C. R. Mee, whose appointment as chief engineer of the Louisiana Railway & Navigation, with headquarters at Shreveport, La., was announced in the *Railway Age* of April 22 (page 1012), was born at Post Oak Springs, Tenn., on August 1, 1880, and entered railroad service in 1898 as an axe-man on the Tennessee Central. In 1900 he entered the service of the Lake Erie, Alliance & Western, as assistant to the resident engineer, and in 1901 he went with the Pittsburgh, McKeesport & Youghiogheny as a transitman on location. Later in the same year he was appointed assistant to the division engineer on the Wabash, and served in that position until February, 1903, when he was appointed locating engineer of the Louisiana Railway & Navigation Company. He was promoted to general roadmaster in 1908, and served in that capacity until December, 1918, during part of which time he was assigned also the duties of chief engineer. On the latter date he left railroad service to take up private engineering practice, and was engaged in this work until he returned to the service of the road, as above noted.

### Purchasing and Stores

J. E. Mahaney, general storekeeper of the Seaboard Air Line, has been appointed superintendent of stores of the Chesapeake & Ohio with headquarters at Huntington, W. Va., effective May 1.

R. M. Nelson, purchasing agent of the Chesapeake & Ohio, has been appointed assistant to the director of purchases and stores with headquarters at Richmond, Va., effective April 10. The position of purchasing agent has been abolished.

W. H. King, Jr., whose appointment as general purchasing agent of the Seaboard Air Line was announced in the *Railway Age* of April 29 (page 1056), was born on April 20, 1883, at Portsmouth, Va. His education was continued through high school and preparatory school. In 1900 he entered railway service with the Seaboard Air Line as a clerk in the accounting department. Two years later he became a clerk in one

of the company's agencies and the following year became a clerk and statistician in the accounting department. In 1910 he was appointed assistant statistician in the operating department and, in 1912, chief statistician and fuel agent. He was promoted to chief statistician in 1913 and four years later became the assistant to the president and federal manager and also general manager of subsidiary lines. He was appointed assistant to the vice-president, and vice-president of the Baltimore Steam Packet Company in 1920, which position he held at the time of his recent appointment.

### Obituary

L. H. Korty, former superintendent of telegraph of the Union Pacific, died at his home in Omaha, Neb., on May 15. Mr. Korty was born at Hanover, Germany, on October 22, 1846, and entered railway service in 1862, as an operator on the Chicago & North Western at Minnesota Junction, Wis. After serving from 1863 to 1866, in the military telegraph service of the United States, and from 1867 to 1869 as an operator with the Western Union Telegraph Company, Mr. Korty entered the service of the Union Pacific. He was appointed superintendent of telegraph in 1887, and retired from active railroad service in 1908.

Robert C. Perkins, former general freight agent of the Illinois Central, died at Covington, Ky., on Friday, May 6. Mr. Perkins was born on March 20, 1857, near Brookhaven, Miss., and entered railway service in 1880, as a waybill clerk on the St. Louis, Alton & Terre Haute at St. Louis, Mo. Two years later he was made claim agent of that road and served in that capacity until 1884, when he was appointed superintendent of the St. Louis Weighing Association. In 1886, he was appointed traveling freight agent of the Mobile & Ohio and a year later was promoted to general agent, with headquarters at New Orleans, La. He entered the service of the Illinois Central on May 1, 1901, as division freight agent, with headquarters at New Orleans, and was promoted to general freight agent with the same headquarters, on January 1, 1905. Mr. Perkins retired from active railroad service on December 31, 1919, on account of ill-health.

William Henry Davisson, assistant district engineer, Bureau of Valuation, Interstate Commerce Commission, with office at San Francisco, died at his home in Oakland, Cal., on May 3, at the age of 58. He was born in Kalamazoo, Mich., and was educated at Griswold College, Davenport, Iowa. He began his railroad service on the Chicago, Rock Island & Pacific, in 1884, as chairman. From 1896 to 1900 he was general roadmaster and in 1906 he was appointed assistant chief engineer. A year later he went to the Chicago, Milwaukee & St. Paul, where he was in charge of construction on the Puget Sound extension, in Montana. In 1910 he was principal engineer on the construction of that part of the present Union Pacific System which lies between Ayer Junction, Wash., and Spokane. He remained here until the work was completed, and in January, 1914, entered the employ of the Interstate Commerce Commission, in charge of roadway inventories in the Pacific district.

Franklin K. Lane, LL. D., Secretary of the Interior in the administration of President Wilson and for eight years a member of the Interstate Commerce Commission, died at Rochester, Minn., on May 18, at the age of 56. He had gone to Rochester for a surgical operation, from which he rallied; but he died later of angina pectoris. Mr. Lane was born near Charlotetown, Prince Edward's Island; but passed his early life in California, engaged in journalism and the practice of law. He was an Interstate Commerce Commissioner from 1905 to 1913, when he resigned to enter the cabinet. In 1918 he was chairman of the railroad wage commission. In all of his public offices he was a genuine statesman, while he was a man with broad, human sympathies and a facile power to express them. He lifted his cabinet office from one of relatively minor importance to one of the first rank. During the war his patriotic services were notable, especially in connection with the Liberty Loans; and after the war he was energetic and original in works of relief and restoration.

The present is a buyer's market. The seller, in an effort to obtain sufficient business to keep his organization together and pay fixed charges, has established prices based on a minimum margin over the out-of-pocket cost. This is evidenced daily. Prices noted in current awards for structural steel fabricating contracts indicate the minimum spread over the cost of plain materials so characteristic of the slack season. One recent award for steel truss spans in the middle west was made at less than four cents, f. o. b. shop, while a contract for plate girders for an eastern road was taken at a little more than four cents, erected. The present condition of the lumber market is well known. The tie producers are also in a most receptive mood. Taking this situation as a cue a few roads are anticipating the restoration of earnings by entering the market for these products when everything is in their favor. There is, however, that weakness in human nature which leads one to expect the impossible, namely, a period of large earnings and low prices, so that many desire to see earnings definitely assured before making purchases with the idea that they will be able to get into the market just ahead of the other fellow. Unfortunately, this plan can never be a complete success. Somebody always gets left. Don't be the last man in.

Too Late**

permanent markets for coal abroad, more particularly in South America, in the Mediterranean countries, etc. The result is going to be an increased demand for transportation on those coal roads which reach tide-water. In the case of the Virginian, which is referred to because so much attention is given that road in the present issue, the effect upon the growth of traffic has been particularly striking.

There has been a lot of loose talk about the danger to American producers of foreign competition in the domestic market due to high freight rates in this country and an instance of rates from inland American points to the Atlantic seaboard higher than the ocean charges for similar commodities from Argentina has been cited in high government circles. As Daniel Willard pointed out to the Senate investigating committee last week, these rates on imported commodities do not take into consideration the inland rail haul in the country of origin. It is interesting to note, therefore, in this connection, that the shippers of Argentina are complaining about the high freight rates on the railways of that country which, they say, are putting them at a disadvantage with American competition in European markets. The railways all over the world have found it necessary to increase their rates for much the same reason that rate increases have been made necessary here and the charges for rail transportation in America are still very low when compared to those of most countries. The success of American producers and of American exporters hinges on the exchange rate, which in turn resolves itself into a problem of credit extension—the present freight rates offer no serious barriers to successful competition by Americans in any market.

The question as to the relative rights of the common and preferred shareholders of the Reading Company as to the stock of the new corporation which is to take over the equity in the coal properties seems to be about as difficult of solution as any question that has arisen for some time. It seemed by way of solution on Saturday, when the Federal district court announced, after considerable discussion and consideration, its decision that the preferred and common shareholders should be given equal rights. On Monday morning, however, the matter was again brought to the fore when it was stated that the common shareholders would appeal to the Supreme Court with a view to continuing their fight for exclusive participation. However, the district court has apparently settled the other leading question which it had before it, namely, that relating to the disposition of the Central of New Jersey stock. The court decided that this stock should be put in the hands of trustees and held until a more suitable time for its disposition had arrived. The government attorneys desired, it will be remembered, the setting of a definite time limit on the sale of the Jersey Central stock. In view of the provisions of the Transportation Act relating to railway consolidation,

In analyzing the operations of a railroad such as the Virginian or any other carrier which moves large tonnages of bituminous coal to tidewater, one is particularly struck by the great increases which have been made in the amount of coal for export. This brings out the idea that those who are interested in these roads should watch with particular interest the developments in the British coal mining situation which must be so disconcerting to our British friends. Prior to the war the larger part of those countries of the world which did not have coal of their own secured it from the United Kingdom, the British being especially fitted to supply it because of their well-organized export business and their predominance in shipping. When the war came on, the British were unable to supply their usual markets because the efforts of their merchant fleet had to be devoted to the needs of warfare and were further handicapped by German submarine activity. Since the termination of the war, another and equally serious complication has arisen in the continued labor difficulties which have cut down the supply of coal through strikes characterized by animosity and lack of patriotism such as the world has seldom seen. The result has been that British coal is now no longer available for the world in the same quantity as before the war. Those countries needing coal have had to come to America for their supply and our coal export business out of Hampton Roads, Baltimore, etc., has expanded to proportions hitherto not thought of. There is no one who will say that our export coal business is what it should be. As yet we have not the organization, nor have we gotten to the point where we have granted the desired credits. However, it seems highly probable that this export business in coal is here to stay and that we may look forward to having good and

this would have been a real hardship on the Reading Company, as there could have been no sale except at a great sacrifice until the disposition of the Central of New Jersey in the consolidation plan had been finally decided upon. The court in this case has made the only proper decision as to the disposition of the Jersey Central stock and, fortunately, refused to listen to the argument of the government attorneys, who in this matter showed themselves to be without adequate comprehension of what Congress intended when it passed the Transportation Act.

The efficiency of mechanical devices in railway offices is no longer a matter of doubt, provided the devices are carefully selected and properly utilized.

### Selecting Office Equipment

The selection of proper equipment for any particular office, however, the care and maintenance of the devices and intelligent supervision of their use presents a problem as important and perplexing as ever. Frequently expensive mechanical equipment has been purchased without sufficient preliminary investigation to determine the kind of machines best suited to the work, the number of them required and whether the savings to be expected would justify the necessary outlay. Often, too, equipment carefully designed to effect great savings has failed to come up to expectations because of improper use and maintenance. On the Pennsylvania a method has been adopted whereby all purchases of mechanical office equipment must be passed upon by a committee of officers representing several departments. This committee has made extensive studies of the various devices on the market and, after a careful investigation of the office ordering the equipment, is able to say authoritatively whether or not the proposed purchase is justified. The work of this committee and of the office which keeps the records and oversees the repairs of all mechanical devices is described in an article by D. T. Jones, elsewhere in this issue. In view of the great savings often made possible by the careful selection and proper utilization of mechanical devices in railway offices and the possibilities of heavy losses when equipment is purchased without sufficient study, the success of the Pennsylvania in meeting the difficulties of the situation suggests the advisability of a study of this road's methods by those who are confronted with the same problem.

The Thirtieth Annual Session of the Freight Claim Division of the American Railway Association, which is noted elsewhere in this issue, marked the launching of an organized effort to cut in half the constant drain on revenues caused by freight claims. For some time past it has been apparent that the

### "It Can Be Done"

conditions which caused the outlay for loss and damage of freight to leap from \$35,000,000 in 1917 to \$51,000,000 in 1918 and \$106,000,000 in 1919, and then to increase to \$109,000,000 in 1920, demanded correction. It remained for the Freight Claim Division to recognize the seriousness of this situation officially, and to break precedent by setting aside a day at its annual session in which to discuss, analyze, and more important still organize for a claim prevention campaign. The movement is one which should command the interest and active support of every officer and employee on the railroads. Freight claims represent an absolute waste which can be reduced with no additional outlay for new equipment. It was established at the recent session that the success of a prevention campaign depends in considerable measure upon two factors. First, there is the necessity for closer co-operation between the carriers themselves. For instance,

if the clear record which is necessary to the proper settlement of a claim is to be made, there must be more active co-operation between the carrier on whose lines the freight originates, and the road finally called upon to settle the claim. Second, much can be done to eliminate the carelessness and neglect which result in a considerable part of the loss and damage, if efforts will be made by each individual carrier to interest its employees in a prevention campaign. The results to be derived from frequent meetings of division officers and employees for discussion of the subject, to say nothing of the interest which can be aroused by a series of claim prevention bulletins posted in conspicuous places, are so decidedly worthwhile, that they can hardly be overlooked. The Freight Claim Division has chosen as its slogan "Cut Claims In Half—It Can Be Done."

The development of the Port of New York, both as to its present status and its possibilities have already been commented upon in these columns. One point outstanding so far in this work

### Tunnel to Staten Island

has been the understanding shown by the legislatures of New York and New Jersey of the need for better and more comprehensive rail and water terminal facilities at this port. The passing of a recent bill, mandatory in its character, concerning the construction of a tunnel across the lower bay at New York for freight and passengers between Brooklyn and Staten Island now served by ferries and car floats, is still more evidence of the desire, at least, of the New York legislature to provide increased facilities. The bill as passed is purely a mandatory one and requires that the City of New York begin construction of the tunnel mentioned above within two years, thus bringing the project off the back of the stove where it has been cooling since the administration of Mayor Mitchel. It is estimated that the work will cost at least \$50,000,000 and will include facilities capable of extension or expansion to fit growing needs. Since it is desired to furnish arrangements whereby freight, in addition to passengers, may be moved from Brooklyn piers to connections with the Baltimore & Ohio on Staten Island and the Long Island and New York Connecting on Long Island, the improvement will practically unite the New England roads with those now terminating along the New Jersey waterfront. There is also present the possibility that the completion of the tunnel may bring about a more comprehensive development in this section, leading ultimately to a much greater unification in the handling of freight between the transcontinental and New England lines. In compliance with the law, preliminary work has already been started. Routes are being discussed, surveys being made and soundings taken. Several different plans will be submitted, after the surveys have been completed, probably at public hearings, and the most feasible one chosen.

The Moshassuck Valley Railroad, a short line (two miles, with two locomotives) is a time-honored institution of the

### A Second Lesson from Rhode Island

smallest state in the Union, but its experience affords a big lesson; big, that is, in its simplicity. It is a lesson applicable to the most extensive and important railroads of the country; and yet it is entirely free from the bewildering array of figures which the railroad executives have to use in presenting their case at Washington, and should make a convincing appeal to those citizens, congressmen and shippers who declare that they cannot see why the railroads are so sorely in need of money. A dewdrop will mirror the sun, and a two-mile railroad can illuminate financial problems measured by

billions. The Moshassuck Valley, in 1920, earned \$68,026 and its expenses were \$110,125. The net loss, \$42,100, is chargeable mainly to the unprofitable passenger traffic; and on May 16 the Public Utilities Commission of the state authorized the entire suspension of passenger trains after the end of this month. There is a street railway near enough so that the public will not suffer much inconvenience. This decision to economize might perhaps have been taken long ago, but for feelings of sentiment; the line has been running for 44 years. Its "train" is a familiar sight, at Woodlawn, to passengers who travel frequently on day trains between Providence and Boston. The report of the hearing before the Utilities Commission indicates that it took eight persons to accomplish this simple act: the three commissioners; the controller, the clerk and the counsel of the corporation; a stenographer and a newspaper reporter. There were no remonstrants, and no spectators except the reporter.

After long months of delay, the government, represented by Sir Eric Geddes, Minister of Transport, has introduced in

### British Railway Legislation

the British House of Commons a bill covering the return of the railways to their owners, which is scheduled for August. This bill, which is described in greater detail elsewhere in this issue,

follows in some respects our own Transportation Act, but it differs from it in many essentials. The most striking feature of the bill is the provision for consolidation of the railways into six groups, and this section, unlike our Transportation Act, is mandatory. Furthermore, these groupings are on a regional basis and do not form "independent competitive systems." The companies designated in each group are to amalgamate by January 1, 1923, unless by consent of Parliament some variations in the present grouping scheme are allowed. An "Amalgamation Tribunal" is to be constituted to adjudicate disputes arising out of the amalgamations. The Ministry of Transport and the Railway and Canal Commission are given authority to require the companies to furnish reasonable services and facilities not prejudicial to their financial well being. An elaborate commission, known as the "Railway Rates Tribunal," will be given authority over charges, which are to be fixed to allow a certain fair return to be earned by the carriers. Labor disputes are to be referred first to joint conferences in each group. Failing settlement there, a dispute may be carried to a "Central Wages Board" in which the railways and employees only are represented and, finally, to a "National Wages Board," in which the public also is to appear. The railway unions will not be represented on the boards of directors, as was expected in some quarters, but shippers are to be represented by a minority on each board. British labor is a strong factor politically in spite of the recent disagreement in the ranks, and the government's proposal will doubtless elicit strong protest from them; while the railways themselves will probably not be entirely satisfied with all the provisions of the act. Consequently, it is expected that the fate of the government's proposal will be watched with considerable interest.

The study of the operations of a railroad of such interesting characteristics as the Virginian Railway which appears on

### The Virginian Railway

another page of this issue should prove of particular interest at this time for a number of reasons. The Virginian uses the heaviest equipment and the most powerful locomotives in use on

any railroad. It was the first road to use the 120-ton coal cars and its 2-10-10-2 Mallet locomotives of 147,200 lb. tractive effort are as yet without an equal. In 1920, the

Virginian led the railroads of the country in heavy train loading. Its net tons per train averaged for the year no less than 1,800, the second carrier in the list being the Bessemer & Lake Erie, which managed to secure an average of 1,764 net tons per train. This high average on the Virginian is being brought about by the operation of trains in regular service aggregating between 8,000 and 9,000 gross tons—trains of 90 to 100 cars being hauled over some districts with a single locomotive. Further than that, in an effort to show what the real possibilities in the situation might be, on Tuesday last a test train was run consisting of 100 of the new 120-ton cars and handled by one of the huge 2-10-10-2 Mallet locomotives, which train had an aggregate gross tonnage of no less than 16,000 gross tons. The full details of how the road secures its heavy train loading and more particularly how it managed to run a train of 16,000 gross tons will be found in the article. Further than all these things, the Virginian was one of those few roads which earned in 1920 well over its standard return and guaranty; in fact, in 1920 its net railway operating income was nearly double that earned in 1919. The Virginian is a bituminous coal road almost exclusively, 92 per cent of its tonnage in 1920 being of that commodity. It was built for handling this coal as cheaply as possible, its engineering standards being such as to permit the heaviest possible train loading. The manner in which the road has realized upon the constantly expanding coal business which moves to its tidewater terminal at Hampton Roads is one of the most interesting features of American railroad operation.

## The Railways and the Commission Merchants

IF THE RAILWAYS individually and collectively would make as much of a row when they are attacked as do the commission merchants who handle fruits and vegetables, those who make a business of attacking the railways would soon be so deeply buried under counter propaganda they would perish before a rescue party could dig them out. Whatever else the *Railway Age* may think of the wholesale produce merchants of the country, we bow in reverence before their propaganda department. It is one of the most active, energetic and ubiquitous organizations of its kind in existence.

In its issue for April 22, page 967, the *Railway Age* published an editorial entitled "Piratical Commission Merchants' Attacks on Freight Rates." We charged the commission merchants with carrying on a dishonest and a selfish propaganda to make the producers of fruits and vegetables believe the low prices the producers are receiving are due to the advances in freight rates, and thus to cause agitation by the producers to drive down the rates. We showed that prices being paid to producers in Texas for cabbage, white onions and spinach, plus all the transportation charges to Chicago, were only 25 per cent, 36 per cent and 10 per cent, respectively, of the prices for which these things were selling at retail in Chicago. In other words, some other person or persons besides the producers and the railroads were getting 75 per cent of the retail price of cabbage, 64 per cent of the retail price of white onions, and 90 per cent of the retail price of spinach. We charged the propaganda of the produce merchants was dishonest because the facts showed it was a gross misrepresentation to allege that the low prices the growers were receiving were due to the advances in rates. We charged it was selfish because it was being carried on by the commission merchants to increase their own profits at the expense of the railroads. We even went so far as to imply that the commission merchants bore the reputation of having been "remorseless profiteers."

Our editorial has been very widely quoted. In consequence

the *Railway Age* has been deluged with personal calls, telegrams and letters from individual commission merchants and organizations of commission merchants throughout the country who have loudly complained that we have misrepresented their practices and profits and have demanded that we retract the statements made concerning them. No retraction having been made, one of the organs of their trade, the *Packer*, published a garbled account of a conference between the commission merchants and the editor of this paper at Kansas City in which it falsely stated that the editor of the *Railway Age* admitted that the editorial in question, in so far as it concerned the wholesaler, was "utterly wrong."

Space will not permit us to publish all the communications we have received. In order, however, that the commission merchants may have opportunity to present their case to our readers we publish elsewhere a letter entitled "A Protest from the Commission Merchants," and signed by officers of the National League of Commission Merchants of the United States, the Western Fruit Jobbers' Association of America and the International Shippers' Association.

In three respects all the communications we have received are alike: (1) They all deny that the commission merchants are making excessive profits, and denounce the *Railway Age* for its alleged unjust attack upon them; (2) none of them denies that they and their organizations have been engaged in widespread propaganda to drive down freight rates; (3) none of them has attempted to disprove the correctness of the figures we gave regarding the prices paid to the producers, the amounts received by the railroads for transportation and refrigeration of the commodities in question, or the retail prices charged for them. We are willing to let the commission merchant and retailer fight out between them the question of who got the 64 to 90 per cent of the total retail prices of cabbage, onions and spinach which the railway and the grower did not get. Since we are giving the commission merchants space elsewhere to denounce us and tell how little money they are making, we shall confine our comments to the real subject of the editorial in our issue of April 22 to which they take exceptions.

The real subject of that editorial was the propaganda being carried on by the commission merchants against the existing freight rates. They protest violently against what they call "unjust attacks" upon their business. But what have they been doing with respect to the railroad industry? They have been persistently and completely misrepresenting the effects of the advance in rates upon fruits and vegetables. The last advance in the freight rate from Texas to Chicago on cabbage, which recently sold at retail for \$140 a ton or 7 cents a pound in Chicago, was \$5 a ton or 2½ mills a pound. The advance in the rate was less than 4 per cent of the retail price at which the cabbage sold. On spinach, which sold in Chicago at retail for \$300 a ton, the last increase in the rate from Texas was \$6 a ton. This was 3 mills a pound, or 2 per cent of the retail price. Is it not manifestly absurd to contend that an increase in freight rates amounting to 2 to 3 per cent of the retail prices of vegetables which sold at retail for \$140 to \$300 a ton is responsible for the fact that the grower of the vegetables received only \$5 or \$7 a ton for producing them? The retail price the consumer paid was large enough to have covered a reasonable profit for the retailer, a reasonable profit for the wholesale merchant, the total amount received by the railroad for transportation and, in addition, three or four times as high as a price the grower was paid. That the grower did not receive a reasonable price obviously was not because the charges made by the railroad was excessive, but because somebody else took a toll that was excessive. This somebody else was either the commission merchant or the retailer. If, as the commission merchants' communications to us necessarily imply, it was the retailer, why do the commission merchants carry on their

propaganda against the railways instead of against the retailer?

The commission merchants complain that they and the grower, under present conditions, cannot make reasonable profits. Doubtless it never occurred to them that the railroads have some right to make a reasonable profit. The commission merchants say that the "turn-over" on their business averages only 2½ per cent. In the year 1920 the net operating income of the railways of the United States was only \$62,000,000, which was a turn-over of less than 1 per cent on their total business, and, unlike commission merchants, they have enormous fixed investments upon which they must earn and pay a return or be plunged into bankruptcy. Railway rates were advanced last August because the railways were incurring an enormous deficit and without an advance in rates actually would have been thrown into bankruptcy. If without previous large reductions of railway operating expenses the rates in effect prior to last August should be restored, practically every railway in the country would speedily be rendered hopelessly insolvent. Nevertheless, the commission merchants and their organizations without the slightest consideration for the financial needs of the railroads, carry on a nation-wide propaganda to force down freight rates, and then, when the *Railway Age* attacks their propaganda, have the effrontery to write us letters urging us to be "fair" in our comments on their business and to refrain from "trying to break down that splendid spirit of co-operation which the shippers are building up with the carriers."

The fairness of the propaganda for reductions in freight rates on fruits and vegetables was illustrated at a recent conference between the southern lines and the watermelon growers. It was developed that the recent average increase in rates to northern points varied from 2.3 cents to 4.9 cents per melon. It was shown the grower received an average of 7½ cents per melon, and the carriers 12.7 cents per melon for transportation, or a total of 20.2 for the producer and railway, and that the melons sold in Baltimore for an average of \$1 each, or 400 per cent more than the amount received by both the grower and the carrier.

In his recent testimony before the Senate committee J. Kruttschnitt, chairman of the Southern Pacific, gave the following facts regarding lettuce: "Parties in Washington calling themselves 'Producers and shippers of perishable and high tonnage commodities on the Pacific coast' had issued a circular containing the statement, 'Increased freight rates put tax of \$185 per car on lettuce.' The increase in freight rates from California amounts to 7/10 of 1 cent for large sized heads running 54 to the crate. The number of heads grown per acre is about 9,530, which at 7/10 of a cent a head, makes the increase in the rate \$66.71 per acre and not \$185 as asserted. The cost to the producer of one carload of the lettuce sold to distributors in New York, all charges paid including transportation and refrigeration, was \$638.51. The carload at retail prices sold in New York for \$2,382. Naturally the question is asked 'who gets the other \$1,743.49?'"

The *Railway Age* agrees with those who contend that the grower of fruits and vegetables is not, at present, receiving high enough prices for his products. It declines, however, to subscribe to the manifestly false doctrine of the commission merchant that the low prices being received by the grower are due to the present freight rates and that the freight rates should be reduced in order that the grower may make more money. It is the commission merchant, not the railroad, that buys the produce from grower and pays him the present low prices.

Since the commission merchants are so greatly concerned because of the low prices the grower is getting, we suggest to them that instead of advocating reductions in railroad rates to enable the producers to get better prices, they

might themselves voluntarily pay the grower higher prices. The commission merchants will reply, of course, that they are not making enough money, but neither are the railways. The railways are incurring heavy losses even with the present rates. The public certainly would be no more injured by the ruin of the commission merchants than it would be by the ruin of the railways.

Undoubtedly many of the present railway rates are too high. Undoubtedly when the reductions in railway operating expenses that ought to be made have been secured many rates should and will be reduced. But those who, like the commission merchants, carry on propaganda grossly misrepresenting the effects of the present rates and advocating reductions absolutely regardless of the ability of the railroads to stand them, are not helping to solve the present railroad problem or any other problem that confronts the country, and they are in a very poor position to protest against alleged unjust attacks upon their own business.

## Proposed Wage Reductions and Rates

REPORTS are being persistently circulated to the effect that the reduction in wages to be announced by the Railroad Labor Board in the near future will average only 10 or 12 per cent, or, as some reports have it, will aggregate about \$400,000,000 a year. The circulation of these reports is accompanied by speculation regarding what changes in freight and passenger rates will be made if the reported reductions in wages are made.

The Railroad Labor Board has not itself made any public statement indicating what the total reduction in wages will be. There are reasons for believing that the reports mentioned regarding the probable extent of the reduction in wages are originating with persons who are interested in having them made as small as practicable.

The public should understand that if the average reduction in wages granted shall be as small as these reports indicate they will not be sufficient to make practicable any substantial reductions of rates. The advances in wages granted by the Railroad Labor Board on July 20, 1920, when the cost of living was about 112 per cent more than before the war, averaged about 20 per cent for each employee, and, on the basis of the number of men employed in 1920 amounted to about \$775,000,000.

It made the average compensation per employee about 136 per cent more than before the war. The reduction in the average cost of living since that time, according to the most reliable estimates, is at least 40 per cent, and since the present wages were based chiefly upon the cost of living prevailing at the time they were fixed there seems no good reason why the reduction in wages should not be at least equivalent to the advance in wages granted last July. On the basis of the cost of living there would be justification for making the wages even lower than they were before the last advance in wages was granted.

With the present wages in effect, it was found in the latter part of 1920, even when the railways were handling a heavy business, that they were failing at the rate of about \$500,000,000 a year to earn a net return at the rate of 6 per cent upon the valuation placed upon their properties by the Interstate Commerce Commission.

The business being handled at the present time is much smaller than then and the railways thus far in 1920 have earned almost no net operating income at all. Unless, therefore, the Railroad Labor Board shall both wipe out the national agreements and make a reduction of wages equivalent to the advance in wages which was granted last summer, the prospect of any substantial reduction in rates necessarily will be very remote.

## Letters to the Editor

### "A Protest from the Commission Merchants"

WASHINGTON, D. C.

TO THE EDITOR:

Our attention has been directed to an editorial in the *Railway Age* under date of April 22, headed "Piratical Commission Merchants' Attacks on Freight Rates" which for its vehemence and misstatement of facts in an attempt to influence the public mind against the commission merchants, savors only of railroad propaganda, and, we are convinced, will act as a boomerang in its attempt to influence the minds of those high in authority, who have under consideration the necessary downward adjustment of freight rates.

These organizations, representing as they do many of those whose honesty and sincerity of purpose you so unjustly attack, are now in the thirtieth year of successful operation and are recognized by the carriers and governmental agencies as one of the indispensable and most important links in the chain of economic and proper distribution of fruits and vegetables. Therefore, their officers and members strongly and justly resent your unwarranted attempt to defame an industry so important to the carriers, the producers and the consumers of this country.

In your editorial, you link up with the commission merchants in this alleged "piratical attack" two of the leading trades papers, viz., the *Packer* and the *Produce News*, and say that the commission merchants through and in conjunction with these and other trades papers, are conducting one of the most dishonest and selfish propagandas you have ever observed. Why shouldn't we use those papers which print facts concerning our industry and not such papers as the *Railway Age*, which evidently panders to anything that will give the public a misconception of facts concerning the so-called middleman, or commission merchant. It was the *Packer* which took the very statements upon which your editorial was based concerning the enormous profits on onions, spinach, etc., and proved by actual conditions and government figures the falsity of your figures and that instead of the alleged high profits, the dealers suffered a loss.

These organizations composed of wholesale dealers and distributors of fruits and vegetables, hold no brief for the retailer whom you have linked up with the commission merchant, but we do feel that you owe to them the same duty you owe to us; that of investigating and proving your facts before attacking, and inflaming the minds of the consumer, with unjust and unwarrantable statements regarding the retailer, which can but have the effect of retarding the free movement of fruits and vegetables with resultant injury to everyone concerned, and not the least to the railroads.

In your editorial you go so far as to say that "It has long been known that the commission merchants dealing in fruits and vegetables have been among the most remorseless profiteers in this country." If this was not such a serious utterance, we would be inclined to laugh. It is serious because it is such a bald, deliberate misstatement of facts. Why didn't you take the time to investigate and really find out what the average margin of profit is on the annual gross sales of the commission merchants? We can tell you that it is less than 2½ per cent. Why didn't you take the time to look up in connection with the question as bearing on profits, the financial statement of the United States Food Administration, completed on February 1, 1919, which showed the net profit of the wholesale fruit and vegetable dealers in the United

States from August 1, 1917, to August 1, 1918, to be 2.42 per cent on the turnover? This should be ample evidence, and will be to the right thinking mind, that the fruit and vegetable trade was and is efficient in the performance of its duty and by no stretch of the imagination could be considered profiteers.

You know, we know, and the carriers know, that freight rates are too high. The issue cannot be dodged by such attempts as your paper is making. President Harding in his address to Congress said: "*Freight carrying charges have mounted higher and higher until commerce is halted and production discouraged. Railway rates and cost of production must be reduced.*"

Every word of this is true, so let's go at it in a sensible way, as this industry is doing with the carriers and every one concerned, and work out the problem. Stop your mud slinging and get down to facts.

We recall that in 1917, on invitation from you, R. S. French, general manager and secretary of the National League of Commission Merchants of the United States, served as one of three judges in a contest put out by your paper for the best paper on "The Reconsignment and Diversion Privilege," for which a prize was awarded. This was an interesting, constructive and instructive contest and experience.

Why not continue a constructive policy and devote your energy to a campaign of investigation to determine the effect of the high transportation costs on the commerce of the country?

The congress wants this information, and so does the Interstate Commerce Commission in its investigations which are now going on, and will welcome real facts such as these and other organizations are giving them.

Do this instead of trying to break down that splendid spirit of co-operation which the shippers are building up with the carriers and which was so manifest in the conference between seventeen railway traffic executives and representatives of shippers at New York on November 17 and December 14, 1920, and of which Chairman Clark of the Interstate Commerce Commission was advised, and to which he replied as follows:

"I appreciate your promptness in giving me this information and I desire to express to you the satisfaction which I feel over the fact that such a meeting has been held, and congratulate you upon the spirit which was entertained by those in attendance and the acquiescence in the broad principles which it was agreed should be followed. I have an abiding faith in the good effect of such conferences and of the great good that will come from the developing and fostering the spirit which prompted calling the conference and which permeated the proceedings. I sincerely trust that this spirit will not be allowed to languish but that it will be accepted and co-operated in by all of those who were present in person and that the result may be a general acceptance of the principles agreed upon and a cordial determination to not only abide by them but to further their acceptance by others.

"This spirit is especially fitting preceding the holiday period when our minds turn to 'Peace on earth, good will to men,' and I hope that it may survive as all truly good and right things survive."

We were a party to this conference and like all other shippers, we are doing everything possible to carry out the spirit and understanding of the conference.

As we write this letter, our attention is called to an article in the Packer of May 6, in which it is stated that at the request of fruit and vegetable dealers in Kansas City, you met with them on Wednesday of last week in the Chamber of Commerce and were given first-hand information concerning profits and losses of wholesale dealers; that you acknowledged to the dealers at this meeting that you had made no investigation concerning wholesale selling prices before writing your editorial, but tried to justify its publication by pointing out that retail prices were high compared with the prices producers were receiving; that it was also shown you that wholesale prices, after transportation costs were paid, were out of line, and that your article, insofar as it concerned the wholesaler, was utterly wrong. It is also stated that you admitted that transportation rates should be reduced,

but stated that operating expenses of the carriers precluded such reduction at the present time.

In view of these statements, the accuracy of which we have no reason to doubt, and as your editorial article was directed primarily at the wholesaler, you should at once set the public right, through your paper, by a frank admission of your error and a retraction of your statement, which we trust you will do. Furthermore, in fairness to the members of these organizations and others whom you have so unjustly attacked in your editorial, we ask that you print and give to this letter the same prominence in the next issue of the *Railway Age* as you did to your article.

## Freight Rates Not Restricting Traffic Movement

HOUSTON, TEXAS.

TO THE EDITOR:

I have read with great interest the editorial in the *Railway Age* of April 22 concerning the propaganda which is being carried on in the United States to bring about a reduction in the freight rates. These propagandists are claiming that the high rates are curtailing the movement of traffic. They evidently fail to remember that traffic was likewise curtailed during the panic of 1907 and again in 1914, when the freight rates were very low.

As a practical example that high rates do not curtail traffic to any extent we have before us at present the situation in Mexico. There is considerable accumulation of traffic for Mexico at all of the Rio Grande crossings, due principally to the shortage of motive power on the National Lines of Mexico. In order to help out this situation the Mexican lines have for some time been allowing private concerns, such as mining companies, contractors and others to operate trains over the tracks of the National Lines. These private concerns charge the full freight rates in effect in Mexico, plus 50 per cent, and they have all been offered more traffic than they have been able to handle on this basis. It is understood that they pay the Mexican Railway Lines the regular rates and the additional 50 per cent is retained by them for their services.

It has been stated recently that shippers in some cases have offered to pay these private train operators as much as 100 per cent more than the regular tariff rates in effect in Mexico in order to get their traffic handled.

As a practical illustration, this would seem absolutely to dispute the statements of the propagandists in the United States that the present freight rates are restricting the movement of traffic.

THEORWELL FAY,  
International & Great Northern.

A BILL has been introduced before the Illinois legislature to require all railroads to construct and maintain an illuminated danger signal on each side of the railroad at all highway grade crossings. The bill provides that the signal shall consist of a wired glass disc not less than 17 in. in diameter with a 5 $\frac{3}{8}$ -in. optical lens in its center, and light to be projected by intermittent flashes of not less than 30 per minute; all crossings to be equipped before July 1, 1922. It is estimated that it would cost about \$650 to equip each highway crossing as here provided, and approximately \$60 a year for maintenance and inspection.

# Record Train Loading Features Virginian Operation

Describing the Methods Used to Handle Loads of 8,000 to 9,000 Tons in Regular Course

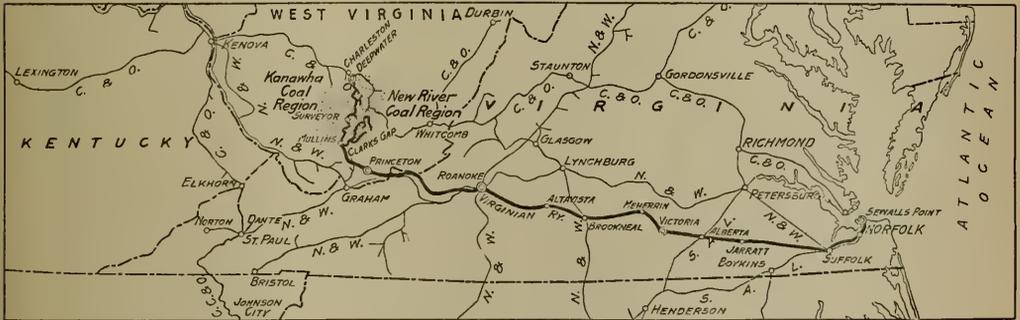

ALL records for heavy train loading were shattered on Wednesday last when there was handled from Princeton, W. Va., eastward to Roanoke, Va., on the Third district of the Virginian Railway, a train of 100 loaded 120-ton cars of coal aggregating 16,000 gross tons. This train was a test train run to demonstrate what could be done with the new 120-ton cars and the heavy power used by the Virginian Railway. It marks the latest step in the progress towards heavier train loading which has characterized the operations of the Virginian Railway since its inception.

The Virginian Railway's theory of operation is stated in the following words: "The more loads you haul in one trip the less trips you'll have to make." The road was built with that idea in mind. Today the company is operating with the largest capacity equipment and most powerful locomotives which are in service in this country and therefore in the world. The success the road has been having in working out its scheme of operation is attested by the fact

put in complete operation. At his death the line from Princeton, W. Va., east to tide-water had been put in its desired shape, with one pusher grade of 0.6 per cent on one district, with grades against eastbound traffic of but 0.2 per cent otherwise on the three districts and on the whole with a line descending to tide-water. The line west of Princeton—that is, into the coal fields themselves, was not up to the standards which characterized the other three districts. It has gradually been improved, however, the most important feature of this improvement being the double tracking and accompanying tunnel widening between Elmora and Clark's Gap now nearing completion. Eastbound traffic at this point has to overcome a 2.07 per cent grade and until this work was carried out this section was in reality the neck of the bottle in the road's operations.

## Bituminous Coal 90 Per Cent of Traffic

The traffic of the Virginian is predominantly bituminous coal, the tonnage of that commodity making up about 90

The Virginian Railway

that the road is hauling in regular service trains of 90 to 100 loaded cars aggregating 8,000 to 9,000 gross tons. The average net tons per train—the figure which includes all freight trains of whatever kind—in 1920, totaled 1,800, the largest for any road in the country. A study of the operations of the Virginian Railway is further of interest because in 1920 the road was one of the few which earned well over its standard return and guaranty. In the first three months of 1921 its net railway operating income exceeded that for the same three months of 1920.

## Of Exceptional Engineering Standards

The Virginian Railway was built by H. H. Rogers of the Standard Oil Company who had become financially interested in coal properties in West Virginia, particularly in the neighborhood of Page. Mr. Rogers built a short line to a connection with the Chesapeake & Ohio, but being unable to secure from that carrier a division of the through rates, or a satisfactory outlet over the Norfolk & Western, he conceived the idea of building a line of his own to tide-water. The result was the Virginian Railway. In building this line, Mr. Rogers spared no expense and the final result insofar as the project was carried out before Mr. Rogers' death was a low grade line of exceptional engineering standards. Unfortunately Mr. Rogers died before the road was

per cent of the road's total tonnage. In 1920 the proportion was 92 per cent. This coal all moves eastward, about 80 per cent of the total being dumped at tide-water. The coal is secured on the main line and branches which constitute what the Virginian terms its Deepwater district. The Virginian's lines reach a few mines in the Pocahontas coal fields, but, as will be seen from the map, by far the larger part of the tonnage is secured in the New River fields. This New River coal moves to tide-water under a rate of \$2.80; the average haul is 410 miles.

The coal territory is adjacent to the New River fields served by the Chesapeake & Ohio, and in fact a larger number of mines are served by both roads through trackage agreements which permit mines to ship over either road. New River coal is a low volatile steam coal. Until the last few years the demand for it was for bunker coal and for coastwise movement to industries in New England, etc. During the war large quantities of the better grades were supplied to the United States Navy. With the elimination of British coal during the war and the subsequent disorganization of the British coal mining industry, there arose a great demand for this coal for export with the result that the coal business in the Virginian's territory has increased by leaps and bounds. The prospects of the British coal now are rather problematical, but it is probable that the

growth of American export business will be continued, in which case except for uncertain periods, like the present, the Virginian's traffic will continue to expand in large proportions. In 1920, the road handled 7,621,555 tons, representing an increase of 32 per cent over 1919. This coal was supplied by 103 mines, of which 73 are on lines owned by the Virginian and the remainder on the lines of the Chesapeake & Ohio, or on the Kanawha, Glen Jean & Eastern, a coal property.

The rapid expansion of the Virginian's coal business can best be shown by the following figures:

Year	Coal all freight	Coal tonnage	Coal dumped at tide-water
1911	2,713,135*	2,141,009*	2,012,445
1912	3,614,011*	3,103,309*	2,474,052
1913	4,410,622*	3,775,423*	3,283,667
1914	4,776,663	4,122,987*	2,841,433
1915	4,088,609*	3,603,390*	.....
1915	4,415,952	3,890,565	3,116,903
1916	6,093,013	5,509,798	4,366,243
1917	7,096,532	6,398,836	4,429,296
1918	6,866,089	6,279,289	4,220,778
1919	5,983,824	5,463,321	3,618,432
1920	.....	7,621,555	5,497,131

\*Years ended June 30.

The Virginian is the third carrier, in point of coal business handled, in the Pocahontas district. The figures given above indicate that it is more than holding its own in this rapidly growing group and show what may be expected of the road in years to come.

The Virginian's Equipment

Inasmuch as bituminous coal constitutes so large a percentage of the total tonnage of the Virginian Railway, it is, of course, natural that its operations should be characterized by heavy train loading and by the features in general peculiar to handling traffic of this kind. It is next in order to see why it is that the Virginian is the leader in heavy train loading and how it is that the road is able to make up and handle a record-breaking train of 16,000 gross ton.

It has been noted that the Virginian has on its lines the largest cars and most powerful locomotives in use on any railroad. This equipment is as follows:

FREIGHT CARS			Total capacity, tons
Number in service	Type	Capacity in lb.	
534	Box	80,000	21,360
182	Flat	80,000	7,280
944	Stock	80,000	37,760
148	Hopper	100,000	7,400
2,171	Steel hopper	105,000	113,978
998	Steel hopper	110,000	54,890
2,984	Flat bottom gondola	105,000	150,660
590	Flat bottom gondola	114,000	84,450
983	Flat bottom gondola	218,000	107,147
9,834			560,925

COMPARISON WITH PREVIOUS YEARS		
December 31, 1918	8,896	452,057
December 31, 1919	8,875	451,192
December 31, 1920	9,834	560,925

LOCOMOTIVES				
Number in service	Type	Class	Tractive effort	Total
5	0-8-0	SA	45,200	226,000
6	4-6-0	EA	21,400	128,400
4	4-6-0	TA	30,900	123,600
6	4-6-2	PA	44,300	265,800
1	2-8-0	CA	29,400	29,400
2	2-8-0	CA	29,400	58,800
2	2-8-0	CB	29,400	58,800
1	2-8-0	CC	29,400	29,400
2	2-8-0	CD	29,400	58,800
				979,000
2	2-8-2	MA	45,200	90,400
4	2-8-2	MA	45,200	180,800
42	2-8-2	MB	56,000	2,352,000
18	2-8-2	MC	60,800	1,094,400
4	2-6-0	AA	70,800	283,200
8	2-6-0	AC	90,400	723,200
1	1-8-2	AB	97,400	97,400
6	2-8-0	AD	115,000	690,000
10	2-10-10-2	AE	147,200	1,472,000
20	2-8-2	US	101,300	2,026,000
				9,006,200

144 locomotives Total..... 9,985,200 lb.

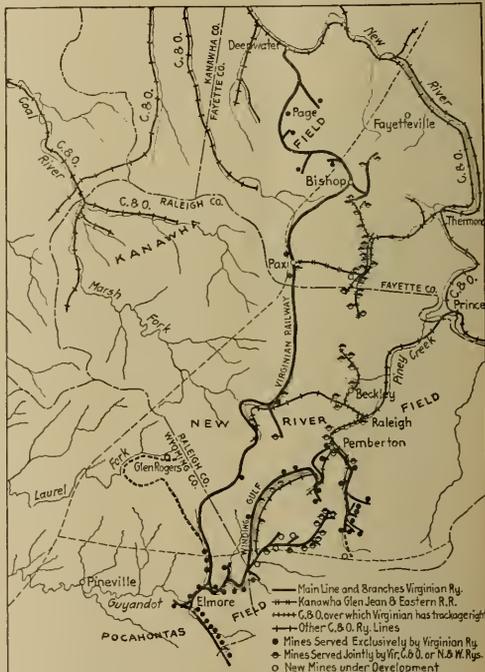

TOTAL LOCOMOTIVE TRACTIVE EFFORT COMPARED WITH PREVIOUS YEARS

December 31, 1918	119	7,859,700
December 31, 1919	139	9,884,790
December 31, 1920	144	9,985,200

Probably the most noteworthy feature of these figures, other than the size of the equipment used, is the great increase which has been made in the total tractive effort of the locomotives and the total carrying capacity of the cars.

Cars Assembled at Elmore, W. Va.

It has been noted that the Virginian secures its coal along the lines in its Deepwater district. As will be seen from the map showing the coal district, all the mines, excepting a very few, lie north of Elmore. The cars of coal are assembled by mine runs and brought into Elmore. The yards at Elmore have a capacity of almost 800 cars, and they serve also as the distributing center for empties returning

The Coal Fields Served by the Virginian

to the mines. From the yards at Elmore the loaded cars must be brought up to Princeton. Between Elmore and Clark's Gap there is a grade against east bound traffic of 2.07 per cent. The usual procedure is to make up trains of about 75 cars handled by an AA, AC or US Mallet with two of the heavy AE or 2-10-10-2 type Mallets cut in the train. These pushers are dropped off at the summit or Clark's Gap whence the single Mallet handles the train to the end of the freight district at Princeton. The AE Mallets are the largest locomotives in service on any railroad. They have a total weight in working order, including engine and tender, of 898,300 lb. Working simple, they have a tractive effort of 176,000 lb. and compound, 147,200 lb. The Virginian owns 10 of them. It was an engine of this type which was used to handle the test train of 16,000 gross tons mentioned as setting a new record in heavy train loading. The 14 miles of 2.07 per cent grade between

Elmore and Clark's Gap was at one time the most difficult obstacle the operations of the Virginian had to overcome. With the larger power in the form of the AE Mallets and the double tracking now nearing completion, the problem is by way of being solved.

The following figures showing the amount of coal moved over Clark's Gap will indicate clearly the results that have been attained:

COAL MINED OVER CLARK'S GAP							
1920				1919			
Month	Trains	Loads	Tons	Leads at mines	Trains	Loads	Tonnage
January	203	11,012	863,114	11,223	137	8,048	636,735
February	159	8,604	674,315	7,845	85	5,167	383,384
March	203	11,996	941,501	12,066	114	6,049	457,018
April	191	11,798	922,507	11,383	86	5,300	396,281
May	135	8,267	640,467	8,287	122	9,006	658,869
June	181	11,069	856,207	11,257	142	10,012	774,197
July	218	13,521	1,056,296	13,492	125	8,985	675,932
August	241	13,457	1,052,667	13,517	152	10,597	827,424
September	217	12,842	1,009,044	12,813	157	10,938	848,489
October	242	13,947	1,095,729	13,361	179	11,749	914,516
November	220	11,640	903,894	12,321	161	9,927	773,693
December	231	10,749	868,133	10,064	160	9,498	745,226
Total	2,441	138,902	10,894,074	137,629	1,620	105,294	8,091,784

The following brings the table up to date and gives some interesting details concerning trainloading in 1921 as compared with 1920:

Month	Trains	Loads	Tons	Loaded in 1921 month, 1920	Average tons per train, 1921	Average tons per train, 1920
January	272	9,852	852,857	11,028	3,135	4,350
February	129	6,617	558,757	6,630	4,331	4,233
March	110	6,712	568,929	6,995	5,177	4,638
April	132	8,153	695,444	8,868	5,268	4,829

### Dropping Trains Down 1.5 Per Cent Grade Present Operating Feature

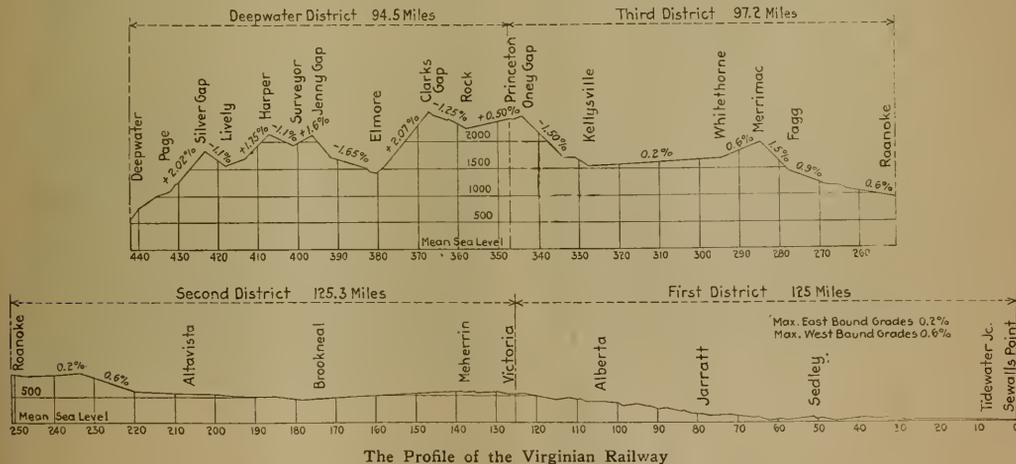

With the difficulties contingent upon the operation of the trains up the Clark's Gap hill nearing solution, the next

solution came about through the use of the empty and load brake, by which as is well understood, the loaded car may be given considerably more braking capacity than when empty. The Virginian has about 2,000 cars equipped with the empty and loaded brake. One thousand of these are hopper cars of 110,000 lb. rated capacity; the other thousand are the new 120-ton gondola cars which have recently been put in service. It was early developed that to secure the required results, it was necessary to put in a train cars with the empty and load brake to the amount of 15 per cent of the total train—in other words, 15 cars in a total of 100. At first it was thought necessary to keep the empty and load brake cars at the front of the train. This was later found to be unnecessary, so they are now distributed throughout the train as they happen to come, the only requirement being to get the 15 per cent empty and load brake cars.

### A Train of 16,000 Gross Tons

The impressive run—the peak of heavy train operation on any railroad—which was made on the Third district of the Virginian on Wednesday, May 25, presumably sets a record in heavy train loading which will not be again reached for some time. On that day a train of 100 of the new 120-ton gondola cars, each loaded to its full capacity, making an aggregate train load of approximately 16,000 gross tons, was successfully handled both on the heavy grades and on the comparatively level sections between Princeton and Roanoke. This train was handled with one of the Virginian, Class 800, AE 2-10-10-2 Mallet locomotives at the head end. Pushers were used in starting the train and on the grade between Rich Creek and Merrimac, as noted in a following paragraph.

The distance from Princeton to Roanoke is 97.2 miles. Train operation over this district, as has been noted, is down

problem that had to be attacked was that of dropping the trains from Princeton east. Beginning at a point a short distance east of Princeton, there is a descending grade of 1.5 per cent down to Kellysville, 12 miles from Princeton. Between Princeton and Roanoke—the third district 97 miles in length—the coal trains are operated in 80 to 100 car-lengths, their tonnage averaging from 8,000 to 9,000 tons depending upon the size of the cars making up the train. To handle trains of this size with one locomotive down a 10 or 12 mile descending grade of 1.5 per cent was not a thing that could be worked out in a day. Naturally, the problem was one of securing proper braking capacity; its

a descending grade beginning a short distance out of Princeton and extending to Kellysville, 12 miles east of Princeton, the grade being of 1.5 per cent. The successful operation of the train down this grade was the real test which the train had to meet. From Rich Creek east of Kellysville there is an ascending grade of 0.2 per cent which presents no particular difficulty. Between Whittherhorne and Merrimac an ascending grade of 0.6 per cent is encountered and in regular operation, as in the case of the test train, pushers are used. Beyond Merrimac, there is a short descending grade of 1.5 per cent, followed by descending grades of 0.9 per cent and of 0.6 per cent into Roanoke.

### Test Demonstrates Train Load Limit Not Yet Reached

The project of handling this long and heavy train over this particular district was undertaken with the idea of demonstrating that the limit for train loading has not yet been reached and also to observe, in actual service, the new Westinghouse empty and load brake with which the cars are equipped. During the run to Roanoke, records of the brake performance were made by means of recording instruments on the locomotive, on the fifth car and on an observation car at the rear end of the train. The speed of the train was also shown by speed indicators installed in the observation car.

To start the loaded train at Princeton, three eight-wheel switching locomotives were used as pushers, these being dropped when the train had reached a speed of 12 miles an hour. A 2-8-8-2 Mallet pusher was also used from Rich

A Coal Operation on the Winding Gulf Branch

Creek to Merrimac, over the 0.2 per cent grade to White-thorne and thence up the 0.6 per cent grade from White-thorne to Merrimac. The start at Princeton was made smoothly. The run down the 1.5 per cent grade from Princeton to Kellysville was made at a speed of 20 to 27 miles an hour under control at all times. Due to the long and heavy train it was necessary to put a pusher on at Rich Creek instead of at Whitethorne as is done in normal operation. The pusher was dropped at Merrimac. From Merrimac to Fagg down the short stretch of descending 1.5 per cent grade, the train was handled at a speed of from 20 to 30 miles an hour, and from there on to Kumis and Roanoke at 15 to 20 miles an hour. During the trip the train had two break-intwos due to defective knuckles and to the fact that the engineer was not familiar with so heavy a train.

Before starting on the run to Roanoke a thorough inspection of the train was made and every precaution taken to have the cars and brakes in good condition. In order to insure proper action of the brakes, and also to demonstrate the special features of the empty and load brake to the railroad men and other engineers and observers who were present, a number of standing tests were made in the yard at Princeton. For the purpose of making these standing tests, the train was parted at the middle, the two parts placed on adjacent tracks, and the brake line connected up so that the front and rear ends were brought near together where both the start and finish of the brake action might be observed. These tests included an emergency serial action of the brake which was completed in 7.5 seconds; a quick service serial action in 10.5 seconds; and an emergency action in 7.75 seconds after the completion of a heavy service application. The value of such a brake performance, particularly in the severe service on the Virginian, will at once be apparent to men familiar with train operation. Demonstrations were also made of the operation of the take-up

cylinders; the operation of the brake under both empty and load conditions; and the automatic return from load to empty position.

On Thursday, May 26, a train of seventy-five empty 120-ton gondolas was hauled up the grades from Roanoke to Princeton. During this run tests were made of the empty and load brakes in order to demonstrate the practical elimination of shocks during heavy service and full emergency applications.

The train was hauled by a 2-10-10-2 Mallet to Rich Creek. A full service stop was made west of Salem (about 8 miles west of Roanoke) from a speed of 18 miles an hour in 38 seconds with a brake pipe reduction of 12 lb. A full emergency stop was made on the grade near Eggleston (about 55 miles west of Roanoke and 22.6 miles east of Rich Creek) in 18 seconds from a speed of 20 miles an hour with the brakes in the light capacity position.

On Friday, May 27 (today), it is intended to take another heavy train over the line from Princeton to Roanoke. On this run more complete records will be made of the application of the brakes. The data thus obtained will be the basis of an exhaustive study of the problem of braking extremely heavy trains on severe grades and the handling of practically empty trains of about one-third the tonnage in the opposite direction—a condition which prevails on the Virginian Railway. Tests are to be made of the reserve capacity of the brake which is designed to compensate for losses due to air leakage on individual cars even though the leakage might exceed the capacity of the air compressors. For this test, air leakage will be purposely caused on a number of cars. Emergency applications will be made and also emergency application after a heavy service application.

The records for the entire four days' test will be compiled by the engineers in charge and will be available at an early date.

Some 150 railway officers and supply men were present at the tests. The party was in charge of R. C. Cusick, of

One of the Mines on the Virginian Railway

the Westinghouse Air Brake Company, and the members of it were the guests of the Westinghouse Air Brake Company under the auspices of which company and the Virginian Railway, the unusual tests were conducted.

### Big Cars Not Run in Solid Trains

The Norfolk & Western in using its large 100-ton cars runs them in solid trains. This the Virginian does not do. The test train of 16,000 tons, however, was a solid train of 100, 120-ton cars, which explains why it is that it totaled 16,000 tons, while the 100-car trains run in regular operation total from 8,000 to 9,000 tons.

Between Princeton and Roanoke, the trains are handled by a U. S. Mallet of the 2-8-8-2 type and of a tractive effort of 101,300 lb. Other than the complication accom-

panying the handling of the trains down the grade to Kellysville, there is no other difficulty met with, other than the fact that a pusher—an MC heavy Mikado, is used on the 10-mile 0.6 per cent grade between Whitethorne and Mer-rimac.

From Roanoke east over the Second and First districts, there are no complications to operation, the maximum east bound grades being out 0.2 per cent and the descending

become or how great strides it was to make in the way of heavier and larger trains. These aspects are shown by the fact that a large number of the sidings are not long enough to hold the heavy trains. The method adopted, therefore, is for the loaded trains to keep the main line at all times. Trains of empties, and such few passenger trains as are run, take the siding and the heavy trains are run around them. Another difficulty the Virginian has to contend with is maintenance, the heavy locomotives and cars being especially hard on track. The rail now being put in track is of 100 lb. weight, although some 130 lb. rail has been laid, more particularly on the hill up to Clark's Gap. A considerable amount of 85 lb. rail is still in use. The road is rock ballasted practically throughout; the plates are used on curves only. With all the care that is taken derailments occur occasionally and in all fairness, it must be said that they are a potential handicap which is always present.

**The Facilities at Tide-Water**

In 1920 the Virginian dumped at its tide-water pier at Sewalls Point on Hampton Roads a total of 5,497,131 tons

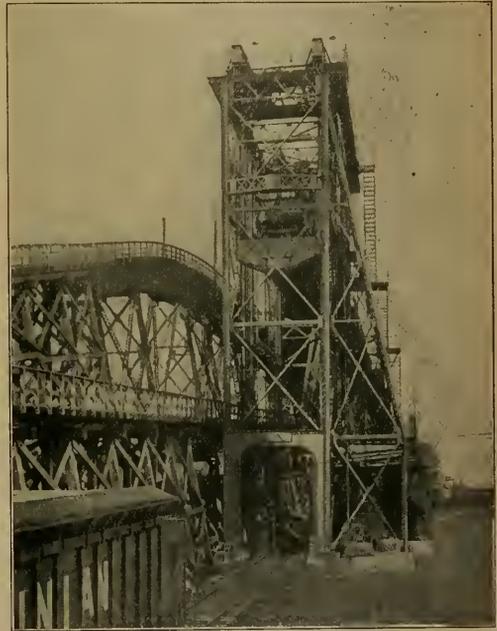

**There Are Two Car Dumping Machines at Sewalls Point Pier. This Tandem Dumper Handles in One Operation Two 55-Ton Cars or One 120-Ton Car**

grades 0.6 per cent. The MC Mikados are used between Roanoke and Victoria and MB and MC Mikados east from Victoria.

**41.6 Miles Per Car Per Day in 1920**

The most interesting feature of the Virginian's operations that we have yet to discuss is the operation of the Sewalls Point pier, the tide-water terminal at Norfolk or Hampton Roads. Before discussing that facility, it may be interesting to note one of the other features of the Virginian's operations that gives it another reason to stand out as an exceptional road. In 1920, the Virginian moved its cars on the average of 41.6 miles per day. During April, 1920, its best month, the car miles per day of coal cars was 61.9 and of all cars 48.1. With its heavy car loading averaging 53.4 tons per loaded car, it is not surprising that in the twelve months of 1920 a figure should have been reached of 1,152 net ton miles per car per day.

A great deal might be said of the engineering standards of the Virginian Railway. That feature of the Virginian is, however, well known and comments concerning it have appeared in these pages from time to time. The road was built with more than ordinary foresight. Other than its low grades, it is characterized by bridges built in many places for double track over which but one track has been laid, and over which the other track may not be laid for some time. Nevertheless, the builders, even with all their foresight, did not foresee how important a carrier their road was to

**The Elevator Which Carries the Heavy 120-Ton Tractor Cars to the Top of the Pier. The Inclined Track to the Left Is the Barney Incline Used by the 60-Ton Tractor Cars; the Center Track Is That by Which the Tractor Cars Return to the Foot of the Pier**

of coal, or a million tons more than was dumped in the best previous year, 1917. The best month in 1920 was October, when 581,968 tons of coal were handled. The pier, when working at its capacity, can dump 90 cars an hour. The best record it has ever made for a single day is 675 cars; an average day's dumping approximates 475 cars. One of the performances to which the road points with particular pride is that of having put on the U. S. Collier Orien, 10,000 tons of cargo coal and 250 tons of bunker coal in 6 hours and 15 minutes, the loading going on simultaneously with that of other ships.

The fact, mentioned above, that approximately 80 per cent of the coal handled over the Virginian is dumped at

tide-water, shows how important is the Sewalls Point coal pier in the efficient operation of the railroad. The coal pier when it was built was of the most modern type yet constructed up to that time. It has since been considerably increased in capacity and through the improvements that were made is still one of the leaders among facilities of its kind.

The pier is of steel construction and is electrically operated. As built originally, it had a car dumper of sufficient capacity to handle 55-ton cars. The road cars were classified and brought forward as needed into a storage yard known by the name of a "barney" yard built on an incline descending towards the pier. When a car was to be dumped it was dropped down by gravity to the pier and pulled up onto the dumping machine by a barney and cable. It was then turned over on the dumping machine, the coal falling into a 60-ton self-propelled electric tractor car, whereupon the empty car was kicked off the dumping machine by the following car, run upon a kick back and then moved by gravity down to the tracks for empties. The tractor car was then run over the scales, propelled to the top of the pier by a barney and then proceeded forward under its own power to the place on either side of the pier where it was to be dumped. The car had two hoppers which were dumped by air. The coal fell into the desired hopper on the pier and thence down the chute into the hold of the ship. The empty tractor then proceeded to the end of the pier and ran by gravity down a track in the center of the pier back to its starting point. With this method of operation, about 30 cars could be dumped an hour when the pier was worked to its capacity.

#### A Tandem Dumper of 120-Ton Capacity

The addition in capacity included the installation of an additional car dumping machine of 120-ton capacity. This machine operates similarly to the original one which it supplemented, except that it handles at one time two 55-ton cars or one of the new 120-ton capacity cars. New electric tractor cars were added, these being of 120-ton capacity. They have three hoppers instead of two and are carried to the top of the pier, not by a barney arrangement, but by an elevator. They are dumped in the same way as the 60-ton cars and are returned to the foot of the pier down the same inclined track as before. To facilitate their operation down this track, they are equipped with dynamic brakes. This new dumper can handle in one hour, when working at capacity, 60 of the 55-ton cars or a proportionate number of the 120-ton cars. With both dumpers working together, this gives us our capacity of 90 cars dumped in one hour. Twelve of the electric tractor cars are used, six of 120-ton capacity for the tandem dumping machine and six of 60-ton capacity for the single dumper.

The Virginian has at Sewalls Point a classification yard holding about 2,100 cars. Cars are classified into 12 classifications, 6 of these being pool classifications, and 6 other. The Virginian has the usual arrangement for pooling coal which is typical of the tide-water coal piers at Hampton Roads or at Baltimore. About 90 per cent of the coal handled is pool coal and coal for the two more important pools predominates. The usual procedure is for the coal to be brought forward to the barney yard as wanted, that yard holding about 90 cars. Under the present scheme of operation, the coal is weighed in the road cars instead of in the tractor cars as formerly, the car running over a 90-ton scale on its way from the barney yard to the foot of the barney incline up to the dumping machine. Inasmuch as the amount of work done is dependent upon the speed of the dumping machines, it is highly essential that these be in the hands of expert operators. Another feature of the operation of the pier is the extremely skilful manner in which the car riders spot their cars; operation is further assisted by what is termed a disappearing barney, this being a con-

trivance whereby the barney when about half way down on its return trip is dropped to a lower track than that on which it runs up the incline. Something should be said also of the skill of the motormen on the tractor cars and concerning the men who operate the hoppers and chutes of the pier itself.

It is interesting to examine some of the figures relative to the operation of the pier. It has already been noted

The 120-Ton Tractor Cars Used with the Tandem Dumping Machine at the Sewalls Point Pier

that the total dumpings in 1920 were 5,497,131 tons. This figure represented 25.5 per cent of all the dumpings at Hampton Roads, the totals for 1919 and 1920 having been as follows:

Road	1920		1919	
	Tons	Per cent	Tons	Per cent
Norfolk & Western	8,807,803	40.8	5,735,095	44.9
Chesapeake & Ohio	7,264,390	33.7	3,430,626	26.8
Virginian	5,497,131	25.5	3,618,432	28.3
Total	21,569,324	100	12,784,153	100

The largest dumpings for any month in 1920 were in October when 581,968 tons were dumped. The following figures will show how this coal was divided between bunkers, coastwise and export, and the comparison with the same month in previous years will be of special interest as pointing out the great increase in coal for export:

	DUMPINGS AT SEWALLS POINT, MONTH OF OCTOBER		
	1920	1919	1918
Coastwise cargo	112,733	110,249	194,987
Coastwise bunkers	3,117	7,476	6,908
Foreign cargo	385,432	267,772	41,903
Foreign bunkers	61,499	31,394	4,286
Total, including government coal and coal for inside capes	581,968	449,800	316,852

Other interesting figures showing the performance of the pier in October, 1920, the pier's best month and in April, 1921, the most recent month for which figures are available, are given as follows:

	TOTALS FOR MONTH		
	October, 1920	April, 1921	
Cars dumped	11,746	5,598	
Average net tons per car	55.5	64.7	
Gross tons dumped	581,968	323,490	
Percentage of all coal dumped at Hampton Roads	27.8	23.8	
AVERAGES PER DAY			
Cars dumped	430	215.3	
Tons dumped	21,292	12,441	
Average cars dumped per hour	18.7	19.2	
Average tons dumped per hour	925.7	1,110	

These figures for the two months selected are, of course, not strictly comparable because of the difference in the amount of the business handled. However, the increase in the average net tons per car dumped in April, 1921, over that for October, 1920, is especially noticeable. It should be further noted that the daily averages for April, 1921, given in the lower part of the table are affected by the fact that in that month, the pier was operated only 26 days, 14 days of which were on but one shift.

# English Railway Bill Proposes Many Changes

## Roads to Be Returned to Owners in August—Wholesale Consolidations Planned

LONDON.

**C**OMPULSORY CONSOLIDATION of the railways of Great Britain into six large groups and the establishment of tribunals to deal with rates and wages are provided for in the government's bill to govern the conditions of the return of the roads to their owners which is to take place on August 14. The bill was introduced in Parliament by Sir Eric Geddes, Minister of Transport, on May 12, several weeks after the railway unions had presented a bill providing for government ownership and operation of the carriers. In view of the early date when government operation, under existing law, is to terminate, considerable irritation had been manifest in many quarters at the government's delay in bringing out its bill. The bill is divided into six parts dealing respectively with reorganization and consolidation, regulation, rates, wages and working conditions, light railways and general items.

### Wholesale Consolidations Proposed

The railways, exclusive of the underground or subway systems in and about London which are not considered in this bill, are to be divided into six distinct groups as follows:

1. Southern Group—London & South Western; London, Brighton & South Coast; South Eastern; London, Chatham & Dover.
2. Western Group—Great Western.
3. North Western and Midland Group—London & North Western; Midland; Lancashire & Yorkshire; North Staffordshire; Furness.
4. North Eastern and Eastern Group—North Eastern; Great Central; Great Eastern; Great Northern; Hull & Barnsley.
5. West Scottish Group—Caledonian; Glasgow & South Western; Highland.
6. East Scottish Group—North British; Great North of Scotland.

These groups which are to be formed on a regional basis are non-competitive, differing widely from the plan of the Transportation Act in the United States, which provides for combination into competing systems. The purpose of the consolidation, according to the bill, is the "reorganization and more efficient and economical working of the railway system of Great Britain." The principal railway companies in each group mentioned above are to be amalgamated into a single company. Other less important companies are to be absorbed in a manner provided by the act.

The consolidations are compulsory except that the bill provides for a variation in the grouping outlined, provided it is promulgated on or before June 30, 1922, and is approved by the Minister of Transport and by a resolution passed by both houses of Parliament.

The constituent companies in each group are permitted to submit to the Minister a plan of amalgamation, in accordance with the provisions of the act, for his approval and for the approval of an Amalgamation Tribunal, consisting of Sir Henry Babington Smith, Sir William Pender and G. J. Talbot, on or before June 30, 1922. If such a plan is not presented or approved by that date, the Amalgamation Tribunal is to proceed with the formation of the groups which are provided for in the act. These amalgamations are to become operative January 1, 1923, unless otherwise directed by the Amalgamation Tribunal.

### Shippers to Share in Management

The boards of directors for the amalgamated companies are, for the first year, to be elected from the boards of the constituent companies, the total number of directors on each

board not to exceed 21 members. After the first year a board of 21 members for each group will be elected by the shareholders. Four members of this board are to be important shippers in the amalgamated company's territory. Employees are not, as had been expected in some quarters, to have places on these boards. Each member of the board will serve for three years with the exception of the first board elected, of which one-third of the membership will serve one year and one-third for two years, such members to be selected by lot.

Officers and employees displaced or otherwise affected as a result of the amalgamation are to be reimbursed by the amalgamated companies with rights to appeal to a standing arbitrator or board of arbitration appointed by the Lord Chancellor, this arbitrator or board having the power to award damages to be paid by the amalgamated company.

The major constituent companies of the various groups are to prepare plans for the absorption of the smaller railways in their respective groups. Such plans are subject to the approval of the Ministry of Transport and the Amalgamation Tribunal on or before June 30, 1922, in default of which the Tribunal will order the absorptions as it sees fit.

The Amalgamation Tribunal is to hold office until all matters under its jurisdiction are settled. This Tribunal may, and if so required by the Court of Appeal, must state in the form of a special case for determination by the Court of Appeal (the decision of which shall be final) any question of law which may arise before it. The Tribunal has the power to call and examine witnesses under oath and to demand the production of documents. The expenses of the Tribunal are to be met by the Minister of Transport but are to be repaid with interest by the amalgamated companies after they are formed.

### Payment of Claims

The Bill provides that a total of \$291,600,000 shall be set aside by the government for the payment of all claims by the railways which obtain at the end of the period of control, of which one-half will be available December 31, 1921, and the other half a year later. This sum will be distributed among the railway companies in accordance with a plan agreed to by themselves. In case of no such agreement the Amalgamation Tribunal shall decide upon the proportionate distribution. Out of the first \$145,800,000, \$121,500,000 is to be set aside for distribution among the railways in proportion to their net earnings for 1913, and the remaining \$24,300,000 for distribution in payment of claims for compensation for any abnormal increase in the ratio of operating expenses over revenues for the period commencing August 15, 1921, and ending December 31, 1921, as compared with the ratio of operating expenses over revenues for the year 1913.

Of the remaining \$145,800,000, a sum of \$121,500,000 will be available for payment to the railways which on August 15, 1921, are in arrears in maintenance and replacements, in ratio to the extent to which they are so in arrears. The balance, \$24,300,000, will be distributed similarly as the previous sum of like amount, but for the period of the year 1922.

### Regulation of the Railways

The bill gives the Railway and Canal Commission or the Minister of Transport authority to require any railway company to afford reasonable railway services, facilities and con-

veniences which is proved to be necessary, unless the railway company can prove that any such undertakings would affect prejudicially the interest of the stockholders.

The Minister is to have the authority to require any or all railways to conform gradually to general standardization of way, plant and equipment, and to adopt plans for the co-operative use of rolling stock, shops and other facilities; unless the railway companies affected can prove to the satisfaction of the Railway and Canal Commission that the order is such that the capital expenditure involved would prejudicially affect the stockholders' interest. Existing leases or working agreements may be continued with the approval of the Minister, and all future agreements of this nature must receive this sanction.

### Regulation of Rates

Rates are to be provided which yield the aggregate net revenue for 1913, plus a sum equal to 5 per cent on capital expenditures made by the railway during government control, plus a reasonable allowance for capital expenditures on revenue producing improvements (not to be less than £100,000 for any individual improvement) which at the beginning of 1913 had not become fully remunerative.

Authority over rates is vested in a Railway Rates Tribunal, consisting of three permanent members. The three permanent members, who are to hold office not more than seven years, are to be appointed by the King on the joint recommendation of the Lord Chancellor, the President of the Board of Trade and the Minister of Transport. The chairman of this Tribunal is to be a railroad man, one of the members a lawyer and the other a business man. The salaries of the members of this Tribunal and its employees are to be determined by the Minister of Transport and paid by the government, which is to be reimbursed therefor by the railways in a proportion to be determined by the Tribunal.

In order to secure a larger Tribunal when occasion may require, two panels, one made up of 12 shippers appointed by the president of the Board of Trade and another, consisting of 12 members representing the railways and appointed by the Minister of Transport after consultation with the Railway Companies' Association, are provided. When the Minister desires to add to the Rates Tribunal temporarily, he is given authority to select two, one from each panel.

The Rates Tribunal is to have power—

(i) to prescribe in relation to the carriage of passengers and merchandise by railway—

(a) The rates applicable to the carriage of merchandise and the conditions under which those rates shall apply;

(b) The conditions under which exceptional rates may be charged;

(c) The charges to be made as station and service terminals and the accommodation and services to be included in those charges;

(d) The fares for the conveyance of passengers and their luggage and the articles and things that may be conveyed as passengers' luggage;

(e) The conditions under which fares less than the standard fares may be charged;

(f) The conditions (other than those relating to dangerous goods) upon which merchandise shall be carried by railway;

(ii) to determine any questions that may be brought before them in regard to the following matters:

(a) The alteration of the classification of any article, or the classification of any article not at the time classified.

(b) The alteration of any standard charge;

(c) The granting variation or cancellation of any exceptional rate;

(d) The disintegration of any exceptional rate;

(e) The institution of new or the modification or cancellation of existing group rates;

(f) The variation of any toll payable by a trader (i.e. shipper) or by one railway company to another;

(g) The rebate to be allowed when any terminal services are not performed;

(h) The alteration of any terms and conditions which they may have determined or prescribed;

(i) The reasonableness or otherwise of any charge made by a railway company for any services or accommodation for which no authorized charge is applicable;

(j) The reasonableness or otherwise of any conditions as to packing of articles specially liable to damage in transit, or liable to cause damage to other merchandise;

(k) Whether any merchandise is properly included in the category of dangerous goods;

(l) The granting, variation, or cancellation of through rates with power to allow the rate with or without modification either as to amount or as to terms and conditions;

(m) The apportionment between the railway companies concerned of any through rate.

An entire new classification of freight is now being developed by the Rates Advisory Committee appointed under the Ministry of Transport Act, 1919. This is to be incorporated into the present bill and the constituent companies of each group must put forward before December 31, 1921, standard rates under this classification for their own particular group, for the approval of the Rates Tribunal. The Rates Tribunal is to determine after hearings just what the standard rates shall be for each individual group. No deviation from these standard rates will be permitted except:

(o) Where an exceptional rate has been granted.

(b) Where a special rate is granted for a special and non-recurrent purpose.

(c) Where in the case of two railways connecting the same places the route by the one railway is longer than the route by the other, in which case the company owning the longer route may charge the rate applicable to the shorter route.

(d) Where in the case of fares, fares lower than the standard fares are adopted under conditions prescribed by the Rates Tribunal.

The bill provides for a revision of these standard rates with the approval of the Rates Tribunal.

The bill further provides that the Rates Tribunal shall review the standard and exceptional rates yearly. If it is found that any company is earning in excess of its standard return and it is, furthermore, deemed advisable by the Rates Tribunal, the rates will be reduced so as to absorb 80 per cent of the excess of the net revenue earned during the year reviewed.

### Wages and Conditions of Service

For the settlement of labor disputes the bill provides a Central Wages Board and a National Wages Board, the latter to consider appeals from the former. Councils are to be provided on each railway composed of officers of the railways and representatives of the employees. The constitution and functions of these councils are to be agreed upon by a committee consisting of six representatives from the railways and six from the various railway unions.

The Central Wages Board is to consist of five representatives of the railway companies, three representatives of the National Union of Railwaymen, and two representatives of the Associated Society of Locomotive Engineers and Firemen and the National Wages Board is to be made up of four representatives of the railway companies, four representatives of the two unions above-mentioned, and four representatives of the users of railways.

### Further Powers of the Minister of Transport

The Minister of Transport is to be given authority over the light railways of the realm which has heretofore been vested in the Light Railway Commission. Furthermore, the Minister is empowered to prescribe forms and methods by which the railways are to keep their accounts and statistics.

SAFETY BULLETIN No. 53 of the Delaware & Hudson, reports the number of employees, on duty, killed in 1918 as 40; in 1919 as 18; and in 1920 as 19; and the number per million locomotive miles averaged in the three successive years 2.9; 1.5; 1.4. The numbers injured in the three successive years were 1,615; 920; and 1,815.

The Train Shed for the Boston & Maine Section of the Station Was of an Unusual Construction

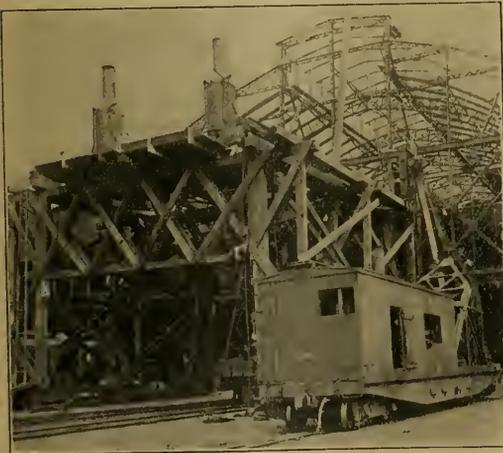

## The Passing of an Historic Passenger Train Shed

Structure Over Tracks of North Station, Boston, Removed  
After Nearly Fifty Years' Service

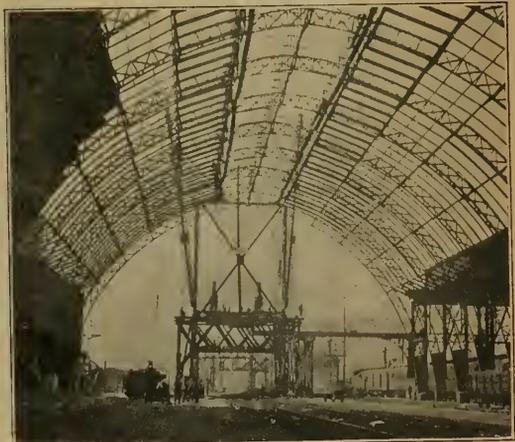

**T**HE RECENT RETIREMENT of the train shed structure over the 23 tracks of North Station, Boston, marked the passing of two noteworthy train sheds. One of these was the arch shed over the six tracks of the original Boston & Lowell station, built in 1872 and one of the first large train

sheds constructed in this country. The other was the shed over the 17-track extension to the original station, built by the Boston & Maine in 1893 and 1894 according to a multiple gable or monitor construction that is unique in American station practice. Loss of metal by corrosion made it necessary to remove these old structures and they have been replaced by platform awnings or sheds of frame construction of the type illustrated in the drawings and photographs. The chief interest lies not in the new structure but in the old ones and the manner of their removal.

The arched roof of the shed was built by the National

Erecting the Traveler Used to Remove the Old Boston & Lowell Train Shed

Under the Old Arch Shed Built in 1872

sheds constructed in this country. The other was the shed over the 17-track extension to the original station, built by the Boston & Maine in 1893 and 1894 according to a multiple gable or monitor construction that is unique in American station practice. Loss of metal by corrosion made it necessary to remove these old structures and they have been replaced by platform awnings or sheds of frame construction of the type illustrated in the drawings and photographs. The chief interest lies not in the new structure but in the old ones and the manner of their removal.

Bridge & Iron Works of Boston, Mass., and erected in 1872. There were at that time no published methods of computing the stresses in parallel braced arches and the contractors deduced the probable weight of material necessary for these arches from illustrations of the St. Pancras arched roof train shed which had been recently built in London. The braced

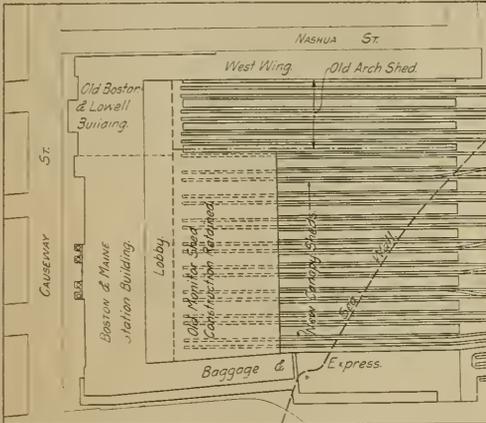

arches for the (old) Grand Central train shed in New York City were in process of erection before erection was begun upon the Lowell railroad train shed, but no information or advice as to computing the stresses could be obtained from the engineers of the New York Central. The graphical system of plotting the stresses in open truss work had not

10,000 lb. per sq. in. and in compression considerably less. The iron used was asserted to have a tensile strength of from 48,000 to 50,000 lb. per sq. in. and the arches weighed about  $13\frac{1}{2}$  tons each."

**Original Structure Extended in 1893**

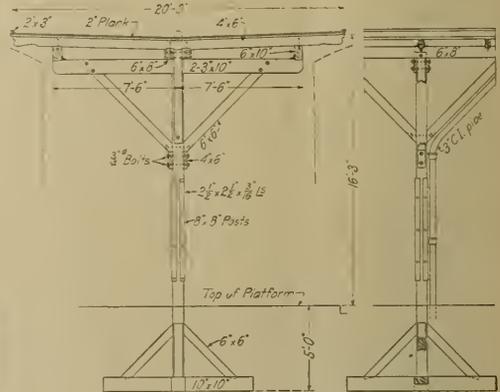

In 1893 the Boston & Maine built a new station building beside the old Boston & Lowell terminal, making such minor modifications in the old station as were required to permit of the use of the combined facilities as a single terminal which has long been known as the North Station. With the completion of this addition, the combined shed substructure was 472 ft. wide by 540 ft. long and covered 23 tracks, with a capacity of 184 cars (of the sizes prevailing in 1893). The train shed built at that time was of an entirely different construction than the old arch shed, consisting of nine spans of roof trusses, each covering two tracks except the one adjacent to the old shed which covered only one track. The roof trusses were supported on posts set in the center of each platform, making a spacing of 39 ft. transversely and 32 ft. longitudinally.

Photographs of the interior of this train shed appearing in the Railroad Gazette of May 25, 1894, showed that this

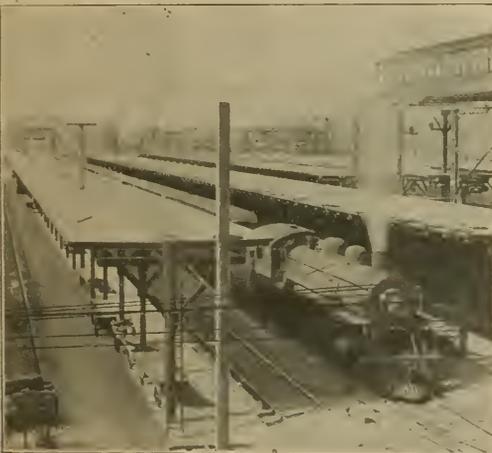

Plan of North Station, Boston, As Now Arranged. The Old Sheds Covered All of the Area Now Occupied by the Canopy Sheds

then been practically developed and a study was made by the use of a catenary chain distorted by weights hung over sheaves with all possible friction eliminated. The calculations were all based upon the braced arches extending to the

Details of the New Canopy Sheds

Type of New Canopies Built. A Portion of the Old Monitor Shed at the Right

shed was of a gable roof construction with a very large proportion of the roof area in glass (reported to aggregate a total of four acres). This design was modified subsequently so that at the time that the structure was wrecked it consisted of a series of longitudinal monitors with flat roofs, the glass area being restricted to the vertical walls of the monitors. This is shown clearly in one of the photographs.

**Problem in Removal of Large Arches**

The recent alterations included the removal of all of the old arch shed except the three ribs nearest the headhouse and over the concourse, since the metal in these ribs was still in fairly good condition. In the case of the monitor type shed the removal was carried back to the last seven panels nearest the headhouse. These were also in good condition, owing no doubt to the fact that the tracks under this shed are used primarily for outgoing trains so that ordinarily the locomotives stood only under the outer end of this shed.

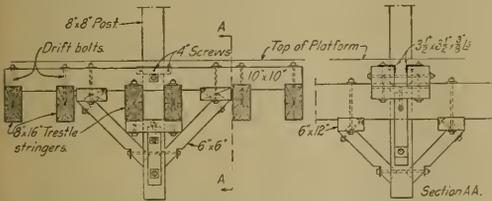

The wrecking of the old arches was undertaken first and represented the most difficult feature of the project, particularly because it was necessary to keep the tracks in this shed clear for use during the morning and evening rush hours each week day. Because of this demand on the use of the tracks under this shed, the wrecking operations were re-

foundation. The foundations of the arches were not calculated to resist the thrust at the bottom of the arches and an iron rod of sufficient size was carried under ground from one arch foot to the opposite foot. The material used was wrought iron of the strength of which no test can be recalled, but the stress in tension allowed under the calculation was

stricted to the hours between 9 a. m. and 4 p. m. on week days and to regular working hours on Sundays when all six tracks could be released from station service.

The work was carried out with the aid of a special traveler designed to stand astride of the two center tracks and capable of being moved longitudinally on rollers and skids on the two adjoining platforms. This traveler supported a pair of stiff leg derricks on a platform 30 ft. above the track level and since these derricks had masts 40 ft. high and booms 70 ft. long, the ends of the derrick booms reached well above the top of the shed. After being relieved of the roofing and purlins and bracing, each arch rib was cut apart at the crown and at the haunches while each half was being supported by one of the derricks and as soon as the cutting had been completed, each derrick lifted down its portion of the rib. After the arches were taken away the lower portions of the ribs or uprights were removed by a bridge derrick car standing on the outer tracks.

The removal of these column portions of the arch ribs introduced one complication along the west side of the train shed owing to the fact that the west wing of the station, which was built after the arch shed had been erected, was supported in part by these columns. As a consequence, the

Method of Supporting the Canopy Posts Where the Platforms Are on the Trestle

east wall of this wing had to be largely rebuilt, providing supporting columns to take the place of the old columns removed. In addition the wall had to be remodeled so that it would support a canopy that was cantilevered from the side of this building as a shelter for the platform adjacent to track No. 23.

Owing to the fact that three arch ribs left standing adjacent to the headhouse extend to such a great height as compared with the new platform canopies, the great open space at the ends of the outer arch left the train concourse at the head of the platforms particularly exposed to driving rain or drifting snow from the west. Consequently, it was found necessary to cover the concourse with a continuous wooden shed designed to make suitable juncture with the canopies.

The removal of the trusses of the monitor sheds was less difficult. The two tracks under one span of this construction were released to the wrecking work at a time and a derrick car occupying one of these tracks lifted off the roofing construction and removed the trusses in turn.

#### Portion of the Train Sheds Over Pile Trestles

The construction of the new platform canopy offered no particular problem, except over that portion of the station where the tracks and platforms are supported on pile trestles over the waters of the Charles river. Here the posts supporting the canopy are carried by a pair of 8-in. by 16-in. stringers, forming a part of the trestle deck, but with the posts extending below the stringers for a distance of about three feet so that they could be adequately knee braced on the underside to secure the required stability.

The wrecking of the old structure and the construction of the new sheds were under the general direction of A. B. Corthell, chief engineer of the Boston & Maine, Boston,

Mass., F. C. Shepherd, assistant chief engineer and B. W. Guppy, engineer of structures. G. L. Huckins, construction engineer, was in direct charge of the work, which was done under contract by the Boston Bridge Company.

## Short Lines to Ask Court to Determine Status

WASHINGTON, D. C.

THE AMERICAN SHORT LINE RAILROAD ASSOCIATION is planning to go to the Court of Claims for the purpose of obtaining a decision as to whether the short lines relinquished by the Railroad Administration just prior to July 1, 1918, were or were not under federal control for the first six months of 1918. This was decided upon at the annual meeting of the association in Washington on May 19 after the members of the executive committee had held a conference with Director General Davis of the Railroad Administration for the purpose of determining their status. L. S. Cass, vice-president, who read the report of the committee at the meeting, said that the Interstate Commerce Commission had held that the period during which these roads were to be reimbursed by the government for losses during the period of federal control under Section 204 of the transportation act, was the 20 months' period beginning July 1, 1918, and it had refused to issue certificates covering the first six months of 1919. On the other hand, the Railroad Administration had refused to pay compensation to the roads for the first six months of 1918 on the ground that the roads had never actually been operated by the federal government. Mr. Cass stated that the director general had told the committee that he might lay their position before the President and ask for instructions, but he would prefer to have the organization join the Railroad Administration in going to the Court of Claims and ask for a ruling as to whether the Railroad Administration was responsible for the six months' period. Mr. Cass said that the director general was of the personal opinion that the short lines were under federal control during that time and that they had been discriminated against by the Railroad Administration, but that he desired a definite ruling from the court. The committee seemed to be of the opinion that the present director general intends to give fair treatment to the short lines and that there are reasons for hoping that the situation would be straightened out soon.

#### A Short Line Purchasing Agency

Action was also taken at the meeting in the direction of establishing a purchasing department of the association to handle purchases for such short lines as desired to take advantage of the opportunity on a co-operative basis. At the last annual meeting the president of the association was authorized to establish such a department, the necessary funds to be provided by borrowing from the general fund of the association. The association, however, did not have sufficient funds available and nothing had been done in that direction. A resolution was adopted authorizing the President to establish a purchasing agency under a plan by which the necessary funds could be contributed by the roads that desired to take advantage of the opportunity and urging the railroads not to make individual purchases until after they had consulted the purchasing agency to ascertain whether it could effect a saving. There was a suggestion that the agency should be created as a joint stock company, the stock of which would be held by individuals or individual members. It was stated that the Interstate Commerce Commission was inclined to regard the present purchasing methods of some of the short lines as extravagant and that it would look with favor upon a plan for effecting economies.

There was a considerable discussion at the meeting of the

serious effect on the traffic of the short lines in many communities and the competition of motor trucks and auto busses handling freight and passengers for hire on highways paralleling the railroads, which are taxed to sustain the highways while the competing motor truck lines are not required to pay adequately for their share of the maintenance of the highways. A resolution was adopted to be put in appropriate language later by the officers of the association, taking the position that automobile transportation for hire should be required to pay an adequate share of the taxes and be subject to some form of regulation which would require them to abide by published tariffs and regular schedules. Another resolution provided for a recommendation on behalf of the association to the Congressional committee having jurisdiction over federal aid to state highway construction that the federal assistance should be rendered only on condition that the users of the highways for the carriage of freight or passengers for hire be required to contribute proportionately.

Accounting Methods

Another point of discussion was the necessity for improvement in the methods of accounting, particularly in view of the necessity for having the accounts in shape to present claims to the Interstate Commerce Commission under Section 204 and in view of the closer scrutiny now being given by the commission to the subject of railroad expenditures. A letter was presented from Commissioner Eastman of the Interstate Commerce Commission, calling attention to the great difficulty experienced by the commission in handling the claims of the short lines because of the fact that so many of them have

A resolution was adopted opposing any general reductions in rates at this time, but expressing the opinion that there ought to be a reasonable readjustment of the existing rate structure after business has increased and the railroads get into a better condition.

The present officers of the association were re-elected, but it was decided to increase the membership of the executive board by adding a new Pacific Coast district and dividing the membership of the board among the four districts, Eastern, Southern, Western and Pacific, in accordance with the grouping used by the Interstate Commerce Commission in the general rate advance case. C. M. Oddie, G. F. Dietrich and D. M. Swobe were elected additional members of the board for the Pacific Coast district.

Freight Car Loading

WASHINGTON, D. C.

Freight car loading showed a good increase during the week ended May 14, according to the weekly report of the Car Service Division of the American Railway Association. The total was 750,158 as compared with 843,145 in 1920 and 739,945 in 1919. This is a gain of 32,000 cars in a week and shows a gain over the corresponding week of 1919 almost for the first time this year. A large part of the gain as compared with the previous week was in the coal loading, which amounted to 161,782 cars.

The summary of the report follows:

REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY--ALL DISTRICTS; COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. FOR WEEK ENDED SATURDAY, MAY 14, 1921

Districts:	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise L.C.L.	Miscellaneous	Total revenue freight loaded					
										This year	Year	Two years ago	Per cent

Increase compared 1919	1919	32,004	26,553	165,964	5,160	51,660	42,562	215,524	235,538	750,158	843,145	843,145	843,145	501,228	620,196
Increase compared 1919	1919	3,708	5,804	1,826	4,773	15,063	28,549	100,076	92,987	100,076	92,987	92,987	92,987	118,968	118,968
Increase compared 1919	1919	2,414	584	4,182	5,126	2,295	19,756	185,664	185,664	185,664	185,664	185,664	185,664	39,727	39,727

L.C.L. merchandise loading figures for 1921 and 1920 are not comparable as some roads are not able to separate their L.C.L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

Date	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise L.C.L.	Miscellaneous	Total revenue freight loaded	Received from connections
May 7	1921	34,847	27,123	143,323	4,626	48,095	13,041	213,535	233,435	718,025	843,184
April 30	1921	34,426	29,909	145,010	4,659	84,554	7,725	213,792	277,922	721,997	800,960
April 23	1921	32,735	26,602	138,376	4,393	46,713	5,691	211,627	235,010	704,527	717,772
April 16	1921	33,367	26,530	135,658	4,365	47,909	4,941	214,082	237,044	703,896	601,695

apparently failed to appreciate the necessity for keeping their accounts in conformity with its regulations. He called attention to the fact that it had been necessary to withdraw the commission's examiners from some of the roads until the accounts could be re-stated in accordance with the regulations, and urged the importance of a reform in the accounting practices of some of the lines, suggesting that they take steps to acquaint themselves with the commission's accounting regulations and particularly those pertaining to the destruction of records. A resolution was adopted under which the president of the association was authorized to take into consideration the establishment of an accounting department of the association to assist the roads.

The freight car surplus for the week ending May 15 was 450,453, a reduction of 21,000 as compared with the previous week. Of the total 170,595 were box cars, or about 4,000 less than for the week of May 8 and 202,348 were coal cars, a decrease of 18,000 in a week.

A total of 309,971 freight cars, or 13.5 per cent of the total, were in bad order on May 1, according to the semi-monthly report of the Car Service Division. Of these 228,219, or 99 per cent, required heavy repairs and 81,752, or 3.6 per cent, required light repairs.

On the same date 18.8 per cent of the locomotives were out of service for repairs requiring over 24 hours and 5.4 per cent for repairs requiring less than 24 hours.

# Selection and Maintenance of Office Equipment

## Pennsylvania's Methods—Committee Must Pass on All Requisitions—History for Each Device

By D. T. Jones

Assistant to Purchasing Agent, Pennsylvania Railroad, Eastern Region.

WITH THE GREAT INCREASE in the use of mechanical devices in railway offices in recent years adequate supervision over the operation and maintenance of these devices and the intelligent selection of additional equipment of this character have become problems worthy of considerable study on the part of railroad officers. A carefully planned system of choosing, maintaining and supervising the utilization of these machines has been evolved by the Pennsylvania by careful study over a number of years and has been found effective in producing the desired results.

Mechanical devices have been used in the offices of this road for many years. They have assisted the clerical forces in the performance of their work by relieving much of the mental strain and have produced a more efficient and accurate

the purchase price of the equipment will prove to be only the first installment of continued expense.

### Committee on Office Mechanical Devices

The nucleus of the Pennsylvania's method of solving this problem is the committee on office mechanical devices. This committee is composed of officers representing the purchasing, accounting and operating departments and all requisitions for new equipment must be approved by it. Every requisition submitted to this committee must bear the signature of the general superintendent, if it comes from an operating office, or from the proper superior officer, if it is from other than an operating office.

Data relative to the need for the equipment must be fur-

GENERAL OFFICE, BROAD STREET STATION,  
Philadelphia, Pa.

File 818  
Broad 495

Dear Sir:—

In connection with requisition dated

Consignee:

Calling for

Please note numerical numbers under classification listed below— which is a cross reference to enumerated data on the reverse side, which must be submitted in detail prior to Committee action on your request.

- A. Typewriters ..... 1-2-3-4-5-6-7-8-9-10.
- B. Typewriter Adding.... 1-2-3-4-5-6-7-8-9-10-11-12.
- C. Adding—Listing ..... 1-2-3-4-5-6-8-9-11-12.
- D. Calculating ..... 1-2-3-4-5-6-11.
- E. Dictating ..... 1-2-3-5-6-12.
- F. Duplicating ..... 1-2-3-4-5-6-14.
- G. Numbering ..... 1-2-3-5-7-13.
- H. Registering Time ..... 1-2-3-5-14.
- I. Pencil sharpeners..... 1-2-5.
- K. Scales ..... 1-2-5-15.

An early reply will be appreciated, thus assuring prompt attention to your requisition.

Yours truly,  
Chairman, Committee.

#### DETAIL OF DATA TO BE SUBMITTED FOR COMMITTEE CONSIDERATION.

1. Is it additional equipment?
2. a Is it a direct replacement, if so why?  
b Is it a re-arrangement to provide additional equipment for some other office? If so outline in detail, basing your answer as applying to the office receiving the additional equipment.
3. Its use: (a) Approximate hours in service daily (b) semi-monthly (c) monthly.
4. Character of work: (a) outline in detail giving samples or quoting form numbers; (b) show volume of each, daily, semi-monthly and monthly.
5. What are conditions in office affected? (a) Is request caused by an increase or a decrease in number of employees? (b) Total number of employees at present. (c) Number of employees using present equipment. (d) Number of employees who will use additional machines. (e) The number of devices similar to one requested.
6. Why is make mentioned preferred to others?
7. Style type preferred.
8. Size carriage; give dimension of largest blank to be used.
9. Do you need any special attachments?
10. For billing, reports or both? If the former, fanfold, single or double?
11. Adding or calculating capacity; number and size of registers desired?
12. Hand or electric? If latter give current and voltage.
13. Is movement to be consecutive, duplicate and repeat or otherwise?
14. Automatic or electric?
15. Standard; mail or parcel post? The former, beam to 4 lbs., the latter spring to 24 lbs.; which is preferred?

Fig. 1—The Form of Questionnaire Sent by the Committee to Offices Ordering Mechanical Devices

service at a decidedly decreased cost. The use of mechanical devices in an office may be compared to the use of automatic signals, instead of hand motion signals, in the movement of trains. They promote safety and accuracy and save valuable time.

On a large railroad any important change in the methods of office work is fairly sure to disarrange the work and call for temporary additional expense and the Pennsylvania is no exception to this general rule. The introduction of mechanical devices has occasioned inconvenience in varying degree, but the final results in each case have been satisfactory. With the value of mechanical devices in office work once established the problem resolves itself into one of determining methods for selecting the most efficient machines to meet the requirements of each particular office and, after the machines are purchased, of supervising the utilization and maintenance of the equipment. Unless due care is taken in these matters

nished in accordance with the inquiry blank shown in Fig. 1, which is required to accompany all requisitions. Whenever necessary, a personal investigation is made by an expert on mechanical devices who makes reports and recommendations, first, as to the necessity of the purchase, and, second, as to what is the most efficient machine, at least cost, which will meet the needs of the office making the request. All requests for trial machines must be submitted to the committee.

Experience has proved that offices making requests for new equipment, or for trials of new equipment without the information which the committee has available, are often at the mercy of manufacturers' representatives who make attractive demonstrations. It is not an uncommon occurrence to have requests made for machines costing several hundred dollars, when a device costing much less is better adapted to the needs of the office.

Requests are often made for the machines of a special type,

posed of to the one who offers to allow the company the highest credit for the used machines.

### Repairs

The extent of repairs to machines by the department is limited somewhat by the size of the force and the available facilities. Some of the work done in this department may give a better idea of its effectiveness: Typewriter cylinders are recovered at a cost of 50 cents, representing a considerable saving over the purchase of new cylinders which cost from \$2 to \$3. Broken main frames of typewriters are welded at a total cost of \$7 or \$8 instead of purchasing new ones at a price of \$20 or \$25 each. At least 80 per cent of the cost of overhauling and repairing this equipment is a labor charge, and the greater part of the work of dismantling, cleaning and assembling does not require great mechanical skill. By employing junior repairmen at relatively low wages the company is able to effect a considerable saving in cost over the high rates paid to outside concerns for this work.

In order to facilitate the giving of shipping directions on machines and to insure prompt and efficient handling of them when they arrive, a system of records is kept as shown in Fig. 5. This card is filled out in triplicate as soon as directions for shipping a machine are given. The memorandum under which these orders are issued is numbered and the office which ships the machine affixes this number to the box in which the machine is packed. When the machine arrives the receiving clerk notes the memorandum number and refers from it to the form, Fig. 6, which shows exactly what is to be done with the machine. On each of these cards, Fig. 6, the date of receipt is then stamped. One card is then filed under the memorandum number, another is sent to the repair department for its work file and the third is attached to the machine. When the machine is repaired by the department's repairmen, the reverse side of the card on the machine and its duplicate in possession of the repair department are filled out. This card is then sent to the department office and the cost of repairs and other data are taken from it and filled in on the individual machine card and the repair requisition and all the correspondence connected with the transaction are properly filed. This method has been found to provide an excellent check on the receipt and disposition of equipment.

## The Northwestern Pacific's Safety Organization

By William S. Wollner

General Safety Fire Prevention and Welfare Agent, Northwestern Pacific, San Francisco, Calif.

**P**RIOR TO THE PERIOD of federal control, the responsibility for the safety of employees and patrons of the Northwestern Pacific was vested in the division superintendents and in the heads of the various departments. During federal operation, however, a safety department was organized under the uniform plan recommended by the Safety Section of the United States Railroad Administration. This organization, as inaugurated in September, 1918, consisted of a general safety agent, a safety supervisor, a general safety committee and four subordinate safety committees. The general safety agent, the safety supervisor and all the members of the five committees were appointed to their positions by the general manager of the road; the "officer members" permanently, and the "alternating members" for a period of six months.

The alternating or employee members selected in this way were the local chairmen of the various brotherhoods and other employee organizations. Fortunately it happened that the committee personnel which this election produced was of such high character that the safety organization functioned

as it was intended. At the same time it was realized that this method of choosing would eventually produce a different personnel not fitted to secure these good results. The fact that members of the safety committee were selected by the management might lead the employees to look upon this organized effort for safety as a scheme adopted solely in the interest of the company. Furthermore, the selection of organization chairmen or other organization representatives might easily result in the safety committee meeting assuming the character of a "grievance conference."

Realizing that the securing of increased safety is very largely a problem of the human element and that, in consequence, the responsibility must be placed primarily upon those most interested, the Northwestern Pacific, in January, 1919, issued the following statement to its employees, outlining a new plan:

"The term for which employee members of our various safety committees were elected will expire February 28, 1919.

"In replacing the retiring committeemen, the safety department wishes to experiment with a plan which should create a craft which is truly representative of all the employees; if this plan operates successfully, its use will be continued in the future.

"The method to be followed in this election is: Each retiring safety committee member will nominate two men of his own craft, one of whom is to be elected as his successor. These nominations are to be made immediately and ballots will be printed, carrying the names of all nominees, and a space where the name of any other person may be written in.

"A ballot will be handed to each employee with his pay check for services rendered during the first half of the month of February. Each employee should indicate with an "X" or by writing the name on his ballot of the man he wishes to represent his craft on the safety committee, and hand the ballot to the retiring committeeman who has represented the craft. The ballot will carry nothing to indicate by whom it was cast. Retiring committeemen will canvass the ballots and furnish the names of their duly elected successors to the chairmen of committees."

This method of electing safety committee members proved so successful that upon the expiration of the term for which they were elected, that is to say in February, 1920, a similar election was held. A further change was made at this time by having each retiring safety committee member nominate three fellow craftsmen instead of two. By another ruling, ballots were forwarded to safety committee secretaries instead of being handed to the retiring committeemen.

The results of the third election that this road has held for safety committee members has just been announced. This last balloting, it is believed, shows a further improvement. Publicity was given to the election several months before it was held through the medium of the company's bulletin. It was desired that the interest of every employee be stimulated, since it appeared likely that the employee who took an interest in the election would also be concerned with the general safety program. Each safety committee member who had been elected a year before by the votes of his fellow employees was asked to nominate three fellow craftsmen, one of whom would be elected as his successor. The nominations were made to the safety committee chairmen who in turn forwarded them to the general safety agent. In the previous election, the names of all candidates had been printed on the ballot, but some of the employees called attention to the possibility of men voting for other than members of their own craft. They pointed out, for instance, that if engine-men and firemen were interested in the election of a certain conductor, they might place him in office regardless of the desire of the majority of the other conductors. It was decided, therefore, that in this election the ballots distributed among the members of each craft should contain only the names of the candidates from that craft.

The large proportion of our employees who voted in this election indicated the real interest that they are taking in safety matters in general. At the present time the Northwestern Pacific is instituting a special campaign to bring before safety committee members their responsibility for the prevention of accidents caused by unsafe practices, as well as those caused by unsafe conditions.

It is believed that the realization by the individual safety committee members of the fact that he has been elected to office by his fellow craftsmen as their representative increases his sense of responsibility for their safety.

# Railroad Hearings Before Senate Committee

## Testimony by A. H. Smith and Howard Elliott Regarding Causes for Poor Financial Showing of the Railroads

WASHINGTON, D. C.

**A.** H. SMITH, president of the New York Central Lines, concluded his statement before the Senate Committee on Interstate Commerce in the railroad inquiry on May 23 and was followed by Howard Elliott, chairman of the Northern Pacific. Mr. Elliott began with a general statement, followed by a statement applying more particularly to the Northern Pacific. He said in part:

### Transportation Act Not Responsible for Present Conditions

There is much discussion in this period of business depression and deplorable results from the operations of the railroads about the recent Transportation Act and whether it is a wise or unwise measure and can accomplish what was expected.

Final judgment of this act now would be like judging some great manufacturing plant before it had been furnished the raw material to be used. The Transportation Act was to apply to something like normal conditions and was not intended to be a "cure-all" for a world-wide depression of unexpected severity in all kinds of business.

The act did not undertake to create commerce; its object was to insure to the public adequate means of transportation and to this end secure the safety of securities of sound railroads; to protect the existing transportation machine and to encourage its development to meet the needs of the country; to regulate the transportation of commerce by railroads in such a way that those engaged in that business, either owners or employees, should, if possible, have a fair return for services rendered to the public.

One provision of the act provides that until March, 1922, the rates shall be such that, as nearly as may be, there will be a return of 5½ per cent or 6 per cent on the fair valuation of the railroads, but the act did not and could not insure the business necessary to earn such return.

If the policy of extreme regulation of the railroads by the government is to continue, then this particular provision of the act is of great importance.

The Transportation Act and the principles and rules contained therein are not responsible for the present unfortunate disappearance of railroad net earnings. The Congress, the public, the railroads, and the labor organizations should do all they can to help those upon whom the very great responsibility is imposed of administering the act.

Two boards, with vast powers over the railroads, are set up; one dealing with rates and regulations affecting commercial questions, and the other with wages and rules about wages and working conditions.

If those two powerful boards, one in Washington and one in Chicago, with no close relations between them and with no common authority over them, short of the Congress, and with their large membership, should find that the questions submitted to them are so numerous that they are unable to act promptly and decisively, then no matter how good the fundamental principles may be, there is danger that the full benefit of the law will not be obtained.

I know that it is the earnest desire of the officers of the railroads to cooperate to the best of their ability, both individually and collectively, with the commerce commission and the labor board, to make the administration of the act effective and to obtain the results intended when the act became a law. Much has already been done in this direction, and the managements of each road are all the time hard at work on the home road, and through various associations of executives, operating and traffic officers, working together and with the commission and labor board to improve results and obtain, to as great degree as practicable, for all roads what the law calls for—"honest, efficient and economical operation."

A railroad is a complicated and delicately adjusted manufacturing plant and its product is transportation, manufactured daily and in countless forms, and under widely varying conditions. Its product, however, must be used as produced; it cannot be stored up for the future. Other people are manufacturing other commodities; generally they can raise their prices in prosperous times and can store their products in poor times for future delivery, or close their plants entirely; the railroad has not been allowed to raise its prices to the extent that the manufacturers and producers have and it has nothing accumulated from the large business of

the past few years to care for the present period, and it cannot close down its plant.

It is self-evident that the railroad, manufacturing transportation, cannot, on a falling business, long continue to be a solvent enterprise, if it cannot, as other manufacturers do, have some control of its income and outgo and pay wages substantially on the same basis as may be paid by other employers in similar territory. This is not the case to-day and the inability of the railroad to adjust promptly its costs to meet depressed business conditions is the chief cause of the present situation.

### Results on Northern Pacific

During the past 20 years, about \$430,000,000 has been spent by the Northern Pacific for additions, improvements, betterments, equipment and new lines, so as to make a better transportation machine for the development of the country. Here are statements showing the general financial data for the Northern Pacific for the years ending June 30, 1912, 1913, 1914, 1915, 1916, 1917, and for the calendar years ending December 31, 1918, 1919 and 1920. Figures for the average of the three years ending with June 30, 1914, are given, also for the three years ending June 30, 1917, and so-called test period.

	1st Period	2d Period	1919	1920
Operating revenue.	70,111,933.62	74,860,736.16	101,474,968.80	111,872,097.43
Operating expenses	43,022,796.93	41,559,336.84	78,672,509.37	100,983,374.19
Operating ratio....	61.36	55.56	77.53	90.26
Transportation ratio	31.86	29.05	37.71	43.29
Net Ry. op. income	24,667,774.81	30,196,329.98	15,104,113.74	6,737,147.87
Income balance after interest and 7 per cent div....	3,097,689.17	6,854,944.36	*6,597,407.53	*15,741,260.00

\*Deficit.

This statement shows that the operating revenues of the property increased from the first period, \$70,111,933.62, to \$111,872,097.43 for 1920, but the ratio of operating expenses to earnings increased from 61.36 per cent to 90.26 per cent and the ratio of transportation expenses to revenues increased from 31.86 per cent to 43.29 per cent. The result was that while the property, for the period ending June 30, 1914, paid all of its expenses, taxes, interest, a 7 per cent dividend and had \$3,097,689.17 left, in the year 1920, with an increase of over \$41,000,000 in gross revenue, the expenses had so increased that it failed to meet expenses, interest, taxes and dividend charges by \$15,741,260.

The figures also show that the efforts of the company, its officers and men, to improve operating methods, resulted in a reduction of the operating ratio in the second or test period to 55.56 per cent for all expenses, and to 29.05 per cent for transportation expenses (an improvement over the first period) which, however, under government wages, methods, etc., increased to 77.53 per cent and 37.71 per cent respectively for 1919, and to 90.26 per cent and 43.29 per cent respectively for 1920. This very great increase in the amount of each dollar of operating revenue used in operating expenses was, for reasons already fully explained by the previous witnesses, beyond the control of the railroad operating officers.

In the case of this particular property, the figures for units of service produced from the use of tracks, cars and locomotives show, in the main, a steady improvement, as per the following figures:

	Test period	1919	1920
Net ton miles per road mile....	1,218,310.	1,310,924.	1,364,961.
Av. gross tons loco. mile.....	1,366.7	1,347.6	1,350.5
Av. tons per loaded car mile....	23.9	26.7	27.3
Per cent of net ton miles to gross	46.66	48.09	48.74
Per cent of loco. miles to train miles	111.41	113.17	113.04
Per cent of loaded to total car miles	72.45	71.20	70.58
Av. miles per frt. car per day....	26.6	27.5	32.9
Net ton miles per car day.....	461.	522.	633.7

It will be noted from this table that the amount of tonnage over each mile of track, the loadings of engines and of cars, and the movement per day of cars were better in 1920 than in 1919, or than in the test period, clearly showing that if wages, working rules and prices of coal and other materials necessary to carry on the business had been on the same basis as in the test period, the costs would have been lower in 1920 than in the test period.

### Effect of Increase in Expenses

Statements are herewith submitted in considerable detail showing various units measuring the operations of the railroad for

the test period for the years 1918 and 1919, and for the year ending December 31, 1920. These statements show that the physical use and operating performance of the railroad in 1920 was equal to, and in many items better than during the test period, and the same compared with 1919. This shows clearly that good use was made of every part of the plant, as already explained in the figures for density of traffic, car loading and movement, train loading, etc., and indicate that the increases in expense do not come from mismanagement, but from higher costs for fuel and materials, increases in wages, and the disturbing influences generally of the war affecting, as they did, the morale and general effectiveness of large bodies of men in all walks of life.

The following figures are interesting on this point:

	Test period	1919	1920
Total expense per mile of road.....	\$6,408.61	\$11,934.71	\$15,178.04
Aver. cost, maint. of way per mile of main track.....	1,293.96	2,187.32	2,806.02
Operating revenue per train mile.....	3.54	4.79	5.11
Operating expense per train mile.....	1.97	3.71	4.61
Net oper. revenue per train mile.....	1.57	1.08	.50

## Number of Employees, Hours

### Worked, and Compensation

In 1917, the average number of officers and employees managing, maintaining and operating the road was 31,887; they worked 1,312,420 days, and 91,710,810 hours, and received \$35,877,879.

In 1919, there were employed 33,700 officers and employees, who worked 1,286,092 days and 80,886,575 hours, the compensation amounting to \$52,605,395.

In 1920, the average number of officers and employees was 35,553, working 1,371,933 days and 86,058,373 hours, receiving therefor \$66,503,794; on the basis of the wages fixed by the Labor Board and applied to the entire year, 1920, their compensation would have been \$69,975,740, very nearly double the amount of money for a smaller amount of time worked than in 1917.

### Some Reasons for Decline in Net Revenue

The remarks already made and various statements submitted have a bearing on the first, second and fourth questions of Senate Resolution No. 23.

Speaking for the Northern Pacific and considering the first paragraph of the resolution, the increases in expenses and the consequent decrease in net earnings are due almost entirely to causes beyond the control of the management, and what is true for the Northern Pacific is true for other roads; namely, to

The increases in wages brought about by war conditions and by orders of agencies of the United States government.

The more general application of the 8-hour day, greater payments for punitive overtime, changes in rules and working conditions, all as a result of governmental action and orders; and also to the general disturbed morale incident to the upheaval of the world war.

The increase in prices (over which the carrier could have very little control) of fuel and materials due in part to higher wages paid for the production of said fuel and materials, and to the excessive demand for them during the war period and for some time after.

The increases in taxes, affecting all business and individuals.

The increase in the volume of passenger train service given in 1920 as compared with 1919, because of the desire of the railroad managements to restore, in part, the unexcelled service given prior to the war.

While it is true advanced interstate rates were authorized, taking effect September 1, such rates were only in effect for one-third of the year in interstate business, and on intra-state business were in effect less than one-third of the year in all of the states traversed by this company's lines, and in one state, namely, North Dakota, the new rates are not in effect to-day. Therefore, the increased revenues derived from these new rates were not anywhere near sufficient to offset the increase in expenses due to the causes already given, or to produce the result anticipated.

The wage award of July 1, retroactive to May 1, increased wages for four months \$3,818,033, for which there was no corresponding increase in rates.

Maintenance of way increased in 1920 over 1919—\$4,780,000. This was brought about by the following conditions:

The railroad of the Northern Pacific was under-maintained during the period of federal control and sustained itself, in part, because of the very high standard of maintenance in years gone by and the unusually good condition in which it was when it was turned over to the Government on January 1, 1918.

The wages under the Labor Board's award, retroactive to May 1, 1920, were on a much higher basis than in 1919, together with time and a half for overtime for all maintenance of way employees.

The cost of much material used in 1920 was, on the whole, higher than in 1919.

When the properties were turned back to the companies, they had a very proper and praiseworthy desire to restore them as

quickly as possible to a condition to serve the public thoroughly well, on the theory that in the autumn of 1920, there would be a very good business, and it was most desirable to have maintenance work well out of the way, thus permitting the maximum attention to the moving of the business. For these reasons, maintenance work was pressed vigorously in 1920.

### Effect of War Conditions on Efficiency

As to paragraph 4 of the resolution about efficiency. It is proper to say that the officers of the railroad of every rank were, during the war and the period of federal control, as patriotic and as energetic and helpful in doing their allotted tasks as any class of men in the United States. They were, however, disturbed over a change in their relation to the properties where many of them had spent their lives; they did not know what their relations were to be in the future; their powers and responsibilities were changed and in some cases reduced; decisions that they formerly could make promptly were made at some point off the road or in Washington; discipline was weakened; and there was an increasing tendency to long-distance management, and the affection and pride of the officer in his particular road was weakened by telling him he did not work for that road but for a part of a United States system of railroads. In an effort to save a relatively small amount in supervision, men were given more territory and spread out too thin, out too thin.

All of this had some effect on the mind and courage of the officers, and we all know that suspense and uncertainty have a disturbing effect in efficiency. But in spite of it all, the officers of the railroads did splendid work during the period of federal control and they are "on their toes" now to get the best results they can since the properties came back to the owners.

In addition "leadership," so important in any undertaking, was changed and men looked to the officers on their division or on their road to a much less extent than formerly, for reward for good work or punishment for bad. They rather looked to some more distant person or board in Washington and to the head of their union.

The relation between the men and management, which should be close, co-operative and friendly, without interference from outside if the best results for the country are to be obtained, was not so close as in pre-war times.

There was less interest, there was more slack and careless work and not as high efficiency as prior to the war. This condition was not peculiar to the railroad employee; everyone knows that it existed in the household, the store, the office, on the farm, in the factory and the mine, as well as on the railroad. It had a marked effect on the cost of everything and on the cost of maintaining and operating the railroads. It is difficult to measure that cost in dollars and cents and operating officers have varying opinions in accordance with their personal experience and the part of the country in which they worked. Generally the conditions were better the further away you got from Washington, and from those manufacturing and shipbuilding regions where the necessity of the war required that production be speeded up regardless of costs.

Estimates have been made that efficiency at times was only 50 per cent of the best pre-war record, and from that up to 65 per cent, 75 per cent, and 80 per cent, and in some cases were 100 per cent, but the consensus of opinion is that there was a noticeable reduction on the whole.

Officers and men since federal control have slowly been getting together again and the disturbed conditions developed during the war and federal control are improving, and began to change for the better in the autumn of 1920, when it was evident that the man wanted the job rather than the job the man.

### Effect of Increases in Rates

The third paragraph of the Senate resolution relates to the reasons for the fall in business and the influence of increased rates in causing such fall. I have made many inquiries of all kinds of people during the past few months about this question because the decrease in the volume of the business on the road I represent has been as severe as on any road. The almost universal opinion, and my own judgment coincides, is that the increase in rates has been a negligible element in the decrease in the volume of business.

The reduction in the volume of business, in my judgment, results from many causes entirely distinct from the increase in freight rates. Merchants and manufacturers had accumulated stocks of goods at the end of 1919 and in 1920, bought at high prices, and they were naturally slow in reducing prices. The retailers were in the same condition; orders for foreign and domestic goods were cancelled; raw materials were not moving because no one would buy them, until it was evident that stocks of finished goods already on hand could be disposed of and until there was a demand for new stocks. The reaction from the extravagance of the war, the increasing unemployment, the fall in the price of farm products brought sharply to the attention of thousands that it was necessary to save. Buyers, hoping that

prices would fall, were waiting until they thought the bottom was reached and there was a widespread buyers' strike.

The aftermath of the war, the inability of Europe, one of our best customers, to buy and pay for goods, the disturbed condition of foreign exchange, the long delay in settling the war, and the question of the German reparation are all very vital factors in the world situation which affects the United States most seriously.

Making a general reduction in freight rates will not help solve the present complicated, economical and psychological conditions in this country, but will reduce still further the ability of the railroads to survive and become buyers themselves of those articles which, when they are prosperous, they use in such large quantities.

In saying this, I do not mean that no rates should be readjusted, because there are some now in process of adjustment, but I believe it would be unfortunate to give the impression at this time that the railroads can be sustained, as contemplated by the Transportation Act, and, at the same time, make any general reductions in freight rates, until it is evident that expenses have been reduced enough to justify such reduction.

It should be remembered that prior to governmental control the general level of rates in the country was not enough to sustain the carriers and to permit them to expand and take care of the growing business of the country. The director general recognized this and in 1918, attempted to bring his income up to his outgo by increasing freight and passenger rates, but the increase in expenses during federal control overtook the increase in rates, as has already been shown by the figures submitted.

Prior to the end of federal control, the director general was urged repeatedly to bring the earning power of the roads back at least to the 1917 basis when the government took them over, by increasing the rates as he alone had the power to do; but he declined, claiming it was better to make up deficiencies in railroad operations from the general funds of the Treasury, although he did take action in regard to the working rules which still further increased the cost of operation. So the railroads were turned back with their earning power practically annihilated and nowhere near the basis of 1917 which, in itself, was too low for the general health and growth of the transportation machine.

There was no "inflation" of railroad prices to a point where any large profit was received, as was the case with many industries; in fact, no profit was made at all in 1918, 1919, and 1920, so there is no basis for "deflation" of railroad prices or rates at the present time. Rather there is a necessity for holding them where they are until the country finds out what will be the results on the railroads under the new Transportation Act and the orders of the Commerce Commission and the Labor Board.

The Transportation Act recognizes the possibility that rates may produce earnings that are too high in the judgment of the commission, by providing in such cases that any excess shall be disposed of partly to the owners for certain defined purposes, and partly to the government, to be administered for the common good. To-day, considering the sore distress of the railroads and the fact that very few of them are earning enough to more than pay expenses and taxes, and many not even that much, the sound national policy would seem to be one of liberality to the roads in their rate structure, rather than parsimony, because, as already stated, any excess earnings are disposed of by law. In addition, the power at all times rests with the commission to reduce rates if and when the rates are earning enough to comply with the principles laid down by the Transportation Act.

### Development of Regulation

The gradual development of the law since 1887 has been in the direction of encouraging and protecting the buyer of transportation and safeguarding him from possible injustice, extortion and unwise financing on the part of the producer. Admitting for the sake of argument that this course was necessary, the time has come when the producer of the transportation must be protected and encouraged or he will be unable to furnish the transportation needed by the buyer at any price.

The Transportation Act is a protecting and encouraging measure and reflects a growing public opinion that legislation has gone too far in reducing the earning power of the carriers. The recent repeal of the full crew law in Pennsylvania is another indication of this.

I believe the Transportation Act should be given a fair trial under more normal business conditions than exist today, and that before making changes it should have such fair test.

Regulation of private corporations serving the public is necessary, but I believe that the best results can be obtained for the public by allowing the individual, in any kind of business, the maximum freedom of action consistent with due protection of the public interest.

The Hepburn act in 1906 took away from the railway owner and manager the right to make effective the price at which he should sell his service to the country. The Commerce Commission found itself subjected to pressure of 100,000,000 buyers of

transportation who thought that their interest was in getting the lowest rates, regardless of the effect on the seller of the transportation. The influence of the great body of buyers has been more powerful than that of the smaller number of sellers and the general tendency has been towards rates entirely too low to maintain the railroads properly, pay satisfactory wages, and make such return to the owners that they can continue in the business and increase their plants.

Congress recognized this situation in the rule of rate-making in the new law which gives the commission instructions and support in allowing rates that will enable the owner to carry on the business and furnish the necessary transportation to the public. With a more normal volume of business it is reasonable to believe that this principle in the law will produce the results anticipated.

Congress also in passing the act reflected the opinion of the country that it wanted its railroads owned and managed by private individuals. Imposing this responsibility upon the owner necessarily carries with it the idea that he shall be allowed reasonable freedom to act so as to produce the results expected from him. In interpreting and administering the law, it is certainly a sound policy to give the owner, who is responsible for the results, the maximum of freedom, consistent with the public interest, so that the undoubted talents and ability of the American business man can be exercised.

I believe that the tendency of the laws and the administration of the Transportation Act and, if it should be found necessary, any new legislation should be along the line of permitting the owner and manager to utilize to the highest extent, compatible with the public interest, his vision, enterprise, judgment, initiative and skill.

In creating our railroad system the work was done through the courage, brains and money of the individual man who developed a wonderful transportation machine with the lowest rates, the best service and the highest wages of any railroad system in the world. I believe the owner and manager can continue to do this in his activities are not curtailed too much.

The wage cost for operating a train one mile, Mr. Elliott said, was \$2.92 in 1920 compared with \$1.47 in 1917 and \$2.39 in 1919 while if the wage increases made by the Railroad Labor Board in last July had been in effect the entire year, the average cost per train mile would have been \$3.07.

The cost per mile run by all freight locomotives in February last was \$124.46 compared with \$96.93 during that month the previous year and \$59.42 during that month in the test period, 1915-1917. Cost per mile run by passenger locomotives was \$71.21; \$58.56 and \$34.61 during those periods.

"I give these figures," he continued, "because they show that increase in locomotive costs in 1921 has not been due to poor management or the inability of the locomotives to handle the business, but is due to higher cost of fuel and materials, changes in working rules and conditions and to increased wages."

Mr. Elliott called attention to the "very significant effect caused by the increase in the prices of materials and wages, the rules in the so-called national agreements and the general disturbing effect of the war" on the cost of repairing freight cars and locomotives. This together with the financial condition of the carriers, he said, has resulted in an increase "to beyond the danger point" in the amount of equipment out of repair because the carriers have not got the money with which to make such repairs.

Approximately 13.8 per cent of the cars owned by the Northern Pacific are in bad order, he said, of which about 4,000 require heavy repairs, requiring approximately \$1,500,000 to repair. On April 15, he said, statistics showed about 19 per cent of the locomotives on the railroads of the country were in need of repairs requiring more than 24 hours. Ten per cent is regarded as the maximum to be allowed in normal times.

The average cost of repairing a car on the Northern Pacific during the test period was \$4.05 while in 1920 it was \$13.69. Mr. Elliott told the committee, while the total cost of freight car repairs during the test period was \$2,987,697 compared with \$12,140,554 in 1920. One reason for this enormous increase in the cost of repairing cars he said was the fact

that since 1916, car repairers have been increased 229 per cent in wages.

Mr. Elliott also said that during the test period which covered the three years prior to June, 1917, 12,437,188 hours were spent by labor in the maintenance of equipment on the Northern Pacific at a cost of \$3,729,839, or an average of 29 99/100 cents per hour.

In 1919, the hours put in at this work totaled 14,723,837 while the total labor bill was \$9,526,696, or an average of 64 70/100 cents per hour. In 1920, the hours totaled 16,333,388 and the total labor bill was \$12,401,287 while the average cost per hour was 75 63/100 cents. On this basis, the increase in hours in 1920 over those for the test period was only 31.33 per cent while the increase in the total cost was 232.49 per cent.

He furnished the committee with figures which showed that there was an increase of 76 per cent in the cost of materials for equipment repairs during the year which ended on February 28, 1919, compared with the test period, and of 97 per cent for the year which ended on February 28, 1921, over the test period.

Mr. Elliott filed with the committee a table which showed that out of 30 classes of railroad employees, the wages of 19 increased more than 100 per cent from 1916 to 1920 and only 9 received less than 100 per cent.

Mr. Elliott read into the record a report made to him by an official of the Northern Pacific in Seattle, Washington, which showed that the increased rates have had very little effect on the movement of lumber and other products from that territory. The report said in part:

"With reference to your inquiry as to the extent to which I think the increased rates on lumber or other products in this territory have checked business, I can truly say that it has had little, if any, appreciable effect in that direction, and this opinion is almost daily confirmed in discussion with various interested shippers of different commodities.

"Take forest products, for instance. The reductions in selling prices during last year amount to more than the entire freight rate to Missouri River territory, notwithstanding which there is a decreased movement.

"A year ago the ocean rate from Puget Sound to the Orient was \$45 per thousand. Today it is \$10, but notwithstanding this heavy reduction in the ocean rate, together with very much lower prices for lumber, has not stimulated the demand or increased the movement, indicating conclusively that there are other and more controlling factors determining the present situation. This is also true of many other commodities.

"The public generally are not yet satisfied to buy. Readjustment is necessarily a slow process, and out in this territory at least retailers are still endeavoring to hold up their prices until they can dispose of their high priced stocks. However, I believe the situation is gradually improving."

While Mr. Elliott was discussing the effect of the rate increases, Senator Pomerene said that he had had information from all over the state of Ohio that many shipments of roadbuilding and building materials have been prevented by the high rates and that lower rates would give the railroads more traffic in these materials. Mr. Elliott replied that he had said that some of the rates should be readjusted and the railroads were giving close study to that situation. Senator Pomerene asked if it were not possible for the railroads and the shippers to get together with a view to discussing such readjustments without the necessity for long hearings. Alfred P. Thom, counsel for the railway executives, said that a conference between the traffic officers and the shippers of roadbuilding materials had already been arranged for June 2 and that he proposed to present as a witness later Edward Chambers, vice-president of the Atchison, Topeka & Santa Fe, to discuss the rate situation. He said he thought the committee would be surprised to learn from Mr. Chambers of the extent of the readjustments in

rates that have already been made. Senator Cummins remarked at this point that when Congress is willing to make another appropriation to help sustain the railroads it will be time to talk about reducing rates, but when the railroads are receiving very little net income it is quite obvious that many rate reductions cannot be considered until expenses decrease.

During Mr. Elliott's discussion of maintenance expenses, Senator Cummins remarked that he understood the Northern Pacific had just made a settlement with the Railroad Administration and asked how much the government had paid for undermaintenance. Mr. Elliott replied that the government had been unwilling to specify how much of the amount was for undermaintenance or to allocate it specifically and had taken the position that it did not intend to do so in the case of any railroad. The company had finally agreed to settle on a trading basis by which they received \$9,000,000 in cash with an agreement that the amount should be readjusted later as a result of the check of the stocks of materials and supplies. One million dollars of the amount was specifically stated as for materials and supplies and the balance represented undermaintenance and other items. The company did not think the settlement entirely fair, he said, as it represented about 50 cents on the dollar of its claim, but thought it was better to make a settlement. He said that the railroad is not yet up in maintenance to where it was in 1917 and expects to spend a large part of the \$9,000,000 to restore Northern Pacific standards. He said the roadway and the locomotives were now in better condition than when the property was returned, but the cars are not. Mr. Elliott said that in the negotiations with the Railroad Administration, Director General Davis had made the point that there was not enough money in sight to pay all the claims of the railroads, whereas the railroad officers had taken the position that that was a consideration for Congress rather than the Railroad Administration. Mr. Elliott said the sticking point in the negotiations was the difficulty in proving the amount of undermaintenance of the equipment. The company had claimed about five and one-half millions on this account, whereas the Railroad Administration also had a claim against it for overmaintenance.

Senator Cummins said it had been charged that the railroads had increased their operating expenses by their failure to continue various unifications made during federal control. Mr. Elliott said that some unifications had produced savings and some had been found to produce an increase in expenses and had been discontinued. The entire question of unification of facilities, he said, is now being carefully considered by a special committee of the Association of Railway Executives and railway officers are keenly alive to the situation, but in many instances where a superficial view appears to warrant unification closer investigation shows that it is not practical. At Seattle, he said, the unification of terminals produced an increase in expenses, and while the total amount of savings that might result from unification of facilities is substantial, it is such a large sum as to represent an important element in the situation. Senator Cummins asked the witness' opinion as to the economy that might result from the pooling of freight cars. Mr. Elliott said that this is a big question with two sides to it. In tight times the railroads have practically pooled the cars, but he was inclined to the opinion that better results can be obtained in the long run under individual ownership of cars. He pointed out that the Interstate Commerce Commission now has power to move cars in an emergency and the railroads have their own organization working with the commission.

Senator Cummins asked Mr. Elliott, as he had asked Mr. Smith, to file with the committee a statement of the operation of the railroads by months for the past several years, saying he wanted the data to prove or disprove the charges made that the railroads had expended too much for maintenance and operation during the guaranty period of 1920. Mr.

Thom pointed out that the transportation act makes the railroads responsible for maintenance expenditures above an amount to be determined by the commission.

### Railroads Should Be Allowed More Latitude

In response to requests by members of the committee for specific recommendations as to what could be done to improve the present system of governmental regulation of the railroads, Mr. Elliott submitted the following suggestions:

It is a very grave question whether *regulation* has not been overdone, encroached on the field of *management*, and by dividing responsibility and checking initiative done more to increase costs and therefore rates than would have been the case with more freedom of action permitted.

Inasmuch as the Interstate Commerce Commission, under the new transportation law, controls the aggregate earnings of the railroads, and there is a limitation upon the rates to produce that aggregate, and a provision for sub-dividing the earnings if there is any excess, it would seem as if there was no longer any need of the Hepburn act.

Better and more prompt results for the public could be obtained if railroad managements, familiar with all local conditions, studying constantly their business, and trying to expand it, should be allowed to make rates effective, subject to investigation and review by the commission and to be set aside after such review, if found in any way contrary to public policy, and due reparation then made.

The labor board has been empowered to take up and settle disputes about wages, and about rules if a dispute about rules threatens strikes. Here is a tribunal set up by the Congress for the purpose of handling any labor disputes, and prompt action is very necessary; also the hands of the labor board should not be tied by a mandatory statute such as the Adamson law, and I believe, in the interest of the public, that law should be repealed.

The public are allowed to appeal to the Commerce Commission if they think rates are too high. I believe the public should be allowed to appeal to the labor board if they think wages (ultimately paid by the public) are too high.

Let the railroad managements and the men get together and try to settle their differences, and authorize the railroads to name the rates of pay, and working conditions, subject to review by the labor board, and subject to reparation if the railroads should do anything that was unfair.

It would seem as if it was a mistake to attempt to enforce so-called standardization of all wages and rules, which standard, so far as pay is concerned, is a misnomer, because by giving a man the same rate in a little town in northern Vermont that he gets on the outskirts of New York is really paying the New York man less than the Vermont man, because the latter can live more cheaply.

Let labor organizations be incorporated and state clearly in the charters what is intended; they should be bodies that could sue and be sued, and there should be the same publicity of all their transactions as there is about the transactions of the railroads, reporting the number of members, amount of money received, distribution in detail; in a general way just as much information filed with governmental authorities as there is by the carriers.

If disputes threaten a strike, let the federal government, possibly the Secretary of Labor, frame the form of question about which the strike vote is to be taken, and not let that vote be framed by either the labor organization or the railroads. Have that ballot handled by the Secretary of Labor and the vote should be secret—neither the railroads nor the labor organizations to know how any man votes—the Secretary of Labor to count the ballots and announce the result.

Unless at least 75 per cent of all employees in the craft about which there is a dispute voted to strike (not 75 per cent of the ballots cast) then the strike vote is not carried. If 75 per cent of all employees vote to strike, then a strike not to begin until 30 days' notice has been given.

Under such plans, the public would be protected, because the owner and manager would always, in naming his prices or rates, have in mind the fact that if he went too far, his price or rate could be set aside by the commission and reparation made. He would also have the labor board's power to reckon with if he attempted to be unfair in his wage adjustments and here again make reparation if he did wrong.

In other words, restore to the owner and manager some of the functions surrounding other business and which, when exercised in the upbuilding of the railroads in years gone, produced a most remarkable transportation machine with the lowest rates in any country, the highest wages in any country and the best service in any country. The war and the interference by the government in this delicately adjusted transportation machine have produced conditions resulting in greatly increased charges and poorer ser-

vices to the public, and a checking of developments so necessary for the next uplift in business.

Action, courage and vision is needed now and imperatively needed.

We talk about frozen credit and we have a frozen transportation system that helps to keep credit frozen and retards the growth of the country.

Let the railroad owner and manager have a little liberty of action and in the long run, in my judgment, better results will be obtained for the country.

Mr. Elliott also suggested the appointment of a Secretary of Transportation to have the same advisory power as other cabinet officers. He commended the work of the Interstate Commerce Commission but said it was overburdened with work. He thought that a Secretary of Transportation, by advising with the Interstate Commerce Commission, the Railroad Labor Board and the railroads, could bring about the desired result—promptitude of action.

### A. H. Smith Describes Results on New York Central

Resuming his testimony before the committee on May 19, A. H. Smith, president of the New York Central, said that "less in the effectiveness of labor" due to the operation of the national agreements and the increase in the labor bill as a result of reclassification of employees, was one of the main reasons for the increase in the cost of furnishing transportation service to the country.

The witness declared that due to the reclassification of employees cases were numerous where a number of employees were required to do work formerly performed by one. The average pay per man in the locomotive repair department increased from \$134.47 per month in 1919 to \$166.52 per month in 1920 and in the car department from \$147.19 in 1919 to \$187.25 in 1920.

As reflected in the cost of maintenance of equipment, Mr. Smith testified that because of the abolition of piece work and the advent of the national agreements, it cost the New York Central \$5,448,300 more and required 60 per cent more men to turn out only 2 per cent increased work in the company's locomotive repair shops compared with 1915.

"Under piece work and the other shop conditions existing in 1915, 2,799 men turned out 73,072,000 shop miles," he said. "In 1920 practically the same amount of miles were turned out, namely 74,655,000, but it required the services of 4,521 men. The cost in 1915 was \$2,903,700 and the cost in 1920 was \$8,352,000, or an increase of \$5,448,300. That is to say, there was an increase in men of 60.3 per cent and an increase in money of 187 per cent and the mileage output was increased but 2 per cent."

Mr. Smith told the committee that from the standpoint of the railroads nothing was gained by the reclassification of employees which has resulted now in "everything being done by agreement and regulation."

"Not only were wages of specified classes of employees raised but many employees were placed on higher grades than those in which they were prior to the orders and national agreements," Mr. Smith said. "The reclassification not only had the effect of increasing wages but very largely increased the number of men."

In the locomotive department alone of the New York Central Lines, Mr. Smith said, the number of employees on the monthly rolls was increased from 11,545 before the agreements took effect to 11,972 immediately following the agreements and to 13,665 in 1920. In the car department the average number of men employed in 1919 was 12,350. By the operation of agreements and rules made at the close of federal control, the average number of men in this department was increased to 13,888.

Going into details, Mr. Smith stated that an air brake repairer in December, 1917, was paid 27 cents an hour. Under an order of the director general, the rate of pay was raised to 58 cents and under the national agreements, his

classification was changed to that of tender repairer and automatically his wages were raised to 68 cents per hour.

An engine cleaner, who in December, 1917, was paid 22 cents per hour was raised successively to 45 cents and then as a painter-helper to 49 cents.

A stripper was raised from 30 cents an hour in December, 1917, to 68 cents an hour and then under the national agreements became a machinist at 72 cents an hour.

In the car department, a passenger car inspector in December, 1917, was paid 37½ cents per hour, then 63 cents and under the national agreements became an inspector leader at 67 cents.

Oil room men in 1917 were paid 28¼ cents per hour, then 68 cents and under the national agreements became blacksmiths at 72 cents an hour.

Starting at 55 cents, blacksmiths under orders of the director general went up to 68 cents and classified as hammer-smiths under the national agreements received 82 cents an hour.

An additional cause of increased labor costs due to these orders and agreements was the application of punitive overtime to all classes of employees. Overtime which had previously been paid at pro-rata hourly rates was placed on a time and half basis, increasing by 50 per cent the rate per hour for overtime pay.

Mr. Smith pointed out that the above rates were those prevailing before the increased wage award made by the Railroad Labor Board in July and made retroactive to May 1, 1920. This involved for the New York Central Lines alone an increase in wages of approximately \$21,640,000 including back pay of \$8,100,000.

Mr. Smith was frequently interrupted during the reading of this part of his statement by Senators who inquired as to the reasons for the various reclassifications which were made by the railroad administration in the fall of 1919. At one point, Senator Pomerene of Ohio inquired as to how an oil room man came to be classified as a blacksmith. "I haven't the slightest idea," Mr. Smith replied. "They might just as well have called him a saint and paid him accordingly."

Mr. Smith presented an exhibit showing how a man previously engaged in sharpening crow bars and similar work and classed as a laborer had been reclassified as a blacksmith at 65 cents an hour and with \$1,710 back pay.

Another exhibit filed with the committee showed the increases in pay of train service employees in 1920 over 1917. Among these were freight engineers, 54 per cent; firemen, 70 per cent; yard engineers, 73 per cent; firemen, 124 per cent, and passenger conductors, 56 per cent.

Interrupting the reading of his statement, Mr. Smith praised the loyalty and services of the trainmen and engineers. Unlike ordinary workmen, he said, they are specialists, men who have devoted their lives to railroading and who are the backbone of the transportation system.

"Overtime payments on the New York Central for 1920," said Mr. Smith, "amounted to \$25,540,073 at the punitive rates. Under former arrangements providing for straight overtime at pro-rata rates this would have amounted to only \$17,786,188. The additional \$7,753,885 represent the penalty imposed upon the company by the agreement requiring payment of punitive rates. There is no argument about overtime. We ought to pay that. Everyone recognizes that. But it is this punitive overtime to which we object."

Mr. Smith said he sought to have the director general modify the rule, telling him that the railroads would rather pay a premium to employees to get the trains in on time than a reward for keeping them out overtime.

Mr. Smith told the committee that the property of the New York Central was "very much undermaintained" during 26 months of federal control. Under the standard set by the company, 7,315,000 ties, 1,325,000 cubic yards of ballast,

138,500 tons of new rail and 134,000 tons of second hand rail would have been put in during the 26 months had the road been under private managements during that time. In reality, he said, the director general only put in 5,445,000 ties, 1,000,000 cubic yards of ballast and 138,000 tons of rail. This deficient maintenance imposed a heavy burden upon the road when it was turned back to its owners.

### Causes for Decline in Traffic

Taking up the causes for decline in traffic beginning in January, Mr. Smith attributed this decline in part to falling off in export business amounting to \$657,000,000 in the first three months of 1920, as compared to the same months of 1919. It is a matter of common knowledge, Mr. Smith said, that the harbors were crowded with idle vessels, whereas prior to January it was necessary in order to avoid congestion at terminals for the railroad to issue export permits. Now the permit system has been abolished because there is much more shipping than there is freight to be carried.

High discount rates also tended to curtail business, the witness stated. "Another cause," he added, "was the propaganda which spread through the country against purchasing at high prices, and which led to a marked reduction in the purchases of commodities generally.

"It was well understood that the period of war inflation would have to be followed by a period of deflation. The general causes were in effect and were manifesting themselves prior to the rate increase of August, 1920, and it is not believed that this increase had any decided bearing upon the falling off in business, which became apparent in January, 1921."

Taking up the question of efficiency as reflected in the transportation department of the New York Central, Mr. Smith said that the average revenue per ton-mile increased 54 per cent in 1920 over 1917. The average monthly pay of all employees increased 86 per cent. "The relative efficiency of employees in producing revenue ton-miles decreased 10 per cent. That is to say it took 10 per cent more men in 1920 to do the same amount of work. This comparison is made as between 1920 and 1917 because the number of revenue tons carried one mile in 1920 was practically the same as the revenue tons carried one mile in 1917, the actual figures being 22,567,929,000 in 1920 and 22,452,548,000 in 1917."

The efficiency of a railroad, Mr. Smith said, depends principally upon its men. "It is estimated that 95 per cent of railroading is human; it is a business of moving things; it is a live thing. At the close of government control labor naturally desired to have rules and regulations set up for their best interests in the future, and the corporations inherited what was awarded to them. Railroad men are no different in their desire than labor in other endeavors."

"These men engaged in this special endeavor of handling transportation on which our country so greatly depends should receive an adequate wage. But after compensation comes results—that is, what shall labor do for what it receives, and that is in a measure where our difficulties have been. It is a matter between management and labor, to be decided on its merits, and will no doubt now be taken care of."

In concluding his prepared statement Mr. Smith said:

From the foregoing statements and figures the following facts are stated and conclusions are drawn:

For the year ending December 31, 1920, revenues increased 19.5 per cent over 1919. For the year ending December 31, 1920, operating expenses increased 40.8 per cent over 1919.

For the last four months of 1920 freight revenues increased 40.1 per cent over the corresponding months of 1919 and all revenues increased 29 per cent over the corresponding months.

For the same four months operating expenses increased 1920 over 1919 43 per cent. For the eight months from May 1, during which the increased wage order of the Labor Board was in effect, operating expenses increased 55.4 per cent. Of this in-

crease 37.7 per cent is represented by labor. The remainder is accounted for by the increased cost of material and supplies.

Neither traffic nor earnings decreased during 1920. The diminished traffic in 1921 was caused by the general business depression. That depression was not caused by increase in freight rates. Other causes sufficiently powerful to cause the depression were operative before the increase in freight rates was made.

The railroad management, hampered by the necessity of undertaking the operation of the property burdened with the large advances in expenses, with undermaintenance of way and equipment, and further burdened with the additional increase of expenses by reason of the orders of the Labor Board, moved all the tonnage that was offered during 1920, and endeavored to make substantial progress toward restoring the property to the standard which the best judgment considered necessary to enable it to do properly and safely the business of the public.

The enormous increases in operating expenses have been in the main due to the great war. War necessities broke through and largely destroyed normal conditions in the industrial world. The materials of war had to be supplied at any cost of labor and material. The situation had to be met in the railroad world, and it was met. This statement does not attempt any apportionment of the responsibility. The war ended, but normal conditions could not at once be restored. That restoration can only come through time and patient effort, but pre-war or normal conditions and a normal cost of living can only be restored by general reduction in the cost of both labor and material.

Senator Watson asked if the falling off in traffic which began late in the fall resulted from the increased rates or from a falling off in the industry of the country. Mr. Smith replied that it was due to the industrial situation, "the state of mind of the people" being a great factor. Industrial stagnation had been brought about by the fact that many persons were holding off buying in the hope of a reduction in prices.

"If rates were lower, what would be the effect on traffic," asked Senator Pomerene of Ohio.

"I wish I had the power to try it out," replied the witness, "I'd like to have the authority to move a million bushels of grain and see if there was a market for it."

If the railroad operated on maximum traffic with the present rates and costs in effect, Senator Watson asked as to whether it would make money.

"You can't do it because the costs are too high," answered Mr. Smith. He added that he believed some rates should be readjusted because successive percentage increases had thrown some of the rates out of line. There could not, however, be any general reduction in rates until there is a reduction in expenses which will assure the earning capacity of the carriers.

Compilations made by the New York Central showed, Mr. Smith said, that in the locomotive repair shops of that railroad there was a decrease of 25½ per cent per man hour in the output of employees in the last six months in 1920 compared with the first six months in 1918.

In the first six months of 1918, he said it required one man 113.4 hours to produce 1,000 shop miles, which is the yardstick of efficiency in the repairing of locomotives. During the first half of 1919, this had been increased to 134.8 hours and in the first half of 1920, it was 146.9 hours. For the last six months of 1920, the labor had increased to 152¼ hours, which was an increase of 30.1 hours or 34½ per cent compared with the first six months of federal control of the railroads.

Asked by Senator Cummins as to the reasons for this showing, Mr. Smith replied that it was due to the abolition of piece work and the injection of rules whereby two men were required to do work formerly performed by one "as well as the hundreds of things that have been injected into this work since the war began.

"Senator, you are playing with human nature all the time and a man will not perform as well when his work is measured by time as when it is measured by performance."

Senator Wolcott sought to ascertain if Mr. Smith knew who issued the various Railroad Administration orders.

"I hold no brief for the Railroad Administration," said the Senator, "but there is a tendency to blame the administration for the superimposing of various orders to which objection is now being made."

"Mr. McAdoo is not a railroad man and we all know that," interjected Senator Kellogg.

"I've not mentioned Mr. McAdoo," quickly rejoined Senator Wolcott.

"He's the man who did it and everybody knows it," declared Senator Kellogg.

### Outside Contracts for Locomotives

Taking up the repair of locomotives in outside shops, Mr. Smith declared the New York Central was forced to let outside contracts because, while the company shops were being operated at the maximum, it was impossible to repair all the locomotives requiring attention. He denied that any work done for the company in outside shops had been performed at excessive prices or that the company had any interest whatever in the Baldwin Locomotive Works.

"In view of the fact that everything possible was being done to realize output from the company's shops and as it was apparent that they could not, from the pace being made, repair the locomotives that required attention, the only alternative was to contract for the work in outside shops," Mr. Smith said.

He explained, however, negotiations were entered into with the Baldwin works as well as the Lima Locomotive Works and the American Locomotive Company in order to "obtain the lowest price at which repairs could be made by them."

"Was this work done at a fair price?" asked Senator Cummins.

"Yes," he replied, "but it was done in a seller's market and a seller's market is higher than a buyer's market." The outside shops did not want repair work," Mr. Smith said, "and in some cases pressure had to be brought to bear to induce them to accept it. I told the Lima people we would never buy another engine from them unless they did."

During the period that locomotives were sent to the outside shops for repairs 13,239 men were employed in the company shops compared with 11,326 in July, 1919. In August there were 13,882 men employed compared with 11,410 during the same month the previous year; in September, 14,343 compared with 11,449 the previous year and October 14,039 compared with 11,972 in October, 1919.

"During this same period the shop mileage output notwithstanding the number of men employed, decreased sharply in September and October," he said.

"The repairs in the outside shops were made under the supervision of competent representatives of the railroad company acting as inspectors. Criticism has been made of the amounts paid or agreed to be paid to those outside companies for the repairs and this criticism has been sought to be fortified by statements that the same repairs could be made or that repairs of the same class actually were made in railroad shops for vastly less amounts of money. It is sufficient to say as to this that the reported cost of the repair of a locomotive in a company shop covers only the labor and material involved and no other factor enters into it. To these costs the outside shops add 120 per cent for profit, interest, and other overhead charges, which are not shown in the railroad shop costs." He added that after business fell off he stopped sending engines to outside shops.

Regarding charges that have been made that part of the increase in operating expenses was due to failure of the railroads to introduce mechanical improvements designed to bring about economies in operation, Mr. Smith said:

"If there is anything that can produce economy and we can get the money to do it, you can rest assured we will get

it. I know of nothing in the last word of engine construction that we have not adopted."

Eighty-five per cent of the total number of locomotives on the New York Central Lines, he said, are equipped with superheaters, while 96 per cent of the locomotives fit to have them are so equipped. He also said that 98 per cent of the locomotives have brick arches.

In addition to the improvements already installed, Mr. Smith said the New York Central was constantly experimenting with new devices designed to improve efficiency.

He estimated that the company would be able to save in the neighborhood of five and a half or six million dollars in its coal bill this year.

Mr. Smith said several times during his testimony that he had no desire to criticize the government for what was done during the period of federal control and that he had once or twice tried to interject the statement that it was up against a difficult situation. He referred to the fact that he was with the government as regional director, that the railroads had difficulties before the war and the government found many difficulties afterward. It was a question of winning the war and doing the best under the circumstances, he said. Senator Kellogg asked why if piece work was considered more efficient, an order was given to abolish it. Mr. Smith said that he was merely on the firing line and that the general had ordered the piece work taken out. He hated to make the move, but he did it. "I was merely a soldier in the ranks," he said, "so why they did it, I don't know. I used to kick, but it did not do any good."

At another point Mr. Smith said he was not claiming that the increase in wages was not necessary, but if he had had his way he should like to have had a good bonus given to the men during the war and then looked it over afterward in accordance with the conditions existing and not tie it up for the future. He also pointed out that the rules of the national agreements were put into effect just before the government let go of the railroads, although it was known that they were to be returned.

Senator Watson asked the witness if he made his recital the basis of some recommendation by which the railroads could get back to average man efficiency.

"The recital is made," replied Mr. Smith, "because you asked us for the facts. You asked us to tell you why 1920 was as it was. As to the future, of course, we have got to change the situation in some way or we cannot go on. We are in bad shape today and getting worse every day. What has happened is not concerning me one-tenth as much as what we are going to do because we are going the wrong way this moment and the things that governed me then in regard to these methods and these actions are no help to me now. I should be up and figuring what I am going to do for next winter because just as soon as business returns, and it will return, then you will want these transportation machines and I say to you they will not be ready. You will want them and they will not be there. We have not had any chance to get any fat on us in 20 years. We haven't had the opportunity that other business has had. Other business has good years and can lay up a sum in real money for the rainy day, but we have never had that opportunity and now while we should be repairing these locomotives and getting this plant in the very best order, for the future, we are not doing it. We haven't the money."

Senator Watson said he wanted to "put the grease where the squeak is."

"Well," replied Mr. Smith, "the squeak is that our cost factors are too high. I don't mean only labor, but our material is too high and our fuel has been too high and all of these things have gone up. Our taxes are awfully high. I don't imagine they can be reduced, but there they are. I think labor on railroads should have liberal consideration,

but in some instances labor is out of line now. I should say that we have gotten out of balance with the outside. There was a time when that was the reverse. There was a time when these rates were held so low on us that a railroad was not paying its men fairly, but the people did not give us money enough so we could and we were always having an argument with our men, they wanting more and we not being able to give it to them."

### Railroads Should Have More Latitude

This led to a discussion of the effects of railroad regulation and Mr. Smith pointed out that the railroads no longer have much latitude. "What made the railroads," he said, "was vision, initiative, energy, study, competition. Now when you tie us up so there is nothing of that left we just plod along like the plow horse hitched to the other one."

Senator Cummins asked what particular restriction should be removed. Mr. Smith replied that he was not a lawyer and that perhaps his suggestions would be considered too general, but he would like to see more freedom of activity allowed to the railroads. "I do not mind regulation," he said. "I do not mind coming in and telling you what we have done or that we have not done it. I do not mind a yardstick of duty laid on me and if I do not do my duty, why do something with me, but we cannot do much nowadays. If we want to buy anything or if we want to get anything we have got to come down and have a long hearing before it is done. We must show all there is to it." In reply to questions, he said he would not advocate the withdrawal of the supervisory power of the Interstate Commerce Commission over rates, but he would like to see the Interstate Commerce Commission so placed that they could allow him to put in an emergency rate, see whether it would move traffic, and if it did not, put the rate back. The difficulty, he said, is that if a rate is reduced and fails to produce the desired effect, it is necessary to "go over some pretty high hurdles" before it can be put back. He said undoubtedly some rates are too high as a result of the percentage method of advance and also many are too low. He thought they could be readjusted if the railroads were allowed more latitude, but that to do so it is necessary to move faster than can be done under the present system.

Senator Cummins asked whether he would advocate the abolition of the labor board.

"No," replied Mr. Smith, "I think the labor board is a good thing. I would like to see the board situated so that it can function more rapidly and perhaps it will when it gets more practice. I have no quarrel with the labor board and the Interstate Commerce Commission is a necessary umpire in this game, but, to use a baseball illustration, we are not allowed very much latitude on the bases. We are held up pretty tight."

Senator Cummins announced that he had had a request from the heads of the four train service brotherhoods for an opportunity to testify at the hearing and that they would be allowed to appear at a date to be determined later.

Mr. Elliott completed his statement before the committee on May 25 and he was expected to be followed by H. E. Byram, president of the Chicago, Milwaukee & St. Paul; Samuel Rea, president of the Pennsylvania; Edward Chambers, vice-president of the Atchison, Topeka & Santa Fe, and E. T. Whiter and J. G. Walber as representatives of the railroads' committee that presented the evidence of the railroads before the labor board.

THE MONTHLY MEETING of the Railway Club of Pittsburgh was held on May 20 at the Fort Pitt Hotel. Judge Joseph Buffington of the United States Circuit Court addressed the meeting on "Government, Patriotism and Duty." The next meeting will be held in September.

old engines, and the conversion of old engines into up-to-date ones that did it. This demonstration justifies the policy of equipping so many old engines with improvements that compel a ton of coal to do more work. That policy has made good completely. These capacity increasing factors are ready to do more than anybody realizes. Only the surface has been scratched.

**This Is Ready Now**

A certain large passenger locomotive, built five years ago, and which was up-to-date at that time, was being taxed to its capacity. It had reached its limit of load and speed. It had no reserve for bad weather or unusual conditions of service. A thorough study reveals the fact that this locomotive, already among the largest and most powerful of its class, may be replaced by one of the same type, but giving 58 per cent more starting drawbar pull, producing 30 per cent more drawbar pull at 60 miles per hour and with no more destructive effect upon the track than the present engine at 60 miles per hour, the destructive effect at 70 miles per hour, being less than that of the present engine. In this study absolutely nothing new or untried was contemplated. Refinement of design was considered, also enlarged capacity by a specially high degree of superheat, an improved firebox, the arch, light reciprocating parts of high grade steel, plus the booster to give greater starting power.

Think a moment of the operating advantages to be had from over 50 per cent more starting power and 30 per cent more drawbar pull at 60 miles per hour. This design did not include the feed water heater because it was not ready for consideration at the time. Heating the feed water by waste steam would still further increase the power of this engine.

Any builder may build this engine. It is the first example, of which I have record, of a design for high power, which was prepared co-operatively by a railroad, a locomotive builder and by the engineers of the concerns which are devoting themselves to improvements for increasing capacity. Similar improvement is available to any railroad.

Of course, such a locomotive will cost more than a weak and obsolete one. It will, however, increase operating speed, reduce double heading, will apply high wage crews more effectively and will cheapen operation.

This increased power per engine will reduce the number

years, the maximum revenue tons handled in a regular train being 3,200. This road shows 233 per cent increase in weight of train and 66 per cent increase in speed in 25 years. It hauls 5,000 ton trains on 25 mile schedules. It makes excellent use of improved locomotives. In five years the average revenue train load of the country as a whole increased from 475 tons to 728 tons, or an increase of over 53 per cent since 1915.

Second: The 20th Century is the direct successor of the World's Fair Flyer of 1893 and represents continuous development. The weight of that train has increased 215 per

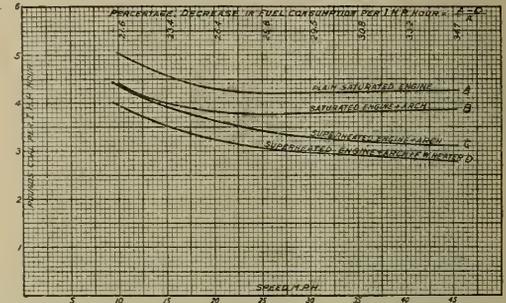

Fig. 4—Fuel Consumption of Locomotives With and Without Power-Increasing Factors

cent and its speed has increased seven per cent. *Only an improved locomotive can haul it today.*

Third: Consider the fact that the heaviest passenger trains on one of the Western roads weigh 1,290 tons and are on fast schedules with maximum speed of 68 miles per hour. It is only 25 years ago that the newspaper men of New York were invited to see a 600 ton passenger train slowly pulled out of the Grand Central Terminal by what was then considered a monster locomotive. That locomotive is now hauling a milk train on a branch line. It and its class have given place to really powerful ones that were not then dreamed of. Today the fastest long distance trains in the country weigh twice as much as the exhibition train referred to. Until we are reminded of the past we do not appreciate what the railroads have accomplished.

**Capacity First**

In the usual sense of the expression saving fuel will not greatly reduce the cost of transportation, but conserving fuel by compelling every pound to yield more power will do so because it involves operation as well as engineering improvements. Power to get the maximum business delivered is the cheapest power. Heavy pulling at favorable speeds will reduce cost and as congestion increases, speed becomes a greater factor. Power to keep trains on time, to get through storms, to get in under the overtime limit is what is needed. Let us take a glance at some of the power increasing, capacity increasing factors with a view of giving the operating officer greater power capacity to work with. Many others are important and would be discussed here if time permitted.

**Brick Arch**

For many years arches have been used in locomotive fireboxes. Their function is to baffle the gases and flame on its way to the flues. They mix the gases from the fire, aiding combustion. They cause the burning of many of the cinders and they protect the flues from streams of cold air from the fire door, or from holes in the fire. They protect flue sheets and materially reduce honey-combing. Arches increase the heat making capacity of coal and reduce boiler failures, thus

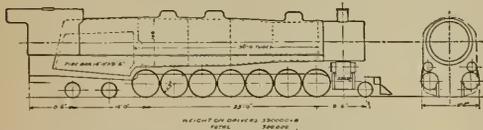

Fig. 3—A Plain Saturated Locomotive to Deliver the Same Drawbar Pull at 45 Miles an Hour as the Engine Shown in Fig. 2

of engines required to do a given amount of work. This will reduce maintenance. Obviously, it is easier to maintain two engines with these capacity increasing factors than to keep up three without them. The cost of these improvements is now going into coal and wages. It may go into new engines when by improving old ones the new ones will not for a time be needed.

**Progress**

Progress in the use the railroads are making of locomotive improvements is revealed by many examples of heavy trains and fast schedules. Here are three:

First: A well known road has increased its average revenue tonnage from 400 tons to 1,700 tons per train in 25

increasing the availability of engines. Success of the present arch and arch practice is due to structural improvements in the bricks themselves and in methods of support that renders renewal easy and to improved firebox design. Over 43,000 locomotives now have these arches. Every engine fit to run at all should be equipped on coming out of the shops if it did not have an arch when built. There is no other capacity increasing factor so easily and so inexpensively applied to existing locomotives.

**Superheater**

To this improvement the largest increase in locomotive capacity is due. The heavy trains of today could not be handled without superheaters. In June, 1910, the Superheater Company got fairly started. Since 1910 our railroads have applied 33,000 superheaters to new and old locomotives, about 90 per cent of new ones having been equipped during the past few years. The application to many more existing engines offers a promising opportunity to still fur-

for the same amount of coal. Feed water heating is a success.

**Booster**

This capacity increaser is well named. It boosts a heavy train in starting and also on the critical points on grades. It is the latest improvement. It supplies an ideal method of utilizing weight and steam that is not needed for other purposes at low speeds and only at the time that the boost is wanted.

When the train is going the demand for steam is greatest. Immense boilers are needed at speeds. There is a surplus of boiler power when starting and at low speeds. The big boiler requires trailing wheels to carry it. This weight on trailing wheels is also a surplus when starting or when running slowly. The booster couples up this surplus steam and idle weight, making both useful to get the train going and to keep it from stalling on ruling grades. Usually there are a few points on a division which determine the load an engine can haul over the entire division. If these are mastered the rest is easy. This is one of the booster functions. Another is in starting a heavy train, getting it out of a siding or through the switches of a yard. Here is where the 70 to 100 feet of slack between the cars of a long train causes havoc with draft gear. The booster works like an automobile in low gear. It applies its extra power smoothly, avoiding the jerks that a big engine otherwise must give to get going at all.

Again, it solves the problem of the big passenger engine. With 20 to 25 per cent more starting power backing up to take slack is avoided, eliminating the frequent five to 10 minutes' delay in getting a heavy train moving every time it stops. Operating men will appreciate this advantage, especially when they have big passenger trains in several sections, each losing minutes every time they start, especially when they start on grades.

The booster will help keep passenger trains on schedule and the road clear for freight. It puts in your hand the means for placing any engine having trailing wheels into the class above itself in starting capacity. It is as good as another pair of drivers but avoids the larger cylinders, heavier rods and extra weight that these drivers entail and which are wanted only in starting. In fact the booster is better than another pair of drivers because it changes trailing wheels into drivers when wanted, and then changes them back into trailers when the pull is reduced after the wheels are rolling. This is conservation of the highest order.

Control is semi-automatic, giving the enginemen the maximum resource for starting power and a negligible minimum of attention or mental effort. Tests on a large railroad show for the booster the following results on a Pacific type freight engine:

1. An increase of 23 per cent in train tonnage, or
2. An increase of 12 per cent in speed on the division in question.
3. An increase of 18 per cent in drawbar pull at 7½ miles per hour.
4. An increase of 13 per cent in drawbar pull at 13 miles per hour.
5. An increase of 22 per cent in starting power.

It is an important tonnage increaser. It is capable of doing more to reduce the cost of transportation than any locomotive improvement except the superheater, and it does more to supplement the superheater than any other factor available.

David L. Barnes will long be remembered for advocating the wide firebox for locomotives. The change "came hard." Dr. Goss helped it immensely with his grate area test at Purdue. At first fireboxes were extended over the frames, but this was not enough. In those days locomotives had leading trucks and the rest of the wheels were drivers. The real wide firebox, needed for steam making at speed, brought the

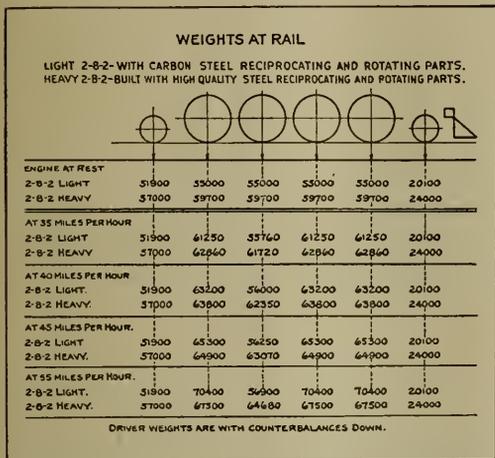

Fig. 5—Decrease in Rail Pressure Effected by Using High Quality Steel

ther reduce the cost of transportation. It is a financial error to operate any locomotive today without a superheater, and the penalty is perpetuated as long as the engine runs.

**Feed Water Heaters**

This conservation factor is the first to utilize waste heat. It gives back to the boiler heat that is on its way to waste. For generations stationary and marine steam plants have used feed water heaters as a matter of course. The application to locomotives has been attempted many times and has waited only for practicable heater and pump. Thousands of European locomotives are already equipped and several thousand are being applied every year.

For over four years feed water heaters raising the temperature of the water from 40 to 50 degrees to from 230 to 250 degrees have been in successful service on locomotives in this country. These equipments also return for use again about 15 per cent of the exhaust steam in the form of water that has been distilled and filtered. This increase in the tender tank capacity is important in operating because of the ability to save some water stops.

Heat from the exhaust steam is returned to the boiler, giving the boiler less work to do. Therefore, less coal is burned to do a given amount of work or more work is done

trailer axle with its "idle" wheels. We hated the thought of wheels under a locomotive that did not work. This explains the struggle of the Prairie type which persisted until distrust of pony trucks at high speeds effectively buried that type of engine. We gave up not gracefully but under force. Next we became blind to the "idle" weight and went ahead until the country has a lot of it. The booster has given back what was lost and more. The booster uses this idle weight by applying power to the trailers.

Someone will say: "You are talking power and more power. We have too much power now and are compelled to run big, powerful Pacific type engines on light local passenger trains of five and six cars." Let me answer "yes." This work is being done with big engines because lighter ones will not make the time with the frequent stops of local trains. Put boosters on old Atlantic type and the lightest Pacific type engines that have been superheated and do this work with these engines that are suitable for it.

### Increase of Capacity

The accumulated increase of capacity due to the superheater, arch, feed water heater and booster is indicated in Fig. 1. At 45 miles per hour the increased power due to these factors is 79.7 per cent, when they are applied in combination. This is now considered too high speed for such a heavy engine. These combined curves indicate that at 30 miles per hour the power increase for the same coal is 50 per cent, at 25 miles per hour 40 per cent, at 20 miles per hour 29 per cent. The diagram also shows the increase in the speed possible with the same load and fuel in case speed rather than heavier loading is wanted. At 30 miles per hour two engines completely equipped give as much power as three "plain" engines. The increased power in this case costs half that of another plain engine and the cost of maintaining two sets of improvements will be less than the cost of maintaining another complete plain engine. The base engine in the case is the Administration light Mikado, as it would appear if built without any of the improvements we are discussing. If greater drawbar pull, due to these improvements, is not desired, the curves show the increased speed that may be had with any given pull.

Fig. 2 outlines an engine equipped to give this power. The absurdity of trying to get it without the efficiency factors is shown in Fig. 3. This engine (Fig. 3) is as "simple as a grindstone." A plain engine to do this work would be a freak that could not be put on any railroad. Look at the wheels, the flue length, the size of the firebox and then think of what this means. I cannot present a better demonstration.

The fuel consumption as affected by these capacity factors is shown in Fig. 4. Of course, increased power means stronger cars, longer sidings and removal of other physical restrictions which in every case are paying business propositions.

### High Quality Steel Reciprocating Parts

High quality steel forgings if applied to the reciprocating parts of the United States Railroad Administration heavy Mikado locomotives reveal an interesting possibility. Both light and heavy Administration Mikados were actually built with reciprocating parts of open hearth steel. The results in rail pressures which would be obtained if the heavy Administration engine had been built with high quality steel reciprocating parts of light weight are shown in Fig. 5. The first sets of figures show the rail pressures of the light Mikado with open hearth reciprocating parts at rest and at different speeds. The lower figures in each case show the rail pressures of the heavy Administration Mikado if fitted with light parts of high quality steel. These are shown at rest and at speeds of 35, 40, 45 and 55 miles per hour. At speeds between 40 and 45 miles per hour the light Mikado

becomes more destructive to the track because of driving wheel pressures than the heavy Mikado when equipped with light reciprocating parts. In other words, at all speeds where the engines are likely to damage the track the heavy Mikados with light parts are safer engines than the light Mikados with heavy parts. In this comparison, it should be borne in mind that the heavy Mikado has 10 per cent more tractive power than the light one and 14 per cent more heating surface. The total weight of the heavy Mikado is  $9\frac{1}{2}$  per cent greater than the light one. As railroad officers with track and bridge responsibilities, which engine would you choose? Remember that the heavy one has 10 to 15 per cent greater capacity than the light one.

### Stokers

Locomotives of greatest power when coal is the fuel have passed the physical capacity of the fireman to maintain steam enough to supply the large cylinders that present operating conditions demand. As the result of development in the severest service known, mechanical stokers are ready not only for present needs but they provide reserve capacity for years to come. In considering the stoker, the chief question is one of increased capacity to get the power from the tender to the grates, in order to get the greatest loads over the road at the least cost. The vital question is the provision of the horsepower at speeds that bring economy in use of tracks and yards and economy in the application of high wage schedules and prohibitive overtime. The stoker development began at about the right time to be ready for power demands that are coming. Power stokers emancipate the big locomotive from the limitations of the human fireman. They render it possible to operate locomotives that require too much coal for the ablest of firemen to handle. They also provide means for getting higher horsepower out of engines at high speeds than otherwise would be possible.

### Air Brakes

Air brakes have increased the capacity as well as safety of railroads. By improved brakes alone the capacity of the New York Subway was more than doubled. Without highly efficient air brakes heavy trains could not be run at all. This great subject is merely mentioned here, but it must be considered in connection with the future because today the improved equipment of brakes is in the lead of common practice.

### Look Forward

New locomotives are going to last almost indefinitely when kept up-to-date as to modernizing. They lose their useful lives only by obsolescence. The design of new equipment is therefore of the utmost importance and someone on the road should be charged with the responsibility of looking ahead and determining what new engines are to be, long enough in advance to be sure that they absolutely fit conditions as they are and that they will fit as nearly as may be conditions that are to come. This involves a deep study of operation in all its phases. It seems obvious that the general manager or operating vice-president would find his job much easier if every new engine built should receive the same attention that the building of every new big bridge receives. But bridge design is a routine. Locomotive design is improving so fast that most of us cannot keep up with it. The new engine question in itself is a big task, offering great possibilities.

Then comes the question of the existing power and what may be done to it to increase its capacity, increase its pulling power, reduce its failures on the road, to quicken and cheapen the maintenance work and to increase its thermal efficiency and the number of hours that it is available. This involves intimate knowledge of progress in machine tools, in labor-saving equipment, in equipment of locomotive terminals and particularly equipment for running repairs at the round-

houses. Some of the roads are approaching this ideal now. The roads which come nearest to doing it are those which are making best use of their power, and which are in the best shape financially.

The kind of problems which need working out are represented by a study of locomotive drawbar pull which will show whether it is cheaper to increase the power of locomotives or to cut down a certain grade. The money value in reduced cost of operation due to reducing certain grades is already well worked out. It is practically reduced to a formula, but the effect of increased drawbar pull needs to be reduced to a formula. This would at once reveal the money value in operation of increasing the drawbar pull of a Mikado by 50 per cent at a speed of 30 miles per hour or by nearly 30 per cent at 20 miles per hour. Another study of great value is that of considering available drawbar pull hours of locomotives as if it were a deposit in the bank. Figures that show how much of this deposit is used under daily conditions and how much it can be increased by relatively small expenditures offer a promising field for saving.

Because of the improvements of 20 years the locomotive, its construction, its operation and its maintenance presents

the trump card in the reduction of the cost of transportation in the present emergency. That card has been well played, play it now to win.

In conclusion there are two very important points which I do not wish to leave either unsaid or unheeded:

First: In emphasizing the importance of all these items of modernizing, of vitalizing, locomotives we have discussed tonight, I wish to make most prominent the first and greatest obligation of the railroad companies, namely, their responsibility to their owners and stockholders, who first and above all others are entitled to a fair return upon their investments.

Second: As I have already attempted to point out railroad managements have done and are doing wonderfully well in the application of capacity increasing factors to locomotives to augment power. These improvements will by necessity result in substantial savings. There are, however, additional means of economy which are not so closely hooked up with pure problems of capacity increase. These must be further considered by themselves. Funds for carrying out programs in this direction will be made available quickly when the possibilities and necessities are fully appreciated.

## Freight Claim Division Plans to Reduce Losses

### Organization Contemplates Active Campaign to Arrest Increase in Payments for Loss and Damage

**P**REVENTION WAS THE KEYNOTE of the Thirtieth Annual Convention of the Freight Claim Division of the American Railway Association (formerly the Freight Claim Association), which was held at the Hotel Sherman, Chicago, from May 17 to 19. The meeting was featured by the setting aside of an entire day for the discussion of causes of, and means for preventing freight claims. It was the first time in the history of the organization that any part of its annual session had been thus set aside for a special order of business centering around claim prevention, and the interest which was manifested, as well as the presence of numerous representatives of the operating departments of the roads, who had been invited to attend, indicated clearly the general realization that the sum of \$109,000,000 paid out in claims in 1920, must be materially reduced. Especially noteworthy was the fact that the 350 representatives of the claim departments of the carriers who attended did not limit their prevention campaign to a discussion, but followed it through with a complete analysis of the causes of the situation, together with recommendations for bettering it.

Following the usual custom, the opening day of the meeting was given over to committee reports and other routine business. The convention was called to order by H. C. Pribble, general claim agent of the Atchison, Topeka & Santa Fe, and chairman of the Freight Claim Division, who emphasized the importance and seriousness of the problems confronting the meeting in his opening remarks. Upon the recommendation of its executive committee, endorsed by the Committee on Rules and Order, the Freight Claim Association voted to incorporate formally in the American Railway Association. By this action the former Freight Claim Association becomes Division VII, Freight Claim Division, of the American Railway Association. Its assets were turned over to the A. R. A. and its members were accorded full voting privileges in the latter organization.

#### Freight Claim Prevention Most Important Topic

It was obvious from the unusual attendance at the second day's session, that notwithstanding the interest in the amal-

gamation with the American Railway Association, the special order of business was claim prevention. The necessity for an organized claim prevention campaign was emphasized by R. H. Aishton, president of the American Railway Association, who addressed the session in the absence of N. D. Maher, president of the Norfolk & Western and representative of the Freight Claim Division on the Board of Directors of the American Railway Association. Mr. Aishton stated that the Division had made an excellent start toward a reduction in the heavy drain on revenues caused by freight claims, especially in view of the generally run down condition of equipment following federal control, the switchmen's strike of a year ago, and other serious obstacles with which it had been confronted.

President Aishton was followed by Francis C. McAdams, assistant director of accounts of the Interstate Commerce Commission, who presented the views of that body on the claim prevention movement.

#### Campaign Already Under Way

That the interval since the last session had been utilized in preparing and launching the prevention campaign, was brought out in the report of the Committee on Cause and Prevention, which was presented by the chairman, J. B. Baskerville, assistant general claim agent of the Norfolk & Western. The outstanding feature of the year's effort was the employment of three special claim prevention representatives, to devote their entire time to the work.

In connection with the report of the Committee on Cause and Prevention, it had been decided that the task of analyzing and recommending means of preventing the main causes for claims, in view of the large general session, would be facilitated if the more important subjects were grouped for discussion into five general classes, as follows: *I.* Robberies, resulting in losses of nearly \$2,000,000 per month; *II.* Loss of Entire Packages, costing approximately \$1,500,000 per month; *III.* Rough Handling, responsible for claim payments of about \$1,000,000 per month; *IV.* Defective Equipment, involving a cost of slightly less than \$1,000,000 per month;

1. Delay, resulting in charges of approximately \$500,000 per month.

Aside from the specific recommendations on each of these subjects, two outstanding facts were developed during the session. The first was that excellent results were to be derived from frequent meetings of employees and officers on individual roads for the discussion of prevention of loss and damage claims. Investigations in this connection disclosed that only 57 per cent of the roads of the country were properly organized to interest their employees in investigating and helping to cut down claims. It was the consensus of opinion of those present that strenuous efforts should be made to secure the active co-operation of every carrier in the claim prevention movement. A second feature of the special session was the launching of a movement to secure closer co-operation in the settlement of important claims between the carrier on whose lines shipments originated and the carrier called upon finally to settle the claim.

**Robbery and Lost Packages**

The subject of robbery, which, it developed, is resulting at the present time in a more serious loss to the carriers than ever before, was discussed at length. It was brought out that the increasing number of depredations was due in large measure to the widespread unemployment at the present time, coupled with the leniency of the courts. It was further established that the pilferers were not confined to any special class of persons, but were in the service of carriers, draymen and shippers alike. The session recommended that the president of the American Railway Association be petitioned to impress the seriousness of the situation upon the various railroad executives throughout the country. It was further recommended that the protective sections of the various carriers be further strengthened at the present time rather than curtailed, in order that freight, as well as the large amount of idle equipment, be amply protected.

The Division agreed that the serious drain resulting from lost packages was due principally to the large number of these packages which go astray and, in consequence, are never recovered. To remedy this difficulty, three proposals were laid down:

1. The carriers should require proof of ownership on astray packages at destination.
2. Notice should be sent to all lines at destination point of the delivery of astray packages.
3. The delivery should be "followed up" to secure revenue billing, in order that the line "short" might be fully advised of the delivery of the "over."

**Rough Handling Discussed**

The subject of rough handling was brought before the session from a new angle by J. L. Pilcher, mechanical engineer of the Norfolk & Western. Mr. Pilcher illustrated by charts the result of tests which indicated that cars in switching must not be brought together at a speed greater than two miles an hour. It was claimed that the movement at the time of contact can be brought down to this speed, although representatives of the operating departments who were present declared that this practice would slow up operation. The subject of rough handling was referred by the session to the Mechanical, Transportation and Operating Divisions of the American Railway Association for further consideration, in view of the fact that the theory outlined was new and somewhat drastic, and pertained especially to the work of the other Divisions.

**Defective Equipment and Delay**

Delays, it was established, are not a serious cause of claims at the present time. Those present agreed with representatives of the operating departments, that freight in general is now

moving practically on schedule time. In the same way the meeting held that the subject of defective equipment could well be deferred until the financial condition of the carriers had improved. The sense of the meeting was that equipment had been allowed to run down in many instances during federal control, and that claims resulting from that cause could be reduced only as a favorable opportunity for placing equipment in good condition was again presented.

**Election of Officers**

The remainder of the session was devoted to outlining the claim prevention campaign for the coming year when a determined effort will be made to reduce the bill for loss and damage claims materially.

The final day of the meeting was occupied with committee reports and with the election of officers. H. C. Pribble, chairman of the Freight Claim Division during the past year, was re-elected. H. C. Howe, freight claim agent of the Chicago & North Western, was re-elected first vice-chairman; W. C. Fitch, freight claim agent of the Southern Pacific, was elected second vice-chairman; Lewis Pilcher was re-elected secretary, and J. B. Baskerville was re-elected chairman of the re-organized Committee on Freight Claim Prevention. These officers were also appointed members of the General Committee of the Division. In addition to the officers, the following were elected members of the General Committee: R. L. Calkins, freight claim agent, New York Central; J. A. Beahan, freight claim agent, New York, New Haven & Hartford; W. B. Kellett, freight claim agent, Fort Worth & Denver City; T. S. Walton, freight claim agent, Missouri Pacific and H. R. Grochan, freight claim agent, Chicago, St. Paul, Minneapolis & Omaha.

There Are Some Folks Who Are Beginning to Wonder How Much Longer That Orchestra Is Hired for

# Annual Convention of Fuel Association

## Papers on French Fuel Conditions, Pulverized Coal and Feed Water Heaters at Opening Sessions

WITH AN ATTENDANCE of approximately 200, the International Railway Fuel Association opened its thirteenth annual convention at the Hotel Sherman, Chicago, on May 24 and adjourned after the consideration of a heavy program on May 26.

Following the usual opening exercises the meeting was addressed by Samuel O. Dunn, editor of the *Railway Age*. An abstract of Mr. Dunn's address follows.

### Present Railway Situation

By Samuel O. Dunn

The fuel bill of the railroads, like all their other expenses, has increased very greatly within recent years. In the year ended on June 30, 1915, the fuel used by the Class I railroads cost them less than \$210,000,000. In the calendar year 1916 it cost them over \$250,000,000, in 1918 it cost them over \$500,000,000. There was a decline in the amount of traffic handled and in total expenditures for fuel in 1919, but in 1920, owing to increases both in the amount of fuel consumed and in the average price, the total fuel bill of the Class I roads was \$675,000,000. This was an increase since 1916 of \$423,000,000, or almost 170 per cent. This increase in the cost of fuel was partly caused by an increase in the amount consumed, due to the fact that a larger traffic was handled, but much more largely by increases in the price of fuel. A large part of the increases in price took place last year. In the last four months of 1919 the average price per ton paid by the railroads for fuel was \$3.42, while in the last four months of 1920 it was \$4.74, an increase of 39 per cent in twelve months.

Since the end of 1920 there have been substantial reductions in the prices paid by the railroads for coal. It is clear, however, that further reductions must be secured in all their operating expenses, including the cost of fuel. The cost of fuel must be further reduced both by reductions in price and by the effecting of greater economies in its use. The effecting of greater economies in its use must be brought about by securing greater efficiency in the firing of locomotives and also by continuance of the installation of devices which result in less fuel being burned in proportion to the power produced.

I have touched upon this phase of railroad operation because it is the one in which the members of your organization are most directly interested. Speaking now of the general railroad situation in this country, it is at present in some important respects the worst that it has ever been.

Passenger and freight rates are higher than for many years. There is complaint from many travelers and shippers that they are too high. In spite of these relatively high rates, the railroads as a whole never in any month since the rates were fixed have earned the net return it was expected they would. Recently most of them have not been earning enough to pay their operating expenses and taxes, and have seemed headed for bankruptcy.

There is at present a very large surplus of freight cars. It is well known, however, that the present capacity of the railroads have proved unequal, when production and commerce have been active, to all the traffic offered. How are the railroads to handle the unprecedentedly large traffic they are bound to be offered within the near future unless, meantime, their capacity is increased?

In the railroad as in other businesses, new capital is needed

for two purposes. One of these is to increase the amount of business that can be done. The other is to reduce the cost of doing the business. When new investment is wisely made in a railroad or any other enterprise, such as a manufacturing concern having a large plant, it increases the interest and dividends that must be paid. But by saving labor and in other ways it reduces the operating expenses that must be incurred more than it increases the capital charges, and, in consequence, tends to enable the concern to make larger profits, to reduce the prices it must charge, or both. The main reason why for years most of the railways of this country were able, despite steadily advancing wages and other costs, to increase their own profits while making lower and lower rates was that they were constantly investing large amounts of new capital in improvements for the express purpose of reducing or holding down operating expenses. The reduction of the net return of the railways by government regulation reduced the amount of new capital they could raise. This, in turn, reduced the improvements that could be made and greatly impaired the ability of the managements to effect operating economies.

On March 1, 1920, the railways were returned to private operation. During government control the operating expenses had continued to increase rapidly right down to the last day of government control. In the very last month of government control the railways failed at the rate of \$270,000 a day to earn enough to pay their operating expenses and taxes, leaving nothing with which to pay the government guarantees. Within a few months the Railroad Labor Board, a government body, granted the largest advance in wages ever made to a single class of working men at one time in the history of the world. The prices of fuel and materials were advancing, and within a few months attained higher levels than during the war.

The Interstate Commerce Commission granted an advance in rates late in August. Although the railways were handling a record breaking business, the rates failed from the start to yield the net return expected. In consequence, in the last four months of 1920, when the railways handled the largest traffic ever known in those months, it cost them 88 cents of each dollar they earned to pay their expenses and taxes, and the net return earned was at the annual rate of only  $3\frac{1}{2}$  per cent instead of 6 per cent.

While the railways were in the precarious position financially these figures indicate there began a large slump in traffic. Not only were net earnings wiped out, but beginning in January and February the operating expenses and taxes, in spite of great retrenchments, exceeded the total earnings.

Nobody connected with the railways believes or has contended that all the reductions in the cost of operation should be made in the payroll. The railways contend, however, that the payroll is excessive, that it is the main reason why the operating expenses are excessive and that the main reasons for the excessive payroll are that, first, rules and working conditions adopted under government control have reduced the efficiency of labor and forced the railways to employ too many men, and, secondly, that the basic wages of railway employees are too high.

The Railroad Labor Board has ordered the National Agreements abrogated on July 1, subject to certain principles which it has laid down. The labor union leaders have announced that they will draft and submit to the individual

railways throughout the country a set of uniform rules and working conditions, and they undoubtedly will make a strong effort to get these adopted. No uniform set of rules and working conditions could be applied throughout the country without causing great inefficiency and waste. The benefits that will be derived from the decision in the National Agreements case are, therefore, yet to be determined.

In addition to seeking abrogation of the National Agreements, the railways have asked the Railroad Labor Board to make general reductions of wages. They base their application mainly upon the grounds that wages have been reduced in most other industries and that the cost of living has declined.

The principal answer of the labor leaders to this argument is that through mismanagement the railways are wasting about \$1,000,000,000 a year, and that all this alleged waste should be eliminated before the payroll is curtailed.

After the present wages were fixed, and when the railways were still carrying a heavy traffic, their total operating expenses were running at the rate of about \$6,000,000,000 a year, and of this amount almost \$4,000,000,000 was going to labor in wages, leaving about \$2,000,000,000 for other expenses. Since the labor leaders defend the present payroll, it follows, on their theory, that, by eliminating preventable "wastes" the managements could and should reduce all expenses except the payroll by almost 50 per cent. At least four-fifths of this other \$2,000,000,000 of railway expenses consists of expenditures for fuel and for equipment and materials and supplies—iron and steel, lumber, office appliances, stationery, etc. The labor leaders claim the railways pay excessive prices for these things because the railways are under the same financial control as the concerns from which they make purchases.

It would be easy to prove, if time permitted, that all this talk about the control of railways and the concerns from which they make purchases by the same financial interests is the wildest buncombe. But suppose they are under the same control. Where is the evidence that this causes the railways to pay excessive prices for fuel and for materials and supplies? Do they pay more for coal than other large consumers? The coal operators complain loudly that the railways use the "assigned car" rule to get coal cheaper than other concerns. Do they pay more for iron and steel? Until recently they, like other consumers, were paying the United States Steel Corporation, which is supposed to be the archetype of a concern controlled by the house of Morgan, the same prices which were fixed by a government board in 1919, and which other people were paying; and they are now paying it and other steel concerns less than these prices. Do the railways pay more than others for lumber? Every lumber manufacturer and dealer will say they are close buyers. The allegation that the railways as a whole, because of their actual or alleged financial control, waste money by intentionally paying excessive prices has never been supported by a scintilla of evidence, and it never can be, because it is absolutely baseless.

The labor leaders also criticize the railways for not having made certain important improvements in their physical properties which would enable large economies to be effected. To make large economy-producing improvements the railways must first raise large amounts of new capital to invest in them. But they cannot raise this new capital until they are enabled to earn a net return sufficient to pay reasonable interest and dividends on their present valuation. Their net return cannot be made adequate for this purpose without large reductions of their present expenses, of which the payroll constitutes two-thirds; and the labor leaders oppose all reductions of the payroll.

The Railroad Labor Board has definitely announced that reductions of wages will be made which will be effective on

July 1. It has not, however, indicated how large these reductions of wages will be.

It is very doubtful if we shall ever return to pre-war wages and other expenses, or to pre-war rates, and highly probable that it will be a long time before we even approach them. The great war has made profound changes in economic and social conditions throughout the world, and also in man's thinking and in the relations of different classes of men to one another; and until you have restored, if you ever shall restore, pre-war conditions, pre-war ways of thinking and pre-war relationships between employers and employees elsewhere, you cannot hope to restore them on the railroads of this country. What we can do and must do on the railroads is to deal more justly with labor of many classes than formerly was done with respect to both wages and working conditions and at the same time make the railroads once more an instrumentality which can and will render their service to the public with a high degree of efficiency and economy.

I have not the slightest idea that the pre-war wages of railway employees ever will be restored, nor do I think they ever should be. There were many classes of employees who, before the war, were not paid as much as they should have been in proportion to the cost of living at that time, and I hope to see their wages in future kept higher in proportion to the cost of living than they were before. And in this connection I think special reference should be made to the cases of supervisory officers. It is a fact today, as it has been for years, that many supervisory officers are paid less than the higher paid employees over whose work they exercise supervision. Indeed, the average salary of all division officers, including superintendents, master mechanics, trainmasters, road foremen of engines, etc., is less than the average wages of some employees. According to the latest available statistics the average salary of all division officers now average \$3,437 per year, while the wages of passenger locomotive engineers average \$3,450 and the wages of freight engineers \$3,586. The advances granted to divisional and supervisory officers since before the war have been relatively much less than those granted to most classes of employees, and as a matter of justice to the officers this fact, together with the fact that many of the officers were underpaid before, should be given great weight in any readjustments which may be made in future.

Bad as the situation is today, I am not pessimistic about the future of the railways. On the whole, I have no doubt that we have seen the worst we are going to see in the railroad business.

However, we should clearly recognize the fact that if the railroads are again to be put upon their feet the utmost efforts must be made by all of us who are directly interested in the business, first, to secure the utmost efficiency and economy of operation, and, second, to keep the public fully informed regarding everything that is being done to promote efficiency and economy, in order that the many unjust attacks which will continue to be made upon the managements of the railroads in the future, as they have been in the past, will not mislead public opinion regarding private management. All of us who are in close touch with railway affairs know that private management is by no means perfect, but we all have very good reason for believing it is much better than government management or Plumb plan management would be, and, therefore, it is our duty to do all we can to make sure that private management will be perpetuated.

### President Hurley's Address

Following Mr. Dunn's address, J. B. Hurley delivered the presidential address, of which an abstract follows:

The occasion that bids us gather in convention at this time is indeed an important and impressive one. Many great and perplexing questions confront the mind of America to-

day and call for settlement—never probably in the history of the nation was there a time when loyal citizenship and patriotic co-operation on the part of all for the good of her institutions, for the maintenance of her business enterprises and for a respectable moral standard was more desired than at present. War with its horrors and sacrifices brought extravagance. The emergencies of the times to a great extent broke down our systems of economy and an extravagant increase in material, in production, in labor was a natural outcome of urgent necessity.

The war has ended, but it has left its impressions and its deadly influence—excessive profits and wages of war times have brought a spirit of unrest and discontent to the minds of those who in their loyalty are asked to practice economy that our business interests may prosper, that we may take our place even with keen competition, not only as the first nation of the world by our wealth, but first as an industrial and commercial nation. This is the prime object of our convention—that we may bring about a better feeling and spirit between employer and employee, that we may win the employee by interesting him in his work and making him feel that work is rather a pleasure than a crime—that we may better the employee by educating him to know and understand his work that he may do it well, and hence, be a source of satisfaction and interest to his employer.

That by so working, the employer may know and understand that the work of the employee is of first interest to the employer and that he concern himself in working for and bettering the working and home comforts of his employees when consistent. A spirit of mutual interest between employer and employee is an absolute necessity if our business is to prosper and grow.

At the close of Mr. Hurley's address the report of the secretary was read, showing a membership of 1,311 members at the close of the calendar year 1920.

### Report of Committee on Pulverized Fuel

The progress of the art of burning pulverized coal by railroads on locomotives or in stationary plants the past year has, on account of well understood economic and other conditions, been practically nil, no new installations having been made.

Some few tests have been made. One of these which is of some interest was made on Lehigh Valley locomotive No. 1360 between Easton and Leighton, Pa., to determine the practicability of burning pulverized North Dakota lignite containing 15 per cent moisture and Red Lodge sludge (Montana sub-bituminous coal) without resulting in serious honeycomb formation or unusual disintegration of brick work.

The results were successful with the exception of the honeycomb formation which with either coal developed rapidly on the back flue sheet when the locomotive was worked hard and seriously hampered operation. The committee suggests that this honeycomb formation be not taken too seriously and believes that with proper research and engineering work to determine the coal characteristics and to develop proper design of boiler and firebox with particular reference to combustion area and also to drafting, that this problem can be solved. In connection with drafting the committee has in mind the elimination of pulsating draft and correctly determined air supply.

In stationary practice two new cases of pulverized coal operation have been called to the committee's attention. The Milwaukee Electric Railway & Light Company during the past year completed and put into operation a new power plant at St. Francis, near Milwaukee, Wisconsin, manifesting their confidence in the economic advantages of burning pulverized coal.

The Oklahoma City plant of Morris & Company, originally equipped with chain grates, has been modified to burn either pulverized coal or oil and has been in successful operation for a little over a year. By the use of suitable burners it is practicable to burn either pulverized coal or oil without changing furnace or boiler. The coals used are Macalaster Field having a B. t. u. value of 10,000 to 11,500; moisture, 5 to 10 per cent; volatile matter, 20 to 30 per cent; fixed carbon, 40 to 45 per cent; ash, 30 to 35 per cent; sulphur, 1 to 2 per cent, and Texas lignite having a B. t. u. value of 6,000 to 7,000; moisture, 30 to 35 per cent; volatile matter, 20 to 25 per cent; fixed carbon, 25 to 30 per cent; ash, 10 per cent.

This plant is reported as being particularly economical in cost of operation, showing an 8 to 10 per cent saving in cost of steam production based on MacAlester coal, over the stoker fired boilers burning coals of equivalent B. t. u. values. Accurate daily records of cost are maintained for purposes of comparison.

The state of the art today indicates an unquestionable field for pulverized coal and that its commercial use depends upon the economic conditions obtaining, each case requiring its own particular analysis.

The committee repeats its previous recommendation that thorough research and engineering work accompanied by conclusive tests be conducted at one of our universities adequately equipped, particularly in connection with the burning of pulverized coal on locomotives, the work to be supervised by competent men representing the railroads and the university.

The report is signed by W. J. Bohan (Nor.-Pac.), chairman; H. T. Bentley (C. & N. W.); R. R. Hibben (M. K. & T.); H. Piollet (Lehigh Valley); W. G. Squires (N. Y. N. H. & H.); J. M. Nicholson (A. T. & S. F.); L. R. Pyle (Locomotive Firebox Co.); W. L. Robinson (B. & O.), and E. C. Schmidt (North American Co.).

### Discussion

Alonzo G. Kinyon (Fuller Engineering Company) expressed the opinion that it would not be many years before as high as 50 per cent of the coal burned would be in a pulverized form, this statement applying particularly to industrial and power plants. He said that the locomotive, as at present designed, was not well adapted to burn pulverized coal under all of the conditions it is called on to meet. Thus far nothing has been developed which will eliminate trouble from honeycombing, with certain coals when the locomotive is working at high capacity.

Eugene McAuliffe said that it is yet to be proved whether a kilowatt-hour is produced with fewer heat units from pulverized coal than from coal burned on grates, but laid stress on the versatility of pulverized fuel burning equipment where relative values of oil and coal call for frequent changes from one to the other.

### Locomotive Feed Water Heating

The interest in feed water heaters in America is shown by the history of the past year to be growing, in that the number of roads to take up the two main types of feed water heaters for tests has increased. There are no new feed water heaters brought out this year, but progress has been made in the simplification of the design of the Locomotive Feed Water Heater Company and Worthington systems.

In 1920 there were seven roads using the Locomotive Feed Water Heater Company, Weir, Worthington, Caille, and the Simplex Blake-Knowles feed water heaters. There are now eighteen American roads with five types of heaters on order or in service; namely, the Locomotive Feed Water

Heater Company, Weir, Worthington, Caille, and the Simplex Blake-Knowles. These are as follows:

The Superheater Company's Feed Water Heater:	
Delaware & Hudson.....	2
New York Central.....	4
Delaware, Lackawanna & Western.....	1
Rt. Smith & Western.....	2
Grand Trunk.....	5
Erie Railroad.....	5
Canadian Pacific.....	5
New York, New Haven & Hartford.....	5
Atchison, Topeka & Santa Fe.....	4
Southwestern Pacific.....	4
Central Railroad, New Jersey.....	2
Central Vermont.....	2
Chicago & North Western.....	2
Lake Shore & Michigan Southern.....	1
Elgin, Joliet & Eastern.....	1
Total on order and applied.....	35
Worthington Feed Water Heater:	
Pennsylvania Railroad.....	4
Norfolk & Western.....	1
Southern Pacific.....	5
Chicago & North Western.....	2
Total on order and applied.....	12
Weir Feed Water Heater:	
Canadian Pacific.....	1
Southern Railway.....	2
Grand Trunk.....	1
Total on order and applied.....	4
Caille Feed Water Heater:	
Baltimore & Ohio.....	1
Simplex Blake-Knowles Feed Water Heater:	
Erie Railroad.....	3

The Southern Pacific is trying out some of both the open and closed types of heaters. The roads which have tested out these heaters are securing practically the same results as given in the results of tests of the two classes of heaters, a saving of between 13 and 15 per cent based on increase in evaporation of pounds of water per pound of oil. However, in bad water districts it has been found necessary to clean the closed heaters due to scaling, in order that this saving be maintained. No data are available in bad water districts of the Worthington heater. Several means have been tried for the cleaning of the closed type of heaters, and it is believed that satisfactory means at low cost have been secured using a dilute solution of hydrochloric acid, but service alone can determine the life of the feed water heaters and flues.

The question of weight on drivers has to a certain extent influenced the adoption of the feed water heaters as at the present time the railroads have this problem to contend with, and in order to keep the weights of the locomotives within the bounds prescribed by their various roads, this valuable method of saving fuel has not been universally adopted.

The report is signed by E. E. Chapman (A. T. & S. F.), chairman; E. A. Averill (The Superheater Co.); O. S. Beyer, Jr.; B. J. Farr (Gd. Tk. Wn.); F. Kerby (B. & O.); A. T. Pfeiffer (N. Y. C.); L. G. Plant (Ry. Review); L. R. Pyle (Locomotive Firebox Co.), and W. H. Winterrowd (Can. Pac.).

**Discussion**

Eugene McAuliffe expressed the opinion that feed water heating had proved an effective means of reducing fuel consumption and the application of such devices is now only a question of obtaining the necessary capital.

J. N. Clark (Southern Pacific) described the results of feed water heater tests which showed that in some cases the heaters, raised the temperature of the water up to 255 deg. F. He stated that the maintenance of the heater needs to be carefully considered, especially in bad water districts where it requires frequent cleaning because the savings largely disappear when scale forms on the surfaces.

E. E. Chapman stated that the saving in various tests range from 8.4 to 16.6 per cent. He pointed out that feed water heaters reduce the rate of combustion and thus lengthen the life of boiler tubes and firebox sheets. It has been found advisable on the Santa Fe to clean the heaters every two weeks with a diluted solution of muriatic acid. This operation requires about two hours and is effective in removing scale.

**Report of the Committee on Storage Coal**

There has been very little activity in connection with the storage of coal by railroads since the last report of the Storage Committee.

The Fairbanks, Morse Company report of the completion of three locomotive coaling stations, including yard storage of coal, built for the Erie. At Salamanca, New York, the coaling station consisted of four circular concrete bins of 1,000 tons' capacity and tributary storage for 38,000 tons. A similar plant was built at Hornell, New York, with tributary ground storage for 33,000 tons. A 300-ton coaling station was also built for the Jacksonville Terminal Company at Jacksonville, Florida, where 300 tons is stored in overhead pockets and 2,500 tons on the ground.

All of these plants were of the drag scraper type which has been largely used by the Southern Railroad and has been described in previous reports of the committee. As to cost of operation of such plants, F. P. Drinker, manager, engineering department, Fairbanks-Morse Company, says that in 1914 observations of the operation of some of the plants on the Southern Railway showed that the cost of handling coal in and out of yard storage, including power and supplies and maintenance, averaged about 2½ cents each way, or 5 cents per ton, delivered to locomotives, and that this would indicate on the same basis a handling cost of from 10 cents to 12 cents per ton at the present time.

The Roberts & Schaefer Company report the development of a new type of storage in connection with the Rand portable coaling and cinder plant.\* This type of coaling and storage plant may be equipped with a large capacity hoist or a small capacity hoist. A price for the structure complete above the rails and electrically operated, is quoted as follows:

For large capacity hoist.....	\$36,670
For small capacity hoist.....	34,490

No figures are available at this time for the cost of operation of the storage portion of this plant for it is difficult to obtain separate storage figures as many of the railroads do not attempt to separate storage and coaling costs.

The Portable Machinery Company, Passaic, New Jersey, reports an installation of portable conveyors for the Atlantic Coast Electric Railway, Asbury Park, New Jersey. The pile contains about 3,000 tons and the Atlantic Coast Electric Railway reports that it can store 350 tons a day with four men unloading and attending the conveyors. The company reports that during the past two years it has built up a similar pile at four different times and later removed it to the station. At the other end of the power plant the company has a similar storage pile.

The last report of the committee† included a circular upon coal storage sent out by the Fuel Department of the Railroad Administration to all of the railroads of the United States. This was prepared under the direction of Eugene McAuliffe and a committee of railway representatives. Mr. McAuliffe reports that "No definite information regarding the outcome of the storage circular is available. Personally I have heard but one comment, that 'Railroad officials with few exceptions paid little attention to the circular.'"

Depleted stocks of railroad fuel are particularly significant to the general consumer because they point to the probability that the railroads will have to confiscate coal or assign cars freely, measures which necessarily interfere with the regular deliveries of coal to other users. Stocks of railroad fuel were far below those held by the railroads at any time during the last four years.

The Consumers' Fuel Company, Morgantown, W. Va., built in 1920 a Thornley storage plant. A number of inquiries in regard to storage of coal at the mines have been

\*This plant was described on page 607 of the March 15, 1921, issue of the *Railway Age*, Daily Edition, and illustrated on page 644 of the issue of March 16.  
 †See page 1311 of the May 30, 1919, issue of the *Railway Age*.

received, but a number of companies that have investigated the subject have concluded that such storage is not advisable unless an increased car rating may be obtained by the mining company as a result of such storage facilities. The general public and the large users of coal should have impressed upon them the fact that storage at the mine is not of any particular assistance to the railroads or to the consumers of coal in providing coal under emergency conditions, but acts merely as a safety valve upon operating conditions at the mine. The proper place to store coal to relieve the railroads and the consumer is as nearly as possible to the point of consumption.

In a circular issued by the United States Geological Survey under date of March 27, 1921, entitled, "Are We Buying Coal Enough?" Doctor George Otis Smith, director, and F. G. Tryon, coal statistician, summarize the present condition as follows:

"In so far as the consumer is waiting for the price to come down, at the risk of depleting his reserves against winter requirements, the relief turns upon a question of fact, namely, whether the present market price of coal is a reasonable price, whether it is as low as can be expected later. It is to be regretted that the Federal Trade Commission has been enjoined from learning the facts and so is not able to issue a statement of present-day costs that would enlighten the public.

"But only as needed,' may prove too conservative advice at this time. The consumer waiting for low prices and the producer delaying price adjustment might be found equally responsible for the uneconomic seasonal fluctuations in coal output. 'Buy only as needed,' may result in cheaper coal in the bin, but the bin may be too nearly empty much of the time when the need is greatest."

The necessity for the storage of coal was stressed in a set of conclusions prepared by the Committee on the Stabilization of the Bituminous Coal Mining Industry of the American Institute of Mining and Metallurgical Engineers, which may be summarized as follows:

(1) The bituminous industry, by the nature of its organization, functions economically in a too inefficient manner. Employment in the industry averages less than 220 days per annum, with a minimum district average of less than 200 days.

(2) The causes are largely (a) intermittency in seasonal demand, (b) irregularity of car supply, and (c) the lack of storage facilities and incentive for their use.

(3) The cure lies in: (a) The co-operation of railroads in the establishment of seasonal differentials in rates that will induce summer demand; (b) increased transportation facilities and a more efficient and equitable distribution of cars; (c) increased use of central and inter-connected electric-power plants; (d) lower selling prices in dull seasons made possible by differentials in profits, freight rates and wages; (e) recognition by the larger consumers, that not only continuity of operation, but also the safety of the public from the stoppage of supply, demands that they provide adequate storage to be replenished in the dull season.

(4) Such storage is feasible and can be made financially remunerative by differential rates and prices.

(5) No adequate solution can be found, except through organized co-operation of operators, labor, railroads, and large consumers.

The committee feels that one of the greatest problems is to get the higher railroad authorities to thoroughly understand the importance of the storage of coal and that they may appreciate the necessity for careful and systematic storage. Spasmodic attempts to store coal have always proven unsatisfactory both to the consumer and to the producer and that storage of coal may be successful it must be conducted regularly and in a methodical manner and by the fullest co-operation of producers, carriers and consumers. The storage

proposition must be tied up with production to such an extent that it will co-ordinate properly, and when large stocks of coal have been stored the production and movement will have to be regulated in such a way that the storage coal can be used most advantageously and not become simply a high priced inventory article. The experience of the past 3 or 4 years shows conclusively that storage of coal must be more carefully considered and that only by such careful consideration can it become the stabilizing influence that it should.

If a practicable plan of storage at large distributing centers had been operating during 1919 it is probable that the November strike of that year would not have produced the condition of panic that followed during the spring and summer of 1920.

The report is signed by H. H. Stoek (University of Illinois), chairman; A. H. Davies, C. G. Hall (Walter Bledsoe & Co.); J. B. Hutchison (Texas Steel Co.); B. P. Phillippe (Penn System); R. E. Rightmire (Consolidation Coal Co.); A. P. Wells (Central of Georgia); H. Woods (Colorado & Southern); S. L. Yerkes (Grider Coal Sales Agency).

## Fuel Conditions on the French Railways

By M. de Boysson, Ing.,

Chief of Locomotive Service, Paris-Orleans Railway, Paris, France

The question of locomotive fuel consumption has always been one of the greatest importance to the French railways for the cost of coal, even before the war, has been relatively high and the yearly fuel bill represents a large proportion of the total operating expenses.

In 1912 the average cost of coal used by the French railways was about 18 to 19 francs (\$3.60 to \$3.80) per ton loaded on the cars, and about 21 to 22 francs (\$4.20 to \$4.40) per ton delivered on the tender, including the cost of freight and handling. In 1914, on the eve of the war, these prices had increased some 60 or 80 cents per ton, and at that time the cost of fuel for the French railways amounted to about one-sixth of their total operating expenses.

The average price of French coal and imported coal was, in 1920, more than 250 francs (\$50) per ton. Furthermore this increase in price was accompanied by a decrease in quality. The amount of ash, which in ordinary times averaged from 8 to 10 per cent, rose to an average of nearly 17 per cent. This naturally caused an increase in fuel consumption. At the present time the French railways are, therefore, paying about fifteen times the pre-war cost for fuel and the total fuel bill now amounts to about 35 or 40 per cent of the total operating expenses as compared to about 16 per cent before the war.

Under these circumstances it has been necessary for the French railways to give careful attention to the fuel consumption and the price of fuel. They have concentrated principally on the three following points to obtain fuel economy: choice of fuel, improvements in the locomotive to improve fuel consumption, and training of the engine crew and supervision of fuel consumption.

Unfortunately, in spite of the increase in price, it has not been possible to accomplish much in the direction of economy. The reason for this is due to the scarcity of coal, the difficulty of obtaining sufficient supplies of all kinds to provide the proper mixtures, and the fact that a large number of inexperienced men have had to be employed to replace the men lost in the war.

### Choice of Fuel

The destruction of the mines in the North and the Pas-de Calais districts, greatly reducing the coal resources of France, no longer permitted the railways to choose the fuel best suited for locomotive use and they have had to be satisfied with what they were able to obtain. Furthermore, the

decrease in the amount of coal carried in stock has forced them to burn the coal as it arrived without permitting them to make mixtures, as had been done in the past, which would give the best results. The situation has, however, improved a little during the past few months and the railways are gradually returning to more economical methods.

Before the war it was the practice of the railways to mix coals of various qualities in order to provide a mixture which would give the most economical results, taking into account the cost and consumption. By this means the railways were able to use a fair proportion of coal of inferior quality, containing a large proportion of dust, and fuels low in volatile which could be obtained at a comparatively low price. Such coals which would be unsatisfactory when burnt alone, gave very good results when mixed with coals of a better quality.

Another method of using this inferior coal is to combine it with a certain amount of resin to form briquettes. The French mines from which the railways draw their supplies, produce a fairly large proportion of small coal and, further, screened coal coming from abroad arrives with a large amount of coal dust caused by repeated handling. It is necessary to find a use for this small coal and dust, of which there is too large a quantity to be burned as it stands. Briquetting solves the problem and at the same time increases the supply of select coal, which is not obtained in sufficient quantities from the screened coal to meet the needs of the country. Briquettes are made by mixing 92 parts, by weight, of coal with 8 parts of resin. This mixture forms a briquette of good quality which can be used under the same conditions as the best coal, both under difficult operating conditions and for firing up. The total cost of this briquetted coal is practically the same as that of screened coal and the briquettes have the advantage in that they can be handled and stored in the open with much less deterioration than the screened coal. Furthermore, by the addition of the 8 per cent of resin, it is possible to use low volatile fuels which under ordinary conditions would be useless.

These briquettes are manufactured in special presses in which the mixture of small coal and resin, after being heated to about 250 degs. F. to give the resin a consistency of paste, is compressed at pressures of from 3,000 to 4,200 lb. per sq. in. The small coal used in the briquettes can be used just as it comes from being screened, but as a rule it is best to clean it by washing. The weight of the briquettes vary from 6 to 20 lb. The briquettes are made either at the mines or at the ports at which the foreign coal is delivered. Some railways have briquetting plants of their own.

It is the practice of the French railways to mix different grades of fuel in order to obtain the most economical combination for the locomotive service involved. These mixtures will contain more or less high grade fuel according as the service is more or less difficult. The degree of perfection obtained in these mixtures is, however, subject to the kinds and quality of coal available and the cost involved in obtaining the proper quality of coal for the ideal combination.

The amount of volatile matter contained in these coals is rather variable. The average of the mixtures have from 18 to 25 per cent volatile, but all fuel having 15 to 30 and even 32 per cent can be used. In exceptional cases even these limits have been exceeded. Coals with a fusible ash below 2,200 deg. F. are avoided as much as possible and those which produce clinkers which adhere to the grates are not used at all.

#### Fuel Stocks and Methods of Handling Coal

In order to obtain the proper mixtures it is necessary to have at each coaling station a fairly large stock of fuel, because regular deliveries of the different grades of fuel cannot be depended on. A large stock is still more important in districts which are supplied with imported fuel.

The normal stock allowed for the railways was about three to four weeks' supply for pit coal and six weeks' to two months' for briquettes. The latter should not be used until they are dry which takes about a month after they are manufactured. The coal coming from the ports is either mixed immediately when it arrives at the coaling stations, or is placed in separate piles, if the arrivals are too irregular, and mixed in the desired proportions when it is loaded onto the locomotive.

In order to facilitate making these mixtures, mechanical methods of handling have been devised which have the added advantage of reducing the cost of handling. A complete study of the methods of handling would exceed the scope of this paper and only a few particulars of the machinery used by the railways will be mentioned.

The coal cars at the coaling stations are unloaded by steam or electric traveling cranes. A certain amount is delivered directly to the locomotive but the most of it is placed in storage for the purpose of making the mixtures, the same cranes being used in the future handling of the fuel.

At engine houses of medium size the locomotive tender is loaded with the same apparatus that is used for unloading the coal as it arrived from the source of supply. In the larger engine terminals, however, the two operations are distinct, principally because the lack of space required that the storage ground for the fuel be placed at a considerable distance from the engine houses. When the locomotive tender is not loaded directly by the means of cranes, one of the following two methods is adopted: (a) the coal is placed in small push cars, holding about 3,000 lb., and pulled up an inclined trestle by an electric hoist, where the coal is dumped directly onto the locomotive; (b) the coal is raised, either by a crane or chain buckets, into a regular coal chute from which it is delivered directly to the locomotive.

The briquettes cannot be handled with the grab buckets. The greater part of the work is done by hand, although it is possible to load them into the push cars and deliver them to the locomotive in the same manner as is described under (a) above. They are also loaded onto the locomotive by means of ordinary buckets filled by hand.

Practically all of the coal delivered to the locomotives is weighed. This does not present any difficulties when the push cars are used but when the coal is loaded onto the locomotives by the means of buckets no attempt is made to obtain the actual weight, the practice being merely to count the buckets. However, the workmen who are accustomed to doing this work are able to fill the buckets to very nearly the same weight and there is but little appreciable error.

#### Purchase and Inspection

On account of the various qualities and sources of supply of the coal used, it is not possible to rely upon the analyses at the mines. The contracts are therefore made for each different grade of coal, fixing the maximum amount of ash and also quantity of water in washed coal at the point at which the fuel is received. Fines or premiums are provided for coal whose maximum is above or below these figures. In the case of briquettes there is an additional cohesion test.

A maximum proportion of small coal content is specified for both screened and run-of-mine coal. There are, also, other limits which if exceeded are grounds for rejection. The quality of the coal is checked from samples taken either at the mines or at the ports where the coal is unloaded, or even at the coaling stations. These samples were analyzed in the laboratories. This system of checking was discontinued during the war, for the first consideration was to increase production. The railways are trying gradually to put it into force again.

The ordering, inspection and handling of fuel is under the control of a special department, which may or may not be under the jurisdiction of the general supply department of the railways.

## Locomotive Improvements for Economical Operation

### BOILER IMPROVEMENTS

As regards the boiler, the following have been the chief improvements:

1. The use of brick arches, while at the same time protecting the tube plate, has reduced the fuel consumption by 3 or 4 per cent. At the present time all the French locomotives are equipped with them.

2. The dumping grate and the shaking grate, while not reducing the fuel consumption, have allowed the use of inferior fuel. The dumping grate is used on all engines and the shaking grate on most of the modern engines.

3. The use of a circular exhaust nozzle, with a variable opening, gives the maximum draft with the least back pressure. Great progress has already been made in the study of the best arrangement for exhaust nozzles; new ones are still being tried. Considerable economy can be obtained by the use of a well built nozzle which is kept clean, without play and which is operated in accordance with established rules. A dirty or badly centered nozzle may increase the back pressure to a considerable degree and at the same time diminish the draft.

4. Boiler lagging is not in general use as the cost of upkeep seems to equal the saving made on the fuel. However, new trials are being made taking into account the present price of coal.

### COMPOUNDING AND SUPERHEATING

Compounding has realized an economy of 10 per cent compared with the ordinary engines. At first compounding was applied to two-cylinder locomotives, but they have been almost entirely given up on account of the unequal balance caused by this arrangement. All the recent compound engines have four cylinders.

The use of the superheater overcomes these difficulties and gives, in the case of powerful engines, a saving of about 12 per cent on single expansion engines and 8 per cent on compound engines of the same type. In spite of the economic advantage of compound engines with a superheater and four cylinders, the tendency at present is to return, at any rate as regards engines of average power, to simple engines with a superheater and two cylinders on account of a considerable saving in maintenance and the increased facility of operation.

### FEED WATER HEATING

Feed water heaters using exhaust steam were tried before the war. More than one hundred engines are already fitted with this apparatus. These feed water heaters achieve a certain saving of fuel, but on the other hand there are maintenance difficulties and the question is deserving of thorough study.

### WASHING BOILERS WITH HOT WATER

Mention should also be made regarding the development of washing and filling boilers while they are hot. Instituted at first in order to diminish the stress of metal in the boilers and to allow the engines to be used again sooner, this process also allows, in certain cases, the recovery of the heat contained in the water of the boilers which are emptied. However, this recovery required extensive apparatus which it was out of the question to install during the war. The present prices are too high for the expected saving to compensate to a sufficient degree for the cost of the apparatus.

## STOKERS

Mechanical stokers have not yet been applied to French locomotives. The limitation of the weight per axle (18 tons) does not allow of boilers powerful enough to make these stokers indispensable.

### PULVERIZED COAL

Neither has any use been made of pulverized coal, but the railways are following with close attention what is being done abroad and the trials undertaken in France, in order to be able eventually to adopt the practice more or less extensively.

### Training of the Engine Crew and Supervision

The engine crew can have a great influence on economy in fuel. Therefore the hiring and training of locomotive engineers and firemen have always been closely watched by the railways. The employees start as workmen or laborers in the engine houses. After a theoretical and practical examination they can, after a certain time, be employed as extra firemen according to the requirements of the service; but they are not called firemen for a considerable time, which, before the war, was not less than three or four years. After acting for some time as firemen, depending on the aptitude of the employee, they have to undergo a more complete theoretical and practical examination to prove their fitness for the duties of locomotive engineer. Before the war a man was not made an engineer, except in special cases of those who had a more complete training, in less than seven or eight years, of which three years were served as fireman.

During the whole training period the employees are carefully supervised and placed under locomotive engineers who are particularly qualified to act as instructors. During their work the engineers and firemen are frequently accompanied by traveling engineers, who complete their instruction.

The necessity for increasing the strength of the staff very quickly on account of the requirements arising from the war and especially on account of the application of the eight-hour day, forced the railways to train the engine crews very hurriedly and to reduce the length of the term of probation, certainly to the detriment of the skill of the employees and the fuel consumption.

### PREMIUMS FOR ECONOMY

It is not enough to train the engine crews; they must also be interested in producing results. To accomplish this the railways give the engineers and firemen a share in the fuel savings. A certain quantity of coal is allotted to each service, based either on train-miles or ton-miles and the saving made on the allotment is paid to the men at a contract price. The results obtained from this premium were very satisfactory. Recently, owing to pressure from the unions, a guaranteed minimum of premium has had to be assured to the men each month, whatever the amount of the premiums actually realized, and many of them have been content to draw this minimum without trying to obtain greater savings.

### ROAD SUPERVISION

On the one hand, the traveling engineers make sure that the engineers and firemen are getting the best possible out of their locomotive; on the other hand, by means of statements of consumption on each engine, attention is drawn to the engine crews or the services which are unsatisfactory. They are carefully watched, and, as required, the management takes action. If the fault is in the engine, it is immediately sent to be repaired.

### LOCOMOTIVE MAINTENANCE

The maintenance of the locomotives is also closely watched. Strict rules as to the periodical inspection of the

engines are in force at the engine houses and supplementary inspections must also be made whenever it is necessary to maintain the engines in good condition. Provision is made in particular for the piston rings to be replaced about every 20,000 miles; but the rings are replaced before this when the wear exceeds a certain amount. The cylinders are re-bored when the difference between two perpendicular diameters reaches 1.5 m.m. (.06 in.). A sharp lookout is kept in this respect at the main shops.

#### ASSIGNED LOCOMOTIVES

In general, each engine is assigned to an engineer who alone is to use it. This arrangement gives excellent results as regards economy in fuel consumption. Moreover, in this way more delicate and more economical machinery can be used, because it can be kept in better order. Naturally, this method requires a large number of engines. However, the difference is not so great as might be supposed at first sight, for the better care the engines receive greatly reduces the number of engines held out of service for incidental repairs. From the attempts made by the railways to pool the engines on account of the lack of engines during the war and at the time of the application of the eight-hour day, together with the observations made on the results obtained in the transport service by the American forces in France during the war, we have been able to draw the conclusion that, even in the case of two-cylinder single expansion engines the number of locomotives required for the assigned service, only slightly exceeds—less than 10 per cent—that required in the pooled service. With the more complicated compound engines, the maintenance of which requires more attention, the difference would be still less and, perhaps, even to the advantage of the assigned system.

As this latter system is much superior as regards fuel consumption and cost of maintenance, the French railways continue to use it even though the eight-hour day has increased the number of engine terminals and the number of engines themselves.

#### Conclusions

The efforts which the railways made to reduce fuel consumption had produced very considerable results before the war. In both passenger and freight service the fuel consumption per gross ton-mile hauled, had diminished by more than 10 per cent between the years 1900 and 1913, in spite of an appreciable increase in speeds. In 1913 the average fuel consumption was about 65 kilograms of coal per 1,000 ton-kilometers (209 lb. per 1,000 ton-mile) hauled and 18 to 19 kilograms per train-kilometers (64 lb. to 67.5 lb. per train-mile). In some services, where the engines had been replaced by more modern ones, the saving reached 40 per cent.

Unfortunately, the disorganization occasioned by the war has caused the greater part of the progress made to be lost. The railways are trying to remedy the causes of this increase, but it is certain that a considerable time will be required to get back to 1913 conditions.

On the other hand, experiments have been made for replacing coal with liquid fuel and also by the development of electric traction. Several engines have been equipped to burn oil, using the oil burning arrangements adopted in the United States. Up till now the results appear satisfactory from an operating point of view, but France does not possess any oil and has to import it. The problems of the cost of this fuel and certainty of supplies are still far from being solved.

On the other hand, the development of electric traction with hydro-electric power stations—there is abundant water power available in France—is certain. The three railways which are in mountainous districts, the Paris-Lyon-Mediterranean, the Paris-Orleans, and the Midi, have drawn up

programs including, from now onward, the electrification of a large portion of their lines. Surveys are being made, a large part of the concessions granted, and the work will commence shortly. Nevertheless, it will still be some years, especially with the present delays in construction, before an appreciable saving in coal is reached. It will be possible to make a saving of 3,000,000 tons of coal per year when the whole program is completed.

Even for parts where steam-driven electrical power stations have to be used, the substitution of electrical power for steam locomotives ought to bring about a saving in coal of about 50 per cent.

A report of the proceedings of the later sessions of the convention will appear in a later issue.

## The Pennsylvania and Its Employees

GENERAL W. W. ATTERBURY, vice-president of the Pennsylvania Railroad, has announced to employees that plans are being made for conferences with representatives of employees as recommended by the Railroad Labor Board in its decision under which all national agreements are to be terminated on July 1, next. General Atterbury says:

"The aim of the Pennsylvania Railroad during the last year has been to re-establish with its own men a happy and harmonious relationship. The request of the United States Railroad Labor Board is in line with precisely what the management of the Pennsylvania has desired. The employees have the right to select their representatives from among their own number. Detailed conditions designed solely to secure an accurate expression (by secret ballot) of the desire of the employees, under which representatives will be chosen, will be announced later. The men thus selected will be recognized by the management as empowered to speak for the men by whom they are chosen. The representatives chosen by the employees may or may not be union men, as the employees themselves decide.

"As soon as the representatives are elected, the officers will seek a conference with them, in order to negotiate rules and regulations. The representatives so chosen will be protected in their position no matter what may be their attitude with reference to the provisions of such rules and regulations. They will be provided with the necessary transportation, and the company will reimburse them for time lost and for reasonable expenses while on this service.

"While the immediate emergency to be covered is the preparation of mutually satisfactory rules and regulations, it is the hope of the management that the men thus chosen as representatives may serve as the nucleus of committees which shall frequently confer with the officers on all matters, not only affecting your welfare, but also the welfare of the railroad and of the public that we all serve.

"Together we will develop a plan under which every individual employee may have a voice in the progressive efforts of the railroad itself.

"There are three 'musts' that we shall have to work out in co-operation:

"First. The public must have efficient and economical service.

"Second. The officers and the employees must be paid good wages in return for good service rendered.

"Third. We must earn a reasonable return on the capital invested in the property.

"Through the representatives of the employees to be selected in the manner mentioned we shall be able to get closer together; we shall be able to look one another in the face and mutually to understand the facts affecting our common interest. The highest interests of the Pennsylvania Railroad can only be realized in the welfare of its employees."

## George R. Loyall

**G**EORGE R. LOYALL, who has been selected, as already noted in these pages, to succeed J. H. Young as president of the Norfolk Southern when the latter leaves to take up his new duties as president of the Denver & Rio Grande Western, is an operating man of thorough training and experience. Mr. Loyall started his railroad career as an operator and station agent on the Chesapeake & Ohio. He later served in the employ of the East Tennessee, Virginia & Georgia, which subsequently became a part of the Southern Railway and then with the Southern itself. Employed first by the Southern as a superintendent, he then was promoted to assistant general superintendent, to general superintendent and to assistant vice-president (operation) with headquarters at Washington. Mr. Loyall, in other words, has a well grounded knowledge of railroad operations in the south to assist him in his new work with the Norfolk Southern.

The Norfolk Southern is not a large road. Its total mileage is 902 miles, exclusive of 42 miles of electric lines in the vicinity of Norfolk, Va. This mileage is all in Virginia and North Carolina, the lines of the railway extending from Norfolk, southwest and west to Charlotte, N. C., with various branches. The road was built primarily to reach extensive timber areas, but in more recent years its lumber business, while it has not decreased greatly in actual volume, has decreased greatly relatively to the total traffic. In 1910, for instance, the traffic in products of forests amounted to 816,252 tons, making up 55 per cent of the total tonnage. In 1920 the tonnage of products of forests was 698,572; but the percentage of the total tonnage handled was but 24.91. As the timber has been cleared, the land has been turned over to agriculture; products of agriculture in 1910 totaled 197,725 tons or 13 per cent of the total tonnage; in 1920, 393,456 tons or 14.04 per cent of the total tonnage. Another feature of the road's development has been the great expansion in traffic in products of mines and in manufactures. In 1910, products of mines made up 139,078 tons or 9.38 per cent; in 1920, 724,993 or 25.86 per cent. Manufactures in 1910 made up 248,047 tons or 16.72 per cent in 1910; in 1920, 723,193 or 25.79 per cent. The Norfolk Southern owns all the stock of the John L. Roper Lumber Company, which owns in fee some 600,000 acres of timber land. This land as it is being cut is being turned over to agriculture and has been found to be exceedingly fertile and productive.

The Norfolk Southern up to a few years ago extended only to Raleigh, N. C.; its extension to Charlotte is of comparatively recent date. When this extension was built it served more or less as a feeder to the rest of the system. In fact, it is worthy of note that until recently something like 95 per cent of the road's traffic was originated or delivered on the line or on connecting short lines. In August, 1920, however,

this arrangement of things was changed by means of a traffic arrangement with the Southern Railway whereby through rates and divisions were established through Charlotte between points in the North and East and points to the south, southwest and southeast of Charlotte. This will give the Norfolk Southern a through traffic which it did not previously have and should have considerable effect on its earning power. To improve the line between Raleigh and Charlotte to meet the new conditions, a loan of \$200,000 has been secured from the revolving fund. The total cost of the improvements contemplated is estimated at \$400,000; they will give the road a considerably better grade and a much improved alignment.

These brief remarks about the Norfolk Southern will indicate the interesting problems which will confront Mr. Loyall when he takes up his new duties.

George R. Loyall was born in Albemarle County, Va., and was educated in the common schools. He began railway work with the Chesapeake & Ohio and served at various places as

telegraph operator and station agent. He then went to the East Tennessee, Virginia & Georgia at Knoxville, Tenn., serving consecutively as car record clerk, operator, train dispatcher, chief dispatcher and master of trains. He subsequently entered the service of the Southern Railway and served consecutively on that road as superintendent of the Louisville division, also of the Asheville division and of the Knoxville division, then as assistant general superintendent of the Middle district at Knoxville, Tenn. Mr. Loyall was then appointed general superintendent of the Eastern district with headquarters at Charlotte, N. C., and later became general superintendent of the Middle district with headquarters at Knoxville, Tenn. He leaves the position of assistant vice-president in charge of operation of the Southern Railway System with headquarters at Washington, D. C., to take up his new duties as president of the Norfolk

G. R. Loyall

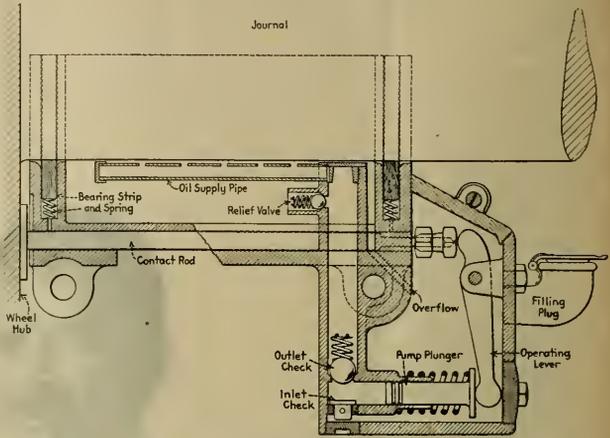

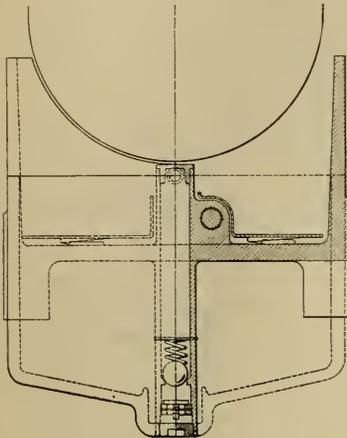

Southern. Mr. Loyall will have his headquarters at Norfolk, Va., in his new position.

**NORTHERN PACIFIC CASUALTY RECORDS.**—Substantial progress in safety work has been made by the Northern Pacific during the last five years as is shown by the fact that fatal accidents to both employees and non-employees have been reduced 75 per cent and casualties to employees 60 per cent. In 1916, this road had 151 fatalities, while in 1920 there were but 52. Considering only employees in service, the record of 1916 shows one injured per month per 100 employees, while in 1920 this was reduced substantially one-half (to 0.51 per month); and in the four months ending with March this year the percentage was further reduced to 0.40. F. M. Metcalfe, assistant to the general manager, says that these casualty reductions mean a large money saving for the company, its total charges to personal injury accounts actually decreasing during the war and post-war periods, as compared with pre-war times. This, he says, is remarkable in view of the increase of 70 to 100 per cent in cost of settlement.

### Automatic Journal Lubrication

OWING TO INCREASED JOURNAL LOADS, speed requirements and extreme temperature variations in some parts of the country, present methods of lubricating the journals of railway equipment sometimes prove more or less inadequate. It is generally conceded that they have not kept pace with other improvements in equipment design. The amount of oil fed to high duty journals by capillary attrac-

Lubricators designed to accomplish the above results have been developed by the Hennessy Lubricator Company, New York, being made in four styles for use with locomotive trailer, driver and truck wheels; also car wheels. Advantages claimed for these lubricators are that they are cheap, fool proof, have few parts and are easily applied, displacing the regular cellars without change or addition to bearings, journals or boxes. The lubricators are packed with waste in the regular manner and can be applied in roundhouses by

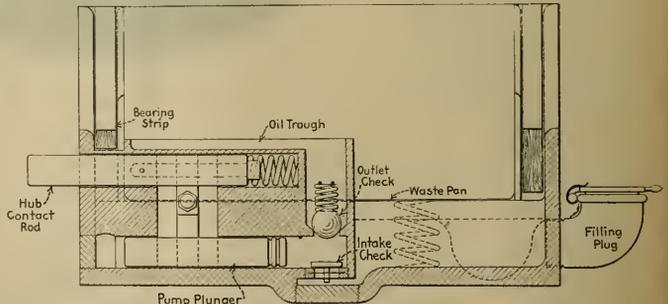

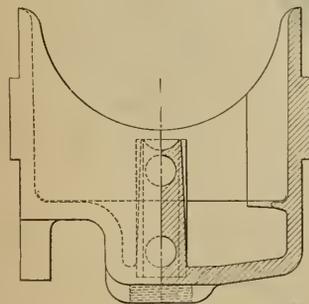

Lubricator Arrangement as Applied to the Journals of Main Driving Wheels

tion through waste is insufficient and the direct results are costly hot boxes, delays and repairs to equipment. Contrary to the usual experience with car journals, locomotive driving journals lubricated with hard grease seldom become hot (at least hot enough to cut or score). This is because main bearings receive the personal attention of enginemen, and hard grease lubricates at a high temperature. The trouble is that hard grease does not begin to lubricate effectively until the journals become warm, and there is excessive friction.

regular forces. Pumping action is obtained from lateral wheel movement which is positive and regular. The waste is kept in contact with the journals by means of loose plates and springs and oil, being pumped up through to the journals, prevents the waste from glazing. The waste, in addition to distributing oil over the faces of the journals, is also a safety feature in the event of the pump becoming inoperative for any reason. Being always saturated with oil, the waste will continue to lubricate the journals, heating gradually and finally smoking, if a hot box develops.

The result of lubricating journal bearings with too light

Cross Section Showing Operation of Hennessy Engine Truck Journal Lubricator

oil or too heavy grease is unnecessary friction, power loss, rapid wear of journals and bearings and consequent deterioration of other moving parts. Important economies in labor, material and reduced equipment delays would immediately result from delivering oil of a proper consistency (from a lubrication standpoint and not from a standpoint of its ability to feed through waste) to the journals. This oil should be delivered at all times and in a predetermined quantity regardless of atmospheric conditions by positive, reliable, mechanical means.

Tests of Hennessy lubricators on lead trucks have demonstrated that about five times the ordinary mileage is made with a given quantity of oil. While it is recommended that the lubricators be removed for inspection at intervals of about 90 days, some have been in service on the Norfolk & Western as long as 11 months without being taken down for any purpose. The only attention required is the filling or supplying of oil to the cellars about once a week, dependent upon the class of service. It is stated that oil of the consistency of vaseline can be pumped through the lubricator if necessary.

# General News Department

The De Queen & Eastern has completed the construction of its extension from De Queen, Ark., to Broken Bow, Okla., and has commenced the operation of this line.

The Order of Railroad Telegraphers, in convention at Savannah, Ga., on May 20, re-elected E. J. Manion, president. L. J. Ross was chosen secretary; headquarters, St. Louis, Mo.

The Interstate Commerce Commission has announced that oral arguments will be heard at Washington on June 20 in the case involving locomotives sent by the Pennsylvania to outside shops for repairs.

Senator Watson, of Indiana, has introduced in Congress a bill to amend Section 10 of the Clayton act, by defining the term "substantial interest" as used therein as meaning a financial interest of one per cent or more.

The City of Philadelphia has adopted "summer time," to go into effect on June 6; and the railroads are preparing new time-tables so as to run suburban trains, and some others, one hour earlier than by the present time-tables.

The Association of Railway Claim Agents held its annual convention at St. Louis, Mo., May 18, 19 and 20. James B. Green, claim agent of the Chicago & Junction, Chicago, was elected president. R. H. Doolittle (C. & S.), S. J. Peterson (U. P.), and W. H. Failing (C. N. J.), were elected vice-presidents, and H. D. Morris (N. P.), St. Paul, Minn., secretary-treasurer.

The Dallas Traffic Club, which has been inactive since the war, has been reorganized and the following officers elected: President, A. L. Reed, traffic manager, Sanger Brothers; secretary-treasurer, H. C. Eargle; first vice-president, Paul Junkin; second vice-president, Ferd Hicks; third vice-president, Julian Nance; board of governors, J. B. Jones, Elbert Blair, G. S. Maxwell, P. A. Richardson, E. C. Newlien and Don Allen. The officers will hold office until the regular election in November.

The bill reported at the last session of Congress by the Senate committee on interstate commerce as a substitute for Section 10 of the Clayton Anti-trust law was reintroduced in the Senate on May 24 by Senator Cummins as S. 1876. The bill represents a modification of the bill originally introduced by Senator Frelinghuysen at the request of the Association of Railway Executives in accordance with a number of suggestions made to the Senate committee by the Interstate Commerce Commission.

A. J. County, vice-president of the Pennsylvania Railroad, in an address before the Pennsylvania Bankers' Association at Atlantic City, N. J., on May 25, declared prompt and fair settlement for the Federal control and guaranty periods to be the essential need of the railroads to enable them to weather the deflation period successfully. "Beyond clearing away the differences that prevent prompt settlements, I feel that under existing conditions suggestions looking to a new national railroad policy and a vast increase of the regulatory commissions or bureaus should be held in abeyance until the Transportation Act has had a fair trial under something approaching normal conditions. Railroad managements, railroad employees and railroad investors should stand united. . . ."

## American Association of Freight Traffic Officers

The American Association of Freight Traffic Officers held, at Chicago, on May 11, its first meeting since 1917, the war and federal control of the railroads having interrupted the activities of the organization. The following officers were elected: President, Fred Zimmerman (C. I. & L.), Chicago; first vice-president, C. E. Airey (C. of Ga.), Savannah, Ga.; second vice-president, R. C. Wright (Penn.), Philadelphia,

Pa.; third vice-president, W. T. Stevenson (C. C. C. & St. L.), Cincinnati, Ohio; fourth vice-president, S. D. Houghton (A. T. & S. F.), Chicago; secretary-treasurer, Grant Williams, district freight agent, Chicago, Milwaukee & St. Paul, Chicago; executive committee, Paul Wadsworth, R. Van Umerson, Archibald Fries, C. H. Stinson, Eugene Morris, W. M. Rhett, Charles Barham, L. E. Chalenor, W. A. Rambach and B. H. Stanage. The association now has 589 members.

## The Labor Board's Pending Decision

The Railroad Labor Board, since its announcement of a "readjustment downward of wages" as reported in last week's *Railway Age*, has been in practically continuous executive session to determine the extent of the proposed reduction which it will announce on June 1. The necessity for these extended executive sessions is in part due to the fact that three members of the Board were seated after the wage case had been in progress for several days and partly because of the mass of evidence submitted by both the carriers and the employees.

## Annual Election of New York Section of the A.S.C.E.

At the annual meeting of the New York Section of the American Society of Civil Engineers held on May 18th, 1921, the following officers were elected to serve for one year: President, Nelson P. Lewis, chief engineer, board of estimate and apportionment, New York City; secretary, J. P. J. Williams, New York; directors, Charles Gilman, C. F. Massey Company, New York and J. J. Yates, engineer of bridges, Central of New Jersey, Jersey City, N. J. The election of officers was followed by an address by Nelson P. Lewis on the New York Metropolitan District.

## No Progress in Formation of Regional Boards

In none of the four regions of the country—Eastern, South-eastern, Northwestern or Southwestern—has agreement been reached between the representatives of the train and engine service brotherhoods and the managements of the various carriers for the establishment of regional boards of adjustment for the settlement of labor disputes. Negotiations with this end in view were started sometime ago at the request of the brotherhoods. It is understood that in two districts the proposal has been definitely vetoed by representatives of the railroads. In one district the employees failed to agree to the companies' proposal that the public should be represented on the board. In the Southeastern district, a conference on the proposal has been called for May 30.

## Decline in Most Living Costs—Rents Rise

The Bureau of Labor Statistics' index number of wholesale prices of all commodities for April is 154. In March this figure was 162, and in April, 1920, it was 265. The total increase in living costs from the beginning of the war to March, 1921, was 68.7 per cent, according to data compiled by the National Industrial Conference Board. The rise in the cost of the major items from July, 1914, to March, 1921, is estimated as follows:

Food .....	56%	Fuel and light.....	87%
Shelter .....	71%	Sundries .....	85%
Clothing .....	74%		

The report shows that the peak of the living cost was reached in July, 1920. Since then total living cost has declined 17.5 per cent. This decrease is in food and clothing. Rents have, however, increased eight per cent, and fuel and light 13 per cent since that date. In some important cities rents have increased upwards of 100 per cent since 1914.

**Pennsylvania Scheduled Freighters Make Good Record**

The through freight trains of the Pennsylvania Railroad which are run on schedules as recently announced, arrived at destination on time, in April, in 79 per cent of the trips. This is the first month for which complete figures of performance are available and the record is the best ever established by this road for regularity. It includes both east and west bound freight between Chicago and St. Louis on the west, and New York, Philadelphia, Baltimore, etc., in the east. During the month 1,396 freight trains were run on these schedules and 1,104 arrived at destination on time. But those that were late made connections in every case, so that all the freight was delivered to consignees on time. All perishable freight and live-stock, with some high class non-perishable merchandise is handled in this through freight service.

**Hearings on Outside Repairs**

The Interstate Commerce Commission's hearings on repairs to locomotives by contract in outside shops in 1920 were re-opened May 23 at New York by Examiner Barclay of the Interstate Commerce Commission. F. H. Hardin, Chief Engineer of Motive Power and Rolling Stock of the New York Central, was the principal witness. Mr. Hardin testified that the motive power of the company was in lamentable condition at the end of Federal control and that assistance in repairing some locomotives was absolutely necessary in order for the road to be able to handle the greatly increased traffic which was required of it. He pointed out also that the cost of classified repairs in the company's own shops showed a relatively low figure because various items of overhead expenses were not included in it.

R. B. Gregg, of the Railway Employees Department of the American Federation of Labor, cross-examined Mr. Hardin. Mr. Gregg said "Our view of the situation is that all railroads have followed the uniform policy of sending railroad equipment to outside shops for repairing for several reasons. The first and most important was an attempt to discredit and disrupt, if possible, the labor organizations of the roads. . . ." The hearings are being held in the rooms of the Merchants Association, 235 Broadway.

**Revenues and Expenses for March**

The Interstate Commerce Commission's monthly report of railway revenues and expenses for March and three months, covering 201 class I roads is as follows:

Item.	March		Three Months	
	1921	1920	1921	1920
1 Average number of miles operated....	235,581.76	234,599.99	235,575.51	234,444.81
Revenues:				
2 Freight .....	\$320,694,043	\$324,598,960	\$929,644,096	\$935,377,083
3 Passenger .....	97,312,305	92,631,705	291,107,003	267,076,918
4 Mail .....	9,673,927	8,390,790	25,514,961	77,978,159
5 Express .....	6,980,555	11,729,993	18,883,198	37,300,721
6 All other transportation .....	13,038,363	11,942,232	38,203,468	33,630,569
7 Incidental .....	11,173,604	10,677,666	30,326,954	35,066,127
8 Joint facility—Cr.	659,099	401,084	1,972,908	1,783,604
9 Joint facility—Dr.	269,386	178,993	593,202	595,214
10 Railway operating revenues .....	459,262,510	460,187,437	1,335,359,386	1,385,617,967
Expenses:				
11 Maintenance of way and structures....	62,029,061	67,464,136	176,510,015	189,760,588
12 Main. of equipment .....	107,416,514	117,268,106	340,154,840	353,815,196

**Traffic News**

The Denver Commercial Traffic Club has elected James P. Gibson, president, and Charles J. Hotchkiss, secretary-treasurer.

The Atchison, Topeka & Santa Fe will run 16 special trains, leaving Chicago and Kansas City, July 3 and 4, for the Elks' convention at Los Angeles, Cal.

Shipments of perishables from California have been greater this year than last, according to figures given out on May 13, by C. M. Secrist, vice-president of the Pacific Fruit Express Company. Fruit and vegetable shipments in 1920, for this period, originating in the territory west of Ogden, Salt Lake, and El Paso, and south of Ashland, Ore., numbered 22,574 cars, while this year the total is 24,777 cars.

The National Industrial Traffic League, at its meeting in Cleveland, Ohio, on May 25, adopted a resolution advising members to proceed in an orderly manner, as provided by the Act to Regulate Commerce, to obtain proper redress of their individual grievances: "the National Industrial Traffic League deprecates any effort toward a general downward revision of rates until the carriers have had an opportunity to adjust their expenses so as to insure proper transportation service and facilities and a reasonable return on their property under economical and efficient management." Traffic executives of the carriers, and shippers, through their respective organizations, are urged to meet in conference and endeavor to reach agreements on all questions in controversy, thus avoiding wherever possible litigation before the commission.

A conference between the traffic vice-presidents of the Eastern railroads and representatives of shippers of road-building materials for the purpose of discussing possible reductions in the rates on these materials in order to stimulate their movement has been arranged for June 2. Representatives of the shippers had previously announced that such a conference was to be held with the railroad executives at Washington on May 13, but the announcement was premature. In a letter dated May 13 to E. Guy Sutton, of the Sand & Gravel Association, Daniel Willard, president of the Baltimore & Ohio, said that the matter of a conference between the railroad executives and shippers as proposed by the shippers has been given consideration at a meeting of the railroad executives and as a result it was decided to ask G. H. Ingalls, vice-president of the New York Central, and chairman of the executive committee of the eastern traffic vice-presidents, to get in touch with the shippers and arrange for a conference for the purpose of discussing any inequalities that may have resulted from or have been emphasized by the commission's decision in Ex Parte 74. Mr. Willard said that he understood it was expected that the discussion would be confined to materials entering into the roadbuilding program, but that he was certain that the committee or the traffic official of any railroad would be willing to take up at any time any inequalities of the rate structure such as he had referred to.

**Traffic Statistics for February**

According to the Interstate Commerce Commission's monthly bulletin of revenue traffic statistics covering 173 steam roads, the number of ton miles of revenue freight moved during February was 22,544,000,000, as compared with 30,291,000,000 in February, 1920. The average haul shows an increase as compared with 1920, and the average revenue per ton mile shows an increase as compared with previous months, an average of 1.25 cents as compared with .985 in February, 1920. In January it was 1.21 cents. The number of revenue passengers carried was 83,474,000 as compared with 91,673,000. The average revenue per passenger mile was 3.08 cents as compared with 2.59. The number of revenue passengers per car was only 16.56 as compared with 18.49 in February, 1920.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended from May 27 until September 24, the operation of schedules which provide increased minimum weights and increased class and commodity rates between points in Oregon, Washington and British Columbia to the level of the rates in the same general territory not affected by water competition.

### Liability for Telegraph Negligence Increased

The Interstate Commerce Commission in decision No. 11,524, reviewing also case No. 8,917, has decided that the rules of the telegraph companies limiting liability for negligence in the transmission or delivery, or for non-delivery, of interstate messages, repeated and unrepeated, are unreasonable; and has ordered that, beginning July 13 next, the universal rule must limit the liability of the company in the case of unrepeated messages to not less than \$500, and in the case of repeated messages to not less than \$5,000; and on messages on which the sender puts a value, in writing, the rate is to be one-tenth of one per cent of the amount by which such valuation shall exceed \$5,000.

The principal ground on which this extension of liability was ordered seems to be that the Western Union has for many years followed the liberal policy of allowing general superintendents to pay reasonable claims, up to \$500, without submitting them to the legal department and without reference to the contract printed on the telegram blank, to which, among other provisions, stipulates a limit of \$50. The Postal Company opposed any increase of liability on the ground that it could not stand the additional expense; but no figures were given to sustain this argument.

Commissioner Potter dissented, holding that senders of telegrams desiring insurance should pay for it and that under the rule now prescribed, the company, in paying perhaps excessive damages, would be putting a burden on all other senders of telegrams. Existing arrangements, said Mr. Potter, will amply secure those who are willing to pay for their insurance.

The majority opinion holds that the practice of the Western Union is contrary to the spirit and terms of the Interstate Commerce Act; paying a sum larger than the stipulated liability is the same as making an unlawful rebate. The Western Union also objected to having its practice written into the terms of the law, fearing impairment of revenue; but the Commission finds that notwithstanding the company's liberal practice in the past, its surplus increased from \$7,733,693 on June 30, 1910, to \$32,518,994 on December 31, 1918; that dividends in 1917 and 1918 were at the rate of seven per cent and that in eight years the company's funded debt had been reduced from forty millions to thirty-two millions.

The report in this case brings out interesting details. The Commission seems to think that fewer mistakes in transmission ought to be made now than fifty years ago, when the limitation of liability was first imposed, because of the improvement in machinery. At the present time one-half of all the messages transmitted by the Western Union, particularly between large cities, are sent by automatic apparatus. The records of the Postal Company show that messages erroneously transmitted number only one in 25,000 or 30,000. Repetition of messages is seldom ordered, one operator testifying that in 18 years he had not transmitted more than about 200 such messages. Dealers in perishable commodities say that they cannot afford the delay incident to repetition of messages. The record in this case shows only one instance where a repeated message failed to accomplish its purpose; that was a case where delivery was delayed. The valued message appears to be of no practical use in the great majority of instances; as neither the sender nor the company can make any reasonable estimate of the probable loss in case of default on the part of the telegraph company.

## Foreign Railway News

### Swiss Federal Railways Losing Money

The operating revenues of the Swiss State Railways for the first three months of 1921 were \$16,287,600 and the operating expenses \$17,169,600, according to information from Consul Thornwell Haynes at Berne. For the similar period of 1920, operating revenues were \$17,354,400 and operating expenses \$15,815,000.

### Seek Agreement in Argentine Railway Dispute

According to a correspondent of the Evening Post (New York), conferences are now being held in Buenos Aires between the British railways, the government and representative shippers in the attempt to arrive at an amicable settlement of the disputes which have arisen over the sharp rate advances put into effect in March. These increases have been declared illegal by the government and the companies have been fined heavily. The shippers are contending, the correspondent says, that the new rates will put them at a disadvantage in competition with American, Russian and Australian producers in the European cereal markets. It is believed that the government is disposed to look favorably upon some rate increases in view of recent wage increases, but has adopted a stern policy toward the railways in order to secure the presentation of evidence on both sides of the controversy.

The earnings of these roads for the fiscal year 1920, which were reported in the *Railway Age* of May 20 (page 1190), were comparatively high, but from July 1, 1920, to April 1, 1921, it is said that the Central Argentine is the only road which shows any gain over the figures for the preceding year. The other lines show declines in revenue from seven to 22 per cent.

### American Becomes Mechanical Officer

#### of a Manchurian Railway

Frank S. Robbins, formerly master mechanic of the Pennsylvania at Pittsburgh, has been appointed mechanical advisor to the Chinese Eastern Railway, which is a part of the Trans-Siberian System. He will serve under the direction of J. F. Stevens, president of the Inter-Allied Technical Board of the Orient. Mr. Robbins was born at Menantico, N. J., December 22, 1880, and was educated at Purdue University. Upon graduation in mechanical engineering he entered railroad work as a machinist's apprentice with the Union Railroad in New Jersey. He later entered the Altoona shops of the Pennsylvania Railroad as special apprentice and upon completion of this course was appointed motive power inspector at the West Erie shops. In 1909 he was appointed assistant master mechanic of the Monongahela division and, in 1911, assistant road foreman of engines, Renova, Pa. In 1912 he was appointed assistant general foreman of the Piteairn car shops, Piteairn, Pa., and in 1913 was promoted to master mechanic of the Pittsburgh division.

In 1917, Mr. Robbins entered military service and was commissioned a captain in the Railway Engineers, being assigned to command Company D of the 19th Engineers (Railway). While a member of the American Expeditionary Forces in France his railroad experience was of considerable assistance in constructing railway shops at Bassens and organizing the personnel for their operation. He was appointed superintendent of motive power of "D" line and as a result of his work was promoted to the rank of major of engineers. In 1919, Major Robbins was discharged from military service and was appointed assistant engineer, maintenance of equipment, in the office of the assistant to the president of the Pennsylvania at Philadelphia. In December, 1919, he was appointed master mechanic of the Pittsburgh division which position he held until the reorganization of the Pennsylvania. Upon the return of the roads to their owners, Mr. Robbins was appointed master mechanic of the new Pittsburgh Terminal division. On March 15, 1921, he resigned his position with the railroad company to serve with the Inter-Allied Technical Board. Mr. Robbins' headquarters in his new position will be at Harbin, Manchuria.

## Equipment and Supplies

### Car Building in 1919 and 1914

A preliminary statement of the general results of the 1919 census of manufactures with reference to the construction of steam and electric railroad cars has been issued by the Bureau of the Census, Department of Commerce.

Returns were received in 1919 from 121 establishments which manufactured 162,511 steam and electric railroad cars, valued at \$403,517,000, these figures including such cars as were built in railroad repair shops, and as subsidiary products by establishments engaged primarily in other lines of manufacture.

Of the total number of cars built in 1919, 160,159 were for use on steam railroads, and 2,352 on electric roads. Only 294 steam passenger cars were constructed during the year as compared with 3,568 in 1914, while, on the other hand, freight and other types of steam railroad cars increased from 131,292, in 1914, to 159,865 in 1919.

The statistics for 1919 and 1914 are summarized in the following table. These figures are preliminary and subject to such change and correction as may be necessary from further examination of the original reports:

	1919	1914
Total Cars Built—		
Number .....	162,511	137,823
Value .....	\$403,517,000	\$164,960,000
Steam Railroad Cars—		
Number .....	160,159	134,960
Value .....	\$389,078,000	\$154,797,000
Passenger—		
Number .....	294	3,568
Value .....	\$5,602,000	\$45,245,000
Freight and Other—		
Number .....	159,865	131,292
Value .....	\$383,476,000	\$109,552,000
Electric Railroad Cars—		
Number .....	2,352	2,863
Value .....	\$14,439,000	\$10,163,000

### Locomotives

THE MISSISSIPPI CENTRAL has ordered 3 Mikado locomotives from the American Locomotive Company.

THE CALIFORNIA WESTERN RAILROAD & NAVIGATION COMPANY has ordered one Pacific locomotive from the Baldwin Locomotive Works.

THE CIA MEXICANA DE COMBUSTIBLES, Mexico City, Mexico, has ordered 4 consolidation type locomotives from the Baldwin Locomotive Works.

THE PARKLAP CONSTRUCTION CORPORATION, 84 Pine street, New York, has ordered 1, 4-wheel switching locomotive from the American Locomotive Company. This locomotive will have 14 by 22 in. cylinders and a total weight in working order of 79,000 lbs.

### Freight Cars

THE SIERRA OF CALIFORNIA has renewed its inquiry for 30 to 40 ballast cars.

THE PHILADELPHIA & READING is contemplating having repairs made on 500 to 1,000 box cars.

THE BUFFALO CREEK & GAULEY has ordered 10 20-ton flat cars from the Koppel Industrial Car & Equipment Co.

THE ALABAMA, TENNESSEE & NORTHERN is inquiring for 150 gondola cars and 100 box cars, U. S. R. A. standard.

### Passenger Cars

MIITSUI & Co., New York, are inquiring for 150 electric motor trucks, for use on the Tokyo Municipal Railways.

## Machinery and Tools

THE HARTFORD & SPRINGFIELD STREET RAILWAY COMPANY has ordered a 200-ton car wheel press from the Niles-Bement-Pond Company.

THE CHICAGO, ROCK ISLAND & PACIFIC has ordered 1 36-in. lathe and 1 90-in. quartering machine from the Niles-Bement-Pond Co.

THE VIRGINIAN RAILWAY has ordered 4 Ryerson-Conradson engine lathes and a 5-ft. Ryerson-Conradson radial drill, from Joseph T. Ryerson & Son; 1 boring mill from the Bullard Machine Tool Company and a driving wheel lathe from William Sellers & Co., inc.

### Miscellaneous

MIITSUI & Co., New York, have ordered from the Union Switch & Signal Company four sets of color light signals, for use on the Japanese Government Railways.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon June 8, for its requirements until July 1, 1921, of steel wheels for passenger car and locomotive repairs, in accordance with standard blue prints and New York Central specifications 372-C.

### Signaling

THE ERIE RAILROAD has ordered from the General Railway Signal Company an electric interlocking machine, 11 working levers, with four switch machines and three signals, for a draw-bridge at Newark, N. J.

### Railway Construction

CHICAGO, ROCK ISLAND & PACIFIC—This company is accepting bids for the construction of a new roundhouse at Amarillo, Tex.

CHICAGO, ROCK ISLAND & PACIFIC—This company, which was noted in the *Railway Age* of May 6 (page 1093) as accepting bids for the construction of a coaling station at Morris, Ill., has awarded the contract for this work to Roberts & Schaefer, Chicago. The station will be a 500-ton, fireproof structure.

CHICAGO UNION STATION.—This company closed bids on May 26 for the completion of the filled portion of the Polk street viaduct, Chicago, and the construction of a viaduct on Van Buren street, between Canal street and the Chicago river.

DETROIT & Ironton.—The Interstate Commerce Commission has issued a certificate authorizing the construction of a line in Wayne County, Mich., approximately 15 miles long, extending southward from Spring Wells or Fordson to a connection with the Detroit, Toledo & Ironton near Trenton or Flat Rock. The matter of the application for a certificate authorizing the acquisition by lease of the property of the Detroit, Toledo & Ironton has been assigned for argument before the commission in Washington on May 27.

ILLINOIS CENTRAL.—This company closed bids on May 23 for the construction of a subway near Earlville, Ia. The company is also accepting bids for an extension to its roundhouse at Paducah, Ky.

ILLINOIS CENTRAL.—This company which was noted in the *Railway Age* of May 20 (page 1192) as accepting bids for the construction of additions to its roundhouse at Freeport, Ill., has awarded a contract for this work to Joseph E. Nelson and Sons, Chicago.

THE PITTSBURGH & WEST VIRGINIA reported in the *Railway Age* of May 6, as asking for prices on repairs to 500, 70-ton coal cars, is now inquiring for 500 steel hopper car bodies.

THE SIERRA RAILWAY OF CALIFORNIA, is inquiring for 35 to 40 Roger ballast cars, of 40 and 50-ton capacity.

TEXAS MIDLAND.—This company has awarded a contract to Becknal Brothers, Terrel, Tex., for the construction of a line between Greenville and Commerce, Tex., at an estimated cost of \$500,000.

## Supply Trade News

The Galena-Signal Oil Company will remove its New York City office on June 1, from 17 Battery Place to the Liggett Building, 41 East Forty-second street.

E. D. Wilmer, vice-president of the Steel & Tube Company of America, at Milwaukee, Wis., has been elected president of the Goodyear Tire & Rubber Company, at Akron, Ohio, succeeding F. A. Seiberling.

Clement F. Street, formerly vice-president of the Locomotive Stoker Company, has opened an office in the Smith building, Greenwich, Conn., for the purpose of placing on the market the Street locomotive starter for application to locomotive trailer trucks and tenders.

Ralph S. Cooper, vice-president and general sales manager of the Independent Pneumatic Tool Company, Chicago, has been appointed general manager in addition to his other duties. Mr. Cooper has just returned from Europe where he has been for the past eight months establishing branch offices and agencies for the company.

Harry B. Stafford, for some time general agent for the Southern Railway at Minneapolis, has become associated with the National Surety Company, 115 Broadway, New York. Mr. Stafford left the Southern Railway to enter the Construction Division of the United States Army early in the war and attained the rank of major.

Harry W. Finnell has become connected with the sales department of the Automatic Straight Air Brake Company, with headquarters at the company's general offices, 210 Eleventh avenue, New York City. Mr. Finnell served with the Chicago Railway Equipment Company from 1906 to 1909 as railway sales manager and later became assistant to president of the Carbon Steel Company, Pittsburgh, Pa. In 1914, he was appointed general manager of the Henry Giessel Company, Chicago, and during 1915 and 1916, was vice-president of Templeton, Kenley & Co., Ltd., Chicago. He was manager of the War Industries Bureau for Illinois and was also affiliated with the War Industries Board during the war, since which time he has been in the export business. His appointment with the Automatic Straight Air Brake Company became effective on May 15.

## Obituary

Lawrence F. Braine, a director of the Rail Joint Company, New York, died on May 24, at his home in New York City, at the age of 64. In 1896, he went with the Continuous Rail Joint Company of America, Newark, N. J., which company was combined later with the Weber rail joint and the Wolhaupter rail joint to form the present Rail Joint Company. From 1905 to 1916, Mr. Braine served as director and vice-president of the Rail Joint Company and then retired from active service, remaining as director of the same company until his death.

## Trade Publications

WATER SOFTENERS.—The Graver Corporation, East Chicago, Ind., has issued two bulletins describing the company's large continuous water softener (type K) and the small continuous water softener (type KM). Each bulletin opens with a short discussion of water softening and the choice of suitable apparatus. This is followed by descriptions of the operation of the plants which are described in detail and illustrated in numerous photographs. Drawings are shown of typical foundations and upper and lower housings, and charts are given to illustrate the loss of water storage space by converting existing storage tanks into water softeners.

## Railway Financial News

ALABAMA GREAT SOUTHERN.—*Dividends Reduced.*—This company has declared semi-annual dividends of 3 per cent on the common stock of record May 31, and 3 per cent on the preferred stock, payable August 18 to stock of record July 14. The last semi-annual dividends paid by the company were 3½ per cent on both issues.

BUFFALO, ROCHESTER & PITTSBURGH.—*Authorized to Issue Bonds.*—This company has been authorized by the Interstate Commerce Commission to issue \$3,949,000 of consolidated mortgage bonds and to pledge and repledge from time to time all or part of the bonds as collateral security for short term notes.

CHESAPEAKE & OHIO.—*Dividend Deferred.*—The directors on May 20 deferred action on the usual dividend of 2 per cent for the current half year. Disbursements at the rate of 4 per cent a year were made from 1917 to 1919 inclusive.

*Annual Report.*—The corporate income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919	Increase or Decrease
†Net Income, including compensation for January and February, 1920, and net operating income of company from March to December, 1920, inclusive	\$14,878,831	\$14,588,579	\$290,252
*General expenses (corporate)	39,642	202,048	-162,407
Federal income tax accruals	580,000	319,999	260,002
	\$14,259,189	\$14,066,532	\$192,657
Other Income	1,901,583	1,215,839	685,753
Gross Income	\$16,160,772	\$15,282,362	\$878,410
Interest on Debt	\$9,953,407	\$8,773,843	\$1,179,563
Total deductions	\$10,174,314	\$9,508,193	\$666,121
Net Income	\$5,986,458	\$5,774,169	\$212,290
Dividends, 4 per cent	\$2,511,264	\$2,511,264	
Balance to credit of profit and loss December 31, 1920			\$15,341,106

†Includes \$2,700,000 amount received from the Interstate Commerce Commission as an advance under the grants provided by Section 209 of Transportation Act, 1920.

\*General expenses 1920 refer to months January and February only.

The annual report of the Chesapeake & Ohio will be reviewed editorially in an early issue.

CHICAGO JUNCTION.—*Hearings on Acquisition by New York Central Closed.*—See New York Central.

CHICAGO, ROCK ISLAND & PACIFIC.—*Asks Authority to Issue Bonds.*—This company and the Burlington, Cedar Rapids & Northern have jointly applied to the Interstate Commerce Commission for authority for the issuance of \$1,905,000 of consolidated first mortgage 5 per cent bonds of the B., C. R. & N., to be used to retire another issue of bonds at maturity and to be sold to the Rock Island for cash. The Rock Island also asks authority to issue a similar amount of first and refunding mortgage gold bonds to be issued against the B., C. R. & N. bonds.

DELAWARE, LACKAWANNA & WESTERN.—*Annual Report.*—The corporate income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919	Increase or decrease
Net earnings coal department:			
Sales and rents	\$51,193,938	\$44,325,488	\$6,868,450
Less expenses	44,662,844	39,344,273	5,318,571
	\$6,531,094	\$4,981,215	\$1,549,879
Adjustment of value of coal on hand	27,152	8,467	-35,618
	\$6,503,942	\$4,989,682	\$1,514,261
Earnings railroad department:			
Revenues	\$70,478,816		
Less operating expenses, taxes, etc.	65,218,581		
	\$5,260,235		\$5,260,235
Income from lease of road (2 months)	13,249,379	*17,324,424	-14,075,045
Government advances on guaranty	5,124,500		5,124,500
Miscellaneous rent income	304,024	328,300	-24,276
Dividend income	386,756	413,269	-26,514
Income from funded securities	680,250	362,848	317,402
Income from unfunded securities and accounts	786,985	554,891	232,094
Depletion of coal deposits	2,018,593	1,956,616	61,977
Hire of equipment—Cr. balance	653,858		653,858
Total including other	\$25,446,520	\$25,453,407	-\$6,887

Deductions from income:			
Rentals of leased lands.....	\$6,128,996	\$6,126,908	\$2,088
Additions and betterments.....	2,509,679	869,556	1,640,123
War revenue taxes.....	1,122,917	1,710,374	—587,457
Total including other.....	\$13,675,109	\$16,072,200	—\$2,397,091
Dividends declared.....	8,444,110	8,444,455	—345
	\$5,230,999	\$7,627,745	—\$2,396,746

\*Certified compensation accrued year 1919, including \$1,574,948, being 10 per cent of compensation for the year 1918 accrued in July, 1919, upon completion of the contract between the director general of railroads and the company.

†Includes adjustment of standard return for years 1918 and 1919 amounting to \$616,930.

‡Covers railroad operations for the ten months ending December 31, 1920.

The annual report of the Delaware, Lackawanna & Western will be reviewed editorially in an early issue.

**DENVER & RIO GRANDE.—Another Protest from Stockholders.**—Arthur M. Wickware, counsel for the stockholders' protective committee, has sent a letter to Hon. Edgar E. Clark, chairman of the Interstate Commerce Commission, in which he says, in part:

The stockholders' protective committee now desires to present a further objection, namely, that the new company, to which it is proposed to transfer the Denver & Rio Grande properties, is not organized under the laws of either Colorado, Utah or New Mexico, where the railroad is located, but under the laws of the state of Delaware, located about 2,000 miles away.

The charter of this new company—the Denver & Rio Grande Western Railroad Company—is a legal anomaly, and is what is known as a "tramp" corporation. It is not organized under the provisions of the Delaware laws governing railroads operating in Delaware; but is organized under the provisions applicable to ordinary business corporations with power to own and operate railroads only outside the state of Delaware.

Railroads organized for operation within the state of Delaware are subject to many regulations, enacted for the protection of the stockholders, the bondholders, the adjacent landholders, and the public. Not one of these safeguards is contained in the statutory provisions applicable to the charter of this new company. It cannot operate a mile of railroad in the state of Delaware; but it is authorized to exercise railroad powers anywhere outside the state of Delaware. The legislation of Delaware has been very careful to protect its own citizens with respect to all railroads within the state, but it authorizes charters for foreign use under which roads may operate without any safeguards or restrictions whatever.

**GRAND TRUNK.—New Directors.**—The Canadian Government has nominated the following directors in accordance with the bill recently passed by the Dominion Parliament: Sir Joseph Flavelle, Howard G. Kelley, A. J. Mitchell, E. L. Newcombe, K. C., and J. N. Dupuis.

This board will be temporary, preparatory to the bringing into force of the Canadian National Railways Act, which provides for the unified management of all government railways.

**HAWKINSVILLE & FLORIDA SOUTHERN.—Asks Authority to Abandon Line.**—The receiver has applied to the Interstate Commerce Commission for certificate authorizing the abandonment of its line of 96.38 miles in Georgia, on the ground that it is impossible to operate it except at a loss and that it has been operated at a loss for the past seven years.

**HOCKING VALLEY.—Dividend Deferred.**—The directors on May 19 deferred action on the regular semi-annual dividend of 2 per cent which is usually paid in June.

President W. J. Harahan stated that the directors had simply decided to defer action until the trend of conditions had been more clearly demonstrated.

**LOS ANGELES & SALT LAKE.—Union Pacific Acquires Senator Clark's Holdings.**—See Union Pacific.

**MICHIGAN CENTRAL.—New Directors.**—Vice-President E. D. Bronner and Henry M. Campbell, of Detroit, have been elected directors. Samuel Mather has resigned from the board.

**NEW ORLEANS, TEXAS & MEXICO.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$561,800 of first mortgage 6 per cent gold bonds to reimburse the treasury for expenditures for additions and betterments and to be used as collateral for a loan of \$500,000.

**NEW YORK CENTRAL.—Hearings on Acquisition of Chicago Junction Closed.**—The hearings before Examiner W. H. Colston, of the Interstate Commerce Commission, at Chicago, on the application of the New York Central to take over the Chicago Junction, were brought to a close on May 19, upon telegraphic

instructions from the Interstate Commerce Commission. This is in line with the recent policy of the commission to rush to a close important hearings after sufficient testimony has been heard in order that a prompt decision may be rendered.

On May 17, J. W. Roberts, general superintendent of transportation of the Northwestern region of the Pennsylvania, stated that a diversion of traffic from other trunk lines connecting with the neutral Junction property, as might be expected if the New York Central secured control, would greatly reduce the value of the facilities of other trunk lines, built to take care of the Junction traffic. Fifty-two per cent of the total Chicago business of the Pennsylvania System, according to Mr. Roberts, came out of the Chicago Junction district. To consent to the sale, he said, would deprive the trunk lines of some of their privileges, would hinder the flexibility of operation within the Chicago terminals and make more difficult the co-ordination of the terminals with other facilities. All of these conditions, he declared, would be against the public interest.

W. H. Scriven, superintendent of the Chicago terminal division of the Pennsylvania, stated that the Pennsylvania is not opposed to unified terminals, provided their interests in the public service are safeguarded, but it is opposed to the acquisition of a neutral switching road like the Chicago Junction, by one or two trunk lines.

O. F. Clarke, superintendent of transportation of the Grand Trunk at Chicago, testified that if the New York Central acquired the Junction road it could and probably would get all or most of the competitive business of the Junction and so deprive the Grand Trunk of about 60 per cent of its traffic out of Chicago.

On the closing day of the hearing Willis E. Gray, terminal expert, testified that if the New York Central acquired the Junction facilities ample opportunities for expansion and were more than adequate. He also said that the New York Central was negotiating for the purchase of the Chicago & Illinois Western, a 25-mile line, with 37 miles additional under construction, between Chicago and Joliet. He asserted that the acquisition of this outer Belt property by the New York Central would give it monopolistic control of the inner and outer belt lines of the Chicago Terminal.

Irving Herriott, attorney for the shippers who are objecting to the sale of the property, called several witnesses at the close of the hearing, who testified to the pressure that had been brought to bear upon them to make them withdraw their opposition.

**PENNSYLVANIA.—Asks Authority to Acquire Stock.**—This company has applied to the Interstate Commerce Commission for authority to purchase from the Pennsylvania company \$34,000,000 of the guaranteed special stock of the Pittsburgh, Fort Wayne & Chicago and to assume the obligation and liability of the Pennsylvania company under its guaranteed trust certificates for which the stock was deposited as collateral security. The certificates are outstanding to the amount of \$33,239,000, and the Pennsylvania is to pay the difference of \$761,000 in cash.

**PENNSYLVANIA RAILROAD.—Loan from Revolving Fund Approved.**—The Interstate Commerce Commission has certified to the Treasury its approval of a loan of \$5,700,000 to this company for 15 years for the purpose of assisting it in meeting maturing indebtedness to the amount of \$5,857,900, of which the company itself is to provide \$157,900.

**READING.—Dissolution Plan Approved.**—The United States District Court at Philadelphia, on May 21, approved the modified plan for segregating the Reading company's coal and railroad properties. The two important points decided by the court for modification from the original plan, noted in the *Railway Age* of February 18, 1921, page 425, were decided and will be embodied in a new decree to be submitted within fifteen days, or on June 6, by the Reading company to the government.

The first point was the disposition of \$8,000,000 of stock of the Reading Coal and Iron Company, which was owned by the Reading company. The court orders that this stock is to be divided proportionately between the two classes of Reading stock, the preferred sharing equally with the common. The second is regarding the sale of the stock of the New Jersey Central. The court orders that this stock be placed in the hands of a trustee until a favorable time arrives for its sale.

See editorial on another page of this issue entitled "Reading Plan Approved."

Alfred A. Cook, attorney for Henry Evans, representing the Continental Insurance Company and the Fidelity-Phenix Fire Insurance Company, will appeal to the Supreme Court against the decision. These insurance interests hold 8,400 shares of common stock in the Reading company. They object to that part of the plan which gives the same and equal rights to the preferred and common stockholders to subscribe for stock in the new coal company.

E. P. Maynard, president of the Brooklyn Trust Company, has been elected chairman to succeed Seward Prosser, president of the Bankers Trust Company, and chairman of the Reading common stockholders' committee. Frederic F. Gunnison, vice-president of the Lawyers' Title and Trust Company, has been

elected secretary to succeed B. W. Jones, also of the Bankers Trust Company.

It is understood that Mr. Prosser will remain as a member of the committee, which will be enlarged to include four other members. Mortimer N. Buckner, president of the New York Trust Company, and John H. Mason are also slated to remain on the committee.

The reorganized common stockholders' committee will cooperate with counsel for the Henry Evans group of insurance companies in carrying their fight to the United States Supreme Court.

**ST. LOUIS-SAN FRANCISCO.—Annual Report.**—The corporate income account for the year 1920 compares with 1919 as follows:

	1920	1919
Federal compensation (2 months of 1920).....	\$2,270,838	\$13,415,510
Government guaranty (6 months).....	\$7,518,198	.....
Additional compensation.....	1419,034	.....
Net operating income (4 months).....	5,536,517	.....
Total.....	\$15,744,587	\$13,415,510
Other income.....	597,498	524,251
Gross income.....	\$16,342,085	\$13,939,761
Interest, taxes, rentals, etc.....	14,598,854	14,091,812
Surplus.....	\$1,743,231	Def. \$152,051

\*Includes \$705,684 on account of equipment allocated and purchased and additions and betterments.

†Difference between tentative standard return taken into account and standard return as finally certified January 1, 1918 to December 31, 1919.

‡Includes interest on cumulative adjustment bonds and on income bonds.

The annual report of the St. Louis-San Francisco will be reviewed editorially in an early issue.

**ST. LOUIS-SAN FRANCISCO.—Asks Authority to Sell or Pledge Bonds.**—This company has been authorized by the Interstate Commerce Commission to sell all or any part of \$4,232,000 of prior lien mortgage bonds now held in its treasury at not less than 90 per cent of par, or to pledge and repledge any part thereof from time to time as collateral security for short-term notes.

**TENNESSEE, ALABAMA & GEORGIA.—Special Master Appointed.**—D. L. Grayson has been appointed special master to assemble indebtedness of this road, which has been in the hands of receivers since December, 1920.

**TENNESSEE CENTRAL.—Sale ordered.**—Federal Judge E. T. Sanford has ordered this road sold on June 30 at Nashville, Tenn., for an upset price of not less than \$2,000,000, with a cash payment of not less than \$250,000. The court appointed A. Lyon Childress, of Nashville, as special master to conduct the sale. John H. Dewitt, of Nashville, was appointed to make a report on claims prior to first mortgage bonds. The receivers were directed to accept a loan of \$30,000 from the Mississippi Valley Trust Company with which to pay arrear rentals due the Nashville Terminal Company to prevent forfeiture of the Tennessee Central's lease on the bridge across the Cumberland river at Nashville.

The receivers deny that the claim of the government for \$650,000 advanced to the road during the war is just.

**TENNESSEE CENTRAL.—Auction.**—By decree of the Federal court at Chattanooga, Tenn., on May 22, this property, now in the hands of receivers, will be sold at public auction at Nashville, Tenn., on June 30.

**UNION PACIFIC.—Acquisition of Senator Clark's Holdings in Los Angeles & Salt Lake.**—The Union Pacific has purchased from Senator W. A. Clark and his friends the remaining half of the stock and bonds of the Los Angeles & Salt Lake Railroad. Judge Robert S. Lovett, chairman of the executive committee of the Union Pacific, made the following announcement on May 25 concerning the transaction:

The Union Pacific, which already owns through a subsidiary one-half the stock and bonds of the Los Angeles & Salt Lake Railroad Company, has reached an agreement with Senator Clark, who, with his friends, owns the other half, for the acquisition of his entire holdings. This gives the Union Pacific control of the property and assures the permanency of its position in southern California with its rails into Los Angeles and to the Pacific Ocean at San Pedro Harbor. The logical and natural destiny of the Los Angeles & Salt Lake ultimately as a railroad property is as a part of the Union Pacific System; and appreciation of this and not any differences led to the sale. It is a rather remarkable fact that during the 18 years of equal joint ownership and control by Senator Clark and ourselves absolutely no disagreements respecting policies, control or management have ever arisen between us. Our relations could not have been more co-operative and harmonious.

For the \$29,000,000 of the 4 per cent bonds of the Los Angeles & Salt Lake held by Senator Clark and his friends (we already owning a like amount) we are giving in exchange dollar for dollar approximately \$6,000,000 of the Southern Pacific's San Francisco Terminal 4 per cent bonds, \$8,500,000 of the Southern Pacific Railroad First Refunding 4 per cent bonds and \$14,500,000 of Oregon-Washington Railroad & Navigation First and Refunding 4 per cent bonds now in the Union Pacific treasury. The latter issue is guaranteed by the Union Pacific Railroad Company, and before they can be disposed of it is necessary to get permission of the Interstate Commerce Commission. Application for this will be made immediately and no objection is anticipated, but in the meantime, of course, the exchange of bonds will be delayed.

No change in the personnel of the staff operating the line or in their headquarters is contemplated, though, of course, the jurisdiction of our system general offices will be extended over the line and separate traffic agencies and other duplication of offices, if any, will be abolished.

In regard to the sale of his half-interest in the Los Angeles & Salt Lake to the Union Pacific, W. A. Clark said:

About twenty years ago R. C. Kerens, a prominent and distinguished western operator, called my attention to the Los Angeles Terminal Railroad Company, extending from Los Angeles to San Pedro harbor, and I and my brother, J. Ross Clark, joined him in the purchase of it, with the purpose of extending it to Salt Lake City.

Soon afterward E. H. Harriman at the head of the Union Pacific Railroad Company, which already had a line extending to the southern part of Utah, joined us in the scheme, and the line was constructed on a fifty-fifty basis, each party putting up the funds required until the road was completed. The capital stock and bonds were issued to cover expenditures and were divided equally between the Union Pacific Company and ourselves, but none of these securities by either party was ever placed on the market. All of the earnings have been applied to additions and betterments and extensions. In the near future the entire line will have been relayed with 90 lb. steel, which has been purchased and now partly laid, and the equipment of the highest character, is ample and complete.

The advantage in the unification of the great Union Pacific Company's interest amply warrants them in the purchase of our holdings of the capital stock. In effecting this arrangement the interests of all bond and stockholders have been amply protected. In making the contract I have reserved for the benefit of the holders of any of the bonds not controlled by me the right to exchange them on the same terms as obtained for myself. In the severance of our relations as joint owners of this great property with the Union Pacific officials we extend to all of them personally and officially our most cordial wishes.

**WABASH.—New Director.**—C. G. Edgar, of Detroit, has been elected a director to succeed Guy E. Tripp, who has resigned his position as a director to comply with the provisions of the Clayton Act.

**WESTERN PACIFIC.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue and sell at not less than 85 per cent of par and accrued interest, \$4,180,000 of first mortgage 5 per cent gold bonds, due March 1, 1946, to be deposited with the trustees under the applicant's first mortgage and to be used only for capital expenditures specifically authorized. It was proposed to use the bonds for the purpose of acquiring bonds of the Sacramento Northern, but the commission's order provides that the applicant shall not expend any of the proceeds of the bonds for the purpose of acquiring the property of the Sacramento Northern or control thereof and shall not otherwise acquire the property or the control until the commission has approved such acquisition upon application duly made.

**WILLIAMSPORT & NORTH BRANCH.—Asks Authority to Issue Securities.**—This company has applied to the Interstate Commerce Commission for authority to issue \$200,000 of bonds, \$200,000 of 6 per cent preferred stock and \$500,000 of common stock, to be delivered to four individuals in payment for the property of the railroad.

### Guaranty Certificates Issued

The Interstate Commerce Commission has certified to the Treasury Department that the following amounts are due various carriers as partial payments on account of the six months' guaranty: Chicago & North Western, \$800,000; Michigan Central, \$260,000; Nez Perce & Idaho, \$6,000; Peoria & Pekin Union, \$55,000; Louisville Bridge & Terminal, \$150,000; Peoria Railway Terminal, \$87,000; Mount Hope Terminal, \$4,000; Maryland & Pennsylvania, \$15,000; Frankfort & Cincinnati, \$12,500; Detroit & Mackinac, \$50,000; Leavenworth Terminal, \$18,000.

### Dividends Declared

Mobile & Birmingham.—Preferred, 2 per cent, semi-annually, payable July 1 to holders of record June 2 to June 30.  
Pittsburgh, Youngstown & Ashland.—Preferred, 1 3/4 per cent, quarterly, payable June 1 to holders of record May 20.  
Reading Company.—2nd preferred, 1 per cent, quarterly, payable July 14 to holders of record June 27.

# Annual Report

## Buffalo, Rochester & Pittsburgh Thirty-Sixth Annual Report

The Directors of the Buffalo, Rochester and Pittsburgh Railway Company submit to the Stockholders the following report for the year ending December 31, 1920.

### U. S. R. R. ADMINISTRATION.

As stated in last year's report, in accordance with a proclamation of the President of the United States issued under date of December 24th, 1919, and with the terms of the Transportation Act of 1920, Government control of railroads was terminated at 12:01 a. m. on March 1st, 1920.

A final settlement was effected on December 4, 1920, in full satisfaction of all the accounts in favor of and against the United States Railroad Administration.

### GUARANTY PERIOD.

The Transportation Act of 1920 above referred to, among other things contains Section No. 209 guaranteeing to any carrier which accepts it, a return for the six months immediately following Federal Control of not less than one-half the amount named in the contract with the Director General of Railroads as annual compensation, provided a written statement is filed with the Interstate Commerce Commission accepting all the provisions of the Section, on or before March 15, 1920. As stated in last year's report, such an acceptance was authorized by your Board of Directors and duly filed on March 8, 1920.

The Section also provided for partial payments of the guaranteed amount, under certain conditions, upon applications made during the Guaranty Period. Under this authority the Secretary of the Treasury from time to time advance to your company funds to meet fixed charges and operating expenses.

The completed statement of account with the Interstate Commerce Commission has been filed, and the final settlement for the guaranty period will be progressed as rapidly as possible.

In accordance with the precedent established in the last two years, the full details of the operations under Federal Control for the first two months of this year, the subsequent six months of the Guaranty Period, the four months of corporate control, and the comparative combined results for the year are given in an appendix to this report.

ROAD.			
	1920.	1919.	Der.
Owned .....	368.31	368.31	
Leased .....	90.30	90.30	
Trackage rights .....	131.11	131.11	
Total length of road operated .....	589.72	589.72	
Second track .....	212.59	212.59	
Sidings .....	455.13	456.21	1.08
Total miles of all tracks, all steel rails.....	1,257.44	1,258.52	1.08
INCOME.			
	1920	1919.	INCREASE OR DECREASE.
OPERATING INCOME:			
Revenues .....	\$9,145,766.08	\$9,145,766.08	
Expenses .....	7,126,122.02	\$9,154,84	
Net revenue .....	\$2,019,644.06 (Def.)	\$91,544.84	\$2,111,188.90
Tax accruals .....	407,000.00	99,108.52	407,891.48
Uncollectible revenues.....	46.63		46.63
	\$507,046.63	\$99,108.52	\$407,938.11
Total operating income.....	\$1,512,597.43 (Def.)	\$190,653.36	\$1,703,250.79
NON-OPERATING INCOME:			
Rental—U. S. R. R. Admin. ....	557,935.43	3,276,410.42	-\$2,718,474.99
Rental—Guaranty Period .....	1,759,612.97		1,759,612.97
Other items .....	731,439.71	385,222.30	346,217.41
	\$3,048,988.11	\$3,661,632.72	-\$612,644.61
Gross income .....	\$4,561,585.54	\$3,470,979.36	\$1,090,606.18
DEDUCTIONS:			
Rentals of leased lines, interest, etc. ....	\$2,235,825.18	\$2,407,012.07	-\$171,186.89
Net income .....	\$2,325,760.36	\$1,063,967.29	\$1,261,793.07
APPROPRIATIONS:			
Pension and Fire Insurance Funds .....	30,710.95	28,601.63	2,109.32
Surplus available for dividends .....	\$2,295,049.41	\$1,035,365.66	\$1,259,683.75
Return on capital stock.....	13.91%	6.27%	7.64%

The increase of \$407,891.48 in tax accruals is chiefly due to the income and excess profit tax.

On account of the irregular periods and conditions affecting the operations of this year, no further analysis is made of the comparative results with the preceding year.

### DIVIDENDS.

	1920	1919
Preferred Stock .....	\$6,000,000 6%	\$360,000 6%
Common Stock .....	10,500,000 4%	420,000 4%
Total .....	\$16,500,000	\$780,000

Since the close of the fiscal year, your Board of Directors has declared semi-annual dividends of three per cent. on the preferred stock and three per cent. on the common stock, payable February 15, 1921.

### CAPITAL STOCK.

There has been no change during the year in this account. The total outstanding Capital Stock of the Company amounts to \$16,500,000, and consists of \$6,000,000 preferred stock and of \$10,500,000 common stock.

### FUNDED DEBT.

In accordance with the provisions of the Consolidated Mortgage of 1907, the Trustee delivered to the Company \$1,059,000 4½% Bonds, representing the entire issue of Equipment Bonds, Series B, amounting to \$1,000,000, and 50% of Equipment Bonds Series E retired during the year.

These bonds, added to those in the Treasury of the Company, make a total of \$4,081,000 held in reserve.

To provide for the rolling stock allocated by the United States Railroad Administration and provided delivered to your Company in 1918, an issue of \$2,004,000 six per cent Equipment Gold Notes was authorized, secured by 800 fifty-five ton capacity steel coal cars, costing a minimum sum of \$2,004,000. The final cost figures, still under determination by the Government, will slightly exceed this minimum.

These notes were issued under an Agreement with the Director General of Railroads, known as "Equipment Trust No. 10" dated January 15, 1920, and were all taken by the Government at par. They mature in annual installments of \$133,500.00, commencing January 15, 1921, and ending January 15, 1935.

Bonds issued during the year:  
Equipment 6% Gold Notes..... \$2,004,000

Bonds retired during the year:	
Series B (Balance of issue).....	\$892,000
" C .....	66,000
" E .....	119,000
" F .....	181,000
" G .....	184,000
" H .....	125,000
" I .....	100,000
" K .....	80,000
Rochester & Pittsburgh Railroad Co. First Mortgage 6% Bonds .....	15,000
	\$1,762,000

Less reduction of amount of bonds held in funds..... 1,660,000

Net increase in bonded debt of the Company held by the public on December 31, 1920..... \$344,000

### LOANS.

The floating debt of the Company was extinguished during the year by the payment of the outstanding notes, amounting to \$1,865,000.00.

### COST OF ROAD.

Capital account has been charged during the year with \$407,640.22 for investment in road, as follows:	
Terminal facilities, Buffalo Creek, N. Y.....	\$67,833.21
Roadway machines .....	13,265.82
Highway bridge, C. & M. Junction, Pa.....	17,717.78
Subway, Brown St., Rochester, N. Y.....	17,320.74
Increased weight of rail, etc.....	134,318.37
Stone and slag ballast.....	71,994.93
Additional sidings, yard extensions, etc.....	65,189.37
Total .....	\$407,640.22

The terminal improvements at Buffalo, N. Y., referred to in last year's report, are completed.

The work on the subway, Brown St., Rochester, N. Y., undertaken jointly by the City, the New York Central Railroad Company and your Company, is now in progress and will be finished this coming year.

The general program of strengthening the road with stone ballast and heavier type of rail was continued.

### COST OF EQUIPMENT.

Expenditures were made for additions to equipment as follows:	
Sundry locomotive betterments.....	\$20,262.46
Eight hundred steel gondola cars, purchased per allocation of U. S. R. R. Administration.....	2,004,000.00
Four gondola cars purchased.....	2,180.30
Four work equipment cars purchased.....	1,832.19
Sundry car betterments.....	11,906.65
	\$2,040,181.60

There was credited for equipment sold, transferred or destroyed, the following book values, on which the accrued depreciation to January 1, 1918, and subsequent to February 29, 1920, was charged to Accrued Depreciation Account, and the balance to the U. S. R. R. Administration:

Twenty-four locomotives .....	\$300,608.94
Four hundred and ninety-six freight train cars.....	387,543.06
Seven work equipment cars.....	2,091.18
Three miscellaneous equipment cars.....	1,424.47
	\$691,667.65
Making a net increase of.....	\$1,348,513.95

The use of heavy modern power purchased in recent years enabled us to spare twenty-one of the lighter type locomotives, which were sold at favorable prices. Also, owing to the high cost of repairs, three hundred and six gondola cars were disposed of at market values. The rolling stock statistics are affixed as follows:

The total tractive power of engines aggregates 14,281,845 pounds, a decrease of 1,064,985 pounds during the past year.

The average tractive power of each engine increased 1,530 pounds, being 45,630 pounds as against 44,100 pounds on December 31, 1919.

The total carrying capacity of cars in freight service now amounts to 748,215 net tons, a decrease of 23,326.

The average carrying capacity or efficiency of each freight car increased .15 ton, being 44.12 tons as against 43.97 tons.

Of the cars in passenger service, 47.31 per cent are of steel construction; and in the freight service 94.60 per cent of the cars are all-steel, or are equipped with steel underframes.

### FIRE INSURANCE FUND.

The assets of this fund were increased \$42,116.30 and now amount to \$429,805.53 in interest bearing securities and cash.

PENSION FUND.

The assets of this fund, created July 1, 1903, were increased \$4,677.57, and now amount to \$257,375.30 in interest bearing securities and cash. There were 80 pensioners upon the roll on December 31, 1920, a net increase of 8 during the year.

GENERAL REMARKS.

The increased rates for the transportation of mail, fixed by the Interstate Commerce Commission, became effective November 1, 1916, when the space balance was put into operation. The back amount for the period prior to Federal Control, amounting to \$23,008.07, was credited to Profit and Loss Account.

A new agreement uniform in its application over all rail lines was made with the American Railway Express Company, effective on September 1, 1920, for a period of five years, and to continue thereafter until a four months' notice in writing is given by either party.

The valuation of your lines by the Interstate Commerce Commission began July 1, 1917, and is about 80% completed. The amount expended to date on this account has reached \$161,259.44.

The officers in charge of the operations of the road prior to Federal Control, were reinstated on March 1, 1920, the date on which the corporation resumed its active management.

The acknowledgments of the Board are renewed to its officers and employees for their faithful and efficient service.

By order of the Board,  
WILLIAM T. NOONAN, President.

Rochester, N. Y.  
March 7, 1921.

PROFIT AND LOSS ACCOUNT.

NOTE.—For contingent liabilities representing bonds of leased lines, the payment of principal and interest of which is guaranteed by the Buffalo, Rochester and Pittsburgh Railway Company, see page 29 of report.

## Railway Officers

### Financial, Legal and Accounting

R. A. McNaughton has been appointed general accountant of the Lake Erie & Northern with headquarters at Galt, Ont., effective May 5, succeeding A. McL. Campbell, transferred.

William A. Northcutt, whose promotion to general solicitor of the Louisville & Nashville, with headquarters at Louisville, Ky., was announced in the *Railway Age* of May 20 (page 1195), was born in Grant County, Ky., on February 5, 1876. He was educated in the public and private schools of Williams-town, Ky., and in the law department of the University of Louisville. He entered railroad service on October 11, 1900, as a stenographer in the law department of the Louisville & Nashville, and has served that company continuously since then. In 1902, he was made chief clerk in the law department, and served in that position until 1910, when he was promoted to commerce attorney, with headquarters at Louisville. In 1918, when Federal control went into effect, Mr. Northcutt was promoted to general attorney. His promotion was confirmed in March, 1920, following the return of the roads to private management, and he was serving in that position at the time of his recent promotion.

W. A. Northcutt

### Operating

J. M. Doyle, assistant general superintendent of the Great Northern, with headquarters at Everett, Wash., has been appointed superintendent of the Spokane and Marcus divisions, with headquarters at Spokane, Wash., effective May 20.

B. W. Proctor, assistant to the general manager of the International & Great Northern, with headquarters at Palestine, Tex., has been promoted to assistant general manager, with the same headquarters, succeeding E. G. Goforth, whose promotion to general manager was announced in the *Railway Age* of May 13 (page 1149).

### Traffic

J. D. Noriega has been appointed Mexican traffic representative of the Missouri, Kansas & Texas, with headquarters at Mexico City.

### Engineering, Maintenance of Way and Signaling

Col. C. N. Monsarrat has been appointed consulting engineer of bridges of the Canadian National with headquarters at Toronto, effective May 1.

P. G. Lang, Jr., assistant engineer of bridges of the Baltimore & Ohio, with headquarters at Baltimore, Md., has been promoted to engineer of bridges, succeeding W. S. Bouton, who has retired on account of ill health.

I. H. Schram, superintendent terminals of the Erie, with headquarters at Marion, Ohio, has been appointed division engineer, with the same headquarters, succeeding H. S.

Elliott, who has resigned. The position of superintendent of terminals at Marion has been abolished.

F. L. Wheaton, division engineer of the Delaware, Lackawanna & Western with headquarters at Binghamton, N. Y., has been transferred to Buffalo, succeeding G. E. Boyd. Mr. Wheaton will have jurisdiction over both the Buffalo and the Scranton divisions, the office of division engineer at Binghamton having been abolished.

### Purchasing and Stores

W. J. Sidey, general storekeeper of the Buffalo, Rochester & Pittsburgh, has been assigned other duties and the position of general storekeeper has been abolished, effective May 20. Officers and employees heretofore reporting to the general storekeeper will report to the chief engineer.

### Obituary

Henry B. Ledyard, chairman of the board of directors and former president of the Michigan Central, died in his home in Detroit on May 25.

E. C. D. Marshall, general freight and passenger agent of the Louisiana Railway & Navigation, with headquarters at Shreveport, La., died at Baltimore, Md., on May 10.

Edward L. Brown, former president of the Minneapolis & St. Louis and the Denver & Rio Grande, died at St. Paul, Minn. on May 22, after an illness of several months. He was born at Pella, Iowa, in 1864, and entered railroad service in 1875, as a messenger on the Chicago, Rock Island & Pacific. From 1877 to 1890, he served successively as telegraph operator, station agent, and train dispatcher on the Rock Island. In 1883, in addition to his other duties he was made joint agent of the Rock Island and the Wabash & Iowa Central. In August, 1890, he was appointed general agent of the St. Paul & Duluth, with headquarters at West Superior, Wis., and in April, 1891, he was transferred to St. Paul, Minn. In December of the same year, he was appointed master of transportation, being promoted to superintendent in March, 1896. In June, 1900, he left the St. Paul & Duluth to become superintendent of the Lake Superior division of the Northern Pacific, with headquarters at Duluth, Minn. From February, 1902 to April, 1903, he served as general superintendent of the Montana Central, and on the latter date was appointed general superintendent of the Eastern district of the Great Northern. In October, 1907, he was transferred to the Western district, with headquarters at Seattle and Tacoma, Wash., serving in this position until February, 1912, when he was elected vice-president of the Denver & Rio Grande. In July, 1913, he was elected vice-president of the Western Pacific in addition to his duties with the Denver & Rio Grande, but resigned in September, 1916, to accept the presidency of the Minneapolis & St. Louis. He was compelled to give up this position in March, 1917, on account of ill-health. In October, 1917, Mr. Brown was elected president of the Denver & Rio Grande, and at the advent of federal control, was appointed federal manager of that road. He resigned on account of ill-health in November, 1918. During the latter part of federal control, Mr. Brown served as assistant to the regional director of the Southwestern region, with headquarters at Dallas, Tex. He was not engaged in active railroad service at the time of his death.

Railroad grade crossing accidents and deaths resulting therefrom are increasing from year to year at an appalling rate.

### "Arouse the Public"

Statistics of the Interstate Commerce Commission for 1919 show that 6,400 people were killed or injured in such accidents during that year and that of this number 4,790, or about 75 per cent, resulted from collisions between trains and automobiles. On the Atchison, Topeka & Santa Fe lines east of Albuquerque, N. M., the number of crossing accidents in 1920 was a little over 20 per cent greater than in 1919. The Baltimore & Ohio, in a check made during the month of April, 1921, at its crossings in Chicago, found 550 instances where drivers of automobiles, in crossing the tracks, failed entirely to either look, listen, or take any other precautions to avoid being struck by a train. Such is the condition over the entire country. The problem confronting the railroads is to devise some way to arouse the public to this situation. The Chicago, Burlington & Quincy, Illinois Central and other roads have inaugurated campaigns to eliminate crossing accidents in which they have gone direct to the newspapers in the territory served by their lines, supplying them with data and articles which the papers are carrying to their readers. This is the most effective method that can be used to give the public the education on the subject that it needs.

One of the most serious blows at efficiency of operation for which the Railroad Administration is responsible was the abolition of piece work. By this step

### Restoration of the Incentive

all labor was reduced to a level and incentive for special effort was removed. While piece work had received its widest application in the mechanical department, it was also receiving serious consideration from maintenance officers when the roads were taken over by the government. It had long been maintained by many maintenance of way officers that their work did not lend itself to standardization of operations to such an extent that standard schedules could be prepared. They pointed out the differences in local conditions, the variations due to interference from traffic, etc., which affected the output of their gangs. However, as pointed out in an article in another column, these objections have been found to be more imaginary than real on at least two railways which had adopted piece work systems for maintenance of way work on an extensive scale, on one of which it was in effect for upward of six years. It was found from extended experience that there was surprising uniformity in the performance of gangs in different territories and that the effect of local conditions was far less than had been supposed. It was also found that from 75 per cent to 90 per cent of all of the work ordinarily done by maintenance forces could be scheduled. Records for an extended period demonstrated that the men can earn bonuses and that bonuses did afford an incentive for many of the gangs, the bonus payment on one road averaging over \$15,000 per month or about five per cent of the total payroll of the force concerned. The maintenance of way department has long suffered from the flat rate paid to experienced and inexperienced employees alike

which in effect denies recognition of the value of experience and skill. The bonus system offered a means of rewarding special industry, skill and experience and thereby creates an incentive for the men to exert themselves and to remain in the service as they become more proficient. Some incentive of this character is necessary if the railways are to increase the efficiency of their operations.

A British correspondent at Valparaiso, Chile, has written in exulting terms in an important London weekly telling of the offer of credit by an English financial house for the construction of a new railway line, better than the present one, from Valparaiso, Chile, to Santiago. The financiers stipulate, he says,

### Britain Scores in Chile

that the work of construction must be done by a British firm. The correspondent indicates, furthermore, that the terms of this offer, which will run upwards of \$15,000,000, are much more liberal as to security and interest than American bankers are generally disposed to grant. This is the most important evidence thus far that Britain is making progress in regaining her old supremacy in South American railway markets and the spectacle is not one which indicates any particular competitive strength of Americans in that field. A long term credit overcomes the temporary barrier of adverse exchange rates. There is no good reason why British investment funds should be more readily available for such purposes than our own—in fact the contrary might well be expected. At any rate, there is slight chance of a return to normal in our world trade until American investors are attracted in important numbers to foreign credits. In March last year, our exports were valued at almost a billion dollars. In March of this year they had fallen to \$384,000,000. When these figures are understood it is not necessary to go much farther to find one of the primary causes for business depression in this country.

In the minds of a goodly proportion of the people, public utilities commissions can have but one function—to reduce rates. As long as the regulatory bodies fulfilled this prerogative in good measure they were popular, but when, as a consequence of the decreased value of the dollar, it became necessary to raise rates, the popular acclaim for the state commission was overwhelmed by the cry for "home rule." As a consequence, bills have been introduced in many of the legislatures calling for the abolition of the commission or providing for the tinkering of public utility laws which promise to do serious harm, unless the resultant reduction in the effectiveness of state regulation will serve to strengthen the arm of the Interstate Commerce Commission. As an illustration of present tendencies, House Bill No. 741 now before the Illinois legislature proposes to wipe the slate clean and provide an entirely new commission, completely under the control of the party in power. It provides definitely for independent utility regulation by any city or "transportation district" which may desire "home rule", such regulation to be exercised by the city council or any other body designated. That the framers

### Regulation Is Dead, Long Live Regulation

of the commission was overwhelmed by the cry for "home rule." As a consequence, bills have been introduced in many of the legislatures calling for the abolition of the commission or providing for the tinkering of public utility laws which promise to do serious harm, unless the resultant reduction in the effectiveness of state regulation will serve to strengthen the arm of the Interstate Commerce Commission. As an illustration of present tendencies, House Bill No. 741 now before the Illinois legislature proposes to wipe the slate clean and provide an entirely new commission, completely under the control of the party in power. It provides definitely for independent utility regulation by any city or "transportation district" which may desire "home rule", such regulation to be exercised by the city council or any other body designated. That the framers

of this bill have been prompted entirely by political expediency is plain in every line of the act as drawn. It is politics from start to finish. Even the pass privilege to state officers, which died so hard in Illinois, would be restored under this act, while arrangements for complete circumvention of civil service, and for a larger personnel, increased salaries and a tenure of service for commissioners coincident with the gubernatorial term would provide fat picking for the politicians in power. All that has been done in many years to reduce the politics and increase the fairness and efficiency in regulation of public utilities would speedily be undone.

In a period like that of the past few years and which will probably continue for a time, operating, engineering and maintenance officers have an opportunity to realize the advantages of farsightedness in permanent roadway construction. The roads which adopted the policy of securing permanency in

### Permanence in Railway Construction

bridges, buildings and other structures in the more prosperous days previous to the war and at the same time attempted to follow, as nearly as possible, the same standards in their track, now have much to be thankful for. While such roads may now show deterioration when compared to their own previous standards, they are still well above the general average just as they have been in the past and just as they will be no doubt in the future. Lines of dense traffic which were laid with heavy rail on tie-plates and crossoties ties are now reaping the benefit of their efforts, for such tracks can still be maintained to fair standards at an expenditure, small compared with that which would be necessary if it were not for those improvements. Roads with concrete and other types of permanent structures are worrying little about where the money for renewals or reconstruction can be found because there is little or none to be done. Roads that have made similar expenditures for permanent track construction are not spending anywhere near the amount of money for this class of work that must be expended on other roads because of the lack of permanence in their construction methods. Permanent construction pays in both good and bad times, but is most appreciated in the latter. It is a policy which cannot be carried out all at once, but the benefits of which will assume considerable proportions in a short time if a little toward that end is done each year. The saying "Do well what you do" may be trite but it is still good advice nevertheless.

Since there is a wide diversity of opinion among railroad men regarding many questions of engine terminal design and operation, it is not surprising to find

### Engine Truck and Tender Wheel Drop Pits

a lack of agreement on the proper location and construction of engine truck and tender wheel drop pits. The need for such pits, however, is acknowledged by a large majority of railroad men who admit that the number now installed is entirely inadequate. Some of the roads reporting to the American Railway Association Committee on Engine Terminals recommended the installation of separate drop pits to handle tender wheels, while others felt that a single pit should serve for both engine truck and tender wheels. Whatever the decision as to number and location, these drop pits should now be installed to suit local conditions and in accordance with the best judgment of mechanical officers in charge. The advantages of auxiliary drop pits are numerous. Heavy locomotive front ends will not have to be jacked up to remove the trucks and change defective wheels. If a pair of tender wheels develops flat spots or chipped

flanges, if a journal is cut or a journal box broken, the wheels can be readily changed without jacking up the tender. If the defective wheels happen to be in the front truck, the drop pit eliminates cutting the tender, disconnecting the drawbar, safety bars, air and steam lines and automatic stoker connections when the locomotive is stoker fired. A large amount of manual work is thus saved and the locomotive is returned to service quickly. The installation of suitable drop pits to facilitate the ready changing of engine truck and tender wheels will pay large returns on the comparatively small investment involved due to three facts. First, and most important, the locomotive will be held out of service a shorter length of time; second, the actual cost of changing the wheels will be reduced due to the shorter time and less manual work involved; and third, if wheels can be changed easily, minor defects will be immediately repaired and the general standard of engine truck and tender wheel maintenance raised.

## The Reduction in Railway Wages

THE ANNOUNCEMENT of the Railroad Labor Board on June 1 regarding reductions in wages to be put in effect on July 1 shows what the board intends to do regarding the entire subject of wages. In the cases of the railways that are technically before it, it has granted reductions averaging about 12 per cent. It intends to make corresponding reductions on all other railways as they apply for them. The largest reduction is in the wages of section men, who are unskilled workers, and who are reduced 18 per cent, or from a daily basis of \$3.70 to \$3.02. This puts section labor back where it was before the wage award on July 20, 1920, but leaves its wages averaging almost 38 cents an hour, which is more than is being paid in most other industries.

Most of the reductions in wages amount to about nine per cent, including those of employees performing such widely varying duties as machinists, carmen, switchmen and yard foremen. The reduction in the wages of passenger locomotive engineers is only about seven per cent. The advance in wages granted by the Labor Board last July ran at the rate of almost \$775,000,000 a year, or an average of 22 per cent, while on the basis of the same number of men who were employed in 1920 the reductions now announced amount to something over \$400,000,000, or an average of about 12 per cent.

The decision should be satisfactory to the employees. It cannot be received with satisfaction by the railways. The reductions which have occurred in the cost of living and in the wages paid in other industries since the present wages were fixed would have justified a larger reduction in railway wages. The decision leaves the railways and the Interstate Commerce Commission in an unhappy position. The public believes that a large reduction in railway expenses will result from the decision of the Labor Board announcing the abrogation of the national agreements. It has given little consideration to the fact that the Labor Board specifically recognized the principle of the eight-hour day, thereby rendering impracticable a large part of the savings the railways estimated could be made by abrogation of the national agreements. Furthermore, the public does not understand that all the remaining points involved in the national agreements controversy are still unsettled. Although the Labor Board has ordered abrogation of the national agreements, the representatives of the labor unions on individual railways, under instructions from their national officers, are demanding the retention of practically every rule in the national agreements. Their purpose apparently is to throw the entire controversy back into the hands of the Labor Board. At any rate, the Labor Board's decision regarding national agreements has thus far settled nothing and there-

fore nobody knows what savings, if any, it finally will cause. Not only, however, does the public apparently believe that large reductions in expenses have been made certain by the national agreements decision, but in addition it now receives news of a reduction in wages which to it seems large, but which really will reduce the excessive operating expenses of the railways only by about seven per cent.

With the public being led to believe that very large reductions in operating expenses are in sight there is going on an extensive agitation for large reductions in freight rates. The reductions in operating expenses that are in sight are not sufficient to justify substantial reductions in rates. Even when the railways in the last four months of 1920 were handling a large business they were failing at the rate of about \$500,000,000 a year to earn an annual net return at the rate of six per cent on their valuation. Since the big slump in business began they have been earning almost no net return at all. In the face of these facts it is plain that if the railways are to be set upon their feet financially, and enabled to put their properties in good shape again and increase their facilities sufficiently to handle the country's traffic when business revives, substantial reductions of rates must be indefinitely postponed. A general reduction of even eight and one half per cent in freight rates alone would reduce the earnings of the railways as much as the entire reduction in wages granted will reduce their expenses. This would leave them as badly off as they would be without any reduction of wages, and would not satisfy any of those who are agitating for a large reduction in rates.

The things the country will need most from the railways in the immediate future are, first, improvements in the physical properties which will enable the roads to handle the traffic that will be offered when business revives, and, secondly, readjustments in rates which will eliminate discriminations and inconsistencies resulting from the horizontal advances which have been made and the reduction of such rates as can be shown to be actually hindering or preventing the movement of traffic. The rehabilitation and expansion of the properties necessary to enable the roads to give good and adequate service cannot be secured unless the roads are allowed to earn larger net returns, and they cannot do this if any considerable general reductions in rates are to be made in the near future. As to the readjustments needed, testimony presented to the Senate Committee on Interstate Commerce shows that these are in process of being made now. The general tendency of rates should be, and will be, downward in future, but the decision of the Labor Board precludes any substantial general reductions in the near future.

## A Bad Freight Car Situation

IN 1917 there were in service on the Class I railways of the United States 2,479,500 freight cars, the largest number owned in the history of the railroads. Since that time each succeeding year has seen a decline in the number of freight cars. There were 81,600 less in service in 1918 than in 1917 and 36,800 less in 1919 than in 1918. In 1920 there was a further decrease of 8,200 cars. In 1918 and 1919 the average capacity increased from 41.5 tons to 41.6 and 41.9 tons respectively. Each year, therefore, marked a decrease over the preceding year in the aggregate tonnage capacity as well as in the number of cars. In 1920 the average capacity had increased to 43 tons so that in spite of a decrease of over 8,000 in the number of cars, there was a material increase in the aggregate tonnage capacity, which, however, was still considerably less than in 1917.

From these facts two conclusions are inevitable: First, that the cars ordered by the Railroad Administration in 1918 and 1919 were entirely inadequate, both in number

and in aggregate capacity, to replace those retired during those two years, and second, that the railroad companies have vigorously attacked the problem of restoring the country's freight car resources during the short period since the properties were returned to them for management.

But, notwithstanding the manner in which the tide of depression has been stemmed, the condition of the equipment at the present time is a matter of grave concern to railway managements and the shipping public alike. Of the 2,479,500 freight cars in service in 1917, about 5.7 per cent, or 141,300, were in bad order when the railroads entered the period of federal control on January 1, 1918, leaving 2,338,200 freight cars in condition for actual service. On May 1 of this year, according to the semi-monthly report of the Car Service Division, there were 310,000 freight cars in bad order out of a total of 2,352,900 cars, leaving 2,042,900 freight cars in serviceable condition. At present, therefore, the Class I roads have over 295,000 less cars fit for actual service than they had at the beginning of government control. Furthermore, during 1918 the number of bad order cars requiring heavy repairs varied from 85,000 to 96,000 and constituted from 50 to 60 per cent of the total number of bad order cars. Of the 310,000 cars now in bad order, 228,200, or 74 per cent, are in need of heavy repairs.

In 1917 the railroads handled the largest volume of traffic in their history up to that time, but under conditions which clearly indicated the need for more cars. The year 1920 again broke all records for the volume of traffic and this business was handled with about 160,000 less cars actually in condition for service than were available in 1917. This accomplishment marked the highest effectiveness ever attained in the utilization of freight cars, but it was attained by the adoption of some methods to the permanency of which the shipping public could hardly be expected to agree. It is improbable that equal effectiveness, not to mention a further increase, can be maintained indefinitely.

The railroads now face a revival of business. Since the last week in March, when car loadings reached their lowest point with the exception of one other full week during the year, there has been a steady increase in car loadings, which increase for the week ending May 14, amounted to 12.5 per cent in a period of six weeks. The movement of coal is increasing and must continue to do so if the country is to catch up on the winter's supply. With the grain harvest approaching, there is an unusually large amount of last year's crop still to be moved and already in some localities it is becoming difficult to meet the demand for grain carrying cars.

With prospects of an accelerating business revival the railroads have about 134,000 fewer cars immediately fit for service than were available during the period of heavy traffic last year. To handle a volume of traffic approaching that of the late summer and early fall of last year under these conditions would require a new record in car mileage and car loading, which would be accompanied by car shortages, forced car distribution and embargoes—expensive alike to the railroad and the shipper.

In order to restore the number of cars fit for service to last year's figure, the number of bad order cars must be reduced by 134,000 and this reduction must come very largely from the 228,000 cars requiring heavy repairs. Under normal conditions the daily output of repaired cars will probably average 10 per cent heavy repairs and 90 per cent light repairs and it is evident that if no move is made to clear up the present abnormal accumulation of heavy repair work until there is again a demand for cars, the accumulation will be reduced with difficulty and only at the expense of inadequate attention to much of the equipment. This accumulation of bad order cars is one of the results of the bitter struggle for corporate existence that railway managements have ever had to face and for many of them the end of the

period of stress is not yet in sight. Others, however, are in a position to anticipate a reasonably certain improvement in business conditions and such roads should immediately bend every effort to the task of restoring their idle equipment to a fit condition for effective service.

But the burden of meeting the demands of reviving business does not rest with the railroads alone. Shippers must in a measure share the responsibility. It is a practical impossibility to provide a supply of freight cars or of other essential facilities large enough to handle all of the business offered when a year's requirements of the country are crowded into a few months. Like any other machine the capacity of the railroads is limited and output can best be secured by steady operation. For his own advantage, therefore, every shipper and every receiver of freight in a position to anticipate the revival of normal business activities should make the fullest possible immediate use of the railroads, thus saving himself delay and uncertainty later. At the same time he will assist in relieving the congestion at the inevitable peak of traffic which is to come, besides supplying the revenues so essential for the immediate adoption of a vigorous policy of equipment rehabilitation by the railroads as a whole.

## Chicago, St. Paul, Minneapolis & Omaha

THE CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA operates 1,749 miles of railway, of which it owns all but 70 miles operated under trackage rights. This mileage lies principally in Wisconsin, Minnesota and Nebraska, but the lines extend also into Iowa and South Dakota. The property is controlled by the Chicago & North Western through majority stock ownership of the preferred and common stock. Inasmuch as it is related to the North Western, although operated separately, our discussion of the annual report can be brief, for much that has been said about the North Western applies also to the Omaha.

Taking into consideration the standard return for January and February, the guaranty for the guaranty period and the net railway operating income for the remaining four months of the year, the operations of the Omaha in 1920 permitted that road to earn a surplus, after the payment of 7 per cent on the preferred stock and 5 per cent on the common stock, of \$871,684. This compares with \$660,732 in 1919, when the property was under federal control. It was considerably in excess of the surplus earned in 1917, the last year prior to federal control, when after the payment of the same dividends the surplus was \$402,603. It by no means rivaled, however, the figure for 1916, when there was a surplus of \$1,627,754 after the payment of 7 per cent dividends on both the common and preferred stocks.

The business done by the Omaha in 1920 was in excess of that in 1919. The traffic handled in the first eight months of the year was in excess of that handled in the corresponding months of 1919. In the last four months, however, the traffic handled was less than in the corresponding months of 1919. October, 1920, was the best month of the year, but there was not as much traffic handled in that month as in October, 1919. After October the traffic fell off rapidly and the December, 1920, and January, 1921, figures were the lowest for some time. It was presumably the large amount of traffic handled in October and the fairly high average for September that gave the road a net railway operating income sufficient for it to better its 1919 earnings. The falling off in traffic after these months is the familiar example of a railroad being unable to realize on the increases in rates established in August to compensate for increases in labor costs.

In the review of the Chicago & North Western's report, which appears in these columns this week, there was extended

comment on the fact that the operations of the North Western and Omaha were characterized by train loads and figures of car utilization below the averages for neighbor roads. It is hardly necessary to repeat what has already been said about the North Western in these brief comments concerning the Omaha. Nevertheless, it is of interest to observe that although the Omaha had in 1920 an average of net tons per train—revenue and non-revenue freight—of 448, it has been making steady increases in its train load over a period of years. The average of net tons per train in 1920, that is 448, compared with 459 in 1919, but it represented increases over the figures of 429 in 1917; 414 in 1916; 360 in 1915; 331 in 1914, etc.

It would appear, nevertheless, that the Omaha has not gone after heavy train loading in quite the fashion which has characterized the operations of many other roads. The Omaha succeeded in 1920 in getting an average load per loaded car of 23.9 tons; the average car miles per day were 22.2 and the ton-miles daily per car were 393. The first of these three figures was the same as in 1919, the latter two represented increases over 1919.

The following gives the figures for operation in 1920 as compared with those for 1919:

	1920	1919
Mileage operated .....	1,749	1,749
Freight revenue .....	\$20,845,238	\$18,335,828
Passenger revenue .....	8,272,351	7,589,842
Total operating revenue .....	31,911,606	27,732,018
Maintenance of way expenses .....	4,907,551	3,838,174
Maintenance of equipment .....	6,273,265	5,230,102
Traffic expenses .....	350,648	265,361
Transportation expenses .....	15,251,523	13,079,739
Total operating expenses .....	27,957,338	23,316,464
Net from railway operations .....	3,954,267	4,415,553
Taxes .....	1,568,349	1,309,002
Net railway operating income .....	2,385,918	2,677,245

The foregoing figures are not given in the report, but are taken from the December, 1920, monthly report to the Interstate Commerce Commission.

The corporate income account is given in brief as follows:

	1920	1919
Standard return .....		\$4,934,790
Compensation, January and February .....	\$815,603	.....
Net railway operating income, March 1 to December 31 .....	1,335,388	.....
Due on guaranty .....	2,749,197	.....
Gross income .....	5,075,879	5,031,160
Net income .....	2,587,670	2,376,718
Dividends—		
Preferred, 7 per cent .....	788,151	788,151
Common, 5 per cent .....	927,835	927,835
Balance income for year .....	\$871,684	\$660,732

## Chicago & North Western

THE CHICAGO & NORTH WESTERN is another of that large number of railroads which in 1920 did a record business but which were unable, because of increased costs of operation, to reflect that fact in net earnings. The corporate income account for 1920 showed gross income amounting to \$23,811,563 after the accrual of dividend income, etc.; the compensation for the first two months of the year while the property was still under federal control, and the guaranty for the following six months, as compared with gross income in 1919 amounted to \$24,140,709. The net income after the payment of interest, etc., was \$12,545,856 in 1920 and in 1919, \$14,088,104. In June, 1920, because of the uncertainties in the railway situation at the time, the company reduced its dividend on the preferred stock from 8 to 7 per cent and on the common stock from 7 to 5 per cent, thereby reducing the dividend payments in the amount of \$3,127,000 as between the two years. The net for 1920, therefore, was \$3,633,979 as compared with \$2,030,307 in 1919.

The trend of the amount of traffic handled on the North Western in 1920 was fairly typical of that on the railways of the country as a whole. The road did more business in every month of 1920 than in the corresponding months of 1919 with the single exception of April, when the outlaw strikes

cut down the ton-miles handled about one half from March. The month of September was the best for the entire year, but after that month the traffic decreased rapidly, thereby preventing the road from realizing on the increases in rates which were granted to offset the increases in labor and other costs.

Another interesting feature of the year's developments was a rather marked change in the traffic handled. This change is shown in the following table:

	1920 Revenue tons	1920 Per cent of total	1919 Per cent of total	Per cent increase or decrease in number of tons
Products of agriculture.....	\$7,744,549	12.85	16.36	-8.94
Products of animals.....	2,333,186	3.87	5.69	-21.15
Products of mines.....	29,598,508	49.10	41.49	37.24
Products of forests.....	6,883,662	11.42	12.62	4.96
Manufactures.....	10,650,551	17.67	16.91	21.20

Total, including misc. and l. c. l.....	1920	1919	Per cent
Bituminous coal.....	60,275,207	100.00	100.00
Ores.....	10,254,478	17.01	13.03
	14,338,669	23.79	18.99
			45.26

The total tons of revenue freight carried in 1920 were 60,275,207, as compared with 51,981,263 in 1919, an in-

crease of 15.96 per cent. The increase in mileage is not due to any extension of the system; it is due to the acquiring last April by the parent company of various proprietary companies which formerly were controlled by entire ownership of capital stock and, in some cases, also leased. The lines acquired were 11 in number, the more important of which were: The Wyoming & Northwestern from Casper, Wyo., to Lander, 148 miles; the Pierre, Rapid City & North Western, Fort Pierre, S. Dak., to Rapid City, 164 miles; the Belle Fourche Valley, Belle Fourche, S. Dak., to Newell, 24 miles, and the James River Valley & North Western, Blunt, S. Dak., to Gettysburg, 40 miles. The result of these changes is that the North Western is now a completely knit system consisting entirely of mileage which it owns. The savings in the way of accounting and records from this change will probably be considerable.

The North Western's lines traverse a prosperous territory, from which it derives a traffic of large volume and varied character. The property is characterized by high standards

The Chicago & North Western and the Chicago, St. Paul, Minneapolis & Omaha

crease of 15.96 per cent. The table points out that this increase was made up principally from increases in the tonnage of bituminous coal and ores, whereas there was a decided decrease in farm products. The tonnage of bituminous coal increased as between the two years in the amount of 51 per cent, that of ores 45 per cent and in products of mines in general 37 per cent. There was also an increase in manufactures of 21 per cent. With the decrease in products of agriculture, amounting to 8.94 per cent, and in products of animals amounting to 21 per cent, the final result was that products of mines, which in 1919 made up but 41.49 per cent of the total traffic, in 1920 made up 49.10 per cent. The manner in which the wheat growers held back their wheat for higher prices during the latter part of 1920 received no small amount of attention at the time. The rather striking result of holding back the farm products on the traffic of an important system is, nevertheless, of more than passing interest.

The Chicago & North Western now operates 8,402 miles of line extending over nine states. Of this total mileage it owns 8,329 and operates 73 under trackage rights. This figure of miles operated is a considerable increase over that

of maintenance and construction. It is well regarded by shippers and the service given is generally recognized as satisfactory. The company is rather noted for its conservatism. This was shown in 1920 in the decision to reduce the dividend on both the common and preferred stock. Other writers have also called the North Western conservative because it has not sought to build or obtain a connection to the Pacific Coast, such as the Chicago, Milwaukee & St. Paul obtained by building its Puget Sound extension, or the Chicago, Burlington & Quincy was given by its being acquired by the Hill lines. However, this view does not appear to have much weight, particularly in view of the relationships of the North Western with the Union Pacific.

Nevertheless, it will have to be admitted that the North Western has apparently been a bit more conservative in matters of operation than some of its neighbors. With a tonnage of coal aggregating 13 to 17 per cent of the total tonnage, ores 19 to 24 per cent, or, of products of mines as a whole, 41 to 49 per cent, it might be expected that the revenue train load would have reached a high average. This, however, is not the case. It should be clearly recognized in comparing the average train load of the North Western with that

of other roads in the same territory that the comparatively small increases in its train load have been due to the policy consistently followed by the management in developing the property and based upon the belief that the public is better served by operating comparatively light trains at relatively high speeds than by operating tonnage trains at low speeds. The North Western is well equipped in the way of motive power as far as the number of locomotives and their condition is concerned. It has not, however, gone in for heavy power. For example, it received from the Railroad Administration 35 six-wheel switching locomotives, but no heavy freight engines. In 1920 it placed orders for 40 heavy freight locomotives; these were Mikado locomotives with a total weight in working order of 302,000 lb. and similar to those which were ordered in 1917. By way of comparison, it should be noted that the U. S. R. A. standard heavy Mikado has a total weight of 322,000 lb. The average revenue train load on the North Western in 1920 was 452 tons. For purposes of comparison, however, one must use the figure of net tons per train—revenue and non-revenue combined. In 1920 this was 552 tons. This compared with 530 tons in 1919, but 1919 was a low year in this respect, for in 1917 the net tons per train were 544. The figure for 1917 represented, it is true, an increase over 1915 and 1916, but it is nevertheless significant that there should have been an increase of but eight tons in the net tons per train as between the averages of 1917 and 1920.

Further than that, it also develops that despite its opportunities for heavy train loading, the North Western, besides not having made much progress in the past three years, is operating with train loads that are considerably below those of its neighbors in the same or adjoining territory. Thus, the net tons per train in 1920 were for the Burlington, 766; Great Western, 629; St. Paul, 631.

Other figures that are usually regarded as indicating the efficiency of a road's operations are the tons per loaded car, the car miles per day and the ton-miles daily per car. The North Western in 1920 had a figure of tons per loaded car of 26.3 as compared with 24.0 in 1919. This is a good figure and rather better than the average for the roads whose train loads were mentioned above. The figure of car miles per day, averaged in 1920 only 21.5.

Despite what may be said about the North Western's failure or lack of desire to secure a heavy train load, it is still a fact that the North Western has adopted a progressive policy as to the matter of keeping the amount of equipment up to the mark. As has been noted, there were received from the Railroad Administration 35 six-wheel switching locomotives. The North Western was also allocated 3,250 cars, including 1,000 50-ton box, 1,250 40-ton box and 1,000 50-ton composite gondola cars. During 1920 the road placed orders for 40 Mikado and 20 Pacific type locomotives, 500 ore, 500 stock, 250 refrigerator and 50 caboose cars and for 62 passenger train cars. The equipment allocated by the U. S. R. A. was financed through the equipment trust agreement made by the Guaranty Trust Company and the Director General. An application is pending for a loan from the revolving fund to assist in financing the equipment mentioned as ordered in 1920.

The total tons of revenue freight carried by the North Western in 1920, as has already been mentioned, were 60,275,207, an increase of 16 per cent over 1919. The total revenue ton-mileage was 9,559,269,662, an increase of 15 per cent over the figure of 8,294,482,641 in 1919. The average haul was 159 miles. The total number of passengers carried in 1920 was 40,692,627 and the passenger mileage 1,444,559,205, an increase of 2.26 per cent over 1919. The average journey per passenger was 35 miles.

The following gives the figures for operation in 1920 as compared with 1919:

	1920	1919
Mileage operated.....	8,298	8,090
Freight revenue.....	\$110,500,758	\$92,084,614
Passenger revenue.....	37,386,603	35,213,606
Total operating revenue.....	165,692,399	139,589,915
Maintenance of way expenses.....	*25,084,856	20,696,215
Maintenance of equipment.....	*2,889,502	29,687,410
Traffic expenses.....	*1,303,661	879,110
Transportation expenses.....	*65,898,448	64,202,497
Total operating expenses.....	157,110,200	119,579,387
Net from railway operations.....	8,582,199	20,010,528

\*Only ten months' figures are given.

The corporate income account is as follows:

	1920	1919
Accrued compensation.....		\$23,201,016
Compensation, January and February.....	\$3,803,000	
Guaranty March 1 to August 31.....	16,509,185	
Net railway operating income, September 1 to December 31.....	669,652	
Gross income.....	23,811,563	24,140,709
Net income.....	12,545,857	14,088,105
Dividends—		
Preferred (8 per cent in 1919; 7 per cent in 1920).....	1,567,560	1,791,600
Common (7 per cent in 1919; 5 per cent in 1920).....	7,257,625	10,160,675
Balance income.....	3,633,979	2,030,307

## New Books

*Economic Development of the United States.* By Isaac Lippincott. 5½ in. by 8¼ in., 691 pages. Published by D. Appleton & Co., New York.

This work brings the economic history of the United States through the war and up to date. In addition it has the advantage of being a rather thorough treatment confined within the limits of one volume which is not ponderous enough to be the source of much discouragement to the casual reader. The author has endeavored, as he announces in the preface, to give not only the bare economic aspects of American history but to develop the successive events and correlate them as causes and effects—"to present a complete and continuous picture of growing industrial society." Novelty is not a characteristic of economic phenomena. Each situation which arises has, of course, certain aspects which are novel but, in the main, almost any problem in economics which ever presents itself for solution is essentially analogous to one which has arisen and been solved before. True, the study of economic history does not always tell us just how we should solve our present problems, but, if it does not do this, it will generally tell us how *not* to attempt a solution, which is quite important. The facts which this work deals with are explained in terms which will present no difficulties to the reader not trained in the terminology of economics.

This work begins, as it should, with an explanation of the relation of economic history to the study of economics. A rather detailed explanation of the natural resources of the country is next given and then the history proper, beginning with the earliest colonization of the country by Europeans. The nationality of the colonists, their occupations and habits of living and the goods produced at that time are dealt with in considerable detail. The history of government finance and price inflation following wars, the history of the tariff and the industrial revolution are subjects treated especially well by Professor Lippincott in this work—which is fortunate since an understanding of these subjects is of particular importance in a time of post-bellum readjustment like the present when our chief economic ills are so strongly accentuated. The author traces carefully the development of practically every important American industry. Railroad history, of course, is not omitted and the growth of the railways, their financial history and the development of government regulation are outlined in the essential details. For a reader whose main interest lies in the railway industry, the work is not, unfortunately, as complete in its consideration of this phase of our economic development as could be wished. The book, however, does not purport to be a railroad history simply, and a broad knowledge of our industrial history is quite as important for railroad men as it is for anyone.

# Labor Board Announces Wage Reductions for July 1

Decreases Approximately 12 Per Cent Estimated to Save Class I Carriers \$400,000,000 Yearly

**W**AGE REDUCTIONS approximating 12 per cent were ordered by the Railroad Labor Board in a blanket decision made public on June 1. The effect of this decision if applied to all employees of all Class I roads, it riers approximating \$400,000,000 annually. The decreases range from 18 per cent for unskilled maintenance of way labor to 7 per cent for road passenger engineers.

As a result of wage orders issued by the Director General during the period of government control, the wages of railway employees were increased from an average of \$78 in December, 1917, to \$116 in January, 1920, or about 49 per cent. The Railroad Labor Board handed down a decision effective May 1, 1920, which increased the wages approximately 22 per cent, or to an average of \$141 per month. After this latter increase the railway workers were receiving an average increase of 81 per cent more than they were re-

ceiving prior to federal control, and about 10 per cent of them, chiefly the lower paid, unskilled workers, had received increases in excess of 100 per cent. General reductions in wages as outlined in the present decision would mean an average monthly wage of about \$125 for all employees.

The present decision applies to the various cases which were filed with the Board prior to April 18. On June 6 the Board will hear the arguments on the cases submitted subsequent to April 18 and the decision in these cases will also become effective July 1.

The Labor Board's findings are officially designated as Decision No. 147, New York Central Railroad Company et al. vs. Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees, et al. An abstract of the decision follows:

## Abstract of Decision No. 147

The United States Railroad Labor Board, acting under authority of the Transportation Act, 1920, and in furtherance of the purpose of said Act, hereby renders a decision upon a series of controversies between the carriers and the representatives of certain employees of the carriers, involving the question of what shall constitute just and reasonable wages. The various controversies were considered in conference between representatives designated and authorized by the parties, and not having been decided in such conference were referred to the Labor Board for hearing and decision.

### History of the Controversy

Immediately after the organization of this Board and on April 16, 1920, it received and took over for hearing a dispute that had been pending before what was known as the Bi-partisan Board, between a large number of carriers which had been under government control, including most, if not all, of those now before the Board in these cases, and their employees, which dispute, among other things, involved the question of wages.

After a full hearing and as careful consideration as the time and conditions would allow, the Board in that case (Dockets 1, 2 and 3) rendered its Decision No. 2, awarding certain increases and fixing what it deemed just and reasonable wages at that time for all the classes of employees of all the carriers then before the Board. The Board did not then undertake to, and under the law could not, make that decision a permanent award or standard. That decision or award was accepted in good faith and acted on both by the carriers and their employees parties to that decision; and certain other carriers not formerly parties to that case voluntarily applied and put in force the standard of wages fixed by this Board in its Decision No. 2. That decision was rendered at a period of inflation, rising prices and high costs of living. Since then changes, and in some respects very decided changes, have taken place in business, industrial and financial conditions in the United States, and in a varying measure have affected all industries and the entire public.

We now find ourselves in a period of readjustment to which all interests sooner or later must conform.

Following the raise in wages granted by this Board in Decision No. 2, and to some extent based on that, the Interstate Commerce Commission granted an increase of rates to the carriers which was put in force, but after this there came the inevitable pause in the rising tide of prices and business followed by the like inevitable recession, and in some lines a disastrous fall in prices, and the resulting cutting down of production. This has affected all lines of industrial life all over the United States and produced conditions which have to be met and in whose burdens all have to share.

Confronted by these conditions, the carriers before us, after conferences with the representatives of the different classes of their employees as to a reduction of wages, at which conference there was a failure to reach an agreement, have filed their several complaints and brought their disputes before this Board for a

decision as provided by law. The disputes were separately brought; the first being filed by the New York Central Railroad Company on March 19, 1921, followed by numerous other carriers.

Some of the carriers presented disputes applicable only to a few of the classes of their employees; others applicable to nearly all classes of employees.

The Board, appreciating and knowing the general financial and industrial conditions of the country, considered the appeals of some of the carriers for immediate action, and believing that the applications already filed would soon be followed by numerous others, took cognizance of the fact that most of the evidence offered or to be offered in one case would be material and common to all, and that it would be impracticable to reach an early decision in the time at the disposal of the Board if the cases were heard and considered separately, the Board at that time being engaged in hearing other pressing matters, on April 6, 1921, passed a resolution reciting in substance these facts, and that it was desirable that the Board hear at one time and decide in one decision so far as may be possible the question as to what may constitute just and reasonable wages for all the classes of employees of the carriers parties to Decision No. 2, as to whose wages there might be a dispute, and ordered and directed that Monday, April 18, 1921, be set as a date for hearing, at which time the Board would hear representatives of the parties to disputes where applications had been filed, and of other disputes filed at that time between carriers and employees of carriers parties to Decision No. 2, if ready for presentation, and the Board consolidated all the cases for the purpose of hearing and decision so far as practicable.

On the date set the carriers herein named had filed the applications for hearing of disputes with the classes of their employees herein named and set out. The time was limited for the oral hearings to five days for the carriers and five days for the representatives of the employees, but the Board afterwards gave the employees further time to prepare their cases for hearing, and slightly extended the time. Both parties were also allowed to file certain documents in evidence bearing upon the matters in dispute.

The hearings in these cases were completed on May 16, 1921, and the Board has since had the cases before it under consideration.

Pending the hearing which commenced on April 18, and since, a considerable number of the carriers before the Board in that hearing have filed with the Board numerous other cases of disputes with other classes of their employees, and other carriers which had no cases pending before the Board on April 18, have filed cases of disputes, and such cases are still being received. The Board has been impressed with the belief that a reduction of rates of pay on any road applying to some class or classes and not to others, and thus producing inequalities of treatment and a reduction of wages from the standards fixed by and in Decision No. 2 on some roads, without a corresponding reduction on others operating in the same section and under substantially the same conditions, would possibly be productive of unrest, dissatisfaction and

other unfortunate results. It therefore deemed it desirable to render its decision in as many cases and applying to all or as many classes as might come before it at one and the same time and make it effective as of and on the same date. It also deemed it desirable to fix and announce that date in advance so that all parties could in a measure adjust their affairs with that information before them.

With all these things in view, after having considered the evidence heard in the cases before it, the Board on May 17 passed and made public a resolution to the effect that it would announce its decision in these cases on June 1, 1921, to become effective July 1, 1921; and it further decided and announced that it set June 6, 1921, as the date for hearing all other like disputes filed, docketed and ready for hearing at that time, it being the purpose of the Board to make its decision of those disputes then heard effective as of July 1, 1921.

In pursuance of this policy and these orders, it now announces its decision in these consolidated cases already heard.

In the hearing and consideration of these cases there has been available to the Board all the evidence taken and now on file adduced in the hearings of the cases heretofore brought before the Board, information gathered by the Board and its forces under the directions of the statute, including reports of the Interstate Commerce Commission and various other governmental agencies, state and national, in addition to the very voluminous mass of evidence submitted at these hearings by the respective parties, as well as matters of general and universal public knowledge.

As in Decision No. 2, granting increases in wages, the Board found it necessary to assume a known and recognized base and adopted as such base the rates of wages in effect March 1, the date of the termination of federal control; so in this decision the Board assumes as its base the rates fixed and in effect under and by its Decision No. 2.

Except as modified by changed conditions, the preliminary statement set out in and as a part of its Decision No. 2 might well be here repeated, but that is not deemed necessary. Practically the same methods of procedure there outlined were followed in these cases. The Board has been governed by the same principles and the directions of the law as there outlined, and has endeavored to give due consideration to every element of the problem before it.

The decision of the Board is the result of the action of the Board, composed of nine members acting as a body, under the usual parliamentary methods of procedure and its own rules. Each and every separate question was considered and voted upon—each and every rate for each class was voted upon and adopted by a majority vote of the Board, and in every instance one or more of the public good, as the law requires, voted in the affirmative on any classification or rate adopted.

In a problem so complex and involving the inter-relationship of the wages of so many different classes of employees it is obvious that there could not be unanimous agreement among all the members of the Board on all decreases fixed by this decision; but the several decreases hereinafter set forth represent, in each instance, the best judgment of the majority of the Board. This statement is made in order that it may not be inferred that the decision, in all its details, states the precise decrease which any one of the members hereof might have stated if he had the sole power and responsibility for fixing such decrease.

The Board proceeding under the methods outlined, while not attempting to set out all the findings in detail, for the information of the public and those directly interested, may here briefly outline some of its findings which have been considered in reaching the results herein announced.

It finds that since the rendition of its Decision No. 2 there has been a decrease in the cost of living. What that decrease has been it is impossible to state with mathematical accuracy or even what the general average for the United States has been up to and on any given date. The machinery for procuring and stating with accuracy the data to fix this is by no means perfect. The decreases vary greatly according to the locality, and affect different people in different degrees. In some localities the general decrease has been greater than in others. In the cities the general decreases in some lines have been offset to some extent by the high rents. In some of the items or products that enter into the costs of living the fall in prices has been great; in others, much less.

The Board also finds that the scale of wages for similar kinds of work in other industries has in general been decreased. The same conditions are also found as to this element. It is practically impossible to find any exact average line of decrease for the entire country. The decreases vary in different industries and in different localities, and in some instances with different industries, individuals or corporations. In some places and classes the decrease has been heavy; in others, not so great. There has been a decrease, and the tendency is at present downward.

But the most unfortunate condition is that in many localities large numbers are out of employment on account of the prevailing depression, and hence without wages.

On these elements and the others prescribed by statute to be considered, the Board has looked to the general conditions existing and brought to its attention, as well as the evidence offered as to particular localities and carriers.

In a decision of this character it is not practical to fix rates applying with exact ratio to each individual employee and each separate locality, for the reason that necessity compels the Board to accept certain standardizations of pay for railroad employees. But these standards are now somewhat different in different regions, and so the decreases will have relatively the same general effect.

The Board believes that based on these elements shown, i. e., the decreased costs of living and the general decrease in the scale of wages in other industries, that the decreases herein fixed are justified and required.

But the Board is required by the Transportation Act to consider not one, but all of the seven elements especially mentioned in the act, and other relevant circumstances, and this it has endeavored to do in reaching the results herein announced.

It has endeavored to consider as it should all the elements that enter into this complex problem. There are certain facts and conditions known to all and which can neither be disputed nor ignored. Whatever may be said as to the origin or contributing causes, there has been and is a marked, and to some extent distressing and disastrous, depression in business and industry affecting the entire country and some lines of production most seriously. As a result heavy financial losses have been suffered and many hundreds of thousands thrown out of employment and deprived of all wages, and this loss of purchasing power by them has in turn accelerated the general depression by reducing the demand for the products they would otherwise have purchased. While it has been argued that the fall in prices has not reached to any large extent the consumer, it has without question most disastrously reached and affected the producers, especially some lines of manufacture and the agricultural classes.

It should be recognized by all that the problem before us is chiefly an economic one, and we are all confronted by adverse and troublesome conditions which everyone must help to solve. It should not be looked upon as a struggle between capital and labor, or the managements and the employees.

## Decision

The Labor Board decides:

1. That the rates of wages heretofore established by the authority of the United States Railroad Labor Board, shall be decreased as hereinafter specified, and that such decreases shall be effective as of July 1, 1921.

2. That the scope of this decision is limited to the carriers named under Article I herein, to such carriers as may be included hereafter by addenda, and to the specific classes of employees named or referred to under each particular carrier.

3. That the reduction in wages hereby authorized shall be made in accordance with the following articles which prescribe the regulations, designate the employees affected, and establish the schedules of decreases.

### Article I—Carriers and Employees Affected

Each of the following carriers shall make deductions from the rates of wages heretofore established by the authority of the United States Railroad Labor Board, for the specific classes of its employees named or referred to in this article, in amounts hereinafter specified for such classes in the schedules of decreases; apply the rates of wages established in Section 3 (b) of Article II, and Sections 1, 2, 3 and 4 of Article X; and make effective the rates of wages fixed by differentials provided in Section 4 of Article IV.

The article and section numbers used in connection with a carrier refer to the corresponding article and section numbers in the schedules of decreases, and in determining the classes of employees affected on each carrier the following rules shall govern:

(a) When section numbers are used in connection with a carrier without naming the classes, all classes of employees named in the corresponding section numbers of the schedules of decreases are affected.

(b) When section numbers are used in connection with a carrier and specific classes of employees are named, only the same classes of employees named in the corresponding section numbers of the schedules of decreases are affected.

(c) Where section numbers are omitted in connection with a carrier, the classes of employees named in the corresponding section number of the schedules of decreases are not affected.

[Herewith follows a list arranged alphabetically by railroads, giving the articles and sections of these articles of the decision which apply to the individual roads.]

### Article II.—Clerical and Station Forces

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision.

use the following schedule of decreases per hour in wage rates. (Note—For clerks without previous experience hereafter entering the service of a carrier, rates of wages specified in Sec. 3 (b), this article, are hereby established.)

Sec. 1. Storekeepers, assistant storekeepers, chief clerks, foremen, subforemen, and other clerical supervisory forces.....6 cents.
Sec. 2. (a) Clerks with an experience of two (2) or more years in railroad clerical work, or clerical work of a similar nature in other industries, or where their cumulative experience in such clerical work is not less than two (2) years.....6 cents.

(b) Clerks with an experience of one (1) year and less than two (2) years in railroad clerical work, or clerical work of a similar nature in other industries, or where their cumulative experience in such clerical work is not less than one (1) year.....13 cents.

Sec. 3. (a) Clerks whose experience as above defined is less than one (1) year.....6 1/2 cents.
(b) Clerks without previous experience hereafter entering the service will be paid a monthly salary at the rate of sixty-seven dollars and fifty cents (\$67.50) per month for the first six (6) months, and seventy-seven dollars and fifty cents (\$77.50) per month for the second six (6) months.

Sec. 4. Train and engine crew callers, assistant station masters, train announcers, gatemen and baggage and parcel room employees (other than clerks).....10 cents.

Sec. 5. Janitors, elevator and telephone switchboard operators, office, station and warehouse watchmen and employees engaged in assorting way bills and tickets, operating appliances or machines for perforating, addressing envelopes, numbering claims and other papers, gathering and distributing mail, adjusting diesel-horse cylinders and other similar work.....10 cents.

Sec. 6. Office boys, messengers, chore boys and other employees under eighteen years of age, filling similar positions and station attendants.....5 cents.

Sec. 7. Station, platform, warehouse, transfer, dock, pier, store room, stock room and team track freight handlers or truckers and others similarly employed.....6 cents.

Sec. 8. The following differentials shall be maintained between truckers and the classes named below: Fruit and perishable inspectors, one (1) cent per hour above truckers' rates as established under Section 7.

(b) Stowers or stevedores, callers or loaders, locators and coopers, two (2) cents per hour above truckers' rates as established under Section 7.

The above shall not operate to decrease any existing higher differentials.
Sec. 9. All common laborers in and around stations, storehouses and warehouses, not otherwise provided for.....8 1/2 cents.

Article III.—Maintenance of Way and Structural and Unskilled Forces Specified

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision, use the following schedules of decreases per hour:

Sec. 1. Bridge, building, painter, construction, mason and concrete, water supply, and plumber foremen (except water supply and plumber foremen coming under the provisions of Section 1 of Article IV, this decision).....10 cents.

Sec. 2. Assistant bridge, building, painter, construction, mason and concrete, water supply, and plumber foremen, and for coal wharf, coal chute, and fence gang foremen, pile driver, ditching and hoisting engineers and bridge inspectors (except assistant water supply and plumber foremen coming under the provisions of Section 1 of Article IV, this decision).....10 cents.

Sec. 3. Section, track and maintenance foremen, and assistant section track and maintenance foremen.....10 cents.

Sec. 4. Mechanics in the maintenance of way and bridge and building departments (except those that come under the provisions of the national agreement with the Federated Shop Trades).....10 cents.

Sec. 5. Mechanics' helpers in the maintenance of way and bridge and building departments (except those that come under the provisions of the national agreement with the Federated Shop Trades).....7 1/2 cents.

Sec. 6. Track laborers, and all common laborers in the maintenance of way department and in and around shops and roundhouses, not otherwise provided for herein.....8 1/2 cents.

Sec. 7. Drawbridge tenders and assistants, pile-driver, ditching and hoisting foremen, pumper engineers and pumpers, crossing watchmen or flagmen, and lamp lighters and tenders.....8 1/2 cents.

Sec. 8. Laborers employed in and around shops and roundhouses, such as engine watchmen and water, fire, builders, ash-pit men, flue borers, coal passers (except those coming under the provisions of Section 3 of Article VIII, this decision), coal chute men, etc.....10 cents.

Article IV.—Shop Employees

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision, use the following schedules of decreases per hour:

(Note—For car cleaners rates of wages fixed by a differential shown in Section 4, this article, are hereby established.)

Sec. 1. Supervisory forces.....8 cents

Sec. 2. Machinists, boilermakers, blacksmiths, sheet metal workers, electrical workers, carmen, moulders, cupola tenders and coremakers, including those with less than four years' experience, all crafts.....8 cents.

Sec. 3. Regular and helper apprentices and helpers, all classes.....8 cents.

Sec. 4. Car cleaners shall be paid a rate of two (2) cents per hour above the rate established in Section 6 of Article III, this decision, for regular track laborers at points where car cleaners are employed.

Article V.—Telegraphers, Telephoners and Agents

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision, use the following schedules of decreases per hour:

Sec. 1. Telegraphers, telephone operators (except switchboard operators), agents (except agents at small non-telegraph stations as referred to in Supplement No. 13 to General Order No. 27, Article IV, Section c), agent telegraphers, agent telephoners, towermen, lever men, tower and train directors, block operators and stationmen.....6 cents.

Sec. 2. Agents at small non-telegraph stations as referred to in Supplement No. 13 to General Order No. 27, Article IV, Section (c).....5 cents.

Article VI.—Engine Service Employees

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision, use the following schedules of decreases per mile, per hour, or per day, as the case may be:

SEC. 1.—PASSENGER SERVICE

Table with 3 columns: Class, Per mile cents, Per day dollars. Rows include Engineers and motormen, Firemen (coal or oil), and Helpers (electric).

SEC. 2.—FREIGHT SERVICE

Table with 3 columns: Class, Per mile cents, Per day dollars. Rows include Engineers (steam, electric, or other power), Firemen (coal or oil), and Helpers (electric).

SEC. 3.—YARD SERVICE

Table with 3 columns: Class, Per hour cents. Rows include Engineers, Firemen (coal or oil), and Helpers (electric).

SEC. 4.—HOSTLER SERVICE

Table with 3 columns: Class, Per day dollars. Rows include Outside hostlers, Inside hostlers, and Helpers.

Article VII.—Train Service Employees

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision, use the following schedules of decreases per mile, per day, or per month, as the case may be:

SEC. 1.—PASSENGER SERVICE

Table with 4 columns: Class, Per mile cents, Per day dollars, Per month dollars. Rows include Conductors, Assistant conductors or ticket collectors, Baggage handlers, Baggage operators, and Flagmen and brakemen.

SEC. 2.—SUBURBAN SERVICE (EXCLUSIVE)

Table with 4 columns: Class, Per mile cents, Per day dollars, Per month dollars. Rows include Conductors, Ticket collectors, and Guards performing duties of brakemen or flagmen.

SEC. 3.—FREIGHT SERVICE

Table with 3 columns: Class, Per mile cents, Per day dollars. Rows include Conductors (through), Flagmen and brakemen (through), Conductors (local or way freight), and Flagmen and brakemen (local or way freight).

SEC. 4.—YARD SERVICE

Table with 3 columns: Class, Per day dollars. Rows include Foremen, Helpers, and Switchtenders.

Article VIII.—Stationary Engine (Steam) and Boiler Room Employees

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision, use the following schedules of decreases per hour:

Sec. 1. Stationary engineers (steam).....8 cents.
Sec. 2. Stationary firemen and engine room oilers.....8 cents.
Sec. 3. Boiler room water tenders and coal passers.....6 cents.

Article IX.—Signal Department Employees

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision, use the following schedules of decreases per hour:

Sec. 1. Signal foremen, assistant signal foremen, and signal inspectors.....8 cents.
Sec. 2. Leading maintainers, gang foremen, and leading signalmen.....8 cents.

Sec. 3. Signalmen, assistant signalmen, signal maintainers, and assistant signal maintainers.....	8 cents.
Sec. 4. Helpers.....	6 cents.

### Article X.—Floating Equipment Employees

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision, the following schedules of decreased rates of pay are established:

#### SEC. 1.—FERRIES

Class	Per month
Captains.....	\$200.00
Engineers.....	190.00
Firemen and oilers (licensed).....	140.00
Firemen and oilers (unlicensed).....	140.00
Deckhands.....	125.00
Porters.....	100.00

#### SEC. 2.—TUGS AND STEAM LIGHTERS

Captains.....	\$200.00
Mates and first deckhands (licensed).....	130.00
First deckhands (unlicensed).....	130.00
Second deckhands.....	125.00
Flatmen and float watchmen.....	125.00
Engineers.....	190.00
Firemen and oilers (licensed).....	140.00
Firemen and oilers (unlicensed).....	140.00
Bridgemen.....	125.00

#### SEC. 3.—LIGHTERS AND BARGES

Captains, steam hoist—single drum.....	\$135.00
Captains, steam hoist—single drum.....	145.00
Captains, steam hoist—double drum.....	140.00
Engineers, steam hoist—double drum.....	150.00
Captains, derricks—under 30-ton hoist.....	140.00
Engineers, derricks—under 30-ton hoist.....	150.00
Captains, derricks—30-ton hoist and over.....	150.00
Engineers, derricks—30-ton hoist and over.....	160.00
Mates, derricks.....	100.00
Captains, hand winch lighters and covered barges.....	130.00

#### SEC. 4.—LIGHTERS AND BARGES

Captains, hand hoist barges—covered lighters.....	\$120.00
Captains, steam hoist—single drum.....	125.00
Captains, steam hoist—double drum.....	130.00
Engineers, steam hoist—single drum.....	135.00
Engineers, steam hoist—double drum.....	140.00

### Article XI.—Other Supervisory Forces

For the specific classes of employees listed herein and named or referred to in connection with a carrier affected by this decision, use the following schedules of decreases per hour:

Sec. 1. Train dispatchers.....	8 cents
Sec. 2. Yard masters and assistant yard masters.....	8 cents

### Article XII.—Miscellaneous Employees

For the miscellaneous classes of supervisors and employees not specifically listed under any article, named in connection with a carrier affected by this decision, use the following rule for making decreases:

Sec. 1. For miscellaneous classes of supervisors and employees in the hereinbefore named departments properly before the Labor Board and named in connection with a carrier affected by this decision, deduct an amount equal to the decreases made for the respective classes to which the miscellaneous classes herein referred to are analogous.

Sec. 2. The intent of this article is to extend this decision to certain miscellaneous classes of supervisors and employees submitted by the carriers, not specifically listed under any section in the classified schedules of decreases, and authorize decreases for such employees in the same amounts as provided in the schedules of decreases for analogous service.

### Article XIII.—General Application

The general regulations governing the application of this decision are as follows:

Sec. 1. The provisions of this decision will not apply in cases where amounts less than thirty dollars (\$30.00) per month are paid to individuals for special service which takes only a part of their time from outside employment or business.

Sec. 2. Decreases specified in this decision are to be deducted on the following basis:

(a) For employees paid by the hour, deduct the hourly decrease from the hourly rate.

(b) For employees paid by the day, deduct eight times the hourly decrease from the daily rate.

(c) For employees paid by the month, deduct two hundred four (204) times the hourly decrease from the monthly rate.

Sec. 3. The decreases in wages and the rates hereby established shall be incorporated in and become a part of existing agreements or schedules, or future negotiated agreements or schedules, and shall remain in effect until or unless changed in the manner provided by the Transportation Act, 1920.

Sec. 4. It is not intended in this decision to include or make decreases in wages for any officials of the carriers affected except that class designated in the Transportation Act, 1920, as "Subordinate Officials," and who are included in the Act as within the jurisdiction of this Board. The Act provides that the term "Subordinate Officials" includes officials of carriers of such class or rank as the Interstate Commerce Commission shall designate by regulation duly formulated and issued. Hence, whenever in this decision words are used, such as "foremen," "supervisors," etc., which may apply to officials, such words are intended to apply to only such classes of subordinate officials as are now or may hereafter be defined and classified by the Interstate Commerce Commission as "subordinate officials" within the meaning of the Transportation Act, 1920.

### Article XIV.—Interpretation of This Decision

Should a dispute arise between the management and the employees of any of the carriers as to the meaning or intent of this decision, which cannot be decided in conference between the parties directly interested, such dispute shall be referred to the United States Railroad Labor Board in the manner provided by the Transportation Act, 1920.

Sec. 1. All such disputes shall be presented in a concrete and joint signed statement setting forth:

- The article of this decision involved.
- The facts in the case.
- The position of the employees.
- The position of the management thereon.

Where supporting documentary evidence is used, it shall be attached to the application for decision in the form of exhibits.

Sec. 2. Such presentations shall be transmitted to the Secretary of the United States Railroad Labor Board, who shall place same before the Labor Board for final disposition.

Representatives of the various labor organizations involved in the wage cut order of the Labor Board will meet at Chicago on June 27 and 28, to decide on the employees' attitude regarding the lower wage scales. Union officers have consistently refused to comment on the decision and will probably have nothing to say until after this meeting.

A table showing the percentages of these decreases will be found on page 1278 of this issue.

### President Confers With I. C. C.

WASHINGTON, D. C.

PRESIDENT HARDING is again interesting himself in the railroad situation and incidentally is making some progress in his education on the subject. Following the cabinet meeting on Tuesday he told the newspaper men that the cabinet had discussed the evidence presented at the railroad hearings before the Senate Committee and indicated that the administration is not quite willing to accept the position taken by railroad executives against reductions in rates. He did not indicate, however, his own position as to how general a reduction would meet the wishes of the administration. Later he held a conference at luncheon with Senator Cummins and J. C. Davis, director general of railroads, and on Wednesday morning he caused some mild consternation by putting on his hat and walking down to the Interstate Commerce Commission offices unannounced. It is reported that he asked for the chief examiner but he was shown to Chairman Clark's office and Mr. Clark called in the other commissioners.

After the President's return to the White House, it was given out informally that he had called upon Chairman Clark and requested the opportunity to meet the commissioners. He said he had called very informally because he recognized that the commission is the rate-making agency of Congress and inasmuch as he had the right to communicate directly with Congress he wanted to communicate informally with the agency. He made inquiry regarding the progress being made in revising numerous rates where the horizontal increase is regarded as having put a burden on some commodities greater than the traffic would bear and he was gratified to learn that the commission has been working on revisions by the process of securing concerted action on the part of carriers and shippers. The specific thing he had in mind was the possibility of a modification of the fruit rates as to which there has been so much complaint from the West.

The conference with Senator Cummins and Director General Davis was for the purpose of considering the possibility of expediting the settlements between the railroads and the Railroad Administration arising from the period of federal control and of funding a greater part of the carriers' indebtedness to the government so as to release the amounts withheld by the Railroad Administration from the compensation guaranteed to the roads as offsets against the capital expenditures along lines suggested by President Rea of the Pennsylvania in his testimony before the Senate committee.

# Piece-Work, Bonus Systems and Higher Efficiency

## Educational Measures and Systematic Planning Productive of Economy and Stabilized Labor

By C. C. Cook

Maintenance Engineer, Baltimore & Ohio, Baltimore, Md.

THE EFFICIENCY of railroad labor in all departments has been retrograding since 1915. During 1916 and 1917 there was a progressive decline which became accentuated by reason of certain well known causes shortly after our entry into the war. During the war adequate transportation was secured only by extraordinary increases in the number of employees and by the superlative efforts of the more loyal officers and employees. Since the armistice, there has been a fluctuating condition with a tendency toward improvement during the past season, though a conservative estimate of the average condition of the country as a whole would give an efficiency not to exceed 70 per cent as compared to the pre-war period. There are few who would claim the efficiency of forces during 1916 to have been more than 80 per cent of a normal standard. The deduction, therefore, is that efficiency during last season was not in excess of 56 per cent of a normal standard. This conclusion, though startling, is no surprise to those who have analyzed the records.

Innumerable causes for such a condition are known to exist. Generally there has been a lowering of the morale due to the suspicion of intentions of both employers and organized labor. Further, the operation of the National Agreements and the abolition of piece-work and bonus systems have intensified the impression that the interests of the railroads and their employees are divergent.

That impression, it now appears, will be eliminated by the educational influences of the various governmental investigations now in progress and through the beneficial effects already appearing as a result of the operations of the Transportation Act. The co-operation between employer and employee so urgently advocated by all agencies interesting themselves in the transportation question is evidently essential to honest, efficient and economic operation of the railroads.

### The Fiasco of the Abolishment of Piece-Work

The morale of railroad forces was progressively broken down; it must be progressively rebuilt. Piece-work and bonus systems, though only in their infancy on railroads, have proven conclusively that both the company and the employee benefited by their application. Freight car repair forces on piece-work earned as much as 50 per cent to 70 per cent in excess of the day rates; forces engaged in steam locomotive repairs in various shops frequently averaged on piece-work earnings from 60 to 70 per cent in excess of day rate earnings. In track work a bonus system in effect on one road resulted in earnings by efficient gangs of 25 and 30 per cent in excess of the day rate.

These are facts not realized any more fully by all operating officers than they are by all workmen, but they are facts substantiated by every officer who had any extended experience with those systems. There is no hesitancy on the part of those officers in proclaiming the abolishment of the piece-work system to be the one definite act which resulted in the greatest of all decreases in the efficiency of any of the crafts. Piece-workers formerly inspired with the knowledge of commendable performance and pecuniary reward were shorn of their incentive. Many of them, realizing that no further additional compensation would be forthcoming as a

result of extra effort, relapsed into that group (always present to some extent), who do as little as they can for the wages they are paid.

Can any sound reason be advanced why piece-work and bonus systems, properly supervised, should not be restored? Is it not most desirable to have such restoration or original installation accomplished through open dealings which shall command the complete confidence of all employees? Why should not employee and employer, as individuals, or by gangs, by crafts, by divisions, by systems or within any practical geographical or political limitations mutually agree to do the thing which benefits them both as well as the public they serve?

These plans were never in such general use that any national restoration or establishment of them can take place. In fact, there are but few railroad systems that can make them effective for any one or more groups of workers on the system as a whole.

Their establishment and their restoration must necessarily have limited and humble beginnings, but it should not be delayed. Conceivably the employee is in a poor position to make the advances. These must come from progressive managements. The earlier those plans are made effective and the more general their application to all systems and to all classes of labor to which they may be applied, the sooner will the operations of the railroads in their present quasi-public functioning be a success.

### A Piece-Work Plan Applied to

#### Maintenance of Way Labor

It is the intent of this article merely to suggest for one group of workmen whose duties are seldom considered to be subject to standardization, a plan which, in principle, is but a modified piece-work plan, and to note briefly the benefits to be anticipated therefrom. I refer to the track forces and to the standard track work system which had been in successful operation for seven years to a limited, though growing extent, prior to government control of the roads.

Track work has long been thought to consist of such diverse operations as to prohibit development of any extended list of standards for measurements of performance. It is accordingly surprising to have it stated and substantiated by authoritative records that as much as 90 per cent of all track work on a typical railroad division has been measured by standard schedules. This is a greater percentage than has ever been reached by any piece-work plan in any other department of railroad work coming under my observation, and is but an indication of the possibilities of development.

Track laborers have been looked upon as the lowest class of railroad workmen and the most inefficient in performance. Their lot is considered to be the least attractive on the railroad. There is absolutely no reason for that opinion other than failure to measure all angles of the work. Certainly a large proportion of trackmen carry responsibilities of greater weight than those which constitute any part of the duties of most other groups of common labor in railroad work. Trackmen engaged in most operations require skill born of experience in order to do work economically. They have been inefficient but they have not shown the great loss in inefficiency

registered by others of the skilled crafts during the past few years. The work has been unattractive and recorded an excessive percentage of labor turn-over, but the attempts in the past to remedy that condition have oftentimes been lacking in vision and in many cases ludicrous in their repetition in the face of their futility.

During the past few years, the wages of trackmen have so advanced that they are now more nearly on a parity with other similar labor. Notwithstanding this fact, we are still confronted with their continued inefficiency and instability in their occupations.

Improved living quarters are advocated to render them more stable, but it is safe to say that the best quarters that were ever available for their comfort are now existent, partly as a by-product of the war effort to draw men into railroad service, yet, during the past season, the migration and the unproductiveness continued.

The problem of the trackman is no different from that of any other railroad worker. He will respond to enlightened and sympathetic measures for enlisting his co-operation in making his service to the railroad as much a service to the public as any other unit of the organization. Enlist that response intelligently. Establish a system of standard track work which carries with it increased pay for increased effort and there will develop for the company the productiveness which is now so essential and, within the workman, the consciousness of work well done which only will permanently stabilize a man in any position he may hold.

#### The Standard Track Work System

The standard track work system, referred to, had developed excellent printed methods and forms which were used by the engineers, supervisors and their assistants in the direction of their work. The rather universal progressive improvement in the efficiency of forces on every division where it was installed is evidence of its value.

The leading benefits obtained may be briefly outlined by a chronology of the development and operation of the system: Early in the season a program of work is prepared and outlined monthly upon a chart which indicates the location, amount, character and relative order of work to be done. The quantity of labor involved is computed from the standard schedules and the required force allotted.

For the current direction of the work the supervisor uses a work order or dispatch sheet which indicates to each of his foremen in detail the character, location and amount of work and standard time for its performance. Work orders are issued consecutively and preferably limited to a quantity of work which will enable constant live direction of gangs through their use. Carbon copies of all work orders are retained on visible file in the supervisor's office and are always available for ready inspection by any officer associated with the work. The advantage of this feature in avoidance of duplication and interference of orders to forces is obvious. When completed, the work order is returned by the foreman, properly dated and signed.

Foremen report their work upon daily time sheets, distributing the time of their gang in accordance with printed instructions so as to conform to the standard schedule descriptions of work.

A "Daily Record of Track Work Performance" form for each gang is maintained by the assistant supervisor. The actual time, reported daily for each operation by the foremen and the standard time therefor, recorded by the assistant supervisor, is used in computing the per cent efficiency of the day. This form enables the supervisor, at any time to compare the performance of one gang with another, the performance of the same gang one day with another or the performance of various gangs on identical operations with each other. There is apparently the distinctively advantageous

position in which the supervisor is placed with such current data always on hand.

A form "Monthly Record of Track Work Efficiency" which summarizes the information on the daily record is compiled at the end of each month and there is then data available for comparison of the gangs or of sub-divisions or divisions as a whole. It is used particularly in computing the average efficiency for each gang, upon which the bonus payments are based. These are worked out according to a "bonus table" which guarantees the established hourly rate and pays a bonus according to an increasing ratio of the excess above 67 per cent efficiency. For instance, at 100 per cent efficiency there is a bonus of 20 per cent of the wages at hourly rate for actual time worked; above 100 per cent the bonus increases 1 per cent for each 1 per cent increase in efficiency. It should be understood that the basic 67 per cent efficiency represents the normal performance of an average competent group of workmen as developed by time studies of a number of performances prior to the establishment of a schedule. An efficiency of 100 per cent is the standard schedule and represents the accomplishment of workmen who are performing according to standard practice and with a rapidity and continuity of movement within their power but such as not to impair their physical well-being.

After the system had been in operation two years it was common for sub-divisions to show 80 per cent to 90 per cent efficiency, and not uncommon for the more efficient gangs frequently to exceed 100 per cent. It is evident that the corresponding increased pay made a most striking appeal to the employees affected. It acted as a constant reminder of the interest of the management in the welfare of the employees and could not fail to raise the morale, not alone of those who earned their bonus directly but also of their co-workers and associates.

There were numerous other features developed by this system such as a "Track and Roadbed Feature" form, and a "Track Condition" sheet which were prepared or re-stated monthly for the purpose of an equitable distribution of force; also a permanent system of educating the foremen in the preparation of accurate reports, and other beneficial developments which came as by-products of this methodical conduct of the operations of the department. It is sufficient to state that the fundamentals essential to co-operation of management and employee, to methodical conduct of a large and ever expanding organization, and to the consummation of 100 per cent efficiency and economy in maintenance of track are embodied therein.

Building a New Subway Through the Streets of Berlin

# Railways in War Ridden Regions Greatly Improved

## Details of Improvement of Lille Freight Terminal and Yards, Shops and Station at Dunkirk

By Oliver F. Allen

Formerly Major of Engineers, American Expeditionary Forces

BECAUSE of the great property damage in many French and Belgian cities during the war, the railways, in embarking upon their reconstruction program, were enabled to secure additional land and provide increased facilities which otherwise would have necessitated expenditures so high as to be practically prohibitive. One undertaking

trains to depart in any direction. At the lower, or southern, end of this yard is a gridiron of 36 tracks for the making up of southbound trains. Between this gridiron and the main line from Sequedin to Lomme is another of 24 tracks for making up northbound and local trains, with six more available for various emergency demands and for freight transfers between cars.

All tracks in these gridirons have a minimum working length of about 2,000 ft. Engine sheds of modern design, replacing old roundhouses, and new, modern and extensive locomotive repair shops are included, as shown in the map. A large car repair shop is also provided for and there is a wye for turning locomotives. The loops and crossovers necessary for free circulation through these yards include some special lines to be used exclusively for locomotives. Intersections are brought through at different levels, bridges being

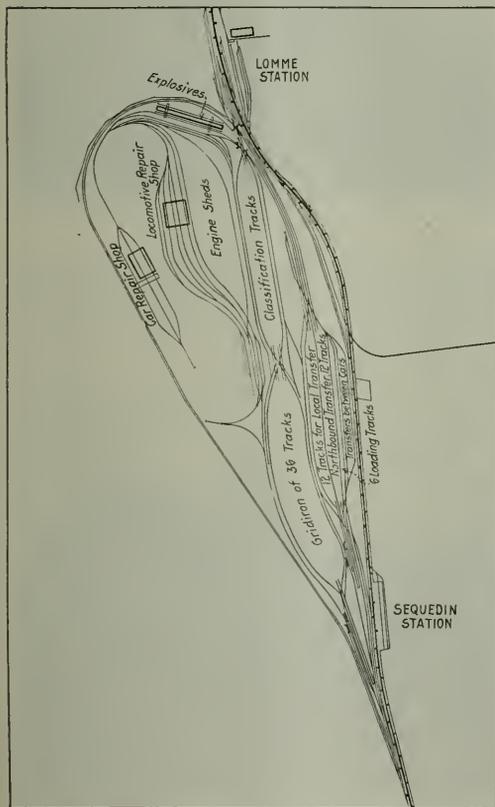

Fig. 1—Classification Yards and Repair Shops at Lille-la-Deliverance, a Part of the Improvement Program at Lille

which is typical of many thus made possible is the construction of a modern freight terminal at Lille-la-Deliverance, forming a part of the general improvement of the Lille loop which was described in the *Railway Age* of April 29 (page 1020).

The classification yard installed at this point is of the gravity type and loops are provided so that a train approaching the yard from any direction will enter the elevated end of the yard. At the other end tracks are provided to allow

Fig. 2—A Typical Military Hut Used as a Passenger Station During and Immediately After the War

used to avoid grade crossings and to assure the greatest safety and ease of circulation. Work on the Lille project was started in the spring of 1920, and is now well under way.

Just as the Lille improvements are typical of the interior cities, the betterments at Dunkirk are typical of what is being done at the ports. The capacity with the pre-war facilities of the incoming lines from Lille to the south, the Belgian industrial centers to the east, and Calais and Boulogne to the west, was only about 20,000 average French freight cars per day; that is, about 20,000 tons of freight. The development of the harbor facilities, largely as a military necessity during the war, by the French and British makes it possible to handle 40,000 tons of freight per day, or about twice the capacity of the railroad facilities. Freight traffic has of late grown much faster at Dunkirk than at the other channel ports—Calais, Boulogne, Graveliers and Le Trepont. In order to take care of this increased traffic a comprehensive terminal system, shown in Fig. 3, is being built. The old transfer gridiron, near Pier 5, while retained for use in connection with the older piers, will be supplemented at its western end by a large gravity classification yard and the

necessary additional tracks for trains entering and leaving the yard.

An outbound yard is being built, as shown in the map, just west of the classification yard. This yard consists of 30 tracks for both transfer and assembling purposes and two groups of eight tracks each for the storage of completed trains awaiting dispatching orders. Parallel to this yard is a gridiron of 46 tracks for incoming trains with the necessary connections to enable freight cars to be classified, grouped and forwarded to the proper piers. The tracks in both of these gridirons have a minimum working length of about 2,300 ft. Adjacent to these yards there will be a modern car repair shop. The locomotive repair and storage facilities at Couderkerque, southeast of Dunkirk on the Lille line, were inadequate. It was decided, therefore, that the shops

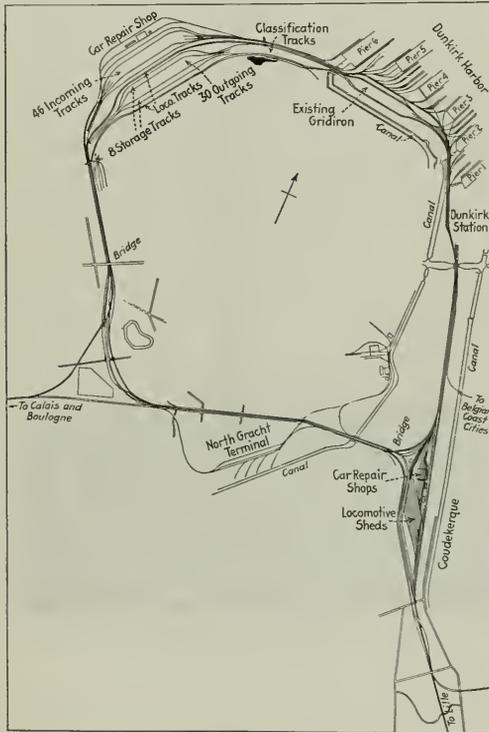

Fig. 3—Improvements at Dunkirk, Showing Enlarged Freight Facilities to Take Care of Increased Harbor Capacity

remaining after the war should be entirely abandoned and replaced by a new large locomotive repair and storage plant. There will be provided here a group of 12 parallel sheds, each with three tracks long enough to take care of three locomotives so that the total covered area will have a capacity of 108 locomotives. To avoid the necessity of installing a turntable, wye connections will be provided. There will also be adequate shops, store houses, etc. An extensive military terminal adjacent to the Bourbourg canal at North Gracht with a double track line, known as the Yser connection, running south between the lines to Lille and Calais, has been incorporated into the lines of the Northern Railway and has become an integral part of the system.

The belt around Dunkirk will consist of seven tracks from

the large transfer yards adjacent to the piers around to the Lille lines at Couderkerque. Four of these are primarily for freight traffic—two each for the Calais and Lille lines. The other three are reserved for locomotives—two for the incoming and one for the outgoing. There will be adequate connections on the eastern side of the loop for the Dunkirk passenger station and passenger service to the docks, together with provision for freight traffic on the line toward Belgium. Here, as at Lille and other places, grade crossings are

Fig. 4—Valenciennes Station Before the War

eliminated where tracks intersect and bridges are employed to facilitate quick and easy movement. This Dunkirk improvement will cost about \$20,000,000 (francs to dollars at par). The railroad company started this work early in 1920, and the project is now well advanced.

A preceding article in this series dealt with the reconstruction of bridges and viaducts and referred to the final phase of railway rehabilitation as including not only the

Fig. 5—Valenciennes Station After the German Evacuation

extension of terminal facilities described above, but the restoration of passenger stations and the return to the more luxurious features of travel. The Northern Railway was very proud of its pre-war passenger stations, that at Valenciennes, Fig. 4, being typical. In the preceding article the condition in which the war left the bridges and canals was shown as indicating the problems confronting the engineers in charge of the reconstruction. The illustrations, Figs. 5-6, of the Valenciennes station are typical of the condition in

which the railway company found its stations following the enemy's evacuation, and Fig. 2 shows a temporary railway station of which hundreds were built and many are still in use. Fig. 7 is a typical view of the condition of the roadbed and adjacent buildings as the Boches left them.

It has been shown how the railways have taken advantage of the general destruction to relocate yards and stations. The

Fig. 6—Interior of Valenciennes Station After the Germans Evacuated

same condition is also affording an opportunity to build larger and better passenger stations. In some places, where eminent architects have made comprehensive plans for the rebuilding of entire communities with designs harmoniously blended, the new stations will fit into the general landscape much more artistically than the old ones did. Where towns were de-

Fig. 7—Laon Station on the Soissons-Hirson Line—Typical Conditions Following German Evacuation

stroyed to the extent of Estaires, Lens or many others which might be mentioned, both freight and passenger stations can be relocated to suit the existing and anticipated demands. Inasmuch as the restoration of damaged stations and the building of new permanent structures is one of the last phases of railway reconstruction, photographs of the accomplishments in this direction are not now available.

THE CHICAGO, MILWAUKEE & ST. PAUL is converting a number of sleeping and parlor cars into open top observation cars to be operated in the Rocky and Cascade mountains.

## N. E. L. A. Electrification Committee Denounces Government Operation

GOVERNMENT OPERATION of railroads was spoken of as a "dread palsy" and recommendations for the future were made in the report of the Committee on Electrification of Steam Railroads at the annual convention of the National Electric Light Association in Chicago on June 3. The first part of the report was given over to a history of the development of electric traction for railroad trains and the summary consisted of recommendations for the future affecting both the railroads and the people who are served by them. The following is the summary of the report:

"The transportation problem is of vital interest to all of the people, and it is important that it should have the loyal support and interest of all classes of citizens and their active co-operation, so as to obtain the most rapid transportation of freight and passengers in the most efficient manner and at the least cost. This can be accomplished by the constructive support of the legislative bodies and the investing public and by the support of the engineering talent of the country. The time is here when the railroads need the united support of all the people, so as to make use of the improved methods of utilizing the advances in the sciences and the arts, in order to give the people the best transportation facilities. This can only be accomplished, first, by legislation which will remove the objectionable restrictions in the management and operation of the railroads; and secondly by the financial support of investors, so that additional capital will be attracted to the railroads, to enable them to add to their facilities such plant and equipment as is necessary to take care of the increasing traffic and to handle this traffic in the most economical way.

"We believe that at this time much good can be accomplished by studies and investigations conducted by engineers of the railroad management who are well qualified by their training and experience to make these studies. They should have the active co-operation and assistance of the engineers representing other utilities and the large industries, and of consulting engineers who are specialists on this subject, so as to bring to bear upon this question the best minds available, in order to effect improvements in the terminal facilities, rights-of-way, motive power, and in the traffic of the railroads. The power companies of the country stand ready to co-operate in these studies, and to be prepared to offer electrical energy at low cost in most cases where it may be utilized to the railroads' advantage.

"Although the railroad situation is one of interest, and the railroads have had their large part in the development of the American nation, the situation in regard to their future is one of compelling importance. It is unthinkable that American transportation should be subjected to the dread palsy of government operation. We have just about reached the point (disregarding the present recession in business as temporary) where possible restriction to traffic movement in its limitations of industry, has become a matter of the greatest concern to large sections of the United States. There is probably no district or community which is willing to admit that its growth in industry should halt or be limited. For the country as a whole, the growth of industry and population has called for an increase in traffic movement of 100 per cent during each interval of approximately 12 years. While it is not certain that the same rate of growth will be followed during the next 12 years, the situation of the future is sufficiently grave to prove the necessity for provision of transportation facilities necessary to care for the vast increase in business.

While it is not our purpose to point the way out, there must, somehow, some way be developed to care for this situation. Undoubtedly, great good could come from education.

The credit of the railroads must be established to provide the large amounts of capital necessary to develop the transportation machine. To that end, all practices, criticisms, legislative action, both national and local, which operate to affect the credit of the railroads, should, through education of the critics, be eliminated. In its stead, should take place discussion of the burdens of expense imposed upon the railroads by class legislation, unproductive improvements, unreasonable demands of one class of labor to profit at the expense of all other classes, along with the obvious education of the shipping and traveling public as to more economical practices in the movement of traffic and other subjects which will prove of value.

The net result of these would be a sufficient margin between reasonable rates and cost of operation to secure a return which would attract additional capital necessary for the expansion of the railroad machine. There is no stronger force under our form of government than public opinion, and American public opinion in the final analysis has been proven to be reasonable. With the support of public opinion, therefore, upon such a program, the timidity of the investing public as to railroad securities would be removed and there should be available the necessary capital at reasonable rates of interest.

The National Electric Light Association, comprising in its elements a large and far-reaching body of intelligent men, should, prompted by their own interest in the expansion of all industry, accept and undertake as a real responsibility, the intelligent discussion and understanding of the needs of the railroads. Even if this view, which is a broad one, should be limited to self-interest, this should be prompted by the unquestionable fact that for the greater expansion of our railroad service, railroad electrification will, as time goes on, come increasingly into use for regular main line passenger and freight service.

## Freight Car Loading

WASHINGTON, D. C.

**F**REIGHT CAR LOADING continued to increase during the week ending May 21, according to the weekly report of the Car Service Division of the American Railway Association. The total for the week was 768,330, an increase of 18,000 in a week. This compares with 862,074 in 1920 and 777,324 in 1919. There was an increase as compared with last year in the loading of grain and grain products, but a decrease in the loading of other commodities. There was an increase as compared with last year in the loading in the Pochontas district.

The freight car surplus continued to decrease during the week ending May 23 when the average number of surplus freight cars was 422,823. This represents a decrease as compared with the previous week of nearly 27,000. Of the total, 176,442 were coal cars, as compared with 202,348 the week before, and 168,272 were box cars, as compared with 170,595 the week before.

The percentage of bad order cars continued to increase. On May 15 it was 14.2 per cent of the total, or 324,969 cars. Of the total, 4.1 per cent required light repairs and 10.1 per cent required heavy repairs.

### Intensive Preparation Urged for Grain Handling

The Car Service Division has issued a bulletin to the railroads stating that intensive preparation is necessary to meet the prospective demands for cars of a grade suitable for grain, flour, cement and other high class commodities. The bulletin points out that on March 1 there were 2,500,000 bushels of grain on farms, an increase over each of the two preceding years of 50 per cent, and including 26 per cent more wheat, 50 per cent more corn and 65 per cent more

oats than in 1920. The condition of winter wheat on May 1 indicated an increased production of 15,524,000 bushels, or 9 per cent. While later reports indicate a somewhat lower yield, the prospects are declared to be good for a yield in excess of 1920 and in excess of the five-year average. It is also stated that preliminary unofficial estimates indicate the spring acreage of all grains to be equal if not greater than in 1920. The box car situation on 20 of the principal grain loading roads as of May 15 shows 92 per cent of total cars on line to ownership and 71.9 per cent of home cars on line, but 13.4 per cent of the cars were in bad order. Particular attention is directed to the percentage of cars on line. Although this is 4.4 per cent better than last year, it is stated that the heavy return of home cars in unserviceable condition has so greatly increased the bad order cars that these roads actually have available for surplus only 78.6 per cent of their ownership as compared with 82 per cent a year ago, a reduction of 3.4 per cent, representing approximately 15,000 serviceable cars. The beginning of the wheat harvest in North Texas and Oklahoma begins very shortly with indications pointing to the immediate marketing of a larger proportion of the crop than usual.

The Car Service Division urges the importance of:

1. Closer supervision over loading to insure proper selection of cars, particularly a more adequate observance of Car Service Rule 1. The latter applies with special force to the grain loading roads which must build up and conserve their supply of home cars.
2. Heaviest practicable car repair program, specializing on producing grain-fit cars.
3. Withdrawal from service and storage in grain loading territory of cars suitable for grain loading.
4. Prompt return to owning roads, loaded if possible or empty if necessary, of cars belonging to grain loading roads.
5. As far as practicable, loading grain-fit cars into grain territory, and confining the loading of rough freight for other territories to non-fit cars.

The bulletin also says:

"With the present heavy percentage of home cars on line (highest for 13 years) and the light traffic demands, each road should take such local measures as may be necessary to provide for prospective loading requirements. It should be possible under such conditions to protect the situation with minimum assistance from the Car Service Division. It will be our purpose to interfere as little as possible with the normal functioning of the Car Service Rules and to encourage the roads to work out their local exchange of equipment problems in accordance with existing rules and agreements."

Why Upper Silesia Voted to Remain German—Germans Leaving Berlin to Arrive in Silesia in Time for the Plebiscite

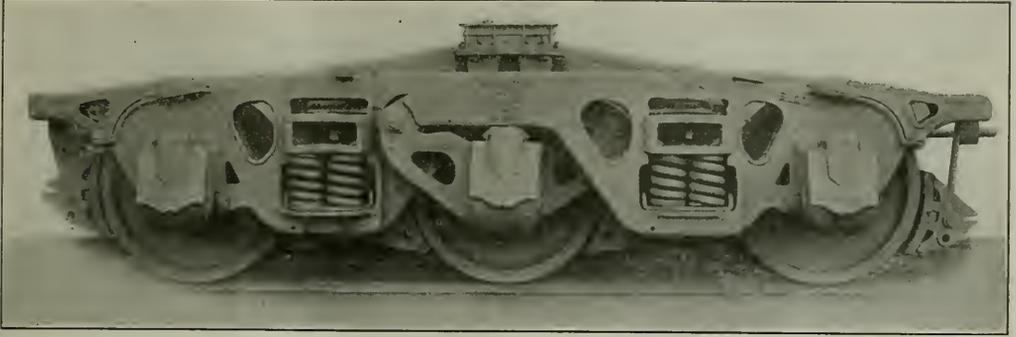

Fig. 1—A Side View of the Buckeye Six-Wheel Truck

## New Designs of Buckeye Six-Wheel Trucks

### Advantages of Four-Wheel Trucks Retained—Construction Facilitates Inspection and Maintenance

**I**N THE DESCRIPTION of the Virginian 120-ton coal cars published in the issue of February 18, brief reference was made to the six-wheel truck manufactured by the Buckeye Steel Castings Company, Columbus, Ohio. The new design which was used on 500 of these cars differs in several respects from the earlier form of this truck as described in the *Railway Age Gazette* of August 31, 1917.

These trucks are of much interest, not only as a new development in high capacity freight truck design, but especially because they are designed to retain practically all of the fundamental advantages which have contributed to the recognized success of the present type of A. R. A. four-wheel cast steel truck.

Generally speaking, this latter type of truck owes its popularity principally to the following: (1) Perfect equalization of load regardless of condition of springs or tracks. (2) Accessibility of parts for maintenance and inspection. (3) Flexibility and short wheel base, facilitating operation over uneven tracks, inclines and sharp curves. (4) Brake suspension arranged from parts independent of spring travel. (5) Safety of the detail structures by avoiding having any part carrying load subjected to direct tension.

#### Method of Equalization

The equalization of the load in the Buckeye six-wheel truck is accomplished by the use of the equalizer casting which engages the center journal as shown in Fig. 1. The side frame castings are so designed that two-thirds of each spring load is supported by the adjacent outside axle and one-third by one arm of the equalizer. Each journal of a given side of a truck, therefore, receives one-third of the total spring load on that side and furthermore the equalizer precludes the possibility of the springs receiving unequal loads on the same side of the truck. This feature affords extreme flexibility in the side members.

#### Maintenance and Inspection

In former designs of six-wheel trucks replacement of axles, particularly the middle axles, has been accomplished only by the use of special facilities such as drop pits, or overhead cranes. Replacement of bolsters required cutting away rivets and complete dismantling of the truck.

Where large numbers of cars with six-wheel trucks must be maintained in constant service, facilitating the routine

work of upkeep is of great importance. The Buckeye truck in its present form is a remarkable advance in this respect. All the parts are of such size and are so disposed with relation to each other that light repairs such as changing bolsters, axles and springs are readily accomplished even in places where no special facilities are at hand.

The simple method employed in the removal of the middle pair of wheels is deserving of special mention. The two consecutive steps are shown in Fig. 2. After removing the bolts, *A*, Fig. 2, from the ends of the equalizer arm and the brake pins, *B*, the two longitudinal bolsters are disengaged from one transverse bolster by tilting them upward so that the truck may be separated as in Fig. 3. Then by placing jacks under the spring seats at *D*, Fig. 3, and removing the equalizer bolts at *F*, the center axle is relieved entirely of its load and can be rolled clear as shown in the illustration.

To facilitate replacement of the transverse bolster, the bolster opening in the frame is designed similar to that of a four-wheel truck frame. The spring seat casting, which carries the brake brackets for the inside brake beams, is separate from the frame. Hence, by jacking up the longitudinal bolsters and removing springs and spring seat castings, the transverse bolster may be replaced in a manner similar to that used with four-wheel trucks.

As will be noted from the illustrations, the use of a separately constructed spring seat and brake hanger casting introduces another advantage, namely, that it permits of making all side frame castings identically alike. This is a distinct advantage, both in the manufacture of the trucks and in the upkeep of repair parts stocks. As an aid to inspection, it is to be observed that all springs in the Buckeye truck are visible and arranged in groups of four in the bolster opening of the side frames as in four-wheel trucks.

Comparing the truck construction shown in the drawing with that shown in the photographs, it will be noted that the former illustrates the use of A. R. A. type journal boxes, also a different construction of end brake hanger. Trucks with these modifications are used only experimentally, the Virginian standard design in all other respects being as shown in the photographs.

By reason of the side frame and bolster construction, the Buckeye truck retains all of the flexibility of the four-wheel truck. Besides providing vertical flexibility, the Buckeye

type of equalizer makes possible the extremely short wheel base of 8 ft. 2 in. Due to the necessity of making the brake parts interchangeable with those of another type of truck of a longer wheel base, the wheel base on the Buckeye trucks

The design conditions specified that the cars should operate successfully over tracks having a horizontal curvature of 20 deg. and a vertical curvature of 350 ft. radius. These conditions have been met with a safe margin as evidenced by

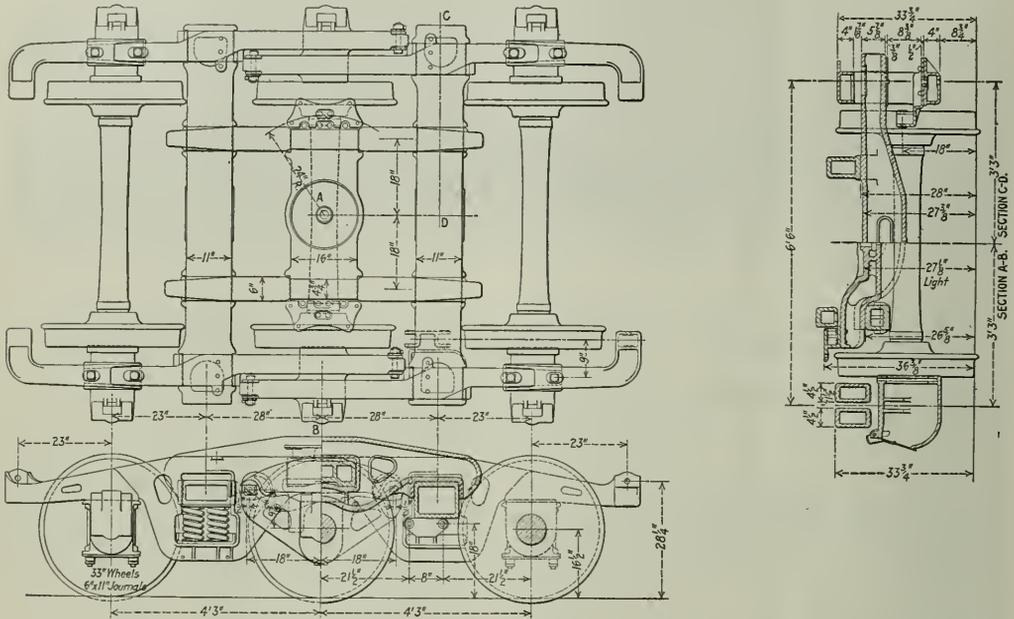

Fig. 2—Assembly of the Buckeye Six-Wheel Truck

on the Virginian cars was increased four inches and is therefore 8 ft. 6 in. as shown in the drawing. The clasp brake rigging used in the Buckeye trucks is suspended entirely from parts independent of the spring travel.

A notable accomplishment in the Buckeye truck design is the avoidance of load carrying members subjected solely to

experimental tests where cars negotiated curves of more than 30 deg. curvature.

The general specifications of the trucks are as follows:

- Wheel base ..... 8 ft. 6 in.
- Center plate height (light car body).....27 3/8 in.
- Side bearing height (light car body)....42 11/16 in.
- Center to center of side bearings.....48 in.

Fig. 3—Center Wheels Ready for Removal

tension. In the Buckeye trucks, the parts that carry the loads are so designed and assembled with relation to each other that they are not subjected to direct tension stresses: i. e., the parts perform the function of beams rather than that of hangers. From the foregoing it will be noted that practically all of the important fundamentals of the four-wheel truck have been observed in this six-wheel truck design.

The Buckeye trucks as used on the Virginian were designed for use with car bodies having either 12 7/8 in. or 18 1/2 in. center sill spacing and with truck centers of 36 ft. 1 3/4 in.

- Axles—A. R. A. .... 6 in. by 11 in.
- Wheels ..... Rolled steel
- Brake equipment ..... Clasp brake with vertical levers
- Springs ..... Virginian No. 28 (Same as A. R. A. Class D except 1 5/16 and 1 1/16 in. bars)
- Free height of springs including caps.... 8 3/4 in.
- Solid height of springs..... 7 in.
- Side bearings ..... Stueckl
- Brasses and wedges ..... A. R. A. standard.

The total weight of the trucks per car is 37,000 lb., distributed as follows: cast steel parts, 14,500 lb.; brake material, 3,800 lb.; springs, 1,100 lb.; wheels and axles, 15,200 lb., and other material, 2,400 lb.

# The Railway Fuel Association Convention

## Subjects Include Fuel Preparation and Distribution, Fuel Organization, and Enginemen's Records

**F**OLLOWING the first day's sessions of the thirteenth annual convention of the International Railway Fuel Association, a report of which appeared on page 1233 of last week's issue, other reports and papers were presented on a wide range of subjects pertaining to the production, purchase, distribution and methods of supervising the use of railway fuel. Abstracts of the more important of these papers follow.

### Preparation and Distribution of Fuel

P. E. Bast

Fuel Engineer, Delaware & Hudson

The railroads of this country use annually about 150,000,000 tons of coal. It was not at all improbable that five per cent more ash was included in railroad coal shipped during 1920 than in normal times. If this is true, 7,500,000 tons of additional ash was handled and hauled. But this tells only a part of the story. It has been authoritatively stated that there is a decrease of about  $1\frac{1}{2}$  per cent in efficiency for each additional one per cent ash content in the coal. The addition of the 5 per cent of ash means a reduction in efficiency of the good coal of about  $7\frac{1}{2}$  per cent, which together with the 5 per cent of ash makes a total reduction in efficiency  $12\frac{1}{2}$  per cent. Therefore, if five per cent more ash was included in the coal used by the railroads in 1920 than during normal times, it would be equivalent to 18,750,000 tons of coal with a money value of \$75,000,000. Each one per cent reduction in extraneous ash would result in a saving of \$15,000,000. To this must be added the waste in car mileage, the additional handling of ashes, delays to traffic, etc., the total of which is no inconsiderable amount. It would, therefore, appear that the preparation of railroad coal should command the careful attention of every railroad operating official.

It would seem reasonable that any railroad consuming an annual minimum of say 100,000 tons could well afford a mine inspection service, the expense of which would be negligible compared with the results possible to obtain.

Preparation of coal in the mine is the very foundation of fuel economy. The operator should feel his sense of responsibility in living up to the true intent of the railroad's contract or specifications, impressing upon his miners and other employees the necessity for clean coal, the railroads co-operating to the fullest extent through their mine inspectors.

The extraneous or free impurities in coal usually consist of slate, shale, mud seams, mother coal, sulphur balls or lenses, sand rock from the mine roof and clay from the mine floor. Sulphur, in the form of pyrites, shale, mother coal and thin slate partings are the most difficult to eliminate because they are more or less broken and intermingled with the coal when it is shot down, but with special care on the part of the miner during shooting and loading in the mine cars, these impurities can be thrown out and consigned to the dump pile. There should be no excuse for the loading of roof slate, sand rock, clay from the mine floor, thick slate band, sulphur balls and lenses, inasmuch as any one of these last mentioned impurities can be detected in the mine and on railroad cars during loading.

Some coal seams have a distinct strata of bony coal. Precaution should be taken to eliminate this bony structure to a minimum. It could be used at mine power plants or disposed of locally.

Preparation of coal has so many varying angles that it

would be difficult and unwise to set down any ironclad rules, yet it is believed that if the following few suggestions were carried out it would result in reducing the ash content of railroad fuel and would relieve the railroads of the burden and expense of transporting superfluous waste.

1. Periodical inspection of mine working places by proper mine authorities to see that coal is mined and prepared according to instructions.
2. Check system to determine the responsibility for loading dirty coal; discipline or docking, if law and agreements permit.
3. Shooting down coal so as to keep the percentage of slack down to a minimum.
4. Installation of picking tables where the nature of the coal requires extra precaution in preparation.
5. Proper and adequate drainage facilities.
6. Inspectors on railroad cars during loading to throw out removable impurities.

Consideration should be given co-operation of the railroad mine inspector and operator so that coals normally classified as undesirable can be made to meet the requirements of the railroads. This applies where coals least commercially salable are used by the coal bearing roads from a traffic development standpoint.

Expensive controversies and rejection of coal could be reduced to a minimum if the railroad would first obtain a complete inspection of the mines, showing all details of their methods of working, as well as of the coals offered before purchasing or making contracts.

### DISTRIBUTION

Distribution of coal is another important step in fuel economy. Like preparation, it is subject to many varying conditions such as irregularity of mine shipments, weather and traffic conditions, shortage of labor, power and car equipment, etc.

During the past three years distribution has been more or less demoralized due to motive power and car shortages, traffic congestion, labor disturbances, etc., and until these conditions have become stabilized for a reasonable period distribution will continue to be subject to necessity.

It would be rather difficult to estimate or even approximate the annual loss to the railroads on account of poor distribution, such, for instance, as the placing of improper equipment under load at coaling platforms, stations, chutes and storage systems; overstocking, causing extra handling and per diem charges on foreign cars; the loss from a shortage of coal which necessitates holding back revenue tonnage in order to rush coal to some particular point, also in many cases, much to the displeasure of the shipper and inconvenience of the consumer, making it necessary to confiscate commercial shipments, which must be paid for at a high price; and last but not least, cross-hauling.

There seems to be a difference of opinion among railway officers as to the department to handle the distribution. This is evident from a survey of thirty railroads covering practically every section of the country. The distribution by departments was as follows: transportation, 16; fuel, 9; mechanical, 2; purchasing, 2; by committees, composed of representatives of different departments, 1.

When we consider the variations in the different coals used by the railroads it can readily be seen how important it is that the coal distributor be familiar with the product that he is distributing. However, on many railroads this is not the case, and the lack of this knowledge has resulted in

the slowing up of transportation by the distribution of coals to certain districts where the crews were not familiar with them or the power conditioned for their use.

Every railroad should have a distribution schedule based on the location of mines and characteristics of the coal so far as grade and quality are concerned. Since contract coal for any particular railroad using a large tonnage is bound to be of varying qualities, it would seem preferable to select the most desirable coal contracted for as a standard, the other coals then being compared and computed in terms of the standard. Distribution would then be simplified, so far as supplying to each district and class of service a uniform grade and quality of coal, which is a very important item from a standpoint of fuel conservation.

Distribution in a general sense is not a one department problem, it requires the closest co-operation of the several departments and with this in view the following suggestions are made regarding the distribution of supply coal:

1. A consumption schedule for all points, frequently revised and kept up to date to meet the demands of traffic, etc.
2. A distribution schedule showing coals contracted for, grading of coals to a fixed standard, showing grades and qualities most suitable for each district and class of service.
3. A schedule showing coal consigned from mines to be shipped preferably to point of consumption with a view of eliminating extra handling and cross-haulage.
4. Daily telegraphic report showing coal on hand under load at each coaling station.
5. Daily telegraphic report covering shipments of coal and receipts at junction points, in order to keep the loads up to a reasonable degree of safety and down to a minimum with reference to transportation needs.
6. Storage of coal during summer months, relieving the road from transporting company coal in the winter months during the season of peak load. This has special reference to railroads located beyond a reasonable distance from coal fields.
7. From a purchasing standpoint, the most economical grade and quality of coal for each district with consideration to price, freight rates, mine locations, etc.

### Discussion

Most of the discussion dealt with the problem of preparation of coal at the mine, C. F. Richardson (West Kentucky Coal Company) very frankly discussed the usual relations between the railroad and the mine and stated emphatically that in order to get clean coal the railroads must be ready to pay a price that will make it possible for the operator to pay the men required on the picking table. He suggested that the railroad purchasing agent might well pay a premium for 100 per cent coal, rather than to buy 70 per cent coal and 30 per cent rock, on a price basis only. He also stated that the demand for tonnage by the railroad is not an incentive for the operator to clean his coal properly, since thoroughly cleaned coal reduces the tonnage output of the mine.

Eugene McAuliffe pointed out that while the B.t.u. basis of purchasing coal is probably the best available, it is not an accurate standard, because variations in ash produce a disproportionate effect on the heating value of the coal beyond the direct effect on the B.t.u. content.

The importance of having a coal distributor was pointed out by W. L. Robertson (B. & O.), in order to avoid the necessity for confiscating commercial coal for railroad use to meet immediate requirements of some stations. Such coal frequently costs as high as \$16 a ton.

### Standards of Fuel Economy

D. C. Buell, director, Railway Educational Bureau, presented a paper on this subject, in which he gave a comprehensive outline of the steps which must be taken before ideal results can be secured in any campaign for the economical use of railway fuel.

Starting with the executive, Mr. Buell took up the essential requirements of a fuel conservation policy, and outlined the

matters for executive attention in the purchasing, operating and mechanical departments. The conditions which require the attention of the supervisory forces were then enumerated for all departments concerned, including fuel inspection, operating requirements, the important points for attention in the shops and roundhouse and the points requiring special attention by the road foreman.

In all, the paper enumerated 78 points, of which he said in closing:

"There is hardly an item in this entire list which has not been a subject for a paper or for discussion at some of the conventions of the International Railway Fuel Association. Those who have been members of this Association for a number of years have their file copies of proceedings which can be referred to in order to check the methods presented to this Association by practical fuel men, which have proven successful in dealing with these numerous problems.

"Those who have only recently become members of the Association can obtain back copies of the proceedings of the last few years from the secretary for a nominal sum.

"The problem of fuel economy is just as much a science as any other of the engineering problems, and it is only through a careful study and analysis of individual problems that an officer whose duties involve a responsibility for fuel economy may hope to obtain satisfactory results. Therefore it is urged upon the members of this Association that our proceedings be used as a scientific or engineering reference library to be referred to and studied, in order that they may become more proficient in this branch or specialty of our great American transportation problem."

### Discussion

Harrington Emmerson briefly sketched the history of the development of the use of steam power from the first crude steam engine when there was no quantitative measure of the energy in the coal at one end or of the work performed at the other, through the steps that finally led to the present knowledge of steam engineering which makes possible a definite determination of the efficiency of the application of fuel to the production of work. He concluded that what was necessary in the efforts of the railways in fuel conservation were similarly definite standards of fuel consumption in relation to ton-mile output so that the success of fuel economy programs could be definitely measured.

In closing the discussion Mr. Buell stated that in developing and correlating the various factors in a complete plan for fuel economy, he had followed the principle of dependent sequences developed by Harrington Emmerson in his paper presented before the association at the 1915 convention. Mr. Buell also acknowledged the importance of definite standards under present conditions, since the public has a right to inquire as to the efficiency with which the railroads are managed and operated and the railroads cannot afford to be without some such standards, the absence of which will indicate to the public a lack of knowledge of the fundamentals of their own business.

### Fuel Department Organization

By L. G. Plant

Associate Editor, Railway Review

Fuel economy is eminently a problem of organization. The acquisition of new locomotives, the erection of new terminals and shops, the purchase of better coal, do not alone constitute fuel economy. This is largely dependent upon consistent and persistent individual effort organized in accord with a well defined plan of action.

If a locomotive is to pull tonnage each part must be designed for a purpose and assembled in its proper place. Yet, when we assemble an organization to supervise the

operation of this locomotive, each man's objective is often obscured and his relation to superior officers and subordinate employees sometimes confused.

On how many roads has the organization of fuel economy been carefully planned to accomplish a well defined aim? More often this organization represents merely a man added here and there to fill a very obvious void.

THE PRESENT STATUS OF ORGANIZATION FOR FUEL ECONOMY

This critical appraisal of fuel department activities is suggested by the result of inquiry into the status of fuel organization on 50 railways, representing 183,884 miles of line and 42,854 locomotives owned. This does not include all of the largest railways nor many small roads. It is

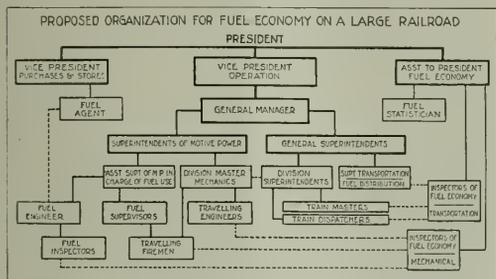

Fig. 1

confined to Class I railways owning an average of more than 800 locomotives each, but does not, for instance, include either the Pennsylvania or the Baltimore & Ohio railroads. It may be said to be fairly representative of the situation throughout the country.

On 68 per cent of these roads we find no semblance of an organization devoted wholly to the supervision of fuel use. On 68 per cent of these railways the mechanical department is held responsible.

What are the most salient points suggested by this analysis of the situation on 50 railways? First, the totally inadequate provision for enforcing fuel economy on many railways must indicate either lack of appreciation for the full importance of fuel economy or failure to comprehend the real nature and scope of the fuel problem. Even where supervision plainly show that there is no common understanding of what does and what does not constitute a real fuel department. The following tabulation demonstrates a wide divergence of opinion as to what is adequate supervision:

Number of railroads in group	Number of Locomotives in active service to:			
	One traveling engineer	One traveling fireman	One fuel supervisor	One fuel inspector
20	64	114	none	164
14	58	90	150	236
7	64	99	639	258
4	83	110	161	674
5	78	88	114	241

But with respect to those railways upon which substantial provision has been made for enforcing economy in fuel use, does not the absence of any uniform plan of action suggest the lack of a well defined objective?

WELL DEFINED OBJECTIVE ESSENTIAL TO EFFECTIVE FUEL SUPERVISION

Since the absence of uniformity in the manner of fuel supervision suggests the lack of a well recognized objective, it is of the utmost importance that the real objective be clearly comprehended before consideration is given to the

organization of fuel economy. The objective of this organization may be concisely defined as the determination and procurement of the least expensive fuel available, service as well as price considered; and the most productive utilization of this fuel.

Traffic considerations which influence the revenues of the railway may also be a factor in the selection of fuel, but it is contended that where traffic considerations are permitted to influence the selection of railway fuel, an effort should be made to appraise the true value of this traffic. Too often are traffic considerations of the vaguest value permitted to determine the selection of a fuel that will cause the railway a quite definite loss.

Therefore, it is the function of an organization devoted to fuel economy to determine, in advance, the most economical fuel, all factors considered, and to undertake the procurement of this fuel. This involves not only preliminary investigation and tests, but subsequent inspection to enforce delivery of fuel that conforms closely to the grade purchased.

Also, it is the function of an organization devoted to fuel economy to enforce efficiency in the distribution and use of this fuel. This involves distribution in accordance with a well arranged plan, expeditious handling at fueling stations, skillful firing and intelligent locomotive operation, efficient motive power and effective operation of the railroad as a whole.

From the foregoing it must be apparent that the scope of fuel economy embraces many departments, but principally, it is the function of the mechanical, the operating and the purchasing departments. Fuel economy can only be attained through the organized effort of each one of these departments. It is idle to talk of a separate department that can assume all the responsibilities of fuel economy. Are there not too many departments at present? To relieve the mechanical, the operating or the purchasing department of a fraction of its individual responsibility would be disastrous. Rather, the effort should be to make each of these departments appreciate its full responsibility for fuel economy and to organize its activities accordingly.

The only possible excuse for shifting these activities lies in the failure or inability of one department to assume a responsibility that properly belongs to it. Where this situ-

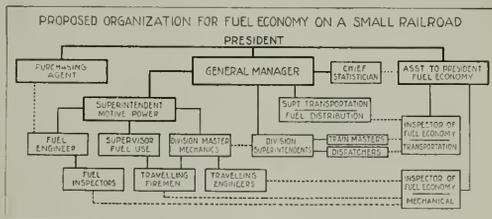

Fig. 2

ation necessitates the formation of an individual department, the purpose of this department should be to assume as few rather than as many routine functions as possible. It is well to bear in mind that fuel economy can never be comprehended within the activities of a single department.

IMPORTANCE OF CONTINUITY OF EFFORT

The organization of fuel economy might be completed with the proper organization of these activities within each department if we were sure of two facts: first, that the activities of each department are being properly co-ordinated, and second, that an adequate supervisory organization is continuously maintained and is functioning to the best advantage.

We may have the most ample and competent organization

for the enforcement of fuel economy within each department, but if this is not continuously maintained it may prove more harmful than helpful. There is no more disorganizing or discouraging factor in the pursuit of fuel economy than the intermittent establishment and abolishment of large organizations for supervising fuel use. The most meagre permanent organization is preferable to the most elaborate temporary organization. Is it possible that the management of a railway on which fuel supervision is allowed to vary with each fluctuation in monthly earnings can realize that eternal vigilance is the price of fuel economy?

#### PROPOSED ORGANIZATION FOR LARGE AND SMALL RAILWAYS

The proposed organization for a large railway is illustrated in Fig. 1, and the proposed organization for a smaller road is shown in Fig. 2. Fundamentally, these plans are the same because, fundamentally, the problem of fuel economy does not change with the size of the road. Both of these diagrams are intended to depict an ample supervisory organization within the mechanical department for adequate supervision over fuel use and the procurement of fuel.

The diagrams referred to in Figs. 1 and 2 are also intended to indicate an operating and purchasing department organization that, so far as the conduct of these departments is concerned, is fully capable of enforcing economy in fuel use. The distribution of fuel is assigned to the superintendent of transportation as a proper function of the operating department. Fuel purchases must be entrusted to the purchasing department, or to a branch of this department, but these diagrams are purposely constructed to suggest an intimate relation between the fuel engineer and the fuel agent, since it is highly essential that there be the closest cooperation between the department that buys and the department that must use the fuel.

There is nothing new in the proposal that a superintendent of fuel service, reporting to the superintendent of motive power, direct the activities of several fuel supervisors toward the enforcement of economy in fuel use. In fact, this appears to be the most popular form of fuel supervision now in effect. Preferably, however, he should be an assistant superintendent of motive power, on account of the real importance as well as the breadth of his task.

Success in the administration of fuel supervision by an assistant superintendent of motive power is dependable upon two factors: first, concentration upon the enforcement of fuel economy, and second, an adequate ratio of supervision, since no possible variation in the structure of an organization can take the place of intimate personal supervision.

The successful supervision of fuel use by the mechanical department is plainly contingent upon the employment of an organization that represents a genuine addition to the supervisory force. To merely alter the title of a traveling engineer to that of fuel supervisor does not constitute a real advance toward fuel economy; there must be a net addition to the supervisory force that will bring the ratio of supervision over locomotive performance to at least one to each 40 locomotives in active service.

#### HEAD FUEL ORGANIZATION WITH AN ASSISTANT TO THE PRESIDENT

But it is upon the establishment of a direct connection between the chief executive and the administration of fuel economy that the successful operation of the proposed organization is chiefly dependent. Otherwise this organization would have no fundamental advantage over organizations that are already in operation and would be subject to the same defects.

To establish this direct connection between the chief executive and the administration of fuel economy, the appointment of an assistant to the president is proposed. It is not the purpose of this appointment to further complicate super-

vision over fuel use. The position conveys no direct authority. He may advise and consult; and, in this impartial way, insure co-ordination in the activities of all departments toward fuel economy. But he will not exercise executive authority except in the conduct of his own very limited staff. His duties require that he know at all times whether each unit of the organization is or is not contributing its best efforts toward fuel economy. He should be able to state with assurance what net savings may be expected from additional supervision over fuel use or where this organization might be curtailed without entailing a net loss to the railway.

The measure of fuel economy lies only in statistics that reflect each phase of operation. These must be interpreted with the utmost discretion and it is entirely consistent that such statistics be compiled under the jurisdiction of an impartial judge in the person of the proposed assistant to the president. Therefore, it is suggested that a fuel statistician be attached to the staff of the proposed assistant to the president or, on small railways, the services of the chief statistician be available to this office.

The position of inspector of fuel service is even a more necessary adjunct to this plan. The number of these inspectors would be proportioned to the size of the railway and density of traffic, but it is contended that on even the smaller roads there should be at least one inspector of fuel economy who would devote attention to the conduct of the operating department, and another inspector who would observe and report upon the activities of the mechanical department toward fuel economy.

But it is the chief function of the proposed plan to perpetuate a broad fixed policy toward fuel economy. In fact, the position of an assistant to the president, and subordinate inspectors acting in the capacities which have been described may truly be said to embody the policy of fuel economy.

#### Discussion

W. L. Robinson (B. & O.) briefly described the form of organization on the Baltimore & Ohio. This is a staff organization, the head of which reports directly to the chief of motive power and the vice-president in charge of operation and maintenance, to whom in turn reports the chief of motive power. The staff organization has supervision over the use of the fuel, the purchase being handled by a fuel agent, and the inspection by the engineer of tests, both of whom report to the operating vice-president. The staff organization includes six district supervisors, three inspectors of fuel service, a fuel statistician and a fuel distributor who is in effect a general superintendent of transportation for railway fuel. The organization includes no traveling firemen, the direct supervision being handled by the road foreman or his assistants under the staff supervision of the district fuel supervisor. In this connection Mr. Robinson stated that on the Baltimore & Ohio the ratio of traveling engineers and assistant traveling engineers to the number of locomotives in service is 1 to 38. Accounting for the fuel is handled in the accounting department under the jurisdiction of another vice-president.

Two principles of a successful fuel organization were particularly emphasized in the discussion. The first is the adoption of a fixed policy on the part of the management and the second, that the authority for the execution of this policy remain in the departments whose regular routine duties include some phase of the fuel problem, thus making the fuel organization advisory rather than executive. Speaking of the first principle, Eugene McAuliffe recalled two cases where railway managements had made records for themselves by the much advertised results of their fuel organizations, both of which at a later date discontinued these organizations, thus securing no permanent benefit. The difficulty of effectively working out the second principle lies in the tendency for the supervisors in the operating organization to think that they know all there is to be known about the problem,

while on the other hand the staff organization, the business of which is to know, too frequently attempts to assume the authority properly belonging to the operating organizations.

## Value of Individual Fuel Performance Records

By Robert Collett

Superintendent Fuel and Locomotive Performance, New York Central

There have been presented before this Association several papers outlining the practice on various railroads where individual fuel records have proved valuable and which in some instances continue in force. A reasonably thorough canvass, however, discloses that such records are by no means standard practice on American railroads, chiefly, it seems, for the reason that the general method of determining individual coal charges to locomotives is largely guesswork. The value of any record lies in what we get from it and depends on the good or bad opinion of those who live with it. Mr. McAuliffe once aptly said: "I have been connected with a dozen different kinds of fuel performance records not one of which was absolutely correct, but the worst was better than none at all."

Railroad officers fully appreciate the need of knowing, first, about how much fuel is required for a given service, and secondly, how much is being used. How best to get this information depends chiefly on local conditions. With present day facilities on the average railroad it is not possible to present to an engineman or fireman a bill, so to speak, for a certain amount of fuel burned for which he is responsible, since all of the old handicaps of delays, light mileage, etc., over which he has no control, are still with us and added thereto are a number of other complications such as changing firemen, pooled engines, no means of measuring coal, and so on.

The engine record seems the best as a rule, save for oil-burners under certain favorable operating conditions, and this plan now predominates. The average cost of compiling such a record proves to be from one-half to one cent per ton of coal used. It is not usually intended as a check against the total fuel consumed, but to keep interest aroused. Grouping selected runs and showing only representative trips and not necessarily the total mileage or total fuel consumption for the month, has met with success on certain roads. The value of a fuel record also depends on how it is handled with the engine crews and the various departments responsible.

There are individual records which may be of value, although not elaborate. On the New York Central Lines East, we have made a great many trip records of fuel consumption and given considerable publicity on the road to these reports in an effort to apprise all concerned what is considered good performance. Also, through various records of observations we attempt to check conditions affecting fuel costs, which include locomotive operation, quality and distribution of fuel, locomotive conditions, transportation matters, and lubrication. One reason for including the latter is the claim so often made that oil is often saved at the expense of fuel. These individual observations are made in company with a division officer and matters are handled on the ground, in preference to writing letters. The idea is not so much to improve the individual waste as to have conditions right on the division and the railroad as a whole.

We give each division officer, including traveling firemen, what we call a bill of expense each month for the fuel burned in each class of service, the unit consumption, and the total cost. We also show this in "Cost per 1,000 Locomotive Miles." One reason for this is to compare the relative cost of fuel with other items which may have received no more attention than they deserved, but relatively far more attention than the fuel costs. On the enginemen's bulletin

boards we post a statement of miles run per ton of coal in each class of service, with a foot-note showing the number of scoops used per mile and what a small saving would amount to. We find the men like this even better than the gross ton-mile statements, although we post them also. Recently, we have been posting at some of our terminals the coal charges as shown by our daily report of disbursements, which shows the engine number, to which we have added the train number. Of course, it gives the crews an opportunity to criticize our coal estimates, but it creates interest and makes us careful in our estimating.

If we get individual effort collectively applied and concentrated on ways and means to encourage pride in having our railroad the best in fuel performance, it matters not so much what kind of records we have. If our records give individuals credit and commendation where due, and point out to all departments and individuals in a co-operative spirit what we are doing, what it is possible to do and in some small way at least how to do it, we will have two fuel supervisors on every engine and one in every officer.

I believe in an individual record and a daily check of the coal burned, so far as practicable, against the ton miles or passenger car miles for the education and interest it affords to those who follow fuel economy and who use fuel. But no record ever taught a man how to fire or run an engine more skillfully than he already knew. We certainly need and in time will have better and more fuel records on American railroads, but where successful, under present coaling arrangements, they will not attempt to stress individual liability so much as they will the possibilities of concerted effort.

## Discussion

J. G. Crawford (C. B. & Q.), presented a written discussion from which the following is taken:

In 1917 a committee consisting of an assistant auditor, fuel distributor, inspector of stores, traveling accountant, engineer of tests and myself were appointed to investigate fuel accounting. The accounting necessary in connection with the "Daily and Monthly Enginemen's Fuel Performance Statements" influenced the fuel accounting to a considerable degree, and the first work of this committee was to find out what use was made of and to estimate the value of the "Daily and Monthly Enginemen's Fuel Performance Statements."

The committee assumed that the reports were for the following purposes:

- (1) To create interest among enginemen which would result in a more economical use of locomotive fuel.
- (2) To give master mechanics and road foremen a statement which they can use to determine the relative standing of the enginemen so that they can urge, require and demand improvement of those whose performance is below what it should be.
- (3) To give superintendents of motive power and other general officers a summary of the effects of fuel economy efforts.

Twelve division points and two important terminals were visited. Master mechanics, road foremen, engineers and firemen were interviewed. Bulletin boards and bulletin books were examined to ascertain the manner and date of posting these statements. About one-half of the eighteen divisions were found to be making out the daily statement, but all divisions were compiling the monthly statement. The cost was about \$1,200 per month as statements were being made out and would have been about \$1,800 per month had statements been made out as originally intended.

All divisions compiled the monthly statement. This could not be avoided, because the monthly statements from each division were consolidated into a system statement. Of the twelve division points visited only eight had the monthly

reports posted. Some of these had not been sent to round-houses for posting for over a year and one was being put in the waste basket by the roundhouse clerk. Only five division points had made out and posted the daily reports. One division did not figure the pounds of coal per switch hour, per passenger car mile or pounds per hundred ton miles or the average speed. In some cases the daily reports were carbon copies, made with pencil instead of typewriter, and were not readable.

The daily reports were posted too late to be of any value. It was originally intended to post these within 48 hours after the day covered by the report. The monthly reports were posted about three weeks after the end of the month. At one point where there are ten bulletin files the four last monthly reports were on three different files. Some bulletin boards are so constructed that it is next to impossible to examine this statement.

Of 122 engineers and firemen interviewed, 51 stated they did not examine the statements and 66 said they did occasionally, but as they could not tell their approximate standing on the current statement it showed that their examination consisted in glancing at the report at occasions a good way apart. Five men knew their approximate standing but there is a possibility that three of these were informed in advance that we were making an investigation.

Of nine master mechanics interviewed eight did not use the reports and recommended discontinuance, one said it was one of the most important reports.

Eight road foremen were interviewed, of whom six did not use the reports and recommended their discontinuance, while one used and recommended discontinuance, and one used and made no recommendation as to discontinuance.

These reports were discontinued.

On any railroad there are a large number of engineers who are as conscientious and as capable as the officials who supervise them. This class does not need much supervision and an inaccurate individual fuel performance record is of no value in bringing about greater fuel economy in their case. There is a second group of men who are as conscientious, but not as capable and could be appealed to through an accurate statement, but not through one which is inaccurate. The third class as I see it is not conscientious; is subdivided between both capable and incapable. This class, though small in number, requires an excessive percentage of the road firemen's time. Something could be done with this group if an accurate individual fuel performance record were available, but an inaccurate record is of no value.

It seems to me that the smallest unit on which to base a fuel performance record, is the division until such time as an accurate record of the coal used by each engineman is obtainable. The statement using the individual engine as the unit is slightly more accurate than the statement using the engineer or the fireman as the unit, as there are a lesser number of engines than engineers or firemen. However, the principal advantage of making an individual engine fuel performance record in place of an individual engineman's fuel performance record is that the engines cannot talk back and tell you how inaccurate is the statement.

Nothing herein should be construed as not advocating working on the individual engineer and individual fireman to obtain the greatest fuel economy, but working through the medium of an inaccurate individual engineman's performance record is not advocated and should be discouraged.

### Report on Fuel Accounting

If we are to form a proper basis for checking fuel, and if we are to measure economy in its use, we must know that our fuel is purchased, distributed and accounted for under well defined methods. At the present time many roads are paying at least a 400 per cent increase in the price of their

coal or oil based on 1915 prices, which further emphasizes the importance of accurate accounting.

At the outset it is the recommendation of the committee that fuel accounting be handled by the auditing department. This does not affect separate organizations or departments which handle the purchase, inspection, nor use of fuel. Every railroad engaged in interstate commerce is guided in its final accounts by certain rules and regulations laid down by the Interstate Commerce Commission. The accounting department of every railroad understands these regulations and knows how to meet the requirements with regard to the allocation of fuel charges to operating expenses. Therefore, all forms used in connection with fuel accounting, are designed to meet these ends.

After the general purchasing agent has arranged contracts for delivery of coal, a mine manifest should be rendered daily to cover all coal shipped, showing destination, waybill reference, kind of coal, car number and initial, and gross, tare and net weights, one copy going to the fuel supervisor and one to car service department or the party handling the distribution of coal. The coal contractor should forward to general purchasing agent an invoice for all coal shipped, who will approve as to price, etc., and pass to the accounting department.

After arriving at distributing or junction point, a diversion report is compiled for the party handling distribution, showing car number and initial, original waybill reference, point to which diverted, shipper, and to whom and why diverted.

After the coal has arrived at the unloading station, the coal dock foreman must inform the fuelkeeper of the amount of coal received and unloaded so that he can render a daily report to the accounting department, with copy to the fuel supervisor; the accounting department to check receipt against invoice before passing for payment. The coal tickets covering issues to locomotives are handled by the coal dock foreman and passed to the fuelkeeper each day. The form for reporting coal received and unloaded provides for showing the waybill reference, the weight of the coal, and the amount unloaded is carried forward from day to day so that the report at the end of the month will show the total amount of coal delivered to locomotives, or otherwise charged out at the station where unloaded. There should be a place provided on the reverse side of the daily unloading report for showing all cars on hand not unloaded. From this and the diversion reports information to locate every car is available.

As coal is generally put through chutes with no weighing device and as estimates of issues to individual locomotives necessarily follow, some adjustments will be required to balance with the inventory. A ten day or shorter period trial balance is therefore the solution in order to correct discrepancies before they become thirty days old, rendering the adjustments so heavy that the accuracy of charges to the individual locomotives and classes of service might be questioned.

Coal spilled at chutes should be picked up every day, if possible, and put back into the chute. If it is not possible to do this with some type of chutes, it should be done at least as often as trial or regular balance is taken, so that the report at the end of the month would show a balance requiring minimum adjustments.

A careful record should be kept of coal issued, and to do this it is necessary to keep before the fuelkeeper a working sheet on which the days of the month are shown, with headings covering every known use of fuel, on which fuelkeeper should be required to show distribution every day, so that at the end of the month the various items may be added and made ready for the balance sheet.

The balance sheet should provide a place for showing inventory and coal received and disbursed for all purposes. This report, with the tickets supporting the issues to loco-

motives, should be forwarded to the auditing department promptly after the close of each month, but only after the fuelkeeper has checked the agent's record to see that he has accounted for every car of coal reported by the agent to the auditor of freight accounts as being unloaded at his station.

To avoid omitting in the report of fuel received the cars under load at the closing period, it is essential that a record be maintained of cars received but not unloaded.

For distribution of fuel to locomotives, a separate form should be used which will show allocation of fuel to each individual locomotive, subdivided as between various classes of service in which the locomotive may make mileage. The form should accompany the balance sheet and will permit the auditing department to make proper charge of fuel to every locomotive.

Fuel oil, which is in general use on many of the western and southwestern roads, should be accounted for under the same basic principles as outlined above.

The report is signed by J. N. Clark (Sou. Pac.), Chairman; R. R. Hibben (M. K. & T.); R. E. Jones (D. & I. R.); C. F. Ludington (Crescent Coal Co.); Joseph McCabe, (N. Y., N. H. & H.); Hugh McVeagh (Big Four); C. F. Needham (Grand Trunk); H. E. Ray (A., T. & S. F.), and W. J. Tapp (D. & R. G. W.).

### Address by Eugene McAuliffe

Eugene McAuliffe, president and general manager, the Union Colliery Company, in an address before the Association spoke of the effect on the quality of railway fuel of the purchasing practices of the more discriminating users, such as public utilities and large industries, the result being an increasing volume of inferior coals which are dumped on the railroads. In this connection Mr. McAuliffe said:

"Whatever progress the coal industry is making toward better coal is almost wholly due to the industrial, utility and domestic demand and the inferior product is flowing in a growing stream toward the railroad bunkers. Is there a railroad in the United States that has ever attempted to weigh the result of an excessive ash content on its total train mile costs? Does any railroad know in what ratio a growing ash content runs against fuel economy? Most of the large utilities do; . . ."

In discussing the effect of the "peaks and valleys" of business on the load factor of the mines and the railroads, Mr. McAuliffe spoke in part as follows:

The load factor of a man, a machine, a factory, a mine, a railroad, is the ratio of the average output (in the case of a railroad expressed in gross ton and passenger miles) to the potential capacity. Do we not as a nation ignore this important factor, with the result that our stand-by losses are tremendous? It is the stand-by losses that are killing the railroads today, yet nothing is done to level the peaks and the valleys of the industrial curve; one year we fight and struggle for output at the expense of quality, building up a tremendous machine that largely stands idle during a subsequent period of depression, only to repeat the operation at recurring periods.

There is a lack of co-ordination between the carriers and the coal industry, although the traffic relation approximating 37 per cent of the gross freight ton-miles, and the purchase relation totaling from 25 to 28 per cent of the bituminous coal production, would seem to warrant a complete entente cordiale. What are the railroads doing to regain and accelerate the upward trend of the fuel economy curve? The application of brick arches, superheaters and perhaps feed water heaters is of necessity moving slowly. These instrumentalities call for capital investment. On the other hand, a broader study of the whole coal problem and a serious attempt to improve the load factor on the mines, on mine labor and on that portion of the railroad equipment and facilities that is devoted to the transportation of coal would

save millions of dollars annually and would reduce capital investment millions of dollars. The load factor on the railroads is at present running from 65 to 70 per cent, on the bituminous mines 50 per cent and on mine labor 40 per cent. This situation insofar as the actual cost of producing coal is concerned is costing at the present moment not less than one dollar per ton or one-half billion dollars annually; the carriers' loss in load factor is expressed in idle cars and locomotives, decimated work forces and an operating cost approaching 100 per cent of gross earnings; the coal miners' and coal operators' loss is expressed in terms of idle men and mines, offset in part by a rate of wage and a selling price far above what they should be, while the collection of profits is deferred.

In support of the statement that a greater community of interest between the railroads and the coal industry is essential, the study of the relative weight of coal produced in 1918 and the other heavy commodities handled by the railroads, is shown in the table.

RATIO OF THE VOLUME OF OTHER PRODUCTS HANDLED BY THE RAILROADS TO COAL

	Net tons	Ratio in per cent
Coal Production—		
Anthracite .....	98,826,084	14.6
Bituminous .....	579,385,820	85.4
Total .....	678,211,904	100.0
Other commodities compared with coal—		
Farm products: wheat, corn, oats, rye, barley, potatoes .....	163,176,298	24.0
Lumber, all grades .....	63,780,989	9.4
Basic metals: steel, copper, lead, zinc .....	51,829,281	7.6
Total .....	278,786,567	41.0

Coal, because of its immense demand on the carriers for transportation occupies a position that not only merits but demands serious study, and the fullest measure of co-operation.

The load factor on the coal mines, on coal labor and on the carriers can be improved by the simple process of paying the public for the service rendered through the simple medium of lower freight rates on coal in the summer months, with a corresponding increase in the winter months; this principle can be further extended to our common advantage, by granting seasonal rates on all building material such as sand, gravel, rock, tile, lumber, etc., that enter into the construction of buildings and highways.

Business decries government regulation and control—I am unalterably opposed to both—but are not our reactionary tendencies forcing the public to "build a fire under the mule."

### Other Papers

A number of other papers and reports were also presented. These were Fuel Economy—A Few Essentials, by Carl Eduard Uddenberg (State Railways of Sweden); Oil Shale as a Source of Oil Supply, by Martin J. Gavin (Bureau of Mines); Cost of Production of Coal, by Mont B. Morrow (Canmore Coal Company, Ltd.); Report on Briquettes and Sub-Normal Fuels, E. E. Ramey (B. & O.), chairman; and Report on Firing Practice, M. A. Daly (Nor. Pac.), chairman.

### Other Business

One of the features of the meeting which received favorable comment on several occasions was the presence of eight engine crews, one from each division of the Atlantic System of the Southern Pacific. These men, who have had the best fuel records on their respective divisions during the past three months were sent to the convention by the management as a mark of recognition for the results they have obtained in their efforts to save fuel. This is a part of the newly developed plan of division fuel committee organization on the Southern Pacific System.

During the convention Harrington Emmerson distributed to the members copies of a summary of the Interstate Commerce Commission railway fuel report for 1920 which he had pre-

pared showing the costs of the various kinds of fuel on an equated heat unit basis.

On recommendation of the Committee on Constitution and By-Laws, the annual dues of the association were raised \$1 a year.

The following officers were elected for the coming year: President, W. L. Robinson (B. & O.); vice-presidents, J. N. Clark (Southern Pacific), M. A. Daly (Northern Pacific),

## Percentage of Wage Reductions Ordered by Labor Board

THE PERCENTAGES of the decreases in wage rates which were ordered by the Railroad Labor Board on June 1 show varying amounts ranging from as low as 7 to as high as 20 per cent. The following table shows former rates, present rates, and amount and percentage of decrease:

DECREASES ORDERED BY THE RAILROAD LABOR BOARD													
1	Average daily rates				5	6	1	Average daily rates				5	6
	2	3	4	Decreases by Board				2	3	4	Decreases by Board		
Class of employee	Dec., 1917	U. S. Railroad Administration	Present rates	Decreases by Board	P. c. of decrease in basic wages	Class of employee	Dec., 1917	U. S. Railroad Administration	Present rates	Decreases by Board	P. c. of decrease in basic wages		
<b>Superintending Forces—</b>													
Yardmasters	\$151.12	\$239.38	\$269.98	*\$16.32	*6.1	Molders (less 4 years' experience)	3.14	4.58	5.62	.64	11.3		
Yardmasters' assistants	143.45	203.65	239.25	16.32	6.8	Helpers—all crafts	2.85	3.96	5.00	.64	12.8

and W. J. Bohan (Northern Pacific); members of the Executive Committee: H. T. Bentley (C. & N. W.); D. I. Bergin (Wabash), C. M. Butler (A. C. L.), J. W. Dodge (Illinois Central), Joseph Keller (Lehigh Valley), and Hugh McVeagh (Big Four).

Chicago was unanimously chosen as the place for the next convention.

RAIL WAGE COST TO THE PUBLIC.—What the Adamson law and government operation did to the American public, then, in plain arithmetic, was to increase the average American family's assessment for railway wages from \$75 a year to \$200 a year. They took an extra \$125 a year out of every family in the United States to put into the pay envelopes of the railway workers. That is cost of living for you!—N. Y. Herald.

# Railroad Hearings Before Senate Committee

Testimony of Edward Chambers, H. E. Byram and Samuel Rea—  
Many Classes of Freight Show Increased Shipments

WASHINGTON, D. C.

TESTIMONY ON BEHALF of the railroads has been presented before the Senate Committee on Interstate Commerce during the past week by H. E. Byram, president of the Chicago, Milwaukee & St. Paul; Edward Chambers, vice-president of the Atchison, Topeka & Santa Fe, and Samuel Rea, president of the Pennsylvania.

Mr. Chambers testified before the committee on May 26, 27 and 31. He discussed the traffic and rate phases of the

railroad problem in more detail than they had been developed by the executives who had preceded him and rather surprised the committee by outlining the extent of the readjustments in rates already made. Members of the committee also were especially interested in the facts which he produced regarding the causes for the business depression and the comparatively minor effect of the increase in rates. An abstract of Mr. Chambers' prepared statement follows:

## Diminished Traffic Not Result of Increased Rates

Statement by Edward Chambers, Vice-President, Atchison, Topeka & Santa Fe

An examination of the facts shows, to my mind, two things: 1. That "the diminished volume of traffic" mentioned in Point 3 of the Senate Resolution has not resulted from the Interstate Commerce Commission's order in Ex Parte 74, in which the commission undertook to provide the adequate revenue for carriers required by the Transportation Act.

2. That, therefore, "the best means . . . of reducing freight and passenger rates" mentioned in Point 5 should not be considered at this time as the subject of general action by either Congress or the Interstate Commerce Commission. The present rates as a whole are not excessive under existing conditions. Until operating costs are reduced or business revives sufficiently to produce the net revenue which the carriers should have under the Transportation Act no general reduction in rates can be made. From my knowledge of the causes of the business stagnation which became marked at the beginning of the present calendar year no reduction of rates that could be made now would stimulate traffic sufficiently to produce the revenue which is needed.

### Thousands of Rates Already Reduced

Reductions in rates to bring about necessary readjustments are going on daily throughout the country by dealings directly between the shipper and the railroad traffic man. While many complaints and statements of a general character have been issued regarding the effect of the higher freight rates, those, however, are very insignificant in number compared with the number of adjustments made effective as a result of direct negotiations between carriers and shippers. The records of the Interstate Commerce Commission show that approximately 10,000 freight tariffs are filed each month, many covering a number of rate changes. Contained in those tariffs are many voluntary changes made by carriers filing direct with the commission and by bureaus established by carriers to publish competitive rates. Late reports from those bureaus show results of cooperation between carriers and shippers in restoring relationship and removing discriminations or inequalities and providing rates for new industries. The reports show:

*Western Trunk Line Committee (Chicago).*—Twelve hundred subjects considered since June, 1920, and 1,000 acted upon; over 90 per cent were reductions and nearly all affect rates under Ex Parte 74. Two hundred applications are still pending, 209 public hearings held; most of the reductions are on raw materials, such as crushed rock, gravel and other building materials, and grain, coal and lumber.

*Southwestern Freight Bureau (St. Louis).*—September 1, 1920, to May 1, 1921, number of subjects considered, 812; number of conferences held, 34; number of subjects considered at public conferences, 112. Subjects on the docket pending consideration which propose reductions, 491; subjects which propose advances, 48; total number of subjects for consideration, 539. Number of subjects pending presented by shippers, 363; number of subjects presented by carriers, 176. The changes are principally reductions and apply upon stone, lumber, sand and gravel, brick, cement, fresh fruits and vegetables, and various other commodities.

*Pacific Freight Tariff Bureau (San Francisco).*—Approximately 16,000 rate changes, of which 11,000 are reductions, balance increases, made by this bureau since Ex Parte 74 decision. Most of these are reductions caused by extending all rates in certain tariffs to apply from new points of origin. The majority of increases are in state rates awaiting approval of state commissions.

*Trans-Continental Freight Bureau (Chicago).*—Number of changes made through this bureau since Ex Parte 74, approximately 236, which includes 63 changes awaiting publication.

During that time 150 conferences with shippers on rate matters were held. Where there is a change in rate involving more than one tariff we have called it one change; likewise changes in number rates have been considered one change. If we should count each rate changed it would run up to many thousands. In other words, we have considered each adjustment of rates one change regardless of the number of rates involved or the number of tariffs affected.

*Trunk Line Association (New York).*—Have received since September 1 last, 2,472 rate proposals and have issued 2,266 recommendation advices, each representing approval of from one to several hundred changes in specific rates, all proposals being published in public docket and conferences with shippers arranged if requested. Only 20 public hearings have been called for.

*Central Freight Association (Chicago).*—Since August 25, 1920, have had approximately 60 conferences with shippers on rate matters; commodity rate changes comprise approximately 3,500 origin point changes and 7,500 destination point changes.

*New England Freight Association (Boston).*—Have considered 619 freight rate proposals and have issued recommendation advices on approximately 500. All proposals initiated by New England members have been published in public docket and trade journals, and on request of shippers 15 public hearings have been held in addition to innumerable informal conferences with individual shippers. It is impossible to make any estimate of number of rate changes involved.

*Southern Freight Rate Association (Atlanta).*—Since Ex Parte 74 our committee has published 1,835 rate advices authorizing changes in rates. Some of those involve change in only one rate, though frequently each rate advice involves a considerable number of changes. We hold conferences with shippers one day out of every week.

The railroads should be allowed to work out traffic problems by dealing directly with shippers or their organizations, aided where necessary by the Interstate Commerce Commission. In every case of disagreement the commission has ample authority under the Transportation Act to dispose of the question promptly. The railroad traffic man is always ready to hear from and confer with the shipper. He is just as anxious to have commodities moving as the shipper is, and can be relied upon to give proper consideration to the commercial conditions surrounding the situation.

When the commission authorized in Ex Parte 74 the present rate adjustment it requested the carriers to give consideration to any disturbances of recognized relationships which might follow and to take immediate steps to correct them. That injunction has been promptly followed wherever variations of former recognized relationships resulted from the application of the percentages prescribed, or where it appeared that the rate was prohibitory, as has just been shown by reports from freight tariff publishing bureaus; the commission, at the request of carriers, retaining jurisdiction over Ex Parte 74 for the purpose of cooperating in and approving of the adjustments agreed to between the carriers and the shippers. Many adjustments have been satisfactorily worked out between shippers and carriers, and conferences are going along in different sections of the country and good results are being obtained. Wherever it is desirable to have the informal help of the Interstate Commerce Commission in adjusting these matters, it is promptly extended.

### Class Rates

The less-than-carload tonnage moving under class rates is about 4 per cent of the total freight tonnage of the country,

and yields about 13 per cent of the total freight revenue. The average haul is about 200 miles. The longer haul of less-than-carload freight is on articles of the higher class, such as drygoods, boots and shoes, and clothing. The shorter less-than-carload haul is of the heavier freight or lower grades, which moves an average distance of about 100 miles, such as canned goods, sugar, and salt.

The increase of less-than-carload rates has not disturbed the sources of distribution. The amount of the increase applied to the unit purchased by the individual cannot fairly be claimed to be an undue burden, and certainly not prohibitory. As illustrative of the small factor which rates are in the cost of staple goods to the consumer, it may be mentioned that the American Stores Company, dealing in groceries and family supplies, on gross sales of \$103,059,000, paid in 1920 in freight and express charges, \$637,000, or 6 cents on each \$10 of sales.

The less-than-carload traffic is the most expensive handled by carriers. Its car loading is light, the average throughout the country being only about 7 tons. The movement usually calls for transfers en route as well as handling at points of origin and destination, all at the expense of the carrier, and the commodities are exposed to theft and damage to a greater extent than any other traffic.

Carload traffic under carload class rates constitutes only a small part of the total carload movement, being of the high-grade manufactured articles where the rate is not an important factor in the selling price. There has been little or no complaint from the shippers using the class rates, either carload or less-than-carload.

The class rate adjustment, both carload and less-than-carload, throughout the country is in no way uniform. For example, in Trunk Line territory there are 59 different class rate scales; the scale on no one railroad is uniform, and no two railroad scales are alike. It may appear in certain sections that the long-haul rates are rather high, but many of the lower rates as they stand today are unreasonably low, particularly for short hauls, and do not bear a fair share of the transportation burdens. The Interstate Commerce Commission, since the passage of the Transportation Act, which gives it power to fix the minimum as well as the maximum rate, is correcting many of those situations and bringing about reasonable, uniform rates and in time will, I assume, correct them all.

### Commodity Rates

Approximately 85 per cent of the commercial tonnage of the railroads of the United States moves under commodity rates made to fit commercial conditions on the basis of what the commodity can reasonably and fairly bear in distribution, that is to say, on the value of the service to shippers. The great staples, such as grain, lumber, fruits and vegetables, live stock, and coal, move to market almost entirely under commodity rates. These rates are the most important. While distance is an important factor, it cannot always be controlling if we are to continue the development of the country as a whole. Adjustment of commodity rates to extend sources of supply and develop markets often requires the same rate from the more distant producing point to market as is charged from a nearer source of supply. In fixing a rate on a commodity so that it may reach certain markets often consideration must be given to what that source of supply can afford to pay in the way of freight rate in excess of the rate paid by the nearer source of supply shipping to the same market. For example, the fruit and vegetable growers in California, shipping 3,000 miles to the New York market, must compete with Florida and Texas in the same market, the distance from Florida being 1,100 miles and from Texas 2,000 miles to New York. If these rates were not thus made eastern and central markets, now depending upon Florida, Texas and California, would still be obliged to draw many food products from foreign countries, as they did before the railroad rate adjustments, constructed on theory of what the traffic could bear (rather than what would be required fairly to compensate the carriers for the service), drove out of American markets foreign food products by directly contributing to the development at home of oranges, lemons, grapes, raisins, olives, nuts, dried fruit, figs and canned goods. Without this method of commodity rate adjustment the far western section of the United States, in particular, would not have been changed from an isolated grazing region into one of the most richly productive and highly populated agricultural areas on the continent.

I come now to the particular commodity rates of which there has been some complaint in the press and elsewhere, and shall speak of coal, lumber, grain, fruits and vegetables, live stock, road material, iron ore and some others. Passenger fares also will be discussed. I have already mentioned that 85 per cent of the commercial tonnage is moved under commodity rates, and of this more than three-fourths consists of comparatively few commodity groups. This is mentioned to impress upon the committee the fact that any general reduction in the rates on the

important commodities moving would mean a considerable volume of revenue taken from the carriers.

### Coal

Coal and coke, in round figures, furnish 40 per cent of the commercial tonnage moved by the railroads. I have seen no direct statement that the movement has been prevented by the increased rates. In complying with the order of the commission in Ex Parte 74, carriers preserved the recognized relationships which had existed as to point of production. This was about all the shippers asked for at that time. The greater production is in the territory east of the Mississippi and north of the Ohio river. In this Eastern section is also located approximately 85 per cent of the manufacturing of this country. It also contains one-half or more of the country's population. The manufacturing plants that are the greatest consumers of fuel are usually located close to the source of supply and therefore pay the minimum fuel rate.

The movement of coal and coke for each quarter of 1920, during the last of which quarters the higher rates were in effect, was as follows:

	1st Quarter, tons	2d Quarter, tons	3d Quarter, tons	4th Quarter, tons
Bituminous .....	90,622,867	83,152,797	100,369,875	110,522,083
Anthracite .....	17,304,993	19,300,597	19,148,533	21,224,244
Coke .....	7,073,275	6,032,255	6,905,008	6,871,501

The freight rate does not show any unreasonable relation to the delivered price, and it cannot be shown that in any of the territories it is preventing the resumption of industrial operations or otherwise prohibiting movement. While the rates on coal as well as the price thereof are low in comparison with those on many other commodities, the percentage relation of the rate on coal to the delivered price must necessarily be greater than with respect to articles of higher value. Fluctuations in the price of bituminous coal during the past two or three years have ranged greater than the entire freight rate. The cartage charged and the charge from the pavement to the cellar in the principal cities in the eastern section are frequently as great as the average freight charge.

### Lumber

The principal sources of supply of lumber are the Southern and Gulf states and the Pacific Coast states. The rates as increased by Ex Parte 74 from Pacific Coast territory to Chicago and West were recently, after several conferences between shippers and carriers, readjusted to fit competitive commercial conditions by reducing the rate to Chicago and to the Mississippi river from 80 cents per 100th to 73 cents, and to Kansas City and Omaha from 73 cents to 66½ cents, the rate to St. Paul and Minneapolis remaining unchanged at 66½ cents. From the producing territory intermediate to the Pacific Coast the recognized relationships which had been thrown out of line by the percentage increase were restored. This adjustment is reasonably satisfactory to the interested shippers, and lumber is moving under the rates to the extent the markets will take. The reports received indicate that the Pacific Coast lumber shippers are rather disappointed in the effect the reduced rate had upon the movement. It is no better now than it was before the rates were reduced. The Southern and Gulf lumber shippers advise of a slight improvement in the demand, but generally the conditions in the common markets are the same in respect to the Southern and Gulf lumber as prevail on the Pacific Coast lumber.

There was also complaint from the Pacific Coast and interior lumber manufacturers with respect to the disadvantage at which they claimed to be placed in seeking business in the eastern territory. Their complaint was largely confined to the advance of rates to markets east of the Mississippi river and north of the Ohio. The advance in rates on a percentage basis disturbed the relationships that had prevailed. Conferences between traffic representatives of interested railroads and the lumber shippers have been held looking to a satisfactory rate adjustment to their territory.

After rates from the Pacific Coast states were readjusted the Southern and Gulf states asked for similar action to territory Chicago and West, or for an adjustment that would leave their rates in cents per hundred pounds below the rates from the Pacific Coast to the extent that they were lower as a result of the Ex Parte 74 percentage increases. This request is now under consideration by the interested railroads. Several conferences have already been had with shippers, and while no conclusion has yet been reached, it is safe to say that some readjustments will be made. The Southern and Gulf states lumber shippers reach the Chicago market today at a rate of 44 cents per hundred, Mississippi river at 36 cents per hundred, Kansas City 39 cents per hundred, and Omaha 42.5 cents. No claim has been made by these southern shippers that the increased rates prohibit the movement of lumber. Their request is for a readjustment of their rates based on what they consider competitive commercial conditions.

The average revenue per ton from lumber for the United States

as a whole is at present about \$5.20. The movement in tons of forest products for each quarter of 1920, during the last of which quarters the higher rates were in effect, was as follows:

1st Quarter, tons	2d Quarter, tons	3d Quarter, tons	4th Quarter, tons
25,575,364	26,448,627	26,585,525	23,003,693

Figures for the month of April so far received indicate that the lumber business in all sections is improving.

The foregoing consideration of the facts shows that the advance in Ex Parte 74 did not prohibit the movement of lumber, and this view is confirmed by recent editorials in the American Lumberman and the Mississippi Valley Lumberman, representing the lumber interests.

**Grain**

Knowing that on account of the delicacy of the grain-rate adjustment the percentage advance allowed in Ex Parte 74 would disrupt some recognized relationships, the Interstate Commerce Commission directed that any such disarrangements be corrected by the carriers in the first supplements after their publication of the advance. This direction was carefully and promptly followed.

We have about completed the readjustment of the grain and grain-products rates at the different primary markets and at the Gulf and Atlantic ports for export. In this readjustment some reductions had to be made. To afford the grain and its products the widest benefit of the competition of markets, freight rates are so adjusted that in moving the grain forward from the field to the primary markets and from one market to another, or from intermediate mills to ultimate destination of the grain products, the through rate from point of origin to final destination is protected. This arrangement permits the millers at intermediate points to purchase grain, stop it at their mills, grind it and ship the product thereof, not on the sum of the rates in and the rates out, but on the through rate from point of origin of the grain to the ultimate destination of the product, provided this transaction takes place within one year following the date of the initial movement. This is a very valuable privilege in marketing grain, and although the rates were advanced on August 26, 1920, these advances have not been applied on any grain which was in transit prior to that date.

The average haul and the average charge per hundred for the country as a whole are as follows:

Country as a whole	Average haul		Average rate	
	Grain, miles	Flour, miles	Grain, per 100 lbs.	Flour, per 100 lbs.
.....	498	630	24.8 cts.	29.25 cts.

That table shows a freight rate of 15 cents per bushel on wheat. The movement in tons of grain and grain products for each quarter of 1920, during the last of which quarters the higher rates were in effect, was as follows:

1st Quarter, tons	2d Quarter, tons	3d Quarter, tons	4th Quarter, tons
18,425,211	14,284,051	19,251,813	18,043,760

The exports and imports of wheat in bushels for three years, ending with 1920, during the last quarter of 1920 the higher rates being in effect, were as follows:

	1918, Bushels	1919, Bushels	1920, Bushels
Exports	11,177,103	148,086,479	218,280,231
Imports	17,035,986	7,910,701	35,848,648

Comparing December, 1919, with December, 1920, the exports and imports of wheat were as follows:

	1919, Bushels	1920, Bushels
Exports	9,519,706	25,896,270
Imports	309,182	11,275,104

The average fluctuation weekly in the price of wheat at Chicago in 1919 and 1920 was nearly 10 cents per hundred. The monthly and yearly fluctuations in price of grains, of course, amounts to many times the increase in freight rates. All irregularities of recognized rate relation have been worked out by the carriers to the satisfaction of shippers; and the experience shows that the thing to do is to leave any remaining adjustments to be worked out by the co-operation of the carriers, the shippers, and the Interstate Commerce Commission. My consideration of the grain subject convinces me that the freight rate has not impeded the movement.

**Fruct and Vegetable Shipments**

**Increased Under Higher Rates**

The markets of the common vegetables, such as potatoes, onions and cabbage, are well established and the distribution usually follows normal and well-understood trade channels. Potatoes, onions and cabbage make up the greater proportion of the total vegetable tonnage of the country and are produced everywhere. The government market reports show all markets well stocked with these vegetables and at times over-stocked. Potatoes, onions

and cabbage carry the lower vegetable rates. This traffic shows a substantial increase in movement over last season under the higher freight rates this season.

The winter producing sections for higher class vegetables are Florida, California and Texas. These sections go to markets largely east of the Mississippi river and north of the Ohio. The extreme eastern markets of New York, Boston and Philadelphia take a very considerable part of these vegetables. California and Florida, for example, ship celery, cauliflower, asparagus and lettuce to all the large markets in the Middle-West and Eastern territory. These high-grade vegetables require the very highest class of service. The movement shows about the same average of increase as in the case of the lower class of vegetables. These vegetable shippers have complained to the carriers and the Interstate Commerce Commission that the rates applied are excessive. The commission has given some informal consideration to the complaint. The carriers also have held conference with the shippers and the matter is now under consideration for final disposition.

Florida and California citrus fruit shippers have complained to the carriers and the Interstate Commerce Commission that prices received at destinations are not equal to cost of production and cost of transportation combined. The interested carriers have had several conferences with the citrus fruit shippers in regard to the volume of the rate now charged, but as yet no definite action has been taken. The commission, however, has lately instituted a very far-reaching informal investigation of the conditions in the citrus fruit, deciduous fruit, and vegetable industry of the entire Pacific Coast, which is welcomed by the carriers and which will elicit facts upon which final disposition will be made. The commission has already given informal consideration to the rates on fruits and vegetables out of Texas and Florida.

The following, taken from the records of the United States Bureau of Markets, shows the movement of fruits and vegetables from the three winter producing sections (California, Florida, and Texas), for the months October, 1920, to March, 1921, inclusive, as compared with the same period 1919-1920:

	California		Florida		Texas	
	1920 (1921)	1919 1920	1920 1921	1919 1920	1920 1921	1919 1920
Number of carloads	1920 1921	1919 1920	1920 1921	1919 1920	1920 1921	1919 1920
Lemons	2,700	2,429	.....	.....	.....	.....
Oranges and grapefruits	12,269	12,650	22,364	18,195	.....	.....
Deciduous fruits	11,896	10,252	.....	.....	.....	.....
Vegetables	22,190	19,630	9,020	9,954	4,029	3,815
Total	49,045	44,961	31,384	28,149	4,029	3,815

All of the foregoing movement in 1920-1921 was under the advanced rates.

Practically all of the apples from the northwestern states have been marketed, with the exception of some small apples which cannot find a ready sale in the East. While it is true that the freight rate has considerably advanced, yet the advance in freight rates has not kept pace with the increase in the farm values of the apples, according to government reports. Although the crop in the West in 1920 was much smaller than in 1919, the total production of commercial apples of the United States in 1920 was probably the largest ever known, or 36,272,000 barrels, compared with 26,223,000 barrels in 1919. As most of the Western apples must find their markets in the East, largely in the states where there is the greatest local production of apples, it will be seen that the Western apples have been able to find a ready market at good prices, notwithstanding the immense crop in the territory where they are marketed and the advance in freight rate.

The movement in tons of fresh fruits and vegetables for each quarter of 1920, during the last of which quarters the higher rates were in effect, was as follows:

1st Quarter, tons	2d Quarter, tons	3d Quarter, tons	4th Quarter, tons
2,301,651	2,248,547	3,553,533	4,902,455

**Sand, Gravel and Crushed Rock**

The movement of these commodities may properly be classed as local, or they are hauled but short distances and at very low rates, comparatively, and are produced everywhere. In the later years, and since drayage charges have increased so much, the cost of distribution in the city of destination is often greater than the freight charge for the main-line haul. The hauls are usually over a single line. The general conditions surrounding the production and distribution compel minimum rates. There are two terminal services to each shipment, and often one is in a large city where the switching is expensive and must be absorbed out of the main-line rate.

Modifications in Ex Parte 74 rates are being made daily throughout the country for one reason or another, the shipper dealing directly with the carrier. While we hear some complaints of excessive rates, when you consider that the annual movement of these commodities is approximately 100 million tons, scattered all over the country, the complaints we hear are insignificant com-

pared to the tonnage moving, and there must be thousands of transactions daily throughout the country where these commodities are involved. As these commodities cannot be moved at the class rates, a commodity rate must be provided for every carload movement, and new commodity rates are therefore, as a result of negotiations between shipper and carrier, being constantly published.

A conference between carriers and shippers of sand, gravel and crushed rock, or road material, will be held in Washington on June 2 at the request of the shippers, that request being the first coming to the carriers from those shippers for any general modification of the existing rate adjustment.

The average haul in the different sections and the average charge are as follows:

	Average haul	Average rate
Eastern District.....	65 miles	73 cents per ton
Southern District.....	68 miles	90 cents per ton
Western District.....	60 miles	74 cents per ton

The number of tons of clay, sand, gravel and crushed rock hauled in each quarter of 1920, during the last of which quarters the advanced rates were in effect, were as follows:

1st Quarter, tons	2d Quarter, tons	3d Quarter, tons	4th Quarter, tons
15,766,002	25,967,455	30,548,043	26,232,054

The drayage charge at Washington for hauling sand, gravel and crushed rock within the city limits is 50 cents per ton for the first mile or less and 10 cents per ton for each additional quarter of a mile, the drayage charge for a mile and a half being as high as the freight rate for the average rail haul in the eastern district.

**Cement, Brick and Plaster**

These commodities move in large volume and generally for comparatively short distances. Manufacturing plants are scattered throughout the whole country; many are close to large consuming markets. There is a substantial movement now and has been right along. The movement in tons of cement, brick, lime and plaster for each quarter of 1920, during the last of which quarters the higher rates were in effect, was as follows:

1st Quarter, tons	2d Quarter, tons	3d Quarter, tons	4th Quarter, tons
6,517,819	9,119,590	10,843,710	8,242,843

**Livestock**

Shippers have complained about the rates, particularly those on the long hauls on range cattle from the southwestern ranges to the northwest pastures. At a recent conference between the Interstate Commerce Commission, livestock shippers, and interested carriers an understanding was reached to modify the rates upon these range cattle, and the agreement has been carried out and the reduced rates are now in effect. It was an emergency proposition, but by the co-operation of the Interstate Commerce Commission the rates were quickly made effective.

The livestock movement in tons for each quarter of 1920, during the last of which quarters the higher rates were in effect was as follows:

CATTLE AND CALVES, HOGS, SHEEP AND GOATS				
1st Quarter, tons	2d Quarter, tons	3d Quarter, tons	4th Quarter, tons	
4,189,653	3,859,101	3,906,899	4,612,508	

**Reduction in Building Operations**

**Due to Other Causes Than Rates**

The conditions in the building industry throughout the country are practically uniform. In the cities on the Pacific Coast and throughout the west, south, and east conditions appear to be about the same. The general report is that a comparatively small amount of building is being done. At San Francisco, Seattle and Portland, where lumber is at the door, conditions are the same as at Kansas City, Omaha, Chicago or Cleveland. For example, Chicago has plants within its city limits which produce all kinds of structural iron and steel, likewise cement, brick, lime, sand, gravel and crushed rock, and building conditions are no different in Chicago than in the other places mentioned.

As an illustration of the relation of freight rates to building enterprises a careful study recently made of the materials going into a typical brick house of six rooms and bath in Philadelphia with the freight charges from the usual sources of supply of materials shows that the freight charges amount to approximately \$70 on a house costing \$8,300 to build in 1920.

In St. Paul the estimated freight charge on all material entering into the construction of a frame dwelling-house costing \$5,000 or \$6,000 would aggregate about \$80. In making this estimate the points of shipment used are those where such materials are produced in large volume, and where the selling price is based.

**Road-Making Material**

Complaint has been made in a general way that the present freight rates are prohibiting road construction. The costs of a

standard concrete highway, in accordance with the published requirements of the Minnesota Highway Department, and according to figures published by the Northwestern Association of General Contractors, taking as an example the Itasca County, Minnesota, Road, are as follows:

Grading, average cost per mile.....	\$16,000.00
Freight on grading equipment, and from job.....	2.4%
Freight on culvert pipe, bridge material, etc.....	1.5%
Total.....	3.9%
Concrete pavement to be put in later will cost, per mile.....	37,000.00
Freight charges on pavement material, etc.....	1.9%
Total cost of road per mile.....	53,000.00
Total freight cost.....	2.5%
	1,327.00

The same published report shows that the cost of laying one course concrete pavement, using railway track for haulage, is \$3.61 per square yard, of which materials represent \$1.73 per square yard or 47.8 per cent, labor 63 cents or 17.5 per cent, depreciation 8.6 per cent, contingencies 5.6 per cent, interest 3.6 per cent, taxes 0.2 per cent, general expense 2.9 per cent, storage 1.5 per cent, insurance 0.5 per cent, bond 1.7 per cent, freight 1.9 per cent, camp site, etc., .08 per cent, repairs 5.3 per cent, fuel and oil 2.1 per cent.

These bids are made on 21 miles of pavement, no part of which will be farther than 3 1/2 miles from the railway site. The source of supply of material, except steel, shall be at such distance from the unloading plant that a 5-cent per hundred freight rate will apply on sand and rock.

To take an example in the East, the figures given by the Highway Commission of Pennsylvania for roads in that state are as follows:

Total cost of reinforced concrete road with hill-side brick on grades, built with light grading and local materials, \$58,000 per mile, made up of the following items:

Freight charges.....	\$6,000 per mile, or 10 per cent
Materials.....	13,000 per mile, or 26 per cent
Grading.....	9,000 per mile, or 15 per cent
Labor.....	13,500 per mile, or 24 per cent
Profit, insurance, etc., etc.....	14,500 per mile, or 25 per cent

It can readily be seen that the freight rate is not an undue proportion of the total cost of the road. These roads do not always pay freight charges. Often the materials, except cement, are close to the work and hauled by trucks. When the railroad is used the volume is usually large and is moved by rail close to the work. The very conditions surrounding the operation compel the minimum rates on most of the materials.

**Iron Ore**

The rates on iron ore from the heaviest shipping ranges, the Mesabi, Vermilion and Cuyuna, in Minnesota and Wisconsin and Michigan, were not advanced August 26, 1920, under Ex Parte 74, to the upper lake ports, but they did receive an advance in 1918 under General Order 28 of the Railroad Administration.

The rates from Wisconsin and Michigan ranges were advanced this spring and there were also advances under Ex Parte 74 from the Lake Erie ports to the furnaces. Ore is sold delivered at Lake Erie ports, and the statement showing the price at Lake Erie of Bessemer and non-Bessemer ores for the years 1893 to 1920 inclusive, with the rail rates to Lake Superior and the vessel rates from Lake Superior to Lake Erie indicate that, after deducting the present rail rate to Lake Superior and the lake rate to Lake Erie, the producer receives a much higher net price for his ore than in former years.

The shipments of ore, of course, are greatly affected by the prevailing industrial conditions, especially with the steel production. For several years past shipments were as follows, in tons:

STATEMENT OF IRON ORE IN TONS OF 2,240 LBS. SHIPPED FROM RANGES IN MINNESOTA, WISCONSIN AND MICHIGAN (UPPER PENNSYLVANIA) DURING CALENDAR YEARS 1916 TO 1920, INCLUSIVE

Range	1916	1917	1918	1919	1920
Marquette.....	5,396,007	4,874,150	4,354,207	2,992,212	4,608,323
Menominee.....	6,464,363	6,045,750	6,378,698	4,444,868	6,562,106
Gogebic.....	8,489,658	7,981,684	7,936,701	6,230,839	8,763,332
Vermilion.....	1,947,200	1,530,692	1,192,908	929,049	1,007,435
Mesabi.....	42,525,612	41,445,211	40,396,711	31,997,699	37,149,277
Miscellaneous.....	219,381	136,632	98,037	159,990	129,571
Cuyuna.....	1,716,818	2,422,884	2,478,800	1,859,865	2,191,528
Total all Ranges.....	66,658,466	64,437,003	62,836,082	48,812,532	60,411,572

The movement, in tons, of iron ore and other ores for the entire United States for each of the quarters of 1920, during the last quarter of which the higher rates were in effect, was as follows:

	1st Quarter	2d Quarter	3d Quarter	4th Quarter
Iron ore.....	3,215,109	24,183,287	37,487,357	20,605,039
Other ores.....	5,219,500	6,355,047	6,283,422	3,843,791
Total.....	8,434,609	30,538,334	43,770,779	24,448,830
Total for year.....				107,192,552

Those figures show that of the total iron ore movement over 60 per cent is produced in the northwest.

The foregoing shows that freight rates had no effect upon the movement of iron ore. At the present time there is a very light

movement of ore, due to the very large quantity moved last year, a large portion of which is still on the docks at the Lake Erie ports, mainly caused by the decline in steel production, a very small proportion of the furnaces being in operation at this time.

### Passenger Travel Not Seriously Affected

While there has been considerable complaint about the increased passenger fares, the increase has not seriously affected passenger travel. Undoubtedly the increased fares have caused some letup in travel, but a reduction of the fares at this time would not increase the travel sufficiently to offset what would be lost by the reduction. The falling off has been as great in the short hauls as in the longer hauls. The present policy of the railroads to make special fares for excursions and to summer and winter tourist resorts is satisfactory, both to the public and the railroads.

The number of passengers carried for the last four months of 1920, when the higher fares were in effect, in comparison with the last four months of 1919, was as follows:

Last four months, 1919.....	398,576,087 passengers
Last four months, 1920.....	399,435,875 passengers

As showing the trend of passenger business the following earnings are given for the first two months of 1921 in comparison with the same months of 1920:

	January	February
1920.....	\$91,874,146	\$82,571,063
1921.....	105,295,673	88,492,533

There has been considerable objection raised to the so-called Pullman surcharge, principally because of the fact that it is a new application in this country of a theory of passenger fare-making which prevails in other countries and is applied on steamships as well as railroads. The passenger earnings of a Pullman car are practically limited to 32 passenger fares, while a coach costing one-half the price of a Pullman and weighing a third less will accommodate from 70 to 80 persons. In other words, the carrier must haul 2½ Pullman cars to accommodate the load of a passenger coach. The surcharge of 50 per cent of the cost of the Pullman ticket is a comparatively small charge for the additional space occupied and the comfort given to the passenger, and it has not lessened to any considerable extent passenger travel.

### Panama Canal Traffic

Domestic freight tonnage moving between Atlantic and Pacific ports through the Panama Canal in vessels controlled by the United States Shipping Board and independent concerns is increasing rapidly. The rates have been going down steadily for the past three or four months, and there is very active and rather severe competition between the independent carriers and the vessels operated by the United States Shipping Board. This traffic, in both directions, is largely taken away from the all-rail lines. For many years past (except during the war) there has been active competition for this traffic between the all-rail lines and the steamship lines operating between the Atlantic and Pacific ports. The sailings now are entirely by the Panama Canal, which avoids transfer enroute and gives the shortest distance; therefore the water service today is more valuable than ever before. Competition between water carriers themselves has already brought rates down to an unremunerative basis, and unless something be done to stabilize the water rates it is certain that competition will force them still lower and make an unprofitable and consequently less dependable water service. And such competition will be unfair to the rail lines.

The rail lines, especially in the West, have been a necessity for the development of the country. The water carriers have not developed any considerable traffic between the Atlantic and Pacific ports in their years of operation. The business secured in the past and the traffic they are securing today is what has been developed by the all-rail lines. Necessarily, we expect this water service to continue and to take a share of the traffic adjacent to the coast, especially of the heavier commodities, that move more readily by water; but it would seem in the public interest, as well as in the interest of the competing rail lines, that the water rates be stabilized and that the Interstate Commerce Commission be given jurisdiction over them.

We also feel that for the use of the Panama Canal such charges should be made as would pay the interest on the investment and the expenses of operation. While it is true that the principal reason for the construction of the canal was for war or defensive purposes, and it was a necessity which we all recognize for the protection of our country, its use by commercial vessels, especially in domestic traffic between the two coasts, and in competition with the transcontinental lines, should pay a fair proportion of the expense of maintenance and interest on the investment in this waterway. The rail lines pay millions of dollars in taxes on their right-of-way, and it would hardly be considered fair to permit the water lines competing with them to make use of this costly right-of-way by water without paying any portion of the cost of it.

While the manufacturer on the Atlantic and Pacific coasts should be given every benefit of his water location, his advantage should not be increased by still further reducing his cost of distribution at the expense of the interior manufacturer, who will have to pay his share of taxation necessary in case the canal is not made self-supporting.

The water lines should not be restricted as to rate competition between ports in this country and foreign countries where they are in active competition with the vessels of foreign nations. But between ports of the United States, where they are privileged to handle business without competition of foreign carriers, there is no logical reason why their rates should not be under the jurisdiction of the Interstate Commerce Commission, as are those of the rail carriers with whom they compete. Reasonable rates for service on the water would then be prescribed by the commission. Such rates would yield a profit and support a regular, dependable service. This would be far preferable to spasmodic reductions in the water rates, which would result in embarrassment to competing water and rail carriers and make the service far less reliable and less satisfactory, and which would allow tramp steamers to come in for a brief period and take away desirable water business and more or less demoralize the rates and (as has been the practice in the past) leave the coast-to-coast business when they found better paying tonnage elsewhere.

### Depressed Business and Railroad Rates

The present depression in business, while distressing, is no different from depressions in the past. We had one in a smaller degree in 1907. There was a great depression in 1893. None of those depressions were preceded by any general advance of freight rates and passenger fares. We had been warned to expect the present period of liquidation and the consequent depression as an aftermath of the World War. In 1914, just prior to the commencement of the war, there was a depression in business in this country of several months' duration, which had become very severe, especially in the industrial sections in the East, and promised to be of long duration and great severity, but it was cut short and turned into a period of prosperity by the heavy purchases from this country by France, England, Italy and the other allies. A very severe depression followed the armistice in November, 1918, during which the tonnage of the carriers fell off considerably. It lasted until the following June.

I feel that what I have presented sustains the claims with which I started—that is, that the advance of rates authorized by the Interstate Commerce Commission in Ex Parte 74 did not operate seriously to impede the traffic of the country, referred to in Point 3 of the Senate Resolution, and that therefore no occasion exists for any general action, as indicated in Point 5, toward reducing rates by either the Congress or the Commission.

Indeed, as before mentioned, it is not practicable to make any general reduction in rates until the railroads of the country have been put in a going condition, either by a reduction of expenses, or by an increase of tonnage, or by both.

Senator Kellogg asked if Pacific Coast lumber companies had not been making arrangements to ship their lumber to Eastern points by the Panama Canal. Mr. Chambers said they started to make such arrangements before the rates were increased and that they were trying to do more business in the Eastern territory. There is a proposition before the railroads now to reduce the rail rate to compete with the water rates to points inland from the Seaboard. He said the railroads did not expect to meet the water rates at Baltimore and New York, but had expected to adjust the rates so that a certain proportion of the lumber going into trunk line territory will move by railroad. This led to a lengthy discussion of the theory of making the water competitive rates, during which Mr. Chambers pointed out that in some cases the railroads can afford to make very low rates to get loading for cars that move one way empty. Senator Cummins remarked that his statements were rather contrary to the general understanding that the markets have not been supplied with fruits and vegetables during the period of higher rates. Mr. Chambers said the markets had been fully supplied ever since the season opened.

"It may be," said Senator Cummins, "that the larger supply that is indicated by the movement will account for the low prices received by the producers. I wanted to call attention to that because there is a very general misapprehension with regard to the moving of these fruits and vegetables during the period of high freight rates."

Mr. Chambers said that the difficulties of fruit and vege-

table producers lie largely in marketing conditions, but that the shippers say that in many cases they are not receiving in the markets enough to pay the actual cost of production plus the freight and that if this continues the amount of planting for the future will be reduced. The railroads do not want the acreage to be reduced and if the situation is as bad as the producers say something may be done about it, but the fruit and vegetable shippers must bear their reasonable share of the effects of the readjustment period and if they are getting cost the rates ought not to be reduced to a point that will transfer the loss to the railroads. He said he had known of similar cases of the same kind for many years that had very little to do with the freight rates. Sen-

ator Stanley said that if the railroads were not making money out of the rates from Florida to the Eastern markets, they must be losing still more money on the rates on the longer haul from the Pacific Coast and he thought the committee ought to investigate it. Senator Kellogg remarked that the Interstate Commerce Commission has been investigating it for 20 years. Mr. Chambers added that the present rates are based on the Interstate Commerce Commission's investigation. Referring to the recent emergency reduction in the rates on stocker and feeder cattle from the Southwestern ranges, Mr. Chambers read a telegram from one of his representatives in Texas pointing out that movement of cattle was very little increased by the reduction.

## Results on the Chicago, Milwaukee & St. Paul

Statement by H. E. Byram, President, C. M. & St. P.

H. E. Byram, president of the Chicago, Milwaukee & St. Paul, appeared before the Committee on May 26 and presented a statement confined to the situation in the western and northwestern part of the country as reflected in the operations of the Chicago, Milwaukee & St. Paul. He said in part:

Unusual efforts have been made since federal control terminated to curtail expenses in every way possible, and it will be the purpose of this statement to illustrate in various ways that these efforts have been productive of results.

It is regretted that the attitude of some of those who speak for railroad employees of the country does not tend to promote good service. For some time past efforts have apparently been made to develop a belief on the part of the public as well as railroad employees that the responsible officers of the railroads were not operating them efficiently and economically and it is greatly to the credit of the rank and file of employees of the railroads of the country that they have not been misled by these false doctrines, as is shown by the general willingness to co-operate with the management of the railroads in bringing about the necessary efficiency and economy in their operation which prevails at the present time, as has been repeatedly stated by the railroad executives at this hearing.

I shall endeavor to show that the charges frequently and recently made by those critics, that the railroad managers are not alert in endeavoring to prevent wasteful practice and install economical methods, are not correct.

As a part of this testimony I submit for the record a statement showing various statistics concerning the operation of the Chicago, Milwaukee and St. Paul Railway for the years 1916 to 1920 inclusive. The total operating expenses show an increase in 1920 over 1916 of \$90,932,069.93, while the net operating revenue decreased from \$36,844,637.81 to \$3,461,613.17. The total payroll in 1920 over 1916 increased \$61,305,417.43. The average number of employees increased in 1920 over 1916 approximately 11,000 or 21.56 per cent. The per cent of payroll to total operating revenue increased from 44.49 in 1916 to 65.72 in 1920.

The total freight ton miles increased in 1920 over 1916 only 3.96 per cent. These figures indicate that although approximately the same freight ton miles were moved in both of these years 11,000 more men were required to perform the service and it cost approximately \$60,000,000 more on the payroll to pay them.

The items of labor and fuel constitute 80.044 per cent of the cost of operating the railroad, these two items absorbing approximately \$135,000,000 of the total of \$164,000,000 operating expenses for the year 1920, and the next part of the exhibit is designed to show the enormous increase in the cost of fuel, which increased from \$11,797,880.72 in 1916 to \$23,796,922.14, although approximately 250,000 tons less were used in 1920. If we had been able to buy the coal used in 1920 at the price of coal in 1916 we would have saved \$11,999,031.42.

The balance of the figures are designed to show that the usual measures of efficiency, viz., increased train load, increased carload, decreased locomotive miles, revenue ton miles per ton of fuel used, etc., were present in 1920 but by reason of the increased cost of labor and material and the failure to increase freight and passenger rates as operating costs increased, defeated the efforts of the operating department, and instead of producing increased net revenue, which efficient operation ought to produce, the opposite result developed, and, as shown above, the net operating revenue actually decreased from \$36,844,637 in 1916 to \$3,461,613 in 1920.

Taking up the details, we find that the loaded car miles de-

creased 83,322,054 miles, while the empty car miles increased 4,101,925 miles; but the average number of tons in each loaded car per mile increased from 20.667 in 1916 to 25.485 in 1920, or 23.31 per cent, an item of efficiency that should have produced net revenue. The total passenger locomotive miles decreased from 18,186,754 in 1916 to 16,897,163 in 1920, notwithstanding the fact that the total passengers moved one mile shows an increase of 128,527,180. The total freight locomotive miles shows a decrease of 4,105,857 in 1920 over 1916. This reduction in freight locomotive miles is reflected in the increase in train load from 503.23 in 1916 to 620.04 in 1920, or 23.28 per cent.

I believe these figures show conclusively that the measures of efficiency which usually are applied to the operation of railroads and which normally tend to produce net operating revenue, failed of their usual result because of conditions which were beyond the control of the operating staff because of the abnormally increased cost and inadequate addition to the revenue by means of increased freight and passenger rates.

### Co-operation Between the Managements of Railroads and Their Employees for Producing Efficiency

The following quotation was taken from the introduction of the testimony of W. Jett Lauck before the United States Railroad Labor Board:

No far reaching improvements in railroad efficiency are possible without close co-operation between the managements of the railroads and their employees. Without the good will of their men, without a high level of morale and enthusiasm devoted to a common end, the improvements of service and the reduction of cost cannot be achieved. If the two great elements of railroad operation, management and workers, are to be forever at loggerheads, each pulling against the other, each mistrusting and condemning the other, each trying to wring concessions which the other is reluctant to grant, the outlook for eliminating the many wastes revealed in the foregoing pages is dark indeed.

We agree with the principle advocated because the officers and employees of the Chicago, Milwaukee & St. Paul for several years, and particularly of late, have been carrying out the principle of co-operation and study, mutually, in finding and practicing economies and improved practices. Committees have been formed of officers and employees on every division, and at the larger stations and terminals, with regular dates for meeting, usually monthly, to study the details of operation in each particular locality and the situation as a whole for the purpose of eliminating waste and generally promoting efficiency, and it is a pleasure to state that the various campaigns inaugurated to save fuel and supplies and to avoid wasteful practices have been promptly, intelligently and earnestly supported by the employees generally in all classes of service, indicating that the officers and employees of this company are having no difficulty in working out a program in co-operation and harmony.

During the summer of 1920, while business was good and cars in demand, a drive to increase the mileage or freight cars brought very satisfactory results. The miles per day which had been running about 22 were brought up to about 35 in September and October when the demands were heaviest. Since then the great slump in business has made it impracticable to continue this mileage as cars have been plentiful.

Notwithstanding that the number of locomotives has not materially been increased the total capacity of all locomotives has steadily and substantially increased. This is due to the fact that the locomotives that were retired were obsolete and of small capacity.

Freight cars are constantly being retired on account of decay and obsolescence. The cars retired usually are of small capacity

and are replaced with modern steel-frame cars of large capacity. Although 2427 more freight cars were retired than replaced the total capacity of all cars has increased and the average capacity per car has increased from 35.17 to 39.10 tons.

In addition to the new freight cars purchased more than 5,000 cars were overhauled during 1919 and 1920 and improved draft members, roofs, ends, etc., were applied at an average expense of approximately \$1,000.00 per car, or a total of \$5,000,000. This was done to bring this equipment up to traffic requirements, reduce the maintenance cost, and eliminate, so far as possible, the days lost on repair tracks, and loss and damage to loading.

Even with so large an expense for this heavy work the benefits were immediate as the 1920 repair charges were less than those for 1919, reflecting the improved condition of the freight equipment, caused by retiring old cars of small capacity and replacing them with new cars of greater capacity and the rebuilding and strengthening of cars suitable for such improvements.

### Financial Results

I have gone over the various tests of efficiency which are usually applied to management of railroads except one, and have shown, by the operations of this railroad, that it meets successfully every one of these tests except the one I have so far omitted. The omitted test is the test of net financial results. It is obvious from our reports and from the foregoing statement that the net financial results of our operations have been most disappointing. As the operations of the road have measured up to the usual tests of efficiency, it is a great disappointment to find that this efficiency of management has not been reflected in satisfactory financial results, and the facts, I submit, fully justify us in seeking the cause in forces beyond our control. It is not far to seek. We find it in the expense account, which is, to a very large extent, determined by the government, and not by the company, and to a substantial extent also by economic conditions fixing the prices of materials and supplies, and thus also beyond the control of the company.

The railroad problem is, in my opinion, comparatively simple, and its solution is not difficult or at least would not be if it were possible to apply ordinary business methods to its solution. But, unlike other businesses, a railroad cannot shut up shop when business is bad, and there are certain fixed expenditures for maintenance and operation which cannot be reduced to correspond with the decreased traffic, as well as various other needs of the public which must be served whether at a loss or not. At the present time it is costing the railroads more to produce transportation than they can sell it for. Therefore, we must either increase the selling price or reduce the cost. It is obviously impossible at this time to increase the selling price of transportation above the present general level; therefore, we must reduce the cost. There are two ways of doing this, one is to increase efficiency and the other is to reduce expenses.

It has been shown by various statistics presented here that while there is always room for improvement the railroads of this country are functioning effectively and efficiently. Immense opportunity is available for further increasing economy of operation by large investments in reducing grades, double track, improving and increasing terminal facilities, additional cars and locomotives, modernizing and improving existing equipment, installation of automatic signals and safety devices, enlarging shops and engine houses, purchase of new and improved shop tools and machinery, and in many other ways, all of which require the investment of immense sums of new capital, which cannot be obtained unless the net earnings of the railroads are such as to satisfy investors that such investments in railroad securities would be safe and productive.

At the present time, because of the disappearing net earnings of the railroads generally, money for improvements cannot be borrowed except at rates considerably above the rate permitted by the Transportation Act to be earned on the value of the improvement.

Therefore, it would seem that the need of the immediate situation requires a reduction in operating costs, and that fuel and labor, which absorb 80 per cent of the total operating costs, should bear the larger portion of the reduction. Fuel and other supplies already are coming down and the United States Railroad Labor

Board has announced that in the near future it will order an adjustment of wages downward. These two features of the situation are encouraging and with the return of the normal volume of traffic of the country the financial condition of the railroads should be materially improved, depending largely upon the extent of reduction made by the Labor Board in the war-time wages of railroad employees.

### Freight Rates

Much has been said about reducing freight rates recently and the prevailing impression seems to be that they are generally too high, but when it is considered that the average gross earnings of the railroads of the United States as a whole for hauling a ton of freight one mile since September, 1920, when the last raise in freight rates took effect, has been only 1.217 cents per ton per mile, it will be seen that freight transportation probably is the cheapest commodity in the country, notwithstanding the large shrinkage which has taken place in other commodities. But the vast volume of traffic, the large units in which it is carried and the immense distances it is transported in this great country have caused many of our citizens to lose sight of the astonishingly low price which the railroads receive for their freight service when reduced to the unit of moving a ton of freight one mile instead of the usual figures of billions of ton miles and millions of dollars.

Since the earnings of the railroads of the country on the present rate basis are inadequate to meet their requirements it is obvious that no general reduction in rates can be considered until the cost of operation can be reduced sufficiently to assure the railroads at least the net return authorized by the Transportation Act.

Mr. Byram said that of 100,000 cars bought by the Railroad Administration the Chicago, Milwaukee & St. Paul took 4,000, agreeing to pay a maximum of \$3,050 apiece, but under the sliding scale contract under which the cars were purchased it looks as though they were going to cost between \$2,700 and \$2,800 apiece. In reply to a question as to the price at the present time, Mr. Byram said there are no accurate figures because nobody is buying any cars now, but he should think it ought to be possible to buy these cars at somewhere around \$2,000 apiece now.

Mr. Byram said that his road has not been earning operating expenses and taxes since the first of January and is about \$4,000,000 behind, while the volume of business is about 50 per cent less than that of a year ago. A large part of this, he said, is due to the cessation of the buying of lumber and partly because the copper activities are almost at a standstill. Senator Kellogg asked whether the building of the western extension was an advantage or a disadvantage. Mr. Byram said he thought it had been an advantage and that it has not been any disadvantage at least. One of the first things he did when he came to the property in 1917 was to take up that question, and it seemed to him the general impression is wrong. For the year 1917, he said, the western extension was producing 25 per cent of the gross earnings and 40 per cent of the net earnings. Mr. Byram said that arrangements had been made for taking care of the immediate future as to interest and taxes, but, of course, it would be necessary to have more net revenues before long. Asked whether a decrease in wages of 15 to 20 per cent would place his road on an earning basis, Mr. Byram said the wage award of last year added to the expenses of his road approximately \$20,000,000 a year, whereas the interest on the bonds is about \$17,000,000. If the wage decrease is less than 15 per cent, he said, it will be a little more than half enough, although the actual result would depend on the rates and the volume of business.

## Urges Prompt Payment of Federal Control Accounts

Statement by Samuel Rea, President, Pennsylvania Railroad

The government could materially assist the railroads in their present difficult situation, Samuel Rea, president of the Pennsylvania Railroad, told the Senate committee, by completing at once payments still due the roads from the federal control period. If this were done and the roads were allowed

to issue 15 year obligations for the amounts spent by the government for permanent improvements, as would have been done if the roads had themselves spent the money, their present position would be greatly improved, Mr. Rea said. An abstract of his statement follows:

I feel that this inquiry would not be complete without drawing your attention to some important questions which directly affect the present condition of the railroads and their immediate outlook. Your committee very properly examined the results of recent years, for it is clear that if the net returns of the carriers had been ample during the past decade they would now be able to go through the existing depression without serious detriment to their own credit and to the country.

The returns earned from operations for the years 1918 to 1920 cannot be taken as indicative, for the reason that the traffic rates were not adjusted to meet the current costs. In those years the railroad companies had the benefit of the rental under the federal control contract, and the guaranty under the transportation act, provided they realize, such rental and guaranty by actual payment. So far there are serious unsettled questions as to actual settlements for both periods. Unless a fair interpretation is given to the federal control and transportation acts, and the federal control contract, and of the conditions under which the railroads were taken over by the President, the amounts of federal control and guaranty period compensation will prove theories and not actualities, because they will not be paid to the railroads, and the cost either in whole or in part of restoring the properties and the disorganized organizations will be placed on the corporations, which would be an injustice and would endanger their financial condition.

### Present General Condition of the Railroads

In many particulars the present position of the railroad companies and their lack of traffic, is due to world-wide conditions, which prevail also in the other industries as well as in the railroad business. But the difference between these industries and the railroads in meeting those conditions is that the industries had the advantage of sharing in the high prices and profits of the war period, and at present the industries have the power to fix their prices and wages, and to shut down their plant if the business, or profits, do not warrant their operation. The railroads, however, were in the war period restricted to the returns of the test period, and even under the transportation act are not allowed to retain the profits made under reasonable rates if in excess of 6 per cent. Although the railroads were granted higher rates effective August 20, 1920, yet since that date they have proven to be insufficient to cover their costs, and yield a fair return. Though many railroads are facing financial difficulties, they cannot promptly reduce wages nor change the wasteful working conditions, to the level of the going wages and working conditions of the industries, through the territory they serve. That must be done by the Labor Board. By federal law the rates were to be fixed to produce a fair return, yet the railroads are apparently unable to insist upon compliance with that law so long as supply and demand restrict production and consumption, and reduce the volume of traffic.

The railroads, therefore, must get the requisite financial results to allow them to exist, by postponing all capital expenditures, by curtailing employment, by shutting down all possible activities on the road and in the shops and offices, by stopping the purchase and use of supplies, by postponing for the present, even though they will cost more later, all maintenance or replacement expenditures except those requisite for safety.

The return earned by all the railroads of the country for the six months ended February 28, 1921, was only at the rate of about 2½ per cent. per annum, on the value of the property devoted to public use, against a mandatory minimum return of 5½ per cent., but the transportation act alone can scarcely be blamed for the deficiencies of return which reflect a world-wide business depression—for one-half of this period very severe. It will be found by experience that, compared with war conditions, when we supplied all the world, our production is materially in excess of average consumption, so that production, price and consumption all need adjustment, and the railroads are bearing part of the costly loss of traffic incidental to these conditions.

The railroads are not earning fixed charges and fully maintaining their properties. They are short of working capital and are still in a business depression—one of the worst in their experience. While we hope that the bottom has been reached, I would point out that there can be no resumption of railroad prosperity until there has been an increase in the movement of coal, coke, iron, steel and other building construction materials and heavy products. The mines, industries and farms of the country must rise and fall together; one cannot be made prosperous or continue prosperous at the expense of another. Manifestly in view of these conditions as to operating expenses, and the necessity to pay taxes, fixed charges and sustain the credit of the railroads, it became an imperative necessity to reduce labor costs and enforce the serious retrenchments to which I have referred.

Therefore, the real railroad problem at present is to put the carriers in a position to meet their obligations, and support their investment during the period of depression. To save many of them from bankruptcy, a prompt and adequate reduction of

wages is essential, as well as the abolition of the wasteful national agreements, and the substitution thereof of agreements with the employees that will promote greater efficiency and provide reasonable working conditions, so that the wages and working conditions will correspond generally to present conditions. It is not a question of any controversy with employees or labor unions, and it originates from no desire to see that railroad men are not paid adequate wages, because that would be hurtful to the railroad business and cause the better men to go into other industries, but it is clearly a condition where the dollars earned are not sufficient to pay the wages, maintain the property, and also enable the companies to meet their obligations.

The property investment return for the calendar year 1916 enabled the railroads to exist and meet their obligations. It showed a return of 6.17 per cent. and a large volume of traffic was carried with great efficiency and economy. In that year out of every dollar of revenue earned 40.8 cents were paid to labor, but in 1920 59.9 cents out of every dollar were so paid. In 1916, after paying for materials, taxes and rents for equipment and joint facilities, 28.9 cents were left out of every dollar earned to pay fixed charges and a return upon the investment, but in 1920 only one cent was left. Therefore the fixed compensation for the first eight months of the year saved most of the roads from bankruptcy. Taking the last quarter of 1920, when rates as well as wages had been adjusted, it required 55.1 cents out of every dollar of revenue to meet the payrolls. The total payroll compensation rose from \$1,468,576,000 in 1916 to \$3,698,216,000 in 1920.

### General Rate Reductions Impossible

Under the conditions outlined it is clear that no horizontal or general reduction in rates can be granted, until such time as the net railway operating income of the railroads shows a very substantial improvement over the results now obtaining, which are at present insufficient to meet their fixed charges and usual dividends, and also until the railroads have restored any inadequacy of maintenance. Further, until the foregoing economies are effected, a general rate reduction would not be in the public interest, as it would force the railroads to produce and sell transportation for less than cost, and it is extremely doubtful if it would stimulate production, or increase purchases, of goods by the public. In addition, so long as the railroads cannot earn a fair return, and are much below the 5½ per cent. return, and have no cash surplus from the previous years, there must be a deficiency in transportation facilities, equipment and service, and the cost of that deficiency to the public is much greater than the continuation of transportation rates that give some fair measure of profits. Under such conditions it is evident that no steps should be left untaken which will strengthen the financial position of the railroads, as it is evident that while rates should not be reduced, it is equally evident that they cannot be increased under existing conditions.

### Funding of Capital Expenditures

#### During Federal Control

There has never been a doubt in my mind of the intention of Congress to authorize prompt and fair compensation settlements with the railroads for the federal control period, and for the guaranty period. The government assumed the possession, use and control of the railroads, and used them as if it owned them, during the war period. It also made large capital expenditures thereon, amounting to about \$1,200,000,000. These expenditures must be assumed and paid by the railroads with interest. Almost \$400,000,000 was for equipment, and was funded through the national equipment trusts, which require the railroads to pay back to the government these capital expenditures for equipment during a period of 15 years. This left about \$800,000,000 of capital expenditures, chiefly for road and facilities, to be funded by the carriers. Under the terms of the transportation act discretion was conferred upon the President to fund all these expenditures, but the right was conferred upon him with certain limitations to offset against such expenditures, amounts due by the Railroad Administration to the carriers on other accounts for the federal control period, and this right will, by an understanding with individual carriers and under the terms of the act, be exercised by the administration. However, under the different conditions that now exist, these arrangements should be altered if the carriers cannot meet them, as it is impossible for the railroads to sell securities and pay off all these capital expenditures at present, and they have a shortage of working capital and practically no surplus earnings.

In view of the present situation of the railroad companies, and having regard to the emergency which now exists, I suggest that the President should, in the public interest, exercise his discretion so as to permit the funding of the entire expenditures of the character referred to which were made during the period of the federal control. Expenditures for additions and betterments are capital expenditures and should not consequently be

taken care of even in part by the application thereto of current funds, or by withholding any part of the amounts due to the carriers for the federal control period. The railroads themselves would have been obligated to raise the capital in advance of making such addition and betterment expenditures, or else the work would not have been done, and the government—without loss to itself and receiving a good interest return—should be willing to fund these expenditures, instead of withholding the cash that the railroads need badly to meet current requirements, and help them to surmount this difficult period. I, therefore, respectfully suggest, unless the President will so exercise that discretion, your consideration of an amendment of the transportation act which will direct the funding of all expenditures for additions and betterments made during the period of federal control.

## Federal Control Act and Contract

### Differences Should Be Decided

I also suggest, as further relief, an amendment which will assure the observance of the recommendations made by the President at the time he took the railroads over, viz., that the railway properties will be maintained during the period of federal control in as good repair and as complete equipment as when taken over by the government, and further that investors in railway securities might rest assured that their rights and interests would be scrupulously looked after by the government as they could be by the directors of the several railway systems, which in effect means a full observance of the similar provisions of the federal control act. The seriousness of that situation is indicated in the recent statement by the director general, as of May 1, 1921, of the condition of the Railroad Administration in the matter of liquidating questions in dispute arising out of, or incident to, federal control.

The attitude of the director general is not complained of, and he aptly describes the matter when he says: "This adjustment and straightening out of this wonderful adventure on the part of the government presents for solution novel, complex and important questions wholly without precedent." But we may well ask what is to be the financial condition of the railroads while final conclusions are being reached.

The committee may recall, in this connection, the extensive negotiations over the standard contract, and the differences of opinion which have since arisen, to which the director general refers in his statement, as to the meaning to be placed upon the words "cost of labor" in the maintenance provisions of this contract. The railroads believe that it can be shown that the same amount of physical reparation was not produced by the dollars expended in the federal control period as in the test period, and therefore the pledge of the President and of Congress had not been made good. The Railroad Administration, however, holds the view, if I correctly understand their position, that the test of the performance of the pledge is the number of dollars spent for labor, taken in conjunction, of course, with the material applied, in the two periods for maintenance purposes. The carriers contend that the "cost of labor" is the cost to do the same amount of physical maintenance or reparation in the federal control period as compared with the cost to do the same work in the test period.

It cannot be too strongly pointed out that the view of the director general results in theoretical maintenance only—that is, in materials not applied to or in place on the property—while both the President and the act of Congress promised and required that the property should be actually and not theoretically maintained.

If, however, the contract can be said to justify the view of the Railroad Administration, notwithstanding it specifically requires that the cost of labor must be dealt with, and also requires physical reparation, and not merely a dollar test covering only the price of labor, then in the interest of right and justice Congress should clarify the federal control contract provisions as to maintenance, which the director general points out as the chief cause for difference of opinion between the Railroad Administration and the carriers, and which he intimates can only be finally determined by the Supreme Court. This, I feel, could, if necessary, be covered by an amendment to the transportation act to the effect that the extent of the physical reparation should be the measure of the performance of the President's pledge, but even here I am advised that no amendment is required, as the President's authority is already ample under the transportation act.

Further, I suggest this because, based on the director general's report, as to settlements, it may take about 3½ years more to review all claims, and if appeal must be made to the Supreme Court to decide the meaning of the federal control act and contract as they may apply to the different conditions and questions on each road, it may take many more years. The essence of that situation is that many of the roads will be forced to accept much less than they are entitled to, and accept the burden, hoping to

work it off in succeeding years. In making this suggestion I am at the serious disadvantage of not knowing the actual condition of the claims made by the railroads, both those having federal control contracts and those not having federal control contracts; nor the physical reparation in ties, rails, ballast, stations, shops, and other structures, or in locomotive, passenger cars and freight cars, which they will claim as due to them; but the director general's figures, based on the claims already presented, state it is probable that the under-maintenance claims will run between \$700,000,000, and \$800,000,000. I am convinced from talks with other railroad executives that this question of under-maintenance is a live one, combined with the failure to fund all capital expenditures, and the delay in settlements to be made for the guaranty period to which I will refer, is at the root of the weakness of railroad credit because all of these questions deprive the railroads of the ready cash to meet current requirements and to place their property in efficient condition. The main point to my mind is that the situation will not be met merely by legal argument but that substantial justice should be done to the railroads through the fulfillment of the President's recommendations and the act of Congress by ensuring the return to the owners of their property and equipment in substantially as good condition as when they were taken over by the government, and as that has not been done they should be properly compensated. Unless this is done, then I want to make it clear that, for the federal control period and the guaranty period, they will not receive what was promised them by the President and Congress. I am asking for a fulfillment of the promises, and nothing more.

### Settlements for the Guaranty Period

The transportation act seemed to give the broadest power to the Interstate Commerce Commission to make settlements for the guaranty period, and also to determine the expenses. Unfortunately this section of the act, in authorizing compensation to the railroads and in dealing with maintenance, made reference to the terms of the federal control contract, and leads us into practically the same difficulties of interpretation as in the federal control settlements, and that while the Railroad Administration hesitates to settle, the commission may be discouraged in using the broader powers of settlement for the guaranty period conferred on it by the transportation act. I hope I am mistaken in this view as to the guaranty period settlement. The final result means that the conditions prevailing during the guaranty period are not to be fully taken into account. In addition to the maintenance expenses, other expenses should be viewed with a full consideration of the conditions existing in the guaranty period. I have reference particularly to the extra items of cost such as the unauthorized strike of April, 1920, which affected railroad traffic for several months before the congestion eased off; the return of large numbers of cars scattered all through the country to the home railroads; and other causes of increased costs in that period which should be recognized. Despite all these conditions the public service rendered showed improvement and greater efficiency, and, while the business lasted, each month was showing a betterment of operating conditions compared with the preceding period of federal control.

Here was a transition period from war to peace designedly selected by Congress to assist the railroads in adjusting their conditions at the end of federal control, and in re-establishing their working organizations and credit on a peace basis, and yet the net result of the act, if interpreted as suggested, will not enable the railroads to secure the result intended to be realized. Instead the result will be that the railroads shall not be fully compensated for their expenses during this period, but that when they receive the guaranty for six months, as established by what I regard as a misconception of the transportation act, they must at their own cost pay a portion of the expenses of operation and maintenance during the guaranty period, because the expenses are out of line when an attempt is made to adjust such expenses with one-half of the average annual expenses of the test period. If such an interpretation is allowed to stand it will be seen that the intention of Congress would be negated, and the benefits that it intended to confer would not be realized, and that provisions of the act by which all surplus operating earnings were to be turned over to the government for the guaranty period, and the deficits were to be paid by the government for that period, would be rendered null and void. As this is so far from the intention of those who insisted upon the passage of the transportation act, and its consequences are so widespread to the country at large and to the railroads themselves, then, if the Interstate Commerce Commission cannot so exercise the discretion given them by what I regard as the true intention of that act, the passage of an amendment which would enable the real purpose of the transportation act to be made effective seems imperatively necessary and just. It is estimated that this would repay to the railroads several hundreds of millions of money actually expended for operating

and maintenance purposes in the guaranty period, which they believe are at present not being paid because of a clear misinterpretation of the law.

In offering these various suggestions of relief to the railroads, relative to the funding of the war capital expenditures and the removal of differences of opinion that prevent prompt and fair settlements for the federal control and guaranty periods, I do not think that I have suggested anything which is not in the public interest, and which ought not to be willingly acquiesced in. If the present conditions had been anticipated I cannot doubt that Congress would have dealt even more liberally with the railroad companies than has been done in the transportation act. I would be negligent of what I conceive to be to the real interest of the country in this difficult transportation situation, and to the investors in the railroads, if I did not bring this situation, without criticism of any government officer or department but because of real force of existing conditions, to your attention.

### Wage Orders Result in Inequalities

Inequalities in the treatment of railroad employees resulting from the application of the wage standardization policy of the Railroad Administration to diversified conditions of employment were described before the committee on June 1 by J. G. Walber, secretary of the Bureau of Information of the Eastern Railroads, in a review of the numerous wage orders, reclassifications and other adjustments made during the war period. Mr. Walber ascribed much of the loss of morale of railroad employees during the war period to their dissatisfaction with the disparities resulting from the wage orders.

"The reclassification of employees in the shop and telegraph service and the rigid application of the bases of pay and rules throughout the United States in disregard of the diversified conditions encountered have produced some very remarkable and in fact grotesque results," said Mr. Walber, after giving an estimate that the wage scales of approximately 73 per cent of the railroad employees were standardized during the period of federal control. "It will be apparent to this committee that even the general description of these wage orders shows that disparities were bound to result and inequalities must have been the natural consequence, with the resultant effects upon the morale of the employees, who, it can be relied upon, are familiar with what other employees receive and who may, perhaps not deliberately, reflect their dissatisfaction in the character of the service they render.

"The practical effects of the national agreements were presented to the United States Railroad Labor Board and under their Decision 119, they are to be cancelled July 1. Just what relief will result will depend upon the ability of the managements and the representatives of the employees to negotiate new agreements, and in the event of their failure to reach complete settlements, what rules the Labor Board will decide shall be adopted. The question is far from being settled. From the newspaper accounts it appears that it is generally assumed that the decision of the Labor Board will relieve the railroads of the entire expense of these rules. This is purely speculative and in the present situation I cannot see how anyone can calculate what will be saved to the railroads.

"It also appears that when Congress was considering the legislation which culminated in the transportation act it must have been aware of at least some of the conditions attaching to the standardization of railroad wages and working conditions, and that relief therefrom would result from the requirement that in fixing just and reasonable wages and working conditions the United States Railroad Labor Board must take into consideration among other relevant circumstances.

"(1) The scales of wages paid for similar kinds of work in other industries.

"(2) The relation between wages and the cost of living.

"In our opinion, Congress must have had in mind that these elements would be given the most direct and specific application permissible under the circumstances in order to fix just and reasonable wages and working conditions, as it

is obvious that, with the diversified conditions in a country so large as the United States, the establishment of rigid and inflexible rules which cannot take into consideration these diversified conditions, must to a large extent fall far short of meeting the requirements of justness and reasonableness." No standardization of wages was recommended by the Railroad Wage Commission, Mr. Walber said, but dissatisfaction with the award on the part of numerous classes of employees led to reconsiderations by the Railroad Administration of various phases of the award and reclassifications of employees in numerous supplements, interpretations and addenda to the original wage order, and the Railroad Administration decided to standardize the rates for all the skilled crafts for the entire country.

Supplement No. 4 to General Order 27 was the beginning of the reclassification of employees in the mechanical department, which in addition to putting into effect the eight-hour day with time and one-half for overtime, effective August 1, 1918, also provided minute designations of the work to be performed by the respective classes and required that work which had ordinarily been performed by laborers at the laborer's rate be performed by mechanic's helpers at a higher rate.

"The uniform application of the eight-hour day to all these different classes of employees working under different conditions produced very pronounced distortions in the monthly earnings of these different classes of employees themselves and also in comparison with other classes of employees, resulting in outspoken dissatisfaction," said Mr. Walber. In the case of car inspectors, he said, it resulted in an increase of 226.5 per cent in 1918 as compared with 1916 and in the case of car repairers in an increase of 208 per cent.

Great disparities also resulted, Mr. Walber said, from the application of minimum rates to large numbers of employees who had previously received different rates in accordance with different conditions, and also from the methods used in converting former monthly rates to new hourly rates. For example, he said, six employees in telegraph and station service, each paid \$75 a month, because of the difference in the number of hours and days they worked received hourly averages ranging from 20.55 cents to 35.94 cents. Under Supplement No. 13 to General Order 27, their rates were changed to an hourly basis of 51¾ cents each, which produced increases ranging from 43.99 to 151.82 per cent.

"It must also be recognized," he said, "that for the different kinds of positions covered by the supplement it had been the general practice to have different rates, and the introduction of the minimum rate, with the formula for conversion, practically destroyed the relations between the different kinds of positions, which naturally must have affected the morale of the service." As approximately 50 per cent of the railroad employees of the United States are on the Eastern railroads, the increases resulting from these orders, Mr. Walber said, could not be distributed with any degree of uniformity upon all the railroads and while the increase in the average annual compensation per employee in train service in the United States from 1916 to 1920 was 84.6 per cent, in the Eastern territory it was 94.23 per cent.

Mr. Walber said he was not criticizing what was done by the Railroad Administration because he realized the difficult conditions which it faced, but that it had to adopt many short cuts to accomplish results under pressure which prevented the consideration which should have been given.

NEW SLEEPING CAR LINES on trains already in service between Memphis and Asheville on the "Memphis Special"; between Nashville and Asheville (via the N. C. & St. L. to Chattanooga) between New Orleans and Asheville via Mobile; between Norfolk and Asheville on trains 3 and 4 to Danville and beyond on trains 11 and 12.

# General News Department

The Chicago, Milwaukee & St. Paul is converting a number of sleeping and parlor cars into open top observation cars to be used on the company's electrically operated lines in the Rocky and Cascade Mountains.

A wage reduction of 15 per cent has been accepted by masters, mates, pilots, and engineers of railway ferries operated on Lake Michigan, Lake St. Clair and the Detroit river. Non-licensed employees agreed to a similar reduction in April.

The American Association of Traveling Passenger Agents will hold its annual meeting at Hotel Utah, Salt Lake City, on September 12, 13 and 14. The president of the association is Gordon Noble, of Philadelphia, and the secretary is H. K. McEvoy, Chicago.

Representatives of the railroads in the Southeastern district and the executives of the four brotherhoods of train service employees began a conference at Washington on May 31 to consider the request of the brotherhoods for the organization of a regional board of adjustment.

Fifty persons were injured when a freight train on the Pennsylvania crashed into an electric car on the Indianapolis & Southern at Edinburg, Ind., on the night of May 30. The accident occurred in the center of the town on the main street. The cause has not been determined.

The Chicago Chapter of the American Society for Steel Treating has elected the following officers: Chairman, H. M. Wood, Ingalls-Shepard division, Wyman Gordon Company, Harvey, Ill.; vice-chairman, T. A. Lovegren, Standard Forging Company, Indiana Harbor, Ind.; secretary-treasurer, Harry Blumberg, Illinois Steel Company.

The Mississippi Central has nearly or quite completed negotiations for trackage rights by which it will run trains through to Mobile, Ala., over the Gulf, Mobile & Northern. The eastern terminus of the Mississippi Central is at Hattiesburg, Miss., the western terminus of the Hattiesburg branch of the Gulf, Mobile & Northern, whence the distance south-east to Mobile is 96 miles.

The Traffic Club of New York, endorsing an address given before the club on May 31 by Howard Elliott, of California, has adopted resolutions urging repeal of all full-crew laws. Mr. Elliott called attention to the fact that laws of this kind are still in effect in 19 states, including New York and New Jersey; and proposed campaigns of education such as were employed in Missouri to defeat a proposed full-crew law.

Colonel John F. Stevens, president of the Interallied Technical Board, which operates the Chinese-Eastern railroad, together with about 2,700 miles of the Trans-Siberian road, sailed for China on May 28, to resume his duties. The Interallied Technical Board was formerly composed of representatives of England, France, Italy, China, Japan, Russia, Czechoslovakia and the United States. At the present time, however, the Italians and the Czechoslovaks have withdrawn, leaving the remaining nations to carry on the work.

Brooks Morgan, president of the Biscuit & Cracker Manufacturers' Association of America, in his address at the annual convention of the association in Atlantic City, N. J., on May 31, declared that railroad rates at present are stifling industry; but he added that, in spite of high rates, manufacturers must co-operate with the government authorities and with the railroads "for the elimination of hundreds of unnecessary employees and for a reduction of wages;" for all must realize that the present earnings of the railroads are not sufficient for their support.

The Missouri-Illinois Railroad on June 1 opened its entire line for business. The line of this company, which is the successor of the Illinois Southern, extends from Salem, Ill., southwest to Kellogg, on the Mississippi River, and from St. Genevieve, Mo., southwest to Bismarck, a total distance of 127 miles, with a branch from Collins, Ill., south, to Chester, 11 miles. Regular passenger trains will be run between Salem and Chester and mixed trains between St. Genevieve and Bismarck. The river is crossed by a transfer boat. Freight service will be operated, as required, from Salem to Chester and Kellogg.

## Railway Returns for April

Preliminary returns for the month of April for 171 roads operating 199,929 miles, show total operating revenues of \$382,409,000, an increase of 8.4 per cent over April, 1920. The operating expenses were \$329,911,000, a decrease of 6.4 per cent from April, 1920, and the net operating income was \$27,566,000, as compared with a deficit in April, 1920, of \$21,210,000.

## Protective Section—A. R. A.

The Protective Section of the American Railway Association, formerly the Railway Special Agents and Police, will hold its first annual meeting at Hotel Pennsylvania, New York City, on Thursday and Friday, July 14 and 15. Secretary J. C. Caviston, in his announcement, gives the rates not only of the Pennsylvania but of six other hotels, and suggests that members should order rooms at once by wire, telegraphing directly to the hotel. The subjects to be considered at the meeting will be announced later.

## Proposed Changes in Car Service Rules

J. E. Fairbanks, general secretary of the American Railway Association, has issued circular No. 2161 calling for a letter ballot, ordered by the board of directors and to be canvassed on June 23, on proposed changes in car service rules numbers 1, 2, 3, 4 and 5. The proposed changes provide for improved practice in the return of empty cars to owners and for a more favorable operation with respect to empty car mileage (rule 3, paragraphs d and e). It is proposed that a road unable to dispose of empty cars belonging to indirect connections by loading them to or in the direction of home, may return them to the road from which they were received, on the basis of record rights.

## Proposed Revision of Per Diem Rules

The board of directors of the American Railway Association, through a circular issued by General Secretary J. E. Fairbanks, and endorsing a resolution of the transportation division, has called for a letter ballot, to be canvassed on June 20, proposing amendments to per diem rules numbers 1, 11, 13, 14 and 15. The proposed changes aim to provide more economical accounting; to avoid opportunity for dispute in settlements of per diem, and to secure prompt action in the case of cars detained because of railroad errors. A progressive penalty would be provided to lessen the number of delays in reporting; and rule 15 would prescribe the punishment for a road failing to receive promptly its own empty cars.

## Electrical Hazards and Their Safeguards

Protective devices for electrical apparatus used on the New York Central Railroad entering New York City were described by H. S. Balliet, signal engineer, New York Central, in a paper presented before the American Society of Safety Engineers in New York on May 27. Mr. Balliet, with the use of lantern slides, showed how many safety devices were used in the reconstruction of the New York terminal district when it was

electrified, and described methods and apparatus which expedite the movement of traffic into the Grand Central Terminal and make for safe operation. He pointed out the need for screens and fences as a protection around such devices as transformers and bridges and stated that all high-tension poles should be stenciled to warn against the danger of anyone climbing them. He advocated protection to workmen on all electrical circuits of 220 volts or over, and said that the "safety first" slogan is probably the greatest of safeguards.

### Overcharge Claims on the Nashville, Chattanooga & St. Louis

The Nashville, Chattanooga & St. Louis, in a statement covering the handling and settlement of overcharge claims for the month of April, 1921, presents following table:

	Unpaid	Paid	Total
(1) Number of overcharge claims on hand at beginning of month.....	313	383	696
(2) Number of overcharge claims presented by claimants during month.....	916	...	1,479
(2)a Number of claims charged in by connection.....	473	...	...
(2)b Number of claims paid in suspense.....	90	...	...
(3) Number of claims on hand at end of month.....	360	428	788
(4) Number of claims unpaid which were 90 days old (included in item 3).....	16	...	16

From the above table it will be seen that the month closed with only 360 claims on hand unpaid. Further, there were only 16 claims on hand unpaid which had been in the possession of the road more than 90 days and these claims involved track scale weights, demurrage, storage, etc., making it necessary for the road to refer the papers to outside bureaus for information which was required before the payment of the claims could be arranged.

### Merchants' Association Discusses Port of New York

Various plans and ideas relative to the development of the port of New York were discussed recently at a luncheon given by the Merchants' Association of New York at the Hotel Astor on May 27. The talks were not confined to the plans submitted by the commission representing the two states of New York and New Jersey, but dealt also with the problems of the vehicular tunnel and the advocated bridge across the Hudson river. E. H. Outerbridge, chairman of the Port Authority, stated that it was the belief of the Port Authority that remedial results could be obtained more quickly by the inauguration of some system, such as voluntary store door delivery, the consolidation of marine services and equipment and the establishment of inland terminals in Manhattan. In equipping itself to carry on its work, the Port Authority has retained the engineering staff which served the joint commission, and, in addition, has secured the services of Major E. C. Church, transportation engineer on General Pershing's staff in France. A technical advisory board has been created consisting of Francis L. Stuart, consulting engineer, New York, and formerly vice-president and chief engineer of the Baltimore & Ohio; Morris Sherrard, consulting engineer, Newark, N. J., and Nelson P. Lewis, consulting engineer, New York.

J. J. Mantell, regional manager, Erie Railroad, described the shortcomings of the port and suggested, as a big step forward in the solution of its problems, the use of tractors and trailers to deliver freight from the New Jersey yards. General George R. Dyer explained some of the reasons for the hold-up in the work of the vehicular tunnel, while George A. Post discussed the needs for a large bridge at about Fifty-ninth street. The bridge would be double deck and would have about 16 lines of highway traffic on the upper and about 10 standard railway tracks on the lower deck.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.**—F. M. Nellis, 163 Broadway, New York City. Exhibit by Air Brake Appliance Association.
- AIR BRAKE APPLIANCE ASSOCIATION.**—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.**—F. A. Penatous, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.**—S. W. Derr, Philadelphia & Reading, Philadelphia, Pa. Next meeting, July 12, Chicago.
- AMERICAN ASSOCIATION OF ENGINEERS.**—C. E. Drayer, 29 S. La Salle St., E. I. R. R., 332 South Michigan Ave., Chicago.

**AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.**—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Annual meeting, November 21 and 22, Pinehurst, N. C.

**AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.**—J. Rothschild, Room 400, Union Station, St. Louis, Mo. Next convention, August 24-26, 1921, Kansas City, Mo.

**AMERICAN ELECTRIC RAILWAY ASSOCIATION.**—E. B. Burritt, 8 W. 40th St., New York. Next convention, October 3, Atlantic City. Exhibits this year will be omitted.

**AMERICAN RAILROAD MASTER TINNERS', COPERSMITHS' AND PIPE FITTERS' ASSOCIATION.**—C. Borchardt, 202 North Hamlin Ave., Chicago, Ill. Next convention, September 12-14, Hotel Sherman, Chicago.

**AMERICAN RAILWAY ASSOCIATION.**—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Next regular meeting, November 16, 1921.

**Division I—Operating, Freight Station Section** (including former activities of American Association of Freight Agents). R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.

**Medical and Surgical Section.** J. C. Caviston, 75 Church Street, New York. Annual meeting, June 3 and 4, Hotel Westminster, Boston.

**Protective Section** (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association), J. C. Caviston, 75 Church St., New York, N. Y.

**Telephone Section** (including former activities of the Association of Railway Telegraph Superintendents). W. A. Fairbanks, 75 Church St., New York, N. Y.

**Division II—Transportation** (including former activities of the Association of Transportation and Car Accounting Officers). G. W. Covert, 431 South Dearborn St., Chicago, Ill.

**Division III—Traffic.** J. Gottschalk, 143 Liberty St., New York.

**Division IV—Engineering.** E. H. Fritch, 431 South Dearborn St., Chicago, Ill.

**Construction and Maintenance Section.** E. H. Fritch.

**Electrical Section.** E. H. Fritch.

**Signal Section** (including former activities of the Railway Signal Association), F. Pfeleging (Chairman); H. S. Ballou, 75 Church St., New York, N. Y. Annual meeting, June 6-8, Hotel Drake, Chicago.

**Division V—Mechanical** (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. Meeting, June 15 and 16, Hotel Drake, Chicago.

**Equipment Painting Section** (including former activities of the Master Car and Locomotive Painters' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.

**Division VI—Purchases and Stores** (including former activities of the Railway Storekeepers' Association). J. P. Murphy, General Storekeeper, New York Central, Collinwood, Ohio. Second annual meeting, June 9-11, Hotel Blackstone, Chicago.

**Division VII—Freight Claims** (including former activities of the Freight Claim Association). Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.

**AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.**—C. A. Lichtig, C. & N. W. Ry., 319 Bay Ave., Austin Station, Chicago. Next convention, October 18-20, 1921, New York City. Exhibit by Bridge and Building Supply Men's Association.

**AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.**—J. F. Jackson, Central of Georgia, Savannah, Ga. Next meeting, November, 1921, Chicago.

**AMERICAN RAILWAY ENGINEERING ASSOCIATION.**—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Exhibit by National Railway Appliances Association.

**AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.**—(See American Railway Association, Division 5.)

**AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—R. D. Fletcher, 1145 East Marquette Road, Chicago. Next convention, August 9-11, Hotel Sherman, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.

**AMERICAN SHORT LINE RAILROAD ASSOCIATION.**—T. F. Whitteley, Union Trust Bldg., Washington, D. C.

**AMERICAN SOCIETY FOR STEEL TREATING.**—W. H. Eiseman, 4600 Prospect Ave., Cleveland, Ohio. Next convention, September 19-24, Indianapolis, Ind.

**AMERICAN SOCIETY FOR TESTING MATERIALS.**—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June 20-24, New Monterey Hotel, Ashbury Park, N. J.

**AMERICAN SOCIETY OF CIVIL ENGINEERS.**—E. M. Chandler (acting secretary), 33 W. 39th St., New York. Regular meetings, 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.

**AMERICAN SOCIETY OF MECHANICAL ENGINEERS.**—Calvin W. Rice, 29 W. 39th St., New York.

**AMERICAN TRAIN DISPATCHERS' ASSOCIATION.**—C. L. Darling, Northern Pacific Ry., Spokane, Wash. Next convention, June 20, 1921, Kansas City, Mo.

**AMERICAN WOOD PRESERVERS' ASSOCIATION.**—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis.

**ASSOCIATION OF RAILWAY CLAIM AGENTS.**—H. D. Morris, Northern Pacific R. R., St. Paul, Minn. Next annual meeting, May 19, 1922, Montreal.

**ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.**—Jos. A. Andreucci, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Next convention, October 18-21, Hotel La Salle, Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.

**ASSOCIATION OF RAILWAY EXECUTIVES.**—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.

**ASSOCIATION OF RAILWAY SUPPLY MEN.**—A. W. Clokey, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.

**ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.**—(See American Railway Association, Division 1.)

**ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.**—(See American Railway Association, Division 2.)

**BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.**—A. J. Filkins, Paul Dickenson Company, Chicago. Meeting 3rd convention of American Railway Bridge and Building Association.

**CANADIAN RAILWAY CLUB.**—W. A. Booth, 131 Charton St., Montreal, Que.

**CAR FOREMEN'S ASSOCIATION OF CHICAGO.**—Aron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

**CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.**—Thomas B. Koeneke, St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.

**CENTRAL RAILWAY CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.**—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.**—J. B. Wright, 34th St. and Artesia Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.

**CINCINNATI RAILWAY CLUB.**—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio.

**EASTERN RAILROAD ASSOCIATION.**—E. N. Bessling, 614 F St., N. W., Washington, D. C.

**FREIGHT CLAIM ASSOCIATION.**—(See American Railway Association, Division 7.)

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Next convention, August 16, 18, 1921, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. G. Crawford, 702 E. 51st St., Chicago.

**INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hall, 1061 W. Wabasha Ave., Wiroona, Minn. Next convention, September 12-15, Hotel Sherman, Chicago. Exhibit by Association of Railway Supply Men.

**MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.**—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Next convention, October 4-6, 1921, Buffalo, N. Y.

**MASTER HOTLER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.**—(See A. R. A., Division 5.)

**MASTER CAR BUILDERS' ASSOCIATION.**—(See A. R. A., Division 5.)

**NATIONAL ASSOCIATION OF RAILROAD TIE PRODUCERS.**—E. E. Pershall, T. J. Moss Tie Company, 720 Security Bldg., St. Louis, Mo.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.**—James B. Walker, 49 Lafayette St., New York.

**NATIONAL FOREIGN TRADE COUNCIL.**—O. K. Davis, 1 Hanover Square, New York.

**NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, Peoples Gas Bldg., Chicago. Meeting with American Railway Engineering Association.

**NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting June, July, August and September.

**NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, at 29 W. 39th St., New York.

**PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting, 2d Thursday in month, alternately in San Francisco and Oakland.

**RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson, 1116 Woodward Building, Washington, D. C. Next annual meeting, June 8, 1921, Hotel Traymore, Atlantic City, N. J.

**RAILWAY BUSINESS ASSOCIATION.**—Frank W. Nokon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.

**RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, American Club House, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION.**—(See Am. Ry. Development Assn.)

**RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—R. J. Himmelright, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.

**RAILWAY FIRE PROTECTION ASSOCIATION.**—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.

**RAILWAY REAL ESTATE ASSOCIATION.**—R. H. Morrison, C. & O. Ry., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION.**—(See A. R. A., Division 4, Signal Section.)

**RAILWAY STOCK SHIPPERS' ASSOCIATION.**—(See A. R. A., Division 6.)

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Exhibit at June convention of American Railway Association, has been cancelled.

**RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—F. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 20-22, 1921, Exhibit by Track Supply Association.

**ST. LOUIS RAILWAY CLUB.**—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, Schroeder Headlight & Generator Co., New York City. Meeting with American Railway Association, Signal Section.

**SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, Westcott Ry., Ala., Atlanta, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—C. N. Thulin, 935 Peoples' Gas Bldg., Chicago.

**TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

**TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, 117 East 98th St., Cleveland, Ohio. Exhibit by Railway Equipment Manufacturers' Association.

**WESTERN RAILWAY CLUB.**—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Meeting third Monday each month except June, July and August.

## Traffic News

Production of soft coal dropped back slightly during the week ended May 21, according to the weekly bulletin of the Geological Survey. The total output is estimated at 7,957,000 net tons, a decrease of 46,000 tons when compared with the preceding week. Preliminary reports of the loading on the following Monday and Tuesday indicate a resumption of the upward trend of production. The movement of soft coal from the lower lake ports increased.

The Southern Railway announces the establishment of new sleeping car lines between Macon, Ga., and Asheville, N. C.; between Charleston, S. C., and Asheville; between New Orleans and Asheville via Mobile and between Winston-Salem, N. C., and Beaufort, N. C. These arrangements are temporary. On June 26 new night trains and additional sleeping car lines are announced for the summer season as follows: New trains between Columbia, S. C., and Asheville, with sleeping cars to and from Charleston, Wilmington and Savannah. Between Atlanta and Asheville, with sleeping cars to and from Macon. Between Chattanooga and Asheville, with sleeping cars to and from New Orleans.

## Coal Production Increases

The increase in production of soft coal which has marked the past month was accelerated during the week ended May 14, according to the weekly bulletin of the Geological Survey. The output for the week is estimated at 7,937,000 net tons, an increase of 7½ per cent over the preceding week. The largest elements in the change are believed to be the increasing shipments to the lakes and to tidewater for export. In spite of the difficulties experienced in securing boats for the lake coal trade the total dumpings of bituminous coal for the season up to April 30 were greater than for any of the four years preceding. The cumulative total to the end of April was 1,289,160 tons. Complete statistics show that the carry-over from last year at the head of the lakes on April 1 was 2,053,000 net tons.

In a letter to Senator Edge, George Otis Smith, director of the Geological Survey, discusses the situation in anthracite coal, in which he says that a factor undoubtedly contributing to the reluctance of consumers to purchase is the expectation of a downward revision in freight rates. Whatever may happen to freight rates, he says, it is unlikely that any general revision of them can be made quickly, and what may be gained by a purchaser in the shape of a prospective cut in freight is likely to be more than lost in a prospective premium price for coal. The anthracite miners' wage contract runs to April 1, 1922.

## A Big Shippers' Convention

Traffic representatives of manufacturing companies which distribute their products through public merchandise warehouses are to hold a convention at the William Penn Hotel, Pittsburgh, Pa., on June 16 and 17.

The convention will be held under the auspices of the Shippers' Warehousing and Distributing Association, which was organized at Chicago a year ago for the general purpose of effecting standardization and simplification of forms, documents, practices, rules and regulations in the business relationship between the manufacturers and the public warehouse industry. Uniformity, overages and shortages, taxation on stocks in warehouses, methods of billing and systems of reporting of stocks are among the subjects which will be discussed. Details regarding the convention may be obtained from the secretary, Kent B. Stiles, 239 West Thirty-ninth street, New York. Members of the association include the American Sugar Refining Company, Chicago; Bon Ami Company, New York; Furniture Manufacturers' Association, Grand Rapids, Mich.; Jiffy Dessert Company, Waukesha, Wis.; Kellogg Toasted Corn Flake Company, Battle Creek, Mich.; Procter & Gamble Distributing Company, Cincinnati, Ohio, and the Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa.

### Improved Express Service

Robert E. M. Cowie, vice-president of the American Railway Express Company, New York city, speaking at a recent meeting of the Traffic Group of the National Retail Dry Goods Association, said that express service had been brought up to an efficiency equal to the conditions prevailing before the war. The express company is ready to stand or fall on its future service. It has taken a longer time to get into the normal stride than had been anticipated. President Harding is said to hold that the cost of transportation must come down, believing, apparently, as many others do, that high transportation rates have put a stop to the free interchange of business. "I hope he is right," said Mr. Cowie, "but I am doubtful enough to say that I do not think he is. The express company has dismissed lazy and incompetent men and since September we have had a campaign of improvement. By this the American Express has reduced its operating cost, without reducing wages, by something over \$35,000,000 a year. Our labor problem was a much more difficult one than that of the railroads because our service extends from one end of the United States to the other. We have 38,000 offices and ship 1,200,000 packages a day. New York turns out about one-fifteenth of the lighter merchandise shipped in the whole United States. To move that light merchandise requires twenty-four special express trains leaving every night.

"Fifth-morning delivery in San Francisco is now a regular thing. The best possible time from New York is the morning of the fourth day, when everything works with clocklike procedure, but hair-trigger connections are not aimed at, so delivery on the fifth morning was decided upon.

"In the matter of claims the company is nearer up to date than it has ever been. But just because we are so improved in this respect is no reason for sending us claims without merit. There is one concern that sends us claims for everything, whether there is any merit in them or not. We have turned down over 500 claims a month of this one concern. Our office boy could tell that 500 of the 550 claims entered should not have been made. Now, of course, we are easy and try to keep a smile all the while, but we do not want that kind of claims. . . ."

### Proposed Bills in Congress

Bills have been introduced in Congress by Senator New and Representative Burdick to make unlawful the present surcharge collected by railroads from Pullman passengers under the last increase in passenger fares.

The Senate Committee on Interstate Commerce has favorably reported to the Senate, with some modifications, the bill introduced by Senator Fletcher, of Florida, to amend Section 206-c of the transportation act, relative to complaints praying for reparation on account of damage claimed to have been caused by reason of the collector; of unreasonable or otherwise unlawful rates during the period of federal control. The bill provides that such claims may be filed with the Interstate Commerce Commission within two years after the termination of federal control, or against the agent designated by the President for such purpose, who is the director general of railroads. The Railroad Administration had issued a ruling that such complaints should be filed by March 1 this year, but later extended the time to September 1. The bill as amended, however, applies only to claims for overcharges above the legal tariff charge. The report, by Senator Kellogg, says the bill was referred to the legislative committee of the Interstate Commerce Commission, which recommended the passage of the bill with the amendments adopted by the committee. Chairman Clark, of the commission, in a letter, said that the commission feels there is warrant for extending the period of limitation for an additional year as to overcharge claims, but that such extension should not be made as to other claims of different character.

A bill has been introduced in the House of Representatives by Representative Connolly, of Texas, to repeal Section 15-a of the Interstate Commerce Act as amended by Section 422 of the Transportation Act. This is the section that provides the 5/2 per cent rule of rate-making. Representative Sweet, of Iowa, has also announced his intention of introducing a similar bill, on the ground that "it is impossible for prosperity to return under the present railroad freight rates" and that the relief desired cannot be had until Section 15-a is repealed.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended from June 1 and later dates to September 29, the operation of certain schedules which propose to increase rates on lumber and other commodities between El Paso, Texas, and points in Oregon, Washington, Utah and Idaho.

The commission has further suspended until July 25 the operation of schedules published in W. K. Kelly's and F. A. Leland's tariffs, which provide increased commodity rates on iron or steel bolts, 1 c. l. from Kansas City, Mo., to Galveston and Beaumont, Tex.

The commission has further suspended until July 20 the operation of certain schedules shown in E. B. Boyd's tariff, which provide increased rates on pig iron from points in Alabama, Georgia, Kentucky, Louisiana, Tennessee and Virginia to Ogden and Salt Lake City.

The commission has further suspended until July 29 the operation of items, shown in a Kansas City Southern tariff, proposing the cancellation by the Texarkana & Fort Smith of the rule providing for the switching of lumber to and from the track of the Texas & New Orleans at Port Arthur.

The commission has issued a decision in which it finds that the proposal of the Pennsylvania and the Baltimore & Ohio to discontinue the interchangeable use of their 60-trip commutation tickets between Baltimore and Washington, which practice was introduced during the period of federal control, is justified, and the order of suspension is vacated.

The commission in its decision in the case of the Northern Potato Traffic Association was against the railroads, and the director general finds that the relationship of rates on potatoes in carloads from points in Minnesota and Wisconsin to destinations in trunk line territory are unduly prejudicial, and the rates to northeast Texas points from the same territory are found unreasonable. The commission prescribes new maximum rates. The commission also finds that the assessment of a rental charge of \$5 a car during the winter, in addition to the freight rate, is not unreasonable.

The Interstate Commerce Commission has ordered a proceeding of investigation involving the failure of the Oklahoma Corporation Commission to allow the railroads of the state to apply increases in intrastate rates corresponding to those allowed by the federal commission for interstate traffic. A petition had been filed with the commission on behalf of the railroads averring that the state commission by orders on September 4, March 9 and April 11 had ordered them to establish rates within the state which are less in many instances than those which are permitted to be established by the federal commission for interstate traffic.

### Regulations for Transportation of Explosives, Etc.

Because of altered conditions certain modifications in the regulations for the transportation of explosives, inflammables and other dangerous articles by freight and express are desirable, and the commission has ordered a hearing on June 22 at Washington, before Examiner F. E. Brown, to consider suggested amendments which have been proposed by the Bureau of Explosives, after conferences with shippers and carriers, and "attendance upon the hearing does not seem important except for the purpose of presenting objections."

Under the provisions of the act of March 4, 1921, the commission is authorized to avail itself of the services of the Bureau of Explosives; and the bureau has arranged to hold conferences with interested shippers and others on the two days preceding the hearing, June 20 and 21 at Washington; and at these conferences an opportunity will be afforded all parties interested to discuss, and if possible agree upon, the amendments proposed in the regulations.

## Personnel of Commissions

W. R. Williams, secretary of the California State Railroad Commission, has been appointed examiner for the commission and executive of its Los Angeles office, and has been succeeded as secretary by H. G. Mathewson, assistant secretary, effective June 1.

## United States Supreme Court

Texas state authorities have filed a motion in the United States Supreme Court asking permission to file an original bill attaching the Interstate Commerce Commission's order advancing intrastate rates in Texas on the ground of the unconstitutionality of the transportation act.

### Federal Employers' Liability Act

The Supreme Court of the United States last week handed down a decision under the Federal Employers' Liability Act which it regards as important beyond the interest of the parties to it because it formulates a test by which future cases may be assigned to intrastate or interstate commerce.

An award had been made by the Pennsylvania Workmen's Compensation Board for the death of a flagman at a high-way crossing, which was affirmed by the state courts. The flagman was employed to signal both intrastate and interstate trains, without distinction between them or character of service, and in the course of his employment he was killed by a train whose character is not disclosed.

The Supreme Court holds that the case falls within *Pedersen v. D. L. & W.*, 229 U. S. 146, where the court said: "True, a track or bridge may be used in both interstate and intrastate commerce, but when it is used in intrastate it is none the less an instrumentality of the former; nor does its double use prevent the employment of those who are engaged in its repair being employment in interstate commerce."

"The service of a flagman concerns the safety of both commerces and to separate his duties by moments of time or particular incidents of its exertion would be to destroy its unity and commit it to confusing controversies.

"And besides, Di Donato's duty had other purposes than the prevention of a disaster to a particular train. It had purpose as well to the condition of the tracks and their preservation from disorder and obstructions. This service and the other service cannot be separated; and behind them are the respective powers that may have ordained them."

Deducing from the duty of Di Donato that his employment was in interstate commerce, the judgment of the state Supreme Court was reversed, Mr. Justice Clarke dissenting. *Philadelphia & Reading v. Di Donato*. Decided May 16, 1921. Opinion by Mr. Justice McKenna.

Another case, also from the Pennsylvania court, was decided in the same way as being within the rule of the above case. Here one of the crew of a freight train was caught between two cars, sustaining injuries from which he died. Some of the cars of the train were in interstate commerce. The referee did not find definitely as a fact that the deceased was engaged in intrastate commerce at the time of his injury, but assumed that the fact might be so, and therefore regarded it as so, because in his opinion the burden of proving the contrary, that is, that the deceased "was actually engaged in work incident to interstate commerce," was upon the company, and the company had "not met the burden required of it"; and further that the company "offered no testimony whatever to show what work John M. Polk was performing at the time he was injured."

The Supreme Court holds that here, as in the Di Donato case, "the employment concerned both kinds of commerces and was to be exercised as much on one as on the other.

"Besides, we cannot concede to the view that there is a presumption that duties performed on a train constituted of interstate and intrastate commerce were performed in the latter commerce. The presumption, indeed, might be the other way." Judgment affirming the award reversed, Mr. Justice Clarke dissenting.—*Philadelphia & Reading v. Polk*. Decided May 16, 1921. Opinion by Mr. Justice McKenna.

## Foreign Railway News

### Electrification in Philippines

The Manila Railroad Company is planning the electrification of its lines, according to information made public by the Philippine Government Commercial Agency. The power is to be developed from the Agno river in Central Luzon and a thorough topographical survey of the power site is being made under the direction of the company.

### Pilfering Source of Great Loss to French Roads

Pilfering on French railways cost the companies approximately \$48,200,000 in 1920, or more than 14 times the 1913 figure, which was approximately \$3,400,000, according to a Paris dispatch to the *New York Times*. It was pointed out that increased costs of stolen property caused some of the increase, but that it was largely due to the increase in theft which has been great on all roads with the exception of the State Railway.

### British Railway Employees Agree to Handle Coal

Henceforth the employees of the British railways will handle all coal offered for shipment, according to press dispatches from London. Since the beginning of the miners' strike until the present union railway employees had refused to handle "blackleg" coal produced by strike breakers and, in some instances, coal imported from abroad. This refusal resulted in the suspension of a number of employees and threatened to cause trouble between the railway unions and the managements of the carriers. It was stated that the decision of the railway unions to resume the handling of coal was based on the fact that their refusal did not help the miners and not because of any lack of sympathy with the aspirations of the miners' union.

### Rolling Stock Situation in Poland

LONDON.

It is reported that Poland has only 50 per cent of the railway rolling stock that would be necessary to put the railways in normal condition, but that the situation will improve as soon as it receives the 480 locomotives and 12,900 cars, assigned to it by the Reparations Committee. In order to encourage the development of national industry the Polish government has ordered locomotives and cars from Polish manufacturers to be delivered within ten years. These manufacturers it is certain will require foreign capital to enable them to supply the required rolling stock. For the first deliveries the manufacturers have been authorized to purchase abroad various parts such as wheels, axles, and similar material, but they must produce these parts in Poland as soon as possible. A commission of Government officials, it is stated, has left for Italy in order to approach Italian capitalists with regard to their participation in this enterprise.

### Britain Scores in Chilean Competition

English financiers are reported to have arranged for a loan of upwards of \$15,000,000 for the construction of a short line railway from Valparaiso to Santiago, Chile, through Casablanca, according to correspondence of the *Times* (London) Trade Supplement. The bankers stipulate, according to the report, that the line must be constructed by a British firm. It is pointed out that the English financiers were able to offer lower interest rates and were satisfied with less security than American houses which were interested in the project. The new line, it is said, will shorten the distance between the two cities and, by providing better grades, reduce the running time from the present schedule of three and one-half hours to approximately two and one-half hours. In the meantime, the government is going on with its plans to electrify the present line between these two cities and bids will be opened on June 30 for the construction of the first section of this electrification.

April Car Exports

Further declines are noted in the shipments of cars in April when compared with the March figures. The freight car shipments totaled 572, valued at \$808,982, as compared with 707, valued at \$1,311,447, for the previous month. Six passenger cars were exported as compared with 10 in March. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Passenger		Freight and other		Parts of cars
	Number	Value	Number	Value	
Finland					836
France					238
Germany					5,590
Greece					1,858
Italy					369
Sweden					1,872
England					32,482
Canada			66	\$86,798	1,372
Guatemala					40,573
Honduras					1,223
Panama					75
Salvador					27,243
Mexico	3	\$22,098	79		1,152
Newfoundland and Labrador					297
Jamaica					122,704
Trinidad and Tobago					1,587
Cuba			244	\$274,159	16,729

Transportation a Major Subject at

International Commerce Convention

Among the American contributions to the conferences of the International Chamber of Commerce to be held at London, England, during the week of June 27, will be a comprehensive summary of American railroad practices in making international shipments to Canada and Mexico. This report will be submitted with the hope that business men of Europe, where national boundaries clog and impede commerce, may benefit by experience on this continent. Other American contributions to these conferences will be a trial balance sheet of the world's financial condition, a survey of world communications, a review of economic conditions in the United States, reports on ocean transportation, fabricated production, distribution, raw material production and port facilities.

Delegates to the conference will be organized into five groups, each group taking up one of the five main subjects into which the program has been divided. Each of the five "foundation" countries—Great Britain, France, Italy, Belgium and the United States—has been given the chairmanship of one of these groups. The chairmanship of the transportation and communication group has been assigned to this country and Walker D. Hines, formerly Director General of Railroads, has been appointed chairman. Chairmen of the other groups are: Walter Leaf, Great Britain, for finance; Eugene Schneider, France, for production; M. Cassin, Italy, for production; M. Verwilghen, Belgium, for devastated regions.

Among the 200 delegates from this country will be some prominent railroad men and financiers. M. ter Muelen, of Holland, originator of the "ter Muelen plan" for credit extension, will attend the finance group sessions. Chairmen of the various American committees are: Alba B. Johnson, president, Philadelphia Chamber of Commerce, fabricated production; S. M. Felton, president, Chicago Great Western, land transportation; L. B. Stilwell, consulting engineer, New York, port facilities; W. H. Booth, vice president, Guaranty Trust Company, finance; W. E. Kugeman, vice president, American Radiator Company, distribution; E. J. Cornish, president, National Lead Company, production of raw materials; and J. J. Carty, vice president, American Telephone and Telegraph Company, communication.

Equipment and Supplies

Car Deliveries in April

The number of freight cars delivered in April by the 27 car building companies reporting to the Railway Car Manufacturers' Association totaled 4,455 for domestic service and 871 for export. The passenger train cars delivered totaled 116 for domestic service. On April 30 the companies had on hand undelivered orders for 17,513 freight and 565 passenger cars for domestic service and 3,312 freight and 24 passenger cars for export. The detailed figures for the month follow:

New Cars Delivered			
	Domestic	Foreign	Total
Freight	4,455	871	5,326
Passenger	116	0	116
On Order and Undelivered			
	Domestic	Foreign	Total
Freight	17,513	3,312	20,825
Passenger	365	24	389
Car Repairs			
Delivered—April			3,898
On order and undelivered April 30			11,884

Locomotives

THE MEXICAN RAILWAY has ordered 11 consolidation type locomotives from the Baldwin Locomotive Works.

Freight Cars

THE WABASH RAILWAY is contemplating having repairs made to 500 hopper cars.

THE VIRGINIAN RAILWAY is contemplating having repairs made to a large number of freight cars.

THE FLEISCHMANN TRANSPORTATION COMPANY, Chicago, is inquiring for from 10 to 100 steel underframes for tank cars.

THE GREAT NORTHERN reported in the *Railway Age* of April 8, as inquiring for 500 refrigerator cars, has ordered this equipment from the General American Car Company. These cars are to have wooden underframes.

THE UNITED FRUIT COMPANY, New York, reported in the *Railway Age* of May 20, as inquiring for 50 cane cars, has ordered this equipment from the Magor Car Company. These cars are to be used on the Truxillo Railway, Honduras.

Machinery and Tools

THE NEW LONDON SHIP & ENGINE COMPANY, Groton, Conn., has ordered four 60-in. engine lathes from the Niles-Bement-Pond Company.

Miscellaneous

THE NORFOLK & WESTERN will receive bids at Roanoke, Va., until 12 o'clock noon, June 8, for parts for electrical apparatus; 100,000 tie dating nails; 1,000 pairs of angle bars and 800 D bevel steel bars, 25/64 in. by 3 11/64 in. by 20 ft.

THE ILLINOIS CENTRAL is inquiring for a 90-in. driving wheel lathe, a 48-in. by 48-in. by 30-ft. planer, two 24-in. by 14-ft. engine lathes, one 20-in. by 12-ft. lathe, one 18-in. by 10-ft. lathe, one 28-in. shaper, one 24-in. shaper, one 20-in. shaper, one universal grinder, six 18-in. wheel electric double grinders and two bolt cutters, all motor driven.

A WAGE REDUCTION of 15 per cent has been accepted by masters, mates, pilots and engineers of railway ferries operating on Lake Michigan, Lake St. Clair and through the Detroit river.

## Supply Trade News

The R. W. Benson Company removed its offices on June 1, from 50 Church street, to the Liggett building, Madison avenue and Forty-second street, New York City.

The American Flexible Bolt Company removed its sales offices on June 1 from 50 Church street to the Liggett building, corner of Forty-second street and Madison avenue, New York City.

The Steel Fabricating Corporation recently completed its new works and general offices at Michigan City, Ind., and has removed its executive headquarters from Harvey, Ill., to Michigan City.

Max Grant, manager of technical railway sales of the Glidden Company, Cleveland, Ohio, has left the service of that company to become manager of the railway paint department of the Acorn Refining Company, Cleveland.

The Dressel Manufacturing Corporation, New York, has established an office in the Railway Exchange, Chicago, under the supervision of De F. Lillis, who for many years was connected with the motive power department.

The Combustion Engineering Corporation, 43 Broad street, New York, has removed its Philadelphia, Pa. branch office from 1112 Lincoln building to the tenth floor of the Finance building. This territory is under the management of W. C. Strips.

The Vacuum Oil Company, 61 Broadway, New York City, has opened new branch offices at Buffalo, N. Y., and Dallas, Texas. The Buffalo office will cover New York State west of the Hudson river and the Dallas office the states of Texas and Oklahoma.

The Master Tool Company, 20 East St. Clair avenue, Cleveland, Ohio, has been organized under the laws of Ohio to manufacture a new line of pneumatic tools, and will specialize in the reclaiming of all types and makes of same. The officers of the company are: J. Nightingale, president; Charles F. Overly, vice-president, and general manager; Wm. Eckert, secretary-treasurer. C. F. Overly is manager of sales.

## Obituary

Karl G. Roebing, president of John A. Roebing's Sons Company, Trenton, N. J., died at Springlake, N. J., on May 29, while playing golf. He was born at Trenton in 1873. Mr. Roebing was graduated from Lawrenceville school and from Princeton University in the class of 1894. He went with the Roebing Company immediately after graduation and in 1918 was elected president of the company.

Alexis I. du Pont, secretary and director of E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., died on May 30, at Wilmington after an illness of ten days. He was born in Wilmington in 1869, and graduated from Harvard in 1892. After graduation he took up work with the du Pont Company, and had long been associated with the other members of his family in many of the large undertakings connected with their name.

## Trade Publications

**WATER SOFTENING EQUIPMENT.**—The Graver Corporation, Chicago, has prepared three publications on water purification equipment which are of interest to railroads, Bulletins 507 and 2C being respectively a 12-page and 2-page illustrated description of the company's continuous type, cold water softening systems for small water stations and its line of quartz sand pressure filters, while Bulletin 506 is a 24-page illustrated description of its continuous softeners for large railroad stations. The latter bulletin also gives information on the conversion of existing water tanks into softeners and demonstrates and illustrates the adaptability of this system to the conical bottom steel roadside tanks.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company which was noted in the *Railway Age* of April 29 (page 1052) as accepting bids in co-operation with the railroad Y. M. C. A. for the construction of an addition to the Y. M. C. A. building at Topeka, Kansas, to cost approximately \$25,000, has awarded a contract for this work to Jerome Moss, Chicago.

**CHICAGO, BURLINGTON & QUINCY.**—This company is accepting bids for the remodeling of its railway mail terminal building at Omaha, Nebr.

**CHICAGO UNION STATION.**—This company, which was noted in the *Railway Age* of May 27 (page 1246) as having closed bids on May 26 for the completion of the filled portion of the Polk street viaduct, Chicago, and the construction of a viaduct on Van Buren street, between Canal street and the Chicago river, has awarded contracts for this work to the Underground Construction Company, Chicago.

**DETROIT-TOLEDO SHORE LINE.**—This company has awarded a contract to the Ogle Construction Company, Chicago, for the construction of a 70-ton steel coaling station at Dearoad, Michigan.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of May 13 (page 1144) as accepting bids for the construction of the substructure for its bridge over the tracks of the Chicago, Milwaukee & St. Paul, at Genoa, Ill., to cost approximately \$30,000, has awarded the contract for this work to Joseph E. Nelson & Sons, Chicago. This company has also awarded a contract for concrete culvert work in connection with the improvements to the yards at Clinton, Ill., to Bates & Rogers, Chicago, at a cost of about \$25,000.

**ILLINOIS CENTRAL.**—This company has awarded a contract to the Joseph E. Nelson & Sons for the construction of the substructure of a new overcrossing of the Illinois Central over the Chicago, Milwaukee & St. Paul at Genoa, Ill. The work will consist of the building of two concrete abutments at an estimated cost of \$40,000.

**MISSOURI PACIFIC.**—This road has awarded a contract to Joseph E. Nelson & Sons for the construction of pumping stations at Guion, Ark., Cotter, Comal and Myrtle, and Branson, Mo., at an estimated cost of \$80,000.

**NASHVILLE, TENN.**—The Board of Transportation of this city has awarded a contract to Foster, Creighton & Company, Nashville, for the construction of a rail and river terminal building in that city to cost about \$300,000. The structure will be a five-story reinforced concrete dock and warehouse, 140 ft. by 300 ft., and will be equipped with elevators and cranes for handling package freight.

**UNION PACIFIC.**—This road has awarded a contract to Joseph E. Nelson & Sons for the construction of a concrete and brick interlocking tower at Council Bluffs, Iowa.

**WABASH.**—This company is accepting bids for the construction of a new 100 ft. turntable with a concrete base at Tilton, Illinois.

**WABASH.**—This company, which was noted in the *Railway Age* of May 20, as accepting bids for the construction of a brick or stucco passenger station at Macon, Mo., with dimensions of 122 ft. by 24 ft., has awarded the contract for this work to the Unit Construction Company, St. Louis, Mo.

The MISSISSIPPI CENTRAL has nearly or quite completed negotiations for trackage rights by which it will run trains through to Mobile, Ala., over the Gulf, Mobile & Northern. The eastern terminus of the Mississippi Central is at Hattiesburg, Miss., the western terminus of the Hattiesburg branch of the Gulf, Mobile & Northern, whence the distance southeast to Mobile is 96 miles.

## Railway Financial News

**ALASKA ANTHRACITE RAILROAD.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue and sell at not less than 90 per cent of par and accrued interest \$1,500,000 of first mortgage 6 per cent, 20-year gold bonds, the proceeds to be used to pay for construction and equipment and to discharge bonds and other indebtedness. The company's railroad is to extend from a point on Controller Bay, Alaska, northwardly to the Bering river coal fields or branches. Twenty-two miles of the line had been constructed when work was suspended in 1917.

**BALTIMORE & OHIO.—Authorized to Assume Liability.**—This company has been authorized by the Interstate Commerce Commission to assume obligation or liability to the extent of 68.64 per cent in respect of \$640,000 of equipment trust certificates issued under an equipment trust of the Seaboard Air Line. The Baltimore & Ohio desires to purchase the leasehold interest of the Seaboard Air Line in 16 Mallet locomotives purchased under this trust and to pay among other things, as rental, amounts equal to 68.64 per cent of the remaining half-yearly payments and other amounts.

**BALTIMORE & OHIO.—Asks Authority to Issue Bonds.**—This company and various subsidiaries have applied to the Interstate Commerce Commission for authority to nominally issue \$1,624,000 of collateral and refunding 6 per cent mortgage bonds to be used as collateral.

**BOSTON, CAPE COD & NEW YORK CANAL COMPANY.—Referees Report on Compensation.**—A board of referees appointed by the Interstate Commerce Commission to report on the just compensation for the use of this property by the government during the period of federal control has reported that the period of federal control of the property extended from July 25, 1918, to March 1, 1920, but that it is unable on the evidence submitted to find and report any sum of money as the just compensation calculated on an annual basis to be paid by the United States for the use of the property. It is unable to find that the property had an actual rental value which can be determined. The board reported on the cost of certain items of deferred maintenance and the cost of dredging the approach to the channel, but did not allocate it as between current and deferred maintenance. The board also reported a sum as the cost of additions and betterments properly chargeable to capital account and as the value of personal property taken under federal control.

**CHICAGO & NORTH WESTERN.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**CHICAGO & WESTERN INDIANA.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$584,000 of consolidated 50-year gold bonds and to deliver them to the company's tenants in accordance with certain leases and the mortgage under which they are issued. The commission ordered the dismissal of part of the company's application, requesting authority covering the issue of \$130,000 of such bonds on September 1, 1920, and requesting approval of the action of the officers in delivering the bonds to tenant companies.

**CHICAGO, BURLINGTON & QUINCY.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year, as follows:

	1920	1919
Standard return (January and February, 1920; full year 1919).....	\$5,560,114	\$33,360,683
Operating revenues (ten months):		
Freight .....	110,385,624	.....
Passenger .....	31,445,172	.....
Total operating revenues, inc. other.....	\$155,483,805	.....

\*Corporate. †War tax only.

The annual report of the Chicago, Burlington & Quincy will be reviewed editorially in an early issue.

**CHICAGO, BURLINGTON & QUINCY.—Dividend Increased.**—The directors on May 26 declared a dividend of 5 per cent, payable June 25 to holders of record June 20. President Hale Holden stated, after the meeting of the board, that the payment was not voted on a regular basis and that, although the question of continuing the old 8 per cent rate had been discussed, it was decided that it would be best to simply declare a 5 per cent dividend without reference to the annual rate.

The indication is, according to the Wall Street Journal, that the directors contemplate placing the Burlington stock on a 10 per cent annual basis. The Burlington's outstanding capital stock now amounts to approximately \$170,000,000. A 10 per cent dividend would amount to \$17,000,000, compared with former 8 per cent dividend on the \$110,000,000 capital stock, previously outstanding amounting to \$8,800,000. It is known that the owning lines, the Northern Pacific and the Great Northern, favor an increase in the amount received from the Burlington's dividend sufficient to cover the additional interest charges on the new joint 6½ per cent bonds. A 10 per cent dividend on the Burlington's increased capital stock would cover this additional charge with a small margin to spare.

**CHICAGO, ROCK ISLAND & PACIFIC.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$1,000,000 of general mortgage gold bonds to be delivered to the trustee under its first and refunding mortgage and to issue \$1,000,000 of first and refunding mortgage bonds to be pledged as collateral security for its short term notes.

**CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.**—A review of this company's annual report for 1920 appears on another page of this issue.

**CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.—Equipment Trusts Offered.**—White, Weld & Co., New York, are offering \$760,000 7 per cent equipment trust gold certificates at prices to yield from 6.50 per cent to 6.40 per cent, according to maturity. They are dated January 1, 1921, and due, \$95,000 annually, January 1, 1924 to 1931, inclusive. The equipment against which these certificates are to be issued cost approximately \$962,800, of which amount 20 per cent is paid in cash by the railway company. It is all new and consists of six Mikado locomotives, four switch engines and 125 stock cars.

**CHICAGO UNION STATION COMPANY.—Bonds Sold.**—Kuhn, Loeb & Co., Lee, Higginson & Co., the National City Company, the First National Bank of New York and the Illinois Trust & Savings Bank of Chicago have sold \$6,000,000 first mortgage 6½ per cent bonds, due July 1, 1963, at 101 and accrued interest. The principal and interest are guaranteed jointly and severally by the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St. Paul, the Pittsburgh, Cincinnati, Chicago & St. Louis Railroads, and the Pennsylvania Company.

**COLORADO & SOUTHERN.—Dividend Declared.**—This company has declared the regular dividend of 2 per cent on the first preferred stock, payable June 30, 1921, to holders of record June 18, 1921.

The dividend will be paid out of surplus income of the calendar year 1921. As has been the custom for several years past, no action was taken at this time on the second preferred. Dividends on the second preferred stock are payable only after the first preferred dividend had

been paid. If the regular semi-annual dividend on the second preferred were paid at this time, and it was found in the second half of the year that earnings were not sufficient to cover the second half year's 2 per cent dividend on the first preferred, the company would declare a dividend on the second preferred before full payment had been made on the first preferred.

**CUMBERLAND & MANCHESTER.—Loan Approved.**—The Interstate Commerce Commission has approved a loan to this company of \$375,000 from the revolving fund to assist the company in meeting maturing indebtedness consisting largely of short term notes.

**DENVER & RIO GRANDE.—Transfer Date Postponed.**—The date for completing the transfer of this road, sold November 20 at a foreclosure sale to representatives of the Western Pacific, has been extended to June 30 by an order signed by Federal Judges Lewis and Sanborn. The transfer was to have been completed May 30.

**DENVER & RIO GRANDE WESTERN.—Hearing on No-Par-Value Stock.**—See El Paso & Southwestern.

**EL PASO & SOUTHWESTERN.—Hearing on No-Par-Value Stock.**—The Interstate Commerce Commission on May 26 held a hearing on the applications of the El Paso & Southwestern, the Denver & Rio Grande Western, the Western Pacific and the Fort Smith & Western for authority to issue capital stock certificates having no par value. There was no opposition at the hearing, but the commissioners asked numerous questions. Frederick Strauss, who was a member of the Railroad Securities Commission which recommended the use of stock certificates of no par value, discussed the subject from the economic standpoint without reference to the particular applications of the roads. He said that the most important principle of sound finance is that the superstructure of credit shall rest on an adequately firm base of capital, without which the stability of the financial structure is impaired by an ever-growing debt with ever-growing fixed charges. It is difficult to sell stock at less than par, and a railroad whose stock is below par finds its condition becoming worse because of the necessity for financing by increasing its debt. He also pointed out that there is no such thing as constant value; all value fluctuates with use, depending upon various factors, and the fact that a share states that \$100 has been paid to the company is of historic interest only.

W. C. Osborn, representing the El Paso & Southwestern, said that his company desired to get away from any statement of the value of its stock, particularly prior to a valuation of the property by the Interstate Commerce Commission.

A. C. Dustin, representing the Fort Smith & Western, said his company is not authorized to issue anything other than no-par stock.

John J. Bowie, representing the Denver & Rio Grande Western and the Western Pacific, explained the intricacies of the reorganization of those companies, which is now being carried out, and he warned the commission against undertaking to assume the exercise of business judgment of executive committees or boards of directors in connection with railroad financing.

**FORT SMITH & WESTERN.—Hearing on No-Par-Value Stock.**—See El Paso & Southwestern.

**HUNTINGTON & BROAD TOP MOUNTAIN.—Asks Authority to Issue Car Trust Certificates.**—This company has applied to the Interstate Commerce Commission for authority to issue car trust certificates to the amount of \$300,000 for the purchase of four locomotives and ten passenger cars, which cost \$411,393. Arrangements have been made for the sale of the certificates at 88.61 per cent of par.

**MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—Annual Report.**—The income account for the year ended December 31, 1920, compares with the previous year, as follows:

	1920	1919
Operating income.....	\$826,246	
Income from lease of road.....		\$10,619,875*
U. S. Government standard return for operation of Soo Line and Wisconsin Central for January and February, 1920.....	1,763,163	
Estimated amount of guaranteed compensation for period March 1, 1920, to August 31, 1920.....	5,289,489	
Due from U. S. Government under guaranty of Sec. 209, Transportation Act of 1920, for deficit incurred in operation of road March 1, 1920, to August 31, 1920.....	269,815	
Gross income.....	\$9,749,769	\$11,469,772

Rent for leased roads.....	\$2,303,924	\$3,487,435
(Wisconsin Central's proportion of government compensation)		
Interest on mortgage bonds.....	2,913,850	2,913,921
Total deductions from gross income.....	\$6,665,156	\$7,649,994
Net income transferred to profit and loss.....	\$3,084,613	\$3,819,779

Dividends:		
Preferred stock, 7 per cent.....	\$882,238	\$882,238
Common stock, 7 per cent.....	1,764,476	1,764,476
Balance carried December 31.....	22,290,308	21,593,335

*From U. S. Government, account standard return.....		\$10,619,875
Account M., St. P. & S. Ste. M.....	7,123,091	
Account Wisconsin Central.....	3,487,434	
From Minn. Northwestern Electric Railway Company.....		9,350
		\$10,619,875

\*The annual report of the Minneapolis, St. Paul and Sault Ste. Marie will be reviewed editorially in an early issue.

**MISSOURI-ILLINOIS.—Authorized to Issue Securities.**—This company has been authorized by the Interstate Commerce Commission to issue at par, for cash and in payment for certain property, \$1,500,000 of capital stock and to issue and sell at par \$300,000 of first mortgage 7 per cent bonds.

**READING COMPANY.—Prosser Committee to Join in Appeal.**—Seward Prosser, president of the Bankers' Trust Company, denies that he has resigned as president of the Reading common stockholders' committee. According to Mr. Prosser, a sub-committee, representing the larger holders in the committee, has been formed, with E. P. Maynard, president of the Brooklyn Trust Company, as chairman, and Frederic F. Gunnison, vice-president of the Lawyers' Title & Trust Company, as secretary, to co-operate with the Henry Evans insurance companies in appealing from the decision of the Federal Court in Philadelphia. An initial assessment of \$25,000 will be levied to defray legal expenses.

**UNION PACIFIC.—Asks Authority to Guarantee Bonds.**—This company and the Oregon-Washington Railway & Navigation Company have filed a joint application with the Interstate Commerce Commission for authority to guarantee \$14,755,500 of O. W. R. & N. first and refunding mortgage 4 per cent bonds now held in the Union Pacific treasury, which are part of the purchase price to be paid by the Union Pacific to W. A. Clark for his half-interest in the Los Angeles & Salt Lake. The application also provides for a modification of the tax provision in the bonds relating to the deduction of federal income taxes.

**WESTERN PACIFIC.—Hearing on No-Par-Value Stock.**—See El Paso & Southwestern.

*Closing of D. & R. G. Sale Delayed*—See Denver & Rio Grande.

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued certificates for partial payments on account of the six-months guaranty for 1920 to:

Chicago, Milwaukee & St. Paul.....	3,000,000
Grand Trunk as lessee of Atlantic & St. Lawrence.....	\$425,000
Grand Trunk of Canada.....	22,000
Grand Trunk Western.....	1,000,000
Kanawha & Michigan.....	163,000
Lake Charles & Northern.....	21,000
Louisiana & Texas Railroad & Steamship Company.....	85,000
Minneapolis & St. Louis.....	390,000
Rutland.....	225,000
Southern Pacific.....	4,200,000

### Dividends Declared

**Boston & Albany.**—2½ per cent, quarterly, payable June 30, to holders of record May 31.

**Buffalo & Susquehanna.**—Common, 1¼ per cent, quarterly; preferred, 2 per cent, semi-annually; both payable June 30, to holders of record June 15.

**Chicago, Burlington & Quincy.**—5 per cent, payable June 25 to holders of record June 20.

**Chicago, Rock Island & Pacific.**—6 per cent preferred, 3 per cent, semi-annually; 7 per cent preferred, 3½ per cent, semi-annually, both payable June 30, to holders of record June 10.

**Colorado & Southern.**—First preferred, 2 per cent semi-annually, payable June 30, to holders of record June 18.

**Delaware, Lackawanna & Western.**—1¼ per cent, quarterly, payable July 1, to holders of record July 14.

**Fonda, Johnstown & Gloversville.**—Preferred, 1½ per cent, quarterly, payable June 15, to holders of record June 10.

**Lehigh Valley.**—Common, 1¼ per cent, quarterly; preferred, 2½ per cent, quarterly; both payable July 2 to stock of record June 11.

**Morris & Essex.**—\$1.75 semi-annually, extra, payable July 1, to holders of record June 9.

# Annual Report

## Sixty-first Annual Report of the Chicago and North Western Railway Company

Year Ending December 31, 1920

### REPORT OF THE BOARD OF DIRECTORS

To the Stockholders of the Chicago and North Western Railway Company: The Board of Directors submits herewith its report of the operations and affairs of the Company for the year ending December 31, 1920.

As the railway property of the Company was operated by the Director General of Railroads during the months of January and February, 1920, the results of its operation by the Company, shown in this report, cover, unless otherwise specifically stated, the ten months from March 1 to December 31, 1920, inclusive.

OPERATING REVENUES:		
Freight	.....	\$94,570,196.03
Passenger	.....	32,126,380.20
Other Transportation	.....	10,850,286.61
Incidental	.....	3,208,765.05
		\$140,755,627.89
OPERATING EXPENSES (92.54 per cent. of Operating Revenues)		130,252,212.33
Net Revenue from Railway Operations, carried forward.		\$10,503,415.56
RAILWAY TAX ACCRUALS (5.37 per cent. of Operating Revenues)		\$7,557,888.55
UNCOLLECTIBLE RAILWAY REVENUES		28,276.09
		7,586,164.64
Railway Operating Income		\$2,917,250.92
EQUIPMENT AND JOINT FACILITY RENTS—Net Debit		2,217,598.77
Net Railway Operating Income		\$699,652.15
NONOPERATING INCOME:		
Accrued Compensation for lease of road to U. S. Government (January and February, 1920)		\$3,802,999.80
Account amount due from U. S. Government under Guaranty Section of Transportation Act, 1920		16,509,184.88
Rental Income		704,477.83
Dividend Income		1,321,243.90
Income from Funded Securities		222,319.31
Income from Unfunded Securities and Accounts		490,073.52
Other Items		61,611.50
		23,111,910.74
Gross Income		\$23,811,562.89
DEDUCTIONS FROM GROSS INCOME:		
Rental Payments		\$124,056.12
Interest on Funded Debt		1,440,293.55
Interest on Unfunded Debt		360,398.03
Other Deductions		340,958.68
		11,265,706.38
Net Income		\$12,545,856.51
DISPOSITION OF NET INCOME:		
Sinking Funds		\$86,002.56
Dividends:		
7% on Preferred Stock	.....	1,567,650.00
5% on Common Stock	.....	7,257,625.00
		8,911,877.56
Balance Income for the Year		\$3,633,978.95

### GENERAL REMARKS

On March 1, 1920, the property was returned after having been in the possession and under the control of the United States Government for a period of twenty-six months.

As was stated in the last Annual Report, the Transportation Act, 1920, provides that for the period of six months beginning March 1, 1920, and ending August 31, 1920, any carrier desiring to do so could accept a guaranty operating in the amount of one-half of its unpaid compensation during Federal control, and you were advised that the Board of Directors accepted this guaranty.

The total amount due the Company under the guaranty provisions of the Transportation Act, 1920, cannot be definitely stated until all the transactions applying to the guaranty period have been ascertained and the allowances for maintenance and additional compensation determined. The total of \$16,509,184.88, included in the income statements, as published in this report, as "Account amount due," includes only the transactions applying to the period that have been accounted for as of December 31, 1920. Information requested by the Interstate Commerce Commission to enable them to determine the amount due has been furnished as requested.

The account with the Director General of Railroads has not yet been settled. On November 23, 1920, claim was made against the United States Railroad Administration which includes an amount for undermaintenance, and for deficiency in materials and supplies turned back at the end of Federal control, as compared with the amount on hand when the property was taken over. The remainder of the claim was for unpaid compensation, balances on open accounts, accrued interest and depreciations, and for the value of property retired during the Federal control period and not replaced, less all credits due the Railroad Administration, including amounts advanced by the Director General for the construction of additions and betterments and windings up equipment.

In winding up matters arising out of and incident to Federal control, the Federal Control Act authorized the President of the United States to inspect the property and receive all systems of transportation to secure any information concerning matters arising during Federal control, and the carriers were required to provide all reasonable facilities and upon request of the President to furnish all necessary and proper information and reports compiled from records kept during the period of Federal control, and this to be at the expense of the carriers. As a result, as was to be expected,

there were voluminous reports required, which took much time and a large force of employees to prepare. The work of compilation was carried forward diligently, and as a result all of the reports and statements called for by the Railroad Administration in regard to settlement matters were finished strictly in accordance with the instructions of the Railroad Administration and promptly filed, so that, so far as it is known to your officers and directors, no delay in settling the affairs of Federal control is attributable to any lack of diligence on the part of the company nor for the want of any necessary information.

During the period of Federal control many things occurred which have had far-reaching effect upon the affairs of the company, the most significant of which was the increase in wages. During the year 1917 the payroll of officers and employees amounted to \$47,346,247.29. For the year 1920 it amounted to \$100,550,395.72.

During Federal control practically all of the labor not previously unionized became unionized, and there are now, in addition to the brotherhoods of engineers and trainmen and switchmen's unions, unions representing various shopmen, maintenance of way men, telegraphers, station agents and station employees, freight handlers, etc., and clerks. Some of these organizations are affiliated with the American Federation of Labor and others are not.

In the month of July, 1920, the Railroad Labor Board, a body created by the Transportation Act, 1920, granted an increase in wages applicable to all employees excepting certain subordinate officials and the technical employees of the Engineering Department, which increased their compensation approximately 2%. This increase was made effective May 1, 1920, and due to this award of the Labor Board and other necessary wage adjustments incident thereto, the operating expenses were increased from May 1 to December 31, 1920, \$12,421,000. For a full year's operation this award alone requires an amount greater than the total of the interest charges for the entire year and the dividends for a half year.

The property, when returned to the Company at the end of Federal control, was not in as good repair nor in as complete equipment as it was on January 1, 1920, and over by the Government. The President stated in his proclamation of December 26, 1917, and the Federal Control Act guaranteed that the property would be returned in as good condition as when taken over, and the claim made against the Director General contains the amount necessary to make good this deficiency.

**CONSTRUCTION AND MAINTENANCE DURING THE YEAR 1920**  
Owing to the difficulty of securing material and labor, as well as to the necessity for limiting construction expenditures to the minimum of absolute necessity due to the high cost of labor and material, a very small amount of construction work was done during the year.

**Chicago Terminal Elevator.**—During the year 1919 an enlargement of the Chicago terminal grain elevator was undertaken, consisting of the construction of seventy-eight bins with interspaces at the storage house, in order to complete the elevator upon the plan originally adopted. This additional construction increased the storage capacity about 3,364,000 bushels, and brings the total capacity of this elevator to 10,000,000 bushels. The erection of the bins was completed and they were put in service on September 1, 1920.

**Clinton, Iowa.**—During the year 1920 the construction of a modern passenger station and heating plant at Clinton, Iowa, was completed. The station was put in service on May 6, 1920. The work of constructing subways at two streets, and the elevation of the tracks forming a part of the project have been postponed until a more opportune time. The company is required by ordinance to complete one of the subways in 1921, and to complete the other subway and the entire project in 1922.

**Hastings, Neb.**—A passenger station of brick on concrete foundation with basement to accommodate the steam heating plant was constructed. The former passenger station at this point was destroyed by fire.

**Glen Rock, Wyo.**—A passenger and freight station of frame construction, with cement stucco finish on the exterior, was completed and put in service. This station was constructed to accommodate a community which has grown rapidly in the last few years.

**Ely, Neb.**—A passenger and freight station of frame construction, on timber foundation, was constructed and put in service.

**Iraun, Neb.**—A freight and passenger station of frame construction, on timber foundation, was constructed and put in service.

**Franklin Grove, Ill.**—A passenger station of concrete tile with brick facing to the level of the window sills and cement stucco finish above, was constructed. The station building formerly located here was destroyed by fire.

**Fend du Lac, Wis.**—A frame ice house, on concrete foundation and having a capacity of 10,000 tons of ice, with gallery conveyor for filling the house, was constructed. The ice house previously located at this point was destroyed by fire.

**Moyfair, Ill.**—A one-story freight house, on concrete foundation and supplied with steam heating plant, was constructed. Team yards and tracks were also constructed at this point.

**Chicago, Ill.**—A two-story brick building was erected at Erie Street coach yard to provide quarters for the storage of material and tools used at this yard and accommodation for employees. The construction of this structure was made a passenger station on account of quarters previously used having been destroyed by fire.

**Ashland, Wis.**—An extension 840 feet in length is being made to ore dock No. 3. This extension is of timber construction of the same character as the existing dock, and will add 140 pockets to the dock, making its total capacity 300 pockets. This extension is necessary to take care of the additional ore traffic which is increasing rapidly from the territory served by this dock.

Passing tracks were constructed at the following points:  
**Butte, Wis.**—Existing track extended 3,100 feet in length.  
**Eyota, Minn.**—New passing track constructed 5,000 feet in length.  
**Haverhill, Minn.**—New passing track constructed 5,000 feet in length.  
**Lide Siding, Minn.**—New passing track constructed 5,000 feet in length.  
**Lowden, Iowa.**—New passing track constructed 4,800 feet in length.  
**Newala, Iowa.**—Existing passing track was extended 3,326 feet.  
**Woodruff, Wis.**—Existing passing track was extended 1,913 feet.

**Nelson, Ill.**—New passing track constructed 2.65 miles in length.  
**Bend, Ill.**—New passing track 1.13 miles in length constructed. At this point, also, tracks aggregating 3.1 miles in length were constructed for the purpose of affording facilities for cleaning and repairing coal cars.  
**Broadmoor, Ill.**—A second main track 2.12 miles in length was constructed.  
**Hurley, Wis.**—A new track 2,290 feet in length, connecting with the Ashland Division south of Hurley City, and extending eastward to the mines at Ironwood, Michigan, also yard tracks aggregating 11,060 feet, coaling platform, water tank, yard office, coal and oil house and coal heaver's and switchmen's quarters, were constructed to provide for the serving of the mines, access to which over previously existing tracks was cut off by the mining operations.  
**Chicago, Ill.**—A reinforced concrete viaduct extending across the Wells Street Yard was completed and opened to traffic December 31, 1920. This structure provides an approach to a new steel bascule bridge across the Chicago River built by the City and extending from North Franklin Street on the south of the river to Orleans Street on the north, opening a new street from the loop district to the north side, north of Kinzie Street. The viaduct is 80 feet wide and carries two street car tracks. It has a roadway 48 feet wide and two sidewalks each 16 feet wide, with concrete balustrade. The main viaduct is 610 feet long.  
 During the year the following important bridges were constructed:

Carrollville, Wis.	Bridge 1516½.	Reinforced concrete subway at American Ave., necessary to provide grade separation.
Ripon, Wis.	Bridge 1013.	20-foot concrete arch and 320 feet of earth embankment, replacing pile and timber trestle.
Bando, Ill.	Bridge 1863.	118-foot deck riveted steel truss span on reinforced concrete abutment and concrete pier, replacing timber bridge.
Fox Lake, Minn.	Bridge 503.	75-foot deck plate girder span on concrete abutments, replacing timber bridge.
Pisgah, Iowa.	Bridge 256.	90-foot through plate girder span on pile piers, replacing timber bridge.
Rochester, Minn.	Bridge 126.	Three 75-foot deck plate girder spans on concrete piers, replacing two steel truss spans of inadequate strength for modern power.
Lamberton, Minn.	Bridge 526.	43-foot deck plate girder on pile piers and present concrete pier, replacing portion of timber bridge.
Fremont, Neb.	Bridge B-8.	Platte River. 7 concrete piers constructed to replace pile piers. Part of program of replacing all pile piers in this bridge when renewal is required.

**COALING STATIONS**

Modern mechanically operated coaling stations were under construction and partially completed at the following points:  
 Clinton, Iowa. Capacity, 350 tons  
 Carroll, Iowa. Capacity, 300 tons  
 West Chicago, Ill. Capacity, 300 tons

**MISCELLANEOUS**

**Kenosha, Wis.**—In connection with the construction by the City of Kenosha of a new bridge over the river at Main Street, the Railway Company is completing the viaduct over the industry track leading to the Simmons Company and the Bain Wagon Company, a viaduct forming a part of the approach to the new bridge. This is about 40 per cent completed.

**NEW EQUIPMENT**

During the year the Company arranged for the purchase of the following new equipment to be delivered early in the year 1921:  
 500 Steel ore cars.  
 500 Steel underframe stock cars.  
 250 Steel underframe refrigerator cars.  
 50 Caboose cars.  
 25 Steel passenger coaches.  
 9 Steel smoking cars.  
 2 Steel mail cars.  
 3 Steel combination baggage and mail cars.  
 23 Steel baggage cars.  
 40 Heavy Mikado type freight locomotives.  
 20 Heavy Pacific type passenger locomotives.

**RAIL RENEWALS**

The following renewals were made with new rail:  
 63.25 track miles 100 lb. rail  
 129.15 track miles 90 lb. rail  
 60.43 track miles 72 lb. rail  
 .58 track miles 60 lb. rail  
 253.41 track miles.

The following usable rail was applied in renewals:  
 22.98 track miles 100 lb.  
 63.29 track miles 90 lb.  
 50.23 track miles 80 lb.  
 98.48 track miles 72 lb.  
 64.79 track miles less than 72 lb.  
 299.74 track miles.

**BALLASTING**

3.60 miles of track ballasted with crushed stone.  
 77.48 miles of track ballasted with gravel.  
 (17.2 miles of the foregoing material was distributed in 1918 and 1919, but not put under the track.)  
 62.32 miles of track ballasted with cinders, of which 6.5 miles was distributed in 1919, but not put under the track.

**TIE RENEWALS**

A total of 2,543,892 cross ties and 6,450,951 feet (board measure) of switch and bridge ties was renewed.

**PROPRIETARY RAILWAYS ACQUIRED**

In conformity with action taken by the stockholders at the annual meeting of April 13, 1920, on April 30, 1920, the Chicago and North Western Railway Company acquired by purchase the railway, property and franchises of the following proprietary companies, which have for many years been controlled by it through ownership of the entire capital stock.  
*Wyoming & North-Western Railway Company, a corporation of the State*

of Wyoming, owning a single track railway extending from a connection with the Chicago and North Western Railway at Casper, Wyoming, to Lander, Wyoming, a distance of 147.89 miles.  
*Pierre, Rapid City and North-Western Railway Company, a corporation of the State of South Dakota, owning a single track railway extending from a connection with the Pierre and Fort Pierre Bridge Railway at Fort Pierre, South Dakota, to Rapid City, South Dakota, a distance of 163.48 miles.*

*Pierre and Fort Pierre Bridge Railway Company, a corporation of the State of South Dakota, owning a single track railway (and bridge over the Missouri River) extending from a connection with the Chicago and North Western Railway at Pierre, South Dakota, to a connection with the Pierre, Rapid City and North-Western Railway at Fort Pierre, South Dakota, a distance of 1.82 miles.*

*Belle Fourche Valley Railway Company, a corporation of the State of South Dakota, owning a single track railway extending from a connection with the Chicago and North-Western Railway at Belle Fourche, South Dakota, to Newell, South Dakota, a distance of 23.52 miles.*

*James River Valley and North-Western Railway Company, a corporation of the State of South Dakota, owning a single track railway extending from a connection with the Chicago and North-Western Railway at Blunt, South Dakota, to a connection with the railway of that company at Gettysburg, South Dakota, a distance of 39.55 miles.*

*Missouri Valley and Elmer Railway and Bridge Company, a corporation of the State of Iowa, owning a single track railway (and bridge over Missouri River) extending from a connection with the Chicago and North-Western Railway near California Junction, Iowa, to a connection with the railway of that company at Des Moines, Iowa, a distance of 11.75 miles.*

*Iowa Southern Railway Company, a corporation of the State of Iowa, owning a single track railway extending from a connection with the Chicago and North Western Railway near Miami, Iowa, to near Consol, Iowa, a distance of 13.75 miles.*

*Macomb County Extension Railway Company, a corporation of the State of Illinois, owning a single track railway extending from a connection with the Chicago and North-Western Railway at Bend, Illinois, to Staunton, Illinois, a distance of 4.15 miles.*

*The Ladd and Eastern Railroad Company, a corporation of the State of Illinois, owning a single track railway extending from Ladd, Illinois, to Seatonville, Illinois, a distance of 3.25 miles.*

*The Albany Railroad Bridge Company, a corporation of the State of Illinois, chartering the right of way to build, maintain and use a railroad bridge over the Mississippi River between a point below Fulton, Illinois, and Clinton, Iowa, a distance of 1.10 miles.*

*Wolf River Valley Railway Company, a corporation of the State of Wisconsin, owning a single track railway extending from a connection with the Chicago and North-Western Railway near Elton, Wisconsin, to White Lake, Wisconsin, a distance of 1.98 miles.*

**PENSIONS**

The Company has continued its policy of awarding pensions to employees, and during the calendar year 1920, 161 employees of the Company were retired from active service and granted pensions. Of these, 91 were on account of pensions having reached the age of 70, and 70 were granted on account of employees having retired permanent physical disability.

On December 31, 1920, there were 1,102 retired employees receiving pensions. The amount paid in pensions during the year was \$385,235.42, of which \$60,081.47 was paid by the United States Railroad Administration and the balance, or \$325,153.95, was paid by the Chicago and North-Western Railway Company. The average monthly pension in force December 31, 1920, was \$3.25.

Since the inauguration of the pension system, the total payments made from January 1, 1901, to December 31, 1920, was \$3,804,030.38.

**FEDERAL VALUATION**

The work of valuation of the property by the Interstate Commerce Commission has been carried forward throughout the year. The field work, which was commenced in 1919, and carried on continuously from that time to December, 1920, has now been completed, with the exception of some miscellaneous items, which will be finished during the coming spring. This work is done by the Bureau of Valuation of the Interstate Commerce Commission, but the cooperation and assistance of the Railway Company is required in the matter of furnishing maps and information and the preparation of descriptive statements of the property, detailed statements of the cost of its land and equipment, as well as the rendering of active assistance in carrying out the field work and in the preparation of detailed statements of quantities, values and co-operation of the Interstate Commerce Commission and the Federal through the period. It is expected that the work of tabulation and the application of prices and the computations of the various costs, estimates of reproduction costs, etc., will be substantially completed during the year 1921, and that the Commission will be in a position to render a tentative report some time in the year 1922.

During the year 1920, \$426,549.25 was expended, of which amount \$357,632.44 was borne by the company and \$68,916.81 by the Railroad Administration. Since the commencement of this work, \$1,740,935.94 has been expended.

**RATES**

During the period of Federal control, rates were not advanced as the expense of operation increased. Effective August 26, 1920, however, the Interstate Commerce Commission increased the rates on interstate passenger traffic 20 per cent and on interstate freight traffic 10 per cent, from that time to 25 to 40 per cent. Several of the State Commissions declined to make like increases on intrastate traffic, and to secure such increases and eliminate unlawful discrimination between state and interstate commerce, the Company applied to the Interstate Commerce Commission and the Federal courts, with the result that substantially all of the intrastate freight and passenger rates were given the same percentage of increase as was given to the interstate rates.

**CAPITAL STOCK**

There has been no change since the close of the preceding year in the Capital Stock and Scrip of the Company.

The Capital Stock authorized by the Company is Two Hundred Million Dollars (\$200,000,000), of which the following has been issued to December 31, 1920:

HELD BY THE PUBLIC:	
Common Stock and Scrip	\$145,157,128.82
Preferred Stock and Scrip	22,395,120.00
Special Stock	65,000.00
Total Stock and Scrip held by the Public	\$167,617,248.82
OWNED BY COMPANY:	
Common Stock and Scrip	\$2,342,512.15
Preferred Stock and Scrip	8,834.56
Total Stock and Scrip owned by Company	2,346,346.71
Total Capital Stock and Scrip, December 31, 1920	\$169,963,595.53

FUNDED DEBT

At the close of the preceding year the amount of Funded Debt held by the Public and in Sinking Funds was.....\$213,125,000.00

The above amount has been decreased during the year ending December 31, 1920, as follows:

By Bonds and Equipment Trust Certificates redeemed:	
C. & N. W. Ry. 30-year Debentures, 5%.....	\$10,000.00
M. L. S. & W. Ry. Consolidated First Mortgage, 6%.....	4,000.00
M. L. S. & W. Ry. Extension and Improvement Sinking Fund Mortgage, 5%.....	43,000.00
C. & N. W. Ry. Sinking Fund of 1879, 5%.....	80,000.00
C. & N. W. Ry. Sinking Fund Debentures of 1933, 5%.....	285,000.00
C. & N. W. Ry. Equipment Trust Certificates of 1912, 4½%:	
Series A.....	\$300,000.00
Series B.....	300,000.00
Series C.....	400,000.00
	1,000,000.00
	\$1,422,000.00

By Bonds and Equipment Trust Certificates transferred to the Treasury from the Sinking Funds on W. & St. P. R. R. (Ext. Western Div.) and North Western Union Ry. First Mortgage Bonds:

C. & N. W. Ry. 30-year Debentures, 5%.....	\$46,000.00
M. L. S. & W. Ry. Extension and Improvement Sinking Fund Mortgage, 5%.....	22,000.00
C. & N. W. Ry. Sinking Fund of 1879, 6%.....	19,000.00
C. & N. W. Ry. Sinking Fund of 1879, 5%.....	67,000.00
Wisconsin Northern Ry. First Mtge., 4%.....	440,000.00
C. & N. W. Ry. Sinking Fund Debentures of 1933, 5%.....	45,000.00
Mankato and New Ulm Ry. First Mtge., 3½%.....	416,000.00
F. E. & M. V. R. R. Consolidated, 6%.....	1,000.00
C. & N. W. Ry. Equipment Trust Certificates of 1912, Series C, 4½%.....	4,000.00
	\$1,060,000.00
Total Funded Debt redeemed and transferred.....	2,482,000.00
	\$210,643,000.00

And the above amount has been increased by Bonds and Notes sold during the year, as follows:

C. & N. W. Ry. 10-Year Secured Gold Bonds, 7% (secured by \$2,500,000.00 General Mortgage Gold Bonds and \$15,000,000.00 First and Refunding Mortgage Bonds).....	\$15,000,000.00
C. & N. W. Ry. Equipment Trust Certificates of 1920, 6% (secured by equipment allocated to Company by United States Government).....	9,973,500.00
	24,973,500.00
Leaving Funded Debt held by the Public December 31, 1920.....	\$235,616,500.00

BONDS IN THE TREASURY AND DUE FROM TRUSTEE

At the close of the preceding year the amount of the Company's unpledged Bonds and Equipment Trust Certificates in the Treasury and Due from Trustee was.....\$19,749,600.00

The above amount has been increased during the year ending December 31, 1920, as follows:

Bonds Redeemed, exchangeable for General Mortgage Gold Bonds of 1937:	
W. & St. P. R. R. (Extension Western Division), First Mortgage, 7%, redeemed.....	\$14,400.00
North Western Union Ry. First Mortgage, 7%, redeemed.....	20,000.00
C. & N. W. Ry. 30-year Debentures, 5%, redeemed.....	10,000.00
M. L. S. & W. Ry. Consolidated First Mortgage, 6%, redeemed.....	4,000.00
M. L. S. & W. Ry. Extension and Improvement Sinking Fund Mortgage, 5%, redeemed.....	43,000.00
C. & N. W. Ry. Sinking Fund of 1879, 5%, redeemed.....	80,000.00
C. & N. W. Ry. Sinking Fund Debentures of 1933, 5%, redeemed.....	285,000.00
	\$456,400.00
C. & N. W. Ry. General Mortgage Gold Bonds of 1937, due from Trustee on account of Construction Expenditures made during the year.....	1,000,000.00
	\$1,456,400.00

Bonds and Equipment Trust Certificates transferred to the Treasury from the Sinking Funds on W. & St. P. R. R. (Ext. Western Div.) and North Western Union Ry. First Mortgage Bonds:

C. & N. W. Ry. 30-year Debentures, 5%.....	\$46,000.00
M. L. S. & W. Ry. Extension and Improvement Sinking Fund Mortgage, 5%.....	22,000.00
C. & N. W. Ry. Sinking Fund of 1879, 6%.....	19,000.00
C. & N. W. Ry. Sinking Fund of 1879, 5%.....	67,000.00
Wisconsin Northern Ry. First Mtge., 4%.....	440,000.00
C. & N. W. Ry. Sinking Fund Debentures of 1933, 5%.....	45,000.00
Mankato and New Ulm Ry. First Mortgage, 3½%.....	416,000.00
F. E. & M. V. R. R. Consolidated, 6%.....	1,000.00
C. & N. W. Ry. Equipment Trust Certificates of 1912, Series C, 4½%.....	4,000.00
	\$1,060,000.00
	2,516,400.00
	\$22,266,000.00

And the above amount has been decreased during the year, as follows:

C. & N. W. Ry. Equipment Trust Certificates of 1913, 4½%, retired:	
--	--

Series D.....	\$400,000.00
Series E.....	485,000.00
Series F.....	115,000.00
C. & N. W. Ry. Equipment Trust Certificates of 1917, 5%, retired:	
Series G.....	422,000.00
Series H.....	400,000.00
Series I.....	178,000.00
C. & N. W. Ry. General Mortgage Gold Bonds of 1917, 5% (in Treasury on December 31, 1919), deposited as part security for the C. & N. W. Ry. 10-Year Secured Gold Bonds sold during the year.....	2,500,000.00
	4,500,000.00

Total in Treasury unpledged December 31, 1920.....\$17,766,000.00

In addition to the bonds in the Treasury, as above, the following bonds owned by the Company are pledged as security for the C. & N. W. Ry. 10-Year Secured Gold Bonds sold during the year:

C. & N. W. Ry. General Mortgage Gold of 1937, 5%.....	\$2,500,000.00
C. & N. W. Ry. First and Refunding Mortgage, 6% (issued during the year on account of construction expenditures made during the preceding five years).....	15,000,000.00
Total.....	\$17,500,000.00

MILES OF RAILROAD

The total number of miles of railroad owned December 31, 1920, was.....8,328.86 miles

In addition to which the Company operated under Trackage Rights:

Peoria & Pekin Union Railway (in the City of Peoria, Ill.).....	2.02 miles
New York Central Railroad (Churchill to Ladd, Ill.).....	2.80 "
Union Pacific Railroad (Broadway Station, Council Bluffs, Iowa, to South Omaha, Neb.).....	8.73 "
Chicago, St. Paul, Minneapolis & Omaha Railway:	
Blair to Omaha, Neb.....	24.70 "
Elroy to Weyville, Wis.....	22.79 "
In Sioux City, Iowa.....	2.28 "
Illinois Central Railroad (Sioux City to Wren, Iowa).....	10.10 "
	73.42 "

Total Miles of Railroad Operated December 31, 1920.....8,402.28 miles

The above mileage is located as follows:

In Illinois.....	824.53 miles
Wisconsin.....	2,160.12 "
Michigan.....	510.90 "
Minnesota.....	650.30 "
Iowa.....	1,632.55 "
North Dakota.....	14.28 "
South Dakota.....	1,230.45 "
Nebraska.....	1,100.80 "
Wyoming.....	278.35 "
Total.....	8,402.28 miles

LANDS

During the year ending December 31, 1920, 16,396.11 acres and 92 town lots of the Company's Land Grant lands were sold for the total consideration of \$877,400.18. The number of acres remaining in the several Grants December 31, 1920, amounted to 268,133.16 acres, of which 42,074.51 acres were under contract for sale, leaving unsold 226,058.65 acres.

The Board announces with sorrow the death, on July 22, 1920, of Mr. William K. Vanderbilt (Senior), who served as a director from September 27, 1884, and as a member of the Executive Committee from June 4, 1891, to the time of his death.

Appended hereto may be found statements, accounts and statistics and the condition of the Company's affairs on December 31, 1920.

By order of the Board of Directors.  
W. H. FINLEY, President.  
Chicago, April 1, 1921.

PROFIT AND LOSS—DECEMBER 31, 1920

	Cr.
Credit Balance, December 31, 1919.....	\$55,531,371.42
Expenses for the Year Ending December 31, 1920:	
Balance Income brought forward from Income Account (see statement, page 32).....	3,633,978.95
Donations.....	42,279.41
Net Profit from Sale of Land Grant Lands.....	909,320.46
Amount transferred from "Appropriated Surplus" on account of the retirement of W. & St. P. R. R. (Extension Western Division) and North Western Union Ry. First Mortgage Bonds.....	2,541,036.62
	\$62,657,986.86
Dr.	
CHARGES FOR THE YEAR ENDING DECEMBER 31, 1920:	
Depreciation accrued prior to July 1, 1907, on equipment retired or changed from one class to another.....	\$443,827.05
Net loss on property sold or abandoned and not replaced.....	181,818.71
Debt discount extinguished through surplus.....	723,803.35
Miscellaneous Debits (Net).....	568,140.01

Balance Credit, December 31, 1920, carried to Balance Sheet.....\$62,657,986.86

## Railway Officers

### Financial, Legal and Accounting

**George N. Yard**, acting secretary and treasurer of the Gulf, Colorado & Santa Fe, has been elected secretary and treasurer with headquarters at Galveston, Texas.

**J. G. Lynch** has been appointed freight claim agent of the Louisiana Railway & Navigation, succeeding J. N. Campbell, who has been promoted to general freight and passenger agent, effective May 23.

**J. C. Hume**, division claim agent of the International & Great Northern, with headquarters at San Antonio, Tex., has been promoted to general claim agent, with headquarters at Palestine, Tex., succeeding J. S. O'Flynn, deceased.

### Operating

**W. H. Johnson**, superintendent of terminals of the Norfolk & Western with headquarters at Norfolk, Va., has been appointed general agent and superintendent of terminals, effective June 1.

**Charles M. Shriver**, assistant superintendent of the Baltimore terminals of the Baltimore & Ohio, has been promoted to superintendent of terminals to fill the vacancy made by the advancement of F. G. Hoskins to superintendent of the Baltimore division, effective June 1. Mr. Shriver is 28 years old, having entered the service of the Baltimore & Ohio 11 years ago as a machinist helper at the Mt. Clare shops. After serving his apprenticeship, he served as a machinist at the Riverside shops and later was promoted to fuel inspector. On April 1, 1916, he was promoted to assistant road foreman of engines at Cumberland, Md., and, in March, 1917, he became trainmaster of the

C. M. Shriver

Philadelphia division. He was later transferred to the Ohio division in a similar capacity. Mr. Shriver was furloughed in July, 1918, for military service, and sailed immediately for France where he served as a lieutenant with the railroad engineers in handling the heavy rush of troops and materials. Mr. Shriver returned from abroad in May, 1919, and resumed his service with the Baltimore & Ohio as trainmaster of the Wheeling division at Wheeling, W. Va. He became assistant superintendent of the Baltimore terminals July 1, 1920, from which position he has now been promoted.

### Traffic

**C. O'D. Pascault**, division passenger agent of the Buffalo, Rochester & Pittsburgh, with headquarters at Pittsburgh, has resigned and the position has been discontinued.

**J. N. Campbell** has been appointed general freight and passenger agent of the Louisiana Railway & Navigation, effective May 23, succeeding E. C. D. Marshall, deceased.

**J. A. Rockwell**, general agent of the Buffalo, Rochester and Pittsburgh with headquarters at Rochester, N. Y., will retire

in accordance with the pension rules of the company and the office will be abolished, effective June 1.

**Robert A. Trovillion**, chief clerk to the general freight agent of the Illinois Central, with headquarters at Chicago, has been promoted to assistant general freight agent, with

R. A. Trovillion

the same headquarters, effective May 21, succeeding H. G. Powell, who has resigned to accept service with the Illinois Terminal Company, with headquarters at Alton, Ill. Mr. Trovillion was born at Golconda, Ill., on August 26, 1887, and was educated at the Western Military Academy, Alton, Ill. He entered railroad service on December 10, 1906, as a stenographer in the office of the assistant general freight agent of the Illinois Central at St. Louis, Mo. During the next ten years, he served in various positions including chief clerk in the St. Louis office, and on February 15, 1916, was transferred to Chicago as assistant chief clerk to the general freight agent. He was made chief clerk to the general freight agent on May 11, 1917. Mr. Trovillion served in the air service of the army during the war, and upon his return to civilian life resumed his position as chief clerk.

**Robert W. Davis**, freight traffic manager of the Buffalo, Rochester & Pittsburgh with headquarters at Rochester, N. Y., has retired under the pension rules of the company, effective May 20, and the office of freight traffic manager has been discontinued. Mr. Davis was born at Union Square, Oswego County, N. Y. He entered railway service in 1871 as an apprentice for the Syracuse & Northern (now a part of the New York Central). The following year he became a telegraph operator. In 1876 he was promoted to agent at Union Square. In 1880 he became train dispatcher and night ticket agent at Watertown, N. Y., and, in 1881, traveling auditor. He then served a short time as auditor and assistant treasurer of the Syracuse, Chenango & New York (now also a part of the New York Central). From 1882 to 1884 he served as a train dispatcher for the Rochester & Pittsburgh (the predecessor of the Buffalo, Rochester & Pittsburgh). He then became traveling freight agent and chief clerk in the freight department and remained in the position until 1892, when he was promoted to general freight agent. In 1907 he was appointed freight traffic manager.

### Mechanical

**E. J. McSweeney**, division master mechanic of the Baltimore & Ohio with headquarters at Washington, Ind., has been transferred to Garrett, Ind., succeeding W. F. Moran, resigned. **C. M. Newman** succeeds Mr. McSweeney. These appointments and changes were effected June 1.

### Engineering, Maintenance of Way and Signaling

**J. J. Desmond**, roadmaster of the Louisiana division of the Illinois Central, with headquarters at McComb, Miss., has been transferred to the Chicago Terminal, with headquarters at Chicago, succeeding P. H. Leonard, who has been appointed track supervisor, with the same headquarters. **C. M. Chumley**, roadmaster of the Mississippi division, with headquarters at Water Valley, Miss., has been transferred to the Louisiana division, succeeding Mr. Desmond. **C. M. Pittman, Jr.**, succeeds Mr. Chumley. The appointments and changes were effective June 1.

**P. G. Lang, Jr.**, whose appointment as engineer of bridges

of the Baltimore & Ohio was announced in the *Railway Age* of May 27 (page 1252). was born at Philadelphia, Pa. He was educated at the Northeast Manual Training High School of that city and at the University of Pennsylvania, from which institution he was graduated in 1905 with the degree of bachelor of science in civil engineering. During 1905 and 1906 he was employed at the Pencoyd plant of the American Bridge Company. During the latter year he left this company to become bridge designer for the Carolina, Clinchfield & Ohio at Johnson City, Tenn. In December, 1907, he entered the service of the Baltimore & Ohio as assistant engineer in the bridge department. In December, 1917, he was promoted to chief bridge draftsman and on August 1, 1918, to assistant engineer of bridges, which position he held at the time of his recent promotion. Since October, 1919, Mr. Lang has been in complete charge of bridge work for the company.

P. C. Lang, Jr.

#### Purchasing and Stores

**John E. Mahaney**, whose appointment as superintendent of stores of the Chesapeake & Ohio was announced in the *Railway Age* of May 20 (page 1196), was born at St. Paul, Minn., December 23, 1879, and entered railway service in the stores department of the Minneapolis, St. Paul & Sault Ste. Marie at Minneapolis in 1895. In 1900 he went with the Eastern Minnesota (Great Northern) as general foreman. From 1903 to 1906 he served the Chicago, Rock Island & Pacific in a similar capacity. He then served the Southern Pacific as storekeeper, leaving that position in 1910 to become general storekeeper of the Oregon-Washington Railroad & Navigation. In 1913 he went with the Spokane, Portland & Seattle as general purchasing agent and general storekeeper. Two years later he became general storekeeper of the Norfolk Southern. During federal control Mr. Mahaney served the Procurement section, Railroad Administration, as supervisor of stores of the Northwestern region. On May 1, 1919, he returned to the Norfolk Southern as general store-

keeper, which position he held at the time of his recent appointment.

#### Obituary

**F. M. Rugg**, general agent, passenger department, of the Chicago, Burlington & Quincy with headquarters at St. Paul, Minn., was killed in an automobile accident near North Branch, Minn., on May 20.

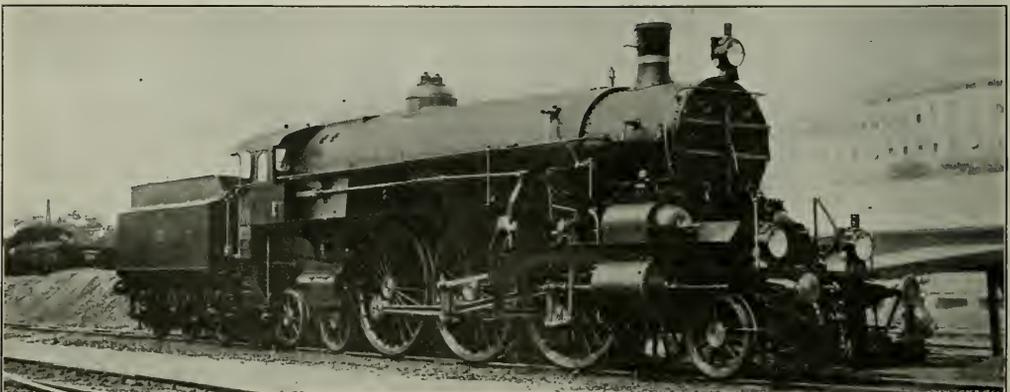

**Henry B. Ledyard**, chairman of the board of directors and former president of the Michigan Central, whose death was announced in the *Railway Age* of May 27 (page 1252), was born at Paris, France, on February 20, 1844. He was educated at the United States Military Academy at West Point, New York, and entered railway service in January, 1870, in the engineering department of the Northern Pacific. In July of the same year he became a clerk in the office of the division superintendent of the Chicago, Burlington & Quincy, and in 1872 was promoted to assistant superintendent of that road. A year later he was promoted to superintendent of the Eastern division. In October, 1874, Mr. Ledyard was appointed assistant general superintendent and chief engineer of the Michigan Central. He was promoted to general superintendent in 1876, and in 1877, was appointed general manager. Five years later he was elected president of the Michigan Central and served in that position until January, 1905, when he resigned the presidency to become chairman of the board of directors. This latter position he held continuously until the time of his death.

H. B. Ledyard

THE CHICAGO CHAPTER of the American Society of Steel Treating has elected the following officers: Chairman, H. M. Wood, Ingalls-Shepard division, Wyman Gordon Company, Harvey, Ill.; vice-chairman, T. A. Lovegren, Standard Forging Company, Indiana Harbor, Ind.; secretary-treasurer, Harry Blumberg, Illinois Steel Company.

F. W. Pflieger, chairman of the Signal section, American Railway Association, in his opening address at the third annual meeting, touched on a point of great importance in recommending the appointment of a Committee on the Economics of Railway Signaling, this committee to make recommendations

for the handling of traffic by signal indications and the operation of outlying switches by remote control to increase efficiency and economy in train movements. It was suggested that this committee be composed of representatives of the operating and of the signal departments. However, train operation is so closely allied with a number of departments that it would appear advisable that representatives of the telegraph and mechanical departments serve on such a committee. The scope of work could be greatly extended by making studies showing the savings accomplished, turning some of the so-called "intangible" ones into the tangible form of dollars and cents. All admit that signals facilitate traffic and promote safety, but what does an hour saved in train movements mean in dollars and cents and what is the actual money saved by preventing unnecessary stops for the delivery of train orders or for taking sidings or stopping at non-interlocked grade crossings? A study of the subject should take into account wear and tear of equipment, fuel consumption and numerous other items; and it appears to be one well worthy the consideration of the American Railway Association.

One of the most marked developments in the design of shop, enginehouse and freight house buildings in recent years has been the increased attention which engineers are giving to illumination, natural and artificial. Conditions are particularly adverse in an enginehouse with its constant cloud of smoke and steam. They are scarcely less severe in the average shop. But curious as it may seem, the value of adequate light in such buildings was not fully realized until recently as will be shown by an inspection of almost any building of this character built a decade or more ago. It is not many years since the action of a progressive eastern road in whitewashing the interior of its blacksmith shop at frequent intervals as a measure for increasing production was heralded as an innovation. More recently building engineers have replaced solid walls pierced by small windows with great areas of metal sash as illustrated in the new Monon shops at Lafayette, Ind., described on another page of this issue. In this building 80 per cent of the wall area is of glass. Nearly the same proportionate area is glass in the new roundhouses built by the Pere Marquette at Saginaw, Mich., and New Buffalo, as indicated in a description of the latter which appeared in the *Railway Age* of March 11. Almost equal attention is being given to the artificial illumination of these buildings by flood lighting and other means of electrical illumination. This increased attention to light is resulting from the growing realization that a workman can do more and better work in adequate light while incurring

less danger of accident; likewise, in freight-house construction where the improved lighting makes for accuracy in reading markings. Rapid as the progress in the provision of increased attention to lighting has been in recent years, railway engineers can afford to devote still more attention to it, for even a further advance can be made in railway building construction.

With the economy of timber preservation positively established, it is difficult for the layman to understand why the railroads do not use treated cross-ties universally. The answer would appear to lie in the fact that few investments for betterments made by the railroads are so long in paying a return, even though the ultimate gain from such an investment is absolutely certain. Until nearly all of the old untreated ties have been replaced, the annual renewals are determined, not by the average life of the treated ties, but by that of the untreated ties being replaced. Consequently, the advantage to accrue from the greater outlay for treated ties does not assert itself for a period equal to the average life of the untreated timber. But added to this natural obstacle is an artificial one imposed by the Interstate Commerce Commission. Whereas the added outlay covering increases in weight of rail and other items of roadway betterment are chargeable to capital account, no portion of the expense involved in the transition to cross ties subjected to preservative treatment may be handled in the same way. In other words, the road which decides to replace untreated ties with treated ones must carry the added cost in its operating expenses and as a consequence, the expense for tie renewals must be considerably above normal for the period of from five to nine years before the increased life of the treated timber will become effective in reducing cross-tie renewals enough to offset the cost for the preservative process. That it would be difficult to formulate satisfactory rules for capitalizing the change to treated timber is conceded. Timber preservation covers a wide range in the degree of perfection and refinement. Careless, indifferent or unscientific methods, might easily neutralize all the potential advantages to accrue under properly conducted work. Nevertheless, the change to treated timber is a true betterment which should be recognized in some manner in the accounting. The fact that any management which undertakes this betterment must be penalized by increased operating expenses over a period averaging seven years is unquestionably the most serious deterrent to the introduction of the preservative process on many railroads, and there is no question but that a great impetus would be given to this agency for conservation if the Interstate Commerce Commission would recognize the equity of a capital charge for the added outlay during the period of transition. Until then it is up to the directors of the roads to recognize that this movement for real economy involves an added operating outlay for a considerable period and due allowance must be made therefore in passing on the annual operating results, obtained by those in charge of the properties.

### Why All Roads Do Not Treat Ties

### More Light In Railway Buildings

Only eight weeks have elapsed since a new record for idle cars was established. At the present time the surplus is still

**Is a Car  
Shortage  
Imminent?**

almost as great as existed at the beginning of 1919, during the recession in business following the armistice. Despite this enormous surplus, the country is certain to have a car shortage within two months if the present rate of increase in traffic and in bad order cars continues. Between January 1 and April 8 the idle cars increased from about 200,000 to 507,274. This was the maximum and there has been a fairly steady reduction since that time. On April 30 the surplus was 482,076 and on May 15, 450,164, a reduction of 31,912. During the same interval there was an unprecedented increase in the number of bad order freight cars. On January 1 there were 191,234 of all classes unserviceable and there has been a continuous and rapid increase ever since. On May 1 the bad order cars numbered 309,971, and on May 15, 324,969. These figures are all based on the Class I roads. Since the bad order cars are included in the idle cars, the margin of serviceable cars not in use is the difference between the bad order cars and the idle cars, which amounted to 172,105 on May 1 and 125,195 on May 15, a decrease of 46,910 in two weeks. It is evident if the number of serviceable idle cars continues to decrease at the rate of 23,000 a week, there will be a car shortage within six weeks. The situation is sufficiently serious to demand immediate attention. In the normal annual variation of traffic there is usually a gradual increase from April until September or October when the maximum is reached. There is reason to believe that the present increase in traffic is not a temporary revival, but that the improvement will continue. An actual car shortage with over 300,000 cars idle, but all unserviceable, would be a novel situation but one that could never be explained to the satisfaction of the shipper. The first step necessary to ward off such a shortage is to decrease the number of bad order cars. There were 93,279 cars requiring light repairs on May 15 and these can probably be returned to service with little delay. The heavy bad orders amount to 10.1 per cent of all the freight cars and present a serious problem. All of them need extensive repairs. Many are not fit to remain in service, yet they may be badly needed. This is an opportune time to make a careful survey of freight car conditions to determine which cars are to be repaired and which replaced with new equipment. Unless this is done there is danger that new cars will not be obtainable promptly and the demand will be so insistent that the railroads will be obliged to perpetuate obsolete and uneconomical equipment.

## The Vast Purchases of the Railways

THE PURCHASES AND STORES SECTION of the American Railway Association met in Chicago this week. How many people in the United States, or even how many railway men, have any adequate conception of the magnitude of the business which is handled by the railway officers who compose the Purchases and Stores Section?

These officers include the buyers of the railways. They do not determine all the things that shall be bought, but they have very great influence in determining the things that shall be bought, and they carry on the negotiations incidental to the buying. It is necessary for each railway to keep on hand at all times a sufficient quantity of materials and supplies with which to make current repairs and replacements and also to make such improvements as are under way. The officers of the stores department have the responsibility of handling, distributing and accounting for all these materials, while the purchasing officers have the responsibility of seeing that they are bought at the best prices consistent with the

quality of the things bought. In addition, the purchasing department usually has, directly or indirectly, responsibility for the purchase of fuel. How large is this business of purchasing, storing and handling fuel, materials and supplies?

Some statistics recently compiled by the Bureau of Railway Economics make it practicable to answer this question more definitely and in more detail than ever before. A comparison of the figures for the year 1916 with those for the year 1920 will throw light not only on the magnitude of the business transacted, but also on the effects produced upon it by the increases in prices and other changes which have occurred within recent years.

In 1916 the Class I railways, exclusive of switching and terminal companies, paid \$250,544,862 for fuel. They charged \$119,785,157 to their operating expenses for depreciation and retirements, which in the long run represent expenditures for materials and supplies. They spent \$447,316,143 directly for "materials, supplies and miscellaneous," the "miscellaneous" being a comparatively small item. This made a total of about \$817,646,162 which was spent for fuel and, directly and indirectly, for materials and supplies. The foregoing figures cover only the items chargeable to operating expenses. As nearly as we can estimate, of the total capital expenditures made in the calendar year 1916 about \$209,100,000 was devoted to the purchase of materials. Therefore, in that year the total expenditures made by the railways, directly and indirectly, for fuel, materials and supplies amounted to about \$1,027,000,000.

In the year 1920 the fuel bill of the Class I railways, exclusive of switching and terminal companies, was \$672,891,964. They charged to their operating expenses \$145,252,339 for retirements and depreciation and \$1,063,769,900 for materials, supplies and miscellaneous. If we assume that one-half of their capital expenditures were made for materials, then on the basis of the estimate of the Bureau of Railway Economics regarding the total capital expenditures in 1920 the outlay for materials chargeable to capital account was over \$285,000,000. This makes a total for the Class I railways, exclusive of switching and terminal companies, of approximately \$2,167,000,000 which was spent in 1920 for fuel, materials and supplies.

It is not claimed for the figures given that they are exactly accurate. They undoubtedly are smaller than the total amounts spent by all the railways of the United States for fuel, materials and supplies, because they include nothing for the expenditures of the Class II and III railways or of the switching and terminal companies, which operate almost 20,000 miles of line.

In view of the magnitude of these figures it is hardly necessary to lay stress upon the importance of the work done by the purchases and stores departments of the railroads. In view of the fact that the figures for 1920 are more than twice as large as those for 1916, it is hardly necessary to dwell upon the extent to which the increases in prices have affected the operating expenses of the railroads.

Furthermore, it should hardly be necessary to do more than give the figures to show how important to the general business of the United States are the purchases of fuel, materials and supplies made by the railroads, and the effects upon general business which are inevitably produced by wide fluctuations in the amounts of these purchases. When the railways are financially able to make purchases on the scale required for the adequate maintenance and development of their properties they are the largest market for some of the largest industries of the country, especially those of coal mining, iron and steel and lumber manufacturing. On the other hand when, as has been the case within recent months, it is necessary for the railways drastically to reduce their purchases of all kinds and practically to suspend their buying of materials and supplies of many kinds, the adverse effect produced upon general business is tremendous.

It will be an auspicious day for the general business of the country when the purchases and stores departments of the railroads are enabled to resume buying and handling fuel, materials and supplies in normal quantities.

## Reduction of Railway Wages

THE RAILROADS are again before the Railroad Labor Board requesting the restoration of the rates of pay for railway employees which prevailed before the wage increase of last July. Last week the Labor Board announced wage reductions which it estimates will cut about \$400,000,000 from the annual payroll. This announcement came after the board had received a large amount of evidence from the carriers regarding the decreases which have taken place in the cost of living and in the wages being paid in outside industries for work of a character similar to that performed by railway employees. The Labor Board split the difference, less than two-thirds of the increase of last July being eliminated. Railway executives expressed disappointment; employees' representatives are non-committal and by inference, satisfied.

The average annual wage per employee in 1914 was \$815.44. The wage award of last July made it \$1,926, an increase of 136.2 per cent. The cost of living at the time the award was made was 104.5 higher than in 1914, according to the National Industrial Conference Board's figures. The average railway employee, therefore, was awarded a wage when the cost of living was at its height which was 31.7 per cent higher relatively to the cost of living than he had received in 1914. The decrease just ordered by the Labor Board averages 12 per cent, thus reducing the average annual wage of the railway worker to \$1,694.88, or 107.7 per cent more than it was in 1914. But the cost of living since July, 1920, according to the Industrial Conference Board, has dropped approximately 40 per cent. The railway employee, therefore, instead of receiving an actual reduction in his wages, can, after his money wages have been reduced 12 per cent, buy 40 to 50 per cent more with his wages than in 1914. The average railway wage, measured in money, being, after the 12 per cent reduction, 107.7 per cent more than in 1914, compares very favorably with the increase of 89 per cent which the Department of Labor estimates took place in the average wages of employees in other industries between 1914 and May, 1920. Since that time there has been a decided decrease in general wages, but statistics are not yet available.

Even if the Labor Board were to grant the full requests of the carriers at this time the railway workers would still receive a "just and reasonable" wage measured by the cost of living and the wages being paid for comparable work in other industries. The increase last July averaged about 22 per cent. If all this were wiped out the average annual compensation per employee would be about \$1,581, an increase over 1914 of approximately 94 per cent, as compared with a cost of living which is now 63.6 per cent more than in 1914. The average railway wage would still have fully 30 per cent more purchasing power than before the war.

Many representatives of the employees recognize very clearly the favorable position of their constituency, and, despite public criticism of the board's ruling, have privately admitted its mildness, a few going so far as to characterize the wage cut ruling as a "victory" for the workers.

The carriers are again before the board reiterating their request for the restoration of the rates of pay in effect prior to the board's Decision No. 2, and substantiating them with additional data regarding the two relevant factors in the case, namely, the cost of living and the wages being paid for similar work in other industries. The Labor Board should, in fairness to the railroads and to the public, formulate a new order. The decreases in wages made should approximately restore the wages in effect prior to last July.

## A Lesson from the

## Missouri, Kansas & Texas

THE RAILWAYS of the United States in the last four months of the years 1915, 1916 and 1917 had average net earnings of \$442,000,000 while in the last four months of 1920, under the present rates, they had net earnings of only about \$349,000,000, a decline, compared with the net earnings of the same months for the three other years mentioned, of 23 per cent. In the last four months of 1915, 1916 and 1917 the Missouri, Kansas & Texas had, on the average, net earnings of \$3,872,000, while in the last four months of the year 1920, under the present rates, it had net earnings of over \$5,375,000, an increase over its average net earnings in the same four months of the three years preceding government control of almost 39 per cent.

The Missouri, Kansas & Texas is not a large railway, according to American standards, but it operates 3,793 miles of line, and the fact that it showed in the last four months of 1920 so large an increase in net earnings under the present rates while the railways of the country as a whole showed a decrease, as compared with the three years immediately preceding government control, is a fact which is noteworthy.

The Missouri, Kansas & Texas has been in receivership since 1915. We publish this week the first of two articles regarding the improvement of its physical property and its operating and financial results in the years from 1913 to 1920, during which it has been under the present management. The facts given in these articles seem to make quite clear the reasons why its experience recently has been different from that of most other railways. The principal reasons are that a substantial amount of new capital has been invested in improvements in the property, and that the management has taken advantage of these improvements to increase the efficiency of operation. Since 1913 the average tons of freight carried per train has been increased from 299.4 to 504, or 68.3 per cent. In consequence, an increase of almost 74 per cent in ton-mileage has been handled with an increase of only 3.3 per cent in freight train mileage. An increase of 58.50 per cent in the number of passengers carried one mile has been handled with a reduction of 5 per cent in passenger train mileage.

Practically all the new capital which has been invested in the road under the receivership has been furnished by its creditors, since the new capital invested has been almost the equivalent of the accrued interest which the receiver has not paid. This, however, hardly constitutes an argument for bankrupting all the railroads of the country in order that the interest that otherwise would be paid by them may be invested in improvements. The bankruptcy of one or a few railroads has never caused a national financial catastrophe. The general bankruptcy of the railroads would ruin so many banking and fiduciary institutions and individuals who own their bonds and notes that it would be disastrous to every class of business concerns and individuals in the country.

The lesson which the experience of the Missouri, Kansas & Texas does forcefully inculcate is the desirability from the standpoint of the public of letting the railways earn net returns which will be large enough to enable them to raise sufficient new capital to make needed improvements in their facilities. Such improvements, as the experience of every railway which has been able to make them shows, not only enable the railways to handle a larger amount of business, but also to handle it at less cost than would otherwise be the case.

It is very difficult to make business men and farmers realize that in the long run they do not reduce, but increase, the cost of transportation to themselves when they hold down to the lowest possible limit the net return earned by the railroads. If the railways in the year 1920 had earned a net return of 6 per cent upon their valuation, the total net

return received by them would have been less than one-fifth as large as their operating expenses. Obviously, therefore, in the long run the extent to which the cost of transportation to the public will be reduced will depend mainly upon what permanent reductions are made in operating expenses. All the larger economies in operation, in turn, always have been and always will be obtained largely through permanent improvements in the properties. Improvements in tracks, terminals, locomotives, etc., have made it possible for the Missouri, Kansas & Texas to increase its average trainload so much, and thereby enabled it to handle a largely increased traffic without corresponding increases in the amount of fuel and materials used and the number of men employed. But improvements in the physical plants of the railways can be made only by the investment of new capital, and therefore when business men and farmers cause regulation unduly to restrict the net return that the railways earn they prevent from being made the improvements in the physical properties which are essential to substantially increasing the economy of operation.

While most of the railways of the United States under the present rates suffer from declines in their net earnings compared with pre-war years, some even when still handling a large business, like the Missouri, Kansas & Texas, showed increases in them. These increases in net earnings in every case were due to the fact that the operating expenses did not increase in proportion to the amount of business handled, and in almost every case where a railway recently has suffered relatively less from increases in expenses than its neighbors this has been due to the fact that within the last ten years it has suffered less than its neighbors from inability to raise new capital, and therefore has been able to make more economy-producing improvements.

Of course the lower in the long run the operating expenses of the railways are made the lower in the long run it will be practicable to make their freight and passenger rates. How long will it take to awaken business men and farmers of the country to the fact that in the long run prosperous railways will be able to serve them not only better, but at lower rates, than unprosperous railways?

## Chicago, Milwaukee & St. Paul

THE CHICAGO, MILWAUKEE & ST. PAUL did not prove much of a money maker for the government during the period of federal control. It drew on the government heavily during the guaranty period from March 1 to August 31, 1920. In the period since the end of the guaranty period it has been operating at a deficit; it is not even making its operating expenses, let alone sufficient for its fixed charges. The standard return for the St. Paul was \$27,946,820, including extra compensation in the amount of \$440,000 to cover the installation of electric operation between Harlowton, Mont., and Avery, Idaho, which was completed prior to federal control.

The net railway operating income in each of the years 1918 and 1919 was less than \$4,000,000; approximating that figure in 1918, but nearer \$3,000,000 in 1919. In other words, in each of these two years the operations of the property yielded something like \$24,000,000 less than the standard return. In 1920 the operations of the St. Paul resulted in a net operating deficit as shown in the December, 1920, monthly report to the Interstate Commerce Commission, of \$5,819,216. The guaranty for the six months from March 1 to August 31, 1920, the guaranty period, would be one-half the standard return, or \$13,973,410. The net operating deficit for these six months was such that to make good this deficit and the guaranty the government has been called upon to pay no less than \$22,250,811 to meet the provisions of Section 209 of the Transportation Act.

Referring now to 1921, so that we may bring our figures up to date, we have available at this time the figures for January, February and March as shown in the monthly reports to the Interstate Commerce Commission. The net operating deficit, after taxes and rentals, for these three months was \$2,473,236. It is evident from this array of figures that the St. Paul was hardly benefited by federal control. The handicaps arising from federal control, combined with the sharp decline in business in the St. Paul's territory in recent months, give the officers of the property a real problem. There is very good reason for believing, however, that the problem will be solved if present adverse conditions of general business do not last longer than now appears probable. The present management is making energetic and successful efforts to advance efficiency of operation, and a substantial increase in the road's traffic undoubtedly would be followed by a great improvement in its financial results.

The Chicago, Milwaukee & St. Paul is a system with 10,634 miles of line, of which it owns 10,168 solely, 109 jointly and operates 347 under trackage rights. This mileage extends over eleven states. The St. Paul was in the earlier days of its history a granger road. With the building of its Puget Sound line it became one of the transcontinental carriers. The building of this line was intended to give the system an outlet to the Pacific coast, such as was obtained by the Chicago, Burlington & Quincy through its acquisition by the Hill lines. The outlay represented in the Puget Sound extension, the money that has since been spent on it for electrification, and the publicity that has been given these things make it difficult for an observer to realize that the St. Paul was a railroad system of considerable importance even before it reached the coast. Nevertheless, the building of the new line was a matter of no small importance, speaking comparatively, and its effect on the welfare of the system fully as great to warrant the great amount of discussion that has gone on concerning it.

The electrification of that portion of the line from Harlowton, Mont., to Avery, Idaho, 440 miles, was completed in 1915. In 1920 electric operation was begun on the section from Othello, Wash., to Tacoma and Seattle, about 200 miles. A new line, and a line built to such standards as this one, needs business and a large amount of it. It has apparently not had that business in sufficient quantity as yet, although it has done fairly well in spite of the competition of the strong and efficiently operated carriers which were in the field before it. The failure thus far to realize to a sufficient extent on the potentialities of the situation—or, in other words, the fact that the northwest has not yet realized to a greater extent on its own potentialities—explains much of the present difficulty of the St. Paul system.

The lumber industry is one of the most important industries, if not the most important industry, of the region served by the St. Paul. It has been idle for some months; cuttings have been kept down to an absolute minimum. The effect on the St. Paul's earnings can readily be appreciated when it is observed that products of forests constitute 20 per cent of the St. Paul's total tonnage. It is natural, speaking still of 1921, that the present decline in the business of the northwest, particularly in lumber, should have been so sharply reflected in the earnings of the St. Paul as it has been.

The St. Paul is one of the few roads that have made final settlements with the Railroad Administration for operations during the period of federal control. On November 1, 1920, it entered into an agreement with the Railroad Administration whereby it funded the cost of all additions and betterments to its properties, except as to equipment, in a note for \$20,000,000 payable March 1, 1930, and whereby it received in cash, in addition to sums already paid, \$13,750,000. This sum was applied in payment of a note of \$11,500,000 held by the War Finance Corporation and in the payment of the balance on notes held by banks, originally

amounting to \$4,000,000. The notes mentioned had been given in 1919 when the corporation, because of the withholding of its compensation, had to borrow money to meet interest maturities and for other requirements. "In negotiating this settlement," the annual report says, "differences developed between the claims of the company and the director-general, particularly those relating to maintenance expenditures, and rather than involve the company in prolonged and expensive litigation, the outcome of which would necessarily be uncertain, the board favored a final settlement at this time upon the terms above stated, believing it to be for the best interests of the company." In the situation, one cannot help but believe that had the road been in a stronger position financially, it would not have had to make this settlement with the Railroad Administration as quickly as it did and would probably have secured a larger payment than was made it.

The St. Paul carried more tons of freight in 1920 than it did in 1919, but the tons carried one mile were less because of a decrease as between the two years in the average haul. The freight revenue in 1920 was \$117,183,815 as compared with \$106,288,453 in 1919. The number of revenue tons carried in 1920 amounted to 45,041,277, the average haul was 253 miles and the total ton-mileage of revenue freight was 11,384,600,804. The tons carried in 1919 totaled 40,295,220; the average haul was 285 and the revenue tons one mile were 11,501,514,483. The St. Paul's revenue train load in 1920 was 544 tons, a reduction from the average of 554 in 1919. The 1920 average exceeded that for years prior to 1919, typical figures being 442 in 1916; 468 in 1917 and 532 in 1918. The average load per loaded car in 1920 was 25.48 tons; in 1919, 24.58.

One of the features of the St. Paul's operations during the past two or three years has been the large amount of new equipment which has been acquired. The company was allocated by the United States Railroad Administration 100 heavy Mikado locomotives and 3,000 box cars, which number was later increased to 5,000. In 1920, the road placed orders for an additional 100 Mikado locomotives. It also received during the year 15 electric locomotives for its electrified sections.

The figures for operation in 1920 compare with those for 1919 as follows:

	1920	1919
Mileage operated .....	10,624	10,647
Freight revenue .....	\$117,183,815	\$106,288,453
Passenger revenue .....	31,035,594	30,391,921
Total operating revenue .....	168,189,734	150,370,394
Maintenance of way expenses .....	28,810,633	23,144,811
Maintenance of equipment .....	41,557,151	40,422,005
Traffic expenses .....	17,257,663	1,107,107
Transportation expenses .....	86,276,148	69,288,819
Total operating expenses .....	164,697,121	138,561,705
Net railway operating revenue .....	3,461,613	11,808,689
Tax accruals .....	1,872,832	6,306,997
Railway operating income .....	Def. 8,451,167	5,362,271

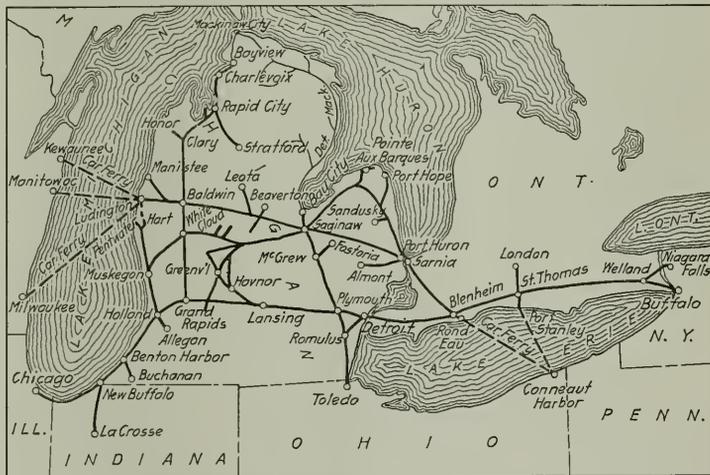

The corporate income account is as follows:

	1920	1919
Compensation accrued .....	4,640,721	27,945,820
Compensation, January and February .....	2,250,811	.....
Compensation under guaranty provision .....	1,372,519	.....
Railway operating income, March 1 to December 31 .....	31,128,295	31,723,534
Gross income .....	17,593,581	16,690,833
Interest on funded debt .....	26,762,224	24,090,489
Total deductions from gross income .....	4,366,071	7,643,043
Net income .....		

## Pere Marquette

THE PERE MARQUETTE was one of the few roads that elected not to accept the guaranty of net railway operating income embodied in the provisions of Section 209 of the Transportation Act. The earnings of the property while it was under federal control had been such that this decision seemed at the time it was made to be the proper one. The unusual events which characterized railroad operations in 1920, however, affected the road's operating expenses so drastically, without permitting compensating improvement in operating expenses, that the operations for the six months ended August 31 resulted in a corporate income account deficit amounting to \$46,286.

The earning power developed by the Pere Marquette during the period of federal control was one of the features of that eventful portion of American railroad history. The Pere Marquette had been following a somewhat rocky path, it having been in the hands of receivers from 1905 to 1907 and again from April, 1912, to the latter part of 1916. When the road was taken over by the government its standard return was set at \$2,932,162. In 1918, the first year of federal control, the operations of the property resulted in a net railway operating income of \$3,814,052, or about one-third more

The Pere Marquette

than the standard return. In 1919, when most roads suffered a pronounced decrease in net, the Pere Marquette proved very much of an exception. In that year, its net railway operating income was \$6,680,358, a yield to the government in 12 months sufficient to pay the standard return for the entire 26 months of federal control. The Pere Marquette proved a good money maker for the Railroad Administration.

President Frank H. Alfred in the annual report in explaining the reason for the decision not to accept the guaranty, says: "The Pere Marquette had demonstrated its ability, if unhindered by unusual and exceptional restrictions in the use of its property to earn a sum largely in excess of the standard return allowed. It was considered to be of vital interest to the public that any such excess so to be earned, should be, at the earliest opportunity used for betterments and additions to the property of the company." It was expected, he points out, that the net earnings from operation for the six-months period would approximate \$1,375,000, whereas the corporate net income based on the guaranty would have amounted to \$672,000. As already noted, the corporate

income statement for the six months actually showed a deficit of \$46,286. The reasons that the calculations failed to work out are, of course, well known. They include the outlaw strike of April, the Labor Board's decision in July, the fact that the increase in freight rates and passenger fares was not decided until August, etc.

The Pere Marquette was further handicapped because intrastate passenger fares in Michigan were not increased until March, 1921. Mr. Alfred estimates that the additional wages paid to employees under the Labor Board's award amounted to \$1,340,972 for the four months, May to the end of August. If the increased freight rates and passenger fares had been effective May 1, as, indeed, the directors anticipated they would be, it is estimated that the freight revenues for the four months would have been \$2,863,914 greater than they actually were in that period and passenger revenues \$580,480 greater, a total of \$3,444,394. The excess of estimated additional revenues over the actual amount of additional wages paid, the report continues, would have been \$2,103,423.

The Pere Marquette operates 2,239 miles of line of which it owns 989, controls 127 and operates 227 under trackage rights. The larger part of this mileage is in the state of Michigan. There are, however, lines to Chicago and Toledo and a considerable mileage in Canada. About half of the mileage operated under trackage rights is included in the connection to Buffalo and Suspension Bridge, secured by operation over the Michigan Central from St. Thomas, Ont. A feature of the Pere Marquette's operations is its car ferries which give the property access to connections at Milwaukee and Manitowoc, Wis., and at Conneaut Harbor, Ohio.

Considering the territory traversed by the Pere Marquette it is to be expected that no particular class of traffic would predominate; this is borne out by the following figures: products of agriculture, 13.2 per cent; products of animals, 1.36 per cent; products of mines, 46.40 per cent; products of forests, 8.71 per cent and manufactures, 16.90 per cent. In using these figures attention should not be lost of the Pere Marquette's traffic in and out of the Detroit district. Automobiles make about two per cent of the total tonnage but related products make up a large tonnage the size of which is not indicated by that figure. Because of its location the Pere Marquette is handicapped by having to pay prices for coal somewhat above the average, particularly because of the freight rate on the haul to the Pere Marquette lines. The road also has to meet large debit balances for hire of equipment, that figure in 1920 being no less than \$1,692,898, an amount greater as it happens than the interest on bonded indebtedness.

The Pere Marquette carried more tons of freight in 1920 than in any previous year but owing to a shorter average haul in that year, the ton-mileage of revenue freight was less than in 1919 or 1918. The number of tons of revenue freight moved in 1920 was 14,855,393, the average haul, 165 miles and the total revenue ton-mileage, 2,449,010,342. The revenue tons carried in 1919 totaled 14,783,616; the average haul was 170 miles and the revenue ton-miles, 2,511,959,726. In moving this freight the road secured an average revenue train load of 587 tons. This was a reduction from the figure of 604 in 1919 or that of 637 in 1918, but compared with 563 in 1917, which was the best train loading up to that time. The average revenue tons per loaded car in 1920 were 24.22.

The total freight revenues of the road in 1920 were \$29,754,566 as compared with \$26,504,204 in 1919, and the total operating revenues were \$40,372,814, an increase of \$4,929,678 over 1919. As against this increase in revenues, there was an increase of \$9,883,227 in operating expenses, the total operating expenses in 1920 amounting to \$36,731,955. The operating ratio in 1920 was 90.98 per cent as compared with 75.75 per cent in 1919. The net operating

revenues in 1920 amounted to \$3,640,859 as compared with \$8,594,408 in 1919, a decrease of \$4,953,549. The reasons for this sharp decrease in net are plainly pointed out in the report in an interesting table showing the relation of labor, fuel, material and other costs to total operating revenues. The following selection of figures from this table hardly needs comment:

	RATIO OF CHARGES TO OPERATING REVENUES					
	1918		1919		1920	
	Amount	Per cent	Amount	Per cent	Amount	Per cent
Labor	\$12,694,169	43.84	\$16,531,391	46.64	\$22,938,954	56.82
Material and supplies	2,977,577	10.28	2,759,026	7.79	3,745,885	9.28
Fuel	3,218,971	11.12	3,346,947	9.44	4,983,520	12.35
All other charges	4,497,159	15.53	4,211,363	11.88	5,061,596	12.53
Total operating exp.	\$23,387,876	80.77	\$26,845,728	75.75	\$36,731,955	90.98

Labor costs, it will be observed, made up the larger part of the increase in operating expenses. The increase in fuel costs is also noteworthy. The Pere Marquette does not go through a coal country, with the result that it has suffered from the high prices of fuel coal. As far as 1920 was concerned it suffered also from uncertain deliveries and had to confiscate coal for fuel with resulting higher costs. The poor quality of fuel necessitated a greater consumption; the miles run by locomotives per ton of coal in 1920 were 12.5, as compared with 13.83 in 1919, a decrease of 9.62 per cent.

In addition to these figures showing the relation between labor, fuel and other costs, the annual report also has some interesting data on the matter of deferred maintenance, especially as to equipment. On January 1, 1918, at the beginning of federal control there were in service on the road 398 locomotives good for a total of 2,694 months' service, an average of 6.769 months per locomotive. On February 29, 1920, at the end of federal control, there were 453 locomotives in service, including 58 new locomotives placed in service during federal control. The total months good for service was only 2,263 and the average per locomotive but 4,996. During the 26 months' period prior to federal control, 839 locomotives received general repairs; during federal control, only 639. The average mileage made by locomotives between general shoppings in the 26 months prior to federal control was 26,873; during federal control, 33,035. As far as freight cars are concerned the following figures will be of interest: in 26 months prior to federal control, cars receiving general repairs, 7,593; rebuilt, 6,265; in 26 months of federal control, cars receiving general repairs, 2,006 and rebuilt, 2,678.

The corporate income account for the Pere Marquette shows for 1920 a surplus for the year's operations, including the standard return for January and February, amounting to \$1,393,973 after the payment of interest as compared with a surplus in 1919 amounting to \$1,896,931 in 1919 or \$1,894,125 in 1918. Dividends amounting to \$560,000 were paid on the prior preference shares. No dividends were paid, however, on the 5 per cent preferred stock either in 1919 or 1920; this stock is cumulative beginning January 1, 1919, and dividends on it would amount to \$621,500.

The figures for operation in 1920 compared with those for 1919 are as follows:

Mileage operated	2,234	2,232
Freight revenue	\$29,754,566	\$26,504,204
Passenger revenue	6,938,505	6,127,461
Total operating revenue	40,372,814	35,443,137
Maintenance of way expenses	5,309,721	3,495,488
Maintenance of equipment	8,618,193	6,468,045
Traffic expenses	561,127	337,974
Transportation expenses	19,667,511	14,764,362
Total operating expenses	36,731,955	26,848,728
Net from railway operations	3,640,859	8,594,408
Taxes	1,073,822	762,283

The corporate income account is as follows:

Gross income (including standard return, full year, 1919, two months, 1920)	\$6,433,365	\$3,744,772
Total charges excluding interest	2,801,311	1,212,294
Balance before deduction of interest	3,632,265	3,623,478
Total interest accruals	2,238,292	1,726,547
Surplus	1,393,973	1,896,931

# Mechanical Department Must Tackle Big Program

Some Constructive and Practical Suggestions Which Will Bear  
Rich Fruit if Followed Generally

**T**HE INTENTION of this article should not be misunderstood. The mechanical departments of the railways have been subjected to much ignorant and malicious criticism during recent months. The really remarkable and steady progress which has been made by that department throughout the development of the railways of this country seem to have been lost sight of. True, the department is not perfect by any means—it never will be. It is, however, on a par with most other American institutions and organizations; in many respects—considering the conditions under which it is forced to operate—it is far ahead of most of them.

With proper backing on the part of the chief executives the capable and efficient leaders in the mechanical department will go steadily forward with the still larger program which lies ahead of them. The purpose of this article, then, is briefly to outline some of the more important parts in this larger program. It must be clearly understood that the things which are here set down are not dreams or vain imaginings of an idealist or chair warmer but rather that they

reflect the attitude and experiences of the foremost mechanical department officers—leaders who have demonstrated rare ability, who have the confidence of their associates and superiors, and who are going forward with a determination of securing an early and satisfactory solution of the great and complicated problems which now confront them.

The right solution of these problems will be a big factor in insuring the future stability and prosperity of American railroads. More than this it will have a large influence in the improvement of the railroad situation the world over since railroad officers in many of the foreign countries are looking intently to this country for inspiration and for guidance.

For convenience the program will be discussed under five heads: Management Problems and the Human Element, Getting the Most Out of Locomotives, Car Conditions Need Permanent Improvement, Speeding Up the Shop Production, and Increasing Engine Terminal Output. The study is not intended to be complete or exhaustive; it simply touches upon a few of the high spots.

## Management Problems and the Human Element

A. H. Smith, president of the New York Central Lines, in testifying before the Senate Committee on Interstate Commerce said that "the efficiency of a railroad depends principally upon its men. It is estimated that 95 per cent of railroading is human."

Because the truth of President Smith's statement is generally recognized and because the foreman and subordinate officers form the only live contact between the men and the managements, the tendency to give more attention to the selection, education and training of the foremen and to the elevating and upholding of the dignity of their positions is becoming more and more pronounced. The foreman cannot function properly and efficiently unless he is fully informed as to the policies of the railroad and his particular department, and unless "he has at heart the interest of the company and of the men under him and will

painstakingly co-operate with and assist in every way possible those coming under his jurisdiction."

If able, capable foremen and subordinate officers are not provided it will be absolutely impossible to develop the right spirit and morale. Managements and men must work together in a common cause—a house divided in itself cannot stand—and yet how can this co-operation be secured if the aims, objectives and feelings of the men and the managements are not intelligently and correctly interpreted one to the other. The foreman is the keystone. Progressive industrial leaders and railroad officers have come to a strong realization of this and are giving special attention to selecting, training and cultivating these men.

How can real results be expected when the following condition exists: "The little fellow down the line has his troubles in a supervisory way, which to him are many times mystifying. This is due to the fact that he is following

orders which to him may seem very foolish because he has not full knowledge of the reasons for such orders. This then places him in the class of critics which destroys efficiency."

There are many things which may be done to overcome this condition and to strengthen the foreman so that he may intelligently put forth his best efforts to develop the right sort of co-operation and build up the morale of the organization. Here is what one road is doing: "Each car foreman has a book of instructions outlining his full tour of duty and we are now completing a locomotive book for the foreman in that department. In addition to this we use great care in issuing circulars; before they are sent out every man has an opportunity to pass on the proposal and to give us his suggestions. The result is that when the instructions are issued our men respond very quickly and realize the necessity for any modifications in practice which may be submitted to them.

"We have followed the practice of having the different classes of foremen meet separately each year, thorough preparation being made for each of these meetings which include the presentation of suitable reports and papers. In addition to these meetings for tool foremen, boiler foremen, air brake foremen, back shop foremen, etc., we have an annual car foremen's meeting, a traveling engineers' meeting and a master mechanics' meeting. Bronze tablets are presented each year for first and second prize stations for the locomotive and car departments separately. There is great rivalry among our various points; the award in each case is made by a committee of five judges."

"If a man understands what is wanted of him he is responsible if he goes wrong. If a man is not properly instructed and directed his superior is responsible." This statement has a peculiar significance for the railway mechanical department. With its great variety of equipment and with the

forces scattered over large areas there is need for a painstaking and yet intensive, educational effort not only for the new men and apprentices but for men who have been on the job for months or even years, and yet have never had sufficient instruction as to exactly how important parts of their work should be done and who may not have a clear understanding of the responsibility which rests upon them. This is, of course, a question of supervision and is closely related to the problem of developing the right sort of foreman. It involves also, however, the development of accurate and complete schedules for shop and engine house practices. Some roads have made excellent progress in this direction with splendid results.

The difference between work and play is largely an attitude of mind. When men can be encouraged to go at their

### Playing A Game

work in a spirit of play they do more and better work with less fatigue. There is often just as much fun in making a record on a job, or in helping the department, shop or division to make a record, as there is in playing a spirited game. The successful supervising officer must be something of a promoter to secure this interest. There are numberless examples in railroad work of what may be done in this direction. Spirited contests to reduce accidents, to save fuel, to reclaim material, to cut down loss and damage, to increase car and train loadings, to increase production, etc., are familiar to all. It is the promotion of this spirit—and it can be done with small groups as well as large ones—that helps to locate and eliminate lost motion and waste. This spirit, however, cannot be developed by the mere issuing of orders or sending out of circulars; nor can a great deal be accomplished by correspondence, particularly that kind which is often carried on in railway service. Enthusiasm is contagious but it can best be transmitted by personal contact.

Modern apprenticeship methods have had a hard fight to gain a secure foothold on the railroads. Fortunately a number of officers with real vision have stood by through thick and thin. Conditions during the past few years have been hard to contend with and in many respects have been exceedingly discouraging; the clouds are breaking, however, and a goodly number of mechanical department leaders are going forward with renewed energy to carry on the good work and even to extend it beyond the field of training shop apprentices only. Changing conditions require different treatment and without doubt some radical improvements and modifications will have to be made in the methods of a few years ago. The fundamental principles, however, are sound and will serve just as well today as in the earlier days when modern apprenticeship methods were first introduced.

This brings us naturally to another development which has been gradually taking place in the mechanical department in recent years. Possibly the

### Get Out On The Job

thought can best be developed by quoting from a letter which we have recently received. "You had an editorial a short time ago (*Railway Age*, April 22, 1921, page 965) which was very good and it would help the mechanical department to function better if it was followed—scrap 90 per cent of the typewriters and let the heads of departments and their subordinates do more super-

### Instruct The Men Fully

vising and not be confined to their desks trying to educate chief clerks in other departments and answering a great many foolish letters that would be better unanswered."

This sounds pretty strong and yet not a few mechanical department officers have refused to allow themselves to be buried in detail routine work and have personally cultivated their subordinates on the firing line with excellent results. Their personalities have been projected down through their subordinates to the very ranks and there has been a great improvement in the morale of the department.

There is a considerable interest among mechanical men on many roads as to the relative merits of the departmental and divisional types of organization.

**Departmental vs. Divisional Organization**

Poor results are sometimes found on roads having the divisional form and where the operating officers have had no mechanical experience or do not seem to have a proper appreciation of the importance of the maintenance of equipment. Both forms of organization have strong advocates; indeed there is so pronounced a difference of opinion that it would seem advisable to determine the special conditions which must be maintained to make the greatest possible success of either form. True mechanical department officers have little to say in the determination of the kind of organization which shall be followed; at the same time the importance of the mechanical department is such as to warrant a keen interest on the part of its officers in helping to determine the exact conditions under which either type of organization can function to the best advantage so far as the maintenance and operation of the equipment is concerned.

There has been a decided change in status of the mechanical department on many roads in relation to the railroad organization as a whole in recent years—largely since the entry of this country into the world war. The importance and necessity of keeping up the maintenance of the equipment in the interests of good business was strikingly demonstrated early in the war; as a result the head of the mechanical department has assumed a larger place in the organization than he was generally given in pre-war days. Many roads, however, are too far behind the procession in this respect. The recommendations of a chief engineer when he restricts wheel loads or speeds over a piece of track or a bridge are regarded as law. The advice of the mechanical department head, on the other hand, is disregarded in many instances when he protests against the running of inferior and unsafe equipment or insists upon the use of better equipment. Considering the danger of disregarding these protests and con-

**Heads of the Mechanical Department**

sidering also the importance of the mechanical department and the amount of expenditure which is controlled by it the head of that department is too far removed from the chief executive on many roads. "When constructive ideas are developed by the mechanical department it often takes so long to go through the various channels before they reach the man in authority that by the time they do get to the president and the board of directors the father is frequently unable to recognize his own child. In such cases a mechanical department head to accomplish anything requires more perseverance than mechanical skill."

There are those who contend that the head of the mechanical department should have the standing of a vice-president and report direct to the chief executive who should listen to the comments of a seasoned mechanical department officer who stands exceedingly high in the councils of his road. The chief mechanical officer should at least report directly to the operating vice-president. "Outside of dictating the business and financial policy of the road there is no other post of duty that requires a man with a clearer sense of just what his duties consist of and a complete knowledge as to how they shall best be performed, than that of the man in charge of the mechanical department. Locomotives, cars and roadway must be kept in condition to carry a train safely, of a weight and at a speed consistent with a safe, practical and approved earning operation. Anything below this standard of maintenance and train operation inevitably results in losses that consume the funds required for maintenance and dividends. The old cry of 'too poor to be economical' has been the pitfall for numberless unwary executives. Had they been guided by that time honored axiom of Anything worth doing at all is worth doing well, their managerial history and that of the property they supervised would have been written differently."

Not a few mechanical department officers have been following closely developments in other industries relating to the handling of men. It is becoming recognized more and more that a real study of the labor turnover, for instance, often locates weaknesses in the organization which can be readily overcome. Moreover it costs money to break in new men and the correction of these weaknesses not only increases the efficiency and promotes economical operation but it saves the trained men to the organization. The selection, training and promotion of men is receiving special attention on many roads. More of an effort is being made to assign the men to the kind of work best suited to their peculiar characteristics and efforts are being made to study the men individually and strengthen their weak points. These things

**Questions of Personnel**

Not a few mechanical department officers have been following closely developments in other industries relating to the handling of men. It is becoming recognized more and more that a real study of the labor turnover, for instance, often locates weaknesses in the organization which can be readily overcome. Moreover it costs money to break in new men and the correction of these weaknesses not only increases the efficiency and promotes economical operation but it saves the trained men to the organization. The selection, training and promotion of men is receiving special attention on many roads. More of an effort is being made to assign the men to the kind of work best suited to their peculiar characteristics and efforts are being made to study the men individually and strengthen their weak points. These things

are all exceedingly helpful in cultivating a right spirit and understanding between the men and the managements.

Standardized wage scales have had a deadening effect upon the mechanics. The men on some roads at least are apparently ready to insist upon a return of piece work.

#### Incentive Wage Payment

Mechanical department officers have been studying this question carefully and if piece work is re-installed it will undoubtedly

be on a better and more stable basis than former methods which resulted from a gradual development in departing from the day rate basis. Some means must be devised to establish a basis upon which the rates can be developed so that as the costs of living change the prices can readily be readjusted. Suggestions along this line were made in an article by G. W. Armstrong in the *Railway Age* of May 20, 1921, page 1157.

The following extract from a letter of a mechanical department officer speaks for itself: "No matter how hard

#### Opportunity For Promotion

a man tries to give his best, he cannot render one hundred per cent or more without interest and enthusiasm. Interest and enthusiasm in a job cannot be bought; they must be given. They

may be encouraged and nothing encourages this spirit so much as hope for and opportunity of promotion. The best paid executive positions are in the operating department. Mechanical department men are seldom appointed to positions of superintendent and to the higher operating positions.

"The experience of some roads at least has demonstrated that men who began their careers as stenographers and clerks can be developed into capable administrative officers. They were given opportunity. They were given a chance to develop. Possibly these men might not be artists at tamping a tie; possibly they might not be able to run a transit as well as some others, but as they have advanced, they have absorbed information and knowledge by observation and contact and they have developed executive ability. Many master mechanics and other men trained in the mechanical department are equally capable of absorbing and advancing if they are not kept on a siding with the switch stand locked.

"Do the higher mechanical officers endeavor to shove their subordinates over into other channels where they can go ahead? Do they endeavor earnestly to find opportunity for their subordinates? Do not some mechanical officers labor under the delusion that unless a man is capable at every job that any machinist, boilermaker, blacksmith or other mechanic has had to do, or may ever have to do, he is unfit to hold a higher mechanical position? Have not the machinists who have advanced to be master mechanics, superintendents of motive power, etc., absorbed useful information on locomotive operation, boilermaking, pattern making, car work, dispatching and to some extent on auditing accounts? They can absorb still more. Others can absorb. Encouragement to learn and opportunity to advance will help any ambitious man to add to his efforts to make the mechanical department function more efficiently and more effectively."

## Getting the Most Out of Locomotives

Locomotives built today must operate not only next year, but 20 years from now. They must be built with an eye to the future and, therefore, the mechanical officer tries to incorporate in new power every worthy improvement, realizing that progress is certain to continue and the best today will be

#### Build for the Future

scarcely good enough to "get by" a few years hence.

The efficiency of the locomotive as a heat engine has been nearly doubled within a decade, yet the future promises to bring developments of equal importance. The study of combustion has led to a better understanding of firebox and boiler design, and new types are being evolved as a result. The feedwater heater has passed through the experimental stage and may now be regarded as having established a definite place in future construction. Superheating steam

to an extremely high degree has been tried and its feasibility determined. Improved methods of creating draft are now receiving close attention. Alloy steels have been used to reduce dynamic augment with varying success; the benefits that will accrue are so great there is no question that the trials will be continued until a thoroughly satisfactory material is found. Devices for increasing the tractive effort at slow speed utilize idle weight and improve the tractive power characteristics of locomotives built with trailers. These and other promising innovations are, or soon will be available and as in the past mechanical department officers will play a large part in overcoming the difficulties in their application. Much could be done to accelerate development by preliminary trials on a test plant and it is to be hoped that arrangements can be made for co-operative research at some of the laboratories available for this work.

Fifty-five per cent of the total operating expenses of the railroads is affected to a greater or less degree by the character of the motive power. Because

**Locomotives, the Vital Factor in Operation**

its influence on operation is so far reaching, the locomotive is the most important single factor in the operation of the roads today. Executives

are looking to it more and more as the instrument for cutting the cost of handling traffic. But whether it is a question of designing a new class of locomotives for special conditions, or of distributing the power to get the best results, an intimate knowledge of locomotive characteristics as well as operating conditions is necessary for its solution. The selection of the most economical tonnage or the locomotive best adapted for the traffic requires familiarity with the tractive effort, fuel consumption and maintenance costs of locomotives which few operating officers possess. The mechanical department men are thus becoming more closely allied with those who must determine operating conditions to move the traffic with the least total expenditure.

The selection of new power is becoming an extremely complex problem. When locomotives varied in few particulars, except in weight and the sizes of cylinders and wheels, the choice of the proper design was a simple matter. Now there are available numerous devices to increase the loads that can be hauled, to save fuel and to reduce maintenance. The range of possibilities to effect good operation or bad are almost unlimited.

Closely related to the problem of design is that of the rehabilitation of old locomotives. Remarkable progress has

**Convert Old Engines Into Assets**

been made in this direction during the past few years. However, there are still many locomotives in service that are uneconomical in the use of fuel and not sufficiently powerful for the service in which they must be used. Such power is only a liability from any standpoint. If kept in operation it is wasteful; if it is to be taken out of service a large charge to operating expenses must be made to retire it if proper depreciation reserves have not been set up.

The benefits of improving old locomotives can be obtained in two ways; first, by reducing the cost of operation and maintenance, and, second, by lengthening the service life and thus decreasing the yearly amortization. So many modern accessories are applicable to existing power that, from the engineering viewpoint, practically any old locomotive can be made as efficient as the latest improved design. There are, however, rather sharply defined limits to the changes that can profitably be made in an old locomotive. For many classes of service such locomotives are well adapted and the

extent to which the design can profitably be modified depends on the relative maintenance cost of the existing locomotive, the normal life that can be expected from the boiler, and the fuel consumption. This has been one of the most attractive fields for saving, because under suitable conditions large economies can be effected with a comparatively small expenditure.

To get the most out of the locomotives, they must not only be designed right, they must also be operated right.

**Effective Utilization of Power**

Adjusted tonnage rating, now quite generally used, insured proper loading, but failed to take into account the time element. One of the important advances in improved utilization came

with the general introduction of the record of distribution of locomotive hours. The importance of this form is generally recognized and some roads have adopted special methods for insuring the accuracy of the records. If this feature is closely checked, the data becomes invaluable as a means of getting a higher percentage of time in revenue service and reducing delays and time in shops and terminals. The intensive use of power increases the locomotive miles per day, enables the efficient power to be used to the best advantage, and reduces maintenance costs and fuel consumption. Many roads are now running engines over two divisions with splendid success. Other systems are turning the engines without cleaning or dumping the fires and report a large saving in fuel.

Even more important than getting the most miles per locomotive is getting the most ton-miles. Adjusted tonnage rating, where carefully supervised, gives splendid results. Roads that have supplemented this system by dynamometer car tests have obtained some remarkable improvements in operation. Much of this work was postponed during the war, but a revival of traffic will no doubt find the roads again actively engaged in improving their power by scientifically checking its performance in every-day operation.

The condition of locomotives is seldom considered as a major factor in train loading, yet it has a very great effect.

**Economy of a High Standard of Maintenance**

One road found that with equipment in good condition the tonnage could be increased in some instances 300 to 400 tons per train, and double-heading could be eliminated. How can the

highest standard of maintenance be assured? First and most important is thorough workmanship in the back shop. The majority of operations can be performed while the engine is receiving classified repairs for a fraction of what the work costs if done in the roundhouse. It is, therefore, economical to put the locomotives in condition for efficient con-

tinuous service while they are in the shop for overhauling. As long as the power is in service it should be maintained at the highest degree of efficiency until it is again due for classified repairs. This means that the stitch in time should be given rather than neglecting the engine until heavy repairs are needed and then trying to patch up the defects. One of the greatest aids in accomplishing this object is a definite standard of maintenance for the entire road. Systematic instructions for repairs are being adopted on numerous roads and the benefits are apparent.

Proper workmanship in the vital parts of the locomotive is absolutely necessary, but how is it to be secured with shops filled with "McAdoo mechanics" and jobs assigned according to seniority? The solution of the problem seems to be in the use of special men to follow the troublesome details. One road, for instance, has a man who does nothing else but look after valve motion on the entire system. He is able to check up waste of fuel at the source. Is this not more logical than leaving the detection of errors in valve setting to the fuel supervisors or traveling engineers who have no definite means of checking the cut-off unless the engine is so bad that it does not "sound square"?

Fuel economy is receiving close attention and now, more than ever before, careful supervision is warranted because the cost of fuel absorbs such a large proportion of operating expenses. As an example, on one representative road the cost per 1,000 gross ton-miles increased 246 per cent from 1916 to 1920.

#### Increasing Ton-Miles Per Pound of Fuel

The reduction of the quantity of fuel used can be accomplished partly by improved equipment, but the greatest factor is the method of operation, irrespective of the equipment. The technique of full economy has been thoroughly developed and securing the best performance practicable is now a matter of administration. In considering this matter two features stand out clearly. First, so many departments are concerned in the conservation of fuel that the organization which is responsible for its use should not have its activities restricted to the bounds of a single department. Secondly, the individual enginemen, and especially the firemen, can effect large savings or cause great losses. Without their full co-operation the best results can never be attained. The fuel department head may be a capable engineer but unless he is also a promoter, unless he can sell the idea of fuel saving to the men, he cannot achieve the full measure of success.

More than the usual amount of trouble has been experienced during the war and since from failure of materials. One mechanical engineer states the problem concisely in the following words: "There is economy of maintenance and operation in purchasing durable material. Material that soon requires repairs, patching or renewal is expensive. During the period of the war, there was a liberal tendency to grant concessions in order to facilitate output. Wherever quality was sacrificed by these concessions, higher costs of maintenance and repairs followed the use of the lower grade material. Where quality was sacrificed, immediate steps should be taken to direct it toward higher grade."

With the proper workmanship and material, and systematic maintenance in the engine house, a definite service can be obtained from each locomotive between shoppings. In this connection a superintendent of motive power recently said: "We have given very close study to the shopping of engines on a mileage basis according to a treatise which was given to every locomotive foreman on the railroad. Shop scheduling of work and the fact that engines are not allowed to be taken into the shop without careful study and, furthermore, knowing that material and shop space is available in advance, have caused our power to be more carefully followed up locally on each division. Master mechanics now readily understand that they must get a certain amount of service out of their power and they, therefore, keep it up from day to day and are avoiding the former practice of wearing an engine out intensively, figuring they can send it to the back shop whenever they please."

A matter allied to locomotive maintenance which deserves at least passing comment is the question of cleaning engines. Few roads have a definite policy with respect to all classes of power and often the appearance is a reliable indicator of the condition of traffic: if revenues are ample, the engines are clean; if times are hard, they are dirty. If there is no economy in wiping, the practice should be permanently discontinued, but if it effects a saving, it is needed at one time as much as at another. If the appearance of the locomotive indicates to the engineer that the railroad is indifferent about the condition of the power, is it reasonable to expect that he will crawl among the dirty parts to make a thorough inspection, or be careful in handling it? The saving effected by keeping motive power clean can never be computed accurately, but the moral effect on the organization gives a handsome return on the money thus spent.

## Car Conditions Need Permanent Improvement

On May 15 the Car Service Division reported 324,969 freight cars in bad order, 231,690 of which were in need of heavy repairs. This is a bad situation. Normally the bad orders should not constitute more than four or five per cent of the total equipment and during the months of heavy traffic last year they did not exceed eight per cent; now there are over ten per cent in need of heavy repairs alone. This extraordinary accumulation of run-down equipment is the result of the struggle for solvency which, during the past few months, has compelled many railroads to effect drastic

curtailments in maintenance expenditures without consideration of their ultimate wasteful effect.

Essentially, however, the present situation differs only in degree from that which periodically follows a decline in traffic. Whenever there is a surplus of equipment there is always a heavy movement toward home lines. Large numbers of these cars, which may long have been in need of heavy repairs, are set aside by the owners to await the much needed general overhauling. But, because of lack of adequate facilities or excessive curtailments of maintenance

expenditures, much of this equipment is still in need of heavy repairs when the succeeding period of increasing traffic compels its return to service.

During the period of heavy demand such cars appear repeatedly on the repair tracks, on each occasion to be patched up and moved on with the least possible expenditure. In the aggregate, however, the cost of maintenance under these conditions is excessive, the revenue service performance is seriously impaired and claims for loss and damage are excessive.

There are a number of conditions which, so long as they continue, make any adequate permanent improvement standards of car maintenance and serviceability practically impossible. The first is the lack of an adequate financial surplus to permit an intensive program of maintenance during these periods of light traffic. The effect of this condition has been most marked during the recent business decline and it will probably always exert more or less influence on the maintenance standards of financially weak roads.

How general this influence will be is largely a matter of public policy and is not directly within the control of railway managements. There is ample room for betterment, however, by changing conditions which are within the control of railway managements either individually or collectively, through the agency of the American Railway Association.

From the standpoint of its effect on operating costs, service and the cost of maintenance, the worst condition is probably the perpetuation of weak equipment which should either be retired or adequately reinforced to meet modern service conditions. The cars within this classification, while they probably

do not exceed 15 per cent of the total number of cars of railroad ownership, are the source of a much larger proportion of the total cost of maintenance and account for a large part of the accidents and loss and damage claims chargeable to freight cars.

The desirability of keeping cars with weak draft sills from interchange has been discussed for many years. In 1914 it first received serious attention before the Master Car Builders' Association and a provision, adopted by letter ballot, was added to Rule 3 to the effect that cars of less than 60,000 lb. capacity having short draft arms be not accepted in interchange after October 1, 1916. In 1916 the effective date was extended to October 1, 1917, because of the large number of refrigerator cars affected. In 1917 the date was again extended because of the material shortage existing at that time. In 1918 the time was again extended to October 1, 1920, and last year the effective date was set ahead to Oct. 1, 1922.

In 1918 a provision was added to Rule 3 requiring that after October 1, 1918, suitable reinforcements be applied to all cars of the weak construction as fast as they received general repairs.

Is it not probable that, should this provision fail to eliminate all of the cars of objectionable construction by October 1, 1922, the effective date of the ban on interchanging

these cars will again be moved forward? The time when the railroad may expect to be really free from this equipment probably depends entirely upon the extent to which the policies of the individual roads square with the reinforcement provision of Rule 3.

In the past year two other steps have been taken by the Mechanical Division to improve conditions caused by equipment of weak construction. These are the adoption of changes in Rules 114 and 120. The first recommends that where destroyed foreign cars are rebuilt on the handling line the original construction be modified to the extent of the application of metal draft arms, steel draft members, or other approved reinforcements. The second recommends the application of ends of box cars of the type specified for new cars when equipment with steel underframes requires extensive repairs to the ends.

It is significant that these provisions are recommendatory and not mandatory.

In the meantime, the evils resulting from the operation of weak equipment continue unabated and nation-wide in their effect. Is it probable that further direct legislation will prove to be more effective than that which already has been written into the rules?

Some conception of what it is costing the railroads to continue to operate cars with weak draft construction may be obtained from an analysis of car repair costs which was made in 1911 by F. F. Gaines, then superintendent of motive power of the Central Railway of Georgia, in which it was found that items connected with the draft gear and its attachment to the car accounted for 38.9 per cent of the cost of repairs, 28.4 per cent being chargeable to the item of draft bolts alone. That the equipment under consideration was not operating under the unfavorable conditions that prevail in many sections of the country is evident from the fact that draft timbers and longitudinal sills combined, did not exceed three per cent of the total.

On another railroad, during a recent period of 13 months, there were 889 wrecks or accidents caused by the failure of freight car parts. The largest single item in a classified list of the defects was 144 accidents caused by couplers pulling out. Including with this the other defects pertaining to the draft gear and its attachments, a total of 222 accidents, or 25 per cent of the whole, were attributable to the group.

The next largest single group of accidents was caused by arch bar failures which were responsible for nine per cent of the total. Add these to the draft attachment group and the sum amounts to 34 per cent, practically all confined to a small group of cars aggregating probably not more than 15 per cent of all the railroad-owned equipment in service.

This analysis suggests forcefully the extent of the losses other than the excessive cost of their own maintenance which are being sustained by the continued operation of these weak cars, since their retirement or adequate reinforcement would make it possible to eliminate practically all wrecks and the accidents attributable to these two large classes of defects.

The lading in these cars must frequently be transferred enroute. Apart from the cost of the transfer itself, it is an

exceedingly fruitful source of loss and damage claims. Few loads are transferred for which claims are not presented. Furthermore, an accident resulting from the failure of a weak car seldom occurs, that several other cars do not also appear on the repair track.

The question may well be asked, "If these things are true why does this equipment continue to run?" One reason is a general lack of service records of freight car equipment. Few roads are in a position to apportion to each class of freight equipment its share of the cost of repairs or the added operating expenses resulting from car failures. This is a fundamental defect which makes impossible intelligent decisions on questions of design, maintenance or retirement policies. This statement is not a reflection on the soundness of the judgment of car department officers; but good judgment is helpless without a sound basis of facts on which to act.

While the proper disposition of equipment of weak design is undoubtedly the most pressing problem pertaining to the permanent betterment of freight car conditions, there is still a large field for improvement in general maintenance policies. The two problems are very closely related and the same factors which so strongly tend to perpetuate cars of weak and unsafe design, exert a potent influence in preventing a generally higher standard of maintenance.

#### Can Maintenance Standards Be Improved?

Little evidence is needed to support the statement that general standards of freight car maintenance are low. The conditions with which the grain shipping roads are confronted yearly during the heavy movement of the crops have repeatedly been referred to in discussions on the floor of the Master Car Builders' Association conventions and elsewhere, in which opinion has usually been divided on territorial lines. These discussions were only reflections of the fact that few railroads maintain the freight cars on their lines beyond the margin required to provide for the handling of the commodities with which they have to deal.

Looking at the situation from the standpoint of good public service and the best interests of the transportation industry, such standards of maintenance are indefensible. And yet under present conditions can any one say that such standards are not sometimes justified when the immediate interests of the individual road are under consideration? With cars in great demand the percentage of home cars on lines rapidly decreases until it seldom runs above 50 per cent and in extreme cases, such as existed last year, drops as low as 25 per cent.

During these periods a large percentage of such repairs as are made must be made on foreign lines. But there is little incentive for the foreign lines to make more than the repairs immediately necessary to keep the equipment fit to run. The direct benefit of any more than this amount of work would probably be derived by a connecting line. During such periods the owning lines have little opportunity to carry out extensive programs of improvement or heavy repairs and with prices for labor and material fixed on the present basis of bare cost plus overhead, many roads find it cheaper to neglect their own equipment and pay for such repairs as are made at M. C. B. billing prices.

Is there not a basic inconsistency between Rule 1 and the

remainder of the interchange rules? Rule 1, by mandate attempts to place all cars, irrespective of ownership, on an equal basis so far as inspection and repairs are concerned. But it overlooks the fact that railroad corporations are essentially no different from and are subject to the same motives as individuals or corporations engaged in commercial or industrial pursuits, and that loyal officers and employees of these corporations are governed primarily by the immediate interests of their own organizations. The rules themselves imply a recognition of this fact since their purpose is largely to define and protect the rights of the car owner and the handling line respectively, the one from the other.

Is it reasonable to expect a high standard of freight car maintenance on a scale of standard billing prices low enough to discourage the handling line from carrying out the spirit of Rule 1 and at the same time, to encourage car owners whose costs are high to neglect their own equipment? A code of billing prices carefully established to avoid exceeding the average cost of labor and material and to which a percentage has only in recent years been added to cover legitimate items of overhead expense, necessarily must be applied at a loss by all roads whose costs are higher than the average and only those roads whose costs are lower than the average are offered any inducement other than a bare interest rate on the investment to provide facilities adequate properly to maintain all the cars on their lines.

Do these facts not suggest the desirability of establishing a scale of billing prices in which is included a reasonable profit in addition to all of the items of expense now taken into consideration?

The effect of such a scale of prices will be felt in several directions. In the first place, instead of being directly opposed, as they frequently are, the common interest of the roads to provide a high standard of public service and the individual interests of the roads would point in the same direction. The increased prices would tend to increase the extent and character of repairs to foreign cars. Just how extensive this improvement would be is open to some doubt, owing to the difficulty of securing promptly such material as must be furnished by the owner. The condition of many cars on their return to the home lines last fall, however, indicates that there is ample opportunity for improvement within the field requiring only such material as is commonly carried by all roads.

But the real responsibility for the maintenance of freight cars rests with the owner. With the suggested scale of prices the owner will be called upon to pay the repairing line a profit on a large part of the work done on foreign lines. And there would be a real incentive to provide for a high standard of heavy repairs to their own equipment to the end that frequent light repairs will be unnecessary. The wasteful results of continuing to operate the troublesome equipment of weak design would be brought home with an added force that would do much to hasten the complete rehabilitation or retirement of these cars. Eventually there would also be a marked improvement in the average standard of construction.

Considering the wasteful results of the patchwork methods of car maintenance, is it not reasonable to suppose that a high standard of maintenance would result in an actual reduction in the aggregate expenditure?

The question of standardization has received a great deal of attention for a decade by executive and operating officers as well as officers of the car department.

#### Standardization of Freight Cars

Several attempts to force the adoption of a complete standard box car design have been made, but so far without success. Considering the difficulties which have been encountered in the attempt to legislate cars with short draft arms out of service, the prospect for the adoption of a complete standard design does not look bright. Much good work has already been done by the Master Car Builders' Association and its successor, the Mechanical Division of the A. R. A. toward establishing limited dimensions for the strength and interchangeability of essential features of design. Such a standardization of details leaves little more to be desired, so far as interchangeability in interchange service is concerned. The limited extent of further requirements is evident from the fact that eliminating the repairs to draft gear attachments, and assuming an adequate maintenance program on the part of the owner, by far the largest part of the running repairs is confined to trucks, couplers and air brake equipment, the most affected details of which are already interchangeable.

In 1920 the total cost of maintaining over 94 per cent of the freight cars owned by all Class I railroads in the United States was \$626,746,636, an amount over \$17,000,000 larger than the total cost of locomotive maintenance on the same roads. Had the \$609,360,716 spent for locomotive maintenance been administered with the same lack of a definite program which characterizes the maintenance of freight

cars it is doubtful if 50 per cent of the locomotives in the country would now be fit for service. In order to maintain a high standard of serviceability and to secure a maximum of service for each dollar of maintenance expenditure, locomotives are scheduled for periodical classified repairs on a mileage basis. Cars operate under conditions which make impossible the same attention in service that locomotives receive. Is it not therefore a matter of even greater importance that they receive classified repairs at regular intervals, established after careful study of all the factors and strictly adhered to? With an established percentage of the equipment scheduled for classified repairs each year, programs for improvements needed to overcome weaknesses in design or to provide for changing operating conditions can be carried out before the continued failure and repeated patching accumulates an excessive but ineffectual maintenance expenditure.

The one thing most needed to improve car conditions is an adequate basis of fact concerning the service performance of each class of freight cars in relation to the cost of maintenance and the capital investment. With this as a foundation, design, maintenance and retirement policies can be established with a high degree of assurance that the results will be reflected in better net earnings. But to put the subject in its proper light before executive and operating officers, as well as the officers of the mechanical department, and to provide the incentive most needed to make a high standard of maintenance equally attractive to the individual car owner and the railroads as a whole, the prices in the rules of interchange must both be put on a sound economic basis.

#### Conclusion

## Speeding Up the Shop Production

Realizing that slack times should be used to get equipment in good shape for future needs, forward-looking railroad managers have reduced shop and enginehouse forces only under compulsion. Here is what one official has to say regarding this: "Railroads should be so financed by means of a cash reserve that when business is slack the equipment may be put in proper shape for the coming rush of business. The usual procedure is to let repairs lag in slack periods and then, as business picks up, attempt to make repairs when the equipment should be on the road earning revenue. A large number of men must be hired in a hurry, meaning inefficient help and high cost."

New shops and enginehouses are also needed in many

cases but few roads are in a financial position at present to supply this need and some alternative method of obtaining increased capacity and speeding up the work must be adopted.

Increased shop output at lower unit costs can be secured only by a careful analysis of the three component factors:

#### Three Factors In Shop Output

men, machinery and methods. Of these three factors, the first is most important. The importance of the human element can hardly be overestimated and unless it is taken into consideration, no attempt to improve shop output will be successful. Some roads are already benefiting by care in the

selection and training of employees and when the roads are allowed to pay employees in proportion to their efforts the results will be still more satisfactory. It is important that mutual understanding and confidence, based on fair dealings between management and men, be established to secure the best results. The community loses when square men are fitted in round holes. Wherever possible, men should be given work for which they are adapted and be promoted promptly as opportunity offers. After men, the other two factors, machinery and methods, are about equally important, efficient shop operation being impossible without either.

The modern tendency is to develop and utilize more and more efficient, powerful, labor-saving machinery. Railroad shops are no exception to the general rule and when new machines and devices are tried out, recommendations regarding them should not be lost sight of as is too often the case. That railroad shop men understand the importance of keeping machine tools in good repair and replacing obsolete tools as fast as possible is shown by the analysis of railroad operating expenses recently published by the Bureau of Railway Economics, Washington, D. C. This analysis shows that for 1920 the amount of money spent by the railroads for shop machinery (Account 302) was \$4,596,016 greater than in 1919. Similarly the amount allowed for machinery depreciation, while far too small, was twice as much in 1920 as in 1919. Is "any machine that will run" good enough for a railroad shop? This old idea is fast being dissipated and the time will come, if it is not now here, when the same standards of economy and efficiency will be required of railroad shop machinery as of that used in industrial plants.

Second only to the need for improved, modern machinery is the necessity of utilizing present equipment more effectively.

#### Utilize Old Equipment More Effectively

It has been pointed out many times in the *Railway Age* that the output of many heavy repair shops is limited by the capacities of the respective machine departments and proper attention to these departments will show big results. Many old machines are too antiquated to be of value except for scrap but in many cases, desirable results can be secured by providing more powerful drives, increasing the speeds or speed ranges, or possibly strengthening the machines at weak points.

Competent repair gangs should be developed, charged with the duty of carefully and periodically inspecting all machines and keeping them keyed up for maximum production. In this way weak points in the machinery will be discovered and many breakdowns with their resultant delays prevented. It is important that the mistake should not be made of furnishing new machine tools and failing to supply the jigs and fixtures necessary for their efficient operation. Too much stress cannot be laid on the necessity for adequate, time-saving jigs and fixtures. A line should be drawn between efficient devices and those which cost more to make than they will ever save. The government valuation showed a great abundance of small tools of all sizes, kinds and conditions of usefulness. It is apparent that real economies can be effected by restricting the manufacture of these

tools to certain standards determined by experience to be most satisfactory.

One of the most important, if not the most important, method of increasing railroad shop output at small expense is by the installation of shop schedule or routing systems, in charge of competent schedule men and supported by the managements. The idea is not to introduce complicated systems with a multiplicity of cards and forms to make out, but rather to apply the essential principles, allowing details to work themselves out as may seem desirable. The efficacy of shop scheduling has been amply demonstrated. Perhaps the most comprehensive description of what has been accomplished with shop schedules is included in the report of the Committee on Scheduling made at the meeting of the Mechanical Division, A. R. A., last year.

It is important that live schedule men be selected to direct the routing operations but it is most important that shop superintendents and general foremen appreciate the value of the system and determine to realize the maximum benefits from it. By lack of co-operation, an unconvinced general foreman can practically nullify the good effects of a shop schedule system. In doing this, he handicaps himself since the shop schedule will relieve him of an immense amount of detail, show just which department is lagging behind, and why, and so co-ordinate the work of all departments that the maximum number of locomotives, consistent with local conditions, will be turned out per month.

The economies that result from applying locomotive schedule systems can well be duplicated in handling car shop repair work (*Railway Mechanical Engineer*, June, 1921, page 349). This article shows that the same fundamental principles apply and there is no reason why they will not operate practically the same in both locomotive and car shops. As in locomotive repair work the principal object is to have the various car parts repaired in time to be assembled and the cars painted ready for service on a given date. It is not expected that the schedule would apply to light car repairs but only to heavy repair work.

The need of accurate and yet simple methods of computing shop costs is essential and perhaps not fully realized.

#### Accurate Knowledge of Shop Costs Essential

Without accurate knowledge of the cost of making a bolt in a certain way, it is impossible to tell whether the correct method is being used. Similarly, it is impossible to decide on the advisability of purchasing an expensive, specialized machine tool unless the relative costs of manufacture by the old and new methods are accurately known and the difference is large enough to pay interest and depreciation charges on the larger investment. Regulations of the Interstate Commerce Commission clearly define a system of railroad accounting, but details of shop costs are not required and without these there can be no effective control of shop costs. It is not maintained that an army of clerks should be employed to figure every detail, but enough details must be included to guide shop managements in securing the most economical operation. It is particularly important that cost accounts be figured as near as possible to the time when the charge is made and data should be available to predict in advance

what the cost of a new operation will be. This will avoid the expense of making new parts that can be more cheaply bought.

The tendency on progressive railroads at the present time is to establish centralized production shops for the manufacture of all standard small locomotive parts. The use of specialized automatic and semi-automatic machinery for the manufacture of many similar parts in these shops enables great economies to be made. As an example of what may be accomplished along this line an article published in the *Railway Mechanical Engineer*, June, 1917, page 289, will be of interest. The advantages of centralized production are numerous aside from the reduced cost of manufacturing each piece. In the first place finished, or semi-finished parts, in large number can be placed in stock in central storehouses, being furnished on order from any shop or roundhouse on the system. The final machine operations can be quickly performed on local machines and locomotives or cars returned to service in a minimum length of time. Moreover, the fact that small parts are standard and interchangeable is a valuable, time-saving feature. There is also little question that a closer inspection and better grade of material can be secured for all parts made in centralized production departments.

In connection with this it is important that reliable standards be developed for the entire road and more important still that these standards be lived up to. Standards based on good practices and made after thorough investigation can be enforced readily and should be arranged in a substantial systematic form so as to be placed in the hands of all concerned. In order that they may be readily enlarged and revised, a loose-leaf folio should be used.

Much can be accomplished by encouraging constructive criticism on the part of shop employees. Many of these men with long experience have valuable ideas if they can be brought out. A great deal of waste can be avoided by the more careful inspection of material used in the construction of locomotive and car parts. The material should be ordered on practical and conservative specifications and there is economy of maintenance and operation in purchasing material which is durable. During the war, both material and the quality of work were sacrificed in favor of output but this practice should now be corrected. When quality is sacrificed, the well-known final result is an excessive cost over the cost of doing a good job in the first place.

The installation of a modern flue welding plant in a certain shop enabled the flue welding organization to be reduced from nine employees to six with no reduction in output. In another instance, all brake pins for the entire system were manufactured on a forging machine, a practice which re-

leased a turret lathe for other work. In manufacturing cylinder and air pump packing rings, gang tools with six cutters each have been developed decreasing the cost of production 33 per cent. Main rods, side rods, eccentric rods and combination levers are now being manufactured interchangeable from right to left. This results in economy since it is not necessary to carry so many parts in stock. Application of an improved carriage to a driving wheel journal lathe has made it possible to turn and roll two journals at the same time, thus doubling the output. Reclamation plants upon a sound business basis will yield splendid returns.

The importance of grinding, particularly for finish operations on certain locomotive and car parts, should not be overlooked. In view of the success of some railroads with grinding, it is a little surprising to find that many others are not benefiting by this modern practice. Not only is greater accuracy and speed of production obtained but the finish of the work is superior. Ground bearings have demonstrated their superiority over turned and rolled bearings. It is generally conceded that piston rods, valve stems and guides, should be ground, but a great many railroads also grind crank pins, axles and journals. Still other railroads have had success in grinding chilled cast iron car wheels and car axle journals.

On account of the considerable distance between various departments and buildings of repair plants it is essential that some form of transportation system be provided for the movement of locomotive and car parts. In a certain case four industrial trucks were placed in service and are doing the work formerly handled by 20 employees with the usual hand trucks. In addition, the material is handled more promptly with a resultant increase in efficiency due to the material being on hand when needed. Second only to the scientific layout of shops and machinery is the need for wide, clear passageways and rugged, reliable, power-operated trucks. Hard smooth walks should connect all shops and buildings and all passageways should be kept clear. Otherwise the maximum advantages from the use of such trucks cannot be realized. While other forms of motive power may be used the electric storage battery truck, on account of its ease of operation, reliability and relatively low cost has won high favor. Not only has hand trucking been largely eliminated in certain shops but the trucks are scheduled to leave certain points at specified times, thus providing what may be called a shop transportation system. The advantages of this arrangement consist not only in moving material at a reduced labor cost but in increasing the actual production of individual departments. As soon as one operation on a machine part is completed the part is moved to the next machine, and the result is to speed up the production.

### Centralized Production Departments

### Grinding Locomotive and Car Parts

### Shop Transportation Systems

### Machine Shop Practice

## Increasing the Engine Terminal Output

The tendency at the present time is to provide engine terminals equipped to handle heavy running repairs, thus accomplishing two important results.

The time locomotives are held out of service is reduced to a minimum and, by reserving back shops for heavy repair work, shop schedules are more easily maintained and maximum output secured. It is important, however, to draw a line between repairs which can be economically made at roundhouses as now equipped and those repairs which should be made at back shops.

### Draw Line Between Enginehouse and Back Shop

One motive power superintendent, commenting on the increased size and weight of locomotive parts, explains that many terminals are required to meet conditions and follow practices which answered the purpose ten years ago but are now extremely expensive and unsatisfactory. Enginehouse forces should be organized and equipment provided to maintain locomotives at a high degree of efficiency between shoppings for classified repairs. It is important to install the right kind of machine tools in roundhouses and the old practice of

### Simple, Rugged Machine Tools Are Needed

shipping obsolete, wornout tools from back shops is expensive and in many cases unwarranted. The cost of a machinist's time is just as great in a roundhouse as in a back shop, and usually the work is wanted in a greater hurry. Why handicap the roundhouse? The installation of simple, rugged machine tools will pay an ample return on the investment.

Perhaps the greatest possibility of economy in operating many locomotive terminals is in providing improved coal and ash handling facilities. The high cost of labor makes it essential to install as much labor saving machinery as is consistent with the size of the terminal. In addition to reducing labor costs, the installation of modern coal and ash handling equipment will facilitate turning locomotives and increase locomotive revenue earning hours.

While overhead electric traveling cranes have been installed in roundhouses this involves practically rebuilding the roundhouse structure and the expense is in many cases prohibitive. For new terminal developments and where it is planned to do a large proportion of the heavy running repairs, however, there can be little doubt of the need for electric overhead traveling cranes. In the average roundhouse, there are big possibilities of improvement by installing monorail electric hoists, jib cranes and portable cranes. These will facilitate removing and handling heavy locomotive parts which must be renewed. As in the case of railroad shops, terminals also should be provided with power-operated trucks and hard smooth passageways in order that materials may be moved from place to place readily. While the two-wheel hand truck still has its use, all long hauls of heavy material should be made by power trucks, or if the size of the terminal does not warrant this refinement, four-wheel trucks with ball bearing wheels of large diameter should be used.

The need of auxiliary drop pits for engine truck and tender wheels is acknowledged by a large majority of railroad men. The advantages of these pits are mainly reduced labor costs and a considerable saving due to returning the locomotive to service more quickly than would be the case if it had to be jacked up at the front end to remove defective truck wheels. If the front tender wheels are defective, a drop pit also saves cutting the engine-tender connections, including the automatic stoker connections when the locomotive is stoker equipped.

It is exceedingly important in roundhouse work to make sure that inspectors and repair men know definitely just what part of the work is assigned to each, no chance of shifting responsibility being allowed. Good results have been accomplished by posting work reports but it is not alone necessary to post these reports on the boards. Each man should be given a slip for the work he is supposed to do, otherwise he will almost invariably pick the easiest work and leave the more important items to the last, often delaying locomotives.

A considerable saving can be effected in the case of loco-

moives requiring but minor repairs by having these repairs made without putting the locomotives over the turntable. The provision of a covered inspection shed with a few repair men to perform the little jobs as soon as discovered by inspectors will thus greatly increase the number of locomotives that can be turned at a given point. Each district boiler inspector should make the same kind of inspection as a government inspector and his report be observed as seriously. Experience has demonstrated that it will pay to have a man on the personal staff of the superintendent of motive power to do nothing else but look after boiler washings, the cost of boiler maintenance being largely dependent on careful, periodical boiler washing with hot water. Hot water washing and refilling systems should be installed in roundhouses with pipes extending to each pit.

The development of careful, reliable men periodically to inspect and pack journal boxes is essential. On one road an expert in valve setting was also assigned to the superintendent's staff and was responsible for saving large amounts of fuel monthly due to the more careful squaring of valves and adjusting of cut-offs.

A timely article on modern roundhouse needs and operation is published in the *Railway Mechanical Engineer*, June, 1921, page 337. It points out among other things the need for careful inspection and prompt repair of all locomotive defects. The time to cure engine failures is before and not after they occur. The possibilities of altering track layouts at small expense and with important savings in the time required to turn locomotives are mentioned. It is also recommended to provide emergency outlets around single controlling switch points in case of derailment at these points. The most important point developed in the article is the need of capable, efficient roundhouse forces, able and willing to co-operate with each other and with the transportation departments. The need of reasonable hours, good working conditions and adequate compensation, to attract men of the necessary calibre, was strongly emphasized.

Mechanical department officers of both shops and engine-houses should be keenly alert for possible improvements either in machinery or methods, and accompany all recommendations with a full and complete statement of details. Recommendations should be based on facts. To quote another superintendent of motive power, "I have frequently found, both when making or passing upon recommendations, that a full, complete statement setting forth the existing facts, also covering several different remedies and selecting the one which accomplishes the greatest good at the least expense, is usually acted upon quickly and favorably if the funds are at all available. A vague recommendation without supporting facts, on the contrary, causes the officer passing upon it immediately to start some investigating on his own account to see whether he can figure out a cheaper way to do it. Perhaps the case appears so weak that he does not think it entitled to further consideration and sometimes it is put so vaguely that he does not have time to study it out."

# Progress of Missouri, Kansas & Texas Since 1913

## Increased Capital and Maintenance Expenditures Under Receivership Have Enabled Great Improvement in Operating Results

### Part I.

By Samuel O. Dunn  
Editor of the *Railway Age*

THE MISSOURI, KANSAS & TEXAS RAILWAY LINES passed under the present management when C. E. Schaff became president in April, 1912. The railway was then a typical southwestern granger road in physical condition and in traffic. It was built with grades conforming to the general surface of the territory served, with narrow banks and cuts and rails of light section and varying weights; and these general conditions still prevailed. Its tracks and bridges were not strong enough to accommodate locomotives of modern size and weights. Most of its engines were light and of old designs, and it lacked good engine terminals and shops for handling and maintaining its power. These things rendered it impracticable to move freight in large train loads and with economy.

Various parts of the property had been built at different times by construction companies largely for speculative purposes. It had been loaded with heavy fixed charges upon an indebtedness taking a wide variety of forms. Its high operating costs and fixed charges had rendered it impracticable to raise the new capital required to make the permanent improvements without which needed operating economies could not be effected.

In 1906 the company had begun to pay small dividends upon its preferred stock. To meet the heavy fixed charges and these dividends, maintenance expenditures were unduly restricted. The total paid in dividends between 1906 and 1914, when they were discontinued, was \$4,420,000. This involved the disbursement of money which should have been spent on the property.

The years 1914 and 1915 were a period of reduced traffic and poor earnings for all the railways of the United States, including those of the southwest. The new management of the Missouri, Kansas and Texas, in addition to discontinuing the dividends on the preferred stock, effected some reduction in operating expenses, especially in transportation expenses. But the condition of the property rendered impracticable as large reductions of expenses as were needed to make a satisfactory financial showing.

In 1915 there came due \$19,000,000 of 5 per cent two year notes. Part of the holders refused to consent to an extension for one year at 6 per cent. In consequence, on September 27, 1915, the Missouri, Kansas & Texas Railway Company and the Missouri, Kansas & Texas Railway Company of Texas passed into receivership, Mr. Schaff being appointed receiver.

In this same period railways having most of the mileage in the southwest became insolvent. This was due very largely to the policy of state regulation to which they were subjected. The southwestern states fixed freight and passenger rates so low that even under good and economical management most of the railways could not make enough net earnings to meet their fixed charges when business was poor.

Immediately after Mr. Schaff took charge of the Missouri, Kansas & Texas in 1912 the formulation of plans for needed improvements was begun, but until the receivership it was impossible to make progress in carrying them out. The receivership removed the necessity of meeting all fixed charges

and made it possible to begin carrying out a real improvement program.

The change in policy was reflected immediately in a large increase of expenditures for maintenance. Before 1916 these expenditures had not in any year exceeded \$10,000,000. In 1916 total expenditures for maintenance were increased to \$14,909,499, or over 50 per cent, and a liberal maintenance program has been continued since. The expenditures chargeable to capital account made under the receivership from September 27, 1915, to December 31, 1920, were \$25,556,283. The interest not paid was almost the same, being \$24,000,000. Of the total expenditures chargeable to capital account \$11,109,965 were chargeable to equipment and \$14,446,318 to roadway and to other permanent structures.

Capital expenditures on a railroad have one or both of two purposes—to enable it to render more and better service, or to handle its traffic at a lower operating cost. If the new investment makes it possible to reduce operating expenses more than it increases interest it yields a net profit. But that new investment may reduce expenses more than it increases overhead charges a proper balance must be maintained between the various improvements made. The mistake has been made on not a few railroads within recent years of acquiring heavier and more powerful locomotives faster than other facilities have been provided to make it possible to secure the greatest practicable service from them. The problem of maintaining the most efficient relationship between increases of the various kinds of facilities is a very difficult one, but only by correctly solving it can a management derive the greatest practicable benefits in increased operating efficiency from any given additional investment.

The entire program originally outlined for making the Missouri, Kansas & Texas a modern railroad in physical facilities and operating and financial results has not yet been carried out. The progress thus far made, however, as evidenced by the manifest improvement of the physical property and of the operating and financial results, has been so great as to afford the best testimony that the general plan of improvements is adapted to the special conditions and needs of the railroad, and when fully carried out will enable the road to produce operating and financial results which will compare favorably with those of other railways having similar conditions.

### Improvements in Track and Permanent Structures

The density of traffic on different parts of the M. K. & T. system varies widely. Between Muskogee, Oklahoma, and Denison, Texas, 157 miles, the densest and best balanced traffic on the system is handled. The total freight on this part of the line is almost twice that on the line between St. Louis and Sedalia or on that between Kansas City and Parsons, and almost three times that on any of the lines in Texas below Denison. Indeed, except between Sedalia and Parsons, 159 miles, between Parsons and Muskogee, 117 miles, and especially between Muskogee and Denison, 157 miles, the freight traffic is still so light that it can easily

be handled on a well equipped single track railroad line.

The following table summarizes the expenditures on roadway, track and other permanent structures chargeable to capital account made under the receivership to December 31, 1920:

Class	Improvement to roadway and structures chargeable to Cap. Account
Road—	
Right of way and fills, etc.	\$1,102,295
Ballasting	691,270
Rails and other track material	1,260,817
Bridges, trestles and culverts	1,217,462
Elimination grade crossings	15,563
Grade crossing and crossing signals	422,107
Additional main tracks	
Additional yard tracks, sidings and industry tracks	2,945,300
Change of grade or alignment	139,623
Signals and interlocking plants	593,614
Telegraph and telephone lines	204,325
Roadway machinery and tools	145,025
Section houses and other roadway buildings	416,868
Fences and interlocking plants	48,089
Freight and passenger stations, office buildings and other facilities	441,500
Hotels and restaurants	
Fuel stations and apartments	609,693
Water stations and appurtenances	439,610
Shop buildings, engine houses and other appurtenances	819,692
Shop machinery and tools	332,539
Grain elevators and storage warehouses	120
Real estate	39,332
Assessment for public improvement	16,529
Terminals and other large projects	1,615,424
All other improvements	719,421
	\$14,446,318
Extension branches and other new lines	
Total road	\$14,446,318

The total mileage operated is now 3,558 miles. Of this, 1,197 miles have been improved and strengthened by widening banks and cuts, 355 miles have been newly ballasted and 970 miles have been reballasted. Before the improvements under the receivership the railway had practically nothing but dirt ballast, and heavy rains and high water frequently resulted in tracks being washed out or sinking into the mud until operation over them became unsafe, if not impracticable. The cost of maintenance of way as well as of transportation was unfavorably affected by these conditions. The remedy was the construction of a more permanent roadway, and the situation in this respect has been greatly improved. Large parts of the railroad are now well ballasted, this being especially true from Sedalia to Parsons and more particularly from Parsons to Denison. The company has quarries and rock crushers at three convenient points where a good quality of rock ballast is obtained. There is a large mileage ballasted with chatts, a considerable mileage with burned clay and some with shell.

The average weight per yard of rail in track on the whole system on December 31, 1912, was 67.56 pounds. As this figure indicates, there was a great deal of very light rail. The average weight of rail on September 30, 1920, was 73.85. New 90-pound rail has been laid on 384 miles and new 85-pound rail on 361 miles; and 260 miles of 85-pound rail, 13 miles of 75-pound and 144 miles of 66-pound second hand rail have been relaid to replace lighter rail, making a total of 1,162 miles on which the rail has been improved. Formerly only a small part of the track was equipped with tie plates. Under the receivership 933,232 tie plates have been applied.

When the present management took charge the bridges were not strong enough to carry heavy locomotives. There have been erected 6,208 linear feet of new steel bridges; and 2,096 linear feet of second hand steel bridges have been erected to replace light spans and trestle bridges. Almost 33,000 linear feet of trestle bridges have been replaced with permanent structures, and 40,087 linear feet of trestle bridges have been strengthened by the application of additional stringers.

There have been acquired 386 motor cars to replace hand cars used in track maintenance work. Important line revisions and grade changes have been made at 11 different

places. Safety in operation as well as expedition in handling traffic have been promoted by the installation of 176 miles of automatic block signals. Numerous new station buildings have been constructed and others enlarged. Many improvements have been made to enable the railway to better maintain and utilize its locomotive power. Six mechanical coaling stations have been constructed and a coal pulverizing plant established at Parsons shops. Oil is now used almost exclusively for fuel on the Texas lines, and fuel oil stations have been provided at all terminals in Texas, including storage facilities, with a total capacity of 750,000 barrels. The water supply of the entire system has been improved by new reservoirs, wells, treating plants and modern pumping stations.

When the present management took charge the Missouri, Kansas & Texas, like many other single track railways, needed a large expansion of its terminals to enable it satisfactorily to handle the traffic it already had and to provide for the steady increase of traffic which was occurring, and the terminals have been enlarged at most important points.

In most respects the most important point on the system is Parsons, Kansas. Here the lines converge from St. Louis, Kansas City and Junction City, Kansas, on the north; and from here runs the branch to Joplin, Missouri, and also the main line southward to Oklahoma City and to Denison. Here are located the principal locomotive repair shops and large classification yards. The freight terminal yard here was extended in 1917 and 1918 by the construction of 27.97 miles of additional track, including three miles of second freight main track approaching the terminal. The standing capacity of the yard was increased from 1,068 to 3,498 cars. As rearranged the yard contains 16 tracks of capacity from 106 to 119 cars, and 32 classification and hold tracks of from 24 to 78 cars capacity. A 32 stall brick roundhouse was extended 15 feet to a depth of 100 feet and seven additional 100-ft. stalls were constructed. The old 50,000 gallon wood water tub was replaced by a 150,000 gallon steel tank on a steel tower. Inadequate boiler washing facilities were replaced by a modern plant of large capacity.

One of the most complete and modern reclamation plants in the country provides excellent facilities for reworking second hand and scrap materials, and adjacent to it is storage space for bridge and building lumber and track and switch material. It has been estimated that during the period when prices of materials and supplies have been so high this reclamation plant has enabled the railway, by reworking old materials, to effect savings averaging around \$50,000 a month. It is always difficult accurately to estimate savings made by reclamation work, largely because of the practical impossibility of assigning to it proper overhead charges; but there can be no doubt that the reclamation plant of this railway has been developed and managed along right lines and has effected large savings.

Other points at which important improvements in terminal facilities have been made are New Franklin and Lindale, Missouri; Muskogee, Osage and McAlester, Okla., and Dallas, De Leon and Wichita Falls, Tex. At Oklahoma City, Oklahoma, complete new locomotive and car facilities are now under construction to replace facilities which had been outgrown.

At San Antonio, Texas, a new belt line was constructed in 1916 and 1917 which is  $7\frac{1}{4}$  miles long from the point of the old connection with the Southern Pacific tracks near Fort Sam Houston to the new passenger and freight terminals at South Flores and Durango streets. The work here included the construction of a crossing under the Southern Pacific main track, seven concrete crossings under streets, and eight concrete and one timber crossing over streets. The new passenger station erected here is built of tile and concrete and is one of the most commodious and architecturally

attractive stations in the southwest. It is served by four passenger tracks.

As already indicated, Denison, Texas, is one of the most important points on the system, and here extensive terminal improvements of all kinds are needed and projected. The yard and engine facilities are especially inadequate. It is planned to enlarge the yards at an expenditure of about \$2,000,000, and to build a new modern roundhouse to cost about \$1,000,000. The locomotive repair shop here is to be converted into a central car repair plant for the entire system, and the locomotive shop at Parsons is to be very substantially enlarged to care for the locomotives.

**Improvements in Equipment**

The expenditures for equipment chargeable to capital account which have been made under the receivership have been as follows:

Class	Expenditures for equipment chargeable to Cap.
	Account
Locomotives, steam .....	\$4,356,179
Freight train cars .....	4,079,986
Passenger train cars .....	498,578
Work equipment .....	711,651
Miscellaneous equipment .....	13,927
Improvements to existing equipment .....	1,449,644
<b>Total equipment .....</b>	<b>\$11,109,965</b>

**Improvements in Locomotive Equipment**

Undoubtedly the most significant and important improvement the Missouri, Kansas & Texas has made in its equipment is in its freight locomotives. Table 1 shows the class, number and tractive power of the freight locomotives in service on June 30, 1912, and December 31, 1920.

It will be noted that the largest freight locomotives the road had when the present management took charge were Consolidateds with an average tractive power of 36,313 pounds. At present it has 150 Mikados with an average

the policy of the management to change as rapidly as conditions would permit from the use of the Atlantic to the Pacific type of locomotive for through passenger service. Passenger service to the southwest is quite highly competitive, and improvements in its passenger locomotives were required to enable the Missouri, Kansas & Texas to hold its own in this competition.

During this period the receiver bought 3,500 new freight cars, 410 ballast cars and 300 oil tank cars. Of the new freight cars 1,500 were coal cars (gondolas), 1,000 box cars and 1,000 combination coal and stock cars. A large amount of obsolete car equipment was retired and in consequence there was an actual decline from 24,804 to 21,483, or almost 14 per cent, in the total number of freight cars. The average capacity per car increased about 11 per cent, however, resulting in a total decrease in revenue freight car capacity of less than 4 per cent.

The receiver evidently reasoned that the traffic the road could handle and the economy of handling would be increased more by improving and adding to its locomotives than by improving and increasing the amount of its freight car equipment.

Increase in the road's freight traffic has, however, been so much greater than the increase in the total capacity of its cars as to indicate that it seriously needs more freight cars. An additional evidence of this is afforded by its figures regarding hire of equipment. Within recent years it has been paying out increasingly large amounts for hire of freight cars. Its debit balance on this account in 1918 was \$585,000 and in 1919 was \$841,400. In the last four months of 1920 alone it was \$452,452. These figures probably represent a complete, if not more than complete, offset to the savings in fixed charges and maintenance of equipment costs that have been made by not buying more freight cars.

While there has been a decline in the number of freight

TABLE 1  
NUMBER AND CAPACITY OF FREIGHT LOCOMOTIVES, DECEMBER 31, 1920, COMPARED WITH JUNE, 1912

Percentage of increase in total tractive power .....					55.5 per cent				

\*Indicates decrease.

tractive power of 57,671 pounds. These locomotives are especially well adapted to the character of freight service that must be rendered on the main lines of heavy traffic. While they are very efficient on its main lines at present, they could not have been efficiently used without the strengthening of bridges and tracks which has been described above. The average weight on drivers of the road's old Consolidated engines was only 85.3 tons, while the average weight on drivers of the Mikados is 112.4 tons. With the bridges and tracks in the condition they were when the present management took charge the operation of these heavy engines on many of the lines where they are now used would have been impracticable.

While there has been an increase of but 9.5 per cent in the number of the railway's freight locomotives, the increase in their combined tractive power has been 55.5 per cent.

The number of switch engines has been increased from 127 to 178, and their average tractive power from 24,709 pounds to 32,490 pounds. The number of passenger locomotives has been increased from 163 to 180, and it has been

cars, an energetic policy of maintenance and improvement of old equipment has been pursued. At the end of the year only about 4 per cent of the road's freight cars were in bad order, as compared with almost 8 per cent for the railways of the country as a whole.

In 1912 the Missouri, Kansas & Texas had 459 passenger train cars, and in 1920 only 442. The principal decline was in the number of coaches. The receiver has bought 67 new passenger cars, the decline in the total number being due to the retirement of obsolete equipment.

**General Condition of the Property**

Both study of the data regarding the program of improvements which has been carried out, and the writer's own inspection of all the principal lines, show that the property's general physical condition has been greatly improved. This improvement has been mainly due to the expenditures chargeable to capital account which have been mentioned, but also largely to a generous policy of maintenance. The railway's main line from Sedalia, Missouri, to Denison,

Texas, and especially from Parsons, Kansas, to Denison, on which the heaviest business, both passenger and freight, is handled, is in such fine condition that heavy through passenger trains can be run over it in comfort and safety at speeds as high as 70 miles an hour. The various branch lines have not, of course, been improved anywhere near so much, but the improvement in many of them has been substantial.

### A Word About the Organization

No matter in how good condition physically a railway is, good results cannot be obtained in its operation without a good organization. Whatever the precise form of organization adopted, its efficiency depends mainly upon its personnel and upon whether there is friction or close co-operation between the different departments. It is decidedly true that Mr. Schaff has succeeded in building up an excellent organization, and even the parceling out of the system under two federal managers under government control produced no effects upon the organization which have very seriously affected its working since the railway was returned to private operation. The successful everyday operation of a railway requires that the operating organization shall be composed chiefly of men still in the prime of life and having not only the initiative and ready resourcefulness, but also the physical endurance, which most men necessarily begin to lose after

### Operating Results

The real, ultimate test of the wisdom of any policy of railway development, improvement and operation is the operating and financial results secured. Table 2 gives freight traffic and operating statistics.

It will be seen that the total number of tons of revenue freight carried one mile during the year 1920 was 79.1 per cent greater than in 1913. Including company freight, the increase in ton miles was 73.9 per cent. The increase in the density of revenue freight traffic—that is, tons carried one mile per mile of road—was from 484,573 to 873,342, or 80.2 per cent. Including company freight, the increase in traffic density was 74.9 per cent.

The average tons of revenue freight per train in 1913 was 254.83 and in 1920, 441.93, an increase of 73.4 per cent. The increase in average tons per train, including company freight, was from 299.40 to 504.00, or 68.3 per cent. The increase in the average revenue freight train load of the railways of the United States as a whole in the same period was 46 per cent. The average gross tons per freight train mile on the Missouri, Kansas & Texas increased from 783.66 to 1206.26, or 53.9 per cent. Because of the relatively very large increase in its average freight train load, the Missouri, Kansas & Texas in 1920 rendered 79.1 per cent more revenue freight service than in 1913 with an increase of only 3 per

\*Indicates decrease.

passing middle life. The Missouri, Kansas & Texas has in the important positions in its transportation, mechanical and engineering and maintenance of way departments an unusual number of men who are still young and full of energy and initiative. There is good feeling and close co-operation between the different branches of the operating department.

The relations between the management and the employees also are unusually good. The management recently inaugurated the policy of inviting the chairmen of the grievance committees of the labor organizations to participate in staff meetings and serve on efficiency committees of various kinds with the officers and to bring before these committees and the staff meetings all the suggestions for improvements in operating methods and service that may occur to them or that may be made to them by other employees. This policy has been received in a cordial and helpful spirit by the representatives of the employees, and will, it is believed, not only serve directly to increase efficiency of operation, but also to increase it indirectly by establishing and maintaining more harmonious relations between the railway and its men.

cent in the mileage run by freight and mixed trains, and an increase of only 2.5 per cent in total miles run by freight locomotives.

It should hardly be necessary to say that this greatly increased efficiency and economy in handling freight was due not only to improvements in locomotives and operating methods, but also to improvements in tracks and other facilities. Without the improvements in tracks, yards and other terminal facilities, it would have been impossible to have utilized the locomotives with so much greater efficiency.

The second part of this article about the progress of the M., K. & T. will be published in our next issue.

400 MILES WITH ONE LOCOMOTIVE.—The Missouri, Kansas & Texas, of Texas, is operating passenger trains between Denison and San Antonio, a distance of 400 miles, without changing locomotives. There are eighty daily trains on this line. The locomotives are of the Pacific type, using oil as fuel, and practically all the engines are making 400 miles a day. This arrangement has been in effect over a year and has been very successful.

New Car Repair Shop of the Chicago, Indianapolis & Louisville at Lafayette, Ind.

## C. I. & L. Builds Modern Car Repair Shop

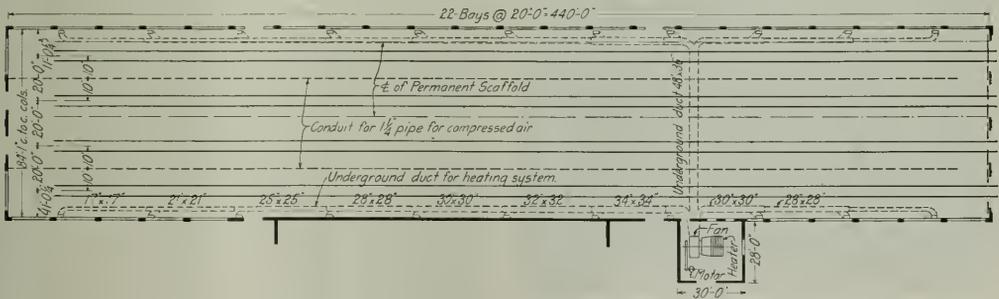

Installation at Lafayette, Ind., Will Greatly Facilitate Rip Track Performance

ON DECEMBER 3, 1920, the Chicago, Indianapolis & Louisville undertook the construction of a large car repair shop and a jacking stall at Lafayette, Ind., the latter for use in straightening steel cars. In less than four months the car repair shop was completed and placed in operation. It is a steel frame structure of the longitudinal type, 440 ft. long, 85 ft. wide, and 40 ft. high, with brick curtain walls and steel sash, transverse monitor roof construction and a concrete floor. It contains four tracks having an

this construction the facilities at Lafayette for repairing cars consisted only of a series of unprotected tracks on cinders.

### The Shop Has Well Lighted Interior

The car repair shop as completed joins the paint shop which was already in existence and occupies the site which had previously been utilized for car repairing purposes in the open. A special feature of the building, is the abundance and distribution of the light, the walls, the roof, the interior

Floor Plan of Chicago, Indianapolis & Louisville Car Repair Shop at Lafayette

aggregate capacity for 32 cars, all served by an overhead crane. The total expenditure for the improvement is approximately \$200,000.

This building is an excellent example of modern practice in car repair facilities. Providing as it does complete protection from unfavorable weather, built of walls almost entirely of glass, having a solid, dry and level working floor, affording wide aisles between cars and spacious headroom, and equipped with heating facilities, electric floor trucks and an overhead crane, it stands as an evidence of the increasing realization among railroad officers that it pays to promote the health, comfort and convenience of workmen. Prior to

clearances and even the concrete floor, contributing in producing this effect.

The walls themselves are practically 80 per cent glass. Constructed in bays of 20 ft., of which there are 22 in each side and four in each end of the building, the use of brick is confined to the pilasters and to three narrow horizontal courses, one across the top of the bay, a second across the bottom and a third midway between, the latter serving to obscure the I-beam and crane rail inside the building as well as to assist in bracing the building. The remaining area of each bay is occupied by windows, these windows being 17 ft. wide and 17 ft. high and occurring two in a bay, one above

the other, excepting in every fourth side wall which, being lower by about seven feet than the other three (in order to accommodate the transverse monitor design of the roof) have but one and one-half windows. Each window is composed of 14-in. by 20 in. Truscon glazed glass framed in steel and for the purpose of strength is reinforced by a narrow horizontal steel mullion and by vertical sag rods.

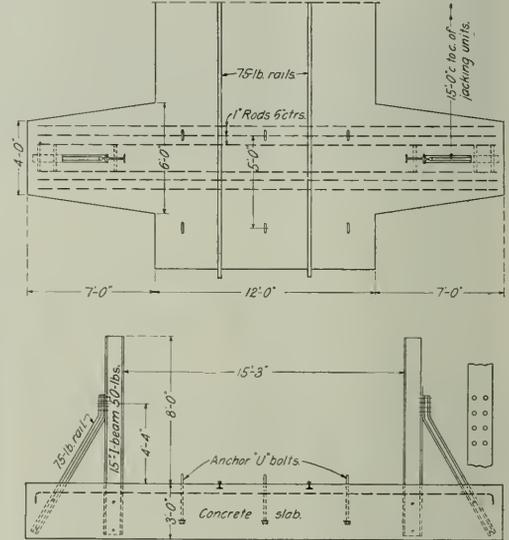

The degree to which the roof contributes in producing the general lighting effect may be appreciated when it is considered that it is supported 40 ft. above the floor on steel trusses which in themselves offer practically no obstruction to light. Also roof monitors 60 ft. wide and about 7 ft. high extend entirely across the building above three of every four wall bays, in the sides of which are window sash 5 ft. high and practically 80 ft. long.

The four tracks enter the building at one end, each through a separate door. They are imbedded in the concrete floor and extend through the house on 20 ft. centers to within 20 ft. of the rear end where an area 20 ft. wide and 85 ft. long is reserved for various machine tools and the supply racks. Spaced as these tracks are on 20 ft. centers with no columns between (the roof, as mentioned, being supported on trusses), an areaway is provided on either side which is ample for the free movement of electric trucks, which are employed throughout the building, as well as the convenient performance of all car repairing work. The widths of these aisles is also such

lengthwise, it provides a means of handling material quickly and conveniently without interfering with work in progress on the floor.

Another feature of the construction is a permanent system of scaffolding erected through one-half of the house. This consists of a row of columns along each side of two of the four tracks, the columns occurring at intervals of 18 ft. along the aisles and together comprising a system designed to facilitate work on the sides of cars, it being the plan to consign all cars requiring such repairs to these tracks.

Access to the shop is had by the four main doorways and

Partial Plan and Elevation of Jacking Stall

Exterior View of Car Repair Shop

as to contribute materially to the effective distribution of the light.

#### The Shop Is Served by an Overhead Crane

Unusual in car repair shop design and therefore standing out prominently as a feature of the construction is the traveling crane which serves these tracks. This crane, of Bedford make, spans the entire width of the shop 25 ft. above the floor, being supported on crane rails along the side walls of the building. It is operated from a self-contained cab. Equipped as it is with a 20-ton hoist and a 5-ton auxiliary, and capable of moving under its own power either across the shop or

six side entrances, two doors being provided in each side wall and two in the rear. Both car doors and side doors are of the wooden swinging type, the side doors being 8 ft. wide and high, equipped with window sash, while the car doors are all wood in steel frames 14 ft. wide and 17 ft. high.

Air for operating pneumatic tools and for testing purposes is obtainable at valves in the floor between each side wall and its nearest track, there being valves every 50 ft. along a 1¼-in. pipe carried in a plank-covered conduit in the concrete floor.

Ventilation is provided by large and numerous sections of pivoted sash in the wall and monitor windows. Provision is made for heating the shop by a hot air system, whereby air is passed around steam coils and forced by a No. 11 "Si-rocco" fan operated by a 30 hp. electric motor, into hot air ducts which extend along the shop walls below the concrete floor and distribute the air through radiators at intervals of 40 ft. along the wall. Artificial light is provided by electric drop lights extending through the building above the aisles at intervals of 40 ft., auxiliary to which are plugs in the walls for attaching portable lights.

The floor consists of five inches of concrete reinforced with No. 9 woven wire and laid on gravel. The tracks are imbedded in this concrete and depend for their support on cross ties below the floor. The roof consists of 1½ in. tongued and grooved yellow pine sheathing covered by a 4-ply Carey built-up roof and laid directly on steel channel purlins spaced on 7-ft. centers. The roof rests directly on the top chords of the trusses in all cases excepting between

monitors, where the purlins are attached to the web posts near the lower chords. The roof slopes towards the sidewalls on an inclination of  $\frac{3}{4}$  in. to the foot, excepting in the last 7 ft. where the slope is greater. The gutters are formed by the tile coping of the walls, and drainage is effected by 5-in. wrought iron down-spouts which descend to the ground on the inside of the building.

#### Jacking Stall an Innovation in Shop Equipment

All brick in the walls excepting the pilasters and the bottom courses and all side construction excepting the bays directly above the base brick wall are carried by the steel columns which also support the roof trusses and the crane rails. For the purpose of assisting the curtain walls in reinforcing the building longitudinally, diagonal sway bracing is provided in the middle one of each of the three high wall bays.

The jacking stall consists of a row of posts imbedded in a heavy concrete slab, between which a car may be run and jacked tightly against its sides, the posts serving as the jack support. It is 57 ft. long and 18 ft. wide and, in addition to the posts, accommodates three rows of U-bolts, the heads of which extend six inches above the concrete for anchoring purposes. The posts, of which there are four in each row, are 15 ft. apart and consist of I-beams 8 ft. high, braced against horizontal thrust by bent rail sections. The distance between the two rows of posts is 15 ft. 3 in.

The car repair shop and jacking stall have been designed and erected under the supervision of A. S. Kent, chief engineer of the Chicago, Indianapolis & Louisville and were built by A. E. Kemmer of Lafayette. All steel used in the structure has been furnished by the Indiana Bridge Company, Muncie, Ind.

## Railroad Hearings Before Senate Committee

Adjournment Taken to June 14. J. G. Walber and E. T.

Whiter Explain Labor Questions

WASHINGTON, D. C.

THE HEARINGS before the Senate Committee on Interstate Commerce in the inquiry into the railroad situation were adjourned on June 3 until June 14 to give the committee time to devote some attention to other matters before it. When the hearing was adjourned E. T. Whiter, chairman of the railroad conference committee which represented the carriers before the Railroad Labor Board, had not quite completed his explanation of the situation created by the national agreements. Mr. Whiter will complete his statement when the committee resumes and will be followed by L. E. Wettling, statistician for the Western roads, who is to put in evidence a series of statistical exhibits, and this is expected to conclude the presentation of the railroad case before the committee. No announcement has yet been made as to the order in which other witnesses are to be heard representing the labor organizations, the shippers and others interested.

Mr. Whiter's testimony regarding the effect of the national agreements consisted largely of the same material he had presented before the Railroad Labor Board at the hearings in Chicago. He said the exact cost to the carriers had never been definitely calculated, but that the estimate made by General Atterbury of \$300,000,000 a year was conservative. Mr. Whiter also included a discussion of the effect of the abolition of piecework. Supplement No. 4 to General Order No. 27, he said, by which men employed on piecework were guaranteed the same minimum hourly rate as the workers on an hourly basis, resulted in a decrease ranging from 10 to 40 per cent in the output of men employed on piecework. Tests conducted by four of the largest railroads showed that men formerly employed on piecework were guaranteed 58 cents an hour on work that would have yielded them only from 28 to 36 cents an hour if they had been paid on the piecework basis. This falling off in production became uniformly noticeable immediately after July 25, 1918, when it was known by the pieceworkers that they would receive no increase, but were guaranteed the minimum hourly rate. Mr. Whiter said, and piecework was finally abolished by the director general on December 31, 1918.

#### Concerning the National Agreements

After Mr. Whiter had explained the effect of many of the rules of the national agreements, the question was raised as to whether the question is in any way within the jurisdiction

of the committee. Senator Poindexter said that the whole question before the committee is as to whether or not the law should be changed in any respect. Senator Cummins said he understood the showing was made in order to account for the extraordinary expenditures of 1920 which the railroads were compelled to make in observing the rules of the national agreement. He said the committee would not want to take up questions which are pending before the labor board or the Interstate Commerce Commission, but it must necessarily go into the same field in order to ascertain whether there should be any additional legislation to relieve the situation and as the investigation was primarily on the question of railroad expenscs the committee would want to know whether the money was wisely or necessarily spent.

Several of the Senators expressed difficulty in understanding why the national agreements made by the Railroad Administration should have been in any way binding upon the railroads after the expiration of federal control. Mr. Whiter explained how the question got before the Railroad Labor Board and how the rules of the national agreements were kept in effect by that board at the time it announced its wage award last July. Senator Cummins said that there is nothing in the Transportation Act, in his opinion, which required the railroads to continue for a single moment the agreements entered into between the director general and the men. The railroads might have attempted to change the rules immediately, he said, but the moment they attempted to change the rules and the men resisted that change, that would have created a dispute which both the railroads and the men were bound under the law to submit to the labor board.

Mr. Whiter said that when the bi-partisan board last March took up the requests of the labor organizations for increased wages which were pending at the expiration of federal control, one of the first questions which the labor organizations placed before the committee was the request for the continuation of the national agreements. The railroads took the position that the national agreements were not a part of the dispute and they continued to take that position before the labor board, but the board did assume jurisdiction over them under its Decision No. 2.

Senator Stanley asked whether under the decision of the labor board the railroads are not still under government control. "What effect," he asked, "has the act of 1920 had

except in relieving you with reference to freight rates, so far as the control of the business is concerned? Are you in any more control of it now than you were before?"

Mr. Whiter said that so far as labor questions are concerned, the railroads are still just as much under government control as before, but they have recently made a gain by getting away from centralization because the labor board has decided that in negotiations with the men on these agreements the individual railroad and the men shall negotiate, but so far as the result of the negotiations for new rules is concerned, it would be necessary to see what develops, whether or not the railroads are still bound hand and foot with some of these restricting conditions or whether they are going to be able to negotiate rules that are reasonable to the men and to the companies.

The statement given before the committee by J. G. Walber, secretary of the Board of Information of the Eastern Railroads, was reported in last week's issue. In reply to questions regarding the handling of wage matters during the period of federal control, Mr. Walber pointed out that he was not criticizing what was done, saying it is hard at this time to look back and appreciate the position in which the Railroad Administration was situated during the war.

Pressure due to the demands of outside industries, loss of railroad employees for the service, the necessity for prompt action made it impossible for its wage board to study the matters before it as exhaustively as can be done now. "The lack of data, the time necessary to assemble the data, made it necessary for them to adopt short cut methods and any way to get the results and, as one railroad man, I am here to say that I have the utmost sympathy for the conditions under which the board had to do its work and I have not the least criticism of what they did. I think in many respects they did a remarkable job, considering the conditions under which they had to work. I am trying to simply state the facts and state the situation."

### Settlements With Railroad Administration

The testimony of Samuel Rea, president of the Pennsylvania, aroused considerable discussion at the hearing regarding the relations of the railroads with the Railroad Administration concerning the application of the standard contracts. Senator Cummins said that if the railroads entered into contracts he assumed that their attitude is that they are content with the proper interpretation of that contract. Mr. Rea said he could not say that the roads were over content with the contract but that they are, of course, willing to stand by it now and it is only a question of the proper construction.

Alfred P. Thom, counsel for the railway executives, made a statement regarding the controversy with the Railroad Administration, saying that the railroads' claim that the proper interpretation of the contract would fully carry out the intent of the federal control and transportation acts as passed by Congress, but that the interpretation placed on the provisions of the contract relating to maintenance by the director general does not carry out the intent of the law. Senator Cummins said that the director general of railroads would be called before the committee before the hearings are concluded in order that he may be given the opportunity to state his side of the case.

The formula for maintenance contained in the standard contract, Mr. Thom said, is an agreed method of ascertaining whether or not the director general has redeemed his contract to keep the properties in repair and return them in good condition. He was to expend on the property as much money as the carriers expended on the average in the test period and to fairly distribute it over the property, the amounts of money to be adjusted to the different levels of the cost of labor and the cost of material during the federal control period. Moreover, the contract provides, he said, that that

shall be done so that the result shall be as nearly as practicable the same relative amount, character and durability of physical repairation.

The director general, he said, contends that he is not responsible for actual physical repairation if he spends a certain amount of money. Calling attention to the fact that all the members of the committee present are lawyers, Mr. Thom said that the agent of the President, acting under an act of Congress as well as under instructions from his principal, will not be construed to have violated those instructions and to have departed from the act of Congress unless there is no other interpretation which can reasonably be put upon the contract. If there is any reasonable construction of the contract which will put what he did in conformity with his instructions and the act of Congress, that construction must be adopted.

Senator Pomerene said he did not quite see the force of Mr. Rea's suggestion that there might be an amendment to the Transportation Act, because if the question were put up to Congress again it might take a position in entire accord with the position taken by the director general. Mr. Rea said he had only made such a suggestion if it were the only way to avoid a delay of three to five years. If Congress should take the view of the railroads it might bring about a quicker settlement. He thought, however, that the President had full authority and discretion under the law. Mr. Rea said there also seemed to be a difference of opinion among members of the Interstate Commerce Commission in interpreting the maintenance provisions of the standard contract as it applies to the expenditures for the six-months' guaranty period of 1920, because they have not yet reached a conclusion and large sums still due to the railroads for that period are thus withheld. Mr. Rea said that the Pennsylvania's estimate of undermaintenance for roadway and structures for the period of federal control is in the neighborhood of \$40,000,000. As to the maintenance of equipment, the final estimate is not yet concluded.

### Railroads Add to Equipment

THE Car Service Division of the American Railway Association has issued its quarterly equipment report for Class I roads for the quarters ended March 31, which shows a net increase over retirements for the quarter of 166 locomotives, 4,591 revenue freight cars, 67 non-revenue freight and 176 passenger cars; while on March 31 there were on order 390 locomotives, 20,340 freight cars and 668 passenger cars.

A summary of the report follows:

	Jan. 1 to March 31		Total Ownership March 31, 1921	Number on order
	Acquisitions	Retirements

# Signal Section Holds Annual Meeting In Chicago

## Proper Signal Location for Efficient Train Movement, Valuation and Other Subjects Are Presented

THE PROPER LOCATION of automatic block signals to direct train movements most economically and effectively, while at the same time affording safe operation, formed the basis of a report which received special attention at the annual meeting of the Signal section, Engineering Division, American Railway Association, which was held at the Drake Hotel, Chicago, on June 6, 7 and 8. This is the third annual meeting of the Signal section and the twenty-sixth annual convention of the former Railway Signal Association. Chairman F. W. Pflieger (U. P.) presided. There was a total attendance of about 300. This meeting is the first held since the stated meeting at New York on December 2 and 3, 1920, as the March stated meeting always held heretofore in connection with the annual meeting of the American Railway Engineering Association at Chicago was cancelled this year.

Chairman Pflieger, in his opening address, commented on the results of the past year's work, pointing out the good accomplished by the Sectional committee meetings in advancing the knowledge of signaling among the rank and file of the men. In pointing out how the field of action is enlarged each year, Mr. Pflieger called attention to the co-operation of the Signal section with the Interstate Commerce Commission in connection with the investigation of automatic train control. He also stated that it is not enough to work on improving and systematizing the signal apparatus but that it is necessary to find new uses for the improved apparatus. In this connection he stated that it is the tonnage train kept moving which returns interest on capital invested and that this movement can be facilitated by eliminating train orders and by communicating the movements which will be made by signal indication. In order to facilitate such work and to promote increased efficiency by signal operation the chairman recommended that a Joint Committee on the Economics of Railway Signaling be appointed, this committee to consist of operating and signal men.

H. S. Balliet (N. Y. C.), secretary of the Signal section, presented his annual report covering the membership and a general outline of the work accomplished by the committees during the period from July 17, 1920, to June 5, 1921. The membership as of July 10, 1920, was 1,510; a total of 276 were enrolled during the last year while 15 were reinstated; the losses during the year totaled 234, giving a total net membership of 1,567 as of June 5, 1921. Five meetings were held by the Committee of Direction, at which 17 subjects were considered. The standing committees had 29 meetings and considered 83 subjects while 36 Sectional committee meetings were held at which 52 different subjects were discussed. There was a total attendance of 2,740 at these meetings. Forty subjects were submitted to the annual meeting for acceptance and submission to letter ballot and 12 publications have been issued during the period covered by this report. Thirteen of the 18 standing committees of the Signal section presented reports with subject matter for submission to letter ballot, for discussion, or as information.

### Proper Location of Automatic Block Signals

Committee No. X—Signaling Practice, W. J. Eck (Southern), chairman, submitted for consideration reports on various types of light signals, day and night indication; requisites of signal locations for automatic block signals; automatic train control; application of aspect indicating that train must take siding having non-interlocked switch.

The following requisites for light signals were presented and it was recommended that they be accepted for submission to letter ballot for inclusion in the manual:

1. They shall be free from the possibility of phantom indications.
2. When lamps are operated at normal voltage, the range (on tangent) of signals used to govern high speed trains, must be at least 2,500 ft. on a clear day with a bright sun at or near the zenith.
3. They shall not be so bright as to cause confusion in reading signals at night.
4. Normally a beam spread of 6 deg. each side and below the axial beam shall be provided. Means shall be provided for increasing the beam spread on either side to suit special conditions.
5. Means must be provided to give a distinct indication to enginemen when approaching and when stopped at the signal.

Beam spread is interpreted to refer to points at the angle mentioned where the intensity of the beam is 50 per cent of the axial beam candle power.

The report on requisites of signal location for automatic block signals—which the committee recommended be accepted as information—covers 12 pages of the journal and has in addition 9 diagrams. In the introduction the Committee says:

In the treatment of locations for signals, main consideration has been given to those locations which will most economically and effectively direct train movements, not losing sight of arrangements which afford safe operation.

The subject is first treated with respect to signals for single track railways since more factors enter into the proper locations of signals for these lines than for lines where the normal traffic is in one direction only and much of the reasoning covering following movements for single track roads will apply to the signaling of two or more tracks with traffic of one direction.

Clear vision of signals is important and their location on curves near overhead structures or at other points where the view is obstructed should be avoided in so far as practicable. It is also desirable to avoid their location on bridges supporting the track signaled and such other points where an element of risk may enter into trainmen alighting from a train which has been stopped at a block signal.

In two-position signaling it is desirable that distant signals be not placed too far to the rear beyond the stopping distance to home signals, the approach to which they regulate. So also in three-position signaling, since each signal acts as a distant signal to the next preceding one, consideration should be given to the avoidance of too long blocks. The reasons for this are:

To avoid enginemen running for a considerable time after receiving a caution indication involving, for those roads which require an immediate caution movement at a caution signal, a slowing up of traffic.

To avoid, on those roads requiring an interpretation of a caution signal as indicating the next signal at stop, a tendency for enginemen to forget, after a lapse of some minutes entailed in running this distance, the indication of the caution signal last passed.

To minimize the time, by shortening the space consistent with stopping distance, in an endeavor to preclude opportunity for change in conditions in the second block ahead during the time a train runs between a given proceed signal and the next preceding one.

The following terms have been used which may require some explanation:

A differentiation is made between the meaning of stopping distance and braking distance.

**Stopping distance** is taken to mean the distance in which any train, operating in the territory involved, can stop and then be in a position with respect to its air apparatus and draw bars to again start.

**Braking distance** is taken to mean the distance required to

stop any train in territory involved. The train may not necessarily be in condition again to start with ease.

**Sighting distance** is taken to mean that distance to the rear of a signal in which a following train may have time to observe the signal and also in order that the signal may have time to assume its proceed position after a preceding train has passed out of that section of track controlling the signal.

**Time spacing** is taken to mean the time required for a train to run over that portion of the line which controls the proceed position of a signal.

Considering now that signals as covered in the subject are fundamentally for the purpose of directing train movements, they must obviously be arranged effectively to provide for: (a) Meeting trains. (b) Passing trains. (c) Spacing trains.

### Automatic Train Control

In reporting on automatic train control the committee outlined the work which had been accomplished by the Joint Committee on Automatic Train Control of the American Railway Association and the Interstate Commerce Commission, the duties of which are as follows:

(a) Prescribe rules and requirements for tests of automatic train control devices.

(b) To review the work already done by previous committees in the testing of appliances and to bring the work up to date.

(c) To confer with representatives of the Interstate Commerce Commission in the consideration of this subject.

(d) To arrange with the carriers for practical tests as may seem advisable, and to arrange for the terms and conditions of such tests.

(e) To arrange for necessary record of performances and cost of installation and maintenance and comparisons.

(f) That at all times to co-ordinate their work with that of the representatives of the Interstate Commerce Commission, and to work in co-operation with such representatives.

Information was also presented on the work which had been done by the New York Central-New York State Public Service Committee on automatic train control.

The report on this subject was recommended for acceptance as information.

### Take-Siding Signal

In reporting on the application of aspects indicating that a train must take siding at a non-interlocked switch, the following was submitted with the recommendation that it be accepted for submission to letter ballot for inclusion in the Manual:

1. The aspect for instructions to trains to take siding at a non-interlocked switch shall be provided by the display of the letter "S."

2. The day and night indications shall be distinctive from other forms of signal.

3. Where located less than braking distance from the switch, an approach indication shall be provided.

4. Its mounting may be either on a separate mast, or on any signal mast best suited to meet the requirements.

5. The minimum distance of visibility under normal conditions shall be 500 ft.

6. When not functioning, the indicator shall not be visible.

### Discussion

All reports, with the exception of the one on automatic train control, met with little or no discussion. J. B. Latimer, signal engineer, Chicago, Burlington & Quincy, went on record as opposed to speed control in connection with automatic train control. It was his feeling that an automatic train stop would amply serve all requirements and he made reference to the use of such a train stop and the results obtained on the Chicago & Eastern Illinois. It was his personal opinion, however, that there would be no necessity for an automatic train control or train stop if an audible warning were used at distant signal locations to indicate audibly the caution position of the signal. Others expressed the feeling that the signal section was 10 or 15 years behind times on the automatic train control question and that one cause of this was the effort to obtain the ideal rather than allow this device to pass through the development stages that is required of any other device which has been adopted in the past. Com-

mittee X would not assume any responsibility for the report on this subject, stating it represented data which has been developed by the government and the Joint Committee on Train Control and that it was given as a matter of information.

### Valuation

Committee No. XV—Valuation, J. M. Carley (B. & A.), chairman, submitted reports on the following subjects:

1. Report on average service life in years of the important units of the different types of signal installations.

2. Prepare typical construction program which will include the various types of interlocking, automatic signals and other signal apparatus for: (a) Single-track railroad. (b) Double-track railroad. (c) Three-track railroad. (d) Four-track railroad.

3. Prepare table of relative value units of signal installations.

Under subject 1, the average minimum and maximum service life and the average service life of a large number of units used in signal construction were presented for discussion and for acceptance as information.

Under subject 2, referring to such a program for signaling the committee stated that "after a careful study of the requirements and analysis of the discussion in committee meetings and certain recommendations by letter, the committee recommended that the following outline of, and instructions for, preparing construction programs be accepted as a report on item 4 of the outline of work for the reason that no typical program, however carefully prepared, would be of value to any except a very small percentage of the carriers interested. Each carrier must necessarily investigate the conditions for itself and it is the consensus of opinion that the following outline and instructions will serve the purpose for which the instructions of the committee were initiated." This subject was presented for discussion and for acceptance as information.

### Discussion

Committee XV-Valuation, presented a supplemental report for discussion and acceptance as information. This report was based upon an editorial appearing in the *Railway Age* of March 16, 1920. It suggested a method or scheme which may be employed by the various signal departments for keeping a record of the various major units from the time of their installation to their retirement.

It was the recommendation of the committee that a record be kept of the units for property changes. This record should include:

1. Property record in statement form of each change during the life of the installation.

2. Plans showing each change to be indexed or filed with the property record.

The committee presented the following for discussion and action by the section, to the end that a recommendation be made to the Bureau of Valuation, Interstate Commerce Commission, that the instructions governing reports in connection with Valuation Order No. 3 be changed as follows:

Paragraph 7, page 7, of the Second Revised Issue of Valuation Order No. 3.

#### PRESENT FORM.

Where one carrier assumes the cost of a change upon another carrier's property, or where one or more carriers participate with the owner in the cost of a change in the latter's property, the full detail of the property units involved and their costs shall be recorded in but one set of records, and they shall be the records of the carrier to which the property in which the change has been made was originally inventoried by the commission.

#### RECOMMENDED FORM

Where one carrier assumes the cost of the change upon another carrier's property, or where one or more carriers participate with the owner in the cost of a change in the latter's property, the full detail of the property units involved and their cost shall be recorded in but one set of records, and they shall be the records of the carrier that originates the charges for changes in the property.

This is desirable due to the fact that many joint plants were inventoried to the carrier which does not originate charges for changes in the property on account of the government field party reaching such points before parties on the other line had reached them.

It was recommended that the section take such action as will bring this matter to the attention of the Bureau of Valuation, Interstate Commerce Commission.

Under subject 3, Units for Use in Signal Valuation, the committee presented units for the record of property changes under accounts 15 and 27. These units were subdivided under primary units and the list was submitted as a guide as to what would be required, with the thought in mind that each carrier is to arrange the list to suit the characteristics of its property. This report also was presented for discussion and acceptance as information.

#### D. C. Track Circuits

Committee No. XVIII—D. C. Track Circuits, A. R. Fugina (L. & N.), chairman, in submitting a report on specifications of characteristics of track circuits outlined the general conditions existing with reference to a study of this subject. The most important factor, and the one over which the signal engineer has absolutely no control, is the train shunt. Little information about the train shunt under varying conditions is available. Such investigations as have been made by this committee seem to point to the fact that on main track rails the shunting resistance of even a single car or a single pair of wheels is much less than .06 ohm and that for the usual fouling circuit of a switch, the shunting resistance may be less than .06 ohm, but often is much greater. The committee is developing information and data about the shunt resistance under varying conditions, so that it may submit a definite recommendation.

The minimum releasing point of the track relay in service is a vital factor in the safety of the track circuit. This will bear a direct relation to the maximum resistance of the track shunt. It is highly desirable to decrease the rail resistance. Decreasing rail resistance reduces the adverse effect of low ballast resistance. Economy and reliability of operation may therefore be obtained by reducing the rail resistance instead of expending money to increase the ballast resistance.

The report was presented at this time for discussion and acceptance as information only.

A general discussion on track circuits brought out the necessity of devising some means of improving the protection to be afforded by the track shunt fouling circuit at switches. It was the general opinion that with or without improvements in this feature pipe-connected derails should be required on all turnouts in automatic signal territory.

#### Other Committee Reports

Committee No. XIV—Contracts, R. C. Johnson (B. R. T. System), chairman, presented four standard forms with the recommendation that they be submitted to letter ballot for inclusion in the Manual. The first form covered an invitation to bidders on block signal and interlocking work; the second was the contractor's proposal for block signal and interlocking work; the third was a standard form of bond to accompany contracts for block signal and interlocking work, while the fourth form submitted covered the proposed contract for execution in connection with block signal and interlocking work.

Committee No. V—Maintenance Rules and Instructions, G. K. Thomas (A. T. & S. F.), chairman, presented two reports and recommended their submission to letter ballot for inclusion in the Manual. The first report covered rules for signal maintenance intended to supersede rules 751 to 777 inclusive and 782 to 784 inclusive now contained in the Manual under the heading Rules for Signal Maintainers.

The remaining 19 rules now in the Manual under this heading have reference to interlocking, batteries, lamps and pole line and will be covered under those heads in later reports. The second report consisted of examination papers on signal maintenance and included 102 questions and answers.

When the maintenance rules and the set of examination questions and answers were presented exceptions were taken to a number of rules because of the liability of their being misinterpreted, particularly with reference to conditions affecting men working at the same place but in different departments. A number of revisions were presented and accepted, after which the entire report was accepted for submission to letter ballot for inclusion in the Manual.

Committee No. VIII—Alternating Current Automatic Block Signaling, C. H. Morrison (N. Y., N. H. & H.), chairman, submitted for consideration a report on calculating power supply and distribution for an alternating current signal system. This report covered the choice of voltage, frequency and transmission and treated of the material of the conductors and their size with paragraphs on wire and pole spacing, sectionalizing, center of gravity of load, line losses, lightning protection, commercial source of supply, power equipment and calculating forms. The calculating forms consisted of power summary sheet, engineering data sheet and load diagram, which were recommended for use in calculating power requirements. These sheets were also submitted with the report and the committee recommended it for acceptance and submission to letter ballot for inclusion in the Manual.

In addition to the above reports others were presented by Committee I—Editing, H. S. Balliet (N. Y. C.), chairman; Committee II—Mechanical Interlocking, C. J. Kelloway (A. C. L.), chairman; Committee III—Power Interlocking, F. B. Wiegand (N. Y. C.), chairman; Committee IV—D. C. Automatic Block Signals, C. F. Stoltz (C. C. C. & St. L.), chairman; Committee VI—Standard Design, F. P. Patenall (B. & O.), chairman; Committee XI—Batteries, A. B. Himes (B. & O.), chairman; Committee XIII—Electrical Testing, P. M. Gault (I. C.), chairman.

#### Other Reports and General Business

Committee No. 3, on power interlocking, presented specifications for a circuit controller for draw bridges, which after brief discussion was referred back to the committee for revision. After some discussion a specification for electric-motor switch-operating and locking mechanism, together with an operating and overload curve chart was adopted for submission to letter ballot for inclusion in Manual.

In connection with the progress report of Committee 16, oils, the discussion brought out the fact that the specifications for illuminating oil for switch and signal lamps had been adopted by the American Railway Association and that one road, operating 500 miles of line, had saved \$500 in one year by following these specifications.

A general discussion on the education of signal department employees resulted in approval of a recommendation that the sectional committees offer programs of practical educational value and that copies of the proceedings be furnished to all those interested.

R. H. Aishton, president of the American Railway Association, in a brief address to the Signal Section, complimented it on the volume and quality of work completed during the past year. The keynote of his address was that the Signal Section has been entirely too modest with respect to its accomplishments and that it was the duty of each and every representative to tell his railroad management what good has really been accomplished by the Section. In this connection he called attention to the showing made on the road mentioned above by following the specifications for oils prepared by this Section and adopted by the American Rail-

way Association. In submitting reports to the executive committee of the A. R. A. Mr. Aishton recommended that the committees incorporate as an opening paragraph of their reports an outline of the purpose and the important results to be obtained through the adoption of the report.

After miscellaneous business was disposed of the Secretary announced that the next meeting of the Signal Section would be the regular New York meeting, to be held on November 3, at the McAlpin Hotel.

**Signal Section Officers Elected**

The following officers for the Signal section were elected for the ensuing year: F. B. Wiegand (N. Y. C. Lines West), chairman; C. A. Christofferson (N. P.), first vice-chairman; B. T. Anderson (D. L. & W.), second vice-chairman. Those elected to serve three years on the Committee of Direction are: W. J. Eck (Southern); F. W. Pfleging (U. P.); W. Y. Scott (B. & M.); and W. M. Vandersluis (I. C.).

**Signal Appliance Association**

The officers of the Signal Appliance Association, chosen for the ensuing year at a meeting held at the Drake Hotel, Chicago, are: Chairman, Henry Lee, *Railway Age*; vice-chairman, G. A. Blackmore, Union Switch & Signal Co.; secretary-treasurer, F. W. Edmunds, Sunbeam Electric Man-

ufacturing Co., New York. Those elected to serve on the Executive committee for two years are: M. R. Briney, Federal Signal Co., Albany, N. Y.; W. J. Gillingham, Hall Switch & Signal Co., Garwood, N. J.; John Roberts, General Electric Co., Schenectady, N. Y.; and F. J. Lebreau, Macbeth-Evans Glass Co., Pittsburgh, Pa. E. A. Condit, Rail Joint Co., N. Y., was appointed chairman of the Arrangement Committee.

**The Trend of Railway Earnings Shown in Charts**

By Henry M. Sperry, M. Am. Soc. C. E.

DANIEL WILLARD, president of the Baltimore & Ohio in an address before the annual meeting of the National Civic Federation at New York last February, made the statement: "I think that the most constant and persistent problem that confronts the railroads at all times, through all seasons and all periods, is the problem that grows out of being misunderstood. The railroads are such a large undertaking and we have to talk in figures that we so little comprehend that this difficulty is ever present. . . . The

TABLE 1—STATISTICS OF CLASS I RAILROADS—UNITED STATES

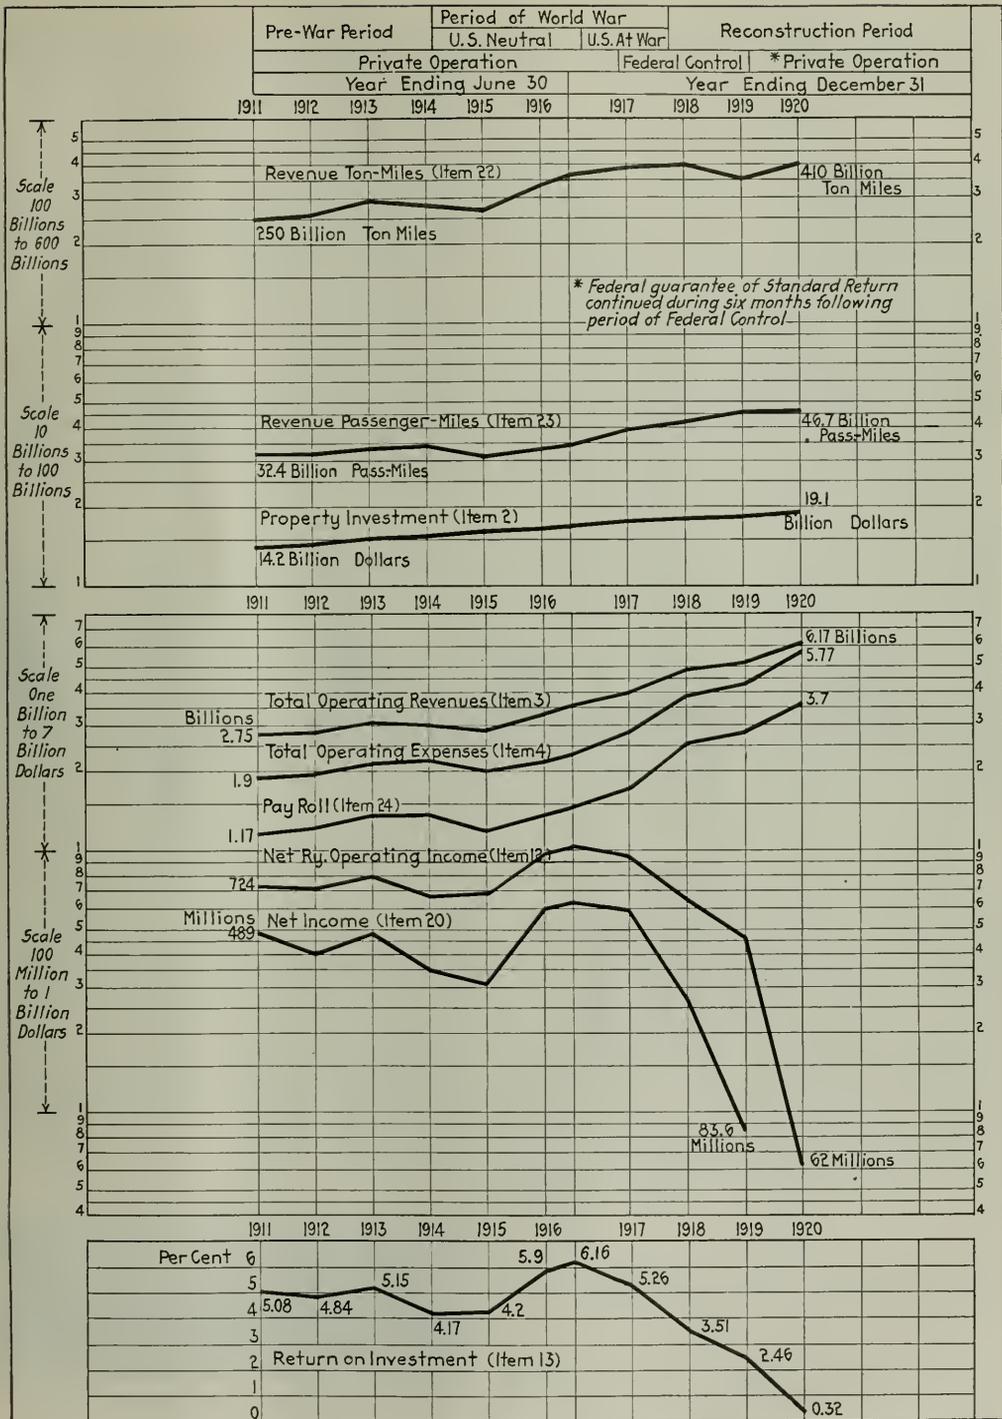

(Railways Having an Annual Operating Revenue above \$1,000,000) (Does Not Include Switching and Terminal Companies)

Item	Fiscal years ended				
	1911	1912	1913	1914	1915

\*Not yet available. a Total operating revenues for 1920, includes \$64,508,260 of back mail pay collected in 1920, but applicable to services rendered 1917, 1918 and 1919. b Partially estimated.

Note—Net railway operating income, as shown above for 1918, 1919 and 1920, represents the actual earnings from operation of the Class I railways. The "standard return" for these roads (i. e., the net operating income after collecting rental from the U. S. Government), amounted to approximately \$89,500,309 for the years 1918 and 1919, and for 1920 amounts to approximately \$825,000,000, taking into account two months of Government operation, six months of Government guarantee and four months of private operation.

Fig. 1—Leading Factors in Railway Earnings on a Ratio Scale, for a Clearer Comprehension of Relationship

trouble is that we talk in such big figures all the time that no one understands what we are talking about. When we get into billions, millions become minimized. They lose their relative value."

The present article is an attempt to work out a method

Table II—Important Dates

World War—Austria declared war on Serbia.....	July 28, 1914
Adamson Act approved.....	September 3 and 5, 1916
Adamson Act effective.....	January 1, 1917
United States entered World War.....	April 6, 1917
Federal Control began at noon.....	December 28, 1917
Armistice declared.....	November 11, 1918
Transportation Act approved.....	February 28, 1920
Federal Control ended.....	February 29, 1920
Federal Guaranty Period from.....	March 1, 1920
Federal Guaranty Period to.....	September 1, 1920

which permits of a clearer understanding of the relationships between the various factors of railway traffic and earnings and more particularly to show the relationships between those figures expressed in millions and those expressed in billions. One of the charts is worked out in the form of curves plotted on the ratio scale, while in the other the various values are plotted as percentages. The charts point out clearly the great increase in traffic handled in recent years, the great increase in revenues, and show how the still greater increases in cost of operation, more particularly in wages,

not include the standard return for the period of federal control or the guaranty for the guaranty period from March 1 to August 31, 1920. The third part of the chart shows the return on the investment; i.e., the relationship between the net railway operating income and the total property investment.

In this chart the most striking feature is the increase in railway operating expenses, the great increase in the pay roll and the sharp decline in net income. The ratio scale used in these charts is for the purpose of showing relative changes. An increase or decrease of a given percentage in any item on the chart will show the same degree of upward or downward inclination regardless of the magnitude of the item or its position on the chart. If the ordinary arithmetical scale were used the fluctuations in the large items would be more pronounced than the same relative fluctuations in the smaller items.

In Fig. 2 these figures have been put in the form of percentages, based on the years 1911 to 1914 as an average of 100. The chart shows that in the year 1920 as compared with the average of 1911-1914, the Class I railroads of the United States handled 150 per cent of the revenue ton miles of the average 1911 to 1914 and 137 per cent of the revenue passenger miles. This greater transportation service yielded

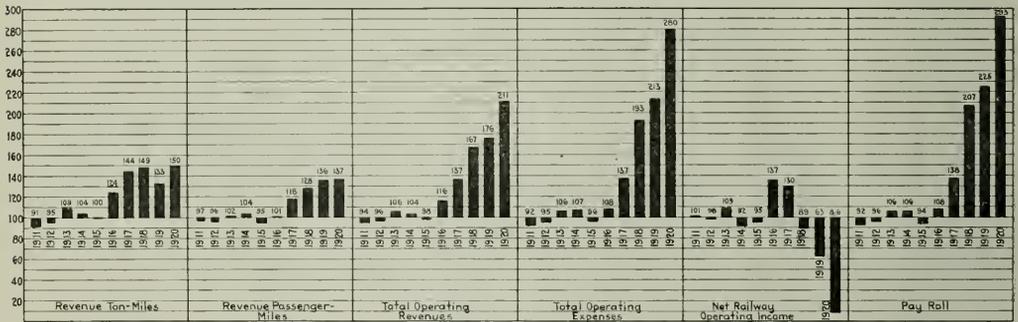

Fig. 2—Railway Traffic, Earnings and Expenses Shown in Percentages of the Average for 1911 to 1914 as 100

have succeeded in reducing and almost eliminating net income.

Fig. 1 is in three parts. It covers the years from 1911 to 1920 and shows (a) the revenue ton miles of traffic in these

Table III—Wage Advances During Federal Control

To all employees, January 1, 1918.....	\$360,000,000

To maintenance of way employees (time and one-half for overtime), December 16, 1919.....	25,000,000
To clerks (time and one-half for overtime), January 1, 1920..	25,000,000
Total.....	\$990,000,000

May 24, 1921 (a).

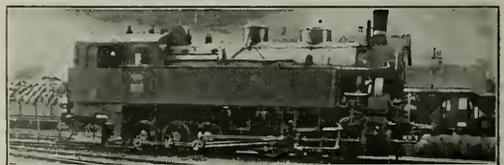

RATE INCREASES

June, 1918—Director-General increased freight rates approximately 28 per cent, and passenger rates approximately 22 per cent.  
 August 26, 1920—I. C. C. increased freight rates about 33 per cent and passenger rates 20 per cent, with a 50 per cent surcharge on Pullman fares.

years; the revenue passenger miles and the property investment; (b) the total operating revenues, the total operating expenses, the pay roll, the net railway operating income and the net income available for dividends. The latter figure does

211 per cent of the operating revenues of the 1911 to 1914 period, but as the operating expenses reached a figure of 280 per cent, principally because of an increase which brought wages up to a ratio of 293, the net railway operating income was reduced to but 8.6 per cent of what it was in the years from 1911 to 1914.

The figures from which these charts were made up were compiled by the Bureau of Railway Economics and are given in Table I. For the purpose of making the information readily available Tables II and III are given to show some of the important factors which resulted in the figures which are indicated on the charts.

# Carriers Again Ask Labor Board to Decrease Wages

## Restoration of the Rates of Pay in Effect Prior to Decision No. 2 Requested by Many Railroads

REPRESENTATIVES of eastern and western railroads assailed the recent \$400,000,000 wage cut authorized by the Railroad Labor Board, the standardization of railway employees' wages and the payment of time and one-half for overtime in freight and yard services in reopening the wage question before the Labor Board on June 6. The recent wage cuts, considered in connection with the data presented to the board at the previous hearings by the carriers, are not large enough and should be increased so as to restore the rates of pay in effect prior to the wage increase of last July, according to the testimony presented at the opening session. The standardization of wages and the payment of time and one-half for overtime in freight train service were attacked by J. G. Walber, representing the eastern roads, who suggested in lieu of the former, that standardization of wages extend only to those rate making groups fixed by the Interstate Commerce Commission.

In opening the hearings, which are a continuation of the hearings which began on April 18 and which have been reported currently in the *Railway Age*, Mr. Walber said in part:

Since the submission by the railroads of their exhibits in April, the downward movement in the cost of living, and in the rates of pay in outside industries has continued and is still continuing. It is evident that there is a general necessity for revisions of the wage scales in all classes of employment. These changes will unquestionably have a pronounced influence upon costs of all kinds, including the cost of living, and will, in our opinion, require in the very near future much greater reductions in the scales of the railroad employees than have been asked up to this time. If the elements set out in Section 307 of the Transportation Act are in control of the situation, and we believe that it was the intent of Congress that they should be given the most specific and direct application that the conditions would permit, a very serious situation will be constantly before us, and it requires very serious consideration whether, in view of the constant changes which are taking place in this period of readjustment it is possible to continue to handle these readjustments of the wages of railway employees in the manner which is now being pursued and the necessities of adjustment of individual classes with relation to all classes.

In other words, the question before us is whether it is to be impossible to make adjustments in the wage scales of one class of employees without involving all other classes. We realize that this is not a matter which can be decided at this time; in fact, it may not be necessary to decide it at this time, but with the diversified conditions in the commercial industries and with the great many different classes of employment in the railroad service, we assert that Section 307 of the Transportation Act does not contemplate that specific relations between wage scales of the various classes should be continued, and that one class cannot be changed without affecting every other class. The Transportation Act itself recognizes that there are differences in the commercial necessities in the different parts of the country, by the establishment of the different rate regions, and as that act requires the Interstate Commerce Commission to give direct consideration of the wage scales in their decisions affecting traffic rates, there appears to be sound reason for holding that in any circumstances the largest area to be considered by the Labor Board in determining wage scales should correspond with these traffic rate regions. In fact, we repeat that Section 307 requires making the most direct comparisons possible, even to the extent of subdividing carriers, if the conditions warrant, so that if for no other reason, railroad wages in each particular section of the country can be brought in direct conformity with prevailing scales of pay for analogous occupations in those particular localities, and similarly with reference to the cost of living in corresponding communities.

The differences in all the elements entering into the situation, whether cost of living, rates of pay in outside industries, general social conditions, etc., are so pronounced as between different portions of even distinct sections of the country; as for instance, within the New England district, within states themselves, and as between rural and urban communities on individual railroads;

that to pay the same scales of wages and apply the same working conditions results directly in discrimination between the employees working in these different places. The standardization of wages for all classes of railroad employees which disregards such local conditions is a serious violation of economic law, and the continuation of such policy would be in violation of the Transportation Act of 1920. The attempts in the past few years to standardize wages over the entire country, when the conditions over the entire country are not and could not, and, in fact, should not be standardized, is a contributing factor to the present situation which is resulting in criticisms of the expenses of the railroads and the quite general conception that there is wastefulness in the expenditures of the railroads, and, therefore, the shippers are being required to pay traffic rates unnecessarily. This experience has also demonstrated that payment of standard railroad wages to all employees is reflected in the wages paid by outside industries and on the farms, all of which contributes to the high cost of living.

It is felt that not only on the railroads but as between the railroads and the commercial industries, economic peace cannot obtain under the existing standardized rates for all classes in disregard of the local conditions as to cost of living, rates paid in outside industries, social conditions, etc., as before referred to, and the eastern railroads are anxious and ready to do all within their power to correct this situation in conformity with the provisions of the Transportation Act of 1920.

In addition to reductions in the unit or base rate of wages as to which the board has announced its judgment in Decision No. 147, there is involved in the present dispute a proposition not covered or provided for by that decision. The proposition referred to is the substitution of pro-rata pay in place of time and one-half for overtime in freight and yard service. We cannot too strongly and emphatically urge the careful consideration by the board of this feature of the pending dispute. Overtime basis of pay in road freight service was injected into the wage schedules as a pay increase measure, and for that reason, as well as because it directly and substantially affects the amount of the employees' compensation rather than the working conditions under which he labors, the railroads feel that it should be dealt with in this wage adjustment proceeding.

After outlining the history of punitive overtime payments, Mr. Walber continued:

Road freight service provides a dual basis of payment; miles and hours cannot be considered in the same category or comparable with other classes of service or labor which is regulatory on the part of the railroads. The principle of overtime for road freight service on the basis of time and one-half is wrong and inequitable, and cannot be fairly applied where the regulation of hours is beyond the control of the employer. The object of overtime, or rather the establishment of penalty rates of pay after a stipulated number of hours of service is a restrictive feature instituted for the purpose of limiting the individual hours of service for what might be termed "stationary employment" where an equitable return is obtained and the duration of service is governable by the employer. The emergencies of road service, involving uncontrollable features which are non-regulatory on the part of the carrier and which it cannot control, separates this class of service from all others, as the railroad has no means of obtaining a proper equivalent. In real service it is quite evident that in many cases neither the management nor the men can prevent overtime. Weather conditions, density of traffic, unexpected breakdowns at points lacking facilities for prompt repairs, may either singly or together cause delays to such an extent that a run which under reasonable conditions takes eight hours, may be protracted to twelve hours. In such cases, the crew is not called upon to perform fifty per cent more labor, as would be the case in a shop, but is required to spend fifty per cent more time in performing the same amount of labor.

After outlining the further development of punitive overtime payments to engine and train service employees during federal control, and quoting Director General Walker D. Hines with respect to his attitude toward these payments, Mr. Walber continued:

It will be observed that the Director General plainly stated that he could not approve of the granting of time and one-half

for overtime on the basis for which it had heretofore been contended, his views coinciding with those of the arbitration boards which had passed upon the subject, and also with those of the railroad managements who are unable to see any justification for the granting of such a penalty measure applying to conditions which are almost entirely beyond the control of the managements or the men themselves.

This attitude of the Director General was brought to the attention of the board in the hearings involving the wage scales, which resulted in Decision No. 2. The contention of the railroad managements that the increased pay resulting from the granting of time and one-half for overtime, which the Director General treated as a wage adjustment in his memorandum, was evidently ignored by the board in rendering Decision No. 2, as we construe the increases granted, which were the same number of cents per hour as were granted other classes of skilled employees, and in that way granting disproportionate increases to the engine and train service employees as compared with other classes. Therefore, all such classes having been treated equally with reference to the amount of increases per hour or per day, in the basis rates, with no consideration whatever of the dual basis of pay applicable to the men in road freight service, we believe we are fully justified in the conviction that the reasons which influenced the Director General in making this concession no longer exist and have been wiped out by the action of the Labor Board in the promulgation of the increases under Decision No. 2.

### J. W. Higgins Testifies for Western Roads

Mr. Walber was followed on the stand by J. W. Higgins, executive secretary of the Association of Western Railways, who spoke on behalf of the western carriers. Mr. Higgins said that despite the recent wage cut of \$400,000,000 in the pay of railway employees, western railroads will continue to stand squarely upon their requests for reductions in wages which will restore the rates of pay in effect prior to the last increase of \$700,000,000 ordered by the Railroad Labor Board last July. "The evidence now before the board shows conclusively that the grounds upon which the last increase was made have entirely disappeared by reason of changed circumstances and conditions affecting the cost of living and the rates of pay for work of the same character in outside industries," Mr. Higgins said in outlining the carriers' position.

"The western carriers," he said, "notwithstanding Decision No. 147 which established decreases in rates of pay that are less in amount than those which these carriers have asked this board to establish and which it is asserted are justified upon the records in this proceeding, stand squarely upon and adhere to the prayers in the applications which have been filed for reductions in wages and rates of pay that will restore the wage schedules of these carriers to the basis not in excess of the wages and rates of pay which obtained before the promulgation of Decision No. 2."

Frank H. Alfred, president of the Pere Marquette; F. W. Sargent, general solicitor of the Chicago & North Western; J. J. O'Neill, general manager of the Chicago, St. Paul, Minneapolis & Omaha; J. L. Coleman, general attorney of the Atchison, Topeka & Santa Fe, and G. S. Waid, general manager of the Southern Pacific lines in Texas and Louisiana, also testified for their respective roads, reiterating, to a large extent, the arguments made in the previous hearings regarding the cost of living and the wages being paid for similar work in outside industries. All asked for the restoration of the rates of pay in effect prior to Decision No. 2.

### J. G. Walber Presents Additional Exhibits

Mr. Walber, on behalf of all of the carriers, submitted numerous exhibits regarding the cost of living and the wages being paid in outside industries for work similar to that performed by the railway employees. These exhibits showed in general that the cost of living has decreased approximately 5 per cent since the filing of similar exhibits with the board in the wage hearings just ended. One of these exhibits, for instance, showed that the cost of living in May, 1921, is approximately 41 per cent lower than it was in July, 1920, when the peak was reached. Wholesale prices are shown in

other exhibits to have decreased from 5 to 13 per cent since February and it is necessary, according to Mr. Walber, to go back to 1915 and 1916 to find comparable periods.

Regarding the relation of wholesale prices to the cost of living, Mr. Walber called attention to the fact that the Bureau of Railway Economics, which prepared the exhibits, mentions the tendency of retail prices to lag behind wholesale prices.

"We feel that your board is thoroughly alive to the conditions which generally exist with reference to this feature in our industrial situation," Mr. Walber said in explanation. "It is common knowledge that this situation is receiving attention in various ways; press dispatches indicate that the administration at Washington is taking an active interest in the matter of reducing retail prices. We confidently believe that there will be a continued decline in all the elements entering into the cost of living; also that wholesale prices have not reached as low a plane as they will and that there will be a gradual drawing together with the lines of decline of the retail and wholesale prices. In any event, as wholesale prices are steadily declining, the downward movement in retail prices will continue for a much longer period of time."

The railroads completed their pleas for wage reductions on June 7, the remainder of the western roads outlining their requests and the reasons therefor, and Dr. C. P. Neill taking up the arguments in behalf of the southeastern roads. The afternoon session was opened with a controversy between B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor and representatives of the Pullman Company over the right of that company to bring its case for wage reductions before the Board at this time. Mr. Jewell contended that the Pullman Company has had no conferences with "the authorized representatives of the employees" in accordance with the terms of the Transportation Act. The action of the Pullman Company in bringing the case before the Board was defended by G. S. Fernald, counsel, who stated that Mr. Jewell's objections were purely technical. Chairman R. M. Barton of the Board, ruled that the pleas of the Pullman Company for wage reductions would not be heard until the Board had decided the question of jurisdiction.

Representatives of the various classes of employees involved in the wage controversy testified at the afternoon session, all of them stating that they are resting their cases upon the testimony introduced in the recent wage hearings.

Intimations that the attitude of employees in engine and train service was such that their acceptance of wage cuts at this time was not probable were made before the Labor Board on June 8 by L. E. Sheppard and W. G. Lee speaking on behalf of employees in Group I. Mr. Sheppard outlined all the adverse circumstances which might act to influence representatives of the employees in Group I to vote for rejection of the decreased rates of pay fixed by the Labor Board last week when the general chairman of all the carriers affected meet at Chicago on July 1. No specific threats were made, both Mr. Sheppard and Mr. Lee confining their remarks to outlining the probable frame of mind of these employees and stating that if a strike was called blame would lie first with railroads in trying to reduce wages at this time and second with Labor Board in ordering decreases. Mr. Sheppard defended the position of the conductors, whom he directly represents, by stating that discrimination in rates of pay which prevailed prior to federal control has merely been continued by awards of the Railroad Administration and Labor Board. "The cost of living," he said, "has never been argued as a factor in wage schedule making and should not be so considered at this time." He also made a vigorous attack on "open shop" propaganda and in closing stated that railway employees prefer private control, provided they can obtain concessions under such system as they obtained while railroads were under federal control.

Mr. Lee's arguments were based largely upon the statement that the Labor Board after rendering one decision could not alter its findings within a few days without the inference being drawn that it admitted error in the first wage cut order. H. P. Daugherty, representing the engineers, and W. S. Carter, representing the Brotherhood of Locomotive Firemen and Enginemen, also testified before the Board, the latter filing voluminous exhibits regarding the regularity of employment of firemen and enginemen, increases in efficiency as measured by traffic handled, hazards of employment and increases in cost of living as compared with wages paid these employees.

## President Not Urging General Rate Cut

WASHINGTON, D. C.

PRESIDENT HARDING and the administration are not seeking an immediate general or horizontal reduction in freight rates. The attitude of the President on the subject of rate reductions is now far more closely in accord with that of the railroad officers, the Interstate Commerce Commission and that expressed in the resolutions recently adopted by the National Industrial Traffic League than would be inferred from most of the despatches from Washington to the daily newspapers. There is no warrant for the assumption on which many of the news stories were based that, because the President wants rates reduced as a step toward the "return to normalcy," he is working for a general or percentage cut in rates which would transfer to the shippers most of the \$400,000,000 which it is estimated the railroads will save in wages during the next year, and that he has been urging such a policy upon the Interstate Commerce Commission.

The President is anxious to have rates reduced and he called on the commission on June 1 to get first-hand information as to what was being done in that direction because of conflicting statements that had been made to him, but he has made no attempt to dictate to the commission in any way and he has since expressed not only surprise and gratification at the progress already made but approval of the course adopted by the commission of working in co-operation with the carriers and the shippers to bring about readjustments of rates where they will do the most good.

Information obtained from commission sources checks with what was given out at the White House regarding the President's conference with the commissioners on June 1; the President also in a later conference with the newspaper correspondents corrected some of the conclusions to which many of them had jumped. The President referred to the evil of horizontal increases or decreases in rates which affect some commodities much more than others because of the difference in the relation between the amount of the rate and the value of the article, in the case of coal for instance as compared with a suit of clothes, and he indicated his entire approval of a readjustment by commodities rather than a general reduction. Incidentally he expressed a rather favorable attitude toward a seasonal reduction in coal rates, such as is proposed by the Frelinghuysen bill now awaiting action in the Senate and which Secretary Hoover has been attempting to bring about by voluntary action of the carriers. The President is interested in this proposal not only from the general standpoint but because the government itself is a large purchaser of coal, but it is understood that railroad officers have expressed an unwillingness to make the experiment.

President Harding's attitude toward the railroad problem has undergone a considerable evolution during the past two or three months, during which he has been consulting on the subject with representatives of all sides of the question. At first he appeared to be convinced that the high rates them-

selves were the principal cause of the railroads' difficulties, instead of the outward and visible manifestation of the high expenses which caused the high rates. In his address to Congress he declared that both rates and the cost of operation must be reduced and possibly he had an idea that it could be done simultaneously. Further investigation of the question showed him that comparatively little could be done toward reducing rates until wages could be reduced and that even then it must be a gradual process. It also showed him that there were many other factors at work of greater importance than the freight rates to cause the business depression. The President was continually receiving complaints from delegations who called upon him or from Congressmen who passed on to him the complaints of their constituents who were being hardest hit by the maintenance of the high level of freight rates while their own prices were being rapidly reduced by the operation of the law of supply and demand.

After various conferences the President began to understand that the complaints of high rates as the term was used generally were actually based on objections to particular rates that had been thrown out of relation to the value of the shipments by the fact that the process of readjustment has been working much more actively in some other directions than it has on railroad expenses. It is likely that the President was particularly impressed with the resolutions adopted by the National Industrial Traffic League at its convention in Cleveland on May 25 and sent to him deprecating "any effort toward a general downward revision of rates until the carriers have had an opportunity to adjust their expenses" and favoring readjustments in conference between carriers and shippers.

As late as May 31 the President had indicated an unwillingness to accept the position of the railroad executives, as it had been reported to him, of general opposition to rate reductions, but apparently he learned later that they had qualified general statements of this character by recognizing the need of many particular adjustments downward. The only information given out at the time of the President's visit to the commission was a memorandum read to the newspaper men at the White House, to the effect that the President had gone to inquire of the commission what progress was being made and that he was gratified to learn of the extent of the readjustments from the general percentage advance that had already been made.

It gives more punch to a newspaper story to picture the President of the United States as an all-powerful boss whose expression of a desire means that he proposes to "start something" than to represent him as a layman seeking information on a somewhat technical subject. Therefore, the President's repeated statements that rate-making is a legislative function delegated by Congress to a commission, rather than a legislative function, and that the present Executive is not inclined to go over the heads of the duly constituted authorities, have either been ascribed to a becoming modesty or subordinated to the interest of dramatic journalism.

The President has been a newspaper editor and publisher, but, to apply a newspaper analogy to his present office and to treat his cabinet as a staff of reporters who are supposed to keep the chief informed as to what is going on, it may be stated that the staff does not include any man assigned to the railroad run. When the President asks his advisers what is doing in their departments that is of general interest there is no one to talk for the railroad business. It is understood that the railroad problem was first brought before the cabinet by the Vice-President because none of the other cabinet officers has any jurisdiction over transportation, but there are men who are somewhat interested in railroad matters and who have heard mild rumors from their friends, the farmers or the manufacturers, that they are not making as much money as they ought to or would like to and if it did not cost so much to transport their products from the places where

they grow or are made to the places where they are worth something they might make more money. Although prices are not regulated it occasionally occurs to the producer that his government has the power to regulate freight rates.

As a result, when Managing Editor Harding holds his semi-weekly staff meetings, his agricultural department editor or his commercial editor may remark that he understands that freight rates are very high, that something ought to be done about it and that as far as he can see nothing is being done about it. Having no member of his staff assigned to cover the Interstate Commerce Commission, Editor Harding decided to go out one fine morning and interview the commission itself. The bulletin he issued on his return indicates that he thought he had dug up a good story and it is said that he expressed some surprise that he had been able to land something like a scoop as a reward for his enterprise in going after both sides of the story.

The commissioners told him that for months they had been working in co-operation with the railroads and the shippers in correcting inequalities that had resulted from the latest percentage increase in freight rates and that several important reductions in rates on particular commodities had been

criticism on the part of those who do not share such feeling on the ground that it has tended to cause many people to hold off buying and thus delay the readjustment.

## Freight Car Surplus Continues to Decrease

WASHINGTON, D. C.

THE NUMBER of surplus freight cars for the week ending May 31, as compiled by the Car Service Division of the American Railway Association, shows a further decrease to 394,040, or about 28,000 less than for the previous week. Of the total 155,040 were box cars as compared with 168,272 the week before, and 165,102 were coal cars as compared with 176,442 the week before. The freight car loading also continues to increase, but the compilation of the report for the last week in May was delayed until too late for publication in this week's issue.

The summary of car loading for the week ended May 21 is given in the following table.

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

worked out and more were in process of being worked out. They may have told him also that the \$400,000,000 wage reduction would not be all velvet for the railroads, that a considerable part of it is needed merely to avert bankruptcy, that even if it could all be applied to rate reductions a 10 per cent horizontal reduction in freight rates would hardly persuade many people to buy in much larger quantities than they are now buying, while it would certainly reduce by that much the revenues on the business that is moving anyway, while a larger reduction on some commodities might stimulate some business to be handled in otherwise empty cars.

As a newspaper man, Mr. Harding may also have been reminded that the thousands of rate adjustments already made have naturally attracted little publicity individually, while those who have been complaining about high rates have naturally made more noise than those who have not been complaining.

The effect of the Presidents' various statements to the newspaper correspondents, however, has undoubtedly had a tendency to encourage a feeling throughout the country that freight rates were due for a fall and there has been much

Central Station, Copenhagen, Denmark

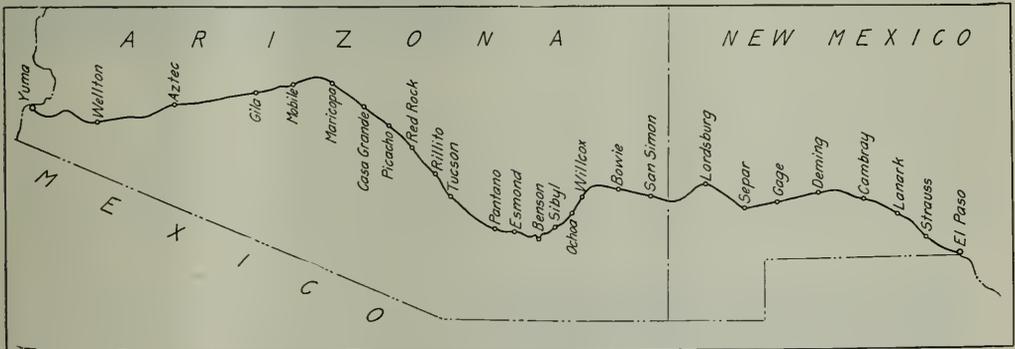

# Traffic Troubles Reduced by Enlarging Water Supply

Southern Pacific Effects Annual Saving of \$104,000 by Organizing Systematic Campaign on Tucson Division

THE CONDITIONS on the Tucson division of the Southern Pacific practically from the time the division was opened for operation have borne constant testimony to the extra importance that should be attached to the item of water supply as a factor in train movements through comparatively arid sections of the country. This division extending from Yuma, Ariz., to a point near El Paso, Tex., includes 564 miles of main line, all of which is through desert. The character of this territory is such that in constructing the line in 1879 and 1880, one of the largest items of expense was that of hauling and transporting water for the work. In fact, it was a common belief of the men in charge that no water was to be had in that section. As a result of this belief, together with the urgent need of hurrying the construction in order to effect a connection between the Pacific and Atlantic, the water supplies developed were unsatisfactory, even at that time. However, with but little improvement they remained the only ones until 1917, when it was decided to attempt a substantial improvement. This plan was precipitated by the events of the preceding year when, as a result of large in-

it available for boiler use in order to effect a settlement of the mud. The breaking down of the machinery was a frequent cause of trouble, there being but the one pumping unit. Also freight traffic regularly experienced delays incident to the preference given to passenger movements, there being five passenger trains in each direction daily, all of which carried water cars and which in themselves often encountered conditions at Yuma where it became necessary to obtain their supply of water from the small mains of the city. The change made was that of drilling two wells, one 246 ft. and the other 252 ft. deep and installing two electrically operated Lane & Bowler turbine pumps. The water, though not of the best quality, is present in ample quantity for all purposes.

Having corrected the trouble at Yuma, attention was directed to the situation at Wellton, 37 miles east. The trouble here was not so much one of inadequacy of supply as excessive cost of operation, the supply here in many instances having been carried over the entire freight division from Yuma to Gila, a distance of 123 miles, over a period when

Map of Southern Pacific Showing Water Stations on Tucson Division

creases in the tonnage on the Pacific coast and through the Imperial Valley of California, conditions were aggravated to a point where substantial relief seemed essential. Annoying delays incident to a shortage of water at stations or to their distance apart, and more or less costly maneuvering to make the best of a bad situation were every-day occurrences, while train failures and blockades, though less common, were not unknown. The condition was partially met by hauling water cars a distance of 400 miles, oil tank cars being used for the purpose, but this was an expensive practice, each water car decreasing the capacity of a train for revenue freight by one car and there being a demand at all times for cars capable of transporting oil.

## Program for Better Water Supply Begun at Yuma

The plan of relief called for the establishment of water stations on the Tucson division at intervals of 25 miles. Predictions of failure were plentiful but the work was undertaken and a beginning made at Yuma, the west end of the division. It had been the practice here to secure water from the Colorado river, pumping it into large concrete settling tanks and confining it therein for 12 hours prior to making

other wells had been pumped dry or rendered inoperative by machinery failures. The employment of three pumps at this point, however, was a matter which invited improvement. To the end of effecting such an improvement, two Lane & Bowler pumps, belt-driven by two gas engines, were installed with the result that one attendant now handles the work. The saving effected by this change exceeds \$3,000 annually in pumps' salaries alone. The quality of the Wellton water, however, is the poorest on the division. It contains 26.59 grains per gallon of incrusting salt and 53.42 grains per gallon of non-incrusting matter, the total dissolved matter being 80.01 grains per gallon.

The one unfavorable condition now outstanding on the freight division between Yuma and Gila was that of operating trains between Wellton and Sentinel. With a distance of 50 miles between these stations, it happened at times that trains attempting to operate over the district on the supply of water carried in the engine tender would run short before reaching Sentinel and experience serious delay on that account. To overcome this condition, water was prospected for at Aztec. Although an unlikely place for water from all surface indications, Aztec being one of the most desolate

spots on this route, efforts at drilling were successful, the installation at this point consisting of two wells, 710 ft. deep, two gas engine driven Lane & Bowler pumps and a 350,000 gal. steel tank.

**Wells 1,746 Ft. Deep at Gila**

The situation at Gila was one of inadequacy and, being a terminal point, it was especially urgent that the trouble be overcome. Although there were two wells at this point, the supply would become exhausted during periods of heavy business and necessitate the hauling of water from Wellton, 85 miles west, and from Maricopa, 42 miles east. The problem of supply was solved by digging deeper, a seemingly inexhaustible supply being found at a depth of 1,746 feet.

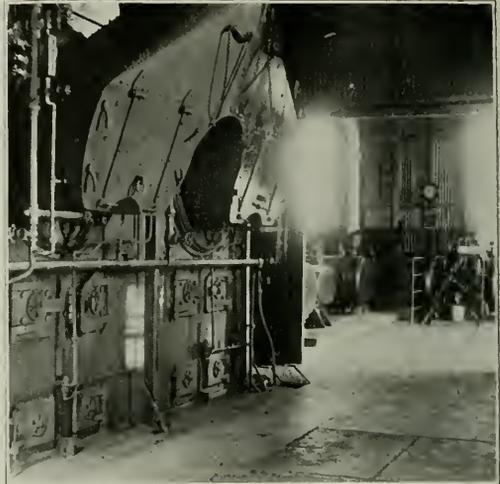

This water, however, like that at Sentinel has a temperature of 110 deg. F., a temperature at which locomotive injectors experience difficulty in picking up the water. A cooling device which has been installed serves a beneficial purpose during most of the year, but considerable trouble from this source is experienced in extreme hot weather. The pumping installation is an air lift system, the air being supplied by two Ingersoll-Rand Imperial air compressors.

The next water station eastward was located at Maricopa, 42 miles from Gila. Twenty-two miles of this distance is up a 1.5 per cent grade, necessitating the hauling of water cars in both directions. In order to overcome this difficulty a search for water was made at Mobile, situated about midway between the two stations and a good supply of fair quality water was found at a depth of 451 ft. Since sinking the one well and the installation of a Luitweiler double-acting deep well pump, operated by a 30-hp. gas engine, no necessity has arisen for the hauling of water cars in this section.

At the several water stations between Maricopa and Benson, 136 miles farther east, it developed that as at Gila the solution of the problem was one of digging deeper, the supply not only being more plentiful at the greater depth but of a better quality. At most stations in addition to deepening the wells, the program included the installation of two pumping units to protect the system against machinery failures. In

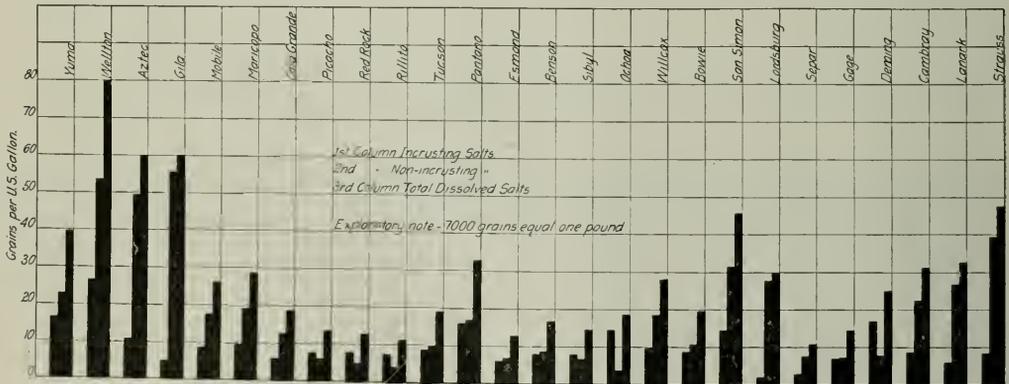

Knowles deep well pumps, supplied by two 80 hp. Pennsylvania type steam boilers.

The likelihood of being able to develop water supplies between Lordsburg, N. M., and El Paso, Tex., a distance of 147 miles, and the only remaining part of the division not yet considered, was considerably less of a certainty than

Interior of Pumping Plant at Bowie, Ariz.

it was at some of the other points. Considerable money had already been spent without success in this region and at one time the hope of obtaining water had been given up entirely. However, judicious prospecting brought in a well at Akela, 81 miles east of Lordsburg, and farther east stations were developed at Afton and Strauss, the plant at Strauss com-

Analyses of Main Line Waters, Tucson Division, Southern Pacific

many instances large steel tanks were also erected. A duplicate of the situation between Gila and Maricopa on the west was encountered in eastern Arizona between Benson and Willcox.

The situation at Bowie, Ariz., was another case of insufficient water which simply required deepening of the existing wells, of which there are three. The wells are now 495, 505 and 768 ft. deep, respectively, and are operated by two

prising two wells 975 ft. and 950 ft. deep, respectively, from which the water is pumped by a Sullivan air lift system. Since the establishment of these stations, the need of water cars on this division has apparently been obviated completely.

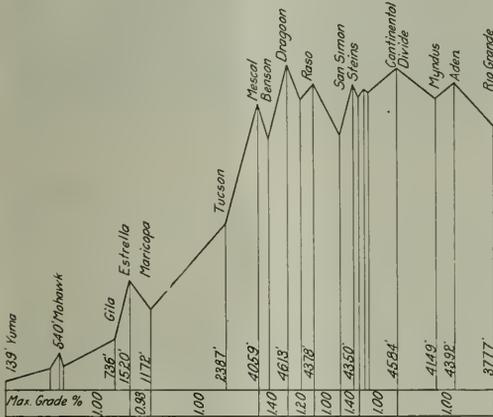

But it cannot be said that the problems have been altogether overcome. On the contrary, the conditions at some points are still far from ideal. Between Yuma and Tucson, for in-

stance, the quality of the water leaves much to be desired. An engine with new flues will only last about four months in this territory, a condition which is partially met by transferring the engines east of Tucson, where about three months' more service is secured from them. As a matter of fact seven or eight months is the average life of flues in any engine operating through the desert. Also during periods of heavy business it is necessary to hire a great number of enginemmen whose experience has been in good water territory and as a result much trouble is encountered in operating the trains until they are able to adapt themselves to the waters. How-

This code is substantially the same as that which has been approved by the Territorial Health Officers' Association, in which are members from the health boards of practically all of the 48 states; and it also conforms to the standards prescribed in the quarantine regulations of the United States Bureau of Public Health. In connection with the adoption of the code by that Bureau, the railroad surgeons had a number of conferences with the government officers, and the code also has been discussed in former meetings of the railway surgeons; the discussion at Boston, therefore, resulted in no material changes.

The report of the committee on physical standards, Dr. C. W. Hopkins (C. & N. W.) chairman, was in the nature of a progress report embodying conclusions, so far as conclusions were reached in this matter, which were formulated while the railroads were in the hands of the government and which were the subject of a brief report by the Railroad Administration just before the return of the roads to their owners. The committee presented a proposed code of general or preliminary rules, embraced in twelve paragraphs; but because of the short time that the committee has been in existence the subject has not been studied in all its bearings, and the matter of recommendations for action was deferred until a future meeting.

The officers for the ensuing year are as follows: Chairman, D. Z. Dunott (W. M.), Baltimore, Md.; first vice-chairman, G. G. Dowdall (I. C.), Chicago; second vice-chairman, Duncan Eve (N. C. & St. L.), Nashville, Tenn.; third vice-chairman, C. W. Hopkins (C. & N. W.), Chicago; secretary, J. C. Caviston, 30 Vesey street, New York.

Condensed Profile of the Main Line of the Southern Pacific, Tucson Division

ever, the condition common to the period prior to 1916 and 1917 when an entire division would become blocked and the freight finally backed up to the extent of blocking other divisions owing to the water supplies becoming exhausted at one or two points is now a thing of the past. In 1918 it was estimated that just in avoiding the use of water cars and eliminating the delays which had been incident to their use, a saving of \$104,000 was effected.

We are indebted to Wm. Wilson, division superintendent of the Tucson division, for the information on which the above article is based.

### Annual Meeting of the Medical Section

THE first annual meeting of the Medical and Surgical Section of the American Railway Association was held at Hotel Westminster, Boston, Mass., on June 3 and 4, with about 75 representatives in attendance. This was the first full meeting since the Railway Surgeons' Association became a part of the American Railway Association, and the temporary officers were confirmed in their positions for the ensuing year.

The principal business was the discussion of the reports of two committees, one on a sanitary code and one on physical standards for railroad employees. The first-named committee, Dr. R. W. Knox (Southern Pacific), chairman, presented a carefully prepared code of 91 sections, which was adopted for use as standard railway practice. It prescribes rules for transportation of sick persons, cleansing of passenger cars and passenger stations, safeguarding ice and drinking water and hygienic care of construction camps. This code will come before the American Railway Association, at its next meeting, for confirmation.

### Railroads Suffer Heavy Losses in Colorado Floods

By J. B. Day

RAILROADS in Colorado have suffered losses estimated at from \$3,000,000 to \$4,500,000 in the floods which have occurred during the past week. The greatest damage was done at Pueblo on June 3 and 4 and the heaviest

Photo by Underwood & Underwood, N. Y.

Arkansas and Fountain Rivers, Joined by Flood, Washing Away Bridge at Pueblo

losers were the Denver & Rio Grande, the Atchison, Topeka & Santa Fe, the Missouri Pacific and the Colorado & Southern. Other roads which are affected, but to a less degree, are the Union Pacific, the Chicago Rock Island & Pacific and the Chicago, Burlington & Quincy.

Many miles of track have been washed out all over the

state and many bridges large and small have either been washed away entirely or so badly damaged as to require extensive repairs. Rolling stock and shops have been hard hit. On top of the physical damage to the various roads is to be added the loss of revenues resulting at this time from partial paralysis of traffic resulting from the floods, and the loss that is yet to come from shrinkage of tonnage

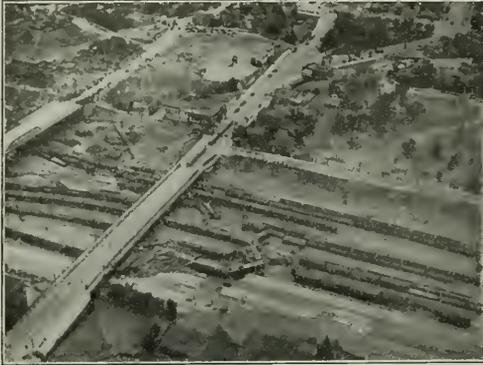

Photo by Underwood & Underwood, N. Y.

#### Railroad Yards at Union Station, Pueblo. Two Overturned Passenger Trains

due to ruined crops and the apparent wholesale slaughter of cattle, horses, sheep and hogs indicated by reports from various sections of the state.

It is estimated that there are upwards of 300 freight cars piled up in the Pueblo yards in various stages of destruction. How much of this rolling stock can be salvaged is problematical at this time. Two passenger trains, Denver & Rio Grande Number 3 arriving in Pueblo on the evening

Photo by Underwood & Underwood, N. Y.

#### Overturned Freight Cars

of June 3 and a Missouri Pacific passenger train on an adjacent track, were caught in the union station yards when the flood descended upon the city and were turned over. The loss of life on the Denver & Rio Grande train was estimated at 23. At this writing the trains are still partly submerged and it is impossible to determine definitely how many of the passengers lost their lives. The union station was in ten feet of water at one stage of the flood and the water was reported to have reached a depth of 15 ft. in the Santa Fe yards.

South of Pueblo and east almost to the Kansas line along the Atchison, Topeka & Santa Fe the flood waters wreaked heavy damage. The Santa Fe shops at La Junta were reported under five feet of water and two locomotives and a large number of freight cars were said to have been destroyed. Near Las Animas two miles of the Santa Fe's track was reported washed out and between four and five miles between Lamar, Colo., and Syracuse, Kans. Of all the lines radiating from Pueblo those leading northward toward Denver were least affected. The Santa Fe expects to have its California line in service by June 12 and its Pueblo line some time next week. The Union Pacific, on its Fort Collins branch, north of Denver, incurred severe losses as a result of washed-out track. The Colorado & Southern lines north of Denver to the coal fields also were badly washed out. The collapse of the main tunnel on the Midland Terminal road completely tying up that line for the time being was reported Tuesday.

With the work of surveying the damage only just begun it is impossible at this date to determine with any great degree of accuracy the extent of the damage done. H. A. Tice, superintendent of the Atchison, Topeka & Santa Fe at Pueblo, is quoted as estimating the probable damage to the property of his company at \$2,000,000 and that of the Missouri Pacific at \$1,000,000. At the headquarters of the Denver & Rio Grande it was said that the most conservative estimate of the physical injury to that road, based on incomplete information, is upwards of \$1,000,000. Robert Rice, vice-president and general manager of the Colorado & Southern, said that a conservative estimate of the damage to the property of his company would be \$200,000.

## Electric Power for Railroad Traction

**F**UTURE EXPANSION in the use of central station power was the subject of an address delivered by Samuel Insull, president of the Commonwealth Edison Company, Chicago, at the forty-fourth convention of the National Electric Light Association recently held in Chicago. The major part of his address dealt with the development of interconnecting power systems and in this relation he said he would like to see every committee of the association watch the progress of any plans of federal control of the power industry. With reference to the railroads Mr. Insull spoke as follows:

"I think we can be of great help in the rehabilitation of steam railroads of this country. I am not one that believes in universal electrical propulsion of railroads immediately. I believe that the economic way to get around to that proposition is to develop our production of energy along economic lines, and to develop the transmission of that energy throughout the country on economic lines; to see to it that we are in a position at any time where electrification of steam railroads is desirable in some particular locality, that we shall be able to take care of it.

"I see no reason why we should not finance that operation right up to the point where our energy is taken by the prime mover of the railroad, that is, the locomotive, and in that respect I think we can be of very great assistance; but in all these investigations—and I have studied some of the figures sent out from Washington—there should be the stabilized knowledge that exists in this industry and in this association and its members as the result of forty years of work in the manufacture of energy. The nation is entitled to the benefit of it, the industries are entitled to the benefit of it, and we are entitled to the benefit of it to the extent that it will stabilize our investment to a greater extent . . . and will help to reduce the cost of electric power and enable us to sell it at cheaper prices to all of our customers. . . ."

## Meeting of Railway Accounting Officers' Association

Important Action Taken in Favor of Making Portion  
of R. A. O. A. Recommendations Mandatory

**A**DDRESSES BY L. F. LOREE, president of the Delaware & Hudson, and by B. H. Meyer, member of the Interstate Commerce Commission, and important action in favor of making mandatory a portion of the recommendations of the Association relative to interline freight, passenger and disbursement accounting, featured the unusually successful thirty-third annual meeting of the Association held at Atlantic City this week. The meeting, which was held at the Hotel Traymore, June 8 to 10, was attended by some 500 accounting officers. The docket which the meeting followed was the largest yet handled at any of the annual meetings of the Association, being double in size over that of 1920. Besides the important steps looking towards making mandatory a portion of the R. A. O. A. recommendations, the meeting also adopted a large number of new forms, the number of such forms presented exclusive of revisions, being equal to that presented in nearly all of the other years of the Association's history combined.

L. F. Loree, president of the Delaware & Hudson, in his

address before the opening session, outlined the uses for which accounting work was done. He emphasized the necessity for having the records made up as promptly as possible and made a plea for greater co-operation between the accounting and other departments. An abstract of his remarks follows:

### The Accounting Officer's Work from the Executive's Viewpoint

By L. F. Loree  
President, Delaware & Hudson

The system of accounts with which we are concerned is that prescribed by the Interstate Commerce Commission. Its great defect lies in the meticulous detail and the lack of balance. Some of the accounts in the Commission's system involve sums of money so small as to be almost microscopic when compared with the total, while some of the larger items

could be subdivided to advantage. The main source of the trouble would seem to be the attempt to initiate a method of cost accounting on lines similar to those used by a manufacturing plant.

Statistics cannot take the place of judgment, but they are most valuable aids to judgment. They serve as instruments to thought, to knowledge and to work, and should be compiled in the clearest, the briefest and the most compact form. The ramifications of railroad operations are so widespread, the sources of possible wasteful expenditures, or possible economies, so numerous, that if a railroad is to be managed with a maximum of efficiency, it is important that all information bearing on work done and cost of operation be drawn together and tabulated on uniform bases; that is, there should be adequate statistical information. If sufficiently comprehensive, statistics will aid in the solution of problems and enable conclusions to be drawn and judgment matured. Constant usage cultivates a sense of arithmetical values to that in which the mind becomes responsive in a way analogous to that in which the trained ear becomes responsive to values in harmony.

Statistics should be as few as will cover the essential items and contain the details that explain the fluctuations which have taken place and where they occur. They are exposed to the danger of a careless assumption of data without testing their correctness and to undue refinement in the calculations based thereon. They should be kept so that information can be condensed from period to period on statements that will enable comparison of cumulative periods, and they should be brought together in folders. Much of the beneficial effects to be derived from their use is now lost through their being scattered over numerous sheets and a failure to draw them together.

#### Greater Use of Diagrams Suggested

The use of diagrams is very helpful and they may be drawn to illustrate many statements, bringing in a very direct way material facts into prominent notice. The changes stand out and save much mental labor in carrying in mind a long series of figures, and the appeal to the memory is, in some ways, more intense. Great care must be exercised in the choice of scales and illustrations for the diagrams, while the use of colors is frequently advantageous to give emphasis or direct attention to the significant facts.

It is important to keep in mind that we have two classes of statistics for measuring efficiency—financial and physical. Much more should be done than has been done by the accounting department in the developing of physical statistics. Such statistics have the great advantage that the units used are constant and not subject to the fluctuations entailed by changes in wages and prices, while they have the advantage of familiarity and close personal association.

The lawyers have a saying "time is of the essence of the contract." Time is of the essence of all statistical data. It may well be that a statistic available on the 4th of the month will have four times the value of the same statistic not furnished until the 20th. Careful study should be made of the dates upon which statistical data are to become available and resolute discipline imposed to produce them on time.

#### INTIMACY WITH OTHER DEPARTMENTS SOMETIMES LACKING

There is an intimacy in the relationship of the auditor and his accountants with the other departments of the railroad service which is much more direct and pervasive than are the relationships between one and another of the other department chiefs, and his work carries with it a penetration into the several departments that is quite distinctive. On the other hand, the personal and official intimacy that exists between the other departments is singularly lacking in the relationship between the auditor and his accountants and

the officers and employees of the other departments. It is very much to the interest of the railroad properties that this situation, which is in some respects harmful, should be corrected, and it cannot be corrected unless the reasons for it are understood and the proper means to overcome it known.

In the early days of railroading the jurisdiction of the average officer was so limited, and the details with which he had to deal were so comparatively few, that he was to a very large extent able to do his own accounting. A generation ago railroad accounting was a simple matter. As division engineer, I had a "road and bridge material" clerk but I made out the payrolls, handled the correspondence and the rest of the office duties myself. As the business developed and grew, this was no longer possible and the entire accounting of the railroads was drafted into one department. Today the work is most elaborate and is only gotten through with by the aid of much office machinery. Beyond question the change in the practice was not only desirable but unavoidable. To a considerable extent the irritation on the part of the operating officer is a natural consequence, due to the loss of control over work that was until lately under his jurisdiction. It is a natural resultant of the transitional period. What should be done is to make the change as agreeable and as promptly as possible.

A further reason for the existing disharmony is the lack of acquaintance and familiarity of both sets of officers with the problems and difficulties of their associates. In the two great maintenance departments the problems presented involve an acquaintance with mathematics and the laws of physics, which form the basis of the technical education of the officers employed in each, so that the tools they use and their habit of mind are alike, making easy the comprehension on the part of one of the work of the other and the various aspects in which it presents itself. Not to so great an extent, but measurably so, this is also true between the two maintenance departments and the transportation department. The division engineer, in arranging for his ballasting, distribution of ties and rails, putting in new bridges and many other activities, is compelled to consult the train schedules and reconcile his interests with those of the transportation officer, and, similarly the transportation officer has to modify his own movements to meet these demands and is led to consider them in detail and familiarize himself with them. Thus these officers come to have the same intellectual outlook and to speak the same language; they have a common stock of experience and understand each other when they exchange ideas.

#### ATTITUDE OF I. C. C.

There is no such relationship between the officers of the accounting department and those of the other departments. Bookkeeping is to the average operating officer an esoteric mystery with which he is not in the way of becoming familiar unless he deliberately acquires a new, highly technical and difficult art. On the other hand, the accounting staff has neither the foundation of the technical training nor the experience of transportation movements that make a base from which they can build up a body of knowledge. Much attention will have to be given to broadening the field of knowledge of both parties. The situation, with these inherent and initial disadvantages, accentuated by the changing conditions, is further disturbed by the Interstate Commerce Commission. In putting into effect the accounting rules made effective by the commission on July 1, 1907, its statistician, Henry C. Adams, called together the accounting staff of the commission, and, among other things, said to them:

The government has recently undertaken to do something quite different from that which it has ever undertaken to do before. It has undertaken to exercise a controlling influence upon the administration of railway properties through the agency of their accounts.

The aim of the supervision of accounting is to exercise influence upon the administration and management of railway property.

Not only was this attitude assumed but a provision of the law was taken advantage of to promulgate the idea that the auditor is not so much an officer of the railroad company as he is a responsible officer of the government, and that failure to obey the instructions of the commission might lead to his fine or imprisonment. It would be, perhaps, too much to say that railroad operations can be controlled through the accounts. That would be to make the history of the fact the actuating force bringing the facts into existence. In railroad practice, time, space and matter cannot be made to assume these relations, whatever we may think of Einstein's theory of relativity.

It is needless to say that the attitude of the railroad executive was heartily opposed to this assumption of power, both in letter and in spirit. Mr. Adams went on further in his remarks to say:

I do not know whether what I have said was consciously recognized by the members of the Interstate Commerce Commission when they framed the order under which the operating accounts were promulgated.

Happily, the commission took much the same view of the matter as was taken by the railroad executives and sought to use its powers in the regulation of the carriers rather than in the management of their business. Notwithstanding this, much harm was done, and still to too great an extent the attitude of individual members of the staff of the Commission is in this direction.

It is of the very first importance, if I rightly apprehend the situation, that we, every one, set ourselves resolutely to work to put all these matters in their right relation; and I, myself, think few things are more important, looking to the improvement of railroad practice and the success of the transportation interests from the standpoint both of the public and the owners. As a means to this end, I believe every opportunity should be taken to bring the officers into personal contact—on inspection trips, at staff meetings, at the meetings of the technical organizations—in short, wherever opportunity offers. Much more important than this is the avoidance wherever possible of letter-writing and the substitution thereof of the warmth and sympathy of personal explanation. It might quite well be that this would have the appearance of adding to the work of people already over-taxed, but I am satisfied it would shortly have the effect of materially reducing the volume of the work. Whether this were so or not, it would be, in my opinion, the most effective way of correcting the conditions to which I have alluded.

It is inevitable that with the continued growth of the volume and complexity of the business, the work of the auditor should grow in authority, influence and usefulness.

We who are in a position to influence this growth should be foresighted, diligent and patient in working out the details and fitting them into place, and especially in encouraging and forming those personal relations that will so powerfully aid in their final success.

## Some Criticisms and Suggestions

By B. H. Meyer

Member, Interstate Commerce Commission

There never has been a time when the profession which you represent has been more vital to the transportation interests of the country than at present. Without your work the proper conduct of the railroad business from a company standpoint and the performance of the duties of regulatory bodies would be impossible.

New accounts have been set up and old ones modified to meet new requirements of law and of practical operation.

Changes are not always welcome. The decisive test whether or not to make a change lies in the public interest connected with it. The decision, however, can not be made solely from the standpoint of the apparent public interest, because there are a good many things which public interest in a certain sense might seem to require but which do not promise sufficient public and private benefit to warrant the expenditure of the sums necessary to put the proposed changes into operation. To a large extent public and private benefit from improved accounts and statistics coincide. Where the public interest is clearly controlling even the absence of private benefit in the narrower sense of the word may not stand in the way of doing that which the larger public interest requires. There are many interesting things which accounts and the statistics based thereon could readily furnish; but interest alone is not an adequate test. There must exist a dominant public consideration for the requirement. From my official standpoint, changes in accounting and statistical requirements find their justification in the necessities of the proper administration of the laws with the execution of which the Interstate Commerce Commission has been charged by Congress. We have sometimes been requested to require the compilation of statistics thought to be useful to cities and other political units in government, as well as private commercial bodies. Personally, I should not feel justified in extending accounting and statistical requirements of railroads into such fields until Congress has specifically authorized us to do so.

## Comparability Lost by Changes

An objection that has frequently been raised against the making of changes in railroad accounts and statistics is that comparability will be destroyed. Comparability has been destroyed or made more difficult as a result of certain changes which have heretofore been made in the form of accounts and statistics, and in the period of time for which they are made. This is a loss which could not be avoided. Comparability is not an end in itself. Public necessity is. Comparability should be preserved to the fullest extent possible, but the mere fact that proposed changes will make comparability more difficult or impossible should not weigh heavily against changes which public interest and efficient company management may require.

Public interest dominated the original formulation and subsequent elaboration of the uniform system of accounts. The principles which these accounts exemplify will in all probability be incorporated in the accounts which may be required in the near future by statute of what are now essentially unregulated private industries. The same considerations which gave rise to public regulation of railroads will usher in an epoch of public regulation of hitherto essentially private industries in certain of the respects in which private industry has not heretofore been regulated. I do not expect this development of public regulation to cover the entire field of industry at once. It will probably begin with relatively few large basal industries, in which the public element has become dominant and the names of which lie in everybody's mind who has had to deal with railroads during the last decade. I believe when that time comes it will be found that the work you have done and the experience which you have accumulated will provide a foundation and a guide in the initial steps of control of price of the products in question. The consolidation authorized by the transportation act may promote this movement.

## The Separation of Expenses

When the time comes that general reductions in rates may be seriously considered, one question which will again present itself, and which demands an intelligent answer is whether such reductions as may be warranted shall be made horizontally, covering all traffic, or whether certain commodities or

classes of traffic shall take precedence over others in the downward trend. When we were considering the rate increases of 1920 in Ex Parte 74 this question was presented to us. During the earlier stages of that proceeding it had been suggested that passenger fares, for instance, should not be increased at all, and that the entire burden of providing the increased revenues should fall upon the freight business. That was before the wage awards of the summer of 1920 had been announced. Such figures as were then available indicated that the passenger traffic was at that time yielding a somewhat higher rate of return than the freight traffic. On that state of fact I should have opposed any increase in passenger fares. Until Congress directs otherwise, I shall be unwilling through my official acts to cause passengers to travel substantially at the expense of those who ship freight, or freight transported at the expense of people who travel. Within practicable limits each branch of the business should carry its fair share of the total burden.

Those of you who were members of the joint committees of 1907 will remember that at that time I tried in every way possible to incorporate into the then proposed uniform accounts the basis for this fundamental principle. Happily, we shall soon be in a position where basic data will be available, in fact to a limited extent they are now available, which will enable those charged with that responsibility to say within practicable limits what the rates of return on the passenger and freight services respectively are and should be. It is not for any one except the individual citizen to say who shall and who shall not travel; and yet the contrary would result were some of the views suggested in the record in Ex Parte 74 to prevail. Some seemed to think that no travel except their own was really necessary. The encouragement or discouragement of traveling is a matter of public policy respecting which Congress has not specifically legislated, except to a limited extent, and within the scope of such legislative action we must perform our duties. In the performance of these duties the accounts relating to the separation of expenses between the different branches of the business are indispensable, as they are likewise fundamental for a more detailed development of what is generally discussed under the caption of cost accounting and efficiency.

### The Severest Professional Tests

In the administration of section 210 of the transportation act which provides the so-called revolving loan fund of three hundred millions of dollars, we have given much consideration to the earning capacity and probable earnings of the applicant carriers. One of the findings which we are required to make as a prerequisite for the making of a loan is that the applicant has furnished reasonable assurance of its ability to repay the loan within the time fixed therefor. In making up statements of probable earnings, the temptation may present itself to overstate past earnings and estimates of future earnings; and the more doubtful the case the greater perhaps the temptation. On the other hand, when increases in rates are asked for, a temptation in the opposite direction to overstate expenses and underestimate the revenues may be met. Accounts covering the guaranty period present their own inherent difficulties and invitations to be adaptable and elastic in the interpretation of rules and regulations are not wanting. Situations of this kind subject accountants and statisticians to the severest professional test. The strictest conformity to established accounting rules and regulations must be insisted upon as a matter of public right, professional ethics and personal honor and self respect.

In the thought that you would like to know what peculiarities and defects are noted by those in our organization in whom the multitude of currents from the many outside offices which you represent concentrate, I asked our three Directors of Finance, Accounts and Statistics, respectively,

to note those matters which it might be mutually helpful for me to bring to your attention on this occasion. Before I enumerate the matters mentioned by them, I may remark that, generally speaking, the same character of errors, variations and departures is discoverable in all examinations whether made with reference to section 204, 209 or 20 of the interstate commerce act. As might be expected, the large carriers with greater division of labor, higher specialization and ability to command first-class talent keep their accounts in the best form while the small lines where one man often represents several departments, if not the whole road, encounter the greatest difficulties. However, we have found roads in all classes that have seriously handicapped themselves and us because of the condition of their accounts, in making partial payments, for instance, or final settlements under the most urgent financial needs. Please remember that the law requires us to make determinations, not estimates or guesses. We have made every effort to act with promptness but it is impossible for us to be prompt if we lack vital accounting and statistical information without which we cannot lawfully act.

### Accounting Shortcomings That Are

#### Found by Bureau of Accounts

Director Wylie at my request has kindly enumerated the most common accounting shortcomings disclosed in connection with the work in his bureau (Accounts). Among them are the following:

[Commissioner Meyer discussed in detail each of the following points mentioned, but lack of space prevents the inclusion here of his complete remarks.]

1. Improper credits to revenue account 142, Rents of buildings and other property.
2. Improper apportionment of depreciation in accounting for retirement of equipment.
3. Improper distribution of expenditures incurred in making betterments to equipment and fixed improvements.
4. Improper accounting in connection with facilities not used by accounting carrier jointly with one or more other carriers.
5. Improper accounting in connection with property retired and replaced.
6. Improper entries to profit and loss accounts with respect to items of delayed operating revenues, operating expenses and other income items.

### Bureau of Statistics

From Director Lorenz I learn that in spite of the development of adding and computing machines the Bureau of Statistics is compelled to conduct voluminous correspondence with carriers regarding simple clerical errors. The following are among the most frequent of correspondence connected with annual reports:

1. Errors in addition, computing statistical averages, and inconsistency between related entries in various schedules of the report form.
2. Omission of returns in supporting schedules provided for showing detail of entries to certain primary accounts.
3. Improper entries due largely to misinterpretation of texts of the accounts.
4. Failure to complete schedules through omission of data for certain columns, totals, etc.

In our monthly report section, the causes of frequent correspondence have been noted as follows:

1. Changes are frequently made in the monthly figures of revenues or expenses after the report has been filed without noting that fact in the next report. This causes difficulty in making the cumulative figures balance with the preceding months.
2. In connection with the equipment and joint facility accounts, frequent clerical and typographical errors occur as a result of the confusion of net debit and credit balances.
3. There is not apparently a careful check of the consistency of the return before it is mailed. If train-miles exceed locomotive miles, or if revenue ton-miles exceed the

revenue and non-revenue combined, some explanation is called for.

4. We often find that an average for a cumulative period is given as the sum of the averages of the preceding months, instead of being computed for the period. In general, in connection with averages, it may be suggested that a rough check can be made by inspection to see whether the average for the current cumulative period falls between that for the current month and the previous cumulative period.

5. In giving the tons and cost of fuel charged to account 394, care is not always taken to make the tonnage and cost comparable.

### Bureau of Finance

Since March 1, 1920, I have been intimately connected with financial matters arising under the transportation act. Our Bureau of Finance is the primary workshop in which all such matters are examined and shaped in the first instance. Many suggestions of an accounting nature have come to my colleagues and me from the multitude of problems which have been presented to us. I have relied upon Director Colston to select those which are among the most worthy to be brought to your attention on this occasion. They are as follows:

#### Aggregate Value of Railway Property

1. The classifications of investment in road and equipment and of general balance sheet accounts should be so modified or so observed and enforced that the book cost at least of "the aggregate value of the railway property \* \* \* held for and used in the service of transportation" may be readily ascertained. Increased importance is attached to such a requirement not only by the provisions of section 15a with respect to rate fixing and with respect to recapture of excess income, but also by the authority given to the Commission for the regulation of securities under section 20a of the Interstate Commerce Act. The real purpose of any system of accounts being to reflect as nearly as possible the essential facts of a business, the accounts of carriers should show as far as possible:

(a) The facts as to the property upon which either separately or as part of a whole a return is to be allowed, and

(b) The facts of the property as compared with securities supported by an outstanding against that property, distributed between properties held for and used in the service of transportation and properties not so held or used. While it is true that the general instructions governing the classification of investment in road and equipment provide that the accounts prescribed in the classification are designed to show the investment of the carrier in property devoted to transportation service, these accounts, either because of failure to observe this general accounting principle or because of customary interpretation of the term "investment" do not reflect the value of the railway property held for and used in the service of transportation. Specifically, it is quite doubtful and because of the condition of accounts up to 1907, it may be impossible for the accounts of many carriers to distinguish between the Investment in Road and Equipment and Miscellaneous Physical Property, account 705, as they should. Account 706, Investments in Affiliated Companies, in many cases does not adequately reflect the property held for and used in the service of transportation and represented by this account. For example, where a majority of the stock of subsidiaries is held by an operating company, and these subsidiaries are leased to the controlling line, the total value of the railway property held for and used in the service of transportation by the operating company is not always reflected in its account. Some roads include the real cost of road and equipment of the leased line in the accounts of the operating line, but others do not. On the other hand, the account Investments in Affiliated Companies may represent large values of the affiliated companies not devoted to the service of transportation, as in the case of subsidiaries owning coal mines or other non-railway property. If in such cases the total of the account, Investments in Affiliated Companies, is used to measure against the requirements of section 15a, or of section 20a, the result would be an overstatement of the capital account upon which earnings may be demanded or against which securities may properly be issued. Consideration might well be given to the question as to whether or not there should be an account intermediate between account 701, Investment in Road and Equipment, and account 702, Improvements on Leased Railway Property, which would show the investment by the lessor company in road and equipment of leased railway property; and if with the leased railway property control of property similar to that embraced by account 705, Miscellaneous Physical Property, were obtained, a subdivision of account 705 might appropriately be provided for.

#### A Suggestion as to Rent for Leased Lines

2. In view of the preceding suggestion it may be well to invite consideration of the question as to whether or not the obligations of long term leases should be set up on the balance sheet just as the obligations of bonds and other securities are now represented. We have carried into our system of accounts the fallacy frequently held with respect to the obligation represented by a bond, to the effect that the face value of the instrument only need be considered. The obligation to pay the annuity is in the case of a long term bond of very much greater importance than the obligation to pay the principal amount at maturity. In this connection it may be asked if it would not be well to divide or subdivide account 753, Funded Debt Unamortized, according to the rate of interest borne by the obligations, and to provide a further account wherein the obligation to pay rents on long term leases would be represented on the liability side of the balance sheet

either by capitalizing the amount of rent at the rate indicated in the lease or otherwise at the rate fixed as a reasonable rate under the provisions of section 15a, with appropriate adjustments on the asset side of the balance sheet for amounts of capitalized values, if any, in excess of the real values of the properties leased. If it be thought unwise to carry any such amounts in the outside columns of the balance sheet it might be well, nevertheless, to show them in the inside or short columns. A direct application of the principle involved may be noted in a recent case in which the applicant stressed the fact that it had practically no bonded debt and consequently no fixed charge bearing debt, but admitted that rents due upon its leased roads were practically the same as interest payments on funded debt. If one company buys a property and issues against that property 100-year, 6 per cent bonds for the full purchase price, the result is substantially the same as that affecting the transactions of another company which should lease the same property or similar property for 100 years at 6 per cent on the estimated value or purchase price.

### Depreciation

3. Consideration might be given to a change in the practice of showing accrued depreciation on the liability side of the balance sheet. It might be better to show it, as I understand is a practice with telephone companies, as deductions from the investment accounts in respect of which the depreciation accrued.

4. As a matter of temporary but considerable interest your attention may be invited to the fact that in respect of the adjustments of railway operating income in the administration of sections 204 and 209 of the transportation act we are required to eliminate improper charges to income, but we are not authorized to supply or increase charges not properly reflected on the carrier's books, and therefore carriers should understand that in making adjustments under sections 204 and 209, the operating accounts and other operating expenses or for any other account against income can be allowed unless they actually appear on the carrier's books of account in accordance with our accounting regulations.

5. Your hearty co-operation is requested to secure a proper classification of items of ways and structures subject to depreciation in order that scientific bases of rates may be promulgated for application thereto in view of the provisions of section 15a of the Interstate Commerce Act.

### Job Costs for Repairs

6. Serious consideration of the matter of maintenance accounts is requested with the view not only of classifying the expenditures, but also of ascertaining job costs for various classes of repairs. Such classifications in the past, through control and guaranty periods would have resulted in great help in solving present problems under the transportation act.

7. The Bureau of Finance thinks some consideration should be given as to whether or not maintenance of way and structure account No. 272, "Removing snow, ice and sand," should be classified as a transportation account similar to account No. 415, "Clearing wrecks."

8. When an order is issued under paragraph (18) of section 1 of the Interstate Commerce Act, authorizing the construction of a new line or the extension of an old line, and under paragraph (18) of section 15a retention of earnings is authorized for a period of years, the operating accounts should be so kept that the separate results of the new line or extension can be shown for the purpose of returns under section 15a.

9. In giving effect to section 209 of the Transportation Act, when any primary accounts other than those for maintenance of way and structures and maintenance of equipment during the guaranty period appear to be disproportionate, carriers should prepare statistics to show that such accounts, under the circumstances, are not disproportionate or unreasonable.

In confining my remarks, as I have, to accounting matters with which you are constantly dealing, I have had in view mutual helpfulness between the offices you represent and the three bureaus through which our related activities are administered. I am persuaded that we can save one another much trouble and expense through a more complete understanding of our respective needs and requirements. What I have brought to your attention has been put forward solely from that standpoint and I know that you will receive and consider it from the same point of view.

### The Ground Covered by the Meeting

The association conducted its meeting this year in a new way which proved very successful. The organization has a comparatively small number of standing committees, the more important of which are the Executive Committee and those dealing with general accounts, freight accounts, passenger accounts and disbursements. These committees each consider a large number of subjects, and considerable use is made of sub-committees. The committee reports are prepared in detail and are submitted to the association membership in an agenda, published about a month or six weeks prior to the annual meeting. The agenda this year contained 500 pages. The reports of the committees on freight accounts and on passenger accounts each covered over 120 pages and each over 70 subjects. The annual meeting's opening session was on the morning of June 8. The business of the meeting, however, was begun on June 7 in the form of

meetings of several committees to which all members of the association were invited that they might have opportunity to discuss with the committee any points that were not clear. In case, as a result of the committee meeting, the committee found it desirable to change or enlarge upon its recommendations, its findings were made known in supplements to the agenda made up in mimeograph form and presented to all members of the association present. On the floor of the convention, discussion of the committee's report was conducted with the committee chairman on the platform, committee members being called upon to explain points concerning which there might be question. The committee report was not read in the manner usual of the railroad conventions; only those sections of it were covered in detail concerning which there might be discussion. These details are given to explain how it is that reports covering so much ground could be treated in a manner permitting adequate and satisfactory discussion.

The report of the meeting which follows is of necessity brief.

## Report of the Executive Committee

*Making R. A. O. A. Interline Accounting Recommendations Mandatory.* Under the conditions now and heretofore prevailing, the rules of the Railway Accounting Officers' Association relating to interline accounting—that is, accounting transactions affecting two or more carriers—are, in fact, only recommendatory and have no binding effect beyond the merits of the recommendations.

It is worthy of note that the association's interline accounting recommendations have been generally adopted, on their merits, and are generally in effect on all, or substantially all, carriers.

According to the results of a canvass made a few years ago, the deviations from the R. A. O. A. interline recommendations, by individual roads, were trivial in number and inconsequential in effect. Those deviations are usually attributed to individual opinion or some local condition.

The principle is well recognized that carriers should account, in a uniform manner, for their interline transactions. Uniformity in this respect promotes fairness, fosters impartiality, and is necessary in the interest of the efficient and economical conduct of accounting among carriers. Uniform, standard rules—impartially applied—constitute an integral part of inter-road accounting.

Certainly, those conditions cannot be perpetuated which make it possible for a carrier to deviate from an interline rule according to the whim of the moment or according to its interest in the individual case, while under other circumstances the same carrier may insist on making a literal application of the same rule, when its interests lie in that direction.

If "the greatest good for the greatest number" is to be effective, it is hardly to be conceived that conditions can prevail which warrant a carrier sending to other carriers statements or reports of a size and arrangement that do not conform to a generally accepted standard. Reports, statements, or other interline forms—if lacking uniformity of size and standardization of arrangement—are the source of additional labor and inconvenience in filing and using such reports, statements, or other interline forms, by carriers receiving them.

So far as the executive committee has been able to ascertain, representative members of the Association believe that some of the interline R. A. O. A. recommendations and some of the standard forms devised by this association can and should be made mandatory and binding upon carriers. Other rules and standard forms probably should not be made mandatory and binding at this time, although the future may indicate that more progress can be made. The initial steps

in this direction will not attain perfection and will not represent any fixed or unalterable procedure for the future. The endeavor now is to make a start, and future efforts can be devoted to alteration, expansion, or intensive development, as experience may show to be wise and necessary.

The enforcement of mandatory rules in this connection need not cause us to pause very long. The professional pride of railway accounting officers will undoubtedly be sufficient incentive for them, individually, to enforce such rules. A penalty is not regarded as necessary, beyond bringing the failure to observe any particular rule to the attention of the chief accounting officer of the road at fault.

Any reasonable plans for mandatory rules would take cognizance of the latitude essential for progress and the incentive necessary for development of interline accounting. In other words, mandatory rules must not be so rigid and must not be so absolutely comprehensive as to exclude further progress and development.

This whole subject of mandatory rules for interline accounting, by direction of the executive committee, has been placed before the Committees on Freight, Passenger and Disbursement Accounts, and those committees will submit to the association, in their reports, appropriate detailed recommendations.

This subject refers only to interline freight, passenger and disbursement accounting. The subject has no connection whatever, with local accounting matters. In other words, it does not, in any way, relate to recommendations of the association regarding accounting local to one road or recommendations that partake purely of either an informative or co-operative nature. This subject does not refer, in any way, to freight overcharge claims, as the R. A. O. A. already has in effect mandatory rules for overcharge claims.

Your executive committee recommends to the association that it adopt and prescribe, as far as practicable, mandatory rules with respect to interline accounting for freight, passenger and disbursement transactions.

*Committee on Valuation Accounting.* Your executive committee recommends that the association create, for the ensuing year, a special committee on valuation accounting, consisting of nine members.

*Honorary Membership for Frank Nay.* Your executive committee unanimously recommends that honorary membership be extended to Frank Nay, who resigned as vice-president and comptroller of the Chicago, Rock Island & Pacific, effective February 1, 1921, to become comptroller of the Allied Chemical & Dye Corporation of New York.

To the Railway Accounting Officers' Association, Mr. Nay is, and has been, the source of inspiring and encouraging the loftiest ideals for the science and profession of railway accounting and for the association.

He has served this association as president, and has a long and honorable record of service on various committees of the association.

*Membership Changes.* During the current year your committee has admitted into the association 115 new members.

As of April 23, 1921, the Railway Accounting Officers' Association has 968 active members, representing 329,144 miles of railroad, also certain express companies and water carriers—an increase (as compared with April 21, 1920,) of 85 active members.

The association is now carrying the names of 25 persons on its honorary rolls.

*Creation of Committee on Statistics.* This recommendation was one of those submitted in a supplement to the agenda.

Heretofore the work of the association has been confined largely in the direction of uniform accounting, particularly with the settlement of accounts between carriers. During the year progress has been made in the matter of uniform

methods. All this, however, is within the well defined jurisdiction of the accounting department, whereas recent events have clearly demonstrated that if we are to maintain our present favorable position in the railroad organization we cannot work and live entirely within ourselves. During the past year, the president of the Railway Accounting Officers' Association has, on several occasions, been called upon to nominate members of the association to serve on committees to consider various matters in which the accounting department was largely interested but for which it could not be expected to assume full responsibility of final determination.

To accomplish the most satisfactory results, the association should be so organized that any subject in which the accounting department may be interested can be referred to a standing committee, which, acting as a whole or through a subcommittee, could consider such subjects with members of committees representing other departments, and thus secure reports on the results of such joint findings.

Your committee recommends that there be created for the ensuing year, a special committee on statistics, consisting of nine members, which would study and report on statistics of the nature necessary and useful to the carriers, but not involving returns required by governmental authorities. It is considered that subjects incident to the reports to be made to the Interstate Commerce Commission, etc., should continue to be handled through the Committee on General Accounts.

The secretary has been directed by your committee to submit an appropriate amendment to the constitution, for action at the 1922 convention, providing for the Committee on Statistics as a standing committee of the association.

Such a Committee on Statistics would undoubtedly be very helpful in forming a point of contact for the accounting officers with the other departments or organizations in railway service, that are intimately concerned with statistics.

*Creation of Committee for Conference with Railway Treasurers' Association.* The Association of Railway Executives has rescinded its previous action and has continued the Society of Railway Financial Officers, whose name will probably be changed to Railway Treasurers' Association.

Your Executive Committee recommends the creation of a committee for conference with the Railway Treasurers' Association, consisting of five members. Such a committee should be a special committee for the ensuing year, and the Secretary will submit an appropriate amendment to the Constitution, for action at the 1922 convention, making the conference committee a standing committee of our association.

The report is signed by J. G. Drew, president of the association.

## Report of Committee on General Accounts

*Material Accounting.* There was placed before your committee a report prepared by the Committee on Disbursement Accounts of the Railway Accounting Officers' Association on this subject. Your Committee on General Accounts approves the principle that accounting for material should be under the supervision of the accounting department.

*Depreciation Charges.* The committee submits as information a report of the Depreciation Committee of the Presidents' Conference Committee on Valuation, giving suggestions as to depreciation accounts and the rates of depreciation on various classes of railroad property. The committee was formed to co-operate with the Interstate Commerce Commission with reference to the provision of the transportation act requiring the commission to prescribe rates of depreciation, etc.

*Definition of Short Term Notes.* The committee has approved a proposed order of the Interstate Commerce Commission as to modifications in the classifications of income, profit and loss and several balance sheet accounts for steam roads, covering the treatment of short term notes, defined in the

transportation act as notes having a maturity date in two years or less from date of issue. Short term notes were previously defined in the classifications as notes having a maturity of one year or less.

*Accounting Procedure for Surcharge on Pullman Fares.* Announcement was made that the work of checking Pullman surcharge accounting had been put by the Association of Railway Executives in the hands of the Express Central Accounting Committee, a body created by the Executives' Association, and of which A. D. McDonald, vice-president and comptroller, So. Pac., is chairman. The Committee is now organizing a bureau in charge of George W. Lamb, general auditor of the Auditing Bureau, New York.

*Settlement of Balances Due by Canadian Roads.* The Canadian authorities have instituted a plan of surcharge on current freight and passenger business, which will make it possible for the Canadian carriers to settle balances on current interline freight and passenger business in United States funds, without the necessity of any specific arrangement therefor.

All other balances, accounts, bills, etc., for services rendered or applying on business accruing on and after April 1, 1921, between Canadian and United States carriers shall be settled in United States funds. This arrangement shall be continued for at least ninety days.

The Interstate Commerce Commission has been asked for a ruling as to the so-called "back business" which would permit the carriers to effect the best possible settlement for accounts, bills, etc., accruing in connection with Canadian carriers prior to April 1, 1921. This was considered necessary in view of the commission's order making it illegal for carriers to accept settlements in depreciated currency, and the refusal of certain large Canadian carriers to settle in United States funds for this "Back Business."

The question also came up as to shipments from Canada for export through United States ports, it being explained that the railway traffic officers had made an arrangement which would permit such ports to compete with Montreal.

*Suburban Passenger Miles and Passenger Revenue.* Reference is made to the following communication from Dr. M. O. Lorenz, director of the Bureau of Statistics, I. C. C.:

At the present time the reports of passenger-miles and passenger revenue of steam roads cover all classes of passenger traffic. It has been suggested that the suburban business could be segregated without much additional labor. Such segregation seems to me desirable in view of the fact that the average revenue per passenger-mile from suburban travel is far below that of the regular passenger travel. I should be glad if you would refer this proposal to the proper committee for comment.

The committee understands that the commission will call for this information, confining it to "commutation" business as distinguished from "suburban."

*Equalization Accounts.* The committee included in its report, as given in the agenda, proposed text of accounts as suggested by the Interstate Commerce Commission, but discussion of the subject was omitted, as it is understood that the commission's suggested text has since been changed.

Subject: Compilation of Ton-Mile Figures.

This subject was covered in the agenda. The following was given in a supplement thereto:

The sub-committee handling this subject submitted the following report, which was accepted by the committee on general accounts:

The subcommittee, appointed to consider and report back to the members of the committee at its next meeting on the subject of the desirability of a uniform method of compilation of ton mile figures on Forms OS-A, OS-D and other reports of the Interstate Commerce Commission, is of the opinion that in order to bring about uniformity in reporting net ton miles (Item 10 on Form OS-A), the data should be computed from conductors' wheel reports for the following reasons:

(a) The data shown on Form OS-A relates to the actual movement of traffic during the month for which report is rendered and is related to the effort expended in transportation without reference to the revenues received, in that sense being solely an operating statement of traffic moved during the month.

(b) Neither the net ton miles nor gross ton miles actually moved during

the month can be correctly compiled from any reports usually made by Class I carriers other than wheel reports.

(c) It is assumed by your subcommittee that when reference is made to net ton mile statistics being computed from waybills the computation is made from either the monthly freight forwarded reports or received reports, according to the carrier's method of auditing its accounts; and not from actual individual waybills on which the date of movement of the traffic over various sections of the carrier's line would be stamped. On this assumption it is evident that the ton mile statistics of a large majority of Class I railroads would not represent the actual movement of traffic during the month as the calculation would be on the theory that tonnage reported either as received or forwarded from the first to the last day of the month would have either been forwarded from or delivered to stations during the same period. To illustrate—if a railroad audited its accounts on a received basis the calculation would be based on the theory that a shipment received at destination on the first day of the month was forwarded from the originating station on the same day; and so far as its interline accounts are concerned, it would be the assumption that it was forwarded by the connecting carrier on the same day. For this reason your subcommittee feels it is important that all carriers compile and report to the Interstate Commerce Commission the net ton mile figures on a uniform basis, because it is clear that compilation from waybills overlaps that from wheel reports. It is the recommendation of this subcommittee that in order to obtain the uniformity in calculating the ton mile figures required by Form OS-A, the following methods be used:

A. For carload freight the actual weight of lading be used in compiling net ton miles. Where impracticable to obtain the total actual weight of L. C. L. merchandise, estimated weights may be used as follows: (a) On through cars, 7 net tons per car or such other net tons as tests and experience of different carriers indicate is a correct average tonnage to use; (b) on peddler cars unloaded by trainmen, 6 net tons per car of such other net tons as tests and experience of different carriers indicate is a correct average tonnage to use.

B. In determining gross tons there should be added to the net tons as determined above, the stenciled weight of cars.

Your subcommittee recommends, if the compilations as outlined above are made at Division or outside offices, that for the sake of insuring approximate correctness, periodical checks be made to avoid errors of consequence.

The data required by Form OS-D, Item 4, has no reference to that required by Form OS-A, Item 10, and in order that it may be correctly compiled it must of necessity be calculated from waybills for the reasons outlined in paragraph (c) above. Your subcommittee is, however, of the opinion that in the absence of the substantial additional work required in order that absolute correctness may be obtained in determining the net revenue ton miles corresponding with the freight revenue each month, that approximate correctness can be obtained in calculating Item 4 on Form OS-D by using the ton miles ascertained as outlined above for Item 10 on Form OS-A, deducting therefrom the number of tons of company freight carried one mile, the calculation being made either direct from notations on wheel reports or from waybills or other records of actual movements in trains.

It is the opinion of the subcommittee that, covering a period, the method recommended herein will result in approximately as correct statistics of the movement of revenue freight and revenue per ton mile as though the compilation had been made from waybills and as in practically every case where a particular rate is under consideration special statistics are necessary, the method recommended herein would result in uniformly correct statistical matter at a minimum cost and is preferable to different methods of compiling the ton-one-mile statistics.

It should be understood that the recommendation made by this subcommittee refers entirely to the method of compiling statistics required by the Interstate Commerce Commission.

**Settlement by Terminal Carriers with Intermediate Carrier.**  
This subject was discussed in supplements to the agenda.

Whereas, during the past several months agreed balances, particularly freight traffic balances, have not been paid promptly, resulting in much embarrassment on the part of creditor roads, which were unable to meet their obligations due to the failure of debtor roads to pay on the dates specified. It is, therefore,

Resolved, That it is the sense of this Association that the attention of the Railway Executives' Association be called to the necessity of providing such measures as will be appropriate to end such practice.

The committee recommends that the following suggestions be embodied in letter transmitting the resolution, if adopted:

It has been suggested that unpaid traffic and other balances should bear interest from the first of the month following the date when such balances are declared to be due by the rules of this Association, or that perhaps a high rate in the nature of a penalty should be applied. The objections to the adoption of such method are that debtor roads would construe such a rule as sanctioning the withholding of payments provided that they pay interest, and that further, it would offer a temptation to debtor roads to delay rendering reports, or even to withhold the inclusion of waybills, so as to minimize the amounts on which they would be withholding payment and paying interest (or penalty). For these reasons the adoption of a penalty was thought, perhaps, not to be the means of accomplishing the desired purpose.

The Railway Executives may wish, however, to consider the expediency of the adoption of a plan involving the payment of interest or a penalty.

In any event, suitable action should be had as will impress upon debtor carriers that they hold the moneys representing traffic balances only as trustees, and that unless carriers are freely in position to pay such balances as and when payable

under the rules of this Association; that such carriers shall at once take steps to segregate in cash in their own treasuries as collected, or remitted by Agents, such sums as will enable them promptly to meet traffic balances when due.

**Reports Furnished Commission.** E. M. Thomas, comptroller, C. & O., has been made chairman of a sub-committee to investigate this subject and to compile data showing the numbered reports which carriers are required to furnish the various commissions.

The report is signed by A. D. McDonald, vice-president and comptroller, Southern Pacific.

## Report of Committee on Freight Accounts

**Revenue Accounting, Forwarding Basis vs. Receiving Basis.**—The committee in its original report drew up some detailed recommendations on this subject, but finally decided to hold the matter over for another year.

**Special Form of Waybill Covering Perishable Freight.**  
Your Committee submits herewith a special form of waybill to be used in waybilling perishable freight.

Your Committee understands that the roads generally, use some special form, or attach to the regular waybill stickers to designate preference movement, and it is the sense of your Committee that the adoption of the standard form, by all carriers, would result in uniformity, and eventually all employees handling such waybills would become familiar with the fact that they cover perishable shipments and require preference movement.

**Safeguarding the Revenue of Intermediate Carriers.** Your Committee is of the opinion that in principle there is no difference between the safeguarding of the revenue of intermediate carriers and that of waybilling carriers.

Your Committee therefore recommends that a check be made by the intermediate carrier to insure the reporting of waybills in interline accounts and that the distribution of the revenue be verified with the same care that is accorded the verification of other revenues accruing from interline traffic.

The following plan is recommended:

A passing report, R. A. O. A. Standard Form No. 119, to be made at the passing off junction station, except that when it is not practicable to prepare this report at the passing off junction station on account of there being no stoppage in transit on the lines of intermediate carrier, the report should be made by special arrangement between carriers at transfer point, breakbulk station, or elsewhere.

However, the intermediate carrier may make a passing report at the coming on junction station if necessary to safeguard its revenue. Where individual carriers require a passing report at coming on junction stations such carriers may obtain a copy of the passing off report from connecting carriers or make necessary arrangement for its compilation.

The preparation of this report on the basis of the passing off junction will permit of the exchange of these passing reports and materially reduce the expense of both junction agents preparing passing reports on the same traffic.

**Showing Code Numbers on Interline Forms.** Your Committee recommends that all interline forms interchanged between carriers, hereafter printed, show thereon the code number assigned each road for that purpose in "Waybill Code" circular, issued by the Secretary, under date of November 24, 1920, and supplements thereto.

The code number should appear in the same size and style of type used for the name of the railroad. A small space to the left of the railroad name should be allowed so that the code number will show conspicuously; for example:

900. North & South Railway Co.

The purpose in assigning numbers to the carriers in this connection is to establish a uniform code and eliminate the labor of coding by those carriers that need this information

in using mechanical devices for auditing purposes. The code number of the carrier issuing the forms, when printed as indicated, will tend to eliminate errors that might otherwise be made by code clerks.

The code number is especially desirable to facilitate waybill sorting which can be done more economically by numbers than by road names.

**Placing Stamps on Back of Waybills.** Your Committee recommends that all yard stamps, and all junction stamps in excess of four, be placed on the back of waybills.

**Revision of R. A. O. A. Standard Form No. 98, Freight Waybill.** Your Committee recommends that R. A. O. A. Standard Form No. 98—Freight Waybill, as shown in the R. A. O. A. 1920 Synopsis be cancelled and the form, as per sample herewith, be adopted.

**Two-Figure Per Cent Divisions, Interline Waybill.** This subject vied with that of making R. A. O. A. interline accounting recommendations mandatory as exciting the most discussion of any of the subjects discussed by the Committee on Freight Accounts. The advantages of using two-figure per cent divisions and of interline waybilling were emphasized and attention was drawn to the fact that although the matter of simplified divisions had been discussed by the association for many years, no general action had yet been received. The subject was covered in the original text of the committee's report in the agenda. It was remanded to the committee twice, the final result being the following resolution:

*Whereas*, Interline or through waybilling of freight from point of origin to destination is desirable as an aid in economical and efficient railway transportation; lessens the time required for transporting freight; is helpful in the operation of junction agencies; reduces the number of overcharge claims, and facilitates the investigation of loss and damage, as well as overcharge claims, and

*Whereas*, Experience has demonstrated that without joint through rates and preferably two-figure percentage divisions, the accounting cost incident to interline waybilling is disproportionate, and

*Whereas*, The accounting officers, individually and through the Railway Accounting Officers' Association, have endeavored for a period of more than 33 years, to inaugurate or extend joint through rates and percentage divisions, therefore be it

Resolved, That it is the sense of the Railway Accounting Officers' Association that it is necessary to enlist the aid and direction of the railway executives in this subject, particularly at this time when the substantial economy resulting from interline waybilling and percentage divisions would mean so much to the carriers. To that end it is recommended that the Secretary of the Railway Accounting Officers Association be directed to secure from each carrier an estimate of the annual savings to be accomplished by the adoption of through rates and simplified divisions (two figure per cents), and that the President of the Railway Accounting Officers Association communicate the result to the Association of Railway Executives together with a statement of arguments in favor of simplified divisions and suggesting a constructive program for bringing them about; and be it further

Resolved, That the President of the Railway Accounting Officers Association appoint special committees to deal directly with the freight traffic committees of the several regions in the practical working out of the problem, and that such committees be instructed to present a program to the traffic officers and to urge its adoption; and be it further

Resolved, That as a further means of securing prompt action it is recommended that each chief accounting officer arrange, without delay, for a conference with his chief traffic officer and endeavor to formulate a plan of co-operative effort between accounting and traffic officials for the purpose of arranging for two-figure percentage divisions to be furnished the accounting departments when tariffs are issued, and to reduce to two-figure percentage divisions all existing divisions now on a complicated basis.

**Making R. A. O. A. Interline Accounting Recommendations Mandatory.** In accordance with the policy adopted by the Executive Committee relating to this subject, the Committee on Freight Accounts prepared its recommendations touching certain freight accounting rules and practices. The recommendations as first made up numbered 72 rules, made up in the statement of the provisions which are made mandatory and in the elaborate regulations for arbitration between carriers.

This subject resulted in considerable discussion both in the committee meeting on Tuesday and on the floor of the convention itself. The discussion at the committee meeting centered around the fact that in a number of cases the recommendations of the Committee on Freight Accounts did not agree with those of the Committees on Passenger Accounts and on Disbursements. The Freight Accounts Committee

recommendations required that changes in the rules should require a two-thirds vote, whereas in the case of the recommendations of the other committees only a majority vote was required. Objection was also made to a fee of \$10 to be paid by the carrier drawing attention to an infraction, which provision was not given in the other committee recommendations and to detailed provisions for appeal to the Freight Committee over a decision of the Arbitration Committee. The final action was in favor of making the Freight Committee recommendations uniform with those of the other committees. The proposal to make the R. A. O. A. recommendations mandatory was the subject of heated discussion on the floor of the convention, votes against tabling the matter and against remanding it to the committee for another year being required before the recommendations were finally adopted.

The provision relating to charges in the rules was made to read as follows: "Consideration has been given to various methods of voting on the mandatory rules, and your committee recommends that the adoption of the mandatory rules and future action regarding changes in the rules or additions thereto be taken by the ordinary voting plan."

A brief selection of the rules as finally amended is abstracted as follows. The recommendations which are made mandatory are not new, but have been given in the synopsis for some years.

1. The following rules, relating to interline freight accounting shall be mandatory and binding upon carriers operating in North America that are members of the Railway Accounting Officers' Association, and shall become effective and operative as of January 1, 1922, and shall be applicable to waybills made on and after that date.

2. NAME OF PLAN. Mandatory Plan of Audit Office Interline Freight Settlements.

3. FORMS.
  - 98 Freight Waybill
  - 99 Less than Carload Freight Waybill
  - 100 A stray Freight Waybill
  - 101 Live Stock Waybill
  - 134 Transit Waybill
  - 104 Abstract of Interline Waybills Received (8½ by 11 in.)
  - 109 Abstract of Interline Waybills Received (11 by 8½ in.)
  - 170 Abstract of Interline Waybills Received (8½ by 11 in.)
  - 106 Interline Freight Division Statement.
  - 107 Interline Freight Correction Account.
  - 108 Interline Freight Statement of Differences.
  - 110 Interline Freight Summary.
  - 144 Interline Waybill Tracer.
  - 147 Agent's Waybill Correction.

4. PREPARATION OF WAYBILLS. Waybills shall be prepared by the use of a typewriter, pen and ink, or indelible pencil. If indelible pencil is used, the writing should be set by a press or damp cloth.

5. WAYBILLS TO BE SETTLED. Interline Waybills between such stations and over such lines as have been agreed upon by the carriers interested.

6. COPIES OF WAYBILLS. Copies of Waybills shall not be furnished to destination or intermediate carriers except, that for specific purposes, copies of each individual waybill requested shall be furnished.

7. THE WAYBILL DESTINATION CARRIER SHALL BE responsible for the collection of and accounting for the proper revenues regardless of the final destination of the shipment, and shall promptly issue a waybill correction for each item prepaid or advances corrected, embracing all changes made on the original waybill while enroute or at destination, except that by agreement between carriers, differences in advances and prepaid may be adjusted by "Prepaid Only" waybills.

8. CORRECTION OF WAYBILLS. When an original waybill is corrected by a billing or intermediate agent, the change must be made in ink, showing date, where and by whom made. In such cases, waybill correction should not be issued by billing or intermediate agent. (See Rule No. 7.)

19. ABSTRACTS AND DIVISION STATEMENTS. The waybill destination carrier shall prepare abstracts of all waybills received and reported by receiving agents in the month's account for which settlement is made, showing therefore the amount provided therefor, the per cents, or other bases if divisions, and the apportionment of revenue. Waybills from each station to each station via each junction must be shown separately, each sheet to contain waybills from one station to one station only. By agreement between carriers, the receiving carrier may group a number of receiving stations from one forwarding station. Division statements similarly arranged must also be prepared, showing each carrier's proportion of the joint revenue from each station to each station separately.

20. The settling carrier shall retain original abstracts and division statements, sending first carbon copy to waybilling carrier and legible copies to each intermediate carrier as early as possible but not later than the 18th of the succeeding month.

21. When the settling carrier is unable to forward the abstracts and division statements in time to reach destination on or before the 20th of the month, it shall, upon request, on or before that date, notify carriers interested by telegraph of the amount and respective proportions of the freight revenue and in addition thereto advise the forwarding carrier the amounts of advances and prepaid.

22. STATEMENT OF DIFFERENCES AND CORRECTION ACCOUNTS. Discrepancies discovered by forwarding or intermediate carriers in waybills, abstracts, division statements, or correction accounts shall be taken up for adjustment

with the settling carrier in a statement of differences and if approved shall be embodied in a correction account by the settling carrier, together with discrepancies found in waybills, abstracts, division statements, or correction accounts to which attention may not have been called by any other carrier; provided, however, that corrections in the freight, advances, prepaid or proportions, which collectively amount to a net sum of less than one dollar (\$1.00) shall not be included in statements of differences or correction accounts, except that, if such differences affect the settlement with at least one of the interested carriers, including the settling carrier, to the extent of one dollar (\$1.00) or more adjustment shall be made with all carriers interested. When a correction has been excluded by reason of the minimum rule, and a subsequent correction increases the difference to one dollar (\$1.00) or more, the total difference shall be included in the correction account. (See Rules 39 and 40.) The minimum for correction does not relate to settlements with shippers and consignees, or in any way affect the integrity of the rate.

32. **SUMMARY.** The abstracts, division statements and correction accounts, with the summary as rendered, except as provided in Rule 33, shall constitute the basis of settlement. The summary shall be forwarded by United States or Canadian mail, if it will reach destination before the remainder of the papers.

33. Clerical errors in the summary shall be subject to correction before settlement is made, immediate notice to be given by telegraph.

34. **MANNER OF SETTLEMENT.** The settling carrier shall pay to each intermediate carrier, its proportion of the interline freight revenue, whether the freight charges are prepaid or collect, advances and prepaid to be included in the settlement with the waybill carrier. Settlements shall be made upon balances, which shall be subject to sight draft, on or before the 25th of the succeeding month, except where special arrangements are made between interested carriers.

35. **FUNCTIONS TO ACCEPT AND FORWARD WITHOUT DELAY INTERLINE WAYBILLS FOR SHORT FREIGHT.** Receiving and intermediate carriers shall accept and forward without delay through junctions to destinations, interline waybills for less than carload shipments routed via their lines, when all or a part of the freight checks short, the usual record of shortage at each junction to be noted upon the waybills.

36. **REPORTING WAYBILLS FOR SHORT FREIGHT.** When freight is short at destination, the carrier to be reported, but on request of the despatching carrier, the waybill carrier shall immediately proceed to establish delivery of the freight and failing to do so within sixty (60) days from date of request, adjustment shall be made by claim in accordance with R. A. O. A. Overcharge Claim Rules.

37. **MATCHING WAYBILLS AND FREIGHT AT DESTINATION.** When the destination of short freight is a station on the line of two or more carriers, the agent of each carrier to which the shipment is routed who holds the waybill, shall advise the agents of the other carriers, of the shortage, giving a description of the freight. The other agents should carefully examine their records and warehouses. If the freight is found to be on hand, it shall be turned over to the carrier holding the waybill. If it has been received and delivered, the charges shall be turned over to said carrier. Provided, however, that when a carrier transports an entire shipment which is astray, and the carrier holding the waybill is another carrier, the revenue shall be surrendered to the carrier performing the transportation service. In the event the shipment (5,000 pounds or more) is only a part of a consignment, the remainder thereof having been handled by the carrier holding the revenue waybill, the carrier transporting the astray portion of the shipment shall, on an order from the carrier holding the revenue waybill, effect delivery to the consignee without charges. The revenue on the entire consignment shall be apportioned between the interested carriers on the basis of the weight handled by each. Provided further that when a carrier transports a car containing 1 c. l. astray freight weighing 5,000 pounds or more, the carrier holding the revenue waybills shall surrender them to the carrier performing the transportation service subject to the foregoing provisions of this Rule.

After the collection of charges from consignee by the carrier making delivery of freight received on astray freight waybill, any subsequent adjustment of charges from consignee shall be accomplished by such carrier.

39. **TRACING WAYBILLS IMPROPERLY REPORTED.** The waybill or intermediate carrier shall send to the settling carrier a statement of differences, R. A. O. A. Standard Form No. 108, for each waybill reported, which cannot be located in the records of the carrier to which reported.

40. When the settling carrier finds a waybill has been improperly reported, it shall return the statement of differences showing the correct waybill reference or the month's correction account in which adjustment has been or may be made.

41. **TRACING UNREPORTED WAYBILLS.** After the accounts for the current and two succeeding months have been checked, waybills not reported by destination carriers must be immediately traced for by waybilling and intermediate carriers, a separate tracer, R. A. O. A. Standard Form No. 144, to be used for each waybill. Two copies of the waybill shall accompany the first tracer of waybilling carriers. No copies of waybill shall be required with first tracer of intermediate carriers.

45. **RESPONSIBILITY FOR PROPERLY TRACING FOR UNREPORTED WAYBILLS.** The responsibility for properly accounting for interline waybills rest primarily upon the settling carrier, but the waybilling and intermediate carriers shall share the responsibility to the extent of their revenues, if they do not promptly trace for unreported waybills as provided in Rules 41 to 44 inclusive, and Rules 46 and 47.

49. **PROCEDURE FOR CHANGING THE RULES.** Any member of the Association may take up with the Secretary any specific suggestions for adding to or amending these rules. Such communication shall be referred to the Committee on Freight Accounts for consideration and report to the Association. By a majority vote of the members present and voting, these rules may be amended or altered at any annual meeting of the Association, provided, however, that notice of such proposed amendment or alteration is given to the members in advance.

50. **PROCEDURE IN DISAGREEMENTS.** When any member of this Association disagrees with another member as to the interpretation or application of a mandatory rule, and cannot settle his dispute by ordinary methods, he may submit his case to the Interline Freight Accounting Arbitration Committee for a ruling, and the decision of the majority of the Arbitration Committee shall be binding on the parties involved.

When the decision of the Arbitration Committee has been reached, the

Chairman of the Arbitration Committee shall forward same to the Secretary of the Association, who shall notify all parties interested in the arbitration of the Committee's decision.

The carrier decided against shall within thirty days after receipt of the Arbitration Committee's decision, notify the Secretary of the Association that it has accepted and will abide by the decision, or within the same period, submit the case for reconsideration of the Committee on Freight Accounts as provided in these rules. Failure to so notify the Secretary or submit the case for appeal, shall be considered as refusal to comply with the decision, and the case shall then be handled in the manner provided in Rule 68.

51. **INTERLINE FREIGHT ACCOUNTING ARBITRATION COMMITTEE.** This Committee shall consist of three members directly in charge of freight accounting, one member from the eastern territory, one member from the western territory, and one member from the southern territory. Such Committee shall be appointed by the President after each annual meeting and shall serve until the next annual meeting.

52. **SUBSTITUTE IN CASE OF INTEREST.** If any member of the Interline Freight Accounting Arbitration Committee shall be interested in any question referred to such Committee, or shall for any other reason be unable to serve, the President shall appoint interested members of the Association eligible as substitutes for those interested or unable to serve. If the interest of the President in the specific case is such as to disqualify him for making the appointment, then the appointment of a disinterested member shall be made by the First Vice President, or if the First Vice President be unable to serve for the same or any other reason, then the appointment shall be made by the Second Vice President.

53. **COMPLETING ARBITRATION WORK.** The Interline Freight Accounting Arbitration Committee shall meet on regular days, in addition to its regular term of service, in which to complete the arbitration of such matters as have been submitted to it by the Secretary prior to the annual meeting.

54. **DUTIES OF INTERLINE FREIGHT ACCOUNTING ARBITRATION COMMITTEE.** This Committee shall consider and act upon all matters involving interpretation of the R. A. O. A. mandatory Interline Freight Accounting Rules (except rules governing overcharge and agency relief claims) and involving disputes arising out of the application of such rules.

55. **THE NATURE OF THE INTERLINE FREIGHT ACCOUNTING ARBITRATION COMMITTEE SHALL HAVE NO EQUITY POWERS,** but shall decide upon the evidence contained in the papers. In giving decisions or awards the Arbitrators shall give decision on each and every question submitted and such decision shall be explicit and consistent so that it may be carried out.

56. **NO CAUSE OF ACTION.** When no cause of action lies under the rules, the Interline Freight Accounting Arbitration Committee shall so decide. In such cases, the Interline Freight Accounting Fee shall be charged to the carrier or carriers arbitrating without cause.

57. **STATEMENTS TO BE SUBMITTED.** A comprehensive statement based upon the evidence in the papers shall be made and the points upon which a decision is desired shall be definitely stated. This shall be done over the personal signature of the officer directly in charge of interline freight accounts of the carrier desiring arbitration. All papers shall then be forwarded to the interested carriers for them to attach similar statements. A copy of the letter of transmittal shall be sent to each carrier which handled the file.

66. **PROCEDURE OF COMMITTEE, ETC.** When the foregoing requirements have been complied with (as to which the Secretary of the Association shall be the judge) the Secretary shall attach his acknowledgment of the arbitration fee and forward the papers to a member of the Interline Freight Accounting Arbitration Committee, not the Chairman, who shall render his decision and forward the same to the Secretary, or to any other member of the Arbitration Committee, not the Chairman, who shall render his decision and forward his decision and all papers to the Chairman. The Chairman shall render his decision and forward the decision of the Arbitration Committee, together with all papers, to the Secretary, who shall return all the papers together with the decision rendered by the Arbitration Committee to the carrier from whom he received them originally. Each member of the Arbitration Committee shall send to the Secretary, a carbon of his letter of transmittal to the next member of the Committee. The Secretary shall notify each carrier interested the result of the decision of the Interline Freight Accounting Arbitration Committee.

67. **ARBITRATION FEE; HOW APPOINTED.** The charge for arbitration shall be borne by the carrier or carriers against which the decision is given, and shall be apportioned by the Interline Freight Accounting Arbitration Committee at the time decision is rendered. The adjustment to be made by the bill added to the carrier from whom due.

68. **DECLINING TO COMPLY WITH RULES.** When a member of this Association declines to comply with the decision of the Arbitration Committee, or states in writing that a mandatory rule, not involving a question of interpretation, will not be complied with, the case may be reported to the secretary, who shall notify the chief accounting officers of roads interested of his intention to place the facts before the members of the Association, and failing to receive, within thirty days, advice that this rule will be complied with, shall so arrange.

**STANDARDIZATION OF STATION ACCOUNTING FORMS AND PRACTICES.** Under date of October 6, 1920, J. G. Drew, President, Railway Accounting Officers' Association, wrote Secretary Woodson as follows:

The subject of standardization of station accounting forms and methods offers many opportunities for constructive work that will be of value and assistance to various members of the Association. All railroads have station accounting, and the variations on different roads are largely variations in details. It would be absurd to say that each road's methods or conditions in this connection differed entirely from the methods used by, or the conditions prevailing on, all other railroads. There undoubtedly are and there must be some broad, general principles of station accounting (both as to

forms and methods) that are applicable to all conditions alike. Our problem is to catch those principles, elusive as they may be, and make them captives for all who are now or may hereafter be concerned with station accounting. Such an achievement would be a material contribution to the advancement of railway accounting as a science.

The committee presented to the association 25 suggested forms covering this important phase of accounting. In presenting these forms, it said:

Your Committee, recognizing the scope and importance of this subject as outlined in the foregoing letter, and owing to the amount of work necessary and time required to compile a complete list of station accounting forms and practices, has confined its activity in connection with this subject this year to a study of the principal forms used in station accounting.

The advantages of a daily system of accounting are recognized and have been recommended, and in appreciation of the trend to this system by all carriers, the forms herewith submitted have been primarily predicated on that system. Your Committee has, however, endeavored to allow sufficient elasticity in the forms to enable the advantageous use of them in connection with a monthly system of accounting.

As an aid in its study your Committee secured station accounting forms from various carriers from every section of the country, the best features of which have been embodied in the forms drafted by your Committee.

In devising these forms, due consideration has been given to the individual requirements of the different carriers as reflected in the forms used by those carriers, and it is the opinion of your Committee that the forms herewith submitted are suitable for use at all stations.

Your Committee, therefore, recommends that the Association adopt the forms as submitted, which will have the effect of canceling R. A. O. A. Standard Forms Nos. 112, 114, 123 and 133, as shown in the R. A. O. A. 1920 Synopsis.

Your Committee further recommends that this subject be left with it for further consideration and report.

*Discontinuing the Use of Fractions in Establishing Rates.* The suggestion is made that the traffic departments should be asked to eliminate, as far as reasonably possible, the use of fractions in establishing rates.

"Fractions in rates cause additional labor to the agency forces and in the accounting department; also, fractions increase the possibility of error, and to that extent are the causes of overcharges and undercharges."

*Through Waybilling of Freight.* In the through waybilling of freight from point of origin to final destination, two vital conditions are necessary in order to do so economically, expeditiously, and at the same time protect the revenue of all interested carriers, viz: 1. Through rates, 2. Percentage divisions.

However, to reduce the rebilling of freight en route to a minimum, thus eliminating the possibility of errors, and thereby saving transportation delays, annoyances to patrons from overcharges or undercharges and the adjustments thereof, it is recommended:

1. That freight on which through rates are in effect, but no divisions, be waybilled through instead of rebilled at the junction, to avoid overcharges, on the theory that the ultimate apportioning of revenue between carriers on such traffic can be done more satisfactorily and economically through Audit Offices.

2. That accounting officers continue their efforts to secure the publication of joint through rates and percentage divisions to cover all traffic movements.

3. That we urge the early adoption of a uniform classification, which will more readily permit the publishing of joint rates, especially on inter-territorial traffic. The necessity for

the re-waybilling of freight is primarily caused through failure to publish joint rates.

*Quality of Paper Used for Waybills.* Your committee recommends the use of good quality (not less than 40-pound, 22 in. by 34 in.), manila paper, in printing waybills.

The report is signed by G. E. Bramon, auditor freight accounts, C. B. & Q. chairman.

## Report of Committee on Passenger Accounts

The committee's report covered 72 subjects, the large part of the material given being of a technical nature submitted as information.

*Uniform and Simplified Basis for the Division of Interline Passenger Fares.* The committee presented for discussion the report of a sub-committee suggesting a method of dividing interline passenger fares on a so-called zone rate pro-rate basis. The proposed method was outlined in great detail and the suggestion was made that it should receive careful consideration by the member roads and left with the committee for further consideration and report.

*Card Plan for Recapitulation of Interline Ticket Apportionment.* The committee submitted as information two plans which have been worked out, one by J. F. Mitchell, ticket auditor of the Atchison, Topeka & Santa Fe and the other by J. C. Briggs, auditor passenger accounts, St. Louis-San Francisco.

*Uniform Method for Handling Milk Traffic.* Included in the committee's report was a detailed analysis of the systems of handling milk traffic which are in general use among owners, there being

- (a) The way-bill system of prepaid and collect shipments.
- (b) Ticket system which is distinctly prepaid, and
- (c) Combination of tickets and way-bills.

*Indexing Stations in Official Guide.* Your committee recommends the following for adoption by the association:

WHEREAS, It is found that the "Index of Stations" in the back of the Official Guide does not afford sufficient convenience to interline division clerks and ticket agents in locating stations, be it

Resolved, that this Association recommends that all large carriers publish a station index in connection with their time tables in the Official Guide, and be it

Resolved, That the passenger accountants of such carriers make request on their passenger traffic officials that this be done, and be it further

Resolved, That a copy of this resolution be transmitted by the Secretary to the Association of Passenger Traffic Officers.

*Making R. A. O. A. Interline Accounting Recommendations Mandatory.* With respect to the policy adopted by the executive committee, relating to this subject, the committee on passenger accounts has prepared recommendations, which seem desirable from a passenger accounting standpoint, for action by the association, and which are stated below.

1. The following rules, relating to interline passenger accounting, shall be mandatory and binding upon carriers operating in North America that are members of the Railway Accounting Officers' Association; shall become effective and operative as of January 1, 1922, and shall be applicable only to business originating on and after that date.

2. CORE-CLASSIFICATION AND REMARKS DATA. The following code shall be used in compiling interline reports and correction statements:

DS	Discharged Soldier	WT	Winter Tourist
FS	Furlough	ST	Summer Tourist
Cy	Clergy	Spl	Special Excursion
Ch	Charity	Dvt	Diverted
Emp	Employee	ED	Error in Division
Col	Colonist	EA	Error in Apportionment
Gv	Government	Rd	Redeemed
LG	Land Grant	TT	Ticket Tracer
Exch	Exchange	Cl	Claim for Increased Proportion
HS	Home Seekers	CNE	Coupon Enclosed
AYT	All Year Tourist	UR	Unreported

*Settlements.* Settlements shall be made upon monthly balances, which should be subject to sight draft.

The remaining rules related to dealings among the passenger accounting offices in connection with Labeling Envelopes Containing Reports of Interline Passenger Traffic; Pre-

paid Ticket Orders—Method of Reporting; Exchange Orders; Interchangeable Mileage and Scrip Coupons—Method of Reporting; Correction on Interchangeable Mileage Statements; Baggage Collections—Method of Reporting; Tracing for Unreported Tickets and Baggage Collections.

The rules for arbitration are similar to those recommended by the committee on freight accounts as amended and shown above.

The report is signed by J. C. Briggs, auditor of passenger accounts, St. Louis-San Francisco, chairman.

## Report of Committee on Disbursement Accounts

The chairman, on introducing his report said in part: The work of the disbursement committee for many years was confined to interpreting the accounting classification. Only in recent years has the committee undertaken any work dealing with the standardization of forms and accounting practices. Your committee in its report this year submits some recommendations along these lines, which it believes will be helpful to the carriers. There are many opportunities for constructive efforts in this direction.

*Standard Voucher Register and Voucher Index.* The committee considered this subject, which was left with it at the last annual meeting of the association with the result that four forms are recommended for adoption by the association:

R. A. O. A. standard form No. 211, vouchers audited register.

R. A. O. A. standard form No. 212, vouchers audited condensing sheet.

R. A. O. A. standard form No. 213, vouchers audited register.

R. A. O. A. standard form No. 214, vouchers audited condensing sheet by operating divisions.

*Material Accounting.* There was placed before your committee copy of a committee report, adopted at the June, 1920, meeting of Section VI, Purchases and Stores, American Railroad Association, which report contained a provision that it be submitted to the Railway Accounting Officers' Association.

It is understood that your Committee on General Accounts has recommended that the Association approve the principle that accounting for material should be under the supervision of the accounting department.

Your committee offers the following rules for supervision and accounting for material stocks as recommended good practice, realizing that organization and conditions on different roads may necessarily cause a variation from the rules and practices herein described.

1. **SUPERVISION OF MATERIALS AND SUPPLIES:** All material stocks to be under the general supervision of the Chief of the Stores Department, who should give general supervision to the ordering, receipt, care of and issuance of all materials and supplies, except that such supervision may be exercised over special classes of materials such as fuel, stationery, commissary supplies, etc., by special departments organized for that purpose.

2. Direct supervision shall be exercised by the officer in whose accounts the value of the unapplied material is carried.

3. **ACCOUNTING FOR MATERIALS AND SUPPLIES:** The Chief Accounting Officer shall have general supervision and prescribe the accounting for all material.

4. The officer in whose account the value of the material is carried shall keep such accounts and records, and render such reports to the audit office as prescribed by the Accounting Department.

5. **CLASSIFYING AND PRICING:** A standard material classification should be adopted for use by all railroads and for that purpose the Railway Storekeepers' Association's classification is recommended.

6. A standard price book should be maintained and the material charged out at actual cost, or where not available, at the average or latest price obtainable.

7. **PURCHASE INVOICES:** Purchase invoices having been checked as to price and other contract features by the Purchasing Department will be forwarded to the officer receiving the material to be checked against the received record and verified as to quantity, quality and condition.

8. After verifying extensions, make the following deductions when proper:

Transportation charges in accordance with the terms of delivery.

Credit memorandum received from shipper for the return of empty containers, etc.

Shortages, erroneous shipments, loss and damage or other deductions chargeable to the shipper.

Cash discounts if they are to be deducted from the face of the invoice.

9. Make following additions when proper:

Over shipments.

Errors in weight.

Freight allowances, etc.

10. Show on face of the invoice, class number of material, name or number of material account and month taken into account, invoice then to be taken into account certified as correct and returned to the Purchasing Department or other designated officer for voucher.

11. **TRANSPORTATION CHARGES:** All freight, express and other transportation charges such as switching, drayage, etc., paid by the railroad should be taken into the material accounts under the proper material classification.

12. **MATERIAL TRANSFERS:** Transfer invoices or bills covering material transferred from one stock account to another shall be taken into the receiving account as classified and for the quantities and amount as rendered, after which, they shall be checked against the received record, certified and any differences of overages, shortages (except Loss and Damages in Transit—see Paragraph No. 19) or errors in computation shall be adjusted in the succeeding month by counter or additional transfer invoices or bills.

13. **MATERIAL MANUFACTURED IN COMPANY SHOPS:** Material issued from stock in connection with shop orders for the manufacture of other material or articles, should be transferred from the original classes to the class "Material in course of Manufacture."

14. **MATERIAL RETURNED TO STOCK:** All received second-hand and scrap material should be taken into the material accounts currently on basis of prescribed prices, crediting the appropriate operating expenses or other accounts.

15. **MATERIAL ISSUED:** Material and supplies should be charged out on monthly distributions to Operating Expenses and other accounts as used. Certain items of material, such as lubricants for locomotives, train and station supplies and material for minor equipment repairs, the application of which is locally controlled, may be charged out at the time of issuance, in accordance with the prescribed rules of the Accounting Department. The report for such material will be made to the Accounting Department by the officers in whose material accounts the value of the material is carried.

16. **TRANSFERS:** Materials and supplies transferred from one stock account to another shall be made through the medium of transfer invoices or bills. Loss and damage to current stock, when such material will be classified on the face of the transfer invoice or bill and credited to the material account from which transferred.

17. **MATERIAL IN THE COURSE OF MANUFACTURE:** Charges from shops to the material accounts for labor expended on "Material in course of Manufacture" on shop orders, should be taken into store accounts under the class "Material in course of Manufacture" and accounted for the same as other debits to material accounts. Upon the completion of the order the total cost of the manufactured article should be transferred from class "Material in course of Manufacture" to the proper class of the finished product.

18. **OBsolete MATERIAL:** Obsolete material should be accounted for by charging the account or accounts to which such material should be charged with the difference between the stock values and the amounts received from its sale or at its revaluation as scrap.

19. **LOSS AND DAMAGE TO MATERIAL IN TRANSIT:** Loss and damage to material in transit between stock accounts should be accounted for by the consignee taking into account the transfer invoice or bill and obtaining relief in accordance with existing rules of Freight Claim and Accounting Departments.

20. **LOSS AND DAMAGE TO STOCK MATERIAL:** Disposition of the value of material in stock accounts damaged or destroyed by fire or other causes, should be taken up with the Accounting Department as individual cases, who will issue instructions for the chief of the accounts.

21. **SALES OF MATERIAL:** Sales of materials and supplies to Individual and Companies shall be on the basis of the sale orders from the Purchasing Department and shall be charged direct on the monthly distributions and bills prepared on the basis of the prices and terms of delivery quoted on sale orders.

22. **BALANCE SHEETS:** Balance sheets shall be rendered monthly to the Audit office by each officer having a stock account, which shall show the balance on hand at the first of the month, material received, material released and taken into stock account, freight charges, payroll costs, etc., Total debit, and on the Credit side should show the total issues, sales and transfers to other stock accounts, etc., total credits, and net balance on hand at the close of the month.

23. **CLASSIFIED STATEMENT OF MATERIAL, RECEIVED, ISSUED AND ON HAND:** Monthly classified statements in balance sheets in detail by classification in accordance with Railway Storekeeper's Classification of material shall be rendered showing the amounts on hand as of the first of the month, receipts, transfers, total debits—issues, sales and transfers to other stock accounts—total credits and balance on hand at close of month.

24. **INVENTORIES:** Inventory of material and supplies including scrap should be taken periodically, at such times and in such manner as designated by the Accounting Department.

25. The prices applied to inventories should be the cost price of the material.

*Standard Form for Reporting Cost of Ice and Salt in Connection with Perishable Freight.* The committee recommends the use of a proposed standard form and plan worked up by the National Freight Perishable Committee. The plan is intended to assist the carriers to arrive at a more accurate ascertainment of the costs of ice and other materials entering into the handling of perishable freight.

(The remainder of the report of the accounting officers' meeting will appear in next week's issue.)

# Business Meeting of Purchases and Stores Division

## Material Accounting and Distribution Subject of Several Reports; Moving Pictures of Reclamation

A REPRESENTATIVE gathering of over one hundred officers of the purchasing and stores departments assembled at the Blackstone Hotel, Chicago, June 9, for the opening of the business meeting of the Purchases and Stores Division of the American Railway Association. The meeting was called to order at 10 a. m. by H. C. Pearce, director of purchases and stores of the Chesapeake & Ohio and chairman of the Division.

Following a few brief remarks by Mr. Pearce, R. H. Aishton, president of the American Railway Association, addressed the meeting. Mr. Aishton said in part:

### Address by R. H. Aishton

I think that the text for all meetings and conventions that are being held today, not only in the railroad business but in every other, is economy and conservation. What we are all trying to do in the various sections of the American Railway Association is to develop means of producing economy and conservation that will appeal to the railroads, be adopted by them and result in greater economies.

This matter of economies is very largely in the public eye today. There has been some criticism made of the various sections of the American Railway Association as to lack of effectiveness. In other words, a section or division meets and does most earnest work. The division passes a resolution and prints it in a book and then we wait until the next meeting. When a body like you determines that a thing would be of advantage to the railroad situation, agree also that you will undertake to sell that proposition to the railroads.

There are two matters I want to impress upon you: Clearness in your reports and an absolute declaratory statement. If you believe a thing is good, leave this room with a determination to sell that proposition to your own railroad. A third matter is to let the public know what you are doing, because they do not know today and a great many of our misapprehensions as to the railroad situation arise from a lack of knowledge of what you are doing.

Your chairman asked me before the meeting what I thought about the railroad situation. I am an optimist. It is going to work out. It must work out. There is no question about it. We have solved such problems before and this problem is going to be solved in the same way. The work that you are doing in this division is one of the important factors, in my opinion, that will finally help to solve the problem right.

### Chairman Pearce's Address

It was decided not to hold our regular convention this year due to the financial conditions of the railways and for the further reason that it is the duty of every organization, as well as every individual, to apply himself wholeheartedly to the task of readjustment by applying the most rigid economy both publicly and privately. After weighing all conditions carefully it seemed desirable to eliminate every expenditure we possibly could and at the same time to review the work that has been done during the year and lay out the plans for the coming year. With this object in mind a business meeting was decided on to consist of all members of the General Committee, all chairmen of subcommittees and as many members of the Division as each individual railway considered desirable to have attend. All members of the association will have the full privilege of discussion and participation in our work and we will endeavor to develop plans and recommendations for the coming year so that we may start out with a plan of organization which will carry

on the work effectively and be in a position to hold the regular annual convention of all our members next year as usual.

There has been little real constructive work accomplished by this division during the past year due to many causes. Emerging from federal control March 1, 1920, with organizations more or less disarranged, with the greatest activities known in the industrial world, prices climbing, deliveries practically impossible, federal inventories of every description demanding our attention, there was no time to deliberate or carry on constructive organization. While it is true there was little money allocated to carrying on and developing the work we could not have spared the time to have done the work even if we had had the money available.

At the conclusion of the address of the chairman a communication from W. G. Besler was read expressing regret because of his inability to attend the meeting and offering some suggestions regarding the work of the Division.

The minutes of the last convention were approved as printed and the report of the General Committee was then read. The committee reviewed briefly the reports submitted to the last annual meeting of the American Railway Association and the activities of the committees since the last meeting. The report was approved without discussion.

J. Marshall, special representative of the Freight Claim Division of the American Railway Association, addressed the meeting on freight claim prevention with particular reference to the part which members of the Purchases and Stores Division could play in reducing loss and damage.

### Stores Department Book of Rules

Consideration was given to the book of rules through a questionnaire sent to 41 railroads, as well as in the discussion at former meetings. Suggestions for changes, additions or revisions of any part of the book of rules which the committee believes are worthy of consideration were set forth in detail together with the recommendations of the committee. Several of the recommendations for changes in the rules are made with the purpose of accommodating the rules to some particular type of railway organization, and where such recommendations would affect the fundamental principles of storehouse organization, the committee has declined to recommend their consideration.

Sample forms have been submitted by several railways for requisition blanks, stock books and receiving records, which differ in varying degrees from the forms recommended in the book of rules. The forms recommended were prepared for general adoption and use, and can be modified to suit the special requirements of any particular railway organization.

### SUGGESTED CHANGES

A substitute was proposed for Part 1, Section 1, Paragraph 4, in which the committee did not concur.

*Part 1, Section 1, Paragraph 7.* The general storekeeper shall be responsible for the proper inspection of all fuel, released rail, lumber, piling, ties (track and switch), and all inspectors employed for this purpose should be carried on his payroll and report direct to him.

Objection is made to this paragraph on the ground that the work of inspection of material should be done by an inspection department. The committee does not recommend any change in Paragraph 7. The items covered by Paragraph 7 and for which the general storekeeper is held respon-

sible for the proper inspection, are in nearly all cases inspected on the line of road and can be more economically inspected by the stores department than by the inspectors of an inspection department.

*Paragraph 11.* The addition of a sentence specifying that the stock book be kept was suggested, but the committee considered it unnecessary.

*Paragraph 17.* A rearrangement of this paragraph was suggested which the committee did not approve.

*Paragraph 18.* The storekeepers at the different division points will report to and receive their instructions from the general storekeeper. It is suggested that this paragraph be rewritten: "The storekeepers at the different division points will report to and receive their instructions from such officers as may be designated by the proper official."

The committee does not recommend any change in Paragraph 18 regardless of the type of organization on the particular railroad; no principle in stores department organization is more firmly established than that the division storekeepers should report direct to the general storekeeper.

*Page 51—Section 14.* Pricing and classifying usable, needing repairs and scrap materials. All usable material, whether new or second-hand, should be taken into stock at new value, except rail and ties, or at a fixed percentage of the new value to be set by the general storekeeper. Exceptions may be made to this rule and certain items taken into account at fixed prices established by the general storekeeper, if desired.

It is suggested that for the sake of uniformity some definite rule should be laid down for the guidance of all roads, instead of leaving to the general storekeeper the decision as to what price second-hand, and needing repairs, material should be taken into and carried in stock. It is suggested that a certain percentage of the value of the new material should be stated.

The committee does not recommend any change in section 14 as written, believing that a statement of the general principles under which second-hand and scrap material should be handled is sufficient, leaving to each railroad the matter of prices, which must be governed by conditions which prevail in connection with reclamation work and the use made of second-hand material.

It has been suggested that in connection with the delivery of material along the line of road by supply trains some additional recommendations in the matter of accounting for material on the line of road should be made. Special reference is made to material delivered by supply trains and not intended for immediate use.

The committee recommended that the material be carried in stock until used.

Considerable interest is manifested in the use of stock books in division storehouses and the master book in the general storekeeper's offices, the replies from the various railroads indicating a general use of the stock book as recommended by the Railway Storekeepers' Association and Section 6, with such modifications as seem necessary to meet the requirements of the individual lines.

The report was presented by J. W. Gerber, chairman.

#### DISCUSSION

W. F. Jones, New York Central, in discussing Section 14 stated that the practice of charging out second-hand material at various rates makes comparisons between roads difficult. He advocated the adoption of a definite percentage of the value new. On the Santa Fe and the Burlington second-hand material is taken in hand and charged out at the price of new material. The Southern Pacific uses one-half the price new to provide an incentive for using such material.

D. C. Curtis, Chicago, Milwaukee & St. Paul, described the system of stock books used on that road. The master stock book used at the general store is too cumbersome for

use at smaller points. For outside stores, loose-leaf forms are used, each having the line, page and class shown corresponding to the master stock books.

The rules as amended by the committee's report were adopted and the committee continued.

#### Classification of Material

The committee sent out a questionnaire to which replies were received from 78 roads. It would appear from the replies received that only about one-half of the member roads have adopted and are using this material classification. Of this number about one-half favor it with no changes to suggest, and claim that it is not costing any more to operate than the classification formerly used, and permits of a better analysis of material used.

The committee recommended several additional subclasses and the transfer of items to permit of closer analysis of values carried. These were as follows:

*Class 1c*—Take motor, hand, push, and velocipede cars and parts of same from this class, which includes track tools, track materials and wire fencing, and segregate them in a new group as Class 1d.

*Class 4*—Segregate bridge ties as Class 4a and include lumber, bridge and building, piling and posts as Class 4b.

*Class 5b*—Separate treated from untreated cross ties, designating the former as Class 5b and the latter as Class 5c.

*Class 8*—Segregate new rail from second-hand and scrap rail, designating the former as Class 8a and the latter as Class 8b.

*Class 13b*—This class is created for arch brick for locomotives, removing it from foundry supplies.

*Classes 14 and 15*—Soft metals in bars, pigs or sheets are taken from Class 15, which includes bar iron and steel, etc., and are placed in Class 14, which includes brass, copper and steel tubing, etc.

*Classes 18 and 20*—Car forgings are removed from Class 20, which covers car castings of all kinds, brake beams, couplers, metal bolsters, side frames and metal roofs, and are placed in Class 18.

*Class 36b*—This class is created to cover grain doors, grain and coal door lumber and cooping material for grain and flour cars which are now included in Class 36 with locomotive train and station supplies.

*Class 37a*—This class is proposed to cover locomotive and car lubricants, exclusive of wool waste, in order to segregate them from all oil house material now included in Class 37.

*Class 37b*—Includes all oil house material other than locomotive and car lubricants.

The committee further recommended that before the proposed material classification, if adopted, is issued the entire detail or index be gone over with all member roads interested; any stock items not shown being listed and furnished the committee handling this subject for the coming year; also calling attention to errors in units and descriptions.

The committee further recommended that this work of preparing the proposed classification complete with index be assigned to two or three men selected from various interested roads using same, and that ample time be given to complete the work. It is felt that the regular committee assigned this subject cannot devote the time necessary to revise all the details, in bringing this classification up-to-date. The report was presented by C. H. Rost, chairman.

#### DISCUSSION

With the exception of the changes in Class 37 all of the recommendations of the committee were adopted. During the discussion of the various items considerable difference of opinion was expressed as to the advisability of constantly enlarging the classification. Some of the members are opposed

to a large classification and it was suggested that what was needed was a revision of the classification rather than an enlargement.

The committee was continued and enlarged to enable the appointment of technical sub-committees for handling its future work.

### Material Accounting

This committee had not new material to present, but urged the importance of carrying out the present rules. These were adopted by the former Railway Storekeepers' Association at the 1919 convention and were submitted as part of the committee report at the meeting of the Purchases and Stores Division at Atlantic City in June, 1920. The report was referred to the American Railway Accounting Officers' Association for the information and approval of that body, which has it under consideration.

The report was presented by W. E. Brady, chairman.

### Uniform Accounting

By H. H. Laughton

Assistant to Vice President, Southern Railway

This subject, so frequently discussed but never concluded to the satisfaction of all carriers, during the past year has been actively before the appropriate committee of the Railway Accounting Officers' Association. The following suggestions are largely in line with the recommendations of its disbursing committee.

#### SUPERVISION

Unapplied material, irrespective of location, should be under the direct general supervision of the chief of the stores department, who should have general charge of the ordering, receipt, care and issuance of materials.

#### ACCOUNTING

The chief accounting officer should prescribe the accounting, and through his subordinates should periodically check records, reports, and all local department documents upon which materials and supplies transactions are recorded to see that they are properly kept and that proper distributions of issues are made in obedience to rules of the Interstate Commerce Commission. Accurate accounting can be best secured by having the detail work performed at the local, divisional, or district store, as the actual data can be more accurately obtained at such points than when the accounting is centralized in the general office.

#### CLASSIFICATION

The universal adoption by all carriers of the standard classification as made by the Railway Storekeepers' Association is advised, to the end that proper comparisons may be procured for the benefit of all railroads. There can be no objection to increasing the number of sub-accounts in any given class to meet local requirements of individual carriers.

#### PRICES

The charges for material issued should be made at actual cost, or where that is not available, at the average or latest price obtainable. A standard loose leaf price book should be maintained and kept up-to-date.

#### PURCHASE INVOICES

Accounts payable should be checked as to prices and other contractual features against the original purchase order by the purchasing department and forwarded direct to the officer to whom the material is consigned, who should check each invoice against the receiving record and certify as to quantity, condition, quality, etc. Extensions and calculations should be accurately verified. Deductions, when proper, should be made as follows: Cash discounts when to be taken from invoice; transportation charges according to terms of

delivery; credits from shippers for return of empty containers; erroneous shipments, shortages, loss and damage, or any other deductions which should be charged to shippers.

Additions should, when proper, be made for freight allowances, over shipments, errors in weight or rates, etc.

On the face of the original invoice should be designated the class number of material, name or number of material account, date received and month taken into account. It should be certified as correct and listed to the purchasing department where vouchers should be prepared for settlement.

All freight, express and other transportation charges paid by the carrier should be taken into the appropriate material accounts under the correct classification number.

#### MATERIAL MANUFACTURED IN COMPANY SHOPS

All material issued from stock on shop orders for manufacturing other articles should be transferred from the original classes to the class "material in course of manufacture."

All charges from shops to the material accounts for labor expended on material in course of manufacture are accounted for the same as any charges in the material account. The total cost of the article manufactured should then be transferred to the proper finished product class.

#### RECLAMATION

The operation of all reclaiming plants should be under the supervision of the stores department.

#### MATERIAL ISSUED

Materials and supplies issued for current use should be charged out on monthly distribution reports as designated by the I. C. C. classifications. Reports of issues should be sent direct to the designated representative of the accounting department and copies forwarded to the appropriate officer of the stores department.

#### TRANSFERS

Transfers made on proper authority from one stock account to another should be through the medium of transfer bills, invoices or requisitions, values of materials transferred to be based on current stock prices. Proper classification should be given on the face of the transfer bill. Quantities and values should be taken into the receiving account as classified on such bills. Overages, shortages, or errors in calculations should be adjusted in the succeeding month by contra-bills.

#### MATERIAL RETURNED TO STOCK

All released, new, reclaimed, second-hand and scrap material should be taken currently into the proper material accounts on the basis of prescribed prices, to the credit of the appropriate operating expenses or other accounts.

#### OBSOLETE MATERIAL

When material becomes obsolete it should be immediately considered as scrap and accounted for by charging the proper account to which it would have been charged with the difference between the stock value and the amount of its revaluation as scrap or the amount realized from its sale.

#### SALE OF MATERIAL

Material and supplies sold on authority of the stores department on sale orders from the purchasing department should be covered by collectible bills or sale invoices based on prices, loading, terms of delivery, etc., as specified on sale orders. These bills should be promptly forwarded to the proper officer for audit and collection. The materials and supplies should be charged out of monthly distribution report for the month for which the materials were shipped.

#### LOSS AND DAMAGE

Material lost or damaged in transit between stock accounts should first be taken into account by the consignee, and

relief should immediately be granted either by the freight claim or accounting department. Disposition of the status of material that is carried in stock accounts which is damaged or destroyed by fire, floods or other causes, should at once be reported by individual cases to the accounting or claim departments. Prompt relief to the stock account should be granted therefor.

#### BALANCE SHEETS

There should be rendered to the accounting department by each officer having a stock account a monthly balance sheet, which should show the balances on hand at the first of the month, materials received through purchase, transfers, release and taken into stock account, freight charges, payroll costs, corrections, etc., and the total debit on stock on the credit side. It should show the total issues, sales, transfers to other stock accounts, corrections, etc., total credits, and the net balance at the close of the month.

The accounts should be held open after the end of each month the agreed length of time for taking into that month's balance sheets all obtainable bills payable or transfer invoices received and procurement of requisitions for material issued during the same month. There should also be made each month classified balance sheets in detail in accordance with the Railway Storekeepers' Classification.

#### STOCK BOOKS

In each department there should be kept detailed stock records especially prepared to cover a period of two years' operations. A master stock record should be kept for all stores by the general storekeeper.

#### INVENTORIES

There should be taken periodically on the last day of a designated month, not less than twice a year, a full and complete inventory of all unapplied material, including scrap and obsolete material, wherever located. The prices applied to all inventories should be the cost price of the material as reflected by the records. It is frequently desired to take inventories of certain classes of materials monthly. Materials and supplies in transit between stores at the time inventories are taken should be listed on separate sheets as a special exhibit, to be added to the amount on hand.

Materials and supplies on hand when the inventory is taken and included therein, or which may have been issued prior to taking the inventory and charged out, but for which purchase invoices or bills payable have not been received and taken into account, should be listed on separate sheets as a special exhibit to be deducted from the gross amount of material on hand.

Transportation and other charges which may have been included in the cost of material and charged out prior to the completion of the inventory, or included in the cost prices but not taken into account prior to closing, should be listed on separate sheets as a special exhibit to be deducted from the gross amount of the inventory.

All materials reported on special exhibits should be properly classified on such exhibits and either added or deducted from the appropriate classes of the final summary. The net amount of the inventory should be the basis for starting the balance sheet of the stock account on the first of the month of taking inventory. Adjustment of the overs or shorts, as reflected by comparison of balance sheets and inventories should be made by the accounting department.

#### DISCUSSION

Exception was taken to the recommendation of the author that the inventory be taken twice a year by several members, who objected to the extra expense and considered one adjustment a year as all that is necessary. It was suggested that the use of a price book might be an obstacle in clearing accounts if it is not kept up-to-date, particularly under market conditions when prices are rapidly changing.

### Purchasing Agents' Office Records

The committee (C. E. Walsh, Asst. Pur. Agt., Pennsylvania System, Central Region, chairman) unanimously recommended for use as standard in purchasing agents' offices, Form 12-4, an order form (original) and Form 12-4-a, an office copy of the order form.

The committee had also investigated the fan fold machine for writing orders and "is of the opinion that it should be considered where a large number of orders are issued."

The committee was of the opinion that it is not necessary to recommend any particular form for a requisition record in the purchasing agent's office. It recommended the use of the same order form for lumber and stationery as for other material.

During the year the committee prepared several standard forms for use in connection with the requirements of the Clayton anti-trust act.

The chairman of the committee and Assistant Secretary Farrell had several conferences with representatives of the National Association of Purchasing Agents in connection with its proposed invoice form; the committee recommended that next year special attention be given to this form by the new committee, as it is believed considerable money may be saved by the adoption of a standard form of invoice. It should, of course, be understood that the committee of Division VI should confer with the Railway Accounting Officers' Association and the National Association of Purchasing Agents before making any definite recommendations.

#### DISCUSSION

F. D. Reed, Chicago, Rock Island & Pacific, advocated the use of the uniform invoice. The Rock Island sends its own invoice blank with every order for material. The discussion showed that practically all roads favored the adoption of a standard form and some were already using the one recommended.

H. C. Pearce stated that roads that have not adopted the standard invoice have been deterred from doing so because of the expense involved. The plan proposed by the National Association of Purchasing Agents requires the sellers to provide the standard invoice and should insure its general adoption.

Mr. Pearce recommended that this division confer with the National Association of Purchasing Agents and the Accounting Officers' Association to prepare a standard form of invoice to be furnished by the sellers. The report was accepted and the committee instructed to carry out Mr. Pearce's suggestion.

### Unit Piling for Counting

J. G. Stuart (Gen. Storekeeper, C. B. & Q.,) presented an individual paper on this subject. He said in part:

Proper methods of storing material on shelves and in bins and the proper piling in racks and in piles is a long step forward in making it possible for the stockman to get the correct information as to the amount of material on hand and to get it easier.

What is meant by "piling in units?" Simply this: that when material is being placed in stock a certain number of pieces are designated as a unit and as the material is stored it is separated so that each unit contains the designated number of pieces and each unit is in some way separated from the other units of the same material and stands out alone so that, in counting the stock, the stockman counts the units and not the items. For example: If machine bolts were piled in units of 100 each the stockman would count the units and would not attempt to count the bolts. If the pile contained eight units he would count the units and know he had 800 bolts. In case one of the units should be broken so that there were eight full units and part of the ninth, it would, of course, be necessary to count the number of bolts

in the broken unit to get an accurate count of the pile.

In the same way a great many other items, in fact, practically all items of storehouse material, may be piled in units. Bar iron may be piled in units 50 or 100 bars and separated by a wire or a stripe of paint or by recessing a few bars an inch or two back of the face of the pile. Galvanized, black sheet and light sheet steel when piled flat may have the first sheet in each unit extend an inch beyond the face of the pile, in this way making the separation very distinct. Heavier sheet steel may be piled in the same way or all sheets may be piled flush with the face of the pile and a stripe of paint be put along the edge of the first sheet in each unit to mark the separation between the units. Pipe fittings and other small articles may be separated by sheets of scrap steel or tin or cardboard and have a unit piled on each sheet, or trays may be made and a unit put in each tray and the trays put one above the other. Rope received in coils may have tags attached showing the number of feet originally in the coil and the number of feet still left in the coil. Coiled chain may be handled in the same way or if removed from containers and put in bins, tags or washers may be attached to every 50 or 100 feet so that the first tag out shows the total number of feet still left. Leather and rubber belting and hose, when received in large coils, may be handled the same as rope or chain. Gaskets and other items of which large numbers are carried in stock may be put on strings 50 or 100 if count is required, or in packages containing a certain number of pounds if weight is required.

Unit piling may be followed in any store as the improved appearance of stock will usually justify it, but the real benefit in stock taking is obtained where larger quantities of material are carried.

So far as it is possible, the units of each article should be of such number as is usually issued at one time so that the time ordinarily spent in counting or weighing when the material is issued may be saved. In many cases it will be found possible to change the amount to be issued, especially where material is being transferred between stores, so that complete units may be issued.

Some of the advantages obtained in unit piling are as follows: More accurate information as to quantity on hand: When material is piled in units it eliminates the errors which might naturally creep in when material is being counted and, if errors should be made in count when the units are being piled, the different size of the units will be apparent and make it easy to detect the mistakes. The stockman, in going through his stock, in most cases, will be able to get the amount on hand in from one-half to one-tenth of the time which would be necessary if he had to stop and actually count the items instead of counting the units. By giving a more accurate knowledge of material on hand it enables the stockman to more intelligently place his orders or refrain from placing orders and, in this way, enables the store to give better service. Material piled in units always presents an orderly appearance. While it is possible to pile material orderly without piling in units, it is impossible to pile in units and have it disorderly. It conserves material by making it necessary to take better care of material. It conserves space: Unit piling gets the maximum amount of material in a given space and by keeping the material in units it prevents scattered and small piles.

#### DISCUSSION

U. K. Hall, Union Pacific, spoke on the advantages of unit piling. He stated that where material is not properly piled the storekeepers lack the proper knowledge of the stock on hand and therefore proper piling is reflected in the amount of stock carried. The tray system is used extensively on the Union Pacific and has reduced the time required to take stock fully 50 per cent and has resulted in more accurate records.

Other speakers told of similar results from the introduction of this system.

#### Handling and Distribution of Material to the Users

The committee (W. D. Stokes, Asst. Gen. Storekeeper, Ill. Cen., chairman,) presented a report of which the following is an abstract:

The purchasing agent must purchase the material and deliver it to the railroad for which it was ordered. The general storekeeper must take the material from this point and follow it to the user, recovering, reclaiming and reporting the salvage.

In order satisfactorily to carry out such procedures as are necessary, the first consideration should be given to the location of stocks, it being an essential that they be placed to the best advantage for delivery when and where wanted without causing an excess investment or unnecessary movement. The ideal arrangement would admit of one general store, as this would provide adequate and thorough inspection, test, check and care of materials, which should be located with proper reference to geographical relationship of the territory to be served and also to the sources of supply. It may be necessary, when conditions warrant, to duplicate this idea by the establishment of district and division stores, but there should be no greater investment in the base supplies than is necessary properly to take care of the requirements.

By restricting the number of places where stock is carried, a larger and more general stock can be maintained for the investment, and the opportunity is enhanced for having on hand that which is wanted.

#### STORE DELIVERY OF MATERIAL

*Delivery to Shops*—The shops representing the largest users of classes, if not values of materials, must be first considered. A practical plan is for the stores department to deliver material to the users in the shops, for economic and other reasons; it prevents expenditures for wages to high-priced mechanics, who are frequently used for this purpose. It keeps them at their work, and their machines in operation during a period which otherwise would cause them to be absent securing needed materials. It enables the supervisory forces to keep in closer touch with the progress of the work and the actual needs of the mechanics.

This system ensures accuracy in accounting by reason of requiring that all material orders be revised and the proper description entered thereon by the store delivery supervisor, before they are delivered to the office. It provides the means for obtaining a material order for all material issued. It enables store employees to observe the use of material by coming in personal touch with the men who are actually using it and provides a method by which they can intelligently anticipate and provide for the needs and satisfy themselves that the men will utilize the material as intended. It results in delivering material to points required in less time than other systems now in effect and at a minimum expense. It ensures an opportunity for locating and returning to store stock, materials drawn for use and not applied. It ensures the proper supervision over the manufacture of materials on orders and the return of the finished or repaired products to the store, when completed. It encourages the use of serviceable second-hand and repaired material in lieu of new, and enables by co-operation, to dispose of shop worn material in proper sequence. It prevents inadvertent disarrangement of stock.

*Recommended Methods of Delivery to Shops*—Delivery of material to shops and repair yards should be made by stores department employees with their own forces and facilities, as well as the return to the store of all material manufactured in the shops, and all material not used for the specific purpose for which drawn.

The work must be under the direct charge of a supervising employee fully capable of co-operating with the user to the extent that only what is required will be delivered as actually needed and of a quality approved as suitable and economical for such use.

The patrol box system is recommended, which consists simply in arranging boxes at specified places in and around shops, where material orders shall be placed and gathered on schedule as provided, and checked by proper supervisory forces. It is less expensive to install and will provide more satisfactory and reliable results. The committee carefully considered the feasibility of the use of the telephone and annunciator systems, and also recommends them when feasible.

When installing shop delivery where it has not been previously effective, a careful check should be made prior to so doing, of the exact cost under the old plan for doing the work—in order that the saving effected may be clearly and decisively shown—and such records should be maintained as may be necessary for illustrating the cost from month to month.

#### DELIVERY TO LINE OF ROAD

*Supply Train*—The supply train serves the same purpose for the line that the store delivery does for the shops in precisely the same way. It places the representatives of the stores department in personal contact with the users on the line; it places the storehouse at the disposal of the men on the line that use the material; it establishes the closest and unified relation between the two, which, when coupled with a thorough inspection by the supervisory officers, as it should, furnishes the ideal method of distributing material on the line.

*Rail*—In the handling of rail the plan must be broad enough to take into consideration all conditions. Generally speaking, new rail should be delivered direct to where it is to be used. Second-hand and relaying rail, except assigned rail for other purposes, should be assembled at central points (as few as possible) where it can be reinspected, reclassified, reclaimed and reshipped. We heartily endorse the report of the Rail Committee, known as Subject 14, which was approved at the 1920 Annual Meeting of Division VI, Purchases and Stores.

*Cross and Switch Ties*—Generally speaking, cross ties should be shipped and unloaded direct where they are needed, either from the manufacturers' right-of-way or from the treating plants. In many cases the distribution of cross ties can be carried out advantageously with work trains, and in some cases the work can be done by the supply train. On other roads the supply of ties can be generally provided along the right-of-way. No plan for the distribution of cross ties can be adopted that would be satisfactory to all conditions.

Switch ties should be purchased to specified lengths and shipped to a central yard (where they should be assorted into lengths) from which point they should be distributed as ordered.

*Bridge and Building Lumber*—We are strongly in favor of bridge and building lumber and other materials connected therewith, such as mill-work, hardware, etc., being assembled at as few places as possible, one being preferable, and having all lumber, mill-work, hardware, and other materials assembled and shipped complete direct to the work. This plan does not prevent heavy material like steel girders, stringers, piling, brick, cement, etc., being shipped direct from the sellers, but the fundamental principle of having the material assembled so that all is available and can be forwarded to the work, and the users notified so that forces must not be sent out before material is available, is sound and should be adopted as standard practice.

#### EMERGENCY STOCK

We recognize the necessity of having an emergency stock of bridge and building and track material at certain locations in case of washouts, floods or other disasters. The amount and kind of such stocks must be determined by the local conditions. Such stocks shall be under the control of the division storekeeper and carried in his stock and he shall be responsible for maintaining them according to the authorized list.

*Transfers Between General Store and Division Stores*—The usual method would be in carloads in through freight trains, but recognizing the need of having fast service, it is recommended that a certain number of baggage cars be assigned, operating between the general stores and the various division stores. Where baggage cars for this service are not available, then baggage cars on the regular trains can be used, but special service is recommended.

*Distribution to Roundhouses, Inspection Points and Large Terminals*—The principal inspection points and terminals should be provided for through the division stores, although there are many railroads where this is not practicable and provision can be made from the general store. The reason why it is more desirable to protect these points through the division stores is that the division storekeeper is, and should be, in closer touch with the division officers, and in position to provide, police, control, and therefore be responsible for the requirements, better than any other officer. Generally speaking, this class of material should be delivered via local freights and via baggage cars from the division stores.

#### Minority Report

C. D. Young, general supervisor stores, Pennsylvania System, made a minority report as follows:

*Stores Delivery of Material*—It is my recommendation that a paragraph be inserted under the heading "Stores Delivery of Material" to provide for small articles of little value, but of frequent use, which are disposed of by a large number of charges; the thought being that Working Stock Sections should be provided for such material, these Working Stock Sections to contain only an authorized list of items which might be carried as such. By such an arrangement a reduction is made in the accounting; and the material is convenient to the workmen and does not require attendance of material distributors as provided for under heading "Delivery to Shops." Objection was raised by some of the members, who stated that this was not good stores practice, as it resulted in unauthorized use of material and improper charges. I disagreed with this view, and explained that by having a proper authorized list of those items which should be contained in the Working Stock Sections, the first object was met, and that by proper disposition, in a short period of time, of the items consumed, proper charges could be made from an accounting standpoint. I am still of the opinion that this is good stores practice and had in mind that it should be included in the report under "Recommended Method of Delivery to Shops," as supplemental to the patrol box system which was touched upon, with which system I am thoroughly in accord.

*Delivery to Line of Road*—Under this heading the supply train is recommended; but I feel that the supply train should be supplemented by the use of, and in some cases replaced by, supply cars traveling as a part of local freights or other convenient scheduled train service, and that the report should recognize the desirability, under certain conditions, of operating supply cars as outlined, as well as supply trains.

#### DISCUSSION

The principal discussion centered around the minority report. Some of the speakers did not consider the establishment of emergency stocks as desirable and advocated that material

should be in the hands of the stores department until actually applied. Others stated that emergency stocks were valuable especially in large shops and no disadvantages were noted in handling material in this manner. The majority report of the committee was accepted.

### Moving Pictures of Scrap Reclamation

During Friday afternoon's session a moving picture exhibition illustrating the extent to which reclamation work can be developed was presented by C. H. Hoynville, assistant to general purchasing agent, Atchison, Topeka & Santa Fe. The pictures showed the scope of and the methods employed at the Corwith, Chicago, scrap reclamation plant of the Santa Fe system, which was developed by and is under the jurisdiction of M. J. Collins, general purchasing agent. In connection with the pictures attention was called to the fact that during the Railroad Administration control this reclamation plant was a source of supply of a large amount of material, a quantity of re-rolled iron having been shipped to other roads. A number of other roads also shipped broken and worn material to Corwith, where it was repaired.

The pictures follow the progress of producing re-rolled iron from the receipt of the material at the yards to the stock piles, showing the unloading of the material by cranes, the sorting and classification of material after it has been unloaded, the cutting up and piling of the scrap ready for the furnaces and the rolling process. The pictures also illustrated the repairing of brake beams, cutting worn tires off of truck wheels preparatory to retiring the steel centers, as well as a number of pictures of various classes of reclaimed material.

### Supply Train Operation

It is the recommendation of the committee that the following paragraph be added to the original report of last year:

"In addition to the previous recommendations as to the operation of supply trains, it should be understood that on branches or in territory where conditions do not warrant the operation of a train, the service should be modified and a regular supply car substituted, local supervision to determine the frequency. Such a car should be accompanied by the proper stores officer."

It is recommended that Exhibit A, showing service performed by supply train, be made standard practice where supply train service is inaugurated. (Exhibit A is a form for showing the service performed by the supply train. It lists for each division and each month the value of material picked up or recovered and the total credits, the value of material delivered, the per cent of salvage and the per cent of car days saved.)

It has been demonstrated that the supply train can be operated successfully in congested territory and it is being effectively operated on an eight-track railroad.

One of the important results of the supply train is the reduction of stocks on line; rail, new and second-hand and scrap; switch ties; track fittings; frogs; cattle guards; emergency stocks; charged out stocks; all unapplied material, and scrap. It also results in better care of material, consolidation of all material—joints, tie plates, etc.—on each section at tool houses for monthly inventory and check by supply train.

The supply train makes for good housekeeping on the property. The committee feels that figures should be produced showing comparison on various railroads between the cost of distributing supplies under the former system and with a supply train but it has not been successful in obtaining complete data on this subject.

The operation of the supply train is flexible, so that it can readily be adjusted to meet the requirements of a congested main line division of a branch line with light traffic. As conditions change and demand for material and supplies falls

off, the organization on a supply train can be reduced to one man, if necessary, and the disbursements reduced to such essential items as oil, switch and signal lamp supplies, etc. The saving in the distribution of oil alone by supply train as compared with the old method of distributing by local freight is worth the operation of a supply train regularly each month, and when business is light and purchases restricted there is even greater necessity of knowing what is disbursed along the road and in gathering up surplus.

During the past year we have knowledge of three railroads that have installed supply trains based on the report of this committee approved at our first annual meeting. The committee has in its possession letters commenting upon the efficiency and desirability of the service and of the supply train for the information of anyone desiring to review them.

A. S. McKelligon was chairman of the committee.

### DISCUSSION

The outstanding feature in the discussion of this report was the experience of a number of roads on which the supply train had been adopted during the past year and the success attending its operation as an economy measure during the recent business depression.

On the Northern Pacific its use has met with great success, where it has won the whole-hearted support of operating and maintenance officers. On other roads, because it looks like an additional operating expense, its use has been curtailed and in some cases discontinued. A number of such cases were mentioned, however, where it has again been reinstated after a month or two of experience under the old method of shipment or supply car distribution. Members who have investigated the Southern Pacific's practice as presented before the division at Atlantic City last year endorse all that was said in favor of supply train operation at that time.

The additions to the standard practice adopted last year as recommended by the committee were adopted.

### Reclamation of Material

The committee (W. Davidson, General Storekeeper, Ill. Cen., chairman) has not been able to locate any new process other than covered in previous reports. However, it is noticeable that all railroads are reclaiming very closely. Investigations of scrap being disposed of by sale shows a considerable improvement over previous years. This would indicate that every available piece of material that is eligible for reclaiming is being set aside and worked up. Officers interested should go into this personally, especially at this time, when, with the high cost of material and high price of labor, almost any kind of reclaiming operation is beneficial.

Competent supervision is the most necessary adjunct to successful reclamation. The man to whom the operation of the reclamation plant is entrusted should be one who has been thoroughly trained along these lines. He should be thoroughly familiar with the various classes of material handled on the railroad, so that he can direct this work economically and effectively, eliminating operations from which no profit is derived.

The men who watch the scrap piles should know the values of new materials and at the same time be sufficiently familiar with the various operations necessary to reclaim each class of material that nothing may be salvaged except such material as can be reclaimed with profit.

One of the new features in reclamation, and one which is being developed rapidly, is the welding of materials by the electric or oxy-acetylene process of welding. The success of these processes depends to a great extent on having competent operators, and requires constant personal supervision on the part of the officer in charge to see that proper facilities are provided and a sufficient amount of each class

of work is kept available for reclamation convenient to the operators. It is recommended that attention be paid to facilities for pre-heating, as this important feature at a small cost greatly lessens the cost of welding. These pre-heating furnaces are also of a great deal of value in annealing work after it has been welded, thus preventing fractures from stresses caused by expansion and contraction.

Successful reclamation cannot be carried on without the interest of all concerned, especially the users of the material. Each member should take steps to keep the management of the railroad he represents informed from time to time of the savings made as well as the various processes developed, for by thus stimulating this interest they will not only reflect credit on their organization but will secure the assistance from the heads of other departments which is so necessary to make successful reclamation as a whole.

#### DISCUSSION

The discussion indicated that not many roads are using large rolling mills but a great many roads are equipped with small rolling mills for reducing the size of scrap rounds and flats. The Southern Pacific has carried on extensive reclamation and rolling mill operations for many years, the long distance from the market making these operations particularly advantageous on this road.

The importance of knowing exact costs of reclamation plant operation, including all items of overhead, and checking closely against prices of new materials was emphasized. Several roads are now endeavoring to keep all possible material away from the scrap dock, concentrating on efforts to save all possible reclaimable material at the points of origin.

#### Rules for Carrying Out Section X,

##### Clayton Anti-Trust Act

The committee formally presented a report which has already been issued to all the carriers in circular form under date of November 29, 1920. The plan proposed by the committee recommends that the purchasing officers of each carrier prepare a complete list of the corporations, firms and parties, with whom it is probable it will have dealings aggregating \$50,000 or more during the year, and that these lists be forwarded to the secretary of the carrier by the purchasing agent at frequent intervals during the year with the request that the secretary ascertain from the directors, president, manager, purchasing or selling officer or agent, whether or not

they have any substantial interest in any of the concerns listed, informing the purchasing officer of the facts whenever required by him. A number of forms were submitted by the committee to facilitate carrying out this plan.

H. B. Spencer was chairman of the committee.

#### Other Reports

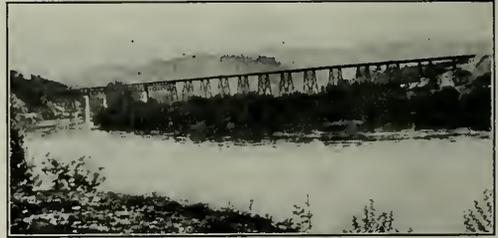

Reports were also presented on Cross-ties—Purchasing, Inspection and Distribution and by the joint committee of the operating, mechanical and purchases and stores divisions on fuel conservation. An abstract of the first of these reports will appear in a later issue.

The report on Lumber—Specifications, Purchasing, Inspection, Storage and Distribution was presented by William Beatty, chairman. An abstract of this paper will be presented in a later issue.

Reports on "Buildings and Structures" and "Scrap Classification—Handling and Sales" were also presented and will be reviewed in next week's issue.

#### Election of Officers

The following officers were elected to serve for the coming year: Chairman, H. E. Ray, Atchison, Topeka & Santa Fe; vice chairman, F. D. Reed, Chicago, Rock Island & Pacific; members of the executive committee: U. K. Hall, Union Pacific; W. A. Hopkins, Missouri Pacific; H. C. Pearce, Chesapeake & Ohio; E. W. Thornley, Baltimore & Ohio; S. B. Wight, New York Central; D. C. Curtis, Chicago, Milwaukee & St. Paul; and E. J. McVeigh, Grand Trunk.

The Virginian's Longest Bridge—the Glen Lyn Bridge, 2,155 Ft. in Length

## The Mechanical Division Meeting Postponed

Word Was Received After Paper Was On Press That  
Meeting Will Be Held June 29-30

UNDER date of June 10 the American Railway Association, Mechanical Division, issued a circular announcing the postponement of the annual meeting which was to have been held at the Drake Hotel, Chicago, on June 15 and 16. Following is text of the circular:

"Owing to present unusual conditions and inability of members to attend the meeting of the Mechanical Division, American Railway Association, called to be held in this city

(Chicago), Wednesday and Thursday, June 15 and 16, 1921, the meeting has been postponed to Wednesday and Thursday, June 29 and 30, 1921.

"The sessions will be held at the Blackstone Hotel, Chicago, instead of at the Drake Hotel, as originally planned. It is suggested that members arrange for their hotel reservations without delay."

The *Railway Age* will publish a complete account of this meeting in its issue of July 1.

ernment all produce conditions that can only be met through intensive economies.

The executive committee of the association and the Board of Engineers believe that co-ordination and joint facility uses can be best secured through the railroads effecting the organization of their groups in the four rate-making territories established by the commission under the Esch-Cummins Act. Failure to produce substantial economies may lead to supplying by taxation part of the costs of railroad operation.

Consolidations of the railroads into a "limited number of railroad systems" is contemplated by the act as a means for economies. In such consolidations "the capital of the consolidated corporations shall not exceed the value of the consolidated properties as determined by the commission."

The valuations now being made by the government will form the basis of value at which the roads will be taken into the "limited number of systems" called for by the act. They will also determine the aggregate value of the roads comprising each group upon which the return from rates is computed. Upon the proper determination of these and other questions depends the value of railroad securities owned by millions of people, very largely represented by this association.

The board will be of material service in the solution of all these problems.

All of the members of the newly appointed board are men of considerable experience in railroad work. Mr. Stevens has served as a vice-president of the Chicago, Rock Island & Pacific and the New York, New Haven & Hartford and as president of the Spokane, Portland & Seattle. He was chief engineer of the Panama Canal and a member of the American railroad commission in Russia during the war. Mr. Wallace was at one time vice-president of the Kansas City, Mexico & Orient and from 1914 until his present appointment has been chairman of the Chicago Railway Terminal Commission. Mr. Darling was for a number of years chief engineer of the Northern Pacific and was also a member of the American railroad mission to Russia. Col. Molitor, Mr. Stillwell and Mr. Colpitts are consulting engineers with considerable experience in dealing with railroad problems.

## Building Material Rates to Stand

WASHINGTON, D. C.

**A**T A SERIES of conferences held in Washington on June 2 and 3, between the traffic executives of important rail carriers and representatives of associations and shippers interested in the movement of sand, gravel, crushed stone, chert, slag, asphalt, tar, paving brick, cement, yellow pine lumber, short-leaf pine, lumber, redwood, fir, hemlock, oak, gum, cottonwood, and other hardwood lumber, logs, building brick, tile, terra cotta, talc, and other building materials, the carriers were urged by representatives of the building tile and building brick interests to reduce the rates on these commodities by eliminating the advance of 40 cents per ton established under General Order 28 and applying the percentage advance under Ex Parte 74 to the rates in force prior to General Order 28. Representatives of other shipping interests asked for a reduction equalling the entire advance authorized by the commission in Ex Parte 74. The tonnage directly affected by these requests approximates 25 per cent of the total tonnage of the railroads.

A statement was issued by the Association of Railway Executives on June 8 announcing that "after a most careful consideration of the situation as presented by the shippers, and of the present and prospective financial conditions of the carriers, the representatives of the carriers concluded that under existing conditions no general reduction in freight rates can be justified or made effective, and that the carriers are in no condition to accept the far-reaching consequences of the reductions requested at these conferences, carriers themselves, by impairing their ability to continue to The carriers, no less than the shippers, are anxious to work towards a lower level of rates, but it is manifest that this result cannot be accomplished until there is such a reduc-

tion in operating costs and increase of business as will restore the proper relation of net to gross earnings.

"It cannot be overlooked that there are many articles analogous to those above mentioned, on which the demand and the equity of reduced rates could be equally as pressing and as great as they are with respect to the commodities mentioned, and it would be difficult, if not impossible, to prevent the inclusion of these analogous articles in any reduction in rates such as is now requested. Thus substantially more than the 25 per cent of the total tonnage of the railroads above mentioned would be either directly or indirectly involved in the requested reductions. The seriousness to the carriers of the proposal is thus evident.

"The conferences developed that, while, in the opinion of various shippers reductions in freight rates would stimulate the movement of these commodities, the fact remained that this was altogether conjecture, and that there was no assurance that any reduction in freight rates would substantially increase the movement of this traffic. It was admitted that reductions in the selling prices of some of the commodities mentioned, far exceeding the present total freight charges, had failed to create any broader markets. It was also clearly brought out that the hope of reductions in freight rates has resulted in hesitancy on the part of consumers and dealers to place orders, and because of this it was urged that carriers promptly announce their conclusion in order that the present uncertainty may be cleared up."

In notifying the shippers of this action, the carriers stated: "No industry in the country is in more acute distress than are the railroads. Many are not earning their operating expenses and taxes, many more are not earning interest charges, and no group of railroads is earning anything approximating the return contemplated by the Transportation Act to enable them to provide the facilities necessary to accommodate the normal commerce of the country.

"Obviously, therefore, the carriers cannot afford to make any general reduction in rates, nor even the reductions that would follow from the acceptance of shippers' proposals.

"The reduction in wages recently authorized by the Labor Board, but not yet realized, is more than offset by the decreased volume of business due to world-wide conditions affecting, generally speaking, all business and all interests. This traffic does not now produce, even under the advanced level of rates, a margin of profit anywhere near sufficient to meet the universally recognized needs of the carriers. It is a fact that the increases allowed by the Interstate Commerce Commission in August, 1920, in response to the provisions of the Transportation Act, are yielding the carriers less by \$622,000,000 than the return contemplated by this Act; there has been no estimate, from any source, that the recent wage reduction will even approximate that figure.

"The carriers are vitally interested in any changes which will produce needed revenue and would be justified in considering reductions could they have any reasonable assurance that the volume of traffic would be augmented sufficiently to increase their net return. However, the arguments presented indicate that even in the minds of the shippers the result of any substantial reduction in rates is purely speculative not only as to increased volume of traffic but also as to the time when an increased volume of traffic may be expected. It should be universally recognized that the carriers are in no condition to enter the field of uncertain experimentation substantially involving their revenues, for the reason that disappointment in the experiment would result in serious consequences to the public, as well as to the furnish needed transportation to the commercial public.

"It must not be overlooked that the carriers have realized that the percentage increases in rates produced inequalities and in many instances threw rates out of line, and to correct these conditions they have been and are diligently adjusting such situations. . . ."

# General News Department

The Missouri, Kansas & Texas has opened an office in the City of Mexico at 24 Avenue Del Cinco De Mayo, in charge of Juan D. Noriega.

The International Railway General Foremen's Association has decided to cancel its 1921 convention which was to have been held September 12, 13, 14 and 15 at the Hotel Sherman, Chicago, owing to the financial stress and serious business conditions.

The first of five Pacific type passenger locomotives now being built in the Reading shops of the Philadelphia & Reading has recently made a trial trip. The four additional engines will be completed and put into service this summer. The engines of this class have a tractive effort of 39,046 lb., and a total weight in working order, exclusive of tender, of 273,600 lb.

The Railroad Training School at Elmira, N. Y., which is fostered by the Erie Railroad, and which teaches telegraphy and all kinds of work required in a small railroad station, now receives women as well as men. Under proper regulations the tuition is free. The age limit for entrants is 17 to 30. The manager is L. J. Baird.

The Pullman shop employees throughout the country, through the system federation, are taking a strike vote to be turned in on June 10. The ballot is being taken because the employees claim the company has not obeyed the decision of the Railroad Labor Board ordering the company to confer with the employees with a view to an agreement on rules and working conditions to take the place of the national agreements.

Preliminary compilations of railway returns for the month of April show a slightly smaller net income than that reported for March. For 196 roads the net operating income was \$25,318,000 as compared with a deficit of \$24,157,000 for April, 1920. The operating revenues were \$411,000,000 as compared with \$381,000,000 last year, while the operating expenses show a reduction; \$359,000,000 as compared with \$381,000,000 last year.

The Senate committee on interstate commerce has decided to hold a hearing on the bill introduced by Senator Cummins to strike out of the valuation act the provision requiring the Interstate Commerce Commission to report the cost of purchase or of condemnation of lands. The committee will allow a short time to W. G. Brantley, representing the railroads, J. E. Benton, representing the state commissions, and a representative of the Interstate Commerce Commission to present their views.

The Interstate Commerce Commission has announced a supplemental tentative valuation of the property of the Chicago, Terre Haute & Southeastern as of June 30, 1916, in which it finds the final value of the property owned and used to be \$20,502,223. This includes \$2,223 for property leased from private parties and \$580,924 on account of working capital and materials and supplies; and the commission reports the present costs of condemnation and damages or of purchase of lands in excess of the present value as \$1,053,557.

The American Foundrymen's Association has postponed the date of its convention and exhibit from October, 1921, to April or May, 1922. This decision does not reflect a lack of confidence in the revival of business in the foundry industry in the near future, for all of the members of the executive committee, at the time of the decision, felt that conditions would be sufficiently improved in the Fall to justify the usual convention and exhibit. It was found, however, that in none

of the eight cities considered was it possible to find, during September or October, adequate hotel accommodation and exhibit facilities. It was therefore deemed advisable to defer the convention till Spring.

H. C. Bixler, for the last three years superintendent of the Manhattan division of the Pennsylvania Railroad, has been appointed transportation engineer for the Port of New York Authority, office at 11 Broadway, New York City. Mr. Bixler was in the service of the Pennsylvania about 33 years, having begun as telegrapher on the Pittsburgh division. In 1891 he was appointed train despatcher and later assistant trainmaster on the Pittsburgh division. In November, 1909, he was appointed trainmaster of the New York Terminal division and was in that position when the passenger terminal at Thirty-third street was organized and opened for business. Two years later he was promoted to be assistant superintendent of the Philadelphia Terminal division, later becoming superintendent of stations and transfers, with authority over the whole road. From that position he was called back, in 1918, as above noted, to New York City. In this position he had charge of the marine department, the freight piers and stations, the Manhattan division having little or no main line territory. Here, as well as in his last position at Philadelphia, Mr. Bixler had occasion to study all kinds of freight terminal problems. He installed tractors and trailers and other machinery on the New York City piers. He was also on a committee of the American Railway Association which made a study of freight handling at important cities throughout the country.

## Superintendents' Association

Owing to the unusual conditions existing on the railways at the present time, the executive committee of the American Association of Railroad Superintendents has deemed it advisable to postpone the 1921 convention which was to have been held in Kansas City, Missouri, on August 24, 25 and 26.

## Grand Trunk Loses Suit

The court of appeals of the District of Columbia on June 5 affirmed the action of the supreme court of the District of Columbia in denying a mandamus asked by the Grand Trunk Western to compel the Secretary of the Treasury to issue a warrant for \$500,000 on a certificate of the Interstate Commerce Commission for a partial payment on account of its guaranty for the six months following the period of federal control. Since this action was instituted, Congress has specifically authorized such partial payments to the railroads in advance of final settlement by the passage of the Winslow bill.

## Progress in Store Door Delivery

The establishment of store door delivery throughout the country for the relief of terminal congestion and for improving transportation is showing some progress. Upon recommendation of the Federal Highway Council a committee representing the shippers and carriers of Baltimore, Md., has been appointed to work out the details for operating such a system in Baltimore. It has already been decided to undertake such a service. The committee appointed consists of A. E. Beck, chairman and representative of the Federal Highway Council and the Merchants and Manufacturers Association of Baltimore; for the shippers: George P. Neilson, superintendent, American Wholesale Corporation; James M. Easter, president, Daniel Miller Company; Walter Halstein, president, Baltimore Transfer Company; and Robert A. Masson, Masson Transfer Company; for the railroads: Pennsylvania—G. M. Smith, superintendent; S. T. Stackpole, division freight agent;

J. S. Corcoran, freight agent, and F. W. B. Humes, superintendent, stations and transfers; Western Maryland—J. M. Allison, freight traffic manager; C. F. Eckhart, agent, and T. E. Withers, manager of warehouses; Baltimore & Ohio—Golden Shumate, freight traffic manager; W. E. Neilson, freight agent, Camden station; M. F. Steinberger, special engineer, operating department, and J. C. Brown, manager, Blue Line Transfer Company.

### John Fritz Medal Goes to France

The John Fritz medal and diploma, the highest honor bestowed by American engineers, has been awarded to Charles Prosper Eugene Schneider, the distinguished French engineer and scientist and head of the great Creusot engineering and steel works of France. The following cable has been sent to his home in Paris:

"John Fritz Medal Board of Award, representing national societies of civil, mining and metallurgical, mechanical and electrical engineers, has awarded you the John Fritz Gold Medal for achievement in metallurgy of iron and steel; for development of ordnance, especially the 75-mm. gun, and for notable patriotic contribution to the winning of the war.

The medal and diploma will be presented to Mr. Schneider by a party of prominent American engineers, led by Ambrose Swasey, chairman of the board of award.

### Operating Statistics for March

The bulletin of operating statistics for the month of March issued by the Interstate Commerce Commission shows that the records in car efficiency made by the railroads last year are not being maintained during the period of depression in traffic. The miles per car day for March averaged 20.9 as compared with 24 in March, 1920; the net tons per loaded car averaged 27.2 as compared with 28.1, and the net ton miles per car day averaged 359 as compared with 487. The number of cars per train averaged 37.4 as against 35.6, but the net tons per train were only 626 as compared with 703 last year. The train speed per car shows an increase from 10.1 miles an hour in March last year to 11.4. While the percentage of unserviceable freight cars shows a considerable increase, the percentage of unserviceable locomotives, on the other hand, shows a decrease from 25.7 last year to 23.1 this year.

### The Burden of Taxation

"Taxation is the greatest burden industry has today," said Paul Shoup, vice-president of the Southern Pacific Company, in a recent address before the California Bankers' Association at San Diego. Mr. Shoup cited the Southern Pacific Company as an example of industry handicapped by high taxation. "The Southern Pacific Company," he said, "had in 1912, before payment of taxes, interest and other fixed charges, or dividends apportioned to California on the accepted basis, \$23,556,970 of its earnings, out of which in the succeeding fiscal year it paid to the State of California on its property devoted to public service, \$2,954,084 in taxes. In 1920, its earnings apportioned to California on the same basis were \$19,364,560, out of which it will have to pay in the succeeding fiscal year under the new tax laws, \$8,167,000. The ability of the company to give service is impaired, and its consequent inability to reduce freight rates and passenger fares in turn has its effect on other industries."

### Black Tom Damage Suits

The United States Supreme Court on June 5 declined to grant a writ of certiorari providing for a review of the decisions of New York and New Jersey courts which held the Lehigh Valley Railroad liable for damages caused in the explosion of munitions at Black Tom Island, New York harbor, in July, 1916.

At Trenton, N. J., on June 7, the Supreme Court of New Jersey, affirming a decision of the county court, decided in favor of the Lehigh Valley in suits brought by the King of England, the Republic of France and the Actna Explosives Company. These suits had been brought for losses due to the explosion, including considerable quantities of munitions which were on barges, and smaller quantities which were in cars on tracks of the Central Railroad of New Jersey, adjacent to the Lehigh Valley dock; and the present decision is

to the effect that the Lehigh Valley is not responsible for these losses, which did not occur on its own premises. In the case of the barges, it is held that they had no business to be at that place at the time of the explosion. Of the sum demanded by France (over one million dollars) about \$122,566 was allowed; and this partial award to France has been made the basis of an appeal by the railroad company to the Court of Errors and Appeal.

### Report on Elimination of Waste

The special committee on the elimination of waste in industry appointed by Herbert Hoover while president of American Engineering Council presented its report at the meeting of the executive board of the council at St. Louis, Mo., on June 3. The report as presented was not accepted as final, but was referred back to the committee for revision. It dealt with housing and building, men's ready made clothing, shoes, metal trades and printing industries and its findings show that "waste results from an interruption of production, low production, restriction of production and lost production," of which "over 50 per cent of the responsibilities for these wastes can be placed at the door of management and less than 25 per cent at the door of labor." The report covers in detail many of the abuses found in all industries both on the side of the managements and on the side of labor while recommendations for elimination of waste and also an outline for governmental assistance were likewise submitted in the report.

### Mr. Ford's Railroad Raises Pay

Henry Ford, president of the Detroit, Toledo & Ironton Railroad (463 miles, 75 locomotives), announces that from July 1 the minimum daily wage rate of six dollars, now prevailing in the Ford factories, will be extended to all employees of the railroad, with bonuses for demonstrated efficiency. Railroad employees will work only six days a week, the same as workmen in other industries. From 6 p. m. Saturday to 6 a. m. Monday not a wheel will move on train or in shop, except the minimum required to move milk trains. "We are trying to put this railroad on a factory basis," said Mr. Ford. "We are going to work the railroad six days a week, with eight-hour shifts, and rest on the seventh day. We believe it will mean better service to the public. . . . In one month, with a reduced revenue of \$100,000, we showed a profit on our operations, where formerly there had been a \$200,000 deficit."

Off-line commercial agencies are to be closed on July 1 and all traffic solicitation will be managed from the general office in Detroit.

### Organization of Technical War Service Officers

In connection with the organization, under the direction of General Pershing, of the reserve armies of the United States, it is proposed to associate informally members of the Army Ordnance Association and the ordnance officers of the Reserve Corps. The membership of the Army Ordnance Association, of which Benedict Crowell is president, is comprised of some 2,400 technical and business experts who, during the war, served either as officers of the Ordnance Department or as executives of industries engaged in ordnance manufacture. For the purpose of offering assistance in the organization of the Reserve Armies and in the solution of local war plans, it is now proposed to form in the metropolitan district of New York, a local organization of the Army Ordnance Association to include as members all ordnance officers of the Officers' Reserve Corps.

There will be a meeting for this purpose at the Engineering Societies' Building, 29 West 39th street, at 8 p. m., Wednesday, June 15. Short addresses will be made by Maj. Gen. C. C. Williams, Chief of Ordnance; Maj. Gen. Robert L. Bullard, Commanding General of Second Corps Area; Brig. Gen. William Weigel, Chief of Staff, Second Corps Area; Col. Samuel G. Shartle, Assistant Chief of Staff, Second Corps Area; Major M. L. Brett, Office of Assistant Secretary of War, and others. All who served as officers in the Ordnance Department during the war, and all who are interested in Ordnance as a factor in preparedness, are invited to attend.

## Freight Station Section—A. R. A.

The first annual session of the freight station section of the American Railway Association will be held at Hotel Sherman, Chicago, on Tuesday, Wednesday and Thursday, June 21, 22 and 23. The call, signed by R. O. Wells, secretary (Chicago), advises members to secure their hotel accommodations direct, without delay, because of general congested conditions. The Pullman Company will, according to its usual custom, refund one-half the sums paid by members on Pullman cars.

The program of topics to be discussed at the meeting is embraced under five heads, namely, Freight Claim Prevention; Operation; Station Settlements; Station Traffic; General. The topics are lettered, as follows:

*Freight claim prevention:* A—Prevention of loss of entire package. B—Affirmative check of l.c.l. merchandise. C—Detection and correction of errors in l.c.l. freight before cars are forwarded. D—Locating concealed losses. E—Pilferage of shoes, hats and drygoods; detection of concealed losses. F—Elimination of various bureaus. G—The inspection bureau. H—Advantages of blind tally checks. I—Distinctive coloring of way-bill blanks for order shipments. J—Bonding of receiving and delivery clerks.

*Operating:* A—Weighing less l.c.l. freight. B—Illegible billings. C—Licensing of public cars.

*Station Settlements:* A—Accounting for interline switching. B—Collections and credits. C—Credits, safe method of handling. D—Forwarding of way-bills overhead for all merchandise cars, excepting local freight. E—Use of card way-bill with car instead of revenue way-bill. F—Interline waybilling. G—Desirability of universal through waybilling.

*Station Traffic:* A—Question of assessing charge for intercepting l.c.l. shipments at point of origin.

*General:* A—Organization of freight station forces in the interest of education and efficiency. B—Relation of freight station to traffic department. C—Warehouse supervision. D—Standardizing freight cars and application of the graduated minimum weight rule.

## Inspection of Cars on the Interborough

The right kind of discipline of car inspectors consists in securing men so fully competent for their duties that they do not have to be disciplined. This would seem to be the lesson of the experience of the Interborough Rapid Transit Company, New York City, as interpreted by Frank Hedley, president of the company. The Interborough runs express trains every day, for hours at a time, at intervals of two minutes or less. In such an exacting traffic a delay of half a minute is liable to be the subject of an inquiry, so that the inspection of the hundreds of passenger cars (motors) in use on these trains constitutes a problem which must be dealt with in the most thoroughgoing fashion.

Mr. Hedley, in a recent address, said:

"You must, of course, have a high standard of inspection and maintenance. We maintain our motors on a mileage basis in connection with lubrication. Our motor cars make 1,200 miles before they are laid up. Then they are taken in, oiled and adjusted, the carbon brushes adjusted, the brakes adjusted, etc., and put in shape for another 1,200 miles. We do not have any terminal inspections at all. After a car runs 1,200 miles the mileage clerk puts it in the yard for inspection. We have a system of indexing all the work there is on that car. When the car comes in it is carded by the shop clerk. And this card has on it a list of every item that has to be examined. Different men are assigned to different things, and before that car goes out that card has to be filled out with the initials and number of every man who inspected his particular part of the work.

"If anything happens to that car out on the road, and it hasn't gone 1,200 miles, we know the very men that should have put it in shape to make it go 1,200 miles. If a man is at fault, he is, of course, disciplined. But we don't administer very much discipline, other than conversation, because after a man has proved himself two or three times to be careless, we can't bother with him any more. We let him go. It is much better to let him go than to suspend him. That only makes a man dissatisfied and more careless. As a result, we run frequently, day in and day out, for thirty days, without developing a single second's interference with the train movement because of defective inspection or defective equipment."

## Traffic News

E. L. Dalton has been appointed traffic manager for the American Radiator Company, with headquarters at Chicago.

A. C. Holmes, traffic manager of the Empire Refineries, Inc., Tulsa, Okla., was appointed president of the Transportation Club of Tulsa at a meeting of the board of governors on May 23, succeeding J. A. Bernier.

Freight rates on vegetables, melons and apples from the Pacific Coast to eastern points are to be reduced, according to an announcement given out on June 6. On vegetables and melons the rate will be \$1.75 per 100 lb. to places east of Chicago and the Mississippi river. On apples, without the storing in transit privilege, the rate, beginning September 1, will be \$1.50 per 100 lb. This last applies to Colorado and practically all points thence east to the Atlantic seaboard.

For the third week in succession the production of soft coal has been practically stationary at approximately 8,000,000 tons, according to the weekly estimate of the Geological Survey, the total for the week ended May 28 being 8,053,000 net tons. The general trend of production continued to parallel closely that of 1919, but was below it. The average daily output for May was the lowest in any May since 1915. Shipments of soft coal from the lower lake ports, however, continued to increase during the last week in May and the total shipments for the season are well ahead of both 1918 and 1920.

Although the proposal of the transcontinental railroads to reduce rates between the Atlantic and Pacific Coast terminals on a large number of commodities especially subject to water competition has not yet reached the Interstate Commerce Commission, the Commission is already being flooded with telegraphic protests, based on the newspaper reports of the intentions of the carriers, from the representatives of the intermediate communities whose rates would not be lowered. The application of the roads for fourth section relief is, therefore, expected to stir up the old controversy over the relation of transcontinental rates.

## Pacific Coast Fruit via Panama Canal

Shippers of perishable commodities from the Pacific Coast have obtained the promise of the United States Shipping Board, through R. M. Semmes, district representative in the West, of facilities for the shipment of greater quantities of Washington, Oregon and California fruits and produce to the Eastern seaboard by water, according to a statement issued in Washington.

The attitude of the board as outlined by Mr. Semmes is to place refrigeration in Shipping Board vessels, if the shippers can assure the board that the business will be a profitable one. Members of the Pacific Coast Producers' Association formed to promote shipments of fruits and vegetables through the Panama Canal, assured Mr. Semmes that all refrigerated space provided would be filled on Eastern voyages. Representatives of the association are said to be negotiating with steamship companies for a rate of 90 cents a box from Pacific to Atlantic ports. Representatives of the fruit growers say that the fruit industry is being strangled by high rail rates and that railroads have refused to give emergency rates, as was done with lumber industry, because growers had not taken advantage of competitive water routes and forced reduction.

## Congress Should Keep Hands Off

The New England Traffic League, composed of leading shippers of New England, in resolutions adopted on June 8, disapproves immediate general reductions of freight rates. The resolutions say:

"Whereas, The New England Traffic League notes a tendency in various sections of the country to call for a general reduction in freight rates and . . . bills have been introduced in Congress calling for a plan of legislation whereby rates would be fixed by Congress; be it

"Resolved, That freight rates are only a small factor in the

present business depression and at this time no general reduction in freight rates can be made effective without serious harm to the carriers; adjustments of individual rates should be handled in an orderly way by application to the carriers or by complaint before the Interstate Commerce Commission as provided by law; . . . it is not for the best interests of the country to have rates made by Congress or to depart from the method of rate making as provided in the Transportation Act of 1920; and . . . the league is opposed to efforts that are being made to obtain a general reduction in freight rates prior to railroad operating costs being reduced. . . ."

### Cattle Raising in Georgia

The Central of Georgia Railway, to promote cattle raising in the territory adjacent to its lines, has encouraged the farmers—one in each county—by joining in the establishment of test pastures for the purpose of demonstrating, to everyone interested, that good results can be obtained in this business in spite of obstacles formerly supposed to be prohibitive; and 46 such pastures have been sown with approved grass seed this year.

Cattle raising has been classed as a risky enterprise in the southern states because of the ravages of the Texas cattle tick, and also because the climate was supposed to be less favorable than that of the northern states; but the Agricultural Department of the railroad company decided to try to overcome the objections—the tick having been practically exterminated—and last autumn announced that it would spend \$100 in co-operation with some farmer in each one of the counties traversed by the railroad's lines; and the offer has been quickly accepted in all of the 46 counties; 12 in Alabama and 34 in Georgia. Each tract has been selected because of its suitability for pasturage, offers of land which is already producing profitable crops being rejected. Three kinds of seed were principally used, and the railroad company bought large quantities of these and sold them to the farmers at cost prices; two tons of Dallis grass, three of Carpet grass and six of Lespedeza (Japan clover), some of the seed going to farmers other than those operating the test pastures.

That beef and milk can be produced in Georgia and Alabama at a good profit has been demonstrated already, as appears from statements published in the railway company's magazine.

### Shippers Ask Reductions in Freight Rates

Representatives of shippers of sand and gravel and other road building materials and also shippers of lumber held conferences at Washington on June 2 with a committee of railroad traffic executives for the purpose of urging reductions in the rates on those materials. Facts were placed before the railroad officers for the purpose of showing that high rates are preventing the movement of those kinds of freight. The lumber men said that the present rates are forcing users of lumber to look to local mills and that the railroads are losing the long haul traffic. No definite reply was given by the railroad men.

An appeal to President Harding to give his assistance in securing reductions in freight rates to "save the California fruit and vegetable growing industry from destruction" was presented to the President on June 1 by all the California members of the House of Representatives. G. W. Luce of the Southern Pacific and W. G. Barnwell of the Atchison, Topeka & Santa Fe, held a conference at Washington on June 3 with Traffic Director Hardie of the Interstate Commerce Commission and Henry J. Ford, special assistant to the commission, who has just concluded a series of conferences with railroad officers and shippers in the West on the subject of fruit and vegetable rates. The information brought out at these conferences was discussed and it was understood that a plan of adjustment involving some reductions in the rates was proposed to be submitted to the various railroads concerned.

Senator Fletcher of Florida on June 1 read in the Senate a telegram from the Florida Citrus Exchange, doubting railway testimony to the effect that the movement of perishables shows increase over last year. "It is indisputable largest percentage Florida's citrus crop in its history was not shipped this last season because price not sufficient to justify expense of shipping. The vital question is not the volume moving but the net result to producers and their ability to continue production. . . . This has been most disastrous season in every citrus area of the United States in which increased freight rates have played the big part."

## Commission and Court News

### Interstate Commerce Commission

The Commission has found not justified proposed new individual and joint minimum rates for less than carload shipments, between eastern points and points in Carolina, south-eastern and southeastern Mississippi Valley territory.

R. H. Countiss has filed a fourth section application with the Interstate Commerce Commission for permission, on behalf of the Southern Pacific and the Santa Fe and their steamship connections at Gulf ports, to make rates on canned goods, dried beans, barley, asphalt, condensed milk, dried fruits and rice from California terminals to New York, low enough to meet the competition of carriers using the Panama canal. Application for fourth section relief on westbound traffic has not been received by the commission. In this application permission is requested to reduce the rate on asphalt from 83.5 to 65 cents; on barley from 74.5 to 65; beans, from \$1.42 and \$1.1255, according to the minimum, to 65; condensed milk from \$1.205 to 65; dried fruits in tight containers from \$1.835 and \$1.665, according to the minimum, to 75; dried fruits in sacks from \$2.165 and \$2, according to the minimum, to 95; and rice, from \$1.00 and 92, according to the minimum, to 65 cents. A large number of requests to be heard in protest against reduced rates westbound, have been received from Spokane, Salt Lake, and Arizona and New Mexico points. No protests have been received against the proposed reduced eastbound rates.

### State Commissions

The Corporation Commission of the state of Oklahoma on May 26 ruled that the railroads of that state should file tariffs before June 10, which will reduce freight charges within the state 35 per cent, passenger rates 20 per cent and Pullman rates 50 per cent. The ruling followed the denial of the plea of the carriers to extend increases granted last September.

### Court News

#### Federal Control Did Not Suspend

#### Hours of Service Act

The Federal District Court for the Western District of Pennsylvania holds that the taking over by the government of the control of the railroads did not suspend the operation of the Hours of Service Act, and a railroad's officers and agents, retained in their positions by the Director General of Railroads, remained subject to the act. In an action against them for permitting employees to remain on duty for a longer period than 16 consecutive hours, it is held that the delay of a train by unavoidable accident is not a license to keep the crew of the train on continuous duty over 16 hours. To excuse such service it must be shown that the officer or agent made at least some effort to avoid excess service. *United States v. Geer*, 268 Fed. 385.

#### Engine Standing Near Crossing Not a

#### Signal of Danger as a Matter of Law

The Circuit Court of Appeals, Fourth Circuit, in a crossing accident case holds that whether a traveler on the highway has duly looked and listened is generally a question for the jury; and a standing engine, that has given no sign of movement, is not such a signal of danger that a court should hold as a matter of law that a traveler must have it under observation every moment as he approaches a public crossing. Not all reasonable men would agree that a reasonably prudent man, seeing an engine standing at rest about 100 feet from the crossing with no sign of movement, might not with a sense of safety undertake to go over the crossing after passing an obstruction of his view of only 25 feet, rely-

ing upon hearing a signal before the movement of the engine. Judgment for plaintiff was affirmed.—*Director General of Railroads v. Zanzinger*, 269 Fed. 552.

#### Federal Taxation Act—Allowance for Depreciation

On the question as to the amount a railroad is entitled to deduct from its gross income for depreciation under the Federal Corporation Tax Act, §38, the Circuit Court of Appeals, Sixth Circuit, holds that the measure of depreciation is the difference in the intrinsic value of the property as a whole at the beginning and end of the year, and that the enhanced value of parts through repairs and replacements should be set off against the depreciation of other parts not repaired or replaced.—*U. S. v. Nashville, Chattanooga & St. Louis*, 269 Fed. 351.

#### Discrimination Not Sufficient Evidence of Damage

The Federal District Court for the District of Massachusetts holds that a finding of the Interstate Commerce Commission that an unjust discrimination has been made by a railroad in making a separate charge against a shipper for switching from the pier used by him, while absorbing such charge from piers used by his competitors, is not sufficient evidence to authorize the recovery of damages by the shipper. The measure of his damages is not the amount of the unjust discrimination, but the amount by which such unjust discrimination has injured him.—*Hillsborough Mills v. Boston & Maine*, 269 Fed. 816.

#### Bill by Stockholders to Enjoin Consolidation of Lake Shore and New York Central Held Insufficient

The Circuit Court of Appeals, Sixth Circuit, holds that a bill to restrain the consolidation of two railroad companies (the Lake Shore and the New York Central) on the general ground that it would be a violation of the Constitution statutes and public policy of the States concerned, filed by the holder of a fraction (one thousandth) of 1 per cent. of the stock of one of the companies, purchased after the consolidation agreement was made, does not state ground for equitable relief where no objection to the consolidation is made by the State authorities, and no allegation is made showing that the complainant would suffer injuries by depreciation of stock. It is also held that section 4 of the Anti-Trust Act limits suits to enjoin violations to those brought by the government, and does not authorize a stockholder to maintain a suit to restrain his corporation from consolidating with another on the ground that it would be an illegal combination under the act.—*General Investment Co. v. L. S. & M. S.*, 269 Fed. 235.

#### Day and Night Telegraph Offices

The Circuit Court of Appeals, First Circuit, reversing 265 Fed. 800, holds, in a case similar to that reported in the *Railway Age* of May 20, page 1188 (*U. S. v. Cornwall & Lebanon*, 268 Fed. 680), that the language of Section 2 of the Hours of Service Act does not exclusively mean stations continuously operated throughout the 24 hours; it includes stations operated at night and by day and may include hours which are part of the day and part of the night. The opinion is a long one. The court says in part: "The words night and day were apparently used in a general sense, and not in the sense that, in and of themselves, the words were to be accepted as arbitrarily decisive of a classification based strictly upon a division between night and day." The offices in question, were Amherst and Arlington, in Massachusetts. The station at Arlington remained open from 5:45 a. m. to 9 p. m.; Amherst from 6 a. m. to 9:06 p. m. The Interstate Commerce Commission, says the court, has interpreted the phrase "continuously operated night and day" as applying to all offices operated during a portion of the day and a portion of the night. \* \* \*

The court cites two Circuit Court of Appeals cases—one in the Fourth Circuit, *U. S. v. A. C. L.*, 211 Fed. 897, and one in the Sixth Circuit, *U. S. v. G. R. & I.*, 224 Fed. 667.—(*U. S. v. B. & M.*, 269 Fed. 89).

#### Extreme Rule as to Care for Passengers Does Not Extend to Trifling Dangers

A passenger in a Pullman chair car, while walking along the aisle to the door after the car had stopped at a station, stumbled over a hassock or footstool which was in the aisle or projected into it, and fell and received an injury for which he sued the Director General of Railroads, alleging that the insufficient lighting of the car co-operated with the careless placing or leaving of the obstacle to constitute actionable negligence. From a verdict and judgment for the defendant the plaintiff appealed, contending that the instructions to the jury did not require from the defendant a sufficiently high degree of care.

The instructions put upon the defendant the duty to exercise ordinary care to see that the aisle was not obstructed by a footstool. The trial court declined to charge that the defendant was bound to exercise the highest degree of care and prudence consistent with the conduct of its business. The stricter rule imposing the more extreme liability is the one which expresses the duty of a common carrier as to all the special perils of transportation. The reason of the rule is that the passenger delivers himself into the custody and control of the carrier, that he is helpless against these perils, and that he is compelled to, and rightly does, rely upon the carrier for protection. The Circuit Court of Appeals, Sixth Circuit, affirming judgment for the defendant, says that the reason of the rule does not extend to those comparatively trifling dangers which the passenger meets while upon a railway car only in the same way and to the same extent as he meets them daily in his home or in his office or on the street, and from which he easily and habitually protects himself. The rule of merely reasonable or ordinary care, to be measured by the circumstances of the case, has been frequently applied under closely analogous circumstances. Such as the falling of a package from the parcel rack; the falling of a car window; a door sill or platform slippery with ice; baggage in the aisle; fingers caught in a door. *Bassell v. Hines*, 269 Fed. 231.

#### Consignee Cannot Escape Payment of Lawful Freight Charges by Contract With Carrier

A railroad as terminal carrier sued a consignee, a commission merchant, for a balance claimed for freight and refrigeration on nine carloads of vegetables and fruit, delivered at Boston during 1911 and 1912. They were shipped in interstate commerce on straight bills of lading, but the consignee had no knowledge of their issuance or terms. When the consignee accepted the cars it paid all charges claimed. The merchandise was sold at once and the net proceeds remitted to the shippers. Later, the railroad company discovered that it had collected less than the lawful rate, and demanded the undercharges. Maintaining that it had accepted the shipments on the understanding that the charges were as reported, and had not agreed to pay more, the consignee refused the demand. Neither party was wholly successful in the courts below (230 Mass. 206). Each obtained a writ of error and a writ of certiorari to the United States Supreme Court. That court says, by Mr. Justice McReynolds:

"Commission merchants often receive from strangers shipments of perishable articles for sale at market prices. The court below held that whether York & Whitney Company impliedly agreed to pay the rates imposed by law was a question of fact to be determined upon consideration of all the circumstances. It accordingly approved a judgment, entered upon a verdict, favorable to that company as to charges upon one carload (No. 280), and in behalf of the railroad for those claimed on account of eight carloads (No. 281).

"We think . . . the liability of York & Whitney Company was a question of law. The transaction between the parties amounted to an assumption by the consignee to pay the only lawful rate it had to pay or the carrier the right to charge. The consignee could not escape the liability imposed by law through any contract with the carrier, either expressed or implied. The judgment in favor of the consignee was reversed and that in favor of the railroad was affirmed.—*N. Y. C. & H. R. v. York & Whitney*. Decided May 16, 1921.

## Foreign Railway News

### New Line in Chihuahua

The Mexican government has signed a contract with a mining company permitting the construction of a railway in the northern part of the Mexican state of Chihuahua, according to advices from Commercial Attache Jackson, Mexico City. The projected line is to run from Candelaria to Lamentos Mountain, a distance of approximately 80 miles.

### French Railway Unions in Quarrel Over Issues

According to Paris dispatches to the New York Times, the organized employees of the French railways are suffering from serious internal dissension resulting from a recent vote of 55,140 to 33,667 in favor of adhering to the doctrines of the communists at Moscow. The executive council of the union is still in the hands of the moderates, however, and the radically inclined members were unsuccessful in their attempt to secure a revision in the personnel of the council. In the general disorder resulting the moderates have withdrawn from the unionists' congress and a schism has resulted which seems at present to have weakened considerably the labor movement on the railways.

### Program of Ninth Congress of the International Railway Association

The ninth congress of the International Railway Association will be held at Rome, Italy, from April 18 to May 1, 1922. The following subjects will be discussed:

*Construction of Roadbed and Track*—by C. H. Ewing, vice-president of the Philadelphia & Reading; K. Alberg, principal engineer of the bureau of roadway construction of the Swedish State Railways; E. F. C. Trench, chief engineer of the London & North Western; M. Henry, associate chief engineer of way and works of the Eastern Railway (France); and M. Candelier, chief engineer of surveys, plant and structures, of the Northern Railway of France.

*Maintenance and Supervision of Track*—by Earl Stimson, chief engineer of maintenance of the Baltimore & Ohio; C. J. Brown, chief engineer of the Great Northern (England); and G. Barbieri, chief of the works division of the Italian State Railways.

*Special Steels*—by W. C. Cushing, engineer of standards of the Pennsylvania; M. Mesnager, professor and director of the test laboratory of the School of Bridges and Highways (France); and M. Sand, vice-president of the directorate general of the Swiss Federal Railways.

*Reinforced Concrete*—by G. A. Haggander, bridge engineer of the Chicago, Burlington & Quincy; W. W. Grierson, chief engineer of the Great Western (England); C. Leemans, engineer of way and works of the Holland Railway; P. M. Buelow, chief of the bureau of engineering of the Danish State Railways; and M. Golard, chief engineer and director of special service and works of the Belgian State Railways.

*Economic Production and Use of Steam by Locomotives*—by G. J. Churchward, chief mechanical engineer of the Great Western (England) and M. Lacoïn, associate chief engineer of motive power and rolling stock of the Orlean Railway (France).

*Trucks, Axles and Locomotive Springs*—by George Hughes, chief mechanical engineer of the Lancashire & Yorkshire (England); E. Minsart, principal engineer of motive power and rolling stock of the Belgian State Railways; and M. Bochet, inspector general of mines (France).

*Passenger Cars*—by W. J. Tollerton, general mechanical superintendent of the Chicago, Rock Island & Pacific; R. W. Reid, carriage and wagon superintendent of the Midland (England); F. de Vargas, chief engineer of motive power and rolling stock of the Northern Railway (Spain); and M. Biard, honorary chief engineer of the Eastern Railway (France).

*Electric Traction*—by George Gibbs, chief engineer of electric traction of the Long Island; J. J. W. van Loenen Martinet, manager of electric traction of the Netherlands State Railways; E. Gerard, honorary secretary general of the Ministry of Railways, Marine, Posts and Telegraphs of Belgium; M. Ofverholm, director

of the electro-technical bureau of the Swedish State Railways; A. Donati, director of the special electrification service of the Italian State Railways; E. Huber, chief engineer of electrification of the Swiss Federal Railways; and M. Sabouret, chief engineer of technical services of the Orleans Railway (France).

*Passenger Terminals*—by A. S. Baldwin, vice-president of the Illinois Central; L. Maccallini, principal inspector of the directorate general of the Italian State Railways.

*Freight Stations*—by H. G. Kelley, president of the Grand Trunk; E. Ehrenfreund, manager of the Italian State Railways in the department of Turin; M. Moutier, assistant manager of operation of the Northern Railway (France).

*Slow Freight Traffic*—by W. H. Williams, vice-president of the Delaware & Hudson; V. U. Lamalle, administrative director of the Belgian State Railways; Sir H. A. Walker, general manager of the London & South Western; and E. Ehrenfreund, manager of the Italian State Railways in the department of Turin.

*Locomotive Cab Signals*—by A. Herdner, honorary chief engineer of motive power and rolling stock of the Midi Railway (France); and F. Villa, chief engineer of works of the Italian State Railways.

*Net Cost, Rates*—by Howard Elliott, chairman of the board of directors of the Northern Pacific; and Henry Gréard, chief operating assistant of the Orleans Railway (France).

*Customs Examination*—Messrs. Jordan and Prudent of the operating department of the Paris, Lyons & Mediterranean.

*Interchange of Rolling Stock*—C. W. Crawford, chairman of the general committee of Division II, Transportation, American Railway Association; M. Charron, associate chief engineer, operating department, of the Midi Railway (France).

*Workmen's Dwellings*—A. F. Banks, president of the Elgin, Joliet & Eastern, and F. Lollì, chief of the works division of the Italian State Railways.

*Cars for Light Railways*—C. Gaviraghi, director of the Haute Valteine Railways (Italy).

*Operation of Light Railways, Working Rules and Regulations*—by F. Level, director of the Local Interest Railways (France).

*Special Methods of Traction on Light Railways*—H. B. Spencer, director of the Division of Purchases of the United States Railroad Administration, and P. Biraghi of the Sicilian Society of Economic Railways.

*Safety Appliances on Light Railways*—by M. Bonnevie, general technical inspector of the Belgian National Society of Local Railways.

### Brazil to Spend \$21,000,000 on Railways

Because of the present transportation crisis throughout Brazil the national congress has authorized the government to construct new railway lines and to improve those already existing, the funds for the work to be secured by the ordinary federal revenue and by additional credit operations, according to Commercial Attache Schurz, at Rio de Janeiro. According to the local press the present expense budget sets aside \$1,092,000 (milreis to dollars at par) for the termination of the construction of the Sao Luiz-Caxias railway; a like amount for the prosecution of the construction on the Central of Piahy; \$928,200 for the Petrofina-Therezina railway; \$291,564 for the Cruz Alta railway; \$346,000 for the Paranapanema-Rio de Peixe lines; a like amount for the Araranga and Urussanga; and \$819,000 for the Mossoro railway. For construction on the Great Western and the Rede Bahiana, bonds of the public debt will be emitted to the amount of the respective contracts.

Besides these expenditures, the budget is said to authorize the following expenses "for the account of credit operations or other extra resources": \$1,092,000 for the San Luiz-Caxias, intended for the large bridge connecting the island of Maranhao to the continent; \$546,000 for the Central of Piahy; \$2,347,800 for the Petrofina railway; \$218,400 for the Cruz Alta; \$5,460,000 for various lines of Rio Grande do Sul and the San Pedro de Alcantara-Uberaba; \$491,400 for the construction of the Central Rio Grande do Norte; \$1,638,000 for a line at Massiaambu, in Santa Catharina; \$2,184,000 for the coal lines of Parana; \$819,000 for the Mossoro railway; and \$1,092,000 for the coal lines in Santa Catharina. The total amount authorized for these projects reaches the sum of \$21,585,564.

The government of the state of Rio Grande do Sul is negotiating in the American market for a loan of \$10,000,000 for railway improvements, according to unconfirmed press dispatches.

## Equipment and Supplies

### Locomotives

THE LIGONIER VALLEY is having repairs made to 2 locomotives at the shops of the Baldwin Locomotive Works.

THE INTERNATIONAL RAILWAY SUPPLY COMPANY, New York, has booked with the American Locomotive Sales Corporation, for account of the Trinidad Government Railways, 6 10-wheel freight locomotives to be constructed at the Montreal plant.

### Freight Cars

THE ILLINOIS CENTRAL is asking for prices on the repair of 1,000 coal cars.

THE MISSOURI PACIFIC is asking for prices on the repair of 2,000 cars.

THE NEW YORK, ONTARIO & WESTERN is having repairs made to 250 box cars.

MITSUI & Co., New York, reported in the *Railway Age* of April 22, as inquiring for 40 air dump cars, for the South Manchurian Railway, has ordered this equipment from the Kilbourne & Jacobs Manufacturing Company. These cars are to be of 20 cu. yd. capacity.

### Iron and Steel

MITSUI & Co., New York, has ordered from the United States Steel Products Company, 550 tons of 60-lb. rail and accessories, for use on the Hanshin Electric Railway, Japan.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, June 23, for 1,000 tons of No. 120 Dudley section open hearth steel rails, plus 5 per cent of second quality rails, with the necessary angle bars.

THE DELAWARE, LACKAWANNA & WESTERN will receive bids until 12 o'clock noon, June 20, for steel bridge in connection with elimination of grade crossing 0.93 mile west of Mountain Lakes, N. J., and also will receive bids for 300 tons of Mayari pig iron, Pennsylvania Steel Company's specification No. 1.

### Miscellaneous

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, June 20, for a minimum of 300,000 gal. and a maximum of 400,000 gal. of asphaltum base fuel oil, with gravity of 18-20 deg. Baume cold test 10 deg.

THE NORFOLK & WESTERN is asking for bids until 12 o'clock noon, June 22, at Roanoke, Va., for parts for electrical apparatus; 400 rods galvanized wire fencing; 24 steel flanged engine truck wheel tires; approximately 45,861 lb. soft steel bars; 116,711 lb. steel plates; 580,302 lb. steel shapes and repairs to electrical apparatus.

### Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company is contemplating additions to its power house at Albuquerque, N. M., to cost approximately \$150,000.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has awarded a contract to the Railway Water & Coal Handling Company, Chicago, for the construction of a new water treating plant at West Liberty, Iowa. This company is also accepting bids for the construction of a coaling station at El Reno, Okla., to replace a structure which burned, and for new coaling stations at Enid, Okla., and McFarland, Kan.

ILLINOIS CENTRAL.—This company, which was noted in the *Railway Age* of May 27 (page 1246), as accepting bids for the construction of a subway over Hawkeye Highway near Earlville, Iowa, has awarded the contract for this work to W. J. Zitterell, Webster City, Iowa, at a cost of approximately \$50,000. The company, which was noted in the same issue of the *Railway Age*, as accepting bids for an extension to its roundhouse at Paducah, Ky., has awarded the contract for this work to the Ellington-Miller Company, Chicago, at a cost of approximately \$15,000. R. L. Frazer, La Center, Ky., has been awarded the contract for improvements to the yards at Paducah, Ky., at a cost of about \$10,000. The Illinois Central has awarded a contract on its Yazoo & Mississippi Valley lines to E. H. Walsh & Company, Memphis, Tenn., for the construction of a brick yardmaster's office at Baton Rouge, La., at a cost of \$12,000.

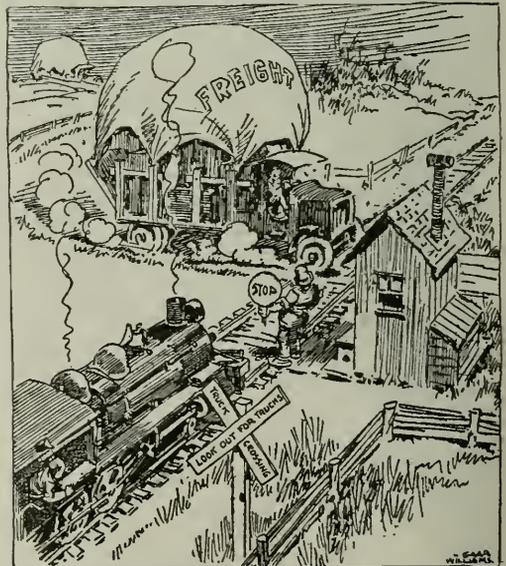

LOUISVILLE & NASHVILLE.—This company has awarded a contract to the Roberts and Schaefer Company, Chicago, for the installation of three N. & W. type mechanical cinder handling plants at Corbin, Kentucky.

MISSOURI PACIFIC.—This company has awarded a contract to Joseph E. Nelson & Sons, Chicago, for the construction of a water station at Bush, Ill., which is estimated to cost between \$40,000 and \$50,000.

SAN ANTONIO & ARANSAS PASS.—This company contemplates the construction of a new passenger station at Taft, Tex.

WABASH.—Correction.—This company, which was noted incorrectly in the *Railway Age* of June 3 (page 1295), as having awarded a contract for the construction of a passenger station at Macon, Mo., to the Unit Construction Company, St. Louis, Mo., has awarded this contract to Joseph E. Nelson & Sons, Chicago.

THE STOP-OVER PRIVILEGE at Philadelphia, which has been suspended for several years, is to be restored. This assurance has been given the Philadelphia Chamber of Commerce by officers of the three railroads. This promise is the culmination of more than a year of constant appeals of Philadelphia business firms claiming that they had lost business because purchasers from cities of the West and South have found it inadvisable to stop in Philadelphia, owing to absence of stop-over privilege on tickets.

From the *Indianapolis News*.

Pretty Soon

## Supply Trade News

Roy G. Owens, vice-president in charge of sales of the Lakewood Engineering Company, Cleveland, Ohio, has resigned.

The Canton Foundry & Machine Company, Canton, Ohio, has removed its New York City office, from the Grand Central Palace, to 45 West Eighteenth street.

The Concrete Mixing & Placing Company has removed its office from 123 West Madison street to 802 Great Northern building, 20 West Jackson boulevard, Chicago.

T. G. Windes, Jr., sales engineer of the Refinite Company at Omaha, Neb., has been appointed sales engineer of the International Filter Company at Chicago, effective June 1.

Ward A. Miller, manager of the wire products division of the Midvale Steel and Ordnance Company at Philadelphia, Pa., has been appointed district manager of sales at the Chicago office of the company, effective June 6.

W. H. Bleecker, Jr., district sales manager at the Chicago office of the Page Steel & Wire Company, New York, has been transferred to the New York office in the same capacity, and E. J. Flood has been appointed district sales manager for all Page products at the Chicago office, 208 South La Salle street, succeeding Mr. Bleecker.

Charles A. Kothe has been appointed mechanical superintendent of the American Automatic Connector Company, Cleveland, Ohio, succeeding N. M. Barker, resigned. Mr. Kothe in 1900 entered the service of the Erie Railroad as a machinist and subsequently served in various positions at different places until 1913, when he was promoted to master mechanic at Marion, Ohio. He subsequently was transferred in the same capacity to Port Jervis, N. Y., and from 1919 served as general inspector at Youngstown, Ohio, until his recent appointment with the American Automatic Connector Company.

Colonel Washington A. Roebling, for many years vice-president of John A. Roebling's Sons Company, Trenton, N. J., has been elected president, to succeed his nephew, Karl G. Roebling, who died on May 29. Colonel Roebling, who is 84 years old, was engaged, with his father, John A. Roebling, in building the suspension bridge over the Allegheny river at Pittsburgh, and the Cincinnati and Covington suspension bridge. With his brother, Charles G. Roebling, he successfully carried out the work of completing the Brooklyn bridge, the construction of which devolved upon them after the death of their father in July, 1869.

Henry T. Gerdes, mechanical engineer and manufacturer, of New York, has been elected president of the Hauck Manufacturing Company, Brooklyn, N. Y., maker of oil burners, oil forges, oil burning appliances, etc. The other officers of the company are: M. C. Hauck, first vice-president; A. B. Hauck, second vice-president; H. H. Kress, third vice-president; A. H. Stein, treasurer, and J. Lutz, secretary. Mr. Gerdes, who succeeds the late Arthur E. Hauck as president, is a graduate of Stevens Institute of Technology. He was for many years manager of the Treadwell Engineering Company, Easton, Pa., and has a practical knowledge of the manufacture of oil burning torches and appliances.

The Manufacturers Exhibition Company, Inc., has established a permanent world market for machinery in the building occupying the block on Sixth avenue, Eighteenth street and Nineteenth street, New York City. The company's plans are broad in scope, including American and international promotion of the sale of all American manufactured mechanical products. There are exhibits of machinery of all kinds and many of the exhibitors have their own representatives in the market, but those who have no one present are repre-

mented by trained technicians who will conduct the buyers through the exhibits, explaining all points desired. L. R. Duffield, who was general manager of the Philadelphia Bourse for over ten years and recently general manager of the International Exposition of Industries, is president and general manager of the Manufacturers Exhibition Company, Inc.

## The Westinghouse Electric and Manufacturing Company

The gross earnings of the Westinghouse Electric & Manufacturing Company from sales billed for the year ended March 31, 1921, as shown by the company's annual report, were \$150,980,106, which is an increase of nearly \$15,000,000 over the gross earnings of the previous year. The manufacturing and selling cost was \$138,774,085; and the net income available for dividends was \$12,617,536, or 16.8 per cent on the company's capital stock. Dividends at the rate of 8 per cent per annum were paid during the year on both the preferred and common shares of stock.

There is included in the cost, \$5,315,196 for depreciation and adjustment of inventories, which were valued as of December 31, 1920, at a cost or market value, whichever was lower. An appropriation of \$5,000,000 from surplus for a special contingent reserve has also been made to provide for further possible shrinkages and adjustments in the inventories.

Property and plant account shows an increase over the previous year of \$9,361,404. The amount of unfilled orders on hand April 1, 1921 was \$65,621,000.

The consolidated general balance sheet follows:

ASSETS	
Property and plant.....	\$48,708,478
Investments .....	16,624,717
Current assets .....	135,339,230
Other assets .....	5,592,093
<b>Total.....</b>	<b>\$206,264,518</b>
LIABILITIES	
Capital Stock—	
Preferred .....	\$3,998,700
Common .....	70,813,950
Funded debt .....	36,275,000
Real estate, purchase money mortgage.....	60,000
Current liabilities .....	44,748,683
Reserves .....	8,102,905
Profit and loss—Surplus.....	42,265,280
<b>Total.....</b>	<b>\$206,264,518</b>

## Trade Publications

LOCOMOTIVE CRANES.—The Browning Company, Cleveland, Ohio, has issued an elaborately illustrated, forty-eight-page catalog, on its locomotive cranes. The book contains a detailed description of the construction of the Browning crane, with data concerning the capacities, clearances and dimensions of the various types and a large number of illustrations showing the cranes engaged in a wide variety of work on the railways and elsewhere.

BURLINGTON COUNTY (N. J.) farmers were surprised last week by a notice from the Pennsylvania Railroad of an increase of 100 per cent in the tariff on their special daily fast freight to New York markets. The farmers say that they will at once turn to motor truck transportation. Beverly, in the heart of the rich truck-growing section of Burlington county, shipped more than 1,000 carloads of products by special train into New York markets last year. The 100 per cent increase in the cost of their special train comes on top of the 40 per cent increase in freight rates made last summer. To obtain the special train the farmers pay the regular freight rate, plus an extra tariff. This tariff last year cost them \$102 extra a day and they arranged for the service at the same rate this year. Then the railroad gave notice that the special charge would be increased to \$205 daily this year. The railroad had overlooked in its first estimated order No. 11,241 of the Interstate Commerce Commission issued Jan. 5 of this year, which raised the mileage charge for all special freight trains from \$1.25 to \$2.50.

## Railway Financial News

**ATCHISON, TOPEKA & SANTA FE.**—*To Continue Dividends in 1921.*—This company expects to continue the present dividend rates on both its preferred and common stocks throughout 1921, according to a statement of President W. B. Storey made at the close of the board meeting on June 7, at which the regular semi-annual dividend of 2½ per cent was declared on the preferred stock. The Wall Street Journal quotes Mr. Storey as saying:

Even if the Labor Board's wage decision had not been made, the company had plans in mind whereby the dividends could be kept up at the expense of a most rigid program of economy on upkeep. This would have been accomplished without neglecting the safety of the lines and in a way that would meet all traffic demands. It would have meant an increased amount of work in the future to take care of the company's natural growth and expansion. But even with the wage decrease, the company will still have to curtail to some extent on upkeep and improvement in order to carry out its decision to keep the dividends going. Under present depressed traffic conditions the wage reduction was not sufficient, but the decrease showed that the Board had taken proper consideration of the importance of the matter.

The wage reduction should cause no expectation that rates will come down. They will only come down if the volume of business increases to a point where the carriers can take the business at a lesser cost than at present. To give an example of how the company has been misled in order to meet requirements, since December 16,000 men have been laid off at a saving of about \$3,000,000. Under good conditions nearly all of these would have been necessary for work in connection with the road's natural growth. In view of the wage reduction some of them will be put back on, but the number will be regulated not so much by the reduction as by the way in which business picks up.

Man and June should show much better than the earlier months of the year in earnings, but an appreciable improvement is not looked for until July. In that month the Atchison especially is favored by heavy grain business.

The flood in Pueblo has cost the company several hundred thousand dollars and has caused a temporary cessation of both passenger and freight traffic to certain points in that vicinity. The California business has not been hurt since transcontinental business regularly routed through Pueblo has been diverted to the road's southern lines, but business into Denver will be held up for about ten days.

**BALTIMORE & OHIO.**—*Authorized to Assume Obligations.*—This company has been authorized by the Interstate Commerce Commission to assume obligation of liability in respect of \$675,000 of equipment trust, 6 per cent gold notes issued by the Bethlehem Steel Company in connection with the purchase of 549 steel hopper cars.

**CENTRAL OF NEW JERSEY.**—*Authorized to Assume Liability.*—This company has been authorized by the Interstate Commerce Commission to assume obligation or liability as guarantor in respect of the payment of principal and interest of \$4,987,000 of bonds of the American Dock & Improvement Company, the maturity date of which is to be extended.

**CHARLES CITY WESTERN.**—*Asks Authority to Issue Notes.*—This company has applied to the Interstate Commerce Commission for authority to issue \$384,000 of 10-year, 6 per cent gold notes to retire an outstanding issue of 7 per cent bonds and other maturities.

**CHICAGO, ROCK ISLAND & PACIFIC.**—*Authorized to Issue Lease Warrants.*—This company has been authorized by the Interstate Commerce Commission to issue six lease warrants for \$158,885.54 each in connection with the procurement of 30 steel coaches and five steel chair cars from the Pullman Company.

**CHICAGO, TERRE HAUTE & SOUTHEASTERN.**—*Authorized to Issue Notes.*—This company has been authorized by the Interstate Commerce Commission to issue 7 per cent promissory notes to the amount of \$837,000 to refund the amount remaining unpaid of its outstanding 7 per cent demand notes and to pledge as collateral for the notes all or part of \$1,485,000 of its first and refunding mortgage 5 per cent gold bonds.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.**—*Authorized to Issue Bonds.*—This company has been authorized by the Interstate Commerce Commission to issue \$1,052,600 of refunding and improvement mortgage bonds and use them in the acquisition of the capital stock of the Evansville, Indianapolis & Terre Haute.

**EVANSVILLE, INDIANAPOLIS & TERRE HAUTE.**—*Authorized to Issue Bonds.*—This company has been authorized by the Inter-

state Commerce Commission to issue \$400,000 of its first mortgage 7 per cent, 30-year bonds and to pledge them with the Secretary of the Treasury as collateral security for a loan from the United States of \$400,000 to assist it in making additions and betterments estimated to cost \$800,000.

**GRAND TRUNK.**—*Defaulted Interest to Be Paid.*—The New York agency of the Bank of Montreal announced on June 3 that it would pay coupons due on April 1, 1921, detached from Grand Trunk Pacific Railway 4 per cent mortgage, Prairie section, Series A, and Mountain section, Series B, and Lake Superior Branch bonds. The payment of the interest on these bonds, amounting to approximately \$500,000, has been in technical default since April 1.

**LONG ISLAND.**—*Authorized to Issue Bonds.*—This company has been authorized by the Interstate Commerce Commission to issue \$3,876,000 of refunding mortgage 4 per cent gold bonds and to exchange them for a like amount of its unified mortgage 4 per cent gold bonds. The Pennsylvania is also authorized to guarantee the principal and interest of the refunding mortgage bonds.

**MASON CITY & FT. DODGE.**—*June 1 Interest Defaulted.*—The controlling road, the Chicago Great Western, has officially announced that the interest due June 1, 1921, on the first mortgage 4 per cent, 50-year gold bonds will not be paid. The bondholders' protective committee, formed last November, with Mortimer N. Buckner, president of the New York Trust Company, as chairman, states:

The committee in December last advised holders of the bonds that the payment of the June 1, 1921 installment of interest, as well as subsequent installments, was seriously imperiled, and that a situation existed which made it imperative in the interests of the holders of the bonds to examine into the affairs of the railroad company and its operation, maintenance and management by the Chicago Great Western, and to take concerted action for the establishment and enforcement of their rights and the protection of their interests. A very substantial amount of the bonds has since been deposited with the committee, and the detailed examination referred to is now being conducted. In compliance with the request of holders of undeposited bonds and in order to afford further opportunity to avail of the benefits of the deposit agreement, the committee has extended the time within which bonds may be deposited with the New York Trust Company, 26 Broad street, New York City, depository, or with the Illinois Trust and Savings Bank, Chicago, sub-depository, to and including June 20, 1921, after which date further deposits will not be received except at the option of the committee and upon such terms and conditions as the committee shall prescribe.

**MISSOURI, KANSAS & TEXAS.**—*Authorized to Issue Notes.*—The receiver has been authorized by the Interstate Commerce Commission to issue \$450,000 of receivers' equipment notes and to pledge them with the Secretary of the Treasury as security for a loan. The authority previously granted to issue \$675,000 of equipment notes has been revoked.

**NORFOLK & WESTERN.**—*Authorized to Sell Bonds.*—This company has been authorized by the Interstate Commerce Commission to sell at not less than par and accrued interest \$269,000 of convertible, 4 per cent, gold bonds, 1,213,000 of convertible 4½ per cent gold bonds and \$522,000 of convertible 6 per cent gold bonds, the unsold remainders of three issues which were authorized for general corporate purposes prior to June 28, 1920.

**NORWOOD & ST. LAWRENCE.**—*Authorized to Sell Bonds.*—This company has been authorized by the Interstate Commerce Commission to sell or issue in exchange for certain outstanding promissory notes \$199,000 of first mortgage 5 per cent gold bonds for the purpose of satisfying certain existing liabilities and to issue promissory notes for \$16,969.50 in connection with the purchase of a locomotive.

**PENNSYLVANIA.**—*Asks Authority to Lease Roads.*—This company has applied to the Interstate Commerce Commission for authority to lease the railroad and property of the Pittsburgh, Chicago & St. Louis and the Grand Rapids & Indiana for 999 years from January 1, 1921.

*To Pay Notes.*—The \$24,469,322 ¼ per cent notes due June 15 will be paid off at maturity at the offices of the company, Broad Street Station, Philadelphia, Pa., or at 85 Cedar Street, New York City.

**PERE MARQUETTE.**—*Authorized to Issue Notes.*—This company has been authorized by the Interstate Commerce Commission to pledge and repledge from time to time \$3,231,000 of its first mortgage, 5 per cent bonds of 1916 as collateral security for short-

term notes, but the commission withholds authority applied for to issue notes for a sum not exceeding \$2,100,150 in its present financial condition, because no information has been furnished by the applicant as to the terms of the notes.

**READING COMPANY.—Decree Form Filed.**—The form of decree by which the Reading Company properties will be separated in compliance with the decision of the United States Supreme Court was filed in the United States District Court at Philadelphia on June 6. It was drawn up in accordance with the plan recently approved by the court and was submitted by counsel for the Reading Company. Under the decree the Reading Coal and Iron Company will be separated from the Reading Company and the latter will be merged with the Philadelphia & Reading Railway under a new name and will be subject to the regulations of the federal and state laws as a common carrier. The only trustee named in the plan of segregation is the Central Union Trust Company of New York, to take over the stock of the Lehigh and Wilkes-Barre Coal Company from the Central Railroad of New Jersey. The other trustees, who will hold the stock of the Jersey Central, owned by the Reading, until a favorable time arrives for its sale, have not been named. Neither is the name of the new coal company to be formed given in the decree.

**New Director.**—Charles Ewing, vice-president of the Philadelphia & Reading, has been elected a director to succeed Isaac Heister, deceased.

**SOUTHERN RAILWAY.—Application for Loan Withdrawn.**—This company has withdrawn its application to the Interstate Commerce Commission for a loan of \$3,825,000 from the revolving fund and the commission has cancelled the certificate. The commission has also vacated its order of December 31, in so far as it authorized the Southern Railway to pledge \$5,900,000 of general mortgage bonds as security in part for the loan, but authority has been granted to the company to pledge and repledge from time to time all or part of \$7,229,000 of its development and general mortgage 4 per cent gold bonds as collateral security for short term notes.

**ST. LOUIS-SAN FRANCISCO.—Voting Trust to Expire.**—The voting trust for the preferred and common stock will expire by limitation on July 1 and will not be extended. Preparations are now being made for the exchange of stock certificates for the voting trust certificates.

**TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$719,000 of general mortgage, 4 per cent bonds to reimburse the treasury for expenditures made from income in 1920. The bonds are to be sold on a 6 per cent basis through the Central Union Trust Company.

**TONOPAH & GOLDFIELD.—New Director.**—Walter L. Hachlen has been elected a director.

**UNION PACIFIC SYSTEM.—Annual Report.**—The income for the calendar year 1920, compared with the calendar year 1919, after excluding all offsetting accounts between the Union Pacific Railroad Company, the Oregon Short Line Railroad Company and the Oregon-Washington Railroad & Navigation Company, is as follows:

	1920	1919	Increase or Decrease
Operating revenues (March 1 to December 31) .....	\$175,260,837	.....	\$175,260,837
Operating expenses (March 1 to December 31) .....	135,112,026	.....	135,112,026
Revenues over expenses (March 1 to December 31) .....	\$40,148,811	.....	\$40,148,811
Rental from United States Railroad Administration .....	7,099,433	\$39,369,411	-32,269,958
Railway operating income .....	\$47,248,264	\$39,369,411	\$7,878,853
Operating expenses, corporate, not assumed by United States Railroad Administration .....	\$191,217	\$909,343	-718,126
Federal income and other taxes .....	10,754,015	2,293,226	8,460,789
Total corporate expenses and taxes .....	\$10,945,232	\$3,202,569	\$7,742,663
Railway operating income over corporate expenses and taxes .....	\$36,303,032	\$36,166,842	\$136,190
Other income, representing rents received and incidental operations .....	1,492,885	527,183	965,701
Total income from railroad properties .....	\$37,795,917	\$36,694,026	\$1,101,891

Deductions, representing rents paid, hire of equipment and incidental operations .....	1,833,655	144,926	1,688,729
Net income from railroad properties .....	\$35,962,262	\$36,549,100	—\$586,838
Income from investments and other corporate income .....	12,298,956	13,026,686	—727,730
Total income from all sources .....	\$48,261,218	\$49,575,786	—\$1,314,568
Interest on funded debt and miscellaneous corporate charges .....	15,586,987	15,156,573	430,414
Net income from all sources .....	\$32,674,231	\$34,419,213	—\$1,744,982
Dividends on stock of Union Pacific Railroad Company:			
Preferred stock at 4 per cent .....	\$3,981,740	\$3,981,740	.....
Common stock at 10 per cent .....	22,229,160	22,229,160	.....
Sinking fund requirements .....	30,877	11,377	19,500
Total appropriations of net income .....	\$26,221,777	\$26,222,277	—\$500
Surplus, transferred to profit and loss .....	\$6,452,454	\$8,196,937	—\$1,744,482

The annual report of the Union Pacific will be reviewed editorially in an early issue.

**WICHITA NORTHWESTERN.—Asks Authority for Mortgage.**—This company has applied to the Interstate Commerce Commission for authority to place a first mortgage for \$600,000 on its property to secure a loan from the United States of \$381,750, or, if arrangements can be effected, for \$431,750; also to retire \$200,000 of an outstanding mortgage of \$181,750 for additions and betterments.

### Settlements With Railroad Administration

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts: Carolina, Clinchfield & Ohio, \$550,000; Oregon Electric, \$90,000; Oregon Trunk, \$100,000; Farmers Grain & Shipping Company, \$25,000; Southern Illinois & Missouri Bridge Company, \$40,240.10; Baltimore Steam Packet Company, \$820,000. The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued certificates for partial payments by the Treasury on account of the six months' guaranty period to the railroads for 1920, as follows:

Ann Arbor .....	\$75,261
Arizona Eastern .....	390,000
Cincinnati, Saginaw & Mackinaw .....	90,000
Detroit, Grand Haven & Milwaukee .....	250,000
Detroit & Huron .....	7,500
Galveston, Harrisburg & San Antonio .....	150,000
Houston, East & West Texas .....	145,000
Houston & Texas Central .....	900,000
Maryland & Pennsylvania .....	60,000
Michigan Air Line .....	30,000
Missouri & North Arkansas .....	27,000
New York & Pennsylvania .....	15,000
Ohio River & Western .....	70,000
Pontiac, Oxford & Northern .....	110,000
Toledo, Saginaw & Muskegon .....	75,000

The commission has also reached a final determination of the amount of the guaranty of the Ann Arbor and has issued a certificate for the balance of \$75,261.85 due the carrier, which has already received partial payments amounting to \$240,000.

### Dividends Declared

Atchison, Topeka & Santa Fe—Preferred, 2½ per cent, semi-annually, payable August 1 to holders of record June 30.  
 Beech Creek—50 cents, quarterly, payable July 1, to holders of record June 15.  
 Delaware & Hudson—2¼ per cent, quarterly, payable June 20, to holders of record May 28.  
 Kansas City, Ft. Scott & Memphis—Preferred, \$1 quarterly, payable July 1 to holders of record June 24.  
 New York, Chicago & St. Louis—1st preferred, 2½ per cent, payable July 2 to holders of record June 20.  
 New Orleans & Northeastern—6 per cent, payable June 29 to holders of record June 15.  
 New York & Harlem Common and preferred, \$2.50, payable July 1 to holders of record June 15.  
 New York, Lackawanna & Western—1¼ per cent, quarterly, payable July 1 to holders of record June 14.  
 Pittsburgh, McKeesport & Younghoegheny—\$1.50, payable July 1 to holders of record June 15.  
 St. Louis, Rocky Mt. & Pacific—Common, 1 per cent quarterly; preferred, 1¼ per cent, quarterly; both payable June 30 to holders of record June 18.

## Railway Officers

### Executive

**T. S. Rowland**, vice-president, secretary and treasurer of the Chicago, Burlington & Quincy, has resigned as secretary and treasurer, effective May 26. He will continue to serve as vice-president.

**E. E. Nash**, general manager of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., has been elected vice-president and general manager, with the same headquarters, effective June 3.

**V. V. Boatner**, superintendent of the Memphis division of the Yazoo & Mississippi Valley, with headquarters at Memphis, Tenn., has been elected president of the Peoria & Pekin Union, with headquarters at Peoria, effective June 1.

**C. I. Twyman**, division passenger agent of the Chicago, Burlington & Quincy, with headquarters at Galesburg, Ill., has been promoted to general agent, passenger department, with headquarters at St. Paul, Minn., succeeding F. M. Rugg, deceased.

**Carl Nyquist**, secretary and treasurer of the Chicago, Rock Island & Pacific, with headquarters at Chicago, has been elected vice-president, effective June 1. He will retain his duties and title of secretary and treasurer. Mr. Nyquist was born at Chicago on November 17, 1877, and entered railway service on March 3, 1898, in the department of the secretary and treasurer of the Rock Island at Chicago, and has served continuously in that department since then. In 1910 he was promoted to assistant secretary, and later was appointed assistant treasurer in addition to his other duties. In July, 1918, during the reorganization accompanying federal control, Mr. Nyquist was appointed federal treasurer of the Rock Island. He resigned this position on November 1, 1918, to accept election as secretary and treasurer of the corporation, succeeding George H. Crosby, vice-president, who had retired.

C. Nyquist

### Operating

**J. M. Walsh**, superintendent of the Memphis terminal division of the Yazoo & Mississippi Valley, with headquarters at Memphis, Tenn., has been transferred to the Memphis division, with the same headquarters, succeeding V. V. Boatner, resigned to become president of the Peoria & Pekin Union. **E. Bodamer**, trainmaster, with headquarters at Memphis, succeeds Mr. Walsh. **J. A. Zanone** has been appointed trainmaster, succeeding Mr. Bodamer. The appointments and changes were effective June 1.

**W. J. Edwards**, superintendent of the Alabama Great Southern, has been promoted to general superintendent of the Southern with headquarters at Chattanooga, Tenn., succeeding F. P. Pelter, resigned. **M. E. Madden**, superintendent of the Georgia Southern & Florida, has succeeded Mr. Edwards as superintendent of the Alabama Great Southern with headquarters at Birmingham, Ala. **L. F. De Ramus**, train-

master of the Georgia Southern & Florida, has succeeded Mr. Madden as superintendent, with headquarters at Macon, Ga. **L. O. Perkins**, trainmaster of the Northern Alabama with headquarters at Sheffield, Ala., has succeeded Mr. De Ramus as trainmaster of the Georgia Southern & Florida, and **H. A. DeButts** has succeeded Mr. Perkins as trainmaster of the Northern Alabama. These changes were effective June 4.

### Financial, Legal and Accounting

**H. W. Johnson**, assistant controller of the Chicago, Burlington & Quincy, with headquarters at Chicago, has been promoted to controller, with the same headquarters, effective May 26, succeeding C. I. Sturgis, elected secretary and treasurer.

**C. I. Sturgis**, controller of the Chicago, Burlington & Quincy, with headquarters at Chicago, has been elected secretary and treasurer, effective May 26. Mr. Sturgis was born at Paris, France, on July 21, 1860, and entered railway service in 1880, as a clerk in the local freight office of the Burlington at Chicago. His entire railway service, amounting to forty-one years, has been spent with that company. After serving in various positions in the Chicago offices, Mr. Sturgis was appointed cashier with headquarters at Denver, Colo., and later was returned to Chicago as paymaster. He served in this position until February 1, 1895, when he was promoted to assistant general auditor, with the same headquarters. Mr. Sturgis served successively in this position and as general auditor of the Burlington for twenty-three years. On September 1, 1918, he was promoted to controller, retaining his headquarters at Chicago, and was serving in this position at the time of his recent election.

C. I. Sturgis

### Traffic

**H. A. Williams** has been appointed district freight representative of the Baltimore & Ohio, with headquarters at Milwaukee, Wis., effective June 1.

**J. W. Britt** has been appointed general agent of the transportation and traffic departments of the New York Central, Lines West, with headquarters at Detroit, Mich., effective June 1.

### Mechanical

**Reinier Beuwkes**, electrical engineer, of the Chicago, Milwaukee & St. Paul, has been granted a leave of absence for several months and has gone to South America with his family.

**C. M. Hoffman**, superintendent of machinery of the Verde Tunnel & Smelter railroad, with headquarters at Clarkdale, Ariz., has been appointed superintendent motive power and machinery of the Los Angeles & Salt Lake, with headquarters at Los Angeles, Cal., effective June 1, succeeding D. P. Kellogg, who has resigned.

### Obituary

**A. L. Kuykendall**, assistant superintendent of the Southern Pacific, Texas lines, with headquarters at Houston, Tex., was killed in a motor car accident near Garrison, Tex., on May 25.

The *Railway Age* in its issue of last week devoted twelve pages to the annual meeting of the Railway Accounting Officers' Association at Atlantic City, June 8 to 11. The report, as it appeared, was

### The R. A. O. A. Meeting

not complete; the remainder of it, therefore, is given in the present issue. The space used, however, was by no means excessive when one considers the calibre of the speakers who were invited to address the meeting; the great amount of ground which the meeting covered; and the multiplicity of the important subjects on which action, favorable or otherwise, was taken. The R.A.O.A. annual meeting discussed committee reports aggregating 500 pages. Two of the important committees each discussed over 70 subjects and their reports each covered over 120 pages. Despite this great weight of material which had to be handled, the meeting was so ably conducted that there was not an uninteresting moment during the entire four days the accounting officers were at Atlantic City, nor was there a single subject that failed to receive as complete discussion as the nature of the subject warranted or as the members present desired. The committee chairman and committee members of the Railway Accounting Officers' Association deserve credit for the amount of work which they have done to make the past year's work a success and for the able manner in which the R.A.O.A. annual meeting was conducted.

The management of the Illinois Central was among the first in the country to foresee the coming of a decline in railroad traffic and to begin preparations for reducing its operating expenses in anticipation of the approaching decline of business. President Markham issued warnings to his officers and

### Mr. Markham's Significant Letter

employees regarding what was coming while his railroad was still handling the largest business in its history. For this reason a circular letter to officers and employees of the Illinois Central which Mr. Markham issued on June 10 is of unusual interest. He refers to the fact that the decision of the Labor Board in regard to the reduction of wages will result in a substantial reduction of operating expenses. He adds, "You will be interested in learning that we intend to invest that money in maintenance which has been deferred—in the employment of additional men and in the purchase of materials and supplies. We have not waited for the money to come in, but we have already entered upon our program, and we believe that other railways will do likewise. The action of the Labor Board, therefore, operates as the first signal for the opening up of business which will redound to the benefit of the public at large. Crop prospects are favorable. This railway recognizes its pressing duty to patrons to place roadway and equipment in condition to serve them this fall. The Labor Board decision will help to enable it to meet that duty." It is significant that Mr. Markham in his letter refers to the necessity of putting "our affairs in such shape that we will be enabled to grasp the first signs of business revival" to start upon a program of expansion and development. With railway traffic slowly but steadily increasing, with the car surplus slowly but steadily declining,

and with more freight cars and other railway facilities needing rehabilitation or enlargement than ever before, it will hardly be necessary for anybody to emphasize to the railway managers the need for entering promptly upon programs of improvement and expansion if regulating bodies and the public will give them opportunity to earn the money necessary to enter upon and carry out such programs.

The hearings before the Railroad Labor Board on the requests of the various carriers for wage reductions, outlined elsewhere in this issue, ended in a somewhat remarkable manner, considering what had passed before. Instead of the bitter reiteration of charges and counter-charges, which had marked

### The Labor Board's Lovefest

many previous sessions, there were expressions of good-will, sympathy and understanding and pledges of co-operation. This phase of the proceedings was introduced by remarks of F. W. Sargent, general solicitor of the Chicago & North Western, an abstract of which appears elsewhere in this issue. Negotiations between the railways and their employees are in progress throughout the country, and there is contained in Mr. Sargent's remarks and the remarks made by labor leaders in response to them a lesson for both the employers and employees directly engaged in these negotiations. From the standpoint of both the employees and the railways there is great need of the better understanding and co-operation advocated in the concluding session of the Labor Board in the wage hearings. Better understanding and co-operation would mean more efficient operation of the roads, larger net earnings for the companies and higher wages for the employees than they can reasonably hope to retain without them.

Speaking of a project in which he was interested but concerning which he was experiencing difficulty in securing data much needed to strengthen his case

### A Salesman Without A Price

before the management, a purchasing officer said: "I am in the position of a salesman without a price and you know how much consideration I would give to a salesman who couldn't quote me a price on the goods he was trying to sell." Is this not highly suggestive of the difficulty met by many railway mechanical, engineering and signal officers who complain of inability to secure much needed equipment and facilities? Carrying the figure further, can any salesman expect to inspire confidence in the mind of the prospective purchaser who does not possess a thorough knowledge of his own goods? Do not mechanical officers, for example, who are seeking additional facilities for their shops and engine terminals, frequently fail to meet this essential requirement of salesmanship? There are many psychological problems of salesmanship to which the true salesman devotes much thought and hard work, the solution of which may be beyond the capacity of the busy department head. But he can acquire a knowledge of his project so thorough that he can anticipate and answer intelligently every question likely to arise in the mind of the executive

and until he has this knowledge not only is he almost certainly doomed to failure if he asks for authority to proceed, but he is acquiring a reputation likely to prove a serious handicap on future occasions when executive authority is required. Nothing is likely to do more to paralyze the much needed progress in building up and improving mechanical department and other facilities than attempts to sell nebulous projects to railway executives. The effect of no essential plan for improvement is so intangible that a little critical study will not disclose a means of placing it on a concrete dollars and cents basis.

The alinement of a signal light may play an important part in safe train operation, particularly at places where more than one light is visible at once to the engineman of an approaching train. For example, at an interlocking plant the home signal and train order lights, which may be in close alinement with each other, may have their lamps focused where the maximum beam or most favorable indication is picked up at different points as a train approaches the signals instead of being focused on the same point, which should be the location at which an engineman obtains his first view of the signals. If one signal gives a stronger indication than the others at the point where it is first seen, that indication will naturally be impressed more strongly on the mind of an engineman than those giving a dim indication, particularly on high speed trains. As a consequence there may exist an opportunity for an engineman to misinterpret his indication, causing him to think he has a clear home signal when the light may be from the train order or other signal located close to and in line with the home signal. In the investigation of accidents such as at Porter, the alinement of the lights has been given little consideration, but it is important that every operating officer should know that the most favorable conditions exist at locations where confusion may be caused.

As might be expected of a compromise measure, the British railway bill, which has been advanced to its second reading in the House of Commons, is being severely criticised from all sides. Perhaps the strongest opposition of all is that of the Scottish railway companies. These companies object to the bill because they say it will tend to perpetuate the present wage scales which they believe to be on too high a plane for the railways to bear. Rate increases, they believe, do not afford a remedy for the situation because of the diminished traffic resulting. Compulsory consolidations they hold to be unconstitutional. Mr. Clynes, speaking for labor, opposes the bill because it fails to provide for public ownership and control. Sir F. Banbury of the Railway Companies' Association says of the bill that in order to avoid a temporary catastrophe the railways are being asked to submit to something which will lead to a catastrophe lasting for all time. He proposes as the only solution for the problem the return of the roads to their owners without government interference. Although they fail to grow very enthusiastic about it, apparently many shippers and business men have taken the attitude that the bill offers the only solution of a very complicated situation. Various objections have arisen regarding the amounts to be paid the railways for claims against the government. In some quarters they are said to be insufficient, in others too large. It would perhaps be safe to conjecture, in view of the fact that the objections to the measure are arising from sources whose interests are so varied, that there is little likelihood of any formidable combination on a substitute measure. The very

divergence of the criticism, rather than any intrinsic merit in the bill itself, would seem to be its chief source of strength, auguring well for its final passage without substantial change.

One of the most convincing reasons why the railroads, as well as other industries, should give careful study to methods of performing work is contained in the report of the committee of engineers appointed by Secretary Hoover to investigate waste in industry. The report brings out the fact that the production of the country could be increased immediately 50 per cent by the full utilization of existing facilities. The managements of the industries of this country are acknowledged to be the most efficient in the world, and the railroad managements are no exception. It is, therefore, somewhat surprising to find such disparity between present efficiency and the attainable; and it would be even more surprising if this report should not prove to be the incentive for intensive studies to ascertain the best ways of more closely approximating the attainable. So far as the railroads are concerned, one means to the end that immediately suggests itself is an increased use of mechanical handling devices. Many such machines have already proved their value in the various branches of railroad work. By no means, however, have the roads exhausted the possibilities of material handling apparatus in the shops, in speeding up the handling of freight, in saving of time and labor in construction and maintenance and for various other purposes. No one can doubt that further studies in this direction will be well worth while.

Continually increasing in size and weight the motion work, machine parts and appliances of locomotives have long since passed the point where they can be economically removed by hand and transported on two-wheel trucks. Locomotive parts have to be renewed frequently in roundhouses, and mechanical devices for handling them should be installed wherever the volume of work warrants. Manual labor will thus be reduced to a minimum and important savings effected. For example, when removing an air compressor in a roundhouse not provided with crane facilities, some sort of make-shift support must be arranged above the compressor to which to attach a chain and falls for lowering the compressor to the floor. Not less than two and sometimes four men are required for this operation which takes considerable time and physical effort and is also more or less dangerous. Overhead electric traveling cranes have been installed in certain engine terminals for handling work of this kind quickly and effectively, but their installation involves practically rebuilding the enginehouse structures. The expense would seldom be warranted except in new terminal developments where it was intended to handle large amounts of heavy running repairs. There is considerable room for improvement in present roundhouses, however, at a relatively small expense, by installing monorail electric hoists, jib cranes and portable cranes. These will accomplish practically the same results at a much smaller cost. Closely allied with the question of proper facilities for removing and applying heavy locomotive parts is the need of efficient means to transport them from the locomotive to the machine shop or department where necessary repairs are made. Important economies can be effected by eliminating as far as possible the use of two-wheel trucks and substituting four-wheel trucks with roller- or ball-bearing wheels of large diameter. In all important roundhouses, electric storage battery or other power-operated trucks and

### Why Not Use More Machines?

### Signal Lights and Accidents

### Engine Terminal Crane and Truck- ing Facilities

### Objections to English Railway Bill

tractors should be used. To realize the maximum benefit from these material handling devices, the enginehouse floors must be maintained in good condition, hard and smooth, and all passageways kept clear. Arrangements for the prompt and easy handling of material in roundhouses will pay large returns on the comparatively small investment involved.

## What Railway Capital and Labor Have Got

THE SPOKESMEN of the railway labor unions will soon appear before the Senate Committee, which is investigating the railway situation, to give their explanation of the fact that the railways are in a serious financial condition. No doubt they will offer the same explanation they offered to the Railroad Labor Board. They have charged before the Labor Board that the troubles of the railways are chiefly due to financial mismanagement. They have alleged that the railways have issued excessive amounts of securities, large parts of which are fictitious because not based on actual investment made in the properties, and have paid interest and dividends on these securities, thus disbursing money which should have been spent for improvements. They have contended that failure of the companies to invest this money in improvements has prevented them from effecting economies in operation, and that this, and not high wages and inefficiency of labor, is the reason why their operating expenses are excessive.

The answer to all these charges is afforded in incontrovertible form by the statistics of the Interstate Commerce Commission. These statistics show just what has been done with all the earnings of the railways each year, and especially what part of them has been paid to Capital as a return upon its investment in the physical facilities, and what part has been paid to Labor for its work. Since Labor claims that Capital has been getting too much, let us compare the amounts Labor and Capital actually have been getting.

The Senate Committee asked for data regarding developments of all kinds on the railways from 1912 to 1920. In 1912 the railways had 1,642,119 employees, to whom they paid approximately \$1,210,000,000 in wages, or an average of \$737 per employee. In 1919 they had 1,913,422 employees, to whom they paid approximately \$2,843,000,000 in wages, or an average of \$1,486 per employee. The increase in the average wage per employee was over 100 per cent, and the increase in the total wages paid was \$1,634,000,000, or over 135 per cent.

In the year ended on June 30, 1912, the interest paid by the railways on both their funded and unfunded debt was \$376,600,000, and the dividends paid on their stock \$340,000,000. This made the total amount received by the holders of all their securities \$716,600,000. The average amount paid out annually to the owners of all their securities in the years 1913 to 1919, inclusive, was \$720,300,000. The total amount of interest paid by them in the year ended December 31, 1919, was \$446,800,000, and the total amount of dividends paid by them was \$278,500,000, making a total paid to the holders of all their securities in that year of \$725,300,000. In other words, between 1912 and 1919 the amount of wages paid to the employees increased \$1,634,000,000, or 135 per cent, and the total amount of interest and dividends paid to all the holders of the bonds and stocks increased \$8,800,000, or 1.25 per cent. In 1912 railway Capital received 59 per cent as much as railway Labor. In 1919 it received less than 26 per cent as much.

Comparison is made between the statistics of 1912 and 1919, because complete information regarding the interest and dividends paid in 1920 are not yet available. If the data compared were those of 1912 and 1920 the contrast between

the increase in the reward received by railway Capital and railway Labor would be much more striking. In 1920 railway Labor received \$2,500,000,000 more in wages than in 1912, or over 200 per cent more, while the total interest and dividends paid to railway Capital certainly was not more than in 1919. Therefore, while in 1919 Capital received 59 per cent as much as Labor, in 1920 it did not receive 20 per cent as much.

While the total return paid to railway Capital increased hardly at all between 1912 and 1919, the total investment in property, as shown by the books of the railways, increased from \$14,600,000,000 to \$18,500,000,000. The interest and dividends paid in 1912 were 5 per cent upon the property investment; in 1919 they averaged 3.9 per cent. The figures given for interest and dividends are not the net operating income earned in the years mentioned, but the actual net amounts paid to the stockholders and bondholders, whether from earnings, government guarantees or from any other source.

When the spokesmen of the labor unions appear before the Senate Committee with their charges regarding the causes of the present financial condition of the railroads, the members of that committee may deem it not inappropriate to ask them some such questions as the following:

How can financial mismanagement of the railroads logically be held responsible for their troubles when in seven years the total interest and dividends paid by them increased only \$8,800,000, while in the same seven years the wages paid to railway Labor increased \$1,634,000,000 or 185 times as much, and in the eight years from 1912 to 1920, \$2,500,000,000, or 285 times as much as the return actually paid to railway Capital?

How can it logically be claimed that railway Capital has been treated, or has treated itself, too well and Labor has been treated unfairly, when the facts show that the average percentage of return upon investment received by Capital declined from 5 per cent in 1912 to about 3.9 per cent in 1919, while the average wage of a railway employee increased from \$737 in 1912 to \$1,486 in 1919, or over 100 per cent; to \$1,820 in 1920, or 147 per cent, and is now running at the rate of \$1,926, or over 160 per cent more than in 1912?

The total amount of public service rendered by the railways in 1920 in hauling freight was 55 per cent more than in 1912, and the amount of public service rendered in carrying passengers was 45 per cent more. For its part in rendering this increased service to the public railway Capital received practically no more interest and dividends than in 1912, while railway Labor received 200 per cent more. Wherein do these facts indicate that railway Capital, by dishonest manipulation, etc., "explicitly" both the public and the employees, as the labor leaders allege?"

The charge that the present plight of the railroads is due to financial mismanagement is as baseless buncombe as was ever disseminated. They have not all been well managed, financially or otherwise, but they have been brought to the verge of ruin, not by the way they have been managed by the companies that own them, but by the war, by government control, by indefensible and intolerable labor union exactions, and by a policy of regulation which until recently has been amazingly wanting in both intelligence and foresight.

The simple fact that the total interest and dividends paid to the security owners of the railways have stood practically still for ten years while all items of their expenses have been greatly increasing, while the profits made in all other industries have been increasing, while the total production of the country, and, in consequence, the demands made upon the railroads for transportation, have been increasing, is quite sufficient to show why the railways are physically and financially in the condition they now are.

## Attitude of the Railways Regarding Rates

THE RAILWAYS of the country recently have sought to make clear their attitude regarding general reductions, and also regarding readjustments of rates. On behalf of the railways Chairman Morris, of the Central Freight Association, on June 8 sent an open letter to shippers of road building and other construction materials who had asked for general reductions of rates to stimulate the movement of their traffic. This letter was quoted in the *Railway Age* of June 10, page 1365, under the heading "Building Material Rates To Stand." It stated that neither present conditions nor reductions in operating expenses which are in immediate prospect will justify any general reductions in rates, but that the carriers are hospitable to suggestions of readjustments which it can be shown are needed, and which will be advantageous to shippers and general business and not unduly disadvantageous to the railways.

Nobody claims that on the present rates the railways are making too much, or even enough, net earnings. Everybody knows that they are not. Substantial reductions in expenses due to declines in the prices of fuel and materials, to reductions of wages and to the abolition of some wasteful rules and working conditions are in sight. With the traffic which has been moving, and the total earnings which the railways have been making thus far in 1921, they would not, however, be able to earn anywhere near a 6 per cent return if they were allowed to retain the benefit of all the reductions in expenses which are actually in prospect. Traffic and total earnings are slowly increasing, but deferred maintenance which has accumulated within recent months is so large that increased earnings due to increased traffic should and will, for months to come, be largely absorbed by increased maintenance expenditures.

It is argued by some that general reductions of rates would cause a large increase in traffic and net earnings, but the relative smallness of the traffic moving is due to general business conditions. The improvement in general business conditions is causing an increase of traffic, and it is very doubtful if the increase would be appreciably accelerated by general reductions of rates. In response to demands from different classes of shippers the railways in several cases already have made general reductions in rates. On April 1 a reduction of approximately 10 per cent in freight rates on lumber was made from the northwest to points east of the Missouri River, but the increase in lumber movement from the northwest since then has been so small as to indicate that the reduction in rates has had almost no effect. The western lines made a reduction in rates on potatoes, but it did not have any appreciable effect. An emergency reduction in live stock rates was equally fruitless. The outcome in each case show that the small business of the shippers was due not to the freight rate, but to want of sufficient demand for their commodities. So long as this condition exists the effect of general reductions in rates would be merely to reduce the earnings of the railways, and not to stimulate traffic.

The ablest and best informed group of industrial traffic experts in the United States are those composing the National Industrial Traffic League. This organization at its recent meeting in Cleveland adopted resolutions strongly deprecating any general reduction of rates and urging that there should be none until the railways are able to make enough net earnings to put them on a sound basis financially and to begin improving and enlarging their facilities.

While it is certain that early general reductions of rates would increase the financial difficulties of the railways and postpone needed rehabilitation of their properties, it is so doubtful whether they would have a good effect on any other class of business that experiments of that kind should be

postponed for the present. On the other hand, it is generally recognized that the percentage advances in rates which were made in 1918, and again in 1920, created many unfair discriminations and made many individual rates, and even groups of rates, in different territories and communities excessive. The Interstate Commerce Commission, the railways and the shippers are engaged almost daily in making readjustments to eliminate these inequalities, and the general tendency of these readjustments is to reduce the general level of rates. This process of readjustment should be carried on as rapidly as possible so that the many inequalities will be removed before the time comes when general reductions can be made.

That the time will come when the general reductions can gradually be made, we have no doubt. The total traffic handled, if we may judge by past experience in this country, is sure largely to increase, and large reductions in operating expenses in addition to those in immediate prospect are bound to be made. The result is sure to be large increases in the net earnings of the railways if experiments in general reductions of rates are not made too soon. The Transportation Act not only requires the Interstate Commerce Commission to permit the railways to charge rates which will enable them to earn an average annual return of 5½ to 6 per cent, but the same provisions in effect require the Commission to reduce the rates when the net earnings of the railways are sufficient to justify it.

The general tendency of rates should, and undoubtedly will, be downward in future, but general reductions should follow and not precede the earning of adequate net returns by the railroads. The effect of unduly hurrying the process of reduction would be to further cripple our already seriously crippled transportation system, and would not only delay the time when it could be restored to a satisfactory physical condition, but indefinitely delay permanent improvements in the physical properties which are needed to enable the roads to handle their business with the greatest practicable economy and with the lowest practicable rates.

## Number of Railroad Employees Reduced 400,000 in a Year

WHILE THE RAILROADS will continue until July 1 to pay the increased wages awarded by the Railroad Labor Board last year, they are paying them to a much smaller number of employees than they had on their payrolls last year. A compilation just made by the Bureau of Railway Economics from returns from 175 Class I railroads shows a reduction of 14.97 per cent in the number of employees during the first quarter of this year as compared with the first quarter of last year and a reduction of 20.05 per cent for the month of March as compared with March, 1920. As there were 2,009,000 employees in the service of all the Class I roads last March, if the same percentage holds good the total reduction in force during March amounted to about 400,000. For the 175 roads alone it was 379,000 for March and 282,000 for the quarter. For January the reduction was 8.37 per cent and for February of this year it was 14.74 per cent.

There was also a reduction for the three months' period of 22.28 per cent in the number of hours worked by the employees on an hourly basis, and a reduction of 3.59 per cent in the days worked by those reported on a daily basis, but because of the higher wages in effect since May 1 of last year the reduction in the payroll was only 4.93 per cent and the average employee in service received 12 per cent more than for the first quarter of 1920. The total compensation paid to employees for the three months was \$717,425,173 for the 175 roads, or \$37,000,000 less than they paid for

the corresponding quarter last year before the latest wage increase.

The reduction in the number of employees for the quarter corresponds very closely with the decrease in the volume of freight business, which was about 15 per cent less than for last year. The decrease in passenger travel was somewhat less. The greater reduction in the number of hours than in the number of employees indicates not only that a part of the forces have been put on a short time basis but also a reduction in the amount of overtime work.

The fact that the reduction in force is less than the decrease in the volume of business handled may reflect some increase in efficiency but it probably represents in the main a considerable amount of deferred maintenance, as during the period of dull business the railroads have been forced to delay the repair of cars and locomotives for lack of funds. The bureau's compilation for the 175 roads follows:

Number of employees—	1921	1920	Increase or decrease 1921 over 1920
January .....	1,734,675	1,893,185	d 8.37
February .....	1,592,338	1,867,622	d14.74
March .....	1,509,597	1,888,068	d20.05
Average 1st quarter.....	1,604,713	1,887,220	d14.97
Total hours worked.....	858,449,158	1,104,504,381	d22.28
Total days worked.....	17,142,012	17,780,742	d 3.59
Total compensation.....	\$717,425,173	\$754,653,744	d 4.93
Average for quarter.....	\$447	\$399	12.

d Decrease

which its association recently has committed itself, its efforts will be of very doubtful value. We are impressed by the experience and calibre of the men who compose the new board, but we are frankly dubious as to the amount of good it can accomplish.

### New Books

*Railway Accounting Officers' Association 1921 Synopsis.* Edited by E. R. Woodson, Secretary of the Association. Published by the Railway Accounting Officers' Association, 1116 Woodward Building, Washington, D. C. 6 in. by 9 in.; 400 pages. Bound in cloth.

The R. A. O. A. synopsis which was published in July last year was a book of 228 pages. The 1921 Synopsis contains 400 pages. This expansion in size has not been due to any change of policy which has led the editor to change the style of the book; it represents the additional material developed in the biggest year in the history of the Railway Accounting Officers' Association.

The R. A. O. A. Synopsis is a somewhat unique publication. It is a compilation of the recommendations, mandatory or otherwise, as to standard practices, forms, etc., which have been made and approved from year to year. Because of the multiplicity of the subjects which have been covered and the care that is taken in the association as to the recommendations made, the book is in reality a text book on the subject of railway accounting. It does not attempt to cover the underlying basic principles upon which railway accounting rests, but it does give those details of railway accounting practice which are not available to the student of the subject in any other form. To the accounting officer, the book is an absolute essential. To the ambitious clerk, it should prove equally indispensable for there is no other way in which a student of railway accounting can secure the information as to what are agreed upon as the best methods of carrying out railway accounting work.

The book is divided into four principal sections: Freight, passenger, disbursement and overcharge claims. The recommendations as to over-charge claims have been mandatory in the past; this year the association took the further step of making mandatory also a portion of the freight, passenger and disbursement recommendations. To take care of this situation properly, the editor has arranged each of the freight, passenger and disbursement sections so that in each case the recommendations which have been made mandatory are given first, followed by those which are recommendatory only and concluding with the standard forms. Each section is carefully indexed, so that the book may readily be used for reference purposes. The value of the standard forms is so well realized as hardly to need comment. The number of forms shown is especially noticeable; during the past year the association originated as many new forms, not counting revisions, as in nearly all the previous years' history of the association combined.

There is another feature of the book that should not pass without comment. That is its timeliness. The book naturally could not be published until after the annual meeting had passed on and approved the recommendations resulting from the year's work. The fact that the book is in readiness so soon after the annual meeting is worth more than passing notice.

THE STATE OF TEXAS in 1920 had 4,158 railroad accidents, as compared with 3,351 in 1919, an increase of 807. It was estimated that the damage to track and equipment in 1920 was \$1,752,222 and \$1,121,353 for 1919. Other figures, as tabulated by the Railroad Commission of the State, showed that 289 persons were killed, compared with 196 in 1919, including four passengers in 1920 and seven passengers in 1919. The total injuries in 1920 were 2,933 and in 1919 they were 2,651.

## The Board of Economics and Engineering

UNQUESTIONABLY, IT IS a real task which lies before the Board of Economics and Engineering, the creation of which has recently been announced by S. Davies Warfield, president of the National Association of Owners of Railroad Securities. The board in a measure must first justify its existence as a new complication in the already complex railway situation; it has an exceedingly difficult problem to consider, and it is not unlikely that its creation and future procedure may be the subject of criticism in various quarters. The desire behind Mr. Warfield's various efforts, of which this is the latest, to make the security owners more of a power in the railway situation can readily be appreciated. The present position of the security owners is not as favorable as it might be nor as satisfactory as it really must become if railroad securities are to be looked upon with sufficient satisfaction by the investor. However, the *Railway Age* must agree with those who assert that successful operation of our railways is the task of those who are in charge of operating them.

It must reassert its opinions that what the railways and the public need is the opportunity for the railway managers to work out their problems "on their own" and as provided by the Transportation Act. Technically the managers represent the stockholders, but actually they represent the interest of the bondholders, also, for whatever they do to further the real interests of the stockholders is bound to protect and benefit the bondholders, who have a prior claim upon net earnings.

If the Board of Economics and Engineering enters upon its investigation in a purely scientific spirit, and one appreciative of and sympathetic regarding the real difficulties with which railway managements are faced, it can be helpful. If, on the other hand, it allows itself to be dominated by the spirit of intolerance, and antagonism toward and unwillingness to co-operate with the railway managers which has been manifested at times by the association which it represents in the past; and if it enters upon its work with strong preconceptions in favor of the plan of railroad reorganization to

## Letters to the Editor

### Do the Railroads Want College Men?

STATE COLLEGE, Pa.

TO THE EDITOR:

Although the college student has had very little to say as to the policy pursued by the railroads in the employment of the college man, he is deeply interested in what the future has in store for him in railroad work. The *Railway Age* has from time to time discussed the problems of the college man and the railroads. Letters on the subject from college professors and railway officials have been published, the faculty claiming that the general attitude of the railroads toward the college man does not induce him to go into railroad work.

On the other hand, letters from railway officials state that the college man does not come up to expectations in most cases and that railroad work requires men of certain temperament and qualifications. One letter in particular stated that the railroads wanted students who had received good grades in their studies and had also taken an active part in athletics and campus activities. From this it appears that the railroads must have the highest grade of material available. In years past it has been commonly understood that if you desired a first class article you had to pay the price.

There are three institutions, of which the writer has some knowledge, that offer special courses to prepare a student for railroad work. They are Purdue University, the University of Illinois and the Pennsylvania State College. These courses and special subjects were added to the curriculum to meet the demand for technically trained railroad men. In comparison with the number who have registered in other courses, few students have availed themselves of the facilities offered to prepare themselves for railroad work. All three of these schools have excellent laboratory equipment and other facilities that usually make a course attractive. With few exceptions, the students who have taken the course in railway mechanical engineering at Penn State have been special apprentices from the New York Central or Pennsylvania railroads. Very few students who are not already affiliated with some railroad register in the railway course.

At the recent convention of the A. R. E. A. there appeared to be considerable discussion on this subject. Some of it was devoted to the kind of a course the student should pursue in preparing for railroad work. Such discussion will be of little value if only a few students take the course. Criticism without something better to offer is worthless. We realize that the railroads are going through a critical period in their history. At the present time the problem of the college student does not amount to much in comparison with the other problems that are to be solved. However, something should be done towards forming a connecting link or liaison between the technical railway student, or the college student who would like to go into railroad work, and his future employer.

Let us consider what the relation is between the student in other courses and his probable future employer; for example, the mechanical engineer. The American Society of Mechanical Engineers has a student branch in which it takes a great deal of interest and goes to considerable pains in seeing that the student members are well informed about the fields of work they are going into. Each week some prominent engineer from some well-known firm or manufacturing concern speaks to the student society on the engineering field that he is engaged in. The students are told of the opportunities in sales engineering, refrigeration, power plants, etc. These different lines of work are made to look very attractive and interesting because quite a number of the speakers come with moving picture films or with stereopticon views. Before

the college year is over most of the larger fields of engineering endeavor have been presented to the student in some manner or other, with one exception—he hears nothing or very little about the railroads.

Of course he reads quite a bit about the railroads in the daily press at the present time, but as an appeal to the college student to go into railroad work it is very poor advertising. At the same time, the engineers who come to speak to the student societies get a good line on the most promising of the senior class and if their firms are in need of men they usually get the pick of the lot. During the past three weeks representatives from quite a number of well known manufacturing companies have come to Penn State and have interviewed a large number of the engineering students who will graduate in June. They have already signed up for their respective companies some of the most promising material in the class. Other students whom they thought would be of value to their companies were approached in regard to future employment. The railroads cannot complain, for they make no effort to pick their men, they simply wait for the men to pick the railroad. Possibly this is the reason that the college man who has started to work for the railroad has not always come up to expectations.

For the past eight years the students in railway mechanical engineering at Penn State have supported an organization known as the Motive Power Club. For eight collegiate years they have met once a month to listen to a railroad talk from a member of the faculty or one of the students. Sometimes they have been fortunate in getting some man over from the Altoona shops of the Pennsylvania Railroad or someone from the New York Central. However, this has not happened very often. There has not been a representative of a railroad here this year, and further there is no record of one coming here since 1917. As other concerns come to Penn State year after year for engineers they must be well pleased with men that they are getting. We have gotten reports of similar conditions at both Illinois and Purdue, but the point that the writer wishes to bring out is that the men who have declared their intention of going into railroad work do not receive any encouragement or have any interest shown in them by their future employers. The lack of interest would not be so noticeable if it were not being received by the other student societies. The freshman who has not quite made up his mind as to the engineering course that he intends to pursue cannot help but see that there is a difference.

As a solution the writer would like to offer the following:

1. The appointment of a "student relations" committee from the American Railway Association to see that the student engineer is properly informed of the opportunities in the railroad field; that there is some kind of liaison between the A. R. A. and the student railway societies; that arrangements be made whereby each technical school is provided with at least one speaker a year from the nearest railroad to speak on a purely railway subject.

2. The eventual organization of a student branch of the A. R. A. Such an organization would be composed of students from all courses, such as civil, electrical, industrial and mechanical engineering, who contemplate going into railroad work. It would be similar in composition to the senior organization.

3. Change of policy of the railroads whereby there will be selection of the men whom they believe will be best fitted for railroad service, instead of the present policy of making the man come to the railroad for the job regardless of whether he is the right kind of a man or not.

The writer does not intend to be presumptuous or to take issue with the opinions and judgment of older and more experienced men in railroad work. He merely offers the above as a possible solution of the situation, if the railroads really want the college man.

MARTIN B. RICHARDSON.

President of the Motive Power Club of The Pennsylvania State College.

# Progress of Missouri, Kansas & Texas Since 1913

## Marked Improvement in Efficiency of Operation Due to Physical Improvements and Better Methods

### Part II

By Samuel O. Dunn  
Editor of the *Railway Age*

AS THE INCREASE from 299.4 to 504, or 68.3 per cent, in the average tons of freight per train of the Missouri, Kansas & Texas between 1913 and 1920 indicates, there was a great increase in the efficiency of operation of the property between these years.

The increase in service obtained from freight locomotives has been especially great. On June 30, 1913, the Missouri, Kansas & Texas had 395 freight locomotives with a total tractive power of 12,218,545 pounds, or an average per locomotive of 30,933 pounds. On December 31, 1920, it had only 370 freight locomotives, but their total tractive power was 15,225,870 pounds, or an average per locomotive of 41,151 pounds. The average increase in tractive power per locomotive was 42.07 per cent. The increase in the number of tons moved one mile per locomotive (including company freight) was from 5,501,127 in 1913 to 10,211,622 in 1920, or 85.6 per cent.

The railways of the country for many years have been increasing the average tractive power of their locomotives. The increase in the amount of traffic handled with each locomotive has not been in proportion to the increase in average tractive power. In consequence, in the ten years from 1902 to 1913 the number of ton miles of revenue freight service handled per 1,000 pounds of tractive power on the railways of the United States declined from 269,000 to 222,000. Since then it has been increasing, and in 1920 it was about 260,000 tons, an advance over 1913 of over 17 per cent. During 1913 the revenue ton mileage per 1,000 pounds of tractive power of the locomotives of the Missouri, Kansas & Texas was 151,369; while in 1920 it was 217,587, an increase of 43.8 per cent. The Missouri, Kansas & Texas has a lighter traffic and one consisting of a smaller proportion of bulky commodities adapted to slow freight service than the average American railway, and therefore cannot reasonably be expected to render as many ton-miles of freight service with each locomotive in a given period as the average railway of the country, but the figures show that since 1913 it has increased the ton mileage of freight service rendered two and one-half times as much in proportion to the increase in the tractive power of its locomotives as have the railways of the country as a whole.

An increase in the average freight service rendered with each locomotive may be obtained either by running each locomotive more miles in a given period, or by making each pull more tons in each train, or by both means. As the size, power and complexity of design and construction of locomotives have increased in this country, there has been generally a decline in the average number of miles run annually by each freight locomotive. Undoubtedly this has been largely due to the fact that the number, size, power and complexity of locomotives have been increased faster in proportion than the increase in and improvement of the facilities for turning and maintaining them.

The experience of the Missouri, Kansas & Texas has been much more satisfactory than that of the railways generally. The average miles run by each of its freight locomotives in 1913 was 18,729 and in 1920 it was 20,498, an increase of over 9 per cent.

The average mileage made by its locomotives probably would have shown a still greater increase if it had had better facilities for turning and maintaining them. During most of the last two years it has had an average of about 25 per cent of its engines out of actual service, 10 per cent being in the shops and 15 per cent waiting to get in. The locomotive plants and machinery at locomotive terminals have been inadequate to making needed light running repairs, while the main locomotive repair shops have been inadequate to handling all the heavy repairs needed. This is a condition which the management understands, which it already has made some improvements to remedy, and improvements for more completely remedying which it has projected. Besides the extension of the locomotive shop at Parsons, plans for which already have been mentioned, it is expected to build a small locomotive shop at Waco. Better facilities and machinery for making light running repairs also are to be provided at various locomotive terminals.

The large increase in the traffic handled, both in proportion to the increase in the number of locomotives and in proportion to the increase in their tractive power, has been due mainly to an unusual increase in average tons hauled per train. An increase in average train load may be secured by increasing the number of tons of freight loaded in each car, by increasing the number of cars in each train, or by both means. The increase in car loading obtained depends largely upon the co-operation secured from shippers and regulating authorities. Increase in the number of cars hauled per train depends almost entirely upon improvements in facilities and operating methods. Average tons per loaded car, including company freight, increased from 17.28 in 1913 to 24.35 in 1920, or 40.9 per cent. Average cars per freight train increased from 25.82 to 33.89, or 31.3 per cent.

### Statistics of Car Efficiency

The hauling of loaded cars causes operating expense, but also brings in revenue. The hauling of empty cars causes directly nothing but expense and is a patent economic waste when at all avoidable. The Missouri, Kansas & Texas always has had an excessive proportion of empty car mileage, and the figures show that this condition has not been improved. In 1913 its empty car mileage was 31.70 per cent of the total car mileage, and in 1920 it was 37.81 per cent. The average number of empty cars per freight train in 1913 was 8.50, and in 1920, 13.19, an increase of over 55 per cent. This large amount of empty car mileage is partly due to a badly balanced traffic, and partly to special characteristics of the traffic. The northbound and southbound freight on the densest part of the system, that between Denison and Muskogee, are about the same, but there are important parts of the railroad such, for example, as that between Sedalia and Parsons, where the traffic in one direction is as much as 50 per cent greater than in the other.

Furthermore, on some lines commodities are moved in large volume in one direction which cannot be handled in the same kind of cars as commodities moving in large volume in the opposite direction. There is a large livestock movement from Texas to Kansas City and St. Louis, with con-

sequently a long haul of empty cars practically the entire length of the road back to Texas. In 1919, 3.54 per cent of the road's total traffic was livestock—an unusually large proportion. Cars in which coal is moved southbound must be returned empty, as there is practically no lumber or other bulky traffic northbound for which they can be used. The empty car mileage of the Missouri, Kansas & Texas was increased in 1920 by orders from the Car Service Commission which required it to haul large numbers of empties practically the entire length of its line to protect loading in south Texas. The railway is also in an oil producing territory, which makes it necessary to handle large numbers of tank cars for which there is practically no back loading. It is subject to large seasonal movements of cotton and other agricultural products, for a large part of the cars used in which no back loading can be secured.

The large empty car mileage seems irremediable as long as the conditions of production and commerce in the territory of the Missouri, Kansas & Texas remain what they are now. An attempt partially to remedy it has been made by providing 1,587 combination coal and stock cars.

The average miles per freight car per day also seem quite low, having been 21.85 miles in 1913, 24.96 in 1917 and 23.23 in 1920. This low average is partly due to delays to cars at cotton compresses, and to the holding of tank cars

Louis-San Francisco were not so protracted as that of the Missouri, Kansas & Texas, and therefore the Missouri, Kansas & Texas has had the advantage of having a relatively larger amount of money invested in it which otherwise would have been paid out to the owners of its securities than have the Missouri Pacific and the St. Louis-San Francisco. The average load per car of the Missouri, Kansas & Texas in 1920 was less than that of either of the other roads, but the increase of its average carload between 1913 and 1920 was greater, both in amount and percentage, than that of either of the other roads. Its average train load in 1920 was about 42 tons more than that of the Frisco, and about 121 tons less than that of the Missouri Pacific, but its increase in average train load in seven years was 81.89 per cent, that of the Frisco 41.92 per cent and that of the Missouri Pacific 48.71 per cent. The absolute increase in its number of tons per train also was greater than that of either of the other roads. The management of the Missouri, Kansas & Texas was added in securing its relatively greater increase in tons per car and per train by the fact that it had a relatively larger increase in total traffic. The revenue ton mileage of the Missouri, Kansas & Texas increased 50.5 per cent, that of the Frisco 24.3 per cent, and that of the Missouri Pacific 44.4 per cent.

The effects produced by the increases in traffic which have

\*Indicates decrease.

for long periods, which is characteristic of territories where oil development is going on. It is also partly due to congestions which occurred as a result of large and practically overnight opening of oil fields on lines which were not in condition to handle the sudden increase of traffic. Another unfavorable influence is the chronic delays to cars loaded with grain, cotton and similar commodities at Galveston awaiting export.

Some light may be thrown on the results which have been obtained by the development and operating policies which have been followed on the Missouri, Kansas & Texas by a few comparisons of its operating units with those of some other railways in the same general territory. The Missouri Pacific, the St. Louis-San Francisco and the Missouri, Kansas and Texas all have lines in the southwest, but the Missouri, Kansas & Texas has a larger part of its mileage in that territory than either of the other roads. The Missouri Pacific, for example, has lines extending as far west as Pueblo, Colorado, while the Frisco has a line running to Birmingham, Alabama. However, all of them are classed as primarily southwestern roads. Furthermore, all have greatly improved their operating results within recent years, and all have been in receivers' hands within recent years, although the receiverships of the Missouri Pacific and St.

occurred, the increases in efficiency of operation which have been obtained, and the advances in rates which were made under government control are indicated by the statistics regarding total revenues from freight and passenger train service which are given in Table 1. These statistics also reflect to some extent the effect of the advances in rates which were made on August 26, 1920, and which, therefore, were in effect during the last four months of 1920.

The increase in total freight revenue in 1920 over 1913 was 133.9 per cent. The increase in freight revenue per train mile was from \$2.79 to \$6.32, or 126.5 per cent. Since the increase in the revenue per ton per mile was only from 1.09 cents to 1.43 cents, or 31.2 per cent, it will be seen that very much the greater part of the increase in the revenue per train mile was due to the increase in the average tons per train. The increase of 135.3 per cent in freight train revenue per mile of railroad, with an increase of only 31.2 per cent in the average revenue per ton per mile, of course reflects chiefly the very large increase made in the amount of traffic moved over each mile of road.

The increase in passenger service train revenue of 111.7 per cent was due only in a small measure to advances in passenger rates, since the average revenue per passenger per mile increased only 27.8 per cent. It was due chiefly to an

increase of 58.5 per cent in the number of passengers carried one mile. This largely increased passenger traffic was handled with 396,514 passenger train miles less than in 1913, a reduction of 4.9 per cent. In consequence of an increase of 66.8 per cent in average passengers per train mile, and of the increase of 27.8 per cent in the average revenue per passenger per mile, the passenger revenue per train mile increased 113.4 per cent.

Table 2 gives total revenues and expenses during the years 1913, 1917 and 1920.

The increase in total earnings in 1920 over 1913 was 127.9 per cent. Unfortunately, the Missouri, Kansas & Texas between 1917 and 1920 suffered from the same enormous increases in operating expenses, unaccompanied by corresponding advances of rates, from which all the railways of the United States suffered. While between 1913 and 1920 its total earnings increased 127.9 per cent, its operating expenses increased almost 193 per cent. Between the years 1917 and 1920 its total earnings increased 68.2 per cent, and its operating expenses 110.8 per cent. In consequence, during 1920 its expenses consumed over 95 per cent of its earnings, and with gross earnings of almost \$72,915,000 it had a net operating revenue of only about \$3,000,000. But it came out of this period better than most of the railways of the United States, for most of them during this period had no net operating revenue at all.

One measure of the comparative efficiency with which a

present freight and passenger rates were in effect, and also in the last ten months of 1920, during six months of which the advances in rates granted by the Interstate Commerce Commission in August were not in effect. It will also be

	4 Months ended Dec. 1920	10 Mos. ended Dec. 1920	10 Mos. ended Dec. 1917	Increase 1920 over 1917	Per cent increase 1920 over 1917

seen that the transportation ratio of the Missouri, Kansas & Texas increased less between 1917 and 1920 than that of any of the other lines mentioned. Its comparatively low present transportation ratio is due to the improvements in facilities and in operating methods which have been made under the receivership.

### Results of Operation Under Advanced Rates

These improvements put the railway in a good position to benefit by the advances in rates granted by the Interstate Commerce Commission in August, 1920, and statistics regarding its earnings and expenses in the last four months of 1920, following the advances in interstate rates authorized by the Interstate Commerce Commission, make, of course, a

\*Indicates decrease.

railway is being operated which often is used, is the ratio of its transportation expenses to its total earnings. Expenditures which are made for maintenance go into the physical property, and therefore a relatively high ratio of maintenance expenses to total earnings, other things being equal, indicates that a property is being well maintained. On the other hand, every dollar which is spent for transportation expenses is gone forever, and therefore the lower is the transportation ratio to total earnings the more favorable are the operating and financial results, other things being equal.

Recent years have been a period of high transportation ratios because operating expenses, and especially transportation expenses, have been increased more than rates. The railways of the southwest usually have had comparatively high transportation ratios, because they usually have suffered from relatively low freight and passenger rates and inadequate earnings.

The table at the top of the page shows the transportation ratios of some railways having large mileages in the southwest in the four months ended December, 1920, and also in the ten months ended December, 1920, as compared with the ten months ended December, 1917.

It will be seen that the Missouri, Kansas & Texas Lines had the lowest transportation ratio of any of the railways mentioned, both in the last four months of 1920, when the

much better showing than those for the entire year 1920. They alone afford a real and substantial basis for estimating the financial results which the management of the Missouri, Kansas & Texas really can hope to obtain in future.

It is a difficult and precarious undertaking under present conditions to estimate the net return which any railway can reasonably be expected to earn. There have been greater changes in all the unit costs of operation and in both freight and passenger rates within recent years, and even within recent months, than in many years before. Furthermore, there have occurred, and are still occurring, extraordinarily wide fluctuations of both freight and passenger traffic.

The Missouri, Kansas & Texas has been subject to these changing influences along with other railways. We have entered a period when it is only reasonable to assume that there will be marked reductions in all the unit costs of operation, including especially the principal items, cost of supplies, cost of fuel and cost of labor. If these reductions in costs prove to be large, and if developments show that present freight and passenger rates are so high as to restrict the movement of traffic, we shall probably see in the comparatively near future reductions of rates. No one can foretell how these changes will affect the financial results of the railways as a whole, or of individual railways.

It seems fair to assume, however, that the combined effect

of the changes will be to increase rather than to reduce the net return of the railways as a whole. The Interstate Commerce Commission has held that the railways of each large group in the country should be allowed to earn a net return of six per cent upon the valuations fixed by it. On a six per cent annual basis the Class I railways of the country in the months of September, October, November and December, 1920, should have earned a net operating income of \$407,815,000. Even the guarantees under government control which were based upon the net operating income earned in the three years ended on June 30, 1917, were in these months for the Class I railways as a whole \$342,424,000. The net operating income actually earned by these railways in these months was \$233,146,000.

The railways as a whole in the western territory, in which the Missouri, Kansas & Texas is located, fell almost as far short of earning the net operating income expected in these four months as those in other parts of the country. It is fair to assume, therefore, that measures will be adopted which will result in substantially increasing the net earnings, and consequently the operating income, of the railways as a whole, including those in western territory, and that the Missouri, Kansas & Texas will be benefited to some extent at least by these measures.

It is therefore interesting, and seems highly significant, to find that in the last four months of 1920, when the railways as a whole, including those in western territory, showed a great decline of net operating revenue compared with the average earned by them in the same months of the years 1915, 1916 and 1917, the Missouri, Kansas & Texas earned a much larger net operating revenue than it did on the average in the same months of 1915, 1916 and 1917. The net operating revenue earned by it on the average in the last four months of the three years just mentioned was \$3,871,807, while its net operating revenue in the months September to December, 1920, inclusive, was \$5,375,291. The Missouri, Kansas & Texas on the average in the last four months of 1915, 1916 and 1917, earned 43.4 per cent of its annual average net operating revenue in these years. If we should assume that the net earnings in the last four months of 1920 were 43.4 per cent of what it should earn in a normal year with existing unit costs of operation and existing rates, we should conclude that its net operating revenue for a year would be \$12,385,463. Its average net operating revenue in the years 1915, 1916 and 1917 was \$8,907,222.

This would indicate a very substantial increase in net operating revenue. When, however, other very important and pertinent factors are taken into consideration, it will appear that this estimate of its probable net operating revenue is too low. Among these factors are the following:

First: The Missouri, Kansas & Texas on the average in the years 1915, 1916 and 1917 carried 36.5 per cent of its freight tonnage in the last four months of the year. In the latter part of the year 1920 it suffered from a decline in traffic, as a result of which in the last four months of the year it handled only 32.5 per cent of its total freight for the year. The tonnage handled by it in the last four months of 1920 was actually smaller than in 1917. If its total tonnage in the last four months of 1920 had been relatively as large as it was in the first eight months of the year it would have handled 837,298 tons more than it did. Its average revenue per ton during these four months was \$4.25, and this additional tonnage would have increased its total earnings by \$3,558,516. The additional cost of handling this additional business would not have exceeded one-half of the total revenue derived from it, and therefore this business would have increased the net operating revenue by at least \$1,779,000.

Second: A large amount of traffic originating prior to the advance in rates in August was carried at the old interstate rates in these four months. It is estimated that if all

its business had been carried at the new rates the total earnings in the four months would have been \$225,000 greater. All this would have been added to the net revenues.

Third: Operating revenues as reported for the four months do not include an item of about \$100,000 in sleeping car surcharges earned during the period.

The following table indicates how the earnings would have been affected by these differences in traffic and in earnings in the four months September to December, inclusive:

	Actual earnings	Estimated earnings
Total operating revenues.....	\$27,600,379	\$31,483,895
Total operating expenses.....	22,225,088	24,004,088
Net operating revenue.....	\$5,375,291	\$7,479,807

In the three years 1915, 1916 and 1917, when there were very few changes in the rates of the Missouri, Kansas & Texas, and when the unit costs of operation were increasing, but not at such an abnormal pace as in recent years, the road in the last four months of each year earned on the average 37.8 per cent of its total annual operating revenues and incurred 36 per cent of its operating expenses. These percentages applied to the "estimated" earnings and expenses for the last four months of 1920 in the above table to get figures for a constructive year under present rates and wages, produce the following results:

Total operating revenues for a year.....	\$83,291,000
Total operating expenses for a year.....	66,678,000
Net operating revenues.....	\$16,613,000
Operating ratio.....	80 per cent

Tax accruals and uncollectible revenues, which must be deducted before arriving at total operating income, amounted in the last four months of 1920 to \$655,118. This indicates that under present conditions these items will amount in a year to about \$2,500,000, which would leave operating income of about \$14,100,000 available for rentals, hire of equipment, interest and dividends.

I believe that this is a reasonable and conservative estimate of the net operating income that the railway should earn with a normal traffic under existing unit costs of operation and existing rates. As already stated, the average net operating income earned in the years 1915, 1916 and 1917 was \$8,907,222.

There is, however, another important point to be taken into consideration in this connection. The authorities of some states in which the Missouri, Kansas & Texas operates did not make advances in state rates corresponding to those made by the Interstate Commerce Commission in interstate rates. The Interstate Commerce Commission in certain cases already has instructed state authorities to advance state rates to the same basis as those fixed by it. It is estimated that from the traffic handled by it in the months of September to December, 1920, inclusive, the Missouri, Kansas & Texas would have earned \$907,300 more than it actually did if the state rates had been advanced. On this basis, its annual earnings would be increased by about \$2,400,000 a year by appropriate advances in state rates, and all of this additional revenue would be added to its net revenues. On this basis the road would have total operating revenues in a normal year of \$85,691,000, an operating ratio of about 78 per cent, and, after paying its taxes, an amount of about \$16,300,000 would be available for rentals, hire of equipment, interest and dividends. This is the most optimistic estimate that can be made now of its operating income under normal conditions: a conservative estimate on the basis of a traffic equal to that of 1920 would be around \$14,000,000 available for rentals, hire of equipment, interest and dividends.

Looking to the future, it seems that the principal needs of the Missouri, Kansas & Texas, assuming that it is to be reorganized and taken out of receivership, are the following:

1. A conservative reorganization which will reduce its fixed charges so that they will not be more than \$5,000,000

a year, and preferably somewhat less. Every railway is subject to wide fluctuations of traffic and earnings, and high fixed charges make it necessary in every period of light traffic drastically to reduce maintenance expenditures, which injures the property, with resulting higher operating expenses and smaller net earnings in the long run. The foregoing estimates of the Missouri, Kansas & Texas' earning capacity are based on a normal year's business. No railway should be required to pay much more than one-third of its normal annual operating income in fixed charges. If, then, in a normal year, it pays another one-third of its operating income out in dividends, it has a reasonably safe margin for declines in earnings in bad years, and for investment in improvements in good years.

2. The Missouri, Kansas & Texas needs a large increase of traffic. With adequate terminals and equipment it could handle a much larger traffic on most of its lines, and a great part of the increased gross earnings would go to net earnings. The road has at present an excessive empty car mileage. Great efforts should be made to stimulate industrial and agricultural development in parts of its territory from which

traffic would move in the same directions as the present empty car mileage, and thereby help to load the empties. Every ton of freight loaded in a car that otherwise would move empty is almost so much clear gain.

3. The road needs relief from state legislation which requires it to maintain general offices in three different states—Missouri, Kansas and Texas. It is estimated that the elimination of this duplication of general offices, which is due to unwise state legislation, would save \$250,000 in operating expenses annually.

4. It needs a continuance of the development of its physical property along the lines of the present general program, and especially increases and improvements in its yards and in its facilities for repairing and maintaining its locomotives and cars. It also undoubtedly needs a substantial addition to its freight car equipment.

Under a reasonable system of regulation and with able and foreseeing management, such as the railway has had within recent years, it can be made a property which cannot only earn fixed charges of the amount indicated, but also substantial dividends for its stockholders.

## Labor Board Considers Wage Reduction Pleas

Hearings Closed with Good-Will and Promises of Co-operation—  
Decision Expected Soon

HEARINGS before the Railroad Labor Board on the requests of various carriers for wage reductions were closed on June 9 after short rebuttal statements on behalf of both carriers and employees. The requests of the railroads, which were substantially for the entire elimination of the increases granted by the Labor Board last July, are now under consideration by the Board in executive session. The Board has announced that its decision will be handed down before July 1 so that the reductions decided upon will become effective on that date.

The session on June 9 was opened with the testimony of W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen. Mr. Carter, in concluding his remarks requested the Board to rule as to whether the Board's Decision 119 abrogating the national agreements applied to the train service brotherhood's schedules. Mr. Carter stated that many roads have so construed this decision and that the employees will "fight ten times as hard against the abrogation of their schedules as they will against a moderate wage cut." Mr. Carter's stand was backed by the executives of the other brotherhoods. The controversy was finally ended when Dr. C. P. Neill, representing the southeastern railroads, stated that the carriers would agree with the men in their request for a ruling as to the scope and intent of Decision 119.

Among the other representatives of the employees who presented short arguments against wage reductions were G. A. Grubb, secretary-treasurer, National Marine Engineers' Beneficial Association; T. F. Jones, chairman of a committee representing a majority of the clerks on the Nashville, Chattanooga & St. Louis; J. L. Eldridge, Railroad Yardmasters of America; W. B. O'Neill, president, International Association of Railroad Supervisors of Mechanics; P. F. Richardson, president American Federation of Railroad Workers; John Grunau, United Association of Railroad Employees of America; W. L. Heacox, Order of Railroad Station Agents; J. W. Costello, Marine Engineers' Beneficial Association No. 13, Port of Philadelphia; E. P. Groff, Ferry Boat Engineers, Port of Philadelphia; R. C. Bailey, Ameri-

can Association of Engineers, and W. A. Williams, Brotherhood of Dining Car Conductors.

### Case Closed with Talk of Better Co-operation

The case was closed with a rebuttal statement by F. W. Sargent, general solicitor of the Chicago & North Western. Mr. Sargent's plea for co-operation between railway employees elicited similar remarks from many of the labor leaders and caused Chairman R. M. Barton to say: "The chairman thinks he can say for the Board that he is delighted to have this hearing close with such good humor on both sides and he would be even more pleased if he could expect to have the decision that is to be handed down by the Board received in the same way."

After admitting certain inaccuracies in an exhibit filed earlier in the hearing and to which his attention had been called, Mr. Sargent said in part:

I was considerably disappointed after the last hearing at some of the articles appearing in some of the labor journals—glaring headlines to the effect that the railroads treat labor as a commodity, and so on and so forth. I repudiate that statement on behalf of the western carriers. So far as we are concerned, we want to co-operate with our employees in every way we can. I personally want to see them have all the wages that we can possibly pay them that are fair and reasonable. I believe—and you will pardon me for being personal—there is no man in this room that has faced poverty any harder than I have, and I know what it means. I have chopped wood in my lifetime from daylight to dark in order to live, and I have had the gaunt figure of poverty staring me in the face at different times. I have ridden the middle plains of the West from daylight to away into the night, and while I have plowed corn as hard as any living man, I have never limited myself to eight hours, and what I did has never injured me in the least.

I am not making any argument against the eight-hour principle. I am merely saying to these men I can sympathize with them. I want to state to these men who have such great influence with the great masses of railroad labor in the country, that no living man can make a success of his life based on the eight-hour day. If he does not engage himself in some useful occupation and study after his ordinary vocational hours have closed—if he puts in his time in the poolrooms and moving picture theatres—he never can and never will be able

to make a success out of his own life. I want to say—and I would like to drive it home to every young man—that the time is here when we must remember what our forefathers did in our country. Do you think these great railroads would have been built on an eight-hour day? Do you think the pioneers of this country could have developed this country on an eight-hour day? Let us not forget these fundamental principles. Let us work to the end of the eight-hour day, but in doing it let us undertake to inspire the thought and belief in every man that he owes a duty to himself, to his country and to his fellow-man to make use of the other eight hours.

Just in passing I want to say to our good friends on the other side that so far as we are concerned, there is not a locked door in our general offices. We have some marked "Private," but they are not private. The books are open, and I would like to have Mr. Daugherty come and examine them all. There is no class and no distinction on our property, and I want to say that in my judgment the time is here when the employees must get into the harness with us, and we with them, if we are to pull this country out of the horrible depression that it is in to-day. Let us co-operate to that end.

I want to compliment this board in co-operating toward that end. This board is, in a large measure, an experiment. It is the greatest experiment, in my judgment, ever undertaken in any civilized form of government, and I say to you and to these men we want co-operation. As far as our company is concerned, we are going to obey the board's orders in every detail, even if it drives us into bankruptcy, without any qualifications whatsoever. That is our purpose and our spirit, and we want Mr. Carter, Mr. Sheppard, Mr. Daugherty, Mr. Lee and Mr. Jewell to co-operate with us to the end that we may show this property in a condition of progress, and if we do, our employees can share with us in that prosperity. Let us meet across the table and understand one another, and if this board does not do any more than bring about that spirit, it has accomplished the greatest good that could be accomplished for this country.

I cannot refrain from saying, at this time, that I feel that the public of this country ought to understand these matters thoroughly. I am not going to criticize any co-ordinate branch of the government, but I have seen some criticisms in the investigation going on in Washington to the effect that the board has not acted with promptness and there have been some dilatory methods. Speaking for the western carriers, I want to say that we believe this board has acted with the utmost promptness and dispatch and that the country ought to understand that the questions involved in the Transportation Act have made it impossible to act with greater rapidity in this matter.

#### Employees' Representatives Promise Co-operation

The manner in which Mr. Sargent's plea was received is indicated by the following remarks of some of the labor leaders:

H. P. Daugherty, representing the Brotherhood of Locomotive Engineers, said: "I do not know when I heard anything that pleased me so much as what Mr. Sargent said about co-operation and I want to say to him that we will meet him more than half way and we will go down on the Chicago & North Western if that is the disposition of that railroad and settle these things without coming to the Board."

Mr. Carter said: "Perhaps if that which has been said in the last few minutes could have the same publicity in the public press as the contrary has, public opinion might be different. After all these scraps, as we call them, the closest of friendships between the representatives on both sides have arisen. We may call each other names at times, we may disagree with each other, and if it were not for the 18th amendment we might go out and take a drink together."

B. M. Jewell, president of the Railroad Employees' Department of the American Federation of Labor, said: "I want to say to Mr. Sargent that the organization I represent will accept his invitation. We will help the railroads to make a record and to show other organizations in this country that the way to do business is to co-operate with one another."

#### Board Hears Pullman Dispute

The dispute over the right of the Pullman Company to bring its request for wage reductions before the Board at this time, the opening phases of which were outlined in the

*Railway Age* of June 10 (page 1336), was heard by the Board in an extra session on June 10. The character of the arguments presented at this hearing were similar to those outlined in the *Railway Age* as noted above. Mr. Jewell introduced as a witness, Harry Smith, chairman of the committee representing those Pullman employees who are members of the Railway Employees' Department of the American Federation of Labor. Mr. Smith described the dissatisfaction which he claims exists among the Pullman shop employees as the reason for the strike order which he put out several weeks ago. This order was later revoked by Mr. Jewell. After hearing the arguments on both sides the Board took the case under advisement.

#### Board Rules in Agreements Controversy

A dispute which had arisen between several of the larger carriers, including the Chicago, Burlington & Quincy, the Chicago & Eastern Illinois and the Texas & Pacific, and their shop employees as to whether an agreement should be made in accordance with the Board's Decision No. 119 with each of the six shop crafts or with the Railway Employees' Department of the American Federation of Labor representing the six crafts was decided by the Board in a decision handed down on June 14. After Decision No. 119 was handed down these carriers and their employees proceeded with the negotiation of agreements as to rules and working conditions. At the outset the question arose as to whether a separate agreement should be made with each of the shop crafts or one agreement which would include the employees, members of the Railway Employees' Department, regardless of the department in which they were employed or the craft in which they worked. The carriers insisted that they had the right to make a separate agreement with each of the crafts or separate agreements with the employees in the maintenance of equipment, maintenance of way and structures and the maintenance of signals and telegraph departments of the various roads.

The decision of the Board in each case is that inasmuch as "the work of the six shop crafts and the conditions under which it is performed are so similar in the main characteristics as to make it practicable and economical to treat said crafts as constituting such an organization or class of employees as is contemplated in the Transportation Act and in Decision No. 119 of the Labor Board, but one agreement should be made for the six shop crafts including employees in other departments.

# Lift Bridges Compared With Other Movable Forms

## An Analysis of Their Relative Advantages and a Detailed Study of the Vertical Moving Types

IT IS A coincidence that two valuable papers on movable bridge spans, prepared by well known bridge engineers, have been made public almost simultaneously. One of these, a paper by Ernest E. Howard, consulting engineer, Kansas City, Mo., was presented before the American Society of Civil Engineers on May 4, 1921, and comprises a detailed study of the vertical lift bridge. The other is an analysis of the relative economy of movable spans, comprising essentially a comparison of the lift, bascule and swing types by Dr. J. A. L. Waddell, consulting engineer, New York, and will form one of the chapters of his forthcoming treatise on "Economics of Bridge Work." Abstracts of these two papers are presented below. Dr. Waddell's, being more general, is presented first.

### The Economics of Movable Spans

By Dr. J. A. L. Waddell  
Consulting Engineer, New York

In dealing with the economics of movable spans it will suffice to consider only those types thereof which have survived the test of time, relegating the others to oblivion. The surviving types are the swing, the bascule and the vertical lift; and the first mentioned, as will be shown further on,

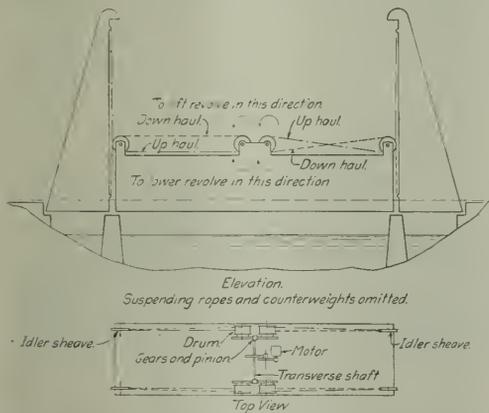

Diagram Showing Typical Arrangement of Operating Machinery and Cables for a Lift Span

has no longer any real *raison d'être*. The choice today, consequently, is between the bascule and the vertical lift, with the preponderance of advantage and economy in most cases favoring the latter.

Before beginning a discussion of the comparative costs of the three surviving types, it will be well to consider thoroughly all their important advantages and disadvantages, excepting only those that relate to first cost of construction, plus capitalized cost of maintenance and repairs.

### Swing-Span Versus Either Bascule or Vertical Lift

(1) The swing provides two openings, while either the bascule or the vertical lift affords only one. This is claimed by the advocates of the swing as an advantage; but it is

not often such, because very seldom is there a location at which there exists a possibility of the water traffic being so great as to necessitate the simultaneous passage of vessels in opposite directions.

(2) The swing, on account of either its pivot pier or its draw protection, offers much more obstruction to the flow of water than does either of the other types.

(3) The cost of maintenance is more in a swing span than in either of the others on account of the upkeep and periodical replacement of a costly and perishable draw protection.

(4) The swing, of necessity, occupies space outside of that required for the accommodation of land traffic, while the other types do not.

(5) The least practicable time of operation is usually twice or thrice as great for a swing as for a corresponding single-leaf bascule or vertical lift.

(6) Either the vertical lift or the bascule affords better automatic adjustment of the railroad tracks thereon than does the swing span.

(7) In the case of future enlargement of the bridge to accommodate an increase of traffic, the swing has to be torn down and rebuilt, but a vertical lift or a bascule can simply be duplicated alongside.

(8) The danger of the span's being struck, when in motion, by passing vessels is much greater in the case of a swing than in that of either of the other types.

(9) The wider the roadway of a swing the more obstructive does it become to navigation, while the widening of either a vertical lift or a bascule does no harm thereto whatsoever.

(10) In passing vessels with low masts, a swing has to open just as fully as for a high-masted craft, which is not the case with a vertical lift or a bascule.

(11) In sand-bearing streams the protection-works for the moving span of a swing bridge cause a deposit of sediment, and thus often tend to obstruct navigation.

(12) In the case of a shifting channel, the two openings in a swing may score an advantage for that type over the other types, in that vessels might be able to pass through one opening after the other has been silted up; but under such conditions the silting is more than likely to block both openings. Moreover, for such conditions the vertical lift is far superior to the other two types, in that the design of the structure can be made so as to raise at any time any one of several similar spans, simply by shifting thereto the towers, the machinery, and the house or houses.

### Vertical-Lift Versus Bascule

Comparing the vertical lift with the bascule, the former has several advantages, amongst which may be mentioned the following:

(1) The floor is always horizontal, permitting the employment of any type of deck that can be used on a fixed span, which is not the case for a bascule. That type of movable span necessitates a timber deck with its consequent fire-risk.

(2) Great wind pressure during operation has no appreciable effect on a vertical lift, while it may cause serious delay to a bascule, or even, under extreme conditions, prevent its operation altogether.

(3) The vertical lift does not have to rise so high for

low-masted passing craft as does the bascule; and thus it saves a considerable amount of time and power.

(4) In railroad bridges when the moving span is down, it acts just like any fixed span, as far as operation under traffic is concerned, which cannot be said for either the swing or the double-leaf bascule.

(5) In case of a shifting channel, it is feasible to make a number of the spans alike and to arrange, for any time in the future and at comparatively moderate expense, to have the towers and machinery taken down, transferred, and re-erected, so as to lift any one of the spans.

(6) The vertical lift, when its towers do not rest on flanking spans, lends itself readily to a further raising or lowering of the grade line in a way that no other type of movable span can possibly do; for all that is necessary is to change the elevation of the bearings of the lift span.

(7) The vertical lift accommodates itself to a skew crossing far better than does the bascule, as in the latter the tail has to be squared, while in the former both the span and the towers may be skewed, thus reducing the clear waterway (and consequently the length of moving span) to a minimum.

(8) By spanning the opening between tops of towers in a vertical lift bridge, electric-wires, water-pipes and gas-pipes can be carried across; but the accomplishment of this in the case of a bascule or a swing would necessitate either expensive and troublesome submarine cables and conduits or special towers for carrying an overhead span.

(9) The inherent simplicity of the vertical lift as a piece of mechanism, compared with the bascule, makes it more reliable in operation, and, on that account, somewhat less expensive.

### Types of Swing Spans

The choice between these rim bearing and center bearing swing spans is mainly a matter of taste or sometimes one of prejudice; for there is no great difference in their first costs, what there is being in favor of the latter, which also has a slight advantage in respect to amount of power required to operate. In the author's opinion the principal economic advantage of the center-bearing type is due to the smaller diameter of the pivot pier. There is a difference of opinion among railroad engineers and even among high authorities on bridges concerning both the relative merits and the economics of these two types. A combination of the rim-bearing and the center-bearing swings is advocated by some engineers, but the author, on general principles, objects to hybrid designs, and especially in the case where there must exist a great uncertainty concerning the distribution of load between rim and pivot.

While there is apparently a saving in first cost by cutting down the length of one arm of a swing-span so as to convert it into a "bob-tailed" structure, that saving is generally absorbed by the adoption of more power and heavier machinery (with which to operate against unbalanced wind loads), heavy counterweights, and the special metal needed to support the counterweights.

### Economics of Bascule Spans

Bascule spans may be divided into two general classes—single-leaf and double-leaf. The former type is superior to the latter in rigidity, but inferior in appearance, because of lack of symmetry. In the opinion of most railway engineers, on account of the difficulty in properly connecting the outer ends of the two leaves, the double-leaf bascule ought not to be employed for steam-railway bridges, for the reason that the lack of rigidity and the great deflection involved are not compatible with truly first-class construction.

The simplest form of bascule is the ordinary heel-counterbalanced, trunnion type; and this is the kind which is generally adopted when the minimum clearance allowed above water will permit. In many cases the height is not sufficient

for the heel of the span and the counterweight to clear the water or the pier-tops, and then the span must be lengthened and a water-tight pit must be provided into which the heel and the counterweight may descend. The expense of construction thus involved is very great; and, consequently, the more complicated and unsightly types, having towers and counterweights above the roadway, are resorted to.

Either of the two primary types of bascule may be divided into three general classes, viz., trunnion, rolling-lift, and roller-bearing. All of these are good, but none is best for all conditions, nor can it be said absolutely that one is always more economical than another.

The rolling-lift is sometimes the cheapest, as has been shown often by competitive bids on different types submitted by contractors; but it is not good practice to adopt it when the pier foundations are of piling, on account of the shifting of the center of gravity of the load on the piles as the span rolls backward and forward, and because of the possibility of pier settlement. The great advantage of this type is its retreating bodily out of the way of passing vessels.

The roller-bearing type has not been much used. When properly designed, it is neat, scientific, and in every essential way excellent, but is not pre-eminently economic.

### Economics of Vertical-Lift Spans

The governing conditions which prove economic for the vertical lift, in comparison with the other types of movable spans, are as follows: Low vertical clearance; large horizontal clearance; heavy moving span; existence of fairly-long flanking-spans; deep foundations, especially when the flanking spans are long; expensive piers, when flanking spans are long; skewed crossings; concrete deck desired; other first-class deck, especially if heavy; shifting channel; high wind pressures to be provided for; wide deck; necessity for quick operation.

A low vertical clearance is evidently favorable to the vertical lift. The real factor in this case is the required vertical movement of the lift span. A greater clearance above the water when the span is down favors the vertical lift; since, for any required clear height with the span raised, the vertical movement is reduced.

A large horizontal clearance favors the vertical lift in comparison with the bascule. For a given weight of moving span, the towers, counterweights and machinery of a vertical-lift bridge are independent of the span length, while those items for a bascule vary nearly directly therewith.

Increased weight of span is favorable to the vertical lift. This is chiefly due to the weight of the rear legs and bracing of the towers, which, for a given height thereof, are nearly as heavy for light spans as for heavy ones. For a very light span and high vertical clearance, the weight of the towers may nearly equal that of the span; whereas, for a heavy span and the same vertical clearance, it may be only one-third of the said weight. There is no such variation in the case of the bascule, since the weight of the bracing is a smaller proportion of the total weight of the towers and counterweight trusses.

A layout in which the economic length of the flanking spans is much greater than the proper length of a bascule tower-span favors the vertical lift. In such a case the rear legs of the vertical-lift towers rest on the flanking spans without producing any material stresses therein. But in bascules with overhead counterweights it will be necessary to put in an additional pier, or to carry the weight of the counterweight on one of the flanking spans, or to put the counterweight trunnion over the pier and cantilever the flanking span out to support the trunnions of the moving span.

Deep foundations and expensive piers are favorable to the vertical lift, as compared with the bascule, when long flanking spans are employed; but for crossings over canals or canalized rivers the cost of the substructure usually has little effect

on the comparison. A crossing where the piers rest on piles or sand is especially favorable to the vertical lift, since the total loads for that type are less than those for the bascule. Rolling-lift bascules are not well adapted to such foundations. Deep foundations are usually unfavorable to the swing, on account of the large base of the pivot pier.

Advantage can be taken of a badly-skewed crossing by the vertical lift; for both the span and the towers may be skewed with very little extra expense, while at least one end of the bascule will have to be squared, thus lengthening the span and increasing the cost.

In respect to quickness of operation, this condition does not affect materially the comparative economics of vertical lifts and single-leaf bascules; but both the double-leaf bascule and the swing are at a disadvantage, since they take fully twice as long to operate as do the other types.

The question of flanking spans is of such importance that the author has found it necessary in his practice and in his economic studies to divide the vertical-lift bridge into two distinct types—one where there are fixed spans flanking the movable span, and the other where there are not.

## General Elements in the Design of Vertical Lift Bridges

By Ernest E. Howard

Consulting Engineer, Kansas City, Mo.

The principal element of the lift bridge, in its simplest form, is a simple span equipped with machinery for operation, suspended at each end by wire ropes which pass over sheaves on towers and connect to counterweights about equal to the span weight. Variations in almost every feature have developed: Towers may be in part supported on adjacent spans; four vertical columns per tower, with four sheaves, may be used; both towers and span may be square or skewed.

When the lift span is short, the rear bracing of the towers

An Elaboration of the Lift Span Idea. The North Kansas Bridge Over the Missouri River with a Lifting Lower Deck

may be omitted and overhead struts used instead. Where the lift movement is small, each column may be independent, the sheaves placed transverse to the span, and two counterweights hung outside the columns at each end. In one bridge the columns are part of the lift span and extend down as legs into wells in the piers; the sheaves are on the piers and the counterweights are suspended underneath the floor, thus no tower or machinery is above the deck. Towers may be of steel, wood or concrete; concrete towers may be treated architecturally and excellent appearance secured.

### Adaptability and Economy

In some alluvial rivers the location of deep-water channels varies through periods of years. Large expenditures occa-

sionally have been made to construct additional movable spans or to maintain a channel under an existing span. This condition may be met by the use of equal spans, as any span can be made to lift and the towers supported on adjacent spans; towers and machinery may be removed from one location and re-erected in another. Similarly, a bridge may first be constructed with fixed spans, and, later, one span may be made movable; also, towers and machinery may be installed and an old fixed span converted into a lift span, thus economically providing for navigation.

Substructures as well as superstructures must be considered in determining comparative economics of movable spans. Tower piers of lift bridges differ little from ordinary piers. The added loads are vertical and do not change in amount or position during span movement, wind excepted. The elaborate protection pier, common with the swing span, is not necessary, and the lift span shows its greatest comparative economy where foundations are deep or expensive, or are carried on piles. For narrow openings where vessels with lofty masts must be accommodated a bascule is preferable; but where the vertical clearance required does not exceed the channel width, the lift span is found to be nearly always cheaper than the swing bridge or bascule, notably for long spans.

### Qualities of Wire Rope

The qualities of wire rope are essential features of lift-bridge development. A wire rope composed of steel wires twisted into strands which are twisted about a central rope or strand of wires or oil saturated hemp, is much more elastic than the elements composing it and more flexible than a bundle of the same wires wrapped together straight. Extreme fiber stresses from bends of large radius are very small. Steel of great tensile strength can be used, and no other flexible tension member can approach so small a cross-section with equal strength. Each wire and the finished rope can be tested and an element of marked homogeneity secured of varying characteristics as desired.

The life of a wire rope operating over a sheave is a function of the number of operations. Biggart's experiments with sheaves up to 42 rope diameters developed that the first wire will break approximately at the mid-point of rope life in operations. Applied to sheaves of 60 diameters, his formulas indicate a rope life of about 1,000,000 operations, or for a bridge, say, 50 operations daily up and down for 25 years. Yearly examination of suspending ropes will give timely warning of approaching weakness long before replacement is necessary. With suitable connections such replacement can be made without any interference with traffic or bridge movement.

Forged steel sockets of full rope strength are used to connect ropes to structural parts. The load on a group of ropes of unequal length or uneven stretch may be distributed equally to each by equalizing bars or levers. A clamp on the ropes just below the sheave prevents movements of equalizers due to rope divergence, yet leaves every rope free to equalize.

### Suspending Sheaves

Suspending sheaves of 60 to 80 rope diameters afford satisfactory proportions between direct tension and bending stresses in ropes. Grooved sheaves of single steel castings, or of cast rim sections and hub riveted to structural webs are used. Composite sheaves not fully riveted are not satisfactory unless the shop work is better than is ordinarily the case. Sheaves 12 ft. in diameter, 36-in. face, have been supplied as single castings.

The two sheaves on a tower are quite independent, and slight variations in position cause no difficulty provided only that each pair of bearings are in proper relation. The sheaves can be skewed and the suspending ropes led directly from lift-span truss to counterweight, or the sheaves can be

set in any lateral position and the ropes connected to a portal girder of the lift span.

### Operating Machinery

The most used and most approved operating machinery comprises operating drums with motor attachment on the lift span controlling operating ropes. Near the middle of the span are four spirally grooved drums connected through trains of gears to motor or engine. Each drum contains and controls two operating ropes which pass, respectively, under and over deflecting sheaves at the corner of the span, thence one upward and one downward to connections on the tower column. Revolution in one direction winds on the up-haul ropes, pays off the down-haul ropes, and lifts the span; reversal of the drums pulls the span down.

The operating ropes connect to take-up devices and may be adjusted to have the same general tension at each corner. The span is thus moved, held level during operation, and may be held at any point or backed down by stopping the machinery. No other locks are necessary, although occasionally used, principally as part of a track-interlocking system.

Methods of constructing counterweights vary with navigation conditions. When there is a closed season the lift span is placed on the piers, the suspending ropes connected and laid over the sheaves, the counterweight frames hung in place, wood forms bolted to them, and the concrete deposited. When the channel must be kept clear, the counterweights can be built in raised position on special beams attached to the towers or other falsework, the lift span floated in, or erected in elevated position, attached to the ropes and lowered to lift the counterweights so their supports may be removed.

Counterweights of pre-cast blocks can be erected with ordinary equipment without falsework, provided only that the channel may be blocked for the few hours needed to raise and place the counterweight parts. They can be taken down as readily, so this form is always used where various spans are made liftable, and is regarded with favor for any bridge.

Except when the span and counterweights are at the same elevation, the suspending ropes are unbalanced. Ordinarily, this varying unbalanced load is handled by the surplus capacity of the operating machinery. Exact balance for all conditions may be secured with counterbalancing chains. Suspending sheaves may be used at the corners of a lift span effecting a three-part rigging of suspending ropes, reducing the counterweights by one-half, and doubling their height of movement. This was found advantageous with a very heavy span with low lift.

The counterweights are guided during movement by jaws engaging vertical tracks on the towers. The span is similarly guided, with allowances for temperature variations of span length, and for the deflections of the towers. At one end the span is held both laterally and longitudinally, at the other only laterally. To bring the span to exact lateral position for proper junction of track rails, the lower few feet of the guide-tracks are battered out to take up all lateral clearance in the guides at the seated position of the span. The guide-jaws may have rollers. Spring guides bearing on tracks on the faces of tower columns have been used, but are less satisfactory than the jaw guides.

The pier at the end of a lifting span supports, in addition to the loads of a fixed span, one tower, sheaves, and ropes, one counterweight, and additional wind load. For a single-track railroad bridge, Class E-55 loading, and lift span 200 ft. long for an ordinary inland river, this total extra load on one pier, except wind, is about 275 tons, which is additional to an ordinary imposed load for the fixed span of about 1,200 tons.

Near together over the Willamette river in Portland, Ore., serving the same kind of traffic, are one steam operated swing

span, one electrically operated swing span, one excellent double-leaf bascule span, one double-deck lift span, and one simple lift span. County records show that the latter, the Hawthorne Avenue bridge, serves more tonnage of traffic, operates more quickly, and costs less per operation than any of the others. Its openings average 15 daily, the average time that traffic is delayed per opening is 110 sec., the power consumption is less than 2 kw. per operation, and the cost of power per operation is about 5 cents. The lift span is 245 ft. long.

The lift-bridge idea may be applied not only to lifting spans, but also to a bridge floor supported at several points along its length, called a lifting deck, which is peculiarly adaptable to double-deck structures. In older forms, of

A Further Elaboration of the Vetical Lift Span. The Harriman Bridge at Portland. A Lift Span with a Lower Lifting Deck

which a few small spans have been built, the lifting deck and its counterweights were supported from the overhead trusses. The later structures relieve the supporting trusses of about half this load by placing the counterweights at the ends of the span. The North Kansas City Bridge over the Missouri River has a lifting deck, 425 ft. long, serving a double-track railway.

The Harriman Bridge over the Willamette River at Portland, Ore., offers a noteworthy example of the exceedingly feasible variations possible with the wire-rope lift-bridge idea, for it has a lifting deck suspended under a lift span which can be operated without movement of the span; or both can be raised at will. This design met the special condition of dense highway traffic on an upper level which is obstructed only a few times a day for the passage of masted vessels, although the lower deck is open sometimes for as many as one hundred boats per day.

A LIQUIDATING CORPORATION whose object will be to round up and take title to all American goods sent to South American countries which have been unclaimed or refused by the consignees is to be formed by a committee which has been named by the Argentine-American Chamber of Commerce. This committee will endeavor to dispose of such unclaimed merchandise and return the proceeds to the owners in this country, thus assisting in the liquidation of a credit which has been frozen solidly for several months.—*New York Times*.

# Railroad Hearings Before Senate Committee

## Presentation of Railroad Testimony Nearly Completed —Maintenance Expenditures Discussed

WASHINGTON, D. C.

THE HEARINGS on the railroad situation before the Senate committee on interstate commerce were resumed on June 14. E. T. Whiter, chairman of the railroad conference committee which represented the carriers before the Railroad Labor Board, completed his statement regarding the effect of the National Agreements and was followed by L. E. Wettling, manager of the statistical bureau for the Western lines, who presented and explained to the committee a large number of statistical statements prepared by the Bureau of Railway Economics which contain the basic data prepared by the railroads for the hearing, some of which had already been presented in the testimony of individual witnesses. Mr. Wettling was to be followed by W. H. Williams, chairman of the Wabash, and Alfred P. Thom, general counsel of the Association of Railway Executives, was expected to conclude the railroads' presentation this week with a final summing up of the case. The committee has indicated its intention of hearing next from S. Davies Warfield, president of the National Association of Owners of Railroad Securities, who has a plan for the reorganization of the railroads, and later from any shippers who desire to be heard, although the committee has thus far heard from very few representatives of shippers who desire to testify. Representatives of the railroad labor organizations asked that their appearance be postponed until July 5 because of the hearings before the Railroad Labor Board in Chicago and general meetings of labor organizations called for the first part of July to consider the wage decisions.

The necessity for making up for the lack of adequate maintenance during the period of federal control in order to restore the railroads of the country to a condition to meet increased transportation demands was responsible for a large part of the increase in the cost of railroad operations in 1920, Mr. Wettling said.

Chairman Cummins called attention to the fact that this increase in the cost of maintenance was particularly marked during the six months' guaranty period; and, in reply to his question, the witness explained that it was necessary to make extraordinary expenditures for maintenance immediately after the termination of federal control.

### Guaranty Does Not Cover Any Excessive Maintenance

"It has been alleged," said Senator Cummins, "that the railroads were reckless during the guaranty period because the government in any event must make good the amount from the federal treasury. I want it to be especially emphasized that the Transportation Act guarded completely against any such contingency as that and if it turns out that the railroads have expended more from March 1 to September 1, 1920, than they ought to have spent according to a formula which was adopted under the standard contract, then the government is not required and will not be required to pay anything because of that fact."

"In other words," interjected Mr. Thom, "the guaranty does not protect the railroads for any excessive expenditure for maintenance."

"One of the controlling factors," said Mr. Wettling, "which tends to distort such comparisons and makes the increase in these expenses in the 1920 period seem disproportionate to the increase in other expenses, lies in the fact that the expenses in the corresponding period in 1919 were subnormal because of restrictions placed upon them by the director general.

"Necessarily such a policy produced a condition of under-maintenance and the roads were turned back on March 1, 1920, in a run-down condition which made it imperative, in the interest of safe and adequate service to the public, that so far as possible the roads be rehabilitated and restored to the condition and efficiency in which they were found when taken over by the government on December 28, 1917.

"This necessity was especially urgent in view of the fact that the public was at that time demanding of the railroads with fair promise of continuance the greatest service in their history, and to perform this task it was essential that the roads be promptly brought to their highest possible point of efficiency, limited only by the ability to obtain the necessary labor and material together with the money with which to pay for the costs.

"The costs were abnormally increased over the corresponding period of 1919 by several well known factors, the principal items being the labor award of July 20. This large increase affected the costs materially during four months of the period under consideration and the cost was also greatly increased, during the entire six months, by reason of the so-called National Agreements, none of which were in effect during the corresponding period of 1919; another large factor entering into the increased cost of maintenance was the increase in prices of material which in May, 1920, were more than 20 per cent greater than in May, 1919, and continued to increase, reaching their maximum in July and August, the average for the year being estimated at about 30 per cent over the average price for 1919.

"The fact that the natural tendency was to limit these maintenance expenses to what were absolute necessities should be evident when consideration is given to section 209 of Transportation Act, 1920, which definitely fixed a limit on the amounts to be allowed for such expenditures and constituted public notice to the carriers that any expenditures in excess of such limits would have to be borne by the carriers themselves.

"Nevertheless, because of the urgent necessities therefore the carriers continued their program of restoration of the properties until in October, 1920, when it became apparent that a general business depression was imminent and that the full net revenues anticipated as a result of the advances granted in Ex Parte 74 were not being realized. Most of the roads had little hope of further advances from the Railroad Administration and because of the refusal of the Secretary of the Treasury to honor certificates of partial payment for the guaranty period the carriers found themselves short of funds and were thus manifestly unable to continue the necessary maintenance expenditures and the expenditures since November, 1920, have suffered a substantial reduction below the necessary requirements by many roads."

### Expenditures Necessary to Put Properties in Condition to Handle Traffic

Senator Cummins had called attention to figures shown in an exhibit filed by Mr. Wettling which divided the 1920 figures between the two months' period during which the roads were still under federal control, the six months' guaranty period and the four remaining months of the year after the rate increase. Senator Cummins said that the increase in expenses for maintenance of way and structures during the guaranty period as compared with the corresponding period of 1919 of 45.4 per cent, and in maintenance of

equipment expenditures of 39.2 per cent as compared with increases of only 15.1 per cent and 10.9 per cent, respectively, in the six months ended with February, 1921, arrested attention. Mr. Thom replied that for that reason he desired to call attention to the fact that under the terms of the law the railroads are not protected by the guaranty for the entire amount of the maintenance expenditures during this period, but only to the extent of the amount to be determined by the commission. The railroads made this necessary increase in expenses with their eyes open, he said, because the expenditures had to be made to put the properties in condition to handle the traffic. Senator Cummins said it would be well at that point to read into the record the provision of the transportation act which thus limits the guaranty and directs the commission to apply the rule of the standard contract as to maintenance, saying that he desired to emphasize that point. He added that it is not yet known whether the commission will allow the full amount of the expenditures. Mr. Thom said that it is known, however, that the commission will reduce the amount to be charged for maintenance, for the purpose of fixing the guaranty, to the standard provided for in the act.

In explaining the increase in the amount of money spent by the railroads during 1920 for maintenance purposes compared with the previous year, Mr. Wetling said the railroads performed more maintenance work during the past year than in either 1918 or 1919 when they were under federal control. Although the cost was much greater owing to the increased cost of labor and materials, he said, they performed less, however, in 1920 than they averaged annually during the test period which consists of the fiscal years of 1915, 1916 and 1917. Mr. Wetling said the increase in the amount expended for maintenance purposes in 1920 over 1919 "was not abnormal or excessive."

"In full recognition of the fact," said Mr. Wetling, "that the roads had not been fully maintained to the proper standard during federal operation and that the traffic being offered by the public demanded that the roads be immediately restored to pre-war efficiency in order to render proper and adequate service and notwithstanding the realization that the costs would be excessive because of the trend of prices of material and the probable outcome of the demand for higher wages than before the Labor Board, the roads diligently began their efforts to restore their properties to the high degree of efficiency which obtained prior to the war."

Reports from 93 per cent of the Class I railroads representing approximately 218,000 miles, show that in 1920 they spent \$961,304,000 for maintenance of way and structures compared with \$727,705,000 in 1919 and \$616,742,000 in 1918, while during the test period they averaged \$383,699,000.

In 1920, those roads laid 2,262,033 tons of new and second-hand rails the total cost of which was \$82,219,999, compared with 2,027,159 tons costing \$69,961,049 in 1919 and 1,615,963 tons costing \$50,836,964 in 1918. During the test period the yearly average was 2,041,676 while the total cost was \$54,166,631.

The ties placed during those years follow:

	Average per annum Test Period	1918	1919	1920
Switch ties (feet).....	172,689,571	160,024,789	176,079,389	170,345,383
Bridge ties (feet).....	55,625,964	45,400,555	49,644,851	41,533,926
Other ties (number)....	83,885,109	69,327,243	73,398,922	77,015,580
Total cost .....	\$58,135,355	\$62,886,865	\$84,156,035	\$107,772,885

Taking up the question of ballast, Mr. Wetling said those roads in 1920 applied 19,118,553 yards at a cost of \$12,045,000 or an average cost of 63 cents per yard. In 1919 those roads applied 17,518,791 yards at a cost of \$9,481,545 or an average cost of 54 cents, while in 1918 they applied only 14,796,252 at a total cost of \$6,472,151 or an average cost of 43 7/10 cents per yard.

Of the total cost of maintenance of way and structures, \$577,688,000 or 60.09 per cent was paid to labor. Cost of material was 29.67 per cent. During the test period \$209,906,000 or 54.71 per cent went to labor; \$401,331,000 or 65 per cent in 1918 and \$439,140,000 or 60.35 per cent in 1919.

In connection with the exhibit showing the results of operation since the rate increase, Senator Cummins called attention to the fact that railway revenues in March showed a decrease of two-tenths of one per cent in spite of the increase in rates, showing the effect of the decrease in traffic. Mr. Wetling said there was a reduction for the month as compared with March last year of 27 per cent in ton miles and 13 per cent in passenger miles. The senator also pointed out that the railroads had effected a reduction of \$20,000,000, or 4.8 per cent, in the operating expenses for the month and asked if that were not a hopeful sign. Mr. Wetling said that while the railroads were reducing their expenses, the figures showed that about \$15,000,000 of the reduction was in maintenance expenditures, which represented largely the postponement of work rather than a real saving. He also called attention to figures compiled by the Bureau of Railway Economics from a questionnaire sent to the railroads, showing that the railroads had actually expended less for labor in the first three months of 1921 than in the corresponding period of 1920 by reductions in force, because the number of employees during the first quarter this year was about 15 per cent less than last year. In connection with the table comparing the operating accounts from 1912 to 1920, Senator Cummins said that the public is being misled by the repeated publication of figures showing the net operating income earned in 1918 and 1919 during the period of federal control, because people were led to believe that the government's loss from the operation of the railroads was only the difference between the amount actually earned and the guaranty to the railroads. If the government had properly maintained the properties, he said, the net operating income would have been smaller and the loss to the government would have appeared larger, and he estimated that the government's loss after allowing for undermaintenance claims would be at least a billion and a half instead of seven hundred, eight hundred or nine hundred million dollars.

"The public will never comprehend what government control cost," he said, "until we have to make an appropriation to pay the final bill."

### National Agreements

Mr. Whiter had been questioned by members of the committee as to who was responsible for the rules of the national agreement for shop men. Quoting from the testimony of Frank McManamy, formerly assistant director of the Division of Operation, Railroad Administration, before the Railroad Labor Board on April 11, Mr. Whiter said the committee which actually negotiated this agreement was composed entirely of men of union labor affiliation, at the time employed by the Railroad Administration, after two distinct groups of representatives of the men and of the Railroad Administration had failed to agree on a set of rules. The final negotiation of the agreement, he said, "really amounted to a session of labor representatives sitting down with former conferees and working out a schedule satisfactory to themselves, but in large part wholly unsatisfactory to the railroad officers who represented the government and who had previously disagreed upon about half of the rules suggested."

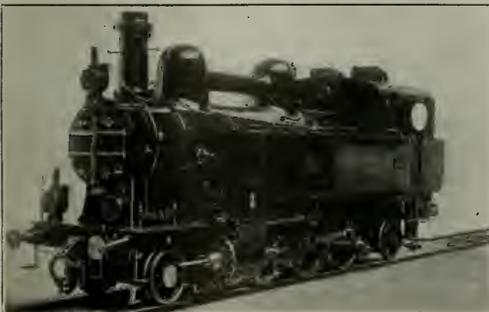

"I have read in the newspapers," Mr. Whiter said, "some criticism of the Labor Board as to the long delay in hearing and disposing of the question of continuing the national agreements, rules and working conditions. The Labor Board had before it the demands of some 20 or more organizations for consideration in addition to the short line hearings, hearings on cases of individual railroads, and other routine work, so that when the magnitude and scope of the question is taken

into consideration in my judgment all things considered the Board has handled their work promptly.

"Decision No. 119, dated April 14, 1921, issued by the United States Railroad Labor Board, directs that Decision No. 2, extending the rules, working conditions and agreements in force under the authority of the United States Railroad Administration, will cease and terminate July 1, 1921, and calls upon the individual railroads and their employees to negotiate new schedules of rules covering working conditions. The Labor Board lays down 16 principles which are to be taken into consideration in the formation of the new rules. If the organizations meet the individual managements in the spirit intended by Decision No. 119 much will be accomplished; if on the other hand the organizations maintain the position contending for that which in effect would be a continuation of the national agreements, thus ignoring the principles laid down in Decision No. 119, little or no progress will be made. Therefore, it remains to be seen whether the roads will be successful in negotiating reasonable and proper rules, or whether the whole question will again be thrown back to the Labor Board for decisions as to what constitutes reasonable rules. If the latter becomes necessary it is obvious that the railroads will not promptly realize the relief from these ultra-restrictive rules, which they believe Decision No. 119 intended."

Mr. Whiter said he had received information that the federated shop crafts intend to remain firm for the principles if not the exact language of the national agreements and that he had just received a pamphlet issued to the members of the federation reporting the results of the negotiations up to date on 85 railroads, which he said plainly indicated the purpose and intention of the federated crafts to hold out without any qualification for the principles of the national agreement. If that is to be their attitude, he said, it is going to be impossible to reach any satisfactory agreement and the whole matter will go back to the labor board for consideration and decision. The crafts will refuse to consent to any agreement unless the railroads agree to accept the principles of the national agreement, which would mean the continuance of the burden of at least \$300,000,000 a year, which the railroads ought to be relieved of. Mr. Whiter said that a large number of the railroads have entered into negotiations for new rules to take the place of the national agreement, but that very little progress is being made because of this attitude of the organizations.

Senator Cummins announced that the railroads would be expected to complete their presentation by Friday, June 17, and that Mr. Warfield would be heard beginning on June 21. Clifford Thorne and S. H. Cowan have arranged for an appearance on July 11. Only three or four Senators attended the hearing on Tuesday and Senator Cummins alone represented the committee on Wednesday.

An Austrian Suburban Locomotive

## Committee Reports of Purchases and Stores Section

AN ACCOUNT of the business meeting of the Purchases and Stores Division of the American Railway Association, held on June 9-11 at the Blackstone Hotel, was published in the *Railway Age* issue of June 10, page 1355. Owing to lack of space, the reports of the Committees on Buildings and Structures, Scrap Classification and Cross Ties were not included and abstracts are therefore given below.

### Buildings and Structures

The committee (J. E. Byron, Gen. Storekeeper, Boston & Maine, chairman) stated that few questions had been referred to it during the year, but that it thought it desirable to emphasize certain points referred to in previous reports.

**Construction and Insurance**—Lest any impression prevail that "steel unprotected" is not damageable by fire, the use of unprotected metal as structural material, particularly in carrying weights, is even less desirable than substantial timber and plank construction, being more susceptible to fire damage, losing its strength quickly when heated, involving extra expense in removing debris from ruins of such construction, and under schedule insurance the rate on storehouses constructed of wood or unprotected metal is about 50 per cent greater than where other materials are used.

The aggregation of value represented by the contents of a storehouse would alone justify protection against fire regardless of any insurance consideration. But seldom does insurance carried completely cover heavy loss, generally leaving a balance which is irrecoverable, and, what many times exceeds the direct loss, a consequential loss, which includes, among other items, expense of temporary quarters, increased cost of new facilities or in replacing stock, delays to or loss of labor and equipment through lack of proper material and high cost of recovering salvage, necessitating the most careful consideration of fire hazards and their protection.

With regard to rates, nearly all railroad storehouses are insured under schedule policies carried by the road on its property in general, and as the scheme of rating and renewing such general schedules is one of broad classification of risks and fluctuations according to the loss record of each road, it is not possible to estimate the probable rates for any particular type of construction or protection.

**Fire Protection**—Among other protective measures the subdivision of storehouses by substantial partition walls at reasonable distances to help confine fire to the section in which it starts is most important, and automatic sprinklers are recommended as the best device available, the installation to be planned by experts.

Fire protection appliances and safeguards should be provided only after consultation with fire prevention department of the road, or, if none, with other competent authority, as to what types and locations are suitable, etc. As some appliances on the market are not approved, the standards developed along these lines in recent years by men of wide experience, such as the Railway Fire Protection Association, should be carefully adhered to.

Fires in oil houses or similar hazards are of such nature as to require special precautions, and their prevention should be the subject of reference to the fire prevention department, or such other competent authority as the Railway Fire Protection Association.

**Standards**—The more this subject is investigated, the more is realized the entire lack of standards covering buildings, shelving, counters, racks, containers, etc. A careful study of this subject by each road is again recommended, and the adoption of standard prints covering the various types of buildings, as well as of standard facilities to be used therein or in connection with such buildings.

Attention is again called to the tremendous need of suit-

able structures in which to house materials to prevent loss and deterioration from exposure to the elements. While this has been followed carefully on some roads, we feel that on many roads it has not been given the attention it deserves.

*Location*—While every report dwells upon the importance of locating material storage buildings where they will be most convenient to the operations to be served there still exists a tendency to place such buildings without regard to their accessibility, and the saving in labor and time which due consideration of this feature involves.

### Scrap Classification—Handling and Sales

The committee submitted the following changes in the Standard Scrap Classification:

#### TERMS OF SALE

##### *Old Form*

Sealed bids for this scrap to receive consideration must be in this office by 12 o'clock noon on.....

Final shipping directions must be furnished within 10 days from date of award. When shipping directions for material are not furnished within 10 days from date of award, it shall be optional with this company to cancel the sale at any time thereafter.

Shipment will ordinarily be made within 30 days after receipt of shipping directions unless prevented by causes beyond our control. If shipment is not made within 60 days, prevented by causes beyond our control, it will be optional with either party to cancel balance due, within 10 days thereafter.

Current tariff switching charges will be made for delivery to connecting lines.

##### *Suggested Changes*

Sealed bids for this scrap, to receive consideration, must be in this office by 12 o'clock noon on..... and remain in effect until 12 o'clock noon on.....

Final shipping directions must be furnished within five days from date of award. When shipping directions for material are not furnished within five days from date of award, it shall be optional with this company to cancel the sale at any time thereafter.

*NOTE*.—Majority report, five days: Messrs. Hoinville, Kirk, Jones and Hughes. Minority report, ten days: Messrs. Haynes and Munster.

Shipment will ordinarily be made within 30 days after receipt of shipping directions unless prevented by causes beyond our control. If shipment is not made within 45 days, prevented by causes beyond our control, it will be optional with either party to cancel balance due, within ten days thereafter.

#### CLASSIFICATION OF SCRAP IRON AND STEEL

10 Boilers, Fire Boxes and Tanks, Uncut.  
All kinds, attached or separate.

11 Boilers, Fire Boxes and Tanks, Cut Up.  
Iron or steel boiler or tank plate cut into sheets and rings.

17 No. 3 Railroad Cast.  
Pieces weighing over 500 lb.; includes cylinders and driving wheel centers, and all other material that can be broken under a drop; otherwise same specification as Classification No. 15.

29 Limed Iron and Steel.  
All kinds of material from interior of boilers (except flues which are encrusted with lime or corrugated by the action of water), such as crown bars, crown bar bolts, staybolts, etc.

43 Sheet Scrap No. 2 and Miscellaneous.  
Includes netting, other than stack wire, all galvanized or tinned material, composition brake shoes and gas retorts.

82 Belting.  
No. 1 belting, leather, six inches wide and over.  
No. 2 belting, leather under six inches, punchings and trimmings.  
No. 3 belting, rubber, all kinds.  
No. 4 belting, compositions.

Other changes suggested consisted merely in the wording of class designations.

The report is signed by C. H. Hoinville, chairman of the committee, A. T. & S. F.; J. C. Kirk, C. R. I. & P.; J. R.

8 Angle and Splice Bars, Patented Joints Only.

11 Boilers, Fire Boxes and Tanks, Uncut.  
All kinds, attached or separate. Specify whether with or without flues.

11 Boilers, Fire Boxes and Tanks, Cut Up.  
Iron or steel boiler or tank plate cut into sheets and rings (with or without staybolts).

*NOTE*.—Question of whether to include sheets from steel cars.

17 Cast, Railroad No. 3.  
Pieces weighing over 500 lb.; includes cylinders and driving wheel centers, and all other castings; otherwise same specification as classification No. 15.

29 Limed Iron and Steel.  
All kinds of material from interior of boilers (except flues which are encrusted with lime or corroded by the action of water) such as crown bars, crown bar bolts, staybolts, etc.

43 Sheet Scrap No. 2 and Miscellaneous.  
Includes netting, other than stack wire, all galvanized or tinned material, composition brake shoes and gas retorts, and any other iron or steel material not otherwise classified.

82 Leather Belting.  
No. 1 leather belting six inches wide and over.  
No. 2 leather belting, under six inches, punchings and trimmings.  
No. 3 rubber belting, all kinds.  
No. 4 composition belting.

Haynes, C. B. & Q.; W. F. Jones, N. Y. C.; A. W. Munster, B. & M.; E. H. Hughes, K. C. S., and B. T. Jellison (chairman ex-officio), C. & O.

# Railroad Losses in Colorado Exceed Five Millions

Early Estimate on Destruction to Property and Life Greatly  
Overshadowed by Recent Survey

REPEATED HEAVY RAINS and warm weather attacks on mountain snows have caused untold damage to Colorado railroads in the last two weeks. The catastrophe at Pueblo on June 3, which resulted in the death of several hundred persons and a \$5,000,000 loss to the railroads, overshadows the troubles elsewhere in the state, but these collectively add a great sum to the flood bill imposed on the roads. Nearly all roads have suffered north of Denver. The Colorado & Southern, the Fort Collins branch of the Union Pacific and other lines were thrown out of service by washouts. Similar conditions near Sterling caused short interruptions to traffic on the Union Pacific and the Chicago, Burlington & Quincy. Later, about June 10, high

road bridges over the Arkansas River, besides three over the Fountain River. Only one, the Santa Fe bridge to the Union Station, escaped. All the others lost one or more spans or large portions of approaches. The Missouri Pacific yard and engine terminal has been cut off by a new channel of the river, so it is now on an island without rail connection. A Denver & Rio Grande and a Missouri Pacific train were caught in the flood while trying to escape to high land, and the cars were overturned, with the loss of several lives, the number not known.

The two thousand cars in the yards during the flood suffered enormous damage; many were floated away and overturned or crushed by impact or pressure of debris. There

Overturned Passenger Trains on the Station Tracks. Pueblo Union Station Building on Right

water in the Grand and the Animas rivers threatened the Denver & Rio Grande near Grand Junction and Durango, respectively, while the Silverton branch of the former road is out of service.

The great local precipitation which led to the Pueblo disaster brought about a sudden runoff into the channels of the Arkansas River and its tributary, the Fountain, which joins in the city, and the rush of water which wrought such havoc in this city carried destruction to railway property from Canon City on the west to the state line on the east and as far north as Colorado Springs. As a consequence, not a single line of railroad was in a condition to carry relief trains into the city for two days after the flood.

The flood on the evening of June 3 passed through the heart of the city, covering a scene about one mile wide with a 12-foot blanket of madly rushing water. The flooded area included nearly all of the intensive terminal developments of the railroads entering Pueblo. In it were six rail-

road bridges over the Arkansas River, besides three over the Fountain River. Only one, the Santa Fe bridge to the Union Station, escaped. All the others lost one or more spans or large portions of approaches. The Missouri Pacific yard and engine terminal has been cut off by a new channel of the river, so it is now on an island without rail connection. A Denver & Rio Grande and a Missouri Pacific train were caught in the flood while trying to escape to high land, and the cars were overturned, with the loss of several lives, the number not known.

The two thousand cars in the yards during the flood suffered enormous damage; many were floated away and overturned or crushed by impact or pressure of debris. There were 467 overturned cars on the Denver & Rio Grande tracks alone in the Walker yard of that road. The effect was like that of a bad railroad wreck on every track. Some cars were floated great distances and will never be recovered. The reclamation has been slow because of the debris and mud which covered all tracks except those in the path of the fastest water, many of which were washed out. A large part of the tracks were covered from one to two feet with mud and had to be dug out before cars could be moved. The Rio Grande and the Santa Fe roundhouses were in a like condition. Twenty carloads of mud had to be taken out of the Santa Fe turntable pit before a single locomotive could be released.

The first line to be opened into the city was the Rio Grande and Santa Fe route from Denver, detouring from one line to the other to avoid the worst washouts, and coming into the Santa Fe Eighth Street yard, the only one in shape to handle any cars at all. Next, the Denver & Rio Grande

Trinidad line was opened, and after clearing a track through the Union Station, it was possible to run trains through from Denver to Trinidad on June 9. The Missouri Pacific, after completing a long pile trestle approach to its Fountain River bridge, was able to bring in its first train from the east on June 12, using Santa Fe terminal tracks. The Santa Fe has driven a 1,000-foot pile trestle to take the place of its

this stretch. East of Nickerson, Kan., the river had crossed the roadbed at two different points into Bull Creek, and it is at these two points that the greatest damage was done.

The Rio Grande line north along the Fountain River was

**Railway Property in the Lower Part of the City**

bridge over the Fountain and also repaired breaks in the approaches to the Arkansas River bridge near Nepesta, and was expected to resume service to La Junta about June 16.

**Arkansas River Bridges: Santa Fe on Left, Denver & Rio Grande on Right**

cut by caving river banks, requiring shooflys totaling about three-quarters of a mile in length, and will be opened for traffic shortly. The line of this road to Salida suffered very heavy damage, consisting largely in washing track off the roadbed. Traffic will not be restored for ten days or more, as

Copyright, 1921, by Rocky Mountain News and Denver Times

**View in Yards South of Arkansas River**

The regular service over the Santa Fe's Northern division will be restored on the night of June 14. A work train passed over this division on June 13, and two local trains were restored to schedule on June 14. In this district the roadbed between Syracuse, Kan., and La Junta, Colo., is very soft and it will be necessary to run trains very slowly over

a break in this line of the Rio Grande cuts the Denver-Salt Lake City line in two. Through passenger trains of the Rio Grande are now routed via the Union Pacific.

The Denver & Rio Grande was affected at so many points on June 14 that freight movement totaled only 150 train miles. The Colorado & Southern's Leadville line will be out

of service for at least two weeks. The Denver & Salt Lake has been subject to repeated traffic interruptions of short duration.

The Colorado & Southern's approach to Pueblo from the south will not be opened for some time, as changes in the channels of the Arkansas and Fountain rivers make it difficult to restore the north approach to this road's bridge over the Arkansas.

Reclamation of railway property in the city is progressing rapidly. Large numbers of wrecking cranes are picking up the overturned cars and many locomotive cranes are being used to clear tracks of mud and debris. The labor situation in the city has been good, as a uniform rate of pay established under martial law removes competition for men. The local supply is plentiful, and very few men have been recruited outside the city. Railways are as yet unable to estimate damage accurately.

### Freight Car Loading

WASHINGTON, D. C.

**A**N INCREASE OF 18,907 in the number of cars loaded with revenue freight during the week ended on May 28, compared with the previous week, was shown by reports from the railroads compiled by the Car Service Division of the American Railway Association. The total for the week was 787,237 cars. This was 110,970 cars under that for the corresponding week in 1920 but 23,476 more than were loaded during the corresponding week in 1919.

Increases as compared with the previous week were reported in the loading of all commodities except ore. The largest gain was made in the loading of grain and grain

loaded with ore, or 1,500 below the week of May 21. Grain and grain products were the only commodities to show an increase over the corresponding week last year.

All districts reported increases in the number of cars loaded during the week which ended on May 28 over the previous week except the Pocahontas, although that district was the only one to report an increase over the corresponding week in 1920.

The freight car surplus for the period from June 1 to June 8 averaged 389,526, a decrease of less than 4,000, as compared with the previous week. Of the total, 147,656 were box cars and 162,035 were coal cars. On June 1 the percentage of bad order freight cars was 16.7 as compared with 16 on May 15.

### Short Lines Establish Consolidated Purchasing Agency

WASHINGTON, D. C.

**A**S ONE MEANS of lowering railroad operating costs, with which the Interstate Commerce Commission as well as the railroads, is actively concerning itself, the American Short Line Railroad Association has established a consolidated purchasing agency in Washington for the benefit of its membership throughout the United States. This membership now consists of some 500 separate railroad corporations with a combined main line mileage of approximately 25,000.

It is believed that important economies will accrue to the short lines by the combined purchases of their material requirements and that in like manner the cost to the manu-

L.C.L. merchandise loading figures for 1921 and 1920 are not comparable as some roads are not able to separate their L.C.L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

May 21	1921	37,252	26,368	158,512	5,337	50,216	30,214	216,030	244,401	768,330	862,074	777,324	508,969	666,585	557,879

products, the total being 46,337 cars or 9,085 more than the previous week. A total of 164,870 cars were loaded with coal which was 6,358 cars greater than during the preceding week but 9,700 less than during the corresponding week last year.

Merchandise and miscellaneous freight, which includes manufactured products, showed a gain of 3,526 cars over the previous week, the total being 463,957, while the total loading of livestock was 27,518 cars, or 1,150 cars higher than the week before. A total of 50,277 cars were loaded with forest products and 5,605 with coke. Reports showed 28,673 cars

manufacturer will be greatly reduced by dealing in quantities through one purchasing agency only, while serving at the same time some 500 railroads. This agency will have three sections or departments: new equipment and materials, second hand equipment and industrial development.

The so-called short line railroads of the United States vary in size and character from a small industrial railroad with practically a one-man organization up to a completely equipped railroad of several hundred miles. They are located in all parts of the United States, some in remote sections, and for this reason the selling expense to the manufac-

turer in proportion to the volume of business done is such that his margin of profit to these lines must be greater than to the trunk lines.

The plan contemplates that the consolidated purchasing agency will secure from these lines budgets of their anticipated requirements for the approaching quarter, and from these budgets the various items will be tabulated and consolidated. Inquiries will then be sent to the manufacturers on a basis of the aggregate quantities to be purchased, and they will be given shipping specifications at the same time to enable them to make up manufacturing schedules.

Where advisable, a blanket agreement will be made with a manufacturer covering a group of lines in a certain territory; or where practicable from a distribution standpoint; for the entire membership of the association, whereby all requirements in his line will be bought from this manufacturer.

Orders will either be sent direct by the member lines, or through the consolidated purchasing agency, as may be deemed most expeditious; but in all cases the material will be shipped and invoiced direct to the railroad company.

In the purchase of fuel, wherever practicable, an agreement will be made with mines or oil producers whereby their total output will be taken and distributed to a group of lines in that particular territory.

The locomotive and car builders will be asked to assist with composite designs of locomotives and cars, using, wherever possible, standards for which patterns are already available, and any other manufacturing practices which will make for economy in the construction of equipment and yet secure for the Short Lines the very best product obtainable.

There are a great many short line railroads that are endeavoring to use equipment entirely unsuited to their needs. In some cases this equipment was bought during the construction period and from divers sources. The short line has been unable to dispose of this equipment except at a sacrifice usually demanded in second-hand deals, and has, therefore, worried along with it at a considerably greater expense than if an exchange could be made for something different. The consolidated purchasing agency is, therefore, planning to send out questionnaires to each line, asking that it list such equipment or material as it desires to sell, with a fair price thereon; and in another column it will be asked to list such equipment or material as it desires to purchase provided proper disposition can be made of that which it has for sale. These items will then be tabulated and negotiations started between the various roads.

Wherever a short line railroad is in the market for second-hand equipment, and nothing of the desired quality and specifications is available among the members of the association, inquiries will be sent direct to the trunk lines and the sale of the equipment handled direct from the trunk line to the short line at a considerably lower cost than in the past where it has passed through a number of hands.

The short lines, located as they are in all parts of the country, originate a large quantity of raw materials used in various industries, and this department will devote its efforts to developing these various sources, primarily for increasing the traffic of the various lines, but of equal advantage to industries in general and to the entire railroad system of the country.

In the matter of cross ties alone, the short lines probably originate a very large percentage, and through the operation of this department, sales will be promoted between the producers along the short lines and those trunk lines not located in tie producing territories.

While it will require time and energy to work out the various details of this plan, considerable headway has already been made through the co-operation and help of the manufacturers. The members of the American Short Line Railroad Association are equally desirous of co-operating to the fullest extent, and as the consolidated purchasing agency will

act as the medium between the two bodies, it would seem that the results are destined to be mutually advantageous.

James W. Cain, who has been appointed manager of purchases of the American Short Line Railroad Association, with headquarters in Washington, D. C., has had an extended experience both in railroading and in the supply business. He served a machinist's apprenticeship with the Atchison, Topeka & Santa Fe at Topeka, Kan., and later took a mechanical engineering course at Purdue University, graduating in 1905. From 1906 to 1907 he was assistant engineer of tests on the Atchison, Topeka & Santa Fe, and in 1907 he became general sales manager of McCord & Company, Chicago. After two years he was appointed chief engineer of the company at Detroit, which position he held until 1914, when he became vice-president of the G. F. Cotter Supply Company, and the Houston Tie & Lumber Company at Houston, Texas. He remained with this company until 1918 when he offered his services to the government and was assigned to the inspection of ordnance in the Chicago district. After the armistice he formed the firm of Cain-Smith & Co., consulting engineers at Houston, Texas, and was engaged in developing oil and mineral properties until coming to Washington to assume his new duties.

## More Fruit and Vegetables Shipped in Spite of Higher Freight Rates

WASHINGTON, D. C.

SHIPMENTS TO MARKET of leading fruits and vegetables up to June 4 this year have been 15 per cent greater than during the corresponding period of last year, according to official statistics given in the weekly Market Reporter published by the Bureau of Markets of the U. S. Department of Agriculture under date of June 11. This report seems to controvert the assertion so frequently made that the increase in freight rates made on August 26 last year has decreased the shipments of fruits and vegetables.

According to the Market Reporter, the carload shipments of fruits and vegetables this season to June 4 totalled 367,741 cars, an increase of 58,560 cars as compared with last year. For the week ending June 4 the total was 8,105 cars as compared with 6,904 last year; for May the total was 34,524 as compared with 23,221; for April, 31,035 as compared with 20,250, and for March, 29,990, as compared with 25,185. The figures for the season to June 4 for the two years are as follows:

Apples:	1921	1920
Boxed .....	35,022	45,579
Barreled .....	68,989	41,278
Cabbage .....	11,659	13,044
Cantaloupes .....	1,199	1,313
Celery, Florida .....	4,148	3,602
Lettuce .....	12,031	8,790
Onions .....	4,704	6,148
Peaches .....	1,592	101
Potatoes:		
Sweet .....	17,567	15,423
White, old .....	186,755	159,927
Strawberries .....	9,192	5,139
Tomatoes .....	6,146	3,442
Watermelons .....	1,556	127
Vegetables, mixed .....	7,181	5,868
Total .....	367,741	309,181

"Severe declines in the prices of western cantaloupes featured the fruit and vegetable markets during the week ending June 6," the Market Reporter says. "The monthly report of carlot shipments shows that the volume of leading lines has been increasing for the past two months. May shipments totalled 34,524 cars compared with 31,035 in April and 29,990 in March. Movement of apples, cabbage, celery, lettuce and old potatoes showed big decreases, while the supply of cantaloupes, peaches, new potatoes, strawberries, tomatoes and watermelons recorded important increases. Carlot movement continues about 11,000 cars in excess of the corresponding month of last season.

# Meeting of Railway Accounting Officers' Association

Concluding Session Addressed by Col. Colston, Director of I. C. C.

Bureau of Finance

**T**ENTATIVE PRINCIPLES relative to the action that the Division of Finance of the Interstate Commerce Commission was prepared to take as to maintenance charges during the guaranty period were outlined in an address by W. A. Colston, director of the I. C. C. Division of Finance before the concluding session of the Railway Accounting Officers' Association annual meeting at Atlantic City last week. Director Colston outlined the provisions of Section 209 of the Transportation Act relative to maintenance charges for the guaranty period, and invited the carriers to co-operate with his division in arriving at the proper solution of the problem represented. Mr. Colston's address is given in part as follows:

## Maintenance Charges During the Guaranty Period

By Col. W. A. Colston  
Director, Division of Finance, I. C. C.

In settling up the accounts under the guaranty of section 209, if we don't do something we will crucify the carriers on the cross of inaction. We have not been able to get a decision in the most important or most troublesome factor affecting the settlement of the accounts—the matter of maintenance, and I do not believe that we can entertain any great hope of obtaining a general ruling in the very near future. I think, however, that I have a way to suggest out of this trouble. I have been authorized by the chairman of Division 4 to put up a specific case or cases. I am willing to put up not only one specific case or cases as a test, but I am willing to put up the case of every carrier that wants to come in and talk the question across the table, and we can get a decision on each case just as well as we can in a general situation.

What I am going to submit is the plan upon which the Bureau of Finance is willing to enter into a discussion. It is not the decision of the Commission.

### Provides an Accounting Method

#### For Enforcing the Physical Test

I think that the basis for us to build our construction upon is the basis of the law itself. There has been no substitution of anything for the physical test. The physical test is provided as the final result that we must accomplish, and there is provided merely an accounting method for enforcing the physical test; and the result must be as nearly as practicable the same amount, character and durability of physical reparation. Less than that would be unfair to the carrier. More than that would be unfair to the United States.

In the President's Proclamation, when he took over the railroads, and in the paper annexed to that proclamation, he stated that there were two things that we must be assured of, first, that the railway properties should be maintained during the period of Federal control in as good repair and as complete equipment as when taken over by the Government, and, second, that the roads should receive a net operating income equal in each case to the average net income for the three years preceding June 30, 1917. The President promised to recommend those things to Congress, and he did recommend those things to Congress.

When Congress started in to consider those recommendations it was made to appear that, although these two things were ordinarily treated as separate, nevertheless under the system of accounts laid down by the Commission, pursuant to Section 20 of the Act, there was an inseparable connection between maintenance and income and that, therefore, although the President had considered the two things as entirely distinct, it must be recognized that there was an inseparable bond between the two, and that provision must be made to recognize that fact, and Congress legislated with conclusive knowledge of the accounting classifications which had the force of law. Therefore, although Section 1 of the Federal Control Act provided "that the property should be returned in substantially as good repair, and substantially as complete equipment as it was at the beginning of Federal control," Con-

gress recognized then that if during Federal control the carrier had over-maintained its properties you might still comply with that covenant and not give the carrier as much as it was entitled to, because the carrier would have reduced the income that it was entitled to claim during Federal control because of over-maintenance in the test period. On the other hand, if a carrier had under-maintained its properties and you made a double allowance—

- (1) of income realized after under-maintenance or insufficient maintenance had been deducted, and
- (2) then full maintenance.

you would be giving it more than it was entitled to. So Congress went a little beyond what the President had said in his proclamation, and provided that the United States should be reimbursed by deductions from the just compensation, or by other means, for the cost of any additions, repairs, renewals and betterments to such property not justly chargeable to the United States; recognizing that with compensation based on income for the test period, in the case of under-maintenance during the test period if the Government fully maintained the properties during Federal control it would be undertaking a greater maintenance than the carrier was entitled to, therefore, it should deduct from full compensation enough to bring down the allowance for maintenance to the standard actually observed in the test period by the carrier. And it was provided that in making these adjustments consideration should be given to the amounts expended or reserved by each carrier for maintenance and repairs, renewals and depreciation during the three years ending June 30, 1917, and the condition of the property at the beginning and at the end of Federal control, and any other pertinent facts and circumstances.

Possibly it would be well for me to indicate a syllabus of the tentative principles we propose to use in the Bureau.

### Amounts to Be Charged for Maintenance

First, our rule is that in fixing the maximum amounts to be included in operating expenses for maintenance under the guaranty of section 209 of the Transportation Act, 1920, the Bureau of Finance will, as far as practicable, under the accounting test established by the proviso of Section 5 of the standard contract, fix such amounts as would have resulted during the guaranty period in the same amount, character and durability of physical reparation as was applied to the respective carrier properties, during an average six months of the test period, three years ending June 30, 1917, making due allowance for differences in the amount and use of the properties involved.

### Adjustments for Charges in Cost of Labor

Second, in making the adjustments for changes in cost of labor consideration will be given to all changes of any character which affect in any way the labor cost of material in place, and will include not only changes in price of labor per payroll hour or other unit paid for, but also the relation of time paid for to effective time of work, differences in the efficiency and cost of labor due to changed personnel, and any other elements affecting the aggregate cost of labor necessary to affect the standard of maintenance observed by the carriers respectively during the test period.

### Depreciation and Repairs

Third, in fixing the maximum maintenance allowance for the properties during the guaranty period, all charges representing depreciation and repairs will be computed upon the same bases for the guaranty period as were used in the test period.

### The Accounting Test

Fourth, in the computation of railway operating income or any deficit therein for the guaranty period for the purpose of section 209 of the Transportation Act, 1920, the provisions of paragraph (3) of sub-division (f) of the section are provisions limiting the inclusion for guaranty computation of maintenance expenses to amounts actually charged or chargeable on the carrier's books of account under the accounting rules of the Commission, and do not contemplate any increase in or addition to such charges for the purpose of the guaranty settlement.

### Amount and Use of Properties

Fifth, while adjustments for differences in the amount and use of properties involved are not merely matters of accounting to be

settled by the application of fixed and unalterable rules that may be followed by accountants and statisticians, and many adjustments may present serious practical questions not to be anticipated by any rules or formulas, nevertheless, within the limits required by practical substantial settlement of these matters, certain general rules may be determined by men who have had actual extensive experience in the railway field, and carriers are invited to appoint representatives to meet the representatives of the Bureau of Finance to consider and recommend fair and workable formulas for the determination of these questions in specific cases, with the right reserved to any carrier involved in a determination to show that in its case the general rule would be inequitable.

**The Tentative Formula**

I will give the results of a tentative formula which we have worked out and which I have submitted to one carrier to be discussed beginning with the commencement of next week, and it is

substantially this, applying these principles as to maintenance of way and structures, there shall first be deducted from the total charges for maintenance of way and structures for the average six months of the test period the following elements:

1. Depreciation.
2. All charges for retirements based on original cost.
3. Assessments for public improvements.
4. Fire losses.
5. Injuries to persons.
6. Insurance.
7. Possibly joint facility accounts. I have an open mind with respect to the seventh item.

The remaining expenditures, representing material and labor actually expended and directly chargeable to maintenance of way and structures shall be divided so as to ascertain the amount of material and the cost thereof utilized during the average six months of the test period, and such cost shall be equated at

**The Officers, Committee Chairmen and Other Members of the R. A. O. A.**

guaranty period prices to determine the amount for material allowable for the guaranty period. In addition to the allowance for material thus obtained, the carriers will be allowed all actual cost of labor or other expenses incident to putting such material in place. In ascertaining such guaranty allowance for labor and other expenses incident to putting such material in place, the maintenance of way and structure expenses for the guaranty period shall be segregated similarly to the way in which the test period expenses were segregated after taking out the seven items which I have indicated. The remaining expenses representing labor and material are to be separated between the two elements, and the ratio between the two shall determine the allowance for labor in connection with the allowance for material as we have stated. For instance, if the test period material cost equated at guaranty period prices is \$100,000 and the total labor cost during the guaranty period was twice the total material cost during the guaranty period, the labor allowance for the guaranty period will be \$200,000. To the items of labor and material thus allowed we shall, of course, add back the eliminated items adjusted as may be proper in each case.

That is a very general rule and we shall have to make an additional computation. Our rule contemplates calculation at one step of differences in cost of labor arising from differences in price and differences arising from factors other than price. And in order that the Commission may know what is involved in the controversy we shall require intermediate adjustments similar to those which are provided for in Exhibits B and C, I think, of the report of the Sub-committee of the Adjustment Committee of the Executives Association, one of which will show the facts up to the point where you adjust for differences in price of labor and for labor paid for but not worked, because of the regulations as to punching the clock, going to and from work on company's time, etc. In other words, it would show the adjustment of the cost of the effective hours of labor regardless of efficiency, and then the second step will be that which is shown by Exhibit C, which is the adjustment for factors other than price, which will include efficiency or inefficiency and any other elements that may affect the cost of material in place. So we would set forth here the result with respect to all the labor costs for the guaranty period.

For maintenance of equipment, the same procedure will be followed as I have indicated for maintenance of way and structures, except we will make a separate ascertainment for

1. Steam locomotives.
2. Other locomotives.
3. Freight train cars.
4. Passenger train cars.
5. Work equipment.
6. Floating equipment.
7. Miscellaneous equipment, or such combination of the elements as may be found necessary in making the ascertainment.

That, I think, will outline the methods which we purpose to employ. We want to sit down and talk these matters over with you across the table. My advice is don't wait for a final determination on the maintenance question as affecting all the carriers. Come down and present your own case and let us settle it upon these principles or upon these principles as modified after discussion with you. Let's get down and have a heart to heart talk, and I assure you that in the Bureau of Finance we will endeavor on the one hand to so administer this Act, and make our recommendation that we will at least observe the constitutional prohibition against taking of private property for public use without just compensation, and on the other hand I have no doubt in the assistance and in the aid that will be given to us by those with the understanding and the integrity of the members of the Accounting Officers Association.

## Report of the Committee on Disbursement Accounting

The first part of the report of the meeting of the Railway Accounting Officers' Association was given in last week's issue of the *Railway Age*, pages 1343 to 1354. The report as given in the *Railway Age* covered the meeting as far as part of the report of the Committee on Disbursement Accounting. Other important subjects discussed by that committee follow:

**Wage Statistics.** This subject received considerable attention, particularly because of the new rules issued by the Railroad Labor Board which become effective July 1, 1921. The committee submitted the following in the supplementary agenda:

Your committee has considered the order of the Interstate Commerce Commission, issued under date of April 18, 1921, prescribing rules governing the classification of steam railway employees and reports of their services and compensation, effective July 1, 1921. Several forms for compiling the required data were submitted by carriers, which illustrated the wide difference in their respective organizations.

The rules issued by the United States Railroad Labor Board are comprehensive and will serve to guide each carrier in classifying its employees, and enable them to compile the information from their existing sources of information, with such changes as may be necessary.

In order to bring about uniformity in the reports, it is recommended that all carriers adopt nomenclature of the Labor Board's rules for use on payrolls and all supporting papers.

Your committee does not believe it possible at this time to make any recommendations as to specific forms to be used in collecting the data under this order, for the reason that the organizations of the carriers are so different. In some instances, the data will be assembled at division headquarters, while in other instances, it will be done in general offices. Standardization of forms and plans for this work should be deferred until the carriers have had at least one year's experience.

**Making R. A. O. A. Interline Accounting Recommendations Mandatory.** In accordance with the policy outlined by the Executive Committee in the minutes of its meeting held in Chicago, February 15, 1921, the following recommendations are made by the Committee on Disbursement Accounts:

The following rules, relating to inter-road disbursements accounts, shall be mandatory and binding upon carriers who are members of the Railway Accounting Officers' Association, operating in North America, and shall become effective and operative as of January 1, 1922:

**Rule 482 R. A. O. A. Synopsis 1920, reading as follows:**

**LOSS AND DAMAGE CLAIM AUTHORIZATION BLANK**—As a means of facilitating the ready identification of the authorization blank when attached to claim papers, R. A. O. A. Standard Form 200, Loss and Damage Claim Authorization Blank—shall be printed on salmon colored paper.

**Rule 484, R. A. O. A. Synopsis 1920, be made to read as follows:**

**STANDARD FORM OF BILL BLANK**—Carriers must use the standard form of bill blank, R. A. O. A. Standard Form 206, as between carriers, except for car repairs.

**SUBJECT 12—CURRENT DOCKET, COMMITTEE ON DISBURSEMENT ACCOUNTS, SETTLEMENT OF PER DIEM BALANCES**—Rule to read as follows:

The settlement of Car Service and Per Diem balances between Carriers should be by draft on net balances, net balances to include the debits and credits for per diem accrued in the same month; also corrections on reports previously rendered and delayed reports for previous months.

Reports to creditor lines shall be forwarded by the 10th day of the second month following that in which per diem accrued (see Rule 11, Paragraph A of American R. R. Association, Current Code of Per Diem Rules) and settlements thereof shall be subject to draft on the 25th day of the second month, i. e., the second month following that in which per diem accrued.

**SUBJECT 15—CURRENT DOCKET, COMMITTEE ON DISBURSEMENT ACCOUNTS, RENDERING BILLS COLLECTIBLE IN DUPLICATE**—The rule to read as follows:

All bills against other carriers (except for car repairs) must be rendered in duplicate.

**SUBJECT 19—CURRENT DOCKET, COMMITTEE ON DISBURSEMENT ACCOUNTS, STANDARD FORM FOR USE IN TRACING FOR UNPAID BILLS**—The rule to read as follows:

All tracers for unpaid bills between carriers shall be accompanied by a statement of such bills on R. A. O. A. Standard Form 210, rendered in duplicate, the original to be returned to the forwarding carrier, and the copy retained by the receiving carrier.

The description of account on the tracer must be clear and concise, and that for bills covering the shipment of material, must show the destination of the shipment.

Subject 29, relating to the rendition of bills covering the joint use of facilities was included in the agenda, but it was voted to omit it from the mandatory rules.

[Herewith follow the rules for arbitration similar to those recommended by the Committees on Freight Accounts and on Passenger Accounts.]

The report is signed by A. E. Fowler, auditor, Southern Railway, chairman.

## Report of the Committee on Overcharge and Agency Relief Freight Claims

The committee report consisted of various detailed recommendations relating to the overcharge claim rules.

**Minimum Charges on account of Overcharge Claims.** This was the most important subject which the committee discussed. The committee submitted the following:

There is now in effect a minimum of \$1.00 for adjustments incident to interline freight accounts and junction settlements which correction minimum is the same amount as the R. A. O. A. Overcharge Claim Minimum. To create a disparity between these two minimums, such as would result

from increasing the R. A. O. A. Overcharge Claim minimum and allowing the interline freight account minimum to remain at \$1.00, would create a situation that would probably disturb uniform interline accounting. That phase is regarded as being of serious concern to some, if not all, carriers.

On the other hand, it is maintained that to increase both the R. A. O. A. Overcharge Claim minimum and the interline freight account minimum would gravely affect the revenue of some carriers.

The argument is advanced that the R. A. O. A. Overcharge Claim minimum should be increased on account of the additional expense involved in clerical hire and similar expenses incident to handling overcharge claims.

Your Committee is not convinced that the convenience of an increased Overcharge claim minimum will offset or surpass the effects in other directions, therefore,

Your Committee recommends that the R. A. O. A. Overcharge Claim Minimum remain \$1.00.

The report is signed by E. J. Bloodgood, auditor of freight accounts of the Chicago & North Western, chairman.

## Report of the Committee on Terminal Companies' Accounts

The committee submitted recommendations dealing with various phases of accounting by terminal companies. One of the more important subjects covered was the following:

### *Standardization of Terminal and Switching Companies' Forms*

As a result of study and investigation, your committee reached the following conclusions:

Terminal companies doing a regular freight or passenger business are constrained to use, and do use, as far as possible, the R. A. O. A. Standard Forms.

The various terminal companies throughout the country are so diverse in their operations and there is such an absence of similarity in their methods and in their contracts with tenant lines, which in some cases are the owning lines, that there is necessarily some reasonable limitation to standardization of forms in this connection.

It is the opinion of your committee that a standard form of Conductors' Car Report, Joint Mileage Per Cent Sheet and Summary of Joint Expenses, could be devised, it being understood that the arrangement of and information shown on the forms could be modified to meet the individual requirements of some companies.

Your committee, therefore, recommends, for adoption by the Association, the R. A. O. A. Standard Forms, the following, as per samples submitted herewith:

R. A. O. A. Standard Form No. 400, Conductors' Car Report.

R. A. O. A. Standard Form No. 401, Joint Mileage Per Cent Sheet.

R. A. O. A. Standard Form No. 402, Recapitulation of Joint Operating Expenses.

The report is signed by F. B. Huntington, general auditor, Baltimore & Ohio Chicago Terminal, chairman.

## President's Address

During the past year, the greatest volume of work ever turned out by the association in any one year throughout its entire history has been performed. You have had before you approximately 300 subjects, to say nothing of special committee reports and other extraordinary matters.

By submitting recommendations on 56 subjects in 1917, the Committee on Freight Accounts established a record for handling the largest number of subjects ever handled by any one committee in any one year *up to that time*. During the past year, the Committee on Freight Accounts has again made history by handling 77 subjects, thus excelling its own high record, while each of the Passenger and Disbursements Committee have by far exceeded its own respective previous "high water" mark.

There is one suggestion, in connection with the future, which I should like to offer for consideration and action by the Executive Committee. Accounting is practically the only important branch of railway work that does not have a magazine or regular publication devoted to it. The outstanding hiatus in railway accounting, from my viewpoint, is the lack of educational opportunities. The only way by which, under the existing conditions, any ambitious person may progress in railway accounting is by actually doing the work, which, in principle, the old apprenticeship system that was abandoned, in connection with all other professions, many years ago. My opinion is that a magazine or periodical devoted to railway accounting would be helpful to the accounting

officers and would prove particularly beneficial to ambitious clerks, agents and others. There are some practical difficulties, in connection with such a publication that would need to be worked out, but I do not believe that those difficulties are insurmountable. I therefore, commend, to the Executive Committee, the thought that the establishment of a periodical, devoted to railway accounting, would be a step for the advancement and development of our profession.

There is another matter of a momentous nature to which I call your attention. In my opinion, the necessity exists for our association to take action promptly and effectively towards constructing uniform, workable, useful physical statistics; that is statistics which will visualize the physical characteristics, developments, operations, etc., of the carriers. Statistics of that nature, if made practical and applicable to all carriers, would unlock the great storehouses of railway accounting and make available the stupendous funds of information stored there. Those statistics should be made such as to present a picture of the conditions that prevail. Clearly, there rests upon the carriers, under existing conditions, an obligation to undertake studies of that nature and the accounting officers, who have available such a tremendous stock of data, could well inaugurate the necessary plans, although any studies made along this line should, naturally, have the co-operation and collaboration of other interested departments. My recommendation is that our association forthwith create a committee to handle this subject.

It is generally admitted that a science or profession make progress in the same degree that the ideas or ideals of the men engaged in that science or profession advance. It has been, and is, the policy of the Railway Accounting Officers Association to maintain and foster the loftiest ideals for the science and profession of railway accounting. The association finds its field of productive effort in the individual interest and professional pride of its members in the advancement of railway accounting. No more convincing proof can be offered of the effectiveness of those efforts than the tremendous strides which have been and are being made.

Practically every railroad is so organized that the accounting department is not under the jurisdiction of an officer who originates expenditures or revenues.

In the days long gone by, nearly all of the railway accounting officers had the title of auditor. The title was significant because then they merely audited accounts or kept books. Today, many accounting officers have the title of vice-president or comptroller. Most chief railway accounting officers are executive officers. They are able to serve the carriers more effectively by having a wider and broader viewpoint—by being analysts, advisors—and not mere recorders. Although the corollary to freedom of action and judgment is added responsibility there are compensating opportunities for development and progress.

## Other Business

The association was addressed on Thursday morning by Commander C. A. Mayo, Navy disbursing officer, and on Friday morning by W. A. Colston, director of the division of finance of the Interstate Commerce Commission. Mr. Mayo spoke on the relations between his department and the railroads. Mr. Colston spoke as above noted on the subject of settlements for the guaranty period.

The election of officers resulted in the choice of J. J. Ekin, comptroller, B. & O., as president; L. G. Scott, vice-president and comptroller, Wabash, first vice-president; A. J. County, vice-president, Penn., second vice-president, and E. R. Woodson, secretary. The following were elected members of the executive committee: J. G. Drew, vice-president, Mo. Pac.; F. W. Charkse, comptroller, U. P.; W. C. Wishart, comptroller, N. Y. C. and E. Deschenes, comptroller, C. V. The decision as to the time and place for the next annual meeting was left with the executive committee.

The 100-Car Demonstration Train Rounding a Curve on the New River

## Virginian Demonstration of Double-Capacity Brake

Speed Regulated Within Narrow Limits—Low Air Consumption a Notable Feature

**I**N AN ARTICLE on the operation of the Virginian Railway in the issue of May 27 there was published an account of the air brake demonstrations conducted on that road on May 25-27. Only the general results of the runs were given as more specific data was not available at that time. The report of the brake performance has now been made public and a more extended description of the results is therefore given below.

The double capacity brakes as applied on the Virginian 120-ton cars represent the latest development of the Westinghouse Air Brake Company's equipment for long trains of extremely heavy cars. Some time previous to the introduction of the 120-ton car, the road had consulted the air brake company with regard to handling still greater tonnage by operating 90 or more 55-ton cars per train. This brought up the question of applying a special brake with a double capacity feature, the KCE 10-10, which had already been developed in anticipation of a demand for heavy-tonnage operation that would necessitate the use of a brake providing a more uniform braking ratio, lighter retardation on empty cars with a substantial reserve braking force available in the case of loaded cars.

Eleven hundred of the 55-ton cars of the type then in use were equipped accordingly with the double capacity feature. The results were so gratifying that the Virginian saw the possibility of extending the use of such apparatus to cover the requirements of much heavier rolling stock.

During the spring and summer of 1914, the advisability of increasing the capacity of the individual car was suggested with the object of not only increasing the tonnage of the train, but at the same time decreasing its length. This suggestion resolved itself into the 120-ton capacity car. The Virginian ordered the construction of the cars on the assurance of the Westinghouse engineers that the first double capacity brake had been further developed to a point that would meet the requirements of the heaviest car that any railroad could conveniently handle from the standpoint of motive power.

The problem of providing the proper brake equipment for these record-breaking cars was solved by minor modifications in the double capacity equipment, which had already been brought to a high degree of development in anticipation

of a demand for freight brakes of exceptionally high capacity. It is significant of the well-rounded development of the air brake art that the conditions to be met on the Virginian involved only one new factor, the high ratio of loaded weight to the light weight of the car. The grades presented no special difficulty since trains are being handled daily with air brakes alone on much steeper gradients. The length of the train was no greater than has been successfully handled with the existing equipment and the total weight of the train is of secondary importance since each additional unit increases the braking force correspondingly.

The principal problem in braking these heavy cars, as already stated, was to provide a suitable ratio of braking force to car weight, both loaded and empty. The equipment as finally applied and demonstrated between Princeton and Roanoke is known as Schedule KDE-4-10-16, indicating that three cylinders, whose diameters are represented by the figures, are employed. A change over valve and a load reservoir are used to provide the flexibility in braking force which makes it possible to obtain a uniform braking ratio in solid trains of loads, solid trains of empties, or mixed trains. The cylinders in load operation augment each other in such sequence that only a short piston travel is required in each case, making for practically normal air consumption, though providing a much greater braking force than is obtainable with the standard single capacity brake. The relative braking force and air consumption of the double capacity brake and various types of single capacity equipment are clearly shown in one of the diagrams.

### Operation of the Westinghouse Double Capacity Freight Brake Equipment

The fundamental characteristic of the Double Capacity freight brake equipment is that it provides for the same percentage of braking force (ratio of total shoes pressure to car weight) on a loaded car as on an empty car.

With the single capacity brake the braking force developed is constant in magnitude but varying in its relation to the car weight. Consequently, it is much less effective on a loaded car than on an empty car. The usual practice has been to so design the brake layout as to provide the highest practicable percentage of braking force on the empty car,

60 per cent being the standard for freight cars, and then to accept whatever reduced braking ratio might be available for the loaded car. This means that in grade service the retarding force on a loaded train may not be adequate for safe control, and in level road service the retarding force may vary so much throughout a mixed train as to be productive of damaging shocks. Furthermore, in long trains of empties, severe shocks are often created because of the high braking ratio, which manifestly cannot be lowered if any appreciable braking force is to be realized on a loaded car, and also because of the inherent serial action of a purely pneumatic brake.

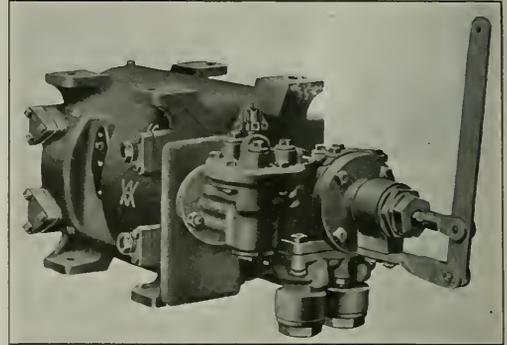

In the effort to mitigate these undesirable effects, various expedients are sometimes resorted to which are far from satisfactory, and restrictions are often imposed on train make-up and operation which tend to curtail traffic.

Obviously the ideal condition is that in which the braking force on loaded cars bears the same relation to the loaded weight as that on the empty car bears to the light weight, so that adequate and uniform retardation may be possible.

The ideal condition, always desirable, becomes imperative with heavy tonnage trains made up of high capacity cars, because of the great difference between the loaded and empty car weights. In other words, the operating conditions of loaded and empty trains with modern equipment are so widely separated that any attempt at a compromise between the two will result in unsatisfactory operation with either one or the other. The degree of retarding force set up on an empty car must be such as to permit a train of empties to be handled without the possibility of unduly severe shocks. On the other hand, with a loaded car a degree of retarding force must be provided which will be adequate to control safely a loaded train down a grade. These two requirements are so far apart that a solution of the problem is possible only with a *double capacity brake*, one which will be equally as effective when the car is loaded as when it is empty.

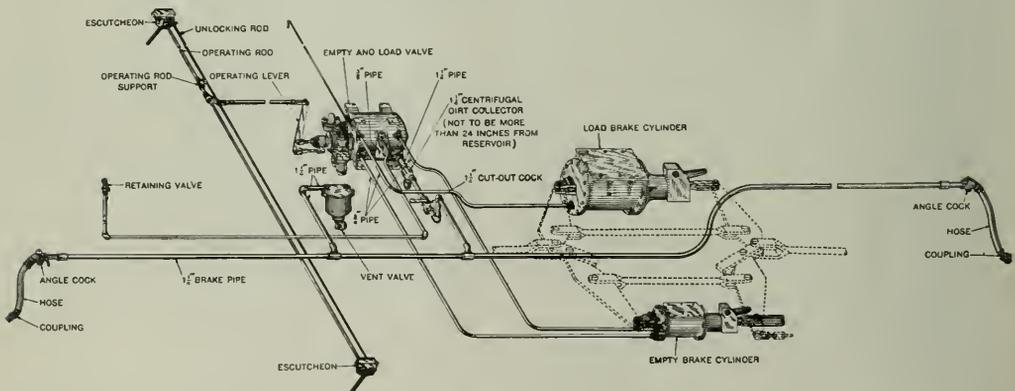

With the Double Capacity brake equipment the brake layout is designed to provide for 40 per cent braking ratio

When the equipment is set for empty car operation, the take-up and empty cylinders, which are built into one structure with the small piston operating within the larger, operate as one 10-in. cylinder similar to the standard single capacity brake. When the equipment is set for loaded car operation the take-up cylinder piston first takes up the slack in the rigging and brings the shoes firmly against the wheels. Then the empty cylinder piston moves out a slight amount, its clutch gripping the notched push rod of the take-up cylin-

Double Capacity Brake Equipment; Triple Valve Change Over Valve and Two-Compartment Reservoir

der piston, thus supplying additional force. Finally, as the brake pipe reduction continues, the load cylinder piston moves out a slight amount, gripping its notched push rod and adding to the force already developed, through the connecting rods and levers. By this method of slack take-up and short travel of the larger pistons the volume of air required for a given application is reduced to a minimum. In addition, especially where retaining valves are used, after

General Arrangement of Double Capacity Brake Equipment on the Car

as against the usual 60 per cent for an empty car (permitting smoother brake operation on long trains of empty cars), and also 40 per cent for the loaded car as against the usual average of 15 per cent.

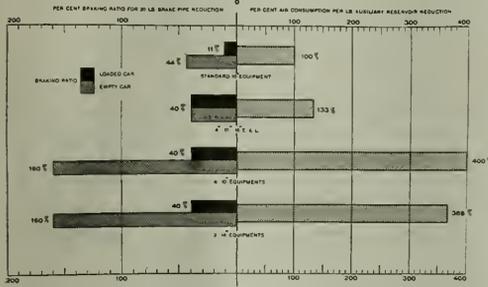

The equipment, known as schedule KDE-4-10-16, has three brake cylinders of the size indicated by the numerals. They are the take-up cylinder, the empty cylinder and the load cylinder respectively. In addition to the usual auxiliary reservoir there is a small load reservoir provided to supply the additional air required for loaded car braking.

the first reduction required to bring the load cylinder into operation (about 12 lb.), all succeeding reductions are much lighter, and consequently the air consumption is more economical than with any other form of equipment for a corresponding degree of train control, and still within the capacity of the standard  $1\frac{1}{4}$  in. brake pipe—an important requirement.

The higher braking ratio necessary for the loaded car can only be obtained when desired, since the equipment is manually changed for loaded car braking, through the me-

dium of an operating mechanism which shifts a change-over valve to its load position. This valve functions similarly to a number of cut-out cocks to effect the proper volume and port arrangements, and also controls the flow of air to the cylinders in the proper sequence.

The equipment may be manually cut into empty posi-

Comparative Braking Ratios and Air Consumption for Various Brake Equipments

tion again, or if this is not done, it will automatically return to empty position when the pressure in the system leaks down to about 15 lb., as would be the case, for example, when the car is being unloaded on a siding.

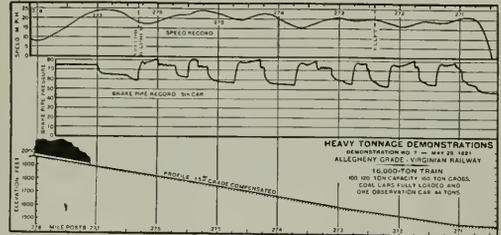

The triple valve used with this equipment (designated the K-E-N) possesses the same essential characteristics of quick service, uniform recharge and uniform release as are embodied in the well known K type of valve now in general service. A separate quick action device in the form of a brake pipe vent valve is employed.

Attention should be called to the fact that the unit system, fundamental to all brake equipments now in use on freight cars, is preserved with this new equipment, so that if there be excessive brake cylinder leakage on one car it affects that

Car 70 was 13.9 sec.; the rate of quick service propagation, 294 ft. per sec., or 201 m.p.h. The resultant cylinder pressure on Car 1 was 35 lb. and on Car 70, 25 lb. The time from movement of the brake valve to full release position to start of release on Car 70 was 10.5 sec.

No. 2—EMERGENCY APPLICATION—EMPTY POSITION

Time from movement of brake valve to emergency position to piston start on Car 70, 7.5 sec.; rate of emergency propagation, 546 ft. per sec., or 372 m.p.h. The resultant cylinder pressure on Car 1 was 54 lb., on Car 70, 51 lb.

Speed and Brake Pipe Pressures on Allegheny Grade, 100-Car Train

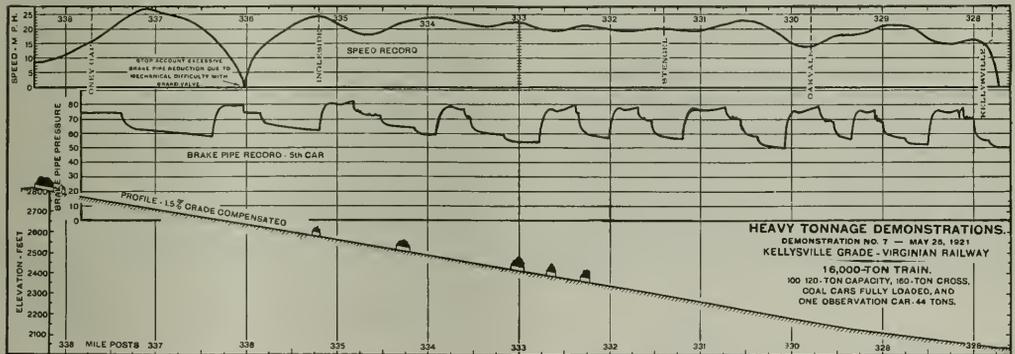

no compensation for 37 ft. connection between cars 35 and 36). The resultant cylinder pressure on Car 1 was 54 lb., and on Car 70, 51 lb.

No. 3—EMERGENCY AFTER SERVICE APPLICATION—EMPTY POSITION

Service pressure in pounds, Car 1, 36; Car 70, 19. Service time in seconds, 13.8. Emergency pressure in pounds, Car 1, 53; Car 70, 50—time, brake valve to car 70, 3 sec.

No. 4—TO ILLUSTRATE THE DOUBLE CAPACITY AND AIR ECONOMIZING FEATURES

It was demonstrated that the brake cylinders operated in the intended sequence, as follows, take-up cylinder, empty

Speed and Brake Pipe Pressures on Kellysville Grade, 100-Car Train

car only and does not interfere with the proper operation of the remaining brakes in the train. This feature insures the desired flexibility and safety of brake control.

FURTHER DETAILS OF STANDING TESTS

As the cars were assembled for the standing tests the train brake pipe, exclusive of the branch pipe on locomotive and tender, measured 4,097 ft. on the 70 car train, and 5,837 ft. when the additional 30 cars were later cut in.

No. 1—10-POUND SERVICE APPLICATION—BRAKES IN EMPTY POSITION

The time from brake valve movement to piston start on

cylinder and load cylinder on application and in reverse order on release. The time from movement of brake valve to start of release on car 70 was 21 sec.

No. 5—AUTOMATIC RETURN TO EMPTY POSITION

The return to empty position occurred on Cars 1 and 70 when pressures were between 15 and 10 lb.

After the completion of Demonstration No. 5 the train was increased to 100 cars by adding 15 cars to each of the strings.

No. 6—BRAKE CYLINDER LEAKAGE

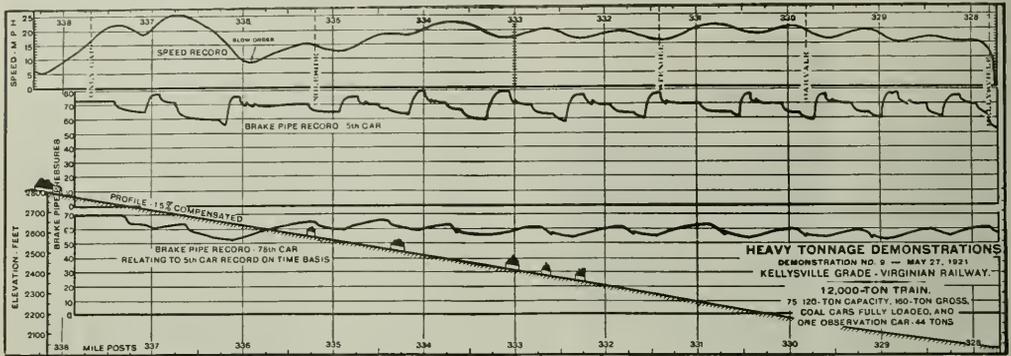

Cocks having No. 8 drill (.199 in. diameter) orifices were opened on five cars adjacent to Car 70, preventing the

development of brake cylinder pressure on those cars, while normal pressures were developed in the remainder of the cylinders.

That this intended brake cylinder leakage did not influence the pressure in the brake pipe is evidenced by the fact that while Demonstration No. 6 was in progress the

cars and the observation car. The gross weight with the locomotive was 12,519 tons; without the locomotive 12,070 tons. As on previous occasions, a brake pipe pressure of 75 lb. was maintained.

Five cars in the train (15th, 30th, 45th, 60th and 74th) had open drain cocks in the cylinders. The speed fluctu-

Speed and Brake Pipe Pressures on Kellysville Grade, 75-Car Train

brake pipe leakage was determined and found to be 5 lb. in two minutes from 61 lb. pressure.

**SPECIAL DEMONSTRATION A (REQUESTED)**

BRAKE PIPE LEAKAGE CORRESPONDING TO BRAKE CYLINDER LEAKAGE OF DEMONSTRATION NO. 6, ESTABLISHED STEP BY STEP ON CARS IN REGION OF CAR 70.

No. Orifices (No. 8 Drill) Open	Brake Pipe Pressure		Brake Cylinder Pressure Car 100
	Car 1	Car 100	
None	69	66*	
1	69	60	+
2	66	47	46
3	65	41	46
4	64	30	45

\*Lack of time prevented waiting for complete recharge of train.  
 +Not observed. (10 lb. reduction of Demonstration No. 1 gave 25 lb. cylinder pressure on last car.)  
 The value of a No. 8 drill orifice is 48 cu. ft. of free air per minute from 70 lb.

**SPECIAL DEMONSTRATION B (REQUESTED)**

**QUICK ACTION TIME ON 100-CAR TRAIN**

Total Length of Brake Pipe (Less Branch Pipes and Engine and Tender)—5,837 Ft.

Time from movement of brake valve handle to piston start on Car 100, 10.7 sec.; rate of emergency propagation, 545 ft. per sec., or 372 m.p.h.

**Speed and Air Consumption with 100-Car Train**

The speed and brake pipe pressure as recorded on the 100-car train are reproduced herewith. Briefly the record shows the following for the descent of Kellysville and Allegheny grades:

	Length of 1½ per cent grades	Average Speed
Summit to Kellysville.....	10.5 miles	20.6 m. p. h.
Merrimac to Fagg.....	7 miles	19.0 m. p. h.

The speed down the grade ranged from 18 to 24 m. p. h., except for a reduction to 14 m. p. h. at Oakvale. The air consumption per car was .328 cu. ft. of free air per minute.

The train performance down the Allegheny grade from Merrimac to Fagg was a duplicate of the run down the Kellysville grade. At no time did the speed range exceed a 5 m. p. h. variation from the desired mean speed of 20 m. p. h. The air consumption was .304 cu. ft. of free air per minute per car.

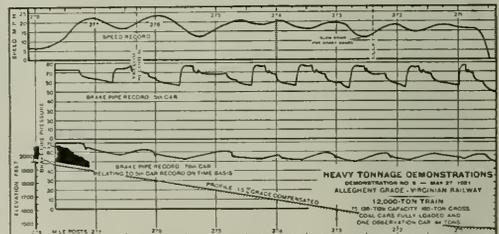

**Demonstration With 75-Car Train**

The concluding run of the demonstration was made on May 27, from Princeton to Roanoke, as mentioned in the issue of that date, with a train of 75 loaded 120-ton capacity

ations did not exceed 5 m. p. h. for any brake cycle except on the observance of a 10 m. p. h. slow order at one point a short distance east of the summit. The average speed down the Kellysville grade was 17.6 m. p. h. and from Merrimac to Fagg 19.2 m. p. h. The air consumption was 1,112 cu. ft. of free air per minute per car.

Just east of Rich Creek station, on a .9 per cent descending grade, an emergency stop was made from a speed of about 27 m. p. h. As measured by rail lengths, the stop distance was 760 ft. The slack was stretched prior to the emergency brake application and the run-in was even milder than that of the preceding day's test.

With a view of making this test under more critical conditions, a repeat at about 13 m. p. h. was made just east of McCoy station on an ascending grade of .2 per cent. The

Speed and Brake Pipe Pressures on Allegheny Grade, 75-Car Train

slack run-in at the rear end came just at the stop, and while more noticeable than in the first test, was very mild, being insufficient to move a camera in a leather case acting as an improvised slidometer on a planed board bench. The stop distance according to rail lengths was 230 ft.

The train was handled between Merrimac and Fagg with the same uniform control as on Kellysville grade, including a slow down for orders at Elliott, with a total variation of speed of from 13 m. p. h. to 23 m. p. h.

The train arrived at Roanoke at 3:10 p. m., a total of 8½ hours elapsed time, showing the practicability of handling a 12,000-ton train in regular traffic in reasonably close to an eight-hour period. The air consumption per car was .97 cu. ft. of free air per minute.

# General News Department

The Railway Fire Protection Association will hold its annual meeting at Hotel Sherman, Chicago, on Monday, Tuesday and Wednesday, October 18, 19 and 20.

The convention of the American Railway Tool Foremen's Association which was to have been held at the Hotel Sherman, Chicago, on August 9, 10 and 11, has been postponed.

The convention of the International Railroad Master Blacksmiths' Association which was to have been held at the Hotel Sherman, Chicago, on August 16, 17 and 18, has been postponed.

The Interstate Commerce Commission has announced a hearing at Norfolk, Va., on June 21 with reference to the cost of locomotive equipment of the Seaboard Air Line repaired in outside shops.

Z. J. Fury, of the division of conciliation of the Federal Department of Labor, is attempting to effect a settlement of the threatened strike of the Pullman Company employees at Chicago. Mr. Fury intervenes for the federal government and strike ballots sent to 80 cities have been recalled.

The Midland Valley Railroad, about 300 miles long, from Fort Smith, Ark., northwest to Wichita, Kan., is installing Western Electric telephones for use on its train dispatching line throughout the length of the road. The dispatcher's office is at Muskogee, Okla., and there are 37 stations.

On the night of June 10 six pouches of registered mail were seized at Arion, Iowa, while awaiting transfer to the Chicago & North Western train No. 26, a fast mail train to Chicago, when three bandits overpowered the telegraph operator and escaped with the pouches in an automobile.

The Baltimore & Ohio has consolidated the Ohio river and the Wheeling divisions, making Wheeling, W. Va., the headquarters and discontinuing the offices at Parkersburg. On the Indiana division, Seymour, Ind., has been abandoned as a freight terminal and North Vernon is to be the terminal instead.

American Station, Cal., on the Southern Pacific, 70 miles east of Sacramento, has been made a regular stop for the through overland trains, in order to enable passengers to view the American river from an observation platform which has been erected at that point. The river is hundreds of feet below the railroad in a vast canyon.

The new classification of railroad employees and rules for reporting their number and compensation announced some time ago by the Railroad Labor Board has been completed and issued in book form to the carriers. The employees are divided into approximately 148 classes, which in turn have been subdivided so that there are approximately 500 distinctive classes created.

The South Eastern Express Company, operating on the Southern Railway Company, has filed with the Interstate Commerce Commission a complaint that the American Railway Express Company has closed expeditious and well established routes and denied to the South Eastern Company joint rates, thus forcing shippers to pay combination rates in order to avail themselves of the services of the South Eastern Company.

For the accommodation of delegates to the convention of the American Society for Testing Materials, which will be held in Asbury Park, N. J., on June 20 to 24 inclusive, the Pennsylvania will operate a solid Pullman train, in case there are sufficient number of reservations to warrant, leaving Chi-

cago at 10:15 a. m. Sunday, June 19, and running direct to Asbury Park without change, arriving there at 10 a. m. Monday, June 20.

The Supreme Court of the United States has given permission to the attorney general of Texas to file an original suit attacking the constitutionality of the transportation act, particularly the rate-making and labor provisions. The state authorities asked that all acts and orders of the Labor Board and of the Interstate Commerce Commission taken under the authority of the new law be declared invalid and that if any section of the act be held constitutional the remaining sections be declared invalid.

The Newfoundland Railroad (Reid Newfoundland Company, Limited) is to be returned to its owner, the Railway Commission, consisting of three members appointed by the cabinet and three by the Reid-Newfoundland Company, having decided that on June 30 government operation shall be terminated. The company sustained a loss of nearly \$1,400,000 in its operation of the system for the year ended in June, 1920, and it is estimated that the loss for the current year under government control will be greater. Officers of the company declare it impossible to operate the railway under present conditions without substantial financial help from the country, but they have made no announcement of future plans.

Postal inspectors at Chicago have made arrests which they claim will clear up the recent theft from the Dearborn station of a registered mail sack containing some \$350,000 in securities and cash, and the \$100,000 station robbery at Pullman (Chicago) last August. The arrests followed information given out by a railroad mail clerk on the Monon following his arrest on information furnished by a clerk who had become suspicious of the man's actions following the robbery. From time to time the inspectors have recovered securities contained in the loot when "fences" sought to convert them into cash, and on June 13 \$98,600 in Liberty Bonds and \$14,300 in cash were recovered following the arrests.

The average cost of freight train operation per freight train mile based on certain selected accounts for the month of March, according to the monthly bulletin of the Interstate Commerce Commission, was \$1.97 as compared with \$1.78 in March, 1920. The cost, however, was less than that for February, when the average was \$2.11. Practically every item included in the bulletin shows an increase as compared with 1920, but the wages of enginemen averaged 25.9 cents as compared with 27.1 cents in March, 1920, and 27 cents in February, 1921. The average of selected accounts in passenger train service was \$1.07 as compared with 96 cents in March, 1920, and \$1.14 in February, 1921.

## Cape Cod Canal

The Secretary of War has recommended to Congress the purchase by the government of the Cape Cod Canal for \$11,500,000, a price agreed upon by the canal company and the department, which is approximately \$5,000,000 less than the valuation which was allowed by a federal court jury at Boston in condemnation proceedings instituted by the government. Secretary Weeks says that the canal is the busiest inter-coastal waterway of the world. It has more traffic than the Suez Canal and is regarded as one of the chief arteries of commerce in New England. It likewise has great military and naval potentialities. Under the Rivers and Harbors act passed by Congress in 1917, the advisability of the purchase of the canal was approved by the Secretary of War and he entered into negotiations for its purchase, but not being able to agree on a price condemnation proceedings were instituted by the Attorney General. Six hundred acres of land owned by the construction company is included in the proposed purchase.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF APRIL AND FOUR MONTHS OF CALENDAR YEAR 1921—CONTINUED

Name of road.	Average mileage operated per period.	Operating revenues			Operating expenses			Net from operating operations.	Operating income (or decr.).	Net after rentals.	Increase (or decr.) comp. with last year.
		Freight.	Passenger.	Total.	Maintenance of way and structure.	Traffic.	Trans- portation.

### Freight Rate Proposals in Congress

Representative Sweet of Iowa has introduced in the House of Representatives a bill to amend the transportation act so that it will not authorize interference with the regulation of intrastate commerce by the several states; to repeal Section 15a of the act, which contains the 5½ to 6 per cent rule of rate-making, and to limit the effect of orders of the Interstate Commerce Commission to prevent their application to intrastate traffic.

A resolution adopted by the California legislature objecting to the rate-making provision of the transportation act of 1920 has been presented to the United States Senate in which Congress is asked to eliminate the objectionable features pointed out and to "grant a rate structure that will not place the false earning power on a large fictitious railroad capital, the payment of which is stifling to industries of the Pacific Coast."

Senator Kellogg of Minnesota has presented in the Senate a resolution adopted by the Minnesota legislature petitioning Congress to take such action as will nullify the orders of the Interstate Commerce Commission as to intrastate rates and to so amend the act to regulate commerce as to forbid such orders in the future.

### Government Attitude as to Automatic Train Stops

Commissioner C. C. McChord, speaking for Division 1 of the Interstate Commerce Commission—Messrs. McChord, B. H. Meyer and C. B. Aitchison—has written to the American Railway Association concerning the automatic train control situation, and the substance of the letter has been issued by Secretary J. E. Fairbanks, in circular No. 2,163, for the information of the members of the association.

The members of Division 1 are agreed that no unnecessary delay or obstruction should be indulged. The letter, with this introduction, goes on to recount briefly the history of what has been done by the government, since 1906, when Congress first called for an investigation of the subject; and now "it is apparent that Congress expects definite and prompt action on our part." Mr. McChord thinks that as the automatic stops now in operation on the Chicago & Eastern Illinois and other roads have been functioning for some time, the report of the government inspectors concerning them ought soon to be available. Continuing, the letter says: "It is the Commission's desire not to be forced to issue specific orders to the various carriers, nor to discourage initiative in the matter of the installation of these devices on the part of the carriers. We suggest that you [the A. R. A.] indicate to the various executives that it is the Commission's desire to effectuate the purposes of Section 26 within the two-year period mentioned therein and that proper steps to that end be taken. We are pleased to note the interest being taken in the matter by the Joint Committee."

### Railway Returns for April

The net operating income in April of the railroads of the United States totaled \$29,201,000, or \$1,494,000 less than it was in March. On the basis of the tentative valuation fixed for rate-making purposes by the commission, this would be at the annual rate of return of 2.18 per cent, as compared with 2.30 per cent in March. The carriers in April fell short \$51,286,000, or approximately 64 per cent of earning the amount contemplated by the law.

The ratio of operating expenses to revenues in April was 86.74 per cent, compared with 87.19 per cent in March. Reductions, compared with April, 1920, in operating expenses were reported in all districts. The total operating revenues of the railroads in April were \$433,181,000, or an increase of 7.7 per cent over those for the same month last year, while operating expenses were \$375,732,000, or a decrease of 6.2 per cent under April, 1920. The net operating income was \$29,201,000, compared with an operating deficit of \$23,767,000 in April, 1920. In considering comparisons with April last year, however, consideration must be given to the fact that railroad operations were affected that month by the switchmen's outlaw strike.

During the eight months since September 1, 1920, when the guaranty period expired, the net operating income of the carriers has totaled \$279,008,000, which would be at the annual rate of return of 2.41 per cent on the tentative valuation of the railroads. This sum, however, is \$414,253,000 under the amount contemplated to be earned from the rates established by the commission.

### Report on Collision at Welch, West Virginia

The Interstate Commerce Commission has issued a report on the collision which occurred on the Norfolk & Western near Welch, W. Va., on May 3, last, when six passengers were killed and 41 passengers and one employee were injured. This accident occurred on the Tag Fork branch, and the train, passenger No. 160, consisting of a locomotive and five cars, was moving backwards at about 15 to 18 miles an hour. It ran over a misplaced switch and collided with some loaded coal cars, wrecking two passenger coaches. The switch had been left misplaced by trackmen, working near it, and Foreman Fine is held responsible; and Brakeman Powell, at the rear of the train—that is, on the leading car—is held blameworthy for not keeping a good lookout. The inspectors believe that he should have discovered the open switch in time to make an emergency application of the air brakes. The inspectors cannot decide whether Foreman Fine left the switch open, and forgot it, or closed the switch and later instructed Sectionman Hale to throw it, on the assumption that it was still set for the side track. The sectionman may have thrown it, on instruction, without observing its position.

### Valuation Bill Hearing

The Senate committee on interstate commerce held a brief hearing on June 10 and 11 on the bill to amend the valuation act by striking out the provision requiring the Interstate Commerce Commission to report separately the cost of acquisition of land. The bill was opposed by S. W. Moore, counsel for the Kansas City Southern, and W. G. Brantley, representing the President's Conference Committee on Valuation, who asked that the provision be left in the law and that the question of the weight to be allowed to this part of the evidence of value be left to the courts. Otherwise, they said, if the courts should decide that this evidence had been improperly excluded it might require considerable delay. The bill was advocated by P. F. Farrell, chief counsel of the Interstate Commerce Commission, and J. E. Benton, solicitor for the National Association of Railway and Utilities Commissioners. Mr. Farrell contended that the provision now requires the commission to spend a large amount of time and money to get an estimate, which he called a mere guess, of no use to anyone. He said the commission has all the information necessary to the determination of the real value of railroad lands when it finds the original cost and the present value, and its finding as to a present value based on the value of adjacent lands does not mean that that exact amount is to be allowed in making a final valuation.

### Compliments of the Santa Fe to the Great Western

Isaiah Hale, safety superintendent of the Atchison, Topeka & Santa Fe, believes that good records made by other railroads may be effectively used to stimulate officers and employees of the Santa Fe to increase exertion, and under date of May 17, 1921, he issued and posted a bulletin on his railway which refers as follows to the safety drive on the Chicago Great Western:

The Chicago Great Western Railroad inaugurated a Safety Drive January 1, to continue during the calendar year. Their record of injuries to employees during March this year shows a reduction of 65 per cent, as compared to same month last year; in the first three months they show a reduction of 64 per cent. Their Western Division of 377 miles has not had a reportable injury (that is, one resulting in loss of more than three days' time) since January 1, a stretch of 128 days, and to prove this in itself is not an accident, let it be known that their Northern Division has not had such an injury in 74 days.

American railroad history records no other similar performance which is a solar plexus blow to the argument that "you can't stop accidents," "they are bound to occur," etc. We cannot decrease their number if we constantly keep telling ourselves we can't; nor can we do anything else, in striving for which we admit we are whipped before the start.

We are not speaking disparagingly of the Chicago Great Western when we say the physical condition of their property is no better than ours; the thing then that makes this record possible is the employee—individually and collectively—and we must swallow the distinctly bitter pill of having to admit that our organization suffers by comparison with theirs.

Do you know of any good reason why we should be content to mark time while Chicago Great Western men are making such wonderful progress and attracting the attention and admiration of the entire railroad world?

**Shriners' Convention Creates**

**Heavy Passenger Movement**

The Imperial Council Session of the Mystic Shrine at Des Moines, Iowa, on June 14, 15 and 16, provided the railroads with the largest passenger movement to any convention of the year and the roads entering that city made elaborate preparations to handle the Shriners going to the session from all points in the country.

It is estimated that the Chicago, Milwaukee & St. Paul and the Chicago, Rock Island & Pacific handled about 25,000 passengers, with equal participation. Next in rank came the Chicago & North Western, while large local movements were also handled by the Chicago, Burlington & Quincy and the Great Western. The movement on the St. Paul comprised organized parties from 20 different points over the country, the largest being a 13-car special train from Tacoma, Wash., carrying the Imperial Potentate of the Order, Lewis Garretson, and Shriners from Everett and Spokane, Wash., Butte, Mont., and other points along the route. It is interesting to note that the Denver, Colo., special was cancelled when the Shriners from that territory turned over their services and money to the flood refugees. The Rock Island lines handled 32 special trains with a total of over 10,000 passengers, the largest special train coming from Brooklyn, N. Y. Another train handled by this road came from California and a third from Newark, N. J. The North Western carried organized movements of passengers from Columbus, Ohio, Indianapolis, Ind., and Atlanta, Ga. One of the trains operated over the Great Western was made up at Washington, D. C.

**Illinois Central Begins Program of Improvements**

C. H. Markham, president of the Illinois Central, on June 10, sent the following circular letter to officers and employees of that system:

"I have been endeavoring to keep you advised in regard to important developments affecting the Illinois Central System. In a communication addressed to you March 1, 1921, I said that it was necessary to put our affairs in such shape that we would be enabled to grasp the first signs of business revival to start upon that program of expansion and development necessary to the well-being of the business interests dependent upon the Illinois Central System for transportation service.

"The decision of the Labor Board in regard to the reduction of wages, when it becomes effective will result in a substantial decrease of the operating expenses of the Illinois Central System. You will be interested in learning that we intend to invest that money in maintenance which has been deferred—in the employment of additional men and in the purchase of materials and supplies. We have not waited for the money to come in, but we have already entered upon our program, and we believe that other railroads will do likewise.

"The action of the Labor Board, therefore, operates as the first signal for the opening up of business which will redound to the benefit of the public at large. The crop prospects are favorable. This railway recognizes its pressing duty to patrons to place its roadway and equipment in condition to serve them this fall. The Labor Board decision will help to enable it to meet that duty.

"You are aware of the agitation for a reduction of freight and passenger rates. The Interstate Commerce Commission is watching that question closely. Already many of the freight rates have been adjusted, and other adjustments are under consideration at the present time. However, on account of the physical condition of the railways and the great necessity of spending large sums to bring them back to their former state of efficiency, it is not believed that rates can be reduced generally at any time within present vision. The railways must first be restored, and that will absorb all the money in sight for some time to come, and much more if it were available.

"I feel that, while you will naturally regret to give up any portion of the increase in wages that was granted to meet living costs when they were at their peak (and I regret that it is necessary that you should do so), you will recognize that the reduction was inevitable, since the costs of living have been reduced. I am confident that you will meet this situation in that same wholesome spirit with which you met each trying situation that confronted you during the last few years."

**Traffic News**

A bill to amend the Interstate Commerce Act to provide for seasonal rates on coal has been introduced in the House of Representatives by Mr. Linthicum.

The Senate committee on oceanic canals on June 13 ordered a favorable report on the bill introduced by Senator Borah, providing that no tolls shall be levied upon vessels passing through the Panama Canal engaged in the coastwise trade of the United States.

The Southern Pacific will put into effect on July 15, a rate of \$16.50 per ton on copper bullion, copper matte, blister copper, also lead bullion and speiss, in carloads, with a minimum weight of 60,000 lb., from points in Arizona and New Mexico to New York, and points taking New York rates, by rail, to Galveston, Tex., and thence by steamship. The reduction amounts to \$20 a ton.

The Senate on June 10 passed with minor amendments the bill, S. 621, providing an additional extension of one year to shippers as to claims in respect of overcharges made during the period of federal control. The bill was recommended both by the Interstate Commerce Commission and the director general of railroads. It amends Subdivision C of Section 206 of the Transportation Act.

The Interstate Commerce Commission on June 10 issued a sixth section permission order authorizing the western transcontinental railroads, represented by R. H. Countiss as agent, to put into effect on one day's notice a rate of \$1.75 per 100 lb. on vegetables, melons and cantaloupes from Pacific Coast terminals and intermediate points to eastern points in place of rates ranging from \$1.83 to \$2.08½.

The state commissions of Alabama and of Tennessee have issued orders requiring the American Railway Express Company to co-operate with the Southeastern Express Company in making through routes and rates substantially in accordance with the practice which prevailed before the establishment of the Southeastern Express Company and when the American operated over the lines of the Southern Railway Company.

Plans for the shipment of more than 10 per cent of the Pacific Coast fruits and vegetables to the eastern seaboard through the Panama Canal have been announced in a statement to the press by C. S. Whitcomb, president of the Pacific Producers' Association. Another statement announced that the western fruit shippers would not accept a reported proposal of the railroads that the rates on citrus fruits to the east be reduced 10 per cent on condition that the shipments be confined to the rail carriers. "The consumer fixes the price," said Mr. Whitcomb, "and our hope is to be able to come within that price." Answering criticisms, Mr. Whitcomb says that in hot spells it is impossible to keep the price of lemons normal.

**Anthracite Shipments, May, 1921**

The shipments of anthracite in May as reported to the Anthracite Bureau of Information, amounted to 5,793,895 tons, a decrease as compared with the preceding month of April, of 173,570 tons, and 361,983 tons less than tonnage shipped during May of last year, when 6,155,878 tons were shipped to market, and reflected the benefit of the termination of the switchmen's strike.

Shipments by originating carriers were:

## Commission and Court News

### United States Supreme Court

#### Penalties Not Recoverable Against Director General

In a proceeding for a penalty for non-payment of wages of a railroad employe, wrongfully discharged, brought under an Arkansas statute, the railroad appealed from a judgment by default to the State Circuit Court and there moved to substitute the Director General of Railroads. This substitution the court refused to make, but joined the Director General as defendant and entered judgment against both him and the company for the debt and penalty. This judgment was affirmed by the State Supreme Court but it is now reversed by the United States Supreme Court for the following reason: "As the Federal Control Act did not impose any liability upon the companies on any cause of action arising out of the operation of their systems of transportation by the government, the provision in Order No. 50 authorizing the substitution of the Director General as defendant in suits then pending was within his power; the application of the Missouri Pacific that it be dismissed from this action should have been granted; and the judgment against it should, therefore, be reversed." The government did not, under section 10 of the Federal Control Act, undertake to punish itself for any departure from the existing laws by the imposition upon itself of fines and penalties or to permit any other sovereignty to punish it. The judgment against the Director General, so far as it provided for recovery of the penalty was therefore held erroneous. Judgment reversed. *Missouri Pacific v. Ault*. Decided June 1, 1921. Opinion by Mr. Justice Brandeis.

#### Supreme Court Sustains Railroad in Objection to Assessment for Highway Construction

In answer to a petition filed by the Kansas City Southern and the Arkansas & Ft. Smith against Road Improvement District No. 6, Little River County, Ark., opposing the levying of an assessment against the railroads for the construction of permanent roads, the Supreme Court of the United States sustained the protest of the railroads, declared the assessment excessive and expressed doubt regarding the railway receiving any benefit from such an improvement. This road district was created in accordance with an act of the Arkansas legislature to include approximately 25,000 acres and within them 9.7 miles of main track owned and operated by the Kansas City Southern and the Arkansas & Ft. Smith, together with the corresponding right-of-way covering 130 acres and requisite station buildings. Little River County is distinctly agricultural, has an area of 546 square miles, and 16,000 inhabitants. The improvement district was created for the purpose of constructing 11.2 miles of gravel road through taxation upon real property, defined by the statute as "land, improvements thereon, including railroads, railroad right-of-way and improvements thereon, such as public buildings, sidetracks, etc., and tramroads."

A duly appointed board assessed the benefits to the roads on account of the proposed road at \$7,000 per mile of main track—\$67,900. They divided the farming lands into five zones, determined by distance from the highway, and assessed uniform benefits upon all within the same zone without regard to improvements or market value—in the first \$12 per acre, second \$10, third \$8, fourth \$6 and fifth \$4. Town lots were likewise assessed without reference to value or improvements at \$10, \$15, \$20, and \$25 each, according to location. A pipe line, telephone line, and telegraph line were severally assessed at \$2,500, \$300 and \$300 per mile, without any designated basis.

The railroads maintained that the assessment upon their property was unequal, arbitrary, unreasonable and in violation of the Fourteenth Amendment. The state courts held to the contrary.

In its decision the Supreme Court stated that the settled rule is that a state legislature "may create a taxing district to meet the expense of local improvements, and may fix the basis of taxation without encountering the Fourteenth Amendment unless its action is palpably arbitrary or a plain abuse." Ordinarily,

the levy may be upon lands specially benefited according to value, position, area, or the front-foot rule.

The statute under consideration prescribes no definite standard for determining benefits from proposed improvements. The assessors made estimates as to farm lands and town lots according to area and position and wholly without regard to their value, improvements thereon, or their present or prospective use. On the other hand, disregarding both area and position, they undertook to estimate benefits to the property of plaintiffs in error without disclosing any basis therefor, but apparently according to some vague speculation as to present worth and possible future increased receipts from freight and passengers which would enhance its value, considered as a component part.

Obviously, the railroad companies have not been treated like individual owners, and we think the discrimination so palpable and arbitrary as to amount to a denial of the equal protection of the law. Benefits from local improvements must be estimated upon contiguous property according to some standard which will probably produce approximately correct general results. To say that 9.7 miles of railroad in a purely farming section, treated as an aliquot part of the whole system, will receive benefits amounting to \$67,900 from the construction of 11.2 miles of gravel road seems wholly improbable, if not impossible. It is doubtful whether any very substantial appreciation in value of the railroad property within the district will result from the improvements; and very clearly it cannot be taxed upon some fanciful view of future earnings and distributed values, while all other property is assessed solely according to area and position. Railroad property may not be burdened for local improvements upon a basis so wholly different from that used for ascertaining the contribution demanded of individual owners as necessarily to produce manifest inequality. Equal protection of the law must be extended to all.

#### Risk on Team Track, First 48 Hours

Shipments of grapes were transported from different points of origin to Chicago, arriving on different days. On arrival each car was placed on a public delivery track and notice thereof given. The consignee accepted each car, breaking the seals. Loss occurred after acceptance and commencement of unloading. In an action for damages the question was whether the railroad was liable therefor, and in what capacity—whether as carrier or warehouseman, or at all. The bill of lading provided that "Property not removed within 48 hours after notice of arrival, may be kept by the carrier as warehouseman only. . . . Controversies have arisen as to this provision, the decisions differing. Consignee contends that the railroad during the 48 hours is responsible as a carrier, this relation not terminating until the expiration of that time. The contention of the railroad company is *contra*, that it, the company, is neither liable as a carrier nor as warehouseman; not as carrier because the shipment had been delivered and accepted, and not as warehouseman because no negligence has been proved against it. Affirming a judgment of the state court for the consignee the United States Supreme Court says: "The property here was not delivered; access was only given to it that it might be removed, and a period of 48 hours was given for the purpose. Pending that time it was within the custody of the railroad company, which had the same relation to it as during transportation. The bill of lading is definite as to the time at which responsibility of the company shall be that of warehouseman, and by necessary implication until that responsibility attaches, that of carrier exists."—*Michigan Central v. Owen & Co.* Decided June 1, 1921. Opinion by Mr. Justice McKenna.

Mr. Justice McReynolds dissented in an opinion in which he says that section 5 of the Uniform Bill "does not purport to establish any rule of liability during the 48 hours, but leaves that to be determined by application of the common law to the circumstances. To say that a carrier insures for 48 hours although the consignee has taken actual custody of the goods would seem an absurd conclusion. And the practical impossibility of stationing an agent at every car within a great terminal while freight is being removed by thousands of consignees and their agents—a necessary precaution if thefts or mistakes by any of them must be prevented—makes it manifest that the Interstate Commerce Commission would not have sanctioned the responsibility now claimed and that the carriers would not have acquiesced."

## Foreign Railway News

### Wage Reductions in Belgium

Reductions in wages are general in Belgium, according to the Times (London) Trade Supplement but the result is a growing dissatisfaction in the ranks of labor which, it is feared, may lead to serious consequences. Railway workers are said to threaten a general strike if proposed wage reductions are put into effect.

### Latvian Railways Forsaking Standard Gage

At the present time there are some 500 miles of standard rail-ways in Latvia, as against 1,125 miles of Russian gage (5 ft.), according to Trade Commissioner Groves, at Riga. The line from Riga to the Russian border on the line to Moscow is a broad gage line, while the road leading from the port of Libau is standard gage. The existing standard gage lines are being converted to the Russian gage as traffic demands.

### Sabotage Hinted in French Accidents

The wrecking of several French trains recently has caused some inquiry into the probability of sabotage in view of the radical disaffection of many railway workers. In one instance a rail was found removed from the track. In another a fixed signal was bound with copper wires to show clear. Several serious accidents have resulted from this apparently malicious tampering with the signals and track.

### German Consolidations

LONDON

A company called the Gutehoffnungshutte, has been formed in Germany by a group of German companies included in which are the Henschel Locomotive Works (Cassel), the Nuremberg Oil Engineering Works, the Deutsche Werft of Hamburg, a shipyard having 22 ways, various steel interests and Hamel & Leng of Dusseldorf, the latter having a dominating interest.

### Further Service Curtailments in England

Due to the coal strike in England, great reductions in train service have been necessitated. The extent of these reductions had been predetermined by the officers and it is estimated that the present service is only about 66 per cent of normal. Sunday service on branch lines has been withdrawn in a number of instances, no collections or deliveries of mail are made on Sundays, and many regular through runs have been suspended temporarily. These economies have been estimated by the Engineer (London) to be sufficient to reduce the consumption of coal by the railways to 50 per cent of normal. It is pointed out that one of the conditions of service of the railway employees is the "guaranteed week" of regular employment. Owing to the curtailment of service this guaranty has now been reduced to three days per week.

### Earnings of Nitrate Railways

The Nitrate Railways, the largest privately operated lines in Chile, earned a net of \$1,218,776 (pounds to dollars at par) in 1920 as compared with \$465,539 in 1919. Gross receipts were \$5,345,708 in 1920 and \$2,357,795 in 1919. Dividends of 7 per cent were paid on all the capital stock excepting the deferred ordinary shares and \$483,090 was transferred to surplus. At the annual meeting of the stockholders in London on May 24, the acting chairman told of the adverse effect which labor troubles were having on earnings. There has, he said, been a great increase in expenses due to wage increases and payment for overtime. It was announced that the company is contemplating the electrification of its line from Iquique to Carpaz, 20 miles, and is seeking the sanction of the Chilean government for this work. The purpose of this undertaking would be to conserve water, which is scarce in northern Chile.

## Equipment and Supplies

### Locomotives

THE SHANTUNG RAILWAY has ordered from the American Locomotive Company through Mitsui & Co., New York, 1 Pacific type locomotive.

MITSUI & Co., New York, have ordered from the American Locomotive Company 5 Mogul type locomotives for the Imperial Karafuto Government, Japan.

### Government Locomotives Sold

The Surplus Property Division of the War Department has sold 45 of the Decapod locomotives originally built for the Russian government to the Erie Railroad. This constitutes the remainder of the Decapods held by the government. The price has not been announced.

### Freight Cars

THE BALTIMORE & OHIO is inquiring for 500 hopper car bodies, of 70-tons capacity.

THE CHICAGO, INDIANAPOLIS & LOUISVILLE is asking for prices on 500 composite gondola cars.

THE SPANISH GOVERNMENT RAILWAYS are asking for prices, through the car builders, on 100 freight cars.

THE BANGOR & AROOSTOOK is inquiring for 300 box cars, of 30-tons capacity and 200 flat cars, of 40-tons capacity.

THE CHESAPEAKE & OHIO is asking for prices for rebuilding from 500 to 1,000 composite cars, also for repairs to 500 to 1,500 steel cars.

THE MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE has awarded a contract to the American Car & Foundry Company, for the repair of 500 box cars.

THE UNION PACIFIC has given an order to the Pacific Car & Foundry Company for repairs to 1,000 box cars. The work is to be carried out at the Portland plant of the Pacific Car & Foundry Company.

THE ERIE RAILROAD, reported in the *Railway Age*, of April 1, as asking for prices on repairs to 1,000 box cars of 40-tons capacity, will have these repairs made at the Hammond shops of the Standard Steel Car Company.

### Iron and Steel

THE ALASKAN ENGINEERING COMMISSION has ordered 10,000 tons of rails and accessories from the Tennessee Coal, Iron & Railroad Company, to be rolled at the Ensley, Ala., mills.

### Miscellaneous

NORFOLK & WESTERN.—Bids will be received until noon, June 22, at Roanoke, Va., for parts for electrical apparatus; 400 rods galvanized wire fencing; 24 steel flanged engine truck wheel tires; approximately, 45,861 lb. soft steel bars; 116,711 lb. steel plates, 580,302 lb. steel shapes, and repairs to electrical apparatus.

### Signaling

THE BOSTON ELEVATED has ordered from the Union Switch & Signal Co. an a. c. electro-pneumatic interlocking for Forest Hills, the machine to have 13 levers for 41 signals and 16 automatic stops; 14 levers for 14 single switches and three double slips, and five traffic levers, making a total of 32 working levers in a 35-lever frame. At each high signal there will be an automatic stop. There will be section and sectional route locking throughout, and time locking on all signal levers.

## Supply Trade News

The Standard Pressed Steel Company, has removed its headquarters from Philadelphia to Jenkintown, Pa.

P. R. Letts has been appointed office manager of the industrial bearings division of the Hyatt Roller Bearing Company, New York, succeeding G. J. Traendly, who is now office manager of the General Motors Corporation, New York.

C. W. Cross has been appointed railroad representative of the Torchwood Equipment Company, Fulton and Carpenter streets, Chicago. Mr. Cross was until June 1, manager of western railroad sales for the Chicago Pneumatic Tool Company.

John B. Seymour, district sales manager of the Verona Tool Works at Chicago, has been appointed sales manager of the Superior Supply Company, 5 South Wabash avenue, Chicago, effective June 16. The officers of this company, which was organized recently, are: President, Will R. Sostheim, formerly director and manager of the railroad, contractor and machinery department of Geo. B. Carpenter & Co.; vice-president, E. A. Kreplin, formerly purchasing agent of that company; and secretary-treasurer, John H. Erby, formerly Detroit district manager of the same company.

The name of The Esterline Company, Indianapolis, Ind., has been changed to The Esterline-Angus Company. The Esterline Company was organized by J. W. Esterline in 1900, and was incorporated in 1906. D. J. Angus became associated with Mr. Esterline in 1910 in a consulting engineering business, and in 1917 he became a stockholder and director of the Esterline Company. Mr. Angus has been responsible for the development of three new types of recording meters, known as the k. v. a. meter, the concentration meter and the graphic ohm-meter.

The directors of the Greenfield Tap & Die Corporation, Greenfield, Mass., on June 9, voted to purchase the entire capital stock of the Greenfield Machine Company, Greenfield, manufacturers of cylindrical and universal grinders, and the Morgan Grinder Company, Worcester, manufacturers of internal grinders. This combination together with the machines now produced by the Greenfield Tap & Die Corporation, will constitute the machine division of the Greenfield Tap & Die Corporation. The operation and organization of both plants will remain the same for the present, although eventually the Worcester plant will be moved to Greenfield.

## Obituary

James Prentice Snedden, general superintendent at Bayonne, N. J., of the Babcock & Wilcox Company, New York, also vice-president of the Pittsburgh Seamless Tube Company, Beaver Falls, Pa., died on June 11, at the Johns Hopkins Hospital, Baltimore, Md., at the age of 58.

## Trade Publications

**BOILER EXPLOSIONS.**—The Falls Hollow Staybolt Company, Cuyahoga Falls, Ohio, has issued a new pamphlet setting forth some of the reasons for boiler explosions, attributable to staybolts. It also enumerates fifteen reasons why the danger of explosion is eliminated by the use of its staybolt.

**FIRE TESTS OF BUILDING COLUMNS.**—The United States Bureau of Standards, Washington, D. C., has issued Technological Paper No. 184 comprising a report of nearly 400 pages on tests of a great variety of building columns subjected to conditions simulating those of building fire while under load in order to determine the relative fire resistance of different constructions. These tests were conducted under the direction of S. H. Ingberg, physicist at the Underwriters Laboratories, Chicago, Ill., and resulted in the accumulation of a large amount of information that will be valuable to the building engineer.

## Railway Construction

**CHICAGO & EASTERN ILLINOIS.**—This company contemplates the construction of a two-story brick railroad Y. M. C. A. building at Mitchell Yard, Ill., to cost \$100,000.

**CHICAGO, BURLINGTON & QUINCY.**—This company has closed its bids for the grading in connection with the track elevation at Broadway, Benton and Clark streets, Aurora, Ill., the work to involve the expenditure of approximately \$50,000.

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company contemplates the construction of a new power plant at Trenton, Mo., on the site of its shops which were destroyed by fire.

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for supplying the coal and sand handling equipment for a coaling station at El Reno, Okla. The station, which will replace a similar structure destroyed by fire, will be built by company forces.

**CHICAGO UNION STATION.**—This company contemplates widening Canal street, between Van Buren and Jackson streets, Chicago.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of May 6 (page 1093) as contemplating the construction of additions to its roundhouse at Waterloo, Ia., has awarded the contract for this work to W. J. Zitterall, Webster City, Ia. The company has also awarded a contract to M. J. Roach, Memphis, Tenn., for grading in connection with the construction of yard and storage tracks at Sarpy, La. The company contemplates the construction of an engine house at Herrin, Ill., to be built by company forces, and the enlargement of its pumping plant at Ramsey, Ill.

**INTERNATIONAL & GREAT NORTHERN.**—This company is erecting a new three-story office building with dimensions of 46 ft. by 52 ft., at San Antonio, Tex.

**LOUISVILLE & NASHVILLE.**—This company has awarded contracts to Joseph E. Nelson & Sons, Chicago, in connection with improvements to its terminal at Hazard, Ky., for the construction of a roundhouse, machine shop, oil storage building, car department building, storage and office building, lavatory building, and an engineers' locker and register building. The total cost of the project is approximately \$180,000.

**PITTSBURGH & WEST VIRGINIA.**—The Interstate Commerce Commission has issued a certificate authorizing the construction of a branch or spur from a point on its main line near Virginia Station, W. Va., a distance of approximately 3.2 miles.

# Annual Report

## New York, Chicago & St. Louis Railroad Company—Thirty-fourth Annual Report

To the Stockholders of The New York, Chicago and St. Louis Railroad Company:

The Board of Directors herewith submits its report for the year ended December 31, 1920, with statements showing the financial condition of the company.

The capital stock authorized and issued to December 31, 1920, was..... \$30,000,000.00  
being the same as at the close of the previous year.

The funded debt outstanding as of December 31, 1919, was.. \$37,715,000.00  
It was decreased during the calendar year:  
By the retirement of Equipment Trust  
Certificates of 1916..... \$110,000.00  
By the retirement of Engine Trust Certi-  
ficates of 1916..... 30,000.00  
By the retirement of Equipment Trust Cer-  
tificates of 1917..... 133,000.00  
By the retirement of First Mortgage Bonds 122,000.00  
..... 395,000.00

Funded debt outstanding as of December 31, 1920..... \$37,320,000.00

During the year, Second and Improvement Mortgage Bonds (Series A), with a par value of \$1,036,000, were executed and delivered to the Treasury of the Company, the purpose of the issuance of these bonds being to reimburse the Treasury of the Company for capital expenditures theretofore made by it. These bonds have not been converted into cash.

The operation of your property under the direct supervision and control of the United States Government was continued until February 29, 1920. On March 1, 1920, the property was returned to the Company pursuant to the provisions of the Transportation Act, 1920.  
The Company did not accept the guaranty provisions of that act. Therefore, your Company has no claim against the United States Government covering the so-called Guaranty Period. The earnings for the Guaranty Period exceeded one-half of the Certified Standard Return by approximately \$890,000.00.

The compensation for the use of your property for the twenty-six months, during which it was operated by the United States Government, has not as yet been determined. Negotiations with the Railroad Administration are well under way, however, and an early settlement of all claims is expected.

### SUMMARY OF OPERATIONS AFFECTING INCOME AND SURPLUS

OPERATING INCOME	Federal operations	Ten months ended Dec. 31	Total	Corporate income for the year
Railway operating revenues.....	\$4,701,940.15	\$23,953,608.15	\$28,655,548.30	\$23,953,823.96
Railway operating expenses.....	4,174,337.91	19,093,838.60	23,268,176.51	19,112,850.38

Expense prior to January 1, 1918.....	2,140,548.74	.....
Additions and betterments (less paid on account, \$712,000.00).....	2,065,209.90	.....
Materials and supplies, February 29, 1920.....	1,922,826.44	.....
Federal assets collected.....	1,729.00	.....
Totals.....	\$10,850,950.21	\$10,618,907.33
Net balance due Railroad Administration..	232,042.88	.....

The foregoing statement is informative only, inasmuch as the Company does not admit the propriety of the Railroad Administration charges.

The usual statistical tables are appended.  
The Board desires to express its appreciation of the faithful and efficient services rendered by officers and employees during the year.

For the Board of Directors,  
J. J. BERNET, President.

## Railway Financial News

**BOSTON & MAINE.—Defers Dividend Action.**—Announcement that no action was taken by the board of directors at a meeting in Boston on June 14 in the matter of declaring a dividend on the first preferred stocks, which would normally be payable on July 1, was made by President J. H. Hustis. He pointed out that dividends on these stocks were cumulative and said they would be paid when earned.

In a statement issued after the meeting Mr. Hustis said:

The conditions which made it necessary to defer action on the preferred dividends due January 1 last have continued during the intervening months, and as a result it is estimated that the deficit for the first six months of 1921, after the payment of fixed charges and taxes, will be over \$7,000,000.

This period was abnormal in many respects for all railroads, as is indicated in their monthly reports. With the Boston & Maine the sharp decline in business which began in November, 1920, has continued up to the present, without any substantial recovery. Wages have been at their maximum, and the fuel and materials used in this period were necessarily purchased or contracted for at the high prices of 1920. Maintenance both of track and equipment, which had been deferred because of conditions due to the war, was necessarily prosecuted to a greater extent than would ordinarily have been justified under the business conditions prevailing during the period.

We believe, however, that there is a turn in the adverse tide against which we have been struggling and that the second half of the year will show a different tendency. We have the Labor Board decision as to wages, which should result in a substantial saving. The Labor Board also has decreed the abrogation of national agreements on July 1, but as this question involves further consideration by the Labor Board in the event of failure to agree upon new agreements locally we cannot as yet estimate the effect of that decision.

We know that reduced prices of locomotive fuel should have a substantial effect on operating expenses in the second six months. A reduction of \$1 a ton, which is conservative, would result in an annual saving on the present basis of consumption of approximately \$1,500,000. We should also have the benefit of lower costs of other materials as fast as present stocks are replenished.

It is believed that any increase in business—and there are some indications of a slight revival—could be handled with a relatively small increase in expenses and should immediately be reflected in the net results.

**CENTRAL VERMONT.—Authorized to Pledge Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$100,000 of refunding mortgage 5 per cent gold bonds and to pledge them from time to time as collateral security for short term notes.

**CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.—Defers Dividend Action.**—Pending adjustment of accounts with the government, the directors have decided to defer until the September meeting the regular semi-annual dividends of 3½ per cent on the preferred and 2½ per cent on the common stock for the first half of the current year. This road is controlled by the Chicago & North Western.

**COLUMBUS & GREENVILLE.—Receivership.**—This road, formerly the Southern Railway in Mississippi, has been placed in the hands of a receiver by Federal Judge Edwin Holmes at Aberdeen, Miss., on the application of the company itself. The court has authorized the receiver, A. T. Stovall, to issue \$200,000 receiver's certificates, of which about \$150,000 will be used to pay delinquent taxes. The road runs from Columbus, Miss., westward to Greenville, 168 miles, with 110 miles of branch lines. The receivership was brought about to prevent the sale of the road for the taxes due.

**DEATH VALLEY.—Authorized to Issue Stock.**—This company has been authorized to issue and sell at par \$34,900 of common capital stock, the proceeds to be used to retire 90 first mortgage bonds which mature on March 1.

**DETROIT & IRONTON.—Authorized to Issue Stock.**—This company has been authorized by the Interstate Commerce Commission to issue and sell at par \$1,000,000 of capital stock, the proceeds to be used in the construction of a line approximately 15 miles long, extending southward from Springwells or Fordson, Mich., to a connection with the Detroit, Toledo & Ironton, near Trenton or Flat Rock. The company has also asked authority to assume as lessee of the properties of the Detroit, Toledo & Ironton obligations in respect of certain securities issued by the latter company. These matters were reserved by the commission for further consideration.

**DETROIT, TOLEDO & IRONTON.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue and sell at par \$182,000 of first mortgage bonds.

**KANSAS CITY TERMINAL.—Authorized to Issue Notes.**—This company has been authorized by the Interstate Commerce Commission to issue and sell at not less than 93½ per cent of par and accrued interest or to exchange for maturing notes \$2,000,000 of 10 year, 6½ per cent, secured gold notes and to pledge as collateral security for the notes \$3,125,000 first mortgage 4 per cent gold bonds.

E. H. Rollins & Sons, of New York, and the Continental and Commercial Trust & Savings Bank of Chicago are offering these notes, dated July 1, 1921, at 96.44 and interest at 7 per cent. The proceeds will be used, with other funds, to retire \$2,500,000 of the company's notes, maturing July 1. The twelve railroads entering Kansas City are bound unconditionally to provide funds for the payment of principal and interest of the pledged bonds and taxes, as well as their ratable share of operating expenses.

**MAHONING COAL RAILROAD.—Extra Dividend Declared.**—This company has declared an extra dividend of \$15 a share on the common stock and the regular semi-annual dividends of \$5 on the common and 2½ per cent on the preferred. The extra dividend on the common is payable July 1 to stock of record June 24; the regular common August 1 to stock of record July 15, and the preferred dividend is payable July 1 to stock of record June 24. The dividends of this company from 1915-1920 have been at a rate of 20 per cent a year.

**READING COMPANY.—Trustees Appointed.**—The trustees appointed under the segregation plan by the United States District Court at Philadelphia for the stock of the Philadelphia & Reading Coal & Iron Company, which will be assigned to the new corporation are: Newton H. Fairbanks, of Springfield, O., and Joseph B. McCall, of Philadelphia, Pa. The trustees of the New Jersey Central stock owned by the Reading company are R. E. McCarty, of Pittsburgh, general manager of the Pennsylvania System, Central Region, and C. S. W. Packard, of Philadelphia.

A decree filed by Judges Buffington, Davis and Thompson, making the appointment, provides that the two groups of trustees shall diligently take up their duties and in case either of the trustees are unable to agree as to the voting of shares or any other matter in the scope of their duties they may apply to the court for instruction.

**SALT LAKE & UTAH.—Application for Loan.**—This company has applied to the Interstate Commerce Commission for a loan of \$700,000 from the revolving fund for 15 years.

**ST. LOUIS-SAN FRANCISCO.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to sell \$4,232,000 of prior lien mortgage bonds at not less than 90 and to pledge them as security for short term notes.

**TENNESSEE CENTRAL.—Nashville Terminal Company Declares Lease Forfeited.**—The Nashville Terminal Company which is leased to the Tennessee Central at an annual rental of \$60,000 has refused to accept \$30,750, being the rental due to January 1, 1921, with interest, and has posted notices to the effect that it has taken possession of the property covered by the lease. The company declares that the lease has been forfeited owing to the failure of the Tennessee Central to pay the rental when due.

Judge E. T. Sanford at Knoxville, Tenn., has postponed until June 25, the hearing on the lease controversy. J. H. DeWitt, of Nashville, has been appointed special master to make a report to the court showing an itemized list of all creditors to whom the receivers are indebted and when and for what each debt was created.

**VIRGINIAN.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Railway Operating Revenues, March 1 to December 31, 1920		
Freight .....	\$13,901,140	.....
Passenger, including excess baggage and club car fare .....	798,531	.....
Total operating revenues (inc. other).....	\$15,989,750	.....

Railway Operating Expenses, March 1 to December 31, 1920:

Maintenance of way and structures.....	\$1,965,229	.....
Maintenance of equipment.....	3,177,424	.....
Trains.....	91,733	.....
Transportation.....	5,518,806	.....
General.....	350,688	.....
<b>Total operating expenses (inc. other).....</b>	<b>\$11,085,299</b>	<b>.....</b>
Net revenue from railway operations.....	\$4,904,451	.....
Railway tax accruals.....	1,026,492	.....
<b>Total deductions.....</b>	<b>\$1,026,507</b>	<b>.....</b>
Total railway operating income.....	\$632,786	.....
Tentative net railway operating income for the ten months ended December 31, 1920.....	\$4,510,729	.....
Compensation due from U. S. Government (January and February, 1920; full year 1919).....	513,365	\$3,247,603
<b>Tentative railway operating income for the year subject to settlement with the United States Government.....</b>	<b>\$5,024,095</b>	<b>.....</b>
<b>Total non-operating income.....</b>	<b>\$284,209</b>	<b>.....</b>
Gross income.....	\$5,308,304	\$3,548,577
Total deductions from gross income.....	2,020,842	1,767,012

Net income (tentative for year 1920 subject to settlement with U. S. Government)..... \$3,287,462 \$1,845,632

The annual report of the Virginian will be reviewed editorially in an early issue.

**WICHITA NORTHWESTERN.**—*Loan from Revolving Fund Approved.*—The Interstate Commerce Commission has approved a loan to this company of \$381,750 for 10 years to be used in meeting maturing indebtedness and in paying for some additions and betterments.

**Railroad Administration Settlements**

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts: Port Bolivar Iron Ore Railway, \$35,000; Chicago, Milwaukee & Gary, \$200,000; Bangor & Aroostook, \$575,000. The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

**Guaranty Certificates Issued**

The Interstate Commerce Commission has issued certificates for partial payments on account of the six months' guaranty for 1920 as follows:

Bath & Hammondsport.....	\$9,000
Central New York Southern.....	6,000
Chicago, Detroit & Canada.....	55,000
Fort Worth Belt.....	12,500
Galveston Wharf.....	100,000
Fenn Yan & Lake Shore.....	2,000
Toledo & Ohio Central.....	105,000
Ulster & Delaware.....	25,000
Lake Erie & Western.....	360,000
Chicago & Alton.....	20,000

The commission has also issued a certificate for the final amount due under the guaranty to the Electric Short Line for \$14,993.67.

**Dividends Declared**

Albany & Susquehanna.—\$4.50, semi-annually, payable July 1 to holders of record June 15.  
 Chicago & North Western.—Common, 2½ per cent, semi-annually; preferred, 3½ per cent, semi-annually; both payable July 15 to holders of record June 23.  
 Chicago, Indianapolis & Louisville.—Preferred, 2 per cent, semi-annually, payable June 29 to holders of record June 22.  
 Detroit, Hillsdale & South Western.—2 per cent, payable July 5 to holders of record June 21.  
 Kanawha & Michigan.—1½ per cent, quarterly, payable June 30 to holders of record June 20.  
 Little Schuykill Navigation Railroad & Coal Company.—\$1.00, payable July 15 to holders of record June 21.  
 Mahoning Coal Railroad.—Common, \$5.00, semi-annually, payable August 1 to holders of record July 15; common, extra, \$15, payable July 1 to holders of record June 24; preferred, 2½ per cent, semi-annually, payable July 1 to holders of record June 24.  
 Northern Central.—4 per cent, semi-annually, payable July 15 to holders of record June 30.  
 Pittsburgh, Ft. Wayne & Chicago.—Preferred, 1¾ per cent, quarterly, payable July 5 to holders of record June 10; common, 1¾ per cent, quarterly, payable July 1 to holders of record June 10.  
 Rensselaer & Saratoga.—4 per cent, payable July 1 to holders of record June 15.

**Railway Officers**

**Executive**

V. V. Boatner, whose election as president of the Peoria & Pekin Union, with headquarters at Peoria, Ill., was announced in the *Railway Age* of June 10 (page 1378), was born at Bethlehem, Miss., on May 6, 1881. He was educated at the Mississippi College at Clinton, and entered railroad service in May, 1901, as a station helper on the Illinois Central at Elizabeth, Miss. His entire railway career has been spent in the service of that company. On August 8, 1901, he was transferred to the office of the trainmaster at Greenville, Miss., as time-keeper and stenographer. In March of the following year he was transferred to Wilson, La., where he served successively as

V. V. Boatner

clerk in the trainmaster's office, copy operator, train dispatcher and chief dispatcher. He was promoted to trainmaster on April 1, 1907, and served in that capacity on the New Orleans, Vicksburg, Memphis and Indiana divisions until July 15, 1916, when he was promoted to superintendent, with headquarters at Vicksburg, Miss. At the time of his recent election Mr. Boatner was serving as superintendent of the Memphis division, to which he had been transferred in August, 1917.

Elliott E. Nash, whose election as vice-president and general manager of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., was announced in the *Railway Age* of June 10 (page 1378), was born at Hudson, Wis., on March 28, 1870, and entered railroad service in June, 1886, with the Chicago, St. Paul, Minneapolis & Omaha. He was employed by this company on part time work until June, 1888, when he became a clerk in the local station at Hudson, Wis. Six months later he was transferred to St. Paul, Minn., as a clerk in the auditor's office, and served in that position until November, 1891, when he was promoted to traveling auditor, with the same headquarters. In

E. E. Nash

March, 1892, Mr. Nash was made agent at Ashland, Wis., and served there until November, 1893, when he returned to St. Paul as agent. In March of the following year, he was transferred to Minneapolis, where he served until January, 1905. On this latter date he was promoted to assistant superintendent, with headquarters at Itasca, Wis., and in May of the same year he was transferred to Eau Claire, Wis. In May, 1910, Mr. Nash was assigned to special work in

the office of the president of the Chicago & North Western at Chicago, and in May, 1911, he was promoted to superintendent of the Minnesota division of the North Western, with headquarters at Winona, Minn. In April, 1912, he was transferred to the Madison division, with headquarters at Baraboo, Wis. In November, 1913, he was promoted to assistant general superintendent, lines east of the Missouri river (except the Iowa, Minnesota and Dakota divisions), with headquarters at Chicago. He was transferred to the Iowa territory as assistant general superintendent with headquarters at Boone, Iowa, in October, 1917. During the period of federal control, Mr. Nash served as assistant to the federal manager of the North Western, with headquarters at Chicago. He was appointed general manager of the Minneapolis & St. Louis in March, 1920, and was serving in this position at the time of his recent election.

### Financial, Legal and Accounting

**C. L. Young**, district claim agent of the Chicago & North Western, with headquarters at Milwaukee, Wis., has been promoted to assistant general claim agent, with headquarters at Chicago, succeeding **F. B. Piersol**, deceased. **O. J. Adams** succeeds Mr. Young.

**George N. Yard**, whose election as secretary and treasurer of the Gulf, Colorado & Santa Fe, with headquarters at Galveston, Tex., was announced in the *Railway Age* of June 3 (page 1301), was born at Harrisburg, Tex., on September 17, 1863. He was educated in the state normal school at Trenton, N. J., and entered railway service in 1884 on the Texas lines of the Southern Pacific. He has been in the service of the Gulf lines of the Santa Fe continuously for 32 years, having entered the employment of that company in July, 1889, as a clerk in the treasury department. He was made assistant cashier and paymaster in 1890, and in August, 1897, was promoted to paymaster. He was serving in that position at the time of his recent election.

### Operating

**Edgar G. Goforth**, whose promotion to general manager of the International & Great Northern, with headquarters at Palestine, Tex., was announced in the *Railway Age* of May 13 (page 1149), was born at Goforth, Tex., on December 10, 1886. He entered railway service on May 1, 1902, as a station helper on the Missouri, Kansas & Texas. After serving for two years as telegraph operator and relief agent on this road, he entered the service of the International & Great Northern, as a telegraph operator and towerman. In April, 1905, he was promoted to train dispatcher and three years later was appointed a chief train dispatcher. In December, 1912, he was made trainmaster, a position which he held for five years, and which was followed, in February, 1917, by his promotion to superintendent. At the time of his recent promotion, Mr. Goforth was serving as assistant general manager, with headquarters at Palestine, Tex., a position to which he had been promoted in June, 1919.

E. G. Goforth

**F. G. Gurley**, assistant superintendent of the Chicago, Burlington & Quincy, with headquarters at Wymore, Neb., has been promoted to superintendent, with headquarters at Alliance, Neb. He succeeds **G. L. Griggs**, who has been

transferred to the Beardstown division, with headquarters at Beardstown, Ill., succeeding **W. A. Chittenden**, who has been transferred to Brookfield, Mo. Mr. Chittenden succeeds **N. H. Young**, who has been transferred to St. Louis, Mo. **H. J. Hognlund** has been appointed trainmaster, with headquarters at Wymore, Neb. The promotions and appointments were effective June 16.

### Traffic

**L. H. Mann** has been appointed general agent of the Erie, with headquarters at Indianapolis, Ind., succeeding **C. A. Rouse**, who has resigned.

**H. C. Dinkins** has been appointed general agent of the International & Great Northern, with headquarters at Mexico City, Mex., effective June 15.

**H. E. Macdonell**, assistant freight traffic manager of the Canadian Pacific with headquarters at Montreal, has been granted a leave of absence on account of illness, effective June 6. During his absence **R. E. Larmour** will serve as acting assistant freight traffic manager, **C. E. Jefferson** as acting general freight agent and **S. C. Hurkett** as acting assistant general freight agent.

### Obituary

**Henry R. Williams**, former vice-president of the Chicago, Milwaukee & St. Paul, died at Seattle, Wash., on June 8. Mr. Williams was born at Palmyra, Wis., on July 14, 1849, and entered railroad service in January, 1867, as a telegraph operator on the Chicago, Milwaukee & St. Paul. After serving for four years in this capacity on various points on the line, he was made assistant train dispatcher at Milwaukee, Wis., where he remained until 1873. In this year, he was made train dispatcher, with headquarters at Minneapolis, Minn., and during the succeeding eight years served in this position on the Hastings, Dakota and River divisions. In 1881, he was promoted

H. R. Williams

to trainmaster on the Hastings and Dakota division, and later was transferred to the Iowa and Minnesota division. On January 1, 1882, he was promoted to superintendent, serving on the Iowa and Minnesota division until September 1, 1885, when he was transferred to the southern Minnesota division, with headquarters at La Crosse, Wis. From February, 1888 to June, 1890, he served as superintendent of the Ottumwa & Kansas City line, with headquarters at Kansas City and Chillicothe, Mo. In the latter year, he was promoted to assistant general superintendent, with jurisdiction over the Northern district of that road, and eight years later was promoted to general superintendent. He served as general manager from February 1, 1900 until October, 1905, when he was elected president of the Pacific road, which had been incorporated to build the Washington section of the Chicago, Milwaukee & St. Paul's extension to the Pacific coast. On January 4, 1909, Mr. Williams was elected president of the Chicago, Milwaukee & Puget Sound, a position which he held until January 1, 1913, when he was elected vice-president of the Chicago, Milwaukee & St. Paul. He served as vice-president of the St. Paul from that time until February, 1918, when he retired from active railroad service.

The Table of Contents Will Be Found on Page 5 of the Advertising Section

**IMPORTANT FOR SUBSCRIBERS.**—*In the interest of the conservation of paper, the Railway Age will print at the end of the present volume only a sufficient number of indexes to meet direct requests from its subscribers. Those desiring indexes should, therefore, immediately advise the New York office, 2201 Wookworth Building, New York.*

On a succeeding page in this issue there appears a statement given to the Senate Committee on Interstate Commerce, now engaged in an inquiry into the railroad situation, on the subject of co-ordinating motor transport with rail traffic, by Stuart B. Moore, former construction engineer of the Southern Pacific Lines.

### Co-Ordinating Motor and Rail Transportation

This article should be given careful consideration by railroad officers in general for Mr. Moore not only definitely establishes the relation between the economic location of railroads and that of highways but also shows how motor transport can be co-ordinated with rail traffic to the advantage of both. It is undoubtedly true that if a system of highways could be established that by the aid of the motor car would make the distant country districts as available to the city as the territory located close by, rural development would receive a tremendous impetus, rail revenues would be greatly increased and the use of motor vehicles largely extended. Mr. Moore's plan for doing this is well worth the careful consideration of the managers of our railroads, motor car manufacturers and highway engineers.

Emergencies such as the disastrous floods which occurred in various parts of the state of Colorado during the past three weeks, or heavy snow storms such as overwhelmed the railroads in January, 1918, present excellent opportunities for a study of the manner in which the roads organize their efforts to restore the properties to service. Some officers pride themselves on their ability to direct the work first hand and honestly feel that it is their duty to be out on the firing line undergoing hardships shoulder to shoulder with the men taking a direct part in clearing the line for traffic. Other officers find it of advantage to direct the work from temporary headquarters located with a proper consideration for the source of supply as well as the scene of action and make it a point to be present at these headquarters for as large a portion of the time as possible, after having made an inspection which gives them a thorough knowledge of the conditions. Close adherence to this plan insures access to the officer quickly when his advice and decision are necessary. On the other hand, it enables him to have an intimate touch with all the activities that play any part whatever with the strenuous work of restoring a line to service. Consequently, he is able to co-ordinate the various branches of the work so as to expedite progress to the greatest extent. Like a commanding general he is stationed at a sufficient distance behind the firing line to enable him to receive and transmit communications with all portions of the front in the sector under his command, while directing

### Organizing for Emergency Work

the service of supply, including the forwarding of men, equipment and tools, with a thorough knowledge of the requirements at all points. But of even greater advantage is the effect on the esprit de corps of the subordinate officers, who being placed to a larger extent on their own responsibilities are enabled to put a greater spirit into their work than when the general manager or chief engineer usurps their prerogatives. There are, of course, cases where the executive officer possesses particular talent for the direction of emergency work first hand but as a general rule his particular province lies in the organization of the emergency forces according to a plan under which individual responsibility for the numerous phases of the work are so subdivided that every detail is covered and each man in the entire organization knows just what is expected of him.

Colonel J. W. Pringle, senior inspecting officer of railways under the British Ministry of Transport, is the author of a report, just received, on the butting collision of passenger trains near Abermule, Wales, on the Cambrian Railway, January 26, when 17 persons were killed, and he omits mention of what seems at this distance an important underlying cause. The report fills 25 large pages, the disaster being classed as unique in the annals of British railways; but the fact that two of the persons at fault were boys under 18 years of age, not well trained, is not accorded special emphasis, nor is anything said as to why responsible station work was regularly entrusted to persons so young. Before the war, the British train accident reports could for long periods of time be searched in vain for examples of persons under 30 years old performing important duties in connection with train operation or signal working, and the war, depleting the forces and making difficult the recruiting of the ranks with satisfactory material ought, it would seem, to be considered as a cause of this collision; remote perhaps, yet potent. The immediate cause and other particulars will be found in another column. One of the main lessons, applicable everywhere, is the danger of delegating delicate duties. So far as this applies on American railroads, we may translate it as The Importance of Employing Many More and Much Better Inspectors. Many managers have said that the men on the firing line, such as trainmasters and road foremen, ought to be more numerous and more energetic; but to make any appreciable progress, this ought to be said much louder and a good deal oftener.

**The Danger of  
Delegating  
Delicate Duties**

The relation of railroad electrification to power supply is now causing much discussion. As much equipment as practicable should, of course, be standardized and it is contended by the advocates of direct current for railroad operation that 60-cycle alternating current, the use of which is increasing rapidly, will some day be universally adopted for power development in this country and that we must look forward to the time when all power for electric traction must be derived from 60-cycle, three-phase alternating cur-

**Electric  
Power for  
Traction**

rent feeders. The advocates of alternating current power for traction purposes are naturally opposed to this contention, for 60-cycle power supply involves the use of rotating machinery in the substations of railroads using alternating current on the trolley. Alternating current motors for 60-cycle signed for lower frequencies and if the power for traction is power are not as suitable for railroad traction as those developed as single-phase power at some lower frequency, such as 15 or 25 cycles, the substations become simple transformer stations. Rotating machinery, or perhaps some form of arc rectifier, is always necessary in substations supplying power to a direct current trolley. Either kind of power for traction may prove to be generally superior to the other but that is still a mooted question.

It is pointed out by F. H. Shepard, director of heavy traction, Westinghouse Electric & Manufacturing Co., in an article in this issue, that it is not desirable to superimpose a variable railroad load on a lighting supply circuit which requires close regulation. To this it might be added that recent experiments indicate that for very high voltage, long distance transmission, it may be found necessary, due to physical difficulties, to develop power at some frequency less than the 60 cycles. Advocates of alternating current power for traction lay great stress on the point that sufficient power for heavy and concentrated traffic movements can be supplied only by alternating current. This may prove to be true, but up to the present time direct current power has been able to meet all such demands of load that have been imposed upon it. In other words there are still too many variables involved to warrant curtailing the development of either kind of power for traction. It is highly probable that both kinds will be adopted as they have been in the past, except that the choice will be based more in the future on conditions of traffic and profile instead of being governed by laws and other extraneous influences which had much to do with the selection of equipment for the earlier installations. Railroad operating requirements should be of primary importance and special features of equipment should be subordinated to them.

## The Taxes Upon Transportation

WHILE THE TAX SYSTEM of the Federal government is under revision and while there is so much talk about railway rates being too high, Congress and the public might appropriately give consideration to the matter of eliminating taxes on railway freight and passenger transportation.

The tax on freight is 3 per cent of the railway rates and amounted in 1920 to \$129,720,000. The tax on passenger traffic is 8 per cent of the railway rates and amounted in 1920 to \$103,320,000. This made a total tax that the government added to the railway rates last year of \$233,040,000. It is not a part of the rates, and the railways did not get any of it. They merely collected it for the government.

On the basis of the total freight and passenger business handled last year and the higher freight and passenger rates which have been in effect since September 1, 1920, the total annual freight tax would be \$148,000,000, and the passenger tax \$120,000,000, a total of \$268,000,000.

These taxes have exactly the same effect upon the cost of transportation and the movement of traffic as equivalent additions to the freight and passenger rates would have, the only difference being that the money collected goes into the government treasury instead of to the railroads. Certain public officials have expressed the opinion that the present railroad rates are too high and are interfering with the revival of business. If this is true then these taxes upon freight and passenger transportation, which are added to the rates received by the railways, increase this undue burden, and since it is the last straw that breaks the camel's back their

removal, on the theory advanced, would be particularly helpful to business. Whether the present rates are or are not burdening business it is obvious that the government cannot consistently reduce a single railway rate on the ground that its reduction is needed to help general business without first removing the transportation tax which is applied upon that rate.

We could not have a better test of the sincerity of the public officials who argue that the present railway rates should be reduced to stimulate business than for them to apply to themselves the position they take regarding the repeal of the transportation taxes. Obviously if the railways are injuring business by charging rates that are too high, then the government is still farther injuring it by adding a tax to these rates. Clearly, it would be more appropriate for the government itself to take off a given tax for the purpose of reviving general business than it would be for the government to retain that tax and require a private industry such as the railroads to reduce the rates to which the tax is applied, not primarily to help their own business, but primarily to help general business.

## Railway Assessments for Permanent Highway Construction

IN VIEW of the widespread movement for the construction of hard surfaced roads throughout the country, a decision handed down by the Supreme Court of the United States on June 6 on a petition presented by the Kansas City Southern and the Texarkana & Fort Smith against a road improvement district in Arkansas, in which the court rejected the assessment levied by the district against the railroad, is of particular interest to railway men throughout the country. In this instance, a road improvement district was created in accordance with an act of the Arkansas legislature, including approximately 25,000 acres having within them 9.7 miles of main track of the Kansas City Southern and the Texarkana & Ft. Smith.

The district was created for the purpose of constructing 11.2 miles of gravel road through taxation upon real property. The assessors divided the farm land into five zones and assessed uniform benefits ranging from \$12 per acre in the first zone to \$4 per acre in the fifth. The property of the railway was assessed at \$7,000 per mile of main track or \$67,900 in all. In its petition the railway maintained that this assessment was so excessive as to amount to a confiscation of its property and pointed out that the increased traffic, if any, would be largely or entirely offset by that which was naturally tributary to it, but which could be transported to competing railways over the road in question. It therefore contended that the benefit which would accrue to it as a railway would be negligible. The Supreme Court characterized this assessment as a palpable and arbitrary discrimination and stated that "it is doubtful whether any very substantial appreciation in value of the railroad property within the district will result from the improvement."

The inroads upon railway traffic which are being made by motor transport companies following the construction of hard roads are becoming so serious in certain areas that the Chicago, Rock Island & Pacific filed a protest with the State Public Utilities Commission of Illinois against the use of hard roads by motor bus companies as "an appropriation of public improvements to private interest without any compensation," stating that the operation of a motor bus line parallel to its road will force the railway to curtail its service. That a railway should be forced to meet competition of this character upon a thoroughfare provided by the public and used by competitors without compensation, which is similar in effect to providing a right-of-way complete with tracks

and bridges and turning it over to a competing railway without compensation, is so unfair as to require no argument. To require a railway to contribute to the construction of a highway for its competitor is adding insult to injury. This is the problem which the railways are facing and which they should meet squarely as the Kansas City Southern and the Texarkana & Ft. Smith have done. The decision of the Supreme Court in this case will do much to establish the proper relation between the railways and public authorities charged with the construction of highways.

## Wages, Cost of Living and Productive Efficiency

IN THE recent wage hearings before the Railroad Labor Board some of the labor leaders protested against the policy of changing wages according to changes in the cost of living. The American Federation of Labor at its convention in Denver adopted a resolution denouncing the basing of wages wholly or mainly on the cost of living as "a violation of the whole philosophy of progress and civilization and a violation of sound economic theory and thoroughly without logic or scientific support."

Most of the advances in wages which have been made in this country since before the war have been based on increases in the cost of living. This has been especially true in the railroad business. Labor leaders were glad to accept advances in wages based on the cost of living when it was increasing. They repudiate the principle now that the cost of living is declining.

Having secured great advances in wages based on increases in the cost of living, the labor leaders cannot hope to prevent all reductions when it is declining. The cost of living is declining because prices are declining. Prices are declining because there is reduced demand for commodities at the high prices which have prevailed. Wages must be reduced when prices sharply decline, because employers cannot pay war wages when they can get only pre-war prices without being bankrupted. In many industries the wages being paid exceed the total earnings of those industries when lower prices and rates were in effect a few years ago. In the railroad industry, for example, the total wages paid in 1920 exceeded the total earnings of 1916. The restoration of pre-war prices means in many industries restoration of pre-war earnings. No industry can pay to labor all its earnings.

However, while in a period when prices are falling so much wages must come down, just as in a period when prices are greatly advancing they must go up, the labor leaders are on a sound economic ground when they condemn the practice of basing wages wholly or mainly on the cost of living. A large majority of the people of the world work with their hands. If wages were always to vary directly with the cost of living, the working people never would get for their work an increased amount of comforts and luxuries. This would mean that working people would derive no benefits from the material progress of civilization. If a large majority of the people derived no benefit from it, this so-called "progress" would be misnamed.

Upon what, then, should wages be mainly based? They should be mainly based on productive efficiency. Capital furnishes the directing brains, the physical plant, the tools, of industry. Working people furnish the manual skill and labor. Both should constantly increase their efficiency. The increasing efficiency of both will result in a constantly increasing product in proportion to the capital invested and the number of workers. Equitable division of this increased product would and should result in increasing returns to both.

Increases of industrial efficiency and output will, how-

ever, be seriously hindered or prevented if either of the partners in industry, capital and labor, constantly tries to defeat all efforts of the other partner to secure increases of efficiency and output. This is virtually what is being done in many industries now. Capital is constantly trying to increase production in proportion to the amount invested and the men employed. The members of many labor unions, under reactionary leadership, are just as constantly trying to prevent increases of output. These reactionary leaders are sometimes called "radicals." They are, in fact, the most reactionary men in civilized countries. If they should accomplish all they attempt, the efficiency of modern industry would be destroyed and its output so reduced that every working-man's family would suffer curtailment of its comforts and luxuries. These labor leaders restrict the number of brick that men can lay; they insist upon classifications which increase the number of men employed to do a given job; they exhaust their ingenuity in devising ways to curtail not only the number of hours which men work, but the amount each does in each hour he does work. Every measure of this kind tends to reduce the number of houses built, the number of suits of clothes made, the quantity of food produced, the amount of transportation rendered.

No better examples of the results of these labor union tactics could be cited than are afforded by developments in recent years on the railroads of this country. Until 1917 there was a steady increase in the amount of transportation service rendered in proportion to the number of men employed. Since then, while wages have been greatly increased, the output per employee has sharply declined.

In 1913 the amount of public service rendered for each dollar of interest and dividends paid to owners of railway securities was 459 ton-miles and 47 passenger-miles. In 1917 it was 582 ton-miles and 53 passenger-miles. In 1920 it was 611 ton-miles and 64 passenger-miles. The increase between 1913 and 1920 in freight service rendered for each dollar of return paid to capital was 33 per cent and in passenger service 36 per cent. Contrast these statistics with the following regarding the production of transportation to the wages paid: In 1913 for each dollar of wages paid the railroads rendered 245 ton-miles of freight service and 25 miles of passenger service; in 1917, 247 ton-miles and 22 passenger-miles; in 1920, only 121 ton-miles and 13 passenger-miles of service. The decrease in transportation output for each dollar of wages paid between 1913 and 1920 was about 50 per cent.

The *Railway Age* pointed out months ago to labor leaders and their followers that the only way they could hope to retain all, or even a large part, of the advances in wages made since before the war was through increased efficiency. High wages and low efficiency for any considerable time always have been and always will be incompatible in any industry. The labor leaders having, however, obtained rules, hours and working conditions from the Railroad Administration which greatly reduced the efficiency and output of the average employee, sought to perpetuate instead of to eliminate, to aggravate instead of to mitigate, the rules and conditions which produced the demoralization. They sought at the same time to maintain a scale of wages which was incompatible with the gross inefficiency that prevailed. They tried to both eat their cake and have it. The result was to force up railroad rates and at the same time bring the railroads to the verge of bankruptcy. Largely in consequence of these things, 500,000 railway men have speedily found themselves out of employment, and now \$400,000,000 of the wage advances has been ordered rescinded.

The labor leaders are right—wages should not be based entirely or mainly on the cost of living. Furthermore, in the long run they cannot and will not be. Efficiency of production always has and always will, in the long run, bring advances in wages largely regardless of the cost of

living. Inefficiency of production always has and always will, in the long run, bring reductions of wages largely regardless of the cost of living. The highest wages in proportion to the cost of living are, and always will be, paid in those countries where the efficiency of capital and labor are the greatest. The lowest wages in proportion to the cost of living are and always will be paid in those countries where the efficiency of capital and labor are the lowest. In the United States wages will increase more than the cost of living in the future as they have in the past if the productive efficiency of capital and labor increases, and decline more than the cost of living if efficiency declines.

Most of the present generation of labor leaders are engaged constantly in trying to reduce wages in proportion to the cost of living by trying to reduce productive efficiency. They may be unconscious of it, but this is what they are doing. Some time, perhaps, the workmen will choose leaders who recognize not only the truth that wages should not be based on the cost of living, but the additional truth that in the long run they always have been and always must be based upon productive efficiency. The worst enemy the workman has is the man who exhausts his ingenuity and energy in trying to reduce the amount of efficient work that workmen do.

## Delaware, Lackawanna & Western

THE DELAWARE, LACKAWANNA & WESTERN found the year 1920 a most unsatisfactory one. Its operations in the first four months of 1921 have shown a considerable improvement over those for the similar period of last year, but despite this improvement the road thus far has not been earning its rentals, let alone anything towards its dividend requirements.

The Lackawanna, under the administration of President W. H. Truesdale, has been among the most progressive railroads in the country. It has for many years been conducting an elaborate program of improvements. During the war and the period of federal control, progress on this program was delayed. Despite the unsatisfactory earnings of 1920 and thus far in 1921, this program has been resumed and the road at the present time is carrying out a number of developments, the most important of which is a \$4,000,000 project looking to the elimination of grade crossings through the city of East Orange, N. J., and the installation of an additional track to take care of a rapidly increasing suburban service.

The Lackawanna's standard return for the use of the property under federal control was \$15,749,477. In 1918 the net operating income exceeded the standard return by a small margin. In 1919, the net railway operating income was \$11,947,364, whereas in 1920 it was but \$6,104,886. The gross earnings of the company for the year totaled \$83,340,062, an increase of \$11,516,015 over 1919. The total expenses, however, were \$73,840,729, or an increase of \$17,775,478. The payrolls for 1920 represent an increase of 117 per cent over the total for 1917. The cost of fuel represents an increase of 50 per cent, or the equivalent of 7 per cent on the capital stock, over 1919. In other words, the story of the Lackawanna's earnings in 1920 is about the same as that for most of the other roads of the country.

Referring briefly to 1921, it is worth noting that the net railway operating income for the first four months of this year, as given in the monthly report to the Interstate Commerce Commission, was \$2,227,319, as compared with \$305,098 in the same period of 1920. The earnings for the first four months of 1921 were not sufficient to pay the rentals on the Lackawanna's leased lines for the period in question. These total over \$7,000,000 a year. Attention should further be drawn to the fact that the Lackawanna

is endeavoring to bring its roadway and equipment back to Lackawanna standards. The charges for maintenance of way and structures in the first four months of 1921 were considerably in excess of those for the first four months in 1920. The results as to equipment are best pointed out by the fact that in March, 1921, but 12.4 per cent of the locomotives were classed as unserviceable and but 7.8 per cent of the cars, both of which figures are considerably below the average for the country.

The Delaware, Lackawanna & Western in 1920 carried 28,315,359 tons of revenue freight, aggregating a total ton-mileage of 5,166,315,007; the average haul was 182 miles. This business was considerably in excess of that for 1919, but was not up to the record made in 1917, when 30,477,491 tons of freight were carried. During the year, the road secured an average of 779 net tons per train and of 28.79 tons per loaded car mile, both of which figures were below

The Delaware, Lackawanna & Western

the averages for 1919. The number of passengers carried in 1920 was 30,612,506, an increase of 12.2 per cent over 1919. The average distance hauled per passenger was 123 miles. The average passengers per train mile was 126 and per car mile 37. These figures indicate the predominance of the suburban service, reference to handling of which is given in more detail below.

The operations of the Delaware, Lackawanna & Western are characterized by a number of interesting features. One of these is its financial structure, another is its high standard of maintenance of roadway and equipment and the progressive ideas which the road has shown in connection therewith; a third is contained in the fact that, although the Lackawanna is a hard coal road, about 40 per cent of its traffic being of that commodity, it has no superiors from the standpoint of its efficient handling of merchandise freight. Another interesting feature is the suburban service out of New York and the care which is taken for the comfort and convenience of the suburban passengers.

In so far as concerns the financial aspect but little comment is necessary in this review, for the reason that so much attention was given this subject in connection with the road's application to the Interstate Commerce Commission for permission to capitalize its surplus.\* With reference to the standards of maintenance, attention has already been drawn to the efforts the railroad is making to restore its pre-war standards. It is generally known that the Lackawanna's construction standards are of the highest. With reference to the freight service, it may be said that the shippers who

\*Covered in the article entitled I. C. C. authorizes Lackawanna stock dividend, *Railway Age* of April 22, 1921, page 995.

use the Lackawanna's rails are outpoken in praise of the service given them.

Attention was drawn above to the fact that the Lackawanna's passenger traffic increased 12 per cent in 1920 over 1919. In 1920 there were carried in and out of the Hoboken station a total of 21,500,000 passengers. This service has been increasing so rapidly in recent years that the Lackawanna has been hard pushed to care for it properly. It has met with difficulties because of inadequate facilities at Hoboken and it has been further handicapped by the failure to come to an agreement with the authorities of the city of East Orange as to the elimination of grade crossings through that community, and it is now meeting a problem in the way of motive power to handle some of its heavier steel suburban trains.

The East Orange difficulty is now by way of solution and work is going on covering the elevation of the line through that community, the work to cost about \$4,000,000. In connection with this work, an additional track is to be added, as above noted, which will greatly assist operation during the morning and evening rush hours. The road has been operating its suburban service between West End and Newark over two tracks. Additional facilities will be available when a third track between these points previously used for freight service has been rock-ballasted and made suitable for passenger trains; this work should be completed during the summer.

The motive power situation is still to be met. At present a considerable number of suburban trains are being handled with two superheated, ten-wheel locomotives; the road would presumably use Pacific type locomotives in this service but for the fact that it lacks suitable turntables and roundhouse facilities at the several suburban engine terminals. These facts are brought in to indicate that the Lackawanna has a real problem on its hands in connection with its growing suburban service, the solution of which problems may necessitate the expenditure of large sums of money in the near future.

We quote from the annual report a paragraph dealing with another important improvement which the road has had under consideration for some time and has been taking preliminary steps to carry out, namely, the electrification of the main line between Clarks Summit, Pa., and Gouldsboro, west and east of Scranton, respectively, and about 28 miles apart. The report says:

In the handling of the company's large coal and other freight traffic over the heavy mountain grades each side of Scranton, many helper or pusher engines are required, which involves the use of a large number of locomotives, at heavy cost, to move the traffic to the top of the mountain grades. Electric experts have given estimates, supported by the experience of other companies that have installed such service for similar purposes, showing that large savings in operating costs can be effected by such installation, and the management is convinced that, under normal conditions of cost as respects labor and materials, the company will be warranted in making the expenditure necessary to provide this improvement.

The operating results for 1920 as compared with 1919 are as follows:

Mileage operated:	1920	1919
Coal revenue .....	\$20,228,484	\$19,055,523
Freight revenue .....	40,132,599	32,839,871
Passenger revenue .....	13,868,517	12,380,787
Total operating revenue .....	83,340,062	71,824,047
Maintenance of way expenses .....	10,178,887	7,682,365
Maintenance of equipment .....	19,508,625	15,132,815
Traffic expenses .....	1,086,074	495,947
Transportation expenses .....	40,165,381	30,661,441
General expenses .....	1,918,854	1,368,205
Total operating expenses .....	73,840,729	56,065,251
Net revenue from operation .....	9,499,333	15,758,796
Taxes .....	3,416,868	3,449,429
Operating income .....	6,079,655	12,287,412
Net railway operating income .....	6,104,886	11,947,364

The corporate income account is as follows:

Income from lease of road (1920, 2 months) .....	\$ 3,249,379	\$17,324,424
Government advances on guarantee .....	5,124,500	.....
Total including other .....	\$25,446,520	\$25,453,407
Total deductions .....	\$13,675,109	\$16,072,200
Less:		
Dividends declared .....	8,444,110	8,444,455
	\$ 5,230,999	\$ 7,627,745

## New Books

*Proceedings of the Telegraph & Telephone Section. Published by the American Railway Association, 75 Church St., New York. 379 pages, 6 in. by 9 in. Bound in cloth.*

The book contains the proceedings of the session of the Telegraph and Telephone section, Operating division, American Railway Association, which was held at the Ft. Gary hotel, Winnipeg, Man., September 22, 23 and 24, 1920. The first 33 pages are devoted to the personnel of committees, articles of organization, by-laws and regulations. A discussion of the various reports presented is next given, while the reports, with numerous drawings and several inserts, are presented on pages 154 to 379, inclusive. Reports are presented on construction and maintenance of wood pole lines along railroads; proposed specifications for telegraph, telephone and other signal wire and cable crossings over and under the tracks and wires across the property of steam and electrified railroads; specifications for the installation of telegraph and telephone equipment in railroad offices; protection against electrolysis; specifications for telegraph and telephone line fuses, office arresters and cable arresters; telegraph and telephone instrument fuses; specifications for telegraph and telephone heat coils; report on telegraph and telephone development; traingrams and message classification, semi-automatic sending-keys and theory of inductive interference.

*Roadway and Track. By W. F. Rench, formerly supervisor Pennsylvania Railroad. 242 pages, 40 illustrations, 6 in. by 9 in. Bound in cloth. Published by the Simmons-Boardman Publishing Company, Woolworth Building, New York. Price \$3.*

This book treats of the practical problems arising in the routine maintenance of railway tracks, including such basic items as the renewal of ties, rail, lining and surfacing, etc. It also discusses many of the problems less frequently encountered, such as legal points affecting the right-of-way and means of protecting slopes with vegetation. The book has been written with reference not only to the more elaborate practices on important main lines particularly in the east, but also with due regard for an average maintenance which is applicable to the majority of roads. Labor saving devices have been treated at length throughout the book as has the idea of safety. While the book is of particular value to the foreman and roadmaster, it will be found equally valuable to engineering and operating officers having more or less direct supervision over track work. The methods described are those which have been found practical in the long experience of the author, who was for 25 years a supervisor on the Pennsylvania Railroad, for a large part of which time he was in charge of the maintenance of tracks on its most important multiple track lines.

The book is worthy of a place on the desk of every railway man having direct or indirect responsibility for track maintenance.

## Letters to the Editor

## The Cost of Train Stops

CHICAGO

### One Way That We Can

### Help Stop the Leak

SAN FRANCISCO, CAL.

#### TO THE EDITOR:

In combating the loss and damage evil it is evident that a large number of patrons of the railroads make a complete study of the proper means of collecting their claims. The vast sums spent annually in payment of the bill for loss and damage claims illustrate all too well the degree to which they are successful in their study. As a division superintendent, I have always maintained that there should be an O. S. and D., and a loss and damage desk in each superintendent's office to obtain first-hand local information. By means of this loss and damage desk, investigations can be made immediately whenever agents and conductors turn in reports of goods found to be damaged, pilfered, or "short" when the car is opened at an agency station, or is looked over at a loading point.

In spite of this precaution, however, the haste of the local crew, the attention of the agent elsewhere, or carelessness in piling freight in a car, may result in further mishaps. To eliminate as far as possible, this expensive carelessness my assistants, trainmasters and road foremen were required to ride the local trains as often as they could, preaching the gospel that a penny saved is a penny earned. We talked on the same theme at our division safety meetings, at our staff meetings and at our general monthly "get-together" meetings for all employees, and the results which we obtained were more than satisfactory.

One request that I always made of the claim department was that it should inform me of the circumstances before paying a claim of any amount. That this request had a considerable monetary value was shown on a number of occasions.

In one instance, our claim department was about to pay a large claim for a consignment loaded on our lines which was declared to have been received in damaged condition. The bills of lading and the way bills bore no markings and were devoid of any notations. The receiving firm was threatening to sue us in order to collect, but I prevailed upon the claim department to defer payment a few more days. The shipment in question was one of baled cotton and after determining its originating point, I went direct to the merchant who had shipped it.

After a somewhat general discussion of the business situation, I casually asked if he had ever consigned cotton to the A. & B. Cotton Company. He replied that he had, and that they still owed him \$2,700, which I recalled was the exact amount of the claim we were holding. I sympathized with him of course, and he in turn, to reward my interest, searched his file and produced a letter from a friend at the point to which the cotton had been shipped. The letter related that the writer had recognized the merchant's mark on a number of bales of cotton lying on their sides and half submerged in water during the frequent hard rains which we were having. I secured a copy of the letter and needless to say, the claim was denied.

To assist the claim department and partly as a result of this investigation, we made it a rule that when exposed cotton was to be loaded from platforms into cars, the way bills and bills of lading should always be endorsed "exposed cotton."

C. W. HOISINGTON.

#### TO THE EDITOR:

According to a formula developed by R. E. W. to determine the approximate cost of stopping a train (which was published on page 708 of the *Railway Age* for March 22, 1918), it can be shown that to bring a 50-car freight train to a stop from a speed of 30 miles an hour and for it to again regain that speed is the equivalent of its running 2.4 miles. Again, referring to the Interstate Commerce Commission's report on operating statistics of large steam roads for February, 1921 (appearing on page 1184 of the *Railway Age* for May 20, 1921), an average cost of freight train operation by selected accounts is shown to be \$2.11 per mile.

From the above it is readily seen that the railroad assumes a cost of \$5.06 for each unnecessary stop made by an average freight train. A considerable saving on freight train operating costs can be secured at many outlying switches by installing electrically operated switch mechanisms and protecting signals. As an example there are many junction points, ends of double track, third track, passing track switches and switches located remotely from existing interlocking plants that are used frequently each day. Not only at such points can the economy of power-operated switch installations be definitely shown, but the increment in safety secured is well worth consideration.

In order to determine the saving made by an installation of electrically operated switch mechanisms at outlying switches we will assume that a saving of \$2.53 is made, or only half the cost of a freight train stop as shown above. On a first cost of \$6,000 for the installation, allowing 16 2/3 per cent for depreciation or \$1,000 per annum and adding \$60 per year for the maintenance of one track circuit, one switch movement, and the necessary signals we have a total of \$1,060 a year. On this basis it will be seen that 418 train stops, or 1.14 train stops a day at such an outlying switch would pay all charges except that for battery. The cost of battery for operating the switch mechanism has been found to be less than 1/4 cent per movement, which is so small as to be negligible. Thus it is seen that the first train which would otherwise have to stop at a switch not equipped with an electrically operated switch mechanism would pay practically all fixed and maintenance charges. If two trains used the same switch each day the second train shows a saving of \$2.18, and each succeeding train after the second would show a saving of \$2.53.

In a test made under the auspices of the United States Railroad Administration two years ago this month it was found that a tonnage freight train on practically level track made a full stop from 20 miles an hour and again accelerated to 20 miles per hour; in doing this 658 lb. of coal was consumed in addition to that required for the distance run. At \$4.61 a ton (I. C. C. cost for February, 1920) this is equivalent to \$1.51 worth of extra fuel consumed for the stop. On the basis of economy alone, the desirability of more complete interlocking and signaling has been demonstrated, even assuming that the increment in safety to railway traffic does not warrant the cost of installations at various points.

J. E. S.

THE LEGISLATURE of Illinois has passed a bill which permits corporations to own not more than 40 acres of land for housing employees. The bill now goes to the governor for his signature.

A GIFT OF RAILROAD PASSES is reported in the Pittsburgh (Pa.) Post; but the statement does not mean exactly what the reader might expect. The gift does not mean free rides for anybody; it is a collection of seven large scrapbooks, given to the Carnegie Museum by E. H. Utey, vice-president and general manager of the Bessemer & Lake Erie, containing the annual passes which he has accumulated during the last 50 years.

Two Trimmers Working in Hold of Vessel at Curtis Bay

## Mechanical Trimmers Facilitate Coal Loading

Baltimore & Ohio Installation at Curtis Bay Piers Reduces  
Time of Turn-Around and Labor Costs

By P. G. Lang, Jr.

Engineer of Bridges, Baltimore & Ohio

**E**XPORT COAL forms a large and important portion of the American mine-owner's commercial field, and, in itself, creates difficult and unique problems. Prominent among these is that of transferring the coal from railroad equipment to vessels at ocean terminals. One practical solution of these difficulties is represented in the export conveyor-belt coal pier of the Baltimore & Ohio, at Curtis Bay, Md. This was described in detail on page 1226 of the June 15, 1917, issue of

for distances up to 50 ft. from the device. Four of these trimmers have been installed, making the Curtis Bay pier a very complete and efficient unit for the handling of export coal.

### Capacity of Pier Exceptionally Large

This coal pier has the largest capacity of any in the world, and includes mechanical appliances for every operation con-

A View of the Pier, with Three of the Six Belts in Operation

the *Railway Age*. A further development of the export coal handling since the construction of this pier, has been made by this road. This consists of the addition of mechanical trimmers which by means of high speed belts distribute the coal at a rate of approximately 25 tons per minute and

nected with the removal of bulk coal from open-top railroad equipment and its delivery to the hatches of vessels. This transfer can be effected at a maximum rate of 7,000 tons per hour. These facilities with the exception of the trimmers were placed in operation February 1, 1917, and immediately

demonstrated a capacity which exceeded the anticipation of the designers.

The pier has a capacity of about 12,000,000 tons per year, and experience in its use during an extended period of intensive service has demonstrated the fact that a very efficient mechanism had been created for the mechanical performance of every operation incident to the transfer of coal from cars to the holds of vessels, and that, so far as "open" boats were concerned, a complete cycle of mechanical transfer had been established.

The efficiency of this pier as a medium for rapid loading was demonstrated in the case of the New England Coal and Coke Company's ship "Malden," into which there was deposited in 1 hr. 58 min., 7,222 tons of bituminous coal, previously contained in 151 cars.

### Trimming by Manual Labor Proves Expensive

In the case of boats whose design embodied numerous small hatches and one or more between decks, a separate operation was necessary for the trimming or distribution of coal after it had been deposited within the hold. For this purpose, the constant employment of large numbers of laborers was necessary, and these men, by the use of shovels, scattered the coal to the remote portions of the hold, which it had failed to reach in its descent from the pier.

The scarcity and high cost of labor during the war period caused the trimming operation to add very materially to the expense of coal movement. It was further productive of extensive delays, both to ships and to the operations of the pier, as the mechanical delivery of coal to the hatches was at a much more rapid rate than its distribution could be effected. Experience at this and other ocean terminals has invariably demonstrated the inability of manual trimming to keep pace with mechanical delivery.

This condition became the object of serious consideration on the part of the railroad management, and, during 1918, extensive studies were undertaken at the Curtis Bay terminals, with a view to evolving some mechanical device capable of supplementing, and, if possible, replacing, manual labor for the performance of the trimming operation. The mechanical features of the pier, the physical characteristics of bituminous coal and the various types of vessels presented may be enumerated among the elements which demanded cognizance in this research. These phases were each considered in their integrity and weighed in their bearing upon each other. The general plans for a mechanical trimmer were gradually developed in the engineering offices of this railroad.

### High Speed, Endless Belt Forms

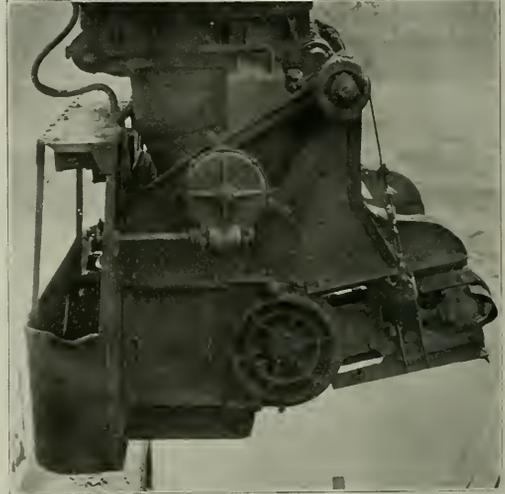

#### Backbone of Trimmer Action

The general principle embodied in this machine is that of an endless belt traveling at high speed over two parallel pulleys or rollers. The coal, in its descent from the shuttle belts of the pier, is direct to and concentrated upon the trimmer belt by means of a telescopic chute. This chute had a maximum cross-sectional area of 2 ft. 9 $\frac{3}{4}$  in. by 3 ft. 2 $\frac{3}{4}$  in. and can be adjusted as to length from a complete extension of 44 ft. 3 in. to a telescoped condition of 23 ft. 6 in. This attribute, in conjunction with the mechanical characteristics of the pier, renders it possible to adapt the movement of the stream of export coal to practically any of the diverse types of vessels using this pier.

In the design of the trimmer itself, a primary consideration was the necessity for so restricting its dimensions as to permit its introduction within the hatches of vessels, which are, in numerous instances, comparatively small. Extreme dimensions for the trimmer of 7 ft. 6 in. by 10 ft. were finally determined upon, which permitted the introduction of these machines within the hatches of 95 per cent of the ocean-going vessels.

The development, within the space thus afforded, of a mechanism capable of exerting the power requisite for the purpose of this device was a matter of some difficulty. The distance center to center of the pulleys of this trimmer is 3 ft. 9 in. The pulleys are 18 in. in diameter, and, when the machine is in operation, revolve at a speed of 527 r.p.m., imparting to the trimmer belt a speed of 2,700 ft. per min., or approximately 30 mi. per hr. The power for the belt movement is supplied by a 50-h.p. direct-current motor, and is transferred to the driving pulley by a chain drive, protected by a metallic dust cover.

The angle of the trimmer belt with the horizontal may be

Side View of Trimmer, Showing Controls and Controller's Cab

adjusted by means of a mechanism consisting of a ratchet wrench driving a worm wheel through a shaft and meshing with a gear segment on a lever arm carrying the belt frame. The endless belt can also be revolved through a complete circle about a vertical axis by means of a 13-h.p. direct-current motor driving a motor pinion engaging gear, which drives a worm and worm wheel and pinion engaging a rack. The conditions under which this machine operates render the protection of its mechanical parts against dust a vital necessity.

The distance to which bulk material must be thrown in order to fill properly the holds of ocean-going vessels was also carefully considered, and extensive studies were made to determine the range and trajectory of material thrown at various elevations and speeds. The expulsion of the coal with sufficient force to effect its transfer to the remote portions of the hold is accomplished by means of transverse cleats with which the trimmer belt is provided. This trimmer belt has a width of 48 in. The cleats are spaced 6 in. center to center, and consists of strips of belting placed across the trimmer belt and at right angles to its edges. These are secured in place and protected by means of metal clips.

### Free Movements of Vessels Necessitates

#### Unusual Method of Support

In order to prevent interference with the free movement of boats alongside of the pier, it is necessary that the trimmer be movable. It is also necessary that it remain steady in heavy winds, be securely attached to the tower and susceptible of

quick adjustment for operating purposes. The weight of each of these machines is about 22 tons, and the method of so attaching them to the pier as to provide for these several conditions was a matter requiring much study and thought.

Each trimmer is supported by means of vertical pipes, which resist the reaction due to the flow of coal, and also the lateral wind pressure. These pipes are suspended by cables from a boom which forms a portion of the loading tower. In the operating position, the weight of the lower portion of the machine is sustained by the boom through the ropes and vertical pipes, while the telescopic chute section is held by brackets placed on top of the cross girders.

Provision is made for the movement of the trimmer from

The Delivery End of the Trimmer, Showing the High Speed Belt

its berth to the end of the ram, whence it can be raised, lowered, carried in and out under the absolute control of the operator located on the end of the hatch. All operations are controlled by electric motors and magnetic controllers.

The time required for the movement of the trimmer from the housed position to the operating position in the hatch of a vessel is about  $3\frac{1}{2}$  min. The operator's cab is attached to the rear of and forms a part of the machine, which, in its various movements, is accompanied by the operator, who is thus enabled, at all times, to exercise complete control over the stream of coal.

The difficulties encountered in the development of this machine can be appreciated when it is borne in mind that the device is new and original. It was conceived and created by the engineers of the Baltimore & Ohio, for whose guidance in this class of construction no precedents existed.

Although the practicability of this machine, its behavior in service, and the trajectory and range of the expelled material are matters which could, by engineering experience or mathematical determination, be forecast, with reasonable certainty, the initiation of the trimmer into service was a matter of some anxiety. In November, 1918, contract was placed for one machine; this order was subsequently increased to four.

The first trimmer successfully trimmed 1,000 tons of petroleum coke in the S. S. "Victorious" during its initial hour of operation. The other trimmers were installed as received at the pier, and the last was put into operation about one year ago.

### Machines Show No Deterioration

#### Despite Heavy Service

During the summer of 1920 the volume of export coal business was very heavy, and the Curtis Bay facilities, including the trimmers, were subjected to practically continuous operation. Since the use of these machines was inaugurated, about 4,500,000 tons of coal have passed through them, and been deposited within the holds of vessels. The actual service capacity of each of these four trimmers may be briefly summarized at 25 tons per min., 1,500 tons per hr., and a maximum throw of 50 ft. No perceptible breakage of the trimmed coal has been observed, and no complaints have been received on this account from any source. In spite of the severity and continuity of the demands imposed upon them, these machines have shown no signs of deterioration, and the mechanism of each device is today as serviceable as on the date of its installation.

In considering the remarkable service record of these trimmers, it should be borne in mind that the particles of coal passing over the Curtis Bay pier vary in size from granular consistency to individual lumps attaining a maximum weight of approximately 200 lb. Bulky foreign substances have also found their way into the chute, and been expelled from the trimmers. These articles include a piece of iron, 2 ft. wide, 3 ft. long, weighing approximately 500 lb., large fragments of stone, 500 to 600 lb. in weight, and, on one occasion, a steel car-strut, 8 ft. long, 10 in. wide and 4 in. thick. Although the entrance of such articles into the trimmer chute, and their passage through the machine is an accidental

A Lane-Galloway Trimmer in Action

condition, for the avoidance of which every possible precaution is exercised, the fact that their actual movement and expulsion has, on numerous occasions, occurred without injury to the machines, is an unmistakable demonstration of the soundness of principle embodied in the design of these trimmers and of their rugged construction.

The economic results effected by the use of these machines have, since their initiation into service, been the subject of constant scrutiny and rigid analysis. Their influence upon the operations at the Curtis Bay terminals is clearly illustrated by the following tabulation which appeared in "The Baltimore & Ohio Magazine" for April, 1921.

From comparison of the operating statistics for the months of October, 1919 and 1920, respectively, it will be noted that,

by the use of these trimmers, the capacity of this pier has been practically tripled.

The significance of the figures appearing in this table is not clearly apparent from a cursory examination, and one might easily be led into the error of surmising that the two months mentioned constitute periods of extremely light and extremely heavy traffic, designedly selected for the purpose of magnifying the service rendered by the mechanical trimmers. Careful

COMPARATIVE RECORD, CURTIS BAY CONVEYOR-BELT COAL PIER, BEFORE AND AFTER THE INSTALLATION OF LANE-GALLOWAY MECHANICAL TRIMMERS.

	Without Mechanical Trimmers October, 1919	Four Trimmers Working October, 1920	Percentage Increase
Total tonnage of coal handled during month.....	266,533	622,097	133%
Total number of cars unloaded.....	6,903	13,504	125%
Average number of cars handled per working day.....	207	500	(*)
Average number of tons placed in vessels per working hour.....	460	1,342	192%

(\*) Average working day in 1919—20 hours.  
Average working day in 1920—17 hours.

analysis of the facts set forth will, however, dissipate whatever doubts of this nature may exist. That the two months cited were both periods of heavy traffic is evidenced by the following facts: In October, 1919, before the mechanical trimmers were in existence, the working time of the Curtis Bay export facilities amounted to 579 hours, which, on the basis of a 20-hour working day, then in effect, indicates that the plant was in use 29 days of the 31 in that month. This certainly represents the practical limit of physical endurance, so far as the operating personnel were concerned, even were the mechanical appliances of this pier capable of withstanding, in a satisfactory manner, more continuous service. In October, 1920, when four mechanical trimmers were in use at this pier, 17 hours constituted a working day. The entire working time for the Curtis Bay plant during that month amounted to 463 hours, or 27 days out of a 31-day month. It is worthy of note in this connection that the imminence of the coal strike which commenced on November 1, 1919, constituted a strong incentive for the realization, during the preceding month, of the utmost possibilities of every facility which existed for the mining and transportation of this commodity, and, as might be anticipated, the tonnage handled at which had, up to that time, passed through this terminal in a Curtis Bay coal pier during October, 1919, was the greatest similar period.

#### A Considerable Saving Is Made by the Elimination of Hand Trimming

A specific instance of the labor-saving characteristics of this device appears in a recent case, where 9,569 tons of bituminous coal were deposited and trimmed in the hold of a vessel in 9 hr. 33 min. Analysis of this operation indicates that, if hand trimmers had been employed, the labor of 200 men for 25 hours would have been required. The record for October, 1920, when an average of 1,342 tons per working-hour was placed in vessels, is believed to be the world's maximum. It should further be borne in mind that this tonnage was placed in all classes of ocean-going vessels.

The capacity of these trimmers for rapid and intensive service was further demonstrated in October, 1920, when, in 22 hours, 9 vessels and 14 scows were completely loaded with bituminous coal, the coal trimmed in the holds, and work commenced on loading three other vessels. The ships involved in this case were the "Brodin," "Aulmuir," "Isfond," "Bur," "Waage," "Hamden," "Trogu," "Ryage" and "Liberty Bell." The "Sygard" and "Laguasuck" received a part of their load from the 1,082 cars which were dumped in making this record, which is believed to be the world's maximum for rapid handling. A total of 49,630 tons of coal was

handled, and this performance is directly attributable to the use of the mechanical trimmers.

An element of prime importance for consideration in connection with the mechanical trimming of coal is that of the service or life obtained from the high speed belts. Belting experts consider that the service which the trimmer belts on these machines must withstand represent the most severe conditions occurring in any field of belt utility. The descent of the coal a distance of 23 to 44 ft. upon the high speed belt, which, moving at the rate of 2,700 ft. per min., hurls the material into distant portions of the vessel's hold, necessarily imposes a severe strain upon this portion of the device, and the development of a type of belt capable of withstanding the needs at this point for an extended period is a matter of some difficulty. Determination of the type of belt most adaptable to the requirements of this service is still the subject of research and experimentation. Many interesting and pertinent facts along this line have been developed since the use of these machines was begun, but investigation has not yet reached such a point as to justify an expression of final opinion concerning this detail.

The appropriation for the necessary studies and the construction of the machines was secured through the efforts of Charles W. Galloway, vice-president in charge of operation and maintenance, Baltimore & Ohio, Baltimore, Md. The development and construction of the machines were under the general charge of H. A. Lane, chief engineer, while the direct supervision of the work, including the preparation of general and detail plans, the construction and installation of the machines devolved upon the writer.

### Chairman Clark Deprecates Agitation for Early Rate Reductions

WASHINGTON, D. C.

IN A LETTER to the secretary of the Michigan-Ohio-Indiana Coal Association, Chairman Clark of the Interstate Commerce Commission said he regarded it "as extremely unfortunate that there should have been so much agitation in regard to early reductions in rates on coal, on other commodities, and in some instances on freight traffic generally." "I think that the result of those rumors, which in the main have had no real foundation, has been to stagnate industry and commerce," he said.

"There is not to my knowledge now pending before the commission any formal proceeding in which general reductions of coal rates under Section 1 of the act are sought. There is now pending before us a formal complaint of the Southern Ohio Coal Exchange which alleges undue prejudice against Ohio points and undue preference of mines in the inner and outer Crescent districts. A similar complaint of the Michigan Manufacturers' Association which brings in issue the rates from mines in Ohio and the Crescent groups to destinations in Michigan is also pending. There is also now before the commission for consideration a petition filed in behalf of carriers operating in Ohio, seeking an investigation under section 13 of the act by reason of an alleged preferential adjustment in favor of the intrastate coal traffic. The Michigan case, No. 12,235, has been recently heard, but complaint in the Southern Ohio case, No. 12,698, was not filed until April 13 last and hearing thereon has not yet been had. The cases are brought primarily under sections 2 and 3 of the act. Other minor complaints of an individual character are pending. All are being handled as expeditiously as possible under the considerable pressure of imperative duties. However, I could not undertake to forecast any probable date of decision or to say what the probable effect of our decisions might be."

# Employees Win Several Cases Before Labor Board

## Pullman Case and Disputes Over Negotiation of Agreements Decided in Favor of Workers

THE DISPUTE over the application of the decision of the Railroad Labor Board abrogating national agreements to the schedules now in effect with the various train service brotherhoods, outlined briefly in the *Railway Age* of June 17 (page 1389), was decided by the Board on June 16 in favor of the employees. In describing the frame of mind which train service employees are now in several of the brotherhood executives, during the progress of the wage reduction hearings, laid great stress on their dissatisfaction over the interpretation of several carriers of Decision 119, which abrogated "the agreements in force under the authority of the United States Railroad Administration." W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, stated that many roads have interpreted this decision to mean that the schedules held by the train service employees should be abrogated on July 1 and that the employees will "fight ten times as hard against the abrogation of their schedules as they will against a moderate wage cut."

The decision made by the Board in this controversy says in part:

The Labor Board did not, nor could it under the provisions of the Transportation Act, 1920, include in its Decision No. 119 any matter which was not properly before it as a dispute. Decision No. 119 did not, therefore, terminate the existing schedules or agreements of the train, engine and yard employees in the service of the carriers involved. Changes in such schedules or agreements, however, may be made after the required notice either by agreement of the parties or by decision of this Board after conference between the parties and proper reference in accordance with the provisions of the Transportation Act and the rules of the Board.

### Pullman Company Loses Case

The controversy between the Pullman Company and its shop employees, which was described briefly in the *Railway Age* of June 10 (page 1336) and of June 17 (page 1390), was also decided by the Board in favor of the employees, the Board's ruling being dated June 17 and designated as Decision No. 174.

After outlining the question in dispute and the history of the controversy, the Labor Board said:

The Labor Board held in Decision No. 119 that the presentation of irreducible demands without a genuine attempt to negotiate a settlement was not in compliance with Section 301 of the Transportation Act, 1920. So far as the evidence shows in this case, representatives of the Pullman Company had no authority further than to ask the employees to accept or reject one proposition.

Furthermore, the carrier takes the stand that it is optional with the carrier, when a dispute arises between itself and its employees, whether or not to confer with the employees directly or with their representatives. In this case, the carrier has elected to meet with the employees and has wholly ignored the respondent organization which claims to represent a majority of the Pullman Company employees directly interested in the dispute.

In taking this course, the Pullman Company contends that the question whether conferences have been held, also whether the respective parties have used every possible means to avoid interruption to traffic, is purely technical.

In Order No. 1 of April 19, 1920, Announcement of December 17, 1920, and various decisions, the Labor Board has clearly set forth its views that parties shall exert every effort to avoid interruption to traffic, that it is the duty of officers of the carrier to confer or attempt to confer with the representatives of the employees, and that these preliminaries are not technicalities but prerequisite to a hearing.

The decision in the case is as follows:

The letter and spirit of Section 301 of the Transportation

Act, 1920, have not been complied with by the carrier. The act will not have been complied with until the carrier shall have met in conference or endeavored to meet in conference the duly designated representatives of the employees directly interested in the dispute, and, in case of disagreement, shall have properly certified the dispute to the Labor Board.

The majority of said employees shall have the right to select their said representatives as provided in Principle 15, Decision No. 119.

Application is therefore dismissed.

### Employees Win Another Point

Another significant decision was rendered by the Board in a dispute between the Missouri, Kansas & Texas and the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees. The question in dispute was, in general, whether or not an agreement covering rules and working conditions of the employees of a carrier be made directly with the employees or with an organization representing the employees. The carrier contended that it was its duty to make an agreement with the employees concerned and not with an organization. Representatives of the carrier conceded that the brotherhood represented a majority of that class of its employees, but declined to permit the caption of the proposed agreement to show that the employees covered by the agreement were represented by this organization. The carrier also objected to the caption offered by the organization on the ground that by its terms it would not include the employees not members of the organization and would result in a "closed shop" on that property. The organization contended that it had the right to make an agreement covering all employees and stated that it was not the desire of the organization to negotiate an agreement that did not cover non-members as well as members of the organization.

The decision of the Board in this case is as follows:

The following language of Decision No. 119 bears upon this controversy:

"The majority of any craft or class of employees shall have the right to determine what organization shall represent members of such craft or class. Such organization shall have the right to make an agreement which shall apply to all employees in such craft or class."

It is, therefore, clear that said organization has the right to make an agreement as to rules and working conditions for said entire class of employees of said carriers, both members and non-members of said organization, and it is proper that the caption be so drawn as to show for whom and by whom the agreement is made, and the Labor Board so directs.

In order that there may be no misunderstanding as to the matter in dispute the Labor Board directs that the caption of said agreement shall be as follows:

Missouri, Kansas & Texas Railway  
Missouri, Kansas & Texas Railway of Texas

Wichita Falls & Northwestern Railway  
C. E. Schaff, Receiver.

AGREEMENT  
between

C. E. Schaff, Receiver,

and all that class of clerks and other office and station employees, represented by the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees.

American Railway Express Company

Asks for Wage Reduction

The American Railway Express Company appeared before the Board on June 17 and through L. R. Gwyn, chairman of the company's board of wages and working conditions, requested that the wage increases granted by the Railroad La-

bor Board last July be wiped out. In support of the request Mr. Gwyn submitted numerous exhibits which showed that the ratio of wages to revenue increased from 26.15 per cent in 1915 to 41.53 per cent in 1920 and to 52.78 per cent in January, 1921. The ratio of wages to operating expenses he showed to be 57.7 per cent in October, 1919, rising to 68.4 per cent in February, 1921. The average wage of all employees of the company increased from \$71.33 in December, 1917, to \$138.54 in March, 1921, Mr. Gwyn testified.

The employees' arguments were presented by E. H. Fitzgerald, president of the clerks' organization. Mr. Fitzgerald, in defending the present wage scales, stated that there has been a marked increase in the efficiency of the express employees, pointing to a decrease of 49 per cent last year in claims against the company as proof of this increased efficiency. Mr. Fitzgerald also contended that the expressman's work was hazardous in that it exposed him to diseases in handling shipments and to death at the hands of bandits. The case was closed on the same day and taken under advisement by the Board.

### More Railroads Ask for Wage Reductions

A hearing was held on June 20 at which approximately thirty carriers presented pleas to the Board for wage reductions for various classes of employees which they had not included in previous presentations. Among those which appeared before the Board for the first time in this case was the Southern and its subsidiary lines. The evidence presented at this hearing was largely a repetition of the evidence which has already been presented in the case and the roads involved will be included in the forthcoming decision.

## New Rules Governing Equalization

### Accounts Issued by I. C. C.

**N**EW RULES governing the equalization of operating expenses have been issued by Division IV of the Interstate Commerce Commission. The new rules supersede section 19 of the special instructions now appearing on page 37 of the Classification of Operating Revenues and Operating Expenses of Steam Roads, Issue of 1914, and add two new sections, namely, Account 280, "Equalization—Way and Structures," and Account 338, "Equalization—Equipment." They are effective as of January 1, 1921, and are as follows:

*It is ordered,* That section 19 of the special instructions as it now appears on page 37 of the classification of Operating Revenues and Operating Expenses of Steam Roads, Issue of 1914, is hereby cancelled, and the following is prescribed as section 19 of the special instructions:

19. **EQUALIZATION OF EXPENSES.**—When carriers adopt a budget or estimate of expenditures for maintenance of fixed improvements or equipment for the year, such authorized estimates may be equalized by division into twelve equal parts, if for a full year, or into a number of equal parts corresponding to the number of months remaining in the year after the adoption of the maintenance program. If advantage is taken of the optional accounting prescribed in this section, the appropriate primary accounts chargeable with the actual expenditures and the equalization account combined shall contain, each month, amounts aggregating one of such equal parts.

Adequate records shall be kept to fully support the estimates for expenditures for maintenance which form the basis of entries to accounts 280, "Equalization—Way and Structures," and 338, "Equalization—Equipment," and these records shall be filed in such manner as to be readily accessible for examination by representatives of the Interstate Commerce Commission. The equalization accounts are provided in order that their use may show, for each month, the adjustment necessary between actual expenditures included in the other primary accounts and the equal monthly proportion of the estimated or authorized maintenance expenses for the period.

If the actual monthly expenditures do not aggregate a sum equivalent to the equal monthly proportion of the estimated cost of maintaining such way and structures and equipment as are provided for in the budget, an amount sufficient to make up the difference shall be charged to the appropriate equalization account. If the actual expenditures are more than the equal monthly proportion of the estimate, the difference shall be credited to the equalization account. Concurrently, a credit or debit, as may be appropriate, shall be made to a ledger account styled, "Equalization reserve—Way and Structures," or "Equalization reserve—Equipment," classable under account 727, "Other unadjusted debits," if the balance be a debit, or account 778, "Other unadjusted credits," if the balance be a credit.

The accounts, "Equalization reserve—Way and Structures," and "Equal-

ization reserve—Equipment," shall be cleared annually unless at the close of the year a credit balance remains therein due to the non-completion of maintenance work because of adverse labor conditions, non-receipt of material, or similar reasons, in which case such part of the balance as is applicable to unfinished work may be carried over to the following year. The carrier shall indicate in its annual report to the Commission the amounts constituting such balance and the reasons therefor. Under no circumstances shall a debit balance be carried over the year. Where a credit balance is carried forward it shall be shown separately as one of the items comprising the detail of account 778 in the schedule provided therefor. Balances in reserve accounts carried forward to the succeeding year shall not be merged with equalization reserves for the subsequent period. The equalization accounts for each year shall be kept separate.

Carriers desiring to make use of the equalization accounts shall file with the Bureau of Accounts of the Commission, each year, before making use of them, a statement of the maintenance program which is to be equalized in the accounts of that year. If conditions arise which necessitate changes in the maintenance program involving changes in the equal monthly charges to operating expenses, a full statement of the facts as to the changes shall be filed with the Commission not later than thirty days after the changes are made.

Estimates of expenses, other than under general accounts I and II, on account of personal injury or loss and damage liability, for stationary and printing, and for advertising, may be equalized in the monthly accounts for the year by use of the regular primary accounts. If, on account of claims for personal injury or loss and damage being unsettled at the close of the year, the accounts for such expenses are not adjusted, the balances carried forward in the operating reserve account shall be analyzed as provided in section 20 of these instructions.

Charges for stationary and printing, and for advertising, for a fiscal year shall be adjusted to the actual expenses.

*It is further ordered,* That accounts 280, "Equalization—Way and Structures," and 338, "Equalization—Equipment," with the taxes pertaining thereto, as follows, be prescribed as a part of the Classification of Operating Revenues and Operating Expenses of Steam Roads, Issue of 1914:

ACCOUNT 280 "EQUALIZATION—WAY AND STRUCTURE."  
This account, the use of which is optional, shall include an adjustment of the monthly proportion of the estimated or authorized maintenance expenses for the year, as provided for in section 19 of the special instructions, the amount included herein being the difference between actual expenditures as reflected in other primary accounts under this general account, and the equal monthly proportion of the estimate for the period. Concurrently, a credit, or debit, as may be appropriate, shall be made to a ledger account styled, "Equalization reserve—Way and Structures."

ACCOUNT 338, "EQUALIZATION—EQUIPMENT."  
This account, the use of which is optional, shall include an adjustment of the monthly proportion of the estimated or authorized maintenance expenses for the year, as provided for in section 19 of the special instructions, the amount included herein being the difference between actual expenditures as reflected in other primary accounts under this general account, and the equal monthly proportion of the estimate for the period. Concurrently, a credit, or debit, as may be appropriate, shall be made to a ledger account styled, "Equalization reserve—Equipment."

## Employees and Their Compensation

**T**HE INTERSTATE COMMERCE COMMISSION'S quarterly statistical report on the number, service and compensation of steam railroad employees (class I roads) shows a reduction of \$38,000,000 in the payroll during the first three months of 1921 as compared with the corresponding quarter of 1920 in spite of the increase in wages. The report shows a decrease of 302,053 in the number of employees for the quarter and a decrease of 416,880 for the month of March as compared with March last year. The total compensation for the quarter was \$757,000,000 as compared with \$795,000,000 for the first quarter of 1920. For the year ending with March 31, 1921, which includes only one month at the old rates of pay and 11 months on the basis of the increased wages made effective as of May 1, 1920, the payroll would appear from the reports to have been \$3,695,000,000. This includes \$801,000,000 for the second quarter of 1920 on the old basis, \$102,000,000 as the commission's estimate for the May and June back pay, \$1,052,000,000 for the third quarter of 1920 on the new basis, \$982,000,000 for the fourth quarter on the new basis, and \$757,000,000 for the first quarter of 1921 on the new basis. The commission's report showed \$3,733,000,000 as the payroll for 1920 for Class I roads. The commission's summary of its report for the first quarter of 1921 is as follows:

Item.	Average number of employees:	1921	1920	Decrease	Per cent of decrease
January	.....	1,894,822	2,000,105	195,283	9.76
February	.....	1,676,543	1,970,525	293,982	14.92
March	.....	1,593,068	2,009,948	416,880	20.74
First quarter	.....	1,691,471	1,993,524	302,053	15.15
Compensation:					
First quarter	...	\$757,325,356	\$795,616,330	\$38,290,974	4.81

# Annual Meeting of the A. S. T. M. at Asbury Park

An Abstract of the Reports and Papers Presented Which Are of  
General Interest to Railway Men

THE ANNUAL MEETING of the American Society for Testing Materials was held this year, as it was in 1920, at the New Monterey Hotel, Asbury Park, N. J., on June 20 to 24, inclusive. The following officers were elected for the coming year: C. D. Young, president; Guillaem Aertsen, vice-president, and F. R. Baxter, E. D. Boyer, F. M. Farmer and W. H. Fulweiler, members of the executive committee.

The joint committee of the American Society for Testing Materials, the American Society of Civil Engineers, the American Railway Engineering Association, the American Concrete Institute and the Portland Cement Association presented its progress report on standard specifications for concrete and reinforced concrete in the form of tentative specifications for the same. According to the method with which this is being handled, the initial report of the joint committee will be submitted to each of the five societies as a tentative report after which it will be referred to the committee for revision.

The following is an abstract of some of the reports and papers presented before the convention:

## Some Failures of Cast-Iron Wheels

By H. J. Force

Chemist and Engineer of Tests, D. L. & W.

TABLE I—WHEELS WORN OUT IN SERVICE  
(All values in per cent)

Mark	Cast	Total carbon	Graphitic carbon	Com- bined carbon	Phos- phorus	Sulfur	Mang- nese	Silicon
A.....	9-20-15	3.34	2.32	0.99	0.360	0.154	0.49	0.70
B.....	6-2-16	3.53	2.77	0.75	0.308	0.136	0.66	0.73
C.....	7-2-13	3.17	2.18	0.98	0.304	0.155	0.55	0.65
D.....	8-24-12	3.08	2.15	0.93	0.260	0.122	0.43	0.59

It is well known that during the past few years railway cars have been loaded to greater capacity; heavier equipment has been placed on many lines; many roads are using rails much heavier than a few years ago; roadways are rock ballasted, and are very largely equipped with tie plates. This rigid track construction has placed a greater duty upon the chilled-iron wheel, a condition which it is felt the manufacturers possibly have not realized, for little or no effort has been made to improve the quality of the wheels to meet these severe conditions.

The cast-iron wheel is about the only part of railway equipment which is not purchased to a chemical specification; yet it is the most important part of such equipment. Such chemical specifications, as have been recommended, are not generally acceptable both to the manufacturer and the consumer. It is generally conceded that unless an improvement is made in the quality of cast-iron wheels, the railway lines will be forced to give careful consideration to the use of steel wheels, with the hope that fewer failures will result in service. From a study of the service condition of cast-iron wheels, we are of the opinion that this wheel can be greatly improved, and that it will be found to be satisfactory under nearly all equipment.

Four wheels were selected from a number of wheels which had been worn out and marked A, B, C, and D. Table I shows the date each wheel was cast, and gives the composition. It will be noted that in most cases these wheels met the requirements of the specifications recommended later, although no effort apparently was made to make the wheels to any specification. The table shows the fact that the composition as to phosphorus and sulfur, and especially silicon, is fairly satisfactory. It should also be pointed out that the

wheel with the lowest sulfur and lowest phosphorus apparently gave the best service. The higher silicon wheels in all cases showed more wear than lower silicon wheels. On the other hand it is believed that the combined carbon content, which in one case is as high as 0.99 per cent, is outside the limit for a cast-iron wheel which would give the best service.

Table II shows a list of wheels which failed in service and in each case caused a serious derailment. Note here the

TABLE II—WHEELS FAILED IN SERVICE  
(All values in per cent)

high combined carbon, high phosphorus and uniformly high sulfur, in some cases low manganese, and in many cases high silicon. Wheels of this composition should not, under any circumstance, be placed in service.

It is not contended that a chemical requirement will at once eliminate all wheel failures, for it is possible that an occasional wheel will fail in service from inferior composition due possibly to some oversight on the part of a workman in the foundry. The cracking of plates is due very largely to inferior chemical composition. Seamy rims and seamy treads are as a rule due to foundry practice, and are usually the result of metal being poured at too low a temperature. It is hardly necessary to call the attention of the manufacturer to the necessity of immediate improvement in both manufacture and composition of cast-iron wheels.

The following specification is therefore recommended to cover all weights of chilled iron wheels:

### SPECIFICATION "A"

Total carbon, per cent.....	3.00 to 3.65
Combined carbon, per cent.....	0.45 to 0.85
Manganese, per cent.....	0.50 to 0.75
Phosphorus, per cent.....	Not over 0.35
Sulfur, per cent.....	Not over 0.17
Silicon, per cent.....	0.45 to 0.75

It is felt that the heavier wheels which are now being recommended will have a further tendency to reduce failures.

It is recommended that special consideration be given to a wheel which contains a small percentage of nickel and chromium, as indicated in specification "B." Wherever wheels of this composition have been placed in service, the results have been highly satisfactory; and the wheels should be especially suitable for the heavier equipment. The increased cost of these special wheels will run from seven to ten per cent.

### SPECIFICATION "B"

Total carbon, per cent.....	3.20 to 3.75
Combined carbon, per cent.....	0.40 to 0.80
Manganese, per cent.....	0.45 to 0.65
Phosphorus, per cent.....	Not over 0.35
Sulfur, per cent.....	Not over 0.17
Silicon, per cent.....	0.45 to 0.70
Chromium, per cent.....	0.10 to 0.25
Nickel, per cent.....	0.10 to 0.20

The majority of the failures of wheels previously cited occurred near the bottom of long, heavy grades, probably due to the elevated temperatures which the wheels attained.

In nearly all cases failure occurred by rupture of the plate, and it is important, therefore, that the composition be controlled so that as much strength as possible may be obtained and the wheel enabled to withstand the elevated temperatures developed on all heavy grades.

### Phosphorus and Sulphur Note in Specifications

The committee, on steel, after careful consideration of the note concerning phosphorus and sulphur, which by action at the last convention was allowed to remain on 14 specifications, recommended that this note be removed from all specifications and that the sulphur requirement be raised 0.01 per cent in four specifications, and the phosphorus requirement for acid steel be raised 0.01 per cent in one specification.

In explanation of these recommendations it was pointed out that of the 14 specifications which now carry the note, the note affects the phosphorus in Bessemer steel in the specifications for rails, splice bars, reinforcement bars, tie plates, track bolts, and the Bessemer grade in structural steel for buildings. The recommendation to remove the note from these specifications will require manufacturers to work to the original phosphorus limit for Bessemer steels.

Of the remaining specifications, three cover rivet steel, original sulphur 0.045 per cent; also the specifications for original tubes and seamless tubes call for sulphur 0.045 per cent. The effect of this recommendation would be to require manufacturers to adhere to the original 0.045 limit. Sulphur for steel chain is specified at 0.05 per cent and this would again become the limit.

As against these changes cutting off the extension for sulphur and phosphorus, it was felt the extension in sulphur from 0.05 to 0.06 per cent in the three classes of structural steel must be retained due to the heavy tonnages involved, and to the continued difficulty in obtaining low-sulphur fuels and melting stock.

### Interpretation of Timber Tests

The committee on timber reported that much confusion arises by various people attempting to use the data in ways that were never intended. This is especially true when they undertake to compare species on the basis of existing structural timber tests. The information is of exceeding great value in formulating grading rules, in determining the influence of defects and in getting the relation between the strength of large and small pieces, but the absolute values do not and can not represent the average strength of any grade of material of the species, as that average value is continually shifting, due largely to manufacturing conditions which at one time will throw into a grade timber of a high quality and at another time changes in demand will cause the same grade to carry a maximum of the poorest stock that will pass. This difficulty is also aggravated by the fact that most of the commercial grades now in use are not based on the size and distribution of defects such as insure any standard strength. It must also be considered that the tests made with the center load will always average higher for the same grade of material than the tests made with the two loads, since with the two loads the knots and other defects have a greater influence.

Two rather comprehensive tables have been published as United States Department of Agriculture Bulletin No. 556. In the use of this bulletin it is important that the engineer and architect read carefully the text, for, while the text appears simple, it contains explanations of many of the variations and the strength data which would otherwise be confusing. Bulletin No. 556 contains by far the largest collection and most authentic strength data yet published.

The committee offered the following comments in regard to working stresses in structural timber:

1. It is well determined that the strength of a particular piece of timber is in a measure determined by the condition under which it is used. Increase in moisture decreases the strength of timber, therefore it must be determined, first, in designing a particular structure, what the moisture conditions are.

2. It is also well determined by tests that resistance to suddenly applied loads is much greater than to slowly applied or constant loading; therefore the condition of loading will affect the amount of allowable stress.

3. Warning of failure of a piece of timber in a structure is usually given a considerable time in advance of actual failure; therefore, when efficient inspection is had this feature gives an element of safety in older structures.

While there is no well-defined "elastic limit" in timber tests, there is in general a region where the proportionality of stress to strain ceases to be constant. It is therefore well to keep stresses well within this limit. Timber, however, does recover from high stresses; therefore its resistance to quick loading.

From the above it will be seen that in order to have a rational design it is necessary to state working stresses of different amounts for different kinds of loadings and exposure of the timber. As an example, for dense structural yellow pine, the minimum working stress will be 1,100 lb. per sq. in. This is for constant loading and for submerged locations where the timber is constantly wet. In locations in the weather, such as bridges, the allowable working stress for constant loading is 1,400 lb. per sq. in. Under cover, where the timber is always dry, the allowable working stress for constant loading is 1,600 lb. per sq. in.

From the tests, it is determined that the resistance of timber is approximately proportional to the speed of loading. For constant loading, the stresses above given are proper, but for sudden loading, resulting in 100 per cent impact, the successive loadings being far enough apart so as to allow reasonable recovery of the timber, the allowable stresses may be doubled (not to exceed 2,800 lb. sq. in.), the stresses due to this sudden loading being those actually computed from the load with the impact. For other proportions of impact, less than 100 per cent, the allowable working stress may be increased in a ratio equal to the percentage of impact. For dense structural yellow pine, the allowable working stresses would, therefore, where  $I$  is the proportional impact stress, be as follows:

1. For wet or submerged locations.....	1100 + 1100 <i>I</i> lb. per sq. in.
2. For exposed locations (bridges).....	1400 + 1400 <i>I</i> lb. per sq. in.
3. For constantly dry locations.....	1600 + 1600 <i>I</i> lb. per sq. in.

### Other Papers

Duff A. Abrams presented a paper on "Wear Tests of Concrete," containing the following general conclusions:

In general the tests showed that the factors that give concrete of a high strength produce concrete of low wear. Increasing the quantity of cement decreases the wear. Increasing the quantity of mixing water causes a material increase in wear. The coarser the grading of the aggregate up to certain limits the lower the wear. One of the most significant results of the tests was to bring out the importance of curing concrete for a time in a moist condition. The quality of fine or coarse aggregate produced less effect on wear than is commonly supposed. The wear was materially reduced by increased mixing. The wear of concrete was not sensibly increased by the use of hydrated lime or other admixtures used in the tests up to 20 per cent of the volume of cement. Wear was reduced with the age of concrete.

The committee on preservative coatings for structural steel submitted, among other tentative specifications, the results of its studies on South American flax-seed in the form of two proposed tentative specifications, one for the purity of raw linseed oil and the other for the purity of boiled linseed oil as made from South American seed.

# Railroad Electrification at High Voltage

## The Development of Alternating Current Equipment and Its Relation to Power Supply

By F. H. Shepard

Director of Heavy Traction,  
Westinghouse Electric & Manufacturing Company

**T**HE OVERHEAD TROLLEY is now accepted as the standard contact system for American railroad electrification, and, in fact, is the only contact system suitable for high voltage. The expansion of the use of electric power has been essentially due to the use of high, and still higher voltages. How, therefore, can we hope for electrification in its highest estate without recourse to high, and still higher voltage on the trolley?

The first use of electric power for full size railway trains was on the Baltimore & Ohio tunnel in 1895. The commitment for this had been made as early as 1891, when the Baltimore tunnel was under construction. This operation was heralded as "Railway Electrification," and the success of these locomotives led to popular references to

First Experimental Single-Phase Car, Pittsburgh, Pa., 1892

the "death knell of the steam locomotive." Subsequent history has shown how far afield these popular references were.

The various studies and consideration for extensive electrification always led to the economical necessity that the contact system be operated at some high voltage. A number of studies were made in which three-phase working conductors were considered. One of the most important of these was that for the Cumberland grade of the Baltimore & Ohio by Messrs. Duncan and Hutchinson, in 1896. The first extensive application of these three-phase was on the Valtellina Railroad in Italy in 1901.

### Alternating Current Tried in 1892

As long ago as 1892, Benjamin G. Lamme had experimented with a commutator type motor, using alternating current at very low frequency. While this experiment was successful from the standpoint of motor design, the development of the alternating current system lay dormant for a number of years, owing to the great pressure of other development. Mr. Lamme, about 1900, in order to respond to the

Train on Lortschberg Railway, Switzerland, Hauled by 15,000 Volt, 2,500 hp. Locomotive

increasing demand for a high voltage trolley, resumed his consideration of this development, and, in 1901, a contract was taken for an interurban installation for the railway line which was projected between Washington and Baltimore. The first public announcement of this was made in Mr. Lamme's paper before the American Institute of Electrical Engineers in September, 1902, and was received with great enthusiasm throughout the technical world. The equipment was built, but never installed, owing to the financial difficulties which prevented the completion of the construction of the railroad. This equipment comprised four 100 h.p. motors at 16 2/3 cycles, with 1,100 volts on the trolley, the motor voltage of 220 being derived from a transformer carried on the car. This equipment was run on a test line at East Pittsburgh, and operated with entire success.

The endorsement this practical undertaking gave to the single-phase system led to immediate activity by other manufacturers throughout the world. This comprised that of the

First Experimental Single-Phase Locomotive for Heavy Haulage, East Pittsburgh, Pa., 1905

General Electric Company, with a repulsion type of motor, described in the paper of W. I. Slichter, before the A. I. E. E. in 1904; the Winter-Eichberg armature excited repulsion motor; the Siemens' series motor and the series motor of the Oerlikon Company, as well as numerous alternatives, such as the Finzi, Deri, Latour and others. The enthusiasm with which the alternating current motor was embraced has unfortunately proved to be a serious handicap to its actual development and use. This is due to the fact that many of the early applications were made with equipment of insufficient capacity, undeveloped design, or untried features of

that period, which had no place in regular operation. The voltage of the trolley increased to 3,300, 6,600, 11,000 and even to 16,000 volts; the frequency was 15, 16 2/3, 25 and 42 cycles.

### Results of Early Application

Most of these installations were designed to accomplish service comparable to that performed on the interurban railroads, and as it was possible to maintain schedules far in excess of the capacity of the motors by voltage control of the single-phase equipment, the motors were almost always outrageously overloaded. This has been the principal reason that the maintenance costs were excessive.

At this time, with direct current, the practical limit of voltage supply was that for the motor—then, 550 volts. To raise the supply voltage, alternating current was adopted as the only available means.

The handicap imposed by the combined operation over direct current lines ultimately led to the replacement of some of this equipment with direct current at 600 and 1,200 volts.

The legislation compelling the use of vaporless traction in the Fourth Avenue tunnel leading to the Grand Central Terminal at New York, compelled the adoption of electric service for that operation. While the New York Central adopted the third-rail system, the New York, New Haven & Hartford, which was under legislative restriction prohibiting the use of the third rail in the state of Connecticut, decided to use an alternating current system with 11,000 volts on the trolley as that which promised to be the most suitable for its requirements, with special reference to the needs for the future.

The Westinghouse Company had, in the meantime, through its study of the electric service for the St. Clair tunnel, developed a 120-ton locomotive, which had been operated experimentally at East Pittsburgh with satisfactory results. This experiment settled the questions of the effect of pulsating torque upon adhesion, commutation of large motors, and the various questions of control. The use of the overhead trolley on the New Haven led to a controversy, which oftentimes took the nature of the burlesque, regarding the relative virtues of direct-current third-rail versus the alternating-current trolley.

The New Haven undertaking was a courageous one, comprising in its initial installation thirty-five 1,000 hp. passenger locomotives, capable of operating at speeds up to 80 miles an hour. These were originally laid out as the geared type, but owing to the preference for the gearless locomotives as constructed were of that type, with the resulting increase in weight entailed. The design of this locomotive was further involved, due to the undertaking to operate over the direct current third rail into the Grand Central terminal. This installation, in many respects, was truly a pioneer one, involving the determination of many features which had previously been untried. Among them were the following:

1. The generation of single-phase power in large steam turbo units.
2. The installation of high voltage trolley exposed to the continued exhaust from steam locomotives.
3. The installation of an overhead conducting system on a four-track railroad.
4. The development of a selective system of circuit breaker protection to handle short circuits of high capacity and great frequency compared to the commercial service then accomplished.
5. The first use of gearless single-phase motors.
6. The combined use of alternating current and direct current on locomotives.
7. The inauguration of a service without the trial period of elements included in power house, line and locomotive.
8. The extensive undertaking of electric service by a steam railroad organization.

The result of the New Haven installation was to establish the sufficiency of an overhead trolley at high voltage for rail-

road service. There was demonstrated as well, the flexibility of alternating current in railway service. This service developed, on a considerable scale, the various conditions which are necessary to satisfy the successful operation of an alternating-current system. In the case of the generating plant, it was shown that damper construction was necessary on generators and that circuit breakers of greater capacity and more rugged type were required. For the line, there was shown the type of installation necessary to withstand the exhaust of the steam locomotives, and also that the initial requirement for mechanical strength in the overhead conducting system was far less than anticipated, and, furthermore, that great attention should be given the question of flexibility at the traveling point of contact. On the locomo-

Electric Passenger Train on the New York, New Haven & Hartford

tives there was developed the need for greater ruggedness in switches, auxiliary parts and connections, as well as certain changes in the mechanical parts of high-speed electric locomotives. The greatest handicap to the most successful operation and one which still prevails, is that due to overloading the equipment. This has apparently been difficult, if not impossible, to prevent, and prevails even to this day to an unfortunate extent. The education of the operating forces on steam railroads has, however, been progressing, and it will undoubtedly follow that railroad electrification in the future will recognize the inevitable fact that electrical apparatus of no kind or type can be overloaded without undue cost for maintenance.

Owing to the accepted advantage of a high voltage trolley, and due to the activities of Frank J. Sprague, complemented by those of James Bryan, the equipments for 1200-volt direct current operation for the Pittsburgh, Harmony & New Castle Railway were built in 1906 and placed in operation in 1907. These equipments were built by the General Electric Company of America. Previous to this time, there had already been placed in operation, in Europe, equipments at 850 and 1,000 volts direct current. The voltage of 1,500 volts was developed later by the Westinghouse Company for the Piedmont & Northern and the Southern Pacific Company. The overhead trolley at 2,400 volts was used on the Butte, Anaconda & Pacific with 80-ton locomotives, and in 1916, the Chicago, Milwaukee & St. Paul inaugurated its notable installation of 440 miles across the Rocky mountains at 3,000 volts direct current.

### The Use of High Voltage Alternating

#### Current for Traction in Europe

In Europe, following the initial development of 1904, there has been carried on a comprehensive analysis of high voltage railway electrification with the use of alternating current, and also with direct current. In Sweden, comparisons were made with direct current voltage as high as 4,000 volts on the trolley. Decision has followed in the case of Sweden, Norway, Germany, Austria and Switzerland to standardize upon

15,000 volts, single-phase, at 15 and 16  $\frac{2}{3}$  cycles, and there are now in operation approximately as follows:

In *Sweden*, 300 miles of track, with 125 miles under construction; in *Norway*, 60 miles, with 50 miles under construction; in *Germany*, 600 miles, with about 100 miles under construction; in *Austria*, 200 miles, and in *Switzerland*, 300 miles, with 300 miles under construction.

In *Italy*, following the successful operation of the Valtel-

Passenger Train at South Portal of the St. Gothard Tunnel, Swiss Federal Railways, 1921. Locomotive Develops 2250 h.p. from a 15,000-Volt, Single-Phase Trolley

lina Railroad, there has been constructed about 600 miles using three-phase at 3,300 volts, and this has been settled as standard for all the heavy railroad operation in Italy, which includes practically the whole of northern Italy. For the lines of light traffic, consideration is being given in Italy to the use of 42 cycles and a higher voltage trolley, and also

A 15,000-Volt, Single-Phase Locomotive in Service in Lapland, Sweden, 1920

to a transmission system for both railroad and commercial use, with possibility of high voltage direct current on the trolley.

In *France*, subsequent to the decision of the Midi Railway to electrify with single-phase, there followed a controversy with the post and telegraph department of the government which has finally led to the decision to use 1,500 volts

direct current with a third rail conductor as a standard for all the railways in France.

In *England*, 1,500 volts direct current with third rail has been adopted as the preferred type, the overhead construction being considered impracticable for general use on account of the limited overhead clearances, although in England the most extensive electrification, that of the London, Brighton & South Coast, will be continued with extensions of the single-phase trolley. In *Belgium* and *Holland*, the importance of multiple unit service with small distances and light trains has led to a decision to use 1,500 volts direct current; in Belgium, with third rail, and in Holland, with the overhead trolley.

#### Present Conditions in America

In America, the commission of the Pennsylvania Railroad, after nearly two years' investigation, decided to use the alternating current trolley at 11,000 volts and 25 cycles. There followed the electrification of the Philadelphia terminal at Broad Street, which includes suburban service as far as Chestnut Hill and Paoli. The Norfolk & Western decided to use the single-phase trolley, and, for extremely heavy service, has used the split-phase type of locomotives, the induction motors being fed from a single trolley through the medium of a phase converter.

It should be recognized that the most comprehensive electrification in America involving high speed passenger service, freight service, multiple unit service and switching service, is that of the New York, New Haven & Hartford, where some 500 miles of track are operating at 11,000 volts on the trolley. In this service there are more than 100 electric locomotives and a large number of multiple-unit cars used for the local passenger service as well as classification yards of great extent.

The heaviest service performed electrically is that on the Norfolk & Western, where coal traffic is moved with heavy tonnage trains over the Elkhorn grade section. The performance of each electric locomotive in this service is the practical equivalent of four of the large Mallet steam loco-

motives replaced. Current input as high as 15,000 kilowatts per train has been reached in this operation. The dispatch with which this service is handled is double that for the former steam service, and this installation forms a good illustration of the increased capacity which may be secured through electrification.

On the Pennsylvania Railroad, at Philadelphia, with

multiple unit trains the flexibility of operation has very greatly reduced the congestion, which would otherwise have required a large addition to that terminal.

In general, an electric locomotive has been used to supplant a steam locomotive and, in this respect, has followed the general history of electrification of other industries. While this has been of benefit, the great value for electrification, and this applies especially to America, lies in the ability to accomplish, with electric power, service which would be entirely impossible with steam.

#### Future Needs

There is arising in America the imperative need of greater capacity for our transportation systems and greater dispatch in the movement of traffic. This latter, in fact, seems to be the logical way by which expansion of our railroad machine can take place. There is no good reason why an electric locomotive cannot remain at the head of a train for a run of hundreds of miles, or why electric locomotives cannot haul a train at speeds much in excess of those which are ordinarily attained with steam service.

There will develop, therefore, with the extension of electric power, the need for a large increase in motive power for each train unit. This may be taken to be roughly equivalent to four times the maximum horsepower now used for the propulsion of a train by steam. This will be utilized in hauling larger freight trains at higher speeds and will enable traffic movement to be handled on schedules which will be somewhat comparable to the movement of passenger trains. Thus, an electrically hauled freight train will be able to continue on the main line for the larger part of its course, thereby facilitating its arrival at terminal points on schedule, which alone will go a long way toward reducing the present serious congestion at terminal points. In fact, except for local distribution, the need for terminals should very largely disappear. A step in this direction was developed to clear up the congestion which existed on our railroads during the past year, trains, in many instances, being made up and run solid for great distances.

If this view is to be taken as to the utility of electric power in the movement of traffic, consideration will have to be given to the still larger concentration of electric power for single trains. The only practical way this can be accomplished is by a high trolley voltage, and this is most readily secured by the use of alternating current.

A great advance has been made in the design of direct current electrical apparatus, so that it is now possible on locomotives to build apparatus which functions successfully with 3,000 volts on the equipment. With direct current, however, the equipment, including the auxiliary apparatus, must necessarily be built to correspond to the voltage of the trolley, while with alternating current the equipment can be designed for the most economical and conservative voltage, and, through a static transformer, receive power from an alternating current trolley at a comparatively high voltage. This is shown by the use of motors of 300 to 400 volts from a 15,000-volt trolley. In fact, as far as the equipment is concerned, its design is quite independent of the trolley voltage.

Inasmuch as some time in the future it is universally accepted that the operation of our railroads with electric power will be great in extent, the development necessary to utilize electric power with the least restriction is that which should be given the utmost consideration. It should not be taken as fanciful to consider a district with complete electrification of the main lines of 500 to 1,000 miles handling the heaviest kind of traffic. The large trains, and the occasional bunching of trains, which is inevitable on certain sections of this major electrification, will cause a relatively poor load factor.

Since this is a condition which should be recognized, it is obvious that the best use of the investment for transmission

and transforming apparatus local to any given section of railway will be that which utilizes the highest voltage for the supply of power to the trains. In other words, to meet the concentration of loads which will be necessary in the future the tendency is toward the highest practicable voltage on the trolley as a matter of economy.

#### Methods for Meeting Demands of the Future

There follows logically the suggestion that even with the highest voltage on the trolley the demand for railroad power should be equalized by the inclusion of many miles of railway deriving their power supply from a common feeder. This, in turn, could very well be at the highest practical voltage, so that it might be considered that hundreds of miles of railway would be fed from a super railway feeder.

The traffic movement on our railways varies during the day, from day to day, and from season to season. It is also subject to fluctuations due to conditions of weather and derangements in train service due to obstructions on the track, wrecks, and other causes. Allowance must be made for a considerable flexibility of movement to avoid congestion. Unfortunately, this condition does not produce an ideal demand from a power generating system, so that a railroad load is not generally considered to be a desirable one.

Close regulation of voltage for railway use is of less importance than that for industrial use, especially where a lighting load is carried, so that an independent railway feeder should be more economical than supply from a common feeder system with its requisite regulation with a super-imposed railway load.

For such a scheme of power supply to our railways, it should follow that power could be taken from the various regional generating systems for common supply according to a schedule or set condition, which could be adapted to use power in the most effective manner. For instance, during times of lesser demand for commercial power, such as nights, Sundays and holidays, there should be little, if any, restriction of power supply from any of the power systems. In the case of hydro plants, the demand should recognize the characteristics of each system, whether dependent upon stream flow or water storage. In the case of steam plants, consideration could be given to the effective loading of the steam generating units in operation. At times of maximum demand for commercial load, the railroad demand from any system could be limited according to a definite schedule which would avoid super-imposing the peak loads for lighting and urban transit upon the railroad demand.

With such flexibility of relation to the various power systems, the amount of spare generating apparatus to provide for emergency would be lessened. In fact, a large part of the railroad load could, undoubtedly, be furnished by assigned generating units, and through their regulation, transfer of load would be readily secured over the super railway feeder, independent of the commercial demand and net work.

For such minor transfer of power between the railroad system and the commercial network as might be advantageous, motor generators could be used, thus lessening the burden of cost due to a frequency for railroad use which may differ from that of the commercial net work.

The expansion in electrical generating capacity for industrial and commercial use has been phenomenal in America. Undoubtedly, this growth is destined to continue to very large proportions. The generation of electric power for railroad use may also be expected to develop and grow. Each, therefore, should be able to develop without restriction by the other, and each in the utilization of nature's resources, could very properly be used to complement the other. It would appear, therefore, that we have not yet reached the time when railroad electrification should be dominated by conditions of power supply and distribution for other purposes.

# Railroad Hearings Before Senate Committee

Railroad Testimony Completed by L. E. Wettling and W. H.

Williams—S. Davies Warfield Presents Plan

WASHINGTON, D. C.

THE PRESENTATION of direct testimony on behalf of the railroads before the Senate Committee on Interstate Commerce was concluded on June 17 and an adjournment was taken until June 22, when S. Davies Warfield, president of the National Association of Owners of Railroad Securities, appeared. Chairman Cummins was the only member of the committee to hear the final testimony of the railroads presented by L. E. Wettling, manager of the statistical bureau of the Western lines, and W. H. Williams, chairman of the Wabash.

The railroads in 1920 suffered a deficit of two-tenths of a cent for each mile run by a train, Mr. Wettling showed in continuing his testimony on June 16. The average revenue received by the carriers per train mile was \$5.065, while the average expenses and taxes per train mile were \$5.067. For the last four months of the year, when the increased rates were in effect, the average revenue per train mile was \$5.883 and the expenses and taxes \$5.328, leaving a net railway operating income per train mile of 55.5 cents.

In 1916 the average revenue per train mile was \$2.938 and the average expenses and taxes were \$2.089, leaving a net operating income of 84.9 cents. While the increase in revenue per train mile from 1916 to the latter part of 1920 was \$2.945, the increase in expenses and taxes was \$3.238 and the net operating income was reduced by 29.4 cents.

Total operating expenses were also divided in the exhibit between labor and materials and supplies. Whereas in 1916 the labor cost per train mile was \$1.20, in the last four months of 1920 it was \$3.27. While materials and supplies per train mile in 1916 cost 72.6 cents, in the last four months of 1920 they cost \$1.75. The average revenue per mile for freight trains in the last four months of 1920 was \$7.94 and the average revenue for passenger train was \$2.465.

Mr. Wettling said railroad operating revenues in 1920 were by far the largest in the history of the railroads, although the net operating income left after paying expenses and taxes was the smallest on record for a year. Of every dollar taken in by the railroads in 1920, 59.9 cents was expended for labor, as compared with 55.3 cents in 1919; 10.9 cents went for fuel for locomotives as against 9.2 cents in 1919; 17.3 cents for material, supplies and miscellaneous as against 15.6 cents in 1919, and 10.9 cents for loss and damage, injuries to persons, insurance, depreciation and retirements, and taxes. These items in 1919 took 11.1 cents of each dollar. Only 1 cent was left in 1920 for return on investment, as against 8.8 cents in 1919 and 28.9 cents in 1916.

An analysis of the expenditures follows:

	1916	1919	1920
Total operating revenues....	\$3,596,865,766	\$5,144,795,154	\$6,171,493,301
Amount			
Labor .....	1,468,376,394	2,843,128,432	3,698,216,351
Fuel (locomotive).....	250,344,862	474,174,792	672,891,964
Loss and damage.....	30,958,221	116,683,270	122,022,696
Injuries to persons.....	29,485,700	37,314,145	50,683,684
Insurance .....	10,731,935	410,677	15,884,070
Depreciation and retirements.	119,785,157	126,292,105	145,252,339
Material, supplies and miscellaneous .....	447,316,143	801,712,094	1,063,769,900
Loss and damage.....	797,486	916,889	1,224,980
Uncollectible railway revenues	157,113,372	232,601,396	278,868,668
Taxes .....			
Hire of equipment and joint facility rents.....	41,471,979	56,576,401	60,751,014
Return on investment.....	1,040,084,517	454,984,953	61,928,626

Despite the fact that the railroads handled more business in 1920 than ever before in their history, the average number of train miles operated per 100 hours of work by the train service employees was 8 per cent less than in 1916, Mr.

Wettling showed. At the same time, the labor cost for operating a train one mile, he said, increased from \$1.20 in 1916 to \$3.27 in the last quarter of 1920, or an increase of 264 per cent.

Mr. Wettling filed with the committee statistics which showed that while the number of hours worked by 10 classes of road trainmen increased from 626,800,000 in 1916 to 670,800,000 in 1920, or seven per cent, the mileage of the trains run in transportation service decreased in that period from 1,224,000,000 to 1,205,500,000, or 1.52 per cent, because of the heavier load carried per car and per train.

While the railroads were obtaining a constantly increasing efficiency in the movement of each car of freight and each locomotive, Mr. Wettling said, the efficiency of the individual employee declined.

Mr. Wettling told the committee that the wage bill of the carriers in 1920, which totaled \$3,698,000,000, exceeded by more than \$100,000,000 the gross revenues of the railroads in 1916, which was the best year in railroad history prior to the war. In 1916, he said, their gross revenues were \$3,596,865,000.

The average compensation of railroad employees per hour increased from 27.8 cents in 1916 to 66.5 cents in 1920 and 70.4 cents in the last quarter of 1920, Mr. Wettling said, while the average compensation per employee per day increased from \$3.048 in 1916 to \$6.156 in 1920 and \$6.513 in the last quarter of 1920. The average annual pay increased, he said, from \$892 in 1916 to \$1,904 during the last four months in 1920, while if the wage award of the Railroad Labor Board had been in effect throughout the year of 1920 instead of from May 1, the average for the year would have been \$1,926.

Despite the fact that the railroads in 1920 employed 289,841 section men, or an increase of 36,264 or 14 per cent more than were employed in 1916, they actually worked during the past year 761,965,074 hours or 23,507,094 hours less than was worked by the lesser number of section men in 1916. Their average pay, however, in 1920, was \$1,192, as compared with \$509 in 1916, or an increase of 134 per cent. Had the wage award of the Labor Board been in effect throughout 1920 their average annual pay, he said, would have been \$1,252.

Mr. Wettling said that in 1916 the total compensation of section men was \$129,033,692, while in 1920 it was \$345,511,579.

Statistics filed by the carriers with the Interstate Commerce Commission, the witness added, showed that despite an increase of 18 per cent in the number of other unskilled laborers employed by the railroads compared with 1916 and an increase during that period of 115 per cent in compensation those employees worked 311,282,925 hours in 1920, or a decrease of 11,230,000 hours. Their average annual pay last year, he said, was \$1,311, compared with \$609 in 1916.

The largest increase in rates of pay received by any class of employees under the wage award of last July, Mr. Wettling said, was that of the car inspectors, who were increased 231 per cent over 1916.

General officers receiving \$3,000 and upwards per annum from 1916 to 1920 actually suffered a reduction of about 10 per cent in their pay.

Mr. Wettling told the committee that up to February last the relative increase in freight rates in the past eight years

had been less than the increase in wholesale commodity prices. In 1913 average receipts per ton-mile was 7.19 mills while in 1916 it had decreased to 7.07 mills. In 1917 it was 7.15 mills and in November, 1920, three months after the increase in rates became effective, it was 12.63 mills, or an increase of 77 per cent over the average receipts in 1913. For the same month the increase in wholesale prices was 107 per cent over 1913. He said that the increase in freight rates and the decline in wholesale commodity prices passed each other last February and that in March the average receipts per ton-mile was 13.33 mills, or an increase of 85 per cent over 1913, while for the same month wholesale prices showed only 62 per cent increase over the same year.

### Increased Revenues Absorbed by

#### Advances in Wages and Other Expenses

How increases in railway earnings resulting both from increased traffic and from increases in rates have been more than absorbed by increases in operating expenses, chiefly by increased payroll costs, which in 1920 practically wiped out the net operating income, was strikingly illustrated by statements filed by Mr. Wettling. From 1912 to 1920 the increase in total operating revenues was \$3,366,000,000, or 120 per cent, while the increase in operating expenses was \$3,809,000,000, or 194 per cent, and the increase in compensation of employees was \$2,489,000,000, or 205 per cent. The payroll was 43.13 per cent of the revenues in 1912 and 59.92 per cent in 1920. The average compensation per employee during this period increased from \$736.68 to \$1,820.05, or 147 per cent, and during the latter part of 1920 the average wage was at the rate of \$1,904 per year.

From 1916 to 1920 the revenues increased \$2,575,000,000, or 70 per cent, but operating expenses increased \$3,411,000,000, or 145 per cent, and the payroll increased \$2,230,000,000, or 152 per cent. In 1916 the payroll was 40.83 per cent of the revenues and 62.3 per cent of the expenses.

From 1916 to 1917 the revenues increased \$418,000,000, or 11 per cent, resulting in part from increased traffic and in part from an increase in rates, but the expenses increased \$472,000,000, or 20 per cent, and the payroll increased \$271,000,000, or 18.6 per cent, largely as the result of the passage of the Adamson law in 1916.

In 1918, after the government took over the railroads, wages were increased effective as of January 1, and rates were also increased effective during the last half of the year. There was also an increase in traffic as compared with 1917. The revenues increased \$866,000,000, or 21 per cent, the operating expenses increased \$1,153,000,000, or 40 per cent, and the payroll increased \$877,000,000, or 50 per cent, amounting to 53.55 per cent of the earnings and 65.64 per cent of the expenses.

From 1918 to 1919 there was a decrease in traffic and no general rate advances were made but the increases made in 1918 were in effect throughout the year and some additional wage advances were made. The revenues increased \$264,000,000, or only 5 per cent, but the expenses increased \$417,000,000, or 10 per cent. The payroll increased \$230,000,000, or 8 per cent.

In 1920 there was a new wage advance effective from May 1, but the rate advance did not become effective until August 26. From 1919 to 1920 there was an increase in revenues of \$1,027,000,000, or 20 per cent, due to increased traffic and in part to the rate advance in effect for four months, while the expenses increased \$1,369,000,000, or 31 per cent, and the payroll increased \$555,000,000, or 30 per cent.

From 1917 to 1920, comparing the years before and after the period of federal control, the increase in revenues was \$2,157,000,000, or 53 per cent. The increase in expenses, however, was \$2,839,000,000, or 100 per cent, or \$682,000,-

000 more than the increase in earnings. The increase in the payroll was \$1,959,000,000, or 113 per cent. In 1917 the payroll was 43.33 per cent of the earnings and 61.43 per cent of the expenses. In 1920 it was 59.92 per cent of the earnings and 64.11 per cent of the expenses. The net operating income fell from \$934,000,000 in 1917 to \$62,000,000 in 1920. Besides the increase in expenses there was an increase of \$65,000,000 in taxes and there were also some increases in equipment and joint facility rentals.

#### Increase in Expenses Greater Than Rate Increase

That the poor showing made by railway net operating income since the increases in rates were made effective on August 26 was due more to increases in expenses than to the reduction in traffic was illustrated by a table comparing the results for the six months ended with February, 1921, with those for the corresponding period of the previous year.

The railway revenues for this period showed an increase of 16 per cent, or from \$2,825,000,000 to \$3,277,000,000, but operating expenses increased 17.9 per cent, or from \$2,443,000,000 to \$2,880,000,000 and taxes increased from \$115,000,000 to \$144,000,000, or 25.8 per cent. During this period both the increased rates and the increased wage rates were in effect. The net railway operating income was \$218,120,632, a decrease of 6 per cent as compared with the corresponding period of the previous year. This was at the rate of 2½ per cent per annum on the railroad valuation.

In spite of a decrease in both freight and passenger traffic for the six months as a whole, the freight revenues for the period increased 21.6 per cent, as compared with the corresponding six months of the previous year, while the passenger revenues increased 14.4 per cent.

#### Railroad Traffic Performance in 1920 Set New Record

The railroads in 1920 performed 12.6 per cent more freight service and 1.2 per cent more passenger service than in 1919, exceeding all previous records for a year, according to exhibits filed by Mr. Wettling. The freight service is measured by the number of tons of revenue freight transported for a distance of one mile, a total of 409,970,656,000 ton-miles, which was an increase of 45,000,000,000 ton-miles, as compared with 1919. The number of tons carried was 2,234,547,672, an increase of 9.9 per cent, and the average distance each ton was handled per railroad increased from 178.97 to 183.47, or 2.5 per cent.

The number of passengers carried was 1,234,222,889, an increase of 5.1 per cent, but there was a decrease in the average journey per railroad from 39.32 miles to 37.86, or 3.7 per cent. As a result the passenger miles increased only 1.2 per cent.

Including non-revenue freight the railroads handled 449,292,355,000 ton-miles, an increase of 13.2 per cent over 1919 and a new record for a year. By increased efficiency in car loading and by increasing the average trainload this increase of 13.2 per cent was handled with an increase of only 11.3 per cent in train mileage. The average revenue received by the railroads for hauling a ton of freight one mile was 1 and 5/100 cents and the average revenue per passenger mile was 2 and 74/100 cents.

#### Maintenance Restricted by Railroad Administration

The director general, through orders restricting the amount to be spent for maintenance during the period of federal control, thereby resulting in the railroads being turned back on March 1, 1920, in a condition of undermaintenance, was largely to blame for the increased expenditures made for that purpose during the past year compared with 1919, Mr. Williams testified.

"A substantial portion," said Mr. Williams, "if not all, of the increase in number of units of material and number of hours of service performed in the year 1920 as compared

with the year 1919 over and above that necessitated by increased service was due to the under-maintenance of 1919 and not to any over-maintenance in the year 1920. Orders issued by the director general limiting the expenditures for maintenance during the year 1919 were largely responsible for this situation. The machinists' strike in August, 1919, was partly responsible for the under-maintenance of locomotives and cars in that year. During the latter part of the year, the director general declined to authorize any new addition and betterment work unless the carriers agreed to finance the same, which most of them were unable to do owing to uncertainty as to their future.

"Order No. 20, issued by the Director, Division of Operation, limited the expenditures for repairs or additions and betterments to certain types of cars, with the result that a substantial number of cars was allowed to get in such condition as to necessitate very heavy expenditures and required their being set off on side tracks; and no charge was made during the year 1919 to cover the cost of placing these cars in proper condition."

Mr. Williams cited a long list of additional orders issued by the director general in 1919 and shortly before the roads were turned back in 1920, the "wording of which orders seemed to indicate that their purpose was to limit expenditures during the period of federal control to the amount which the government was obligated to expend for maintenance of the properties."

"Their practical effect, however, owing to the improper basis established, was to cause serious under-maintenance," Mr. Williams said. "All the under-maintenance of the period of federal control was not made up during the year 1920, owing to the inability of the railroads to secure sufficient rails and ties.

"The director general's telegram of May 27, 1919," he said, "instructed that the ratio of maintenance of way expenditures to operating revenues in June should be no greater than the average maintenance of way ratio for the entire 36 months of the test period. When issuing this order, the director general overlooked the fact that maintenance expenditures in the summer months are necessarily much greater than in the winter months inasmuch as it is not advisable to disturb track during cold weather. He also overlooked the fact that revenues had not increased proportionately with the increase in operating costs and that increases granted to maintenance of way and shop labor were greater than the average increases of all classes of employees. In determining the basis of settlement with the director general for upkeep of the property for the last two months of federal control, viz., January and February, 1920, the director general agreed with the railroads that it was not advisable to expend in each of said months only one-twelfth of the annual maintenance charged during the test period and agreed to accept for said months one-sixth of the annual charge, notwithstanding the fact that a less amount was actually expended, thus conceding that a mistake had been made in issuing the order of May 27, 1919, limiting the expenditures during the summer months of that year."

During the past 10 years, Mr. Williams said, the Wabash had made a practice of renewing rail in its high speed main tracks about once in every 12 years. During the federal control period only 83 track miles of new rails were laid, or 107 miles less than the standard previously maintained by that road.

In order to make the Wabash track safe for operation in 1920, it was necessary for the Wabash to make up this deficit of 107 miles which accrued during federal control and to lay an additional amount of 44 miles partially to take care of the current year, the witness said.

During federal control, he said, 1,052,043 ties should have been placed in order to maintain previous standards. Instead, however, only 861,794 were actually furnished, which

left a deficit of 412,880 ties during the period of federal control.

"In general," Mr. Williams continued, "repair costs for all classes of equipment were much higher in 1920 than in 1919, due to the fact that the 1919 year was a subnormal year of maintenance and during 1920 an effort was being made to re-establish normal conditions. One reason for the subnormal maintenance during 1919 was the reduction in shop forces brought about by regional director's instructions that maintenance of equipment expenses must not exceed a certain percentage of gross earnings."

Mr. Williams denied that existing freight rates are responsible for present business conditions. The rates, he said, have had no appreciable effect on the volume of business carried by the railroads and only a slight effect on the costs of commodities, virtually all of which, because of general market conditions, have been greatly reduced in price during the past year.

Mr. Williams attributed present business conditions to the readjustment that is now in progress throughout the world in an effort to return as nearly as possible to the pre-war conditions and the fact that the country is "now suffering from the unusually large inventories" which resulted from "an artificial augmentation of business" in 1920, "the cause of which was not thoroughly understood."

"No material increase in the volume of traffic can be expected until the inventories are reduced to normal," Mr. Williams said.

Because of over-production in 1920, he estimated that bituminous coal production this year would be from 100,000,000 to 125,000,000 tons below last year. A similar situation, he said, has developed as to sugar, as well as in many other industries with the result that falling prices have resulted in severe losses.

"The sugar companies of Canada lost in 1920 an amount equal to the profits of the preceding six years, this being due to the rapid fall in prices," Mr. Williams said.

#### Present Conditions in U. S.

Speaking of conditions in this country, he said:

"Furnace coke has dropped from \$17 per net ton, in October, 1920, to \$3.50 per net ton, in 1921.

"Open-hearth steel billets at Pittsburgh dropped from \$65 per gross ton, in July, 1920, to \$37 per gross ton, in April, 1921.

"Pennsylvania crude petroleum dropped from \$6.10 per barrel, in October, 1920, to \$3 per barrel, in April, 1921.

"No. 1 Northern spring wheat, at Chicago, dropped from \$2.22½ per bushel, in October, 1920, to \$1.33¾ per bushel, in April, 1921.

"Ohio fine delaine wool, clean basis, Boston, dropped from \$2.35 per pound, in April, 1920, to \$0.92, in April, 1921.

"Prime Western zinc, St. Louis delivery, dropped from \$7.30 per hundred, in October, 1920, to \$4.60, in April, 1921.

"Middling, spot cotton, New Orleans delivery, dropped from 20.25 cents per pound, in October, 1920, to 11.25 cents per pound, in April, 1921.

"No. 2 mixed corn, Chicago delivery, dropped from 95 cents per bushel, in October, 1920, to 55½ cents per bushel, in April, 1921.

"Fair to choice native steers, Chicago delivery, dropped from \$14.75 per hundred, in October, 1920, to \$8.15 per hundred, in April, 1921.

"Pig lead, New York delivery, dropped from 7.80 cents per pound, in October, 1920, to 4.50 cents per pound, in April, 1921.

"Red (facing) brick are now selling at \$12 per thousand, and salmon (backing-up) brick at \$10 per thousand in St. Louis, being one-half of the peak prices of last year.

"These unusual drops in prices and consequent losses in inventories, have seriously affected the buying power of the

dealers and also have affected their ability to borrow funds. At the time the break in prices occurred, producers and wholesalers had on their books many unfilled orders which were subsequently filled at the high prices, with the result that retailers found themselves overstocked with goods at high prices."

Mr. Williams told the committee that the increase in freight rates had been so small that they cannot be said to account for any appreciable amount of the charges in livestock and grain prices. The wholesale price in Chicago of cattle in 1920 was \$14.50 per hundred pounds and so far this year approximately \$8.60. Mr. Williams said, while to ship cattle from Sioux City, Iowa, it costs only 44 cents per hundred pounds. The wholesale price of hogs, he said, was around \$14.85 in 1920 and \$9.25 this year while the freight rate from Des Moines, Iowa, to Chicago is only 40 cents a hundred.

Last year, according to the witness, the wholesale price of corn in Chicago was \$1.41 per bushel and 64 cents this year while to ship a bushel from Decatur, Ill., to that city costs only 7½ cents. To ship a bushel of wheat from St. Cloud, Minn., to Chicago, Mr. Williams said, the cost is 15¾ cents per bushel while in 1920 the wholesale price in Chicago was \$2.80 and this year \$1.47.

Although contentions have been made that existing freight rates have curtailed building operations, Mr. Williams said statistics from six industrial centers in Indiana, Ohio and Pennsylvania as well as the District of Columbia show that approximately twice as many garages as dwellings were built in 1920.

"This plainly indicates that materials for buildings that are very greatly desired must be moving in considerable volume," Mr. Williams said.

#### Some Suggestions for Relief

Mr. Williams submitted the following suggestions as a possible means of providing some relief for the railroads:

State commissions have required the re-establishment of unremunerative passenger service, erection of new passenger stations, and other expenditures which ought to be deferred. The Interstate Commerce Commission, which has authority to regulate the receipts of the carriers, should be the sole agency authorized to require additional service or expenditures for plant facilities.

Freight rates for car-lot shipments should be based upon the cars being loaded to their weight capacity or cubical content capacity. This would make it unnecessary to buy freight cars other than for replacements during the next five years; it would minimize the possibility of car shortage, and would materially add to the revenue tons per train and thereby lessen the cost of operation.

Governmental work, particularly road work, should be done at such times and by such methods as to interfere as little as possible with private enterprise. Materials for such work ought not to be moved by rail when open top cars are needed for the coal trade.

The existing rules with relation to seniority rights when men are promoted, or forces are curtailed, should be modified so as not to apply when those by whom they are claimed are seriously inferior in qualifications. "During the past three years," the witness explained, "the railroads have found it necessary to employ men not the most competent or qualified to perform the work for which they were taken into the service. Many of these men are not capable of assuming increased responsibility and should not be retained in their present positions."

#### Mr. Warfield's Plan

S. Davies Warfield, testifying before the committee on Wednesday, declared that only through far-reaching economical methods for conducting transportation and the obliteration

of old-time prejudices can rates and fares be made satisfactory to the people and the railroads be enabled to compete with other forms of transportation and produce the return essential to enable the roads to finance their obligations.

He stated that a return on railroad property in the aggregate less than that provided for in the Esch-Cummins act would not maintain transportation, and any attempt to impair the provisions of that act would be a menace to the successful operation, in the public interest, of the transportation system.

"The question for the moment is," said Mr. Warfield, "Can sufficient revenue be obtained from rates and fares that will be considered reasonable by the public and the shippers, and will these rates bear a relation to the price obtainable for the articles transported that will not impede commerce; or will part of the money required to meet the necessities of transportation have to be supplied, in the public interest, by taxation?" The latter, he said, means government operation and eventual government ownership, and unless effective railroad organization is consummated to introduce rigid economies this could not be avoided.

Discussing freight rates he showed that the war produced abnormally high prices and high rail operating costs. When deflation set in prices broke precipitately and the unprecedented and unforeseen era of business readjustment, he said, was the real cause of the loss of business to the railroads.

"The exhaustion of general credit was manifest before the increase in railroad rates," said Mr. Warfield. "There had been a progressive decline in the reserve ratio of the Federal Reserve banks from the peak of August, 1917, caused by the expansion of bank credits of over 80 per cent to below 40 per cent in the early part of 1920; the increase in railroad rates was not made until August, 1920, when the exhaustion of credit showed its effect on commodity prices. The increase in rates cannot be held accountable for the contraction in business from which the railroads have suffered acutely."

The economies to be instituted, he classed under two headings: "one, by effecting an organization of the officials of the railroads as grouped in each of the four territories now established by the Interstate Commerce Commission; and two, through a central agency or corporation to supply equipment to the railroads without profit to the corporation, and to perform other services, under the supervision of the commission."

The commission has laid out the country in four districts, applying different ratios of increase or decrease in rates in the several districts, he said. On the aggregate group value of the property of the carriers in the respective groups the yield from rates is computed. He contended these and other conditions made it logical for the carriers of each group to organize themselves, a group railway board, of not less than five members, to be selected by each group of carriers. From among the carriers of the groups, men would be selected to report on advanced methods for producing economies. Three officials would be selected from the four group boards, 12 in all, to serve on a national board, with 12 additional members selected from the trustees of the National Railway Service Corporation. This national board would be composed of practical railroad officials and men trained in finance and general business administration. This board would determine questions of legislation and public policy.

"The group boards and their committees should be advisory," he said. "Neither the national board nor the four group boards would interfere with the boards of directors of railroads." The suggestions of the group and service boards now proposed should be submitted to the directors of the respective railroads, thus keeping before directors the relation of co-ordination to economical operation.

Through the organization proposed, information, he stated, would be available, scientifically assembled, to inform the shippers and the public of the relation of railroad rates to commerce. He contended that there is no organization of the railroads to speak with authority on these subjects, whose con-

clusions or suggestions could be accepted as authentic. "If the railroads themselves cannot produce convincing evidence of the necessity of a railroad rate and the relation that rate bears to the commodity transported fault cannot be found if governmental agencies step in to take up those questions," he said.

Mr. Warfield discussed the relation of valuation to the proposed consolidations and said that the group organizations, in co-operation with the recently appointed Board of Economics and Engineering, would be "helpful to the commission in working out the proposed large consolidations." He called attention to the desirability of keeping consolidations within reasonable limits so as not to impair incentive and retard the building into territories awaiting development. He advocated the immediate adoption of means to fund the obligations of the railroads to the Railroad Administration.

The purposes of the National Railway Service Corporation, organized by the association of security owners in July last, were outlined. This corporation, it was stated, has been supplying equipment to railroads otherwise unable to secure funds to purchase equipment. This corporation should not only supply carriers with equipment under long-time yearly payments, but, if so provided by Congress, it would be enabled to acquire a "floating supply" of equipment to be leased to carriers on a per diem basis. The railroads could largely reduce their capitalization for equipment, making purchases to meet only their normal requirements, securing from the service corporation the equipment to meet seasonal demands. Large savings would be made in first cost of equipment, and a greatly reduced number of cars required, the floating equipment being shifted from one railroad to another and from one section of the country to another.

He asked that Congress require a court or a receiver in a receivership to continue agreements made by carriers in the purchase of equipment. The knowledge that a receivership would not break an agreement would provide a more extended and stable market for the corporation's certificates.

He advocated the use of the excess earnings fund provided under the act through the corporation, to be used as a margin to enable the corporation to sell its equipment obligations at minimum rates of interest.

It was pointed out that the Esch-Cummins act and the commerce act give wide powers of supervision and regulation to the commission and the labor board. The commission is required to institute economies if the railroads themselves do not produce them. The railroad complaints of excessive regulation, he said, grew out of the lack of method for the co-ordination of effort. "It remains with the railroads themselves," he said, "to limit governmental regulation by the organization of agencies among themselves which would guarantee to the public and the shippers adequate transportation facilities at rates which the public must be satisfied are in line with intensive economies and wise administration."

He said the carriers had applied immediately to the Labor Board at Chicago before employing the methods contained in the Esch-Cummins act for the settlement of working conditions and wages. He quoted from the provisions of the act, giving specific methods for handling the questions, among others the formation of local or regional adjustment labor boards by the roads, the National Labor Board to be the board of appeal to settle disputed questions. Yet, he said, complaint is constantly made that the roads are now nearly operated by governmental agencies while little has been done to supply the machinery of organization to avoid or prevent it.

The reports of the commission of railroad revenue and expenditures, he said, gave conclusive evidence of the necessity for a reduction in wages. This is not the only remedy necessary in the emergency. Wage reduction, he stated, cannot entirely supply the means through which to meet the constant demands of the shippers for decreased rates, which can be secured through economies possible of attainment.

Mr. Warfield advocated co-ordinated relations between the commission and the labor board. He said while Congress had placed extensive powers with the commission, which provides the money through rates and fares to operate the railroads, the labor board, another governmental body, had been given the adjustment of wages, now constituting 65 per cent of all railroad operating expenditures. "Can the commission," he asked, "exercise authority to inquire into the management of the business—keep itself informed as to the manner and method in which the same is conducted—have complete information necessary to enable the commission to perform the duties and objects for which it was created," when Congress, without co-ordinate relations between the two bodies, charges one with the sole right to fix wages, and the other with the duty of supplying the money from rates to pay them, keep the railroads running and enable them to sell their securities?"

Mr. Warfield discussed the Board of Economics and Engineering, appointed by the Association as "the only instrumentally free from entangling alliances, which could review the questions involved unhampered by ties of individual, railroad or financial identity or ownership, or by the influences of any particular security owning or banking group, and from the environment that attends governmental appointment." He gave the subjects now under investigation by this board, as follows: Standardization of equipment; repairs and shop practices; power economies, including locomotive improvements and electrification; car service; joint facilities and terminals; consolidations of railroads—valuation; transportation economies—loss and damage; routing of traffic; purchase of fuel and supplies; simplification of accounting; traffic rates and divisions; wages and working conditions. The board is in consultation with representatives of car manufacturing companies for the purpose of discussing standard methods in respect to equipment.

He stated that the group organizations and the plans proposed to investigate, report and institute economies under the group plan, had been gone into by the Board of Economics and Engineering, and it was the opinion of that board that through such organization large economies could be instituted.

Mr. Warfield presented drafts of two bills, one entitled, "An act to further economies and efficiency in railroad transportation," to effect the organizations suggested of the railroads in the four group territories; the other, "An act to incorporate the National Railway Service Corporation."

He said that Congress was not asked to enforce the suggestions made in relation to the economies to be secured, but request is made that the railroads themselves effect the organizations to secure these economies and to bring such relations between the carriers as will permit the economical operation of the transportation system as a whole. All of the actions of these boards are proposed to be subject to the supervision of the Interstate Commerce Commission.

In closing, Mr. Warfield stated: "It has been made apparent that the country cannot look to a thousand or so executives of railroads, nearly two hundred alone representing the great systems, to reach agreements and conclusions among themselves respecting the co-ordination of facilities and service, and the introduction of economies to the extent essential to guarantee the most economical administration and methods of transportation, under the system that is at present observed. Unless these conditions are recognized and relieved through definite organization, then transportation under private operation must fail."

The Board of Economics and Engineering is composed of John F. Stevens, F. A. Molitor, John F. Wallace, W. L. Darling, L. B. Stillwell, and W. W. Colpitts. Mr. Warfield said that several members of the board were present and would indicate briefly the directions the proposed investigations will take. Mr. Stillwell was to indicate the direction in which investigation will be made in respect to equipment.

Mr. Wallace was to discuss the joint use of terminals in larger cities. Edwin Ludlow, president of the American Institute of Mining and Metallurgical Engineering, was to discuss methods for joint coal and fuel purchases. Forney Johnston, of counsel for the association, was to describe the equipment agreements and contracts between the carriers and the service corporation.

Mr. Warfield stated that his association represented the holders of \$11,000,000,000 of railroad securities, mostly bonds. Senator Cummins asked how these bondholders had selected the Board of Economics and Engineering. Mr. Warfield said they had been selected by the executive committee and were to be paid by voluntary subscriptions by members of the association. Senator Wolcott asked what was the attitude of the railroads toward the creation of this board. Mr. Warfield said that he thought the railroads would be willing to co-operate and that he could see no reason why they should not. Senator Cummins remarked that "to state it bluntly, the appointment of this board must be based on the thought that the railroads are not being properly managed and that they will accept the advice of this board and that the association must have had in mind that the railroads are not being as economically managed as possible." Mr. Warfield said there was no doubt about that, but that he thought that one difficulty of the present situation is that each executive is looking out for himself, but that he will welcome a plan of co-operation. He also said that in the event of consolidations it will be necessary to treat with the great bulk of the security owners. Senator Cummins said that if the railroads find it necessary to ask some indulgence from the security owners they will be able to get a hearing at any rate. Mr. Warfield said he desired to have W. A. Colston, director of the Bureau of Finance of the Interstate Commerce Commission appear before the committee to talk about the economies that can be effected through consolidation.

## Report on Collision at Abermule

THE MINISTER OF TRANSPORT of Great Britain has issued a report, made by Col. J. W. Pringle, inspecting officer, on a disastrous butting collision of passenger trains on the Cambrian Railways at Abermule, Wales, on January 26, 1921, in which 11 passengers were killed and 36 persons, mostly passengers, were injured, three of these subsequently succumbing to their injuries. Abermule is about ten miles southwest of Welshpool and about four miles north of Newton; it is the junction of a branch to Kerry. The line is operated under the electric train-tablet system with Tyer's No. 6 instrument, which system has been in use 30 years; and the collision, one mile south of Abermule, was due to negligence in allowing the southbound train to enter the block section at Abermule with the tablet which had just been surrendered by that train (for the section north of Abermule). The trains met at about 25 or 30 miles an hour, and the engineman and fireman at fault were killed.

The inspector says that the engineman and fireman of the southbound train, Jones and Evans, should bear half the responsibility for the collision, holding also that if the engineman had been keeping a good lookout he could have applied the brakes so as to mitigate the effects of the collision. Both men evidently had accepted the tablet in a pouch without reading it. E. P. Rogers, a station porter, 17 years old, accepted the northbound train from the station to the south without authority from the station master or the signalman; and immediately after this he started for the south end of the yard to set the switch for the two trains to meet at Abermule. F. W. Thompson, ticket clerk, 15 years old, took the tablet from the southbound train, as it came in, this also without authority; and instead of putting the tablet into the instrument, he met the acting station master, Lewis, in the waiting room, and handed the tablet, in its

holder, to him, asking him to change it. Thompson then went across the tracks to take up the tickets from incoming passengers from the north. Lewis assumed that Thompson had already changed the tablet and that he was receiving one for the section south of Abermule, and he gave it to the fireman, the engineman being engaged in oiling.

Rogers, at the south end of the loop, was surprised to find that he could not set the switch for the northbound train (the switch being controlled by a bolt lock from the signal cabin) but he saw the station master give a hand signal for the southbound train to proceed, and he assumed that the meeting place of the trains had been changed.

Several other irregularities are noted in the report and responsibility is placed on the acting station master, Lewis, Signalman Jones (60 years old) and the porter and the clerk. The regular station master, Parry, was on vacation; he is held responsible for the growth of these irregular practices, and in a less degree, the inspectors who had failed to detect them. Lewis, with Jones, is held responsible equally with the engineman and fireman. All of the rules which were violated are simple and well understood and of long standing; and, indeed, violations are so infrequent that the collision is characterized as unique in the annals of British railways. "Such indiscipline and slipshod methods would have been incredible prior to this collision."

Having set forth the facts the inspector feels so strongly that the rules will be observed in the future that he finds no justification for recommending additional precautions, except the following: at meeting points where the tablet instruments cannot be placed in the signal cabin there should be electric interlocking between the tablet instrument and the starting signal; in special circumstances such interlocking should be provided even where instruments are in the signal cabin. The switches at Abermule should be worked from the cabin; and the governmental committee which is now engaged in standardization of rolling stock should consider the question of equipping new passenger cars with buffers designed to prevent overriding of one car by another in case of collision.

The engineman and fireman of the northbound train, men of long experience, could not recall cases of enginemen or firemen who did not habitually read tablets handed to them. We find no mention of the age, character or experience of the engineman and fireman who were killed.

President Harding Leaving the Interstate Commerce Commission After His Call on June 1 for the Purpose of Inquiring as to the Progress Being Made in the Revision of Freight Rates

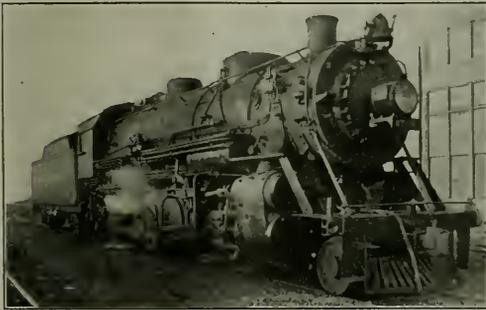

# The Automatic Control of Locomotive Cutoff

Tests on Big Four Demonstrate Its Practicability, Utilizing Back Pressure as Actuating Force

By E. S. Pearce

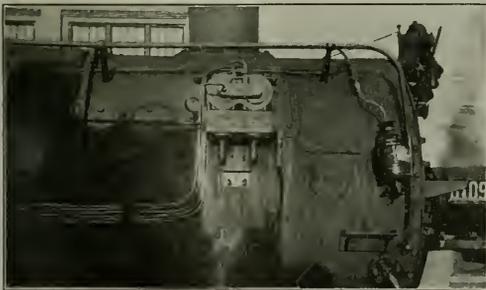

Mechanical Engineer, Cleveland, Cincinnati, Chicago & St. Louis

LOCOMOTIVE DRAW BAR pull is the result of steam pressure on the pistons. Variations in the amount of draw bar pull with changes in speed are the result of variations in the average pressure against the pistons, and changes in the average pressure against the pistons are the result of changes in the quantity, pressure and temperature of the steam admitted to the cylinders at the beginning of the stroke.

Mikado Locomotive Equipped for Automatic Control of Cut-Off

Graphically, the relation of quantity and pressure are represented by the indicator card. As shown by Fig. 1, steam is admitted to the cylinder from the point of admission *A* to the point of cutoff *B*, at a pressure of  $P_1$  lb. At the point *B* the amount of steam in the cylinder, for all practical purposes, is the amount used in the development of the work of one stroke. From *B* the steam expands the remainder of the

Differential Valves Connected to Exhaust Passages and to Reverse Gear

stroke to the point of release *C*. On the return stroke the steam is expelled from the cylinder between *C* and *D* to the point of compression. During the time this steam is being expelled it is exerting against the piston a back pressure  $P_2$ , tending to reduce the positive force of the steam against the opposite face of the piston.

The exhaust or back pressure,  $P_2$ , varies directly with the admission pressure  $P_1$ , the length of cutoff, speed and the ability of the boiler to supply steam at the rate required to maintain  $P_1$ . It varies indirectly with the size of exhaust ports and passages.

Fig. 1 shows the value of back pressure when a constant cutoff is used through a range of increasing speeds as compared to the changes that take place in the admission pressure. The admission pressure falls off with increasing speed due principally to the inability of the boiler to supply steam in such increasing quantity and also on account of the decreased time interval for admission. Back pressure increases with increased speed due almost entirely to the shortened time interval for the escape of the steam. The net effect of the change in  $P_1$  and  $P_2$  was to reduce the area of the indicator card, which is the measure of the average mean effective cylinder pressure.

From the indications of the card, it is reasonable to suppose that somewhere between 12 and 26 miles an hour a shortening of the cutoff would have produced a card of greater area, regardless of the fact that a lesser number of cubic feet of steam would have been admitted to the cylinders. This increased area would be due to the higher value of  $P_1$  caused by the smaller demand on the boiler and there being

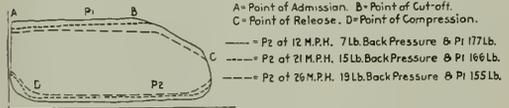

Fig. 1—Indicator Card Showing Relation Between Exhaust and Admission Pressure and Area with Fixed Cut-Off as Speed Increases

less steam in the cylinder to be exhausted the value of  $P_2$  would be less. Should this supposition prove correct the decrease in drawbar pull would be less rapid and the amount of work per pound of steam used would be greater. Within the reasonable limits of practical application it is also possible that the exhaust pressure may bear a relation of a more or less constant nature to  $P_1$ , the point of cutoff and the speed, such that by adjusting the cutoff to hold the exhaust pressure at a constant value an indicator card of the maximum area will be obtained for each speed within the limits of the boiler capacity.

The theory so far advanced, if of any practical value, should easily be demonstrated by the analysis of actual road tests conducted for that purpose. Such tests have been conducted on the Big Four in which no refinements of observation or calculations were indulged in not within the reasonable limits of every day performance. The conclusions, therefore, are within the reasonable limits of practical application.

It is first necessary to determine just what relation cutoff bears to drawbar pull, then what relation mean effective cylinder pressure bears to cutoff, through the same range of speeds. These relations being established, the variation of exhaust pressure as related to speed, cutoff, or mean effective

cylinder pressure can easily be determined. Since the exhaust creates draft and draft supports combustion, which must go on at a certain rate to supply steam, the relation of exhaust pressure and draft must also be determined. Part of the heat of combustion is used in superheating the steam. Since the steam supply, as controlled by cutoff, bears a possible relation to exhaust pressure and since draft may also bear such a relation, it is essential that the relation of superheat to back pressure be determined throughout the working range of cutoffs.

For determination of the above relations and variations in each specific element, a stoker fired locomotive of the Mikado type with the following dimensions was used:

Cylinders	27 in. by 30 in.
Tractive effort	50,000 lb.
Diameter of drivers	63 in.
Steam pressure	200 lb.
Grate area	60 sq. ft.
Evaporative surface	4,650 sq. ft.
Superheat surface	1,165 sq. ft.
Weight on drivers	246,000 lb.
Valve gear, Walschaert	

With respect to the relation of the position of the reverse lever to the amount of steam travel of the piston for several positions of the reverse lever, it should be noted that from the corner back to the third notch the cutoff was shortened .705 in., from the third to the sixth notch 2.135 in., and from the sixth to the ninth, the shortest cutoff, 5.74 in. The effect of one notch adjustment near the corner is, therefore, about one-eighth that of one notch near the center.

The range of speed through which one cutoff will maintain a greater drawbar pull than the next longer or shorter cutoff is very clearly shown in Fig. 2 by the relation of the drawbar pull-speed curves for the positions of cutoff with the reverse lever in the first, third, sixth and ninth notches. The extent to which the use of one cutoff through a considerable range of increasing speeds will tax boiler capacity is shown by the

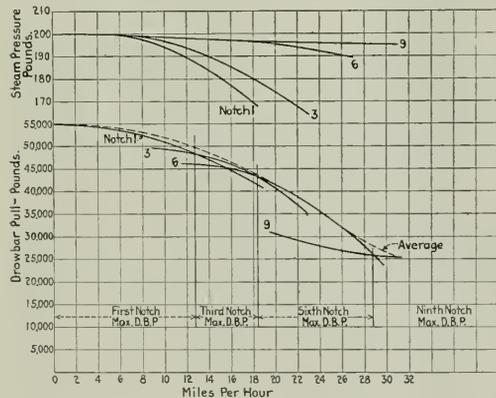

Fig. 2—Variation of Drawbar Pull and Boiler Pressure as Speed Increases with Four Positions of Cut-Off

rate at which boiler pressure falls off as speed increases. It is evident that using the incorrect cutoff when maximum capacity is required will not only prevent such capacity being developed, but will needlessly tax the steaming capacity of the boiler. Cutoff changes to develop maximum drawbar pull at each speed on this particular class of engine should be made as follows:

First notch, 89.1 per cent C. O.	0 up to 12-14 m.p.h.
Third notch, 86.75 per cent C. O.	12-14 m.p.h. to 18-19 m.p.h.
Sixth notch, 79.65 per cent C. O.	18-19 m.p.h. to 28-30 m.p.h.
Ninth notch, 60.5 per cent C. O.	28-30 m.p.h. up.

In actual practice with either increasing or decreasing speed this number of cutoff changes would not be made,

although the advantage of so doing must be evident. In fact, the notches between those cited could be used with profit.

Mean effective cylinder pressure, back pressure and their relation to speed are shown in Fig. 3. Since mean effective cylinder pressure produces drawbar pull, the cutoff changes required to hold it at the maximum with changing speed should correspond to those required to hold drawbar pull at the maximum. From Fig. 3 these are found to be as follows:

First notch	Up to 12-14 m.p.h.
Third notch	12-14 m.p.h. to 18-19 m.p.h.
Sixth notch	18-19 m.p.h. to 28-30 m.p.h.
Ninth notch	28-30 m.p.h. and up.

The slight discrepancy in speed at the upper limit of the third notch and the lower limit of the sixth notch does not

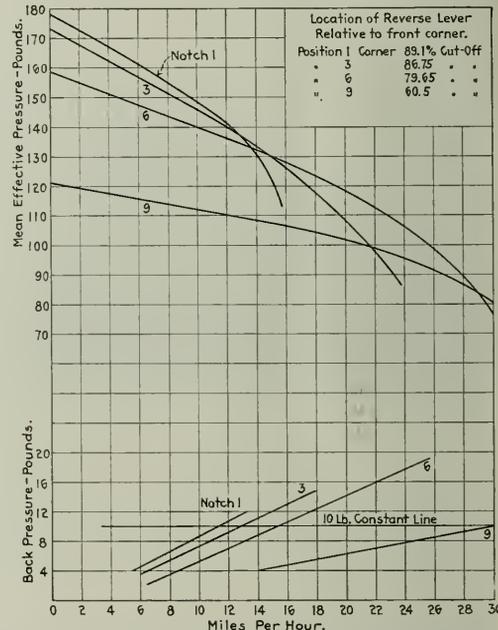

Fig. 3—Relation Between Average Mean Effective Pressure, Back Pressure and Speed for Four Positions of Cut-Off

detract from the theory and the fact that mean effective pressure falls off at a more rapid rate than boiler pressure, as shown in Fig. 2, while back pressure increases in practically direct proportion to increasing speed, is a practical demonstration of the theory set forth in connection with Fig. 1. Attention is called to the fact that the back pressure curve for each cutoff shows a value of approximately 10 lb. at the same speed at which the cutoff should be changed to hold mean effective pressure as well as drawbar pull at a maximum.

Since back pressure apparently bears some constant relation to mean effective cylinder pressure and thence, through cutoff, to drawbar pull, there must be some point of maximum return to be expressed in pounds mean effective cylinder pressure per pound of back pressure. Fig. 4 shows the ratio of mean effective pressure to pounds of back pressure for the various cutoffs and back pressures. The longest cutoff gives the maximum return in pounds mean effective pressure per pound of back pressure up to a point between 10 and 12 lb. back pressure, which occurs for this cutoff at 12 to 14 miles an hour. All values of cutoff show that with 10 to 12 lb.

back pressure the pounds mean effective pressure per pound of back pressure are approximately the same. Therefore, if each cutoff is changed when a speed is reached such that back pressure has reached between 10 and 12 lb., the maximum

10 to 12 lb. back pressure is the point of maximum return is still further evidenced by the fact that the relative positions of the several curves in Fig. 4 are reversed on either side of this critical range.

The relation of draft to back pressure is shown in Fig. 5. Dr. Goss in his book on "Locomotive Performance," states that:

"First—Changes in cutoff have no effect upon the form and character of the jet, except insofar as they affect the quantity of steam discharged.

"Second—With a given weight of steam discharged, whether in heavy exhausts incident to low speed, or the more rapid impulses at high speed, the draft resulting is practically the same. But whenever the weight of steam discharged per minute changes, the draft will change.

"Third—In any boiler the condition of draft determines the rate of combustion and consequently under ideal conditions, the draft will be a function of the rate of combustion."

From Fig. 5 it will be seen that for all of the cutoffs shown, constant back pressure is synonymous with constant draft. This seems to be contradictory to the first and second con-

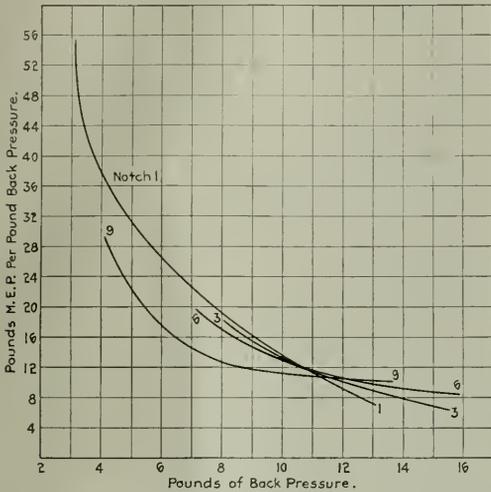

Fig. 4—Average Pounds Mean Effective Pressure Per Pound Back Pressure for Four Positions of Cut-Off

return for the back pressure carried will be obtained, both in economy as to mean effective pressure and capacity as to the drawbar pull obtained as a result of the change. That

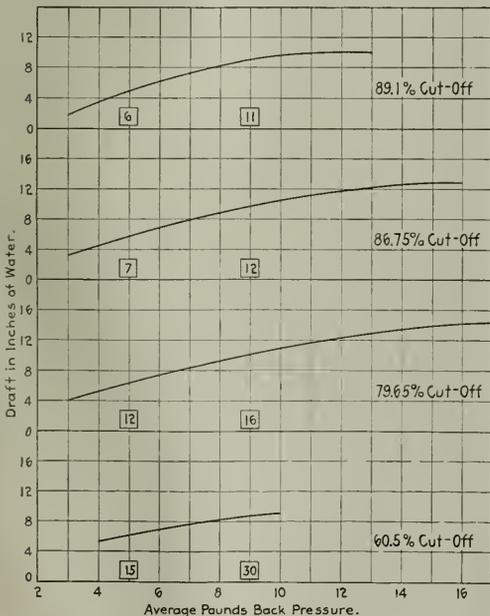

Fig. 5—Back Pressure and Average Draft at Base of Stack for Four Positions of Cut-Off with Varying Speed

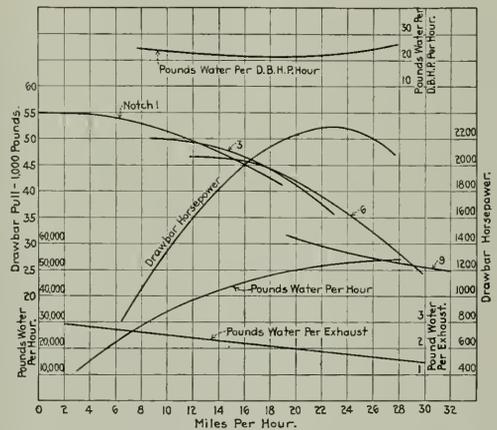

Fig. 6—Drawbar Pull, Horsepower and Water Rate Cut-Off Adjusted for Varying Speed, as Shown in Fig. 2

clusions of Dr. Goss since as speed increases and cutoff is shortened, the quantity of steam exhausted per minute increases with speed as shown by Figs. 6 and 7. It should be noted that as cutoff is shortened with increased speed the amount of steam discharged per exhaust decreases from 2 miles an hour to 28 miles an hour by 45.8 per cent, whereas the quantity per minute increases over the same range by 1,460 per cent. At low speeds the intervals between exhausts is large and the quantity of steam discharged per exhaust is also large. At high speeds the intervals between exhausts is also small and the quantity of steam discharged per exhaust is also small. Low frequency and high quantity in one case is equalled by high frequency and small quantity in the other; the result is a constant.

Constant draft through a range of speed requiring an increasing rate of steam supply and consequently an increasing rate of combustion if steam pressure is to be maintained within working limits, may seem to be contradictory to the third deduction made from the experiments of Dr. Goss. Analysis of the conditions of actual operation very easily explains the consistency of both statements. To supply steam at low rates a heavy fire is used, giving greater resistance to the passage of a given quantity of air through the fuel bed

in a given time, hence a high draft is required although less air is required in a given time than at high speed. To supply steam at high rates a light fire is used with lower resistance to the passage of the air, yet the quantity of air required in a given time is greater than at low speed. For all practical purposes draft is constant for varying rates of combustion and the air supply automatically controlled by the thickness of the fuel bed.

The statement that conditions of operation actually require constant draft is further substantiated by the relation of superheat to back pressure. Shortening the cutoff to hold back pressure constant as speed increases results in constant draft and as a result of this regulation of the quantity of steam passing through the superheater, practically a constant amount of superheat is obtained throughout a great range of speed. For back pressures from 8 to 13 lb. the superheat is the same. The higher back pressure is the maximum of economical return in draft and the range is within that obtained with low as well as high speed.

In summing up the analysis of back pressure and the rela-

temperature at boiler pressure plus the degrees superheat indicated by the pyrometer. In either case the error is negligible. From the data shown on Fig. 6 and previous charts, such calculations may be made.

Applying this method of calculation, the amount of steam per minute, per exhaust and per drawbar horsepower-hour shown in Table I and in Figs. 6 and 7 have been obtained. The water or steam per drawbar horsepower hour is well

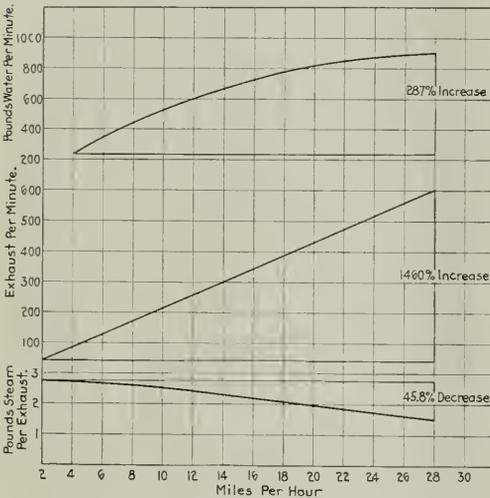

Fig. 7—Total Rate of Steam Discharge Per Minute. Cut-Off Changed at Speeds as Shown on Fig. 2

tion of back pressure to the several features of locomotive operation it would seem that operating an engine to constant back pressure should regulate the cutoff to sustain the maximum drawbar pull at all speeds and consequently develop the maximum drawbar horse power at each speed; and that in developing the maximum drawbar horse power at each speed the required number of pounds of water per drawbar horse power would be supplied, the draft and superheat being so regulated that the boiler would maintain adequate working pressure.

With the pressure, volume, and temperature of the steam used in a given time known, it is possible to calculate the weight of steam used within practical limits of accuracy, which is sufficient for comparing the steam consumption per unit of work at one speed with that at another. From the indicator card the volume of the steam and the average pressure at the point of cutoff can be obtained. The temperature of the steam may be that shown by the pyrometer, which will give the degrees superheat over the saturated temperature at the cutoff pressure, or the total superheat over the saturated temperature at cutoff may be assumed as that of the saturated

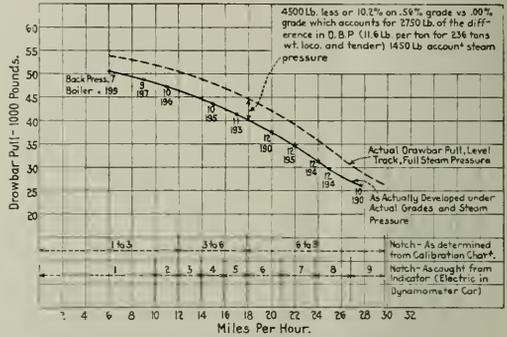

Fig. 8—Maximum Drawbar Pull Compared with That Developed by Regulating Cut-Off to Maintain Constant Back Pressure

within the limits of economical performance and at the maximum is within the limit of economical combustion.

The ability of the engine to maintain steam pressure when operated at 10 to 12 lb. back pressure and the extent to which the maximum drawbar pull will be developed at each speed is shown in Fig. 8. In the operation of the reverse lever to hold the back pressure constant, accelerating a maximum tonnage train from 3 to 28 miles an hour on grades of —13

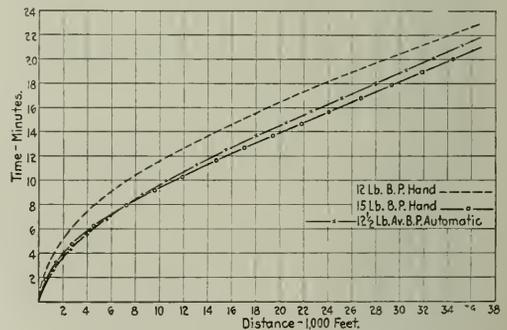

Fig. 9—Time Distance Curves for Runs Under Varying Conditions of Back Pressure

per cent to +.629 per cent, the cutoff was changed 14 times in 7 min. 23 sec. and in a distance of 2.4 miles.

The practical application of the back pressure method of cutoff control so far as the manual operation of the reverse lever is concerned, presents a serious problem because too much of the engineer's time would be required to properly manipulate the reverse lever. To overcome the disadvantage of manual operation of the reverse lever the back pressure principle has been applied to a system of valves which, actuated by back pressure and synchronized with the throttle, automatically operates a power reverse gear to adjust the cutoff and thereby relieve the engineer.

Automatic operation of the reverse lever possesses mechanical, economical and capacity increasing advantages, and it is also on the side of safety. Mechanically the advantages are independence of valve setting, reach rod length or fineness of the quadrant notches, and the elimination of mechanical appliances for the indication of speed, making the adjustment independent of conditions of wear, which would tend toward the inaccuracy of a mechanical speed actuated device. Economical advantages are the operation of the unit to the maximum economical capacity as to hauling light trains or heavy trains at the speeds consistent with the loading, and uniform and synchronous operation with respect to steam

finer cutoff than the engine will practically operate under at high speeds cannot be obtained. The circular quadrant permits the reverse lever to follow the gear and indicates the cutoff and also serves as a quadrant for the reverse lever when under hand control. A control valve is connected to the throttle so that the engine is placed in automatic cutoff and the reverse lever cannot be manipulated by hand when a full throttle is used. At any predetermined speed the throttle may be manipulated to restore hand control and with a small throttle opening, such as used in the movement of the engine alone or the engine and a few cars, the reverse lever may be manually operated.

Three comparative tests to determine the advantages of automatic operation were conducted under constant conditions of train loading, grade and direction. In the first test, the reverse lever was operated by hand to hold 12 lb. back pressure and the time to cover a given distance, while accelerating the train from a stand, was recorded. The second test was the same except that 15 lb. back pressure was to be maintained. The conditions of the third test were the same except that the reverse lever was automatically operated to maintain 12½ lb. back pressure. All tests started from the same point and a full throttle was required. The train consisted of 55 loaded cars of 3,479 tons actual weight.

Fig. 9 is the time-distance chart of these runs, which shows that six miles was covered in 20.9 min. in the first

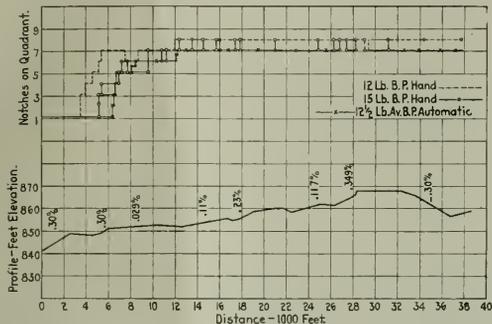

Fig. 10—Profile and Reverse Lever Positions for Runs Shown in Fig. 9

generation and consumption, draft, cutoff, superheat, and drawbar pull. From the standpoint of safety, the advantages are—relief for the engineman from a time absorbing duty, permitting concentration upon such other operating duties as the water, sand, throttle and signals.

The automatic device for the adjustment of cutoff consists essentially of three parts. Two differential valves set

30	146.0	31.6	4920	5.5	895	5.5	863	5.5	863	5.5

test, in 18.5 min. in the second test and in 19.3 min. in the third test.

Fig. 10 shows the rate at which the cutoff was changed and the nature of the grades negotiated. In the first 10,000 ft. seven adjustments were made in 11.4 min., or one every 1.6 min., in the first test; six adjustments were made in 9.0 min., or one every 1.5 min., in the second test, and in the third test six adjustments were made in 9.4 min., or one every 1.56 min.

Some time had elapsed between the first and third tests and as a result, the condition of the fire in the test of the automatic device was not as conducive to good steam pressure as in the two previous tests. Since this condition, however, is to be expected no steps were taken to better it. Fig. 11 shows the steam pressure conditions under which the three tests were run and explains why the automatic device held the engine in the corner longer than was required in the first two tests and did not hook back to the same short cutoff that was obtained in the other tests. It is remarkable, how-

one pound apart are provided, one for shortening the cutoff when the back pressure increases, and the other for lengthening the cutoff when the back pressure decreases. Both valves are connected to the four exhaust passages of the cylinder saddles and to the air supply for the power reverse gear. A circular quadrant and cutout valve are so arranged that a

ever, that in spite of the lower steam pressure the performance practically equalled the first two tests.

The modern locomotive with all the capacity and economy producing specialties and features of design may be divided into two parts by a line extending horizontally under the fire box and through the valve, from tender end sill to pilot beam. Above this line there is every development to produce steam economically and in quantity. Below this line there is every development to utilize the steam and the potential capacity of the entire machine in the production of drawbar pull and gross ton miles—the ultimate justification for the investment. The extent to which the ultimate return in capacity and economy is realized depends upon the element of personal skill of the engineer.

The function of cutoff adjustment is the accurate and constant transfer of energy and the extent to which accuracy and constancy are obtained is the measure by which net return is realized.

## Freight Car Loading

WASHINGTON, D. C.

**F**REIGHT CAR LOADING during the week ended on June 11 was the heaviest reported this year, according to the weekly report of the Car Service Division of the American Railway Association, a total of 788,997, as compared with 930,976 in 1920 and 807,205 in 1919. This represents a gain of 1,760 as compared with the week before the May 30 holiday, although it is still behind the figures for 1919. For the week ending June 4 the loading was only 706,508 cars, as compared with 828,907 in 1920 and 776,610 in 1919, but the reduction is attributed to the holiday.

The freight car surplus for the week of June 15 showed a further reduction of 7,780 to 381,746 cars, of which 143,935 were box cars and 159,448 were coal cars.

The summary for the week of June 4 and the summary for the following week are given below.

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Summary—All Districts; Comparison of Totals This Year Last Year, Two Years Ago, for Week Ended Saturday, June 4, 1921

**THIRTY CENTS FOR A POTATO** is the gravamen of a complaint made against a Canadian dining car by Hon. John Oliver, Premier of British Columbia, recently; and, says the minister, the farmers are selling them at 35 cents a sack. Mr. Oliver made this complaint, however, to a reporter, not to the railroad; and he turned at once to more serious matters. He says that this is going to be one of the best and one of the worst years for the farmer.

Canada never gave such a promise of good crops as this year. "There'll be splendid crops, bar accidents. But prices! Well, I don't know what the farmer is going to do this year. A farmer in Ontario told me that he was getting only \$7 a can for his cream. It dropped from \$22 to \$7 in six weeks. It looks as if this is going to be a year of difficulty for the farmer in spite of potatoes at 30 cents apiece on the trains."

# Co-ordinating Motor Trucks With Railroads\*

## Opportunities for Highway Transportation to Develop New Traffic Instead of Merely Competing with Existing Lines

By Stuart B. Moore

Formerly Construction Engineer, Southern Pacific Lines—Atlantic System

I ASSUME it is generally admitted that traffic should move by the most economical route and that in considering the cost of motor truck ton-miles all items of cost should enter into the motor truck ton-miles. The layman is prone to figure the cost of motor truck service as the cost of wages, fuel and maintenance of equipment, plus a profit for the concern operating the truck line. If the proper charge were added for the damage that the motor truck does to the highway, plus an interest charge on the property investment, the cost of motor truck service would immediately become prohibitive. However, I want to make clear that this argument is not intended to discourage motor transport but on the contrary it is hoped that a way can be pointed out that will greatly extend the use of motor driven vehicles as an aid to our railroads instead of a competitor.

### Motor Transport Now Unregulated

Motor transport as it exists today is totally unregulated from an operating standpoint. There is no prohibition against anybody running a motor truck of any weight, anywhere, regardless of danger to the roads when considered as a structure being able to stand this loading. It is a matter of common knowledge both to the lay and professional minds of the country that the loading of our motor transport is greatly in excess of the strength of our roads, yet no one does anything about it and the evil grows unchecked.

The main highways of today were originally located adjacent to the lines of railroad when the country was sparsely settled and without any view to bringing traffic to the railroads. It is on these highways that we are spending a very large proportion of the road funds today. The function of motor transport is to feed the railroads and not to compete with them and as this is quite generally acknowledged why should we spend most of our road funds on parallel highways and almost totally exclude tributary highways?

The economic theory of railroad and highway location demands that main highways that are built to carry heavy motor traffic should be across the main lines of railroads and should not parallel individual lines of railroads as is now too frequently the case. If the present policy of subsidizing parallel lines of highways whose only service is to compete with the railroads, instead of highways that radiate from transportation centers is continued this policy will certainly result in crippling of our transportation system. It is true that the railroads are here and cannot be removed but it is also true that good service is required, that terminal improvements are urgent and that new and additional equipment is essential if our transportation machine is to function properly. These things are essential and require money, and lots of it, and with the operating ratio of many of our best and most efficient carriers close to 100 per cent the chance of the public through the carriers obtaining these things is not good to say the least.

### How Highways Can Best Serve the Public

It is, however, possible for the highways of this country to be located so as not only to serve the people to a much better advantage but also to assist the railroads to get ade-

quate returns as well as to stimulate very greatly motor transport.

Assuming that a transportation center—and any thriving town surrounded by a farming community or in which industries are located may be considered as such—had a system of good roads radiating from it so that the back areas were as available to the benefits of the city as the locations closer in, it would be possible for motor transport to be developed so that freight could be collected at either the farm or the factory and the bill of lading issued at once by the concern handling the motor transport. The merchandise thus collected could be delivered to the railroad which would haul it to its destination and would in turn be delivered to the motor transport company that would operate in the section to which the freight was destined and would be delivered to its final destination after having been handled throughout by the utmost economy and dispatch.

I of course do not mean to suggest that highways between large centers be not maintained to a high degree of excellence but I do affirm that it is unnecessary to construct these highways so that gasoline locomotives can be operated over them and that the major portion of the road funds available be consumed in their construction and maintenance to the detriment of the tributary territory.

To one familiar with the transportation business many things are obvious. The roads would have to be designed to carry a pre-determined load; and having been built in accordance with this design the load that the structure was designed for could not be exceeded without promptly destroying the structure. Heavy loads could of course be moved over the highways, but the manner in which these loads could be moved would first have to be regulated by the central authority in the district charged with this function of highway administration. If the railroads attempted to run their heavy locomotives indiscriminately over their branch and main lines they would be out of service the first day that such a policy was attempted.

Some definite policy of maintenance would of course have to be insisted upon and the roads of the district should preferably be of a common standard design so as to simplify the maintenance to as great a degree as possible.

The co-operation of the manufacturers of motor truck companies could be secured so that they would refuse to sell in a community a truck that was heavier than the roads in that particular district would carry.

The question as to who would administer a given district in such a manner naturally comes next. The talent to do so is found only in the railroad service and beyond any question the carriers would have to establish a department to co-operate with the local public officials; this department of the railroad functioning under the direction of some public body which would have the power of enforcing or annulling the carriers' suggestions for the handling of the traffic of the district.

The Federal Highway Council of Washington, D. C., has decided that "The encouragement of highway transportation beyond highway development is dangerous. It will discourage the use of motor trucks. Highway transportation will follow highway development but it cannot lead." As this is a strictly true statement and as it can be shown that an

\*From a statement given to the Senate Committee on Interstate Commerce.

adequate system of rural roads of present types that are suitable to stand even light motor trucks is impossible on account of the cost being in excess of what the more sparsely settled communities can bear, a discussion of this sort would be visionary in the extreme if a design for a road that would fulfill the above requirements were not submitted to support the preceding analysis of our motor-transport-railroad situation.

When we come to consider hard surfaced roads we must discard all but one type for general use on our country roads outside of thickly settled communities on account of their cost. This is the surface treated road or as the laymen frequently miscall them, Tarvia roads. In considering this type we are immediately confronted with the fact that the life of this road is but a year and were we to pause here we should be forced to also discard this type on account of its high annual cost.

A careful investigation of this type of road reveals that the reason for the early failure of these roads is that traffic develops a well defined path which is in reality a slight rut and as almost the entire wear occurs in this rut, in the course of a year's time small holes wear through the thin asphaltic surface and as a consequence water is thus admitted to the subgrade. These wet places become soft places and the soft places under traffic quickly become low places and the low places produce impact and the entire rut is then quickly pounded to pieces and unless prompt and extensive repairs are made the road is destroyed.

As this type of road fails because the rut is not only the weak spot, but the very weak spot, a type of roadway has been developed that takes advantage of the psychology of the situation and recognizes the human tendency to follow a rut and furnishes the rut for traffic to follow and places a foundation under the rut so that the rut instead of being the very weak spot becomes the very strong point in the road. The rut (reinforced tracks sunk below the surface) is of course not made deep enough to interfere with a car turning out to meet or pass another car. On roads that have a heavy traffic in both directions the highway should be double tracked.

This road is not a visionary project by any means as it has been approved by the Bureau of Standards in Washington, the Federal Highway Council, spoken of favorably by the Bureau of Public Roads, and Julius Kruttschnitt, chairman of the board of the Southern Pacific Railroad, has gone into the matter and expressed a favorable opinion of the design and his interest in the initial installations.

## International Equipment Association Proposed

WASHINGTON, D. C.

**E**STABLISHMENT of an international railroad equipment association to finance the sale of equipment to railroads has been put forward by the American Committee on Land Transportation for consideration at the first annual meeting of the International Chamber of Commerce in London during the week of June 27. This proposal has been made to Walker D. Hines, formerly head of the United States Railroad Administration, who as chairman of the International Chamber railroad group asked for suggestions from the American committee in the formation of the program for the London conference.

The committee believes that the organization of an equipment pool would be an important step toward relieving a critical situation, which is one of the underlying causes impeding the restoration of the world's commerce. In its report to Mr. Hines, who has been in Europe for the past year, the committee says that "in view of the shortage of capital in

foreign countries it is probable that the additions and betterments of the physical railroad properties and the necessity for increased equipment cannot be locally financed for some time. We suggest that negotiations be entered into with a view to bringing American bankers and the fiscal heads of the nations interested together for the purpose of organizing an International Equipment Association. It would be the purpose of this association to furnish funds for equipment required, to the extent of perhaps 75 per cent of its value, with notes guaranteed by the government of the country concerned in the transaction; an initial payment of 25 per cent to be made by the purchaser."

At the same time, the American committee proposed to Mr. Hines "that it might also be desirable to organize a railroad construction and development association financed in America upon lines similar to those suggested for the equipment association. It would be the purpose of such association to undertake any needed extensions and development of railroad lines in foreign countries."

The committee's report gave considerable attention to the removal or simplification of frontier restrictions which delay either rail or water transport. "It is suggested by this committee," the report says, "that consideration be given to prevailing practices in the United States as related to international commerce between Canada and the United States, between Mexico and the United States, and between Mexico and Canada via the United States, under which system of documentation the local regulations of Canada, Mexico, Cuba and the United States as subordinated to well-defined regulations applying purely on through traffic, as under this system the delay at frontiers is minimized.

"The necessary, international shipments are carried forward under bond, the settlement being made at the established ports of entry in the several countries. Under this plan, the delay at the frontier is only that which is necessary for the proper protection of the customs revenue of the respective government."

The committee recommended the consideration of the possibility of creating at each port a port terminal zone under one authority whereby freight interchanged between the rail lines and the vessels shall be under a joint supervision and interchange of documents which will protect equally both the rail lines and the water carriers.

Another general topic of substantial importance considered by the American committee was that of international bills of lading. In answer to the question "is there any form of international bill of lading which at present is regarded as a standard and which ought to be put forward for endorsement by the London Congress?" the committee says: "The United States bill of lading is applicable on traffic between the United States, Canada and Mexico, and it is susceptible of adaptation to all international traffic. It is considered highly essential that such form of international bill of lading shall be put into effect."

The committee strongly recommended the use of an international uniform railroad gage as an important step toward improving railroad transportation between the various countries.

**THE LOSS AND DAMAGE** claim prevention committee of the Middle Division of the Pennsylvania Railroad has been making a "drive" against poor stowing and rough handling and to abolish the waste of money due to carelessness. Members of the committee are much pleased with the way the men have responded to their solicitation for help. William Elmer, superintendent of the Middle division, addressed the Kiwanis and Rotary clubs at their luncheons in Altoona recently in connection with the drive. He stressed the important part that the shippers have to play in the reduction of claims.

# New Classification of Railway Employees Ordered

## Labor Board Divides Workers Into 148 Reporting Divisions and 500 Occupational Classes

**N**EW RULES for the classification of railway employees and for reports as to their number and compensation have recently been issued by the United States Railroad Labor Board and approved by the Interstate Commerce Commission. The revised classification becomes effective on July 1. Reports to the Interstate Commerce Commission and to the Labor Board will be made under this classification thereafter. The new rules and classification are contained in a volume entitled, "Rules for Reporting Information on Railroad Employees Together with a Classification and Index of Steam Railroad Occupations," issued to the carriers by the Labor Board.

The introductory statement in this volume describes very clearly the inadequacy of the present reporting plan, and after outlining the difficulties encountered by various wage commissions and arbitration boards in collecting data upon which to base their decisions, the statement says: "In deciding questions at issue, the Labor Board was seriously handicapped because of the absence of wage data relating to homogeneous groups of occupations and classified according to the special working conditions found in railway operation. It seemed evident that steps would have to be taken by the United States Railroad Labor Board to secure current and properly classified data if it were correctly to perform its functions according to the provisions of the law.

The classification used for reporting the number of employees and their compensation is based largely upon a plan submitted to the Interstate Commerce Commission by the Railroad Administration during federal control. This classification was not adopted but it was submitted by the Commission to representatives of the railroads and the employees.

### Purpose of the Occupational Classification

In outlining the purposes and value of the occupational classification of railroad positions the Labor Board's statement says in part:

The purpose of the occupational classification of railroad positions is to furnish a basis for the collection of wage and other data on homogeneous classes of railroad positions, to establish as nearly as can be a uniform terminology to be used in describing similar occupations, and to describe classes of positions so that all railroads may have the same general understanding of the kinds of positions that are to be included in any class.

The occupational classification is in no way and under no circumstances to be interpreted by the Board, by the Interstate Commerce Commission, by the railroads or by other interested parties, as setting up jurisdictional lines for occupations, or as limiting the kinds of work which employees may perform or the duties which they may assume. In preparing the occupational classification, the Board has not aimed to standardize for the railroads the occupational duties assigned to, or the kinds of work performed by their employees, and nothing in the classification nor in the report forms is to be construed in this light. Its purpose is solely so to group positions that the wage and other data reported to the Interstate Commerce Commission and to the Board may be used for administrative and public purposes. It specifically provides against grouping together occupations of widely different duties and responsibilities, as well as rates of compensation. By adhering to the classification and the groupings provided for in the reporting forms, wage data will be more than indiscriminate totals and the averages computed therefrom will be valuable for administrative and public purposes.

Reference to the occupational classification in making the reports to the Interstate Commerce Commission and the Board will facilitate the placement of positions and uniform segregation of wage and other employment data. The value of uniformity and definiteness in classification is particularly clear in the analysis of data on railroad positions which are well defined. In obtaining data on wages and other employment conditions for such

positions as those in the train and engine service, where the terminology and language used are fairly uniform on the different railroads, definite and comparable information can be furnished by the railroads and with the least possible danger of misunderstanding.

With respect to other services it is difficult, under present conditions, for the Board to make clear the exact information desired and for the carriers to furnish classified data suitable for analysis. Positions such as those in the clerical and office administrative service are good examples. There is no classification or uniform language at present in use as to clerical positions and there is little or no distinction between positions of varying importance and responsibility. It is therefore difficult to obtain comparable wage data and other information necessary to the Board in rendering decisions or in interpreting and applying such decisions by the interested parties. The use of standard nomenclature based on duties will also enable the Board to make comparisons with similar occupations outside of the railroad service and to detect inequalities between positions on the railroads and in outside organizations.

In order to simplify the reporting divisions and at the same time to secure reports suitable to the Interstate Commerce Commission and to the Board, the distinctive classes in the occupational classification have been re-grouped into 148 reporting divisions. The reporting divisions have been arranged according to established broad departmental lines and data relating to them, based as they are upon a comprehensive grouping of positions, will meet the general requirements of both the Commission and the Board, thereby reducing the amount of labor necessary in preparing any special reports which either body may deem necessary.

### Description of the Occupational Classification

A description of the occupational classification follows:

The basis and general plan of the occupational classification conform to the recognized lines and the best practice which have been followed by industrial and governmental organizations in the development of employment classifications for their services, the entire plan being based upon the principle that duties and responsibilities must control in any orderly arrangement and classification of positions.

The occupational classification may be described as a functional grouping of positions, the aim being to set up unit classes which group together positions of essentially similar nature having due regard to the duties and responsibilities which they require or imply.

All railroad positions are separated into main divisions which, for convenience, are called *services*. These are the broadest divisions of positions and are determined irrespective of departmental lines. Such a grouping of services admits of a bird's-eye view of the entire range of railroad positions.

The services are sub-divided into *groups* of related positions covering work which is generally performed in the same profession, vocation or trade, or in a particular kind of railroad work.

Wherever there are wide and clearly discernible differences in the importance, difficulty and responsibility of the work performed, the groups are further sub-divided into *grades* which consist of one or more *distinctive classes* of positions. These classes are the smallest units provided for in the classification and are made up of positions carrying essentially similar duties and responsibilities. Each class is given a distinct title and described so far as is necessary to indicate the kinds of positions which fall under such distinctive class.

Under each of the respective services, groups and grades there is set out general descriptive statements of the duties and responsibilities of the services and groups and of the distinctive classes of positions. These descriptions are set out solely as distinguishing particular kinds of work, so as to provide for essentially homogenous classes of occupations.

The various positions found in the steam railroad service are grouped in the occupational classification under seventeen (17) major services; these services having been set up according to the general railroad functions as well as the special and peculiar requirements in railroad organizations. The services are sub-divided into 119 groups. Within the groups are the separate grades and distinctive class titles, each of which has a description of duties generally performed and illustrative examples.

Outside of the executive, official and staff assistant service, which is ungraded and unclassified and in which examples of posi-

tions are shown separately under appropriate groups but not distinguished as to importance and responsibilities of work performed, there are 500 distinctive classes which are distributed under the other sixteen (16) services as follows:

Service	Number of Distinctive Classes
Attendance service	26
Clerical and office administrative service	27
Dining car, restaurant and kitchen service	19
Engine and equipment operation service	37
Floating equipment service	31
Inspectional service	34
Investigational and instructional service	10
Labor service	50
Police service	6
Professional service	23
Skilled trades service	103
Sub-professional service	7
Supervisory skilled trades and labor service	43
Traffic service	10
Train and engine service	29
Train dispatching, telegraph and station agent service	20
<b>Total number of distinctive classes</b>	<b>500</b>

The occupational classification with the alphabetical finding list should be used as a basis in distributing occupations in the reports which are to be made to the Interstate Commerce Commission and to the Board. This does not mean that the railroads are re-

- 22 Patrolmen.
- 23 Watchmen (without police authority).
- 24 Supervising traffic agents.
- 25 Traffic agents, advertising and development agents.
- 26 Fire prevention, smoke and time service inspectors and office building superintendents.
- 27 Claim agents and claim investigators.
- 28 Real estate and tax agents and investigators.
- 29 Examiners, instructors and special investigators.
- 30 Miscellaneous trades workers (other than plumbers).
- 31 Motor vehicle and motor car operators.
- 32 Teamsters and stablemen.
- 33 Janitors and cleaners.
- Total (professional, clerical and general).

III—MAINTENANCE OF WAY AND STRUCTURES

- 34 Road masters and general foremen (M. of W. & S.).
- 35 Assistant general foremen (M. of W. & S.).
- 36 Supervising maintenance of way and scale inspectors.
- 37 Maintenance of way inspectors.
- 38 Bridge and building gang foremen (skilled labor, M. of W. & S.).
- 39 Bridge and building carpenters.
- 40 Bridge and building iron workers.
- 41 Bridge and building painters.
- 42 Masons, bricklayers, plasterers and plumbers.
- 43 Skilled trades helpers (M. of W. & S.).
- 44 Regular apprentices (M. of W. & S.).
- 45 Portable steam equipment operators (M. of W. & S.).
- 46 Portable steam equipment operator helpers (M. of W. & S.).
- 47 Pumping equipment operators (M. of W. & S.).
- 48 Gang foremen (extra gang and work train laborers).
- 49 Gang foremen (bridge and building, signal and telegraph laborers).

FORM "A"

Month of.....192...		Service-hours (or days)										Compensation		Railroad
Division number	Reporting division	Number of employees, middle of month	Number of full time positions	Straight time actually worked	Overtime paid for at pro rata rates	Overtime paid for at punitive rates	Time paid for but not worked	Total time paid for	Straight time paid for	Overtime paid for at pro rata rates	Overtime paid for at punitive rates	Time paid for but not worked	Total	Division number

Forms for Reporting Information on Railroad Employees

quired in making up the regular reports to the Interstate Commerce Commission and to the Board to observe all of the separate class distinctions provided for in the classification, but they are required to follow the definitions and make the distinctions which apply to the divisions of occupations upon which they report. It is hoped, however, that the classification in its detailed form will prove of such value to the railroads in viewing their employment problems as a whole that they will, of their own free will, install it as a basis for employment administration, and reap the advantages which would accrue therefrom.

The classes into which the railway employees have been divided for the purpose of reporting their number and compensation are as follows:

I—EXECUTIVES, OFFICIALS AND STAFF ASSISTANTS

- 1 Executives, general officers and assistants.
- 2 Division officers, assistants and staff assistants.
- Total (executives, officials and staff assistants).
- II—PROFESSIONAL, CLERICAL AND GENERAL
- 3 Architectural, chemical and engineering assistants (a).
- 4 Architectural, chemical and engineering assistants (b).
- 5 Sub-professional engineering and laboratory assistants.
- 6 Professional and sub-professional legal assistants.
- 7 Supervisory or chief clerks (major departments).
- 8 Chief clerks (minor departments) and assistant chief clerks and supervising cashiers.
- 9 Clerks and clerical specialists (a).
- 10 Clerks (b).
- 11 Clerks (c).
- 12 Mechanical device operators (office).
- 13 Stenographers and secretaries (a).
- 14 Stenographers and typists (b).
- 15 Storekeepers, sales agents and buyers.
- 16 Ticket agents and assistant ticket agents.
- 17 Traveling auditors or accountants.
- 18 Telephone switchboard operators and office assistants.
- 19 Messengers and office boys.
- 20 Elevator operators and other office attendants.
- 21 Lieutenants and sergeants of police.

- 50 Gang or section foremen.
- 51 Laborers (extra gang and work train).
- 52 Track and roadway section laborers.
- 53 Maintenance of way laborers (other than track and roadway) and gardeners and farmers.
- 54 General foremen and supervising inspectors (signal, telegraph and electrical transmission).
- 55 Assistant general foremen (signal, telegraph and electrical transmission) and signal and telegraph inspectors).
- 56 Gang foremen (signal and telegraph skilled trades labor).
- 57 Signalmen and signal maintainers.
- 58 Linemen and groundmen.
- 59 Assistant signalmen and assistant signal maintainers.
- 60 Signalman and signal maintainer helpers.
- Total (maintenance of way and structures).

IV—MAINTENANCE OF EQUIPMENT AND STORES

- 61 General foremen (M. E.).
- 62 Assistant general foremen and department foremen (M. E.).
- 63 General foremen (stores).
- 64 Assistant general foremen (stores).
- 65 Equipment, shop and electrical inspectors (M. E.).
- 66 Material and supplies inspectors.
- 67 Gang foremen and gang leaders (skilled labor).
- 68 Blacksmiths.
- 69 Boilermakers.
- 70 Carmen (A).
- 71 Carmen (B).
- 72 Carmen (C).
- 73 Carmen (D).
- 74 Electrical workers (A).
- 75 Electrical workers (B).
- 76 Electrical workers (C).
- 77 Machinists.
- 78 Molders.
- 79 Sheet metal workers.
- 80 Skilled trades helpers (M. E. & Stores).
- 81 Helper apprentices (M. E. & Stores).
- 82 Regular apprentices (M. E. & Stores).
- 83 Gang foremen laborers (shops, engine houses, power houses, power plants and stores).
- 84 Coach cleaners.
- 85 Laborers (shop, engine houses and power plants and stores).
- 86 Common laborers (shops, engine houses, power plants and stores).
- 87 Stationary engineers (steam).

- 88 Stationary firemen and cilers (steam and electrical plants).  
 89 Coal passers and water tenders (steam station boiler rooms).  
 90 Total (maintenance of equipment and stores).
- V.—TRANSPORTATION (OTHER THAN TRAIN, ENGINE AND YARD)
- 91 Chief train dispatchers, train dispatchers and train directors.  
 92 Station agents (supervisory)—major stations—non-telegraphers).  
 93 Station agents (supervisory)—smaller stations—non-telegraphers).  
 94 Station agents (non-supervisory)—smaller stations—non-telegraphers).  
 95 Station agents (telegraphers and telephoners).  
 96 Chief telegraphers and telephoners or wire chiefs.  
 97 Clerk—telegraphers and clerk—telephoners.  
 98 Telegraphers, telephoners and towermen.  
 99 Station masters and assistants.  
 100 Supervising baggage agents.  
 101 Baggage agents and assistants.  
 102 Baggage, parcel room and station attendants.  
 103 (general foremen (freight stations, warehouses, grain elevators and docks).  
 104 Assistant general foremen (freight stations, warehouses, grain elevators and docks).  
 105 Gang foremen (freight station, warehouse, grain elevator and dock labor).  
 106 Callers, loaders, sealers and perishable freight inspectors.  
 107 Truckers and laborers, (stations, warehouses and platforms).  
 108 Laborers (coal and ore docks and grain elevators).  
 109 Common laborers (grain elevators).  
 110 Stewards, restaurant and lodging house managers and dining car supervisors.  
 111 Chefs and first cooks (dining cars and restaurants).  
 112 Second and third cooks (dining cars and restaurants).  
 113 Waiters and lodging house attendants.  
 114 Camp and crew cooks and kitchen helpers.  
 115 Barge, lighter and gasoline launch officers and workers.  
 116 Deck officers (ferry boats and towing vessels).  
 117 Engine room officers (ferry boats and towing vessels).  
 118 Deck and engine room workers (ferry boat and towing vessels).  
 119 Deck and engine room officers and workers (steamers).  
 120 Floating equipment shore workers and attendants.  
 121 Transportation and dining service inspectors.  
 122 Parlor and sleeping car conductors.  
 123 Train attendants.  
 124 Bridge operators and helpers.  
 125 Crossing and bridge flagmen and gatemen.  
 126 Foremen (laundry) and laundry workers.  
 127 Total (transportation—other than train and engine).
- VI.—TRANSPORTATION—(YARD MASTERS, SWITCH TENDERS AND HOSTLERS)
- 128 Yard masters and assistants.  
 129 Switch tenders.  
 130 Outside hostlers.  
 131 Inside hostlers.  
 132 Outside hostler helpers.  
 133 Total transportation—(yard masters, switch tenders and hostlers).
- VII.—TRANSPORTATION—(TRAIN AND ENGINE SERVICE)
- 134 Road passenger conductors.  
 135 Assistant road passenger conductors and ticket collectors.  
 136 Road freight conductors (through freight).  
 137 Road freight conductors (local and way freight).  
 138 Road passenger baggage men.  
 139 Road passenger brakemen and flagmen.  
 140 Road freight brakemen and flagmen (through freight).  
 141 Road freight brakemen and flagmen (local and way freight).  
 142 Road conductors and yard foremen.  
 143 Road brakemen and yard helpers.  
 144 Road passenger engineers and motormen.  
 145 Road freight engineers and motormen (through freight).  
 146 Road freight engineers and motormen (local and way freight).  
 147 Road passenger firemen and helpers (through freight).  
 148 Road freight firemen and helpers (local and way freight).  
 149 Road firemen and helpers.  
 150 Total (transportation—train and engine).

The forms on which data regarding these various classes of railway employees are to be reported to the Interstate Commerce Commission and to the Labor Board are shown in the accompanying illustrations.

Form A is to be used for the following groups:

1. Executives, officials and staff assistants.
2. Professional, clerical and general.
3. Maintenance of way and structures.
4. Maintenance of equipment and stores.
5. Transportation (other than train, engine and yard).
6. (a) Transportation (yardmasters, switch tenders and hostlers).

Form B is to be used for reports regarding employees in group 6b—Transportation (train and engine service).

SAFETY MATCHES often prove inconvenient to anyone using them, because of their fragile character, being too short and easily extinguished; and the Railway Fire Protection Association has received complaints from trainmen and lampmen that they have trouble with such matches in lighting lanterns and switch lights. The president of the association has conferred with other superintendents and has found no complaint; but, at all events, he holds that none but approved safety matches should be used on railroads.

## Hearing on Pennsylvania

### Locomotive Repairs

WASHINGTON, D. C.

ORAL ARGUMENTS before the Interstate Commerce Commission at Washington on June 20, on the question whether the Pennsylvania caused 200 of its locomotives to be repaired at the shops of the Baldwin Locomotive Works in 1920 in disregard of efficient and economical management, resulted in a complicated statistical controversy as to whether the Pennsylvania showed wise management in making this contract instead of repairing the locomotives at its own shops. However, it remained for members of the commission to bring out by questions why so little had been put into the record at the previous hearings before an examiner bearing on the charges made by the International Association of Machinists that the repair contract was made for ulterior purposes to transfer money from the Pennsylvania Railroad, to be collected from the United States Government in the form of a guaranty, and into the treasury of an outside company for the profit of the banking combine said to control the railroads. The commissioners' questions on this point merely brought out that it was simpler to make such charges than it was to attempt to prove them and the commission was left to assume the evidence of a gigantic conspiracy which has been used so extensively as publicity material.

In reply to questions by Commissioner Lewis, R. B. Gregg, who appeared as attorney for the machinists' union, said that his organization would have objected to the contract even if the Pennsylvania had paid no more than the cost in its own shops, on the ground that it caused unemployment among the railroad shop men, although it had developed that the laying off of large numbers of Pennsylvania shop men had not taken place until several months after the letting of the contract and after business had begun to fall off in the latter part of the year.

Attorney List, who had represented the commission in the hearings and investigation, devoted himself largely to arguing that the Pennsylvania had paid \$3,173,000 or over \$16,000 per locomotive more than it would have cost to do the same work in its own shops, and that there was no justification for placing the outside contract because he argued that the Pennsylvania had sufficient shop capacity to handle the work itself, and its locomotive condition was better than it had been the year before. He went into a detailed analysis of the Pennsylvania shop statistics to prove his point and asserted that after the making of the contract with the Baldwin Company the Pennsylvania had laid off 10,000 men from its locomotive repair forces. He said that J. T. Wallis, superintendent of motive power of the Pennsylvania, had previously reported to the Railroad Administration, shortly before the termination of federal control, that it was unnecessary to send any of the Pennsylvania locomotives to shops of other railroads for repairs, yet the contract was entered into shortly after the road was returned and some of the engines were sent to Baldwin before the contract had been approved by the Pennsylvania directors. He also disputed some of the testimony of the Pennsylvania witnesses until Commissioner Potter asked him whether he had taken a partisan attitude in conducting the investigation. Mr. List insisted that he had not done so, but admitted that perhaps his experience of 12 or 14 years in the work of prosecution for the commission had led him to adopt a similar attitude in dealing with "somewhat evasive witnesses."

### Necessary to Meet Demands of Shippers

Henry Wolfe Bikle, counsel for the Pennsylvania, admitted that the comparison of costs used was fairly accurate, but defended the action of sending the locomotives to an outside

shop for repairs on the ground that it was absolutely necessary to prepare the locomotives to meet the demands of the shippers for service and that while the cost was large, each locomotive that was put in condition for service was able to earn much more than the cost. Therefore the contract, he said, was not extravagance, but resulted in a real economy. He said the list of shop employees laid off had been put into the record at the request of attorneys for the machinists' union and had been given in complete detail, but had not thereafter been used, and he read from the statement to show that while a few hundred men engaged in running repair work had been laid off during July, August, September and October, 1920, these were not men engaged in making classified repairs, while most of the 10,000 men were laid off in November, December and January. In January, 5,300 men were laid off. Mr. Bikle said the commission would recall that in 1920 the shippers were demanding better service and were even asking the commission to increase freight rates to help the roads give better service and that the company was not able even with the assistance given by the Baldwin company in repairing these locomotives to meet all of the demands for service. He also pointed out that the six months' guaranty provided by the Transportation Act did not provide any immediate cash payment to the railroads and that under its provisions all expenditures of the railroad for maintenance were subject to the scrutiny of the commission, so that the guaranty did not place the burden of any extravagant expenditures upon the government.

He discussed in detail the testimony that had been given at the hearings to show that the Pennsylvania had operated its shops to capacity throughout the entire period that the 200 locomotives were being repaired at the Baldwin plant and that the classified locomotive repair work done at the company's shops in 1920 actually exceeded that done in any previous year. Regarding Mr. Wallis' report to the Railroad Administration, he said that this was made during the latter part of the period of federal control at a time when the Railroad Administration would hardly have had the authority to require the repairs to be made in the shops of other roads when most of the work would have been done at the expense of the corporation. When the roads were returned, he said, the Pennsylvania officers foresaw the heavy traffic that was confronting them at a time when 18 per cent of the Pennsylvania locomotives were in shop or awaiting shop. That was an alarming situation and something had to be done quickly. He pointed out that the comparisons used in criticism of the contract were largely based on 1919 figures for a period when traffic was much lighter than that of 1920 and it was necessary to do a greater amount of shop work to perform locomotive service.

#### Contents Pennsylvania Had Plenty of Shop Capacity

R. B. Gregg, representing the machinists' union, argued that the Pennsylvania had plenty of shop capacity for taking care of all of its own repairs, that it had adequate equipment and an adequate force and that there was nothing in the National Agreement to prevent the operation of the shops for longer hours, although the railroad would have had to pay punitive overtime. In reply to a question by Commissioner Potter as to a statement reflecting on the efficiency of the Pennsylvania management during federal control, Mr. Gregg said his theory was that the management deliberately held down production by delaying the men and withholding material and tools. Commissioner McChord asked why the evidence on that had not been put into the record. Mr. Gregg said that his information was received from employees and he was unwilling to run the risk of having them discharged. Commissioner McChord thought it strange that he had been unable to get one man out of 48,000 to testify and rely on the commission to see that no one was discharged for testifying.

#### Commissioners Ask Some Leading Questions

Mr. Gregg argued that, looking back over the statistical records, it was proved not only that the Pennsylvania could have repaired the 200 locomotives in its own shops in the time that was taken for the work at the Baldwin shops, but that the management should have reasonably anticipated its ability to do so. Commissioner Potter asked if it had been shown that Baldwin made a greater profit on this work than on its other work. Mr. Gregg said there was no information as to the profits on this work. Mr. Potter said that if Mr. Gregg's argument had force it left as the only reason for the action of the Pennsylvania the "conspiracy" regarding which charges had been made and which had been mentioned in Mr. Gregg's brief, but as to which no evidence had been presented. Mr. Gregg said the examiner had excluded evidence as to the entire profits made by the Baldwin Company and that the evidence was limited to the Pennsylvania transaction, whereas the conspiracy was on the part of the groups of bankers in control of the railroads and the equipment companies and was difficult to prove. Mr. Potter asked if the commission was expected to assume the conspiracy. Mr. Gregg said he thought in this case it could. Mr. Potter said that all the evidence went to the question of whether the Pennsylvania had made an improvident contract and gave no light on the question of the ulterior motive. He asked if the Baldwin plant was not very busy at the time and what object it had in taking the Pennsylvania contract unless it got a "fancy" price for it. Mr. Gregg said he did not know how much of the Baldwin work was construction and how much was repair work. Mr. Gregg asserted that men in control of the bankers and the railroads believed it was easier to make money through the equipment companies than through the railroads and that the Pennsylvania management had been particularly hostile to organized labor and that part of the conspiracy was for the purpose of causing unemployment among the railroad shop crafts. Mr. Potter said that nothing had been proven about any ulterior motive or any undue profit to the Baldwin Company. Commissioner McChord then inquired why the evidence regarding the Baldwin profits had been excluded and Attorney List said that the examiner had taken the position that the Baldwin Company was not under investigation. He added that the Baldwin Company had lost money on the first part of its contract, but had later made it up and that if the claim of the Pennsylvania that an emergency existed was true, it made no difference what the Baldwin profit was. Commissioner McChord expressed surprise that this fact had not been shown in the record. Commissioner Potter then asked what witnesses had been presented by the intervenor, the machinists' union, and was told that Mr. Gregg had presented some testimony, but had called Mr. Rea as his witness.

"The company was confronted in March, 1920," Mr. Bikle said, "with a situation of serious moment, serious not only to it, but to the shippers located along its line. It had the choice of pursuing a policy which would have impaired the service which it could furnish the public and which would have reduced its revenues, but which, on the other hand, would have avoided the possibility of unwarranted criticism on the score of supposed unnecessary expenditures. It chose the course which insured, so far as it could, its ability to meet the demands which it foresaw would be made upon it. If, in the making of this choice, there can be found ground for criticism, it is difficult to perceive what decision of managerial policy cannot also be criticised, particularly when it is remembered that the basis of the criticism is that the situation could have been met without adopting the course pursued. In some instances, this perhaps might be regarded a matter of doubt, but in the present instance, considering the actual developments during 1920, after the decision was made, there is, it is submitted, no possible ground on which it can be justly said that the decision was other than a wise one."

## Pullman Fare Hearing

WASHINGTON, D. C.

**A** HEARING on the complaint of the United Order of Commercial Travelers and other similar organizations attacking as unreasonable the increase of 20 per cent in Pullman fares which was made on May 1, 1920, was held before Chief Examiner Quirk of the Interstate Commerce Commission at Washington on June 16. Two hearings in the case were held last fall after which the case was adjourned at the suggestion of the complainants until the figures for a year's operations under the new rates should be available.

J. A. Millener, attorney for the complainants, confined his case at the hearing almost entirely to the reduction in price of half a dozen articles used by the Pullman Company, although he also attempted to make a point of the money the Pullman Company is claiming from the Railroad Administration and of the expected reduction of wages on July 1.

Mr. Millener called as his first witness L. S. Taylor, vice-president of the Pullman Company, and brought out from him that the price of car wheels, which was \$59 in 1920, has now been reduced to \$58; oil boxes from \$13.75 to \$10; brake shoes from \$73 a ton to \$66; plush \$5.22½ a yard, has not changed in price; berth curtain material has been reduced from \$5.97 a yard to \$2.60; and axles from \$4.32 per 100 lb. to \$3.95. Having gained this information, he stopped, but G. S. Fernald, counsel for the Pullman Company, asked the witness regarding the quantities of those materials used and Mr. Taylor said the company uses approximately 20,000 wheels, so that the saving on that item is \$20,000; about 16,000 oil boxes, so that the saving is \$60,000; about 8,000 tons of brake shoes, on which the saving is \$56,000; 90,000 yards of plush, on which there is no reduction; while very little curtain material is now being used because the company is building no new cars.

Mr. Millener then asked if the company had not reduced the wages of the employees in its shops. Mr. Taylor said that a reduction of about 9 per cent on the average had been made on January 1 in the shop of the manufacturing department at Pullman, Ill., which manufactures cars to sell, but is not now building any new Pullman cars and which does no repair work for the Pullman Company except when cars are sent to it to be rebuilt, the ordinary repair work being done at five other shops and in various yards throughout the country in which the wages have not been reduced. Mr. Fernald objected to the introduction of evidence regarding the manufacturing plant on the ground that its costs are not involved in the operating expenses of the car lines, and Examiner Quirk ruled that the questions must be confined to those bearing on the operating accounts. Mr. Millener insisted that the manufacturing plant was part of the company, but Mr. Quirk said that the commission's jurisdiction is confined to the operations of the company as a carrier. Mr. Taylor was asked to file a statement showing the amount of the reduction in wages for a year, but said this would be impracticable because the operations are decreasing all the time and by July 1 the plant will be practically out of orders. He agreed to file a statement showing the difference in the labor cost per car in the first six months of 1921 as compared with the last six months of 1920, which he said would be very slight. There has been no reduction in the cost of repairs, he said. On the other hand, there has been a material increase since last spring because of the award of the Railroad Labor Board last July, retroactive to May 1. The principal material used, steel, has been reduced very little in price.

Mr. Taylor was asked if the Labor Board had not made a ruling which gives the company the right to contract with its employees as to wages after July 1.

"Not to our knowledge," he replied. This led to a dis-

cussion regarding the peculiar status of the company before the Labor Board. Mr. Fernald explained that the Pullman Company was not a party to the decision of the Board which promised a 12 per cent reduction in wages on July 1 and while it has since asked to be made a party, the labor organizations have protested that the company is not properly before the Board and that matter is for the Board to decide. Mr. Taylor said the company hoped to be able to follow the railroads and reduce wages on July 1, but was not yet certain of the result and the reduction would "only be a drop in the bucket," anyway.

Attorney Millener also asked about the company's claim against the Railroad Administration, saying he understood the company was claiming \$9,000 a car for repairs and that the company had expected to get \$2,000,000 from the government. Mr. Taylor said the company's total claim against the Railroad Administration was \$24,500,000, of which about \$7,250,000 is for undermaintenance, and the administration has paid \$7,000,000 on account. He said the claim for undermaintenance was based on an inspection of the equipment, which had been allowed to run down during the period of federal control, made jointly by the representatives of the company and of the administration, and the company had claimed from \$6,500 to \$7,000 each for a number of standard cars, stripped at the order of the director general, used for troop service, and then converted back. The claim also covered loss of supplies and other items. Mr. Taylor also described the damage to the cars done by the soldiers, but later asked that those remarks be kept out of the record. The company has been informed that the Railroad Administration will be prepared to begin negotiations for settlement about September 1. Mr. Millener asked if the claim would not cover the high cost of repairs in 1920 and 1921. Mr. Taylor said that it was confined to the period of federal control, whereas the company had spent \$21,000,000 for maintenance in 1920 and had overhauled only one-third of the cars. Asked how the \$7,000,000 would be used, Mr. Taylor said that it had been spent for wages and materials and had reduced by that much the company's deficit. He said there is very little chance of the company's getting the full amount of its claim because the railroads that have settled thus far have received less than 50 cents on the dollar. The attorneys for the commercial travelers asked questions assuming that the company would collect the full \$24,000,000, but the examiner ruled that they must confine their questions to the \$7,000,000 already collected and ruled out questions regarding "the money the company may never get." In reply to questions as to who had stripped the cars, Mr. Taylor said that he had done so as federal manager of the Pullman Car Lines at the order of the director general, although some cars had been stripped before at the request of the War Department.

Mr. Millener's witnesses were two assistant buyers of a large department store in Washington, who testified as to the reduction in prices of materials similar to those used by the Pullman Company, although in each case Mr. Taylor pointed out that the articles to which the prices were applied were not the same as those used by the Pullman Company, which were specially manufactured for it and of the best quality obtainable. It was testified that the present price of carpet similar to that used by the Pullman Company is \$4.50 per yard with a 10 per cent reduction for large quantities, as compared with \$5.75 last fall, and that the company uses 90,000 yards of carpet yearly. Mr. Taylor said the company is now paying \$4.35 a yard for a better grade of carpet than that described. A price of \$8.70 for blankets as compared with \$11 last year was quoted. Mr. Taylor says the company is now paying \$7.55 for blankets. Figures were also given for sheets, but of a smaller size than those used by the company. When one of the witnesses quoted a price of \$1.50 a dozen for hand towels similar to those used by

the company, Mr. Taylor asked if the witness' company would take a large order at that price for Pullman towels. Mr. Taylor said the company pays \$2.15 a dozen for towels specially woven with a blue stripe and the name of the company and the date. The witness said he had been making only a general comparison of the towels from observation. The witness also said that pillow-slips had been reduced from \$3.75 a dozen to \$3.00 or \$3.25. Mr. Taylor said that there had been a greater reduction in blankets and sheets than in any other articles.

Mr. Taylor's testimony on behalf of the company was confined to the introduction of a series of exhibits giving the revenues, expenses, payroll and costs of materials and supplies of the company, with quantities, for the past year as compared with previous periods. He said the average compensation of the employees had been increased during the year from \$1,406 a year to \$1,484. The car earnings, Mr. Taylor said, had been steadily decreasing since the application of the 50 per cent surcharge until in April, 1921, the revenues were \$458,000, or 7.53 per cent less than in April, 1920, and the number of berth and seat passengers was 24 per cent less. There was an increase in the revenues from May 1, 1920, to August, representing approximately the 20 per cent increase in fares, but after the surcharge was applied there was a steady decline both in the number of passengers carried and in the revenue until, in February, the gain in revenue derived from the increase in fares was entirely wiped out.

"We do not claim," he said, "that this was due entirely to the surcharge, but the application of the surcharge was a serious blow to the Pullman Company's revenues and it is a serious question whether the railroads have gained by it. Our thought is that they have lost in passenger revenues."

The opposing sides were allowed until August 15 to file briefs in the case.

## Freight Rates Must Be Readjusted; Not Horizontally Reduced\*

By Francis H. Sisson

Vice-President of the Guaranty Trust Co., New York

FOLLOWING THE RECENT DECISION reducing wages of railroad employees on about 100 roads, there has been considerable agitation for an immediate horizontal reduction in freight and passenger rates. Such a reduction would be extremely advantageous, of course, if it were possible without further jeopardizing the finances and credit of the carriers. The wage revisions are expected to "add" \$700,000,000 to railway net income. But even that will not enable the roads to earn a net return of 5½ or 6 per cent as contemplated in the Esch-Cummins Law. Certainly, it will not justify a horizontal rate reduction now.

During the war, horizontal rate increases were made, but now, with many commodity prices dropping sharply, the problem is to bring about a rate readjustment by which lower rates will be provided for commodities that cannot be handled at the present rate levels, and not to effect a horizontal rate reduction which will take away from the railroads all that they hope to save through the forthcoming wage economies.

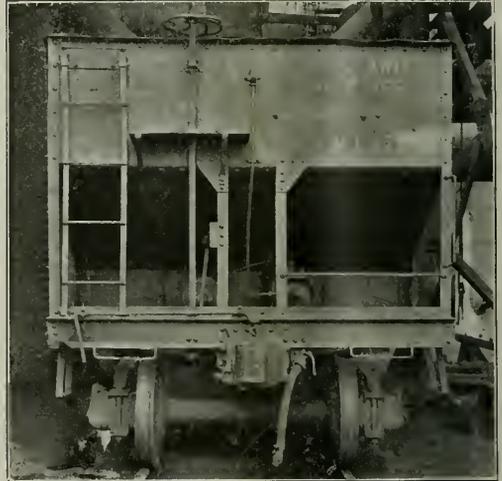

Approximately 50,000,000 Americans are the indirect owners of our railroads through the investment of their savings in railroad securities, and they should be keenly interested in the welfare of the railroads.

They should realize that railroad operating costs must be cut down before there can be justifiable general reductions in railroad rates.

\*Extract from an address before the American Institute of Banking at Minneapolis, Minn., on June 16.

## Safety Hand Brake

A NEW DESIGN of safety hand brake, made by the Minich Railway Appliance Corporation, Philadelphia, Pa., has been tested recently under severe service conditions and reported on favorably by the Interstate Commerce Commission. The brake consists of a vertical shaft, similar to those in common use, and attached as usual to the end of the car. The bottom of the shaft, however, is supported by a special cage casting, and is threaded to take a nut which is guided by slots in the cage. The nut moves vertically up and down, depending on which way the staff is revolved. On opposite sides of the nut are lugs forming trunnions by which a U-shaped lever is operated. The usual brake chain, or air brake lever in the case of hopper cars is replaced by a connecting rod. Round lugs on opposite sides of the cage serve as a fulcrum for the U-lever so that when the staff is revolved and the nut raised, the lever revolves on these lugs and tends to change from an approximately horizontal to a vertical posi-

Hopper Car Equipped with Minich Safety Hand Brake

tion, thus pulling up and applying the brakes through the rigging in common use. The fulcrum of the U-lever changes so that the power is comparatively low at the beginning, permitting the slack to be taken up quickly, but resulting in an increase of leverage, and power towards the end of the application. No pawl is necessary to hold the brakes applied, since they can be released only by turning the staff in the opposite direction.

It is maintained that this brake is an important safety device, being more efficient, inexpensive and easier to operate than the familiar ratchet and pawl type. The brake holds where applied and is not released partly to allow a pawl to engage, consequently all the energy is maintained and not lost when most needed. The brake is said to be three times as powerful as an ordinary brake and this without the use of a brake stick. Ratchet, pawl and brake chain are eliminated. It is stated that cars can be controlled accurately and easily on down grades, accidents being prevented by eliminating danger of sudden releases. All stress on the staff is vertical, therefore the parts will not be frequently bent and forced out of alinement. Owing to the use of few parts and a short, light staff, there is a saving in material and time required to install the brake.

# General News Department

## A. R. A. Mechanical Division Meeting Postponed Indefinitely

The postponed meeting of the Mechanical Division, American Railway Association, which was to have been held at the Blackstone Hotel, Chicago, on Wednesday and Thursday, June 29 and 30, has again been postponed as announced in a circular issued by the Mechanical Division on June 21. In view of the uncertainty as to conditions for the next few weeks no date has been set for the postponed meeting.

A fire at the roundhouse of the Boston & Maine, Portsmouth, N. H., on June 20, damaged the building and several locomotives at a total estimated loss of \$150,000.

Five persons were killed and 16 injured in a rear collision of interurban cars on the Detroit United Railway near Ann Arbor, Mich., on June 18. A wooden car was telescoped by a steel car.

The Interstate Commerce Commission has announced a hearing at Washington on June 29, before the commission, on the final value of the San Pedro, Los Angeles & Salt Lake and the Kansas City Southern.

J. M. R. Fairbairn, chief engineer of the Canadian Pacific and also president of the Engineering Institute of Canada, was given the degree of Doctor of Science by the University of Toronto, at Toronto, Canada, on June 9.

E. H. Morton, president of the Order of Railway Station Agents, has filed a petition with the Interstate Commerce Commission asking it to reopen its regulations regarding the designation of subordinate officers and to classify station agents as subordinate officers.

The Mechanical Division of the American Railway Association has issued a supplement to the 1920 Rules of Interchange, prepared by the Arbitration Committee. This supplement includes corrections to the rules, several additional interpretations rendered by the committee, and a few changes which have been made to clarify the rules.

Passenger trains on the Pennsylvania Railroad System in the month of May, this year, showed a marked improvement: 95.7 per cent of the trains arrived at destination on time, and 97.6 per cent made schedule time. In the three months ending with May the percentage making schedule time was over 97 per cent, as compared with 90 per cent in 1920.

Four strikers from the Missouri & North Arkansas, were convicted in the United States District Court and given jail sentences at Little Rock, Ark., on June 17. The strikers were sentenced on charges of contempt of court growing out of their interference with employees of the road, which is operating under a federal receivership. The offense, which consisted of abusing trainmen, was committed on June 2 and the sentences ranged from 90 days to 30 days each.

## Freight Must Be Prepaid on B A R

The Bangor & Aroostook has given notice that on freight shipped from stations on its line to points on or beyond the Maine Central the freight charges, for transportation over the Bangor & Aroostook, must be prepaid.

President P. R. Todd is quoted as saying that this action is necessary to provide money to meet payrolls and other pressing bills.

## Honorary Degrees

At the commencement exercises at Williams College, Williams-town, Mass., on June 20, the honorary degree of doctor of laws was conferred on Edgar E. Clark, chairman of the Interstate Commerce Commission.

At the commencement exercises at Tufts College, Medford, Mass., on June 20, the honorary degree of master of arts was conferred on Samuel O. Dunn, editor of the *Railway Age*.

## Mechanical Division Scholarships

Three vacancies occur in June, 1921, in the scholarships awarded to sons of railroad men or others with experience in the mechanical department and administered through the Mechanical Division of the American Railway Association. Two of the vacancies are in the scholarships at Stevens' Institute of Technology and the third is one of Joseph T. Ryerson & Son's scholarships which provides for a four-year course at universities elected by the American Railway Association. Application for these scholarships can be made through V. R. Hawthorne, secretary of the Mechanical Division, Chicago.

## Eight Killed in Collision of

### Fire Truck and Locomotive

At a crossing in Perth Amboy, N. J., on the afternoon of June 15, a fire truck dashed at full speed into the side of a passenger train of the Central of New Jersey, which was passing over the crossing at about 40 miles an hour. The truck was wrecked; eight firemen and a gate tender were killed and several other firemen were injured. The gates had not been closed. A number of automobiles had stopped just short of the crossing and it is conjectured that the driver of the fire truck assumed that these automobiles had been stopped in order to clear the road for him.

## Complaints Under Pennsylvania Train-Crew Law

Trainmen of all classes, acting through the lodges of their brotherhoods, have filed with the Public Service Commission of Pennsylvania complaints alleging that numerous trains are undermanned, and asking that the commission exercise its authority to prescribe the number of men in the crews, the railroads having reduced them since the repeal of the full-crew law. These complaints were filed against the Delaware & Hudson, the Delaware, Lackawanna & Western, and the Pennsylvania, the last named being based on charges connected with the operation of certain trains on the Monongahela division. The complaint against the Delaware & Hudson says that the practice of that company is now at variance with the rules prescribed in the company's code of train rules.

## Pennsylvania Relief Department

G. L. Peck, vice-president of the Pennsylvania Railroad System, announces that in response to requests from employees the Voluntary Relief Department will receive subscriptions to additional death benefits up to three times the amount of the death benefit of the class in which the employee holds membership at present. Heretofore the amount of death benefits to which a member could subscribe varied from \$250 to \$1,250; now it will be from \$1,000 to \$5,000.

The Voluntary Relief Department at present numbers about 190,000 members. It was instituted on February 15, 1886. Employees becoming members of the Relief Fund are divided into five classes, each of which carries a certain amount of death benefit in multiples of \$250. It is the amount of these death benefits which has now been raised. Since the Relief Department was established in 1889, total subscriptions by employees amount to

more than \$80,500,000 and total disbursements to more than \$73,800,000. The companies comprising the Pennsylvania System have contributed more than \$10,000,000 as the operating expenses of the fund.

### Bridge Disaster at Whitney, Neb.

Five passengers and one trainman were killed and six passengers were seriously and 25 slightly injured, when eastbound passenger train No. 606 on the Chicago & North Western, went through a bridge over Big Cottonwood Creek, near Whitney, Neb., on the night of June 15. The bridge, which had been weakened by erosion caused by flood water, gave way just after the engine of the train had passed over it; and the mail and baggage cars and two coaches piled up on the bank of the creek and in the stream. One Pullman car and the superintendent's car, which was attached to the train, were left standing on the track. The engine, after breaking away from the train, ran some 600 ft. Two of the trainmen, the express messenger and the fireman were slightly injured.

### Traffic Statistics for March

The net ton miles of revenue freight handled by the Class I railroads in March aggregated 23,962,000,000, as compared with 32,910,000,000 in March, 1920, according to the monthly bulletin of traffic statistics issued by the Interstate Commerce Commission. The number of passenger miles for the month was 3,056,000,000, as compared with 3,533,000,000. The average revenue per ton mile for the month was higher than it has been at any month since the increased rates were made effective, 1.335 cents, as compared with 0.986 cents in March, 1920. For the three months ending with March the revenue per ton mile averaged 1.269 cents. The revenue per passenger mile for March was 3.175 cents, as compared with 2.613 cents in March, 1920, and 3.127 cents for the first three months of 1921. The average number of revenue passengers per car for the first three months of 1921 was 16.66, as compared with 18.68 in 1920.

### E. E. Clark Re-elected Chairman of the Interstate Commerce Commission

The Interstate Commerce Commission on June 18 announced that Chairman E. E. Clark has been unanimously re-elected chairman of the commission for the year terminating June 30, 1922. For many years the commission followed the policy of rotating the chairmanship each year. Last year it was Commissioner Woolley's turn to be chairman and he was elected, but he declined the office on the ground that he had publicly opposed the passage of the Transportation Act which the commission was to administer. Commissioner Eastman was then elected and similarly declined the office, whereupon Commissioner Clark was elected for the term ending June 30, 1921, as senior member of the commission. Mr. Clark was appointed a member of the Interstate Commerce Commission by President Roosevelt in 1906.

### Who Is to Blame for Freight Losses and Damage?

O. C. Castle, superintendent of transportation of the Southern Pacific (Texas and Louisiana lines), is the author of an effective bulletin prepared for use in interesting employees in the special claim prevention campaign which the company has launched. The bulletin is illustrated with a picture showing a section of the unclaimed warehouse, and the articles to be seen in the foreground of the photograph are described in the printed matter which follows, as examples of the results of careless handling, avoidable delays, or errors in marking.

In emphasizing the point that claim prevention can be successful only through the co-operation of the employees, the bulletin says in part: "The real preventive work must be done by the man who handles the goods. You, Mr. Agent, with your bill clerk, your check clerk and your warehouseman; you, Mr. Local Conductor, with your brakemen—you are the men on the firing line—you handle the individual packages that go wrong and find their way to the pile you see in the picture. Why not treat them as though they were

addressed to you, or as though the loss would come out of your pocket?"

### Railway Revenues and Expenses for April

The Interstate Commerce Commission's summary of railway returns for April and four months for 201 Class L roads, is as follows:

Item No.	Item	April		Four months	
		1921	1920	1921	1920
1	Average number of miles operated .....	235,570.45	234,785.09	235,578.09	234,538.55
	Revenues:				
2	Freight .....	\$304,730,452	\$268,812,703	\$1,234,383,735	\$1,204,271,218
3	Passenger .....	\$90,698,125	92,963,857	\$381,809,386	360,078,084
4	Mail .....	7,782,447	7,566,673	33,597,409	85,544,799
5	Express .....	8,221,064	11,823,542	27,104,263	49,114,965
6	All other transportation .....	12,323,996	9,804,227	50,533,242	43,426,611
7	Incidental .....	9,129,188	10,915,720	39,456,190	43,982,354
8	Joint facility— Cr. ....	656,581	556,473	2,629,809	2,338,167
9	Dr. ....	184,654	161,282	777,855	755,329
10	Railway operating revenues	433,357,199	402,281,913	1,768,736,098	1,787,910,869
	Expenses:				
11	Maintenance of way and structures .....	59,936,374	74,511,616	236,432,439	264,440,092
12	Maintenance of equipment .....	101,426,224	111,046,136	441,580,609	464,633,924
13	Traffic .....	7,114,392	5,069,762	28,843,864	20,045,887
14	Transportation .....	188,912,346	192,500,729	823,300,139	836,300,559
15	Miscellaneous operations .....	4,056,923	4,601,347	16,737,901	17,866,264
16	General .....	14,895,321	12,860,609	59,151,636	58,820,064
17	Transportation for investment— Cr. ....	642,594	170,737	2,090,359	1,053,486
18	Railway operating expenses	375,698,986	400,419,462	1,603,956,229	1,653,053,304
19	Net revenue from railway operations .....	57,658,213	1,862,451	164,779,869	134,857,565
20	Railway tax accruals .....	22,390,587	21,772,465	90,482,082	85,353,510
21	Uncollectible railway revenues .....	90,539	58,579	322,792	357,240
22	Railway operating income .....	35,177,087	19,968,593	73,974,995	49,146,815
23	Equipment rent— Dr. balance .....	4,432,558	2,222,638	15,263,640	10,097,606
24	Joint facility rent— Dr. balance .....	1,495,655	1,552,435	6,057,862	6,298,078

26	Ratio of expenses to revenues (per cent)	86.69	99.54	90.68	92.46

<sup>1</sup>Includes \$2,735,279, sleeping and parlor car surcharge.

<sup>2</sup>Includes \$10,334,326, sleeping and parlor car surcharge.

### Plans to Expedite Settlement of Government Accounts

President Harding and the administration recently have been devoting consideration to the possibility of affording relief to the railroads through some way of expediting the settlements of their accounts with the government so that the roads may receive large sums still due them for the period of federal control, as well as for the six months' guaranty period of 1920. While there have been reports that the President was likely to exercise the discretion conferred upon him by the transportation act and authorize the Railroad Administration to increase the payments it may make on sums due the railroads by funding for a period of years the amounts owed by the railroads to the government for capital expenditures made during the federal control period, it is now understood that the President has been advised that this would involve another large appropriation of about \$800,000,000 for the Railroad Administration to enable it to make the payments to the railroads. The director general recently made an estimate for the House appropriations committee that a \$200,000,000 appropriation would carry him through another year on the assumption that he would not be required to fund any large part of the railroads' indebtedness. In view of the desire to reduce government expenditures and taxation, the administration does not take readily to the idea of asking a large appropriation from Congress, but it is regarded as possible that the consideration of the subject may result in some plan for expediting the settlements of the accounts, including those for undermaintenance. The Railroad Administration in the settlements it has been

making with railroads has in general been deducting the additions and betterments from the amounts it owed the railroads, although in one or two cases some of the capital expenditures have been funded and the equipment has all been funded. The settlement of the Southern Railway is reported in the Financial department.

### Automatic Train Control

The Joint Committee on Automatic Train Control of the American Railway Association co-operating with the Bureau of Safety of the Interstate Commerce Commission has been making material progress in connection with the development of automatic train control. Negotiations are being conducted with various railroads looking to the installation of automatic train control on test sections. Arrangements have been made with the Southern Pacific for an installation of the National Safety Appliance Company's intermittent induction type of train control from Oakland, Cal., to Niles, a distance of 22 miles. A proposed installation of the Sprague system is contemplated on a section of the New York Central, the location of which has not yet been definitely decided but will probably be near Albany, N. Y. This system is also of the intermittent non-contact induction type. Plans have been made for the installation of the continuous non-contact induction system as developed by the Union Switch & Signal Company on a short stretch of the Pittsburgh & Lake Erie near Pittsburgh; while a contemplated installation of the General Railway Signal Company's intermittent non-contact inert roadside element type is planned on the Buffalo, Rochester & Pittsburgh.

### Advance List of Exhibitors

#### at Roadmasters' Convention

The plans for the exhibit to be given by the Track Supply Association in connection with the convention of the Roadmasters' and Maintenance of Way Association at the Auditorium Hotel, Chicago, on September 20-22, inclusive, are well under way as evidenced by the fact that 45 firms have already requested and been assigned space at this exhibit. As in previous years this exhibit will be held on the ninth floor of the hotel in a room adjoining the convention hall. A list of manufacturers who have already been assigned space is given below.

Air Reduction Sales Company, New York City.  
 American Chain Company, Bridgeport, Conn.  
 American Hoist & Derrick Company, St. Paul, Minn.  
 American Steel & Wire Company, Chicago.  
 American Valve & Meter Company, Cincinnati, Ohio.  
 Anchor Company, New York City.  
 Baskwill Manganese Crossing Company, Cleveland, Ohio.  
 Bucyrus Company, South Milwaukee, Wis.  
 Carbic Manufacturing Company, Duluth, Minn.  
 Chicago Malleable Casting Co., Chicago.  
 Crerar, Adams & Co., Chicago.  
 Duff Manufacturing Company, Pittsburgh, Pa.  
 Elliot Frog & Switch Company, East St. Louis, Ill.  
 Fairbanks, Morse & Co., Chicago.  
 Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn.  
 Hauck Manufacturing Company, New York City.  
 Hayes Track Appliance Company, Richmond, Ind.  
 Ingersoll-Rand Company, New York City.  
 Kalamazoo Railway Supply Company, Kalamazoo, Mich.  
 Kilbourne & Jacobs Manufacturing Company, Columbus, Ohio.  
 Lundie Engineering Corporation, New York City.  
 Maintenance Equipment Company, Chicago.  
 Mudge & Co., Chicago.  
 National Lock Washer Company, Newark, N. J.  
 National Malleable Castings Company, Cleveland, Ohio.  
 Northwestern Motor Company, Eau Claire, Wis.  
 Oxweld Railroad Service Company, Chicago.  
 P. & M. Company, Chicago.  
 Positive Rail Anchor Company, Marion, Ind.  
 Pocket List of Railroad Officials, New York City.

## Traffic News

An agreement has been made between the Illinois Central and the Mississippi Warrior Barge Line, for a direct interchange of freight at Cairo, Ill. The contracts for the construction of the interchange terminals are in preparation and it is expected the terminal, which will be of the floating barge type, will be in service within 2½ months.

The Salt Lake City Passenger Association, suspended during the war, has been reorganized and has elected the following officers: C. H. Cutting, president; J. E. Light, first vice-president; Frank Yentzer, second vice-president, and A. W. Wagner, secretary and treasurer. The annual convention of the American Traveling Passenger Agents' Association is scheduled to be held at Salt Lake on September 12, 13 and 14.

In addition to the application for a 20 per cent reduction on iron and steel recently decided upon at Chicago by conference of freight traffic managers of transcontinental lines, it has been decided to apply to the Interstate Commerce Commission for a further reduction of 5 per cent in west bound rates on iron and steel from eastern points to the Pacific Coast terminals. The application will be filed with the Interstate Commerce Commission for permission to publish these revised rates to terminals only.

Passenger fares in Canada (eastern territory) are to be reduced on July 1, in accordance with an order which has been issued by the Board of Railway Commissioners. As of September, 1920, the commissioners authorized an increase of 20 per cent in fares, with the understanding that one-half the advance should be taken off on January 1, 1921, and the other half on July 1, 1921; and in accordance with this understanding the present order has been issued. The ordinary rate per mile, after the reduction, will be 3.45 cents.

The transcontinental railroads have filed with the Interstate Commerce Commission an application for fourth section relief to permit the reduction of rates on wool and mohair in carloads from Pacific coast terminals to points in eastern defined territory without corresponding reductions to intermediate points, in order to meet Panama Canal competition. An informal conference was held before the suspension board of the Interstate Commerce Commission on June 16 on a proposed reduction by the transcontinental railroads of the rates on sugar from California coast points to defined territories as far east as Chicago rate points. Various representatives of the sugar industry took different positions on the propriety of the proposed reduction and it was opposed by representatives of the eastern railroads.

Wholesale lumber dealers represented at a hearing at Chicago, before Examiner Butler of the Interstate Commerce Commission, have protested against the ten-dollars-a-day penalty for holding loaded lumber cars at any point longer than 48 hours. The lumbermen want the order passed in October, 1919, repealed. Retail lumbermen attending the meeting argued, however, that cars were made for transportation and not storage purposes, and they asked that the order, made at their request, should remain in effect. Before the order went into effect, they claim, the mills sent out lumber on orders from the commission men and loaded cars were held at different points sometimes for weeks before the lumber was sold. They denied the claim of the wholesalers that the competition created when they were able to hold the lumber on cars for a reasonable time, tended to bring down the prices.

### Seasonal Coal Rate Bill Up in the Senate

The bill introduced by Senator Frelinghuysen to authorize the Interstate Commerce Commission to make seasonal reductions in coal rates to stimulate the movement during the early part of the year and corresponding advances in the rates during the latter part of the coal season, was taken up in the Senate on June 20, having been made the unfinished business. It was reported that members of the so-called "agricultural bloc" in the Senate would take advantage of

## Commission and Court News

### United States Supreme Court

#### Risks on Freight in Car Waiting

#### To Be Taken Into Train

In November, 1917, the Yazoo & Mississippi Valley issued a bill of lading for 31 bales of cotton which had been loaded into a box car at Alligator, Miss., for shipment to Memphis, Tenn. Before the loaded car had been attached to any train or engine it was destroyed by fire. The shipper sued in a state court to recover the value of the cotton. The carrier contended that it was relieved from liability, under section 5 of the Uniform Bill of Lading, providing that property taken from a station at which there is no agent, shall be at the risk of owner until the cars are attached to trains. The shippers insisted that the provision did not apply, because at Alligator there was a regularly appointed agent and that the place where the car was received was, in effect, a part of the carrier's terminal and not a "private or other siding" within the meaning of the provision. The cotton had been loaded from the platform of a gin situated at the blind end of a spur which leads from the main line at a point near the station. The spur, which is 1,000 ft. long, had been built by the railroad many years before at its own expense. About half of it is on the railroad right of way and runs parallel to the main line; the rest is on private land. The spur is used generally by the public for loading and unloading carload freight. A verdict was directed for the shippers. Judgment thereon was affirmed by the Supreme Court of Mississippi on the ground that the quoted clause applies only to stations at which there is no regularly appointed agent; 120 Miss. 690. In the appellate courts of the states in which the question has arisen the decisions are conflicting. For this reason a writ of certiorari was granted, 251 U. S. 550. The only question requiring decision was whether the court below gave the correct construction to the clause. The United States Supreme Court holds that it did. The court said: "It could not have been intended that at stations where there are regularly appointed agents curving loaded cars for which bills of lading have issued and which are left standing on a siding solely to await the carrier's convenience are to be at the risk of the shipper. And this is true whether the siding be strictly public or semi-public, a siding privately used but owned by the railroad. The fact that the spur extends over land not part of the carrier's right of way is immaterial. *Yazoo & Mississippi Valley v. Nichols & Co.* Decided June 1, 1921. Opinion by Mr. Justice Brandeis.

#### Assessment of Railroads in Arkansas for

#### Highway Improvements Held Excessive

The Kansas City Southern and the Texarkana & Fort Smith were assessed by a road improvement district in Little River County, Arkansas (the district including about 25,000 acres of agricultural land and 9.7 miles of railroad owned by the companies), on account of a proposed gravel-road of 11.2 miles, at \$7,000 per mile of main track—\$67,900. Other property was assessed without reference to value or improvements, according to location. The railroads maintained that the assessment was unequal, arbitrary, unreasonable and unconstitutional. The state courts held to the contrary and declared the assignment valid. The Supreme Court of the United States has reversed the State Supreme Court's judgment, saying, in part: "Obviously, the railroad companies have not been treated like individual owners, and we think the discrimination so palpable and arbitrary, as to amount to a denial of the equal protection of the law. Benefits from local improvements must be estimated upon contiguous property according to some standard which will probably produce approximately correct general results. To say that 9.7 miles of railroad in a purely farming section, treated as an aliquot part of the whole system, will receive benefits amounting to \$67,900 from the construction

the opportunity thus afforded to try to press as amendments to the bill some of the various proposed bills to amend the transportation act. There have been numerous bills to repeal the 5½ per cent rate-making rule and also to prevent the Interstate Commerce Commission from interfering with state-made rates, which have been referred to the committee on interstate commerce and have not been acted upon. Senator Frelinghuysen made an opening statement on the bill, which he said has received the approval of Chairman Clark of the Interstate Commerce Commission as well as of the entire interstate commerce committee, and said that unless something is done to stimulate the buying of coal the panic prices of last year may be repeated this winter and transportation may be over-taxed so that a coal shortage will occur. He said the public expects Congress to do something to relieve the coal situation and that they will not endure another season of high prices. There is a great slump in coal buying at the present time and he argued at some length that action is necessary to stimulate coal buying at this time, although he did not discuss the question of how much of a reduction in freight rates would be sufficient to stimulate buying.

#### Railroads Decline General Reduction in Fruit and Vegetable Rates

In view of the many complaints and communications received by the Interstate Commerce Commission from the different producing sections and chief marketing centers of fruits, vegetables and melons, with respect to the freight rates thereon, the commission after investigations of its own, requested that a committee representing the railroads in the different sections of the country convene at Washington at the earliest practicable date for the purpose of considering the situation.

Such meeting was accordingly held on June 21, at which the complaints filed with the commission were placed before the carriers' representatives, supplemented by data which had come direct to the freight traffic officials of the railroads.

According to a statement issued by the Association of Railway Executives, "consideration was given to the complaints and to the reports of actual market conditions and returns to the producers. Many of the complaints were found to be merely in anticipation of reduced profits and unfavorable markets, but the actual figures demonstrated that the daily and weekly results were generally remunerative. Many sections which had definitely expected poor results were shown to have made more than the usual net profits.

"In no case was it shown that any section of the country was suffering from unduly burdensome rates or from inadequate facilities or service, but, on the contrary, the reports of the Bureau of Markets, United States Department of Agriculture, which are issued daily, as well as information in possession of the carriers, show that fruits, vegetables and melons generally are moving currently in larger quantities than ever before, and are being marketed without difficulty at fairly remunerative prices. The following figures, taken from the June 11 issue of the United States Department of Agriculture Market Reporter, show the increase in movement this year compared with 1920:

	Number of Carloads		
	1921	1920	
Apples, cabbages, cantaloupes, celery, lettuce, onions, peaches, potatoes, strawberries, tomatoes, watermelons, and mixed vegetables .....	367,741	309,181	

"In no case was it found that the carriers had failed to furnish, and at greatly increased expense, the adequate and well maintained service so valuable and necessary for this highly perishable traffic, or that there had been any lack of equipment or of facilities for icing and other protection of this traffic in transit or at terminals from which reconsignments were permitted or disposition made to the local markets."

Under these circumstances, announcement was made by the carriers that the evidence presented, both as to the current movement and the movement of fruits, vegetables and melons for the remainder of this season, did not justify a general reduction in the rates on this traffic.

of 11.2 miles of gravel road seems wholly improbable, if not impossible. Classification, of course, is permissible, but we can find no adequate reason for what has been attempted in the present case. *Royster Guano Co. v. Virginia*, 253 U. S., 412, 415. It is doubtful whether any very substantial appreciation in value of the railroad property within the district will result from the improvements; and very clearly it cannot be taxed upon some fanciful view of future earnings and distributed values, while all other property is assessed solely according to area and position. Railroad property may not be burdened for local improvements upon a basis so wholly different from that used for ascertaining the contribution demanded of individual owners as necessarily to produce manifest inequality. Equal protection of the law must be extended to all." *Kansas City Southern v. Road Improvement District*. Decided June 6, 1921. Opinion by Mr. Justice McReynolds.

**Railroads Must Pay for Use of Shippers' Diverted Tank Cars**

In an action by the owner of tank cars for payment for their detention and diversion for other shipments after delivery of the plaintiff's goods, it appeared that the railroad refused to pay for the use of the cars beyond the rate fixed by the Interstate Commerce Commission for empty mileage on tank cars. The Federal District Court for the Southern District of New York holds that rule 29 of the Commission does not authorize the railroad to detain or divert cars at will, and that for such detention and diversion beyond a reasonable time for their return, the railroad must pay the owner a fair amount. The railroad also argued that the A. R. A. rule forbids payment of the kind here sued for. That rule provides that the carriers will pay nothing for delay or diversion except as authorized in tariffs. But this, says the court, is not an assertion of any right deliberately to divert such cars; the practice is to observe the shippers' orders in the return of cars. Such detention remains, therefore, a wrong, both under the regulations and at common law.

The railroad contended that the carriers have nevertheless established a practice by which they have interpreted Rule 29 as covering the case of cars which happen to be delayed or diverted and that this practice must be reviewed by the commission before it can come before any court. The court, however, doubted whether there has been any consistent practice among the carriers on this subject. "Occasional, and even common, assertions of right do not make such a 'practice.' Its essence is its uniformity. Carriers may not claim the sanction of the statute for a usage which they apply only with exceptions. They cannot say that in such cases they 'observe and enforce' it themselves." The court added that the three cases in which the question has already arisen have been decided against the carrier. *Gustafson v. Michigan Central*, 296 Ill., 41, 129; N. E., 516 (Feb. 3, 1921); *Sun Co. v. Pennsylvania*, Pennsylvania Court of Common Pleas, July term, 1920; *Empire Refineries v. Mo. Pac.*, C. C. A. 8th Circuit, March 17, 1921; *Macklin, Brown, etc. v. Baltimore & Ohio*. Dist. Ct., S. D., N. Y. Decided June 1, 1921.

In the *Gustafson* case the railroad was held liable for negligence in delaying unreasonably the return of an empty tank car, the mileage rate filed with the commission referring to the Railroad's use of the car and not to unreasonable delay in its return.

In the *Empire Refineries* case, 271 Fed., 668, a tank car owned by a shipper, filled with gasoline, was delivered to a railroad for the transportation of the gasoline to a consignee under a bill of lading entitling the owner to payment for the use of the car on a mileage basis. The car was not delivered to the consignee, but diverted, and was not returned to the owner for three months. The Circuit Court of Appeals held that the railroad was a bailee for hire of the car, for its use only according to the bill of lading; that the diversion was a breach of the contract of bailment, which, whether intentional or negligent, rendered the company liable to the owner for all damages, including the value of its use during detention.

**Foreign Railway News**

**Alcohol Locomotives in Brazil**

In the vicinity of Pernambuco, Brazil, according to Consul C. R. Cameron, are some 80 sugar factories which operated approximately 800 miles of railways of from .75 meter to 1 meter gage. At the present time wood is the principal fuel but the supply of this fuel is not great and considerable interest is being manifest in the substitution of alcohol which can be manufactured in large quantities as a sugar by-product. The current price of alcohol, says Consul Cameron, is 22 cents a gallon, although the cost of production is much less. Mr. Cameron is impressed, consequently, with the opportunities in this section for American concerns manufacturing locomotives using alcohol as a fuel.

**April Exports of Car Wheels and Axles**

Exports of car wheels and axles in April were valued at \$304,659—a slight increase over the previous month. Brazil was the destination of this material to the value of \$93,089. Detailed figures, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Dollars	Countries	Dollars
Canada	18,757	Chile	52,183
Honduras	3,428	Colombia	600
Sierraguta	765	Ecuador	2,266
Panama	1,078	Peru	10,194
Mexico	18,899	Venezuela	649
Jamaica	308	China	27,830
Trinidad and Tobago	3,216	Kwantung, leased territory	3,950
Other Brit. West Ind.	612	Japan	62,311
Cuba	1,181	Philippine Islands	1,913
Dominican Republic	186	British South Africa	544
Argentina	920		
Brazil	93,089	Total	304,659

**South African Railways Deficit**

LONDON

The report of the South African Railways and Harbors for the year ending March 31, 1921, shows an estimated deficit of approximately \$3,500,000, instead of an anticipated surplus of \$750,000. This is due to the increased cost in wages, necessitated by the increase in the cost of living, which involved an additional expenditure of over \$3,650,000 per annum. To meet this increase in expenditure the rates were raised as from October 1, 1920, but owing to the falling off of both passenger and freight traffic, this increase was found to be far below expectations.

The total tonnage of freight, coal and minerals carried during 1920, was 16,164,700 tons, or an increase of 11.27 per cent over the previous year.

Some interesting figures were given by J. W. Jagger, the minister responsible for the South African Railways and harbors, as follows:

Gross capital expenditure of both Railways and Harbors at December 31, 1920	\$330,000,000
Gross expenditure on Rolling Stock in 1920	\$21,000,000
New Rolling Stock brought into service in 1920:	

Locomotives	113
Passenger cars	120
Freight cars	1919

It is estimated that the deficit for the financial year ending March 31, 1922, will amount to \$2,940,000, which, added to the accumulated deficit to the end of March, 1921, namely, \$12,300,000, will amount to \$15,300,000 for the year ending March, 1922.

**Equipment Situation in Russia**

An exchange telegraph dispatch states that on January 1, there were 7,729 locomotives suitable to run and 10,714 locomotives laid up for repairs in Russia. Likewise there were 358,552 freight cars fit for service and 96,580 in bad order. The repair work done in 1920 exhausted the supply of material for repairs and it was necessary to rob some of the bad order equipment of its material. In the summer of 1920, a program of repairs for four and a half years was adopted, but in the last half of that year only 30 per cent of the repairs scheduled to be done were completed. For 1921, this schedule was reduced 40 per cent, but in January and February only 10 per cent of the reduced schedule was com-

pleted. It is now stated that the Supreme Council of National Industry reports that owing to the lack of material the plans for repairing rolling stock cannot be carried through.

### Objections to English Railway Bill

The English Railway Bill (*Railway Age*, May 27, page 1209) has aroused considerable criticism. Labor representatives claim that the amounts to be allowed the companies for settlements of claims against the government are too large. They also object to the bill because it does not provide for government ownership. The Scottish railways object to the provisions of the bill relating to the settlement of disputes with labor because they fear the perpetuation of the present standards of wages. Higher rates do not solve the problem of high wages, they say in effect, because they drive away traffic. The Scottish companies have suffered more from increased costs and decreased earnings than the English roads proper. Many of the railways are objecting to the compulsory consolidations called for by the bill, and shippers are not satisfied with the provisions for the regulation of rates. The railways object, too, to the extensive state control proposed in the bill.

### Government Authorizes Increased

#### Rates on Mexican Railway

A report from Assistant Trade Commissioner Connell states that, by authorization of the federal government, the transportation rates of the Mexican Railway, a British property, are to be increased 25 per cent, placing them on a par with those collected by the government lines. However, one-half of the additional gross receipts resulting from this increase in rates will be considered as amortization by the government on its debt to the Mexican Railway, which amounts to some millions of pesos. This will obviate the withdrawal of funds from the treasury in order to decrease the obligation, and is apparently a new policy which will be adopted by the Secretary of Finance to cancel many of the claims for damages and losses of property and equipment arising during the time of political disturbance.

### April Locomotive Exports

Exports of steam locomotives in April fell to 66, valued at \$1,922,487, from the March total of 105, valued at \$5,317,029. The largest shipments, 20 valued at \$567,610, were destined for Brazil. Eighteen, valued at \$422,362, went to Mexico. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Number	Dollars
Malta, Gozo, and Cyprus Islands	1	14,548
Canada	1	3,750
Honduras	1	17,550
Mexico	18	422,362
Cuba	5	162,430
Brazil	20	567,610
Peru	4	128,430
China	2	70,800
Hongkong	4	75,200
New Zealand	1	14,957
Philippine Islands	5	268,506
Egypt	4	176,350
Total	66	1,922,487

### Trade Commissioner Predicts Large

#### Purchases of Supplies in India

Trade Commissioner Batchelder, according to Commerce Reports, is much impressed with the opportunity for the sale of railway supplies and equipment of all kinds, which will exist in India as soon as the plans for modernizing the antiquated railways of that country take definite form. Large loans have been floated in England recently for improving the Indian railways but, in view of the fact that the necessity for additions and betterments is so great, still greater capital expenditures will probably be undertaken as soon as possible. Commissioner Batchelder believes that an opportunity exists at the present time for the formation of a car trust to supply rolling stock to the roads. Rolling stock is not the only need—double tracking, new terminals and additions to yards and sidings are also contemplated.

## Equipment and Supplies

### Locomotives

THE PEKIN-SUIYUAN will ask for bids about July 20, through the Universal Steel Export Company, 26 Cortlandt street, New York City, for 7 Mallet type locomotives, 25 Mikado type and 5 Pacific type.

### Freight Cars

THE ATLANTIC FRUIT COMPANY, 61 Broadway, New York City, is inquiring for 100 cane cars of 20 tons' capacity and 36 in. gage.

THE PITTSBURGH & WEST VIRGINIA has ordered 300 hopper car bodies of 55 tons' capacity from the Cambria Steel Company.

THE WESTERN MARYLAND is inquiring for 500 hopper car bodies of 55 tons' capacity, also asking for prices on the repair of 500 hopper cars of 50 tons' capacity.

THE PEKIN SUIYUAN will ask for bids about July 20, through the Universal Steel Export Company, 26 Cortlandt street, New York City, for 400 high side, steel freight cars of 40 tons' capacity.

### Miscellaneous

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, July 6, for its requirements until October 1, 1921, for the line Buffalo and East, of fuel oil, gasoline, kerosene, long-time burning semaphore oil, turpentine substitute, gas oil and tallow candles

The BOSTON AND ALBANY will receive bids until 12 o'clock, noon, July 7, at Boston, Mass., for: 2 trailing truck wheel centers; 3 type E power reverse gears; 2 sand box bodies; 6 pressed steel small front doors; 6 cast steel trailer yoke seats, and 2 steam chest relief valves.

THE NORFOLK & WESTERN will receive bids until 12 o'clock noon, July 6, at Roanoke, Va., for repair parts for Westinghouse engine; parts for electrical apparatus; parts for electric pump; 400 rods of wire fencing; 2,000 double coil draft gear springs, approximately 40,000 lb., and soft steel bars.

THE CENTRAL OF NEW JERSEY will receive bids until 12 o'clock noon, July 6, for the work of repairing, rebuilding, refitting and finishing of its marine floating equipment, including Sandy Hook steamers, tugs, barges, car floats, derricks, lighters, etc., for the period of one year from July 6, 1921, to July 6, 1922. Bids will also be received until 12 o'clock, noon, July 11, for anthracite locomotive fuel coal for delivery at Ashley, Mauch Chunk, Phillipsburg, or Jersey City, as follows: Broken, 60,000 gross tons; buckwheat No. 1, 420,000 tons; buckwheat No. 2, 45,000 tons; pea, 46,000 tons.

### Signaling

THE CANADIAN NORTHERN has ordered from the General Railway Signal Company of Canada a mechanical interlocking, 12 levers, for the Trent Canal drawbridge at Washago, Ont.

### Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company will shortly receive bids for the installation of two new 120-ft. turntables, one at Winslow, Ariz., and the other at Needles, Cal., to cost about \$45,000 each

CHICAGO & ILLINOIS MIDLAND.—This company has accepted a contract for the construction of a 150-ton concrete coaling station at Humpfrey, Ill., to the Ogle Construction Company, Chicago.

## Supply Trade News

The **Morkrum Company**, Chicago, has opened an office at 707 World building, New York, in charge of **J. B. Appleton**, assistant manager sales, engineering department.

The **Canadian Locomotive Company, Ltd.**, Kingston, Ontario, is carrying out improvements at its shops, to include two additional pits to the erecting shop and the construction of a storage building 200 ft. by 75 ft.

**M. E. Lisle**, assistant to the president of the **Terminal Engineering Company, Inc.**, 17 West Forty-fourth street, New York City, has been elected vice-president and **M. E. Peck**, office manager, has been elected secretary and assistant treasurer.

**A. H. Dodge** has been appointed sales manager of the **J. G. Wilson Corporation**, 8 West Fortieth street, New York City. **E. Doscher** has been appointed assistant sales manager and district manager for New York; **S. H. Moncses** has been appointed general sales correspondent and **H. S. Tompkins**, formerly of the Western Electric Company, will specialize on Diffuselite fixtures.

The **Link-Belt Company**, Chicago, has acquired all of the capital stock of the **H. W. Caldwell & Son Company**, Chicago, and **Frank C. Caldwell** has been elected a director of the Link-Belt Company. The Caldwell Company's plant will continue to operate under separate corporate existence, under its present name, and the plant management will remain substantially the same as heretofore.

**Harry W. Torney**, of Torney & Co., New York, was recently elected president of the **Sharon Pressed Steel Company** with office at 66 Broadway, New York City. This company was recently reorganized. **Arthur W. Swan** is now general manager in charge of manufacture; he was formerly chief engineer and works manager of the Crucible Steel Company and its associates. **J. G. White** has been appointed district sales manager at Detroit, Mich. The company recently installed some new machinery at its plant, Sharon, Pa.

**William Aldrich**, who has recently been in charge of thermit welding in the Southern territory of the **Metal & Thermit Corporation**, New York, has been transferred to the Western territory. **William H. Moore**, who recently was assigned to the Chicago territory, now has charge of the Southern territory. This corporation has constructed and will shortly place in operation in South San Francisco, Cal., a large new plant for the production of detinned billets, in addition to the detinning plants already operated by this company for several years at Chrome, N. J., and East Chicago, Ind. **E. Kardos**, superintendent, will be in charge of the new plant which includes a large welding shop. The estimated cost of this plant is \$800,000. The San Francisco offices of the corporation have been removed from 329-333 Folsom street, to the new South San Francisco plant.

## Obituary

**William Jordan Caton**, secretary of the Burden Iron Company, Railroad and Steamship Division, and assistant to the president of the Sanitation & Supply Company, New York, died on June 17, in the Harbor Hospital, Bath Beach, Brooklyn, N. Y., at the age of 66. He began railway work in the auditor's department of the Boston & Albany at Springfield, Mass., and subsequently served in the passenger department of the same road. He was later purchasing agent of the Pittsburgh & Lake Erie. He served for about nine years as New York representative of Brown & Co., Inc., Pittsburgh, Pa., until July, 1920, when he left the service of that company to go to the Burden Iron Company, Railroad and Steamship Division.

## Railway Financial News

**CAMBRIA & INDIANA.—Application for Loan.**—This company has applied to the Interstate Commerce Commission for a loan of \$750,000 for 10 years, payable at the rate of \$75,000 a year, for the purchase and liquidating of two-year, 6 per cent gold notes maturing on August 1.

**CENTRAL RAILROAD OF SOUTH CAROLINA.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue and exchange or sell at par and accrued interest \$300,000 of serial 6 per cent refunding bonds, to retire a like amount of first mortgage bonds.

**CHESAPEAKE & OHIO.—Again Defers Dividend.**—The directors on June 17 again deferred action on the usual dividend of 2 per cent for the current half year. Action thereon was deferred at the May meeting also.

**New Director.**—**W. J. Louderback**, of Chicago, has been elected a director to succeed **F. H. Davis**, deceased.

**CHICAGO & EASTERN ILLINOIS.—Authorized to Extend Time for Issuing Securities.**—The Interstate Commerce Commission has issued a supplemental order extending the time within which the company may issue securities as authorized in its order of February 3 from June 30, 1921, to January 1, 1922.

**Application to Discontinue Operation of C. & I. Coal Railway.**—**R. D. Stephens**, co-receiver, has applied to the commission for certificate authorizing the abandonment of operation of the Chicago & Indiana Coal Railway Division on the ground that the traffic is insufficient to justify the operation.

**CHICAGO, INDIANAPOLIS & LOUISVILLE.—Authorized to Pledge Bonds.**—This company has been authorized by the Interstate Commerce Commission to pledge and repledge from time to time \$3,493,000 of first and general mortgage 5 per cent gold bonds as collateral security for short term notes.

**CHICAGO, MILWAUKEE & ST. PAUL.—Bonds Due July 1 Provided For.**—This company has announced that the \$1,360,000 Chicago & Lake Superior divisional first mortgage 5s, and the \$4,755,000 Wisconsin & Minnesota divisional first mortgage 5s, due July 1, next, have been provided for, and that no new financing is contemplated this year.

**CHICAGO UNION STATION.—Asks Authority to Issue Bonds.**—This company, the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St. Paul, and the Pittsburgh, Cincinnati, Chicago & St. Louis have filed a joint application with the Interstate Commerce Commission for authority to issue and sell \$6,000,000 of first mortgage 6½ per cent gold bonds, dated January 1, 1920, and maturing July 1, 1963, and also for authority to the owning companies to guarantee the principal and interest. The proceeds are to be used to continue the construction of the passenger terminal in Chicago. The bonds are to be redeemable at the option of the company on January 1, 1935, or thereafter at 110. They have been disposed of, subject to the commission's approval, at 97½ to Kuhn, Loeb & Co., Lee, Higginson & Co., Illinois Trust & Savings Bank, National City Company, and the First National Bank.

**DELAWARE, LACKAWANNA & WESTERN.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**DENVER & RIO GRANDE.—B. B. Odell Resigns from Stockholders' Committee.**—**Benjamin B. Odell** has resigned as chairman of the Stockholders' Protective Committee, which has been endeavoring, through a court contest, to set aside the sale of the Denver & Rio Grande to the Western Pacific. He gave as his reason the pressure of other business.

The committee has ordered that appeals be taken from the orders entered in the United States District Court at Denver

confirming the sale of the property on grounds including the following:

Entire proceedings are irregular, because, based upon the original judgment for \$38,000,000, which the committee holds should be enjoined; decree erroneously cut off the six month period of redemption allowed by laws of Colorado, New Mexico and Utah; court is declared to have no power to sell the franchise; price of \$5,000,000, at which the properties were sold, is declared so grossly inadequate as to shock the conscience; Denver property, it is said, was sold at the upset price of \$5,000,000, whereas the treasury assets included in the sale, consisting of stocks and bonds, had a clear stock exchange value of more than \$8,000,000.

**FLINT BELT.—Application to Abandon Line.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of 13½ miles of line in Genesee County, Mich.

**GREAT NORTHERN.—Regular Dividend Declared.**—This company has declared the regular quarterly dividend of 1¼ per cent on the preferred stock, payable August 1 to holders of record July 2. No statement was issued by the company regarding this payment.

**HOCKING VALLEY.—Again Defers Dividend.**—The directors on June 16 again deferred action on the regular semi-annual dividend of 2 per cent.

**New Director.**—G. B. Wall, of Richmond, has been elected a director to succeed F. H. Davis, deceased.

**HUNTINGDON & BROAD TOP MOUNTAIN.—Asks Authority to Issue Equipment Trusts.**—This company has applied to the Interstate Commerce Commission to issue \$300,000 of car trust certificates for the purchase of four locomotives and 10 passenger cars, to cost \$411,393. Certificates are to be sold to W. M. Canby and Robert Gleaning.

**ILLINOIS CENTRAL.—Annual Report.**—The corporate income for the year ended December 31, 1920, compares with the corporate income for the year 1919, as follows:

	1920	1919	Increase or decrease
Operating revenues.....	\$121,804,579	.....	.....
Operating expenses.....	121,874,327	.....	.....
Expenses over revenues.....	69,748	.....	.....
United States Government—guaranty period claim.....	\$19,499,887	.....	.....
Rental from United States Railroad Administration.....	3,399,635	\$17,896,467	—\$14,496,832
Railway operating income.....	\$22,829,773	\$17,896,467	\$4,933,306
Operating expenses, corporate, not assumed by United States Railroad Administration.....	\$117,658	\$351,633	—\$233,975
Federal War income and other taxes.....	7,172,262	853,200	6,319,062
Uncollectible railway revenues.....	23,320	.....	23,320
Railway operating income over corporate expenses, taxes and uncollectible railway revenues.....	\$15,516,534	\$16,691,635	—\$1,175,101
Equipment rents—net credit.....	3,196,849	.....	3,196,849
Joint facility rents—net debit.....	191,297	.....	191,297
Net railway operating income.....	\$18,522,085	\$16,691,635	\$1,830,450
Income from investments and other corporate income.....	7,219,882	7,634,005	—\$414,123
Gross income.....	\$25,741,967	\$24,325,639	\$1,416,328
Interest on funded debt and other miscellaneous corporate charges.....	12,170,845	12,156,720	14,125
Net income.....	\$13,571,122	\$12,168,919	\$1,402,203
Disposition of net income:			
Income applied to sinking and other reserve funds.....	\$118,200	\$118,200	.....
Income appropriated for investment in physical property.....	18,081	170,100	—\$152,019
Total appropriations of income.....	\$136,281	\$288,300	—\$152,019
Income balance transferred to profit and loss.....	\$13,434,841	\$11,880,619	\$1,554,222

The annual report of the Illinois Central will be reviewed editorially in an early issue.

**LEHIGH VALLEY.—Another Extension Granted.**—Judge Charles M. Hough in the United States District Court at New York has granted this company an extension of time until July 24 for filing a plan for segregating its properties. This is the second extension of time secured by the company.

**LOUISVILLE & NASHVILLE.—To Increase Capital Stock.**—Notice has been sent to the stockholders that a special meeting will be held July 23, 1921, at Louisville, Ky., for the purpose of considering the proposed increase of the company's capital stock and a distribution among the stockholders (in the form of a stock dividend) of surplus earnings invested in property and of

taking action on the authorization of a proposed first and refunding mortgage. The notice was accompanied by a letter from President W. L. Mapother which referred to the proposed action as follows:

At the regular annual meeting of the stockholders held April 6, 1921, a first and refunding mortgage for the purpose of retiring existing bonds and other indebtedness of this company and for other purposes was authorized, and will involve an ultimate issue of bonds in excess of the company's present indebtedness.

The most liberal and secure basis of such mortgages by the large systems of railroads needing large amounts for construction of extensions, for additions and betterments and to provide for refunding future maturities of existing bond issues, is to insert a condition that at no time shall the amount of bonds issued under such mortgage exceed at par three times the par value of the stock issued and outstanding. This happens to be almost the exact present ratio of the company's funded debt to its present capital stock—a ratio which the proposed mortgage will necessarily disturb.

The obvious remedy is to increase the capital stock, for the company is to maintain its present standard of excellence and to go forward in the development of the vast tonnage of the future, it must be placed in a position to offer the public investment securities which will be approved and recommended by the most conservative bankers.

For these reasons, and in order to provide for future expansions, the management decided to recommend that the authorized capital stock be increased from 720,000 shares to 1,250,000 shares of \$100 par value each. Having reached this conclusion, the question arose as to whether the additional stock should be sold or distributed to the stockholders as a stock dividend. As bearing upon this question, the records of the Louisville & Nashville disclose the following facts:

The company's surplus as of December 31, 1920, stands at \$82,985,890, and all discounts from the sale of bonds since 1902, aggregating approximately \$7,000,000, have been charged off to profit and loss. The annual amounts of surplus earned closed into profit and loss account, less dividends paid, aggregate (speaking in round numbers) about \$96,000,000. This does not include the items of depreciation of equipment (which stands on the books at \$30,900,097), and of depreciation of certain items of roadway (which stands on the books at \$13,796,051).

In view of the foregoing facts, showing that the proposed increase of stock represents the previous earnings of the company (and nearly a part of them) which were used to increase the property investment instead of being distributed in dividends, the management has decided it to be right and proper that there be issued to the stockholders ratable as a stock dividend so much of the \$5,000,000 increase of capital stock as the Interstate Commerce Commission shall authorize to be so issued.

**MARSHALL & EAST TEXAS.—Certificate for Abandonment Held Not Necessary.**—The Interstate Commerce Commission has reaffirmed its original finding that a certificate authorizing the abandonment of this line is not necessary, on the ground that the abandonment took place prior to the effective date of paragraph 18 of the Interstate Commerce Act. A reargument in the case was held at the request of the applicant, but the commission finds that the cessation of operation of this particular road amounted to complete abandonment, as evidenced by the commencement of proceedings in the federal court for the sale of the line as scrap.

**MISSOURI, KANSAS & TEXAS.—Asks Authority to Extend Certificates.**—The receiver has applied to the Interstate Commerce Commission for authority to extend for one year a series of \$3,000,000 of receivers' certificates bearing interest at 6 per cent instead of 5 per cent.

**MISSOURI PACIFIC.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue and sell or pledge from time to time \$5,501,500 of its first and refunding mortgage 6 per cent gold bonds now held in the treasury. It is proposed to sell the bonds at some future time at not less than 90, or to pledge them at not less than 75. No contracts have been made for their disposal.

**MONONGAHELA.—Asks Authority to Pledge Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$1,300,000 of 6 per cent first and refunding mortgage bonds to be pledged with the Secretary of the Treasury as security for a loan of \$1,000,000.

**NEW YORK, NEW HAVEN & HARTFORD.—To Pay July 1 Interest.**—President E. J. Pearson has issued the following statement referring to a report that the New Haven was going to default on the debenture bond interest July 1:

The affairs of the New Haven show improvement. Revenues during the month of June have increased. Expenses have decreased, owing to the decreased cost of fuel and materials. After July 1, labor costs will be still less. The divisions case is yet to be heard from. There is no doubt in the mind of the management that the New Haven will meet its interest, rentals and other fixed charges on July 1.

**NORTHERN PACIFIC.—Regular Dividend Declared.**—This company has declared the regular quarterly dividend of 1¼ per cent, payable August 1 to stock of record July 2.

Howard Elliott, chairman of the board, made the following statement: "This payment is not from earnings of the property in 1921, which, in common with other railroads, have been on a lower level than in previous years, but out of surplus heretofore accumulated and not distributed."

**OCEAN SHORE.—Abandonment of Line Authorized.**—The Interstate Commerce Commission has issued a certificate of public convenience and necessity authorizing the abandonment of this company's line, extending from San Francisco to Tunitas Glen, and a second line from Santa Cruz to Swanton, Cal.

**PATTERSON & WESTERN.—Abandonment of Line Authorized.**—This company has been authorized by the Interstate Commerce Commission to abandon its line from Patterson to Jones Station, Cal., a distance of 23.6 miles.

**PEARL RIVER VALLEY.—Application for a Certificate Held Unnecessary.**—The Interstate Commerce Commission has rendered a decision that the proposed relocation of a portion of the main line in Pearl River county, Miss., does not require a certificate as it does not constitute an abandonment of a line within the meaning of paragraph 18 of the interstate commerce act. The new line is within a mile of the former location.

**PENNSYLVANIA.—Authorized to Acquire Control.**—This company has been authorized by the Interstate Commerce Commission to acquire control of the Pittsburgh, Fort Wayne & Chicago by the purchase at par from the Pennsylvania Company of \$34,000,000 of special guaranteed stock and as part consideration therefor to assume the obligations of the Pennsylvania Company in respect of the payment of the principal and interest of \$33,239,000 of guaranteed trust certificates heretofore issued by that company.

**PITTSBURGH, CINCINNATI, CHICAGO & ST. LOUIS.—Dividend Deferred.**—The directors at their meeting in Philadelphia on June 22 decided to postpone consideration of the regular 2 per cent semi-annual dividend until later in the year. The following statement was issued:

The directors decided, in view of existing low earnings and prevailing adverse conditions, to postpone consideration of the dividend on stock of the company until later in the year by which time earnings for the year and final results of the reduction of wages by labor board and its action respecting the national agreements and working conditions can be ascertained; also settlements with government for the federal control and guaranty periods will no doubt be definitely determined.

All of the capital stock of the company excepting about 1 per cent is owned by the Pennsylvania company.

**PITTSBURGH, SHAWMUT & NORTHERN.—Asks Authority to Lease Road.**—The receiver has applied to the Interstate Commerce Commission for authority to lease the road of the Rochester, Hornellsville & Lackawanna, 10.13 miles.

**READING COMPANY.—Appeal to United States Supreme Court Granted.**—An appeal has been taken by the Continental Insurance Company and the Fidelity-Phoenix Fire Insurance Company, common stockholders of the Reading Company, from the decision of the United States District Court at Philadelphia, holding that the preferred and common stockholders of the Reading Company should share equally. Federal Judge Thompson, at Philadelphia on June 16, allowed the appeal and required the insurance companies to file an indemnity bond of \$750,000.

The appeal is limited to that portion of the decree deciding that the common and preferred stockholders have equal rights in the new coal company stock. The segregation plan will be carried out in all respects, including merger of the Reading Company and the Philadelphia & Reading Railway, and the trustee of stock, and up to issuing of certificates of interest of the coal company to the trustees.

From that point proceedings are stayed pending a decision by the United States Supreme Court.

Charles Heebner, counsel for the Reading Company, said any modification would seriously upset the plan and cause a great setback in carrying out the decision of the Supreme Court. He said that other plans had been considered, but the present one had been adopted as just and equitable to all interests. In adopting the plan he said the company gave up valuable charter rights to protect common and preferred stockholders. If the contention of the common stockholders is upheld by the Supreme Court, he intimated that the company would ask to submit an entirely new plan which would not contemplate merger of the Reading Company and the Railway Company.

It is expected that the Prosser Committee, representing certain large holders of Reading common stock, will take appeal from the Reading decree of segregation. The sub-committee, representing the largest of these stockholders, of which E. P. Maynard, president of the Brooklyn Trust Company, is chairman, has sent out letters asking that the legal expenses of the undertaking be underwritten by the largest stockholders whose proxies are held by the Prosser Committee.

**TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS.—Authorized to Issue Bonds.**—This company has been authorized by the Inter-

state Commerce Commission to issue nominally \$719,000 of general mortgage bonds to reimburse the treasury for expenditures for additions and betterments.

**WESTERN PACIFIC.—Settlement for \$8,646,053 with Government.**—President Alvin W. Krcch, in a letter to the stockholders dated June 15, stated that the company had effected a final settlement of all claims against the government, equivalent to a net payment of \$8,646,053.

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued certificates for partial payments on account of the six months' guaranty for 1920 as follows: Missouri Pacific, \$1,100,000; Shearwood, \$2,000; St. Louis-San Francisco, \$30,000; New York, Susquehanna & Western, \$205,000; Ocala Southern, \$15,000.

### Settlements With Railroad Administration

The Railroad Administration has announced a final settlement with the Southern Railway covering the adjustment of accounts for the period of federal control, by which the Southern receives a lump sum of \$6,000,000. The company's claim is understood to have been in the neighborhood of \$35,000,000, but the settlement represents a deduction of the amounts devoted by the government for capital expenditures. The Railroad Administration has also settled with the Chicago & Western Indiana for \$450,000, the Belt Railway of Chicago for \$140,000 and the Richmond Terminal Railway has paid to the administration \$17,157.42.

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the railroad administration during the 26 months of federal control.

### Dividends Declared

Atlantic Coast Line.—Common, 3¼ per cent, payable July 11, to holders of record June 25.

Canada Southern.—1½ per cent, semi-annually, payable August 1, to holders of record July 1.

Cleveland, Cincinnati, Chicago & St. Louis.—Preferred, 1¼ per cent, quarterly, payable July 20, to holders of record July 1.

Detroit River Tunnel.—3 per cent, semi-annually, payable July 15, to holders of record July 8.

Grand Trunk Railway Guaranteed Stock.—2 per cent, payable June 30, to holders of record June 3.

Great Northern.—Preferred, 1¼ per cent, quarterly, payable August 1, to holders of record July 2.

Joliet & Chicago.—1¼ per cent, quarterly, payable July 5, to holders of record July 1.

Kansas City Southern.—Preferred, 1 per cent, quarterly, payable July 15, to holders of record June 30.

Louisville & Nashville.—3½ per cent, payable August 10, to holders of record July 12.

Michigan Central.—2 per cent, semi-annually, payable July 29, to holders of record July 1.

New York Central.—1¼ per cent, quarterly, payable August 1 to holders of record July 15.

Northern Pacific.—1¾ per cent, quarterly, payable August 1, to holders of record July 2.

Northern Securities.—4 per cent, payable July 9, to holders of record June 29.

Philadelphia & Trenton.—2½ per cent, quarterly, payable July 10, to holders of record July 1.

Pittsburgh & Lake Erie.—\$2.50, semi-annually, payable August 1, to holders of record July 15.

Reading Company.—Common, 2 per cent, quarterly, payable August 11, to holders of record July 19; first preferred, quarterly 1 per cent, payable September 8, to holders of record August 23.

United New Jersey Railroad & Canal Company.—2½ per cent, quarterly, payable July 10, to holders of record June 21.

**MODESTY IN ADVERTISING.**—"Empty freight cars continue to obstruct some of the views along the Erie system, but they are on sidings in Ohio and Indiana and not along the Delaware or Susquehanna rivers."—*Erie Railroad Magazine.*

**THE ALABAMA, TENNESSEE & NORTHERN** has made a reduction of 16½ per cent in passenger rates. The decrease applies on one-way and round-trip fares with a return limit of thirty days. A decrease of 33½ per cent is made on round trip rates with a return limit of five days.

## Railway Officers

### Executive

Frank H. Hamilton, secretary and treasurer of the St. Louis-San Francisco, with headquarters at St. Louis, Mo., has been elected vice-president, secretary and treasurer, with the same headquarters, effective June 9.

### Financial, Legal and Accounting

R. F. Humble has been appointed general auditor of the Arkansas & Louisiana Missouri, the Mansfield Railway & Transportation and the Louisiana & Pine Bluff with headquarters at Shreveport, La., effective June 1.

### Operating

F. J. Slimer has been appointed car accountant of the Louisiana & Arkansas, with headquarters at Stamps, Ark., effective June 1.

Frank N. Spencer has been appointed general manager of the Chestnut Ridge with headquarters at New York City, succeeding W. L. Coursen, resigned.

G. D. Dager, superintendent of the Adirondack division of the New York Central, has had his jurisdiction extended over the Ottawa division and the Ottawa & New York, effective June 20.

C. E. Lanham, superintendent of car service of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., has been appointed superintendent of car service of the Birmingham & Northwestern, with the same headquarters, effective June 15, succeeding W. H. Trice, car accountant, who has resigned.

R. H. Janes, trainmaster of the Chicago, Milwaukee & St. Paul, with headquarters at Mason City, Iowa, has been given jurisdiction over the territory to Rapid City, S. D., including the entire Iowa and Dakota division. D. A. Gibson, trainmaster, with headquarters at Mitchell, S. D., has been assigned to other duties and the position of trainmaster abolished. The changes were effective June 11.

B. W. Procter, whose promotion to assistant general manager of the International & Great Northern, with headquarters at Palestine, Tex., was announced in the *Railway Age* of May 27 (page 1252), was born at Thornton, Tex., on June 15, 1884, and was educated at the Texas Christian University and the Chicago Correspondence School of Law, from which he graduated in 1909. He entered railway service on June 4, 1904, as a clerk to the roadmaster on the International & Great Northern, and his entire railway career has been spent in the service of that company. In November, 1904, he became a stenographer in the office of the superintendent, and two years later was made chief clerk to the superintendent of the Fort Worth division. He served in this position until May 1, 1919, when he was appointed traveling wage supervisor. At the time of his recent promotion, Mr. Procter was serving as assistant to the general manager, a position to which he had been promoted in September, 1920.

E. Bodamer, whose promotion to superintendent of the Memphis terminal division of the Yazoo & Mississippi Valley, with headquarters at Memphis, Tenn., was announced in the *Railway Age* of June 10 (page 1378), was born at Logan, Ohio, on June 9, 1870, and first entered railroad service as a switchman on the Pennsylvania. In 1889, he became a switchman in the service of the Terminal Railroad Association at St. Louis, and in 1894, took service with the Wiggins Ferry Company of St. Louis. After serving as a conductor on the St. Louis-San Francisco, from 1899 to 1903, Mr. Bodamer became a conductor on the Illinois Central. He was promoted to trainmaster, with headquarters

at Memphis, in 1913, and five years later was transferred to the Tennessee division. During the war he served as superintendent of the Memphis terminal division succeeding J. M. Walsh, and upon the latter's return from military service, he returned to his position as trainmaster. He was serving in this capacity at the time of his recent promotion.

### Traffic

E. E. Overton has been appointed traffic manager of the Midland Continental, with headquarters at Jamestown, N. D.

A. L. Preston has been appointed general agent, freight department, of the Canadian Pacific with headquarters at New York.

Charles J. Rieger has been appointed express traffic agent of the Louisville & Nashville, with headquarters at Louisville, Ky., effective June 15.

G. S. Donaldson, traveling agent of the Chicago & North Western, with headquarters at Toronto, Ont., has been promoted to general agent, with the same headquarters, effective June 7, succeeding B. H. Bennett, deceased.

J. H. Shaw, general freight and passenger agent of the Arkansas & Louisiana Missouri, will also serve the Mansfield Railway & Transportation and the Louisiana & Pine Bluff in a similar capacity with headquarters at Shreveport, La., effective June 1.

A. L. Eidenmiller, general agent of the Chicago, Milwaukee & St. Paul, with headquarters at Boston, Mass., has been appointed general advertising agent, with headquarters at Chicago. F. D. Dodge succeeds Mr. Eidenmiller. The appointments were effective June 15.

P. Schorr, traveling freight agent of the Wabash, with headquarters at Des Moines, Iowa, has been promoted to division freight agent, with the same headquarters. Mr. Schorr succeeds L. E. Clarahan, who has been transferred to Omaha, Neb., succeeding G. M. Entrikin, deceased. The promotion and changes were effective June 15.

H. W. Watson, commercial agent of the Georgia & Florida, with headquarters at Nashville, Tenn., has been promoted to general freight and passenger agent, with headquarters at Augusta, Ga., succeeding W. D. Cook, who has resigned. W. W. Swain succeeds Mr. Watson. D. W. Agnew has been appointed general western agent, with headquarters at Cincinnati, Ohio, and W. H. L. Nelms has been appointed general agent, with headquarters at Atlanta, Ga.

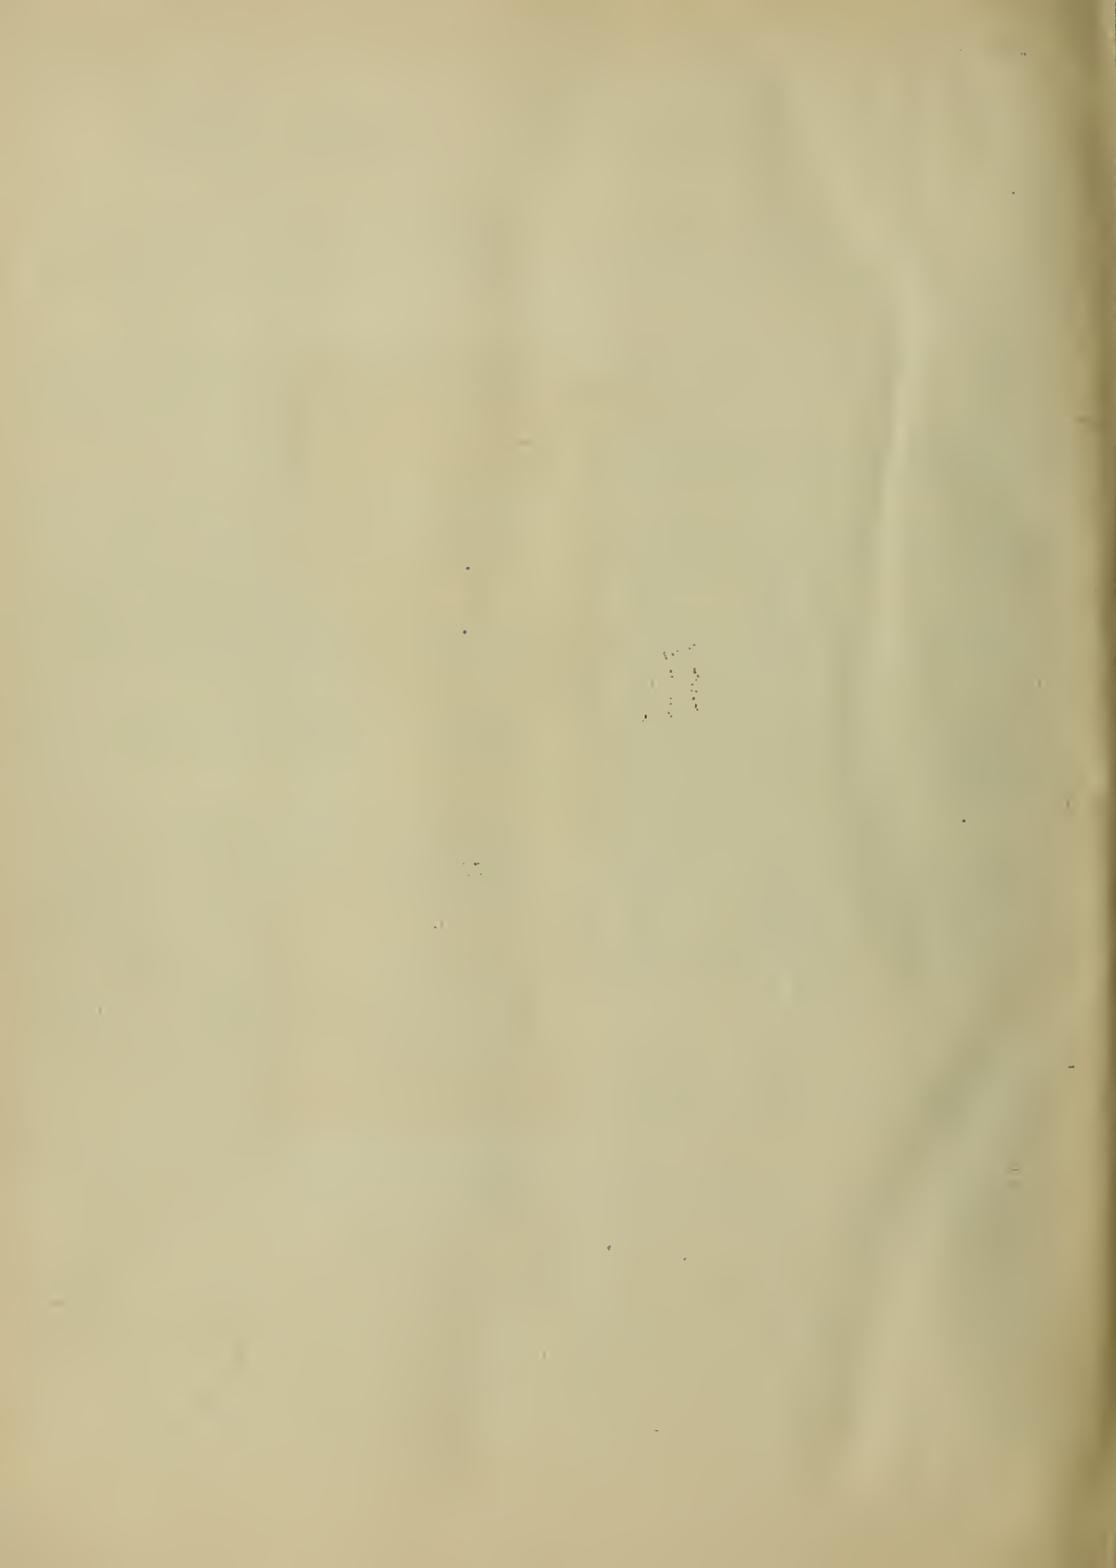

## Obituary

Coleman King, supervisor of track of the Long Island, died in St. Catherine's Hospital, Brooklyn, N. Y., on June 18, at the age of 59. Mr. King was a past-president of the Roadmasters and Maintenance of Way Association of the United States.

William H. Given, at one time assistant general manager of the Waterloo, Cedar Falls & Northern and more recently train rules examiner of the Chicago, Rock Island & Pacific, first district, died at Iowa City, Ia., on June 7, at the age of 63. Mr. Given was born at Coshocton, O., and at the age of seventeen entered the service of the Des Moines Valley, which was later absorbed by the Rock Island. He became trainmaster, and later superintendent, of the Missouri, Iowa & Des Moines Valley. For a short time he was assistant general manager of the Waterloo, Cedar Falls & Northern and in 1917 he returned to the Rock Island as train rules examiner, which position he held at the time of his death.

PENNSYLVANIA RAILROAD STOCKHOLDERS numbered 140,159 on May 1, an increase of 1,766 since April 1, and of 16,272 since May 1, 1920.
