group sessions. The general sessions were devoted to matters of general policy and the group sessions to the problems of various specialized fields under the general subject. The general sessions were as follows: I The Financial Situation; II The Need for Long Term Credits in Our Foreign Trade; III Foreign Trade Policies; IV The Merchant Marine, and V National Program for Foreign Trade.

The various subjects assigned to group sessions were: I Commercial Education for Foreign Trade; II Foreign Credits; III Problems of the Export Manager; IV The Motion Picture in Foreign Trade; V Special Export Problems of the Manufacturer; VI Foreign Trade Advertising; VII Inter-American Trade Relations; VIII Interest of Agriculture in Foreign Trade; IX Banking Service to Foreign Trade; X The Service of the Export Commission House, and XI Trade Relations with the Far East.

In addition to the regular sessions there were a number of experts in various fields of foreign trade from government departments and elsewhere who acted as "trade advisers" to representatives of the various industries who sought their counsel regarding the problems of their particular businesses.

Contrary to the precedent set last year the foreign trade situation as it affects the railroads received no special attention at either the general or the group sessions.

The chairman of the convention was A. C. Brown, president of the Brown Hoisting Machinery Company and president of the Cleveland Chamber of Commerce. Mr. Brown was elected by a unanimous vote of the convention

following the opening of the first general session by J. A. Farrell, chairman of the National Foreign Trade Council.

### The Financial Situation

The financial situation with relation to our foreign trade was discussed in some of its broader aspects by W. P. G. Harding, governor of the Federal Reserve Board, and F. I. Kent of the Bankers' Trust Company, New York. Governor Harding devoted his address to the means of "thawing our frozen credits." He advocated all possible stimulation of business as the most effective means of liquidating these credits. Governor Harding took an optimistic view of the general business situation and stated that the time had come for "renewed courage and confidence," that there was "no point in forcing liquidation further," that "we have passed the worst of our troubles" and that "the problems ahead of us all are solvable." Governor Harding was followed by Mr. Kent, who urged greater honesty in our business relations and the hearty support of investors in purchasing the securities offered by Edge law corporations as solutions for the serious obstacles with which our foreign trade is faced.

### The Need for Long Term Credits

The present difficulties of lumber exporters in meeting foreign competition due to the adverse exchange situation and to the inability to finance the extension of long term credits were discussed by J. J. Donovan, vice-president of the Bloedel-Donovan Lumber Mills, Bellingham, Wash. The importance of long term credits to the manufacturer of specialties was discussed by F. H. Taylor, president of the S. S. White Dental Manufacturing Company, Philadelphia. The same question was treated from the point of view of the manufacturer by G. R. Meyercord, president of the Illinois Manufacturers' Association, and from that of the exporter of agricultural products by J. H. Barnes of the Barnes-Ames Company, New York.

The lack of interest on the part of investors in subscribing to the stock of the various Edge law corporations, particularly the Foreign Trade Financing Corporation, was said by W. C. Redfield, president of the American Manufacturers' Export Association and formerly secretary of commerce, to be holding up millions of dollars' worth of foreign business which would open up many mills and factories and give employment to thousands. Mr. Redfield said in part:

"I know personally of orders from other countries of over \$20,000,000 available to the United States at the present time which can be closed just as soon as the corporation operates. These orders, I know, are for firms in Chicago, New York, Boston, St. Louis, Philadelphia, Cleveland and several southern cities, and, I am informed, it is true also of Spokane, Seattle and San Francisco.

"It is not a question of whether this corporation ought to be formed and put into operation, but one of whether we shall go up or down in the foreign export trade. We have the ability to compete with foreign competitors, but we have reached the end of our financial power with the tools we have, and unless new tools to enable us to extend long-time credits to our foreign trade are created speedily we have reached the end of our useful activities in export trade. Our British competitors can get credits extended for four, six or eight years. We cannot.

"We have no alternative but to shrink at home unless we go after the export trade. This corporation is not being organized to thaw frozen credits, to relieve the banks or to

be representative of any group or clique or part of America, but for America as a whole."

### Senator Edge's Address

At the annual banquet held on May 7, Senator W. E. Edge addressed the convention on the general subject of American foreign trade. He advocated practical legislation to assist in curing the "economic ills" of the country but warned that "industry cannot be inspired or prosperity be promoted merely by legislation." The establishment of confidence at home and the extension of credit to foreign buyers, he said, were the practical methods of stimulating business in this country. Senator Edge emphasized the importance of the "deplorable situation of the railroads" as a factor in "the prevailing uncertainty" in business. He also characterized our merchant marine as a "monumental failure" and declared that the government would "do well to save 35 per cent of the billions of dollars invested, much of it in absolutely worthless and valueless craft that cannot be even given away." The senator summarized his address, in part, as follows:

"I contend that all these ills—depression in business, depression in production, lack of business for railroads and the merchant marine and consequent unemployment—will be corrected only if we attack the root of the evil; and the only solution to these and other related problems is the securing of a market. The buying power both at home and abroad exists; if abroad, it is aided by an extension of credits we can well afford to extend, and the foreign buyers have the security to protect us; and at home by the return of confidence which can only be brought about by a realization that men can develop, can make a reasonable profit on their enterprise and, most important, retain it. We cannot expect to rejuvenate foreign or domestic enterprise as long as the government continues a policy of requiring as high as 70 per cent of the profits to be paid to the government; the tax system must be revised so that the burden will be more equably distributed and in the long run the rich will pay the bill just the same, because they will be encouraged to do big things and thus employ labor, increase production and radiate that happiness and contentment necessary to insure general prosperity. Even the workman can afford to pay a nominal tax if he is employed; it would pay him more to pay such a nominal tax than to have no income with which to pay anything.

"The thought in my mind that I hope I have made clear is that these various troubles of the railroad situation, the merchant marine situation, the farmers' troubles, or whatever the case may be, will be corrected only by the two accomplishments—confidence at home and credit abroad."

### The "Final Declaration"

At the last general session of the convention a "final declaration" of opinions and recommendations was adopted. This statement called attention to the decline of our export trade from \$928,000,000 in June, 1920, to \$384,000,000 in March, 1921, and pointed to the inability of foreign buyers to pay for goods which they are greatly in need of as the cause for the decline. An increase in imports of goods "not detrimental to existing industry" and the "creation of adequate facilities for the purpose of drawing upon surplus American investment funds in order that the long term credits so badly needed by the disorganized countries of Europe may be furnished" were urged as solutions to our present difficulties. The declaration follows in part:

The world is suffering today from unbalanced exchanges. Notwithstanding the position of the United States as a creditor nation, the present unstable financial condition of a large part of the world, especially of Europe, is the fundamental cause for our own business depression. A return to normal conditions in our own country depends in large part upon an improvement of our foreign trade. The present

retrogression is clearly evidenced by the maximum of the country's export trade \$928,000,000 in June, 1920, decreasing in October to \$751,000,000 and in March, 1921, to \$384,000,000.

Foreign nations whose imports exceed their exports have been compelled to curtail purchases because of inability to pay by exports. The result of this would be eventual restoration of more normal exchange, but the requirements of international commerce and domestic prosperity in each country demand immediate relief from present stagnation.

The United States must continue to increase its imports of raw material and merchandise not detrimental to existing industry in order to receive pay for the exports necessary to stable employment of labor in agriculture and industry; and to permit of the liquidation of the obligations of the debtor nations. Continued liquidation in gold of foreign obligations to us will tend to renew inflation and arrest the beneficial readjustment of values on the basis required by present conditions throughout the world.

It is generally agreed that the solution depends upon our ability to create adequate facilities for the purpose of drawing upon surplus American investment funds in order that the long term credits so badly needed by the disorganized countries of Europe may be furnished. Most of the countries of Europe are unable to pay us now and for some time to come in gold or merchandise, and unless they are enabled to obtain credits to purchase the raw materials which they need, their business and ours will continue to stagnate.

We urge the immediate creation of financial institutions under the Edge law, whose machinery will facilitate extension of long term credits to promote free exchange of exports and imports. We commend efforts to acquaint our investing public with the necessity of purchasing debentures issued by such institutions against approved foreign securities for this purpose, so that eventually every community will serve its own vital interest in furthering our foreign commerce as a necessary component of domestic prosperity.

The reduction of loans and accumulation of banking reserves now permit, and the lower prices of many commodities justify, the extension of credits sufficient to accelerate recovery in certain lines. This should gradually thaw frozen credits and end stagnation. It will further provide increasing export and import cargoes for our now partially idle merchant marine and contribute to restoration of economic equilibrium in countries suffering from war debts and inflated currencies and to a proper distribution of commerce in neutral markets.

It is manifest that while many products of our soil have been reduced in value to pre-war levels, a number of manufactured products remain too high in cost of production to compete in neutral markets with foreign goods. It is essential that the substantial reduction in cost of living, which has already occurred in food products and other basic commodities, shall be followed by economies in cost of production until a stable balance of values of all commodities and productive effort is established. No readjustment, however, can be complete without reduction of costs of railroad transportation both for domestic and export shipment. Continuance of our present cost of finished merchandise would maintain unreasonable expense of living and put our products in a non-competitive position in markets of depleted purchasing power.

To insure such equality of treatment, the American tariff, whatever its underlying principle, should provide for additional duties on imports from nations discriminating, by tariffs or administrative practices, against the trade of the United States.

The foreign service of the United States should be reorganized and established under a unified supervision which will promote its efficiency, both in diplomatic representation and in the collection and dissemination of commercial information. This reorganization should provide for a permanent career through the establishment of a national training academy for the foreign service, which will attract competent and ambitious young men into a life work of constructive effort in their country's service.

The convention urges upon Congress the vital importance of prompt action upon measures affecting our foreign trade now pending before it. Chief among those calling for immediate enactment are the increases of appropriation that will provide for much needed expansion and improvement in the Bureau of Foreign and Domestic Commerce and in the Bureau of Standards in the Department of Commerce.

THE ILLINOIS CENTRAL recently organized a committee of officers and employees to act as a General Fuel Conservation Committee. J. F. Porterfield, general superintendent of transportation, has been appointed chairman of the committee.

# Railroad Hearings Before Senate Committee

## Railroads Not Asking New Legislation—Wages Must Be Reduced in Order to Reduce Rates

WASHINGTON, D. C.

HEARINGS before the Senate committee on interstate commerce, pursuant to the Senate resolution directing an inquiry into the general railroad situation, were begun on Tuesday, May 10.

In opening the hearing, Chairman Cummins read into the record statistics showing that while operating revenues have increased since 1913, there has been a greater increase in operating expenses so that for the year which ended on March 1, 1921, the net operating income was only \$2,578,922 compared with \$787,610,435 in 1913. In the latter year, the ratio of operating expenses to operating revenues was 69 per cent while in 1917 it was 70 per cent, in 1918, 73 per cent, and for the year which ended on March 1 last, 94 per cent.

"The railroads received during the year, up to March 1, 1921, as I have stated, \$6,175,962,718 as operating revenues," he said. "I think it can be said without very much doubt that that is a larger revenue than the railroads will ever receive again for the same volume of business. The operating expenses, together with taxes and the adjustment of equipment rents and joint facility rents, consumed all of that sum except \$2,578,923. So we have before us the problem, I think, of trying to ascertain whether the \$6,000,000,000 and more received as operating revenues were wisely and economically and efficiently expended. If we can not increase the revenues, and I think we have reached our limit in that respect for the same volume of business, it is apparent that expenses must be reduced in some way or other if the railroads of the country are to be successful in their operations."

"That situation had led me to ask the railway executives to appear, in the first instance, and give the committee the benefit of their knowledge and their observation with regard especially to the enormous expenses of 1920, so that we might find out, possibly, some way to assist in the operation of these railroads that would enable them to continue in operation, for it is perfectly obvious that if this condition is to be a permanent one a very grave situation confronts the people of the United States. I have therefore asked Mr. Thom, who represents the railway executives, to present the showing which the railroad companies desire to make with regard to this very vital matter."

Because of this situation, he said, he had asked the railroad executives to appear for the purpose of furnishing the committee information which might enable it to assist in meeting the situation, adding that it is "obvious that if this situation is to be permanent a very grave situation faces the people of this country."

Julius Kruttschnitt, chairman of the Southern Pacific, began the presentation of the railroad case, first reading into the record a preliminary statement by Thomas De Witt Cuyler, chairman of the Association of Railway Executives, which outlines the attitude of the executives toward the investigation, and following this with an extensive statement outlining the history of the causes that have brought the railroads to their present condition. Mr. Cuyler said in part:

The Association of Railway Executives welcomes the inquiry undertaken by the Senate.

In a general way, the following will indicate the spirit which will pervade the testimony to be offered by the railroads:

The transportation service of this country is passing through a crisis. It is not a crisis peculiar to the railroads of the United States. It is a situation of world-wide incidence arising from perfectly understandable causes, most of them having their origin in the world war.

Feeling, as we do, that the world has definitely turned the corner of its most acute depression, so we feel that the railroad situation has likewise passed through its darkest hour and has now definitely turned for the better.

The last Congress in passing the Transportation Act, placed upon the statute books the most constructive measure dealing with our transportation situation which had been enacted into law in the past fifteen years.

### Difficulties Not Due to Transportation Act

The Transportation Act has not broken down; the present difficulties of the railroads are not due to the Transportation Act, and the Transportation Act provides effective machinery for remedying, in so far as it may be done by national legislation, the difficulties in which the railroads now find themselves.

The managements of the railroads do not approach Congress or the American people asking for any amendments in existing national legislation. They desire to make perfectly clear their present situation, and the measures they are taking and propose to take to work their way out of existing difficulties.

The railroad managers regret that the operation of inexorable economic laws makes it necessary that railroad wages should be reduced. But the railroad managers have no fight with their employees, and the supreme aim of every railroad management in America to-day is to establish its relationship with its employees on a basis of friendliness and co-operation which will result in work at satisfactory wages for the largest possible number of men and in an efficient and economical service to the public.

The Interstate Commerce Commission has a clear understanding of the real nature of the American transportation problem and has evinced its desire in co-operation with the public and with the railroad managements, to work out the difficult problems of regulation in a manner which will insure adequate facilities and complete protection to public interest.

The public also is manifesting a disposition actively to cooperate with railroad managers.

Railroad managements are fully aware of the feeling in many quarters that certain railroad rates are excessive, and the unremitting effort of the railroad managements of this country is to provide service of such economy and efficiency that it can be rendered at a rate which will promote the movement of the largest possible amount of traffic.

### Facilities More Important Than Rates

The responsibility of railroad management is of course not alone to give low rates, but to provide adequate facilities. In times of prosperity the adequacy of facilities is of more consequence than the rate itself. So that if the railroad managers assent to a schedule of rates in time of depression which make it impossible for them to provide adequate facilities against a period of prosperity, they would be recreant to a duty they cannot escape.

The public and the Congress may rest assured that the railroad managers are straining every nerve so to reduce their expenses that they may be able at the earliest moment to adjust rates to changed economic conditions, and certainly to the end that no individual rate shall be so high as to interfere with the normal movement of a commodity.

The railroads have just emerged from a year of extraordinary expenditures, expenditures so large that even with greatly increased freight revenue they were unable to earn an appreciable sum upon the actual investment in American railroad property.

### All Expenses to Be Accounted For

The railroad executives will explain to the Senate committee the reasons for these expenses. The railroads will show specifically that the greater part of the increased expenses of 1920 are due to causes over which the railroads had no control. The railroads will also show, I believe, that they are rapidly surmounting their difficulties and from now on will realize a progressively improving situation.

The eyes of the railroads are turned to the future, and the railroad managers are confident that as a result of the hearings before the Senate committee there will be a far better understanding on the part of the public of the whole railroad situation.

Mr. Kruttschnitt's statement was in part as follows:

In order to understand the problem which the committee has before it, and properly to apportion the responsibility for the

result, it must be appreciated that, except as either is affected by bad management, the railway operating revenues and more than 64 per cent of the railway operating expenses, being the labor costs, and in 1920, in addition, a very substantial part of the cost of materials and supplies which were purchased by the Railroad Administration during federal control, but used by the railroads at the prices paid, or contracted by the government to be paid, are fixed by the government—in other words, that the government prescribes the charges from which the operating revenues of the carriers come, and likewise fixes the wages which constitute more than 64 per cent of the operating expenses, and that the price of the necessary materials and supplies which the carriers must have are fixed either by the government as above stated or by economic forces beyond the power of the carriers to control. The narrow limits within which the powers of management may be exercised are thus manifest, and, of course, where there is a limit to power there is a corresponding limit to responsibility. At the same time, even within the limits of these restrictions, there is room for the play and for the effect of good or bad management, and the character of the management, whether good or bad, efficient or inefficient, is a legitimate and proper subject of inquiry. Care must be taken, however, to appraise justly the several causes contributing to the result and to apportion to each cause its due share of importance.

### Expenses Largely Controlled by Government

Out of every dollar of operating expenses 30 cents were paid out for materials and supplies. The government operated the roads for two months of 1920 and accordingly agreed to the prices of materials and supplies for these months, as well as incurred all of the other operating expenses for these months. The government also purchased or contracted for a large quantity of materials and supplies which were passed over to the carriers on the return of the properties, and these materials and supplies, as used, were charged into the operating expenses for 1920 at prices fixed for the carriers by the government in making the purchases. It is conservatively estimated that one-half of the materials and supplies used in the year 1920 were thus necessarily charged into the operating expenses for that year at prices fixed for the carriers by the government.

Accordingly, 15 cents out of every dollar of operating expenses for 1920 were paid out for materials and supplies at prices thus fixed for the carriers by the government.

All operating expenses (other than for labor and material and supplies) for the first two months of 1920 amounted to about 3.5 cents out of every dollar of operating expenses for the year. These were incurred by the government and not by the carriers.

This means that the 64 cents out of every dollar of operating expenses were paid for labor at prices fixed by the government; that 15 cents out of every dollar of operating expenses was paid for materials and supplies, at prices fixed by the government, and that 3.5 cents, out of every dollar of operating expenses for the year 1920, was paid for other expenses incurred by the government in the first two months of 1920, or a total of 82.5 cents out of every dollar of operating expenses for the year 1920 was paid out at prices directly fixed by the government itself.

The remaining materials and supplies used during the year 1920 were purchased by the carriers at prices fixed by general market conditions and beyond their power to control, and which cost 15 cents out of every dollar of expense. In other words, prices fixed by the government or by market conditions cover 97.5 cents out of every dollar of operating expenses.

The especially narrow limits within which the efficiency of management might have become effective to control operating expenses for 1920, including transportation expenses, are thus apparent.

It follows that efforts to control expenses during that year were of necessity almost wholly confined to obtaining better results from labor and economical use and consumption of materials.

The difficulty of this task, in the midst of extensive unrest and disorganization of labor and of disturbed economic conditions generally, cannot be easily exaggerated.

Turning to an analysis of the railway operating expenses, there can be no proper dissent from the statement that by far the largest contributing cause to the abnormal amount of these expenses is the cost of labor.

The cost of labor to the carriers may be divided into two classes, the direct and the indirect cost. The direct cost of labor is the compensation paid by the carriers to their employees; the indirect is that part of the cost of materials and supplies which is caused by the labor service in creating them.

The history of the direct labor cost is interesting and in this inquiry is of substantial importance.

The labor bill of the carriers in 1916, which was before the Adamson Law took effect, stood at \$1,468,576,394. The increases since 1916, excluding switching and terminal companies, have thus been as follows:

1917.....	\$270,905,748
1918.....	874,331,209
1919.....	229,315,081
1920.....	855,087,919

or an aggregate increase since 1916 of \$2,229,639,957.

And the increase since 1917, the last year of private management prior to federal control, was \$1,958,734,209.

The figures given are actual. The increase made in 1920, however, was in force only a part of that year.

The labor costs, including switching and terminal companies for 1920, were \$3,742,486,936; for 1919 they were \$2,868,672,284, an increase in 1920 over 1919 of \$873,814,652.

If the increased scale had been in force during the whole year of 1920, the wage bill for 1920 would have been approximately \$3,980,000,000. This means that the labor costs to the carriers of Class I were actually greater in 1920 than in 1917 by more than 115 per cent, and that, if the increased scale had been in effect during the entire year 1920, the increase would have been about 128 per cent.

It must be noted that during the same period the gross revenues of the carriers increased less than 54 per cent.

It will also be noted that since the government took charge of the labor costs by the Adamson law in 1916 the labor costs have been increased by government action by \$2,229,639,957, the total for 1920 being \$3,698,216,351, and that before the government took charge the entire labor costs amounted to \$1,468,576,394.

The properties of these carriers had been taken possession of by the government for a vital and very sacred public purpose. There was a great and relentless agitation for increases in wages during the whole period of federal control, which included more than ten months of the period of actual war. The Railroad Administration deemed it best to yield to this agitation and granted the enormous increases which have been noted as made during that period. Manifestly the burden of these increased costs could not end with federal control but must be passed on to the owners with the return to them of their properties. Nor did the record end with the advances actually made during the period of government possession. For many months prior to the end of federal control still larger demands for increases in wages had been pending and these unadjusted demands were also passed along to the owners with the return of their properties. These were subsequently adjusted by the Labor Board. Thus the inevitable and the recognized effect of what the Railroad Administration did and of what it began and left incomplete was to burden and encumber these properties and their future management after the resumption of private operation with the necessity to meet and provide for an increase of cost for labor amounting to \$1,958,734,209 annually (the difference between the entire labor cost of 1920, excluding switching and terminal companies, \$3,698,216,351, and the labor cost of 1917, namely, \$1,739,482,142), which is greater by more than two hundred and nineteen millions of dollars than the entire annual labor cost at the time the government took possession, namely \$1,739,482,142.

It is a just cause of complaint against the director general that he neglected and refused to recognize and satisfy the moral obligation he was under to make, in the revenues of these properties, an increase corresponding with the enormous and destructive burden of expense which he had placed upon them and left the carriers to assume the burden before the public of seeking an increase of rates to meet the increase of expense which he had placed on them. It was easy to impose this increased burden upon the carriers. It would have been a most ungracious task to transfer it to the public. So this task was left to the carriers, and they were confronted at the threshold of resuming their relations with the public with the necessity to assume the responsibility of asking a large increase of rates. In equity this obligation was not theirs—it was the obligation of those who had created the necessity.

### Freight Rates Not Responsible for Depression

Freight rates are not responsible for the business depression, Mr. Kruttschnitt said. Widespread propaganda is being carried on to arouse public sentiment against existing freight rates. The fact is that even since the rates have been advanced the cost of transporting commodities is far less than the toll taken by the commission merchant and the retailer. Consequently people are misled and conclude that high rates have stopped the movement of a large amount of freight and that the railways would make more money if they would reduce the rates and thereby revive the traffic.

There is the strongest reason to believe that the very great reduction in traffic has been due almost entirely to general business conditions, world-wide in their effect and that would have come if there had been no advance in freight rates.

Prices of commodities reached their maximum in the first

half of 1920 and thereafter fell with great rapidity in France, the United States and the United Kingdom.

The fall in the United States began in May and was rapidly on its way downward in September when the advanced rates took effect. Nevertheless, traffic did not drop for at least four months.

In the last four months of 1920, the net ton miles of revenue freight were 143,349,678,000, an increase of 7 per cent over the preceding year.

It was a general deflation and fall in prices from the heights to which they had been driven by war conditions that has caused a stagnation of business throughout the world.

That it is not caused by the cost of transportation, is convincingly shown by the fact that stoppage of buying has caused an over-supply of ships. Ocean tonnage rates have been recently at the lowest point in their history. Notwithstanding these low rates ocean traffic shows great stagnation as rail traffic and millions of tons of shipping here and abroad are rusting in idleness.

Many commodities would not move even if the freight charges on them were abolished entirely because producers can find no market.

That the decline in business is not due to prohibitive freight rates is shown by the following examples:

In January of this year the total tonnage of lines west of El Paso and Ogden operated by the Southern Pacific fell off 41 per cent. The combined intrastate freight tonnage in Arizona and Nevada declined 50 per cent although no increase in the intrastate freight rates in those states has been authorized or made effective. This decrease embraced grain, hay and livestock as well as ores and other commodities.

Of a Texas cotton crop of over four million bales, 40 per cent remains unmarketed. The average amount of increase in the inland freight rates to Galveston was 24½ cents per 100 pounds. On the other hand the ocean rate from Galveston to Liverpool has declined from \$1.98 per 100 pounds in August, 1920, to 45 cents in March so that the average cost of shipments from producing point to Liverpool has been reduced about \$1.28½ per 100 pounds. Obviously the freight rate is not responsible. Cotton shippers attribute it to absence of demand both foreign and domestic.

Of the total crop of 99,000 bales of cotton in the Imperial Valley of California, about 54,000 bales remain unshipped, notwithstanding that a rate is now obtainable through the Panama canal as low as the rail rate available last season before the August advance, and also notwithstanding that ocean rates to Yokohama have been reduced \$1.10 per 100 pounds and to Liverpool as above stated while the rail rates to Pacific rates were increased only 14 cents and to Galveston only 40 cents.

During September, October and November, 1920, 45 per cent less rice, 54 per cent less canned salmon and 77 per cent less dried fruit were exported than during the same months of the previous year, although the reduction in ocean rates was substantially more than the increase in inland rail rates.

A removal of all the recent increase of the rate on lemons would not help the California lemon grower. He has a rate by sea through the Panama canal of less than half (42 per cent) of the rail rate yet his lemons are not marketed.

More lemons were shipped from California in the four months, November, December, January and February (after the increase in freight rates), than were shipped in the corresponding months one year ago.

The real trouble is that the government has taxed the lemon grower heavily to create a glut of ocean tonnage which has lowered ocean rates to unheard of limits and Sicilian lemons are sold at \$1.25 a box in Eastern markets where the Californian must sell his fruit. The ocean highway is free and the Sicilian knows it. If Congress wants to help the Californian, it knows how it can easily do so but it cannot be done by interminable discussion and investigation of rail rates.

On the basis of 54 heads of lettuce to the crate, the cost per head to the California grower is 6.7 cents. From personal experience at retail markets consumers have to pay from 20 to 25 cents a head for California lettuce and quite as much as for lettuce grown in the neighborhood on which there is no freight charge.

The facts about the freight rates on cantaloupes have been grossly misrepresented. From the report of the United States Department of Agriculture, Bureau of Markets, we find that the average sale price for the 1920 season in New York was \$4.82 a crate. The present freight rates plus refrigeration are \$1.84½ to New York and \$1.49 to Chicago. This leaves a profit to the operator on cantaloupes sold in New York of \$1.62½ per crate. The freight rates have been grossly misrepresented and the statement is made that sale at

\$3.50 yields a little over 30 cents profit. The average price of the cantaloupe laid down in New York in 1920 was not quite 11 cents. They were retailed at about 25 cents.

The percentage of freight charges to the average value of commodities shipped in the early part of 1921 is only two-tenths of 1 per cent greater than it was in 1914.

### Remedies for Existing Conditions

The trouble with our railroads has been intensified by the results of 26 months of an experiment in government ownership and operation. The word "ownership" is used advisedly as the federal railroad administration treated the railroads as if they were absolutely owned by the government and turned them back to their owners helplessly bound in improvident agreements in the making of which their owners had no voice.

The first requisite for the prosperity of any property is the right to conduct its own affairs. Without this efficient operation is impossible. It is not a question of revenues and reasonable return as much as one of life and death to every industry in the land. Poor service no matter how low the rate is expensive and increases the cost of everything.

Some remedies easily applied and productive of great economies are:

1. Stop the use for common carrier purposes of highways built with public moneys without adequate tolls and proper regulations.

2. Make inland waterways built or improved at public expense carry themselves as to interest on cost and maintenance by regulating the common carrier traffic on them and by imposing adequate tolls.

3. Keep the United States government out of the business of operating steamships and stop the lavish expenditure of public money to provide coast to coast ocean transportation in competition with transcontinental railroads.

4. Tolls for use of the Panama canal should be sufficient to pay interest on its cost, operating expenses and maintenance.

5. Do not deprive transcontinental carriers of coast to coast traffic by inflexibly enforcing a strict long and short haul clause.

You call us here to tell you what ails the railroads. We have been telling regulatory bodies for years that railroads were subject to the same inflexible economic laws to which all other industries are subject.

The government having strangled the railroads into something like bankruptcy at last removed its hands and permitted a sudden increase in rates that should have been gradual and started at least 12 years ago. The difficulties with the railroads is excessive operating expenses and an abnormal amount of these expenses is the cost of labor.

These, then, are the directions in which we need and ask your help. You may well ask what the railroads propose to do to help themselves.

The railroad executives have exerted, are exerting, and will continue to exert every effort to increase efficiency of operation, as they realize since the passage of the transportation act to a degree greater than they ever did before their allegiance to the public as well to their shareholders.

Many absurd, impractical and totally indefensible estimates of possible savings to result from the adoption of numerous improvements have been made in the heat of discussion of pending issues with organized labor. These economies are to be made by the universal use of practices and devices of different degrees of merit, some of which have long been used by all roads and all of which are used by some roads. All the suggestions cost money and a great deal of money, and the proposal of organized labor is that the additional capital be invested, not for the benefit of those who provide it, nor for the benefit of the public to reduce rates, but generally and principally to permanently support wages on the inflated war level.

Some of the directions in which the joint and several efforts of the public, the carriers and their employees can help the situation are:

The public can help, among other ways:

1. By continuing the splendid co-operation that it has accorded the railroad since their return to their owners, in using equipment and other facilities intensively.

2. By modifying laws that limit the length of freight trains and compel the employment of unnecessary men.

3. By terminating Government made agreements that put a premium on inefficiency.

The carriers can help:

1. By increasing capacity of existing lines by reducing curves and grades.

2. By conserving fuel through educating enginemen and the use of improved devices.

3. By replacing obsolete locomotives, shops, and tools by

modern ones—matters of supreme importance on account of great increase in wages.

4. By eliminating every ounce of useless dead weight in locomotives and cars, remembering that it costs just as much to haul a ton of useless wood and iron as it does to haul a ton of dry goods.

5. By reducing delays at terminals and in transit through the provision of more second tracks, passing sidings, and terminals.

6. By extended use of power devices for handling freight, and other labor-saving devices.

7. By promoting common use of tracks and terminals wherever practicable.

The employees can help:

1. By increasing and ever increasing production in all departments of railroad service.

2. By loyal, earnest effort to reduce operating expenses to prewar costs, or better, in recognition of the generous increases in wages granted by public regulating bodies.

3. By conserving fuel and saving life, limb, and property through greater care and stricter observance of rules and regulations. Payments for loss and damage to freight increased from \$35,000,000 in 1917 to over \$104,000,000 in 1919, or \$40,000,000 more than they should have done after allowing for 8 per cent fall in traffic volume and 100 per cent increase in value of commodities.

Finally, managers and employees jointly can render incalculable service to their corporations and to the public by cultivating friendly, harmonious, and co-operative relations that were dangerously weakened during governmental control, and above all, by establishing a thorough realization of the obligation of public service, to which we all owe absolute fealty.

We do not wish to be understood as criticizing or disapproving the motives of public policy that determined the construction of the Panama Canal, highways, inland waterways, and ships. We recognize the first as a measure of national defense the last as indispensable to winning the war, whose cost, even if many times what it has been, would have been wisely incurred. The others are necessary for the development of our country and contribute largely to the pleasure and convenience of every one of us. But what we do criticize and protest most earnestly is the unrestricted use for common carrier purposes of these works, built with public money, to destroy the business of public service corporations built with private moneys dedicated to public use; and most of all do we protest against the entry by the United States Government, backed by the United States Treasury, into destructive competition with its own citizens.

Continuing his testimony on May 11, Mr. Kruttschnitt said in explaining the stagnation in railroad building:

In 1920, \$62,264,000 went as a return to those who paid for the properties while 60 times as much (or \$3,742,000,000) went to those who are employed on the railroads. This answers the question "why don't we build more railroads?"

The fall in rate of railroad construction began in 1905 and, with a negligible check in 1916, has continued ever since, so that the new mileage constructed in 1920 was less than the average in the five years from 1840 to 1845. New construction in 1920 was only one-eighth of 1 per cent of the existing mileage, and at this rate it will require eight years to increase it by 1 per cent.

Mr. Kruttschnitt pointed out that for the railroads of the whole country, increased expenses in 1920 over 1919 were as follows:

Actual expenses for 1920.....	\$6,163,138,341
Actual expenses for 1919.....	4,667,774,131
Increase for 1920 over 1919.....	\$1,495,364,210

DETAILED AS FOLLOWS:

Increased cost of—	
Labor .....	\$884,148,739
Locomotive fuel .....	196,429,760
Cross ties .....	28,113,000
Insurance .....	20,160,000
Loss and damage.....	18,917,000
Stationery and printing.....	12,264,000
Depreciation .....	20,135,000
Track material .....	10,764,000
Water and lubricants.....	8,318,000
General supplies .....	29,741,000
Transportation expenses other than labor and items explained above .....	51,488,000
Valuation expense .....	1,887,000
Corporation and printing.....	15,837,326
Other increases in taxes, rents and uncollectible revenues.....	52,771,359
Cost of R. R. Administration.....	7,168,000
Maintenance of way, materials and equipment not accounted for above and deferred federal maintenance.....	121,420,000
Total increase in expenses above explained.....	\$1,499,566,184
Actual or net increase in expenses.....	1,495,364,000

Mr. Kruttschnitt was to return for questioning by the committee on May 12.

## Container Car Expedites Mail Service

NEW RECORDS for speed in the handling and transportation of mail in quantities were established in a recent test of the container car system of the New York Central in the government mail service. The saving of time due to the elimination of handling enabled a mail train from New York to make connections at Chicago which had not been made heretofore and in some instances 12 to 14 hours were saved by placing the pouches on earlier fast trains.

Loading Containers with Mail Sacks at the Post Office

This demonstration opens a new field of usefulness for the container system of transportation which has already been successfully applied to express and l.c.l. freight.

For the test in mail service the express type of container car was used. The nine portable containers were filled with mail at the postal stations, seven being filled at the Grand Central Terminal and the remaining two at the New York general post office. They were then transported by motor truck and loaded onto the car at the Thirty-third street

Unloading the Containers at Twelfth Street Yard, Chicago

yards of the New York Central. Loading the mail into the containers consumed an average of 15 min. The trucks were transferred from the Grand Central Terminal to the yards in an average of 15 min., and from the general post office to the yards in an average of 5 min. each. The containers were loaded from the trucks to the car in an average of 3 min. each, or 27 min. for the nine.

The mail matter carried on the car weighed 34,650 lb. and was made up of 894 sacks, 336 parcels of parcel post matter and 11 registered pouches of valuable mail, a total of 1,241

separate packages. The total weight of mail carried was considerably above the average weight hauled in the present standard mail car which usually carries about 30,000 lb. A single container carried 150 sacks weighing 5,090 lb. and the container car can readily carry a total of 50,000 lb. or more.

Upon arrival at Chicago at 8 a. m., Saturday, May 7, the car was immediately switched to the crane at the Twelfth street yards and was set for unloading at 8:10 a. m. The nine containers were all unloaded and placed on trucks in 21 min., the average time for unloading being 2.3 min. each. The last container left Twelfth street at 8:31 a. m. Delivery at various destinations in the city were made as follows:

Container No.	Destination	Time delivered	Connecting trains due to leave
*105	Dearborn street station.	8:21 a. m.	A. T. & S. F. 9:25 a. m.
107	Main post office.	8:26 a. m.	.....
102	Northwestern depot.	8:34 a. m.	C. & N. W. 9:00 a. m.
103	South end Union depot.	8:31 a. m.	C. B. & O. 9:30 a. m.
110	South end Union depot.	8:38 a. m.	C. B. & O. 9:30 a. m.
106	North end Union depot.	8:45 a. m.	C. M. & St. F. 9:45 a. m.
101	North end Union depot.	8:45 a. m.	C. M. & St. F. 9:45 a. m.
108	Parcel post branch, Main post office, Eleventh and State streets.	8:39 a. m.	.....
111	Parcel post branch, Main post office, Eleventh and State streets.	8:54 a. m.	.....

\*Delayed 12 minutes at track crossings.

If mail had been available, the car could have been reloaded within two hours after its arrival. The containers were locked and released by the post office department one hour before the departing time of train No. 2, 1 p. m. An average of 15 min. was consumed in bringing them from the La Salle street station to the loading point and the containers were loaded from the trucks to the car in an average of 2 min. each. On the return trip the containers carried 37,220 lb. of mail matter in 1,248 separate packages, including 69 pouches of registered mail.

The test was authorized by Postmaster-General Hays and a committee of officials of the post office department were aboard the train that carried the container car. Representatives of the New York Central also were present and supervised the test trip.

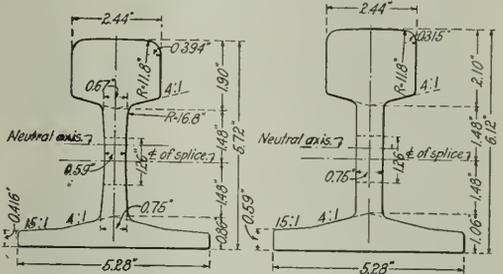

The advantages of the container car method of handling mail may be summarized as follows: It eliminates the possibility of theft or loss of valuable mail while in transit due to the fact that the container cannot be opened until it is removed from the car by the use of a crane. The container will also prevent a repetition of the numerous recent thefts of mail from trucks carrying it from post offices to railroad stations. The system reduces to a minimum the damage to parcel post or other mail in transit. It effects a saving in the cost of handling, both in labor and in trucking, and a material saving in the use of equipment. The possibility of quick transfer at important points and the maintenance of close train connections is an important advantage. The container makes it possible to restore the practice of maintaining ten or more separations in loading cars which cannot be done with solid car loading as now practiced.

## New Standard Rail Sections for French Roads

**A**FTER AN EXTENDED investigation six of the principal railroads in France have adopted four new standard rail sections. This subject is of particular interest to American railway engineers owing to the fact that the investigation included the study of some American rail sections, but these were abandoned in favor of new sections which conform very closely to the general outline of sections previously used in France. The four sections adopted are shown in the illustrations and include a 26-kg. section for narrow-gage tracks, a 36-kg. section for light traffic, stand-

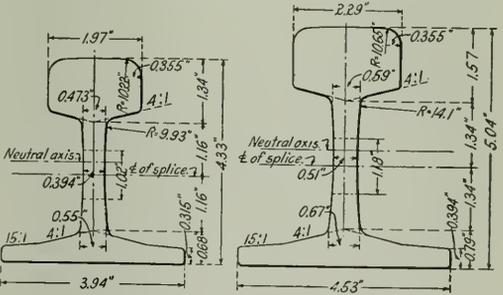

ard-gage lines, a 46-kg. section for light traffic, standard-gage lines and a 55-kg. section for use in tunnels where the action of moisture and smoke results in rapid loss of metal.

It is to be noted that these sections retain the double bevel

46-kg. (92.8 lb.) Rail, 55-kg. (110.9 lb.) Rail for Tunnels

on the top surface of the base in conformity with prevailing French practice. Three of the rail sections have curved faces on the webs and the base widths are appreciably less than the height. Consideration of a great many types of rail splices

26-kg. (52.3 lb.) Rail, 36-kg. (72.6 lb.) Rail

finally resulted in a decision to continue the use of fish plates like those in general use in France, although the thickness has been increased appreciably over that of the types previously used.

## American Railway Development Association

**T**HE American Railway Development Association, formerly the Railway Development Association, held its thirteenth annual meeting at Hotel Pennsylvania, New York City, on Wednesday, Thursday and Friday of this week. The opening session began on Wednesday forenoon, the 11th, with President H. O. Hartzell (B. & O.) in the chair and Secretary J. B. Lamson (C. B. & Q.) acting as secretary of the meeting.

The first address was by Charles H. Herty, editor of the Journal of Industrial and Engineering Chemistry, New York city, who gave a rapid sketch of ways in which railroads could develop traffic in their respective territories by spreading knowledge of how natural resources can be made more valuable in ways that the chemist can explain to them. Railroads have developed vast territories by the aid of the geologist; but the day of the geologist is largely past. The chemist has not been duly appreciated. Not a railroad in America

has made a thorough chemical survey of its territory, though a few companies have done a little at it.

The railroad chemist, to cover the field adequately, should be a man of strong character, imagination and initiative. He should be close to the president, not merely an information bureau; not content to wait for people to come to him, nor to be merely an analyzer of water, oils, steel and paint. Men of this kind are scarce, and a good salary will be necessary.

In the discussion following this address mention was made of the former annual chemical exhibition held in New York city. Mr. Herty hopes to revive this. A member said that the Technology Club, New York city, could furnish a list of chemists open to engagement.

### A Shipper's Views

B. J. Case, of Sodus, N. Y., speaking on the transportation of perishables from a fruit grower's standpoint, told of experiences in that business in central New York. Shipments of peaches have been increased in volume in that region in 15 years several hundred per cent but the risks of the business due to uncertain seasons and fluctuations in crops are considerable, and the hearty co-operation of the railroads is of vital importance. For example, the distribution of fruit cars last year, when New York growers felt aggrieved at what they deemed undue favoritism toward other regions, left a shortage at a critical time; and a thousand carloads of peaches were left in the orchards unharvested. Consumers could have been found for those peaches if the fruit could have been shipped at the right time.

### How to Secure Desirable Settlers for Vacant Lands

E. F. Benson, manager of the department of immigration and industry of the Northern Pacific, in a paper on this subject, presented a strong plea for the establishment of community development associations; only by intelligent co-operation can satisfactory progress be made. To get a man to buy a farm is not enough. The individual with \$2,000 can perhaps take a farm, but the necessary stability, enterprise and intelligence can be had only by co-operative effort.

Of American farms, only 62 per cent are operated by their owners. If that percentage cannot be increased the country is in danger. We see in the downfall of the Roman empire a deadly parallel to tendencies now working in this country. We have warnings on all sides today. The trouble in Russia is due to the ungratified ambition of the masses to own land. A similar ambition among the peons of Mexico accounts for the last ten years of trouble in that country. Denmark, by state action, has made itself a prosperous country of small farms. Even Ireland has in the last ten years been greatly improved by the Irish land bill.

The California experiment was started by Dr. Leeds, who, in 1914, brought to that state the lessons of experience in Australia. The state appropriated \$260,000 in 1917 and a million in 1919. Secretary F. K. Lane, in his recommendations for lands for soldiers, took this experiment as his guide.

The Wisconsin plan is the better one, in Mr. Benson's opinion. Legislatures are only very slowly convinced of the wisdom of appropriating public money, but the Wisconsin Colonization Company (headquarters at Eau Claire) advances the necessary money and thus far has paid good dividends; and has satisfied its patrons. The State Immigration Department cooperates with it. The president of the company will give all desired information. The company does not build houses for patrons, but lends them half the necessary money. It aids them in getting good and tasteful modern houses at a low price. The speaker could see no reason why schemes of this kind could not be worked as well in Maine or California as in Wisconsin.

In the discussion on this paper Mrs. Fullerton (Long Island) described the work of her road in promoting the

prosperity of small farms. County home bureaus are doing good work of this kind all over New York state. C. L. Smith (O. W. R. R. & N. Co.) related some of his experiences. He devotes much attention to home building. A colonization enterprise in Northern Minnesota was mentioned.

### Reforestation of Cut-Over Lands

W. S. Ayres (New Orleans Great Northern) read a comprehensive and instructive paper on the timber problem in the great level country of the south, where 155 million acres have been denuded. Millions of acres are being reforested but much more needs to be done. At Bogalusa, La., this summer there is to be a forestry school, continuing six weeks.

In the discussion it was stated that the Canadian Pacific sends out a train with forestry lecturers every summer, three weeks being spent in the work. The use of trees as wind breaks or snow fences was mentioned, but results are not always satisfactory. The Canadian Pacific is trying hemp as a snow fence. It is an annual and grows ten feet high.

The rest of the proceedings of the meeting will be reported in a later issue.

### A New Brownhoist Locomotive Crane

**D**URING THE PAST few years, many roads have found it economical to handle their coal, ashes and other materials by a locomotive crane. This has been necessary because rapid handling is often essential and because the crane is so much more economical than hand labor. Up to the present time, however, most of these cranes were

The Crane in Use in Material Yard

large capacity machines and too big to be economical for many small jobs. The saving effected by cranes on these larger operations has created a demand for a smaller type which can be used economically where there is not so much material to be handled.

With the idea of filling the need for a smaller capacity crane for this work, a new Brownhoist No. 2 locomotive crane has been developed. This machine can be changed in a few minutes' time to handle either a grab bucket, bottom block or lifting magnet. The new crane will do the same work as the larger types within its capacity. It is built to handle a one-yard bucket, hook loads of 5 tons, or a 36-in. magnet.

In order to meet the different working conditions, these new cranes are made to operate by steam, electricity or gasoline engine. They are built for use on railroad trucks, traction wheels or creeper trucks. This new crane has just been added to the other types of locomotive cranes built by the Brown Hoisting Machinery Company, Cleveland, Ohio.

# General News Department

The American Association of Dining Car Superintendents will hold a special meeting at Chicago in connection with the National Hotel and Restaurant Week, commencing July 12.

Thirty-nine brakemen have already been dismissed, or transferred to other work, on the Pittsburgh division of the Pennsylvania Railroad, on account of the repeal of the full-crew law of Pennsylvania. These men were on through passenger trains.

The Southern Pacific, with its oil burning locomotives, runs passenger trains from New Orleans to El Paso, 1,194 miles, with only two changes. The runs are from New Orleans to Houston, 362 miles; Houston to Del Rio, 380 miles and Del Rio to El Paso 452 miles.

The hearing before an examiner of the Interstate Commerce Commission regarding the expenditures of the Pennsylvania Railroad for locomotive repairs made by the Baldwin Locomotive Works was resumed at Washington on May 9. J. T. Wallis, chief of motive power, was the principal witness.

The Great Northern has abolished its Havre division, effective May 5. The lines of this division from Havre, Montana, to Cut Bank have been added to the jurisdiction of the Montana division and the lines from Pacific Junction to Gibson, Great Falls to Shelby and Virden to Sweet Grass have been added to that of the Butte division.

The Railroad Commission of California has authorized the Sugar Pine Railway to discontinue service as a common carrier, since neither present nor prospective revenues are sufficient to justify further operation. The Sugar Pine Railway operates a standard gage line in Tuolumne County, Cal., from Ralph to Lion's Dam, a distance of 16 miles.

Train accidents investigated by the Bureau of Safety of the Interstate Commerce Commission in the last three months of 1920—October, November and December—numbered 34, and the summary of the reports of these investigations—No. 6—has just been issued. The list includes 13 rear collisions, six butting collisions, four miscellaneous collisions and seven derailments.

Four employees of the Columbus & Greenville were killed and several others injured as a result of the wrecking of a double-header freight train 15 miles west of Columbus, Miss., on April 30. The accident was caused by the tender of the second engine leaving the track as the train was backing down grade into Columbus, causing both engines to leave the track and overturn.

The Interstate Commerce Commission has announced a hearing on the protest filed by the Kansas City Southern to the supplemental tentative valuation recently issued by the commission at Kansas City, Mo., on May 25, before Examiner Hartman. A hearing on the protest of the San Pedro, Los Angeles & Salt Lake will be held before Examiner Hartman at Los Angeles on June 6.

Electrical Hazards and Safeguards Against Them, is to be the subject for discussion at the meeting of the American Society of Safety Engineers, at 29 West 39th street, New York, on Friday evening, May 27. H. S. Balliet, assistant terminal manager, Grand Central Station, will describe the safety equipment of that terminal, and there will be illustrated papers by C. O. Van Dannenberg, W. W. Samuels and L. E. Smith.

An exhibit of transverse and longitudinal fissures in rails is being displayed in the offices of Robert W. Hunt & Co., Chicago, as a means of acquainting railway men with the true character of these serious causes of rail failures. Of

particular interest are samples of rails containing fissures that have not yet resulted in complete failure and disclosing how very little evidence there is to indicate the presence of these dangerous flaws.

The Freight Claim Division, of the American Railway Association, will hold its thirtieth annual session at the Hotel Sherman at Chicago, on May 17, 18 and 19. Coronado Beach, Cal., had been selected as the place of meeting, and later Denver was substituted; but the present railroad situation made necessary a further consideration and Chicago was selected. The report of the committee on cause and prevention will occupy the attention of the members on the 18th.

The Signal Appliance Association, F. W. Edmunds, secretary, announces that in connection with the signal engineers' convention at Hotel Drake, Chicago, June 6-8, there will be a general luncheon each day, Monday, Tuesday and Wednesday, and a dinner on Tuesday evening; luncheon tickets to be on sale Monday morning and dinner tickets on Tuesday morning. Mr. Edmunds announces tentative plans for securing special cars from New York for Chicago on Saturday afternoon, June 4. Another circular will be issued later, and reservations from New York may be made through H. S. Balliet, secretary of the Signal Section, Grand Central Terminal, New York City. Mr. Edmunds suggests that members reserve rooms at the Drake Hotel without delay; rates for single rooms, \$5 to \$7 per day; double rooms, \$6 to \$14.

Misuse of monthly commutation tickets on the Long Island Railroad causes that company an estimated annual loss of \$100,000, and General Passenger Agent P. H. Woodward, in a second circular suggesting that possibly it may be necessary to require the holders of such tickets to paste on them their photographs, says that the stations where the worst offenders live are Far Rockaway, Arverne, Rockaway Beach, Rockville Center, Freeport and Bay Shore. It is further suggested that if citizens would co-operate with the railroads in securing a law imposing penalties for dishonest use of tickets, there would be no necessity of resorting to drastic measures to protect the revenue of the company. A law punishing unauthorized persons for selling, bartering or transferring tickets, now in force in Pennsylvania, accomplishes the desired results, says Mr. Woodward.

Acquisition by the government of all the railroad freight cars in the country at a fair depreciated value, has been proposed to President Harding by S. H. Barker, financial editor of the Philadelphia North American. Mr. Barker proposes that the government issue in payment 15-year serial car trust certificates which he says the railroads can sell readily if they bear a reasonable rate of interest, and thereby can raise additional funds needed for improvements. He has estimated that in this way the railroads could be provided with about \$3,000,000,000 at a cost of around 5½ per cent. Apparently no estimate was made of the amount of such certificates which would have to be given to the holders of the outstanding equipment obligations before the cars could be turned over to the government. The President offered to submit the plan to Senator Cummins if it were placed in written form.

Hearings before W. A. Colston, director of the department of finance of the Interstate Commerce Commission, on the proposal of the New York Central to acquire control of the Chicago Junction and the Chicago River & Indiana, were resumed at Chicago on May 3, when George B. Hanauer, vice-president and general manager of the Indiana Harbor Belt Line, took the stand. Mr. Hanauer maintained, under cross examination by Luthur M. Walter, that the change of the control of the property would be for the good of all con-

cerned and defended his position further under cross examination by representatives of various other interests, including Irving Herriott, attorney for some of the shippers who are opposed to the change and Walter L. Fisher, attorney for the Railway Terminal Commission of the City Council of Chicago. Mr. Fisher tried without success to get an admission that the plan would endanger the unification of all terminals at Chicago, as outlined by the Railway Terminals Commission of the City Council. Hearings during the first part of the week, commencing May 8, were concerned with the valuation of the property and will be continued throughout the week.

### February Operating Statistics

The net ton miles of revenue and non-revenue freight handled by 170 Class I railroads for the month of February, according to the Interstate Commerce Commission's monthly bulletin, was 24,915,000,000 as compared with 32,958,000,000 in February, 1920. The average car miles per car day was 21.3 as compared with 22.3 in 1920, but the net tons per loaded car showed a slight increase, 28.4 as compared with 28.3. The average train load was 618 tons as compared with 675. The coal consumption in road service was only 5,792,000 net tons as compared with 7,505,000 in 1920. The percentage of serviceable cars was 9.8 as compared with 6.5 in 1920 and there were 7,463 unserviceable locomotives as compared with 7,730 in 1920.

### Meeting of Railroad Division A.S.M.E.

A meeting of the Railroad Division of the American Society of Mechanical Engineers will be held on Thursday, May 26, at 10:00 a. m., in the Congress Hotel, Chicago, in connection with the spring meeting of the society. Three professional papers will be presented and discussed as follows: The Design of Large Locomotives, by M. H. Haig, mechanical engineer of the Atchison, Topeka & Santa Fe; The Needs for the 2-10-2 and Other Heavy Freight Locomotives for Road Service, by A. F. Stuebing, mechanical department editor of the *Railway Age*, and the Necessity for Improvement in the Design and Operation of Present-Day Locomotives, by H. W. Snyder, mechanical engineer of the Lima Locomotive Works. Following the discussions of these papers a business meeting of the division will be held.

### Store Door Delivery

According to an announcement by the Federal Highway Council, Washington, D. C., store door delivery of freight is to be established in Baltimore, Md., plans for the enterprise having been agreed upon at a conference between merchants of the city and representatives of the Pennsylvania, the Baltimore & Ohio and the Western Maryland Railroad. A local committee, of which A. E. Beck is chairman, has been appointed to work out the details. General store delivery was in operation at Baltimore, and also at Washington, for several years but was finally abolished because of an order by the Interstate Commerce Commission, made after hearing various complaints, in which the conduct of the railroads in this delivery business was unlawful and discriminatory because of the use only in these two cities and not in other places.

### Protests Against Valuations

Protests against the supplemental tentative valuations served by the Interstate Commerce Commission on March 31 have been filed with the commission by the Kansas City Southern, the Atlanta, Birmingham & Atlantic and the Winston-Salem Southbound. The Kansas City Southern declares that it had introduced evidence that its property was worth \$80,000,000 and the commission has given no analysis of the methods by which it found the property to be worth a smaller sum. It is stated that the commission has ignored the earning power of a carrier, which is the most important, if not the controlling factor, and it has apparently ignored the stock and bond value, which for the five-year period preceding the valuation was approximately \$62,000,000, or \$13,000,000 greater than the final value found by the commission. The protest

also enumerates various items which it asserts the commission has not taken into consideration.

The Winston-Salem Southbound protest objects to the finding of a final value less than its original cost.

### A Canadian View

Hon. F. B. Carvell, chairman of the Board of Railway Commissioners for Canada, in a recent speech at Calgary, Alberta, responded to the calls for a general reduction in freight rates by saying that three essential preliminaries would be: a rearrangement of the working conditions of railroad employees; a reduction in service and a reduction in the price of coal.

"A healthy situation for the railways is just as necessary to the west as sunshine and rain. Without railways the west would still be the home of the Indian and the buffalo."

Mr. Carvell briefly reviewed conditions. It took, he said, \$22,000,000 for the Canadian railways to pay the retroactive part of the Chicago award. The payroll for the Canadian National prior to the McAdoo award was \$43,265,000. It was estimated the payroll for the present year would be \$81,347,000. The Canadian Pacific payroll prior to the award was \$56,190,000. The estimate for this year was \$100,000,000. He would like to see the day, he said, when Canadian business men, Canadian railwaymen and railway officials could gather round a table and settle their own differences, instead of adopting awards made in the United States.

### Revenues and Expenses for March

A preliminary compilation of the returns to the Interstate Commerce Commission by 198 Class I roads for March show a net operating income of \$13,894,000 as compared with \$15,100,000 for March last year. The total operating revenues were \$458,000,000 as compared with \$459,000,000 last year. The operating expenses were \$399,000,000 as compared with \$419,000,000 last year, a reduction of 4.8 per cent. The preliminary report is as follows:

	1921	1920	Per cent of increase
<b>Total Operating Revenues:</b>			
Eastern District .....	\$205,864,936	\$204,085,540	0.9
Southern District .....	75,187,344	77,105,600	d 2.5
Western District .....	177,309,246	178,076,094	d 0.4
United States .....	458,361,526	459,267,234	d 0.2
<b>Total Operating Expenses:</b>			
Eastern District .....	183,721,741	197,523,582	d 7.0
Southern District .....	65,846,562	65,998,267	d 0.2
Western District .....	149,861,144	155,843,322	d 3.8
United States .....	399,429,447	419,365,171	d 4.8
<b>Net Railway Operating Income:</b>			
Eastern District .....	10,547,118	Def. 2,642,991	499.1
Southern District .....	5,268,444	8,526,446	d 38.2
Western District .....	15,078,503	9,217,282	63.6
United States .....	30,894,065	15,100,737	104.6

### Business Men Endorse Secretary Hoover's Plan for Reorganization of Department

Plans for reorganization of the Department of Commerce and increasing its scope so as to make it more helpful to the business of the country were discussed at a conference at Washington on April 29, between Secretary Hoover and a large number of business men representing the most important industries of the country, whom he had invited for that purpose. The men attending the conference later drew up a letter addressed to the Secretary as embodying their views, which endorsed the opinion which he had previously expressed that the department should embrace all the non-regulatory bureaus of the government relating directly to industry (as distinguished from agriculture), to trade and to transportation. The letter said that the Department of Commerce had never developed to the scope implied in the act of Congress which created it. It was suggested that the whole statistical activities of the government relating to production, stocks, consumption and distribution, and movement of the basic commodities, excluding agriculture, should be concentrated in the department and the opinion was expressed that the basic industries would voluntarily aid the department in the collection of vital statistics.

REVENUES AND EXPENSES OF RAILWAYS

MONTHS OF MARCH AND THREE MONTHS OF CALENDAR YEAR 1921

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF MARCH AND THREE MONTHS OF CALENDAR YEAR 1921—CONTINUED

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Operating revenues, Total operating revenues, Maintenance of way and structures, Traffic, Trans- portation, General, Total, Operating ratio, Net from railway operation, Operating income (or loss), Net after losses, Increase (or decrease) last year.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF MARCH AND THREE MONTHS OF CALENDAR YEAR 1921—CONTINUED

Table with columns: Name of road, Average mileage operated per month, Operating revenues (Total, Inc. mac.), Freight, Passengers, Maintenance of way and structures, Traffic, Tonnage, Net operating revenue, Operating expenses, Net from railway, Operating income, Net after rentals, Increase (or decrease) comp. with last year.

(a) War taxes included in March, 1921, \$1,555,515 and in period January to March, inclusive, \$1,625,115. Amounts include collections in revenue for month, alone, and for the period \$938. Includes Pullman surcharge collections for the month of March, 1921, amounting to \$16,865.51, and for the three months of March, 1921, amounting to \$49,609.99. Includes \$349,922 surcharge upon passengers using parlor cars, period ending March 31, 1921.

Stolen Freight

Charles M. MacDonald, freight claim agent of the Boston & Maine, speaking before the New England Railroad Club at the April meeting, in Boston, on freight claims, their cause and prevention, declared that the tremendous amounts paid out by the railroad on account of theft must be taken as showing conclusively that it is the field where the greatest effort must be put forth looking to a remedy. On the Boston & Maine in 1920 over 2 per cent of the gross freight revenue was paid out for loss and damage to freight; and of this gross amount, over a million dollars, more than 11.43 per cent was chargeable to robbery, either of entire packages or in the breaking of packages. This, however, was not the total amount of thefts, for unlocated losses amounted to 32.10 per cent, and of these losses no doubt a considerable portion should be charged to thievery. Citing notable cases, Mr. MacDonald mentioned the theft of two automobiles from a car standing at a junction point and at another place, where a car was held because of an embargo; shoes were stolen to the amount of \$4,000.

Mr. MacDonald hopes that some inventor will arise to give us a better lock for freight cars. The Boston & Maine has appointed a general committee, the duty of which is to formulate and describe proper measures to promote the safe and correct handling of freight.

The Wise Course for Labor Leaders

P. H. Callahan, president of the Louisville (Ky.) Varnish Company, addressing the Brotherhood of Railroad Trainmen at one of their meetings recently, reminded the brakemen that public opinion and the power of the press must be fully considered. "You are in no position to fly in the face of these two powerful instrumentalities that can either be so helpful, or so damaging to your movement," he said. "Your only wise course at the present time is to accept the view of the public and the press that wages and hours must be made to conform to present conditions. It is the part of everyone to bear his own portion of the present burden, even if temporarily it means lower wages and longer hours. You participated in the profits during the time of prosperity and, if the present problem is approached in the proper spirit by your leaders, you will be able to hold the fundamentals which were established during recent years. There was never in the history of this country a time when there was so much at stake. Care and caution will have to be exercised by labor leaders if they are to have a strong appeal to public opinion. During the war, railroad workers participated in the profits and prosperity of the times more, perhaps, than any other class of workmen outside of munition workers; and, better still, were given a definite status; their necessity to industry and society is recognized as never before. There has been a great change in the minds of employers. Moreover, capital, as well as labor, has its anxieties."

Authority of I. C. C. Over Transportation of Explosives and Dangerous Articles Increased

Under the provisions of the bill known as H. R. 12161, which was passed and approved on March 4, 1921, the authority of the Interstate Commerce Commission over the transportation of explosives was extended to include all other dangerous articles and to embrace transportation both by land and by water. The provisions of the new act apply not only to carriers engaged in interstate commerce, but also to shippers of these explosives and other dangerous articles.

The regulations heretofore promulgated by the commission were authorized by the act of March 4, 1909, which gave the commission authority to prescribe just and reasonable regulations to promote safety in the transportation of explosives. There was no specific authority for the commission to prescribe similar regulations for other dangerous articles, but these regulations were prescribed under the authority of the Mann-Elkins Act of June, 1910. The act of March 4, 1909, limited the authority in the case of explosives to transportation by land.

One of the new features of the act is the inclusion of specific authority for the commission to utilize the Bureau of Explosives in the enforcement of its regulations. No action at this

time is necessary on the part of any of the railroads. The regulations of the commission and of the Bureau of Explosives will be revised in accordance with regular practice to conform with the new law and new regulations will be prepared to apply to steamships.

### Railway Business Association

President A. B. Johnson has announced the new members of the executive committee, elected or appointed at or since the March meeting, and the full list of members, as issued by Secretary Frank W. Noxon, is as follows:

President, Alba B. Johnson, Philadelphia.

Honorary Vice-president, Geo. A. Post, New York.

Vice-presidents: W. W. Salmon, Rochester, N. Y.; W. W. Willits, Chicago; Knox Taylor, High Bridge, N. J.; W. H. Woodin, New York; S. G. Allen, New York; Stephen C. Mason, Pittsburgh; Charles J. Symington, New York.

Executive Members: V. C. Armstrong, New York; J. C. Bradley, Buffalo; S. P. Bush, Columbus, O.; Robert F. Carr, Chicago; J. S. Coffin, New York; S. M. Curwen, Philadelphia; G. F. Downs, Buffalo; Andrew Fletcher, New York; Howard A. Gray, Chicago; Irving T. Hartz, Chicago; A. L. Humphrey, Pittsburgh; E. J. Kearney, Milwaukee; R. P. Lamont, Chicago; Frank J. Lanahan, Pittsburgh; E. B. Leigh, Chicago; Herbert I. Lord, Detroit; Burton W. Mudge, Chicago; A. H. Mulliken, Chicago; W. G. Pearce, New York; J. G. Platt, Boston; F. A. Poor, Chicago; William E. Sharp, Chicago; S. L. Smith, Cleveland; Alexander Turner, New York; E. H. Walker, New York; H. H. Westinghouse, New York; W. E. Clow, Chicago.

Secretary, Frank W. Noxon, Liberty building, Philadelphia, Pa.

To avoid too great a difference in the resident contingents and to promote attendance at the New York and Chicago meetings, the number of eastern members has been increased so as to make New York and Chicago equal as regards representation.

### L. F. Loree Answers Lauck's Charges

At the annual meeting of the stockholders of the Delaware & Hudson, L. F. Loree, president of the company, answered charges made by W. Jett Lauck, economist for the unions affiliated with the American Federation of Labor, as follows: Mr. W. Jett Lauck, consulting economist, charged before the United States Railroad Labor Board in his attack on the honesty of railroad finances, that the Delaware & Hudson company has since 1911 issued securities in the par amount of \$34,951,000; that these securities were sold for \$33,889,609. These amounts are correct except that he understates the amount received by \$30,116. They cover four transactions for the raising of new funds to be used for Additions and Betterments, and for refunding maturing securities. But Mr. Lauck then goes on to charge that the difference is in fact water and that the public is wrongfully required to pay a return thereon. As a matter of fact, all four issues were submitted to the Public Service Commission, and, after examination, were approved by them and sold at prices approved by them. The discount, which was really \$1,031,275, was charged against the profit and loss account, as required by the Public Service Commission and by the Interstate Commerce Commission and was not added to the cost of your property devoted to public use.

"Such statements are characteristic of Mr. Lauck. He has that type of mind where, being disappointed in the results of a mathematical calculation, he calmly turns the 6's upside down, uses them as 9's and maintains the new result is the correct one, since he has, he insists, used the same figures. We came to know Mr. Lauck last spring when he testified before the Anthracite Wage Arbitration Board and where he was thoroughly discredited. Such a man, of course, cannot long continue to deceive the country, nor by his false statements do your company any lasting harm. No organization in these times would appear to be complete without a research bureau, and a 'consulting economist,' and the results are sometimes weird. Shareholders should not be disturbed by their outgivings."

## Traffic News

The Senate committee on interoceanic canals on May 9 began a hearing on bills which propose to exempt American coastwise vessels from the payment of tolls for the use of the Panama Canal.

The Chicago & North Western and the Union Pacific will restore the Denver Special, the overnight train between Chicago and Denver, on May 29. This train will leave Chicago at 6:05 p. m. daily, arriving in Denver at 8:59 p. m. the next day.

The Railroad Administration has issued a circular advising the carriers that were under federal control that claims by shippers for overcharges not filed with the Interstate Commerce Commission by March 1 may be filed direct with the appropriate carrier up to September 1. The previous order that all claims be filed by March 1 aroused a storm of protest among shippers.

According to a statement sent to the press on May 10 by the "Producers and Shippers of Perishable and High Tonnage Commodities on Pacific Coast," eastern agents of the California fruit growers in New York, Pittsburgh, Baltimore and Chicago have wired the home offices they will be unable to handle the California products this year because of "the exorbitant prices caused by high freight rates" from the coast and because the competition of Eastern fruit and vegetables "makes it impossible to market the California products."

An indication that business conditions throughout the country are getting better is found in the fact that the volume of distribution by jobbers and retailers showed a distinct gain in March over February, says Archer Wall Douglas, chairman of the committee on statistics and standards of the Chamber of Commerce of the United States. The whole tone of Mr. Douglas' report is optimistic. He points out many signs as indicative of an improvement in the situation, and as tending to foreshadow a return to more settled and stable conditions. However, he says: "Excessively high railroad rates are one of the serious handicaps of the situation, while they likewise fail in their original purpose of providing adequate revenue for the roads. They are prohibitory in their effects. In some cases, especially those of early fruits and vegetables from the far south to northern and western markets, the cost of transportation is from four to five times the price received by the producer."

### Coal Production

The production of soft coal continued to recover during the week ended April 30, though at a diminishing rate, according to the weekly bulletin of the Geological Survey. The total output was estimated at 6,921,000 net tons, an increase as compared with the week preceding of 101,000 tons, or 1½ per cent. In spite of the recovery, the rate of output is at the lowest level touched at any time since April, 1914, except for the period of the great strike of 1919. Moreover, as consumption and exports combined are undoubtedly in excess of 6,900,000 tons a week, the draft upon consumers' stocks of coal, which amounted to perhaps 8,000,000 tons during the first quarter of the year, still continued.

Advance figures on stocks of railroad fuel were published last week in the Geological Survey's preliminary report on consumers' stocks. Additional returns since received by courtesy of the American Railway Association confirm the preliminary results and a report for 319 railroads shows that from January 1 to April 1, these roads reduced their stocks by nearly 92,000 tons, barely 1 per cent, and the stock remaining on April 1 was sufficient for three weeks and three days' operation at the rate of consumption prevailing in the first quarter of the year. The bulletin says it, therefore, appears that while railroad fuel coal purchases have seemed to the coal operator disappointingly small, the actual acceptances by the carriers have been sufficient to meet their current requirements, in view of their present reduced rate of consumption.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended from June 1 until August 18, the operation of certain schedules which provide increased Class B rates from Ohio river crossings to certain South-eastern points.

The commission has further suspended until June 17 the operation of a supplement issued by the American Railway Express Company which provides increased minimum weights on kale, lettuce and spinach.

The commission has suspended from May 11 to September 8, the operation of certain schedules which provide for changes in the carload rates on pig iron from certain points in Alabama, Georgia, Tennessee and Virginia to various points in Louisiana, Oklahoma and Texas.

The commission has further suspended until June 22 the operation of certain schedules which provide for the cancellation of the existing proportional commodity rates on iron poles, pipe and pipe connections between Mississippi river crossings and points in Iowa.

The Interstate Commerce Commission has issued a decision applying its findings in the Montana intrastate rate case, in which it ordered the rates raised by the percentages applied to interstate rates to the charges of the Butte, Anaconda & Pacific, as to which a separate hearing was held.

The Interstate Commerce Commission has rendered its decision in the North Dakota intrastate fare case finding that the rates within the state maintained by state authority are unduly preferential against interstate commerce and ordering the discrimination removed by the application of the percentages of increase authorized by the commission in ex Parte 74.

The commission has suspended, from May 9 until September 6, proposed minimum shipment requirement of 6,120 quarts to apply on milk and cream in less carloads in special baggage cars (no icing), or in open iced milk or refrigerator cars from points on the Central Vermont. At present no minimum shipment requirement is published to apply on this kind of traffic either locally or jointly from points on the Central Vermont.

The commission has suspended from May 10 to September 7, the operation of certain schedules contained in tariffs of the Illinois Traction System which provide for cancellation of existing switching rate of 14 cents per net ton on brick, in carloads, from Danville to Bronson, Ill., when destined to points on and via the Chicago & Eastern Illinois, and establishment in lieu thereof of a proportional commodity rate of 56½ cents per net ton.

The commission has suspended from May 10, until September 7, the operation of certain schedules published in a supplement to St. Louis-San Francisco tariff, which provide for the cancellation of the existing through rate of 42 cents per 100 pounds on plaster from Southard, Okla., to Brooklyn and New York, N. Y. (Gulf Line Piers), applicable via Galveston, Texas, and the Morgan or Mallory Steamship Lines, leaving combination rate of 90½ cents per 100 pounds applicable instead.

The commission has further suspended until July 1, the operation of certain schedules published in a Baltimore & Ohio tariff, which provide a switching charge of 55 cents per 2,000 pounds for switching coal, coal boulets or briquettes and coke, carloads, from points of connection with the Chesapeake Western to private sidings on the Valley, also to connections with the Southern, the operation of which was suspended until June 1, by an order previously entered in the same proceeding.

The commission has suspended until September 3 the operation of all schedules published by the Southern which propose to restrict interchange with other lines at Atlanta, and providing that traffic will be interchanged with connecting lines only at certain points indicated. The proposed designated point of interchange between the Southern and the Louisville & Nashville is Decatur street, and industries more than three miles distant from this point would be assessed a switching charge of 1½ cents per 100 lb., whereas the present charge on coal, for instance, is \$2.50 per car.

### State Commissions

The Railroad Commission of the State of California, on April 26, ordered the railroads in the Los Angeles, Cal., Plaza district, to construct a union passenger terminal in that city and to eliminate grade crossings at Macy, Aliso and Seventh streets. The case has been pending since 1917. The order requires the Southern Pacific, the Atchison, Topeka & Santa Fe, the Los Angeles & Salt Lake and the Pacific Electric systems to join in the station construction and also indicates what grade separation is to be made by each, excepting the Pacific Electric which will be treated in a subsequent order. The order also directs that the new terminal is to be built in a district bounded by Commercial, North Main and Redondo streets, Alhambra avenue and the Los Angeles river. The cost of construction is to be borne by the four roads, and no attempt is made at this time by the commission to divide this cost.

### Personnel of Commissions

E. I. Lewis, who, with J. B. Campbell, on April 27 was appointed by President Harding to the Interstate Commerce Commission and was confirmed by the Senate on May 3, arrived in Washington the first of this week and immediately entered upon his new duties. He comes to the commission from the chairmanship of the Public Service Commission of Indiana. While the bulk of his work there was in the field of public utilities, including electric interurbans, he had attracted attention by carrying through the long-fought-out Indiana-Illinois freight rate controversy. His record was such that he had the support of Senators New and Watson, Postmaster-General Hays, Governor Warren T. McCray, former Governor James P. Goodrich and other leaders in the state. Mr. Lewis is 48 years old. His education, as far as schools were concerned, was limited to two six-months' terms in a one-room country school. At 11 years of age he became a printer's apprentice. He advanced to a journeyman printer and foreman of a daily newspaper, and was a member of the Typographical Union. At 22 he became a newspaper reporter and worked through the various steps of that profession up to that of correspondent. His particular bent seemed to be that of investigation and constructive suggestion. He was sent to New Zealand, Australia, South Africa, Japan, China, Manchuria, Siberia, Korea, Russia, India, and to Europe on several occasions on investigations. In this connection his attention was particularly centered on governmental machinery and policies and, necessarily, on the important part that railroads play in economic and political affairs of government.

Four years ago, when he was selected by Governor James P. Goodrich of Indiana primarily for the purpose of extricating both the Indiana commission and the public utilities and common carriers from politics, he found a docket with 634 open or undecided cases—practically a year's work. This was soon reduced to a point where the commission was abreast with current affairs, and when last week he turned the executive office of the commission over to John W. McCordle, his successor as chairman, there were but 58 live unheard cases pending, or less than the normal current monthly finding. Mr. Lewis, when on the Indiana commission, is understood to have held that the creation of commissions was the result, very largely, of delays occasioned by handling matters through formal tribunals, and that the whole salvation of at least utility regulation lies in dealing with the present and the future rather than with the past.

## Foreign Railway News

### Italian Assistance for Roumanian Railways

LONDON.

It is reported that a representative of the Italian Railway Administration recently arrived at Bucharest for the purpose of studying the question of reorganizing the Roumanian railways and the participation of Italian capital and the employment of Italian workmen in such enterprise. A conference between the representative and the Roumanian Ministry of Communications has taken place regarding the possibility of an agreement being made in this connection.

### Disabled Italian Soldiers Occupy Railway Premises

LONDON.

The soldiers disabled in the war have occupied the premises of the Italian Railway Administration requesting that they should be put in the places of women engaged during the war as stenographers, and so forth. They were removed from the premises by the police, but about 5,000 with but one leg or one eye, attacked the police patrol on duty at the gate of the premises and occupied the offices again. The general manager of the Railway Administration has agreed to replace 5,000 girls engaged during the war with 5,000 disabled soldiers.

### European Bids on Track Materials for Chile

Bids on steel rails, rail joints, spikes, bolts, switches and crossings of a total value of about \$1,800,000 which were received and opened at Santiago, Chile, on March 17, by the state railways included bids from German, French and Belgian manufacturers, in addition to American, according to advices from Commercial Attaché McQueen. The bids received from the Germans were considerably lower than the others but their failure to comply strictly with the specifications, including terms of payment, may prevent their receiving the award, and it is considered probable that all bids may be rejected pending possible reduction in prices.

### Financial Position of the English Railways

The railways of Great Britain are still under government control and are operating under guaranties. Consequently, it is not difficult to understand that the annual reports for 1920, most of which have been made public, show little change in net earnings over 1919. The annual report of one of the companies, the London & North Western, shows this relative uniformity. Some of the principal figures of this report follow:

	1920	1919
Receipts in respect of railway working under Government control.....	\$195,905,871	\$152,484,877
Expenditures.....	165,630,982	122,868,158
Net receipts.....	30,274,889	29,616,719
Other net receipts—miscellaneous, rents, etc.....	3,080,744	3,468,644
Total net income.....	33,355,633	33,085,363
Brought forward from previous year.....	1,316,039	1,284,712
Total.....	\$34,671,672	\$34,370,075
Less—Interest, rentals and other fixed charges.....	8,194,388	7,957,633
Balance after payment of fixed charges.....	\$26,477,284	\$26,412,442

Note: Pounds to dollars at par.

The report does not separate operating income from returns received under government contracts and consequently no measure of its actual earning power is given. The company was enabled to pay 7½ per cent on its ordinary stock in 1920. In spite of this comparatively high dividend rate, the company's stock has been selling in the market at around 70. This low figure may be taken as the market's discount on what it thinks the position of the company will be when government control ceases next fall. During the period of government control the expenses of the carriers have increased tremendously. The chairman of the company, in addressing the annual stockholders' meeting said, in part:

"Our wages bill in 1913 was \$29,160,000 and in 1920 it had reached the enormous figure of \$97,200,000. The various grades (of employees) have been standardized; that is to say, all men doing the same kind of work receive practically the same rates of pay, whether they are employed at the busiest center or at the smallest and most remote stations. . . ."

Relative to the government's proposal to group all the railways into a few large systems, the chairman said, in part:

"There can be no question that, with the present high wages and reduced hours, no possible economies can be effected by any system of grouping the railways or by any other means that we can see will without a further considerable increase in rates and fares, restore the pre-war net revenue earning capacity of the railways, and it must be remembered that increases of rates and fares cannot be carried too far without defeating their object by destroying the traffic. . . ."

### March Car Exports

Ten passenger cars, valued at \$237,730, were exported in March, twice as many as in February. The February totals showed a sharp decline over January in freight car exports and the March totals evidence an even sharper slump in this business. The March shipments totaled 707, valued at \$1,327,959, or a little more than half the February exports. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Passenger		Freight and other		Parts of cars Dollars
	Number	Dollars	Number	Dollars	
France.....	.....	.....	.....	.....	13,011
Malta, Gozo & Cyprus Is.....	.....	.....	.....	.....	175

### Foreign Capital Influences Chinese Railway Purchases

The invitation by Chinese bankers on behalf of the Ministry of Communications for bids on rolling stock to be supplied to the government railways (*Railway Age*, April 22, page 1005) is said by Trade Commissioner Frank Rhea, Peking, to constitute for all practical purposes an invitation for bids by the Ministry itself. Inasmuch, therefore, as certain of the government railways have been financed to a considerable extent by foreign concerns under contracts restricting the powers of the Ministry in many ways, some of these foreign interests are maintaining that on certain railways the equipment to be purchased must, under terms of their agreements, be purchased from manufacturers of their own respective countries. For instance, a British company, which has assisted in financing the Tientsin-Pukow, the Shanghai-Nanking and the Shanghai-Hangchow-Ningpo lines, is claiming that its contract provides that it shall have the option for the purchase of equipment and supplies for these lines and, furthermore, that under the agreement British concerns must be given preference in placing orders for materials.

## Train Reductions in England

LONDON.

On account of the continuation of the coal strike and the severe shortage of coal, the English railways have put into effect a reduced schedule which amounts to about 50 per cent reduction in train mileage. The greatest reduction is made in the long distance runs where the train mileage is the greatest. In addition the number of cars per train has been decreased. Some sleeping cars and luncheon cars have been removed from service and a very determined effort is being made to reduce fuel consumption.

At the present time negotiations between the miners and the mine owners are not in progress. The miners persist in their demands for the national wage board and the national pool for wages, the latter being a demand which neither the mine owners nor the government will consider. Industry throughout Great Britain has been seriously penalized through the lack of coal and unemployment is constantly increasing. The railway union which threatened to refuse to handle the coal has agreed to handle coal only for delivery to public utilities and for household consumption.

## Stagnation of Transportation in Austria

Although the railway situation in Austria is very serious and many years may be required to restore conditions to normal, every effort is being put to improve conditions, according to Colonel W. B. Causey, American Technical Adviser to Austria, and measurable progress is being made. One of the greatest needs of Austria and of all central Europe at the present, says Colonel Causey, is locomotives. The Austrian locomotive shops are filled with bad order engines and they have orders from neighboring states far in advance of their capacity. These shops are laboring under a great handicap in the lack of raw material and coal and to add to their labor difficulties their employees are greatly undernourished. The accompanying photograph

An Austrian Munitions Factory Converted to a Locomotive Shop

shows the progress being made by one concern. During the war this plant manufactured munitions but after the armistice it was converted to a locomotive shop. The capacity of this plant is 50 locomotives but it is being extended to take care of 80 locomotives at one time. At present every available stall in the shop is filled and 2,000 men are employed.

Austrian iron mines, blast furnaces and rolling mills have been idle for practically two years because of the inability to secure coke and coal. All the coke producing territory as well as the other coal mines are either in Czechoslovakia, one of the new states carved out of the old empire, or in Upper Silesia (Germany). Present Austria produces only lignite and that of a poor calorific value, and only about 15 per cent of the fuel needs of the country.

The settlement of the Austrian question is in the hands of the Reparations Commission in Paris which has been working for many months over the allocation of coal and coke; credits to pay for food, coal and other raw materials; and the rehabilitation of the financial system—so far without visible results.

## Equipment and Supplies

### Locomotives

THE SANTO RAILWAY, Shantung province, China, has ordered 6 Consolidation type locomotives, from the Baldwin Locomotive Works.

THE INTERNATIONAL & GREAT NORTHERN reported in the *Railway Age* of January 7, as inquiring for four Mikado and four switching locomotives, has ordered eight locomotives from the Baldwin Locomotive Works.

THE SHANTUNG RAILWAY has ordered 3 Pacific type locomotives from the American Locomotive Company. These locomotives will have 20 by 26 in. cylinders and a total weight in working order of 175,000 lbs. They will be equipped with superheaters.

### Freight Cars

THE CHICAGO GREAT WESTERN is inquiring for prices on the repair of 400 box cars.

THE TIENTSIN-PUKOW (China) is asking for prices through New York export houses, on 100 all-steel box cars of 40-tons capacity.

THE WOO HANG (China) is asking for prices through New York export houses, on 40 composite gondola cars, of 40-tons capacity.

THE PEKIN KALGAN (China) is asking for prices through New York export houses on 450 gondola cars and 500 box cars of 40-tons capacity, 30 box cars of 30-tons capacity and 20 cattle cars.

THE PEKING-SUIYUAN (China) is asking for prices through New York export houses, on 450 all steel box cars and 100 all steel gondola cars, of 40-tons capacity.

### Iron and Steel

THE DOMINION GOVERNMENT has ordered from the Algoma Steel Corporation, 50,000 tons of rails for the Canadian National Railways.

THE ST. LOUIS SOUTHWESTERN has ordered 270 tons of steel from the Virginia Bridge & Iron Company, for a bridge over the Trinity river in Texas.

THE BALTIMORE & OHIO has ordered from the Bethlehem Steel Bridge Corporation, 850 tons of fabricated steel, for a bridge at Foxburg, Pa.

THE MAINE CENTRAL reported in the *Railway Age* of April 1, as inquiring for 400 tons of fabricated steel, for a bridge at Norridgewock, Maine, has ordered this steel from the Bethlehem Steel Bridge Corporation.

### Machinery and Tools

THE NEW YORK CENTRAL is inquiring for one 48-in., 500-ton, double-end wheel press.

### Miscellaneous

THE MISSOURI PACIFIC is inquiring for 500,000 high carbon steel tie plates.

THE AMERICAN ASSOCIATION of Dining Car Superintendents will hold a special meeting at Chicago in connection with the National Hotel and Restaurant Week, commencing July 12.

## Supply Trade News

R. S. Cowan has succeeded A. W. Hillis as railroad representative of the Western Electric Company at Detroit, Mich.

The Nathan Manufacturing Company has removed its general offices from 512 Fifth avenue to 21 East Fortieth street, New York City.

Raymond R. Bilter, formerly secretary of the Trumbull Waste Manufacturing Company, Philadelphia, Pa., is now associated with the Railway Supply & Manufacturing Company, Cincinnati, Ohio.

Arthur G. Johnson, for fourteen years with the Vapor Car Heating Company, Inc., Chicago, and recently with the International Steel Corporation, New York, is now representing the Armspear Manufacturing Company, 447 West Fifty-third street, New York City.

The report that the Ryan Car Company was to move its Chicago offices from the McCormick building, 332 South Michigan avenue, published in this column in the issue of May 6, was incorrect. The company's offices are as formerly in the McCormick building.

D. B. Steinman, formerly special assistant to Gustav Lindenthal, consulting engineer and later professor in charge of civil and mechanical engineering, at the College of the City of New York, has opened an office as consulting engineer at 25 Church street, New York.

Richard Gregory, controller of the Western Electric Company, New York, has been made also a member of its board of directors and S. Wallace Murkland, assistant controller since 1918, has been appointed general contract sales manager; both with headquarters at New York.

Frederick Hayes Wilkins, European general manager of the International Western Electric Company, New York, has been elected a vice-president with headquarters at London, England. This company is the exporting subsidiary of the Western Electric Company, New York.

Sidney G. Johnson, who recently opened an office at 30 Church street, New York City, has been appointed sales representative of the Signal Accessories Corporation, Utica, N. Y. He also represents the Hazard Manufacturing Company, Wilkes-Barre, Pa., as noted in the *Railway Age* of April 29.

The Electric Service Supplies Company, Philadelphia, Pa., will act as exclusive selling agent for the Peerless Equipment Company, Hanover, Pa., manufacturers of Peerless armature repair machinery, and Segur coil winding tools. Heretofore Peerless armature tools were manufactured by the Manley Manufacturing Company, York, Pa., and Segur coil winding tools by the Electrical Manufacturers Equipment Company, Chicago.

E. C. Sattley, associated for 20 years with the Page Steel & Wire Company at Pittsburgh and Monessen, serving a large part of the time as general manager, has joined R. J. Jones, formerly manager, and Oliver G. Boyd, formerly secretary, of the Tube & Pipe Supply Company, in forming a new corporation under the name of the Iron & Steel Products Company, with offices at 230 Fifth avenue, Pittsburgh, Pa. The new organization will continue the business heretofore conducted by the Tube & Pipe Supply Company. E. C. Sattley is president, R. J. Jones, vice-president, and Oliver G. Boyd, secretary and treasurer of the new company.

Wilber Eckels has been appointed western sales manager, with headquarters in the People's Gas building, Chicago, for the Standard Coupler Company, New York. Mr. Eckels graduated from Pennsylvania State College with the degree of mechanical engineer and has been with the Standard Coupler

Company since 1912, with the exception of one year when he served as lieutenant in the 35th Engineers, A. E. F., in France and England. E. G. Goodwin has been appointed chief engineer of the same company with headquarters at New York, vice R. D. Gallagher, Jr., resigned. Mr. Goodwin received his technical education in the Virginia Polytechnic Institute and has been connected with the Norfolk & Western in its engineering department for eleven years.

Homer J. Forsythe, manager of the construction division of the engineering department of E. I. Du Pont de Nemours & Co., Inc., Wilmington, Del., has been transferred to the position of assistant general manager of the Hyatt Roller Bearing Company, Newark, N. J., a subsidiary of the General Motors Corporation. Mr. Forsythe has a wide experience in machine shop work, having been with the engineering department of the Du Pont Company since August, 1906, when he began work at the Wilmington office as estimator. Later he held executive positions at the Brandywine shops, Wilmington, and during the war he was made manager of the combined Wilmington shops which were engaged in the construction of material for the war plants. Since the war, Mr. Forsythe served as manager of the construction division of the engineering department.

## South African Railway Electrification

LONDON.

The Office of the High Commissioner for the Union of South Africa, Trafalgar Square, London, W. C. 2, England, has announced that the time limit for which all tenders regarding the electrification of the Capetown-Simonstown and Durban-Maritzburg Lines, has been extended to noon, July 5, 1921.

## Obituary

Charles Hosmer Morse, chairman of the board of directors of Fairbanks, Morse & Company, Chicago, died on May 5, at his home in Winter Park, Fla. He was born in St. Johnsbury, Vt., on September

23, 1833, and received his education at St. Johnsbury Academy. Mr. Morse began his business career in 1850, as a clerk in the office of E. & T. Fairbanks & Co., scale manufacturers. In 1862, he became a member of the firm of Fairbanks, Greenleaf & Co., Chicago, successors to E. & T. Fairbanks & Co., and on January 1, 1872, when the firm of Fairbanks, Morse & Co. was established, he became president of that company. He retired as president on May 19,

1915, to become chairman of the board of directors of the same company, at which time he was succeeded as president by his son, C. H. Morse, Jr.

C. H. Morse

## Trade Publications

ADVANTAGES OF SUPERHEATED STEAM.—What Every Executive Should Know About Superheated Steam is the subject of Bulletin No. T-7 recently issued by the Superheater Company, New York. The bulletin discusses superheaters for stationary power plants and is designed to appeal to the executives and, therefore, has been made non-technical. After a brief explanation of superheated steam and the methods of producing it, the economies effected by its use are discussed, the concluding section dealing with the application of superheat to existing power plants.

## Railway Construction

**CHESAPEAKE & OHIO.**—This company has entered into an agreement with the county authorities of Logan county, W. Va., for the construction of a bridge across the Guyandot river. The county authorities of Logan county are to construct the substructure and the company is to build the superstructure and the approaches.

**CHICAGO & NORTH WESTERN.**—This company has awarded a contract to Witherspoon and Englar, Chicago, for rebuilding the company's grain elevator on the Calumet river, Chicago, which was destroyed recently by an explosion.

**CHICAGO UNION STATION.**—This company is accepting bids for the construction of a viaduct on Van Buren street, between Canal street and the Chicago river, Chicago.

**ILLINOIS CENTRAL.**—This company will shortly accept bids for the construction of a new turntable at Dubuque, Iowa, and the extension of roundhouse facilities at Dubuque and at Paducah, Ky.

**ILLINOIS CENTRAL.**—This company is accepting bids for the construction of the substructure for its bridge over the tracks of the Chicago, Milwaukee & St. Paul at Genoa, Illinois, to cost approximately \$30,000.

**LOUISVILLE & NASHVILLE.**—This company has awarded contracts to the Roberts & Schaefer Company, Chicago, for the installation of two electrically operated cinder plant equipments at Hazard and Loyall, Ky.

**NEW YORK, NEW HAVEN & HARTFORD.**—This company has awarded a contract to D. O'Connell's Sons, Holyoke, Mass., for regrading a portion of its freight yards and removing and relaying several tracks and cranes at Springfield, Mass., and other work incidental with the construction of the Springfield-West Springfield bridge, now being built under the jurisdiction of Hampden county, Mass.

**SOUTHERN PACIFIC, TEXAS LINES.**—This company has awarded contracts to the W. C. Hedrick Company, Dallas, Tex., for the construction of a three-story storehouse with dimensions of 60 ft. by 208 ft., of reinforced concrete, hollow tile and brick construction, to cost approximately \$100,000, and a coach paint shop of steel construction with dimensions of 173 ft. by 274 ft., to cost approximately \$120,000.

**TEXAS & PACIFIC.**—This company has acquired real estate west of the city of Fort Worth, Tex., which will be the site of future yard and terminal improvements.

**TEXAS & PACIFIC.**—This company contemplates undertaking the construction of a new passenger station at Cottonport, Louisiana.

**TEXAS & PACIFIC.**—This company, which was noted in the *Railway Age* of April 15 (page 958), as accepting bids for the construction of a bridge over Bayou-Plaquemine, La., has awarded a contract for the structural steel and machinery for this work, to the Phoenix Bridge Company.

**UNION PACIFIC.**—This company is accepting bids for the work of lining its Sherman tunnel, near Hermosa, Wyo., with concrete.

**UNION PACIFIC.**—This company has awarded a contract to the Utah Construction Company, Ogden, Utah, for the grading and the construction of bridges along a forty-two mile line from Haig, Neb., west into Wyoming.

**VALDE & NORTHERN.**—The Interstate Commerce Commission after having denied the application of this company for a certificate authorizing construction work by this company has held a re-hearing and issued a report finding that construction work was begun in good faith prior to the effective date of the law requiring certificates by the commission and that, therefore, no certificate of public convenience and necessity is, under the circumstances, required.

## Railway Financial News

**CANADIAN PACIFIC.—Annual Meeting.**—Stockholders at the annual meeting in Montreal, May 4, passed a resolution approving the issuance of bonds, debentures or other securities collateral to consolidated debenture stock which the company is or may hereafter be empowered to issue. Retiring directors were re-elected. President E. W. Beatty, in a statement to the meeting referred to recent financing of the company as follows:

Your directors have recently accepted a proposal for the acquisition by London, England, interests of a substantial amount of four per cent consolidated debenture stock which was very favorable. This is the first application for the acquisition of debenture stock from England since the outbreak of hostilities in 1914, and, in the opinion of your directors, is an incident of the utmost significance as indicating the resumption of interest in your principal capital security in Great Britain. It may conceivably be the first step towards the re-establishment of a market in England for the banking securities of the company which cannot but have an important influence on its future financing.

**CHICAGO, BURLINGTON & QUINCY.—New Directors.**—Arthur C. James, of New York, and Charles Donnelly, president of the Northern Pacific, have been elected directors to succeed J. E. Reynolds and C. W. Bunn, respectively.

**CHICAGO, ROCK ISLAND & PACIFIC.—Asks Authority for Equipment Warrants.**—This company has applied to the Interstate Commerce Commission for authority to issue six lease warrants for \$158,885.54 each, with interest at 7 per cent, payable to the Pullman Company as part payment under the lease plan for 30 steel coaches and five steel chair cars costing \$1,128,840.

**LEHIGH & NEW ENGLAND.—Annual Report.**—The income statement for the year ended December 31, 1920, as compared with the year 1919 is as follows:

	1920	1919
Compensation, January and February.....	\$187,484	.....
Compensation for guaranty period.....	567,463	.....
Compensation for year.....	.....	\$1,135,761
Operating results September 1 to December 31, 1920:		
Total railway operating revenues.....	\$1,897,103	.....
Total railway operating expenses.....	1,401,595	.....
Net from railway operations.....	\$495,508	.....
Railway tax accruals.....	102,937	.....
Railway operating income.....	\$392,571	.....
Net hire of equipment—credit balance.....	108,888	.....
Net joint facility rents—debit balance.....	18,255	.....
Net railway operating income.....	\$483,204	.....
Gross income.....	\$1,255,424	\$1,163,334
Total deductions from gross income.....	408,673	498,813
Net income.....	\$846,750	\$664,521
Balance transferred to profit and loss.....	843,698	661,511

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919 as follows:

	Operating Revenues	
	1920	1919
Anthracite coal freight.....	\$2,659,033	\$2,078,961
Bituminous coal freight.....	479,701	432,909
Merchandise freight.....	1,478,193	1,249,934
Passenger.....	23,572	20,649
Total operating revenues (inc. other)....	\$4,820,406	\$3,981,318
	Operating Expenses	
	1920	1919
Maintenance of way and structures.....	\$789,497	\$573,850
Maintenance of equipment.....	1,048,207	863,067
Traffic.....	70,381	81,772
Transportation.....	1,836,042	1,372,666
General.....	179,466	116,353
Total operating expenses.....	\$3,921,144	\$2,956,117
Net revenue from railway operations.....	\$899,262	\$1,025,201
Tax accruals.....	\$227,775	\$179,671
Total railway operating income.....	\$671,487	\$845,531
Net railway operating income.....	\$903,699	\$833,975
Freight Traffic		
Total revenue tonnage.....	6,881,496	6,749,758
Average ton-miles—revenue freight per train mile.....	560.12	581.25
Average revenue per ton-mile of freight (cents).....	1.80	1.49

**LITTLE ROCK & ARGENTA.—Purchase by Missouri Pacific.**—See Missouri Pacific.

**LEHIGH VALLEY.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—*Authorized to Acquire Road.*—This company has been authorized by the Interstate Commerce Commission to acquire the property of the Wisconsin & Northern by purchase and to issue its 5 per cent consolidated gold bonds to the amount of \$2,671,000 in part payment.

MISSOURI PACIFIC.—*Annual Report.*—The corporate income statement for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919	Increase or Decrease
Railway operating revenues.....	\$98,194,271	.....	\$98,194,271
Railway operating expenses.....	94,909,599	.....	94,909,599
Net revenue railway operations.....	\$3,284,672	.....	\$3,284,672
Railway taxes and uncollectible railway revenue.....	\$3,820,709	\$235,000	\$3,585,709
Total operating income.....	Def. \$536,036	Def. \$235,000	—\$301,036

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued certificates for partial payments to the railroads on account of their six months' guaranty, as follows:

American Railway Express Company.....	\$1,500,000
Buffalo, Rochester & Pittsburgh.....	97,500
Carolina & Northwestern.....	50,000
Chicago, Burlington & Quincy.....	650,000
Chicago, Terre Haute & Southeastern.....	23,000
Cleveland, Cincinnati, Chicago & St. Louis.....	470,000
Peering Southwestern.....	9,500
Kansas, Oklahoma & Gulf.....	90,000
Louisville, Henderson & St. Louis.....	175,000
Martin & Rye Valley.....	8,800
Meridian & Memphis.....	4,000
Mississippi Central.....	245,000
Montpelier & Wells River.....	64,500
New Orleans Great Northern.....	105,500
Paris & Mt. Pleasant.....	20,000
Savannah & Statesboro.....	1,500
St. Paul Bridge & Terminal.....	7,000
Texas & Pacific.....	125,000
Vermont Valley.....	45,000
Virginia Southern.....	2,000

### Dividends Declared

BESSEMER & LAKE ERIE.—Preferred, 3 per cent, semi-annually, payable June 1 to holders of record May 15.

CANADIAN PACIFIC.—Common, 2½ per cent, quarterly, payable June 30 to holders of record June 1.

PITTSBURGH, BESSEMER & LAKE ERIE.—Three per cent, semi-annually, payable June 1 to holders of record May 14.

## ANNUAL REPORT

## The Delaware and Hudson Company—Ninety-First Annual Report

New York, N. Y., April 1, 1921.

To the Stockholders of The Delaware and Hudson Company:

The following presents the income account of your company for the year 1920, arranged in accordance with the rules promulgated by the Interstate Commerce Commission, with comparative results for the year 1919:

	1920	1919	Increase or Decrease
Railway operating revenues...	\$45,354,298.72	\$34,749,709.00	\$10,604,589.72
Railway operating expenses...	42,126,330.91	31,886,711.03	10,239,619.16
Net railway operating revenues	\$3,227,968.53	\$2,862,997.97	364,970.56
Operating income credits:			
Rent from locomotives...	\$100,727.06	\$108,424.04	—7,696.98
Rent from passenger train cars	79,106.12	16,364.66	62,741.46
Rent from work equipment	21,489.56	10,759.33	10,730.23
Joint facility rent income	136,502.10	132,130.79	4,371.31
Total credits	\$337,824.84	\$267,678.82	70,146.02
Gross railway operating income	\$3,565,793.37	\$3,130,676.79	435,116.58
Operating income debits:			
Railway tax accruals...	\$1,186,053.92	\$1,075,802.70	110,251.22
Uncollectible railway revenue			
Hire of freight cars—debit balance	939.26	8,622.03	—7,722.77
Rent for locomotives	79,555.60	Cr. 18,160.12	97,715.72
Rent for passenger train cars	18,447.13	6,595.13	11,851.98
Rent for work equipment	32,593.63	15,513.01	17,080.62
Joint facility rents	1,578.44	994.97	583.47
	428,058.56	376,914.87	51,143.69
Total debits	\$1,747,226.54	\$1,466,322.61	280,903.93
U. S. Govt. compensation guarantee	\$5,621,163.60	\$5,445,404.46	175,859.14
Net railway operating income	\$7,439,730.43	\$7,109,758.64	329,971.79
Non-operating income:			
Income from lease of road	\$88,933.13	\$86,763.87	2,169.26
Miscellaneous rent income	\$85,197.78	\$88,759.68	26,398.10
Miscellaneous non-operating physical property	23,467.84	96,398.09	—72,930.25
Dividend income	1,038,041.03	934,267.98	103,773.05
Income from funded securities	214,969.20	234,251.46	—19,282.26
Income from unfunded securities and accounts	143,876.71	429,666.64	—285,189.93
Income from sinking and other reserve funds	81,374.32	107,245.01	—25,870.69
Miscellaneous income	1,315,427.01	1,474,068.27	—158,641.26
Total non-operating income	\$2,991,287.02	\$3,420,861.00	—429,573.98
Gross income	\$10,431,017.45	\$10,530,619.64	—99,602.19
Deductions from gross income:			
Rent for leased roads	\$1,944,157.01	\$1,964,123.97	—19,966.96
Miscellaneous rents	1,821.25	3,268.00	—1,446.75
Interest on funded debt	3,228,948.12	2,919,237.04	309,711.08
Interest on unfunded debt	303,585.05	412,906.70	—109,321.65
Miscellaneous income charges	19,343.15	626,079.45	—606,736.30
Total deductions	\$5,497,854.58	\$5,925,615.16	—427,760.58
Net income—The Delaware and Hudson Company carried to general profit and loss	\$4,933,162.87	\$4,605,004.48	328,158.39
Percentage to capital stock...	11.61	10.83	.78

## FINANCIAL.

The Delaware and Hudson Company, on December 31, 1920, was capitalized \$2,503,000, there having been no change during the year. The total funded debt on December 31, 1920, was \$68,056,000, a net increase of \$2,953,000. The three-years, five per cent, secured notes aggregating \$9,000,000, issued during 1917, as stated in the annual report for that year, matured on August 1, 1920, and were paid on that date. In order to provide for said three-years notes and for other corporate purposes, the company disposed of \$10,000,000 of its ten-years, seven per cent, secured mortgage bonds, due July 1, 1920, to mature on June 1, 1930, interest payable semi-annually, on June 1 and December 1. During the year, first-lien equipment bonds aggregating \$1,959,000 were purchased through the sinking fund established in connection with their issue. In payment for the 1,500 freight cars allocated to the first and refunding mortgage making the year, \$3,912,000 in the aggregate of equipment notes, bearing date as of January 15, 1920, carrying interest at the rate of six per cent per year, payable semi-annually, on June 1 and December 1, were issued during the year, an equal amount will mature on January 15 of each year, to and including the year 1935.

The sum of \$395,040, being one per cent of the par value of the first and refunding mortgage gold bonds outstanding on June 1, 1920, was paid during the year to the trustee under the first and refunding mortgage making the total paid to December 31, 1920, \$3,636,230. Of the amount paid during the year, \$337,690.83 was expended upon additions and betterments to the mortgaged property in accordance with the mortgage agreement.

There was accumulated in the Coal Department sinking fund during the year, in accordance with the ordinance passed on May 9, 1899, and amended

on May 10, 1920, \$353,777.34, which has been applied to reimburse the treasury for coal lands purchased and unmined coal in Pennsylvania.

The usual payment of \$650,000, required under the terms of the First Lien Equipment Trust indenture, was made, making the total paid to date, \$8,450,000. This has been increased by accumulations or interest on balances and investments.

During the year there was received from the United States, in partial payment of compensation for the taking over of the company's property in December, 1917, and its subsequent operation as an arm of the Government business on February 29, 1920, by the United States, the sum of \$1,285,000, which, with the amounts paid on account of the years 1918 and 1919, aggregating \$14,099,100, makes a total of \$15,384,100. There was also received from the United States, on account of the guarantee of net earnings provided for by the Transportation Act of 1920, the guarantee period extending through August 31, 1920, the sum of \$2,195,000. The balance on both accounts with the United States, subject to adjustments which may be necessary on account of additions to the property during Federal control, and other matters not yet agreed upon, and the establishment of the maintenance charges during the guarantee period, will be provided for in the final settlement with the Government.

## COAL DEPARTMENT.

The anthracite produced by your system corporations during the year 1920, including the product of washeries, aggregated 8,089,182 long tons, a decrease of 116,313 tons, or 1.41 per cent below 1919. The year's output was 11.38 per cent of the total output of Pennsylvania, of which Pennsylvania was 71,023,257 long tons, or 1.5 per cent more than in 1919. Production was reduced during the year by high water in some of the mines, resulting from seepage on account of the sudden melting of the heavy snowfall of the winter of 1919-1920, and of the refusal of the Secretary of Labor to ratify the benefit of the so-called "vacations" which were taken on account of reluctance to accept the wages award made in August, 1920, by the Anthracite Coal Commission. This Commission, which consisted of one representative of the public, one representative of the employees and one representative of the operators, was appointed in March 31, 1920, and on June 3, 1920, after prolonged negotiations between the employees and the operators had failed to produce an agreement. These negotiations were referred to in the annual report for last year, in which it was stated that the agreement between the employees had expired on March 31, 1920, and that efforts to negotiate a new arrangement were in progress, under a stipulation that any change in wages should be retroactive to April 1 of that year. After these negotiations had proceeded between the parties directly in interest for about two months without an agreement being reached, the Secretary of Labor intervened and after conferences in Washington, at which the Department of Labor was represented, suggested a compromise which was accepted by the operators but rejected by the employees. The appointment of the Commission by the President followed this rejection. Hearings were held at Scranton on July 20, 1920, and an award was made on August 30, which became the agreement of September 2, retroactive to April 1, 1920. This agreement continues the award of the Anthracite Coal Strike Commission, made in 1903, including the provision that there shall be no discrimination against members of any organization, or any organization, or any interference by any employee or organization with those who are not members. It provides for increases in wages rates which are estimated by the Department of Labor of the United States to amount to 17.4 per cent of the rates previously in force, and 13.8 per cent over the rates in force prior to the European war. It also reduced the standard day to eight hours in the case of the few classes of employees who had continued to have a longer work day. For the first time since the advent of the United Mine Workers of America into the anthracite fields, an agreement has been made to which that organization, through its district organizations numbers 1, 7 and 9, appears as a party to a contract with the anthracite operators. Despite this concession, and the agreement prior to the submission to arbitration to accept the award of the Commission, both union officers and certain of the employees expressed considerable dissatisfaction with the result that demands for re-opening the arbitration were accompanied by refusals to work which were not at all disguised, although they were called "vacations." President Wilson refused to intervene further until work was fully resumed but upon such resumption he requested the negotiating committees to resume the purpose of adjusting inequalities the existence of which might mutually be agreed upon. The negotiating committees have resumed discussion of certain alleged inequalities. The questions which can properly arise before these committees do not include any relating to the standard rates established by the award, as of course it is recognized that an arbitration award thus made must be given effect in accordance with its terms and for the full period it was intended to cover.

During the latter part of 1920, work was commenced on a new breaker located in Scranton, to have a capacity of 9,000 tons per day, to be built of steel and to have a minimum amount of inflammable material, thus reducing the fire risk to the lowest practicable limit. This breaker, replacing the Marvine breaker, which was constructed of wood, has been completed and is now in operation.

## RAILROAD DEPARTMENT.

The United States continued in possession, through the month of February, 1920, of your system and that of 13 other system corporations in the United States, together with your boat lines operating on Lake Champlain and Lake George, and these properties continued to be operated through the United States Railroad Administration until surrendered to your officers on March 1, 1920, the period during which the properties were returned out of your possession and control was from noon on December 28, 1917, to and including midnight of February 29, 1920. All operations during the months of January and February, 1920, like those of the previous months of Federal control, were conducted on the account of the Federal Government, which was responsible for all expenses of operation, including maintenance and for all taxes except war taxes, and for compensation in the nature of rent for your temporary expropriation at the rate of \$7,042,144.21 per year, in accordance with the contract with the Director-General of Railroads, acting for the United States Government, under the terms of which you were to be in possession of the properties provided for your account during the period of Federal control.

Notwithstanding the pledges contained in President Wilson's proclamation of December 27, 1917, and the Act of Congress of March 21, 1918, and the contractual obligation deliberately assumed on December 9, 1919, your properties were not adequately maintained while they were in the possession of the United States nor were they returned to you in the best condition as good or as fully equipped as that in which they were taken. The extent of this undermaintenance may be illustrated by the items representing renewals of rails and ties. The average number of new rails used for replacements, during the test period, was 8,223 gross tons, during Federal

control it was 7,607 gross tons; the yearly average of renewals of ties during the test period was 339,872, during Federal control it was 270,100. Moreover, the ties used for replacement during Federal control were inferior in quality.

Under date of May 29, 1919, Mr. Walker D. Ilnes, as Director General of the United States Railroad Administration, issued a general letter to all Regional Directors, dealing with maintenance expenses, which while treating the subject from the point of view of economy, appears to have been construed by the recipients as a demand for reductions in these expenses almost irrespective of the expedients necessary. By telegram dated two days earlier Mr. Ilnes had advised the Directors that "for the month of June, 1919, the maintenance of way ratio of each road ought not to exceed its average yearly ratio of the test period." The foregoing was followed by a circular of instructions to the same officers, issued by Mr. W. T. Tyler, Director of Operations, and dated June 2, 1919, in which the Regional Directors were advised in part as follows:

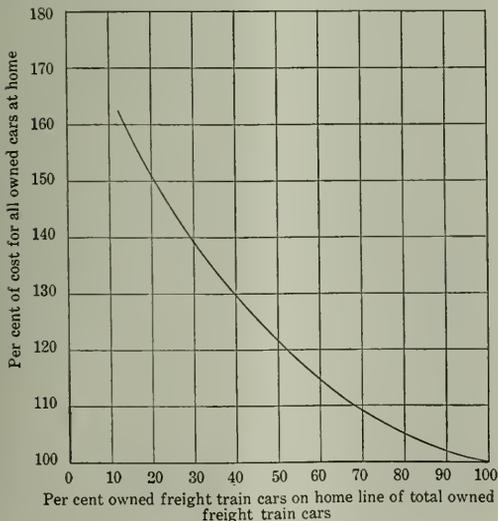

"There is no obligation on the Government to replace upon the properties the same quantities of material and labor placed upon them during the test period."

This circular of instructions repeated the order to make the ratio of the test period the maximum limit of June expenditures and its whole tenor was towards a sharp curtailment in actual maintenance. It included the following:

"There is grave danger that the 1918 and 1919 Maintenance of Way expenditures may substantially exceed the obligations unless immediate action is taken to control such expenditures. The Director General's telegram of May 27th, requiring adherence to the test period maintenance ratio, was intended to act as an immediate and effective curb for the month of June and until a broader policy could be formulated and promulgated for the remaining six months of the year. The tendency to overmaintain appears to be general. The obligation of the Federal Managers and General Managers to the Government is to see to it that if this tendency has play on their properties it must be corrected effectively and at once, so that the Government will not be called upon to pay for maintenance in excess of the obligations."

To fully appreciate the foregoing, it is necessary to note that June is a month in which weather conditions are generally favorable to maintenance work and in which the necessity for making up for the substantial cessation of such work during the months of severe weather ought to result in expenditures very much in excess of the yearly ratio. Moreover, by making the ratio of such expenses to operating revenues during the test period the limit, the Director General resorted to a standard established under radically different conditions. The freight and passenger rates of June, 1919, were not nearly as much above those of the test period as were wages and prices of the materials required for replacements. Hence the adoption of the ratios to revenues of the test period inevitably led to the application of substantially less labor and materials. Careful examination of subsequent instructions, to the end of Federal control, does not indicate the substitution of any more liberal policy. Under the control of such instructions it is apparent that adequate maintenance was impossible.

The dispersal and scattering of freight-car equipment throughout the United States, regardless of ownership and special adaptability to the requirements of the owning line, was a characteristic incident of Federal control. Like other ventures of the Railroad Administration, it diminished efficiency and increased expenses. A study based upon information covering the test period, received from eighty railroads owning eighty-two per cent of the freight train car equipment of the country, has determined the relation between the cost of repairs to freight cars and the per cent of owned cars on home line. This relation appears in the diagram below, which shows that as the proportion of owned cars away from home increases, the cost of repairs increases. This conclusion accords with experience, because it is known that the immediate application of general repairs, when needed, produces a lower total cost of maintenance over a period of time than the application of temporary repairs plus the cost of deferred general repairs.

Curve showing change in cost of freight train car repairs to change in percentage of owned cars on home line.

It was noted in the annual report for last year, that your Board of Managers had accepted the conditions prescribed by the Transportation Act of 1920 in order to become entitled to the guarantee by the United States for the period from March 1, to August 31, 1920, inclusive, of net earnings

equal to one-half of the annual "standard return" of the Federal control period computed in accordance with the Act of March 21, 1918. On February 3, 1921, claim was filed with the Interstate Commerce Commission in accordance with the order of October 18, 1920, for a balance due from the United States account of the guarantee amounting to \$3,266,465.67. The amount claimed represents the difference between the actual net income for the six months of the guarantee period, and one-half of the annual standard return, as finally established by the Interstate Commerce Commission, and finally put together with the adjustments for maintenance which should be charged against this period, and increases in the rate of standard return by reason of additional facilities provided at your expense during Federal control. The amount of \$3,266,465.67 represents, in part, the net result of the operation of the guarantee period, and the time claim was made and will be subject to variation to the extent that actual results differ from these estimates.

During the period of Federal control, and the ensuing six months of the guarantee period, ending August 31, 1920, your account was not affected by the operating results obtained and these results were directly of importance only to the extent that they suggest the conditions under which the property was returned and operations for your account commenced. The following data relating to operating results combine the figures of the two months of Federal control, the two months of the guarantee period, and the four months of operation for your account which together constitute the calendar year 1920.

The railway operating revenues amounted, in 1920, to \$45,354,299, which was \$1,864,589, or 4.22 per cent more than in 1919, and \$19,880,083, or 78.04 per cent more than the average annual revenues for the period from July 1, 1914, to June 30, 1917, known as the "test period," which, by the Act of March 21, 1918, was made the basis of the "standard return" during Federal control. Operating expenses amounted to \$42,122,130, an increase of \$10,239,619, or 32.11 per cent over 1919, and \$24,557,635, or 139.78 per cent over the annual average of the test period. Operating income, before deduction of taxes, was therefore \$3,227,969, an increase of \$3,164,971, or 32.11 per cent more than in 1919, but \$4,677,550, or 59.17 per cent *lower*, than the average of the test period. Freight receipts were \$9,680,200, or 32.83 per cent more than in 1919 and \$18,047,835, or 85.47 per cent more than the average of the test period. Freight movement during the year was equivalent to the movement of 4,265,734,874 tons one mile which is to be compared with 2,531,432,622 tons one mile in 1919, and 3,229,732,728 the annual average of the test period, the increase compared with 1919 being 20.79 per cent and as compared with the test period 32.08 per cent. Average receipts per ton mile amounted to 9.18 mills in 1920, 9.19 in 1919, and 9.18 in the test period, the test period average for 1920 being an increase of 9.94 per cent over 1919 and 40.37 per cent over the test period.

There were no extraordinary changes in the relative volume of the different classes of freight traffic as compared with 1919, the general increase for the year being attributable to the increase in the volume of traffic diverted to other routes under orders of the officers of the Railroad Administration, while the railways were under Federal control.

Passenger movement aggregated 130,971,551 passenger miles, which is to be compared with 132,884,477 in 1919 and an annual average of the test period of 130,984,189 passenger miles, a decrease from 1919 of 1.44 per cent. Mileage of passenger trains increased 4.98 per cent over 1919, but decreased 17.55 per cent as compared with the average of the test period. Passenger car increase was 7.78 per cent over 1919, but a decrease of 14.11 per cent below the average of the test period. Average receipts per passenger mile traveled were 2.88 cents in 1920, 2.45 cents in 1919, and 2.23 cents during the test period. Receipts per passenger train mile were \$1,5836 in 1920, \$1,4358 in 1919, and \$1,0106 during the test period, showing an increase over 1919 of 10.29 per cent and over the test period of 56.70 per cent. Per passenger car mile, the receipts of 1920 increased 7.41 per cent over 1919 and 50.48 per cent over the test period.

Mail revenue during 1920, amounted to \$367,350, an increase of \$27,699, or 163.05 per cent over 1919, and \$229,298, or 166.10 per cent over the average for the test period.

Miscellaneous revenue of 1920 showed a decrease of 43.75 per cent below 1919, principally on account of credits this account during 1919, the latter having been removed from statement during that year, a large tonnage of anthracite which had been stored during 1918.

Although the foregoing shows considerable increases in revenues, the operating income of the year, as already noted, shows but a slight increase over 1919, and as compared with the average of the test period, this decrease amounting to 59.17 per cent. This result was occasioned by the excessive increase in operating expenses resulting from advances in wages, the changes in the conditions of employment as compared with the pre-war period, and the continued high cost of materials and supplies. The Railroad Labor Board of the United States, created by the Transportation Act of 1920, granted increases by an order issued on July 20, 1920, and retroactive to May 1, of that year, which required an increase in your monthly payrolls of approximately twenty-one per cent, as compared with 1919, the maintenance of the existing rate of pay structures of 1920 increased \$937,405, or 22.43 per cent and the increase over the average of the test period was \$3,062,983, or 149.27 per cent. Expenses for maintenance of equipment increased \$2,756,918, or 27.62 per cent over 1919 and \$7,823,111, or 59.47 per cent over the average of the test period. Transportation expenses increased \$6,062,908, or 38.85 per cent over 1919, and \$12,445,128, or 134.91 per cent over the test period. Traffic expenses show an increase of \$149,418, or 63.04 per cent over 1919, principally on account of the railway industry's establishment of the new development of business which were abolished during Federal control.

Increases in rates of wages and changes in the terms and conditions of employment made during Federal control and, subsequent to its termination, by the Railroad Labor Board, greatly increased the operating expenses which the railways have currently to meet. Rules which might not be seriously objectionable under special and local conditions may be wholly unworkable when given general application and it is now evident that rigid standardization of wages and working conditions has become an enormous burden upon the railway industry. The industry has not only failed to give equal treatment of unequals. The wide area of the United States, their diverse resources, industries and economic standards and methods, have imposed varying conditions upon the performance of railway services with wide different demands upon the industry and an equally wide range in the reasonable requirements of labor itself. To ignore these differences in fixing the relations between employees and railway employers must be as unsatisfactory in its results as it would be to build all railways to the same standards of grades, the nature and capacity, road structure, and conditions in traffic requirements and in local topography. Yet such disregard of essential differences is embodied in the so-called standardization of wages and terms of employment which is an evil legacy from the period of Federal control.

The Railroad Administration made no effort to adjust the charges for railway service to the heavily increased expenses which it assumed by successive concessions to importunities for higher wages and reductions in the labor exchanged for wages. Unwillingness to accept responsibility for

these increased expenses to the extent of putting in force rate-schedules adequate to meet them resulted in the operation of the railroads at a heavy loss to the United States and an accumulating deficit in the income account of the Railroad Administration which was forced upon the taxpayers. Whether those who pay taxes accept such burden with less profanity, with less effective protest, is a problem which the Railroad Administration or some higher authority must be assumed to have resolved to its own satisfaction.

The Transportation Act of 1920, provided for the adjustments in rates which the Railroad Administration had refused to make. Before this adjustment could be made, the Railroad Labor Board made the further increases previously referred to, with the result of augmenting the amount of additional revenue necessary to be produced. Application was promptly made to the Interstate Commerce Commission which determined that the rate schedule ought to produce a return of six per cent upon the aggregate value of railway property as determined for each of the four years in which the country was divided into "Eastern Rate Group" and includes railway lines located west of the "Eastern Rate Group" and the Atlantic ocean, the whole region between the Canadian frontier, the Atlantic ocean, the Great Lakes and Mississippi river and (roughly) the Ohio and James rivers.

General authority for increases in freight and passenger rates was accorded, and the new rates to go into effect upon August 26, 1920. In estimating the changes necessary to produce the required revenue the Interstate Commerce Commission assumed (1) the continuance of substantially the existing volume of traffic, (2) the continuance of substantially the same ratio as interstate rates. Neither assumption was justified by the actual facts. Traffic has diminished to an aggregate far below that considered in the estimates and the opposition to certain States to the adjustments indicated proved inconvenient and costly and has, in several instances, resulted in litigation carried to the Supreme Court of the United States.

Railways in the territory served by your lines were granted a twenty per cent increase in passenger fares. All interstate rates were once per cent increase in accordance with this authority. But corresponding adjusted fares for travel within the State of New York was delayed by the opposition of the Public Service Commission for the Second District of New York. A supplementary application to the Interstate Commerce Commission resulted in an order proportionately increasing the State rates on November 19, 1920, but the adjustment was again delayed by an injunction obtained by the Public Service Commission. An order vacating this injunction was obtained on December 18, 1920, and, except as to the value of the same, has been changed by the Interstate Commerce Commission on December 20, 1920. The broad question of the authority of the Interstate Commerce Commission to authorize adjustments in rates for services rendered by interstate carriers but wholly within the limits of single States has been pending in the Supreme Court in several cases, the first of which your company is a party. In one of these suits the Public Service Commission of New York is the plaintiff and the Interstate Commerce Commission a defendant.

Coincident with the increases in passenger fares, a surcharge of fifty per cent of the charge for accommodations in parlor and sleeping cars, per cent of proceeds of which accrue to the railway carriers, became generally effective.

The increase in mail revenue, above noted, resulted from an order of the Interstate Commerce Commission, issued pursuant to the Act of Congress of June 15, 1919, authorizing the question of reasonable compensation for transportation of mails for its determination. The new rates were retroactive to November 1, 1916, the payments in adjustment of compensation for services during Federal control accruing to the Railroad Administration.

The increase in freight rates necessary to produce the return approved by the Interstate Commerce Commission to the railways in the Eastern Rate Group was computed at forty per cent, if applied uniformly to all freight movement and on the assumption of the continuance of the existing volume of traffic. It is to be noted that used in making the estimates. An increase of forty per cent was granted as to traffic originating and ending within the region, but as to traffic to or from other regions the permitted advance was only thirty-three and one-third per cent. In the minimum charge for shipment were authorized.

The Interstate Commerce Commission also authorized increases in rates applicable to milk traffic, switching, storage and demurrage and new schedules affecting these services were put in force on August 26, 1920.

The results of the changes above summarized have been disappointing. Not only was there failure, on the part of the Commission, to authorize the full increases indicated as necessary by the estimates on which it relied, but experience has shown that however thoroughly those estimates were warranted when made, they were too hopeful as to the continuance of business activity and consequent heavy traffic. Moreover, the estimates assumed the continuance of the revenues then arising from express business and these revenues were almost immediately reduced in the sum of \$2,000,000 per year by the operation of the new rates on express business contracts. The difference between the revenue of the carriers of this group from inter-territorial freight, advanced thirty-three and one-third per cent, and that which would have been realized at a forty per cent advance, is about \$50,000,000 per year. It is to be noted that the carriers in this group are now earning not less than \$175,000,000 per year less than six per cent upon the total of their investments in property devoted to public use. A substantial portion of this deficit will probably never be recovered and the carriers will obtain the full benefit of reductions in the cost of fuel and other supplies.

**INDUSTRIAL DEPARTMENT.**

One hundred and fifteen new industries were located on the tracks of your company during 1920, as compared with one hundred and eleven in 1919. Sixty-three extensions to old industries and twenty industrial sidetracks were constructed; the corresponding numbers of 1919 were ten and seven. Representatives of the Industrial Department of the Interstate Commerce Commission have continued to co-operate with the various activities of the Farm Bureau Association and with the Department of Farms and Markets of the State of New York.

**FEDERAL VALUATION.**

The Director of Valuation of the Interstate Commerce Commission furnished your officers, during 1920, with preliminary statements showing proposed reports to the Commission concerning value of your lands in rights of way and elsewhere and also of the structures pertaining to your railway. This was in accordance with the practice of the Bureau of Valuation of affording opportunity to check for errors and omissions and to submit objections to proposed conclusions before formal serving of the reports by the State of New York. The reports of the Bureau have been carefully reviewed in your Valuation Department, and criticisms have been submitted showing in detail claims for corrections of errors

and increases in unit prices above those proposed by the Bureau of Valuation. The report on land values showed a total value of lands used for common carrier purposes of \$7,115,901, and the engineering report estimated the cost of reproduction new, of all structures used for common carrier purposes, as \$97,653,962. The cost of reproduction and depreciation of the structures, when stated on a basis indicating average estimated depreciation of 24.50 per cent. The criticisms submitted show that these estimates of value are substantially below those which should be allowed. It should be understood that the inventory upon which the estimates were made was for the year 1916, but that the unit prices applied were those of June 30, 1914, as estimated by the Bureau of Valuation. The figures stated do not, therefore, include any property added after June 30, 1916, nor do they take into account the large increase in the value of materials and labor since that date. On these accounts the figures stated, even when corrected in accordance with the criticisms which have been submitted, will not at all indicate the present value of your physical property. The total assigned as the value of lands is fundamentally erroneous for the reason that it is based wholly on the value of the structures and of adjacent lands, averages obtained therefrom having been applied to the area of your lands, and includes no allowances for costs of acquisition, damages and other items that invariably increase the cost of railway rights of way. Objections have also been made to the estimate of twenty-four per cent depreciation below new condition. It is considered that this estimate has been obtained by methods and arbitrary assumptions which necessarily lead to gross over-estimation and indicate a condition entirely contrary to the facts. Objections to this result are also made on the account of the cost of valuation, to the end of 1920, amounted to \$502,464.52, of which \$365,930.92 was charged to your operating expenses to December 31, 1920, and \$136,533.60 to the operating expenses of the Railroad Administration during the period of Federal control.

**ALLIED TROLLEY LINES**

An increase to seven cents in the rate of fare charged by this company authorized by the Public Service Commission, which took effect on January 29, 1920, was recorded in the annual report for last year. At the time this rate became effective, the standard rate for last year was adjusted to forty-five cents per hour, the standard rate then being paid to conductors and motormen. This forty-five cents rate represented an increase of fifty per cent over wages in force in the year 1918. A rate of sixty cents per hour for motormen was established and conducted early during 1920, and on July 1, 1920, it became necessary for the United Traction Company to establish the same rate, the alternative being a strike, and it was necessary to make proportionate advances in the rates for conductors. It is to be noted that the increased wages could not be met out of revenues unless a further increase in fares could be obtained and this involved application to the Public Service Commission. The new basis of wages was therefore put in force under a temporary agreement which provided for the continuance of the increased wages until November 1, 1920, in case prior to that date, relief in the form of increased fares could not be obtained. Prompt application was made to the Public Service Commission, which was asked to authorize a standard rate of fare of ten cents per passenger. This application followed the customary course with successive hearings and by legislation. A preliminary ruling favorable to the company on all questions of franchise restrictions except as to the relatively unimportant claim made by the City of Rensselaer, was rendered by the Commission. Final decision was not rendered until January 21, 1920. In this decision, the Commission, after a hearing, held that the Commission held that it was without power to grant the relief sought as to some of the principal lines in the City of Troy. Considering itself without power to afford substantial relief except as to the City of Albany, the Commission held that the increase of the rate of fare in the zone to eight cents but required the sale of four tickets for thirty cents. At that same time, the company was directed to carry passengers within the City of Rensselaer for five cents, between any point in Rensselaer and the plaza in Albany for six cents, and in the cities of Troy, Waterlief, Cohoes, Green Island, Waterford and Colonie, a six cents fare was prescribed. It is estimated that these changes in fares amount to a reduction in annual revenue, as compared with the standard seven cents fare, of \$86,000. The opinion of the Commission plainly expressed the view that operating expenses would soon substantially reduced through return to a lower basis of wages and some decline in the prices of materials and supplies. The following is quoted from the opinion:

"The wages in effect immediately prior to July 1st were about 75 per cent of the present scale. What the company will be obliged to pay in the future is not yet told. We assume that the officials of the company are awaiting the action of the Commission in this proceeding before renewing negotiations.

"It thus appears that wages have increased enormously during the war reconstruction period. We do not believe the Commission can assume that the present scale is to continue. It is to be noted that the company is unwilling to continue it under the present rates of fare, and the existing agreement seems to assume that unless the fares are increased the present scale will not continue. The rate increases granted by the Commission in 1918 and 1919 have been returned to the company by the increased wage scales. In substance, therefore, the Commission in the last two rate orders as well as in the order about to be made has been and is dealing not with return on the company's investment but with wages of the employees.

"It is a matter of general knowledge, of which the Commission may properly take notice, that the costs of both labor and materials which have so sharply advanced within a brief period have begun to decline. The apex seems clearly to have been passed. In view of this condition and of the fact that the present wage agreement is for a limited period, we do not feel justified in fixing rates upon the assumption that the present wage scale of the company will continue any considerable time. It may be that wages will not decline as rapidly as they have advanced, but it seems clear that they will not remain at the present point when the general cost list is receding.

"Under the circumstances, we think we must assume, in arriving at an estimate of expenses for the coming year, that the trend of wages and other expenses will be downward."

The authority having control of the company's revenues having thus formally given notice that it would not accede in an adjustment of rates sufficient to meet the costs of operation at the rates of wages in

force, an adjustment of wages more favorable to the company and that might be expected to have the approval of the Commission, became imperative. On January 2, 1921, the day after the opinion was rendered, employees were notified that the provision to terminate the wages agreement would be exercised and that the company would return to the wages prevailing on June 30, 1920, the change to take effect at midnight on January 28, 1921, when the Commission had fixed as the effective date of the changes in rates required by its order. The employees refused to accept this readjustment and a strike ensued. After some days, during which the property remained idle, an order was resumed by the Public Service Commission, requiring the company to resume operations and efforts to do so with the aid of new employees were promptly commenced and have been continued; disorderly and violent resistance to these efforts occurred and for a time the operation of cars was irregular, traffic inconsiderable and the expenses high. A restraining order prohibiting the interference with the efforts of the company to render public service was entered in the Supreme Court on March 23, 1921. The violations of public order have diminished and seem tending to disappear and operations and traffic are gradually moving towards the normal.

A statute adopted at the present session of the Legislature, extending the Public Service Commission law, extends the authority to approve changes in rates with the effect of removing such limitations as were held to exist in Troy and Rensselaer. Under this statute these companies should be able to obtain reasonable rates of fare.

The operating revenues of the Hudson Valley Railway amounted to \$1,099,072, operating expenses to \$986,998, taxes to \$55,025 and net operating income to \$57,409. These data show increases in operating revenues or 13.14 per cent, in operating expenses of 20.97 per cent, in taxes of 5.78 per cent and an increase in net operating income of 45.11 per cent. Under authority obtained from the Public Service Commission on account of the insufficiency of the revenues at the former rate, the standard zone rate of this property was increased on June 29, 1920, to seven cents. The wages of the employees of this company were necessarily increased on July 1, 1920, to the basis of sixty cents for conductors and motormen, previously adopted in neighboring cities, and put in force on the same date by the United Traction Company. In making this change the company reserved the same right to discontinue the higher basis which was reserved by the United Traction Company. During September, application was made to the Public Service Commission to permit an increase in the zone rate to ten cents, except as to local service in Fort Edward, Hudson Falls, Glens Falls and Saratoga. After hearings by the Commission, the application was supported on briefs and oral argument during November, but no decision has been rendered.

The operating revenues of the Plattsburgh Traction Company amounted to \$33,122, a decrease of 12.29 per cent; operating expenses to \$29,625, an increase of 12.43 per cent; net operating income to \$14, a decrease of 82.46 per cent. The wages paid by this company have been lower by reason of local conditions, than those paid in the Capitol District, but on June 15, 1920, it was necessary to make an increase of five cents per hour to motormen and conductors, making the standard rate for such employees thirty cents per hour, with corresponding increases to other employees. Corresponding adjustments in fares became necessary and an advance to seven cents for service outside the city limits was obtained without opposition. It was also necessary to increase to seven cents, the rate within the city of Plattsburgh and the application for this change resulted in a hearing before the Public Service Commission. A favorable decision was rendered on October 14, and the increased rate of fare was permitted to become effective on October 21, 1920.

The operating revenues of the Troy and England Railway amounted to \$39,442, an increase of 8.27 per cent; operating expenses to \$44,397, an increase of 24.72 per cent, and there was an operating deficit of \$6,825 which compares to the deficit of \$710 in the previous year. The operations of this company are so closely related to those of the United Traction Company that it was necessary to extend to the employees the conditional advance in wages which was accorded to those of the latter on July 1, 1920. Even without this increase, the operating expenses would have required additional revenue. Application for an increase in the zone rate to eight cents with corresponding increases in round trip fares and providing for more adequate rates for chartered cars, was made to the Public Service Commission by a tariff filed on November 20, 1920. This tariff was suspended on the application of the town of North Green, through which the property runs, and after hearing, decision was rendered permitting the advance rates to go into effect on January 29, 1921. The employees of this company are members of the organization which includes the former employees of United Traction Company and the strike on that company included the Troy and New England.

#### LITIGATION

Substantially all the railroads west of the Hudson river, including your company, have been made defendants in a proceeding instituted by the New York, New Haven and Hartford, Central New England Railway, Central Vermont Railway, Rutland Railroad, Boston and Maine Railroad, Maine Central Railroad and Bangor and Arundel Railroad before the Interstate Commerce Commission, claiming increased divisions on freight traffic interchanged at the various New England gateways. Numerous hearings have been held, resulting in a bulky record, and oral arguments before the Commission have been held on April 7, 1921. While the Transportation Act of 1920 empowers the Commission to establish divisions of rates, your counsel consider that the present proceeding is not within its jurisdiction. The New England railroads appear to support one complaint upon grounds which could not be the basis of the basis of an order in respect of divisions. Moreover, it is considered that the existing divisions are, and long have been, rather unduly favorable to the New England lines.

#### GENERAL REMARKS.

The business of the United States is encountering a serious period of depression. Taxation remains at the war level, and its burden is increasing. The conditions of the country are such that war activities disappear. Complete financing of the war in the form of a heavy floating governmental debt, continues to interfere with normal financial operations. Prices in general seem to be tending toward more normal levels, but wages are tending in the same direction but more sluggishly in spite of extensive unemployment. These factors point to adjustments that must precede any return to satisfactory conditions. Basic conditions are essentially sound. In a large degree the people of the country have been the owners of their own industries and have invested largely in foreign securities and on the international balance sheet, the Nation has become a creditor where but lately it was a debtor. If men exercising legislative and other authority will build soundly upon these foundations, general prosperity should soon be realized.

By order of the Board of Managers,  
L. F. LORE, President.

[Adv.]

## Railway Officers

### Executive

**H. S. Ray**, assistant general passenger agent of the Chicago, Rock Island & Pacific, with headquarters at Des Moines, Iowa, has been promoted to assistant to the president, with headquarters at Chicago, effective May 1, with jurisdiction over the newly created department of public and labor relations.

**W. A. Webb**, vice president and general manager of the St. Louis Southwestern with headquarters at Tyler, Texas, has resigned, effective May 10. This position has been abolished and its duties have been taken over by **F. W. Green**, vice president in charge of operation with headquarters at St. Louis, Mo., and Tyler, Tex.

### Financial, Legal and Accounting

**E. B. Conrad**, auditor of freight accounts of the Oregon Short Line, with headquarters at Salt Lake City, Utah, has been appointed freight auditor of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, effective May 1.

**F. H. Harvey**, general auditor of the Pittsburgh & West Virginia and the West Side Belt, has been elected secretary in addition to his other duties, succeeding **H. C. Moore**, secretary and treasurer. Mr. Moore will continue as treasurer of the company.

**H. T. Newcomb**, whose appointment as general solicitor of the Delaware & Hudson was announced in the *Railway Age* of March 18 (page 741), was born at Owosso, Michigan. He graduated from Columbian (now George Washington) University in 1891 with the degree of bachelor of law and received his master's degree the following year. From 1906 to 1916 Mr. Newcomb was senior member of the law firm of Newcomb, Churchill and Frey at Washington, D. C. From 1916 until the time of his recent appointment Mr. Newcomb was engaged in the general practice of law in New York. A great portion of his work has been in connection with railway litigation. He is the author of "Railway Economics," "The Postal Deficit," "Force and Effect of the Orders of the Interstate Commerce Commission," "Constitutionality of the Delegations of the Interstate Commerce Law" and other works on similar subjects.

### Operating

**J. E. Hood** has been appointed general manager of the Uintah with headquarters at Mack, Colo., succeeding **M. W. Cooley**, effective April 8.

**O. F. Ohlson** has been appointed trainmaster of the Northern Pacific, with headquarters at East Grand Forks, Minn., effective April 15, succeeding **F. W. Lyons**.

**C. H. Bland** has been appointed trainmaster of the Louisiana Railway & Navigation Company, with headquarters at Shreveport, La. **W. E. Salyards** has been appointed chief dispatcher with the same headquarters.

**E. G. Goforth**, assistant general manager of the International & Great Northern, with headquarters at Palestine, Tex., has been promoted to general manager, succeeding **A. G. Whittington**, who has resigned.

**F. S. Rosseter**, assistant superintendent of the Toronto Terminals of the Canadian Pacific, with headquarters at West Toronto, Ont., has been transferred to a similar position, with headquarters at Chapeau, Ont., succeeding **V. T. Boughton**, resigned.

**F. S. Deveny**, trainmaster of the Baltimore & Ohio Chicago Terminal with headquarters at Chicago, has been promoted

to superintendent with the same headquarters. **R. A. Barlow**, assistant trainmaster, has succeeded Mr. Deveny as trainmaster. The position of general superintendent of this company has been abolished. These changes were effective May 1.

**H. H. Hooper**, superintendent of transportation of the St. Louis-Southwestern with headquarters at Tyler, Texas, has resigned, effective May 10. The position which he occupied has been abolished and its duties have been taken over by **W. Mosby**, transportation assistant with headquarters at St. Louis. Mr. Mosby's headquarters have been changed to Tyler, Texas. The Illmo and Pine Bluff divisions have been consolidated and **W. E. McGraw**, superintendent of the Illmo division, has been appointed superintendent of the two divisions. **K. C. Marshall**, superintendent of the Pine Bluff division has resigned and his office has been abolished. **E. Richards**, superintendent of telegraph and safety with headquarters at Tyler, has been appointed acting superintendent of the Tyler division, succeeding **D. C. Dobbins**, resigned.

### Traffic

**P. L. Shepherd**, general freight and passenger agent of the Gulf & Ship Island, with headquarters at Gulfport, Miss., has resigned.

**W. D. Cook** has been appointed general freight agent of the Gulf & Ship Island, with headquarters at Gulfport, Miss., effective May 10, succeeding **P. L. Shepherd**, resigned.

**F. W. Elder**, commercial agent of the Gulf Coast Lines, with headquarters at Houston, Tex., has been transferred to San Francisco, Cal., succeeding **E. J. Naylor**, who has resigned, effective May 1.

**W. B. Gheen**, division freight agent of the Atlantic City Railroad and the New York division of the Philadelphia & Reading, has been transferred in a similar capacity to the Philadelphia division. **G. A. Buck**, agent at Pottsville, Pa., has succeeded Mr. Gheen as division freight agent of the New York division and the Atlantic City.

### Engineering, Maintenance of Way and Signaling

**William Hood**, chief engineer of the Southern Pacific, whose retirement from active railroad service, effective May 3, was announced in the *Railway Age* of May 6 (page 1100), was born on February 4, 1846, and was educated in the scientific department of Dartmouth College. He entered railway service in May, 1867, as a rodman on the Central Pacific, being engaged in the construction of that line through the Sierra Nevada mountains at the time of the building of the first transcontinental line. He was appointed assistant engineer on January 1, 1868, and served in that position until June 1, 1872, when he became assistant engineer of the Southern Pacific. Three years later he was promoted to chief assistant engineer, a position which he held until June, 1883, when he accepted an appointment as chief assistant engineer of the Central Pacific. He was promoted to chief engineer of that road on October 10, 1883, but in August, 1885, he returned to the Southern Pacific as chief engineer of the Pacific System. On June 1, 1900, he was promoted to chief engineer of the Southern Pacific. Mr. Hood retired on the 54th anniversary of his first connection with the Southern Pacific company,

Wm. Hood

**R. W. Barnes**, assistant engineer of the Southern Pacific, with headquarters at Portland, Ore., has been appointed assistant engineer of the Southern Pacific, Texas Lines, with headquarters at Houston, Tex. **H. L. Archbold** succeeds Mr. Barnes.

**W. S. Hanley** has been appointed chief engineer of the St. Louis-Southwestern with headquarters at Tyler, Texas, succeeding **A. A. Mathews** resigned. **C. C. Pettigrew**, division engineer with headquarters at Illmo, Mo., has been appointed division engineer of the Illmo and Pine Bluff divisions, which have been combined, with headquarters at Pine Bluff, Ark. **W. N. Raleigh**, division engineer with headquarters at Pine Bluff, has resigned and his position has been discontinued. These changes were effective May 10.

### Mechanical

**W. P. Kershner**, who has been appointed superintendent of motive power of the International & Great Northern, with headquarters at Palestine, Texas, was born at West Leesport, Pa., August 16, 1885. He graduated from high school at Reading, Pa., in 1901 and began his railroad career as a night caller, for the Philadelphia & Reading. Shortly thereafter he became a machinist apprentice and later a machinist for the Reading and resigned to attend the University of Pennsylvania, from which he graduated in 1908. He then entered the employ of the Louisville & Nashville at South Louisville, Ky., as a layer-out on new engines. Later he served the Chicago & North Western in the office of the mechanical engineer. He left that position to go with the Northern Pacific at Livingston, Montana, and shortly afterward resigned to enter the service of the Chicago, Milwaukee & St. Paul at Lombard, Montana. Later he became general foreman for the Oregon Short Line, at Montello, Idaho. He next became a hydraulic engineer for the Bishop Creek Mining Company at Laws, Cal., but soon afterward entered railroad service again—this time as a drop pit foreman for the Southern Pacific. Subsequently he was in the employ of the Texas & Pacific, the International & Great Northern and the Missouri, Kansas & Texas. During the war Mr. Kershner served as second lieutenant, captain and major in the engineers and saw 17 months' service overseas. After his discharge from the service he went to the Texas & Pacific as general mechanical inspector and was later promoted to shop superintendent. A few months later he left this position to become master mechanic of the International & Great Northern at Palestine, Texas, which position he held at the time of his recent appointment.

### Obituary

**B. H. Bennett**, general agent of the Chicago & North Western, with headquarters at Toronto, Ont., died on May 7.

**Henry Boutet**, for 31 years chief interchange inspector for all the railroads entering Cincinnati, O., and organizer of the Chief Interchange Car Inspectors' and Car Foremen's Association, of which Society he was president for seven years, died at his home at Ludlow, Ky., on April 25, at the age of 69.

**John W. Mulligan**, real estate and tax agent of the Chicago, Rock Island & Pacific, whose death was announced in the *Railway Age* of April 29 (page 1056), was born at Fort Charles, Bainbridge, County Downs, Ireland, on June 21, 1874. He was educated in the United States, and after serving the Pullman Company, entered the employ of the Chemical National Bank, while pursuing legal studies at the same time. He entered railroad service on August 1, 1902, as a stenographer in the real estate and tax department of the Chicago, Rock Island & Pacific, and has served that company continuously since then. From 1902 until November 1, 1907, he served successively as stenographer, chief clerk and right of way agent, and on the latter date was promoted to assistant real estate and tax agent, with headquarters at Chicago. He was promoted to real estate and tax agent of the Rock Island system on January 1, 1920, and was serving in that position at the time of his death.

One of the most extravagant conditions which any industry can face is a high labor turnover. While this is particularly true in those classes of employment where a high degree of skill and experience are required, its effect is also evident in the less skilled and so-called unskilled industries. The constant changing of men has been the greatest handicap which has been imposed upon maintenance of way work, particularly track work, as many as 20 men frequently being hired in a single season to keep one man at work. Conditions such as those which existed during the war, when our entire industrial life was thrown into a turmoil, cannot be avoided. However, the exceptionally high turnover in maintenance of way work has existed for so long, irrespective of conditions in outside industries, that many officers regard it as inherent to the work and a condition which must be reckoned with rather than eliminated. That it can be largely reduced is open to demonstration. Other industries employing similar classes of men have stabilized their forces and greatly increased the production per man. If they can do it, the railways can do as much. The present offers an opportunity for the study of this problem and the inauguration of plans for the elimination of those defects in our present system which are contributing to this constant changing of forces. There is now a surplus of labor. Men who desire permanent employment are available. Therefore, the railways have an opportunity to secure and develop forces which can be made permanent. To do this they must learn what conditions are tending towards short tenure of service, and remove them. This may require some radical changes in the railways' methods of work but the great saving which can be effected by reducing this turnover to that prevailing in other industries can be realized when it is considered that the maintenance of way department payroll is now in excess of three-quarters of a billion dollars annually.

### What Is Your Labor Turnover?

One of the disputed points in concrete practice relates to the effect of water on the life of a structure. Waterproofing is generally applied to keep water out of basements, pits, tunnels or other subterranean or subaqueous constructions subject to hydrostatic pressure, as well as to railway decks which serve also as the roof over occupied spaces or passageways. But in most of these cases, the prime reason for keeping out the water is because it interferes with the occupancy of the structure, while the question of the deterioration of the concrete is secondary. A rather wide difference of opinion exists as to the necessity for waterproofing in cases where the only object is the protection afforded to the structure itself. On eastern roads having a larger proportion of permanent structures and where the tendency has been more largely toward heavy massive design, the use of waterproofing as a protection to the concrete is quite general while in the west the practice is more varied. While it is generally conceded that steel imbedded in a concrete of reasonable density is not corroded by the circulation of water through the pores in the surrounding material, the possibilities of electrolytic action or the

### Should Concrete Be Waterproof?

presence of corrosive gases introduces a specific hazard in some cases. Another uncertainty is introduced through the possibility of injury by frost action, especially at construction or expansion joints. It is not the purpose here to suggest what the correct practice should be, but when two parallel roads follow practices that are entirely different in this regard, it should be clear that one or both of them is following precedents rather than conclusions founded on thorough study. If the facts are not now available for a scientific conclusion, it is high time that such investigations be made.

"Commerce Reports" is the name of a daily publication issued by the Bureau of Foreign and Domestic Commerce at Washington. The purpose of this publication supposedly is the dissemination of information of interest and value to those who are seeking to further America's foreign commerce.

### More Red Tape

Probably the most important of any of the information published in this journal is the announcements of projects which are being undertaken in foreign countries which may afford opportunities for the sale of American goods. It might naturally be supposed that the Bureau would be glad to have information of this character copied by business papers and given general circulation. Such, however, is apparently not the case. In "Commerce Reports" of May 11 it is reported that a certain railway in Brazil is contemplating the construction of a bridge to cost \$1,000,000 and that the name of the railroad can be obtained on request by reference to a certain file number. The New York office of the Bureau, however, would not give the name of the road to the *Railway Age* without a promise in writing that the information would not be printed. In other words, the fact that a project is to be undertaken which will afford an important opportunity for American builders who are seeking foreign contracts is to be kept from all except those who have the patience and the time to read "Commerce Reports" every day. Herbert Hoover, the new Secretary of Commerce, has apparently been endeavoring to rid his department of useless red tape and put it on a basis of co-operation with business and the business press. The *Railway Age* is heartily in accord with such a movement and believes that Mr. Hoover can do American business a real service by instructing his subordinates in the Bureau of Foreign and Domestic Commerce that their business is the dissemination of information and not its concealment.

### Promoting the Prosperity of Farmers

The American Railway Development Association, whose annual meeting is reported in another column, is unique among railroad associations, in that its purposes and activities are wholly outside the railroad field; and they extend in all directions. The members work to develop, not railroads, but everything else; everything which will stimulate railroad traffic, provided a suitable opening can be found. This meeting was devoted mainly to farming, and the discussions ranged from seed potatoes to the construction of tasteful cottages. Among

the wealth of practical ideas, those presented by E. F. Benson, of the Northern Pacific, were perhaps the most interesting in their novelty and bigness. His paper was very briefly reported last week. As everyone knows, the fundamental farm problem in America is to make intelligent and energetic people contented to live on farms; and Mr. Benson set forth with great force the essential elements required in dealing with it. Nothing less than hearty co-operation will turn the trick. The Community development association makes available to the individual the benefits of co-operative effort in scientific farming, comfortable home-making, education of children and all the principal elements of a contented life. Such associations should be fostered by the railroads from the plainest motives of self-interest. An association should be voluntary and mutual; but remarkable results have been accomplished in two states, California and Wisconsin, by what may be termed outside initiative. In California by legislative action, and in Wisconsin by a corporation, frankly organized for profit, the settlement of farms has been promoted on a large scale to the great satisfaction of all concerned. As Mr. Benson said, this may be called paternalism or cold business, or whatever you please; but the results challenge criticism. Every railroad officer interested in colonization, or in promoting the prosperity of farmers, will do well to get copies of the paper.

## "Productive Efficiency" of Facilities and Employees

THE LABOR UNION LEADERS are telling the Railroad Labor Board and the public, and will soon be telling the Senate Committee on Interstate Commerce, that the financial troubles of the railways are due to wasteful management and not to the inefficiency and high wages of labor. Therefore, they contend, all the needed economies in operation can and should be secured by increased efficiency of management without reductions of the payroll.

These contentions are a challenge to a direct comparison between the efficiency of management and the efficiency of labor. The operation of the railroads is carried on under the direction of their directors and officers. Their operations are conducted partly by means of human agencies, namely, the employees, who furnish their labor, and partly by means of physical instrumentalities, namely, the tracks, locomotives, cars and other parts of the plant, which are provided by the invested capital of the owners. The only thing produced by the railroads is transportation. Their most important product is freight transportation, their earnings from the transportation of freight being over 70 per cent of their total earnings. All improvements in plant and methods having as their ultimate object the increase of efficiency and economy of operation are designed and intended to secure this object by increasing the amount of traffic handled per each physical unit and per employee. Since the payroll now constitutes about two-thirds of all operating expenses, it is especially essential to the maintenance and increase of the economy of operation that the amount of traffic handled per employee shall continuously increase. It happens, however, that while the track, the locomotive, the car, being inanimate things, can offer no resistance to the efforts of the officers to increase their productive efficiency, the employees, being human beings, can, by securing unreasonable rules and working conditions and by other means, largely defeat the efforts of the managers to increase their productive efficiency.

Having in mind these facts, some interesting and significant comparisons may be made between the changes which have taken place within recent years in the average amount of traffic handled per unit of physical plant and per employee. The accompanying table gives the number of tons carried

one mile (1) per mile of line, (2) per freight locomotive, (3) per freight car, and (4) per employee in the years 1913, 1917 and 1920.

	TONS CARRIED ONE MILE			
	Per mile of line	Per freight locomotive	Per freight car	Per employee
1913 . . . . .	1,335,416	8,650,446	148,474	187,877
1917 . . . . .	1,698,825	11,282,617	173,552	250,997
1920 . . . . .	1,747,948	11,682,068	190,951	221,921

Each of these years was a year of maximum traffic—that is, one in which the amount of traffic handled was larger than in any previous year. It will be seen that in 1917 as compared with 1913, and in 1920 as compared with both 1917 and 1913, there was a large increase in the amount of freight traffic handled per each mile of line, each freight locomotive and each freight car. It will also be seen that between 1913 and 1917 there was a large increase in the amount of freight traffic handled per employee. While, however, between 1917 and 1920 the amount of freight handled with each unit of the physical facilities increased, the amount of freight handled per employee showed a sharp decline.

The railways were under private management in 1917 and again in 1920. Was this decline in the amount of freight handled per employee in 1920 due to shortcomings of private management? On the contrary, it is easy to demonstrate that it was due to the aftermath of government operation. In 1917, under private operation, as the table shows, the number of tons carried one mile per employee was 250,997. This figure was the result of a steady increase in the output per employee which had been going on over a long period of years, and was the maximum figure ever reached. In 1918, under government operation, the tons carried one mile per employee declined to 241,541. This decrease in output per employee was entirely due to a large increase in the number of employees, since the total amount of freight handled by the railways in 1918 was slightly larger than in 1917. In 1919, the second year of government operation, while the total amount of freight traffic carried by the railways declined over 10 per cent, the number of employees actually increased over 70,000. The result was that the number of tons carried one mile per employee declined further to 208,026. While, therefore, the amount of freight handled per employee in 1920, under private management, was less than in 1917, under private management, it was greater than in 1919, under government operation.

The facts are, then, that the tracks, locomotives and cars of the railways, the methods of using which are almost entirely under the control of the officers, have steadily increased their output per unit. It is also a fact that the railway managements in 1920 secured a greater output from practically every other physical facility than ever was secured before. On the other hand, the average output of the employees abruptly declined under government control, and is still much less than it was in 1917.

The labor leaders say that the "productive efficiency" of the employees, measured in passenger miles and ton-miles, is greater than before the war. The figures show this is true, the output per employee being greater in 1920 than in 1913. When, however, the labor leaders appear before the Senate Committee the members of that committee may well inquire why in 1920 the productive efficiency of every physical facility of the railways was greater than ever before, while the productive efficiency of the employees in the years 1918, 1919 and 1920 was less than in 1917, or even in 1916.

The physical facilities of the railways have been provided by the owners. The owners are now getting practically no return upon their investment in these facilities, although the productive efficiency of the facilities in 1920 was greater than ever before. Since the productive efficiency of the facilities has shown a steady increase, while the productive efficiency of the employees has shown a decrease, the members of the

Senate Committee may well ask the labor leaders why those who have provided the facilities should continue to be denied as much return upon their capital as they received in 1916 and 1917, while the employees should, as the labor leaders contend, continue to be paid wages twice as high as they received in those years.

## Forged Testimony Before the Labor Board

THE *Railway Age* has never opposed, or even criticised, the organization of labor. It believes labor has as much right to organize as capital. It has, however, criticised many things that labor organizations, and especially labor leaders, have said and done. Among other things it has criticised leaders of certain railway labor organizations for causing intolerable delays in the proceedings before the Railroad Labor Board by introducing testimony having no bearing whatever upon any question before the board, and having the obvious purposes of delaying action by the board and unjustly discrediting private management in the eyes of railway employees and the public.

While much of the testimony presented by the labor leaders to the board has been irrelevant, the facts regarding the introduction by them in the national agreements hearings of a letter purporting to have been written by I. W. Geer, general manager of the Southwestern Region of the Pennsylvania system, are disgraceful. The letter was introduced on March 22 by B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, and Frank P. Walsh, counsel for the labor unions represented by Mr. Jewell, during the cross examination of General W. W. Atterbury, vice president of the Pennsylvania system. It purported to carry instructions from Mr. Geer to all supervisory officers to ascertain the position of employees on proposed reduction of wages, "resorting to defamation of all labor organizations if necessary." The letter was immediately challenged by officials of the Pennsylvania as fraudulent. In a hearing before the Labor Board last week Mr. Geer and other officers and employees of the Pennsylvania proved that it was a complete forgery—that no such letter had ever been written by Mr. Geer, or received by any of those to whom it purported to have been addressed.

The counsel for the labor unions was obliged to admit that the letter was "unauthentic." A lawyer who introduces testimony which is fraudulent either has knowledge or is ignorant of its fraudulency when he introduces it. Whatever may have been Mr. Walsh's knowledge or lack of knowledge of the character of the letter when he introduced it, it is significant that when the Labor Board by formal resolution asked that he "make known how and from whom this letter, evidently fictitious and fraudulent, came," he refused to do so. "As representing the labor organizations," he said, "I do not intend to pillorize the person from whom this information came to us."

In other words, instead of repudiating or exposing the person or persons who committed the forgery, the labor leaders and their counsel protected him or them.

The course of the labor leaders and their counsel in introducing a letter bearing upon its face plain indications of a fraudulent character, and then, after its true nature as a forgery had been established, refusing to disclose the identity of the forger or forgers, requires no comment from us. Every reader may safely be left to make his own comments and draw his own conclusions. A very large majority of the members of the railway labor organizations are truthful and honorable men and good citizens. It is unfortunate they are represented in important positions by men who will do what

their representatives before the Labor Board did in this instance.

In this connection it is neither inappropriate nor unjust to point out that while this particular piece of "testimony" was a forgery designed not only unjustly to injure the railways, but to ruin the career of a railway officer, a large part of the other testimony which has been introduced by the labor leaders before the Labor Board is hardly more defensible. Practically all the testimony they have introduced regarding the alleged financial crookedness of the railway managements, the alleged crooked relations between railway officers and railway supply companies and the alleged deliberate wastefulness of railway managements is almost as baseless, dishonest and misleading as the forged letter attributed to Mr. Geer. In the long run the labor unions and the railway employees are injured, and not benefited, by being represented in the way they have been before the Labor Board in the national agreements case.

## A Railroad a Composite Structure

A RAILROAD is an aggregation of facilities for the production of transportation. Among its important units are cars and locomotives and the tracks and structures over which they are moved. As in any well-organized machine, these facilities must be co-ordinated into a harmonious unit if the best results are to be obtained. No constituent part can be developed without regard for the others, but it must be designed to be combined with others to form a composite agency. Obviously, the owners of the railways will be served best when these agencies are so co-ordinated as to produce transportation at the minimum cost.

So much for the ideal. Since the earliest days of railroading there has existed a controversy between the engineering and the mechanical departments regarding the load-carrying capacity and the clearances which it is necessary to provide in bridges, these structures forming the limit on the size and weight of the locomotives which can be operated. It is recognized by both that the reductions in the cost of operation of American railways have been due primarily to increased train loads, which in turn have been made possible by larger and heavier locomotives. Since the mechanical department can install these locomotives only as the engineering department provides the tracks, bridges and other structures over and through which these must operate, the engineering department exercises a restriction on the activities of the designer of locomotives. The pressure which the mechanical department has continually placed upon the engineering department is illustrated in the article by M. H. Haig, mechanical engineer of the Atchison, Topeka & Santa Fe, which was published in the *Railway Age* of May 6, page 1073, in which he stated that if a locomotive is to give practically 100 per cent service "its design must not be restricted by personal opinion or by physical limitations of the road \* \* \* The only governing factors should be the size of the train and the traffic of the territory." Taken literally, this would imply that the question of the cost of providing the facilities necessary to enable these locomotives to operate is not a consideration.

It is here that the viewpoints of the engineering and mechanical department officers differ. It is natural that the mechanical officer thinks primarily in terms of the efficiency of the locomotive. It is equally natural that the engineering officer thinks first in terms of the cost of the structure he builds. There is no argument regarding the safe load for any bridge or the safe clearance for a structure; these are matters capable of demonstration. The problem with which a railway management is confronted in harmonizing these conflicting viewpoints is that of determining at what point

the additional cost of providing the facilities necessary for the operation of larger locomotives exceeds the economies derived from this heavier power. The problem is not that of larger locomotives, or of stronger bridges. It is one of economics to determine that point at which fixed charges more than offset possible economies. Both engineering and mechanical officers can contribute to the solution of this problem by combining to study it as a broad problem of the railroad, rather than that of their individual departments.

### Delaware & Hudson

**T**HE DELAWARE & HUDSON is one of the few roads of the country which seems to have made marked progress in regaining the operating efficiency and earning power which characterized it prior to the advent of federal control. The road in 1920 did the largest business in its history. After taking into consideration the amounts necessary to make up the standard return for January and February and the guaranty for the guaranty period, the company had a net of \$4,933,163, equal to 11.61 per cent on the capital stock, as compared with a net in 1919 of \$4,605,004, equal to 10.83 per cent on the capital stock. The Delaware & Hudson is confronted with the national agreements and the high wage scales in like degree with any other railroad. If conditions in 1920 had been back to normal, the road would have had a remarkable year.

President L. F. Loree's annual reports of the Delaware & Hudson are noted for their completeness of detail and for the information they give concerning the actual operations of the road. The 1920 annual report is no exception. It is characterized by comparisons of the operations in 1920, not only with 1919 but with the annual averages for the test period from July 1, 1914, to June 30, 1917, which comparisons assist greatly in making proper analysis of the 1920 results. The figures show the usual trend in the form of increases in gross, proportionately greater increases in expenses and the corresponding decreases in net. On the other hand, they point out in marked fashion the improvements in operating efficiency towards which the Delaware & Hudson was working prior to the time the railroads were taken over.

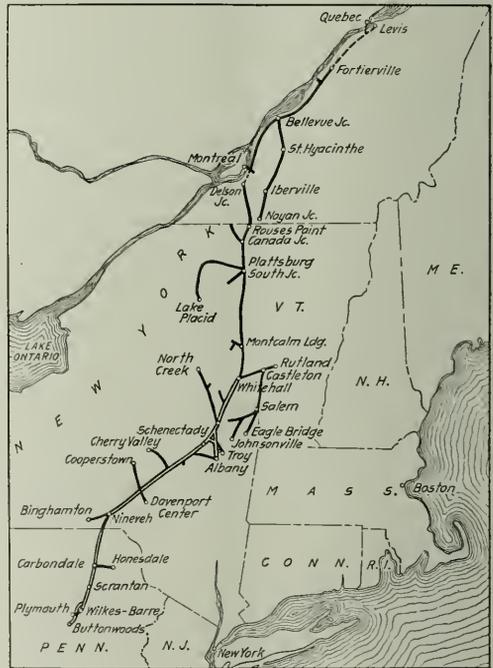

The comparisons between 1920 and the annual average for the test period show among other things these interesting details: The railway operating revenues in 1920 were 78.04 per cent greater than the average annual operating revenues for the test period; the operating expenses, however, were 139.78 per cent greater and the operating income before the deduction of taxes 59.17 per cent less. The revenue ton-miles handled in 1920 were 32.08 per cent over the test period average, the revenue per ton-mile, 40.37 per cent.

The excessive increase in operating expenses resulting from advances in wages, the changes in the conditions of employment as compared with the pre-war period and the continued high costs of materials and supplies are shown in increases for 1920 over the test period averages as follows: Maintenance of way and structures, 149.27 per cent; maintenance of equipment, 159.47 per cent; transportation, 134.91 per cent. The relationship of the increases in gross and decreases in net is presumably fairly typical of what may have taken place on any railroad. It is doubtful, however, if many railroads can point to increases in operating efficiency such as are shown in an increase in the trainload in 1920, as compared with the average for the test period, of 195 tons whereby the average revenue trainload in 1920 was 842 tons; or of an increase of six tons in the revenue load per loaded car making that figure in 1920, 34 tons.

The Delaware & Hudson for many years prior to 1918 was working out a plan of development calculated to increase the efficiency of operation of the property to a measurable extent.

This program was especially well co-ordinated. It included the purchase of heavier power, the building of proper terminals and shops to care for this power, improvements in the line over which the heavier trains were to run, the building of longer sidings to take care of the longer trains and the construction of various new yards necessitated by the other improvements in operation. These things naturally relate one to the other, but that seems to be a feature of railway operation which the Delaware & Hudson happens to have realized rather better than many of the other roads of the country. The improvement program is still under way, although some parts of it were held up temporarily during the latter part of federal control. The results that have been obtained are probably best shown by the increase in trainload already referred to.

The Delaware & Hudson operates 909 miles of line, of

The Delaware & Hudson

which 358 miles is double track. Its principal revenue is derived from anthracite coal; in fact, the road was built originally to carry to market the coal mined by the coal company which built it. The tonnage of anthracite handled in 1920 amounted to 12,388,943 tons of a total tonnage of 28,965,242. Hard and soft coal combined bring in about 47 per cent of the total revenues, including those from passenger traffic. The anthracite coal tonnage is secured from a compact area in the Susquehanna and Lackawanna valleys of Pennsylvania between Plymouth and Carbondale, a distance of about 38 miles. The fact that the mines are so close together is utilized as an assistance to efficient operation in a rather interesting way. Empty cars are assembled at Carbondale, are taken by road engines to the various breakers and the loaded cars are returned to the yard for classification and road movement. The prevailing movement of the coal is from Carbondale over the line to Albany and Mechanicville,

and this section of the road is the portion of greatest traffic density.

In addition to the hard coal moved, there is considerable bituminous coal and merchandise interchanged with the Pennsylvania and Jersey Central at Wilkes-Barre, with the Erie and Lackawanna at Binghamton and with the Lehigh Valley at Owego. This combined tonnage is moved to Oneonta in through trains either from Binghamton or from the Pennsylvania division via Ninevah, all of which points will be found on the map. At Oneonta the traffic is classified and moved northward to Albany, to Mechanicville, or through Saratoga for Canada. The improvements which were carried out were intended to facilitate the operation outlined. The movement southbound is principally empties, so that it does not present such complicated problems.

The changes that were made were outlined in full detail in the annual report of the property for 1918. Suffice it to say that among the most important changes was the enlargement of the yard at Carbondale completed in 1917; this enlarged the capacity of the yard to 3,139 cars, an increase in car capacity of 50 per cent. Other important changes were included in the way of larger motive power and reduction of grades. Between Ninevah and Oneonta as early as 1911 the grades were reduced to 0.3 per cent, making it possible to move full trains from Carbondale to Oneonta without breaking up the load and for one locomotive to haul from the summit north of Carbondale to the end of the division any train which can be taken to the summit by a single locomotive with a Mallet pusher. The maximum grade between Oneonta and Delansong, where the lines to Schenectady and Albany converge, is now 0.8 per cent. It is proposed to reduce this to 0.5 per cent. The work is partly completed; considerable was done on it in 1920 in the way of putting in a new third track between Schenevus and Richmondville Junction. With the maximum of 0.5 per cent it will be possible to haul trains of maximum tonnage from Oneonta to Schenectady with the use of a pusher locomotive between Schoharie Junction and Esperance only.

These various improvements were co-ordinated with a program for larger locomotives, new engine terminals, longer sidings, etc., all planned with the view to increasing freight train efficiency. It is unfortunate that more space is not available to go into the matter in greater detail, for it is these things, combined with favorable traffic conditions, which have enabled the Delaware & Hudson to continue in the van of progress as an efficient and prosperous carrier.

Mr. Loree in his report has considerable to say concerning federal control and the results of it. It is impossible to reproduce the full effect of what he says without using his own words. Speaking of the failure of the Railroad Administration to maintain the property up to its proper standard, he says:

Notwithstanding the pledges contained in President Wilson's proclamation of December 27, 1917, and the act of Congress of March 21, 1918, and the contractual obligation deliberately assumed on December 9, 1919, your properties were not adequately maintained while they were in the possession of the United States, nor were they returned to your control in condition as good, or as fully equipped, as that in which they were taken. The extent of this undermaintenance may be illustrated by items representing renewals of rails and ties. The average number of new rails used for replacements, during the test period, was 8,223 gross tons; during federal control it was 7,607 gross tons; the yearly average of renewals of ties during the test period was 339,872; during federal control it was 270,100. Moreover, the ties used for replacement during the federal control were inferior in quality.

Again, in speaking of the policies of the Railroad Administration as to wages and rates, he makes these pertinent remarks:

Increases in rates of wages and changes in the terms and conditions of employment made during federal control and subsequent to its termination, by the Railroad Labor Board, greatly

increased the operating expenses which the railways have currently to meet. Rules which might not be seriously objectionable under special and local conditions may be wholly unworkable when given general application and it is now evident that rigid standardization of wages and working conditions has become an enormous burden upon the railway industry. Nothing is more unequal than the equal treatment of unequals. The wide area of the United States, their diverse resources, industries and economic standards and methods, have imposed varying conditions upon the performance of railway services with widely different demands upon labor and an equally wide range in the reasonable requirements of labor itself. To ignore these differences in fixing the relations between employees and railway employers must be as unsatisfactory in its results as it would be to build all railways to the same standards of grades curvature and capacity regardless of differences in the traffic requirements and in local topography. Yet such disregard of essential differences is embedded in the so-called standardization of wages and terms of employment which is an evil legacy from the period of federal control.

The Railroad Administration made no effort to adjust the changes or railway service to the heavily increased expenses which it assumed by successive concessions to importunities for higher wages and reductions in the labor exchanged for wages. Unwillingness to accept responsibility for these increased expenses to the extent of putting in force rate schedules adequate to meet them resulted in the operation of the railroads at a heavy loss to the United States, and an accumulating deficit in the income account of the Railroad Administration which was forced upon the taxpayers. Whether those who pay taxes accept such burden with less protest, or with less effective protest, is a problem which the Railroad Administration or some higher authority must be assumed to have resolved to its own satisfaction.

The Delaware & Hudson in 1920 carried 27,260,813 tons of freight, an increase of 3,616,135 tons over 1919 and of 4,498,258 tons over the annual average for the test period. The average haul was 156 miles and the revenue ton-mileage 4,265,734,874. The number of tons carried one mile per mile of road, or the traffic density, was 4,692,261, which is a high average. The revenue per ton-mile was 0.918 cents and the total freight revenue \$39,163,644, an increase of \$9,680,199 over 1919 and of \$18,047,835 over the test period average. The freight revenues constituted 86 per cent of the total revenues. As noted above, the revenue trainload was 842 tons and the average revenue load per loaded car was 33.83 tons. The miles per car per day averaged 27.9 as compared with 26.7 in 1919. The ton-miles daily per car reached the high level of 662, a figure which was exceeded by but few roads during 1920.

The operating results for 1919 and 1920 follow:

	1920	1919
Mileage operated .....	910	910
Total operating revenues (including passenger) ..	\$45,354,299	\$34,749,709
Maintenance of way expenses .....	5,114,909	4,177,864
Maintenance of equipment .....	12,736,975	9,980,056
Traffic expenses .....	386,448	237,030
Transportation expenses .....	21,669,668	15,606,760
Total operating expenses .....	42,126,330	31,886,711
Net from railway operations .....	3,227,969	2,862,998
Taxes .....	1,186,034	1,075,803
Net railway operating income .....	7,439,730	7,109,759

The corporate income account is as follows:

	1920	1919
Gross income .....	\$10,431,017	\$10,530,620
Total deductions .....	5,497,354	5,925,615
Net income .....	4,933,163	4,605,004

## New Books

*Proceedings of the Thirtieth Annual Convention of the American Railway Bridge & Building Association. Edited by the secretary. 248 pages, illustrated. 6 in. by 9 in. Bound in cloth and paper. Published by the association, C. A. Lichty, secretary, C. & N. W. Railway, Chicago.*

This volume contains the proceedings of the annual convention which was held in Atlanta, Ga., October 26-28, 1920. It includes the reports of eight committees and two individual papers. The proceedings of this association are characterized by their highly practical character, discussing the problems of the field forces engaged in the maintenance of bridges, buildings and water stations.

## Letters to the Editor

### "Get Out and See the Shipper"

WASHBURN, MAINE.

TO THE EDITOR:

The editorials in the *Railway Age* of April 22 on "The Art of Working with Men," and "Get Out and See the Shipper" recalled to my mind a little incident which I participated in during 1915. I was asked by an officer of the express company to solicit business during a period in which hog sales were going on in the Middle West. I accepted, and the result was surprising. The sooner transportation companies get their traffic men together and make resolutions to visit and become acquainted with the shippers the quicker business will revive.

I personally believe that visiting and becoming acquainted with the shippers means additional revenue, where the use of the typewriter will promote friction between shippers and carriers, simply because the shipper is like a child that has been whipped because it does not understand. One visit from a live wire traffic man will reveal to the shipper what he most desires to know and they will be friends as never before.

Let us do away with the grievance committee and handle the things most important to the carriers of our country in a business-like manner and all will be well. I am a "Get Out and See the Shipper" advocate.

H. SHANER.

### The Simple Gospel of Self-Control

St. Louis, Mo.

TO THE EDITOR:

The operation of the law of pivotal points or diminishing returns so often amplified by the late Elbert Hubbard was well illustrated in the abuse of the privileges of the Railroad Labor Board by B. M. Jewell in his address before that board, as spokesman for railroad labor on April 28, when he took up the time of the board in making allegations manifestly and obviously untrue, i. e., that railroad laborers' losses were so great during the war period that it will take them three years to even up; that living costs had not been reduced sufficiently to warrant wage reductions, and so on, "ad infinitum, ad nauseum, ad disgustum." The effect of such manifestly misleading statements published broadcast can only have one effect; and that is to militate against the very men who are supposed to be represented.

As was pointed out in an article in your columns signed "Agriculturnist" on November 3, 1916, combinations of railroad and other labor, as a result of advantages of urban life, invariably have the best of it in the cycles of increased wages and costs, over the producers and in particular the farmers, in that these labor combinations enjoy the advantage of prices based on lower labor costs for several months after the wage increase, while the effect of the increase is finding its way into costs of the various necessities. About the time the cycle is completed another raise in wages is forced, with the same result. This is recent history. Labor finally pushed a good thing so far as to pass the pivotal point, and it finally ran up against the wall of enlightened, angered public opinion.

From conversation with many men in the ranks of railroad labor I feel that I know that this man's statements, as quoted above, do not truly represent the views or even the wishes of a large per cent of the thinking, reasoning men whom he presumes to represent.

As is well known, the thrifty, frugal railroad men have saved more money and enjoyed more of the luxuries of life during the war period than they ever did before; and the present crisis is due in large measure to the orgy of spending by a large per cent of railroad men as a result of money coming so free and easy. Many of these men now awaken to find an overdrawn bank account and no job.

Because of the devastation of the war, railroad and other workmen in this country were permitted almost to name their own terms; they profited at the expense of the unfortunates on the other continent. The war is now behind us, and the people of Europe are again at work producing and in competition with us; and we can no more avoid the result of this competition by fiat or resolution, as Jewell proposes, than we can escape by wings to the moon. Railroad labor took the lead in wage advances, and if it does not take the lead down, it will at least have to come along with labor in other lines. There is no peculiar or special fitness required in railroad labor which justifies calling it an excepted class; and the level-headed men in the ranks do not expect it.

Such extravagant statements as these attributed to Jewell come near to being treasonable; certainly unpatriotic; and it is only a little less criminal for the press to give them publicity. They incite the ignorant and unmoral element finally to class hatred and to crime, and they retard the readjustment now so necessary for the good of all. If Jewell will get away from Chicago long enough to get his ear to the ground and listen to the more intelligent of the men he presumes to represent he will hear the whisper, "We prefer work for all, at wages that will start the mills and factories; then, as a result of increased production, prices of life's necessities will come nearer to our reach; and never before."

If there were one thing more striking than another in all of our experiences incident to the great war it was that as wages were artificially held up and horizontally applied, efficiency decreased correspondingly.

We have an illustrative example in Russia today, where Lenine and Trotzky are "saving" the laboring class by the same fiat, i. e., less work and higher pay, with the sad results known to all the world.

There is a point of refinement and luxury (accompanied by lack of enthusiasm and interest and joy in labor) beyond which a nation cannot go and survive. Jewell and some of the other spokesmen for labor are cultivating the spirit of unrest and prejudice which make for that condition.

Spokesmen for labor have gone wild in their chase after luxury by legerdemain. Where today will you find one who dwells on the nobility of labor and the necessity (for the worker's best interest) to put enthusiasm into his work for the real joy in it? Or one who reminds his constituents that the real abiding joys of life come to the producer, not the spender; that man must finally "earn his bread by the sweat of his brow"?

Surely these are times which call loudly for consideration of the following words of the great Irish statesman, Burke; as loudly as did the times when they were uttered, nearly 150 years ago:

"Men are qualified for civil liberty in exact proportion to their disposition to put chains upon their own appetites—in proportion as their love of justice is above their rapacity; in proportion as they are most disposed to listen to the counsels of the wise and good, in preference to the flattery of knaves. Society cannot exist unless a controlling power over will and appetite be placed somewhere; and the less of it there is within, the more there must be without. It is ordained in the eternal constitution of things that men of intemperate minds cannot be free. Their passions forge their fetters."

When we indulge in sentimental and false self pity, we are tending toward bolshevism.

A RAILROAD WORKER.

wages when due to the necessity for false strict economy, it was difficult to secure authority for adequate hourly rates. Consequently, piece rates were based on earnings considered fair and desirable when working under piece-work conditions. For the reason stated above this "piece-work rate" was too often disproportionate to the hourly rate and resulted in an unusually large actual piece-work earning per hour. This condition introduces an additional serious complication to that already presented in the fixed-cost wage system in adjusting piece rates to the fluctuations of hourly rates following the trend of the labor market.

Another effect of the inflexibility of a piece-rate or cost system is the result where men of varying skill and conse-

Fig. 4—A Typical Piece-Rate Schedule

quently different hourly rates are employed on similar classes of work. In the event that the piece-work price is established upon a high rate man and later satisfactorily performed by a lower class workman, a decided overpayment as related to other workmen will result. Further in the operating of a piece-work price requiring the use of one or more mechanics, with one or more helpers, it will be realized that the respective earnings will be dependent upon the rates of pay and hours worked by each workman rather than upon their respective skill. In the event that a higher rate must be paid to retain helpers without a proportionate increase also being allowed mechanics, a pro-rating of piece-work earnings will increase the helpers' earnings and decrease the mechanics' without any modification in the proportionate share of work performed.

The dissatisfaction, or at least confusion, which thus frequently results under a piece rate or fixed labor cost system, from working men of varying skill and experience upon the same operation at the same piece rate, or several workmen of varying skill and experience upon the same operation and pro-rated together, can be satisfactorily overcome by a separation of the time and rate elements and the discontinuance of their combination in a piece-rate system.

### Conclusions

This would be accomplished by the introduction of one of the available wage payment systems based on a time standard instead of a cost standard; the time-rate system described, however, being best suited for railroad operating conditions. Hourly rates must be allowed workmen consistent with their ability and the state of the labor market. A basic time system automatically accommodates itself to these variable demands and at the same time a system can be selected which will fully compensate the workman for effort expended in increasing production. And in the last analysis the merits to the management of the system selected are a balance between the incentive and the reduction in cost (both labor and overhead).

THE UNION OF SOUTH AFRICA will shortly seek a large loan in this country to purchase construction materials.

## Seasonal Coal Rate

### Bill Reported Favorably

WASHINGTON, D. C.

THE FRELINGHUYSEN seasonal coal rate bill, amended to authorize the Interstate Commerce Commission in its discretion to prescribe seasonal differentials instead of having them fixed by law, was reported favorably by the Senate Committee on Interstate Commerce on May 16 after having been reintroduced in the new form by Senator Frelinghuysen. The bill is to amend section 15 of the interstate commerce act by adding a new paragraph as follows:

(19) In order to promote continuous operation of coal mines, steady employment of coal miners, and economical use of facilities for distribution of coal, the commission is hereby authorized to initiate, establish, approve, or adjust rates for the transportation of coal during specified seasons or periods which shall be greater or less than the rates for other specified seasons or periods but which in the judgment of the commission will yield as nearly as may be the same annual revenue for like movement as rates without seasonal variation, to be maintained by carriers as a whole or as a whole in each of such coal rate groups or territories as the commission may from time to time designate for that purpose, or by such carrier or carriers as the commission may designate. The term "coal" shall include anthracite and bituminous coal, lignite, coke, including petroleum coke, and briquettes and boulets made from anthracite and bituminous coal and from coke. Whenever the commission is of opinion that an emergency affecting the transportation of coal and requiring immediate action exists in any section of the country the commission shall have, and is hereby given, authority, either upon complaint or upon its own initiative without complaint, at once if it so orders without answer or other formal pleading by the interested carrier or carriers, to suspend the operation of any schedule in so far as it affects coal rates, whether seasonal or not, upon filing with such schedule and delivering to the carrier or carriers affected thereby a statement in writing of its reasons for such suspension, and defer the use of such coal rates, and to initiate in lieu thereof such seasonal rates for the transportation of coal as in its judgment the emergency may require. The commission shall thereupon enter upon a hearing concerning the lawfulness of the schedule, the operation of which had been so suspended, and the proceedings thereon shall be the same as nearly as may be as those provided in paragraph (7) of section 15. Nothing contained in this paragraph shall be construed as repealing, modifying or denying any other authority heretofore conferred upon the commission.

### Senator Frelinghuysen's Report

In his report on the bill Senator Frelinghuysen said in part:

The bill incorporates suggestions made by Chairman Edgar E. Clark, of the Interstate Commerce Commission, and it has the unqualified and unanimous approval of the members of that commission.

The committee believes that legislation of this character, authorizing the Interstate Commerce Commission to initiate lower freight rates on coal during the spring and summer months and higher rates during the fall and winter months, will tend to encourage consumers to develop storage accommodations, to accept deliveries of coal in advance of their seasonal needs, and thus to keep the mines operating more constantly throughout the year. The committee is of the opinion that such legislation will bring about the following beneficial results:

1. It will stabilize the price of coal. The capacity output of all the coal mines in the United States, assuming fairly constant operation, would far exceed the present consumption. The output of all these mines working as at present only intermittently during the spring and summer months and working to capacity during the fall and winter months is barely sufficient to supply the current needs and the greatly increased cold-weather demand for coal. During the winter the demand so nearly equals the currently available supply that scarcity prices prevail. In addition to this the actual cost of production per ton is unduly enhanced because the operator must during the time his mine is closed down or working intermittently keep together his organization and expend money for the upkeep and maintenance of the property, all of which must be added to the price of the coal which he

mines and sells during the rush season. If the demand for coal were reasonably constant throughout the year, many of these costs based on holding plant, capital, and personnel idle for a large portion of the time would disappear, and the price of coal would more nearly represent only current costs of production plus a reasonable profit, leaving no opportunity for charging scarcity prices during the months when the greatest amount of coal is consumed.

2. Such legislation will obviate very largely the pressing necessity for more coal cars. The present supply of coal cars, while totally insufficient to handle the fall and winter rush under existing conditions, would be fairly adequate to carry all the coal desired by consumers if this equipment could be kept moving with greater regularity throughout the year, as would be the case if the advantage of lower summer and spring freight rates could be held out to induce consumers to receive coal shipments in advance of their winter needs.

### Would Remedy Inadequacy of Terminal Facilities

3. Such legislation would remedy the present inadequacy of terminal facilities. The large amount of coal which must now be transported within a comparatively short time in each year tends to glut already overcrowded terminals. The increasing inability of existing terminal facilities to handle extraordinary seasonal demands without entailing serious delays and disproportionate terminal costs is one of the most glaring weaknesses in the present American railroad transportation system, according to the testimony of Chairman Clark.

4. Such a measure would promote regularity of employment in the mines, and would thus settle most of the outstanding grievances of the miners.

The committee finds, from an examination of some of the disadvantages which might appear to inhere in the requirements of lower spring and summer freight rates for coal shipments, that most of these objections are untenable.

1. The revenues of the carriers would not be affected. A large amount of coal would still have to be mined and shipped in fall and winter to consumers who lacked the capital, credit, foresight, or storage accommodations to enable them to secure their supply during the warmer months.

2. The transportation of more coal in the spring and summer will not embarrass the railroads in handling other seasonal movements, e. g., crops. In some localities cars carrying grain are loaded only in one direction, returning empty to the point of origin because of lack of shipments moving in that direction. If coal could be encouraged to move at the same time, this wasteful practice of hauling empty cars might be at least partially eliminated. Operating conditions during the clear weather of the spring and summer months are much more favorable, so that railroads can better withstand heavy demands for transportation at that period of the year than during the fall and winter months when coal has heretofore moved in greatest volume. The cost to the railroads of transporting coal is also much less in warm weather, when locomotives can haul heavier trains, when they consume less fuel, and when fewer employees can handle more traffic.

3. The acquisition of more coal cars does not afford a practicable and complete remedy for existing difficulties. Under the Transportation Act, the Interstate Commerce Commission is given the power to require carriers to provide themselves with sufficient cars. But most of the railroads have neither the money nor the credit with which to buy a supply of coal cars adequate for current needs under the present system of large seasonal shipments, so it would be useless for the commission to order them to purchase this equipment. On the other hand, most of the railroads which have enough money or credit to finance such purchases already possess an adequate number of coal cars to care for the needs of their own patrons, and they could not reasonably be required by the commission to purchase additional cars to take care of the traffic of other lines.

4. It may be urged that the interstate commerce act now contains ample provisions to permit the commission or the carrier to institute lower summer freight rates for coal. The conclusive answer to this contention is that, during the many years that the same provisions have been law, this practice has never been introduced. The commission does not believe that it possesses the power to require the establishment of such seasonal rates on coal. It has never attempted to exercise this power, and its chairman states that it does not contemplate doing so in the future in the absence of further legislation. The commission assumes that, in prescribing rates and practices, it is not empowered to initiate new systems of rate making, designed principally to remedy general economic situations. It feels that this should be the subject of specific legislative authorization.

While a considerable number of coal operators appeared at the hearings and testified against the proposed legislation, the opposition of the operators was by no means unanimous. One of the most earnest advocates of this legislation is Eugene McAuliffe, of St. Louis, Mo., a gentleman who is interested in various coal mines and public utilities, and who has had many years of experience in connection with the operation of railroads. Most of the operators who opposed the legislation founded their objections on local considerations peculiar to their own properties in relation to the changes in rates proposed in this legislation. For example, certain operators whose coal is of such inferior quality that it will not store satisfactorily, feared the introduction of rates which will encourage the storage of the coal produced by their competitors. The sub-committee feels, however, that legislation which will result in incalculable benefit for the whole public, and which will entail but slight disadvantages for the great majority of mine operators, should not be denied approval because it may be injurious to the interests of isolated coal operators.

The committee realizes, of course, that the feasibility and effectiveness of the proposed legislation depends very largely upon the practicability of storing coal in large and small quantities. It therefore solicited and received a large amount of testimony from such experts as George Otis Smith, Director of the Geological Survey, various coal operators, and from coal dealers on this point. As a result of this testimony and from information secured through correspondence, the committee entertains no doubt whatever but that practically every kind of coal mined in the United States can be stored safely, conveniently, and cheaply. The tonnage of coal produced which cannot be stored satisfactorily is almost negligible.

### Coal Industry Stabilization Bill

The committee also favorably reported Senator Frelinghuysen's "coal industry stabilization" bill. The object of this bill is to direct the Department of Commerce and the Bureau of Mines to make a careful study of all conditions pertaining to the coal industry, in order that the government may assist in stabilizing the coal industry and in working out the problems which now exist in the mining, distribution, and sale of coal.

The bill directs the Secretary of Commerce to investigate the production of coal, the stocks of coal on hand, the distribution of coal in commerce, and coal prices. In case of an emergency and whenever necessary in the judgment of the President, upon proclamation of the President, the Secretary of Commerce is directed to investigate costs and profits in connection with the mining, sale and distribution of coal.

Section 7 authorizes the Secretary of Commerce, upon request and to the extent he deems proper in the public interest, to place any information in his possession in the hands of public boards and commissions engaged in the arbitration, conciliation, or settlement of labor disputes in coal mines. The section provides that no information shall be given such boards which will disclose the business of any person.

Section 8 authorizes the Secretary of Commerce to investigate the practicability of a statutory zoning system defining the distance from the mine in which coal may be transported in commerce and requires a report by December 5, 1921.

Section 9 directs the Secretary of Commerce to investigate the practicability of the purchase of coal for the use of the government by one central agency and requires a report relative to the same by December 5, 1921.

Section 10 authorizes the director of the Bureau of Mines, under the direction of the Secretary of the Interior, to investigate the methods and processes for the storage, inspection, sampling, analysis, purchase, classification, and economical utilization of coal, with a view to determine the most efficient means for coal storage, and to obtain information relative to the processes involved in the preparation, transportation, and utilization of coal.

Section 14 requires the Interstate Commerce Commission to co-operate with the Secretary of Commerce in securing a proper distribution and use of coal cars, in order to promote the most efficient transportation of coal in commerce.

# Economic Advantages of Large Freight Locomotives\*

A Thorough Study of the Effect on Various Items of Expense  
Is Necessary to Determine the Most Suitable Type

By A. F. Stuebing

Mechanical Department Editor, *Railway Age*

PROBABLY THE BRIEFEST presentation of the advantages of large locomotives is that made by James J. Hill: "Receipts are by the ton and passenger mile; expenses are by the train mile." It is not to be expected that such a general statement will hold good in all particulars, nevertheless it is true that a large proportion of operating expenses decrease as the train load increases, although not in the same proportion as the decrease in train miles. Under the operating conditions existing on most of the main line mileage of this country, the greatest possibilities for economy are probably still to be found in the adoption of locomotives of high capacity.

The large locomotive, designed merely for high rated tractive effort, is not a panacea for operating troubles. The first requisite is a design suited to the conditions of the operating territory, the traffic and the service. The relative advantage of specific designs is a problem in the economics of operation that must be solved by the application of engineering principles. It is a question of adapting the design to the operating and economic conditions and then co-ordinating the motive power with other facilities. The last requirement is of great importance for unless all the varied operations can be kept in step, the machine as a whole cannot run smoothly.

The adoption of improved motive power should be only one part of a co-ordinated program. Every appropriation for larger engines should carry with it, as an integral part, provision for facilities to insure the maximum utilization of the power. Engine terminals, shops, yards, the rolling stock and the track structure itself should be prepared to assist in obtaining the proper operating results. The co-ordination of facilities deserves careful study.\*

## The Selection of Motive Power

### Has Far-Reaching Effects

The choice of motive power is of extreme importance because the characteristics of the power affect the earnings more than any other single factor and determine the efficiency of operation usually throughout the life of the engine. The problem of introducing new locomotives is similar to the problem of reducing grades and should be studied as thoroughly. The interrelation between the various factors affected affords large opportunities for savings and also for losses. No executive should be satisfied with a superficial analysis of the probable effect of a new type of power on operating costs. This is one of the problems of operation that has often been studied in a general way, but has seldom been analyzed quantitatively. The writer has made an attempt to develop a general method of determining the savings that might be expected from the use of high capacity locomotives, but at every step was so hampered by lack of accurate information that the conclusion was finally reached that there is no method of solving the problem without extensive research. Many investigations have been held up during the past few years, and the rapid changes in prices have made earlier data inapplicable. It would seem, therefore, that there is a large field for research in the economic problem of operation when normal conditions are restored.

## A Shortcoming of Operating Statistics

The operating statistics as compiled at present are valuable for the analysis of existing conditions, but they furnish little information as to what would happen under other conditions. Thus the predetermination of operating results, which is most important from the standpoint of improved operation, is largely dependent upon the researches of the individual roads and of engineering organizations. Vast numbers of unrelated figures are compiled, but they are of little benefit in the solution of the general problem. What is needed is not merely a statement of the expenses under fixed conditions, but the rate of change of expenses under certain varying conditions, such as train load and speed. If such data were available, the analysis of operating results could be made more truly a diagnosis, rather than a mere post mortem. The investigation referred to above brought out numerous aspects of the economics of operation that apparently merit attention and a few comments on these points may be pertinent.

## Many Factors Affect the Economic

### Value of the Locomotive

Most of the available reports on the economic value of large locomotives consider comparatively few of the items affected. The comparative costs of wages of train crews, of fuel and water and of repairs to locomotives are often the only items considered. In some few cases the comparative mileage and fixed charges on the investment in motive power have been computed. This is not sufficient to determine conclusively the relative merits of various types of power. The locomotive has a direct or indirect influence on many items of expense in the maintenance of way, maintenance of equipment and transportation accounts. The real problem in determining the value of a locomotive is to find the effect that its operation will have on the sum total of these accounts. The complexity of the problem has apparently often deterred railroads from giving it detailed consideration. However, it is a matter that goes to the very heart of the problem of economical operation and the results of a thorough study should more than justify the labor involved.

It is the purpose of the following paragraphs to point out some aspects of the problem that apparently are deserving of attention. A search through the literature on this subject has failed to disclose fundamental data on these questions that is applicable to present conditions.

## The Effect of Motive Power on

### Maintenance of Way Expenses

Some roads have reached adverse decisions on the adoption of 2-10-2 type locomotives on the ground that the increased cost of roadway maintenance resulting from their use would more than offset the savings in wages. This opinion does not seem to be generally held, but as one of the arguments against heavy locomotives, it deserves recognition. Maintenance of way expenses make up about 17 per cent of the total operating expenses, but the greater part of the expenditures are independent of the character of the power. Much of the work of track maintenance is made necessary by the action of the elements, or by the necessity of maintaining the permanent way in suitable condition for fast passenger traffic. The

\*A paper to be presented at the Railroad session of the Spring meeting of the American Society of Mechanical Engineers, Congress Hotel, Chicago, May 26.

expenditures which are most directly affected by heavy locomotives with long, rigid wheel base are rail, ties and track laying and surfacing.

There is little or no information available as to the comparative effect of four and five pairs of coupled wheels on rail wear and the other accounts affected. The more rapid wear of tires indicates that the effect on the rail is appreciable and the tendency to straighten out the track, no doubt, increases the cost of maintaining it in line. The actual effect will vary according to the wheel base, the curvature of the road and whether the locomotive has one or more pairs of drivers equipped with lateral motion devices.

The sum of the maintenance of way expenses which may be increased by heavy motive power is about 10 per cent of the total operating expenses and if the effect is to increase these items considerably, the saving will be difficult to make up in other accounts. However, if the wear and tear on the track is merely proportional to the weight of the engine, as is sometimes assumed, light and heavy engines would be on a par as regards these items. The difference of opinion on this question suggests the necessity for a careful investigation.

#### Maintenance of Equipment

In any study of locomotive operation the cost of equipment maintenance deserves careful attention. The percentage of the total operating expenses falling in this classification has shown a fairly consistent increase over a considerable period. Locomotive repairs and renewals, which in 1898 amounted to 5.9 per cent, in 1918 had increased to 11.7 per cent. So many factors may influence this ratio that no definite conclusions can be drawn, but it is significant nevertheless.

The principal difficulties in maintaining large locomotives are due to the short life of driving wheel tires, driving boxes and main pin bearings. With the proper facilities and proper construction the work of caring for these parts becomes merely a matter of routine running repairs, but where the lack or inadequacy of terminal facilities hampers repairs, the loss of service due to these minor items may become serious. In extreme cases the mileage per month may be reduced so much as to make the fixed charges per ton mile unreasonably high. It is hardly necessary to point out that this should not be charged against the locomotive itself.

While the foregoing remarks are confined to some of the more important items of roundhouse maintenance, they are equally applicable to the work of classified repairs. If the shops and shop machinery are not adequate for new power, repair charges will be high and the time out of service will be increased. The cost of these facilities should be considered when estimating the saving that may be effected by new power. The shop should be regarded as an accessory that is essential to the efficient utilization of the large investment in motive power. Too often the question is decided on the basis of the direct saving on repair operations, without considering the value of the locomotive days saved by proper facilities.

Wide differences of opinion appear to exist regarding the relative cost of maintenance and mileage of 2-10-2 type and Mallet locomotives. While the field for each is to a certain extent distinct, there are districts where either might be suitable and roads that have sufficient data to permit a fair comparison could perform a service by furnishing information that would clear up this question.

#### Long Trains May Increase

##### Car Repair Costs Considerably

A very serious problem in connection with the use of locomotives of high capacity is the effect on the cost of repairs to freight cars. The total amount spent for repairs and renewals is nearly as great as the repairs and renewals to freight, passenger and switching locomotives combined. When

the length of trains is increased beyond a certain point, break-in-tows, shifted loads and damage to the cars in general may increase at a rapid rate. It is not inconceivable that the expense resulting from hidden damage may nullify savings in other items. Local conditions determine whether or not this is an important factor. The effect of increasing the length of the train would be but slight where short heavy trains of steel cars are hauled. It may be serious where the road cannot control the character of equipment in the trains, where the car load is light, the train long and the lading is subject to damage, or of such a nature that it may shift and damage the car. It is significant to note that the study of the operation of Consolidation and Mikado locomotives made by N. D. Ballantine showed the time delayed due to car failures was more than twice as great with the Mikado engine, which had a tractive effort of 57,000 lb., than with the Consolidation of 39,000 lb. tractive effort. No record is available of the cost of repairing the cars involved in these failures nor the defects noted at terminals that were chargeable to unavoidable shocks incidental to the operation of the longer train.

A study of car failures in long trains may demonstrate that the trouble is largely due to equipment with weak underframes. The greater portion of the damage is done to the draft gear and sills, and it is doubtful whether sills meeting the recommendations of the American Railway Association would fail except under the most extreme stresses set up by surging in trains. If wooden underframes are a serious hindrance to the operation of long trains, the remedy can be applied with little difficulty. While the reinforcement of the remaining cars of this type still in service would require fairly heavy expenditures, it would no doubt be justified by the saving in repair costs and improved operation.

#### Transportation Expenses

The character of the motive power has a decided influence on the expenses falling under this head. Directly or indirectly, the locomotive affects items in the transportation expenses which amount to about 35 per cent of the total operating expenses. However, some of the accounts seem to be affected only slightly and the importance of locomotives, which are merely capable of delivering high tractive effort at low speed in reducing transportation expenses, has, no doubt, often been overestimated.

Two of the important items which are reduced almost proportionately as the tractive effort increases are wages of train enginemen and trainmen. The economies in these expenses are considerable and they can be predetermined with a fair degree of accuracy. Probably for this reason they have assumed undue prominence. In the year 1918 the wages of train employees amounted to 10.5 per cent of all operating expenses. The fuel bill for road engines was practically as much. The cost of locomotive repairs was even greater and freight car repairs only slightly less.

#### Relative Importance of Fuel and Wages of Train Crew

Some of the costly measures necessary to obtain slight increases in the train load can probably never be justified on the basis of the savings in the wages of train crews and some of the related savings are problematical. Railroad officers when considering means of promoting economy might well keep in mind this thought: The gross saving due to a given percentage reduction of the mileage of train enginemen and trainmen under average conditions is equalled by the saving due to a like reduction in the consumption of fuel.

Passing to the consideration of the relative fuel consumption of heavy locomotives, each increase in size results in slightly better fuel performance, provided that similar care is used in the design. The essential features of an efficient boiler are large grate area, ample firebox volume and tubes of suitable length to prevent excessive losses in the waste gases. All these can be obtained in the 2-10-2 type or other

heavy locomotives. The large cylinders used with such power are also advantageous because the smaller ratio of the area to the volume reduces the heat loss in the cylinders. Within the range of normal operation, however, the difference in the fuel consumption per unit of work with a well-designed locomotive of the 2-10-2 type and the Mikado type, for example, is probably negligible. The remarkable fuel performance credited to some designs of Mallet compound locomotives suggests the advisability of establishing in as conclusive a manner as possible the comparative results of this type of compound and typical large simple engines.

**Some Items of Expense That Have  
Been Given Little Attention**

The expenses directly chargeable to train service aside from fuel and wages, include lubricants and locomotive and train supplies. These items are of less importance than those previously mentioned and, in general, the charges per ton mile decrease as the tractive power increases.

The expense of yard operation is seldom considered as being influenced by the character of the road engines. In hump yards the cost of switching is probably independent of the length of the train. However, in drilling yards the necessity of hauling long cuts of cars reduces the speed of switching and increases the fuel used. While the net result is largely dependent on local conditions, this factor is of some importance and should not be passed over lightly in analyzing problems of operation with heavy power.

Enginehouse expenses likewise are affected by the character of the power to an extent depending on local conditions. The reduction in the number of units handled will cause a slight decrease in the cost per ton mile unless the new equipment requires additional facilities.

While the major items of operating expenses which enter into the problem of large locomotives have been discussed above, it is pertinent to enumerate several miscellaneous items which are affected to some degree. These include accounts affected by collisions and derailments, loss and damage, damage to live stock, clearing wrecks and injuries to persons. The effect of car failures on loss and damage has already been mentioned. Insofar as these expenses are due to collisions and derailments, they are increased by an increase in train density, rather than by an increase in the length of the train and would therefore be reduced by the use of locomotives of high capacity.

**Fixed Charges**

The only fixed charges on road and equipment which appear in the operating expenses are the depreciation charges on certain parts of the plant. While the separation of interest charges from labor and material may be desirable in the general balance sheet, the analysis of the advantages of various facilities is best made by considering the net amount that can be earned above the prevailing rate of interest.

The fixed charges on the motive power seldom exceed three to four per cent of the operating expenses. The difference between the fixed charges on a thoroughly efficient modern engine and a crude design that might be bought to make an insufficient appropriation to cover a given number of locomotives is negligible. However, the difference in the earning power of these two types is quite appreciable and serves to show what large returns can be derived from the additional capital expended for refinements and accessories that give increased capacity and efficiency.

Reference has already been made to the advisability of considering the capital expenditure required for related facilities when deciding on the type of power. At first thought it might seem that the additional investment for terminals, shops and shop machinery would add greatly to the capital expenditure and the fixed charges. Under ordinary conditions the cost of roundhouse space required properly to house

a locomotive is a comparatively small proportion of the cost of the power. The cost of the shop buildings and machinery is even less important when the added efficiency and decreased cost of repair operations is considered.

Sometimes the introduction of heavy locomotives necessitates strengthening or replacing bridges or laying heavier rail over certain sections. The expenditures involved are often quite large, but the relatively long life of these structures decreases the fixed charges and the additional cost per ton mile becomes comparatively small and is seldom an important factor in determining the most economical equipment. When new rail must be laid the additional expenditure is a more serious item and the charge would probably not be justified except on a line with relatively dense traffic.

The preceding discussion pointing out the more important considerations involved in a study of the economic value of various types of motive power demonstrate the complexity of the problem. Probably no absolutely correct analysis is possible; surely, it is not practicable. The question is of extreme importance because the possibilities of economical operation are circumscribed by the motive power. For that reason the choice of the locomotive should be made with extreme care. The final decision should be based on a definite knowledge of the economies that can be realized, not on unsupported opinion. Engineering methods are essential in working out the solution and the study of the problem offers a field for constructive, co-operative work by the members of the engineering societies.

**Southern Roads Decline to  
Reduce Melon Rates**

WASHINGTON, D. C.

**S**OUTHERN GROWERS of watermelons who have been seeking a reduction in freight rates on the ground that they are not receiving compensatory prices for their products were advised to try to obtain a larger share of the price paid by the consumer which now goes to middlemen, in a letter from Vice-President Green of the Southern Railway to Senator Harris of Georgia, who has been trying to assist the melon growers and had been instrumental in arranging for a conference between representatives of the growers and of the carriers, after a conference with the Interstate Commerce Commission. Mr. Green's letter advised that the southern roads do not feel that the circumstances warrant a reduction in the melon rates and that it is doubtful whether either the grower or the consumer would receive any benefit from a reduction in freight rates.

Mr. Green said in the letter:

Asking that you pass this advice to your colleagues who accompanied you in recent visit to my office, I beg to report that an informal conference between representatives of the watermelon growers and representatives of the carriers was had in Macon, Ga., on April 26.

From the report which I have of this conference, I am led to believe that while there was some division of opinion as to the effect of the increased transportation charge on the ability of the watermelon producer to market his crop it was probably the feeling of the majority, if not all, that the transportation charge was not an important factor in the situation.

In order that you may see at a glance what the last advance in freight charges represents—using an average load of 1,000 melons at an average weight of 27 pounds each, I invite your attention to the following tabulation. Using Albany, Ga., as a representative shipping point the advance per melon is as follows:

Baltimore, Md.....	4.2 cents
Philadelphia, Pa.....	4.8 "
New York, N. Y.....	4.9 "
Buffalo, N. Y.....	4.9 "
Pittsburgh, Pa.....	4.8 "
Chicago, Ill.....	4.7 "
Cincinnati, O.....	2.3 "

It developed at the meeting that the returns to the growers

on last year's crop were very small, averaging about \$75.00 per car and using the same estimate as above approximated 7½ cents per melon.

The last investigation into the price at destination yielded the fact that the consumer paid very much more than was warranted by the returns to the grower plus the transportation charge. For instance, it was shown that melons yielding the grower 7½ cents and the carrier 12.7 cents, Albany to Baltimore, or a total of 20.2 cents for the producer and the carrier, sold in Baltimore for \$1.

It was stated at the meeting that certain carload shipments of melons from Stilson, Ga., to Chicago in last July yielded the grower approximately \$50 per car. Figures were submitted from the Government report (Bureau of Markets daily market report) which showed the average sale at Chicago for melons ranging from 18 to 31 pounds during July, 1920, to have been \$349 per car of 24,000 pounds, based on every other day sales. The freight rate from Stilson to Chicago during July, 1920, was \$134.40 per car of 24,000 pounds and war tax \$4.03, making a total of \$138.43, which deducted from the average sale price left \$210.57 for the grower and speculator, which it seems was divided by the grower receiving \$50 and the speculator \$160.57.

It is reasonably certain that the grower would not receive any substantial addition to his price through a reduction in freight rates. I do not believe the consumer would get the advantage of such a reduction.

The citrus producers in Florida and on the Pacific Coast and the Georgia peach growers long since learned that they could not get fair returns on their crops by handling through commission houses in the markets of consumption and accepting whatever return the commission man rendered. They therefore formed associations and created selling agencies which have produced much more satisfactory results. The distribution under this plan is more intelligent and glutting the markets is avoided with its consequent depression of prices.

The interested carriers wish me to say to you that they do not feel that the circumstances warrant reduction in the melon rates.

In presenting this letter in the Senate for publication in the Congressional Record, Senator Harris said it "shows the amount of profiteering going on on the part of the commission merchant and the retailer" and he had taken that phase of the matter up with the Federal Trade Commission.

## Short Line Problems Discussed

WASHINGTON, D. C.

**T**HE AMERICAN SHORT LINE RAILROAD ASSOCIATION began a two-day annual meeting at Washington on May 18. President Bird M. Robinson presented a report outlining the work of the association and the problems for the future in which he said in part:

The American people have apparently lost their sense of justice in considering the railroad question. They have, in years past, followed the cry that the public must be served regardless of the rights of the owners of the properties, and during that period have enforced a policy of restriction to such an extent that they have practically starved most of the railroads.

The government took possession of the great majority of the railroads of the country for war purposes, and after operating them in an extravagant and reckless way, returned the properties to their owners not only in a dilapidated condition, but saddled with ruinous wage contracts, which have since resulted in sapping their very life blood. When returning the roads to their owners the government gave to one of its agencies unlimited power to regulate the rates to be charged for services, and gave to another agency unlimited power to determine the wages to be paid to their employees.

The result has been most disastrous for notwithstanding a large increase in rates, the revenue received has not been sufficient, in most cases, to meet operating expenses, and as a result of such limitations and impositions, solvent companies have rapidly progressed into bankruptcy.

For the purpose of developing the facts, the Senate, through its Committee on Interstate Commerce, is now engaged in an investigation of the difficulties confronting the railroads. We confidently hope that that investigation will clarify the atmosphere and remove the smoke and poison which has been injected into the situation; and at least result in a clear understanding by a majority of the Senators and Members of the House of the true facts, and of the emergency which confronts the carriers.

In the meantime, however, a large number of bills have been introduced in Congress, not only to amend the interstate commerce statutes as amended by the transportation act, but to add new and burdensome restrictions upon the carriers. The great majority of all the bills so introduced are intended to further curtail the limited authority left to the owners of the properties and to impose additional burdens.

The parties behind these various bills in Congress are prepared to fight vigorously for their adoption and it will be necessary for the carriers to be prepared to defend themselves earnestly and strongly at all times and under all circumstances; otherwise they will be afflicted with additional burdens and restrictions.

The efforts of the carriers to break the strangle-hold of the labor unions and to reduce the amount of wages paid to employees to a degree commensurate with revenues received, has precipitated a fight that has not heretofore been equaled for misrepresentations and brutish villification. The labor leaders have not only used every device to create a smoke screen for the purpose of obscuring the question at issue, but they have vigorously sought to use poison gases of untruths in the hope that they could thus kill off the efforts being made by the carriers to save about \$1,000,000 per day, which they are being forced to pay to employees beyond the amount that should be paid. Only a part of the public seem to realize that in the end it must pay this extraordinary bill, and that therefore the fight of the carriers is for its benefit, as well as their own.

The trunk roads have two very strong associations and many subordinate organizations, for the purpose of promoting efficiency and standardization and to protect their interests. While the short line railroads of the country are large in number, they are limited in mileage, and are very greatly limited in available funds. They cannot maintain more than one organization, but they can, by proper efforts and full co-operation, maintain one very strong and effective association at a cost very small when compared with results accomplished. The surrounding conditions compel that class of roads to increase and strengthen, to the fullest extent, this association, as it is the only organization available, and is the only one that has ever accomplished any substantial results for that class of roads throughout the country.

This meeting must recognize that joint and co-operative effort at this time is the only means or way by which roads of the non-trunk class can obtain protection and secure living conditions in the future. Hence the delegates should carefully consider the association as such, and adopt such plans and devise such means as will insure, not only a continuance of the efficient work heretofore done, but which will lead to greater benefits in the future.

There are about 300 additional short lines in the country that should become members, and the delegates at this meeting should consider ways and means by which these non-member lines could be impressed with the fact that they are not doing their duty to the lines that are members, especially those non-members which constantly and unblushingly take advantage of what the association does, without in any way participating in the work or rendering any assistance in accomplishing the results.

I have just made a careful review of the results accomplished by this association during the past five years, and am convinced that, taking into consideration the amounts actually obtained and recovered by the short lines of the country, or which they would have had to pay had the association not protected them in such instances as the Adamson law, and Wage Decision No. 2, together with the benefits obtained in the federal control act and from the Railroad Administration; as well as those which have accrued under the Transportation Act, but not including the \$8,000,000 or \$10,000,000 per year to be recovered through increased divisions, in the aggregate will be in excess of \$75,000,000; and that great result has been accomplished at a cost for the whole support of the association for the last five years, which is less than one-third of one per cent of those benefits.

Circumstances clearly indicate that it is vital to the short line railroads that this association be continued. In fact, there are strong indications that the organization will be needed to a greater extent in the future than it has been in the past. It is quite apparent that the government is participating more and more in the management of the carriers, and that Congress and the legislatures will have under constant consideration the enactment of laws that will affect the carriers more and more.

J. H. THOMAS, member of the British parliament and secretary of the National Union of Railwaymen, was met on his arrival in New York on May 11 by such banners as "Thomas is fleeing the wrath of his country" and "Judas hanged himself after the betrayal. Will Thomas do likewise"? Those carrying the banners proclaimed themselves members of the "Irish American Labor League" and it is understood that their animosity toward Mr. Thomas was occasioned by the failure of his union to join the striking English miners.

# Non-Interlocking, No-Stop Railroad Crossing

## A Proposed Signal Layout to Control Train Movements Automatically at Intersection Points

By L. B. Porter

Assistant Signal Engineer, Chicago, Milwaukee & St. Paul, Milwaukee, Wis.

THE ECONOMY produced by the elimination of train stops has been the deciding factor in favor of the installation of interlocking plants at railroad crossings and junctions. The large number of non-interlocked crossings, junctions and terminals throughout the country, over which thousands of trains are moved daily with a comparative freedom from accidents, proves conclusively that interlockings are not necessary from the standpoint of safety alone.

Careful studies, calculations and tests were made several years ago which resulted in the estimate that 45 cents would represent the average cost of stopping a train. With this as a basis it was felt that an interlocking plant would be a paying proposition when 20 or more train stops per day could be eliminated. Today the cost of stopping trains is much higher, but the cost of installation, maintenance and operation of a complete interlocking plant has also increased

The stopping of trains before reaching any railroad crossing or junction at grade is required by law, unless certain safe-guards are provided, in which event the state laws grant non-stop privileges. The following is taken from one of the state laws relating to stopping trains at crossings,—“Every company operating a railroad shall cause all trains on such railroad to come to a full stop, not less than 10 nor more than 60 rods before reaching any railroad junction or crossing at grade, unless such stoppage is rendered unnecessary by an interlocking plant or other device approved by written order of the commission or by the court upon appeal.” The statutes in other states are usually drafted along the same general lines as the one quoted.

It will be noted that an automatic arrangement of signals may be approved at the discretion of the railroad commission and that the different forms of interlocking heretofore used almost exclusively are not the only forms of protection that could be considered. The writer knows of one state where the commission's engineer has stated that an automatic signal arrangement would be approved in lieu of interlocking protection for the ordinary simple crossing or junction. Furthermore, several actual installations of this nature have been made in other states where the commissions have given their approval and the crossing or junction stop has been eliminated.

### Application of Automatic Signal Arrangement at Junction

As an example of what it would be possible to accomplish in the way of using an automatic arrangement in place of an interlocking plant, let us consider a simple junction of a single track line with a double track line such as illustrated in Fig. 1. There are numerous junctions of this kind located at outside points, away from towns, where there is no station work, and as the double track line is equipped with automatic block signals, and as the distance to stations on either side of the junction is not very great, there is no necessity for maintaining a telegraph or block office at the junction point. The traffic on the branch line is of minor importance. In some cases it is of such a nature that there would be no objection to or hardship in having train crews handle their own switches. In other cases the train movement can be almost entirely confined within an eight or nine-hour period so that one operator can handle the switches for the few train movements involved. Yet at present, a complete interlocking plant operated by three levermen is maintained—not because traffic on the branch line requires it; not because an open office is required on the main line; not because safety requires it; but because this is a junction point and the state law specifies that all trains must make the stop unless an interlocking plant “or other approved device” is provided, and the road can not afford to stop its main line trains. Were it not for the semi-automatic features of the home signals and the objections to leaving an interlocking plant unattended, the routes on the main line would be left normally lined up during the greater part of the 24-hr. period and the tower would be closed.

Bearing in mind that the interlocking now in use is not required primarily to handle the switches for the branch line,

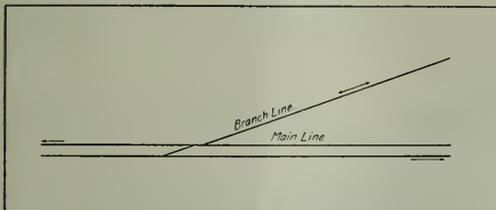

Fig. 1—Junction of Single with Double Track Line

greatly so that it will require careful estimates to prove the economy effected by the installation of a complete plant unless the traffic is quite heavy or local conditions of stopping and starting trains are unfavorable.

### Substituting Automatic Signals for Interlocking

The main items of expense connected with an interlocking plant are the operators' salaries, tower supplies and maintenance of the movable parts of the plant. If these items could be eliminated there is no question but that it would pay to prevent unnecessary train stops at crossings or junctions, even though the traffic were comparatively light. Obviously it is impossible to eliminate these items and still retain an interlocking of the type which permits the passage of trains without stopping.

The question then arises: Would it be possible to substitute any other arrangement, less expensive, in place of the complete interlocking? It has been truly said that “A problem is half solved when correctly stated.” The statement of this problem is: To provide a system of signal indications for governing train movements at railroad crossings and junctions, so arranged as to prevent simultaneous conflicting movements and not to require manual control except possibly during certain periods. There would be no objection to speed restrictions at these points, although the full train stop is to be avoided except where one train must give preference to another. The solution of this problem is: An automatic signal arrangement with selective controls for the signals and with certain modifications of signal circuits now in use.

but that its main function is to permit main line trains to pass without making the prescribed stop and to safe-guard such movements properly, would it be possible to dispense with the interlocking and use automatic signals instead? An arrangement of signals similar to that shown in Fig. 2 is suggested.

The crossover and junction switches are hand throw and are operated by operators employed on one or more shifts as conditions may require, or by trainmen if the branch line traffic permits. Signal No. 2 governs movements from the main track to the branch line and clears up automatically when both crossover and junction switches are thrown. Signal No. 4 clears up when block sections "B" and "D" are unoccupied and the junction switch is thrown. Signals No. 1 and No. 3 govern main line movements and are controlled the same as standard double track automatic block signals in all respects, except that signal No. 3 (and its distant signal) will show caution with a train approaching on the branch line in section "C". The crossover and junction switches must, of course, be in the normal positions for the main line signals to clear. The selection of controls through the switches prevents the simultaneous clearing of conflicting signals and

authority for the movement. If the telephone communication should be interrupted for any reason, or signal No. 4 should fail to clear, the movement onto main line would have to be made under the protection of a flag.

There would, of course, be other ways of handling the movements from the branch to the main line, such as requiring the lapse of a time interval after throwing the junction switch before a train fouls the main track so as to provide a longer overlap or a track circuit overlap might be used for the main line as well as for the branch line signal. An electric lock could be provided on the junction switch, which would be controlled through approach sections on the main track, to prevent throwing the switch with the main line train approaching. A derail might be provided on the branch line to work in connection with the main line switch and the electric lock to insure branch line trains stopping back of the fouling point. However, if proper discipline is maintained, these additional features should not be necessary.

#### Advantages of the Automatic Arrangement

The proposed automatic arrangement would give practically all of the non-stop advantages of an interlocking plant,

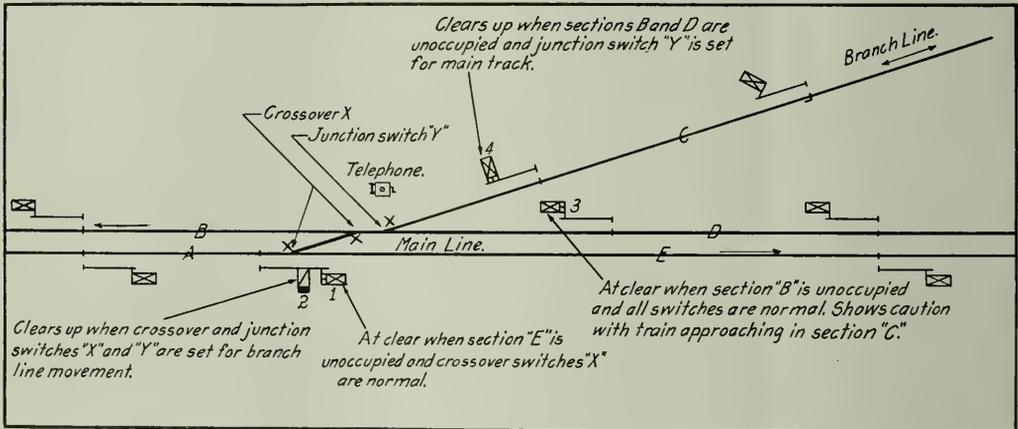

Fig. 2—Automatic Signal Arrangement at Junction

takes the place of an overlap. If desired, signal No. 4 could be made a normal-danger signal with a short clearing section, so that it would not clear up until a train had nearly reached it. This would have the effect of imposing a speed restriction on main line trains approaching the junction from this direction. Switch indicators would be provided on roads using this type of apparatus so as to prevent the throwing of switches in the face of approaching trains.

Trains on both the main and the branch line are operated under one dispatcher and under the same time card; therefore, a movement from main line to branch line "A" to "C" would be identical with any crossover movement in automatic block signal territory and would have the same signal protection. If the switches were handled by train crews, signal No. 2 would probably not be required. During the hours that an operator might be on duty at the junction, there would be no difficulty in taking care of movements from the branch to main line, since he would be fully advised as to main line movements. At other times trains on the branch line would get information regarding main line movements from the last open office on the branch, and before making any move to come out on the main line at the junction, would get into telephone communication with the dispatcher or operator at the main line station and first get the necessary

for main line movements and at a much lower cost. It would be possible to dispense with from one to three levermen and the cost of maintenance and operation would be much lower than for an interlocking plant. A smaller investment would be required for the automatic arrangement, which would reduce the taxes, the interest and depreciation charges. Delays to traffic due to the failure of the complicated electrical features of modern interlocking plants; and delays due to the difficulty of keeping switches, derails and movable parts of a plant free from snow and ice, would be decreased. An automatic arrangement is usually more flexible than an interlocking plant. Taking all of these features into consideration, a conservative estimate of the saving would be from \$300 to \$800 per month in favor of the automatic arrangement, depending upon the number of men required to handle the switches.

#### Disadvantages of and Objections to

##### The Automatic Arrangement

It is admitted that movements to and from the branch line may be somewhat handicapped under the proposed arrangement, especially if trainmen have to handle their own switches; but only junction points where facility in handling branch line traffic is of minor importance are being considered

in this discussion. The first and main objection to the proposed scheme perhaps would be that safety in train operation would be sacrificed, as derails could not be used with an automatic arrangement. Apparently there is a difference of opinion regarding the value of derails in main tracks. It is a well known fact that there are a large number of interlocking plants throughout the country at crossings, junctions, yards, and terminals where no derails have been provided. At some of these plants the speed of trains is high while at others it may be somewhat restricted. These plants without derails, the number of which is constantly increasing, cannot be considered unsafe by any means. On the contrary, the view seems to be gaining ground that the derails are no longer considered necessary, except at special locations. Indeed, it seems probable that derails have done more positive harm in causing unnecessary derailments when no danger existed than the good they may have accomplished in preventing accidents.

The function of the derail is two-fold: It has a moral effect on the enginemen in causing them to be more alert and ready to observe and obey the signal indication from the fear of the serious consequences of a derailment; it also per-

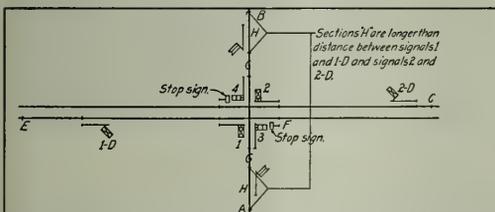

Fig. 3—Automatic Signal Arrangement at Crossing

forms the useful function of preventing possible collisions in case the engineman has lost control of his train and is unable to stop at the governing signal. It undoubtedly would be advisable always to retain the derail at certain locations where there are especially unfavorable conditions to be contended with such as a descending grade or a poor view of the signal. At such points an automatic arrangement could not be used, but it would seem that under ordinary conditions in this day of advanced signaling practice when trains are governed almost entirely by signal indications, when surprise tests are made regularly, and rules rigidly enforced, the main-track derail could be dispensed with almost entirely.

Are the chances of accident any more numerous or would the consequences be any more grave were a train to disregard an automatic signal at a junction point where no derail is used than if it should disregard a distant signal governing the approach to a signal governing over a derail; or if it should disregard the *caution* indication of an automatic signal, when running at 60 mi. an hr. two blocks behind a first-class passenger train that had stopped just out of view around a curve and the flagman failed to perform his duty; or where the automatic signal was at *stop* due to a piece broken out of a rail; or where it was due to a misplaced facing switch or an open switch point? Would the consequences be any more grave than if the engineman failed to observe a train order signal, a staff signal, or a controlled manual signal and the train proceeded on its way against an opposing train?

The argument may also be advanced that an automatic signal at a remote point is more likely to be disregarded than a manually controlled signal; also that the proposed scheme would require occasional movements to be made under flagging protection and that this could not be depended upon. Now these are conditions depending upon the discipline a

road maintains, but the odds are in favor of there being no accident at the junction, especially if an operator is employed to handle all or most of the regular movements, as against the chances of an accident at an automatic signal governing movements into a station where considerable switching movements are made daily. To admit either of these arguments is to admit a fundamental weakness in the discipline that is maintained and that train operation under the automatic block signal system is not safe on such a road.

### Applications of Automatic Arrangement at Crossings

The use of automatic signals to govern train movements over a railroad crossing would involve some complications not encountered at the junction point, for the reason that in most cases the line crossed is owned by another company and train operation is entirely independent on each road, there being no common time-tables in use, and trains on one road have no knowledge of the time of arrival of trains on the other road. There are train movements in four different directions to be taken care of, whereas at the junction practically two movements only have to be considered, and one of these does not involve any special features. To prevent simultaneous conflicting movements at the crossing, full track circuit overlap protection in all four directions is necessary. The complications at the crossing are more serious as the traffic becomes heavier. But there is a certain class of crossings where it would be possible to work out an automatic arrangement that, for all practical purposes and within reasonable limits, would answer the purpose.

Take, for an example, a simple crossing of a single-track road with a double-track road, traffic on the double-track road being heavy and it being equipped with automatic block signals, while traffic on the single-track road is comparatively light. An interlocking plant has been installed, and is maintained by the first-class road for its sole benefit, as the single-track road would have no objection to making the crossing stop. The crossing may be at a remote point, as at the junction, and the men who operate the plant are required for that purpose solely. While the plant may handle one or two passing track switches or a crossover, this is merely incidental, as the other passing track switches and crossovers on the division are not interlocked, and the main function of the plant is to avoid the crossing stop for the trains on the double-track road. The traffic on the single-track road often is of minor importance, and in some cases it consists of the movement of one mixed train in each direction daily except Sunday. The writer knows of one case where it consists of only one regular train movement, down one day and back the next. Yet, in order to avoid stopping its trains, the first-class road has installed a complete interlocking plant, and because of its semi-automatic features and the objection to leaving it unattended, it is necessary to maintain three levermen to operate the plant continuously.

Looking at the matter from an unprejudiced and unbiased viewpoint, giving due consideration to safety, and bearing in mind the urgent necessity at this time of reducing operating expenses, it would seem possible and advisable to eliminate the derails and to substitute an automatic signal arrangement in place of the interlocking plant. If desired, an operator could be employed during the hours when regular trains on the second-class line were scheduled to arrive, who would handle the crossing signals so as to give preference to superior trains during the time he was on duty. The crossing signals would be equipped with number plates and operated as stop and proceed signals, so that there would be no difficulty in closing the office at any time.

An arrangement of automatic crossing signals for a simple crossing of the kind under discussion, where traffic on one road is of minor importance, is shown in Fig. 3. All crossing signals stand normally at *stop*. Signal No. 1 clears up when a train enters the clearing section at E, provided

its immediate block is clear and track sections *A* and *B* on the other road are unoccupied and signals No. 3 and No. 4 are at *stop*. Signal No. 1 is controlled through a stick relay in such a manner that after it has once cleared and the train has passed distant signal No. 1-D at clear, the approach of a train on the single-track line will cause this signal to indicate *caution* only, so as to avoid tripping the signal in the face of a train. Signal No. 1 would, of course, in all cases be controlled to the *stop* position by the track circuit between signals No. 3 and No. 4. Signal No. 2 is controlled in the same manner as signal No. 1. Signals No. 3 and No. 4 clear up when the train is on the short clearing section *G* (this control being directional), provided track sections *C-D* and *E-F* are unoccupied and signals No. 1 and No. 2 are at *stop*. No signals are provided for the reverse current movements on the double track. When such movements are made, the regular crossing stop would have to be made. It will be noted that the simultaneous clearing of conflicting signals is prevented by overlap track sections and the control of each signal is carried through normally closed controllers on all conflicting signals.

The proposed arrangement could, of course, be modified in many different ways. In case an operator is employed during certain periods, some of the automatic control features could be replaced with manual control. If desired, the crossing signals on the double track road could be controlled through short clearing sections immediately in the rear of the signal, the same as proposed for the single-track road, which would act as a speed restriction in requiring trains to come almost to a stop before the signal would clear. Or, if desired, operative distant signals could be provided on the single-track line, together with preliminary clearing sections and full overlaps on both roads.

An arrangement of similar nature could be used at single-track crossings, although it would, of course, be necessary to provide crossing signals for movements in both directions on both lines. The directional control features of absolute-permissive signaling could be used to good advantage and the circuits could easily be combined with a standard single-track automatic signal control scheme. It is not necessary to go into any of the details for the proposed layout, as the arrangement would vary, depending upon local conditions, the amount and nature of the traffic, and the standards used on the individual roads. Standard automatic signal apparatus could be used, making it a comparatively simple matter to design the actual circuits. The advantages, disadvantages, and objections applying at the railroad crossing would be practically the same as outlined for the junction point, although it is admitted that train operation at the crossing is more complicated.

### Conclusions

There are numerous non-interlocked crossings and junctions where the initial expenditure for an interlocking plant would hardly be warranted, even if it were possible to obtain the necessary funds, and the cost of after-maintenance and operation of the plant would overbalance the saving resulting from its use. A study of conditions at these points in many cases would show it to be possible to use an automatic signal arrangement, thereby promoting economy and efficiency. Where an interlocking plant will cost from \$20,000 to \$30,000, the automatic arrangement will cost from \$4,000 to \$5,000. There are also opportunities for reducing operating expenses at points in automatic signal territory where plants are now maintained. The main consideration is to eliminate the derail where this can be done with safety, and to make the governing signals automatic in their operation. If this makes it possible to dispense with even one leverman or to eliminate some Sunday time, it will result in a considerable saving. In many cases the existing plant can be modified to accomplish this at a moderate cost.

## A Novel Crossing Sign

THE AUTOMATIC SIGNAL & SIGN COMPANY, Canton, Ohio, has placed on the market a new type of advance warning signal for the highway approach to a railroad. The signal consists of a heavy gage steel plate 24 in. in diameter coated with metallic aluminum on which letters 5 in. high are painted in black enamel. On the bottom half of the plate, a heavy special Redflex signal lens, 12 in. square, is riveted, which is hermetically sealed in a cast aluminum case, protected by a screen. The steel plate and lens are mounted on a steel post 2½ in. in diameter and 6 ft. long, which is designed to be encased in a concrete base.

This Redflex lens is the ingenious feature of the apparatus. It is a red mirror and reflects automobile lights. The glass is constructed with a thin layer of red near the one surface

The Sign and Its Application at a Busy Highway Crossing

and light is so reflected on the several surfaces as to be greatly intensified, sending out a distinctly red beam.

It is claimed that the signal can be focused in such a manner that at night lights of an approaching automobile will cause it to be seen at a distance of 1,000 ft. or more and as the automobile draws nearer the signal becomes brighter, until it assumes the appearance of a ball of fire. The signal may be placed at any required distance from the railway crossing, usually on the right side of the highway and at a height of 5 ft. above the ground, where it acts as a regulating railway warning sign during the day. It is claimed that due to the powerful reflected red light, it penetrates fog, dust or rain at nights.

The photograph above shows the sign and its application on a highway crossing the Chicago, Milwaukee & St. Paul tracks near Chicago over which heavy automobile traffic passes.

# Railway Terminal Problem Has Many Phases

Congestion of City Streets, Development of Air Rights, and  
Commuter Traffic Are Important Factors

THE RAILWAY TERMINAL PROBLEM will form the basis for several papers which will be presented at a joint session of the spring meeting of the American Society of Mechanical Engineers and the Terminal Committee of the Western Society of Engineers, Chicago, on May 25. Because of the many complications presented in the development of the facilities at Chicago, it has been taken as typifying the complex questions of transportation now pressing for a constructive answer as a consequence of the rapid increases in industrial concentration and commercial development. The general aspect of the problem will be outlined by J. R. Bibbins, manager of the Department of Transportation and Communication of the United States Chamber of Commerce, while various subdivisions will be discussed by others, who will take up such topics as local freighthouses and the handling of l. c. l. freight, the motor truck in its relation to the interchangeable body, terminal unification, the more intensive use of real estate owned by the railways and local rapid transit development. The following summary taken from advance papers now available reviews those features of most general interest.

The reasons for concentrating on the situation in Chicago lies in the particular intensity of the complications as outlined by Mr. Bibbins.

## Outline of the Discussion

"Under the urge of European demand, the rail trunk system of today is largely concentrated in the latitude north of Chicago—St. Louis and fans out west of these points into a great collecting system of feeders. Over this great transcontinental belt travels most of the interior tonnage and the world's supply of American products. This is not simply a problem of providing continuous rail transit through a congested metropolis, but in most of these cases the gateway is a division terminal break-up and transhipment point or terminal transfer point between connecting roads, as well as a large producing district requiring carload service for incoming raw materials and both carload (c.l.) and less-than-carload (l.c.l.) service for outgoing fabricated product.

"Thus we are warranted in examining the port of Chicago, for this great gateway holds the potential place of a water gate as well as a rail head. When the possibilities are developed, Chicago will be the crossroad of the continent in fact as well as in simile, and the problem which engineers must work out in the near future is to design a proper and efficient working machine for handling quickly and cheaply this vast transcontinental tonnage as well as its own originating tonnage. The preponderance of east-west rail movement will no doubt remain, although looking well into the future it seems hardly sensible, on the ground of national safety, that over one-half of the nation's export production should be passed through the 'bottle neck' of New York harbor."

## Suggested Methods for Expediting Transportation

Mr. Bibbins also calls particular attention to the fact that while Chicago has an area of over 200 square miles, the business center occupies only about one square mile and all of the railroads have located most of their local freight houses within or just as close to this area as possible. Another complication lies in the interchange of a large volume of less than carload freight between the railroads by trucking over the congested city streets.

In the main, the discussion will center on the expeditious

handling of less than carload freight and the subject will be approached from a number of different angles. E. J. Noonan, engineer, Chicago Terminal Commission, Chicago, advocates the more intensive use of property occupied by the railroads for the local freight development. His plan embodies primarily the use of the two-level freighthouse with the cars on a lower level and teaming or street vehicle service on an upper level in the same horizontal plane as the city streets. But owing to the high value of real estate this is not enough. The railroads must develop their properties in such a way that multiple story buildings may be erected over the facilities used for purely freighthouse purposes so that it will not be necessary to allocate all of the land rental or interest in land investment to the freight handled through the terminals. Mr. Noonan estimates that the single-level type of freight house with its accompanying tracks can be provided for about \$2 per sq. ft., and the double-level type for about \$5.

With these figures as a basis the relative economy, so far as interest on land used is concerned, is as follows:

	Assumed value of land per sq. ft.			
	\$5.00	\$10.00	\$15.00	\$20.00
Interest charge per ton at 6 per cent, single-level .....	\$0.42	\$0.72	\$1.02	\$1.32
Interest charge per ton at 6 per cent, double-level .....	0.30	0.45	0.60	0.75
Saving, cents per ton.....	\$0.12	\$0.27	\$0.42	\$0.57

Mr. Noonan's solution of this problem hinges primarily on the development now proposed for the rehabilitation of railway facilities immediately south of the business center of the City of Chicago. This was described at some length in an abstract of a report recently issued by the Chicago Terminal Commission appearing in the *Railway Age* of April 8, 1921, page 891.

## Plans for the Interchange of Freight

Improved means for the interchange of freight between the railroads is discussed from two angles. Mr. Bibbins and Mr. Noonan have considered this from the standpoint of the possibilities of the freight tunnel of the Chicago Tunnel Company, and present data abstracted largely from the report made by Mr. Bibbins as supervising engineer for the Arnold Company to the Chicago Plan Commission last year. Excerpts from this report appeared in the *Railway Age* for July 9, 1920, page 52. This is obviously a problem peculiar to the City of Chicago of no direct bearing on the freight handling in general. However, the existence of this tunnel, which now handles 1,800 tons of l. c. l. freight daily and could possibly accommodate 10,000 tons, points to the thorough consideration of this tunnel as the transportation agency in the solution of the city's problems.

The motor truck as an agency in the solution of this problem is discussed in a broad way by Hugh E. Young, engineer, Chicago Plan Commission, Chicago, who points out emphatically the necessity for taking into account the fixed charges and maintenance of highways and streets used by the trucks. Mr. Young's paper is abstracted as follows:

"Before the motor truck replaces trap-car service in order to relieve the rail terminals of local car-movement congestion, investigation should be made to determine if a scientific handling of freight by modern terminal equipment and the employment of such schemes as those adopted in Cincinnati where package freight is loaded into demountable containers, or truck bodies, which are transported to and from motor chassis mechanically, can accomplish the same results. The

principal factor contributing to the local car congestion is a lack of modern terminal equipment.

"In reports from Cincinnati much has been said of the advantages of motor trucks for interchange between terminals and transport between main station and substation, but the effect of such traffic on the maintenance of highways, and the loss to the public due to street-traffic congestion, are not considered in the accounting.

"The tendency in the trucking business toward handling a large freight-transfer tonnage wholesale by contract has developed within late years. Quite recently a new plan has appeared, using standard two- to five-ton motor trucks built with interchangeable bodies so that the more expensive chassis may be kept in continuous operation. Thus house or shippers' freight can be loaded and unloaded in these unit containers as required, independently of the truck itself or its time of arrival and departure. It is even proposed by advocates of this system that motor trucks should replace trap-car service as now operated, thus relieving the rail terminals of much local movement.

"This contract motor-transport plan has advantages, some very real and some apparent. It aims to reduce street congestion by concentrating bulk, and, by maximum loading, reduce the number of motor trucks on the public streets required for freight service. It provides greater latitude in timing of various transport movements, so that individual shipments can be handled with greater ease and less confusion at the freight houses.

"However, for the Chicago situation the fact should not be lost sight of that any plan of motor transport, whether individual or by contract, is defective if the downtown public streets are used as a right of way for a class of traffic which is primarily rail tonnage and should be considered as such. Loop streets are now all too few and narrow, without deliberately planning for their further use for transporting railroad tonnage.

"The importance of legitimate highway transportation has been overlooked in a remarkable manner when it is considered that all movement of produce in the course of its production from raw material to finished product, starts on the highways and finishes over the highways. As a method of transportation incident to railroad transportation and as a solution of the short-haul problem, it far outranks in importance all other means of transportation.

"Recognizing the necessity of the rail carrier, realizing that the prosperity of the country depends on railroad transportation, considering the present difficulties of railroad financing, and knowing the economic waste in duplicating transportation systems for the same business, it is absurd to assume that in the final accounting there is a saving to the consumer in motor-truck delivery. Neglecting the cost of construction and maintenance of highways, which cost more per mile than railroads, and even if commodities were delivered free of charge by the motor truck, the public must still pay a return in some manner or other on the rail investment if it expects to have such a utility maintained and operated, otherwise it will be a case of dismantling the railroad. This latter procedure is already being threatened by one railroad.

"The use of the motor truck for interchange between terminals and transport between main station and substation before being accepted on its face value should be investigated as to its economy, taking into consideration the cost of maintenance of the highways over which it operates; and any plan of motor transport, whether individual or by contract, is deficient if downtown public streets are used as a right of way for a class of traffic which is primarily rail tonnage."

In concluding his paper Mr. Young contends that the ultimate economic application of the motor truck probably lies in store-door delivery and outlines the more general details involved in the application of this system through the

use of demountable bodies or containers. Particular emphasis is placed on the fact that the introduction of this system would entail a very extensive reconstruction of the local freight house facilities.

### Terminal Unification

J. H. Brinkerhoff, general agent Northern Pacific, Chicago, who was Chicago terminal manager for the U. S. R. A., discusses the unification of terminals from the viewpoint of the terminal executive.

"About the time this country entered the war the situation in Chicago was such that it was necessary for some action on the part of the interested lines, and as a result a co-ordination committee was formed and a great deal of good was accomplished through the efforts of this committee.

"When the railroads were taken over by the government in December, 1917, this committee's meetings were discontinued for a time, though the changes that had been put in effect by the committee were in operation. The committee's activities were resumed in the spring of 1918 and they continued to function until July, 1918, when the Chicago terminal district was formed, and the work of the committee was taken over by the terminal manager.

With the operation of the terminal under one head many things were accomplished in the common use of the terminals. In this district there are a number of routes over which cars can be handled to and from industries and between railroads; this is particularly true of the movement between railroads. Economical operation and prompt movement of cars is greatly facilitated when the handling of commodities is concentrated in one channel. This is best illustrated by the concentration on one line that was accomplished in the handling of perishable freight, a large part of which requires re-icing. The result of this concentration gave the switching line an opportunity to handle the cars in large groups and facilitated the outbound movement.

"The Chicago district has become the most important junction point between the east and west and the supply of certain classes of equipment during times of heavy business is not sufficient to take care of the movement. The preponderance of tonnage which requires box cars, particularly grain and grain products, is largely eastbound. This makes it necessary to move empty box cars west. The product of the steel mills requires a large proportion of open top cars, and while the western lines are equipped to handle coal, they are not provided with the type of equipment necessary to handle the products of the steel mills so there is always a use in the Chicago district for the eastbound open top equipment which moves west and this requires in some cases empty open top movement into the district from the west. The distribution of equipment under these circumstances is best handled by one authority. The handling of a terminal where there is a large variety of interests is best accomplished by having it under one head whose authority should be supreme in deciding questions that continually arise between individual carriers.

"In the use of local freight stations those stations that were congested were relieved by sending business to freight stations that were not so busy. This practice kept the terminal open and made unnecessary the placing of embargoes.

"The consolidation of the 21 individual agencies at the Union Stock Yards was effected and the Stock Yards District Agency now handles, from an operating standpoint, business for that district. This furnishes the shippers one point of contact instead of 21, and has been very satisfactory. Few people are aware of the magnitude of the business handled by this agency. The remittances to the various lines interested amount to about \$75,000,000 per year.

"What was accomplished by unified operation was further illustrated by what happened in August, 1918. During a

period of two weeks there was a total of 21,693 cars of grain handled. This is the greatest volume that has ever arrived at the primary market in a similar period of time. There was also forwarded during this same period over 19,000,000 bu., part of it going by lake. No embargoes were placed, and congested individual lines were relieved promptly.

"Congestion always starts at one point and if prompt measures are not taken, the congestion spreads to other lines. Under unified control, measures can be taken to relieve congestion as soon as it is manifest. Under individual operation this has never been accomplished."

### The Steam Railroads in Rapid Transit Development

A paper by Bion J. Arnold, consulting engineer, Chicago, upholds the more intensive use of railway property as the solution of the local rapid transit problem which has been agitated for a great many years primarily in the proposal to construct subways according to a number of different plans. Mr. Arnold shows that the passenger development as carried out according to present tendencies involves the construction of enormous passenger stations, entailing capital charges against the passenger traffic entirely out of proportion to the revenue which can be expected from suburban service. He also called attention to the fact that the present development provides for no direct interchange of passenger traffic between railroads or between routes occupied by the several roads.

"None of these, with the exception of the Illinois Central development, is especially adapted for the economical and

quick handling of commuter or rapid-transit business. On the other hand, they are distinctly ill adapted for handling the large growth in future traffic which will undoubtedly come. While these stations are distributed around the borders of the most intensively developed part of the business district, there is no intercommunication between them and consequently these terminals must necessarily remain as traffic "dumps," rather than as traffic distributors.

"The statement is frequently made by railroad executives, and without refutation, that the commuter rapid-transit business does not pay or is carried at a large loss which must be made up by the long-distance overland passenger and freight business. If this is true, the railroad managements of the country which are confronted with the problem of adequate revenue, stand in the inconsistent position of harboring a passenger-terminal system and conducting a public service at the expense of the stockholders or the other patrons of the system. Either aspect, if true, represents an unstable economic condition which cannot last. And if the commuter traffic is not in fact supporting the full cost of producing this service, there is no better time than the present for the railroads to establish the facts in the case and endeavor to have this traffic handled in a more practicable manner. It is believed by many engineers in railroad service and in civil life that some careful and thorough research into the economics of railroad suburban-passenger business should be instituted at once, with the specific object of finding out whether the railroads could better handle it or should turn it over to some other agency better organized for the purpose."

## The American Railway Development Association

### Helping the Farmer and Showing the Farmer How to Help Himself—Some Unanswerable Questions

**A** PART of the doings of this association at its annual meeting in New York City on May 11, 12, and 13, was reported in the *Railway Age* of May 13, page 1129. The first business on the second day, Thursday, was the election of officers, which resulted as follows: President, G. E. Bates, assistant to the general manager of the Delaware & Hudson, Albany, N. Y. Mr. Bates heretofore was second vice-president of the association. First vice-president, J. B. Lamson (C. B. & Q.), heretofore secretary-treasurer. Second vice-president, J. F. Fox, traveling immigration agent of the Northern Pacific. Secretary, J. F. Jackson, agricultural agent of the Central of Georgia, Savannah, Ga.

A large number of new members were admitted to the association, representing twenty or more prominent roads. Denver, Colo., was selected as the place for the next annual meeting, to be held in May, 1922. A motion was made, and unanimously carried, that the date of the semi-annual meeting, which is held at Chicago and comes in November, might be changed so as to make it convenient for members to attend, on the same trip, the International Livestock Show.

#### Helping Farmers and Others to Advertise

Methods and scope of publicity was the subject of a paper by J. D. McCartney, assistant general passenger agent of the Central of Georgia, who, however, proved to be a publicity agent; he pays as much attention to the shops and the agricultural department as to the direct cultivation of passenger traffic. The publicity agent should do everything in his power to promote the "public be pleased" theory of conducting transportation. Cultivate the weekly as well as the daily press. The development agent should remember that every

day he has interesting news to give out; see that the publicity agent of your road is informed about it. On the Central of Georgia, the president of the road, each month, issues a circular to subordinate officers containing a memorandum of subjects worth talking about, with a view to giving the public useful and accurate information. Every railroad officer must remember that the day has gone by when he can excuse himself for inaction by saying that he is not a good talker. Good talkers are now somewhat common, and it is the duty of everyone to see that he does his duty in that direction.

In the discussion on this paper, Mr. Bates (D. & H.), calling attention to the fact that "public be pleased" was not so snappy a slogan as "public be damned," suggested that "P. B. D." could still be used by making it read "public be developed."

#### Co-operation in Community Advertising

This was the subject of a paper by W. H. Hill, agricultural agent of the New York Central, at Chicago. The railroads should co-operate with the Community development section of the Associated Advertising Clubs of the World. These clubs are made up largely of the merchants in a given town, often a town of moderate size, to work together in the promotion of retail trade. Mr. Hill cited a notable example, that of the Maryville (Mo.) commercial club, and displayed samples of whole-page newspaper advertising which was used to promote the retail business of that town in the country immediately surrounding it; also the case of St. Louis, Mo., which advertised all over the country with a view to drawing to that city 16 different kinds of manufacturing. The speaker cited various cities which had been notably successful in

advertising: Winnipeg, Man., Asheville, N. C., Omaha, Neb., and others. A good deal of money used in experiments of this kind is unwisely spent and railroad development agents would do well to take a hand in these enterprises where opportunity offers. The railroad development agent should investigate to see whether or not he could aid the towns on his line. It will pay to transport local committees to your territory to recommend the idea to towns which have not yet made themselves acquainted with it. This means of community development has been successful in rural districts where no large town was interested; for example, on the Mackinaw division of the Michigan Central.

### The Neosho Development Plan

G. R. Lowe, of Neosho, Mo., by invitation, gave an interesting talk on the Neosho community development plan, illustrated with charts. The merchants of Neosho, to stimulate their retail business, went among the farmers in the territory tributary to the town and induced them to get acquainted with each other by attending a monthly meeting, this meeting being made attractive by an auction, so managed that those attending it would have a good prospect of making a dollar. The farmers come to these auctions month after month. Having got these people more thoroughly acquainted with the town, the merchants adopted a "golden-rule sale-day"—every Monday—in which each merchant gave a specially good bargain in some one commodity. These sale-days were advertised on Friday and Saturday. Then, further to get the people of town and country acquainted with each other, meetings in the country, of the nature of a picnic, were held monthly throughout the summer; and these were attended largely by people from the towns.

### The Farmer's Viewpoint

What the farmers want of the railroads was the subject of an address by S. L. Strivings, of Castile, N. Y., president of the New York State Federation of County Farm Bureaus. Mr. Strivings spoke for farmers in New York state, who—like farmers everywhere—desire good service, low rates and economical railroad management. Setting forth the fundamental truths of transportation economy, points on which both railroad men and farmers can agree, Mr. Strivings described in striking language some of the evils which must be eliminated. Some of these evils are of a kind for which neither farmers nor railroad men are responsible, but the speaker called on the railroad men to co-operate in having them cured. Like Mr. Benson, who spoke on the previous day, Mr. Strivings emphasized the difficulties of getting men to go on to the farms when they have been brought up in a less strenuous life. He characterized Secretary Lane's proposal for colonizing soldiers on the farms as a dream, and nothing more. The farmer in hiring help has to compete with the railroads, and even may have to come to the eight-hour day; yet he cannot recover excessive costs by increasing the cost of his products. The price of wheat in America is decided in the market of London and there is no help for it. Co-operation in getting just laws concerning the relations of capital and labor, and in avoiding extravagant expenditures on national highways, were two points on which Mr. Strivings bespoke the aid of the railroads.

### Marketing Fruit

Developing small town markets was the subject of an interesting paper by C. B. Michelson of the St. Louis-San Francisco. By persistent industry Mr. Michelson enlarged the market for apples for the shippers along his line by promoting shipment to the smaller towns—where the farmers theretofore had confined their efforts to the large places.

F. S. Welsh (N. Y. C.) read a paper further discussing how to market fruit with the best results. The inspectors of the New York Central pay special attention to the dis-

covery and correction of all causes of loss on the road. They inspect cars as well as fruit. They have automobiles, and with these go around and get in close touch with the growers. These inspectors are college boys who have had experience in raising fruit and also in marketing. The shipping-point inspectors, as well as those at destinations, have succeeded in pleasing customers to the extent that one prominent consignee takes the road's record in case of loss or damage, presenting his bill in blank, for the road to fill out with the right sum.

Referring to complaints of New York shippers that in 1920 they were short of cars, Mr. Welsh asked members about conditions in other regions; and was informed that there was a considerable shortage on the Denver & Rio Grande. In Georgia, there was a short crop so that the shortage of cars was not so seriously felt. On the Canadian Pacific, stock cars were in some cases used for fruit, these cars having the slats close together. From Florida, large quantities of strawberries were moved north in refrigerator boxes.

### Colonization Advertising

Colonization advertising was the subject of a paper by Jesse M. Jones (S. A. L.). Mr. Jones discussed briefly the value of a new settler to a railroad; it has been variously estimated at from \$300 to \$2,500 a year. In a certain newspaper campaign, Mr. Jones received 10,000 inquiries, and gave the inquirers detailed answers; telling them not only what to do, but what places and things to avoid, as being not adapted to benefit them.

### Agricultural Development on the C. P. R.

Agricultural development on the Canadian Pacific was discussed by Thomas S. Acheson, general agricultural agent of that road at Winnipeg. The building up of the Canadian Pacific since 1881 by the sale of its 20 million acres of land was described in interesting fashion. In dull times the company had to accept payment for land in wheat, allowing 50 cents a bushel even when the market price was down to 37 cents. The company even advanced money to farmers to pay their taxes. The Canadian Pacific has never had to evict a buyer of its land. The company has irrigated, in Alberta, 743,000 acres of land, at a cost of \$17,000,000.

### Potatoes and Yams

Storage of potatoes on farms, to stabilize the market, was described by E. T. Reed (C. B. & Q.). The problem of the potato farmer is to sell his product early and get a good price, or else store until the following year. After August 1, the price, in Colorado, goes down but the potatoes left in the ground gain in weight. Usually it is not profitable to store unless the potatoes are kept until the following May or June. In the past year, storing was not profitable, but in the year before it was. In reviewing a period of thirteen years, eight years were found to have been profitable. If 75 per cent of the farmers would provide storage room for two-thirds of their product the market could be successfully stabilized.

The same general principles apply in the case of grain. In Kansas and Nebraska the farmers last year built more grain storage space than in several years before, being led to do this by the shortage of cars; and, indeed, the car shortage was a blessing in disguise. For the past four months the movement of grain has been steady.

A careful and detailed essay on the cultivation of potatoes, by F. Benz, agricultural agent of the Northern Pacific was listened to with marked interest.

Discussion by other members brought out the fact that Mr. Benz had produced highly successful potato crops. The importance of using the best seed was emphasized by a number of members; for this purpose potatoes must not be allowed

fully to ripen. C. L. Smith (O. W. R. R. & N.) had proved repeatedly that potatoes grown in a northern climate, where they could not fully ripen, produced, in warmer regions, two or three times as large a crop as seed which had been fully ripened.

The importance of encouraging northern people to eat more sweet potatoes was set forth in a paper by J. W. Firor (A. B. & A.). Growers in Georgia and South Carolina are increasing their shipments of this product; but the best kinds (sometimes called yams) are not appreciated because most people do not know how to cook them properly.

The value of livestock in promoting diversity of crops and agricultural prosperity in general was the subject of a paper by R. R. Walker (M. K. & T.).

Careful attention to pure bred livestock not only promotes good farming, in obvious ways; it is good for the farmer socially: it promotes the happiness of his children and tends to general prosperity. The dairy industry on the M. K. & T. is rapidly increasing.

### Friday

The final session, on Friday morning, was devoted mainly to an address by George E. Roberts, vice-president of the National City Bank, New York City, who made a stirring appeal for close attention to the fundamental elements of right relations between carriers and the public. The railroad, in many cases, is in the position of a non-resident landlord, and therefore must put forth unusual efforts to keep the people in its territory informed of its motives; to keep them well enough acquainted with the officers of the road to deal frankly with them, and persistently warned against unsound economic and social views. The members of this association, who are to develop, not railroads, but the railroads' neighbors, are in a fortunate position, for they can emphasize the things on which the railroad, the farmer and the shipper already agree. Europe is "coming back," and will produce food for herself; the American farmer, therefore, inevitably suffers, and we must suffer with him.

In the long run, the farmers and the rest of us must get on to the same economic level. Our virgin lands were pretty well exhausted by the end of the nineteenth century, and since then the cost of living has necessarily gone up. Today we cannot live, as we formerly did, by so freely using up the accumulated wealth of the past. What society has gained by the improvements of science and machinery has been largely offset by the higher cost of food. This cost must further increase except as methods of production are improved. The railroad corporations are doing the right thing to use their money to investigate and popularize the inventions of the few, the scientific men, for the benefit of the multitude, the producers.

The attendance at the meetings was about 100. On Friday afternoon a part of the members went on sight seeing trips around the city and others visited the immigration station on Ellis Island, New York Harbor.

At the banquet of the association on Thursday evening, Robert S. Binkerd, assistant to the chairman of the Association of railway executives, New York City, made the principal address. Mr. Binkerd said in part:

"We are now in that part of our war chapter which should be entitled 'Paying the Piper.' It is a time which demands in the largest degree patience, good temper, courage and clear sight.

"It is important that we should not be downhearted. We shall get through all this on to solid, firm ground again. It is also very important that we should know just exactly what is the matter. Those who do not know what is the matter, or knowing it refuse to act on it, contribute to making the difficulties a little bit worse. Under normal circumstances

our machinery of production works about two days a week for the rest of the world and about four days a week for our own domestic needs.

For the time being the rest of the world can take little of our products. So far as our domestic requirements are concerned the farmer has been compelled to take the largest and most rapid liquidation—much greater than that which has yet been taken by urban labor and the manufacturing industries generally. As a result the farmer's purchasing power is greatly decreased and commerce and industry are moving at relatively low speed."

### Industrial Section

Those members of the association more particularly interested in manufacturing industries, as distinguished from farming, held two separate sessions, discussing matters connected with their own work.

J. M. Mallory, industrial agent of the Central of Georgia, acted as chairman. G. W. Curtis, industrial agent of the Canadian Pacific, read a paper describing practice, in this field, on his road.

The practice of railroads in all parts of the United States in connection with industrial side tracks was a principal topic of discussion, various proposals being offered looking eventually to standardization of contracts. Among the questions considered were: the advisability of charging for cost of making surveys on private property; apportionment of cost of track renewals; co-operation of two or more roads in industrial tracks and length of refund period on industrial sidings. A resolution was passed authorizing the president of the association to appoint a special committee to deal with this subject.

## Labor Board Will Reduce Wages on July 1

**I**N A STATEMENT issued on May 17 the Labor Board announced that on June 1 wage reductions, effective July 1, would be announced affecting the employees of all roads which filed wage disputes with the Board before April 18. Cases filed with the Board since April 18 and prior to June 6 will be heard on the latter date and the decision in these cases will become effective also on July 1. There was no intimation of the extent of the wage decreases which will be put in effect. The Board stated that "prevailing conditions justify to some extent, yet to be determined, a readjustment downwards" of railway wages.

The Board also announced a new and complete classification of all railroad occupations which is still unpublished and which has been made effective as of April 18 by the Interstate Commerce Commission. This classification is to be used by the carriers in reporting the service and compensation of their employees to the Commission and the Labor Board. The Board said of this classification:

"The occupational classification is not considered by the Board, nor should it be considered by the railroads or other interested parties, as setting up jurisdictional lines for occupations or as limiting the kind of work which employees may perform or the duties which they may assume.

"In preparing the classification the Board has not aimed to standardize for any railroad occupational duties assigned to, or in the kinds of work performed by, its employees and nothing in the classification could be construed in this light."

The various positions are grouped in the occupational classification under 17 major "services," these services having been set up according to the general railroad functions as well as the special and peculiar requirements in railroad organizations. The services are subdivided into 119 groups. Within the groups are separate grades and distinctive class

titles, each of which is provided with a description of the duties generally performed and illustrative examples of pay roll titles.

On May 18 various representatives of railroad labor were said to be planning an appeal to the courts if radical wage decreases were ordered by the Board.

Outside of the executive, official and staff assistant service, which is ungraded and unclassified and in which examples of positions are shown separately under appropriate groups but not distinguished as to importance and responsibility of the work performed, there are 500 distinctive classes distributed under the remaining 16 services. The classification of railroad positions as developed by the Board is made up of the following distinctive parts: (1) An introductory statement showing the needs, purposes and general features of the classification; (2) Rules governing the preparation of reports; (3) Detail on divisions for reporting information on railroad employees; (4) Outline and index of railroad occupational classification; (5) Occupational classification of railroad positions; (6) Alphabetical list of and index to occupational classification and reporting divisions.

#### "Geer" Letter False

With the admission by Frank P. Walsh, attorney for the unions before the United States Labor Board, that the letter alleged to have been written by I. W. Geer, general manager of the Pennsylvania, Southwestern Region, to supervisory employees, and offered as evidence before the board on March 22, was not authentic and had not been authenticated, the letter was branded as fictitious and fraudulent, and this hearing came to a close on May 12.

This letter, alleged to have carried instructions to ascertain the position of employees on proposed reduction of wages resorting to "defamation of all labor organizations if necessary," was first offered to the board during the cross-examination of W. W. Atterbury, vice-president of the Pennsylvania, on the subject of national agreements on March 22, and at that time Mr. Walsh stated that the letter would be authenticated. At the hearing on May 12, Mr. Walsh and B. M. Jewell, in behalf of the employees, refused to present witnesses to substantiate this claim after cross-examining five Pennsylvania officers and employees, including Mr. Geer, who testified that no such letter, or any of similar purport, had ever been sent out by Mr. Geer, or any other officer.

The board then went into executive session and adopted a unanimous resolution calling upon Mr. Walsh and Mr. Jewell to produce witnesses to show the origin and authorship of the letter. The board ruled it to be in the public interest to have such information, its resolution reading as follows: "The board, through its chairman, requests Mr. Walsh, counsel for the employees, and Mr. Jewell, their representative, to present to this board, evidence of the origin and authorship of the letter in question. It is the sense of this board that the representatives of the employees owe it to themselves and to the organizations which they represent, as well as to the carriers and the public, to make known how and from whom this letter, evidently fictitious and fraudulent, came into their hands.

"It is not deemed necessary by the board to pursue this collateral inquiry further upon its own initiative or to compel the production of such proof, but the board contents itself with expressing thus to the said representatives of the employees its conception of the ethics of this matter."

Mr. Walsh in reply said, "The only thing we could hope to bring out by further testimony, would be hearsay or double hearsay evidence. We could not substantiate the letter. As representing the labor organizations I do not propose to pillorize the person from whom this information came to us. The witnesses we have here would protect that person. I desire to protect that person also. I will not be moved from my determination."

## Annual Report of the Bureau of Explosives

**M**ANY INTERESTING DATA on the handling of hazardous commodities are contained in the annual report of the chief inspector of the Bureau for the Safe Transportation of Explosives and Other Dangerous Articles for the year 1920, which has just been issued. To one unfamiliar with transportation conditions, it would naturally seem that the shipments that would cause the greatest damage would be those containing high explosives. It is interesting to note that the loss per ton for nitric acid and "strike anywhere" matches is considerably greater than for either high explosives or black powder. The greatest losses from any single commodity are those resulting from the transportation of gasoline, due principally to the large volume of the shipments.

The actual total loss for the year 1920 amounted to \$1,090,806 for all kinds of dangerous articles. This is a decrease of over half a million dollars compared with the previous year. Nevertheless, the report states that the majority of the 1,977 accidents resulting in this loss should not have happened, as they are due to carelessness or ignorance that should not have existed. Particular interest attaches to the statistics regarding transportation of gasoline, as the losses due to these shipments are greater than from any other single commodity. The total loss from this cause has been decreasing in recent years. In 1918 it was \$900,106; in 1919, \$691,635, and in 1920, \$351,262.

A comparison that has not been made in previous reports is shown in a summary of reported losses compared with the total production for several important commodities. The statistics for 1920, which are typical, show that the loss per ton was as follows:

Nitric acid .....	\$1.71
Matches .....	.51
Black powder .....	.19
Charcoal .....	.08
Gasoline .....	.02
High explosives .....	.00

In discussing the importance of education, the chief inspector mentioned the good results secured by the organization plan prepared by the bureau for the purpose of interesting and educating railway employees in the regulations, which has been adopted quite generally by the railroads.

The glass carboys in which acids are shipped are not sturdy containers, and many accidents are caused by breakage of these vessels. Recently an attempt has been made to prescribe suitable tests for carboys, and this work is outlined in the report.

The review of tank car matters points out that the casualties in gasoline tank car fires were reduced in 1920 to no deaths and 6 injuries, as compared with 2 deaths and 28 injuries in 1919. A review of the work being carried on by the bureau in connection with the A. R. A. tank car committee and the American Petroleum Institute is given. This pertains particularly to improvements in the bottom outlet valve, the dome closure and the safety valve.

The concluding section of the report is devoted to a discussion of the detailed work of the bureau. Numerous statistical summaries are given and circulars issued during the year are collected and reprinted.

#### Results for First Quarter, 1921

Tabular summaries of accidents occurring in the transportation of explosives and other dangerous articles during the first quarter of 1921 are shown in accident bulletin No. 51 of the Bureau of Explosives. The most serious catastrophe during this period was the casinghead gasoline explosion at Memphis, Tenn., on January 24 which caused thirteen deaths and a property loss of about \$150,000. The bulletin also includes suggestions on reporting violations of the regulations, accidents, damages, etc., and describes several accidents, notably a fire caused by loading pyroxylin plastic articles against steam pipes in an express car.

# Railroad Hearings Before Senate Committee

Daniel Willard, A. H. Smith and Julius Kruttschnitt Explain

Reasons for Present Condition of Railroads

WASHINGTON, D. C.

**Q**UESTIONING of Julius Kruttschnitt, chairman of the Southern Pacific, by members of the Senate Committee on Interstate Commerce in the railroad inquiry hearings was concluded on May 16 and Daniel Willard, president of the Baltimore & Ohio, appeared as the second witness for the railroad executives. Mr. Willard had a prepared statement, in which he said in part:

## Conditions of Railroads Result of the War

The condition of the railroads at the present time differs only in degree from the conditions generally surrounding all business activities, and is the direct result of the economic changes brought about by the war. During the war we had in this country a condition of unprecedented business activity accompanied by an equally unprecedented increase in wages and material prices. Those engaged in private enterprises were generally able to so adjust their affairs, including their selling prices, as to enable them to operate at a satisfactory profit, notwithstanding the higher costs. The case was entirely different, however, with the railroads.

For 26 months the railroads were operated by the President or his representative, acting under authority granted as a war measure, and for no other purpose. During that period the roads, or at least many of them, were operated with entire disregard of their interests as independent properties. Notwithstanding the largely increased cost of operating the roads, the director general did not increase the rates and fares proportionately, and consequently the railroads while under federal control were operated at a loss, the deficit being made up out of the federal treasury.

This policy of the director general may or may not have been wise, but in any event it contributed largely towards bringing about the confusion of thought and general misunderstanding of the railroad situation which now exists. Congress, with a full understanding of the matter, enacted the Transportation Act of 1920, which provided for the termination of federal control, and was intended also to provide a basis for the successful operation of the roads by their owners in the future.

I take it that it is the purpose of this committee, among other things, to inquire into the operations of the carriers under the terms of the new act, and I am glad of this opportunity to be heard in that connection.

## The Transportation Act

It has been claimed by some that the railroads under private management cannot be operated so effectively as a whole, and consequently cannot perform as large a measure of service for the public as could be done with the same facilities under federal ownership or control. The fallacy of that argument is clearly demonstrated by the fact that during the year ended December 31, 1920, the more than 1,800 independent railroad companies in this country, reporting to the Interstate Commerce Commission, were able to so co-ordinate their efforts that they handled during the year 9,000,000,000 net ton miles more than they ever handled before in the same length of time. This effective co-ordination on the part of the carriers was made possible by the Esch-Cummins act.

Many in the past have feared that private ownership of the railroads might fail as an economic policy because of the inability of the carriers to secure the adequate rates for the service which they perform, and on that account be unable to provide the new capital necessary for additions and betterments. Congress was fully advised concerning this phase of the problem and the capital needs of the carriers, and realized also that the necessary new capital could not be obtained unless the credit of the road was sound and on a satisfactory basis. The provisions of the Transportation Act with respect to the rate of return may appear academic at the present time. However, the principle recognized in the act with respect to the assurance of reasonable return upon the value of the transportation property devoted to public use has encouraged the owners of railroad securities, and in my judgment has been a most helpful influence in sustaining the credit of the carriers during a very trying period.

To my mind the labor provisions of this act afford a reasonable assurance to the railway employees that they will at all times and under all circumstances receive just and reasonable wages and be granted just and reasonable working conditions. While this part of the act has been somewhat criticized, it can at least be said that by virtue of the act we have had continuity of service during the critical period of 12 months, since the termination of federal control, during which time one of the most complex labor problems that ever confronted the railroads was being slowly worked out and adjusted.

## Operating Results and Expenses—

1920 Compared with 1919

While subject to certain interruptions, because of strikes in the coal and steel industries, the railroads during the year ended December 31, 1919, handled a large volume of tonnage and an exceptionally heavy passenger traffic was also moved, much of it incident to the demobilization of the military forces, which traffic was handled with a lesser train mileage than would be satisfying to the public under normal conditions, resulting in decided economies in the operations for the year 1919. Furthermore, the full effect of the wage advances and changes in working conditions granted by the director general in the latter part of 1919 were not reflected in the operations of that year. These increases were in effect during the entire year 1920, and in addition thereto the award of the United States Labor Board was in effect for eight months, resulting in an average increase in rates of pay in 1920 over 1919 of something more than 20 per cent.

The properties were returned at March 1, 1920, in a somewhat depleted condition, particularly as to equipment, due in part to war conditions in 1918 and in part to an evident desire in 1919 to control and reduce maintenance expenditures. During the months January to October, 1920, there was a persistent and urgent demand for increased service, consequently every effort was made to accomplish essential repairs and to make available all equipment possible. Notwithstanding the decline in business in November and December, the service performed in the year ending December 31, 1920, shows in relation to the preceding years as follows:

### CLASS I—RAILROADS OF THE UNITED STATES

	Total Tons One Mile	Passengers One Mile	Train Miles (Passenger)
1916 .....	396,365,917,082	34,585,952,026	582,859,175
1917 .....	430,319,014,635	39,476,858,549	582,556,148
1918 .....	440,001,713,063	42,676,379,199	536,692,235
1919 .....	395,679,051,729	46,358,303,740	546,180,657
1920 .....	449,292,355,000	46,724,880,000	571,653,863
1920 over 1919 ..	53,613,303,271	366,576,260	25,473,206
Increased service 1920 over 1919 ..	13.55 per cent	0.79 per cent	4.66 per cent

The tonnage handled in 1920 was the largest in the history of the railroads, being 9,000,000,000 ton-miles in excess of that handled in the year 1918, when owing to the nature of the business and the extraordinary measures taken, the greatest tonnage moved up to that time was transported.

The increased expenses for 1920 are roundly accounted for as follows:

Increase in basis of cost 1920 over 1919 ..	\$872,400,000	19.83 per cent
Increased service performed 1920 over 1919 ..	496,600,000	11.29 per cent
Total .....	\$1,369,000,000	31.12 per cent
In the year ended December 31, 1919, the director general had \$454,984,953 net operating income applicable to compensation (estimated at \$896,000,000).		
Had the business of 1919 been done over again with the increases in rates of pay and prices of fuel and material in effect in 1920, his expenses would have been increased by .....	\$872,400,000	
And instead of having a net operating income of .....	454,984,000	
there would have been a deficit of .....	\$417,416,000	
Which added to the compensation of .....	896,000,000	
would have resulted in a total deficit of .....	\$1,313,416,000	

Instead of a deficit of \$421,016,000 for the year 1919.

The roads in 1920 also largely accomplished the relocation of car equipment which had been widely scattered during federal control, especially during 1919. This was particularly so with respect to coal cars which had been sent unusual

distances from customary points to take care of emergencies incident to coal strikes. This resulted in an unusually large ratio of empty car mileage.

Upon the release of the roads on March 1, 1920, 21.9 per cent of home cars were upon home lines, compared with 45.2 per cent at December 31, 1920, and 67.0 per cent at March 1, 1921.

It might be asked why it was necessary to relocate the equipment, particularly in the face of declining traffic. While it was unfortunate in a way that the expense incident to the unusual empty car movement had to be incurred at this time, it was most desirable that the equipment be returned to the companies which had provided the number and character of cars required by the trade and those best meeting the operating conditions under which the traffic must be handled, and, further, it was important that the companies have an opportunity to review their equipment and arrange for necessary retirements and repairs.

In this connection I would call attention to the following as reflecting the situation respecting bad order cars:

	Total cars owned	Home cars on home lines	Per cent of cars owned on home lines	Total bad order cars	Per cent
At January 1, 1918...	2,264,019	1,118,856	49.4	128,780	5.7
At March 1, 1920...	2,328,460	507,887	21.9	153,727	6.7
At March 1, 1921...	2,345,638	1,576,485	67.0	243,586	10.7
At April 15, 1921...	2,346,269	1,683,884	71.8	239,771	12.7
An increase over January 1, 1918.....				160,991	

It will be noted that while the expense basis of 1920 over 1916 was increased 136.34 per cent, the revenue basis during the same period was increased only 51.68 per cent. As a result the ratio of operating expenses to operating revenues which in 1916 was actually 67.32 per cent becomes 107.31 per cent when revenues and expenses are restored to 1920 costs and revenue basis and instead of earning a net railway operating income of \$447,541,000 as was done in 1916, there would be a deficit of \$359,245,000.

### Railway Operating Income Following Change in Rate Structure

Question has been raised concerning the failure on the part of the railroads to realize the anticipated net returns incident to the increases in rates and charges approved by the commission under its decision in what is known as Ex Parte 74, and whether the railroads in their presentation to the commission failed to correctly forecast the results. This situation, because of the varying conditions and the difference in the rate increases in the several territories, can best be considered by the groups or districts adopted by the Interstate Commerce Commission in Ex Parte 74, and as I am more familiar with the Eastern district, I will confine my remarks chiefly to the figures relating to that group.

The commission granted increases in rates and charges for the Eastern district as follows: 40 per cent in freight on traffic local to the district and 33 1/2 per cent on inter-territorial traffic. It is estimated the effect of the inter-territorial rates and the necessary adjustments were given to the Eastern carriers an increase in freight rates on all freight traffic of approximately 34 per cent instead of 40 per cent, and based on the year 1919 would have afforded an additional revenue of about \$618,749,085, as compared with \$723,422,256, the amount that would have been received had the full effect of a 40 per cent advance been realized. The amount thus realized was approximately \$105,000,000 less than originally contemplated. The total difference resulting from under-estimate in rates of pay and lesser revenue than that recommended by the carriers was about \$146,673,000, which deducted from amount required for a 6 per cent return, \$359,409,000, leaves estimated net income for the Eastern carriers of only \$412,736,000, or a return of but 4.42 per cent.

There was a marked increase in traffic during 1920 up to and including October, followed by a sharp decline in November and December, the decline in fact being so rapid that it was not possible to adjust maintenance and operation methods so as to at once effect corresponding reductions in expenses. The increase in rates granted in Ex Parte 74 became effective in large part but not in whole in August, 1920, and the months of September and October of that year measurably reflect the effect of the higher rates in relation to the increased bases of costs. The net railway operating income of the carriers for these two months projected on the same basis for a twelve months' period would give an annual net railway operating income for the year as follows:

	September & October Net Railway Operating Income	Same Projected Over 12 Months' Period	Return on Valuation
Class I railroads of United States	\$159,765,798	\$778,388,507	4.12 p.c.

The returns for these two months, as projected through a 12 months' period, fell much below expectations. It is believed, however, that the full realization of the rate basis as actually authorized, together with such economies and reductions in operating costs as may be effected, will, with a normal business, yield results more closely approximating the intent of the act.

A careful review of the situation shows very clearly that the increases in rates of pay and prices of fuel, materials and miscellaneous items have been greatly in excess of the increase in the basis of charges for transportation and that the adjustments made with a view to correcting this situation have in part failed of their purpose because of the severe decline in traffic.

The situation, not only with respect to working conditions, but also as to rates of pay, is now before the Labor Board.

It is expected that substantial reduction will be secured in the price of fuel for 1921; in fact, a number of contracts have already been made effective as of April 1st much under last year's prices. Other material prices are showing a gradual decline, and as materials and supplies now in stock are consumed and gradually replaced with materials purchased at lower figures there will be reduced charges to expenses on this account—all of which will be reflected in lower operating costs. Meantime the railroad representatives in conference with the Interstate Commerce Commission are making such rate adjustments from time to time as are found necessary in order to remove inequalities and re-establish proper relationships.

### Mr. Willard Challenges Lauck Statement

Mr. Willard also challenged the recent statement of W. Jett Lauck before the Railroad Labor Board as to how the railroads could save \$1,000,000,000 annually in operating expenses.

Taking up the specific items cited by Mr. Lauck, Mr. Willard pointed out, for example, that it was asserted that \$278,000,000 might be saved by modernizing locomotives. To realize the economies claimed to be possible in this direction would require capital expenditures on the Baltimore & Ohio alone of \$165,000,000, Mr. Willard estimated. For the railroads of the entire country the capital outlay required would amount to some \$4,000,000,000 on this basis.

With respect to the improvement of shops, Mr. Willard said that the problem on his own road had been presented in this way:

"Is it desirable to spend at this time for new shops \$2,000,000, which sum is available and which expenditure would enable to repair its locomotives at a lesser cost, or should the money be used for the purchase of new steel coaches which will mean no economy in operation, but on the contrary mean an increased cost of transportation because of the greater weight of the steel equipment?"

"It was decided that the public in this instance would be better served by spending the money available for steel coaches rather than for new shops, inasmuch as it was possible to maintain the motive power in the existing shops."

Mr. Willard stated that he raised no issue at all with the proposition that there are possibilities of still further savings on the part of the railroads. He questioned only the practicability of such savings as have been proposed by Mr. Lauck when considered from the point of view which confronts railway managements.

"The question is a very practical one," Mr. Willard said. "If a condition could be conceived of wherein the railroads had all the money that was necessary—first to provide safe and regular transportation as demanded by their patrons; second, to provide a constantly increasing carrying capacity to take care of the growing business of the country, and in addition thereto a sufficient sum to replace all facilities with modern and more efficient facilities wherever it was shown that by so doing economies could be effected—if such a condition could be conceived of, there would perhaps be no real excuse for the railway managers if they failed to adopt the policy of making the worst as good as the best, as suggested in Mr. Lauck's statement."

"The experience of the past shows that only a certain

amount of new capital in the aggregate is available in any one year for all investment purposes, and of the total amount so available the railroads require and obtain a portion. The capital requirements of other industries and undertakings must also be provided from the same investment fund, and the total amount available is provided presumably in such a way as best fits the demands and requirements of the immediate situation."

Mr. Willard also took up Mr. Lauck's charge that the railroads have given no thought to engineering research for the purpose of promoting efficiency, filing with the committee a chart showing the organization of the American Railway Association, which he said had been maintained by the railroads for 38 years and which had large committees constantly engaged in investigating and reporting on the very things which Mr. Lauck said the railroads are not giving attention to. Mr. Willard went into detail regarding the matters being studied by these committees, showing the committee a large number of the reports and pointing out that the railroads have put into effect many improvements in methods resulting from these investigations as well as the investigations made by individual railroads. He described how the American Railway Association supervises the activities of numerous other organizations which were formerly separate associations and he also outlined the work of the advisory committee, of which he is chairman, which was created last year with particular reference to the new conditions created by the transportation act. Mr. Willard said he believed the transportation act does, in fact, make the future successful operation of the railroads possible under private ownership, but that it is necessary, of course, if they are to succeed that the large railways co-operate effectively and that they are trying to do through the several agencies and particularly through the advisory committee.

Mr. Willard also took up Mr. Lauck's charge that salaries of railway officers are exorbitant. Mr. Willard said that the profession of railway officer is about the only one in which it seems to be regarded as discreditable to succeed. Large salaries paid in the coal, steel and other businesses, he said, are very generally referred to in terms of commendation, even in the case of salaries as high as a million dollars a year, but whenever the salary of a railroad president is published in the newspapers it is done in terms which seem to suggest that he ought to apologize for it. Railroads in recent years have lost many of their best officers because of more attractive offers in other lines of business and whereas formerly railroads received large numbers of applications from bright young college men for opportunities to engage in the railroad service, they now receive very few. Mr. Willard said that he had felt that his own son ought to go into the railroad business, but before he finished his college course he had agreed with him that there were greater opportunities in other directions and that he ought not to go into a business in which to succeed is regarded as a matter of public reproach. He pointed out that if a railroad officer complies with the spirit of public opinion and of many laws he cannot make investments in any business that he knows anything about because as a railroad officer he is dealing with so many other businesses and that he is, therefore, largely limited to his salary.

Senator Wolcott said he had been told by a railroad trainman that the railroads were consuming a large part of their revenue in running private cars for the benefit of their officers and asked Mr. Willard to comment on that. Mr. Willard said that he would be glad to discuss the matter from the standpoint of his own experience because it was a subject of much misunderstanding. He said that he ordinarily spends one or two days a week in his office in Baltimore and a large part of the rest of the time traveling. His car is his office and he uses it for the business of the company. His secretary travels with him and a cook and a porter accompany the

car. In order to save his time also the porter carries his baggage to and from his house and he personally pays half of the porter's salary. Before the war when he occasionally took a vacation he sometimes took the car and in that case personally paid for the supplies used. Ordinarily there was no charge for the handling of the car off his own line because railroads extend that courtesy to each other. Mr. Willard said that while he "might be considered an excrescence," certainly superintendents, general superintendents and other officers are necessary to the operation of the railroad and as their duties require them to be on the road most of the time it is a matter of real economy to have an office car. They are simply traveling officers and they are frequently required to stop at small places where hotel facilities are lacking.

Taking up another point made in an exhibit filed by Mr. Lauck, in which it was stated that 69 bad order cars had been removed from Baltimore & Ohio cars at Cumberland in order to keep them in service, Mr. Willard said he had made an investigation and found it was true, but that the cars were removed by the direction of the foreman, who had substituted his more experienced judgment for that of the inspector, as he had authority to do, because in his judgment the cars were safe to run. These cars have been running since February and nothing has arisen to indicate that the foreman's judgment was not correct. He also referred to a statement made in Mr. Lauck's exhibit that the cost of repairs to a certain number of cars in the Baltimore & Ohio shops was \$514 and that the cost of similar work in outside shops where it was having work done was \$1,015. Mr. Willard said that evidently these figures had been obtained from some subordinate clerk and he had had a check made of 10 cars mentioned and found that where Mr. Lauck's exhibit showed a labor charge of \$229 the company's records showed a charge of \$245, and where Mr. Lauck's exhibit showed \$290 for materials, the company's records showed \$380, making an actual cost in the company's shops of \$625. He had also found, he said, that the cost of repairing these same cars in outside shops under the contracts in force would have been \$680 instead of \$1,015.

Referring to Mr. Lauck's exhibit relating to interlocking directors, Mr. Willard said he was personally interested because the Baltimore & Ohio was mentioned and one of its directors, L. F. Loree. He added that R. S. Lovett and Samuel Rea had formerly been directors, but are not at present. In reply to a question, he said there was absolutely no relation between the Baltimore & Ohio and the Pennsylvania except that of competitors. When such statements as that about the interlocking directorates are made, Mr. Willard said, it is for the purpose of creating the impression that because of the interlocking relationship the directors of other companies probably exercise some influence over the Baltimore & Ohio inimical to its best interests. The directors, he said, were capable of defending themselves from such insinuations, but he was personally interested because under the ordinary form of corporate organization the only way directors can influence contracts or purchases is through the chief executive officer. They do not make contracts or buy materials themselves, but they approve what is done by the executive officer. If the Baltimore & Ohio directors had at any time exerted an influence of the kind suggested over the Baltimore & Ohio, Mr. Willard said, "it was because I was their willing tool, and I was not. Never at any time or concerning any subject did any of these directors ever suggest or hint to me that he would desire me to do anything inimical to the interests of the Baltimore & Ohio. I am saying this in the interest of the executive officers. Even though some such improper influence may have been exerted by some one at some time, it is certainly unfair and unjust to accuse everybody of the same thing."

Mr. Willard also filed with the committee a statement for the year ending February 28, 1921, in which the railroads

had a net operating income of \$2,090,000 as compared with \$530,000,000 in the previous year. This year, he said, included six months under the increased rates and 10 months under the increased wages. If the rates had been in effect for the full year \$507,000,000 would have been added to the freight revenues, \$108,000,000 to the passenger revenues, \$28,000,000 to other revenues, making a total of \$643,000,000 and if the award of the labor board had been in effect for the full year the expenses would have been increased by \$102,000,000 and on this basis the net operating income for the year would have been \$543,000,000 or hardly more than half of the 6 per cent return.

Referring to his statement of the day before regarding poor railroading in 1920, Mr. Willard said that some of his friends had thought he had not given the railroads sufficient credit for what they did in 1920 in moving the largest freight and passenger traffic in history without increase in facilities. He said that the conditions which followed the return of the railroads to private operation which the railroads had to contend with were such that they did not get as good results as he thought they ought to have, but they did move the business by increasing the train load and the car load and increasing the average miles per car per day.

#### A. H. Smith Begins Testimony

Mr. Willard was followed by A. H. Smith, president of the New York Central, who before beginning his prepared statement regarding the results of operation on the New York Central, pointed out the difficulties being experienced by the railroads in collecting what is due them for the period of federal control. He said the railroads before the war were the best transportation machine in the world and furnished transportation more economically than those of any other country. They did their part in the war, and he thought that even today they constitute the best transportation machine in the world and furnish transportation more cheaply than those of other countries, although, he said, that may not be saying much in view of the conditions of the railroads in other countries at present, but he felt that the country had been unappreciative of what the railroads did during the war and that some means ought to be taken to expedite the settlements with the Railroad Administration. He referred particularly to the adjustment of materials and supplies accounts. He said, however, he did not know that the Senate committee was in a position to do anything about it. Senator Cummins said that the committee probably could not do anything, although he was sure it was sympathetic and would be very glad of any opportunity to do anything. He said that he had been very much disappointed in the delays experienced in settling the affairs of the Railroad Administration and that he supposed no member of the committee had ever assumed that the work would take so long. Mr. Smith said that his company had only filed part of its claim with the Railroad Administration, but that the whole subject was so complicated that it is very difficult to do so and the principles have not been laid down on which the railroads can file their claims.

"It seems to me as a citizen," he said, "that some means ought to be found to get us together. These are good railroads and I think as good soldiers they ought to receive liberal treatment from the government."

Senator Kellogg asked questions to bring out the fact that the railroads of England, France and Canada are in a condition very similar to that of the railroads here. Mr. Smith was to continue his prepared statement on May 19.

#### Mr. Kruttschnitt Questioned by Committee

Mr. Kruttschnitt had completed his direct statement on May 12 and was recalled for questioning by members of the committee on May 12, 13 and 16. In response to questions he made the following points:

1. That a reduction in operating expenses is the most vital and important point now.
2. That the proposal to reduce rates in order to stimulate traffic to a profitable point is a "purely speculative" proposal and the roads are in no financial position to undertake problematical experimentation.
3. That the present financial plight of the railroads grows directly out of policies and decisions during federal control in relation to rules and working conditions, wages and prices.
4. That the Transportation Act should be allowed to have a full and fair trial without being tinkered with.

Much of the questioning was devoted to a discussion of freight rates and the probable effect on traffic of an immediate reduction.

"I have some questions as to whether the present rates have not discouraged traffic," said Senator Townsend of Michigan.

"I do not think the rates constitute an overcharge on the part of the railroads," Mr. Kruttschnitt replied.

"Do you think that the increased rates have reduced or increased the revenues?" Senator Townsend asked.

"I do not think they have had any appreciable effect," was the reply. "The increase in rates was given at a time when business was beginning to decline and prices were falling."

Mr. Kruttschnitt said that he did not believe that if the business depression had not occurred that there would have been as much necessity for a reduction in wages.

Senator Myers of Montana asked if decisions made while the railroads were under federal control were not responsible for the present situation of the railroads. Mr. Kruttschnitt replied "Yes, particularly as to expenses."

Attention was called to the contentions that a reduction in rates would have a tendency towards stimulating traffic. Mr. Kruttschnitt declared that the stimulative effect on traffic of reducing rates is largely speculative.

"Are the roads in a condition financially to engage in an experiment of that kind?" asked Senator Myers.

"No," answered Mr. Kruttschnitt. "During the last few months many of the roads have not earned their fixed charges or operating expenses. I do not want to be understood as opposing a reduction in rates where necessary, but I think there ought to be some proof demanded that would show that such a reduction would leave the carriers at least no loss."

"The outlook is extremely bad. Some roads may be able to hang on for a few months but I am afraid some will lose their grip."

"I said first of all we must reduce expenses; we now are compelled to pay laborers from 40 to 46 cents an hour for an eight-hour day on our lines while contractors, farmers and others pay only \$1.75 to \$2.00 for a ten-hour day. We are not allowed to do anything until we can get permission from the government authorities to reduce wages."

"Wasn't government control responsible for this condition?" Senator Frelinghuysen of New Jersey asked, to which an affirmative response was given.

Alfred P. Thom, general counsel for the Association of Railway Executives, reminded the committee that the increase in freight rates "had the very strong endorsement of the shippers of the country" at the time it was made.

"The idea seems to be abroad that it would help the railroad situation much to let them go into the hands of receivers and then squeeze out the water in the stock," said Senator Wolcott of Delaware. "Are the railroads earning the interest on their bonds alone, regardless of stock?"

"No," replied Mr. Kruttschnitt. "Then," remarked Senator Wolcott, "it would not change the railroad situation now even though the stock was all water, would it?"

"It would not," was the reply.

The assertions made that the roads could reduce their operating expenses through further great economies, were characterized by Mr. Kruttschnitt as extravagant.

"I do not know how any more great economies could be

put into effect than are now being practiced," the witness said. "I would be very reluctant to say that we have got to the point where we can not do better. An executive who gets to that point is about ready to be retired. But I do say that we are at a point where contentions that fabulous sums can be saved through further economies are unfounded. If the railroads were allowed to employ unskilled labor at rates other people are paying they could save \$600,000 a day."

Mr. Kruttschnitt said new economies were constantly being instituted but added that the results of those economies could not be as great in the next 10 or 15 years as they have been in the last 10 or 15 years. He said he knew of no waste of importance now being practiced in the management of the railroads.

Asked regarding his opinion of the Transportation Act, the witness said:

"I believe the Transportation Act is one of the best pieces of work Congress has ever done and I would dislike extremely to see it changed in any way until it had been given a full and fair trial. If I had an amendment in mind I would not offer it."

In response to a question by Senator Townsend the witness said he did not believe the action of Congress in directing the Interstate Commerce Commission to fix rates so as to yield, so far as might be, a return to railroads by groups of from 5½ to 6 per cent had resulted in any letup on the carriers' part in economy or caused them to be operated any less efficiently, as a railroad got no profit unless it earned it.

In compliance with a request made by Senator Kellogg, Mr. Kruttschnitt presented to the committee a table showing in complete detail what sums had been spent for railway operating expenses and taxes in each year from 1917 to 1920 inclusive. Senator Kellogg had requested especially that the exhibit show separately the sums expended in payment of salaries of general officers, division officers and for the wages of all other employees, and that this also be shown in the form of percentage expended for each item out of each dollar expended.

The tabulations showed a progressive increase for each year in the items for operating expenses, taxes, and for the total of the two. The following table gives the figures for the lowest point (1917) and the highest point (1920):

Item	1917	1920
Operating expenses.....	\$2,829,325.124	\$5,768,720.013
Taxes.....	213,920.095	278,868.668
Total operating expenses and taxes.....	3,043,245.219	6,047,588.681

The exhibit also shows that whereas in 1917, 55.27 cents out of every dollar expended for operation and taxes went for wages of employees (labor costs), it had increased in 1920 to 59.62 cents out of each dollar.

Salaries of general officers on the other hand decreased from 1.15 cents to .78 cents out of each dollar. The salaries of division officers remained practically stationary, being .74 cents out of each dollar expended in 1917 and .75 cent in 1920.

The table covering the salary and wage distribution of each dollar of money expended is as follows for 1917 and 1920:

Item	1917	1920
Compensation of employees:		
Salaries of general officers.....	1.15c	0.78c
Salaries of division officers.....	0.74c	0.75c
Wages of all other employees.....	55.27	59.62
Total compensation.....	57.16	61.15

The sum total of operating expenses and taxes rose from \$3,043,000,000 in 1917 to \$6,047,000,000 in 1920, of which the greatest increase was in labor cost, an increase in the four years of \$1,866,273,374.

The total for salaries of general officers of the railroads of the United States in 1920 was \$47,119,465, as against \$3,605,755,516 for labor. The salaries of general officers

represented two cents out of each dollar expended in 1917 and 1.27 cents in 1920.

**Government Loss Estimated at \$1,800,000,000**

Senator Cummins, during his examination of the witness, expressed the opinion that the 26 months of federal control would cost the government approximately \$1,800,000,000. His estimate, he explained, was based on correspondence which he had had with Director General Davis.

Director General Davis, in a statement recently submitted to a House committee, estimated that the loss to the government growing out of the 26 months of federal operation would be approximately \$1,200,000,000, or \$300,000,000 more than was estimated by Director General Hines. This estimate, Senator Cummins said, was based on the supposition that the maintenance claims would be adjusted as per the Railroad Administration's theory. "If the claims are settled on the theory advanced by the railroads as to maintenance, then it is estimated that the loss to the government for the 26 months will be not less than \$2,500,000,000. If adjusted between those extremes, I think it is safe to say that the loss will be in the neighborhood of \$1,800,000,000," he said.

Later on, calling attention to the financial condition of the railroads, the Senator intimated that unless some means were found of either increasing revenues or decreasing operating expenses, federal operation of the transportation systems of the country would result, and the government would have to stand the deficit.

"A good deal has been said in the newspapers recently about the failure of the Transportation Act," said Senator Cummins in opening his examination of Mr. Kruttschnitt. "The act did not fail to give to the railroads a larger revenue than they ever had before in the country's history, did it?"

"No," replied Mr. Kruttschnitt, "but as I have already expressed in my statement, the increase in rates were not received until very late in the year and were then only about eight per cent when applied to the whole year."

Mr. Kruttschnitt added that the revenues in 1920 were approximately \$1,041,000,000 greater than in 1919, of which amount only about \$418,000,000 was due to increased rates. He explained that the act in itself was not a failure but said that abnormal conditions in 1920 prevented the carriers from receiving what Congress expected when the bill was passed.

"Do you think it was the duty of the Interstate Commerce Commission to provide larger revenues than were provided?" Senator Cummins inquired.

"The act tells them what to do," Mr. Kruttschnitt answered. "If conditions then had warranted a higher award, I assume they would have made it."

As to the amount of increase in rates asked for by the carriers when the present increase was allowed, Mr. Kruttschnitt said their request was based on "the economic conditions of the times." He added that he believed the Transportation Act "did everything Congress could foresee" and that the law "marked a new era" in the transportation history of the country.

"Do you think the law has failed so far as the Labor Board is concerned?" Senator Cummins asked.

"I don't think the law has been given a fair chance to prove in all directions its merits or shortcomings," the witness answered.

Continuing, Mr. Kruttschnitt said he thought the "theory of the law" relative to the labor provisions was correct but he did not believe anybody thought it had been an exact success so far, asserting that he believed the Labor Board's proceedings had been too protracted and its decisions delayed too long.

Asserting that the labor difficulties had been inherited from federal control, Senator Cummins asked what would

have happened to the railroads if the law had not set up the board at the time of the labor troubles which followed relinquishment of federal control on March 1, 1920. Mr. Kruttschnitt replied that he believed a strike of railroad employees would have resulted.

"If it hadn't been for the law, this country would have been in a very disastrous strike," Senator Cummins asserted, to which the witness replied that the losses to the whole country "would have been almost incalculable."

Senator Cummins asked if it were not true that a very considerable part of the excessive expenses of 1920 was due to the unauthorized strike of switchmen. Mr. Kruttschnitt responded that the strike was very expensive to the railroads.

Asked by the Iowa senator if he thought the delay from April 1 to the following July in solving the problem of a wage increase for railroad employees was "undue delay on the part of the Labor Board in a matter of that magnitude," Mr. Kruttschnitt answered:

"No, because the board in that case offset the delay by making its decisions retroactive. The present delay of the board, however, is costing the roads from \$500,000 to \$600,000 a day because the board's decision cannot be made retroactive."

Senator Cummins asked why it was that after September 1, when the federal guaranty period expired, and when both carriers and employees were free to bring up the wage question, there was such long delay in beginning these proceedings.

"For the reason," Mr. Kruttschnitt replied, "that for several months after the rates were raised, business continued to increase and the roads to a certain extent were making the earnings contemplated by the Transportation Act and they were hoping to avoid this issue because they knew it would be a long, bitter contest. They were compelled, however, to make a protest because of the decline in traffic and earnings."

Calling attention to the fact that the hearing had just been completed before the Labor Board, Senator Cummins said it was his judgment that there has been "remarkable speed in the hearing of testimony and in the submission of the case" but said that the dispute over the abrogation of the National Agreements "engaged the board's attention for three or four months."

Mr. Kruttschnitt explained that the men who presented the railroads' case before the Labor Board were to be called later before the Senate committee to testify.

Attention was then turned to the financial conditions of the railroads. During this Senator Cummins said that if federal operation became necessary and no way could be found to increase revenues or decrease expenses, the deficit would have to be taken from the federal treasury.

Taking up the question of maintenance, Mr. Kruttschnitt called attention to the order issued by the Railroad Administration on December 16, 1920, by which the national agreement was made applicable to sectionment. This, he said, added very largely to the cost of maintenance because it established for the first time not only an eight-hour day for them but also punitive overtime.

As to the prospects for a reduction in the cost of maintenance as one of the means of reducing operating expenses, Mr. Kruttschnitt said cross ties in 1919 averaged \$1.06 apiece while in 1920 the price was \$1.31, but he said the railroads hoped to obtain a reduction this year. Cost of steel rails, he said, had already been fixed, so that no reduction in that direction is anticipated.

The cost of labor for maintenance of way constitutes about 60 per cent, according to Mr. Kruttschnitt, who said the carriers hope that will be reduced. Senator Cummins remarked "We have got to find some way to bring these costs down or you won't have any money for interest, bonds or other purposes."

In reply to a question by Senator Cummins, Mr. Kruttschnitt filed a statement showing that the results for 1920 were not materially affected by the statistics for Class II and Class III roads, because 451 of such roads had a combined deficit of \$1,060,000.

Senator Cummins by his questions tried to bring out an estimate of what economies the railroads would be able to effect this year. He asked what would be the reduction in maintenance and transportation expenses if the wage reductions proposed by the railroads are carried out and how much the roads expect to save on materials in view of the reductions in prices of coal, steel, lumber and ties. Mr. Kruttschnitt was unable to give an answer offhand but agreed to file a statement later. He was also asked to give comparisons of the labor and materials which entered into the operating expense accounts for 1920, 1919 and 1917.

"The main object of this inquiry," said Senator Cummins, "is to find whether the railways are going to be able to maintain themselves or whether we have got to find some better system. It is quite plain that if you don't do better this year than you did last year, you won't last long."

"That is quite plain," replied Mr. Kruttschnitt.

Senator La Follette followed Mr. Kruttschnitt's testimony closely and demanded copies of his various charts and statements but declined to question the witness directly.

The hearing has attracted considerable interest and all the available seats in the committee room have been occupied by railroad officers, shippers, labor leaders, and others.

Frank P. Walsh and W. J. Lauck made their appearance at the hearing on Monday and Senator Cummins read a telegram stating they had been authorized to represent the Railway Employees Department of the American Federation of Labor as counsel, consulting economist and statistician.

Fruit and produce growers of the Pacific Coast have wired to Senator Hiram Johnson, of California, asking that he appear before the Senate committee investigating the railroad situation to appeal for some remedy for the "excessive" freight rates from the Pacific Coast. The communication from the California Vegetable Union said in part:

"In marketing our vegetable crops we meet with competition from other producing sections which have always had advantage in freight rates. The recent horizontal increases have so widened the differentials to the large eastern markets we now cannot overcome this competition. As long as our competitors' products are in the markets we can only sell at heavy loss. There was average loss of approximately \$1.32 per crate on celery last season shipped from San Joaquin, Sacramento and delta regions and in consequence there will be reduction in acreage for coming season of about one-third unless some relief is had in present exorbitant freight rates. Heavy shipments of vegetables to date might be considered as indicating prosperous condition which, however, is not the case. Growers having brought their crops to maturity have shipped them because by so doing their losses were less than would have been had crops been plowed under. Although returns have not covered cost of production they did allow some margin of profit over harvesting expenses. The horizontal increases which failed to take into consideration matter of value always previously used in determining rates were incorrect in principle and fundamentally wrong."

THE CHICAGO, MILWAUKEE & ST. PAUL plans to supplement the quarters furnished by the forty-five or more hotels of Des Moines, Iowa, when the Shriners' Convention is held from June 14 to July 7, with sleeping cars, which will be parked in the yards. Shriners remaining in the cars will have more than the usual traveling conveniences as baggage cars are to be equipped with hot and cold showers and booths will be placed throughout the area where visitors will find clerks ready to provide the service desired.

### Freight Car Loading

WASHINGTON, D. C.

### Protecting Decks and Floors

### With Asphalt Mastic

**F**REIGHT CAR LOADING for the week ended May 7 showed a drop of nearly 4,000 cars as compared with the week before, according to the weekly report of the Car Service Division of the American Railway Association, after three weeks of increases. The total was 718,025, as compared with 843,184 in 1920 and 753,287 in 1919. The decrease as compared with the previous week is accounted for by a drop in the loading of anthracite coal, which caused a decrease in total cost loading from 145,010 cars to 143,323 cars.

There were decreases as compared with the corresponding week of 1920 in all classes of commodities and in all districts, but as compared with the week before there were increases in the Pocahontas, Northwestern and Southwestern districts.

The reports for the weeks of April 30 and May 7 follow:

**N**OTHER EQUIPMENT of a railroad undergoes rougher usage than its floating equipment, such as barges and steel car-floats. Derailments, unequal expansion and twisting, all form depressions in the steel decks which demand continual overhauling. Rust also is a permanent bug-aboo. In order to counteract the necessity of continual overhauling, the Pennsylvania has recently covered ten of its newest steel floats with a flooring of Texaco asphalt mastic. This covering is usually applied to a thickness of from 3/4 to 1 in., sticking firmly and expanding and contracting with the steel as the latter expands and contracts with the repeated changes in temperature. One instance of its use is on barge No. 68, belonging to the Pennsylvania. Freight cars ran off

L. C. L. merchandise loading figures for 1921 and 1920 are not comparable, as some roads are not able to separate their L. C. L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

April 30	1921	34,426	29,909	145,010	4,659	48,554	7,725	213,792	237,922	721,997	800,960	752,362	489,073	545,205

The number of surplus cars showed a decrease for the fourth consecutive week during the week of May 8. The total was 471,922, or over 9,000 cars less than for the last week of April. Of the total 174,227 were box cars or nearly 4,000 less than the week before and 220,529 were coal cars, or nearly 9,000 less than the week before.

the tracks of this barge, cutting holes in the steel flooring and causing it to bulge. In order to repair the damage, the company had asphaltic mastic applied over the flooring, the holes covered thoroughly, and then the entire surface given a 1-in. coat of the mastic.

In doing this class of work the kettles for heating the

material, as well as the material itself, were installed on the dock adjoining the barge, while smaller installations were made on the transfer platform of the barge itself. The

Applying and Spreading the Mastic

heated mastic was then distributed by means of buckets to the section to be covered, where it was poured and spread out by the workmen to the desired thickness.

## A Scale-Proof Boiler for Locomotive Cranes

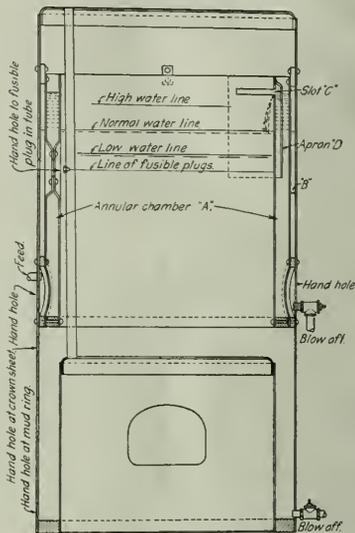

THE INDUSTRIAL WORKS, Bay City, Mich., has recently built a new patented locomotive crane boiler equipped with an annular scale chamber between the tubes and the shell plate. The design of this scale chamber in conjunction with the rest of the boiler design is such that the various impurities present in the feed water are precipitated and held where they can do no damage.

In this boiler the feed water is slowly passed through the scale chamber (at about 1/200 of the speed through the intake pipe) and attains a temperature at which the scale-forming impurities will be liberated from solution without the use of any chemicals. The impurities are then carried in suspension and as the movement of the water is slow these suspended precipitates settle down readily to the bottom of this chamber. This settling is accelerated by the decrease in its fluid friction.

The purifier consists of the annular scale chamber "A" extending completely around the tubes, with a one-inch water space "B" between this chamber and the boiler shell. The outlet into the main portion of the boiler is the slot "C", guarded by the apron "D." The feed water is admitted directly to the scale chamber "A" at a point farthest from the outlet slot. It then travels slowly around this chamber to the outlet, the apron "D" keeping any floating impurities from being discharged into the main boiler.

The sulphates of calcium are the hardest of the scale-forming impurities to get rid of. They are precipitated at 280 deg. F., corresponding to a boiler temperature when holding steam at only 35-lb. gage pressure. The carbonates and magnesia are precipitated at lower temperatures. These are all caught in the scale chamber together with mud, oil, and, in fact, all solids except common salt, for the first application of heat is what causes the liberation of these solids. The impurities left in the scale chamber do not bake into scale, as they do not come into contact with the hot furnace sheets, but are left as a soft mud which may be readily blown or washed out.

In a test of a 42-in. diameter boiler of this type, feed water naturally carrying 5 grains per gallon was loaded with 70 grains of calcium and 70 grains of earth, a total of 145 grains per gallon. The feed was taken from a barrel agitated with carbonic acid gas to form calcium carbonate. After about 1,200 gallons of this kind of water had been passed through the boiler it was allowed to cool. The heating surfaces and the lower mud ring were found to be per-

Vertical Section of the Boiler

fectly clean, with mud about six inches deep in the scale chamber. The blow-offs were both plugged so all impurities remained in the boiler. It was interesting to note that the presence of so much precipitated impurity in the scale chamber did not interfere to any appreciable extent with its operation.

Railroad Station and Statue of Columbus in the Station Plaza at Genoa, Italy

# General News Department

Walter H. Riddell has been appointed general superintendent of the Railway Mail Service, succeeding William I. Denning.

Repeal of the Transportation Tax on freight and express charges and passenger fares is proposed in a bill introduced in Congress on May 12 by Senator Trammell of Florida.

The Eastern Railroad Association, headquarters Washington, D. C., held its annual meeting in New York City on May 12, and re-elected A. W. Gibbs (Penn.), president, and E. N. Bessling, secretary.

Frank H. Alfred, president of the Pere Marquette, has issued an appeal to manufacturers and coal dealers, advising immediate purchase of fuel for the coming Winter. The road is already storing coal for next Winter's operation.

The Railroad Yardmasters of America, at their third annual convention, held at St. Louis, Mo., last week, discussed working conditions on railroads throughout the country. Changes in the constitution of the organization were proposed and additional details of the insurance plan of the order were worked out.

At Island Pond, Vermont, on May 13, the entire crew of a freight train of the Grand Trunk was arrested, together with another man, on charges of smuggling liquor into the United States from Canada. Customs officers are said to have surprised the gang, in a secluded spot, unloading liquor from the train into automobiles.

The American Electric Railway Association will hold its annual convention at Atlantic City, N. J., in the week beginning Monday, October 3, in the spacious and beautiful building which has just been completed on the boardwalk at North Carolina avenue immediately in front of Haddon Hall. The exhibits this year will be omitted.

F. M. Feiker, vice-president and chairman of the editorial board of the McGraw-Hill Company, publishers of Engineering News-Record and other technical publications, New York City, has been appointed personal assistant to Herbert Hoover, Secretary of Commerce, with the title of assistant to the secretary. Mr. Feiker was graduated from the Worcester Polytechnic Institute with the degree of electrical engineer. He has been in editorial work for fifteen years, and with the McGraw-Hill Company for the last six years.

The American Association of Engineers, at its annual convention at Buffalo on May 9, 10 and 11, elected officers as follows: H. O. Garman, chief engineer, Public Service Commission of Indiana, Indianapolis, Ind., president; A. N. Johnson, dean of engineering, Maryland State College, College Park, Md., first vice-president, and A. S. Morris, auditor of capital expenditures, Chicago & North Western Railway, second vice-president. W. R. McKeen, president of the McKeen Motor Car Company, of Omaha, Neb., was elected a director.

Senior Signal Engineers, Grade 1, salary \$3,600, are called for by the last circular of the United States Civil Service Commission, which will receive applications for that position until June 7. A vacancy is to be filled in the Bureau of Safety, Interstate Commerce Commission; age limit, 25 to 55 years. The commission calls for graduates of a college or technical school who have had several years' practical experience. Employees of the Bureau of Safety are entitled to retirement annuities if they serve until the age of 70 and have been in the employ of the government 15 years. A deduction of 2½ per cent is made from the monthly salary to provide for the annuity.

Arthur Hale, formerly with the American Railway Association, has opened an office in the Union Trust Building, Washington, D. C., where he will act as agent and attorney for railroads. He is prepared to handle claims, valuation questions and generally to advise railroads in their relations with any branch of the federal government or with associations located in Washington. When Washington counsel is required, he proposes to engage Minor, Gatley & Rowland, who were attorneys in the private car case. Mr. Hale entered railway service in 1882 and was with the Pennsylvania 19 years. He was then on the Baltimore & Ohio for eight years and in 1909 was appointed general agent of the American Railway Association. Since his retirement from that position he has been vice-president of the Cumberland & Pennsylvania Railroad and the Consolidation Coal Company.

## Operating Costs Reduced In February

A reduction in the cost of operation per train mile in February as compared with January is shown in the monthly bulletin issued by the Interstate Commerce Commission. The total of the selected accounts used by the commission to represent the cost per freight train mile was \$2.112 as compared with \$1.923 in February, 1920, and \$2.166 in January. The total of the selected accounts for passenger train service was \$1.142 as compared with \$1.061 in February, 1920, and \$1.164 in January. The cost of coal per ton was \$4.61 as compared with \$3.58 in February, 1920. The cost in January was also \$4.61.

## Careful Automobile Drivers

The Baltimore & Ohio began its campaign to enlighten automobile drivers in November, 1919, and the four million notices distributed since then, through the co-operation of state officers, and others, are believed actually to have reduced carelessness at crossings. About 100,000 observations have been made, and the percentage of automobile drivers who do not observe safety rules at crossings is smaller than it was in 1919. In January of this year, with 8,000 observations, the failures were five per cent; in February, 17,000 observations, failures four per cent; and in March, 23,000 observations, failures six per cent. Two years ago these percentages were about 25, and in 1920, 16 per cent. Non-observance of safety rule is, wherever possible, called to the direct attention of the driver; and the campaign is to be kept up with full vigor.

## Money Talks

The Narragansett Pier Railroad, an eight-mile line in Rhode Island, which has been threatened with insolvency because of the competition of an electric line and automobile trucks, and from other causes, is to be kept running by the aid of contributions from two towns on its line. The president of the road having explained the situation, and the dependence of the towns on the road for the movement of coarse freight being clearly realized, town meetings unanimously voted specific appropriations. The town of Narragansett appropriated \$5,000 and South Kingstown \$10,000. By agreement with the road each town appoints a citizen to sit with the board of directors of the company. It is understood that the company agrees to continue operation at least until March 28, 1922, and to declare no dividends prior to that date. The road has three locomotives, and its line connects with the New York, New Haven & Hartford at Kingston (township of South Kingstown).

Operating Statistics of Large Steam Roads—Selected Items for the Month of February, 1921.

### International Railway Fuel Association

This association will hold its thirteenth annual meeting at Hotel Sherman, Chicago, on Tuesday, Wednesday and Thursday, May 24, 25 and 26. The program of the meeting shows addresses by Samuel O. Dunn, J. B. Hurley, Eugene McAuliffe and Robert E. Woolley.

The subjects of committee reports, with the name of the chairman of the committee following each subject, are as follows: Constitution and By-Laws, T. D. Smith; Firing Practice, M. A. Daly; Front Ends, Grates and Ash Pans, H. B. MacFarland; Fuel Accounting, J. N. Clark; Fuel Stations, W. E. Dunham; Pulverized Fuel, W. J. Bohan; Storage Coal, H. H. Stock; Locomotive Feed Water Heating, E. E. Chapman; Briquettes and Sub-Normal Fuels, E. E. Ramey.

Nine individual papers are scheduled; these, with their authors, are as follows: Cost of Production of Coal, Mont B. Morrow; Fuel Conditions on French Railways, Mr. de Boysson; Fuel Department Organization, L. G. Plant; Oil Shale as a Source of Oil Supply, Martin J. Gavin; Other Duties of a Fuel Inspector, H. L. Reynard; Preparation and Distribution of Coal, P. E. Bast; Standards of Fuel Economy Practice, D. C. Buell; Fuel Economy, C. E. Uddenberg; Value of Individual Enginemen's Performance Record, Robert Collett.

### The Kushequa Route

What may be called a "seasonal" time-table has been issued by the Mt. Jewett, Kinzua & Riterville Railroad, otherwise known as "The Kushequa Route," in northwestern Pennsylvania. The time-table for the coming summer is headed "For Fire Season, 1921," and beneath the heading it says, "No Trains east of Kushequa on Dry days." The meaning of the word "dry" in this connection is not that which is so familiar nowadays in the humorous columns of the newspapers, but relates to weather conditions. Because of the existence of extensive dense forests adjacent to the railroad line, the danger of fire must constantly be guarded against. Judging from the newspaper accounts which give this information, the five locomotives owned by the road are not equipped with perfectly satisfactory spark arresters.

The total length of this road is about 25 miles (including six leased lines) and that portion east of Kushequa has a length of about 15 miles. One of the features of the road is a locomotive named "Roosevelt," which name was adopted, it is said, because the engine is a rough rider. This railroad is an important one, in that it affords to many residents of McKean County their only convenient means of getting to their county seat, Smethport.

### Fire at Grand Central Terminal

The burning out of a positive third rail feeder at 6:30 a. m. Sunday, May 16, at Tower U interlocking Grand Central terminal, threatened to tie up all train movements into and out of the station and in addition caused damage to the interlocking estimated at \$20,000. Trouble was first noticed when trick fuses could not be kept in on one track circuit. When an inspection of the track circuit was made a thin line of smoke was noticed curling up from the ballast. Electrical department employees were notified, but before their arrival the feeder burned out and the heavy current discharge was carried through the ground, over pipes, and structural steel work in all directions. It appears that this current was carried into the interlocking tower on the steam heating pipes which, in running to the tower, are buried in ballast at this point. From these pipes the current spread to all metal parts of the tower and the insulation on the wires for all the interlocking and intercommunicating circuits was set on fire and burned fiercely, completely destroying all circuits. The city fire department on arrival completely flooded the tower, adding materially to the damage to the machine and instruments. Tower U is an electric interlocking plant with a 92-working-lever machine, and with the exception of the frame and mechanical locking this had to be stripped and entirely rebuilt by the force who immediately started to work to repair the damage. With a train movement of about 400 trains on Sunday over this plant, the accident resulted in only 65½ minutes of accumulated delay, a large portion of which was caused by the fire department requiring all power to be cut off

at this point for about 40 minutes. By 5:35 a. m. Monday, emergency repairs had been made so that all switches and signals needed to handle the heavy inbound suburban and through service were in operation, and with about 625 trains on weekdays, no train delays occurred on Monday.

### Signal Section—A. R. A.

The notice of the annual meeting of the Signal Section, American Railway Association, which is to be held at Chicago on June 6, 7 and 8, has just been issued by Secretary H. S. Balliet. It fills 200 pages and contains the full reports of the committees. Committee X presents a report, prepared by a sub-committee, of which H. K. Lowry is chairman, on the requisites of signal locations for automatic block signals. This committee, among other things, reports on automatic train control, and on a proposed short code of requisites for light signals. Specifications to be discussed at the meeting include those for mechanical interlocking, for power interlocking, for a battery jar, for a concrete battery box and for portable ammeters and voltmeters. Twelve proposed standard drawings of details will be presented. Committee IV presents a code of instructions for making torque tests of power-operated signals, and a drawing of torque testing apparatus. Other subjects to be presented are: Rules for signal maintenance; general provisions for use in major specifications; information for calculating power supply and distribution in alternating current signal systems, and forms of contractors' proposal including invitation, bond, and a full contract.

Committee XV on valuation, J. M. Carley, chairman, presents a report of a dozen pages giving the result of studies in valuation details made by several sub-committees.

### Chicago Belt Line Hearing Continued

Witnesses called by Luther M. Walter, attorney for the roads, protesting against the acquisition of the Chicago Junction Belt Line by the New York Central, in the hearing before Examiner W. A. Colston of the Interstate Commerce Commission, continued their arguments against the plan this week. John F. Wallace, former chairman of the Chicago Railway Terminals Commission, on May 16, declared that trunk line control of the property would make it less flexible in meeting shippers' requirements, and stated that the opportunity for terminal expansion of the New York Central's present holdings north of Sixty-third street, Chicago, was entirely possible. He also stated that the plan of the city of Chicago for terminal improvement north of Sixteenth street, would give the New York Central a chance for intensive development which would afford it practically four times its present facilities now north of that street.

Other witnesses called to the stand who favored joint operation of the property were Fred Zimmerman, vice-president of the Monon; H. E. Poronto, vice-president of the Chicago Belt Line; and Ira L. Burlingame, president of the St. Louis Freight Service Association and former general manager of the St. Louis Terminal Railroad Association. Mr. Burlingame said: "Shippers are better served by jointly owned belt lines than by one under the control of one line. I have located many industries in St. Louis and the big shippers always desire to be on the joint line. As general manager of the St. Louis Terminal Road, I was not hampered in any way by roads interested in the property. When I wanted money for improvements, I went to the president of the company and I got it. Jointly owned belt lines do not discriminate in favor of any one road."

J. A. Spoor, president of the Chicago Junction, testifying on May 16, declared that of the capital stock of \$5,500,000 of the Junction Road, only \$200,000 represented actual cash paid into the property by the stockholders. The balance came from earnings placed back into the property.

Abraham Harris, of Harris Brothers, one of the industries situated on the Chicago Junction, who was called to the stand on May 16, was asked by Mr. Walter why he had quit, after starting active opposition to the plan. He finally admitted that heavy financial pressure had been brought to bear on him by big banks.

# Traffic News

The National Industrial Traffic League will hold its Spring meeting at Hotel Winton, Cleveland, Ohio, on May 25 and 26.

Five railroads in Missouri have made an offer to country newspaper editors to accept advertising space in return for transportation, in order to help the editors go to the twelfth annual journalism week at the University of Missouri, Columbus, Mo., from May 23 to 27.

Iron and steel producers at Chicago have filed an application with the transcontinental lines for a readjustment of through rates on rolled steel from Chicago to the Pacific Coast, to enable them to compete with the Eastern mills now enjoying low water rates.

The recovery in production of soft coal gained additional momentum in the week ending May 7, according to the weekly bulletin of the Geological Survey. The total output is estimated at 7,296,000 net tons, an increase of nearly 5 per cent when compared with the preceding week.

J. H. Beek, executive secretary of the National Industrial Traffic League, called upon President Harding at the White House on Monday to invite him to speak at the next meeting of the league in Cleveland and incidentally discussed with the President the railroad situation from the point of view of the shippers.

The Louisville & Nashville has announced advances, which it is proposed to put in force on June 16, in freight rates on coal, from mines in various sections, to Louisville, Ky., and to certain other places, at the same time making reductions in rates to Lexington and certain territory. In Louisville, loud threats are made that the Interstate Commerce Commission will be asked to suspend the proposed increases. Some of these rates are intrastate and some interstate. The average freight rate on coal received in Louisville is said to be about \$1.25 a ton and the proposed increases average about 15 cents a ton.

The Pacific Railway Club and the Central California Traffic Association held a joint meeting at Oakland, Cal., on May 12, to discuss the topic "Co-operation of Railroad Men with Commercial and Industrial Traffic Managers." C. D. Myers, district freight agent of the Southern Pacific, spoke "On the Value of Solicitation"; G. H. Baker, assistant general freight agent of the Atchison, Topeka & Santa Fe, delivered an address on "Some Phases of the Claim Question"; "High Freight Rates" were discussed by Theodore Harte, assistant general freight agent of the Western Pacific and T. W. Gates, in charge of the tracing reconnaissance bureau of the Southern Pacific, spoke on "How Tracing Service May Be Made of Value."

## Disturbing a Privilege of Sixty Years' Standing

A move on the part of the Erie Railroad to do away with certain free lighterage privileges in New York Harbor (on all lumber except that in carloads, where cars are set ashore and unloaded by consignee) is interpreted by Brooklyn business men as probably the first step in a program of all the trunk line roads serving that city to economize at the expense of Brooklyn, Queens and other boroughs that depend on free lighterage. The Brooklyn Eagle, commenting on the Erie's notice, and reviewing the history of the lumber trade, says:

"Lighterage of lumber from the New Jersey terminals has been part of the railroad freight service for generations. Six or eight big lumber yards on Newton Creek have been established as receiving points for lumber, largely on the basis of free lighterage. To do away with this lighterage would materially add to the cost of the lumber. The service has been in effect since 1862, when the Erie and the New York Central were compelled by competition of water transportation to make the lighterage part of the rail rate. During the war lighterage was

curtailed and in many cases abolished. Cars were scarce, lighters were not available and the lumber supply in Brooklyn was kept down to a minimum. The present move is the boldest that has been made by any road, and it looks like the first move in a general plan to do away with lighterage, except as the consignee wants to pay extra for the service, which would mean adding 4 or 5 cents a hundred pounds. This lighterage service must be maintained as long as our rail connection with the rest of the country is as antiquated as it is."

## Anthracite Shipments—April, 1921

The shipments of anthracite in April, as reported to the Anthracite Bureau of Information in Philadelphia, amounted to 5,967,465 tons, an increase over the preceding month of 229,694 tons, and 1,153,254 tons over April last year when the Switchmen's strike was on.

Shipments by originating carriers were:

	April, 1921	March, 1921
P. & R. ....	1,123,585	1,018,858
L. V. ....	1,102,965	1,022,714
C. of N. J. ....	537,822	540,556
D. L. & W. ....	929,271	1,020,381
D. & H. ....	812,967	837,644
Penna. ....	416,847	333,687
Erie. ....	630,471	561,013
N. Y. O. & W. ....	128,684	144,930
L. & N. E. ....	284,853	257,988
Total.....	5,967,465	5,737,771

## Fraudulent Claim for Freight Damage

An indictment was returned by the Federal Grand Jury at Chicago, on April 29, against the Lakeside Fish & Oyster Company (a corporation) and Benjamin Sacks, president of that company, for filing a false loss and damage claim against the New York Central, in violation of Section 10 of the Act to Regulate Commerce. The claim was filed in connection with a carload shipment of fish consigned to the Lakeside company. Damage was claimed to the amount of \$1,288 based on alleged sale of the fish by the claimant for \$301. The indictment charges that the fish were in fact sold for \$1,135 and that the claim is false to the extent of the difference between this realization and the alleged realization of \$301. The case was developed through an investigation conducted at Chicago by the Interstate Commerce Commission. Benjamin Sacks was arrested on May 3 and his bond was fixed at \$5,000. Both defendants were arraigned before Judge Landis on May 6 and entered pleas of not guilty. For the offense charged in the indictment there is a maximum penalty of \$5,000 fine for a corporation and \$5,000 fine and two years' imprisonment for an individual.

## Eighteen Dollars Per Car Mile

An overcharge of \$3,000 on 52 carloads of freight moved only a little over six miles, is one of the curious incidents disclosed in a recent report of the Interstate Commerce Commission. The excess collection remained in the hands of the railroad for about a year and a half, thus adding to the overcharge nearly \$300 in interest.

In August and September, 1919, the Procter & Gamble Manufacturing Company had 52 tank car loads of silicate of soda shipped from Rahway, N. J., to Port Ivory, Staten Island, N. Y., over the Pennsylvania and the Baltimore & Ohio, 64 miles. The rate was fifth-class, 12 cents per 100 lb.; and at this rate the revenue was \$113.28 a car, equal to \$18.27 per car mile, the average load being 94,400 lb. After about a month the carriers made a special rate of 5.5 cents and the commission rules that that rate was as high as could reasonably be charged on the 52 cars which, apparently, were shipped while the application for a special rate was being considered. At the lower rate the yield per car was \$51.92 per car, or \$8.37 per car mile. The plant of the shipper at Rahway began operations on August 1, 1919, and application was at once made for a commodity rate, silicate of soda being a raw material of low value. It is used in the manufacture of soap and for coating the inside of oil barrels to make them proof against leakage. Rates of 5.5 cents were shown to be in force in various places for distances much more than six miles.

How long it would have taken for the carrier to grant the low commodity rate if it had not been for the restrictions of the Interstate Commerce law, is not stated.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until September 12, the operation of certain schedules which provide increased rates on naval stores between South Atlantic ports and also between interior points and these ports.

The commission has suspended from May 16 until September 12, the operation of certain schedules which propose the cancellation of the existing through rates on cement from certain points in New Jersey, New York and Pennsylvania to points on the Washington, Baltimore & Annapolis Electric Railway, leaving combination rates applicable instead.

The Interstate Commerce Commission has issued its decision in the Arizona intrastate rate case, which is similar to those in the other state rate cases, finding that the failure of the state authorities to authorize increases in rates corresponding to those authorized for interstate traffic results in discrimination, and ordering an increase of the state rates.

The commission has suspended from May 15 to September 12, the operation of certain schedules proposing to establish a terminal charge of \$15 per car, applicable between points in Western trunk line territory, to cover cost of policing shipments of intoxicating liquors while in the hands of the carriers, such charge to be in addition to the line haul rate.

The commission has further suspended until July 1, 1921, the operation of certain schedules which propose to transfer El Paso, Texas, from the eastern boundary of the Mountain-Pacific territory taking 25 per cent increase under Ex Parte 74 decision, over August 25, 1920 rates to the western group, making applicable instead the interterritorial percentage increase of 33½ per cent, applicable on transcontinental class and commodity rates between El Paso, Texas, and the Pacific Northwest, the operation of which was suspended until June 1 and 15, 1921, by orders previously entered.

### Mississippi Valley Case

The hearing before the Interstate Commerce Commission, involving the Mississippi Valley rate adjustment, which was heard by Examiner E. L. Gaddess in Memphis, beginning April 5, and subsequently transferred to St. Louis, April 25, was concluded in St. Louis on May 6. At the conclusion of the hearing the examiner fixed the time for filing briefs at 30 days from that date, subject to the approval of the commission, in view of the short time intervening before the expiration of the suspension, June 28.

In view of the extent of the record in this case (there being approximately 5,000 pages of testimony taken and over 1,100 exhibits filed, some of which are 70 pages in length), and because of the necessary delay that must follow before the transcript of record will be received by the parties in interest, the commission has now fixed June 25, 1921, as the date for filing briefs.

The argument in the case will be heard by the whole commission in July on a date to be hereafter named. The carriers have agreed voluntarily to postpone the effective date of the tariffs for four months from July 28, and the commission has under consideration the necessary modification of its fourth section orders to permit such postponement.

In view of the magnitude of the adjustment of rates involved and the great mass of testimony and exhibits to be considered, this action was necessary in order to properly adjudicate the matter. Certain commodity schedules were filed so hurriedly that justification thereof is admitted by the carriers to be impossible. Thus rates on cement and asphalt have been withdrawn from the scope of this proceeding. In the case of other schedules, where carriers are willing to file amended schedules, and where the schedules are acceptable to the shippers, such amended schedules may be sent to Examiner Gaddess on or before the date fixed for the filing of briefs; but such schedules so filed must show the agreement of both carriers and shippers thereto.

## State Commissions

The Chicago, Rock Island & Pacific filed a protest with the State Public Utilities Commission of Illinois on May 11, at Springfield, Ill., against the use of hard roads by motor bus companies styled as "an appropriation of public improvements to private interest without any compensation." The filing of the protest is a direct objection against the operation of the Peoria White Star Bus Company and the Ivy Way Bus Line, which the railway complains will force it to curtail its service.

### Personnel of Commissions

Harley W. Brundige has been elected president of the California Railroad Commission, succeeding Frank R. Devlin, who resigned on May 1. Mr. Brundige was appointed to the railroad commission for a six year term by Governor W. D. Stephens, in January, 1919. At the time of his appointment he was publisher and editor of the Los Angeles Express.

## Court News

### Yard Tracks and Switch Engines

#### Not Necessarily a Nuisance

The Indiana Appellate Court holds that a railroad's general power under the state statute to erect and maintain all buildings and station facilities necessary for efficient service includes the maintenance of tracks near a station with switch engines thereon ready for immediate use. Where a railroad has been constructed in a district devoted wholly to railroad and manufacturing purposes, those choosing the district for residential purposes do so at their own risk and must take the consequences. They must be held to have anticipated the incidental damages resulting from smoke, gases, fumes, and noises, which must be regarded as *damnum absque injuria*; and a bill to enjoin the maintenance of switch engines with steam up at night as a nuisance will not lie.—Bennett v. Lake Erie & Western (Ind.), 127 N. E. 777.

### Hours of Service Act—"Daytime" and

#### "Night and Day" Telegraph Offices

The federal district court, M. D., Pennsylvania, holds that a telegraph office open 15 hours in winter and 16½ hours in summer is not an office "operated only during the daytime" and therefore is a "night and day" office, within the meaning of the Hours of Service Act, and an operator's time on duty is limited to nine consecutive hours in such an office.

The total period of an operator's duties in a daytime office was about 14 hours 20 minutes, but three periods for his meals, ranging from 20 to 50 minutes each, if deducted, would bring his time on duty within the 13-hour limit. It is held that such intermissions allowed for meals should not be deducted from the time of service. They are "trifling interruptions" in the language used in United States v. Atchison, T. & S. F., 220 U. S. 37. 31 Sup. Ct., 362.—United States v. Cornwall & Lebanon, 268 Fed. 680.

### Liability for Injury Caused by Defective Brake

A carrier furnishing cars to a shipper is liable for injuries to him or his employee due to a defect in a car which might have been discovered by reasonable care in inspection. If the carrier is negligent in furnishing the car, and the shipper in turn is negligent in furnishing it to his employee to be loaded, the carrier and shipper are both liable to the injured employee; but the use of a car obviously so defective as to be dangerous would be either assumption of risk or contributory negligence, according to the circumstances, on the part of the person operating it. Applying these rules, the Circuit Court of Appeals, Fourth Circuit, holds that, where there was evidence that the railroad company furnished a car with a brake seriously defective, due to worn shoes, causing excessive slack, knowing that the brake would be depended on to hold the car loaded with coal on a steep grade, and that the defect in the brake was the proximate result of an injury to an employee who tried to

stop the car with a piece of timber, the railroad company would be liable, if nothing else appeared.—Waldron v. Director General of Railroads, 266 Fed. 196.

**Coal Car Distribution in Emergencies**

The Circuit Court of Appeals, Fourth Circuit, construes the provisions of section 402 of the Transportation Act of February 28, 1920, as to coal car distribution in time of shortage as follows: By subdivision 12 of the section Congress intended to abolish all preference to mines furnishing railroad fuel coal under the assigned car rule in periods of ordinary car shortage. But under subdivision 15, providing that whenever the Interstate Commerce Commission is of opinion that an emergency requiring immediate action exists, it may give directions for preference or priority in transportation, embargoes, or movement of traffic under permits, the commission may suspend the rule prescribed by subdivision 12. When the commission issues an order suspending the rule based on its opinion that an emergency exists it is not within the power of the court to annul the order on the ground that the administrative power conferred on the commission was unwisely or improvidently exercised. *Baltimore & Ohio v. Lambert Run Coal Co.*, 267 Fed. 776. *Certiorari denied*, 254 U. S.—41 Sup. Ct. 148.

**Decisions Under the Federal Employers' Liability Act**

The Circuit Court of Appeals, Third Circuit, holds that a person killed while on his way to work upon a crane used for unloading coal cars so as to create a coal reserve to be used in both interstate and intrastate commerce in case of a threatened strike could not recover under the act, the crane not being engaged in interstate commerce.—*Kozimo v. Hines*, 268 Fed. 507.

The Texas Supreme Court holds that a trucker injured in unloading freight shipped from another state is within the act.—*Cox v. St. Louis & San Francisco (Tex.)* 222 S. W., 964.

The Arkansas Supreme Court holds that a brakeman employed on a train hauling ballast to be used on the main track of an interstate railroad is within the act.—*Kansas City Southern v. Leinen (Ark.)*, 223 S. W. 1.

The Illinois Appellate Court holds that a pipe fitter, employed by an interstate railroad in repairing an engine on a sidetrack preparatory to its being used to haul a passenger car between states is within the act.—*Sheehan v. Wabash*, 214 Ill. App., 347.

The Illinois Supreme Court holds that a railroad employee, returning to a station after delivering interstate mail pouches to another carrier for further transmission is still engaged in interstate commerce, so that the state Industrial Commission cannot award compensation for his death while so returning.—*Cleveland, C. C. & St. L. v. Industrial Com. (Ill.)*, 128 N. E., 516.

**United States Supreme Court**

**Rates for Transportation of Soldiers**

On several occasions in 1914 and 1915 the Atchison, Topeka & Santa Fe at the request of the United States furnished transportation from one state to another for officers and enlisted men of the United States army. In each instance the tariffs provided a through individual rate from the initial point to destination, and also intermediate rates to and from intermediate points. In no instance was there a through party rate, but in all there was a party rate for a part only of the distance. Except in two instances the transportation was furnished without any prior contract. Bills for the transportation, with appropriate land grant deductions were presented to the accounting officers, who in each bill allowed only a part of what was claimed. The Court of Claims, without opinion, sustained the action of the accounting officers, and the company appealed to the Supreme Court.

The accounting officers proceeded on the theory that the collectible rate should be determined by combining the party rate covering a part of the distance and the individual rate for the remainder. In this the Supreme Court holds the accounting officers erred. By requesting and accepting the service without some special arrangement the United States assented to and became obligated to pay the tariff rate.

The judgment was reversed and the suit remanded to the Court of Claims. *Atchison, Topeka & Santa Fe v. United States*, Decided April 18, 1921. Opinion by Mr. Justice Van Devanter.

**Foreign Railway News**

**Locomotives and Cars for China**

The Peking-Hankow Railway is about to close a contract for 30 locomotives and is in the market for 30 more according to Commercial Attaché Julean Arnold at Peking. He reports further that the Peking-Suiguan expects to purchase 1,000 cars and 74 locomotives. It is understood that the South Manchuria Railway has secured a loan for \$600,000 for the construction of a new line from Taonan to Tsenkiatum.

**Rolling Stock Repair Companies in Roumania**

LONDON.

A group of Roumanian financial institutions with a capital of approximately \$7,000,000 (at the present rate of exchange) have made an offer to the Roumanian State Railway Administration to undertake the repairs of the rolling stock of the state railways, since it is thought that the offers from foreign companies to undertake this work are much too high. These financial institutions engage to erect plants capable of repairing 7,000 locomotives within seven years as against 5,000 proposed by the foreign concerns. They undertake also to construct plants capable of repairing within seven years 5,000 passenger cars instead of the 3,000 proposed by the foreign firms and repairing 45,000 freight cars instead of 30,000 as proposed by the foreign companies which offered to undertake the equipment repairs.

**English Exports of Railway Supplies**

LONDON.

The Board of Trade returns give the value of the railway materials exported from Great Britain during the first two months of the year as follows:

	1921	1920
Locomotives .....	\$4,431,660	\$1,911,676
Passenger cars .....	860,660	858,808
Rails .....	3,555,716	791,924
Freight cars .....	3,796,228	1,128,956
Wheels and axles .....	1,575,388	1,128,956
Tires and axles .....	1,177,724	821,004
Rail chairs and metal ties .....	1,438,216	234,268
Miscellaneous track material .....	2,084,076	1,251,560
Total track material .....	9,829,680	4,262,776

The weight of rails exported was 33,290 tons for the first two months of the present year as against 11,792 tons for the same period of the year 1920, and of rail chairs and metal ties 14,565 tons as against 2,646 tons a year ago.

**English Railway Agreements**

LONDON.

The report of the Colwyn Committee appointed by the Ministry of Transport to examine and arrive at some clear interpretation of the various agreements entered into between the government and the railways since 1914, when the government assumed control of the roads, was recently discussed in parliament. It was pointed out that there were three principal agreements under which governmental liabilities arose: (1) By the original agreement the government undertook, in effect, to bear any loss to the railway companies arising from any cause during the period of control; (2) Deferred maintenance was to be made good by the government despite any increase in costs; (3) The railway companies were to receive the difference in the value of any stores in their possession at the end of the period of control and that which would have been the value of those stores at the end of 1914.

It was maintained by some in the House of Commons that by these agreements the railways were greatly relieved from the effects of the war such as no industry nor individual had been. Sir Eric Geddes, Minister of Transport, re-

ferred to the Ministry as the "treasury watch-dog" and stated that during its existence it had challenged some \$97,000,000 in claims. He claimed that the Colwyn report had shown a possible liability of some \$760,000,000 on the part of the government under the existing agreements but that an agreed liability had been entered upon between the government and the Railway Companies' Association of only \$250,000,000, which would be incorporated in the government railway bill to be presented shortly. This payment it was proposed to make in two installments; one at the end of this year and the second at the end of next year.

### Railways of India in Great Need of Equipment

Authoritative statements in the Weekly Bulletin of the Department of Trade and Commerce of Canada tell of the dire need of the railways of India for "enormous quantities of all classes of supplies, and without doubt rolling stock more than any other." It is said further that "it would be practically useless for India to increase her production" until the railways are able to handle more traffic. Violent competition for the supply of manufactured material and labor difficulties in England, together with the decreased production during the war, are blamed for the present difficulties. Relatively little equipment is manufactured in India although it is understood that plans are being worked out for increasing the production of railway supplies. In addition to the serious equipment shortage it is said that India is in great need of new lines and other additions and betterments. A loan of \$36,450,000 (at par) for the Indian railways was floated in London a few weeks ago so easily that an observer has remarked that the railway authorities probably regret that they did not ask for more.

### British Railways in South America

#### Show Increased Earnings

The annual reports of the British operated railways in Argentina, Paraguay and Uruguay for the fiscal year 1920 show that on all the lines except the Northern Extension of the Central Uruguay the net earnings were in excess of those of the previous year, according to Trade Commissioner Brady at Buenos Ayres. While the Northern Extension showed a decrease in net earnings, it was still able to pay dividends of 8 per cent on the capital stock. A compilation of the gross receipts and operating expenses of some of the more important railroads of the southern republics is given in the following table:

Road	Mileage	Gross Receipts	Operating Expenses
Southern (Argentina).....	3,792	\$46,363,360	\$32,080,729
Central Argentine.....	3,305	47,335,204	32,100,038
Buenos Ayres & Pacific.....	3,536	39,853,103	27,761,472
Western (Argentina).....	1,882	25,535,563	17,744,030
Entre Rios (Argentina).....	811	6,908,763	4,407,748
Central Cordoba (Argentina).....	1,205	15,143,760	11,775,780
Central Uruguay:			
Northern Extension.....	185	966,620	446,653
Eastern Extension.....	311	1,641,635	757,013

Paraguay Central.....	274	1,253,870	738,934

NOTE.—Pounds to dollars at par.

All the lines showed a material increase in freight and passenger traffic. The Central Cordoba announced that the shortage of rolling stock was a limiting factor and that, at the time of reporting, 250,000 tons of goods were at its stations awaiting cars. On the Southern the freight traffic increase was 32 per cent over the previous year. This company paid a total dividend of 7 per cent for the year. The Central Argentine paid 6 per cent on its common and 4½ per cent on its preferred stock. The three lines in Uruguay paid dividends of 7, 8 and 9 per cent on the common stock. The lack of coal makes the fuel problem a serious one for these roads. In the past they have been burning wood, but they are turning to oil now wherever possible. Nearly all the lines have asked for rate increases to care for prospective wage raises and other mounting costs. Wage rates at present range from 40 per cent to 70 per cent higher than the 1914 scale.

## Equipment and Supplies

### Locomotives

THE NATIONAL RAILWAYS OF MEXICO are inquiring through the locomotive builders for 100 locomotives. Francisco Perez, director general of the National Railways, is now in the United States arranging for the purchase of this equipment.

### Freight Cars

THE MONTOUR RAILWAY is inquiring for 200 car bodies of 50-ton capacity.

THE UNITED FRUIT COMPANY, New York, is inquiring for 50, 2 compartment cane cars of 12-ton capacity.

### Iron and Steel

THE JAPANESE GOVERNMENT has ordered through Takata & Co., New York, 6,000 tons of 60 and 75-lb. rails, including accessories.

### Track Specialties

THE NEW YORK CENTRAL will receive bids until noon, May 27, for 128,620 square and oval track bolts, manufactured in accordance with New York Central standard plans D-9-A.

### Miscellaneous

MITSUI & Co., New York, has ordered 270 sets of Westinghouse air brakes to be used on locomotives, passenger and freight cars, of the Japanese Government Railways.

THE NORFOLK & WESTERN will receive bids until noon, June 1, at Roanoke, Va., for parts for electric apparatus; 5,000 No. 2, B & S gage copper rail bonds; 650 lb. flux rods; 6 clamps for holding bonds; 800,000 gal. creosote oil and 425,000 gal. creosote oil.

THE INTERNATIONAL GENERAL ELECTRIC COMPANY, New York, has been given a contract amounting to about \$1,500,000 for switch gear, transformers and other equipment by the Victorian Electricity Commission for development of the coal production near Melbourne, Australia. According to advices from Melbourne, the International Company's figure was about \$800,000 below the lowest combination of British sectional bids submitted. No British firm made a single bid for furnishing the material.

### Signaling

THE BOSTON ELEVATED has ordered from the Union Switch & Signal Company 68 automatic block signals to be installed on its elevated lines in the Charlestown and Roxbury districts, together with a large quantity of other signaling material, most of which is to take the place of apparatus installed about 20 years ago. The signals are to be three-indication, color-light, and they take the place of electro-pneumatic semaphores. Electro-pneumatic automatic stops will be put in at each block signal and the blocks will be about 1,000 ft. long, thus keeping trains about 2,000 ft. apart. The old apparatus is still doing its duty, but it was desired to shorten the block section and this seemed a suitable time to introduce these improvements. Alternating current apparatus is to be introduced, in place of direct current, and extensive changes are to be made in the interlocking at North station, Tower C. Color-light signals will be introduced here also. Tower D will have a new electro-pneumatic machine, seven levers. Alternating current was introduced at Sullivan Square about three years ago and the interlocking machine then taken out from that station is to be used, with new locking and other improvements, at Tower C.

## Supply Trade News

The Industrial Car Manufacturers' Institute has removed its executive office from Pittsburgh, Pa., to 68 William street, New York City.

The Ralston Steel Car Company moved its Chicago offices from 20 East Jackson boulevard to the Fisher building, 343 South Dearborn street, on May 1.

W. F. Robinson, for many years connected with James B. Sipe & Co., Pittsburgh, Pa., has been appointed manager of the railroad sales department of the Tropical Paint & Oil Company, Cleveland, Ohio.

The Jones & Laughlin Steel Company, of Pittsburgh, Pa., has purchased 15 acres of ground with a 2,700-ft. frontage on Lake Michigan, just east of the Illinois-Indiana state line near Chicago. This company already owns other land in the Calumet district and it is reported that plans are being made to build a steel plant in that district.

V. Z. Caracristi, until recently a member of the Railway & Industrial Engineers, Inc., has opened consulting offices at 43 Broad street, New York. Mr. Caracristi has been identified

with the railway and industrial fields for the last 22 years. He was at one time shop engineer and maintenance supervisor of the Richmond plant of the American Locomotive Company, and later general maintenance supervisor of all the plants of that company. He was associated as designer and constructor of the Union Station, Washington, D. C., and was assistant to the general superintendent of motive power of the Baltimore & Ohio. He was later in the employ of the Wheeling & Lake Erie, where

he carried out improvements in the Brewster shops, and shortly after did similar work in the Watervliet shops and Carbondale terminal of the Delaware & Hudson. He also supervised the layout, design and equipment of extensions to the plant of the Lima Locomotive Works, Inc. From 1913 to 1919 Mr. Caracristi was engaged in consulting work for banking interests and during this period devoted considerable effort to development work on the burning of pulverized fuel in suspension. In 1919, with J. E. Muhfeld, he formed the Railway & Industrial Engineers, Inc. Mr. Caracristi will specialize in consulting work in railroad and shop design, operation and betterment.

V. Z. Caracristi

## Obituary

George Jesse Foran, for many years manager of the condenser department of the Worthington Pump & Machinery Corporation, New York, died on May 12, at his home in New York City. He was born on January 22, 1862, in Boston, Mass., and graduated from the Massachusetts Institute of Technology in May, 1883, in the department of mechanical engineering, with the degree of bachelor of science. The following September, he entered the employ of the Deane Steam Pump Company, Holyoke, Mass., and shortly afterwards was transferred to the Boston office of that company. In November, 1886, he went with the George

F. Blake Manufacturing Company, as a salesman and later served also as consulting engineer to the president and treasurer of the Blake company. From 1890 to 1897, he was office manager of the new Blake works at East Cambridge, Mass., also head of the estimating and cost department, later returning to the engineering sales department. The above companies were consolidated with others in 1901, to form the International Steam Pump Company, and Mr. Foran then went to New York, as manager and chief engineer of the condenser department of Henry K. Worthington and the associated companies of the International Steam Pump Company. He continued in that position with the Worthington Pump & Machinery Corporation which succeeded the International Steam Pump Company. Mr. Foran was active in the design of high vacuum apparatus during the entire development of that class of machinery and was at the head of the department at the time of his death. During the war, Mr. Foran served upon the committee for condensing apparatus of the United States shipping board and war industries board and as chairman of the American Engineering service of the Engineering Council, which dealt with all questions of personnel between the various departments of the United States Government and the four national engineering societies.

## Trade Publications

**WELDING SPECIALTIES.**—A small pamphlet has recently been issued by the Transportation Engineering Corporation, 200 Fifth avenue, N. Y., which describes and illustrates a number of the electric arc welding accessories manufactured by this company. The specialties described are welding helmets, goggles, a portable sand blast, a metal electrode holder and various types of coated electrodes.

**CONSERVATION.**—In a 16-page bulletin the Lyster Chemical Company, New York, presents a brief exposition of the subject of timber preservation with creosote, placing special stress on open tank, brush and spray treatments. Some space is devoted to the properties of creosote and methods of application and photographs are shown of representative structures that have been subjected to treatment.

**BLAWFORMS FOR GENERAL CONSTRUCTION.**—The Blaw-Knox Company, Pittsburgh, Pa., has recently issued a large size, 52-page, illustrated pamphlet descriptive of the line of forms manufactured by this company for general concrete construction. Among the numerous kinds of forms illustrated and described are various sizes and types for sewer construction, tunnels, subways, heavy walls, piers, fixed and traveling type centers for bridges and others for miscellaneous construction work.

**NARROW GAGE LOCOMOTIVES.**—The Burton Engineering & Machinery Company, Cincinnati, Ohio, has issued a new publication describing its line of gasoline and kerosene locomotives for narrow gage hauling systems. The publication is a 16-page illustrated booklet, describing its equipment and presenting information as to its adaptability and scope. Included in the book are tables giving the hauling capacity of the machines on various grades with various train resistances.

**CONCRETE HARDENING AND BONDING.**—The Livingstone Company, Baltimore, Md., has issued a 12-page folder on its "Livingstone" bonding cement and "Lithotex" concrete hardener. The folder devotes space to the theory and practice of bonding top finishes to concrete bases and contains information relative to its two products together with specifications for its use on new construction and patchwork. This information is supplemented with illustrations of buildings on which it has been applied and also classified lists of users, including railroads.

**COAL AND ASH HANDLING SYSTEMS.**—Catalogue No. 40, 72 pages, illustrated and descriptive of various types of coal and ash handling systems for boiler houses, has been issued by the R. H. Beaumont Company, Philadelphia, Pa. The text of this booklet is descriptive of the various classes of material handling machinery which this company installs, such as skip hoists, crushers, cable drag scrapers, ash cars, hoppers, larries, bunkers, conveyors. The illustrations show many actual installations as well as plan drawings of the different units and sketches of typical systems.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company will shortly accept bids for the construction of the bridge over the Des Moines river near Dumas, Mo., to cost approximately \$356,000.

**ATCHISON, TOPEKA & SANTA FE.**—This company has ordered new electrically operated cinder conveyor equipment from the Roberts & Schaefer Company, Chicago, for installation at Albuquerque, N. M.

**ATCHISON, TOPEKA & SANTA FE.**—This company is accepting bids for the construction of a second floor extension with dimensions of 24 ft. by 100 ft., to its station and office building at Slaton, Tex.

**CHICAGO UNION STATION.**—This company, which was noted in the *Railway Age* of May 6 (page 1093), as contemplating the completion of the filled portion of the Polk street viaduct, at Chicago, at a cost of about \$12,000, is accepting bids for the work.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of May 6 (page 1093), as contemplating the construction of additions to its roundhouse at Freeport, Ill., is now accepting bids for this work.

**ILLINOIS CENTRAL.**—This company has awarded a contract to P. A. Shugart and Blythe Brothers, Nevada, Iowa, for grading in connection with the construction of yard facilities at Clingon, Ill. The improvements include the construction of a northbound unit of 14 tracks and a southbound unit of 10 tracks, each of 100 car lengths. The total cost of the work will be \$650,000. A contract has been awarded to the Unity Construction Company, St. Louis, Mo., for the construction of a viaduct over McLemore avenue, Memphis, Tenn. The company has also awarded contracts to the Ellington-Miller Company, Chicago, for the construction of subways at Eighth and Fourteenth streets, Fort Dodge, Iowa. The company is accepting bids for the construction of 6 additional yard tracks at Paducah, Ky., at a cost of \$225,000. Bids will shortly be accepted for the construction of 8,000 feet of storage tracks at Destrehan, La., and for 11,500 feet of storage tracks at Good Hope, La.

**NEW YORK CITY.**—The governor of the State of New York has signed a bill requiring the municipal authorities of New York City to begin within two years the construction of a railway tunnel under the Narrows to connect Staten Island with Brooklyn. The new tunnel will provide the Staten Island Rapid Transit, a subsidiary of the Baltimore & Ohio, with a connection in Brooklyn with the New York Connecting and the Long Island. In this manner the roads terminating on the New Jersey side of the Hudson river will be given direct rail connections for freight with Brooklyn and with the New York, New Haven & Hartford and the Long Island. In addition the proposed tunnel will provide rapid transit service for passengers between Staten Island and the rest of New York City.

**ST. LOUIS-SOUTHWESTERN.**—This company will build a frame passenger and freight station at De Witt, Ark. The dimensions of this building will be 24 ft. by 198 ft. This structure is being erected by the company forces and will cost approximately \$20,000. It will replace a station destroyed by fire.

**UTAH RAILWAY.**—The Interstate Commerce Commission has issued a certificate authorizing the construction of an extension of 19.4 miles from the present terminus at Watson, Utah.

**UNION PACIFIC.**—This company, which was noted in the *Railway Age* of May 13 (page 1144), as accepting bids for the work of lining its Sherman tunnel, near Hermosa, Wyo., with concrete, has awarded the contract for this work to the Utah Construction Company, Ogden, Utah.

**UVALDE & NORTHERN.**—This company contemplates the construction of a new station and warehouse at Camp Wood, Tex., in addition to stations at Laguna and Kelly Field, Tex.

**WABASH.**—This company is accepting bids for the construction of a brick or stucco passenger station at Macon, Mo., with dimensions of 122 ft. by 24 ft.

## Railway Financial News

**ATLANTIC COAST LINE.**—*Annual Report.*—The corporate income account for the year 1920 compares as follows:

	1920	1919
Operating revenues (4 months).....	\$25,304,073	.....
Operating expenses, taxes, etc.....	22,417,739	.....
Operating income (4 months).....	\$2,866,334	.....
Standard return (2 months).....	1,689,505	.....
Operating income guaranty period (6 months).....	5,478,458	.....
Other income.....	*5,198,486	.....
Gross income.....	\$15,252,783	\$14,116,304
Interest, taxes, rentals, etc.....	7,362,221	6,827,605
Net income.....	\$7,890,562	\$7,288,699
Sinking fund, etc.....	24,935	12,904
Appropriation, physical property.....	181,471	88,258
Surplus.....	\$7,684,156	\$7,187,537

\*Includes adjustment of standard return.

The annual report of the Atlantic Coast Line will be reviewed editorially in an early issue.

**BOSTON & MAINE.**—*Directors Advise Stockholders.*—At a special meeting of the directors in Boston on May 9, it was voted that the following letter be sent to the stockholders:

Certain persons styling themselves the "Boston & Maine Railroad Stockholders' Protective Association," are asking you to sign a paper favoring an investigation of the Boston & Maine under their direction at the expense of the corporation. The directors of the Boston & Maine feel that they should inform you that this movement is entirely without authority from them and does not have their approval.

**CHESAPEAKE & OHIO.**—*Asks Authority to Pledge Bonds.*—This company has applied to the Interstate Commerce Commission for an order authorizing the authentication and delivery of \$8,836,000 of its first lien and improvement, 20 year mortgage bonds and the pledge of \$6,274,000 of the bonds as security for a loan from the United States of \$5,338,000.

**CHICAGO & NORTH WESTERN.**—*Equipment Trusts Sold.*—This company has sold to White, Weld & Co. two series of equipment trust 6½ per cent certificates, to be issued under the railroad's equipment trust agreement of 1920.

To provide the cash equity, the first three installments of each of such series are to be canceled, so that the first instalments of the certificates will be payable in the year 1925. Series J will mature annually March 1, 1925 to 1936, inclusive; Series K will mature annually April 1, 1925 to 1935, inclusive. The total of the certificates thus sold is \$5,436,000. They are to be secured by locomotives and cars having an approximate total cost of \$6,820,000.

**CHICAGO, MILWAUKEE & ST. PAUL.**—*Stockholders Approve Purchase of C. T. H. & S.*—The stockholders of this road met at Milwaukee, Wis., on May 12, and approved the purchase of the Chicago, Terre Haute & Southeastern, at an assessment of \$10 a share.

**CHICAGO, TERRE HAUTE & SOUTHEASTERN.**—*Purchase by C. M. & St. P.*—See Chicago, Milwaukee & St. Paul.

**CINCINNATI, NEW ORLEANS & TEXAS PACIFIC.**—*Dividend Reduced.*—The extra dividend on the common stock has been reduced from 3½ to 2½ per cent. The regular dividends of 1¼ per cent quarterly on the preferred stock and 3 per cent semi-annually on the common, have been declared.

**CUMBERLAND & MANCHESTER.**—*Asks Authority to Issue Securities.*—This company has applied to the Interstate Commerce Commission for authority to issue \$375,000 of 10-year, 6 per cent notes, \$125,000 of general mortgage, 10-year, 6 per cent gold bonds and \$100,000 of equipment trust 6 per cent notes.

**DELAWARE & HUDSON.**—*Annual Report.*—A review of this company's annual report for 1920 appears on another page of this issue.

**DELAWARE, LACKAWANNA & WESTERN.**—*Coal Properties to be Sold.*—A contract for the sale of this company's anthracite coal properties to the Glen Alden Coal Company has been prepared

and will be submitted to the stockholders for approval at a meeting to be held July 21. William W. Inglis, vice-president and manager of the coal mining department of the Lackawanna at Scranton, Pa., has been elected president of the Glen Alden Company. The following notice signed by Mr. Inglis has been sent to the road's stockholders:

The Glen Alden Coal Company has offered The Delaware, Lackawanna & Western Railroad Company the sum of sixty million dollars for its anthracite coal properties, to be paid as per terms of contract of sale, with interest at four per cent. A formal contract of sale has been prepared to be executed upon your approval. The Glen Alden Coal Company is a corporation of the state of Pennsylvania, incorporated in the year 1866. We propose to merge the company with the Diamond Anthracite Coal Company, a Pennsylvania corporation which we also control, and, by action in conformity with the laws of the state of Pennsylvania, increase the number of shares of the capital stock of the merged companies to eight hundred forty-six thousand (846,000) shares, of no par value. We shall offer this stock to the stockholders of The Delaware, Lackawanna & Western Railroad Company of record at the close of business June 15, 1921, on the basis of one share of Glen Alden Coal Company stock for each share of railroad company stock, at five dollars (\$5.00) per share, payable on or before August 20, 1921. Arrangements have been made with the Farmers' Loan and Trust Company, of the City of New York, to act as transfer agents of the company, and with the First National Bank of New York to act as registrar of the stock of the company. On or before June 20th next subscription blanks will be mailed to all stockholders of record June 15, 1921, for the number of shares to which they may subscribe, in accordance with the foregoing plan. This company will be operated by officials now employed in the coal mining department of your company, the vice-president and manager of such department having been selected as its president.

**DENVER & RIO GRANDE.—Stockholders Appeal to Senate Committee.**—Arthur M. Wickwire, counsel for the stockholders' protective committee, has made public a letter sent by him to Senator Cummins, chairman of the Senate Committee on Interstate Commerce, which is investigating the railroad situation. Mr. Wickwire states in the letter that the committee which he represents has filed a bill in equity in the United States District Court in Colorado to set aside judicial sale of the Denver & Rio Grande properties to the Western Pacific. His letter, in part, says:

One fundamental difficulty that confronts the country arises from the laxity in the incorporation laws of various states governing the railroads. The stockholders have been subject to great wrongs arising through interlocking directors, and there have been no proper restrictions preventing railroad magnates from engaging in a multiplicity of schemes for their personal enrichment and aggrandizement at the expense not only of the stockholders but also of vast numbers of innocent citizens. The jurisdiction formerly conferred upon the Interstate Commerce Commission gave them no power save to investigate and then to publish their reports of wrongs already consummated, which amounted to nothing more than locking the barn after the horse was stolen.

Recent legislation of Congress has advanced somewhat in the right direction, giving the commission some little supervisory power in advance, and certain phases of the wrongs, committed in the case of the Denver & Rio Grande are now forbidden and punishable by fine and imprisonment. But the committee believes that the facts of this Denver & Rio Grande case when fully revealed to you will demonstrate that the present legislation does not go far enough. The honest, hard-working people of the United States have been plundered long enough and often enough in railroad steals, and they are now looking to Congress to pass laws rendering it impossible for the perpetrators of these gigantic outrages to repeat them.

**Appeal to Stockholders for Funds.**—The protective committee has issued a call for contributions from the stockholders of 50 cents a share with all new stock deposited. Stockholders who have contributed 20 cents a share are asked to pay the balance of 30 cents. The additional funds are needed to carry on the fight before the courts.

**EVANSVILLE, INDIANAPOLIS & TERRE HAUTE.—Loan Approved.**—The Interstate Commerce Commission has approved a loan to this company of \$400,000 from the revolving fund for 15 years to assist the company in financing additions and betterments to the amount of \$800,000.

**GRAND TRUNK.—Shareholders Vote for Government Control.**—At the meeting of shareholders in London on May 12 it was decided to ratify the agreement between the management and the Canadian government providing for the transfer of the control of the railway to the government this month.

Dominion officials expressed satisfaction with this ratification, which they said would extend the time limit in which the arbitrators could make awards and would make further legislation unnecessary during the present session. Government nominees will supplant the existing board of directors. The shareholders will name a committee to present their case before the board of arbitration.

**HOCKING VALLEY.—Annual Report.**—The corporate income account for the year ended December 31, 1920 (which includes ten

months' operation from March 1, 1920), and comparison with year ended December 31, 1919, is as follows:

	1920	1919
Operating revenues:		
Freight traffic.....	\$12,784,092	.....
Passenger traffic.....	1,175,118	.....
Total operating revenues.....	\$14,949,229	.....
Operating expenses:		
Maintenance of way and structures.....	\$1,826,197	.....
Maintenance of equipment.....	5,714,856	.....
Traffic.....	85,893	.....
Transportation.....	5,714,248	.....
General.....	426,662	\$73,767
Total operating expenses.....	\$13,764,929	\$73,767
Net operating revenue.....	\$1,184,600	\$73,767
Railway tax accruals.....	798,879	108,000
Railway operating income.....	\$384,378	\$181,767
Net railway operating income.....	\$1,377,165	\$181,767
Compensation under contract with director general of railroads.....	461,302	2,637,167
Other income.....	302,423	246,794
Gross income.....	\$2,140,889	\$2,702,194
Total deductions.....	\$1,795,093	\$1,672,326
*Net income.....	\$345,796	\$1,029,868
Dividends, 4 per cent.....	\$439,980	\$439,980
Old accounts written off, and sundry adjustments.....		\$9,846,075
		156,921
Balance to credit of profit and loss, December 31, 1920.....		\$9,689,154

\*The income account for year 1920 contains no payment or accrual on account of the guaranty by the United States Government for the six months' operation from March 1 to August 31, 1920, under section 209 of the Transportation Act, 1920, as the amount is not yet ascertainable.

The annual report of the Hocking Valley will be reviewed editorially in an early issue.

**INTERSTATE RAILROAD.—Asks Authority to Issue Stock.**—This company has applied to the Interstate Commerce Commission for authority to issue and sell \$3,000,000 of capital stock, the proceeds to be used for building and extension.

**KANSAS CITY SOUTHERN.—New Director.**—W. C. Loree, of New York, has been elected a director to succeed John J. Mitchell, of Chicago, who has resigned in compliance with the provisions of the Clayton Act.

**LOS ANGELES & SALT LAKE.—Authorized to Issue Notes.**—This company has been authorized by the Interstate Commerce Commission to issue at par promissory notes in an aggregate amount of \$2,500,000 to meet anticipated requirements during the year 1921 by loans from two of its stockholders, William A. Clark and the Oregon Short Line.

**MAINE CENTRAL.—Asks Authority to Lease Road.**—This company has applied to the Interstate Commerce Commission for approval of a lease of the Belfast & Mooshead Lake as an extension of the lease dated April 27, 1871, which expired on May 10.

**MISSOURI, KANSAS & TEXAS OF TEXAS.—Asks Authority to Issue Equipment Notes.**—This company has applied to the Interstate Commerce Commission for authority to issue \$450,000 of 6 per cent equipment notes, a first lien on 300 tank cars, and to pledge them with the Secretary of the Treasury as security for a loan of \$450,000 to be used in payment for the cars.

**MISSOURI PACIFIC.—Purchase of Little Rock & Argenta.**—The transfer of the Little Rock & Argenta has just been completed after the sale contract which was made last December. The Little Rock & Argenta is an industrial line connecting the Chicago, Rock Island & Pacific and the Missouri Pacific at Little Rock, Ark. The sale price was \$50,000.

**NASHVILLE, CHATTANOOGA & ST. LOUIS.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Standard return (January and February, 1920, full year 1919).....	\$490,236	\$3,182,089
Operating revenues (10 months):		
Freight.....	\$14,306,223	.....
Passenger.....	4,225,018	.....
Total standard return and operating revenue.....	\$20,908,566	\$3,182,089
Operating expenses (10 months):		
Maintenance of way and structures.....	\$4,399,363	.....
Maintenance of equipment.....	5,171,302	.....

Traffic	582,355	
Transportation	9,778,057	
General	614,940	62,069
Total operating expenses	\$20,611,171	\$62,099
Railway tax accruals	\$27,500	118,869
Total operating income	Def. \$231,274	\$3,001,121
Total non-operating income	\$2,912,141	180,431
Gross income	2,680,868	3,181,551
Total deductions from gross income	\$1,817,354	\$1,391,046
Net income	\$863,513	\$1,790,505

\*The standard return finally fixed by the Interstate Commerce Commission was \$3,163,576, instead of \$3,182,089 per annum. The amount shown for 1920, therefore, includes return at the correct rate for January and February (\$527,563) less \$37,927 to adjust the amount of the standard return as originally certified and used in reports for 1918 and 1919, to the correct basis.

Miscellaneous income, amounting to \$2,009,875, includes:	
Guaranty under Transportation Act, 1920	\$1,581,788
Deficit net railway operating income, guaranty period, to close of August accounts	334,600
Interest at 6 per cent during guaranty period on improvements added January 1, 1918, to March 1, 1920	93,487

The annual report of the Nashville, Chattanooga & St. Louis will be reviewed editorially in an early issue.

**NASHVILLE, CHATTANOOGA & ST. LOUIS.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$1,000,000 of its consolidated mortgage 5 per cent gold bonds and to sell or repledge all or part thereof as collateral security for short term notes.

**READING.—Company Files Modifications of Segregation Plan.**—Modifications to the Reading dissolution plan were filed in the United States District Court at Philadelphia on May 12, by William Clarke Mason, counsel for the Reading interests. The most important modification is the proposed sale by the Reading company of all its stock in the Reading Coal and Iron Company for \$5,600,000, subject to the lien of the general mortgage. This stock will be sold to a corporation to be formed, which will issue 1,400,000 shares of stock without par value, and this can be sold to stockholders of the Reading company, preferred and common, share and share alike, for \$2 a share. This is conceded to be an effort to eliminate the controversy that has been waged between these classes of stockholders, many of whom have filed petitions to intervene in the present suit.

The modifications suggested for the court's approval are as follows:

The Reading Company will agree with the coal company that, at or before the maturity of the general mortgage bonds, it will obtain the release of the coal company's property from the lien of the general mortgage and the discharge of the coal company from liability on the general mortgage bonds.

The Reading Company will, subject to the lien of the general mortgage, sell, assign and transfer all its rights, title and interest in and to the stock of the coal company, including the present right to vote and receive dividends thereon, to a new corporation to be formed with appropriate powers, and will agree to save the new corporation and said stock harmless from the lien of the general mortgage, and will agree to obtain, at or before the maturity of the general mortgage, the release of the stock of the coal company from the lien of the general mortgage, and the assignment, transfer and delivery of said stock to the new corporation—all in consideration of the payment by the new corporation to the Reading Company of the sum of \$5,600,000 and its agreement to issue its shares to the stockholders of the Reading Company as hereinafter provided.

The new corporation will issue 1,400,000 shares of stock without par value. Such no par value stock will be sold by the new corporation to the stockholders of the Reading Company preferred and common, share and share alike, for \$5,600,000, or \$2 for each share of Reading stock. Provision will be made for the disposition by the Reading Company of any rights to subscribe which may not be availed of by the Reading stockholders within such period as may be fixed by the court, to the end that the new corporation shall receive the full purchase price of \$5,600,000.

There will be embodied in the final decree a permanent injunction against the new corporation exercising its voting power on the stock of the coal company in such a way as to bring about any new revelations between the coal company and the Reading Company of the character complained of in the present suit.

The final decree may provide that if, by reason of default on the general mortgage bonds the trustee, the Central Union Trust Company, shall exercise the right to vote the stock of Reading Coal Company, it shall so exercise that right as not to bring about a unity of management between said coal company and Reading Company.

**SOUTHERN PACIFIC.—Asks Authority to Guarantee Bonds.**—This company has applied to the Interstate Commerce Commission for authority to guarantee the principal and interest of \$364,000 of first mortgage 5 per cent bonds of the Houston East & West Texas.

**SOUTHERN RAILWAY.—Dividend Action Deferred.**—The directors, at their monthly meeting on May 12, failed to take action on the regular semi-annual dividend of 2½ per cent on the preferred

stock usually paid June 30. This does not mean that the dividend will be omitted; the board may declare a dividend in June.

**TOLEDO, ST. LOUIS & WESTERN.—Authorized to Issue and Pledge Receivers' Certificates.**—The receiver has been authorized by the Interstate Commerce Commission to issue \$692,000 of receivers' certificates and to pledge them as security for a loan from the United States.

**VALDOSTA, MOULTRIE & WESTERN.—Right to Dismantle.**—Confirmation of the sale of this road to C. L. Jones and his associates for \$87,000 with the right to dismantle the line, was given in an order by the United States Court, Savannah, Ga.

The order stipulates that the process of dismantlement shall not be started before July 15. In the meantime, the control and operation of the railroad shall remain in the hands of Robert P. Murray, receiver, who is authorized to make arrangements for freight movements on the line.

**WHEELING & LAKE ERIE.—Annual Report.**—This company has issued a report covering the years ended December 31, 1918, and December 31, 1919. The report does not give figures for 1920. The corporate income account for 1918 and 1919 based upon "standard return" is as follows:

	1919	1918
Income from lease of road	\$1,592,037	\$1,592,037
Gross income	1,687,337	1,725,508
Interest on funded debt	979,224	1,023,416
Total deductions from gross income	1,380,691	1,425,212
Net income	\$306,636	\$300,295

### Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts: Missouri & Illinois Bridge & Belt, \$13,559; New York Connecting, \$1,395,000; Lake Superior & Ishpeming, \$140,000 Munising, Marquette & Southeastern, \$90,000; Kansas City, Mexico & Orient, \$250,000; Cambria & Indiana, \$70,000; Great Northern, \$6,500,000; Texas Midland, \$100,000; Duluth, Missabe & Northern, \$8,525,000; Duluth & Iron Range, \$4,866,000; Gulf, Texas & Western, \$40,000; Northern Pacific, \$9,000,000; Des Moines Union, \$330,000; Bessemer & Lake Erie, \$3,050,000; Western Pacific, \$4,200,000; Ulster & Delaware, \$390,000; Jay Street Terminal, \$290,000; Clinton & Oklahoma Western, \$75,000. The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the Administration during the 26 months of federal control.

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued certificates to railroads for partial payments on account of the six months' guaranty as follows:

Alabama Central	\$3,000
Baltimore & Ohio Chicago Terminal	735,000
Chicago, St. Paul, Minneapolis & Omaha	227,000
Chicago, West Pullman & Southern	22,000
Cincinnati, Lebanon & Northern	150,000
Copper Range	150,000
Grand Rapids & Indiana	780,000
Gulf & Ship Island	20,000
Illinois Northern	35,000
Lehigh & Hudson	200,000
Wisconsin & Northern	27,500

### Dividends Declared

Alabama Great Southern.—Common, 3 per cent, semi-annually, payable June 29 to holders of record May 3; preferred, 3 per cent, semi-annually, payable August 18 to holders of record July 14.

Chestnut Hill Railroad.—75 cents, quarterly, payable June 4 to holders of record May 21 to June 3.

Cincinnati, New Orleans & Texas Pacific.—Common, 3 per cent, semi-annually, extra 2½ per cent; both payable June 27 to stock of record June 6. Preferred, 1½ per cent, quarterly, payable June 1 to holders of record May 21.

Cripple Creek Central.—Preferred, 1 per cent, quarterly, payable June 1 to holders of record May 14.

Erie & Pittsburgh.—87½ cents, quarterly, payable June 10 to holders of record May 13.

North Pennsylvania.—\$1.00, quarterly, payable May 25 to holders of record May 12 to May 19.

Philadelphia, Germantown & Norrisstown.—\$1.50, quarterly, payable June 4 to holders of record May 21 to June 3.

Southern Pacific.—Common, 1½ per cent, quarterly, payable July 1 to holders of record May 31.

Union Pacific.—Common, 2½ per cent, quarterly, payable July 1 to holders of record June 1.

## Railway Officers

### Executive

**George R. Loyall**, assistant vice-president of the Southern, has been elected to succeed J. H. Young as president of the Norfolk Southern, effective when Mr. Young assumes his new duties as president of the Denver & Rio Grande.

**H. S. Ray**, whose promotion to assistant to the president of the Chicago, Rock Island & Pacific, with headquarters at Chicago, was announced in the *Railway Age* of May 13 (page

H. S. Ray

1149), was born at Griswold, Conn., on July 23, 1869, and entered railroad service in October, 1890, as a clerk in the office of the Rock Island at Philadelphia, Pa. Later in the same year he was made city passenger agent at Philadelphia, and served in this position until 1892, when he was promoted to traveling passenger agent with headquarters at New York. In 1893, he was made assistant city passenger and ticket agent at des Moines, Iowa, where he served until 1895, when he was promoted to district passenger agent, with headquarters at Wichita, Kan. In 1897 he was transferred to Pittsburgh, Pa., and two years later was again transferred to Philadelphia. In 1902, Mr. Ray was promoted to general agent, passenger department, with headquarters at Denver, Colo., and two years later was made general eastern passenger agent, with headquarters at New York. He was promoted to assistant general passenger agent, with headquarters at St. Louis, Mo., in 1906. In 1908 he was transferred to Chicago, and in 1912 he was transferred to Des Moines, Iowa. In February, 1917, he was commissioned captain in the quartermaster reserve corps, and was called into service in April of that year. After serving in the railway transportation division of the quartermaster general's office in Washington, D. C., Captain Ray was ordered overseas, where he was assigned to the general staff of the American Expeditionary Forces, being engaged in working out problems in connection with the evacuation of troops and property from Europe. He was promoted to Major in April, 1918, and to lieutenant-colonel in August of that year. Upon his return from military service, he resumed his position as assistant general passenger agent of the Rock Island with headquarters at Des Moines, and was serving in that capacity at the time of his recent promotion.

### Financial, Legal and Accounting

**William F. Peter**, assistant general counsel of the Chicago, Rock Island & Pacific, with headquarters at Chicago, has been given additional jurisdiction over all matters pertaining to real estate and taxation, effective May 2, succeeding John W. Mulligan, deceased. The firm of **O'Brien, Stone, Horn & Stringer**, St. Paul, Minn., has been appointed attorney of the Rock Island in Minnesota and South Dakota.

**W. A. Northcutt**, general attorney of the Louisville & Nashville, with headquarters at Louisville, Ky., has been promoted to general solicitor, with the same headquarters. **Ernest Woodward** has been appointed general attorney, succeeding Mr. Northcutt. **J. H. McChord**, attorney, with

headquarters at Louisville, has been promoted to counsel. **Sidney Smith** has been appointed valuation counsel. The promotions and appointments were effective May 1.

### Operating

**R. King**, division superintendent of the Canadian National, Western Lines, with headquarters at Saskatoon, Sask., has been transferred to Calgary, Alta., effective May 1, succeeding T. J. Brown, who has been assigned to other duties.

**M. Sawyer**, assistant general superintendent of the Chicago, Milwaukee & St. Paul, with headquarters at Minneapolis, Minn., has been appointed superintendent of the Olympic division, with headquarters at Port Angeles, Wash., and the position of assistant general superintendent has been abolished. Mr. Sawyer succeeds **A. O. Veitch**, who has been appointed trainmaster with headquarters at St. Maries, Idaho, succeeding **W. E. Cummins**, who has been assigned to other duties. The appointments and changes were effective May 1.

**C. E. Lanhan**, who has been appointed superintendent of car service of the Gulf, Mobile & Northern and the Meridian & Memphis, with headquarters at Mobile, Ala., was born at Augusta, Ga., on June 17, 1888. He entered railway service in October, 1904, as a clerk on the Mobile, Jackson & Kansas City, now part of the Gulf, Mobile & Northern. In 1906, he entered the service of the Mobile & Ohio, and served successively with that road as clerk, chief per diem clerk, assistant chief clerk to the general superintendent transportation and chief clerk to the car accountant. He returned to the Gulf, Mobile & Northern, in August, 1920, and was serving as assistant chief clerk to the general manager at the time of his recent promotion.

The East and West Iowa divisions of the Chicago & North Western have been consolidated, effective May 8, and are to be known as the Iowa division. Coincident with this consolidation, appointments and changes have been made as follows: **F. F. McCauley**, superintendent of the West Iowa division, with headquarters at Boone, Iowa, has been appointed superintendent of the Iowa division, with the same headquarters. **F. O'Brien**, superintendent of the East Iowa division, with headquarters at Belle Plaine, Iowa, has been appointed superintendent of the Northern Iowa division, with headquarters at Eagle Grove, Iowa. Mr. O'Brien succeeds **S. A. Morrison**, who has been appointed assistant superintendent of the Wisconsin division, with headquarters at Milwaukee, Wis. Mr. Morrison succeeds **P. G. Campbell**, who has been transferred to the Galena division, with headquarters at Chicago, succeeding **J. J. Burns**, who has been transferred to the Dakota division, with headquarters at Huron, S. D. Mr. Burns succeeds **C. E. Sainsbury**, who has been appointed trainmaster of the Dakota division, with the same headquarters. Mr. Sainsbury succeeds **P. F. Braden**, who has been appointed chief dispatcher of the Dakota division, with the same headquarters. Mr. Braden succeeds **L. B. Kendall**, who has been assigned to other duties. **E. L. Henry** has been appointed trainmaster of the Sioux City division, with headquarters at Wall Lake, Iowa, succeeding **H. J. Ewing**, who has been transferred to the Southern Illinois division, with headquarters at South Pekin, Ill. Mr. Ewing succeeds **C. L. Strom**, who has been appointed chief dispatcher of the Southern Illinois division, with the same headquarters, succeeding **I. B. Sherman**, who has been assigned to other duties.

### Traffic

**D. P. Skinner** has been appointed western dairy agent of the Merchants Dispatch Dairy Line, with headquarters at Chicago, succeeding **George B. Horr**, deceased.

**F. W. Sedgwick** has been appointed general agent of the Southern Pacific, with headquarters at Denver, Colo., succeeding **L. B. Banks**, who has been transferred to Kansas City, Mo.

**C. C. Gardner**, general agent, passenger department, of the Chicago Rock Island & Pacific, with headquarters at Detroit, Mich., has been transferred to Des Moines, Iowa, succeeding

H. S. Ray, who has been promoted to assistant to the president. P. W. Johnston, district passenger agent, with headquarters at Wichita, Kan., has been appointed general agent, passenger department, with headquarters at Detroit, Mich., succeeding Mr. Gardner. O. Collins, traveling passenger agent, with headquarters at Oklahoma City, Okla., has been promoted to district passenger agent, succeeding Mr. Johnston. These appointments and promotions were effective May 1.

### Engineering, Maintenance of Way and Signaling

D. M. Lamdin, division engineer of the Atlantic Coast Line with headquarters at Waycross, Ga., has been appointed engineer of construction, effective May 11, succeeding C. M. James, resigned.

W. J. Foster, regional engineer of the Erie with headquarters at Hornell, N. Y., has been appointed division engineer with headquarters at Buffalo. The office of regional engineer at Hornell has been abolished. F. S. Wheeler, division engineer with headquarters at Buffalo, has been transferred to Salamanca, N. Y., succeeding C. A. Daley, who has been assigned to other duties with the same headquarters.

W. S. Hanley, whose appointment as chief engineer of the St. Louis Southwestern, with headquarters at Tyler, Tex., was announced in the *Railway Age* of May 13 (page 1150), was born at Terre Haute, Ind., on September 9, 1877. He was educated at Rose Polytechnic Institute, and entered railroad service in 1902, as an assistant in the engineering corps, of the Pennsylvania, being assigned to the Logansport division. In 1905, he was appointed assistant division engineer of the Chicago & Eastern Illinois, with headquarters at Danville, Ill., and was later promoted to principal assistant engineer, with headquarters at Chicago. In 1912, he was appointed chief engineer of the New Orleans Great Northern, and was serving in that position, with headquarters at Bogalusa, La., at the time of his recent appointment.
